Reddin, D. G., Hansen, L. P., Bakkestuen, V., Russell, I., White, J., Potter, E. C. E., Dempson, J. B., Sheehan, T. F., Ó Maoiléidigh, N., Smith, G. W., Isaksson, A., Jacobsen, J. A., Fowler, M., Mork, K. A., and Amiro, P. 2013. Distribution and biological characteristics of Atlantic salmon (*Salmo salar*) at Greenland based on the analysis of historical tag recoveries. – ICES Journal of Marine Science, 69: 1589 – 1597.

The authors have replaced the Figure 5 that was originally given in the article as this was incorrect in the originally published version of the manuscript.

In Figure 5 there are two panels:

- the upper panel shows European fork lengths of tagged salmon from the 1960's to 2000's
- the lower panel shows the same from North American tagged salmon

Both also have regression lines and 95% cls plotted.

It appears that the regression line (and cls) on the upper (European) panel which show a negative trend, have been repeated on the lower (North American) panel, in place of their own, which in fact show a positive relationship.

The corrected version, with the correct figure, can be found on the online journal site.
