Survey research designs that integrate contextual data have become more prevalent in recent decades, presumably to enable a more refined focus on the person as the unit of analysis and a greater emphasis on inter-individual differences due to social forces and contextual conditions. This article reviews varied approaches to contextualizing survey data and demonstrates the value of two integrative approaches for the study of human development and aging—the use of interviewer ratings and neighborhood information (measured via census tracts). The utility of an integrative approach is illustrated with data from the Health and Retirement Study, revealing what is gained by using a contextualized approach and how substantive conclusions may be misdirected when contextual factors are neglected. Neighborhood disorder, measured by respondent and interviewer ratings, as well as geocoded neighborhood socioeconomic data were used to predict disability and depressive symptoms among older adults. Results indicate that racial and ethnic differences in functional limitations and depressive symptoms may be overestimated when failing to include contextual neighborhood characteristics. To enhance the predictive validity of

survey data, investigators should consider meaningful contextual data for specific research questions.

PATTERNS OF MISSING DATA AT THE END-OF-LIFE: USING LINKED MORTALITY DATA TO EXAMINE BIAS IN PANEL DATA

R. Luff, A. Channon, *National Centre for Research Methods, University of Southampton, Southampton, United Kingdom*

Panel surveys for older adults would ideally contain data up to the end of participants' lives. This allows analysis of key changes, including increasing health and social care use, that more commonly occur in the final years of life. However, all panel surveys suffer from attrition across waves, including non-response. Missing data analysis tends to categorise participants as either participating, missing or dead. Using linked mortality data within the English Longitudinal Study of Ageing (ELSA) a person's death is recorded even if they have missed several waves of data collection. This enables us to determine not just if data is missing but how much data is missing before end-of-life. Three research questions are addressed: 1) For those who have died between waves 1 and 5 of ELSA, how many waves were missing prior to death? 2) What is the average amount of missing data at end-of-life? 3) Is the amount of missing data randomly distributed? Specifically does cause of death relate to how much data is missing? Analysis indicates that almost 30% of those who have died have 1, 2 or 3 waves missing prior to death and the amount of missing data is not random. Using multistate life tables, it is demonstrated that cause of death relates to the chances of having more waves missing. In conclusion, those with declining function over a long period of time are more likely to have more waves missing. These patterns of missingness should be considered when analysing data from older populations.

RETENTION OF PARTICIPANTS IN LONGITUDINAL ALZHEIMER'S DISEASE STUDIES: WHO STAYS?

Y. Hu, H. Iqbal, L.M. DeLaney, P. Hidalgo, S.L. Stark, *Washington University in St. Louis, St. Louis, Missouri*

A high attrition rate is a major barrier in conducting longitudinal studies. The aim of this retrospective cohort study is to explore the traits of participants in longitudinal Alzheimer Disease (AD) studies in order to investigate retention barriers and facilitators. To determine the relationships of baseline demographics, cognitive status (The mini-mental state examination), AD biomarkers (elevated cerebral amyloid-beta (A β) burden measured by positron emission tomography), and the retention rate in an AD research, Pearson correlation, Welch's t test and chi-square were conducted. A retention score was calculated by dividing the number of missed appointments by the number of scheduled appointments. There were 660 participants (age mean = 74.9 \pm 9.2; 60.2% female; 85% Caucasian) who have records of clinical assessments in our study; 71 participants (89.24%) who have a retention score lower than 70% were selected in low retention group for comparison. The results showed that older age ($r = .599$, $p < .01$), being male ($\chi^2 = 4.53$, $p = 0.03$), lower cognitive status ($t = 6.60$, $p = 0.01$), and higher A β burden are significantly related to higher retention rate. The result of this study provided an initial exploration of

characteristics of participants who enrolled and remained in longitudinal studies. Future investigators should be cautious of research design, research generalization, and feasible plans for attrition.

SESSION 3840 (SYMPOSIUM)

DECISION MAKING AND FINANCIAL EXPLOITATION

Chair: M.L. Gilhooly, *Brunel University London, Uxbridge, England, United Kingdom*

Co-Chair: P.A. Lichtenberg, *Wayne State University, Detroit, Michigan*

Discussant: K.A. Roberto, *Virginia Polytechnic Institute & State University*

This is the first of three symposia about older adults and financial exploitation organized by the GSA Lifelong Financial Health Workgroup. Symposium 1 is focussed on what is known about decision-making and financial exploitation. Although it is well established that cognitive abilities such as fluid intelligence declines markedly with age, until recently little was known about the extent to which our abilities to manage complex financial tasks change with age. The first paper by Lichtenberg will set the context and consider decisional abilities and current measures of financial capacity. In paper 2 Boyle will delve more deeply into the implications of findings from research on cognition, dementia and decision-making for the potential for financial exploitation. Dr Marson will consider brain ageing and the implications for financial services in Paper 3. Paper 4 by Price is concerned with household money over the life course and how family dynamics have the potential for financial exploitation. Finally, in Paper 5 Gilhooly explores the potential of the bystander intervention model to help us understand the decision-making that leads to a failure to intervene when financial exploitation is suspected.

CONTEXT, DECISIONAL ABILITIES, AND MEASURES OF FINANCIAL CAPACITY

P.A. Lichtenberg, *Wayne State University, Detroit, Michigan*

Although financial decision making deficits often lead to financial exploitation and, perhaps more importantly, repeat exploitation, there has been little work linking the two together. My presentation will focus on our efforts and empirical work to date to link these two together. We will review the conceptual framework for the Lichtenberg Financial Decision Rating and Screening Scales (LFDRS and LFDSS, (Lichtenberg et al, 2015), and the empirical findings to date (Lichtenberg, 2016) and continuing to emerge. Two hundred rating scales were collected along with neurocognitive and everyday financial skill measures. Whereas 56% of those with financial decisional ability deficits experienced exploitation less than 10% of the remainder of the sample did so. The combination of cognitive impairment and decisional ability deficits rendered participants particularly vulnerable to exploitation. In a separate study of 213 screening scales, decisional deficits were highly related to financial exploitation case substantiation by Adult Protective Service workers

THE CAUSES AND CONSEQUENCES OF FINANCIAL FRAUD AMONG OLDER AMERICANS

P. Boyle, *Rush University Medical School, Chicago, Illinois*

Financial fraud of older adults is a major threat to well-being. This problem is expected to grow as the baby boomer generation retires and more retirees manage their own retirement accounts. This paper presents findings from a unique dataset which allowed us to examine the causes and consequence of financial fraud. We found that decreasing cognitive capacity is associated with higher scam susceptibility scores and was predictive of fraud victimization. In addition, we found that overconfidence in one's financial abilities and knowledge was associated with fraud victimization. Finally, victims of fraud were found to increase their willingness to take financial risks compared to propensity-matched non-victims.

DIMINISHED FINANCIAL CAPACITY AND FINANCIAL EXPLOITATION OF OLDER ADULTS

D.C. Marson, *University of Alabama at Birmingham, Birmingham, Alabama*

The ability independently to manage one's financial affairs, known as financial capacity, is an everyday life skill of critical importance. Financial capacity is closely tied to personal independence and successful community function, and has been equated to "diet, exercise, and sleep" as a key indicator of health status in adults. Impairment of financial capacity is also closely linked to risk of financial exploitation and financial elder abuse. This paper discusses how normal cognitive aging and dementias of aging diminish financial capacity in the elderly and create vulnerability to financial exploitation. It also discusses recent research into very early financial declines in older adults, and their implications for impaired financial decision-making and financial exploitation by others. The paper concludes by discussing neuroimaging studies of financial skill decline in patients with MCI and AD dementia, and the promise they hold for early identification and protection of at-risk elderly.

AUTONOMY, IDENTITY, AND AGEING: HOUSEHOLD MONEY AND LATER LIFE

D. Price, *University of Manchester, Manchester, England, United Kingdom*

Research among younger couples shows that daily money practices require complex navigation and are highly gendered. Very little research has examined these issues for older couples despite gender identities being threatened by biological and social ageing and power relations potentially changing in transitions to retirement. In this paper results from an in-depth qualitative study are reported including ten focus groups and interviews with 45 older couples from across the socio-economic spectrum. We find contrary to expectation that retirement was not a time to reorganize money practices, with maintenance of the status quo and gender hierarchies and couple identities preserved. Women engaged in complex emotional work to maintain breadwinner role identities in their partners and in a number of cases, financial behaviours that could be interpreted as controlling and abusive of women were reported. Our findings pose important

questions for feminism, sociology and gerontology in understanding the experience of daily life.

FINANCIAL EXPLOITATION THROUGH THE LENS OF THE BYSTANDER INTERVENTION MODEL

M.L. Gilhooly¹, G. Dalley¹, K.J. Gilhooly¹, P. Harries¹, D. Kinnear², 1. Brunel University London, Uxbridge, England, United Kingdom, 2. University of Glasgow, Glasgow, Scotland, United Kingdom

Although developed to explain why people fail to act in emergencies, the bystander intervention model has considerable potential to help us understand decision-making in relation to the detection and prevention of elder financial abuse. There are five stages to our modified 'professional bystander intervention model': (1) noticing relevant cues to financial abuse, (2) construing the situation as financial abuse, (3) deciding the situation is a personal responsibility, (4) knowing how to deal with the situation, and (5) deciding to intervene. In the same way that a number of stages must be negotiated in cases of bystander intervention in emergencies, in non-emergencies such as elder financial abuse, the same stages must also be negotiated. Although policies and guidelines might indicate what should be done and who should take responsibility once elder financial abuse is identified, the identification of elder financial abuse itself involves complex judgements which are also part of the decision-making process. This paper will present findings from a two-year UK study on decision-making by health, social care, and banking professionals in detecting and preventing financial elder abuse.

SESSION 3845 (SYMPOSIUM)

EXTENDING WORKING LIFE—POSSIBLE FOR EVERYONE?

Chair: C. Jagger, Newcastle University

Co-Chair: B. Beach, International Longevity Centre - UK, London, United Kingdom

Discussant: A. Börsch-Supan, Max Planck Institute for Social Law and Social Policy, München, Germany

Although increasing life expectancy worldwide is a major achievement, it brings considerable challenges, especially for the long term sustainability of health care, pensions, and other retirement benefits. The policy response in many countries has been to extend the typical retirement age. However, socio-economic inequalities and racial/ethnic health disparities in many countries raise doubts about the fairness of 'one size fits all' approaches, doubts that could reduce public support for programs serving older persons and add to the fracturing of social cohesion that is occurring in many developed countries. There is strong evidence that older adults with less education or lower socio-economic status cannot work as long as those with more education and more resources. This session examines how inequalities play out when work extends later into the life course, and the lessons that extension may bring for policy and business practice. The first presentation uses mixed methods to assess how socio-economic characteristics over the life course influence retirement decisions in a UK 'baby-boomer' cohort whilst the second focuses on how working conditions and mental health affect continued employment in later life. The third presentation contrasts African American and white older people in

the United States on the role of disability as working life is extended. The final presentation explores, through two qualitative studies, the challenges that older migrant groups in the United States and UK face in extending working life.

SOCIO-ECONOMIC INEQUALITIES AND EXTENDED WORKING IN A BABY-BOOM COHORT: A MIXED METHODS STUDY

S. Moffatt, J. Wildman, M. Pearce, University of Newcastle upon Tyne, Newcastle upon Tyne, United Kingdom

The 'baby boomers' are ideal candidates for extended working due to better health and less physically-demanding employment than previous cohorts. This study investigated how circumstances across the life course influence retirement decisions and what it means to have an extended working life in a UK 'baby boom' birth cohort, born in 1947 (n=1142). Mixed-methods were used: prospective quantitative survey data provides evidence on earlier-life predictors of employment at ages 62–64; qualitative data from in-depth interviews (n=28) with a cohort sub-sample explore the 'messy realities' of the decision to retire or remain in employment. We found that socio-economic characteristics throughout the life course influenced retirement decisions and our interviews shed light on inequalities arising from freely-chosen extended employment as part of active ageing and involuntary extended employment (or unemployment) among those without the means to choose. The extending working lives agenda risks amplifying inequalities in later life.

MIDLIFE PSYCHOSOCIAL WORKING CONDITIONS AND MENTAL HEALTH AS PREDICTORS OF EXIT FROM PAID WORK

J. Head¹, E. Carr¹, M. Stafford¹, M. Kivimaki¹, S. Stansfeld², 1. University College London, London, United Kingdom, 2. Queen Mary University of London, London, United Kingdom

This study investigated associations of cumulative mid-life working conditions and mental health with transitions out of paid employment. Participants were 7587 men and women with work measures on at least 2 out of 3 occasions from phases 1 to 3 of the Whitehall II study (mean age 50). Mid-life cumulative working conditions were defined as the number of times a person experienced adverse working conditions. After adjustment for socio-demographic factors, increased likelihood of exiting paid employment between ages 40 and 75 was associated with poor mental health, low decision latitude and low social support at work. Working conditions did not modify the influence of poor mental health on transition out of work in either younger or older workers. Our findings suggest that both work environment and promotion of good mental health are key factors that may contribute to extending working life.

DISPARITIES IN DISABILITY AND THE ABILITY TO WORK: IMPLICATIONS FOR INCREASING THE RETIREMENT AGE

S.B. Laditka¹, J.N. Laditka¹, C.S. Elman², C. Jagger³, 1. University of North Carolina at Charlotte, Charlotte, North Carolina, 2. University of Akron, Akron, Ohio, 3. University of Newcastle upon Tyne, Newcastle upon Tyne, United Kingdom

Employment and health affect one another and mortality. Using the Panel Study of Income Dynamics (1968–2013; $n=16,115$; 261,804 person-years), we studied life-course dynamics of work, health, and mortality for African American and white women and men. We measured: (1) work limitations due to health; (2) difficulty doing activities of daily living; and (3) permanent disability. Using multinomial logistic Markov models and microsimulation, we created large populations, measuring work and disability status each month for each person, age 20 through death. The average age when African American (white) women with high school education last worked was 60.4 (63.6), when 21.1% (24.9%) were disabled. Analogous results with less education were 58.3 (61.6), and 28.0% (34.1%) (all $p<0.001$; similar results for men). Disability disparities increased following retirement, a result that questions the fairness of addressing Social Security's financial challenges by raising the retirement age without considering work patterns and ability to work.

OLDER MIGRANT WORKERS—AN OVERLOOKED COMMUNITY WITHIN THE EXTENDED WORKING LIFE DEBATE

M. Rhee¹, M. Flynn², 1. *University of Southern California, Los Angeles, California*, 2. *University of Newcastle upon Tyne, Newcastle upon Tyne, United Kingdom*

This paper will explore the experiences of older migrants in work and the challenges they face in extending working life. It is based on two qualitative studies involving older Korean people in the USA and older Chinese in the UK. Older migrants face significant barriers in maintaining employment: multiple discrimination; language barrier; and the lack of formal and transferable skills to name a few. Further, migrant workers are more likely to be in either contingent work or self employment than their native equivalents, and extended working life for many means a longer period of financial insecurity. Because migrant people tend to find work within their communities (neighbourhood enclaves) we argue that if they need to work longer, social support to help them to do so such as training can most effectively be channeled through community organizations.

SESSION 3850 (PAPER)

LONG-TERM CARE II

WHAT PREDICTS TRANSITIONS IN CARE FOR OLDER ADULTS NEW TO LONG-TERM SERVICES AND SUPPORTS?

K.B. Hirschman^{1,2}, M. Toles^{3,2}, A. Hanlon^{1,2}, B.K. Daly¹, M.D. Naylor^{1,2}, 1. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*, 2. *NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania*, 3. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Long-term services and supports (LTSS), delivered by home and community-based services [HCBS], assisted living facilities [ALF] and nursing homes [NH]), are provided to nearly six million frail older adults in the US. Physical and cognitive decline are common among LTSS recipients. However, predictors of health care transitions (i.e., to

hospitals, emergency departments, skilled nursing facilities or rehabilitation centers) among this population are poorly understood. The purpose of this study was to examine predictors of health care transitions among a cohort of 470 new LTSS recipients using data collected quarterly over two years. Using multivariable Poisson regression modeling within a generalized estimating equation framework, the mean number of care transitions over the two year period was 3.1 (median=2). New NH and ALF recipients experienced fewer transitions over time, while the transitions' profile for new HCBS recipients remained stable over time ($p<0.001$, time-LTSS interaction). High baseline quality of life (QoL) ratings were associated with a more rapid decline in transitions over time ($p=0.013$, time-QoL interaction). For every five additional medications at baseline, the rate of transitions increased by 11.5% ($p=0.036$) and for older adults requiring ambulation devices at baseline, there was a 31.4% increase in the rate of care transitions compared to those not requiring ambulation devices ($p=0.034$). These findings add to our understanding of both the predictors of health transitions among LTSS recipients and the effect of three types of LTSS on these predictors. Over time, new LTSS recipients' rates of care transitions look similar regardless of type of LTSS type.

ACTUAL VS. INTENDED USE OF THE PHYSICAL ENVIRONMENT IN DEMENTIA CARE SETTINGS: STAFF PERSPECTIVES

H. Cooke², H. Chaudhury², 2. *University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Simon Fraser University, Vancouver, British Columbia, Canada*

While person-centred care is increasingly viewed as synonymous with good quality dementia care, its widespread adoption and integration remains elusive. Consequently, there is a need for greater examination of the organizational structure of care provision and the experiences of Residential Care Aides (RCAs), who provide the majority of hands-on care. To date, the role of the physical environment in RCAs' care practice has been overlooked in the empirical literature. As part of a larger ethnographic study exploring the influence of the physical and organizational care environment on care provision, in-depth interviews with 29 staff (21 RCAs, 3 LPNs, 5 managers) and more than 230 hours of participant observation were conducted in two Canadian nursing homes with specialized dementia units. Thematic analyses revealed a key disconnect between the physical environment *as designed* and *as used* by RCAs in their daily care practice. The first theme, 'it's more for looks', illustrates how despite the presence of features considered central to care quality (e.g., small-scale, home-like environments, well-remunerated and trained staff, and high staffing ratios), opportunities for residents' continuity of self, meaningful engagement, and support for functional abilities were limited. The second theme, 'environment as control', highlights how certain aspects of the physical environment were used to control behaviours of residents and staff and, in turn, limit their choice and autonomy. Findings highlight the importance of recognizing the interrelation between environmental design, supportive organizational policy, and institutional culture in effectively implementing a person-centred approach to dementia care.

FAMILY MEMBERS' PERSPECTIVES ON NEGOTIATING A CULTURE OF SAFETY IN RESIDENTIAL LONG-TERM CARE

G. Puurveen¹, J. Baumbusch¹, D. Beaton¹, M. Leblanc¹, A. Phinney¹, D. O'Connor¹, C. Ward-Griffin², 1. *School of Nursing, University of British Columbia, Vancouver, British Columbia, Canada*, 2. *University of Western Ontario, London, Ontario, Canada*

Responsive behaviours between residents (RBBR) are negative and aggressive physical, sexual, or verbal interactions that occur between some older adults living in Residential Long-Term Care (RLTC). Despite the growing understanding of RBBR, to date research has focused on residents and staff, yet, families, many of whom spend a significant amount of time on-site, have largely been excluded from this research.

The purpose of this presentation is to describe family members' perspectives on responsive behaviours between residents in RLTC. The methodology for the study was critical ethnography comprising semi-structured interviews with 12 family members and over 100 hours of participant observations. A thematic analysis was undertaken using constant comparative methods. Under the over-arching theme of *Negotiating Safety*, family members discussed activities *Promoting Safety* of themselves and the safety of residents. However, *Role Ambiguity* impacted family members' actions in relation to witnessed events of responsive behaviours between residents. *Contextual Features* such as the physical environment and organizational context (e.g., staffing levels) contributed to how safety was perceived and negotiated. These findings highlight family members' perspectives of safety based on experiences of their relatives' being victims or perpetrators of RBBR, their witnessing and active attempts to diffuse situations even where their relative was not involved, and the lack of information and disclosure of RBBR by staff. Study findings have important implications for workplace policy and practice, underscoring the integral need for families to be offered education and support around their unavoidable role in managing RBBR.

THE "WOODWORK EFFECT" IN LTSS, HORSE OR UNICORN? 22-YEARS OF EVIDENCE IN OHIO'S LTC INDUSTRY

I.M. Nelson^{2,1}, D. Berish¹, R.A. Applebaum^{2,1}, 1. *Miami University, Oxford, Ohio*, 2. *Scripps Gerontology Center, Oxford, Ohio*

The "woodwork effect", the concern that increasing access to home and community based options (HCBS), seen as more desirable than institutional care, may result in significantly more eligible individuals seeking access to tax payer supported long-term services and supports (LTSS), has long been a concern for those interested in LTSS policy (Kemper, Applebaum & Harrigan, 1987). One aspect of LTSS policy where there is concern over a potential woodwork effect is re-balancing efforts between institutional long-term care and HCBS. If a significant woodwork effect does occur, any cost savings pursued through diverting consumers from costlier institutional care to less costly HCBS care may go unrealized or payer expenses may even grow. Evidence to support a woodwork effect has been mixed (Kaye, LaPlante, & Harrington, 2009; Eiken, Burwell & Sredl, 2013; Grabowski, 2006; Weissert & Frederick, 2013). As documented over a

22-year, longitudinal, statewide survey of long-term care, Ohio has made considerable progress toward balancing its long-term care system, going from 91% of older Ohioans receiving Medicaid LTSS services in institutional settings and 9% HCBS in 1993 to 50% institutional and 50% HCBS by 2011 (Mehdizadeh & Applebaum, 2013). The data, however, has not shown evidence of a woodwork effect. Analysis of this longitudinal data set has shown that detecting the presence, absence or opposite of a woodwork effect depends on the measurement technique and time interval used. Implications of the presence or absence of a woodwork effect for US and international policy on LTSS are also examined.

SESSION 3855 (SYMPOSIUM)

TACKLING LONELINESS IN LATER LIFE: WHEN, HOW, AND AT WHAT COST? AN INTERDISCIPLINARY SYMPOSIUM

Chair: B. Hanratty, *Newcastle University, Newcastle upon Tyne, United Kingdom*

Discussant: T. Scharf, *Newcastle University, United Kingdom*

Researchers, practitioners and policymakers identify social relationships as a determinant of wellbeing and health in later life. We know that lonely or socially isolated older adults have a greater risk of premature mortality, cardiovascular disease, cognitive decline and dementia. We also know that poor social relationships can affect health through a variety of mechanisms, including shaping health-related behaviours, influencing psychological states and interfering with biological and physiological processes. What is less clear is how we can intervene to tackle loneliness and the adverse health effects associated with it. This symposium aims to inform the design of effective interventions, drawing on findings from complementary studies in three different disciplines: social epidemiology, gerontology and economics. Results from a longitudinal observational study will shed light on how dynamic experiences of loneliness and isolation influence cardiovascular disease risk, highlighting implications for the timing and focus of successful interventions. A qualitative study exploring experiences of loneliness will provide insight into how older adults experience and manage their feelings, inviting a reflection on how these strategies might be incorporated into future interventions. Finally, insights will be presented from the evaluation of a population level payment-by-results programme to tackle loneliness.

LONELINESS, SOCIAL ISOLATION AND CARDIOVASCULAR DISEASE: EFFECTS OVER TIME IN ENGLISH OLDER ADULTS

N. Valtorta¹, M. Kanaan¹, S. Gilbody¹, B. Hanratty², 1. *University of York, York, North Yorkshire, United Kingdom*, 2. *Newcastle University, Newcastle upon Tyne, United Kingdom*

Research suggests that lonely and socially isolated individuals are at increased risk of cardiovascular disease (CVD), but the cumulative effects of poor relationships on health are unknown. We investigated how repeated exposure to loneliness and social isolation (and changes in exposure over time) affects CVD risk, using data from the English Longitudinal

Study of Ageing (7,096 men and women aged 50+, 2004–2012). Analyses were conducted using discrete-time survival models and established CVD risk factors. Across the 8-year follow-up, loneliness, but not social isolation, predicted increased risk of coronary heart disease. We found no evidence of a cumulative effect on CVD risk of loneliness and social isolation over time. Our findings suggest that primary prevention is likely to be most effective for tackling the adverse health effects of loneliness.

HOW DO OLDER PEOPLE MANAGE LONELINESS FOR THEMSELVES? A QUALITATIVE STUDY IN ENGLAND

K. Kharicha¹, S. Iliffe¹, J.T. Manthorpe², C. Chew-Graham³, M. Cattan⁴, M. Kirby-Barr¹, C. Goodman⁵, K. Walters¹,
1. Centre for Ageing Population Studies, Department of Primary Care and Population Health, University College London, London, United Kingdom, 2. King's College London, London, United Kingdom, 3. Keele University, Keele, United Kingdom, 4. Northumbria University, Newcastle upon Tyne, United Kingdom, 5. University of Hertfordshire, Hertfordshire, United Kingdom

Little is known about self-management approaches to loneliness. We conducted in-depth interviews with 28 community-dwelling people in two diverse English areas, aged 65+, with self-declared or risk of loneliness. Experiences, self-management and support-seeking for loneliness were explored. Data were analysed thematically by a multi-disciplinary team, including lay older people.

Participants articulated a breadth of loneliness experiences and their considerations in self-managing these negative emotions. Loneliness seemed complex, often inseparable from life events and circumstances, and characterised by terms of severity/frequency across the life-course. For many loneliness was a private matter for which they were reluctant to seek external support. Management strategies included getting outdoors regularly, planning/engaging in meaningful activity and cognitive coping strategies, including developing acceptance/feelings of control of one's situation, adopting a positive attitude/focus, focussing on the present not future, and relative comparisons with others. New approaches to alleviate loneliness should consider how these coping strategies can be optimised.

MAKING AN ECONOMIC CASE FOR TACKLING LONELINESS IN LATER LIFE

D. McDaid, A. Park, *London School of Economics and Political Science, London, United Kingdom*

Little research has been conducted on the economic case for tackling loneliness. We have developed an economic model documenting the long term costs and benefits of a program to tackle loneliness in older people in rural England. The program provides tailored, one to one volunteer-delivered time-limited support over six months to reconnect participants with interests and activities in their local community. The economic model synthesises published literature on potential avoidable health related costs of loneliness, with insights from interviews with participants and volunteers on rates of uptake and continued engagement with the program, as well as changes in levels of loneliness measured using the UCLA Loneliness Scale. Baseline findings indicate that there

is likely to be a positive return on investment, but that this is highly dependent on the quality of volunteer – participant relationship and on the sustainability of new social connections beyond the duration of the program.

SESSION 3860 (SYMPOSIUM)

PRECARIOUSNESS, THE PRECARIAT, AND AGING: NEW DIRECTIONS IN CRITICAL GERONTOLOGY

Chair: C.L. Estes, *University of California, San Francisco, Healdsburg, California*

Co-Chair: C. Phillipson, *The University of Manchester*

Risk, insecurity, globalization, and the destabilization of the everyday lives of millions of peoples across many nation-states signals the need for a re-framing of old age and aging. With growing economic and health insecurities and inequalities in life expectancy, precarity differs by and across age, class, gender, race, ethnicity, (dis)ability, and nation/citizenship, along with intersectional dimensions. European, Canadian, and North American scholars apply the concept of 'precariousness' and 'precarity', as developed by Butler (2009) and Standing (2010) to research, policy and practice in social gerontology. Portacolone reports on ethnographic research on precariousness in US older adults living alone with Alzheimer's Disease or mild cognitive impairment, applying micro, meso and macro theoretical and policy perspectives. Craciun's qualitative study examines precariousness in the case of older immigrants in Germany, as they confront insecurity and exclusion from main-stream society in old age, whilst demonstrating the possibility of a positive old age. Estes and DiCarlo focus on precarity in old age austerity politics and policy, examining US social movements that are catalyzing political advocacy and digital spaces in pitched battles aimed at preserving the Welfare State *versus* the 'Precariate State'. Phillipson and Grenier illuminate the disjuncture between (a) theories and policies emphasizing productivity/participation, and (b) the rise of a global political economy promoting risk/instability. All of the presentations will explore the extent to which the 'reconstruction of the life course calls for new directions in gerontology and critical perspectives in particular.

THE COMPOUNDED PRECARIETY OF OLDER ADULTS LIVING ALONE WITH COGNITIVE IMPAIRMENT IN THE U.S.

E. Portacolone, 1. *University of California, San Francisco, California*, 2. *Institute for the Study of Societal Issues, Berkeley, California*

Previous investigations have indicated that older adults living alone (OALA) are likely to experience precariousness. Their precariousness derives from their need to prove that they can "make" it alone, at a time in their life when they may need services that are either too expensive, limited, or difficult to access. At the same time, they may also experience a decline in their economic and social resources and physical abilities.

A recent in-depth qualitative investigation of 20 OALA with Alzheimer's disease (AD) or mild cognitive impairment (often a precursor to AD), suggests that having a cognitive impairment often exacerbates the precariousness of living

alone in older age. This paper examines the factors that further exacerbate this precariousness, including distress; need to hide the impairment; managing the impairment alone; little follow-ups post-diagnosis; and lack of appropriate services. Recommendations for specific policies and programs alleviating this precariousness will conclude the paper.

FROM PRECARIOUSNESS TO OTHERNESS: THE CASE OF OLDER IMMIGRANTS IN GERMANY

I. Craciun, 1. *Qualitative Educational and Social Research, Freie Universität Berlin, Berlin, Germany*, 2. *Babes Bolyai University, Cluj Napoca, Romania*

Active aging and ideas concerning integration are generally intertwined in public-policy discourse regarding older immigrants in Germany. Work is considered both a means to reach a happy old age and the key to social integration. However, many older immigrants work in precarious jobs and the media often construes them as a burden or threat to German society. Examining tensions between the model of active aging and challenges posed by “foreigner” status, this paper explores the Turkish and Russian communities, who account for the highest percentage of aging immigrants in Germany. Based on 24 interviews with older immigrants (12 Turkish, 12 Russian), it argues that these are further from the positive aging ideal compared to their German counterparts. Findings reflect how precarious aging immigrants become “the other”, facing insecurity and exclusion from main-stream society, and help explore implications for policy and practice.

POLITICS OF AGING: THE WELFARE STATE VERSUS THE PRECARIAT STATE

C.L. Estes, N. DiCarlo, *University of California, San Francisco, Healdsburg, California*

This paper explores the notion of the precariat as a phenomenon in decoding old age politics and policy. Precarity differs across age, race, ethnicity, gender and culture/citizenship, as observed in diverse life conditions, opportunities, and outcomes via SES, jobs, education, health care, and unpaid/underpaid carework. US social insurance is contingent on age, work history, citizenship, marital and health/disability status. Means-tested safety net programs address pockets of marginalized people. Ideologues contest the responsibility of the nation-state vs the individual, and more recently the responsibility of corporations. Austerity threatens bedrock Social Security and Medicare through privatization and cutbacks. Examining movements coalescing around Social Security, the authors’ analysis is grounded in critical political discourse, networks, interaction rituals, and digital sharing. Social media “trending” is a proposed catalyzing display of success in combating the risk shift from the Welfare State to the Precariat State.

FROM ‘ACTIVE’ TO ‘PRECARIOUS’ AGEING: GLOBALIZATION AND THE RECONSTRUCTION OF THE LIFE COURSE

C. Phillipson¹, A.M. Grenier², 1. *School of Social Sciences, The University of Manchester, Manchester, United Kingdom*, 2. *McMaster University, Hamilton, Ontario, Canada*

Ideas relating to ‘successful’ and ‘active’ ageing have become firmly embedded in research and policy over the

past decade. The idea of ‘active ageing’ has been especially prominent in shaping policies towards older people, with a strong emphasis on the link between activity, labor force participation and health and well-being. However, this approach has run alongside the impact of declining social protection and rising levels of social inequality. This paper examines the tension between theories that emphasise productivity and participation on the one side, and a political economy promoting new forms of risk on the other. The paper explores the extent to which the concept of ‘precariousness’ can provide a framework to address the reality of unequal access to the ideals of ‘successful ageing’ and the benefits of longevity. The paper provides an assessment of the policy implications of re-framing ageing from ‘active’ and ‘successful’ to ‘precarious’ and ‘insecure’.

SESSION 3865 (SYMPOSIUM)

PSYCHOSOCIAL INTERVENTIONS FOR LATE-LIFE DEPRESSION AND ANXIETY: OUTCOMES AND IMPLEMENTATION

Chair: M.P. Aranda, *University of Southern California, Hacienda Heights, California*

Discussant: L. Hinton, *University of California, Davis, Davis, California*

Depression and anxiety are two of the most prevalent late-life psychiatric disorders and are associated with negative outcomes. Although effective psychosocial treatments exist, depression and anxiety typically go unrecognized and under-treated especially in low-income minority groups and persons living with comorbid medical conditions. The purpose of the symposium is to present treatment outcomes across distinct effectiveness trials testing interventions for depression (Problem Solving Treatment), anxiety (Calmer Life), and living with advanced illness and depression (Dignity Therapy). Based on primarily minority samples (Latinos; African Americans), the effectiveness trials administer structured individual behavioral sessions based on skill-building, culturally tailored interventions and pleasant activities. Initial results indicate significant reductions in primary depression and anxiety outcomes as well as health-related indicators. Based on a case study of a promising approach promoting sense of purpose and dignity as well as family involvement in the face of life-threatening illnesses, the last presentation will illustrate how the approach can be tailored to significant physical and sensory changes experienced by patients. Implications for intervention modification, workforce training, and sustainability of evidenced-based interventions in health and community-based services will be covered.

PRIMARY OUTCOMES OF COMMUNITY-BASED INTERVENTION FOR LATE-LIFE ANXIETY IN UNDERSERVED COMMUNITIES

S. Shrestha^{5,1,2}, N.L. Wilson^{1,2}, A. Amspoker^{1,2}, J. Freshour^{2,1}, M. Kunik^{2,1}, J. Bavoineau⁴, M. Turner³, M. Stanley^{1,2}, 1. *Baylor College of Medicine, Houston, Texas*, 2. *Michael E. DeBakey VA Medical Center, Houston, Texas*, 3. *Catholic Charities, Houston, Texas*, 4. *Neighborhood Centers, Houston, Texas*, 5. *University of St. Thomas, Houston, Texas*

Anxiety among older adults is associated with multiple negative outcomes but is usually unrecognized and under-treated, although psychosocial treatments are effective. Most studies, however, are conducted with homogeneous samples. Calmer Life (CL) is a skills-based, person-centered, culturally-tailored intervention for late-life anxiety with options to integrate religion/spirituality and resource counseling. In a community-based, hybrid effectiveness-implementation trial, we compare outcomes following CL and Enhanced Community Care (ECC), which mirrors information and referral assistance in the community, in 150 older, mostly minority adults (75% African Americans) with clinically significant worry. Exclusion criteria include severe depression, active suicidal intent, mania, psychosis, cognitive impairment, and substance abuse. The proposed paper will present primary outcomes (changes in worry and anxiety) from baseline to 6 months for the total included sample. Study outcomes will aid expansion of psychosocial approaches for late-life anxiety to underserved communities.

TESTING THE EFFICACY OF PROBLEM SOLVING TREATMENT FOR LATINOS WITH LATE-LIFE DEPRESSION

M.P. Aranda¹, K. Ell¹, P. Lee¹, D. Camacho², 1. *University of Southern California, Los Angeles, California*, 2. *Columbia University School of Social Work, New York, New York*

Depression is a significant source of late-life disability and mortality. We describe the trial outcomes of a geriatric depression treatment pilot for older Spanish-speaking Latinos with major depression. Based on a randomized trial of 100 primarily Spanish-speaking geriatric patients, we test the feasibility, acceptability, and efficacy of adding individual counseling--Problem Solving Treatment (PST)--to enhanced usual care as an approach for treating depression in low-income Latinos with significant comorbid medical illnesses. Our results show high feasibility, initial screening/identification, and depression care sessions, as well as significant improvements in mental health status as well as HDRS depression severity scores at the 8-week follow-up. Clinical improvements were observed in both treatment groups. Implications for sociocultural adaptations to depression care will be addressed.

TAILORING INTERVENTIONS TO PROMOTE DIGNITY AND WELL-BEING FOR PATIENTS WITH LIFE-THREATENING ILLNESS

K. Ramos, J. Fulton, *GRECC/Aging Center, Durham VA Medical Center/Duke University, Raleigh, North Carolina*

More than 117 million individuals in the U.S. face one or more life-limiting health conditions. These conditions are associated with higher prevalence rates of depression, illness burden, decreased quality of life, and mortality. Life-limiting illness co-morbid with depression, in particular, has been linked to increased illness progression and poorer prognosis. To grow the currently sparse literature of psychological interventions aimed for patients with life-threatening disease, the treatment of depression via novel use of Dignity and Family Therapy (in a long-term care setting) is described and illustrated with a case study. Special emphasis is given to contributing factors

leading to the success of this treatment delivery (e.g., interdisciplinary team collaboration; treatment adaptations to accommodate impaired functioning). Treatment results via improvements in symptom outcomes (e.g., life-satisfaction, meaning, and care-recipient burden) are reviewed. Additional clinical examples of assistive technology utilization to improve both mental health access and coordination of care is offered.

A RANDOMIZED EFFECTIVENESS TRIAL FOR LATE-LIFE DEPRESSION IN SPANISH-SPEAKING LATINOS

M.P. Aranda¹, W. Mack², W. Vega¹, M. Hochman^{1,2}, A. Escaron², 1. *University of Southern California, Los Angeles, California*, 2. *AltaMed Health Services, Los Angeles, California*

The study tests the comparative effectiveness of a brief individual psychosocial intervention for Latino patients 55 years of age or older with depression and multiple medical conditions in a patient-centered medical home treatment setting. We examine mental health (SCL20; PHQ9; dysthymia; anxiety) and physical health (disability; physical function) outcomes at baseline, 3-, 6- and 12-months. A secondary aim is to test the feasibility of training and monitoring the fidelity of the interventionists with non-clinical training. Barriers and facilitators for implementation and sustainability of depression reduction treatments in real-world, community-based settings will be discussed.

SESSION 3870 (PAPER)

TECHNOLOGY AND HOME CARE

THE ROLE OF EHEALTH FOR STRENGTHENING CARE FOR OLDER PEOPLE WITH MULTIMORBIDITY IN EUROPE

F. Barbabella^{2,1}, M. Melchiorre², S. Quattrini², R. Papa², G. Lamura², 1. *Department of Health and Caring Sciences, Linnaeus University, Kalmar, Sweden*, 2. *National Institute of Health and Science on Ageing (INRCA), Ancona, Italy*

eHealth tools in integrated care programmes addressing multimorbidity can support people with chronic diseases, especially older people living in the community. In last decades, different types of eHealth solutions for people with multimorbidity have been fostered and tested in Europe, also with the support of international initiatives, but a wide overview of their potential was missing. Our study aimed at exploring which eHealth tools are implemented in integrated care programmes for older people with multimorbidity across Europe and to develop policy recommendations for further improvement. Within the framework of the ICARE4EU project, co-funded by the Public Health Programme of the European Union, 101 programmes of integrated care were mapped in 31 European countries. Out of them, 85 included at least one eHealth solution, in most cases concerning electronic health records (EHRs) and tools for digital communication between care providers. In-depth analysis by means of 5 case studies of promising programmes suggested that eHealth solutions for people with multimorbidity could differ widely but can have various outcome benefits in terms

of: widening access to healthcare services; enhancing care coordination and integration; enabling patients' self-management; and improving proactive and prevention strategies. Despite this potential, policy interventions in Europe lacked a comprehensive action for successful implementation so far, due to inadequate technical and financial support, lacks in legislative frameworks and in training users and health professionals. A set of policy recommendations was developed for fostering different types of eHealth solutions for multimorbidity care.

OLDER ADULTS AND LEARNING TECHNOLOGY: INNOVATIONS IN ADULTS' AND SENIORS' EDUCATION

A. Lipphardt, E. Leen-Thomele, E. Coroian, P. Held, *FAU Erlangen-Nuremberg, Fürth, Germany*

This paper discusses the results of an empirical survey with 187 people above the age of 50 years (mean age 68,4 yrs) on their digital behaviors, motivation as well as interests, and barriers against the use of new technologies and presents innovative learning approaches for older adults. The interviews were conducted in five European countries (Finland, France, Germany, Ireland, Spain) as part of the research project EHLSSA. The findings show that more than half of older adults are computer users and have Internet access at home. Reasons why they deal with digital technologies are mainly because they want to participate in the information society and keep pace with the younger generation. Main obstacles are physical challenges, fears and reservations to technology and the Internet, insecurity on how to work with digital devices and with regards to possibilities for support in case something goes wrong or questions arise. According to the interviewees, successful learning concepts focus on experimental and active learning, including a more diverse media use, a series of real life examples, and the connection with the daily life of older adults. Responses of ICT-beginners and experienced ICT-users were analyzed separately and compared. The results have been used as the basis for the adaptation of learning approaches for third level education and the development of online course modules in the field of digital literacy and humanities-related topics. The implementation of these courses started in May 2016 and will be completed in June 2017 with at least 800 participants.

AN ANALYSIS OF INTERNET USE BEHAVIORS AMONG THE LONG-TERM CARE INFORMATION SEEKERS

D. Liu, T. Yamashita, C. Lu, B. Burston, *HCAP, University of Nevada-Las Vegas, Las Vegas, Nevada*

The Internet has become a primary source of long-term care (LTC) information. Yet, user characteristics as well as related Internet use behaviors among LTC information seekers are yet to be investigated. Previous studies using a variable-centered approach can only focus on one specific Internet user behavior or one outcome variable at a time. In this study, we employed the person-centered approach (i.e., Latent Class Analysis or LCA) that simultaneously examines multiple Internet use behaviors. Data were derived from the 2010 Pew Internet and American Life Project that consist of fifteen

online Internet use behaviors including LTC and others such as a specific medical problem(s), treatment and procedure. The final sample size is N= 2,018 (excluding none internet users and incomplete data). The LCA identified two underlying groups (i.e., latent classes). In one group (n = 1,120), 25% of members sought online LTC information, and over 90% also looked for online information on other specific medical problem(s), treatment and procedure. While in another group (n = 898), only 2% sought LTC information online, and less than half of them also looked for any health and medical information. Results from the binary logistic regression showed that the odds of more active online seeking for LTC information was associated with younger age, women, higher educational attainment, higher income, greater number of chronic diseases and being caregivers (OR =1.02 to 1.94), and were statistically significant ($p < 0.05$). Theoretical explanations of findings and strategies to improve accessibility of online LTC information will be discussed.

UNDERSTANDING RACIAL AND ETHNIC DISPARITIES IN HOME HEALTH CARE: PRACTICE AND POLICY FACTORS

J.K. Davitt¹, J. Bourjolly², R. Frasso², S. Chan³, *1. School of Social Work, University of Maryland, Baltimore, Maryland, 2. University of Pennsylvania, Philadelphia, Pennsylvania, 3. Independent Statistics Consultant, Philadelphia, Pennsylvania*

Understanding racial/ethnic disparities in home health is essential both ethically and for advancing the overall health of the population, thereby reducing costs from morbidity and mortality. Equitable distribution of home health services is also critical to aging in place.

A mixed methods study was conducted to understand the contributing factors to home care outcome disparities. Utilizing existing Medicare data from the Outcome Assessment Information Set (OASIS), and Provider of Services file, we tested the hypothesis that minority home care patients would have lower functional status at discharge compared to white patients. Multivariate regression procedures were used on composite measures of activities and instrumental activities of daily living. We also conducted focus group interviews with a convenience sample of 23 home health agency staff recruited from a tri-state region. The focus groups explored staff's intimate perspectives on caring for the elderly in their homes and the complex practice factors that contribute to disparate health outcomes.

Quantitative analyses demonstrated that minority home health recipients experienced greater deterioration in functional status during their home health episode relative to white patients. In focus groups, staff reported patient (e.g. health literacy, income), staff (e.g. staff discretion, bias), agency (e.g. lack of staff diversity, cost control practices), and system factors (e.g. insurance coverage, reimbursement cuts,) which influence the relationship between race/ethnicity and outcomes.

Results highlight the relationship between access to care, quality care and outcomes. Staff discretion, bias and institutional forms of racism may contribute to disparities in functional status for minority home health care recipients.

FACTORS ASSOCIATED WITH QUALITY IMPROVEMENT IN LIGHT OF CHANGING PAYMENT SOURCES IN NURSING HOMES

J. Gaudet Hefelet¹, J. Wang¹, A. Barooah¹, C.E. Bishop², 1. *UMass Boston, Melrose, Massachusetts*, 2. *Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts*

Attractive Medicare payments and new Medicare payment reforms create strong incentives for nursing homes (NHs) to increase their Medicare resident census, but little is known about the possible impact these increases have on quality. While higher Medicare payments might be used for quality improvement, multitasking theory suggests increased attention to one area of care (short-stay care for Medicare patients) can have negative effects on other, unrewarded areas (care for long stay residents). Using data from 2005–2010 (LTCFoucUS.org, Nursing Home Compare, and the Area Health Resources File; approximately 14,500 NHs in each year), we sought to determine whether increased Medicare census was associated with a decrease in quality. Our study found that on average, increased Medicare census in the previous year was associated with modest quality improvement in the next year for a number long-stay care quality indicators. However, this pattern was not universal and preliminary findings suggest it may vary systematically across different types of nursing homes, such as ownership type. Our next phase of analysis will identify which nursing home characteristics are associated with being more likely to maintain or improve quality in response to increased Medicare census, and identify other characteristics associated with being more likely to experience a decline in quality.

SESSION 3875 (SYMPOSIUM)

CO-HOST ASA: NUTRITION FOR HEALTHY AGING—POLICY AND PRACTICE

Chair: B. Blancato, *American Society on Aging, San Francisco, California*

Co-Chair: M. Ponder, *Matz, Blancato and Associates, Washington, District of Columbia*

Food and nutrition become ever more important to humans as we age as a social and health support for all our ailments. Aging services can provide food as socialization; programs like congregate dining and home-delivered meals constitute wellness checks and stave off depression. Therapeutic nutrition through healthcare providers and increasingly through aging services programs can provide food as medicine to treat and prevent various conditions. This symposium will examine U.S. society's policies and practices around these social and medical nutrition supports. Where are the gaps in these supports? What challenges do nutrition aging services providers face, both in the field and from their for-profit competitors? Why are seniors in the United States food insecure and/or malnourished? What policies can lawmakers support in order to ensure that no older adult in the United States is hungry or malnourished? These questions and more will be discussed during this symposium.

MAINTAINING SERVICE PROVISION IN AN AGE OF AUSTERITY

P. Downey, *Serving Seniors, San Diego, California*

Many aging services providers in the United States today provide an array of services to the community beyond nutrition, including housing, oral health, physical and mental healthcare, legal aid, and education. However, providing this universe of services in an age of lowered federal funding and competition from for-profit healthcare and other services providers can mean that these not-for-profit aging services providers find it difficult to maintain full funding for even their core missions of nutrition and other basic services provision. This presentation will focus on this challenge and will discuss solutions from the field and from local, state and federal policy.

A NEW MULTIDISCIPLINARY COALITION TO COMBAT OLDER ADULT MALNUTRITION

M. Ponder, B. Blancato, *Matz, Blancato and Associates, Washington, District of Columbia*

Malnutrition is a nutrition imbalance that affects both overweight and underweight patients: in particular, older adult patients. In the acute care hospital setting, it affects approximately 20 to 60 percent of admitted patients. Nearly 35–50 percent of older residents in long term care facilities are malnourished. Chronic disease increases the risk of malnutrition in older adults. While older adult malnutrition is a prevalent and potentially costly problem, it is also preventable. Effective and timely screening is essential to help providers make accurate diagnoses, and early nutrition interventions have been shown to substantially reduce readmission rates, as well as complication rates, length of stay, cost of care, and in some cases, mortality. This presentation will describe the formation of a multidisciplinary coalition, DefeatMalnutrition.Today. The coalition seeks to increase awareness of the problem of older adult malnutrition and to propose policy solutions to combat this growing crisis. The coalition has already taken steps to change policy. This coalition is unique in its multidisciplinary nature, bringing together nutrition, wellness, faith, aging, health, business, and other groups. This is an important health policy opportunity for the gerontology network to become involved in a serious health problem.

AGING AND NUTRITION: WHERE WE'VE BEEN AND WHERE WE'RE GOING

M. Raimondi, *Academy of Nutrition and Dietetics, Washington, District of Columbia*

The U.S. has made great strides in the last few years in older adult nutrition policy, in both regulations and legislation. This presentation will detail these advances and discuss what they mean for older adults. Also, with a new U.S. President in 2017 come new challenges and opportunities. This presentation will discuss the new Administration and its potential goals, as well as the new Congress and potential legislation surrounding senior nutrition, hunger and food insecurity, including the renewals of the Farm Bill and the Older Americans Act. It will also focus on the ways in which gerontologists and others in the field of aging can impact this new policy.

SESSION 3880 (SYMPOSIUM)

USING CROSS-CULTURAL AND INTERNATIONAL EXPERIENCES IN DESIGNING AND IMPLEMENTING FUTURE ELDER CARE PLANS

Chair: R. Aminbakhsh Co-Chair: D. Chau, *University of California, San Diego, California*

Discussant: A. Gass, *VA San Diego Health Care System, San Diego, California*

This Symposium will present a historical review of geriatrics around the world and the current state of elderly health care in different regions, including North America (US and Mexico), South America, Asia (China and Japan), Europe, Middle East, and Africa. It will examine different factors that are responsible for the diversity in elders' care in different countries. It will also discuss the future challenges that elderly will face due to inevitable changes within each society. To be prepared for these challenges, planning should start now. Although each community will need a unique plan, based on its own unique needs and resources, learning from other countries' experiences is an invaluable guide in this process.

THE EFFECTS OF INDUSTRIALIZATION, URBANIZATION, AND GLOBALIZATION ON GERIATRIC POPULATION

R. Aminbakhsh^{1,2}, A. Gass², 1. *Geriatrics, University of California, San Diego, California*, 2. *VA Health Care System, San Diego, California*

Objective: World is graying at different pace around the world. However due to globalization and economic factors almost all countries are facing new challenges in taking care of their elderly.

Design: Extensive literature review

Results: Industrialization, urbanization and globalization have caused young people to leave the farms for city, leaving their elderly parents and traditions behind. This study will explore the social, psychological, economic, and political effects of these trends on elderly.

Conclusion: Industrialization, urbanization and globalization have also increased the aging population across the world. It has tremendous effects on government expenditures for elder care and housing, labor supply and participation, economic productivity and saving levels. Although elder care is different around the world, it is necessary to study and learn about various cultures and plan an appropriate health care for elderly in each community.

A BRIEF REVIEW OF ELDER CARE IN THE U.S. AND EUROPE OVER THE LAST CENTURY

R. Aminbakhsh^{1,2}, D. Chau^{1,2}, 1. *Geriatrics, University of California, San Diego, California*, 2. *VA Health Care System, San Diego, California*

Objective: Elderly care has changes tremendously in the last decades over U.S. and European countries. Although institutionalization of elderly is decreasing on some regions, largest portion of long term funding still goes to institutions.

Design: Extensive literature review

Results: Passing of Social Security ACT in 1935, reshaped elder care. Nursing homes numbers started to increase and more elderly were institutionalized. However, over the recent

years, nursing home population is decreasing. Medicaid funds are also shifting toward home and community-based services.

In Europe, percentage of institutionalized elderly can be as low as 1% in Poland and Russia to as high as 9% in Iceland. Still the largest portion of long term care funding goes to institutions.

Conclusion: The largest portion of elder care funds are still going to institutions. However, the transition toward supporting home and community based services have started in some regions.

A GLANCE AT ELDERLY CARE CHALLENGES IN FEW ASIAN COUNTRIES

R. Aminbakhsh^{1,2}, R. Motarjemi^{1,2}, 1. *Geriatrics, University of California, San Diego, California*, 2. *VA Health Care System, San Diego, California*

Objectives: Rapidly aging society in Japan is facing tremendous health care challenges. One of the most important issues in Japan is housing for elderly. According to Japanese Government, there are 400,000 elderly waiting for a vacancy to move into a public or semipublic nursing home. The same situation is true in China. Due to work pressures and economic changes, extended families are breaking apart and providing care for elderly is becoming a significant challenge.

Design: Extensive literature review

Results: Industrialization of Asia is forcing ancient cultures to adapt to new social changes. Institutionalization of elderly, once strongly opposed in this region, is now becoming an accepted practice. Many elderly are waiting to be institutionalized.

Conclusion: If current health care trends continue, institutionalization of elderly will increase. Policy makers must critically explore experiences of other countries and determine if institutionalization is the best option for future health care plans.

A BRIEF REVIEW OF ELDER CARE IN AFRICA AND LATIN AMERICA

R. Aminbakhsh, 1. *Geriatrics, University of California, San Diego, California*, 2. *VA Health Care, San Diego, California*

Objective: Elderly are facing multiple challenges in developing countries. In Africa, elderly have key social and economic roles like farming and taking care of orphans. Despite more medical needs, they use less health care services due to inequity in access. In Latin America, family networks are losing ground before social services are securely in place, so some call rapid growth of elderly's population to be premature.

Design: Extensive literature review

Results: Despite all differences in developing countries, they share the fact that they are not ready for their elderly's future needs. While elder care is changing enormously, deficiency of funding, limited research and statistical data, inadequate geriatrics education makes planning an appropriate elder care system particularly difficult.

Conclusion: Designing elder care plans are crucial in developing countries. These Plans should be affordable and accessible to elderly and compatible with their beliefs and traditions.

SESSION 3885 (SYMPOSIUM)

CHALLENGES AND OPPORTUNITIES LINKED WITH SUMMARY MEASURES OF WELL-BEING IN LATER LIFE

Chair: J. Goodwin, *Age UK, London, United Kingdom*

Discussant: B. Krause, *Optum Labs Europe, London, United Kingdom*

We've all heard the saying "What gets measured gets done". In addressing challenges and opportunities of population ageing, this motto points to the urgency of developing a high-quality evidence base which can show how specific experiences of ageing at the individual level can be enriched with better informed public policy responses and more age-friendly environments. The relevant measurements are the summary measures of wellbeing of older people and the age-friendliness of the communities in which older people reside. The current examples of such summary measures include the EU/UNECE Active Ageing Index "AAI", the HelpAge Global AgeWatch Index and the AARP's Livability Index. Age UK's Wellbeing in Later Life (WILL) Index is the latest addition which has also sought to improve upon the usefulness for the advocacy and policy advice of such composite indices. The WHO's work on indicators of age-friendly cities also has a similar potential of serving the public good. This symposium will discuss the challenges and opportunities linked with the development of such aggregate summary measures, and what lessons can be learned regarding future collaborative work in this area.

AARP'S LIVABILITY INDEX: A PICTURE OF HOW COMMUNITIES MEET THE NEEDS OF PEOPLE OF ALL AGES

R. Harrell, *Public Policy Institute, Washington, District of Columbia*

By 2030, older adults will account for approximately 20% of the U.S. population. Surveys show that many desire to stay in their communities as they age, but many communities are not prepared. The diverse needs of the older population play a role, as does the evolution of preferences over time. Several factors lead to the development of neighborhoods that will not meet needs of all community residents over time.

To inform policymakers and residents, AARP created a Livability Index measuring seven categories of livability for each neighborhood. Using 60 indicators, the Index provides a picture of how well each community meets the current and future needs of people of all ages. These metrics and policies cover seven categories: housing, neighborhood, transportation, environment, health, engagement and opportunity. This discussion includes the reasons for creating the Index, how it supports the creation of livable, age-friendly communities, and lessons for other nations

WELL-BEING IN LATER LIFE (WILL) INDEX: CAPTURING INEQUALITIES IN AGEING EXPERIENCES OF OLDER PERSONS

M. Green¹, A. Zaidi², J. Iparraguirre¹, P. Rossall¹, S. Davidson¹, *1. Age UK, London, United Kingdom, 2. University of Southampton, Southampton, United Kingdom*

Age UK wants older people in the UK to experience maximum possible wellbeing. However, not everybody does. The older population in the UK is heterogeneous and no less so in its inequalities in wellbeing. Age UK has built a statistical, multidimensional index of wellbeing which reveals what is important to older people in later life and importantly which groups of older people are doing well and those that are not doing so well. Benefiting from large-scale, representative household panel data in the form of Understanding Society, and using a combination of statistical techniques including factor analysis, structural equation modelling and principal component analysis, this is an index that has utility for influencers, policy-makers and practitioners working with older people.

MEASURING ACTIVE AND HEALTHY AGEING: LESSONS FROM ACTIVE AGEING INDEX OF THE EUROPEAN COUNTRIES

A. Zaidi, *1. Ageing/ Gerontology, University of Southampton, Southampton, United Kingdom, 2. London School of Economics and Political Science, London, United Kingdom*

The idea underlying active ageing strategies is to provide an environment that is rich in opportunities and where old age is not synonymous with becoming dependent. Such a paradigm prevents the loss of valuable expertise of older people and strengthens society's human resilience. Many of these ideas are brought together in the Active Ageing Index "AAI" project of European Commission/UNECE. The AAI is a summary measure of active and healthy ageing, using 22 indicators to assess the untapped potential of older people, to capture the baseline position, to monitor progress and identify where challenges remain.

This presentation will draw learnings from the AAI in addressing how countries fare better than others and how this can motivate and orient countries lagging behind. It will show how the AAI allows policymakers to base their interventions on the comparative evidence of active ageing indicators and their aggregation into a summary measure.

SESSION 3890 (SYMPOSIUM)

IAGG EUROPEAN REGION: AGEING RESEARCH IN EUROPE—ACHIEVEMENTS, CHALLENGES, AND OPEN QUESTIONS

Chair: C. Tesch-Roemer, *German Centre of Gerontology (DZA)*

Co-Chair: S. Becker, *Swiss Society of Gerontology, Bern, Switzerland*

Europe is a region with a long history of population ageing, and these demographic changes will continue in the future. The number of Europeans aged over 65 is expected to nearly double from 85 million in 2008 to 151 million by 2060, and the number of those aged over 80 is expected to rise from 22 to 61 million in the same period. Longevity has to be celebrated as societal success, opportunities connected to demographic change should be used wisely, and challenges should be acknowledged as well. Ageing research in Europe takes place in a multitude of institutions across a range of countries which might look similar from the outside, but are

highly diverse, in terms of societal wealth, welfare state policies and demographic composition. In this symposium, we will present selected findings from European ageing research, discussing achievements, challenges, and open questions in gerontology and geriatrics in Europe.

PRESENT STATE OF BIOGERONTOLOGY IN EUROPE

S. Rattan, *Department of Molecular Biology and Genetics, Aarhus University, Aarhus, Denmark*

In Europe, biogerontology deals with: (i) describing the aging phenotype at the level of organs, systems, tissues, cells and molecules; (ii) unraveling the biochemical and molecular mechanisms of age-related changes; (iii) identifying genes that affect the quality and duration of lifespan; (iv) identifying the rate-limiting steps which lead to the emergence of age-related diseases; and (v) developing effective interventions to modulate aging and to extend the healthspan. Different countries have different priority areas for research, which change and evolve in accordance with the changing social, political and economic trends. At the molecular level, failure of homeodynamics, increased molecular heterogeneity, altered cellular functioning and reduced stress tolerance are the main determinants of aging. Gene therapy, stem cells, nutraceuticals, cosmeceuticals and other life style alterations are examples of aging interventions being researched. Another approach is that of hormesis by strengthening the homeodynamic ability of self-maintenance through repetitive mild stress. European biogerontology aims to achieve the goal of extended healthspan by elucidating and utilising dynamic interactions among biological, clinical, psycho-social and environmental factors.

AGING IN EUROPE AND GERIATRIC CARE

M. Barbagallo, L. Dominguez, *DIBIMIS, University of Palermo, Palermo, Italy*

Europeans are living longer than ever, and this pattern is expected to continue. The increased life expectancy is a remarkable achievement, which however poses obvious challenges for health care and geriatric assistance. There is a progressive increase of older persons living alone and in need of assistance. European countries are handling these challenges with very different approaches. There are countries and regional differences in social policies and sanitary assistance, in providers of care, in quality of the assistance and in lodging costs. The long term care models are also very different (cash benefits, public provision of care services, or hybrid rather than pure models of care). The proportion of older institutionalized vs. those receiving care at home is changing differently among countries, as a result of specific policies, with some countries reducing their institutional care capacity to encourage community care, while others increasing nursing home care capacity.

A SOCIETY OF CARE: THE ESSENTIAL CHALLENGE FOR AN AGING EUROPE

J. Yanguas, M. Sancho, D. Pura, D. Elena, *Matia Gerontological Institute, Donostia, Gipuzkoa, Spain*

In the next two decades Europe (and specially the countries in South Europe) will suffer some "tsunamis" related to aging: i) the number of very old people (80+) will be higher than that of young people (20-); ii) a rapid decrease in the

hypothetical number of informal caregivers who are essential for care; iii) social consequences of the economic crisis threaten the maintenance of the welfare state; iv) changes in family structures; v) rupture of the intergenerational pact. What possibilities does Europe have? We need to promote a culture of care. We must place the care as a central axis of social development and retrieve the values and principles associated with care (solidarity, dignity, autonomy, joint responsibility, transversality,...) as values for the whole society from schools to companies. We need to adjust the needs of an aging population with the young/adult population availability and increase relationships between generations. Other ways of reconciling work and care must be explored while minimizing economic impact. Therefore, there is a need for a new model of governance where aging must be the key to all sectorial policies. There must be changes in the production system to adapt to aging, which is an opportunity to create jobs and industry.

Thinking about the future of care means reconsidering the model of society for the future.

Through this presentation, we will review various ongoing projects that are driving this society of care-

STRUCTURES, ORGANIZATION, AND CHALLENGES OF LONG TERM CARE FACILITIES IN EUROPE BASED ON PACE PROJECT

K. Szczerbinska¹, H. Finne-Soveri², G. Gambassi³, B.D. Onwuteaka-Philipsen⁴, S. Payne⁵, N. Van Den Noortgate^{6,7}, L. Deliens^{6,8}, L. Van den Block⁶, 1. *Epidemiology and Preventive Medicine Chair, Jagiellonian University Medical College, Krakow, Poland*, 2. *National Institute for Health and Welfare, Helsinki, Finland*, 3. *Università Cattolica del Sacro Cuoro, Rome, Italy*, 4. *EMGO Institute for Health and Care research, Expertise Center for Palliative Care, VU University Medical Centre, Amsterdam, Netherlands*, 5. *International Observatory on End of Life Care, Lancaster University, Lancaster, United Kingdom*, 6. *Department of Family Medicine & Chronic Care, End-of-Life Care Research Group, Vrije Universiteit Brussel (VUB) and Ghent University, Brussels, Belgium*, 7. *Department of Geriatric Medicine, Ghent University Hospital, Ghent, Belgium*, 8. *Department of Medical Oncology, Ghent University Hospital, Ghent, Belgium*

Long term care (LTC) organization is the most diverse care sector with institutions rendered in the frame of health and/or social care sectors. The main differences are observed in staff resources, range of services, and culture of LTC organization within and across countries. We are going to describe structure and organization of long term care facilities (LTCF) in Europe based on data from 322 randomly selected facilities in 6 European countries collected in the PACE project (Comparing the effectiveness of Palliative Care for Elderly people in long-term care facilities in Europe) funded by European Commission from 7th Frame Programme. We will provide description of differences in organization, staff and services in LTCFs across countries. We will put special attention to development of palliative care structures and services within LTCFs that aims to answer an emerging challenge, which is a high quality end-of-life care for dying residents.

SESSION 3895 (SYMPOSIUM)

THE FIRE OF CHRONIC INFLAMMATION IN OLDER ADULTS: ETIOLOGIES, CONSEQUENCES, AND TREATMENTS

Chair: J.D. Walston, *Johns Hopkins University School of Medicine, Baltimore, Maryland*

Chronic inflammation is recognized as a globally prevalent condition related to aging that worsens chronic disease states, drives functional and cognitive decline, and accelerates mortality in older adults. Age-related etiological drivers are likely senescent cells, altered immune system composition, mitochondrial declines, altered microbiome, and chronic infections such as CMV. The consequence of chronic inflammation is increased production of inflammatory chemokines and cytokines and an altered adaptive immune system which drives pathophysiological changes in organs and tissues, which in turn accelerates adverse health outcomes and chronic disease status in older adults. Although many inflammatory cytokines have been used to identify older adults with chronic inflammation, no diagnostic gold standard exists. Further, few if any preventive and treatment strategies beyond exercise have been identified or tested. In this interdisciplinary and translational symposium, assembled by the Geroscience Interest group of the Gerontological Society of America, an international roster of speakers will discuss 1) the prevalence, consequences, and diagnostic considerations for chronic inflammation from studies of older adults from around the world, 2) the molecular etiologies and the cellular mechanisms, including cellular debris and auto reactive processes, that drive chronic diseases, 3) the role of the altered immune system and the impact of chronic infections such as CMV on the development of chronic inflammation and adaptive immune system modulation and 4) novel intervention strategies in older adults including fish oil and losartan that target chronic inflammation and mobility.

THE EPIDEMIOLOGY AND DIAGNOSTIC CONSIDERATIONS FOR CHRONIC INFLAMMATION IN OLDER ADULTS

J.D. Walston, *Medicine/Geriatrics, Johns Hopkins University School of Medicine, Baltimore, Maryland*

Chronic Inflammation as measured by serum inflammatory cytokines is common in older adults has been studied in dozens of population studies of older adults around the world. Although most of the studies use a similar profile of measures that generally include Interleukin-6 and C-Reactive Protein to identify chronic inflammation, to date, no gold standard measure exists to identify those older adults with chronic inflammation. This is in part due to the lack of standardization of measurement and the inadequate knowledge of the biology that connects serum diagnostic markers to adverse health outcomes. This session will provide an overview of the global prevalence of chronic inflammation and its adverse health consequences from population studies from Europe, Asia, and North America. In addition, new information on the development of specific diagnostic tests, along with some of the newer diagnostic cytokine measures of chronic inflammation that are under development will be presented.

RECIPROCAL FUELLING OF GARBAGING/INFLAMMAGING AND CHRONIC AGE-RELATED DISEASES

C. Franceschi, *University of Bologna, Bologna, Italy*

Inflammaging, i.e. age-associated chronic inflammation, develops with age and represents a major pathogenic component of most age-related diseases. It is thought to be triggered by activation of innate immunity, is macrophage-centered, involves a variety of organs, and is likely influenced heavily by the gut microbiome. A major source of inflammatory stimuli may be the endogenous/self, represented by a variety of misplaced and altered molecules resulting from damaged/dead cell and organelles (cell debris). The production of this cellular 'garbage', is physiological and increases with age while its disposal by proteasome, autophagy and mitophagy progressively declines. This "auto-reactive/auto-immune" process fuels the onset/progression of chronic diseases which in turn release additional garbage ("disease communicome") capable of accelerating aging processes locally and systemically. This session will describe the importance of the life-long capability to adapt by activating anti-inflammatory responses whose efficiency is critical to attain healthy aging and longevity.

IMMUNOSENESCENCE AND INFLAMMAGING: AN INTRICATE CONNECTION

T. Fülöp, *Université de Sherbrooke, Sherbrooke, Quebec, Canada*

One of the most notable biological age-related changes are alterations in the immune system. Near constant antigenic stimulation by various antigens such as chronic viral infections, altered proteins, and/or tumoral cells is characteristic of this change. The innate part of the immune response is chronically stimulated at baseline and is in a state of alertness to respond to various stimulation. This is most of the time assured by the trained memory of the innate cells. Although the effectiveness of innate immune functions are decreased, this state of activation assures a higher adaptive response. This chronic low grade inflammation is stimulating/exhausting the adaptive immune system which itself is constantly under the attack of the chronic antigenic stress. The induction of these adaptive responses will be characterized and the intracellular pathways leading to immunosenescence, which further stimulates innate responses, will also be discussed.

CLINICAL INTERVENTIONS FOR REDUCING LOW-GRADE CHRONIC INFLAMMATION IN OLDER PERSONS

M. Pahor, *University of Florida, Gainesville, Florida*

Low-grade chronic inflammation is an independent risk factor of reduced physical performance and several geriatric outcomes, however it is unknown whether reducing inflammation *per se* prevents mobility loss and disability. Several pharmacological and behavioral interventions have been considered as potential preventive strategies for mobility decline. In addition to being effective, such interventions should be safe, tolerable, acceptable by older persons, practical and affordable. Among a large list of potential therapies, only a few interventions meet these criteria. Physical activity and weight loss improve function and reduce low-grade

chronic inflammation. The ENRGISE pilot trial is testing the effects fish oil and an angiotensin receptor blocker on inflammatory markers and mobility. These interventions have excellent safety records, are tolerable and acceptable, reduce elevated IL-6, and have shown some benefits in improving physical performance. They act with different but complementary biological mechanisms, do not negatively interfere with neuromuscular metabolism, and are widely available.

SESSION 3900 (SYMPOSIUM)

GLOBAL AGING AND THE INTERNATIONAL DISSEMINATION OF KNOWLEDGE: PUBLISHING OPPORTUNITIES IN GERONTOLOGY

Chair: E.A. Miller, *UMASS Boston, Boston, Massachusetts*

Co-Chair: C. Ronneberg, *University of Massachusetts Boston, Boston, Massachusetts*

Discussant: M. Gusmano, *Rutgers University, New Brunswick, New Jersey*

Global aging has proceeded at an unprecedented and accelerating rate. By 2050, one in five people will be aged 60 years and older, up from one in ten in 2015. The aging of the population creates both opportunities and challenges for elders, their families, and society in general. Importantly, there is substantial variation in the effects of and response to global aging both within and across nations depending, in part, on prevailing cultural expectations and values, political and economic imperatives, and social and demographic characteristics. Thus, while some regions and countries have responded with innovative policies and programs to better enable the growing cohort of older adults to remain active and engaged in the community, other regions and countries have struggled with their response or barely begun to plan for the rising population of elders. This symposium assembles editors at five leading gerontological journals to demonstrate the role that peer-reviewed scholarship can play in disseminating knowledge that informs gerontological research, policy, and practice internationally. Editors include: Jeffrey Burr, PhD, Editor of *Research on Aging*; Deborah Carr, PhD, Editor of the *Journal of Gerontology: Social Sciences*; Joseph E. Gaugler, PhD, Editor of *The Journal of Applied Gerontology*; Edward Alan Miller, PhD, Editor of the *Journal of Aging & Social Policy*; and Rachel Pruchno, PhD, Editor of *The Gerontologist*. Each presenter will review the scope, content, and focus of their journals and the role and opportunities for international scholarship. Michael Gusmano, PhD, a leading expert on the economic, political, and social consequences of global aging and International Editor of the *Journal of Aging & Social Policy*, will serve as discussant.

THE ROLE OF INTERNATIONAL SCHOLARSHIP IN THE JOURNAL OF AGING & SOCIAL POLICY

E.A. Miller^{1,2}, M. Gusmano^{3,4}, C. Ronneberg¹, 1. *University of Massachusetts Boston, Boston, Massachusetts*, 2. *Brown University, Providence, Rhode Island*, 3. *Rutgers University, New Brunswick, Massachusetts*, 4. *The Hastings Center, Garrison, New York*

Policymakers, practitioners, and researchers need a balanced, thoughtful, and analytical resource to meet the

challenge of global aging at a rate that's historically unprecedented. The *Journal of Aging & Social Policy (JASP)*, which was founded in 1989, serves this role by drawing contributions from an international panel of policy analysts and scholars who assume an interdisciplinary perspective in examining and analyzing critical phenomena that affect aging and the development and implementation of programs for elders from a global perspective. Study settings extend beyond the United States to include Europe, the Middle East, Australia, Latin America, Asia, and the Asia-Pacific rim. This presentation will document the scope, content, and focus of JASP, including the rise of international submissions, which now account for approximately half of articles published. Opportunities for publishing in JASP will be discussed; so too will strategies for navigating the peer-review process successfully.

INCREASING THE LIKELIHOOD OF SUCCESS: THE GERONTOLOGIST'S ADVICE FOR INTERNATIONAL SCHOLARS

R. Pruchno, *Rowan University School of Osteopathic Medicine, Stratford, New Jersey*

The Gerontologist®, published since 1961, is a bimonthly journal of The Gerontological Society of America. The journal provides a multidisciplinary perspective on human aging through the publication of research and analysis in gerontology, including social policy, program development, and service delivery. It reflects and informs the broad community of disciplines and professions involved in understanding the aging process and providing service to older people. In 2015, more than 75% of submissions were research articles; 8.9% were literature reviews. Other types of submissions included brief reports, forum essays, practice concepts, policy studies, and international spotlights. Although half of all 2015 submissions were from international authors, acceptance rates for international submissions (5.0%) were substantially lower than those for U.S. authors (22.4%). Presentation will focus on strategies international authors can use to increase the likelihood of success publishing in this top-tiered journal.

RESEARCH ON AGING: THE INTERNATIONAL VIEW FROM THE EDITORS' DESKS

J.A. Burr, J. Tavares, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

We review the scope, content, and focus of the peer-reviewed journal, *Research on Aging (SAGE)*, publishing its 38th volume this year. We will discuss how scholarship produced from researchers around the globe has changed over the years. Data on submissions, acceptance rates, and the important role of an international editorial board will be presented. The review process will be described, along with suggestions on how to increase chances of success when submitting original research. Although *Research on Aging* is sometimes considered to focus primarily on social gerontology, the scope in recent years has widened considerably, with manuscripts in aging studies published from such fields as economics, psychology, demography, public health, and public policy, as well as from sociology, and social work, among others. One of several special issues forthcoming in the journal will be described to demonstrate the possibilities for international impact.

JOURNAL OF GERONTOLOGY: SOCIAL SCIENCES —GLOBAL SCHOLARSHIP CHALLENGES AND OPPORTUNITIES

D. Carr, *Rutgers University, New Brunswick, New Jersey*

Journal of Gerontology: Social Sciences aims to publish the highest quality social scientific research on aging and the life course in the U.S. and worldwide. The disciplinary scope is broad, encompassing scholarship from demography, economics, psychology, public health, and sociology. A key substantive focus is identifying the social, economic, and cultural contexts that shape aging experiences worldwide. In the coming decade, social gerontology research is poised to present many opportunities for cross-national and cross-cultural scholarship – driven in part by the proliferation of large parallel data sets from many nations in Europe, Latin America, and Asia. I will discuss the role that peer-reviewed cross-national scholarship can play in disseminating knowledge that informs gerontological research, policy, and practice internationally. I will also identify under-researched areas that will be of great interest to scholars in the coming decade, including LGBT older adults, aging in the Global South, reconfigured families, and centenarians.

APPLIED GERONTOLOGY: AN INTERNATIONAL PERSPECTIVE

J.E. Gaugler, *Center on Aging, School of Nursing, University of Minnesota, Minneapolis, Minnesota*

The mission of applied gerontology is to bridge science and practice to benefit the health and well-being of older persons, their families, their communities, and other contexts. This presentation will provide insights from the *Journal of Applied Gerontology* and its attempts to publish and disseminate scholarship that has international application. Following an overview of the growing internationalization of peer-reviewed submissions to the *Journal of Applied Gerontology* on variety topics and from a range of perspectives, the presentation will highlight key achievements as well as ongoing concerns and opportunities to better achieve the goals of applying gerontological scholarship to aging contexts worldwide. Concluding comments will examine how outlets for dissemination and authors themselves can better position their work to enhance their influence on aging in an international context.

SESSION 3905 (SYMPOSIUM)

ADVANCING HOSPITAL CARE FOR OLDER ADULTS: SCIENCE, POLICY, AND PRACTICE FROM FOUR GLOBAL PARTNERS

Chair: B.A. Liu, *University of Toronto, Regional Geriatric Program, Toronto, Ontario, Canada*

For older adults, the benefits of hospital care are often compromised by the experience of hospitalization itself. The complexity of care for older adults increases the risk for adverse outcomes and complicates discharge. Furthermore, existing hospital design and practices – such as immobility, under-nutrition, sleep deprivation, and unfamiliar surroundings – may cause unintended but significant harm. Quality approaches designed to improve the care of older adults in hospital demonstrate improved physical function, lower

rates of delirium, fewer discharges to long-term care, and improved satisfaction. Increasingly, research is converging on the recognition that adapting processes across the entire organization is needed to achieve these benefits consistently. This symposium will provide an overview of current knowledge on hospital-acquired disability. Three collaborators will then share their approaches, blending clinical research and implementation science, to develop large-scale programs to advance care for hospitalized older adults. In Ontario, Canada, a provincial Senior Friendly Hospital (SFH) strategy identified priorities for system-wide improvement, evolving into SFH ACTION – an 87-hospital collaborative engaged in quality improvement for senior-friendly care. In the Netherlands, a national Senior Friendly Hospital strategy coordinates development of hospital-broad approaches and directly engages community advisors in the improvement and appraisal process. In Queensland, Australia, a state-wide older person friendly survey has been completed, and the “Eat, Walk, Engage” program continues to spread across sub-acute and acute hospitals. The presenters will describe their unique approaches to a common challenge, and also ways in which they have bridged their geographic distances, finding opportunities to collaborate and share ideas.

HOSPITAL-ACQUIRED DISABILITY: AN OVERVIEW

K.E. Covinsky, *University of California, San Francisco, San Francisco, California*

Older patients who are hospitalized for medical illness often leave the hospital with increased disability in activities of daily living, even when the condition that led to admission is successfully treated. This syndrome is often referred to as hospital-acquired disability. This presentation will provide an overview of our current understanding of Hospital Acquired Disability. This presentation will describe the epidemiology of this syndrome. We will present data describing risk factors for the syndrome and the associated long term consequences for patients, caregivers, and the health system. We will describe hospital processes that may increase the risk for hospital acquired disability. Finally, we will present evidence that the better models of hospital care can prevent this syndrome. This will lay the ground work for the next presentations that describe on going examples of efforts to reduce the risk of hospital acquired disability.

THE SENIOR-FRIENDLY HOSPITAL (SFH) STRATEGY IN ONTARIO, CANADA: FROM INQUIRY TO ACTION

K. Wong^{1,2}, A. Tsang¹, D. Ryan^{1,2}, W. Zeh¹, R. Schwartz³, S.E. Straus^{4,2}, B.A. Liu^{1,2}, 1. *Regional Geriatric Program of Toronto, Toronto, Ontario, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*, 3. *Seniors Care Network, Cobourg, Ontario, Canada*, 4. *Li Ka Shing Knowledge Institute, St. Michael's Hospital, Toronto, Ontario, Canada*

We will describe a system-wide approach to change in support of senior-friendly hospitals. The ongoing Ontario SFH Strategy saw the application of a conceptual framework across the hospital system and the identification of provincial priorities for SFH care. We continue this work with SFH ACTION, an 87-hospital collaborative implementing SFH quality improvement supported with centralized coaching. SFH ACTION has made improvement work

a shared experience and has built durable capacity across the system. Within 8 months, 35 of 48 projects in the initial cohort reported progress in their improvement aims, with 20 of these projects reporting significant to sustainable results. A self-efficacy evaluation of participants' abilities to execute SFH principles, quality improvement, and change management demonstrated improvement in all 9 skill areas assessed. Strategies to sustain the collaborative and to evolve the SFH framework into a Senior Friendly Care framework applicable across the healthcare continuum will also be discussed.

THE QUALITY MARK SENIOR-FRIENDLY HOSPITAL CARE: A FRESH BREEZE IN HOSPITAL CARE FOR OLDER ADULTS!

H. Habets, 1. *Zuyd University, Heerlen, Limburg, Netherlands*, 2. *Zuyderland Medical Center, Sittard-Geleen, Limburg, Netherlands*

The Quality Mark 'Senior Friendly Hospital Care', an initiative of collaborating senior citizens organizations in the Netherlands, aims to enhance quality of care for older patients in hospitals. A literature search, the advice of expert teams of seniors and professionals led to a set of 15 criteria 'Senior Friendly Hospital Care'. All hospitals received a questionnaire and were visited by so-called mystery guests judging the physical aspects of the public space and reception.

55 (2015) of the 130 hospitals in the Netherlands received the Quality Mark. The Mark shows to be a desirable Quality Mark. A lot of hospitals invest in concrete improvements to enhance quality of care. Actual topics: family participation, function focused care, continuity of care. In 2017, concrete experiences of older people discharged after an admission will be included in the investigations.

The presentation will give an overview of content, actual results and concrete inspiring practice examples.

EAT WALK ENGAGE: IMPROVING OUTCOMES FOR HOSPITALISED ELDERS

A.M. Mudge^{1,2}, P. McRae¹, K. Lee-Steere¹, M. Cahill¹,
1. *Royal Brisbane and Women's Hospital, Brisbane, Queensland, Australia*, 2. *Queensland Institute of Technology, Brisbane, Queensland, Australia*

Hospital-acquired disability and delirium can be reduced by improving inpatient care practices to support mobility and independence, nutrition and hydration, and meaningful cognitive engagement for older inpatients. The challenge is translating this evidence into practice in all wards caring for older patients. Eat Walk Engage is a unique ward-based program using the i-PARIHS implementation framework to guide sustainable practice change. A skilled facilitator works with the multidisciplinary ward team to prioritise and tailor strategies to the recipients (patients, staff) and context of each ward. Multiple data sources and iterative team discussions build shared understanding of barriers and enablers. Pilot before-after studies have shown reductions in delirium, functional decline, falls and pressure injury, and length of stay. The program has been successfully scaled up to 8 medical, surgical and oncology wards in one large teaching

hospital, and transferability is being tested in a cluster RCT across 4 hospitals.

SESSION 3910 (PAPER)

INNOVATIVE RESEARCH METHODS IN GERIATRICS AND GERONTOLOGY

PROFILE OF VIOLENCE AGAINST THE ELDERLY REGISTERED IN THE DISQUE 100 IN THE PERIOD 2011—2015, BRAZIL

L. de Medeiros Taveira, M. Cunha de Oliveira, *Catholic University of Brasilia, Brasilia, Distrito Federal, Brazil*

This research has as a goal characterize the violence profile against the elderly in Brazil from the reports registered on Dial 100 Service. It's a descriptive, retrospective, exploratory study with transversal focus and quantitative approach. The research was developed based on a computerized database from the Human Rights Secretary from the Presidency of the Republic. The instrument used to collect data was the reports from Dial 100 Service in the period from 2011 to 2015. The data were analyzed through mean, standard deviation, and frequency by taking into consideration Qui-Quadrado, Odds Ratio, and Anova One-Way programs for inferential analysis. The results highlighted that in the years studied there was the prevalence of the female gender (63,7%), with an average of age from 76 to 80 (17%), and caucasians (35,9%). Besides that, it could be observed that the greatest number of violence practitioners against the elderly were the husbands (56,7%) and that the most frequent type of violence was negligence. Thus, this research was able to show the magnitude and gravity of the problem and the need to identify precociously the violence against the elderly. This study suggests the development of other researches which contribute to a greater understanding towards this phenomenon, by being able to train healthcare professionals and improve the victims support system as well as the prevention of violence cases against the elderly and strengthen public policies for seniors.

RECRUITMENT, RETENTION AND DATA COLLECTION WITH VICTIMS OF ELDER ABUSE IDENTIFIED FROM POLICE REPORTS

C.Z. Pickering¹, C. Maxwell², 1. *School of Nursing, University of Texas Health Science Center San Antonio, San Antonio, Texas*, 2. *School of Criminal Justice, Michigan State University, East Lansing, Michigan*

Several methodological issues limit the elder abuse/neglect researchers including difficulties with recruitment and enrollment of victims, lack of tools to help retain participants in longitudinal studies, uncertainty regarding what are safety concerns, and appropriate procedures for data collection with victims. Steps to address many of these issues have in turn led to difficulties gaining IRB approval. As such, we planned a project to obtain data on these issues in order to inform planning of a randomized control trial. First, we developed a protocol for coding police narrative reports in order to identify victims, and a three-step process for contacting the victims about study enrollment which included mailers, cold calls,

and home visits. To limit bias against homebound or isolated older adults, we developed a data collection protocol which involved home interviews but was flexible in case home interviews posed a safety risk. Furthermore, to limit bias against persons with dementia we developed a protocol for consent capacity assessment and a separate protocol for data collection with proxy respondent-participants. We developed guides for our interviewers intended to protect both the safety of the participant and the safety of our team member in the field. In this presentation, we describe our protocols and discuss their successes and failures in terms of recruitment, retention and data collection with victims. We will also discuss what we learnt about safety concerns, our IRB challenges and the solutions we proposed to obtain approval.

VALIDATION OF PRIMARY CARE QUESTIONNAIRES ON KNOWLEDGE, ATTITUDES, AND PRACTICES TOWARD DEMENTIA

N. Sourial^{1,2}, G. Arsenaault-Lapierre², M. Hardouin², I. Vedel^{1,2}, 1. *Department of Family Medicine, McGill University, Montreal, Quebec, Canada*, 2. *Lady Davis Institute, Jewish General Hospital, Montreal, Quebec, Canada*

In 2013, the Quebec Ministry of Health implemented a reform called the 'Alzheimer Plan' in 42 family medicine groups (FMG) to better manage dementia patients in primary care. We created and validated two questionnaires to measure the clinicians' knowledge, attitudes, and practices regarding dementia care in each FMG.

Based on the literature and content validation with experts, one 72-item questionnaire for family physicians and another 70-item questionnaire for nurses and other health professionals were created. The questionnaires were distributed to 865 clinicians after the beginning of the AD plan. Exploratory factor analysis (EFA) was performed to examine the construct validation of each questionnaire and determine the underlying subscales. Prior to the EFA, a clinically-relevant structure of subscales was elaborated.

Five subscales were identified within the physicians' questionnaire: 1) perceived competency and knowledge, 2) attitudes toward the AD Plan, 3) practices for cognitive evaluation, 4) attitudes toward the disease, and 5) collaboration with nurses and other professionals. Four subscales were identified within nurses and other professionals' questionnaire: 1) perceived competency and knowledge, 2) attitudes toward the AD Plan, 3) attitudes toward the dementia patients and their care-givers, and 4) perceived support from external resources. These subscales were consistent with the a priori clinically-derived structure. Items within the subscales correlated well together and differentiated well across subscales.

MISSING DATA IN LONGITUDINAL STUDIES OF AGING: THE GOOD, THE BAD, AND THE UGLY

S. Karunanathan, C. Wolfson, *Epidemiology, Biostatistics and Occupational Health, McGill University, Montreal, Quebec, Canada*

In longitudinal studies of aging, missing data are inevitable. In the literature on the association between grip strength and survival time in older persons, the methods used to deal with missing values are generally not even mentioned. The default in standard statistical software is listwise deletion

- removing all observations with any missing data. Missing data have been classified into three types: missing completely at random (the good), missing at random (the bad) and missing not at random (the ugly). Depending on the type of missing data, listwise deletion may produce biased results. The objectives of this presentation are: 1) To identify different types of missing data that may arise within a longitudinal study of aging and 2) To assess the estimates of the association between grip strength and mortality that result from applying different methods for handling missing data. Using data from the Cardiovascular Health Study, a longitudinal study of 5,201 older persons, we: 1) examined the types of missing data; 2) investigated the association between grip strength and survival time, applying three common methods of handling missing data: listwise deletion, last value carried forward (LOCF), and multiple imputation (MI). We identified all three types of missing data in the CHS. Compared to the method of listwise deletion, estimates of the association between grip strength and survival were weaker when applying LOCF, and stronger with MI. Methods of handling missing data in longitudinal studies of aging should be considered carefully in order to limit the potential for biased results.

ESTIMATING TREATMENT EFFECT OF HALOPERIDOL ON DELIRIUM SYMPTOMS USING OBSERVATIONAL DATA

L. Han, M. Pisani, K.L. Araujo, H. Allore, *Yale School of Medicine, New Haven, Connecticut*

The efficacy of haloperidol treatment on delirium among critically ill older patients has relied on limited randomized trials. Using causal methods, we estimate average treatment effect (ATE) of haloperidol from 304 older patients hospitalized in a medical intensive care unit (ICU) with daily assessment of delirium symptoms using the Confusion Assessment Methods for ICU (CAM-ICU). Haloperidol exposure was tracked daily to define the treatment versus comparison groups. A propensity score (PS) of receiving haloperidol in the ICU was estimated for each patient and used in three approaches: covariate adjustment, matching and inverse-probability-of-treatment-weighting (IPTW). PS matching (N=172 or 56.6%) achieved balance (Standardized Difference < 10%) on 17 of 23 covariates. Based on a generalized estimating equation Poisson model, patients treated with haloperidol had a 1.81 (95%CI: 1.31, 2.31) higher delirium severity score than those untreated in the original cohort. This unfavorable ATE reduced to 0.80 (0.27, 1.32) after PS matching, became nonsignificant [-0.50 (-1.73, 0.74)] using IPTW, and turned beneficial [-0.96 (-1.87, -0.06)] when integrating IPTW with PS-matching. Covariate adjustment significantly reduced the unfavorable ATEs in the conventional [0.60 (0.06-1.13)] and the PS-matched [0.62 (0.14-1.10)] analyses, yet reversed the ATEs to unfavorable direction in both the IPTW [0.94 (0.45-1.44)] and the hybrid IPTW-PS-matching [0.67 (0.10-1.25)] models. In conclusion, PS-matching enhances treatment-group comparability yet still faces residual confounding; whereas IPTW seems capable of "recovering" counterfactual ATE on its own right. Integrating IPTW with PS-matching appears most powerful in bias reduction than either approach alone, despite of inhering the limitation of matching in generalizability.

SESSION 3915 (SYMPOSIUM)

MULTIMODAL AND COMBINED INTERVENTIONS TO IMPROVE GAIT AND COGNITION: FROM THE CCNA INITIATIVE

Chair: M. MonteroOdasso, *University of Western Ontario, London, Ontario, Canada*

Co-Chair: L. Bherer, *University of Montreal, Montréal, Quebec, Canada*

Discussant: Q. Almeida, *Wilfrid Laurier University, Waterloo, Ontario, Canada*

Until recently, both clinicians and researchers treating older adults have performed gait and cognitive assessments separately. However, increasing evidence demonstrates that gait and cognition are interrelated and their decline is a main driver of the insidious disability of aging. A population particularly at risk are older adults with mild cognitive impairment (MCI), who are not only at a 10 times higher risk for progression to dementia syndromes but also at risk of mobility decline and falls.

Five experts in the field who belongs to the **Canadian Consortium in Neurodegeneration and Aging (CCNA)** initiative will review the significance of the gait-cognition interrelationship. They will present current and provocative evidence suggesting cognitive and mobility decline can be treated together by combining physical exercises, cognitive training, and nutritional supplements such as Vitamin D. Lessons learned from three interventional studies in the area of gait, cognition, and brain health will be presented.

Finally, the study protocol, design and preliminary data from the SYNERGIC Trial (SYNchronizing Exercises, Remedies in GaIt and Cognition; NCT02808676), a novel multi-site, phase 3, clinical trial that combines exercises with cognitive remediation and Vitamin D with the goal to delay cognitive decline among older adults with Mild Cognitive Impairment will be shown.

This symposium will introduce multi-modal interventions as a novel approach to the current prevention treatments for cognitive and mobility decline; therefore, we expect it will be of interest to clinicians (e.g., geriatricians, neurologist, psychologists, nurses and physiotherapists) and researchers in the area of gait, cognition, and brain health.

GAIT AND COGNITION AND RISK FOR DEMENTIA AND FALLS. THE RATIONALE FOR TREATING THEM TOGETHER

R. Camicioli, *University of Alberta, Edmonton, Alberta, Canada*

Gait and cognitive impairments in older adults are evaluated and treated as separate entities, which has created gaps in care and obscured common mechanistic connections. Considering them separately is not only inefficient but it does not acknowledge the reality that they co-exist in an important proportion of older individuals and that ultimately leads to insidious disability. The combined view of gait and cognitive decline has substantial public health relevance, not only because of their high combined prevalence, but also because of potential crossover effects on one syndrome by treating the other. The detection of common modifiable risk factors will open the opportunity to treat them as a single entity,

thus, in essence, doubling the repertoire of interventions. The rationale of treating them together will be presented.

WHICH PHYSICAL EXERCISES IMPROVE COGNITION IN MCI? LESSONS LEARNED FROM THE PROMOTE TRIAL

T. Liu-Ambrose, *University of British Columbia, Vancouver, British Columbia, Canada*

Exercise is a promising strategy for the promotion of cognitive and brain health. However, whether it can still benefit for those who have already exhibit cognitive deficits is not well established. Moreover, there are two types of exercise: 1) aerobic training (AT); and 2) resistance training (RT; e.g., lifting weights). Evidence from randomized controlled trials (RCTs) suggests that both AT and RT enhance cognitive function in healthy older adults; although there has been extensive focus on AT. Thus, more research is needed on ascertaining the efficacy of both AT and RT among those at risk for dementia, such as those with mild cognitive impairment (MCI). We will summarize results from RCT of exercise in older adults with MCI, with a specific focus on the results of a 6-month RCT of AT and RT.

COGNITIVE REMEDIATION TO IMPROVE GAIT AND COGNITION. LESSONS LEARNED FROM THE CONCORDIA STUDY

K.Z. Li, *Concordia University, Montreal, Quebec, Canada*

This talk will explore the recent intervention studies and clinical trials that use cognitive training to improve cognitive executive function in order to improve mobility. The use of cognitive remediation to benefit motor performance is based upon the principle of neural overlap, i.e., the common brain regions or networks that underpin cognitive processes and motor behaviors such as walking and balancing. Recent intervention findings will be presented that demonstrate the range of cognitive training methods found to be effective in healthy older adults and elderly fallers. Variations in specificity of training task(s), duration of training, and combinations with other modalities of training will also be discussed.

VITAMIN D DEFICIENCY IN GAIT AND COGNITION. LESSONS LEARNED FROM THE GAIT & BRAIN STUDY

M. MonteroOdasso, *University of Western Ontario, London, Ontario, Canada*

This talk will review recent provocative studies that have demonstrated relationships between Vitamin D deficiency with poor cognitive and mobility performance in older adults. Interventional studies supplementing vitamin D have shown mixed result concerning cognitive and mobility outcomes. Results from the GAIT & BRAIN Study and from a recent meta-analysis will be presented showing that Vitamin D supplementation in doses higher than the current recommendation of 800 IU/d would be needed to achieve serum levels over 75nmol/l which seems needed to improve cognitive and mobility outcomes in older adults with Vitamin D deficiency. Potential neuroprotective vitamin D attributes through antioxidative mechanisms, neuronal calcium regulation, immunomodulation, enhanced nerve conduction and detoxification mechanisms will be reviewed.

PUTTING ALL TOGETHER: THE SYNERGIC TRIAL

L. Middleton, *University of Waterloo, Waterloo, Ontario, Canada*

The SYNERGIC Trial (SYNchronizing Exercises, Remedies in GaIt and Cognition) is a multisite clinical trial aimed to improve cognition and delay progression to dementia syndromes in older adults with MCI using the combination of multimodal interventions. This presentation will review the design, rationale and show the preliminary result and challenges faced in this innovative study.

SESSION 3920 (SYMPOSIUM)**PRESIDENTIAL SYMPOSIUM: DEVELOPING PALLIATIVE CARE SERVICES FOR PEOPLE WITH CHRONIC-PROGRESSIVE DISEASES AT THE END OF LIFE**

Chair: J. van der Steen, *Leiden University Medical Center, Leiden, Netherlands*

Co-Chair: J. Hockley, *University of Edinburgh, Edinburgh, United Kingdom*

Discussant: S. Sternberg, *Jerusalem, Israel*

Increasingly, it is being recognized that people with chronic-progressive diseases including dementia may benefit from palliative care. However, the palliative phase and what palliative care entails exactly, is less well defined for these people compared with for people with cancer. Further, needs may vary greatly across the long and ill-predicted disease trajectories. This may hinder the implementation and integration of palliative care in clinical practice. Special palliative care services should overcome these challenges and also fit with health care systems and with long-term care services that may be disease oriented or focused on the living situation only.

This symposium will present the development and evaluation of palliative care services for people with chronic-progressive disease living in nursing homes and in the community. We report on new initiatives in four countries, the UK, Netherlands, Norway and Israel, for people to die “as homely” and comfortable as possible and to bring palliative care to where people are. We will discuss the new initiatives against a background of literature on how palliative care developed in these countries, in comparison to the US.

SERVICES FOR DEMENTIA IN THE TERMINAL PHASE: INTERVIEWS ABOUT EXPERIENCES IN FIVE COUNTRIES

J. van der Steen^{4,5}, N. Lemos Dekker¹, M.H. Gijsberts², L.H. Vermeulen¹, M.M. Mahler³, B. The¹, *1. University of Amsterdam, Amsterdam, Netherlands, 2. VU University Medical Center, Amsterdam, Netherlands, 3. Stichting Kalorama, Nijmegen, Netherlands, 4. Leiden University Medical Center, Leiden, Netherlands, 5. Radboud university medical center, Nijmegen, Netherlands*

The nature of physical, psychosocial and spiritual care needs of people with dementia and their families may change near the end of life. To prepare for developing optimal palliative care services for the terminal phase, we interviewed 25 experts about 15 special types of services for people with

dementia in five countries (US, UK, Netherlands, Belgium, and Israel). Most services were for dying people or those with a life expectancy of at most 6 months or for advanced dementia (and continued until death), some were for both or earlier enrolment was possible. The interviews pointed to failure of attempts to move people and preferred, successful models in which a representative of a well-trained team takes time and brings specialized care and education of staff and family to where people are and ensures continuity of relationships with and around the patient.

REACHING OUT TO DEVELOP QUALITY PALLIATIVE CARE IN CARE HOMES: DATA FROM A 7-YEAR PROJECT

J. Hockley¹, J. Kinley², *1. University of Edinburgh, Edinburgh, United Kingdom, 2. St Christopher's Hospice, London, United Kingdom*

A fifth of the UK population dies in a nursing home (care home). In 2008, the Department of Health's end of life care strategy encouraged the implementation of specific palliative systems to all settings. St Christopher's Hospice, London became a regional centre for the Gold Standards Framework in Care Homes programme (GSFCH) to reach out to care homes to improve the quality of palliative care. We implemented and audited the GSFCH in nursing care homes across 5 clinical commissioning groups (population of 1.4 million people) over a 7-year period using a research-based model of facilitation. Across 76 nursing care homes, the percentage of residents dying in hospital reduced from 43% to 21% with an increase in documentation of advance care planning and cardio-pulmonary resuscitation decisions. A ‘high’ facilitation model, including a sustainability initiative and ongoing audit, contributed to significant improvements. Reciprocity and trustworthiness underpin the success of this initiative.

INTEGRATED CARE INNOVATION FOR PEOPLE WITH DEMENTIA LIVING AT HOME (ICI-HOMETIME)

B.S. Husebø, *University of Bergen, Bergen, Norway*

Facing an ageing population, priorities in elderly care has changed from narrow acute care focus to broader framework of disease prevention and community care. Living well at home requires integrated care innovation, including palliative care. Thus, understanding what and how Electronic Patient Records (EPR), Information and Communication Technology (ICT), volunteers, and research-based education mediate QoL, is crucial to equip policymakers to better formulate cost-effective policies on healthy ageing at home. Integrated Care Innovation at home (ICI-HomeTime), prepares a new approach to understanding and treating age-related challenges, enabling more people to stay safely at home or to die there. Our approach of development, user-involvement, and research will objective 3 research questions: what are barriers and facilitators for ICI-HomeTime that may contribute to sustainable health systems; what are issues relating to palliative care and how influences ICI-HomeTime communication, participation, and QoL of end-users and health financing? Pilot study results will be presented.

HOME PALLIATIVE CARE FOR ADVANCED DEMENTIA IN ISRAEL

S. Sternberg, *Ministry of Health, Israel, Jerusalem, Israel*

Dementia is a terminal illness with pain and suffering, making the palliative approach an appropriate choice for care. We examined the prevention of hospitalizations, treatment of symptoms, caregiver burden, and satisfaction with care in a pilot project providing palliative care at home for 20 advanced dementia patients. The service was provided for 6 months or until the person died by a multidisciplinary team who were available 24/7. Family members were interviewed once every three months using validated measures and charts were reviewed. After a total of 112 months of care, we found that 33 hospitalizations were prevented. Improvements were seen in symptom management (average scores 33.8 to 38.3 after 6 months) and satisfaction with care (27.5 to 35.3) and caregiver burden declined (12 to 4). We conclude that a home palliative service for 20 advanced dementia patients resulted in improved care.

SESSION 3925 (PAPER)

IMPROVING CARE IN THE COMMUNITY

ADD A LANGUAGE! ADD A PICTURE!—IMPROVING PRESCRIPTION MEDICATION LABELS FOR ELDERLY SINGAPOREANS

R. Malhotra¹, M.C. Bautista¹, N. Tan², W. Tang⁴, S. Tay², A. Tan³, A. Pouliot⁵, R. Vaillancourt⁵, 1. *Health Services and Systems Research (HSSR), and Centre for Ageing Research and Education (CARE), Duke-NUS Medical School, Singapore, Singapore, Singapore*, 2. *SingHealth Polyclinics, Singapore, Singapore*, 3. *National Healthcare Group HQ, Regional Health, Singapore, Singapore*, 4. *National Healthcare Group Polyclinics, Singapore, Singapore*, 5. *Children's Hospital of Eastern Ontario, Ottawa, Ontario, Canada*

In Singapore, medication labels placed by clinics on packs/bottles of dispensed prescription medications are primarily in English. This poses a challenge for elderly Singaporeans (≥ 65 years) as 61% of them cannot read in English. However, nearly half of them can read in ≥ 1 of the other three official languages (Chinese/Malay/Tamil), thus suggesting a potential strategy, i.e., adding another language, for improving prescription medication labels. Pictograms, shown to be helpful for low-literacy populations elsewhere, are another potential strategy. We assessed the utility of these strategies, i.e., bilingual labels and/or labels with pictograms, in improving the understanding of medication labels among elderly Singaporeans. Respondents were randomized to 4 different label types - (A) English-text (n=357); (B) English-text with pictograms (n=357); (C) Bilingual-text (n=353); and (D) Bilingual-text with pictograms (n=350) - for the same three medications, and questioned on their understanding of the label content. While 65% of those randomized to Type A reported difficulty reading the labels, corresponding proportions were significantly lower with the addition of pictograms and/or another language (57%, 32%, 37%, for types B, C, D, respectively). However, even among those able to read English, 12%, 14%, 10% and 9%, respectively

across each label type still reported difficulty. Use of bilingual medication labels is a promising strategy for improving prescription medication labels for elderly Singaporeans. However, careful assessment of the label design and content and of non-label-related factors that may limit the elderly's understanding is warranted. Our findings can support future empirical studies evaluating real-world prescription medication labels for elderly Singaporeans.

INAPPROPRIATE PRESCRIBING OF ANTIPSYCHOTIC MEDICATIONS IN LONG TERM-CARE RESIDENTS: THE HALT PROJECT

F. Harrison, M. Cations, T. Jessop, A. Shell, H. Brodaty, *Dementia Collaborative Research Centres, UNSW Australia, SYDNEY, New South Wales, Australia*

Despite limited evidence for efficacy and safety concerns, antipsychotic medications are commonly prescribed to manage behavioural and psychological symptoms of dementia (BPSD). Guidelines mandating appropriate, short-term use are rarely followed in practice. The aim is to examine conditions under which antipsychotics are prescribed in long term care (LTC) residents to better understand inappropriate practices and opportunities for intervention. Data were from the HALT project, a single-arm longitudinal deprescribing study including 24 facilities across NSW, Australia, with participants aged over 60 years, on regular antipsychotic medication, without primary psychotic illness or severe BPSD. Antipsychotic use including naturalistic dosage history, setting, consent and indication was collected. Of 139 participants, 86.4% were prescribed an atypical antipsychotic, 10.1% a typical, and 3.6% both, among 2.3 concurrent psychotropic medications on average. The current course of antipsychotic was prescribed on average 2.1 years prior, and dose unchanged for 1.2 years. Aggression and agitation were the most common reasons for prescription. Most current courses (57.6%) commenced during residency at an LTC facility. Verbal consent for antipsychotics was recorded in 15.1% of participant files; written consent was located once. Recommendations by health professionals to review antipsychotics were documented in 62.6% of cases. Antipsychotics were commonly prescribed outside guidelines for older adults with dementia. The majority were initiated without informed consent and continued without change for lengthy periods, even when reduction or cessation was recommended. Indications were often unclear or for symptoms with insufficient evidence for benefit. Interventions to improve prescribing practices to meet guidelines are urgently needed.

SALIENT CUES AND WAYFINDING IN ALZHEIMER'S DISEASE WITHIN A VIRTUAL SENIOR RESIDENCE

R. Davis, J. Ohman, *Kirkhof College of Nursing, Grand Valley State University, Grand Rapids, Michigan*

Wayfinding is a problem for persons with Alzheimer's disease (AD), especially in complex environments such as senior residential communities. In this study, persons with AD or Mild Cognitive Impairment (MCI) and a control group of older adults were asked to find their way in a virtual reality simulation of a senior residential community. Subjects had to find their way repeatedly over multiple trials for two consecutive days in standard (no extra cues) and salient

(colorful, memorable cues placed at key decision points) cue conditions. The results showed that there was a significant interaction among group, day, and trial ($F(8, 987) = 8.049$; $p < .0001$ indicating that the subjects in the control group found their way faster over days and trials in both cue conditions when compared to the AD/MCI group. The control group found the goal significantly more often ($M = 16.1$, $SD = 2.23$) than the AD/MCI group ($M = 6.45$, $SD = 5.43$); $t(68) = 25.806$, $p < .001$. There was an interaction among cue condition, day, and trial; $F(4, 986) = 2.534$, $p = .039$, with subjects finding the goal location the fastest in the salient cue condition. Both groups had more goal acquisitions and a faster time to acquire the goal in the salient cue condition when compared to the standard cue condition. The study results indicate that individuals with and without AD/MCI can find their way more often when virtual environments are enhanced with salient environmental cues. Funded by the NIH: 1R15AG37946-1A1

USE OF TELEHEALTH DURING PHYSICAL REHABILITATION FOR PATIENTS WITH CHF: A SYSTEMATIC REVIEW

D. Shaw, A. Anderson, C. Hernandez, J. Padilla, J. Royer, C. Saulog, *Franklin Pierce University, Goodyear, Arizona*

The purpose of this systematic review was to discuss telehealth as a viable adjunct for improving physical outcomes in patients with congestive heart failure (CHF) as compared to patients receiving cardiac rehabilitation in traditional hospital settings. A comprehensive literature search was completed using PubMed, CINAHL, PEDro, Cochrane Central Register of Control Trials, and Google Scholar. Articles were assessed by three reviewers for quality using the PEDro scale. Five randomized controlled trials were selected and analyzed. The results focused on the affect telemonitored home programs (THP) had on select physical outcome measures (i.e. VO_2 peak, Six Minute Walk Test, and ECG monitoring). The articles reviewed all characterize THP as a safe alternative to hospital-based cardiac rehabilitation in patients with CHF. Four of the studies revealed significantly greater improvements in VO_2 peak for THP when compared to hospital-based groups. All studies characterize THP to be as safe as, and sometimes superior to, hospital-based cardiac rehabilitation programs. Improvements in physical outcome measures for aerobic power and functional mobility were consistent throughout. The opportunity for telemonitored patients to receive direct feedback from healthcare professionals regarding physical responses to exercise clearly added to patient confidence. There were no untoward ECG-related events reported in patients participating in cardiac rehabilitation either at home or at a hospital. We conclude THP is an efficacious rehabilitation adjunct for patients with CHF when compared to cardiac rehabilitation received in traditional hospital settings.

THE CRITICAL ROLE OF THE HEALTHCARE SYSTEM ON LONG-TERM CARE ADMISSIONS OF PEOPLE WITH DEMENTIA

N. Donnelly¹, N. Humphries², A. Hickey¹, F. Doyle¹, 1. *Psychology, Royal College of Surgeons in Ireland, Dublin, Ireland*, 2. *Royal College of Physicians of Ireland, Dublin, Ireland*

Background: There are few studies concentrating on the influence of health system factors on long-term care admissions of people with dementia. We address this absence by examining how inadequacies in the healthcare system impact on long-term care admissions of people with dementia. This is in the context of the Irish healthcare system which has been greatly impacted by the economic crisis and austerity.

Methods: Thirty-eight qualitative in-depth interviews with healthcare professionals and family carers were conducted. Interviews focused on participants' perceptions of the main factors which influence admission to long-term care. Interviews were analysed thematically.

Results: Long-term care admissions of people with dementia are affected by inadequacies in the healthcare system in three ways. Firstly, the economic crisis in Ireland appears to have exacerbated the under-resourcing of community care services. These services are also inequitable. Consequently, the effectiveness of community care is limited. Secondly, such limits in community care increase acute care admissions. Finally, admission of people with dementia to acute care can accelerate the journey towards long-term care.

Conclusions: Inadequacies in the healthcare system have a substantial impact on the threshold for long-term care admissions. This suggests that we cannot fully understand the factors that predict long-term care admission of people with dementia without accounting for healthcare system factors on the continuation of home care.

SESSION 3930 (PAPER)

CHRONIC CONDITIONS IN OLDER ADULTS 2

PREVENTING RECURRENCE OF VENOUS LEG ULCERS IN OLDER ADULTS: A LONGITUDINAL, RANDOMISED TRIAL

K. Finlayson^{1,2}, H. Edwards^{1,2}, C. Parker^{1,2}, 1. *Institute of Health and Biomedical innovation, Queensland University of Technology, Kelvin Grove, Queensland, Australia*, 2. *Institute of Health and Biomedical Innovation, Kelvin Grove, Queensland, Australia*

Leg ulcers are a significant cause of chronic ill-health for older adults, and after healing, up to 70% recur. This study aimed to determine the effectiveness of leg elevation and/or calf muscle exercise interventions on preventing venous leg ulcer recurrence. Patients were recruited within 4 weeks of healing and randomised to either 1) usual care (i.e. evidence-based compression therapy and recommendations); 2) usual care plus 60 minutes/day of leg elevation; or 3) usual care plus leg elevation and a calf muscle exercise program. Data were collected 3 monthly for 12 months after healing.

A third (35%) of a sample of 45 participants recurred within 12 months. The mean age was 68 years (SD 14.4) and 62% were male. Using Kaplan-Meier analysis, the mean time to ulcer recurrence for the usual care group was 32.6 weeks (95%CI 19.4–45.9), for the leg elevation group 38.2 weeks (95%CI 27.9–49.4), and for the combined elevation and exercise group 43.8 weeks (95%CI 36.8–50.9), ns. Controlling for age and comorbidities, Cox proportional hazards regression found participants in the combined leg elevation and exercise group were significantly less likely to

recur than those in the usual care group (HR 0.02, 95%CI 0.01–0.79, $p=0.037$), while the leg elevation group were not significantly different (HR 0.31, 95%CI 0.001–1.13, $p=0.059$). Living alone was associated with higher risk (HR 4.68, 95%CI 1.23–17.8, $p=0.024$). Results suggest that significant decreases in ulcer recurrence are possible with regular follow-up after healing and non-invasive, self-management interventions.

COMPLEX COMORBIDITY AMONG OLDER U.S. VETERANS WITH INSOMNIA

C.A. Alessi^{1,2}, J. Martin^{1,2}, L. Fiorentino³, C. Fung^{1,2}, J. Dzierzewski⁴, J. Rodriguez Tapia^{2,5}, Y. Song^{1,2}, M. Mitchell¹, 1. VA Greater Los Angeles Healthcare System, Los Angeles, California, 2. University of California, Los Angeles, Los Angeles, California, 3. University of California, San Diego, San Diego, California, 4. Virginia Commonwealth University, Richmond, Virginia, 5. Pontificia Universidad Catolica de Chile, Santiago, Chile

Background: Current treatment for insomnia does not address the complex comorbidity associated with insomnia in older adults. The purpose of this study was to identify comorbid conditions and symptoms among older US Veterans with insomnia.

Methods: All community-dwelling patients aged ≥ 60 years who received care at one Veterans Administration healthcare system were sent a postal survey. Respondents who met International Classification of Sleep Disorders, 2nd Edition (ICSD2) criteria for insomnia were invited for in-person assessment, including a self-reported Comorbidity Index, Patient Health Questionnaire (PHQ9, depression), symptoms that caused trouble sleeping, home sleep apnea testing (apnea-hypopnea index, AHI), Flinders Fatigue Scale (FFS) and Epworth Sleepiness Scale (ESS).

Results: Of 4717 veterans who completed the postal survey, 52% met ICSD2 diagnostic criteria for insomnia. 519 with insomnia completed in-person assessment (mean age 72.0 years, 98% male, 79% non-Hispanic white). They reported a mean of 6.3 comorbidities; including high blood pressure (65% of participants), back pain (61%), cataracts (50%), enlarged prostate (46% of males), and osteoarthritis (42%). 13% of participants had PHQ9 > 10 (suggesting major depression), and 46.7% had an AHI > 15 (suggesting moderate-severe sleep apnea). Symptoms that caused trouble sleeping > 3 times per week included need to use the bathroom (40% of participants) and pain (15%). 42% reported a FFS > 11 , and 16% reported ESS > 10 .

Conclusions: Insomnia is common among older US veterans, and occurs with complex comorbidity. Treatment approaches for insomnia should address the complex comorbidity that occurs with insomnia in older adults.

DEPRESSION IN COMMUNITY-LIVING OLDER ADULTS WITH CHRONIC VENOUS LEG ULCERS

H. Edwards^{1,2}, K. Finlayson^{1,2}, 1. Institute of Health and Biomedical innovation, Queensland University of Technology, Kelvin Grove, Queensland, Australia, 2. Institute of Health and Biomedical Innovation, Kelvin Grove, Queensland, Australia

Older adults are at higher risk of developing venous leg ulcers, many of which do not heal for months or years.

Qualitative reports suggest the chronic condition is associated with poor self-esteem, anxiety and depression; however, there is little information on the prevalence of depressive symptoms, or factors associated with them.

Data were collected for 24 weeks from a sample of 386 community-living adults with venous leg ulcers, on socio-demographics, health, and symptoms, utilising the Geriatric Depression Scale (GDS) for depressive symptoms. Multivariable linear regression identified factors associated with depressive symptoms, and logistic regression identified predictors of failure to heal within 24 weeks.

The mean age was 79 years (SD 14.4) and 52% were female. On enrolment, 8% ($n=29$) of participants scored at high risk of depression, and another 23% ($n=92$) scored at mild risk of depression. Controlling for gender and co-morbidities, regression analysis found younger age ($p=0.012$), pain ($p=0.017$) and poorer social support ($p=0.001$) were significantly associated with higher GDS scores. Higher GDS scores were significantly associated with failure to heal after 24 weeks at the bivariate level ($p=0.031$), however regression analysis found living alone (OR 2.33, 95%CI 1.37–3.94), rheumatoid arthritis (OR 2.94, 95%CI 1.33–6.67) and weeks of ulcer duration (OR 1.01, 95%CI 1.005–1.014) were the primary predictors of failure to heal ($p<0.01$).

Results suggest that depressive symptoms may not be directly involved in chronic wound healing, rather social factors and management of comorbidities may be significant factors to address to promote well-being and ulcer healing.

ASSOCIATION OF THYROID HORMONES WITH CHRONIC CONSTIPATION IN HOSPITALIZED ELDERLY PATIENTS

F. He, X. Huang, H. Gan, B. Dong, The Center of Gerontology and Geriatrics, West China Hospital, Sichuan University, Chengdu, China

AIMS: The aim of this study was to investigate the relationship between thyroid hormones and chronic constipation in the elderly.

Methods: This pilot study was conducted at the Center of Gerontology and Geriatrics, West China Hospital. A total of 267 inpatients aged 60 years or older were enrolled from January 2015 to May 2016. All the patients were evaluated whether or not chronic constipation. Thyroid-stimulating hormone (TSH), triiodothyronine (T3), tetraiodothyronine (T4), free triiodothyronine (FT3), and free tetraiodothyronine (FT4) were detected using radioimmunity. We assessed associations between TSH and other thyroid hormones.

Results: Our study included 93 patients (34.83%) with chronic constipation, and 174 patients (65.17%) without chronic constipation. At baseline, Compared with the non-constipation patients, the patients with constipation had significantly lower levels T3 (1.38 ± 0.29 nmol/L vs 1.23 ± 0.38 nmol/L; $P = 0.01$), and FT3/FT4 ratio (0.26 ± 0.05 vs 0.24 ± 0.06 ; $P = 0.04$). There was no significant difference in TSH, T4, FT3, and FT4. In the constipation patients, none of the correlations between TSH and T3, T4, FT3, and between TSH and FT4, FT3/FT4 was significant. However, in the non-constipation patients, TSH was significantly correlated with T4 ($R = -0.298$; $P = 0.001$) and FT3 ($R = 0.473$; $P = 0.01$), and between TSH and FT4, FT3/FT4 ratio was significant.

Conclusion: Among hospitalized elderly patients with chronic constipation, there is a decreased T4 to T3 conversion, and abnormal biofeedback regulations in thyroid axis. These changes in thyroid hormone production may contribute to chronic constipation in the elderly.

SESSION 3935 (SYMPOSIUM)

DELIRIUM IN HOSPITALIZED OLDER PATIENTS: EARLY RECOGNITION, PREVENTION, AND MANAGEMENT

Chair: M. Schuurmans, *UMC Utrecht, Utrecht, Netherlands*
Co-Chair: K. Milisen, *KU Leuven - University of Leuven, Leuven, Belgium*

Discussant: S.K. Inouye, *Harvard Medical School, Boston, Massachusetts*

Delirium is a frequent complication of hospitalization in vulnerable old people. Given the greying of all nations and the changes in hospital practice, the expectation is that the number of delirious patients will increase rapidly. The last decades much research has been conducted regarding early recognition and prevention of delirium in hospitalized patients. The 2016 Cochrane review regarding prevention of delirium in non-ICU patients concluded that there is strong evidence supporting multi-component interventions to prevent delirium in hospitalized patients. To bring this knowledge into practice at the one hand, and to strengthen the body of knowledge with easy to use tools and interventions, however, is still challenging. As a result many older patients who enter the hospital will develop delirium and this will eventually not even be recognized or adequately managed. Delirium results in longer hospital stays, morbidity and increased mortality at huge personal and societal costs. Changing practice involves a large variety of professionals and hospital management. What can be done to change practice, what is the effect of national policy, of education and of strengthening tools and interventions? In this symposium a selection of studies targeted at strengthening delirium recognition and prevention will be presented. Finally, our discussant Sharon Inouye, the delirium expert from Harvard Medical School, the United States will wrap-up the session.

A NATIONAL POLICY ON EARLY RECOGNITION OF DELIRIUM

M. Schuurmans, *1. Julius Center, UMC Utrecht, Utrecht, Netherlands, 2. University of Applied Sciences, Utrecht, Netherlands*

In the Netherlands in 2008 the professional associations agreed with the Ministry of Health on a policy of reduction of preventable harm in hospitalised patients. Part of this policy regarded implementation of early recognition and prevention of delirium. In 2010 the Inspectorate of Health defined delirium as one of the mandatory quality of care indicators of hospital care. Although mandatory, in 2015 data of the inspectorate showed that less than 10% of the hospitals succeeded to assess risk in at least 80% of the patients combined with a follow up if needed. A few national studies regarded this mandatory set of delirium recognition indicators and showed that nurses consider the assessment of risk

and the subsequent monitoring as an administrative burden more than a quality of care indicator. The general impression is that the national policy resulted in higher delirium awareness, however, not automatically followed by preventive measures.

VALIDITY OF A SCREENING METHOD FOR DELIRIUM RISK IN OLDER PATIENTS ADMITTED TO A GENERAL HOSPITAL

R. Ettema^{2,1}, N. Heim², M. Hamaker³, M. Emmelot-Vonk², R. van der Mast⁴, M. Schuurmans^{2,1}, *1. University of Applied Sciences Utrecht, The Netherlands, Utrecht, Utrecht, Netherlands, 2. University Utrecht, Utrecht, Utrecht, Netherlands, 3. Diakonessenhuis, Utrecht, Utrecht, Netherlands, 4. University Hospital Leiden, Leiden, Zuid Holland, Netherlands*

Routine care data were used to examine the predictive value of three Dutch health care inspection mandatory questions for screening on delirium. Delirium diagnosis was established on three proxy measures.

The three health care inspection mandatory questions for screening on delirium combined with relevant routine collected patient characteristics were modelled in a logistic regression model. Subsequent potential additional predictive variables were fit into a full model and with bootstrap backward selection a final model was fit.

In data of 3,786 hospitalized patients, 70 years and over (16.4% delirium), AUC (95%CI's) were found of 0.81 (0.79 - 0.83), 0.86 (0.85-0.87) and 0.86 (0.84-0.87) for the three question models, the full model and the final model respectively. The calibration performance was high: *U*-statistic (*p*-value) of 0.00 (1.00) for all three models. The three mandatory questions perform well in screening on delirium risk.

RECOGNITION AND MANAGEMENT OF DELIRIUM IN OLDER HOSPITALIZED PATIENTS

E. van Velthuisen¹, S. Zwakhalen¹, W. Mulder², F. Verhey², G. Kempen¹, *1. Maastricht University, Maastricht, Netherlands, 2. Maastricht University Medical Center+, Maastricht, Netherlands*

A retrospective cohort study was conducted to research the recognition rates and types of management of delirium in older hospitalized patients. The medical files of all 65+ patients who were diagnosed with a delirium in 2014 in one academic hospital were included in the study (N=401, 5% of all admitted older people). Three quarters of the delirious patients (75%) were monitored using the Delirium Observation Screening Scale (DOS), and 67% received one or more delirium consultations from a specialized geriatric nurse practitioner. Most patients (86%) received drugs (Haloperidol or other) to manage the delirium, 69% received interventions aimed at reorientation, and 60% received both pharmacological and non-pharmacological treatment. Overall, recognition of delirium was probably severely underestimated, as previous prospective studies reported higher delirium prevalence rates in older hospitalized patients. The treatment of delirium can also be improved, as many patients did not receive any nursing interventions aimed at reorientation.

EFFECT OF AN INTERACTIVE E-LEARNING TOOL FOR DELIRIUM ON PATIENT AND NURSING OUTCOMES

E. Detroyer¹, F. Dobbels¹, A. Teodorczuk², M. Deschodt¹, Y. Depaifve¹, E. Joosten³, K. Milisen¹, 1. *Department of Public Health and Primary Care, KU Leuven - University of Leuven, Leuven, Belgium*, 2. *Tyne and Wear NHS Foundation Trust, Northumberland, United Kingdom*, 3. *University Hospitals Leuven, Leuven, Belgium*

A before-after study (sequential design) was used to evaluate the effect of a delirium e-learning tool on: (1) presence and duration of delirium in geriatric patients, and (2) nurses' delirium recognition and knowledge. The intervention consisted of (1) a one-hour information session to offer oral and written information about the use of the e-learning tool, which included 11 e-modules integrating knowledge and skill development in delirium prevention, detection and management, and (2) a three-month self-active e-learning program. End points were presence and duration of delirium (Confusion Assessment Method) and delirium recognition (Case vignettes) and knowledge (Delirium Knowledge Questionnaire) for nurses. In geriatric patients, there was no significant difference in presence (21.5% versus 25.9%; $P=0.51$) and duration of delirium (mean $4.2\pm SD$ 4.8 days versus $4.9\pm SD$ 4.8 days; $P=0.8$) between the intervention ($n=81$) and non-intervention ($n=79$) cohorts, respectively. Also, no benefits were found for nurses' delirium knowledge ($P=0.43$) and recognition ($P=1.0$).

SESSION 3940 (PAPER)

PHARMACOLOGICAL MANAGEMENT IN THE ELDERLY

PHARMACOVIGILANCE IN THE ELDERLY (PHARE STUDY)

P. Gareri¹, A. Castagna¹, M. Staglianò², A. Corsonello³, M. Rocca², G. De Sarro⁴, 1. *ASP Catanzaro CDCD Catanzaro Lido, Catanzaro, Italy*, 2. *ASP Catanzaro, Catanzaro, Catanzaro, Italy*, 3. *INRCA, Cosenza, Italy*, 4. *Chair of Pharmacology, School of Medicine, Catanzaro, Italy*

Background: The PharE Study (Pharmacovigilance in the Elderly) is an ongoing study in the ASP Catanzaro, Italy, on elderly home care patients affected with dementia. The aim of the present study is: to assess the use of inappropriate drugs; to study the possible drug-drug interactions; to perform the possible strategies for avoiding the potential harmful prescriptions, by using the STOPP and START criteria.

Methods: Preliminary data were obtained from 461 home patients, 185 men, 276 women, mean age 81.1 ± 6.8 years old. Overall patients with Alzheimer's dementia were 39%, vascular and mixed dementia 52%, other dementias 9%. A classification of potential inappropriate drugs was made according to the Beers criteria. Data were collected through an appropriate software able to gather the main information. In the case of suspected adverse event, Naranjo Scale was applied. The study of possible drug-drug interactions was made by Micromedex 2.0. All analyses were performed using the SPSS program version 18.0 for Windows.

Results: Patients were functionally impaired (ADL 0.8 ± 1.9 , IADL 0.1 ± 0.4) and moderately to severely cognitively impaired (MMSE 12.1 ± 2.5). 71.8% of patients used 5–9 drugs and 10.6% more than 10 drugs. The bivariate relationship between number of drugs and Modification of Diet in Renal Disease (MDRD) showed that the higher the number of drugs used is, the worst is kidney function ($p= 0.0001$). Among the inappropriate drugs anticholinergic drugs were 13.2%, tricyclic antidepressants 2.8% and ticlopidine 2.1%. Long half-life benzodiazepines were used in 4.3% of patients. Antipsychotics were used in 20% of the cases. Proton pump inhibitors were used in 86.6% of the cases. Some interesting case reports were recorded too.

Conclusions: These preliminary data are very impressive and show the need for an accurate choice of drugs in elderly people. The implementation of data collected will bring further details and the application of STOPP and START criteria will improve drug use in older age.

DEPRESCRIBING IN FRAIL OLDER PEOPLE

C. Etherton-Beer^{1,2}, K. Potter², A. Page², R. Clifford², 1. *Royal Perth Hospital, Perth, Western Australia, Australia*, 2. *University of Western Australia, Perth, Western Australia, Australia*

Deprescribing has been proposed as a way to reduce polypharmacy in frail older people, and may improve their survival. We have conducted two randomised controlled trials (RCT) and a systematic review examining deprescribing, the planned cessation of potentially non-beneficial medicines. In our pilot RCT in 35 participants we found that an RCT of deprescribing is acceptable to participants, and that recruitment in residential aged care facilities (RACF) is feasible. In an open RCT enrolling ninety-five people aged over 65 years living in four RACF we found that randomisation to the deprescribing intervention was associated with participants taking 2.0 ± 0.9 (95% CI 0.08 to 3.8, $p= 0.04$) fewer medicines after 12 months. Twelve (of 47) intervention participants and 19 (of 48) control participants died within 12 months of randomisation (26% versus 40% mortality, $p= 0.16$, HR 0.60, 95% CI 0.30 to 1.22). The main limitations of this study were the open design and small participant numbers. Systematic review of the available randomised data suggests that reducing polypharmacy does not have a significant effect on mortality (OR 0.82, 95% CI 0.61 to 1.11). However subgroup analysis suggests patient specific interventions (as opposed to generalized educational programmes) may be associated with a significant reduction in mortality (OR 0.62, 95% CI 0.43 to 0.88). Deprescribing appears to reduce the number of regular medicines consumed by older people with, at least, no significant adverse effects on survival.

ANTICHOLINERGIC MEDICATION USE AND COMMUNITY-ACQUIRED PNEUMONIA RISK IN AN OLDER VETERAN POPULATION

S.M. Nguyen¹, D.H. Le¹, K.M. Allison¹, J.K. Lee^{2,1}, 1. *Pharmacy, Southern Arizona VA Health Care System, Tucson, Arizona*, 2. *University of Arizona College of Pharmacy, Tucson, Arizona*

Community-acquired pneumonia (CAP) is a leading cause of morbidity and mortality among older adults. Identifying medications that pose CAP risk can help health providers reduce

use in their older patients. The purpose of this study was to investigate the association between anticholinergic medication use and the rate of CAP among an older Veteran population.

The study identified a case group of Veterans aged 65–89 years diagnosed with CAP and matched by age for a control group. Any anticholinergic fill within the year prior to CAP diagnosis or index date was noted. Acute use was defined as any anticholinergic fill in the 90 days prior to CAP diagnosis, and chronic use was defined as 3 or more fills in the year prior to CAP diagnosis. Groups were compared using Chi-square test with a priori alpha set at 0.05.

Two hundred and fifty-two patients met inclusion criteria (mean age 73, 97.6% male). Any anticholinergic use in the year prior to index date was observed in 35% of CAP cases and 17% of controls without CAP (OR = 2.683, 95% CI = 1.480–4.863). Acute use of anticholinergics was observed in 23% of cases and 7% of controls (OR = 3.887, 95% CI 1.755–8.605), and chronic use was observed in 21% of cases and 10% of controls (OR = 2.260, 95% CI 1.102–4.634).

In this study of an older Veteran population, any anticholinergic use in the year prior to CAP, acute use, and chronic use were all associated with increased CAP risk.

SAFE MEDICATION TRANSITIONS IN FRAILTY PATIENTS

S.L. Rosen^{1,2}, B. McGalliard¹, R. Shane^{1,3}, D. Luong¹, N. Tantipinichwong¹, K. Amer¹, 1. *Geriatric Medicine, Cedars Sinai Health System, Los Angeles, California*, 2. *UCLA, Los Angeles, California*, 3. *UCSF, San Francisco, California*

Purpose: To determine if transitions of care activities conducted by a clinical pharmacist decrease medication and non-medication related 30-day readmissions in frailty patients admitted to a medical-surgical unit.

Methods: This was a single center, prospective cohort study conducted at Cedars-Sinai Medical Center (CSMC) in which frailty patients admitted to a designated nursing unit were provided with comprehensive medication management services as outlined in the G.E.R.I.A.T.R.I.C. bundle.

Results: Fifty patients were included in the intervention and control groups, respectively. Of the patients in the intervention group, 96% received admission medication reconciliation, 72% received discharge counseling and 88% received post-discharge follow up. The 30-day all-cause readmission rate was not significantly lower in the intervention group (16% vs 30%, $p=0.15$). The number of patients with intermediate or high medication adherence and literacy, defined as achieving a medication adherence and literacy score ≥ 6 points, increased after the implementation of a pharmacy-based transitions of care test of change ($p=0.03$).

Conclusion: This study shows that pharmacists increase medication adherence and literacy in the elderly. There was not a significant difference in medication or non-medication related readmission rates detected between the intervention and control groups.

POLYPHARMACY AND GERIATRIC SYNDROMES IN OLDER HOSPITALIZED VETERANS

S.F. Simmons^{1,2}, E. Vasilevskis^{3,2}, A. Mixon^{4,2}, J.F. Schnelle^{1,2}, W. Ely^{4,2}, J.S. Powers^{1,2}, 1. *Vanderbilt University, School of Medicine, Division of Geriatrics, Center for Quality Aging,*

Nashville, Tennessee, 2. *Nashville VA, Geriatric Research Education & Clinical Center (GRECC), Nashville, Tennessee*, 3. *Vanderbilt University, Section of Hospital Medicine, Nashville, Tennessee*, 4. *Vanderbilt University, Division of General Internal Medicine & Public Health, Nashville, Tennessee*

Polypharmacy is common in older patients discharged to skilled nursing facilities (SNFs) and is associated with adverse health outcomes. As part of a recent VA-funded Quality Improvement project to improve the care transition process from the VA hospital to area SNFs, we prospectively collected data for 134 hospitalized, older Veterans. These data showed that, on average, 14 medications were ordered for Veterans discharged from the VA hospital to SNF, which included 2.5 medications newly prescribed in the hospital that met criteria for being potentially inappropriate medications (PIMs). Moreover, 75% of Veterans had two or more and 43% had three or more geriatric syndromes based on standardized assessments completed by research staff, with an average of 2.6 syndromes per Veteran. The most common geriatric syndromes in this sample of Veterans included: recent fall history (62%), recent unintentional weight loss (41%), depression (41%), incontinence (40%) and cognitive impairment (39%). Multiple syndromes also were reported by Veterans as newly-acquired during hospitalization, which averaged 14.6 (± 10.26) days per Veteran. All of those with polypharmacy (100%) also had one or more medications with side effects related to geriatric syndromes, with an average of 5.4 such medications per Veteran.

Conclusion: The prevalence of both polypharmacy and multiple co-existing geriatric syndromes may, at least partially, explain why these patients often have poor health outcomes. Efforts to de-prescribe PIMs and medications associated with geriatric syndromes deserve further study as they may contribute to improved health outcomes among hospitalized veterans discharged to SNF.

SESSION 3945 (PAPER)

INTERNATIONAL REPORTS ON FRAILTY RISK FOR ADVERSE OUTCOMES

THE ASSOCIATION BETWEEN FRAILTY INDEX AND THE METABOLIC SYNDROME OVER THE LIFESPAN

A.E. Kane¹, E. Gregson^{1,2}, O. Theou^{1,2}, K. Rockwood^{1,2}, S.E. Howlett¹, 1. *Pharmacology, Dalhousie University, Halifax, Nova Scotia, Canada*, 2. *Capital District Health Authority, Halifax, Nova Scotia, Canada*

Both the frailty index (FI) and the metabolic syndrome have been associated with poor outcomes in the general population. In very old people (90+ years) the FI, but not the metabolic syndrome was associated with an increased mortality risk. This study investigates the relationship between FI, metabolic syndrome, and mortality risk, in younger (20–65 years) and older (65+ years) people. The United States National Health and Nutrition Examination Survey (NHANES) datasets for 2003–2004 and 2005–2006 were linked with mortality data up to 2011. The metabolic syndrome was defined using the International Diabetes Federation criteria, while frailty was determined using a 41

item FI. Compared to the younger group (n=6403), the older group (n=2152) had a higher FI (0.10 ± 0.00 vs 0.22 ± 0.00 , $p < 0.001$) and a greater prevalence of metabolic syndrome (24.14 vs 45.5 %, $p < 0.001$). The metabolic syndrome and FI were weakly correlated in younger people ($r = 0.25$, $p < 0.001$) but not in older ($r = 0.08$, $p < 0.1$). In bivariate analyses, the FI predicted mortality risk in both age groups whereas the metabolic syndrome did only in the younger group. In Cox models, adjusted for age, sex and each other, the FI was associated with increased mortality risk at both ages (younger HR 1.05 (1.04–1.06); older HR 1.04 (1.03–1.04)) whereas the metabolic syndrome did not contribute to mortality risk. Thus, the FI is a better predictor of mortality than metabolic syndrome status in younger and in older people.

WHICH PERSONAL RESOURCES MODERATE THE IMPACT OF LEVELS OF FRAILTY ON ADVERSE OUTCOMES?

L. Op het Veld^{1,2}, B. Ament², E. van Rossum^{1,2}, G. Kempen², H. de Vet³, K. Hajema⁴, A. Beurskens^{1,2}, 1. *Centre of Research Autonomy and Participation for Persons with a Chronic Illness, Zuyd University of Applied Sciences, Heerlen, Netherlands*, 2. *Maastricht University, Maastricht, Netherlands*, 3. *VU University Medical Center, Amsterdam, Netherlands*, 4. *Community Health Service South Limburg, Sittard/Geleen, Netherlands*

Although there is a lively ongoing debate on the nature and definition of frailty, researchers agree that the more frail older persons are, the higher their risk of adverse frailty outcomes is. Nevertheless, there are pre-frail and frail people who do not suffer from these adverse outcomes. This suggests that more factors play a role in the occurrence of these outcomes. Research on the potential moderating effect of resources on frailty outcomes among pre-frail and frail persons is, however, scarce. The present prospective cohort study (n=2420) investigates the moderating effects of level of education, income, availability of informal care, living situation, sense of mastery, and self-management abilities on the relation between the level of frailty and the adverse outcomes mortality, hospitalization and (I)ADL disability over a 2-year period. Results show that frail older people have increased odds for mortality and hospitalization, and a higher risk for increased disability compared to pre-frail older people. Only for the development of disability, two resources (income and living situation) had a moderating effect of the impact of frailty. However, overall the included resources had no consistent and convincing moderating effects. The results of the present study indicate (a) that the impact of the level of frailty on adverse outcomes can be generally considered as main effects, and (b) that it is not yet clear whether, and how presumed resources impact the pathway from frailty to adverse outcomes.

SYNERGISTIC EFFECT OF FUNCTION AND COMORBIDITY BURDEN ON MORTALITY: A 16-YEAR SURVIVAL ANALYSIS

C. Chen¹, I. Sia², B. Ma³, B. Tai¹, N. Fong¹, J. Tan¹, G.C. Koh¹, 1. *National University of Singapore, Singapore, Singapore, Singapore*, 2. *National University Hospital, Singapore, Singapore, Singapore*, 3. *The Chinese University of Hong Kong, Hong Kong, Hong Kong, Hong Kong*

The relationship between disability and comorbidity on mortality is widely perceived as additive in clinical models of frailty. National data were retrospectively extracted from medical records of community hospital. There were of 12,804 acutely-disabled patients admitted for inpatient rehabilitation in Singapore rehabilitation community hospitals from 1996 through 2005 were followed up for death till 31 December 2011. Cox proportional-hazards regression was used to assess the interaction of comorbidity and disability at discharge on all-cause mortality. During a median follow-up of 10.9 years, there were 8,565 deaths (66.9%). The mean age was 73.0 (standard deviation: 11.5) years. Independent risk factors of mortality were higher comorbidity ($p < 0.001$), severity of disability at discharge ($p < 0.001$), being widowed (adjusted hazard ratio [aHR]: 1.38, 95% confidence interval [CI]: 1.25–1.53), low socioeconomic status (aHR: 1.40, 95% CI: 1.29–1.53), discharge to nursing home (aHR: 1.14, 95% CI: 1.05–1.22) and re-admission into acute care (aHR: 1.54, 95% CI: 1.45–1.65). In the main effects model, those with high comorbidity had an aHR=2.41 (95% CI: 2.13–2.72) whereas those with total disability had an aHR=2.28 (95% CI: 2.12–2.46). In the interaction model, synergistic interaction existed between comorbidity and disability ($p < 0.001$) where those with high comorbidity and total disability had much higher aHR=6.57 (95% CI: 5.15–8.37). Our finding that comorbidity and disability have multiplicative effects on survival has important implications on measurements and models of frailty.

COGNITIVE IMPAIRMENT AND PHYSICAL FRAILTY IN OLDER ADULTS: IMPACT ON SURVIVAL

G. Grande^{1,2}, D. Rizzuto¹, D. Vetrano^{1,4}, B. Caracciolo¹, C. Mariani², A. Welmer¹, L. Fratiglioni^{1,3}, 1. *Aging Research Center (ARC), Department of Neurobiology, Care Sciences and Society, Karolinska Institutet and Stockholm University, Stockholm, Sweden, Stockholm, Sweden*, 2. *Center for Research and Treatment on Cognitive Dysfunctions, Biomedical and Clinical Sciences Department, "Luigi Sacco" Hospital, University of Milan, Italy, Milan, Italy*, 3. *Stockholm Gerontology Research Center, Stockholm, Sweden, Stockholm, Sweden*, 4. *Department of Geriatrics, Neurosciences and Orthopedics, Catholic University of Rome, Italy, Rome, Italy*

The presence of both physical frailty and cognitive impairment has been recently proposed as a distinctive entity. We investigated the effect of physical frailty and cognitive impairment on survival among elderly. Study participants included 2251 dementia-free people aged 60+ years enrolled in the Swedish National study on Aging and Care in Kungsholmen, Stockholm. Physical frailty was defined according to Fried phenotype (weight loss, weakness, exhaustion, slowness, low physical activity). Cognitive Impairment Non Dementia (CIND) was defined on the basis of an extensive neuropsychological battery. We investigated the impact of CIND and physical frailty alone and the combination of these two conditions on survival in terms of mortality rate at 5 and 10 years of follow-up (Cox models) and differences in median age at death (Laplace regression). The strongest association with short and long survival was found among people with both CIND and physical frailty. Those people, after 5 years, had three times higher mortality rate (HR: 3.1; 95% CI: 1.8–5.4)

and 3.7 years shorter life compared to frailty-free subjects (neither CIND nor physical frail). People with only physical frailty but cognitively intact had an HR of 1.7 (95% CI: 1.1–2.8) as compared with frailty-free ones. Isolated CIND was not associated with mortality. After 10 years, similar results were observed, although attenuated (for CIND+ physical frailty: HR: 2.1; 95% CI: 1.3–3.2). Subjects with both physical frailty and cognitive impairment represent a special frail and complex population that deserves *ad hoc* assessments and care.

INFLUENCE OF COGNITIVE IMPAIRMENT ON PROGRESSING FROM BEING PRE-FRAIL FOR OLDER MEXICAN AMERICANS

B. Downer, S. Al Snih, B.T. Howrey, M. Raji, K.S. Markides, K.J. Ottenbacher, *University of Texas Medical Branch, Galveston, Texas*

Many older adults recover from pre-frailty, but a significant number experience continued declines and may become frail or deceased. Older Mexican Americans are vulnerable to becoming frail. This may be partly due to the high prevalence of cognitive impairment in this population. However, research into the role of cognition in the progression from pre-frailty is limited. Data for this analysis came from Wave 6 (2006–07) and Wave 7 (2010–11) of the Hispanic Established Population Epidemiological Study of the Elderly. The final sample included 1006 participants (age ≥ 77 years). Non-frail, pre-frail, and frail were defined as presence of 0, 1, and ≥ 2 frailty measures (weight loss, exhaustion, slow walking speed, and low grip strength). Cognitive impairment was defined as < 21 points on the Mini Mental Status Examination. Multinomial logistic regression models were used to assess the relationship between cognition and frailty status at Wave 6 (2006–07) and frailty status and mortality at Wave 7 (2010–11). The reference category was being non-frail and not cognitively impaired. Participants who were cognitively impaired and pre-frail ($n=89$) had 5.76 (95% CI=2.27–14.60) times higher odds to become frail and 3.95 (95% CI=1.60–9.79) times higher odds to be deceased at Wave 7. Participants who were pre-frail but not cognitively impaired at ($n=243$) did not have significantly higher odds to be frail (OR=1.51, 95% CI=0.83–2.76) or deceased (OR=0.97, 95% CI=0.54–1.72) at Wave 7. These findings provide evidence that cognitive impairment is an important characteristic of pre-frail older Mexican American adults who become frail or deceased.

SESSION 3950 (SYMPOSIUM)

INNOVATIONS IN CARE

Chair: L.M. Wagner, *University of California, San Francisco, San Francisco, California*

This session will focus on new approaches to innovative care models for older adults. The presentations will involve perspectives stemming from the economic impact of new models of dementia care to models for improving medication use for older adults. Topics included in this session will focus on evidence-based approaches to improving care for older adults with serious illness, models for improving medication use for older adults, the Care Ecosystem model, the

goals of the Global Brain Health Institute, economic models of dementia care, and policy and access to oral health care for older adults.

EVIDENCE-BASED APPROACHES TO IMPROVING CARE FOR OLDER ADULTS WITH SERIOUS ILLNESS

C.S. Ritchie, *University of California, San Francisco, San Francisco, California*

Every day 11,000 Baby-boomers turn 65. With increasing age, a subset of these older adults will experience multiple ailments, increasing symptom burden and serious illness. Geriatric palliative care “combines the principles and practice of geriatric medicine and palliative care; and focuses on comprehensive geriatric assessment; relief from pain and other symptoms; and management of physical and psychological problems, integrating social, spiritual, and environmental aspects of care.” Geriatric-palliative care integrates traditional geriatric assessment with holistic palliative care management to address both functional vulnerabilities brought on by disability, frailty and cognitive impairment and medical vulnerabilities brought on by multimorbidity and advanced illness. A number of geriatric-palliative care models have now been tested and demonstrated to be beneficial in improving quality of life and “right-sizing” cost. This presentation will review evidence-based approaches to the provision of community-based geriatric palliative care and discuss implications of these findings for future care.

ECONOMICS OF MODELS OF CARE DELIVERY: THEN AND NOW

L. Wilson, *University of California, San Francisco, San Francisco, California*

Introduction: CMS under the Obama Administration committed to shifting 50% of Medicare payments from fee-for-service to value-based models by 2018. But Tom Price, the new Secretary of Health and Human Services is an outspoken critic of value-based care. The major economic models being tested by CMMI; pay-for-performance, chronic care management, bundled payment, re-hospitalization, medical homes, and accountable care organizations (ACO’s), have mixed results in demonstrating savings but value-based care is widely supported and may be too embedded to pull-back from them.

Objectives: We will present results of two studies examining economic effects of new models of dementia care: 1). Chronic care management and bundled payments for caregiver support programs 2).

Time-driven-activity-based-costing (TDABC) comparing different dementia care models

Methods: We use caregiver healthcare utilization data, and California Medicare data to compare short-term economic effects of caregiver support programs funded by CMMI innovation grants. We compare annual dementia care costs using TDABC across three types of care delivery systems: ACO’s, neurology practice, and medical home.

Results: We demonstrate the limitations of demonstrating cost-savings within short-term CMMI

demonstration projects, despite showing promising quality outcomes, and use Medicare data to demonstrate limitations of Medicare benchmarking. We demonstrate considerable costs differences across delivery systems.

Conclusions: Value-based care may be here to stay despite new leadership's premium support model' and lack of overwhelming cost impacts.

MODELS FOR IMPROVING MEDICATION USE FOR OLDER ADULTS

M. Steinman, *University of California, San Francisco, San Francisco, California*

Prescribing for older adults is highly complex and challenging. In this presentation, we will discuss several novel approaches to improving medication prescribing for older adults, including evidence about their ability to improve outcomes in this population.

THE DENTAL GAP: MISMATCH BETWEEN POLICY AND ORAL CARE DELIVERY NEEDS FOR INDIVIDUALS IN LONG-TERM CARE SETTINGS

C. Wides¹, K. Walgama¹, E. Mertz^{1,2}, 1. *School of Dentistry, Department of Preventive and Restorative Dental Sciences & Healthforce Center, University of California, San Francisco, San Francisco, California*, 2. *Philip R. Lee Institute for Health Policy Studies, San Francisco, California*

Oral health is critical to overall health and well-being across the lifespan. This mixed method study examines the variation in state policy and provision of dental care to LTC patients and identifies gaps between the policy environment and care delivery needs that are shaping the organization of care in four states with varying policy environments. Factors that enable treatment of this population include geriatric dental training, hygienist autonomy and billing abilities, expanded practice dental providers, inter-professional practice, teledentistry and mobile dentistry. The regulatory environment of LTC settings dictates quality for patients in almost all aspects of care except dental health. A general trend was found toward cross-subsidized mobile service models nationally; however, the range and scope of services varies widely and in relation to the presence or absence of supportive policy factors.

THE CARE ECOSYSTEM: DEVELOPMENT AND EARLY RESULTS FROM AN ADAPTIVE AND SCALABLE DEMENTIA CARE PROGRAM

K. Possin, *Department of Neurology, University of California, San Francisco, San Francisco, California*

Our objective was to develop a scalable model of dementia care that complements primary care with additional caregiver support and education, medication consultation, and support in planning for future medical, financial, and legal decisions consistent with patient values. Care is delivered via the phone and web by unlicensed Care Team Navigators (CTNs), who are trained and supervised by a nurse, social worker, and pharmacist. This 'Care Ecosystem' is being tested via a pragmatic randomized controlled trial. The care model was iteratively improved during the trial based on input from caregivers, primary care providers, and clinical team members. In this talk, we will present the care model, lessons learned, and preliminary results.

ADDRESSING GLOBAL DEMENTIA CHALLENGES THROUGH INTER-PROFESSIONAL TRAINING: THE GLOBAL BRAIN HEALTH INSTITUTE

J. Merrilees², V.G. Valcour^{1,2,3}, B. Lawlor^{1,4}, S. MacDonald^{1,2}, I. Robertson^{1,4}, B. Miller^{1,2}, 1. *Global Brain Health Institute,*

San Francisco, California, 2. *Department of Neurology, University of California, San Francisco, San Francisco, California*, 3. *Division of Geriatric Medicine, Department of Medicine, University of California, San Francisco, San Francisco, California*, 4. *Trinity College, Dublin, Ireland*

Dementia is among the most devastating illnesses worldwide, affecting over 36 million individuals with a prevalence that is expected to double every 20 years if effective interventions are not implemented. In 2010, the worldwide costs of caring for dementia approached 1% of total global GDP. Lower and middle income countries are at greatest risk for the emerging challenges of dementia care. Established in 2015, the Global Brain Health Institute (GBHI) works to reduce the scale and impact of dementia globally by training and supporting a new generation of leaders. We value innovative and inter-professional activities to enhance an international network armed with skills to create social change and inspire optimism around aging and dementia, shape dementia care and policy, reduce stigma, improve public opinion and expand knowledge related to treatment and prevention. We embrace the core hypothesis that our greatest impact will be achieved through inter-professional engagement.

SESSION 3955 (SYMPOSIUM)

ADDRESSING ISSUES FACING A DIVERSE AGING POPULATION: SCIENTIFIC PERSPECTIVES FOR PRACTICE AND POLICY

Chair: D.A. DiGilio, *American Psychological Association, District of Columbia*

Co-Chair: M. Gatz, *University of Southern California*

Discussant: T.C. Antonucci, *University of Michigan, Ann Arbor, Michigan*

The 2015 White House Conference on Aging (WHCoA) put forth a thematic agenda to help guide and shape the landscape for the current and next generations of older adults and their families. This symposium highlights key findings from the behavioral/social sciences that address three themes: retirement security; family caregiving and support services; and elder abuse. Economic and psychological research on the shifting boundaries between work and retirement has shown that a necessary condition for withdrawal from work includes income that replaces lost wages. Drs. Quinn will speak on key aspects of financial security and Dr. James on the importance of connecting on a deep and meaningful level with activities for health and wellness in retirement. Dr. Qualls positions family caregiving work within the context of family life across the lifespan, highlighting overlaps and distinctions between normal family life and caregiving work for older adults whose physical or cognitive challenges require assistance. Older adults and their families, particularly those who are ethnic minority, sexual minority, rural-residing, disabled, and economically disadvantaged, have problems accessing physical and mental health care. Dr. Czaja discusses key findings on the use of technology to facilitate older adults' aging in place and use of long-term services/supports. Elder abuse threatens the health, safety and well-being of far too many older adults. Dr. Roberto identifies risk factors and outcomes of elder abuse for individuals, families, and communities. Dr. Smyer

will provide summative comments and recommendations for translating research to practice and policy changes within the global context of aging.

THE NEW WORLD OF RETIREMENT INCOME SECURITY

J. Quinn¹, K. Cahill², 1. *Boston College, Chestnut Hill, Massachusetts*, 2. *Center on Aging & Work at Boston College, Chestnut Hill, Massachusetts*

We have entered a new world of retirement income security in America, with older individuals more vulnerable to financial insecurity than were prior generations. Traditionally, a secure retirement depended on Social Security, a defined-benefit pension plan, and individual savings. Today, two of these — pensions and savings — are absent or of modest importance for many elderly. Retirement income security now often requires earnings from continued work later in life, which exacerbates the economic vulnerability of persons with disabilities, the oldest-old, single women, and individuals with intermittent work histories. Policymakers can help remedy this by promoting savings at all (especially younger) ages and by removing barriers that discourage work later in life. Inaction now could mean a return to the days when old age and poverty were closely linked. The negative repercussions of this would extend well beyond traditional economic measures, as physical and mental health are closely tied to financial security.

RETIREMENT SECURITY: THE IMPORTANCE OF ENGAGEMENT

J. Boone James, C. Matz-Costa, *Boston College Center on Aging & Work, Chestnut Hill, Massachusetts*

The accumulation of a solid financial foundation is necessary but not sufficient for retirement security in the broadest sense, i.e. to continue to belong and to be a contributing member of society. Too little attention has been paid to creating a path to a rewarding later life. We define engagement in terms of the experience of connecting on a deep and meaningful level with productive activities and test whether there is a differential effect of engagement level (no involvement, low, moderate, and high engagement) on health and well-being in later life. Findings suggest that just staying “busy” in and of itself may not be the key to health and well-being in later life and retirement security; instead the quality of one’s experience (i.e., engagement) with paid work, volunteering, caregiving, and informal helping plays an important role in the extent to which involvement leads to positive outcomes.

PSYCHOLOGISTS’ ROLES WITH FAMILY CAREGIVERS AND HEALTH SYSTEMS

S.H. Qualls, *University of Colorado Colorado Springs, Colorado Springs, Colorado*

Caregiving is ubiquitous to family life across the lifespan, positioning families as key partners in long term services and supports for adults who require it. Ironically, families are poorly integrated into acute as well as long term care service systems despite their centrality in caregiving for adults

requiring long term services and supports. The prevalence, types of long term care work, and consequences of caregiving provided by family members are described, along with the opportunities for psychologists to address barriers to effective partnership between families and care settings. Research, practice innovation, and policy advocacy are all critical roles for psychologists’ involvement in improving the linkages between families and care systems. Psychologists can promote stronger integration of families and care systems, an imperative for the families whose caregiving is so critical to a rapidly aging society.

TECHNOLOGY AND THE PROVISION OF LONG-TERM CARE SERVICES AND SUPPORTS (LTSS) FOR OLDER ADULTS

S.J. Czaja, *University of Miami Miller School of Medicine, Miami, Florida*

The aging of the population, especially the increase in the “oldest old,” presents both opportunities and challenges. Although many older adults enjoy relatively good health, many have one or more chronic conditions or diseases and need help with disease management activities or activities important to independent living. There are a variety of technology applications such as sensing or monitoring technologies, telemedicine applications, or mobile device applications that can be used to enhance mobility and quality of life of people who have limitations and foster the ability of those with chronic conditions to remain at home. Technology can also provide a role in providing support to family caregivers. This paper will discuss the potential role that technology can play in the provision of LTSS for older adults and their families. Challenges and barriers that currently limit the full potential of technology to be realized for these populations will also be discussed.

ELDER ABUSE AND NEGLECT: A WICKED PROBLEM IN NEED OF ATTENTION

K.A. Roberto, *Virginia Tech, Blacksburg, Virginia*

One of the most wicked problems facing society today, elder abuse, affects at least one in ten older Americans. A systematic analysis of the empirical research revealed common risk factors for abuse including gender, race/ethnicity, living arrangements, cultural beliefs/values, physical/cognitive impairments, social isolation, and loneliness. While risk factors vary by type of abuse (physical, sexual, psychological/emotional, financial abuse/exploitation, neglect), older adults typically know their perpetrators, who are usually family members and others they trust or rely upon for assistance. The costs and consequences of elder abuse are typically irreversible and long-lasting. Psychological abuse is one of the most underreported yet damaging forms of elder abuse; its intangible nature makes it difficult to quantify and often goes unrecognized by older victims. Findings suggest the need for collaborations between researchers and practitioners to design and implement rigorous studies to inform integrative approaches to professional practice and policy development to address elder abuse.

SESSION 3960 (PAPER)

REGULATION OF INFLAMMATION IN AGING

INTESTINAL STEM CELL FUNCTION IS IMPAIRED BY EXPOSURE TO AN OLD ENVIRONMENT

D. Huffman, T. Tabrizian, *Albert Einstein College of Medicine, Bronx, New York*

Intestinal aging is characterized by a decline in stem cell regeneration and renewal, inflammation, and loss of mucosal barrier integrity. Studies using heterochronic parabiosis indicate that circulating factors in old blood can mediate the transposition of aging phenotypes. In order to determine if intestinal aging is modulated by the systemic environment, we generated isochronic (Y-Y, O-O) and heterochronic (Y-O) C57BL/6 male parabionts. Utilizing an established organoid assay, we found that stem cell function in young crypts was significantly impaired by exposure to old blood ($P < 0.05$). Furthermore, we observed a significant reduction in crypt area in these young mice to levels observed in old ($P < 0.05$). Reassociation assays with young and old Lgr5+ stem cells and paneth cells confirmed that aging of the stem and niche cells, contributed to this decline. Several age-related intestinal phenotypes could be rescued in old mice by short-term rapamycin or salicylate treatment ($P < 0.05$). Furthermore, while rapamycin had no effect on intestinal mTOR signaling, it reduced circulating levels of TNF α , IL-1 β and INF γ to youthful levels. An *ex vivo* screening assay confirmed that TNF α was able to potentially disrupt stem cell function, suggesting its potential as a key pro-geronic factor in intestinal aging. Importantly, short-term treatment with a TNF α neutralizing antibody (60ug 3 x wk) partially restored stem cell function in old mice. Thus, these data demonstrate an important role for circulating pro-inflammatory factors in intestinal aging, and suggest that TNF α represents a key pro-geronic factor in mediating the transposition of intestinal aging phenotypes by heterochronic parabiosis.

ACUTE MACROPHAGE ACTIVATION PREDICTS SURVIVAL POST-HIP FRACTURE SURGERY IN ELDERLY

D. Sauce^{1,2}, H. Le Petitcorps¹, M. Larsen¹, C. Bayard¹, V. Appay^{1,2}, J. Boddaert^{3,2}, 1. INSERM U1135, Cimi-Paris, UPMC, INSERM U1135, Cimi-Paris, UPMC, Paris, France, 2. Sorbonne Université, UPMC Paris VI, DHU Fast, Paris, France, 3. Pitié Salpêtrière Hospital, Geriatric Department, Paris, France

Hip fracture (HF) is a common and devastating injury as well as a major health issue in old age. HF has a one-year mortality >30% in the elderly and is a frequent cause of institutionalization. The reasons for such poor outcomes in this trauma are multifactorial but we aim here at identifying immunological factors, which can influence and/or predict the outcome of hip trauma in elderly patients post-surgery.

The present study analyzes longitudinally immunological parameters evocating of the Immune Risk Phenotype as well as inflammation markers in sequential pre- and post-surgical samples collected from HF patients over 75 years of age. These markers were monitored by flow cytometry and Luminex to determine the immune status of such patients.

The study revealed that HF is associated with an immune scar. Comparing healthy elderly individuals and HF elderly patients, we found that, despite unaltered homeostatic mechanisms, CD4+ and CD8+ T-cells counts were impacted early post fracture. However, T-cells subsets returned to normal level at the time of hospital discharge. Moreover, this acute event results in a transient hyper-inflammation.

Importantly, we show that blood level of a molecule released by activated macrophages is predictive of one-year mortality in elderly HF patients.

In conclusion, HF patients exhibit transient changes in innate and adaptive immunity. Meanwhile, profound acute inflammatory processes measurable pre-surgery occur, which are predictive of long-term survival after HF surgery. We propose to use the identified predictive biomarker to improve follow-up of patients at risk of early death.

HOW DOES THE SILENCING OF THE INFLAMMATION MEDIATOR GENE: FAT10, EXTEND LIFESPAN IN MICE?

A. Canaan, C. Arjona, B. Gulez, M. Seay, J. Zhang, O. Henegariu, R. Garcia Milian, *Yale School of Medicine, New Haven, Connecticut*

FAT10 knockout mice display 50% reduction in total body fat and 20% increase in median and maximal lifespan, in both sexes. It is still unclear how FAT10 silencing affects aging and metabolism. Our current studies provide novel mechanistic insights for the role of this inflammation related gene - FAT10 in aging and metabolism.

The FAT10 gene encodes a di-ubiquitin homolog that is found only in vertebrates and is expressed at very low levels in most tissues, but can be strongly induced by inflammatory stimuli. FAT10 knockout mice develop normally, but from an early age these mice have substantially less adipose tissue. Our studies have demonstrated that they are metabolically more active than their controls. FAT10 silencing in 3T3-L1 cells resulted in reduced adipogenesis, *in vitro*. RNA-Sequence analysis of these cells revealed major differential gene expressions associated with adipocyte metabolic functions and growth. Pathway Analysis combined with TRANSFAC analysis identified new regulation of FAT10 by adipogenic transcription factors. In addition to the reduced adipogenesis, FAT10 silencing increases various stem cell populations including mesenchymal and hematopoietic stem cells.

FAT10 thus provides a potentially new window into the mechanisms of mammalian aging. The pleiotropic nature of FAT10's action provides several avenues to probe its anti-aging action and ultimately an opportunity to identify drug-gable targets.

THE NLRC4 INFLAMMASOME CONTRIBUTES TO BRAIN INFLAMMAGING

J. de Rivero Vaccari¹, N.H. Mejias¹, F. Travascio², 1. Neurological Surgery, University of Miami, Miami, Florida, 2. University of Miami Department of Industrial Engineering, Miami, Florida

Inflammation is a natural part of aging in a process known as inflammaging. Inflammaging has been associated with deleterious outcomes in the aging brain. It is believed that inflammaging precedes the onset of neurodegenerative

diseases such as Alzheimer's disease and Parkinson's disease. The inflammasome is an arm of the innate immune response involved in the activation of the inflammatory caspase-1 and the processing of the pro-inflammatory cytokines interleukin (IL)-1b and IL-18. We have previously shown that inflammasome contributes to the inflammatory response in the central nervous system after brain and spinal cord injury as well as stroke. In addition, we have shown that inflammasome inhibition in the aging brain results in improved cognitive outcomes. In this study we analyzed the brain of young (3 months old) and aged (18 months old) mice for the expression of inflammasome proteins. Our findings indicate that the inflammasome proteins NLRC4, caspase-1, ASC, and IL-18 are elevated in the cytoplasm of cortical lysates in aged mice when compared to young. Similarly, in the cytoplasmic fraction of hippocampal lysates in aged mice, we found an increase in NLRC4, caspase-1, caspase-11, ASC and IL-1b. Moreover, ASC is involved in the cell death mechanism of pyroptosis. Interestingly, the pyroptosome is elevated in the brain of aged mice. Taken together, our data indicate that the NLRC4 inflammasome contributes to brain inflammaging and that pyroptosis contributes to cell death in the aging brain; thus highlighting the inflammasome as a novel therapeutic target for the treatment of brain inflammaging.

AUTOPHAGY ACTIVITY IS LINKED TO ELEVATED ER-STRESS AND INFLAMMATION IN AGING ADIPOSE TISSUE

A.K. Ghosh, T. Mau, M. O'Brien, R. Yung, *Internal Medicine, University of Michigan, Ann Arbor, Michigan*

Adipose tissue dysfunction in aging is associated with inflammation, metabolic syndrome and other diseases. We propose that impaired protein homeostasis due to compromised lysosomal degradation (micro-autophagy) might promote aberrant ER stress response and inflammation in aging adipose tissue. Using C57BL/6 mouse model, we demonstrate that adipose tissue-derived stromal vascular fraction (SVF) cells from old (18–20 months) mice have reduced expression of autophagy markers as compared to the younger (4–6 months) cohort. Elevated expressions of ER-stress marker CHOP and autophagy substrate SQSTM1/p62 are observed in old SVFs compared to young, when treated with either vehicle or with thapsigargin (Tg), an ER stress inducer. Treatment with bafilomycin A1 (Baf), a vacuolar-type H (+)-ATPase, or Tg elevated expressions of CHOP, and SQSTM1/p62 and LC-3-II, in 3T3-L1-preadipocytes. We also demonstrate impaired autophagy activity in old SVFs by analyzing increased accumulation of autophagy substrates LC3-II and p62. Compromised autophagy activity in old SVFs is correlated with enhanced release of pro-inflammatory cytokines IL-6 and MCP-1. Finally, SVFs from calorie restricted old mice (CR-O) have shown enhanced autophagy activity compared to *ad libitum* fed old mice (AL-O). Our results support the notion that diminished autophagy activity with aging contributes to increased adipose tissue ER stress and inflammation.

SESSION 3965 (SYMPOSIUM)

THE THERAPEUTIC BENEFIT OF ACTIVITY IN DEMENTIA CARE: EVIDENCE ACROSS COUNTRIES AND SERVICE CONTEXTS

Chair: N. Regier, *Johns Hopkins University, Kensington, Maryland*

Co-Chair: L.N. Gitlin, *School of Nursing, Johns Hopkins University, Baltimore, Maryland*

Dementia is a public health crisis that affects a staggering 47.5 million people worldwide and will quadruple in prevalence between 2010 and 2050. There is currently no imminent cure or effective pharmacotherapy, and dementia-related behavioral symptoms carry profound costs and consequences such as caregiver burden and long-term care placement. Consequently, it is vital to identify interventions that minimize behavioral occurrences and improve or sustain quality of life. One promising non-pharmacological intervention is engagement in meaningful activity, shown to increase positive emotions and attitudes toward caregivers, improve performance in activities of daily living, quality of life and well-being, and decrease neuropsychiatric symptoms. This symposium examines the evidence for and utility of activity as a therapeutic modality in dementia care in different countries and service contexts. Aravena and Gajardo will discuss the benefits of activity implementation within a public center supporting persons with dementia and their caregivers in Chile, the Kintun Program. Novelli et al., will report the outcomes of a randomized trial of a home-based activity program in Brazil on neuropsychiatric symptoms and caregiver well-being. Mamo et al. will present the therapeutic benefits of activity within a United States center for hearing-impaired persons with dementia. Regier and Gitlin examine activity engagement as a predictor of well-being, functional independence, cognitive changes, and mortality in persons with dementia participating in the National Health and Aging Trends Study. Taken as a whole, this symposium will highlight implementation challenges and cultural adaptations to optimize the benefits of activity as a therapeutic modality in dementia care.

ENGAGEMENT IN MEANINGFUL ACTIVITY AND WELL-BEING, COGNITION, AND MORTALITY IN PERSONS WITH DEMENTIA

N. Regier, L.N. Gitlin, *Center for Innovative Care in Aging, Johns Hopkins University, Kensington, Maryland*

Per activity theory, older adults who remain engaged in the world around them experience increased levels of psychological and physical well-being. Activity engagement is particularly important for older adults with dementia, as it has been shown to decrease depressive symptomatology, improve performance of daily activities, improve quality of life, foster positive attitudes toward caregivers, and decrease challenging behaviors. Using data from the second (T1) and third (T2) rounds of the National Health and Aging Trends Study (NHATS), we examined activity engagement as a

predictor of well-being, functional independence, cognition, and mortality in participants with dementia through logistic regression models. Engagement at T1 was significantly associated with higher well-being, greater independence of complex daily activities, better cognition, and decreased mortality at T2. Our findings show that meaningful activities may decrease mortality even in the face of chronic health conditions and dementia diagnosis, and can enhance quality of life, well-being, and cognition.

THE EFFECTS OF THE BRAZILIAN VERSION OF THE TAILORED ACTIVITY PROGRAM (TAP-BR) IN DEMENTIA CARE

M. Novelli¹, S. Machado¹, G. Lima¹, L. Cantatore¹, B.P. Sena¹, R.S. Rodrigues¹, L.N. Gitlin², M.S. Yassuda³,
1. *Management and Health Care Department, Federal University of São Paulo, Santos, Sao Paulo, Brazil*, 2. *Johns Hopkins University, Baltimore, Maryland*, 3. *University of Sao Paulo, Sao Paulo, Brazil*

Objectives: Evaluate the effects of the TAP-Br on behavioral and psychological symptoms of dementia and caregiver burden. **Methods:** In a prospective study 30 dyads (patient and caregiver) were randomized to treatment (EG -experimental group – n=15) or wait-list (CG - control group – n=15). Dyads were evaluated at baseline and after 4 months (trial endpoint). The dyads were recruited from the community in Santos. We carried out comparative analyzes (repeated measures ANOVAs with time (pre versus post-test)) between the groups and calculated the effect size of the intervention. **Results:** At posttest, EG caregivers reported reduction in the frequency/intensity ($p=.001$; Cohen's $d = 0.86$) and number of behaviors ($p=.001$; Cohen's $d = 0.90$), reduced caregivers' distress ($p=.001$; Cohen's $d=0.87$) and improved caregivers' quality of life ($p=.001$, Cohen's $d = 0.60$). **Conclusion:** Results suggest the TAP-Br is an effective strategy to support dementia caregivers.

THE KINTUN PROGRAM: LESSONS FOR THE DESIGN OF ACTIVITIES FOR PERSONS WITH DEMENTIA IN CHILE

J.M. Aravena², J. Gajardo², 2. *INTA University of Chile, Santiago, Chile*, 2. *University of Chile, Santiago, Chile*

The Kintun Program is the first public center for the support of people with dementia and their carers in Chile. The program involves different components such as day care center, home visits and caregiver training. Engagement in daily activities and situations is one of the main outcomes of the program, therefore the design and implementation of activities is a major challenge. This symposium will describe the embedded rationale, learnings and recommendations from the process of design and implementation of activities at the center. Three key stages can be described in the history of the Kintun Program since 2013 until today. These stages reflect a progression from an initial structured set of group activities towards a tailored and situated frame for participation in activities. Results show benefits in the reduction of behavioral symptoms, improvement in levels of function and improved caregiver's perception of the person with dementia's participation at home.

IMPROVING ACCESS TO ACTIVITIES IN A GROUP CARE SETTING BY ADDRESSING AGE-RELATED HEARING LOSS

S. Mamo, N. Reed, M. McNabney, E. Oh, F. Lin, *Johns Hopkins University, Baltimore, Maryland*

Untreated age-related hearing loss can exacerbate dementia-related problem behaviors and interfere with a person's ability to listen, follow instructions, and communicate, especially in a group care setting. The intervention presented in this session aims to improve access to activity participation by improving the listening environment, providing staff training in communication strategies, and using over-the-counter amplification on an individual basis to support adults with both hearing and cognitive impairments. After addressing the physical and social context (i.e., room acoustics and staff training), target individuals were offered an amplification device during activities and meals in a group care setting. The primary outcomes focused on participation, engagement, and communication behaviors that were directly observed in the activity hall. This approach to addressing hearing loss in the group care setting allows for on-site staff to support improved communication and in turn, enhance activity participation among at risk individuals.

SESSION 3970 (SYMPOSIUM)

EMOTION, ATTENTION, AND AGING: GOING BEYOND THE POSITIVITY EFFECT

Chair: H.H. Fung, *Chinese University Hong Kong, Hong Kong*

Discussant: U. Kunzmann, *Leipzig University*

For a number of years, the literature on attention toward emotional stimuli across age has been dominated by the positivity effect – the postulate that older adults cognitively process positively valenced stimuli to a greater extent than neutral or negatively valenced stimuli, compared with younger adults. This symposium goes beyond exploring whether this phenomenon exists to identifying its boundary conditions and functions, as well as other age-related differences in attention not covered by the positivity effect. First, Lee, Ngo, Fung, Isaacowitz and Ho found the positivity effect among US Americans, but only under sadness. Chinese did not show the positivity effect. This suggests that the positivity effect may serve emotion-regulatory functions (i.e. seeking positive stimuli under sadness) among US Americans who value positive emotions but not among Chinese who do not. Then, Sands and Isaacowitz examined age differences in the temporal relationship between attention and physiological reactivity. Their findings suggest that the positivity effect may also be used to regulate physiological arousal differentially with age. Next, Fung, Lu and Isaacowitz found an age-related bias in attention that could not be explained by the positivity effect. They found that regardless of the valence of the stimuli, older adults who valued eudaimonic goals (but not those who valued hedonic goals) attended more to close others' facial expressions than did younger adults. Finally, Ngo and Isaacowitz compared the influences of contextual information and stereotypes on age differences in emotion perception. Ute Kunzmann will discuss the theoretical and practical implications of these papers.

AGE DIFFERENCES IN ATTENTION UNDER SADNESS: COMPARISONS BETWEEN CHINESE AND U.S. AMERICANS

J. Lee¹, N. Ngo², H.H. Fung¹, D.M. Isaacowitz², Y. Ho¹, 1. *Department of Psychology, The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 2. *Northeastern University, Boston, Massachusetts*

Previous literature have found positivity effects in age-related cognition, such that with age, people show increased preference in processing positive stimuli relative to negative or neutral stimuli. Yet, in cross-cultural studies the findings are mixed. This study utilized eye-tracking techniques to record visual fixation towards emotional information when participants were under sadness induction or not. Younger and older participants from Hong Kong (n = 119; Young: 19 – 26 years; Old: 64 – 81 years) and US (n = 111; Young: 18 – 23 years; Old: 60 – 87 years) viewed pictures that differed in valence (positive, negative, neutral) and cultural relevance (US, Chinese culture). Results revealed that older participants in both cultures showed decreased fixation duration towards negative pictures compared to younger participants. When experimentally induced into sad mood, US older participants showed increased attention towards positive pictures whereas Hong Kong older participants did not. The findings suggest that age-related differences in attention under laboratory-induced affect may be moderated by one's cultural background.

AGE DIFFERENCES IN THE USE OF ATTENTION TO REGULATE PHYSIOLOGICAL AROUSAL DURING NEGATIVE AFFECT

M. Sands, D.M. Isaacowitz, *Northeastern University, Boston, Massachusetts*

Older adults often exhibit positivity effects in attention to emotional stimuli. In older age, these positivity effects are linked to better moods suggesting that directing attention away from negative and towards positive emotional content may be an effective emotion regulation strategy for older individuals (Isaacowitz, 2012). However, no studies have examined how positive looking patterns relate to the regulation of physiological responses. In this study, 51 younger (18–25) and 49 older adults (65–75) watched six highly-activating negative emotional videos while peripheral physiology and eye-tracking were recorded. As in prior research, older adults fixated less than younger adults on the most negative visual aspects, $p < .021$. Older adults were also less physiologically reactive than younger adults, $ps < .05$. Additionally, we examine age differences in the temporal relationship between attention and physiological reactivity. This study suggests that attention is used to regulate physiological arousal differentially with age.

PURSUING EUDAIMONIC GOALS MODERATED AGE DIFFERENCES IN ATTENDING TO OTHERS' EMOTIONS

H.H. Fung¹, M. Lu¹, D.M. Isaacowitz², F. Zhang¹, 1. *Chinese University of Hong Kong, Hong Kong, Hong Kong*, 2. *Northeastern University, Boston, Massachusetts*

In this study, 59 younger (aged from 18 to 24) and 66 older participants (aged from 58 to 84) were presented with different emotional expressions (happy, sad, and angry),

and the closeness of the facial stimuli was manipulated by telling participants that the targets shared many (little) similarities with them. Participants' values on eudaimonic (hedonic) goals and whether they regarded happiness (meaning) as important were also measured. Results revealed that regardless of valence of the facial expressions, among participants who didn't value eudaimonic goals, older adults generally paid less attention to others' emotions than did younger adults; however, among participants who valued eudaimonic goals, older adults did not differ from younger adults in attending to non-close others' emotions, and even demonstrated more attention to close-others' emotions than younger adults. These results suggested that eudaimonic goals (but not hedonic goals) motivate older adults to attend to others' emotional expressions.

AGE DIFFERENCES IN CONTEXTUAL ATTENTION IN EMOTION PERCEPTION OF STEREOTYPED TARGETS

N. Ngo^{1,2}, D.M. Isaacowitz¹, 1. *Northeastern University, Boston, Massachusetts*, 2. *Chinese University of Hong Kong, Hong Kong, Hong Kong*

Older adults have been shown to be more biased towards context in visual attention. In emotion perception, contextual attention to incongruent context can lead to inaccurate labelling of target facial expressions. However, older adults, due to cognitive and social factors, have also been shown to display more stereotyping behaviors. If the target of emotion perception belongs to a strongly stereotyped social group, such as African American being stereotyped as being angry, older adults might rely more on stereotypes and attend less to the visual context. In this study, White younger (n = 51) and older adults (n = 51) judged facial expressions of White and Black individuals embedded in emotionally congruent and incongruent context. Contrary to initial hypotheses, older adults were influenced by context regardless of the target's race, and were more so than younger adults, especially when the target was angry in a disgust context.

SESSION 3975 (SYMPOSIUM)

UNDERSTANDING THE COMPLEX ETIOLOGY OF SUBJECTIVE HEALTH: THE IGEMS CONSORTIUM

Chair: D.G. Finkel, *Indiana University Southeast*
Co-Chair: C.E. Franz, *University of California San Diego*
Discussant: M.K. Jylha, *University of Tampere, Tampere, Finland*

Deceptive in its simplicity, assessment of subjective health has generated hundreds of papers as researchers attempt to uncover the components that contribute to judgments about personal health. The fact that subjective health predicts mortality and a variety of other health outcomes above and beyond objective health supports the importance of subjective health and generates questions about mechanisms and etiologies. Recent analyses suggest that these mechanisms can vary by age, gender, and even the questions used to assess subjective health. Using data available from the Interplay of Genes and Environment Across Multiple Studies (IGEMS) Consortium, the primary aim of the current symposium is to deepen our understanding of the etiology of

subjective health by presenting several different methods for investigating the relevant issues. The first paper focuses on individuals to examine the relationship between subjective health, multi-morbidity, activities of daily living, and social networks. The next two papers employ the methods of twin analysis to examine genetic and environmental influences on subjective health. The second paper examines the extent to which shared genetic or environmental factors explain the relationship between subjective health and physical health. The third paper examines sex differences in longitudinal trends in genetic and environmental influences on subjective health. The fourth paper moves beyond genetic variance to focus on individual genes. Using available genotyping data to calculate polygenic risk scores, the analysis assessed the degree to which variability in physical health and subjective health could be explained by variability in genes underlying subjective wellbeing.

SELF-RATED HEALTH OVER TIME: THE ROLE OF CHRONIC DISEASE, PHYSICAL FUNCTION AND SOCIAL NETWORKS

A.D. Foebel¹, N.L. Pedersen¹, M. Ernsth Bravell², 1. *Karolinska Institutet, Stockholm, Sweden*, 2. *Jönköping University, Jönköping, Sweden*

Poor self-rated health (SRH) among older people is an important predictor of formal care and mortality. This study explored the association between SRH and chronic diseases, physical function and social networks over 20 years.

Data from 3 questionnaire waves (1987, 1990, 2007) of the Swedish Adoption/Twin Study of Aging were used and 1065 individuals older than 55 years at baseline were included. SRH was measured as good or reasonable/bad. Physical function and number of chronic diseases were measured using 5 activities of daily living (ADLs) and a modified Cumulative Illness Rating scale, respectively. Social networks were measured by the number of relatives, friends, neighbors and caregivers.

Factors associated with SRH changed over time, but did not differ by sex. Fewer diseases, better ADLs and having more friends and a caregiver were associated with better SRH at baseline and 3 years. At 20 years, older age and diseases predicted poorer SRH.

GENETIC AND ENVIRONMENTAL INFLUENCES ON MEDICAL BURDEN AND SUBJECTIVE HEALTH IN MIDLIFE

C.E. Franz, A. Yao, M. Panizzon, W.S. Kremen, *University of California San Diego, La Jolla, California*

Using data from the Vietnam Era Twin Study of Aging, a community dwelling sample of middle aged men, we analyzed the extent to which shared genetic or environmental factors explain the relationship between medical burden (CIRS-IGEMS) and two measures of subjective health from the SF36: physical (SPH) and mental health (SMH). CIRS-IGEMS represents a count of major health conditions. Participants (N=1237) were male twins age 56 (range 51–60). The phenotypic correlation between CIRS-IGEMS and SPH was $r=.34$; for CIRS-IGEMS and SMH $r=.20$.

Heritabilities ranged from .32 to .35, with the remaining variance accounted for primarily by unique environmental influences. The genetic correlation between CIRS-IGEMS and SPH was .70; .41 for CIRS-IGEMS and SMH. This indicates moderately strong shared genetic influences between health counts and subjective health. Medical burden moderated genetic influences on SMH (but not SPH) with higher heritability among those with more illness. Further analyses examine associations over time.

SEX DIFFERENCES IN LONGITUDINAL CHANGES IN GENETIC AND ENVIRONMENTAL INFLUENCES ON SUBJECTIVE HEALTH

D.G. Finkel¹, I. Consortium², 1. *Indiana University Southeast, New Albany, Indiana*, 2. *University of Southern California, Los Angeles, California*

Previous investigations of genetic and environmental contributions to measures of subjective health (SH) have reported generally moderate heritability (25–30%), though estimates can vary widely across studies and measures. In the few twin studies to investigate gender differences in heritability of SH, results are equivocal. A recent analysis of age moderation of heritability of SH in a cross-sectional sample of 12,900 twins identified significant gender by age effects. The few longitudinal twin analyses of SH suggest moderate increases in heritability with age, but gender differences were not examined. The current analysis examines sex differences in longitudinal changes in genetic and environmental influences on measures of SH in a sample of 7372 twins (aged 26–102) with up to 8 waves of measurement (mean = 3.1). Latent growth curve modeling indicated significant sex differences in trajectories of change with age and in genetic and environmental contributions to change. Results also differed across measures.

CAN GENETIC VARIANTS UNDERLYING SUBJECTIVE WELL-BEING PREDICT AGE-RELATED HEALTH PROBLEMS?

M.A. Mosing, N.L. Pedersen, *Karolinska Institute, Stockholm, Sweden*

Single item measures of Subjective well-being (SWB) are often superior to more objective clinical assessment for predicting an individuals' morbidity and mortality, suggesting that SWB is a powerful predictor of future health. Little is known about the genetic architecture underlying this link between SWB and healthy aging. Recently, genetic polymorphisms underlying SWB were identified (rs3756290, rs2075677, and rs4958581) using genome-wide data of more than 298,000 individuals. Based on these findings we derived polygenic risk-scores to predict age-related health problems as measured by self-rated health (SRH) and the Cumulative Illness Rating Scale (CIRS). CIRS scores, SRH as well as genetic information were available in 8,000 individuals from the IGEMS consortium. The observed CIRS and SRH scores were regressed on the polygenic risk-score to assess the degree to which variability in CIRS and SRH could be explained by variability in genes underlying SWB. Findings and implications of these analyses will be discussed.

SESSION 3980 (SYMPOSIUM)

GSA BALTES FOUNDATION AWARD LECTURE: THE ADVENTURE OF HEALTHY AGING: FROM POPULATION HEALTH TO LIFE-SPAN PSYCHOLOGY

Chair: S. Wurm, *Friedrich-Alexander-University Erlangen-Nuernberg (FAU), Nuernberg, Germany*

A common desire among all people is to live long and healthy, yet many individuals experience health-related losses, not only in very old age but also from midlife on. Starting from epidemiological findings on population health, the presentation will go into different predictors of healthy aging. Based on the International Classification of Functioning, Disability, and Health (ICF), three questions will guide the presentation: How do people contribute to how healthily they age? Do people age differently depending on which region they live in? And finally, what can we do to support older people in their endeavor to age healthily? Based on large-scale survey data as well as longitudinal and intervention studies, I will give an overview of my own findings on the role that personal resources can play in the health of an aging society – resources such as individual views on aging, strategies of self-regulation and adaptation (response shift) – and also the role regional resources such as district-level primary care supply can play. Finally, the presentation will point to some open questions that should be addressed in future research.

SESSION 3985 (SYMPOSIUM)

NEW DIRECTIONS IN SOCIAL RELATIONS ACROSS AGE AND OVER TIME

Chair: T.C. Antonucci, *University of Michigan, Ann Arbor, Michigan*

Co-Chair: K.J. Ajrouch, *Eastern Michigan University*

In this symposium we examine social relations across age and over time. Using data from this three wave (Wave 1 = 1995; Wave 2 = 2005; Wave 3 = 2015) study of the Detroit Metropolitan area, we consider different aspects of social relations including structure, quality and influence on health. Wylie and Antonucci consider contrasting theories of social relations: the Convoy Model, the Strength and Vulnerability (SAVI) model and the Socioemotional Selectivity Theory (SST), using the work-retirement experience as illustrative. Their findings, of more proximate, more negative, and less positive relations among workers compared to retirees, suggest each theoretical perspective offers explanatory insights. Manalel and Ajrouch examine the role of relationship quality and health. Positive relationship quality is uniformly associated with better health. Negative relationship quality is associated with more depressive symptoms, an association that is stronger among those with low contact frequency. Birditt and Sherman used monthly reports of social relations for up to one year found that older people had fewer negative relationships than younger people and that their well-being was less likely to be affected by these negative relationships. Finally, Tighe and Webster consider the longitudinal data and examine four income trajectories, decreasing, stable, slightly increasing, significantly increasing incomes. They find no differences in life satisfaction across the four trajectories while slightly and

IAGG 2017 World Congress

significantly increasing incomes are associated with better health. Interestingly, only slightly increasing incomes are associated with increased happiness. These findings suggest the importance of a more nuanced approach to the study of social relations.

RELATIONSHIP QUALITY AND HEALTH IN ADULTHOOD: THE ROLE OF SOCIAL CONTACT

J. Manalel, K. Ajrouch, *University of Michigan-Ann Arbor, Ann Arbor, Michigan*

Research has recognized the positive and negative effects of relationship quality on health and well-being. The extent to which these effects are contingent upon other social network characteristics is less understood. We examined links between relationship quality, health and well-being, and the effects of various contact frequency types on these associations. In a sample of adults (age range=36–99) from the Social Relations and Health Study (n=399), multiple regression analyses revealed that higher levels of positive relationship quality were associated with fewer depressive symptoms, greater life satisfaction, and greater happiness. Higher levels of negative relationship quality were associated with more depressive symptoms. Furthermore, the link between negative relationship quality and depressive symptoms was buffered by in-person contact frequency such that it was observed only for respondents who reported low levels of in-person contact. These findings further specify the independent and interactive effects of structural and functional aspects of social networks.

LESS IRRITATING AFTER ALL THESE YEARS: NEGATIVE RELATIONS AND LINKS WITH WELL- BEING ACROSS ADULTHOOD

K. Birditt, C. Wexler Sherman, T.C. Antonucci, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Negative relationships are associated with poor health, chronic illness, and mortality. Yet, we know little about the dynamics of negative aspects of relationships within individuals over time, how those experiences vary by age and the implications of those relationships for well-being. A total of 615 participants (ages 18 to 97; M= 57; 64% women) from the *Social Relations and Health Study* completed monthly web surveys for up to 12 months. Each month they reported negative relationship quality with their closest network members and multiple dimensions of well-being (positive affect, negative affect, self-rated health and sleep). Multilevel models revealed that older individuals reported less negativity in their relationships than younger people. Further, older individuals' well-being was less detrimentally affected by negativity than younger adults' well-being. Consistent with gerontological theories of emotion regulation, older individuals appear better able to regulate the negative aspects of their relationships.

THE INFLUENCE OF SOCIOECONOMIC STATUS ON HEALTH AND WELL-BEING: COMPARING DIVERSE TRAJECTORIES

L. Tighe, N.J. Webster, *University of Michigan, Ann Arbor, Michigan*

Previous research indicates that health and well-being varies by socioeconomic status (SES). This study expands upon existing research by investigating the association between

changes in SES (i.e., income) and health and well-being. Data are from the three-wave (1992; 2005; 2015) longitudinal Social Relations Study, which included a lifespan sample (age 13+; N=1451) from metro-Detroit, MI. Four longitudinal income trajectories were documented from Wave 1 to 3: significantly decreasing income, stable, slightly increasing, and significantly increasing. Individuals with slightly and significantly increasing income reported significantly better health than individuals experiencing other income changes. Individuals with slightly increasing income were significantly happier compared to those with other income trajectories. Interestingly, life satisfaction did not differ across the four income trajectories. Further analyses will examine longitudinal trajectories of education, financial well-being, and a composite SES indicator. Findings highlight that SES fluctuates over time and these changes have important implications for health and well-being.

WORK-RETIREMENT TRANSITIONS AND SOCIAL RELATIONS

W. Wan¹, T.C. Antonucci², 1. *Oregon Health and Science University, Portland, Oregon*, 2. *University of Michigan, Ann Arbor, Michigan*

The Convoy Model of Social Relations posits that changes in social networks have important implications for social support, health, and well-being. The Social Relations Study (Waves 1 to 3) provides a unique opportunity to examine changes in social networks over 20 years. This study tests the Strength and Vulnerability Integration (SAVI) model and the Socioemotional Selectivity Theory (SST) as competing theories to examine changes between work status (working versus retired) and network characteristics. Bivariate analyses revealed that those who remained working (n=251) from Wave 1 to Wave 3 had more promixate networks (73.5%), more negative networks (M=2.2; t=3.1, p<.01), and less positive networks (M=4.7; t=-3.5, p<.001) than those who retired (n=154; 66% promixate networks; M=1.9 negative networks; M=4.8 positive networks). Findings are discussed using the Convoy Model to elaborate ways in which the SAVI and SST frameworks advance a lifespan perspective on roles and social relations.

SESSION 3990 (SYMPOSIUM)

OLDER MEN'S RESILIENCE AND MENTAL HEALTH

Co-Chair: K.M. Bennett, *University Of Liverpool, United Kingdom*

E.H. Thompson, *College of the Holy Cross, Broadview Heights, Ohio*

Discussant: B. deVries, *San Francisco State University, San Francisco, California*

Resilience is the process of negotiating, managing and adapting to significant sources of stress or trauma, and the process is facilitated or hindered by masculinities as much as individuals' resources and access to community resources. Our objective is to assess what similarities and differences likely exist among older men in terms of their resilience. The symposium brings together papers that have looked at older men's experiences from different parts of the world and different life circumstances. Bennett and her colleagues assess

the resilience among men carers from the vantage of an ecological framework and discuss how the men can be supported in their communities. Heisel reviews a novel group intervention for men transitioning to retirement and discusses how it seems to bolster their resilience. Understanding that 20 veterans daily die of suicide in the US, Jahn and Crosby report on the ways the social and internalized stigmas of men seeking help for distress is a troubling source of suicide risk among older vets. King and Richardson draw on a life course perspective to assess the bearing of the early coming out experience on the older men's resilience and mental health. Tate and colleagues identify distinct predictors of longevity at different life stages among RCAF vets who survived to at least age 90. de Vries' discussion finds the threads among the papers on the bearing of masculinities to older men's resilience and mental health. Participants will better understand how the diversity of masculinities can facilitate or hinder resilience among older men.

HEALTH-RELATED RESOURCES: REFINING THE ECOLOGICAL MODEL OF RESILIENCE FOR OLDER MALE CARERS

K.M. Bennett, L. Cropper, W. Donnellan, L. Roper, *University of Liverpool, Liverpool, United Kingdom*

Increasing numbers of older men are informal carers. Whilst caregiving is stressful, some carers can be classified as resilient: able to adapt or bounce back in the face of adversity (Windle, 2011). There is growing interest in resilience amongst these men, and in the factors that contribute to resilience. We analyse data from twenty-five in-depth interviews of older men who are caring informally for people with dementia, brain injury and who are at the end-of-life. Utilising the ecological framework (Windle & Bennett, 2011), we examine factors promoting or hindering resilience. We identify individual, community and societal level resources, focusing on biological resources, health behaviors, social support and health-related services and social policy. We discuss the methodological challenges in researching resilience, these include: operationalizing resilience and identifying factors in the ecological system. We argue that male carers may be supported to become resilient through community and societal contributions.

MAN'S SEARCH FOR MEANING...IN RETIREMENT: FINDINGS FROM THE MEANING-CENTERED MEN'S GROUP (MCMG) STUDY

M. Heisel, 1. *Western University, London, Ontario, Canada*, 2. *Lawson Health Research Institute, London, Ontario, Canada*, 3. *University of Rochester Center for the Study and Prevention of Suicide, Rochester, New York*

Older men have the highest suicide rates worldwide, yet few interventions have been shown effective in reducing suicide risk in middle-age or older men (Lapierre et al., 2011). We developed and tested a novel, 12-session Meaning-Centered Men's Group (MCMG) intervention with 100-120 cognitively-intact, community-residing men 55 years or older who were struggling to adjust to retirement, a transition associated for some with increased suicide risk. The intervention draws on research demonstrating negative associations of Meaning in Life (MIL) with depression and suicide ideation (Heisel & Flett, 2014, 2016), and aims to build camaraderie through

group discussions about finding meaning in work, leisure, relationships, and generativity. This paper summarizes findings from this on-going study, including controlled analyses comparing MCMG with a current-events discussion group, and experiences disseminating MCMG to distant sites. Discussion will focus on helping men adjust meaningfully to retirement and preventing the onset or exacerbation of suicide ideation.

OLDER MALE VETERANS' RELATIONSHIPS, HELP-SEEKING ATTITUDES, AND SUICIDE RISK FACTORS

D. Jahn^{1,2}, E. Crosby², 1. *University of Maryland School of Medicine, Baltimore, Maryland*, 2. *VA Capitol Health Care Network (VISN 5) Mental Illness Research, Education, and Clinical Center (MIRECC), Baltimore, Maryland*

Older men die by suicide at very high rates (CDC, 2016), and may be particularly at risk for suicide due to a lack of help-seeking (Berger et al., 2013; Crabb & Hunsley, 2006). This study's aim was to examine relations among older men's relationships, attitudes toward help-seeking, and thoughts of suicide. In 30 male Veterans (ages 65+) with mental health diagnoses, social stigma regarding professional help-seeking, as well as social stigma and internalized stigma regarding informal help-seeking, were correlated with suicide ideation. Analyses indicated that social and internalized stigma regarding informal help-seeking mediated the relation between perceived hostility in personal relationships and suicide ideation. Additionally, social stigma regarding professional help-seeking mediated the relation between perceived healthcare provider stereotypes regarding mental health consumers and suicide ideation, though internalized stigma did not. These results suggest that reducing stigma may be important for improving help-seeking among older men to reduce suicide risk.

FAMILY ACCEPTANCE, RESILIENCE AND PHYSICAL AND MENTAL HEALTH OF MIDLIFE AND OLDER GAY MEN

S. King, V.E. Richardson, *The Ohio State University, Columbus, Ohio*

An association between previous coming out experiences and current depression, suicide, and overall physical and mental health was observed in this national, cross-sectional study of 316 older gay men. The older men who retrospectively reported having experienced high levels of stress when coming out to parents and other family members evidenced worse physical health, higher internalized homophobia, lower resilience, weaker internal health locus of control, and more substance abuse compared to older gay men who reported experiencing minimal family stress when coming out. The findings underscore the importance of using a life course framework and Meyer's minority stress theory to understand older gay men's mental and physical well-being. These early experiences evidently affect older men's health throughout their lives although longitudinal studies are needed to confirm these findings. Mental health interventions that address these critical events are discussed.

PREDICTORS OF LIVING TO AGE 90 AMONG THE MEN OF MANITOBA FOLLOW-UP STUDY

R.B. Tate¹, A. Swift¹, P. St. John¹, E.H. Thompson², 1. *University of Manitoba, Winnipeg, Manitoba, Canada*, 2. *College of the Holy Cross, Worcester, Massachusetts*

A cohort of 3,983 young male aircrew recruits from the Royal Canadian Air Force has been followed with medical examinations and regular contact since 1948. In this cohort 98% were born in 1925 or earlier, and hence had the opportunity to live to age 90; 745 (19%) did. A history of childhood illnesses was recorded at entry to the study, mean age 30 years. EKG abnormalities, anthropometric measurements, and disease diagnoses were recorded at routine physical examinations over 68 years of follow-up. Physical activity was surveyed at ~50 years of age, and physical and mental functioning were documented on annual surveys since 2000. Smoking history, blood pressure and body weight at entry; absence of smoking, major ekg abnormalities and excess weight at mid-life; and continuity in mental functioning in later life distinguish the men living to age 90. The life course perspective is invaluable for long-term research.

SESSION 3995 (PAPER)

MILITARY SERVICE AND THE LIFE COURSE

TRANSGENDER OLDER ADULTS—MILITARY SERVICE: IDENTITY STIGMA AND MENTAL HEALTH CHANGES OVER TIME

C.P. Hoy-Ellis¹, C. Shiu², H. Kim², K. Sullivan², A. Sturges², K.I. Fredriksen-Goldsen², 1. *College of Social Work, University of Utah, Salt Lake City, Utah*, 2. *University of Washington, Seattle, Washington*

Depression is a leading cause of disability globally. Transgender older adults experience depression and serve in the U.S. military at disproportionality high rates. Military service has been implicated in mental health outcomes, yet there is scant empirical evidence relating military service to transgender mental health, particularly in relation to identity stigma. Cross-sectional data has limited our understanding of the directional relationship between identity stigma and mental health. Using longitudinal data we examined temporal relationships between these factors among transgender older adults with and without prior military service. We used weighted multivariate linear models to evaluate the relationships between previous military service, identity stigma, depressive symptomology, and psychological health related quality of life (HRQOL) among a subsample of transgender older adults ($n = 183$) from Waves 1 and 2 of the Aging with Pride: National Health, Aging, Sexuality & Gender Study. Over time, Identity stigma was significantly associated with HRQOL only for those without prior military service. Regardless of military service history, changes in depressive symptomatology predicted changes in HRQOL.

The U.S. recently joined 18 other countries in allowing transgender individuals to serve openly in the military. This study provides new insights into the roles of military service and identity stigma in the long-term mental health of transgender older adults, and highlights within-group heterogeneity. As such, it contributes to promoting resilience and better mental health outcomes for both of transgender older adults and current and future transgender service members

– tomorrow’s transgender older adults. Implications for practice, policy, and research are discussed.

IMPACT OF MILITARY SERVICE AND ITS TIMING ON MARITAL HISTORY AND FECUNDITY AMONG U.S. WWII VETERANS

M. Mackintosh¹, E.A. Willis¹, S. Edland², L.J. Launer³, L.R. White¹, 1. *Pacific Health Research and Education Institute, Brentwood, California*, 2. *University of California, San Diego, San Diego, California*, 3. *National Institute on Aging, Bethesda, Maryland*

Military service can have important life course effects on veterans’ marital history and family structure. More specifically, research shows that the timing of entry and exit from military service can impact these family variables (Settersten, 2006). This presentation uses data from 1479 veterans and 6493 civilians from the Honolulu Asian-Aging Study to assess the effects of military service on marital status and fecundity. After controlling for demographic and psychosocial variables, we found an interaction between age at the beginning of World War II (WWII) and Military Status on likelihood of marriage, assessed 25 years later. Compared to civilians, veterans who were older at the beginning of WWII had a greater chance of never marrying, odds ratio (OR) = 0.90, while for civilians it was the opposite, OR = 1.09, p 's < .0001. There were no differences based on military service for ever being divorced. In relation to family size, we found a significant three-way interaction between Education, Military Status and Marital Status in 1941 (i.e., being married or not). Among those who were not married in 1941, civilians had significantly more children than veterans, across all levels of education. However, among those who were married in 1941, there were no differences in the number of children based on Veteran Status, Education Level or their interaction. Overall, results suggest greater disruption on marriage and family status for veterans who had not yet married and started families at the beginning on WWII, despite a short mean military service period of 2.7 years.

EARLY-LIFE DISADVANTAGE, MILITARY SERVICE, AND MEN’S SELF-RATED HEALTH TRAJECTORIES

J.M. Wilmoth, A. London, *Syracuse University, Syracuse, New York*

Although a growing body of research demonstrates the transformative effect of military service on the life course, few studies have considered the extent to which military service can offset the negative impact of early-life disadvantage on later-life health outcomes. This research uses data from the 1992–2012 Health and Retirement Study (HRS) to estimate growth curve models predicting men’s self-rated health trajectories. Distinctions are made between non-veterans, veterans who do not have a service-related disability, and veterans who do have a service-related disability. Models that take into account whether the respondent has a service-connected disability rating are also estimated. Consistent with the findings of previous research, early-life socioeconomic disadvantage is associated with lower self-rated health. Compared to non-veterans, veterans without a service-related disability or service-connected disability rating have better self-rated health, and veterans with a service-related disability or service-connected disability rating have worse self-rated health.

The negative effects of early-life disadvantage on self-rated health are offset by military service: men from disadvantaged backgrounds have better self-rated health if they served in the military, even if they were harmed by that service. The models indicate that part of the observed offset is explained by mid- to late-life characteristics. Overall, the findings provide additional evidence of the early-adulthood institutional pathways that shape later-life self-rated health trajectories, and new evidence that military service can produce discontinuities in the life course by offsetting the negative relationship between early-life socioeconomic disadvantage and later-life health outcomes.

MENTAL AND PHYSICAL HEALTH OF AGING VIETNAM-ERA VETERANS AND NON-VETERANS

L.D. Erickson¹, V. Call¹, M.S. Marsala², J.B. Yorgason¹, 1. *Sociology, Brigham Young University, Provo, Utah*, 2. *Duke University, Durham, North Carolina*

We examine whether participation in the Vietnam War conditions the relationship between early life socioeconomic status (SES) and later-life mental and physical health. Data were from 3,348 (817 veterans) participants in a longitudinal study of high school juniors and seniors that began in 1966. Data from 1966, 1980, and 2010 (ages 60 – 64) were used. Outcome measures assessed in 2010 include depression, posttraumatic stress syndrome, activities of daily living, and chronic conditions. Draft status was related to PTSD but not depression or physical health. Childhood SES was related to physical but not mental health. The role of childhood SES for later-life mental health differed for veterans compared to non-veterans but not for physical health. Aging veterans are not unique in their physical health but are more likely to suffer from mental health problems. Older veterans, even those who were not exposed to combat, likely have mental health needs that may not be sufficiently met.

COGNITIVE ABILITIES AND ALL-CAUSE MORTALITY: THE VA NORMATIVE AGING STUDY

J. Wang^{1,2}, L.O. Lee^{2,3}, A. Spiro^{2,3}, 1. *RTI International, Waltham, Massachusetts*, 2. *VA Boston Healthcare System, Boston, Massachusetts*, 3. *Boston University, Boston, Massachusetts*

Although the association between general cognitive ability and mortality is well-established, few studies have examined specific domains of cognitive functioning, and fewer still include cohorts with lengthy follow-up. This study examined the association between three domains of cognitive abilities and all-cause mortality over 50 years.

Data are from the VA Normative Aging Study, a longitudinal study of 2,280 men that began in 1963. Participants aged 21–81 were screened for the absence of chronic medical conditions at study entry. Verbal intelligence, visuospatial reasoning, and psychomotor speed were assessed in 1965–67 using the General Aptitude Test Battery in half the sample ($n=1,078$; $M_{age}=44$; $SD=9$). Mortality data were available through 2014 (72% deceased). Cox proportional hazards regression with age as the time axis was used to assess whether all-cause mortality risk was associated with domains of cognitive abilities. Covariates included baseline education, income, smoking status, and BMI; smoking and BMI were assessed repeatedly during follow-up.

In unadjusted models of cognitive ability, faster psychomotor speed and higher verbal intelligence were associated with lower mortality risk. After adjusting for all covariates, only psychomotor speed remained predictive. In the final model, faster psychomotor speed (HR=0.88, 95% CI: 0.81–0.95), higher education (HR=0.88, 95% CI: 0.81–0.95), and abstinence from smoking (current vs. never, HR=2.43, 95% CI: 1.95–3.03; former vs. never, HR=1.17, 95% CI 0.99–1.38) were linked to lower risk of death. Facets of psychomotor speed, such as choice reaction time and perceptual speed, may be uniquely associated with mortality.

SESSION 4000 (SYMPOSIUM)

CO-HOST NCOA: BRINGING EVIDENCE-BASED SELF-MANAGEMENT AND PATIENT ACTIVATION PROGRAMS TO SCALE

Chair: J. Firman, *National Council on Aging, Arlington, Virginia*

Co-Chair: C. Zernial, *WellMed Medical Management, Austin, Texas*

Individuals with one or more chronic diseases typically progress to disease complications while accumulating additional chronic conditions. This leads to lower quality of life and increased cost. In addition to access to high quality health care, people with the ability to self-manage their lives and conditions have improved business and health outcomes. To realize these improvements requires individual behavior change. Whether a person has one or multiple chronic conditions, the solutions are generally the same: exercise, diet, nutrition, sleep, medication management, stress/emotional management, role management, and being an informed and activated consumer of health services.

This symposium will address innovative strategies for bringing to scale evidence-based programs that promote self-management and activate older adults to make behavior changes associated with better health outcomes and lower costs.

Moderator: Carol Zernial, VP Community Relations & Executive Director Charitable Foundation, WellMed Medical Management

Neal Kaufman, CMO, Canary Health and Adjunct professor of Medicine and Public Health, UCLA, will discuss how digital delivery can bring interventions to scale and highlight outcomes from a large study of community-based and on-line Diabetes Self-Management Programs developed by Stanford University.

Philip McCallion, SUNY Albany, Director, Center for Excellence in Aging and Community Wellness, will discuss findings from a quasi-experiment of the Aging Mastery Program, a promising patient engagement and activation program for older adults.

James Firman, CEO, National Council on Aging, will discuss NCOA's efforts to help bring to scale evidence-based programs including barriers and potential solutions.

Sponsored by the National Council on Aging.

ONLINE SELF-MANAGEMENT PROGRAMS

N. Kaufman, *Canary Health, Los Angeles, California*

Current approaches to Value-Based Healthcare - improving insurance design, clinical management, and delivery system function - are missing the key element to make it all work - Self-management support- defined as the tasks an individual "must undertake to live well with one or more chronic conditions. These tasks include gaining confidence to deal with medical management, role management, and emotional management." (1st Annual Crossing the Quality Chasm Summit 2004).

The presentation will address the unique ability of internet-based interventions to cost effectively bring self-management support to very large numbers of individuals who have one or more chronic conditions including obesity and diabetes. It will also highlight how user-centered design can create digital self-management support interventions using the best science available while delighting the user and successfully engaging them in their own health journey.

INNOVATIVE COMMUNITY-BASED PATIENT ACTIVATION AND ENGAGEMENT PROGRAM

P. McCallion, L. Ferretti, *SUNY Albany, Albany, New York*

Self-management of their conditions by patients, person-centered care, multidisciplinary approaches and the value of partnerships with community based agencies are being discovered, sometimes as if they are new concepts. And in many ways they are "new" and are at the forefront of moving healthcare from an acute to a chronic care focus. These ideas are challenged by (1) poor understanding of the value and availability of evidence-based self-management interventions; (2) skepticism among professionals and providers, (3) varying levels of readiness among patients to be self-managing partners in their care, (4) a lack of linkages between need for programs and their delivery, particularly structure for electronic exchange of information among healthcare and community based partners, and (4) still to be established reimbursement mechanisms. Resolving these challenges will be a next critical step for healthcare reform.

Health related self-management practice is focused upon enhancing positive health, reducing the risk of ill health, and managing both the consequences and improving prognosis when chronic disease is present. The interventions may include (i) self-management tasks: medical, role and emotional management; (ii) skills in: decision-making, problem-solving, building patient/provider partnerships, resource utilization, action planning and tailoring responses; and (iii) health related behavior changes targeting modifiable risk factors for disease: e.g., smoking cessation and increased physical activity and healthy eating. Underlying processes include building a sense of empowerment and self-efficacy, often through the experience and reinforcement of success, recognizing that social and environmental factors are to be influenced as well as individual behaviors, and understanding that the intervention setting and leader are also of influence.

An approach will be described and supporting data from New York State provided on successful use of evidence-based

health related self-management, including related participatory and empowerment strategies, and activities to overcome policy and access barriers.

OPPORTUNITIES, BARRIERS, AND STRATEGIES FOR SCALING PROGRAMS THAT WORK

J. Firman, *National Council on Aging, Alexandria, Virginia*

For many years, the National Council on Aging (NCOA) has been a national leader in developing community-based and on-line services that improve the health and economic security of older adults and in bringing these programs to scale nationwide. Recent examples include: 1) evidence-based, health and wellness programs offered by community organizations; 2) on-line versions of the Stanford Chronic Disease Self-Management Programs; 3) the Aging Mastery Program; and 4) holistic economic casework programs. Jim Firman will discuss NCOA's successes and failures and offer his insights and reflections about the key barriers to scaling and strategies for overcoming barriers. He will suggest strategies for both program development, evidence-building and policy changes that can accelerate widespread adoption. He will focus on individual, organizational and policy dimensions of challenges and strategies.

SESSION 4005 (PAPER)

RETIREMENT: HEALTH AND POLICY ISSUES

SMOKING CESSATION AFTER RETIREMENT AMONG JAPANESE OLDER WORKERS: DOES RELIEF FROM JOB STRAIN MATTER?

M. Kan, *School of Economics, University of Hyogo, Kobe, Japan*

This paper examines how workers change their health related behaviors, specifically smoking habit, after their retirement in Japan. Previous research across countries has analyzed the effects of retirement on health behaviors, which include various outcomes such as physical exercise and sleep duration. Most effects can be explained by opportunity costs in the health investment framework, however, the mechanism of a change in smoking habit has not been fully uncovered.

In present study, we test a hypothesis in which some people smoke in order to cope with stress, and thus they quit smoking when they are released from it after retirement. Using eight waves of the data from the Longitudinal Survey of Middle-aged and Elderly Persons in Japan, we investigate the effect of retirement on smoking habit with fixed-effect regression model. We include two dummy variables in our model, each of which denotes those who were not satisfied with their work content, and those who were not satisfied with their work-site interpersonal relation in the previous year in order to explore heterogeneous effect of retirement across two different groups according to stress.

Results show that retirement has statistically significant positive effect on smoking cessation among male workers. It is more likely for male workers who were not satisfied with their work-site interpersonal relationship to quit smoking after retirement than other workers. It is possible that stress hypothesis explains the behavioral change after retirement. It suggests that workers might postpone their smoke cessation when their work life is extended.

FINANCIAL PLANNING IN MEXICO: A TEST OF THE INTERDISCIPLINARY RETIREMENT PLANNING MODEL

D.A. Hershey¹, M.I. Bojórquez³, A.E. Pérez³, J.L. Koposko¹, H. Kiso², *1. Psychology, Oklahoma State University, Stillwater, Oklahoma, 2. Susquehanna University, Selinsgrove, Pennsylvania, 3. Universidad Autónoma de Yucatán, Merida, Yucatan, Mexico*

Financial planning for retirement is an important life task for working adults in Mexico, as it is in many economically developed nations around the world. In this paper, we test the generalizability of the Interdisciplinary Retirement Planning Model, which was proposed by Hershey, Henkens, and Van Dalen (2010). As part of this study, we examined the psychological, economic, and social force dimensions that impact financial planning for retirement. The collective influence of these three broad sets of constructs was investigated among 369 working adults, 21–64 years of age. A path analysis model accounted for 72% of the variability in retirement planning activities and 52% of the variability in perceptions of saving adequacy. Moreover, planning activities among Mexican adults were found to differ in important respects from previously published studies carried out in the U.S., the Netherlands, China, and Brazil. Particularly notable among Mexican adults was the impact of early childhood learning experiences on the retirement planning process. The discussion focuses on the value of developing interdisciplinary theoretical models of planning, and how such models can inform the development of savings-oriented intervention programs and public policy initiatives.

ETHNORACIAL DISPARITIES IN ADJUSTMENT TO RETIREMENT: THE HISPANIC ADVANTAGE

D. Carr¹, B. Kail³, R. Calvo², *1. Sociology, Florida State University, Tallahassee, Florida, 2. Boston College, Boston, Massachusetts, 3. Georgia State University, Atlanta, Georgia*

Retirement is a major life course transition, and, as such, both empirical evidence and life course theory find that retirement is related to changes in life satisfaction. Little is known, however, about racial/ethnic differences in the relationship between retirement and changes in life satisfaction. This is an important omission because racial minorities frequently have different work experiences than do whites. To that end, we use the 2004–2014 waves of the Health and Retirement Study to assess (a) racial differences in changes in life satisfaction after retirement, and (b) potential linking-mechanisms that may explain racial differences in changes in life satisfaction after retirement. We find that (a) relative to whites, Hispanics experience elevated changes life satisfaction after retirement whereas non-Hispanic blacks experiences lower changes life satisfaction; and (b) that the differences between blacks and whites is accounted for by differences in wealth and income, but that the differences between Hispanics and whites is not accounted for by differences in health, wealth, nativity status, family arrangements, preretirement job characteristics, or experiences of lifetime discrimination. These findings suggest that even when taking into consideration factors that often explain health and well-being benefits experienced by Hispanics in later life relative to non-Hispanics, Hispanics experience greater increases in life satisfaction at retirement than any other group. In this

session, we discuss the implications of these findings for programs designed to enhance adjustment to retirement.

TO WORK OR NOT TO WORK: THE EFFECT OF PENSION REFORMS ON MALE WORKERS' HEALTH

C. Ardito¹, R. Leombruni¹, A. d'Errico², D. Blane^{3,4}, 1. *Economics and Statistics, University of Torino, Torino, Italy*, 2. *Epidemiology Unit ASL TO3, Piedmont Region, Grugliasco (TO), Italy*, 3. *Imperial College London, London, United Kingdom*, 4. *University College London, London, United Kingdom*

To mitigate the negative effects of ageing population and low labour market participation on economic development, most of the industrialized countries have reformed their pension systems by increasing the age at which workers become eligible for retirement.

This paper investigates the health consequences of the extension of working life on a large sample of Italian men with high labour market attachment during their working life (N=50,143). We focused on the incidence of cardiovascular diseases (CVD) and all-cause mortality, two health outcomes for which there is still contrasting evidence in literature.

The problem of endogeneity of retirement is addressed by adopting an Instrumental Variable identification strategy, which exploits the exogenous changes in pension rules, in a quasi-natural experiment set-up. The analysis is performed using WHIP-HEALTH, a longitudinal administrative database that combines social security records on working histories with hospitalization data.

Results showed a significant detrimental effect of extended working life. A one-year delay in retirement increased the incidence of CVD hospitalization and all-cause mortality at 68–70 years old by 2.1 and 2.6 percentage points respectively ($p < 0.01$). The health risk associated with postponed retirement was heterogeneous, as manual collar workers, lower income earners and those who had longer careers suffered the highest price of being obliged to stay longer at work. The tests for instruments' validity showed very good performance in terms of both relevance and exogeneity.

This pension reform contributed unintentionally to increased health inequalities, by neglecting the differential vulnerability of individuals to work life extension.

SESSION 4010 (SYMPOSIUM)

INTERNATIONAL PERSPECTIVES ON INTERVENTIONS TO DETECT AND PREVENT FINANCIAL EXPLOITATION

Chair: M.L. Gilhooly, *Brunel University London, Uxbridge, England, United Kingdom*

Co-Chair: P.A. Lichtenberg, *Wayne State University, Detroit, Michigan*

Discussant: M.A. Creedon, *A.T. Still University*

This is the second of three symposia about older adults and financial exploitation organized by the GSA Lifelong Financial Health Workgroup. Symposium 2 examines international research and perspectives on training and interventions to detect and prevent financial exploitation of older adults. In the first paper Gutman considers the potential for exploitation and elder abuse during and in the aftermath of

disasters. The second paper by Pearson will help the audience better understand the laws of financial abuse and exploitation; the paper will explore laws from around the globe and will consider whether or not mandatory reporting laws have improved detection and prevention of financial exploitation. Paper 3 by Harries provides an outline of findings from UK research on decision making in relation to detecting and preventing financial exploitation using the bystander intervention model and then goes on to describe a free online training tool developed for professionals in banking, health and social care. Ron Long, in Paper 4 will consider not only the initiatives of Wells Fargo bank, but other financial institutions around the globe. Finally, European initiatives and research on detecting and preventing financial exploitation will be outlined and placed in the context of the report by the European Region of the WHO on elder maltreatment by de Donder.

ELDER ABUSE: FINANCIAL EXPLOITATION DURING DISASTERS AND AMONG MARGINALIZED POPULATIONS

G.M. Gutman, *Simon Fraser University, Vancouver, British Columbia, Canada*

Researchers have rarely considered the potential for increases in elder abuse during and in the aftermath of disasters. Some statistics are, however, revealing. For example, in the three weeks after the 2011 earthquake in Christchurch, New Zealand, domestic violence incidence soared nearly 47%. There was a four-fold increase in family violence after Hurricane Katrina. Child abuse reports have been found to increase during disasters. Apart from the possibility of increasing elder abuse and financial exploitation during and following disasters, marginalized groups may be particularly vulnerable, as well as at other, more normal, times. In this paper issues associated with LGBT elder's vulnerability will be considered. For example, most LGBT people are not protected by marriage or common property laws. In addition, LGBT older adults may be socially isolated because many are estranged from family and are fearful of the health care system.

CAPACITY, CONFLICT, AND CHANGE: ELDER LAW IN AN AGING WORLD

K. Pearson, 1. *Pennsylvania State University, Carlisle, Pennsylvania*, 2. *Dickinson Law, Carlisle, Pennsylvania*

Family responsibility and support laws have a long and interesting history. When first enacted, policy makers used such laws to declare an official policy that family members should support each other, rather than draw upon public resources. This paper tracks modern developments with filial support laws that purport to obligate adult children, and in some states grandchildren, to assist their parents/grandparents if indigent or needy. Filial support laws that have survived into the 21st century are compared. Although such laws are often similar in wording globally, enforcement practices are quite different. Moreover, although intended to ensure that families support their aged relatives enforcement often means attempting to extract from the poor, money for the poor. In addition, it is argued that such laws do nothing to remedy instances of poor children financially exploiting wealthier parents.

ELDER FINANCIAL ABUSE: AN RCT FOR THE DEVELOPMENT OF AN ONLINE TRAINING TOOL FOR PROFESSIONALS

P. Harries¹, K.J. Gilhooly¹, M.L. Gilhooly¹, M. Davies¹, D.C. Kinnear², 1. *Department of Clinical Sciences, Brunel University London, Uxbridge, England, United Kingdom*, 2. *University of Glasgow, Glasgow, Scotland, United Kingdom*

Professionals in health, social care and banking must make complex decisions when they suspect financial exploitation of older adults. Two online training tools were developed, one for the health and social care sectors and one for banking professionals. The training aids involve viewing a series of short case vignettes about elder financial abuse and making judgements as to how they would deal with that case if they encountered it at work. A randomized control trial was conducted to measure the effectiveness of the training aide and to provide evidence that professionals who used the training were able to make decisions more like those with experience. Findings from the RCT will be outlined. For example, it was found that novices who received training were able to make decisions more like those of identified experts and they were more consistent in their judgements after training. Symposium participants will be provided with information on how to locate these free online training aids.

WORKING WITH AGING CLIENTS: EMERGING ISSUES ASSOCIATED WITH FINANCIAL EXPLOITATION

R.C. Long, *Wells Fargo Advisors, St Louis, Missouri*

In this paper the top challenges in detecting and preventing financial exploitation of older adults are outlined. Included are power of attorney abuse, third party investment scams, diminished capacity, familial disputes, new and expensive 'best friends, and account takeovers and wire frauds. Elder client initiatives will be described along with the OWN IT approach – Observe, Wonder Why, Negotiate, Isolate and Tattle. The key issues are poignantly highlighted via two case reviews. Finally, what is needed to improve the elder financial abuse system will be discussed.

DETECTION AND PREVENTION OF FINANCIAL ELDER ABUSE: RESULTS FROM THE BELGIAN AGEING STUDIES

L. De Donder, N. De Witte, D. Verté, *Vrije Universiteit Brussel, Brussel, Belgium*

Prevalence data of financial elder abuse from social and health services only present a tip of the iceberg. A large number of situations are left undetected. An emerging European theme in policy and practice has been concerned with the need to focus more on early detection and prevention. This paper adopts a systematic multi-dimensional approach based on both a progressive (primary, secondary, tertiary, quaternary prevention) and ecological (micro, meso, exo, macro-level) perspective on prevention. Prevention programs for financial elder abuse are described and situated in this multi-dimensional framework. Using data from the Belgian Ageing Studies (N=7,869 people aged 60 and over), the key-argument is developed that most prevention programs are weakened by their undifferentiated treatment of various types of elder abuse. Since the results indicate that risk factors differ

according to type of abuse, it is also important to differentiate by type of abuse when identifying effective prevention strategies. The presentation concludes by discussing the need to develop a particular detection and prevention strategy for financial elder abuse.

SESSION 4015 (SYMPOSIUM)

A COLLABORATIVE RESEARCH MODEL TO IMPROVE THE LIVES OF PEOPLE LIVING WITH DEMENTIA

Chair: S. Kurrle, *University of Sydney, Hornsby, New South Wales, Australia*

Co-Chair: C. Poulos, *HammondCare, Sydney, New South Wales, Australia*

Improving the lives of people living with dementia and associated functional decline and their carers requires co-creation and dissemination of knowledge that changes policy, systems and practice. The Australian Government, through the National Health and Medical Research Council (NHMRC) Partnerships for Better Health Initiative, has recognised that bringing together clinicians, consumers, researchers and decision makers to work on developing research questions is essential to translate research into health and health system improvement. The Partnership Centre on Dealing with Cognitive and Related Functional Decline in Older People (Cognitive Decline Partnership Centre or CDPC) is a working example of this model in practice. During this symposium the audience will hear about how the CDPC was developed and the Funding Partner role in this development, the process of consumer engagement within the Partnership model, as well as preliminary internal evaluation results that examine how the CDPC is progressing towards building effective partnerships. Increased partnerships enhance translation into best practice care for people living with dementia. As an example of this, specific projects within the CDPC will also be discussed including the implementation of Vitamin D supplements in Australian residential aged care facilities to reduce falls, and the role of regulation on the quality of care for people with dementia.

DRIVING RESEARCH FOCUSED ON REAL CHANGE

C. Poulos, 1. *HammondCare, Sydney, New South Wales, Australia*, 2. *University of New South Wales, Hornsby, New South Wales, Australia*

The Cognitive Decline Partnership Centre comes from a desire for the NHMRC to integrate evidence-based research more in industry. As one of Australia's leading aged care providers, and an inaugural Funding Partner in the CDPC, HammondCare recognised the value of defining research priorities from the perspective of those receiving, delivering, managing, and governing services. The CDPC has provided HammondCare with the opportunity to be involved across a range of research projects with very different aims and processes that will shape the work we do and provide a stronger evidence base for the care we provide. The Partnership has also been a facilitator for new research and service development opportunities across the organisation and has given us an excellent insight into how universities, research and

the NHMRC work together. This oral presentation will outline HammondCare's involvement of the CDPC both from a Funding Partner and research perspective.

CONSUMER ENGAGEMENT: FROM RESEARCH QUESTION TO IMPLEMENTATION

S. Kurrle, 1. *University of Sydney, Hornsby, New South Wales, Australia*, 2. *Hornsby Ku-ring-gai Hospital, Hornsby, New South Wales, Australia*

The Cognitive Decline Partnership Centre (CDPC) is a partnership between aged care providers, consumers, clinicians and researchers. Its major focus is on implementation of current knowledge into practice, and also synthesis and dissemination, collaborative new research, and capacity building. Involving consumers (people with dementia and their carers) is integral to all aspects of the CDPC. The Consumer Dementia Research Network of Alzheimer's Australia was engaged as the main consumer representative from the beginning of the CDPC. During the initial stages, all research projects proposed for integration into the CDPC program of work were reviewed by the Consumer Network prior to taking them to a planning workshop with researchers and providers. Consumers have been involved in constructing research questions, in ensuring all activities are appropriately targeted, and have been involved in project steering committees. They have also been integral in preparing final reports and disseminating results to appropriate audiences.

EFFECTIVE PARTNERSHIPS: WHAT IS REQUIRED?

S. McDermott¹, J. Long², K. Radford³, A. Kitching¹, 1. *University of Sydney, Hornsby, New South Wales, Australia*, 2. *Macquarie University, Sydney, New South Wales, Australia*, 3. *Griffith University, Brisbane, Queensland, Australia*

Improving the care for people with dementia requires developing robust evidence about effective programs, services, and outcome measures, and applying that evidence to policy and practice. The Cognitive Decline Partnership Centre (CDPC) aims to overcome the barriers that prevent the translation of research into practice through its unique structure that brings together end users to work in partnership throughout the research process. This presentation considers the elements that are essential for developing effective partnerships between service providers, clinicians, consumers, and researchers. Drawing on data collected by the CDPC over a two year period, the presentation identifies the six elements of working together in partnership, including: commitment to shared goals; addressing different research cultures; problem solving through compromise and support; resourcing; targeted, frequent, and respectful communication; and developing relationships of trust. This presentation aims to equip audiences with the skills required to work in partnership with end users.

IMPLEMENTATION OF VITAMIN D FOR OLDER PEOPLE IN AUSTRALIAN RESIDENTIAL AGED CARE FACILITIES

I. Cameron, *University of Sydney, Sydney, New South Wales, Australia*

In residential aged care facilities one in every two residents will fall each year. There is strong evidence for Vitamin

D supplement use for the reduction of falls in these facilities, and Vitamin D supplementation is recommended in current best practice falls prevention guidelines for aged care facilities. This presentation reviews current usage of Vitamin D in a range of Australian aged care facilities, and presents effective implementation strategies including education which is multifactorial and targets all stakeholders, use of audits and feedback, and addressing stakeholder beliefs and attitudes. Contextual factors may influence the success of implementation and will vary between facilities.

THE ROLE OF REGULATION IN POLICY FOR AUSTRALIAN DEMENTIA CARE

S. Biggs^{1,2}, A. Carr^{1,2}, 1. *Melbourne University, Melbourne, Victoria, Australia*, 2. *The Brotherhood of St Laurence, Melbourne, Victoria, Australia*

The quality of dementia care has become an important policy issue. This paper examines the role that regulation plays in protection and innovation in care settings. Regulation sits at the crossroads of the State's duty to protect its most vulnerable citizens, provider attempts to fulfill market expectations and consumers concern for their rights and protection. Here we examine the way that regulation is not a uniform event, but forms clusters that allow more effective policy development and resourcing.

SESSION 4020 (PAPER)

ALZHEIMER'S DISEASE AND COGNITION

EXPLORING THE LONG-TERM CARE TRAJECTORIES OF PERSONS WITH DEMENTIA—A WESTERN CANADIAN STUDY

D.S. Cloutier Fisher, M.J. Penning, *University of Victoria, Victoria, British Columbia, Canada*

While a considerable body of research has focused on experiences of care within particular settings (e.g., home care, nursing home care or hospital) and the predictors of entry into such forms of care, little research has been conducted to examine the longitudinal experiences of older persons as they navigate across the overall long-term care (LTC) continuum. This is especially true for older persons with dementia. The purpose of this research is to use latent transition analysis (LTA) to explore the most common service use trajectories over time, and their predictors among a sample of long-term care clients with evidence of dementia. This study draws on four years of administrative data for n=3541 individual clients aged 65+ with evidence of dementia who were clients of long-term care (LTC) in a populous health region in British Columbia, Canada between January 1, 2008 and July 31, 2012. Four latent groups were found to represent the most common experiences of these clients: continuous home care, intermittent home care, residential care and an absorbing mortality class. Multinomial logistic regression analysis highlighted the characteristics of persons with dementia that were most significant in predicting membership in each of these common pathways. Predictors such as: age, marital status, living alone, income, chronic conditions, ADL scores, falls, cognitive performance and behavioural issues were most significant in the first year of service,

and became less significant thereafter. Our results reveal that differential patterns in service use over time depend heavily on where people start in the care system.

LOST WITH DEMENTIA: REPORTS IN THE AUSTRALIAN PRINT MEDIA

L. Schnitker, N. Shepherd, M. MacAndrew, E.R. Beattie, *Queensland University of Technology, Brisbane, Queensland, Australia*

Successful environmental navigation requires intact attention, memory and problem solving, all of which are progressively impaired by dementia. People with dementia who get lost have an increased risk of negative outcomes. In Australia no legislated public community alert system exists, so print media is one critical information source supporting safe return.

We examined news reports of lost people with dementia in Australia (2011–2015) sourced from the Proquest Australia & New Zealand Newsstand database. Articles meeting inclusion criteria were analyzed for relevant information e.g. age, gender, transport mode, location last seen, time missing, location found, health outcome.

Missing people with dementia ($n=130$, mean age 75, 74% male), typically left home (75%) or residential aged care (25%) and were on foot (62%). Significant resources, e.g. helicopters, police, dogs, search and rescue units and volunteers, were utilized in searches. Ninety two people (71%) were found (73 alive: 60% well, 20% injured; 19 dead). Of the 19 people found dead most were found within 5 km of where they were living and 7 were found within 1 km. Dehydration and exhaustion were the most common issues for those found.

Our findings reinforce existing evidence that wandering away from a safe environment alone and getting lost is not a benign event for people living with dementia. Community-level interventions targeting dementia awareness and risk reduction need to be urgently explored to reduce preventable deaths.

ACCESS TO TIMELY FORMAL CARE FOR PEOPLE WITH DEMENTIA: INTERVIEW STUDIES IN EIGHT EUROPEAN COUNTRIES

A. Stephan, A. Bieber, A. Broda, G. Meyer, *Institute for Health and Nursing Science, Martin Luther University Halle-Wittenberg, Halle (Saale), Germany*

The timely use of community services is supposed to enable people with dementia to live at home as long as possible. However, access to services seems to be gained late in the trajectory of dementia. As part of the transnational project Actifcare (including Germany, Ireland, Italy, Netherlands, Norway, Portugal, Sweden and United Kingdom), barriers and facilitators when using formal community care as experienced by people with dementia, informal carers and healthcare professionals were investigated. Consecutively, strategies improving service use as suggested by political decision-makers/decision influencers were explored. Across countries, 55 focus groups with 266 participants were conducted, followed by 38 expert interviews. A summarising qualitative content analysis was performed.

Using formal community care seems to be influenced by psychosocial factors of people with dementia and informal

carers together with characteristics of healthcare professionals and system-related aspects. Findings highlight the impact of beliefs of people with dementia and carers (e.g. meaning of caregiving for the families), and underline that people with dementia try to stay independent as long as possible, while using formal care is often considered as a threat to individual independence. Political decision-makers/influencers identified good-practice strategies of dementia care that appropriately reflect explored barriers and facilitators (e.g. care coordinator, proactive person-centred services, and raising public awareness). Nevertheless, implementation of these strategies still seems to be challenging. Further research is needed, aimed at investigating how these strategies can be appropriately implemented, and how formal care can be modified towards supporting the independence of people with dementia.

RACIAL AND ETHNIC PATTERNS IN THE PROGRESSION OF COGNITIVE DECLINE IN A CLINICAL SAMPLE

M.P. Aranda, D. Lloyd, *University of Southern California, Los Angeles, California*

Drawing from the National Alzheimer's Coordinating Center Uniform Data Set, we examined the trajectory of cognitive function among older Asians, African Americans, Latinos, and non-Latino Whites. Using latent trajectory model analysis, we pooled subjects with at least 3 assessments ($N=1483$) and measured cognitive decline using neuropsychological battery test scores. Results indicate an overall declining average trajectory for all groups with increasing heterogeneity at successive assessments. Each minority group had a lower intercept than non-Hispanic whites indicating a less steep decline over time: While Latinos did not differ from non-Hispanic whites in the rate of decline, the slope was significantly less steep among African Americans and Asians. Test administration in Spanish is associated with a flatter trajectory. Implications for early assessment and brain health initiatives are discussed.

COGNITIVE STIMULATION THERAPY: AN EXPLORATORY STUDY IN AN AMERICAN POPULATION

D.B. Stewart¹, M.L. Berg-Weger¹, M. Zubatsky¹, J. Lundy², D. Hayden², 1. *Saint Louis University, St. Louis, Missouri*, 2. *Perryville Memorial Hospital, Perryville, Missouri*

Affecting nearly 5.4 million Americans and 35.6 million individuals worldwide, dementia is one of the greatest health crises of our time. Though pharmacological interventions are a mainstay of treatment, their efficacy remains limited. More attention has been given to non-pharmacological interventions as a primary form of intervention. Offering persons with dementia a voice in selection of stimulation activities is shown to reduce behavioral issues and decrease medication use. One approach, Cognitive Stimulation Therapy (CST), is reported to improve processing and recall for individuals with dementia but few studies incorporate additional social, psychological, or familial measures of improvement within CST interventions. Ninety-four community-based CST participants ($M=78.55$ years, $SD=10.01$) underwent CST with 21 continuing onto maintenance CST. Pre-/post intervention measures of cognition, depression, quality of life, and mobility were taken.

Using a paired samples t test, there is a statistically significant difference of SLUMS score after CST ($t_{93}=6.123$, $p<.001$). On average, post-scores were 2.4 points higher. A statistically significant post-test difference of Cornell Scale for Depression in Dementia exists ($t_{94}=-6.743$, $p<.001$) as well as Quality of life ($t_{94}=5.931$, $p<.001$). Results remained significant when comparing results at 12-month mark to baseline. There was no statistically significant difference in caregiver quality of life, caregiver depression, or mobility. CST proves to be an effective form of treatment among older adults with mild to moderate dementia. Implications for integration into practice and education will be highlighted.

SESSION 4025 (SYMPOSIUM)

THE EVOLUTION OF HEALTH AND LONG-TERM CARE INTEGRATION IN THE U.S., CHINA, TAIWAN, AND JAPAN

Chair: Y.W. Glavin, *Case Western Reserve University/ Taipei Medical U, Mayfield Village, Ohio*

Co-Chair: R. Browdie, *Benjamin Rose Institute*

This Symposium reviews and compares care integration trends in China, Taiwan, Japan and the US. Presentations include development in the context of distinctive policy and cultural environment of each respective system. Integration strategies (or models) are concluded from policy analyses, demonstrations and national surveys/studies, ranging from overall financing, payment methods, shared risk and care management to technology applications, with common goal to improve care, reduce cost and ensure system sustainability.

Josh Wiener will review past and current initiatives to integrate care in the US, including Social/ HMOs, the Program for All-inclusive Care for the Elderly (PACE), Dual Eligible Special Needs Plans (D-SNPs) and the Centers for Medicare & Medicaid dual eligible demonstrations.

John Campbell will discuss LTC Insurance in Japan, efforts between Long Term Care and Health Care Insurances to support community-based integrated care, especially for the elderly with heaviest needs. He will discuss integration in the context of distinctive features of Japan's LTCI system.

Yu-Chun Lee will discuss two financing alternative for long term care in Taiwan: insurance and tax-based financing. Discussion will focus on to what extent these two financing models support care integration. Conclusions derived from policy analyses, budget projections and national LTC surveys will be discussed.

Shuang Liu will discuss China's "Medical and Personal Care Integration" policy and conclude from the Comprehensive Home Care Survey to identify opportunities for hospital and home care agency to collaborate on care integration beyond structure changes.

Ye-Fan Wang Glavin and Rich Browdie will serve as moderators

INTEGRATED CARE IN THE UNITED STATES: OPTIONS AND ISSUES

J.M. Wiener, *RTI International, Washington, District of Columbia*

Older people with disabilities in the United States currently receive care in a fragmented and uncoordinated

financing and service delivery system, both within and between the health and long-term care systems. Financing for acute care is largely the responsibility of Medicare and the federal government, while long-term services and supports (LTSS) is dominated by Medicaid and state governments. As a result, no organization is responsible for managing all aspects of care for a person. The fragmented financing and delivery system has negative consequences for older people, including high levels of hospitalization and potentially avoidable hospitalizations. This presentation will review past and current initiatives to integrate care, including Social/ HMOs, the Program for All-inclusive Care for the Elderly (PACE), Dual Eligible Special Needs Plans (D-SNPs) and the Centers for Medicare & Medicaid dual eligible demonstrations.

LONG-TERM CARE INSURANCE VS. TAXATION: POLICY IMPLICATIONS TOWARD AN INTEGRATED CARE

Y. Lee¹, Y.W. Glavin², 1. *Institute of Health and Welfare, National Yang-Ming University, Taipei, Taiwan*, 2. *Case Western Reserve University, Cleveland, Ohio*

World Health Organization (WHO) global strategy calls for fundamental paradigm shift to a people-centered integrated health system to improve quality, responsiveness, efficiency and financial sustainability. The elderly in Taiwan will grow from 12.6% in 2016 to 41% in 2036. Current Ten-Year Long-Term Care Plan provides home and community services to 35.7% elderly by tax. Government has been working on a universal Long-Term Care Insurance implemented under the existing National Health Insurance Administration to foster an integrated care delivery through seamless financing, uniform assessment/management and IT linkages. The new administration switches to a tax-based financing. This presentation will compare social insurance vs. tax-based financing affecting the creation of an integrated and comprehensive care system. Conclusions derived from policy analyses, need/budget projections & public opinions from national LTC surveys will be discussed relating system design (single payer vs. local government administration), financial sustainability, population and benefit coverage and incentives for integrations.

POLICY CONSIDERATIONS IN SUPPORTING CARE INTEGRATION IN CHINA BASED ON A HOME CARE SURVEY IN CHENGDU

S. Liu, B. Dong, S. Wang, *West China Hospital, Sichuan University, Chengdu, China*

Integration of medical services and personal care is top national policy in China. This presentation will address issues and considerations of Integrated Care development based on findings from the Comprehensive Home Care Survey conducted in City of Chengdu (from January to June 2016) with (n=490) included in the study. Study indicates standardized care and quality monitoring are lacking. General services provided are food preparation, ADL assistance, house-keeping, companion to Dr's appointments and injections. Home care staff often lack of professional training and comprehensive assessments are rarely conducted. The study encourages collaboration between hospitals and home care agencies but should go beyond structure merge or hospital service expansions. The strategies should be staff education

and collaboration ensuring standardized care, early disease detection, health promotion, polypharmacy management and quality of life improvement. Due to resource limitation, University Medical Center is exploring providing patient consultation, staff education and administrative services through internet.

INTEGRATION AS POLICY IN JAPAN'S LONG-TERM CARE SYSTEM

J.C. Campbell¹, N. Ikegami², 1. *Political Science, University of Michigan-Ann Arbor, Oakland, CA, Cabo Verde*, 2. *St. Luke's International University, Tokyo, Japan*

Japanese older people with disabilities receive community-based and institutional care services under the public, mandatory Long-Term Care Insurance (LTCI) system that started in 2000. Levels of provision are among the highest in the world. LTCI includes home nursing, physical therapy and oversight by physicians, but most medical care is covered by health insurance. Integration is a current policy focus, as a means to reduce demand for institutional care by providing "24-hour care" in the community. Specifically, home doctor visits have been encouraged by increasing payments under health insurance, and organizational experiments are being carried out in many localities to improve communication between physicians and LTC care managers. A particular challenge, given the continuing need to control costs, is efficient management of health care and LTC for older people with the heaviest needs. The presentation will discuss integration in the context of distinctive features of Japan's LTCI system.

SESSION 4030 (SYMPOSIUM)

ELDER ABUSE PREVENTION: LESSONS FROM FOUR INITIATIVES

Co-Chair: F.K. Ejaz, *Benjamin Rose Institute on Aging, Ohio*

B. Olsen, *University of Southern California*

Discussant: H. Lamont, *Health and Human Services*

The Administration for Community Living awarded five cooperative agreements to support elder abuse prevention initiatives. This symposium describes findings from four of those agreements.

The discussant is Helen Lamont from Health and Human Services.

Dr. Burnett will describe a 12-month medication adherence intervention developed for victims who were substantiated for self-neglect by Texas Adult Protective Services (APS). Findings revealed 65% of victims had > 9 medications, with complex medication regimens. Those completing at least two assessments were more likely to comply with medication adherence.

Dr. Ejaz will discuss how two APS workers who were embedded in a healthcare system in Texas trained 826 primary care clinicians in 63 clinics. Clinicians had significant improvements in knowledge of abuse and its reporting from pre-to-post training but not at follow-up. Of 7,000+ patients screened for abuse, only 34 reports of suspected abuse were made to APS. Clinicians consulting with APS liaisons during

the same time period reported 500+ cases of suspected abuse to APS.

Dr. Breckman will discuss the implementation of Enhanced Multidisciplinary Teams that included forensic accountants and gero-psychiatrists to address financial exploitation. An end to exploitation was reported in 69% of cases. In upstate NY, the project realized \$530,000 in court-ordered restitution.

Dr. Olsen will discuss the Abuse Intervention/Prevention Model study. 76 older adults with dementia/caregiver dyads were administered assessments of abuse risk at baseline, given resource referrals to mitigate those risks, and reassessed at three month follow-up. Analyses examined pre-post changes in risk profiles, service utilization rates, and APS engagement.

IMPROVING MEDICATION ADHERENCE IN SELF-NEGLECTING OLDER ADULTS: LESSONS LEARNED FROM THE BLACK BOX

J. Burnett, S.R. Abada, L.E. Clark, R.J. Flores, C.B. Dyer, *University of Texas Health Science Center at Houston, UTHHealth, McGovern Medical School, Division of Geriatric and Palliative Medicine, Houston, Texas*

Medication adherence is a significant problem among older adults who self-neglect and, although likely linked to increased morbidity and mortality in this population, it remains understudied. This is the first study to pilot a 12-month medication adherence intervention in older adults with Adult Protective Services substantiated self-neglect. Findings indicated that complex medication regimens, polypharmacy and medication contraindications were common and thus, required a novel and intensive screening process to ensure participant safety. No participants reported high adherence. The majority (65%) were considered hyperpolypharmacy (i.e. >9 medications), regimen complexity predicted adherence levels independent of memory and executive function and among those who completed at least two medication adherence assessments there was a trend towards increased self-reported medication adherence. This study provides rich data and critical lessons to support future medication adherence studies in this population.

IDENTIFYING AND REPORTING OLDER PATIENTS AT RISK OF ABUSE TO ADULT PROTECTIVE SERVICES

F.K. Ejaz¹, M.S. Rose¹, L. Borato¹, D. Billa², R. Kirsch³, 1. *Benjamin Rose Institute on Aging, Cleveland, Ohio*, 2. *WellMed Charitable Foundation, San Antonio, Texas*, 3. *Texas Department of Family and Protective Services, Austin, Texas*

Texas Adult Protective Services (APS) collaborated with WellMed, a healthcare provider, to develop interventions focused on identification and reporting of abuse among patients. Two APS workers were embedded in WellMed and helped train 826 staff in 63 primary care clinics on abuse and the Elder Abuse Screening Index (EASI).

Results from 532 staff who participated in pre-post training surveys indicated significant improvements in knowledge of abuse and its reporting. After a one-year follow-up, these improvements were not maintained.

Over 7,000 patients had 11,000+ EASI screenings completed on them, which resulted in only 23 suspected victims reported to APS. However, APS staff who participated in case conferences concerning high-risk older patients helped to identify and report 500+ suspected abuse cases to APS.

The discussion will center on the usefulness of the EASI compared to the role played by APS staff in identifying and reporting abuse; and its implications for practice.

ENHANCED MULTIDISCIPLINARY TEAMS ADDRESS CASES OF FINANCIAL EXPLOITATION OF OLDER ADULTS IN NEW YORK

R. Breckman¹, P.L. Caccamise², 1. *NYC Elder Abuse Center, New York, New York*, 2. *Lifespan of Greater Rochester, Rochester, New York*

Through an ACL grant to NYS Office for the Aging in 2012, multiple partners implemented Enhanced Multidisciplinary Teams (E-MDTs) that included forensic accountants and geropsychiatrists to address cases of elder financial exploitation in two pilot locations in Manhattan and seven counties in upstate NY. This presentation will address findings regarding the efficacy of E-MDTs in investigating and intervening in cases of elder financial exploitation. Outcomes examined included recovery of assets and asset protection.

Of the 221 cases reviewed by E-MDTs in both sites between 4/2013 through 12/2015, key outcomes were documented in 103 cases. Reduction of exploitation of assets was reported in 81.5% of cases; an end to exploitation in 68.9% of cases, and restitution or recovery of assets in 16 cases. In the upstate site, the project realized \$530,000 in court-ordered restitution and formal repayment agreements. Findings demonstrate the importance of including forensic accountants and geropsychiatrists in E-MDTs.

ABUSE INTERVENTION/PREVENTION MODEL AMONG PERSONS WITH DEMENTIA AND THEIR CAREGIVERS

B. Olsen, A. Nguyen, A. Coulourides Kogan, C. Weber, S. Hirst, L. Mosqueda, *University of Southern California, Alhambra, California*

76 community dwelling older adults with dementia/caregiver dyads were recruited from APS, clinics, and community agencies for the Abuse Intervention/Prevention Model (AIM) study. Participants were administered in-home baseline assessments of abuse risk, given resource referrals to mitigate those risks, and reassessed at 3-month follow-up. All dyads met at-least one criterion for abuse risk. 32.9% (25 dyads) utilized referrals by follow-up. Caregivers who utilized referrals had more education ($p=.03$), greater perceived burden ($p=.04$) and anxiety ($p=.05$), and lower quality of life ($p=.01$). Compared to baseline, follow-up risk scores for caregivers did not change. Care recipients had lower scores for cognitive function ($p=.04$) and ADL difficulty ($p<.01$), and higher empathy scores ($p=.04$). 25 dyads were engaged with APS. APS-engaged caregivers reported greater burden ($p=.02$) and less social support ($p<.01$). APS-engaged dyads reported lower quality of relationship ($p=0.03$). Service utilizers were 63% less likely to be APS engaged compared to non-utilizers ($p=0.07$).

SESSION 4035 (SYMPOSIUM)

ALTERNATE MODELS OF PUBLIC LONG-TERM CARE IN THE UNITED STATES

Chair: L. Polivka, *Claude Pepper Center, Tallahassee, Florida*

Co-Chair: R.A. Applebaum, *Miami University, Oxford, Ohio*

Over the last decade several different models of publicly funded long-term care (LTC) programs, mainly through the state and federal Medicaid program, have emerged in states across the US. Presenters in this symposium will discuss four different models of LTC services that characterize the LTC systems of most states. Baozhen Luo will describe the origins and current operations of the LTC system in Oregon and Washington, which are both non-profit Aging Network (Area Agencies and service providers) administered fee-for-service models of public LTC and analyze why LTC experts rank these two LTC systems highly. Jung Kwak will present findings from her historical case study of the Wisconsin LTC system (Wisconsin Family Care), which is the only non-profit Aging Network administered managed LTC system in the US. Her paper will include an analysis of the conflict between aging advocates and the Wisconsin governor over the latter's proposal to give control of the LTC system to for-profit HMOs. Larry Polivka will discuss a third LTC model in his presentation on Florida's LTC system which became fully administered by for-profit HMOs in 2013 and assess the implications of this model for the future of the Aging Network and its role in LTC. The Fourth model will be presented by Robert Applebaum who will discuss Ohio's hybrid system of public LTC services. This system is designed to include a prominent front-end role for the Area Agencies on Aging, while the service delivery and case management functions are administered by HMOs.

A PUBLIC LONG-TERM CARE SYSTEM FULLY ADMINISTERED BY PRIVATE, FOR-PROFIT HMOs—THE FLORIDA MODEL

L. Polivka, *Claude Pepper Center, Tallahassee, Florida*

Until 2013 the home and community-based services part of Florida's public long-term care (LTC) system was administered by the Area Agencies on Aging and non-profit service providers. In 2013, however, most of the publicly funded HCBS programs were folded under HMOs run by large insurance companies such as United Health Care which received contracts to administer all Medicaid funded LTC programs including the nursing home program. This paper includes a description of the political forces at both the state and federal levels that played major roles in the transition to a full scale managed LTC system in Florida, an analysis of the major problems encountered during the transition from both consumer and organizational perspectives, the impact of the new system on costs and quality of care outcomes through 2016, and the impact of MLTC on the Florida Aging Network, in terms of its role(s) in the state's public LTC system.

AGING NETWORK ADMINISTERED PUBLIC LONG-TERM CARE SYSTEMS—THE OREGON AND WASHINGTON MODELS

B. Luo, *Sociology, Western Washington University, Bellingham, Washington*

Oregon pioneered the development of publicly funded long-term care (LTC) systems administered by non-profit Aging Network organizations (Area Agencies on Aging and service providers) in the early 1980s. Washington adopted the same model a few years later. Since then both systems have become recognized as among the best public LTC systems in the USA with comparatively high levels of cost effectiveness and person centered services. This paper will briefly describe the administrative operations of both systems, quantitative measures of costs and outcomes for both and the implications of these measures for LTC policy in other states and nations. The paper will conclude with a discussion of the major challenges facing both systems over the next decade.

AGING NETWORK MANAGED LONG-TERM CARE, DOES IT HAVE A FUTURE?

J. Kwak, *Social Work, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*

Wisconsin Family Care (WFC) is the only non-profit aging network (area agencies on aging and service providers) administered managed long-term care (LTC) program which is publicly funded in the U.S. Wisconsin Family Care was essentially made a statewide program in 2006 following a rigorous evaluation that produced findings supporting the program's cost-effectiveness. The program has continued to show positive results in the years since and is now regarded as one of the best public LTC systems in the country. This impressive performance, however, has not kept WFC free of controversy and political conflict. In 2016, the state governor and legislative leaders proposed to convert WFC to a for-profit managed LTC program administered by a few large HMOs. This presentation will describe advocacy efforts against this proposed change and discuss its implications for the future of non-profit LTC and the aging network in other states.

INTEGRATING ACUTE AND LONG-TERM SERVICES THROUGH MANAGED CARE ORGANIZATIONS: INNOVATION OR IDEOLOGY

R.A. Applebaum, *Scripps Gerontology Center, Miami University, Oxford, Ohio*

States across the U.S. are faced with ever increasing long-term services expenditures in the context of a large growth in the number of older people likely to need such support. One state level policy response involves requiring all older people relying on the means tested Medicaid program, who are also Medicare eligible, to enroll in an integrated care demonstration. Ohio's MyCare program enrolled 120,000 dual eligible persons starting in May of 2014. . Analysis of the policy and implementation issues will be done in the context of previous efforts to integrate long-term and acute services such as the Social/Health Maintenance Organization, the Program of All Inclusive Care for the Elderly and the Medicaid Long-Term Services initiatives. There are a number of important reasons to integrated acute and long-term services, but previous

work has indicated there are also numerous barriers to the success of these endeavors.

SESSION 4040 (SYMPOSIUM)

GERIATRIC TELEHEALTH—DELIVERING SUSTAINABLE 21ST CENTURY HOSPITAL CARE MODELS

Chair: M. Martin-Khan, *The University of Queensland, Woolloongabba, Queensland, Australia*

Discussant: S.R. Counsell, *Indiana University-Purdue University--Indianapolis*

There are two primary forms of telehealth described here: store and forward, and video conference. Published accounts of geriatric telehealth have been available for over a decade. These services have either been descriptions of research projects outlining the reliability of geriatric telemedicine or boutique, specialised health services provided from tertiary centres. This has begun to change.

Increasingly, with lower equipment costs, improved technology, greater distances and demands on the workforce, telehealth is being recognised as an option for standard health service delivery by technologically savvy health care districts.

Telehealth, with the elimination or reduction in travel, benefits elderly people who either live a distance from the hospital (such as those living in the country who would travel to see a specialists) or those who are too frail to travel (i.e. long term care residents).

This symposium presents four working telehealth systems (from three countries) that are operating within health care systems that consider the telehealth mode as part of 'standard care'. Challenges in implementation have been overcome as part of change management processes. The specific geriatric medicine approaches are used in residential care, general practice, community assessment, memory clinic, and/or acute care.

TELEHEALTH AND RESIDENTIAL CARE

M. Weiner, *Indiana University, Bloomington, Indiana*

Telehealth has important uses in both urban and rural environments, when distance otherwise creates barriers to diagnosis or treatment. Telehealth includes aspects of electronic health information exchange (HIE), geographically dispersed referrals and consultations, and direct communication among clinicians, or between patient and clinician.

The U.S. Department of Veterans Affairs (VA) has a robust telehealth program that includes community-based HIE, clinician-to-clinician consultation, and patient-to-clinician telehealth for homebound patients. Residential care inside and outside the VA creates special challenges, because residents receive care from clinicians who are usually off site. Many of the residents' acute medical problems are thus handled by telephone, but the limited information available often hinders medical decision-making and can increase costs of care when patients are referred for emergency services. We discuss these dimensions of telehealth, unique challenges of remotely managing patients in residential care, an approach to videoconferencing that led to improvements, and issues surrounding sustainability.

TELEHEALTH AND INTER-HOSPITAL SUPPORT

S. Freeman¹, F. Flood², 1. *University of Northern British Columbia, Prince George, British Columbia, Canada*, 2. *Northern Health, Prince George, British Columbia, Canada*

Northern Health in British Columbia (BC) has 7 large telehealth service providers and several individual telehealth projects that form part of the health service. Telehealth in BC is for clinical, educational, and administrative purposes. Videoconferencing (mobile or desktop) is the primary tool. Clinical sessions use patient carts, which include devices that allow collection and observation of patient indicators. Triage and home-monitoring is steadily increasing.

In BC, telegeriatrics is part of the out-patients ambulatory care patients unit at The University Hospital of Northern British Columbia, Prince George. Consultations take place at smaller sites (more than 20 locations in the BC area). There are challenges to ensuring an integrated sustained system relate to systemic and technology issues.

Limited published information found on best practices, however, work with telehealth service representatives in BC identified key influences which included 4 key areas which lead to a review to improve utility across the province.

TELEHEALTH AND COGNITIVE ASSESSMENT

M. Martin-Khan, *Centre for Research in Geriatric Medicine, The University of Queensland, Woolloongabba, Queensland, Australia*

Videoconferencing (VC) provides a way to link a specialist physician with a patient in a remote location for the purpose of diagnosing dementia. Older adults with complex memory problems benefit from comprehensive cognitive assessment provided by specialists who often work in major population centers.

The Princess Alexandra Hospital (PAH) Telehealth Centre (PAH-TC) seeks to provide a whole-of-hospital telehealth service using videoconferencing and store-and-forward capabilities for a range of specialities. Queensland health (Australia) introduced this new centralised telehealth coordination service to improve the scope of telehealth from five medical disciplines, in the year before the establishment, to 34 disciplines two years after the establishment.

Recommendations from community assessment teams, are followed up by a referral from a General Practitioner, to the Memory Clinic at the PAH. Using telehealth, the geriatrician is able to carry out a full cognitive assessment for the diagnosis of dementia or seek additional cognitive testing if required.

TELEHEALTH AND COMPREHENSIVE GERIATRIC ASSESSMENT

L.C. Gray, *The University of Queensland, Brisbane, Queensland, Australia*

The procedure of comprehensive geriatric assessment is a cornerstone of geriatric medicine and aged care. The requirement for participation of geriatricians and multi-disciplinary teams often precludes its applications outside of major centres.

Our team has developed, evaluated and implemented on a large scale a telehealth methodology to deliver CGA at a distance from a University health service. The approach involves: Case preparation by a trained nurse at the patient

end; use of a structured system to record and interpret clinical observations (the interRAI AC-CGA); online case review using a web-based application by geriatricians; and direct patient consultation via video-conference. This model has been applied in small rural hospitals, long term care facilities and in primary care practices.

Our research demonstrates that the process is not associated with loss of diagnostic fidelity. There is good patient acceptance, and a reduction in assessment time for geriatricians due to the extensive case preparation.

SESSION 4045 (SYMPOSIUM)**PRESIDENTIAL SYMPOSIUM: OLDER ADULTS DURING DISASTERS: FACILITATORS AND BARRIERS IN LESS AND MORE DEVELOPED COUNTRIES**

Chair: L.M. Brown, *Palo Alto University, Palo Alto, California*

Discussant: K. Hyer, *University of South Florida*

Disasters are catastrophic events that suddenly and adversely affect populations. International humanitarian support is routinely offered after disasters to alleviate human suffering and facilitate the recovery process. Policymakers and responders use their knowledge and experiences to develop and implement systematized strategies that can be followed during disasters. Yet despite these efforts, the rate of disaster-related morbidity and mortality for older adults remains significantly higher than the general population. Because disasters occur without warning it is difficult to test and enhance strategies and protocols that are intended to mitigate threats and hazards and to quickly and effectively resolve their negative consequences. By identifying persistent challenges encountered during disasters and considering issues facing an aging population, organizations responsible for disaster response may be better attuned to the changing needs of the population and more able to address older adults in their planning and training processes. This symposium will feature five speakers representing Cameroon, Jamaica, Japan, New Zealand, Nepal, Philippines, and the United States. Presentations will describe actual disasters and the challenges and opportunities for preparing and responding to older adults during disasters in countries with varied financial, material, and human resources. Older adults displaced during disasters, assistance during displacement, as well as during return and reintegration after the event will be described. Finally, we will discuss why so many identified problems remain unresolved over time and how disaster managers might adapt lessons learned into processes so that they are culturally sensitive, relevant, and useful in affected regions.

REBUILDING COMMUNITY IN POST-DISASTER REGIONS: ELDERS LEADING THE WAY TO RESILIENCE

T. Patterson¹, E. Kiyota², 1. *LeadingAge Center for Applied Research, Washington, District of Columbia*, 2. *Ibasho, Washington, District of Columbia*

The present study focused on the effects of the Ibasho model of resilience and community engagement on social capital in the communities of Ofunato, Japan after the

Great East Japan Earthquake, Ormoc province, Philippines after Typhoon Haiyan, and Kathmandu, Nepal after the Earthquake of 2015. The Ibasho approach provides a long-term, sustainable model of incorporating elders more fully into their communities to create more resilient communities that are better prepared to withstand future natural disasters and the impacts of global aging. A mixed-methods approach was employed to evaluate the effect of model on social capital among community members, its impact on the community's perception of the recovery process, and on general well-being. Current findings revealed a positive impact on community-level social capital, self-efficacy, social network, sense of belonging, and community perceptions of disaster recovery. Further discussion will address the recent translation and evaluation of the model in Nepal.

DISASTER AND AGEING IN CAMEROON

F.N. Njuakom, *Ageing, CDVTA Cameroon, Bamenda, NWR, Cameroon*

This paper analysis elderly resilient livelihoods and share best practices for promoting disaster risk reduction response mechanisms among vulnerable older people and their communities. The paper highlights elderly vulnerabilities like limited mobility, exclusion, nutrition, health needs, and difficulties in enhancing major livelihoods, security and social protection issues. Older people are valuable resources for resilient livelihoods and can make invaluable contributions towards disaster risk reduction and should be included and consulted in developing disaster risk reduction strategies. In Cameroon, elderly contributions included community knowledge, knowledge on environmental patterns and established networks of elderly groups supported by volunteers, caring for the sick, meeting cost for medicines, providing food, clothing, shelter and income activities. Older people share wisdom and knowledge of past emergencies and can help prepare for future disasters. The paper concludes that elderly resilient activities strengthened elderly capacities, reduced vulnerability and built on elderly centered involvement in developing age-friendly resilient communities.

JAPANESE OLDER ADULTS' EXPERIENCES FROM EARTHQUAKES AND TSUNAMI

J. Otani, *Graduate School of Human Sciences, Osaka University, Suita, Osaka, Japan*

Japan has the highest proportion of older adults relative to other developed nations. This demographic change results in serious concerns about the economic impacts and the abilities of social service agencies to meet the growing needs of older adults. Japan has experienced numerous natural disasters during the past decade. Older adults have not only constituted a high proportion of casualties during each event, but disaster-triggered illnesses have disproportionately affected this subgroup during the recovery phase. This presentation will discuss lessons learned from Japan's experiences, focusing on physical and mental health, issues concerning evacuation centers, temporary shelter housing, and public reconstruction housing, as well as changing living arrangements such as declining multi-generation households. We will also discuss care for people with dementia, people living in isolation, lack of traditional family support, and *Kodokushi* (dying alone), with decent Japanese society's

transitional emphasis from family responsibility to neighbourhood and community.

LESSONS LEARNED FROM OLDER PEOPLE IN CHRISTCHURCH, NEW ZEALAND, IN THE 2010—2011 EARTHQUAKE SEQUENCE

S. Keeling, *Health and Ageing Research Team, Massey University, NZ, Christchurch, New Zealand*

From the perspective of six years after the earthquake sequence which hit the city of Christchurch, New Zealand, this paper reviews a series of research studies on the effects experienced by older people. Immediate, medium and longer term effects show that lessons can be drawn from how these played out over time, and in relation to different sub-groupings of older people. First, the experiences of relocated rest home and hospital residents within the first year related to disrupted support links with family and carers. Second, older community residents reported both short-term negative mental health effects but also demonstrated immediate and longer term resilience through engagement in reconstruction and social support networks. Supportive ties are reported nationally as well as locally. Finally, other national processes for sharing the learning from these events will be discussed, following the metaphor of major ripple effects extending across a relatively small national population.

INCLUDING THE NEEDS OF OLDER PERSONS IN DISASTER PLANS: A FOCUS GROUP APPROACH

D. Eldemire-Shearer^{1,2}, J.G. McKoy Davis^{1,2}, 1. *Community Health & Psychiatry, University of the West Indies, Mona, Kingston, Jamaica*, 2. *Mona Ageing & Wellness Centre, Kingston, Jamaica*

The Caribbean including Jamaica, which will be highlighted, is very vulnerable to disasters particularly hurricanes which are an annual event. Older persons are often primary homeowners and without available financial and physical resources to mitigate the effects of disasters. The presentation will discuss the inclusion of older persons in national disaster plans. Focus groups and community surveys were used to identify both the needs and strengths of older persons especially with regard to hurricanes. Older persons are now recognized in national disaster planning activities and the process of including them will be explored as well as additional resources required.

SESSION 4050 (SYMPOSIUM)

IAGG ASIA AND OCEANIA REGION: RESPONDING TO AGEING IN THE ASIA/OCEANIA REGION—DIVERSITY, ACTION, AND OUTCOMES

Chair: K.D. Hill, *Curtin University, Perth, Western Australia, Australia*

Discussant: P. Assantachai, *Faculty of Medicine Siriraj Hospital, Bangkok, Thailand*

Most of the world's older people live in the Asia/Oceania region, which includes a diversity of countries at different stages of economic development, and different stages and pace of demographic and epidemiological transition. Japan, Korea and Australia are economically advanced countries, with significant proportions of their populations already

aged over 65. Other countries such as China, India and Indonesia are experiencing a rapid pace of population ageing. Over the next 15 years, the proportion of the population aged 65 and over is projected to rise from 9.5 to 16.2 % in China, from 5.5 to 8.2 % in India and from 5.4 to 9.2 % in Indonesia. These countries have a small window in which to respond to changing population needs, taking advantage of lower fertility rates and better health, preventing a rise in chronic disease, promoting and supporting healthy ageing and participation, and providing for the care of increasing numbers of frail older people. This symposium presents perspectives from the Asia/Oceania region considering the vast demographic change and diversity across many countries at different stages of development and transition, as well as economic diversity and health inequity among people within different countries. We will also debate the regional and local responses to population ageing, and how these are playing out across the region to enable optimal health and participation by older people and to maximize the potential for future generations to age well.

AN OVERVIEW OF AGING IN THE ASIA/OCEANIA REGION: DEMOGRAPHY, PROJECTIONS, UNIQUE ELEMENTS

D. Peng, *Renmin University, Beijing, China*

Most of the world's older people live in the Asia/Oceania region, which includes a diversity of countries at different stages of economic development, and different stages and pace of demographic and epidemiological transition. Japan, Korea and Australia are economically advanced countries, with significant proportions of their populations already aged over 65. Other countries such as China, India and Indonesia are experiencing a rapid pace of population ageing. Over the next 15 years, the proportion of the population aged 65 and over is projected to rise from 9.5 to 16.2 % in China, from 5.5 to 8.2 % in India and from 5.4 to 9.2 % in Indonesia. This presentation will provide an overview of these population trends, similarities, differences and challenges for this highly diverse region, setting the scene for subsequent presentations.

AGEING AND CHRONIC DISEASE IN INDONESIA—ASSESSING AND RESPONDING TO INEQUITY

Y. Christiani, *Credos Institute, Jakarta Selatan, Jakarta, Indonesia*

Indonesia is experiencing a rapid pace of population ageing. From the current proportion of 7.6%, it is projected that the proportion of older people aged 60 years or over in 2045 will reach 28.7%.

Despite the increasing proportion, the health of older people is relatively poor, with chronic disease as the most common health problem experienced by older people. Additionally, the inequality in health infrastructure, local income, socioeconomic, and development stage between provinces and districts, has led into the inequalities in health among older people.

This session will describe the burden of chronic disease among older people in Indonesia, and the inequalities between regions/provinces, gender, and socioeconomic group. Next, policies and programs to improve older people's health, and their potential impact, will be presented. These include the

community-based health program for older people, and the newly endorsed Ministry of Health's strategic plan for a healthy ageing program.

WPRO REGIONAL FRAMEWORK FOR AGEING AND HEALTH: FROM POLICY TO PROGRESS

A. Bhushan, *World Health Organization | Regional Office for the Western Pacific, Manila, Philippines*

The *Regional framework for action on ageing and health in the Western Pacific Region, 2014–2019* guides WHO's technical collaboration with Member States in the Region to prepare for population ageing and ensure that efforts towards universal health coverage include adequate responses to older people's health and related needs. The framework contains recommended actions across four pillars: (i) fostering age-friendly environments through action across sectors; (ii) promoting healthy ageing over the life-course and preventing functional decline and disease among older people; (iii) reorienting health systems to respond to the needs of older people; and (iv) strengthening the evidence base on ageing and health.

RESPONDING TO GENERATIONAL CHANGE IN OLDER PEOPLE'S NEEDS: A CASE STUDY OF POLICY REFORM

J. Byles, *Research Centre for Generational Health and Ageing, The University of Newcastle, Newcastle, New South Wales, Australia*

In 2010–11, the Australian Productivity Commission conducted an inquiry into caring for older Australians, consulting widely with older people, their carers, aged care providers, government agencies and other interested parties. The findings prompted major reforms to the delivery and funding of aged care, including an increased emphasis on community care for frail older people living at home, and the introduction of consumer directed care. The reforms look to improve access to care, better meet individual needs, and foreshadow a generational shift in expectations of independence in later life. This presentation will consider some of the major issues identified by the productivity commission, how the reforms are designed to address these issues, and how they fit with the projected needs and expectations of older people.

SESSION 4055 (SYMPOSIUM)

UNDERSTANDING AND ADDRESSING SOCIAL ISOLATION AND LONELINESS AMONG OLDER PEOPLE

Chair: C. Waldegrave, *Family Centre Social Policy Research Unit, Lower Hutt, Wellington, New Zealand*
Co-Chair: T. Scharf, *Newcastle University, Newcastle upon Tyne, United Kingdom*

This symposium will explore the social processes and impacts of Social Isolation and Loneliness (SI&L) on the health and wellbeing of older citizens across differing countries and contexts. There is a growing body of research that links SI&L to greater ill-health and shorter life spans (Holt-Lunstad et al 2015).

Considerable scientific attention has been given to life-style (e.g. smoking) and environmental (e.g. pollution) factors

as risks to mortality, but far less scientific attention has been accorded to social factors despite known significant associations between loneliness and specific mental health (e.g. depression) and physical health (e.g. systolic blood pressure) conditions. The growing international evidence on the impacts of SI&L has profound implications for positive health status and substantially reduced health and welfare budgets.

For these implications to be realised, new studies are required to enable the early detection of pathways in and out of SI&L. The four presentations, involving recent research projects from New Zealand, England, Belgium and Italy present a broad range of new evidence from differing contexts, including quantitative and qualitative datasets, pathways in and out of SI&L and policy implications. Focus will be given to multiple domains of SI&L, including spatial contexts, social relations, community participation, health and well-being, economic trends, elder abuse and ethnic dimensions.

After attending this symposium, participants will have a clear understanding of SI&L in terms of: (1) the broad contextual dimensions; (2) the measurable negative impacts, (3) pathways in and out of SI&L, and (4) useful policy dimensions.

RECENT TRENDS ON SOCIAL ISOLATION AND LONELINESS AMONG OLDER PEOPLE IN ITALY

G. Lamura¹, M. Melchiorre, E. Cela³, 1. *INRCA - National Institute of Health and Science on Ageing, Ancona, Marche, Italy*, 3. *Università Politecnica delle Marche, Ancona, Marche, Italy*

This presentation will provide a basic understanding of how social isolation and loneliness in older age are experienced in Italy. Through the use of both national data and findings from comparative studies, it will be highlighted how social and economic trends are affecting older Italians in this regard, including relationships and contacts with family members, neighbours, friends and the wider society. The connection with elder abuse will be also analysed, as a clear association has been found between social isolation and elder abuse. Finally, recent evidence suggests also that migrants might experience these phenomena differently than native Italians. In particular, findings concerning the Albanian and Moroccan ethnic groups (two of the largest in the country) show that their relatively large networks of close family members and other relatives protect them from social isolation, but not from loneliness, due to the lack of relationships with non-kin co-ethnic peers.

UNEQUAL SOCIAL RELATIONSHIPS: EVIDENCE FROM ENGLAND

T. Scharf¹, S. Bamford², B. Beach², 1. *Institute of Health & Society and Institute for Ageing, Newcastle University, Newcastle, United Kingdom*, 2. *ILC-UK International Longevity Centre, London, United Kingdom*

Growing evidence points to the influence of social relationships on morbidity and mortality outcomes in later life. With the quantity and quality of individuals' social relationships increasingly a concern for public health, this paper explores the scale and nature of inequalities that

characterise the social relationships of people aged 50 and over in England. A central focus is on social isolation and loneliness. The paper draws on evidence from a multi-stage scoping review of inequalities in later life, conducted within the methodological framework suggested by Arksey and O'Malley (2005). The review explores inequalities in terms of personal social relationships that are associated with the characteristics of gender, age, ethnicity, socio-economic status, and place of residence. The review process assesses not only the quality and strength of evidence concerning unequal social relationships in later life, but also identifies promising opportunities for interventions to narrow inequalities in such relationships.

SOCIAL RELATIONS ACROSS THE LIFE COURSE: PATHWAYS TO AND FROM SOCIAL EXCLUSION

S. Van Regenmortel, A. Smetcoren, D. Verté, B. Fret, D. Lambotte, S. Dury, L. De Donder, *Vrije Universiteit Brussel, Brussels, Belgium*

Research on old-age social exclusion seldom takes a life course perspective into account. Therefore, this study aims to explore how older adults experience social relations across the life course and how inclusion in or exclusion from social relations is associated with other social exclusion dimensions (e.g. material resources and participation). Data were collected through 44 life story interviews with older adults (60+) living in Belgium. The interview scheme was based on McAdam's life story method (2008). Findings reveal that social relations can help to cope with experiences of exclusion and might protect from exclusion (e.g. material resources). Besides, exclusion from meaningful social relations earlier in life has lifelong influences. As social relations and events in social networks affected older adults' social exclusion, the principle of linked lives was supported by this study. Conversely, life stories also revealed older adult's influence on other lives.

HEALTH AND WELL-BEING IMPACTS OF BOTH SOCIAL CONNECTION AND LONELINESS AMONG OLDER PEOPLE

C. Waldegrave, *Family Centre Social Policy Research Unit, Lower Hutt, Wellington, New Zealand*

There is a growing body of research that links loneliness and isolation to greater ill-health and shorter life spans. This presentation will provide results from the New Zealand Longitudinal Study of Ageing (NZLSA). Amartya Sen's capabilities approach has formed the conceptual basis of the theoretical framework of this research programme (Sen, 1999). Two survey waves of a national random sample in excess of 3,000 older New Zealand citizens aged between 50 to 86 years have been carried out, which included scales and various questions on health, well-being, social connections and loneliness. The results demonstrated highly significant relationships between the domain scales and the health and well-being scores. Higher loneliness scores were strongly associated with lower health and well-being scores, whereas higher social connection scores were strongly associated with higher levels of health and well-being. The analysis and conclusions include attention to likely causal connections and policy implications.

SESSION 4060 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: A GLOBAL PERSPECTIVE ON WORK, AGING, AND COGNITIVE FUNCTIONING—TYPE OF WORK MAKES A DIFFERENCE

Chair: U.M. Staudinger, *Columbia University, New York, New York*

Co-Chair: A. Börsch-Supan, *Max Planck Institute for Social Law and Policy, Munich, Germany*

Discussant: M. van der Waal, *International Longevity Center Netherlands, Leyden, Netherlands*

Work is an important environment shaping the aging processes during the adult years. In that regard its characteristics and their cumulative as well as acute effects on physical and mental health in later life deserve great attention. Given that population aging has become a global trend with ensuing changes in the global labor market, increased attention is paid to investigating the effects of the timing of retirement around the world and the macroeconomic benefits often associated with delaying retirement. It will be essential for societies with aging populations to maintain productivity given an aging workforce and for individuals it will be crucial to add healthy and meaningful years rather than just number of years to their lives. The symposium presents first results from a unique international consortium of researchers from 8 countries pursuing the same analytical scheme and using harmonized data sets. During the symposium we will first discuss latest data on labor-force participation of older workers in eight countries, will discuss the influences that might govern labor-force participation of older adults, and thirdly present evidence from the same eight countries with regard to association between working at later ages and cognitive functioning as a function of type of job and of the amount of control available at the job.

WORK, AGING, AND COGNITIVE FUNCTIONING IN GERMANY AND THE UK: TYPE OF WORK MAKES A DIFFERENCE

B. Beach¹, F. Hanemann^{2,3}, 1. *International Longevity Centre - UK, London, United Kingdom*, 2. *Munich Center for the Economics of Aging (MEA), Munich, Germany*, 3. *Max-Planck-Institute for Social Law and Social Policy, Munich, Germany*

As part of a collaborative cross-national study which explores the health effects of retirement, we present early findings from analyses of the English Longitudinal Study of Ageing (ELSA) and the Survey of Health, Ageing, and Retirement in Europe (SHARE). We examine the relationship between age, occupational factors, retirement, and cognitive function in the comparative context of Germany and England. Cognitive function is measured by immediate and delayed word recall, an established measure for memory performance.

Results suggest that cognitive decline in later life is influenced not only by age but also by occupation type and working status, while country-specific results are related to institutional settings and to national labour market circumstances. The findings demonstrate that age alone is

insufficient to explain the cognitive decline, whereas work-related and institutional factors play a substantial role.

WORK, AGING, AND COGNITIVE FUNCTIONING IN FRANCE: TYPE OF WORK MAKES A DIFFERENCE

D. Halimi^{1,2}, M. Brieu^{1,2}, J. Salord¹, F. Forette^{1,2}, 1. *International Longevity Center-France, Paris, France*, 2. *Paris Descartes University, Paris, France*

ILC-France promotes health and activity in the aging population and its recent studies have shown that delaying by one year the retirement in self-employed persons is associated with a decrease in the incidence of Alzheimer Disease. In this country-comparative study, we first inspected the labor force participation of the 50+ in France in 2014: it has been very low. France is the only country with no gender difference in LFP. Most men are in high-skilled white-collar jobs, most women in high-skilled white and blue-collar jobs.

Regarding the association between work and cognitive performance, the French data from the 4 SHARE waves (N=15479, age 50–70) show that retirement hurts white and blue-collar workers alike with very similar slopes at different levels of performance. Multivariate analyses demonstrated that cognitive decline in later life is influenced not only by age but also by education and to a lesser degree control at work.

WORK, AGING, AND COGNITIVE FUNCTIONING IN THE CZECH REPUBLIC

I. Holmerova, *CELLO Faculty of Humanities, Charles University in Prague, Praha 8, Czech Republic*

People in the Czech Republic retire usually at the age of statutory retirement which is relatively low. One third retires even earlier. Only 15 % people after this age work. Women in the Czech Republic leave the labour market earlier due to different statutory retirement age for each gender (62.5 for males, 60,5 for females). With recent changes of the retirement system, the statutory retirement age will gradually increase and more people with cognitive decline will stay at work. Results from SHARE data suggest that cognitive decline in later life is influenced not only by age but also by occupation type and working status. The interference of age, work and cognitive decline has many facets that should be addressed. It is not only issue of prevention of cognitive decline but also of involvement and support of older people in general, older people with cognitive decline and dementia at their work.

WORK, AGING, AND COGNITIVE FUNCTIONING IN ISRAEL: TYPE OF WORK MAKES A DIFFERENCE

S. Carmel¹, A. Tur-Sinai², I. Klein-Avraham¹, Y. Bachner¹, 1. *Public Health, Ben-Gurion University, Beer-Sheva, P.O.Box 653, Israel*, 2. *The Max Stern Yezreel Valley College, Yezreel Valley, Israel*

We used data collected in two waves of interviews (2009-T1 and 2013-T2) from the Survey of Health, Aging and Retirement in Europe (SHARE). We included 679 participants out of the Israeli sample (N=1645), who retired from work (early/on time/late), and completed T1 and T2-interviews. The memory score was calculated as the mean of 10 words

recalled in two memory tests (immediate/delayed), ranging 0–20. Significant predictors of memory decline (MD) in a hierarchical regression analysis (Model-1) were: total words remembered at T1, T1-ADL, T1-depression, depression change, T1-age, and T1-education. Early retirement and work type, added to Model-2, were found significant predictors as well, increasing significantly the explained variance of MD (from $R^2=0.28$ to $R^2=0.44$). We conclude that early retirement and work type are significant predictors of MD even when controlling for socio-demographic characteristics, health/function status and changes in health/function. Appropriate interventions to reduce decline in cognitive capabilities should be developed.

WORK, AGING, AND COGNITIVE FUNCTIONING IN JAPAN: TYPE OF WORK MAKES A DIFFERENCE

D. Watanabe, *Seikei University, Musashino, Tokyo, Japan*

This study aims to examine relationship between type of work, retirement process and cognitive functioning in old age. I used macro statistics and panel data from the Japanese Study of Aging and Retirement (JSTAR) to compare with other countries' data (HSR, SHARE, and ELSA). Cognitive function is measured by word recall test.

Based on national statistics, Japanese labor force participation is somewhat higher than European developed countries. The result of descriptive analysis and panel data analysis of JSTAR data is that the cognition score of high-skilled white collar is better than blue collar's one, however is not different from not-working. Additionally, small educational differences exist.

The result is very contrast to European developed countries' evidences. The results suggest the importance of social and institutional aspects of an employment management system and a well-developed inner labor market in Japan.

SESSION 4065 (SYMPOSIUM)

ELDER-CENTERED COMMUNITY CARE: REVISING AND STRENGTHENING CAREGIVING IN ALASKA NATIVES

Chair: R.M. Rosich, *University of Alaska, Anchorage, Anchorage, Alaska*

Co-Chair: J.P. Lewis, *University of Alaska Anchorage, Seattle, Washington*

Discussant: M.C. Crouch, *University of Alaska Anchorage, Wasiila, Alaska*

There is a growing field of research on the health impacts for caregivers and the available and needed support services in rural and tribal communities. Research has mostly focused on a specific western definition of caregiver (i.e., primary caregiver) and the pre-supposed supports needed for these individuals based on a dominant paradigm. In the dominant, western caregiver dyads, there tends to be the individual with Alzheimer's Disease and Related Disorders (ADRD) and their primary caregiver whose role is to take charge of their care, finances, support, and so on. In many cases, it is a family member who assists a person with dementia and their Activities of Daily Living (ADLs). However, the current field of research recognizes that cultural frameworks are an important influence in a family's and community's

approaches to caring for their loved one with dementia. This symposium will discuss the current western models of caregiving dominant in the United States and Alaska, focusing on person centered care, and how they differ from the community-based elder-centered models of care found to be emerging in rural Alaska. We will also share findings from a study to discuss the cultural beliefs of Alaska Native caregivers and Elders around (ADRD) and caregiving. In addition, we will also highlight how these findings can influence policy change to encourage rural and urban agencies and service providers to provide more culturally sensitive and meaningful care.

PERSON-CENTERED CARE AND ALZHEIMER'S DISEASE AND RELATED DISORDERS: ALASKA NATIVE CAREGIVING

R.M. Rosich, *School of Allied Health, University of Alaska, Anchorage, Anchorage, Alaska*

It has been difficult to access prevalence rates for ADRD's within Alaska Natives, however a study focusing upon Alaska Native Elder perceptions of memory functioning/dementia is indicating that is occurring. This study is also indicating that there is a need to understand the health experiences of Alaska Native communities from non-native perspectives in order to develop and implement culturally appropriate and effective supports for Alaska Native primary caregivers dealing with dementia. Within the United States, as well as regionally within Alaska, person centered care (PCC) is an approach that is being utilized with caregivers in meeting the needs of persons with dementia. Although PCC as a concept holds universal appeal, it holds a different meaning for Alaska Natives. This presentation will focus upon person centered care from a western perspective and sets the stage as to how it differs from a community-based elder-centered model of care emerging within rural Alaska.

CAREGIVING AND THE ALASKA NATIVE ELDER: SPIRITUALIZING AND INDIGENIZING SYSTEMS OF CARE

M.C. Crouch, *University of Alaska Anchorage, Anchorage, Alaska*

Alaska Native (AN) peoples represent eight distinct tribal groups comprised of over 220 federally recognized tribes. The diversity and complexity of AN culture is vast and ubiquitous. However, in the face of tribal autonomy, AN peoples share common beliefs, goals, and challenges to care which are made manifest by geography, cultural expectations, access to resources, and the predominance of Western systems of care and caregiving. Preliminary, qualitative analyses of interviews with AN Elders (n =11) concerning indigenous perspectives on Alzheimer's disease and dementia resulted in perceptions rooted in cultural belief systems, spirituality, and holistic approaches to systems of care and familial caregiving. Findings reflect the imperativeness of indigenizing care for AN Elders that represents their lived realities, cultural practices, and accounts for geographic location, cultural diversity, and community-focused, collectivist approaches to the AN lifecycle. Healthcare systems providing services to AN populations could benefit from Elder-centered conceptualizations and approaches to caregiving.

HOW ELDER-CENTERED CAREGIVING MODELS IN RURAL ALASKA INFLUENCE POLICY TO IMPROVE CAREGIVING

J.P. Lewis, 1. *University of Alaska Anchorage, Anchorage, Alaska*, 2. *WWAMI School of Medical Education, Anchorage, Alaska*

With the growing diversity of the US population in both rural and urban settings, the need for more culturally sensitive and meaningful frameworks and models of caregiving is growing. Based on the experiences of Alaska Natives, this presentation will discuss the need for cultural approaches to policies and programs targeting urban and rural caregivers. We will discuss recommendations for organizations and communities to modify policy and programs to effectively meet the unique family and community approaches to caregiving. The findings of this presentation have relevance for other racial and ethnic minority communities who provide caregiving from a community-based, elder-centered approach. These findings can influence policy change to encourage rural and urban agencies and service providers to provide more culturally sensitive and meaningful caregiving services.

SESSION 4070 (SYMPOSIUM)

CUMULATIVE ADVANTAGE AND ECONOMIC WELL-BEING: CHALLENGES OF WIDENING LATE-LIFE INEQUALITY

Chair: C.E. Bishop, *Brandeis University, Weston, Massachusetts*

Co-Chair: S. Crystal, *Rutgers University, New Brunswick, New Jersey*

As concentration of income and wealth at the top of the income distribution attracts increasing concern, this symposium focuses on income and health inequalities among current and future older adults in the US. Late-life well-being reflects the cumulative effects of life chances and choices as they interact with institutional structures. Outcomes evolve from health and economic status at birth through educational attainment, marital trajectory, labor market outcomes, and own/family health. Social insurance programs buffer cumulative disadvantage but leave substantial disparities, especially because those with lower lifetime incomes face poorer health and survival.

The first presentation examines the changing profile of economic inequality by age and cohort over three decades using a comprehensive measure of economic well-being. Results demonstrate rising old-age inequality and presage even higher future rates of inequality as high-inequality cohorts now at midlife reach old age.

The second presentation draws attention to financial factors, including access to pensions and escalating personal debt, that combine to widen income disparities for older adults. Differential longevity magnifies the impact of these trends.

The third presentation estimates the impact on health disparities at older ages of disparate access to opportunity in young adulthood and of childhood disadvantage, stressing changes for successive cohorts of Americans.

The final presentation projects future late-life inequality, highlighting the impact of out-of-pocket spending for

medical and long-term services and supports on economic well-being. Social insurance reforms, including changes to Social Security and Medicare and new insurance programs for older adults with disabilities, could improve outcomes for low-income seniors.

GLOBALIZATION, CUMULATIVE ADVANTAGE, AND INEQUALITY: IMPLICATIONS FOR RETIREMENT INCOME SYSTEMS

S. Crystal¹, D.G. Shea², A. Reyes², 1. *Rutgers University, New Brunswick, New Jersey*, 2. *Pennsylvania State University, State College, Pennsylvania*

Structural changes in economic systems have driven increased income inequality across developed nations in recent decades. Despite much attention to overall increases in income inequality, there has been less attention to the impact of these forces on late-life economic inequality and the age distribution of economic well-being. These developments have powerful implications for retirement income systems, which can either buffer or magnify the impacts of processes of cumulative advantage and disadvantage over the lifecourse. This presentation will examine these issues, drawing on an analysis of evolving patterns of economic inequality by age and cohort between the mid-1980s and the current decade in the U.S., using a comprehensive measure of economic well-being. Results demonstrate rising old-age inequality over this period and presage even higher rates of inequality in coming decades, as high-inequality cohorts now at midlife reach old age. Implications for retirement income policies will be discussed in international context.

INEQUALITY IN WELL-BEING AT OLDER AGES: FOCUS ON FINANCES

T. Ghilarducci, *New School for Social Research, New York, New York*

Gaps in economic and health security, life satisfaction and happiness, and morbidity and life expectancy have grown among the elderly in the last 20 years and are expected to grow larger for the next cohort of retirees. Using data from the Health and Retirement Survey and other supplemental surveys -- including the Survey of Consumer Finance -- this paper documents the growth of inequality for American elders along many dimensions. Factors related to the increasing inequality among the elderly include the erosion of employee pensions and gaps in gains to longevity by race and sex. Increasing debt levels among elderly in the middle- and lower-income groups also contribute to inequality in wealth, income, and economic security. This paper provides a template for other nations to assess well-being inequality in a nation and among groups by gender, class and other pertinent categories that identify subaltern groups.

COHORT SHIFTS IN PATHWAYS TO LATE-LIFE FUNCTIONAL LIMITATIONS AMONG BLACK AND WHITE MEN

J.A. Kelley-Moore¹, R.J. Thorpe², D. Dannefer¹, 1. *Case Western Reserve University, Cleveland, Ohio*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

In the discourse of life course and inequality, little research has examined how shifting opportunity structures

across cohorts have contributed to the rapid expansion of later-life health disparities in past decades. We use data from five cohorts of the *Health and Retirement Study*, with a two-stage selection modeling process, to examine how differential access to social institutions in early adulthood (education, work, military), leads to later-life functional limitations among Black and White men via midlife morbidity and income. In early cohorts, race drives access to these social institutions, thus is a key indicator of functional disparities in late life. However, in later cohorts, racial disparities diminish while childhood dis/advantage becomes the primary determinant of functional limitations via access to early adulthood institutions. We discuss social forces that have suppressed social mobility, effectively “locking in” men to the social class of their family of origin, with implications for health disparities.

ASSESSING POLICY OPTIONS TO ADDRESS WEALTH AND HEALTH INEQUALITY AT OLDER AGES

R.W. Johnson, *The Urban Institute, Washington, District of Columbia*

Ongoing social, economic, and demographic trends have increased economic inequality among working-age families. These trends are also raising inequality at older ages, because income and wealth in later life depend largely on how much people earned at younger ages. The growing cost of medical care and long-term services and supports accentuates late-life inequality because people with few financial resources often have more serious health problems than wealthier adults. This study examines how the distribution of late-life income and wealth will likely evolve over the next 40 years and shows how alternative public policies could shift outcomes. Results show that carefully targeted reforms to Social Security, Medicare, and Supplemental Security Income and new financing options for long-term services and supports could reduce late-life inequality. Simulations come from DYNASIM, a dynamic microsimulation model that incorporates the latest economic, demographic, and health data.

SESSION 4075 (SYMPOSIUM)

FALL INJURIES IN OLDER MEN AND WOMEN: NOVEL ASSESSMENTS AND PREDICTORS

Chair: E.S. Strotmeyer, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Discussant: D.M. Buchner, *University of Illinois, Champaign, Illinois*

Falls are associated with reduced physical function in older adults. However few large epidemiologic cohort studies have characterized fall injuries that were self-treated or all injuries treated in outpatient and inpatient settings. The Study of Osteoporotic Fractures in Men (MrOS) is an ongoing cohort of ambulatory men (N=5,994; 10% minorities; 2000–02 enrollment) aged ≥ 65 years at 6 U.S. sites. The Study of Women’s Health Across the Nation (SWAN; N=3,302; 53% minority; 1996 enrollment) is an ongoing multi-racial/ethnic cohort of women from 7 U.S. sites followed through menopausal transition for 20 years and now in early old age. The Health, Aging and Body Composition (Health ABC) Study enrolled well-functioning, ambulatory

Medicare beneficiaries, aged 70–79 years (N=3,075; 52% women, 42% black) at 2 U.S. sites in 1997–98. Each study collected self-reported falls and fall injuries, including non-fracture and fracture injuries. Additionally Health ABC linked Medicare Fee-For-Service claims from denominator, inpatient, outpatient, physician/supplier, and carrier files to treated fall injuries and fractures over 8 years. Perceived fatigue levels will be associated with fall risk in MrOS men (Welburn). Sensory peripheral nerve impairments will be described as fall and fall injury risk factors in SWAN women (Ylitalo). Quadriceps strength will be related to incident fall injuries in Health ABC (Winger). Medicare payments will be compared pre- vs. post-injury for non-fracture and fracture fall injuries in Health ABC (Strotmeyer). The Discussant (Buchner) will focus on the importance of all fall injuries, including self- or outpatient-treated, as these may be early signs of late life decline.

ASSOCIATION BETWEEN FATIGUE AND INCIDENT FALLS IN OLDER MEN: THE OSTEOPOROTIC FRACTURES IN MEN STUDY

S.C. Welburn¹, A.J. Santanasto¹, T. Blackwell², N. Lane³, E. Orwoll⁴, J.A. Cauley¹, N.W. Glynn¹, R. Boudreau¹, 1. *Department of Epidemiology, University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania*, 2. *California Pacific Medical Center Research Institute, San Francisco, California*, 3. *Departments of Medicine and Rheumatology, University of California Davis Medical Center, Sacramento, California*, 4. *Bone and Mineral Unit, Oregon Health and Science, Portland, Oregon*

Fatigue is a component of frailty; both fatigue and frailty are associated with lower physical function. Frailty is a known fall risk, but the independent contribution of fatigue to fall risk is unclear. This association was examined in 5,994 men aged 64–100. Fatigue was measured “during the past four weeks, how much time did you feel energetic?” then classified (fatigued=none, little, some; non-fatigued=good bit, most, all). Incident falls were captured using triannual questionnaires over three years. Men with fatigue (25%) were older (75.1 ± 6.2 vs. 73.2 ± 5.7 years), less active (Physical Activity Scale for Elderly= 118.7 ± 62.1 vs. 155.9 ± 67.7), and lower functioning (narrow walking speed= 1.05 ± 0.27 vs. 1.18 ± 0.26 m/s) than non-fatigued (all $p < 0.0001$). Fatigued versus non-fatigued men had 26% higher fall risk (RR=1.26, 95%CI:1.15, 1.40) adjusted for demographics, fall history, medications, activity, and function. Perceived fatigue is an important risk factor of falling and, if reduced, may lessen the burden of falls in older men.

PERIPHERAL NERVE IMPAIRMENT PREDICTS INCIDENT INJURIOUS FALLS: THE SWAN STUDY

K. Ylitalo¹, C.A. Karvonen-Gutierrez², Q. Peng², 1. *Baylor University, Waco, Texas*, 2. *University of Michigan, Ann Arbor, Michigan*

Falls and related injuries are an important public health concern but are underappreciated in non-elderly populations. This study examined the association between peripheral nerve impairment (PNI) and falls among mid-life women. Women (n=297) from Michigan SWAN completed a neuropathy symptom questionnaire and 10-g standard monofilament testing in 2012; PNI was defined as report of

≥4 symptoms or monofilament insensitivity. Falls and injurious falls in the previous 12 months were assessed in 2013. Women with PNI were more likely to report a fall (35.0% vs. 19.0%, $p < 0.01$) and injurious falls (26.7% vs. 9.7%, $p < 0.001$) as compared to women without PNI. Women with PNI had 3 times increased odds (OR=3.38, 95% CI 1.65–6.92) of injurious falls as compared to women without PNI; this association persisted in stratified analyses among women with and without diabetes. Clinical neuropathy screening instruments may identify mid-life women with and without diabetes at high risk for fall injury.

QUADRICEPS STRENGTH AND FALL INJURIES IN MEDICARE CLAIMS: THE HEALTH ABC STUDY

M. Winger¹, R. Boudreau¹, A. Newman¹, J.A. Cauley¹, P. Caserotti², T. Harris³, T. Waters⁴, E.S. Strotmeyer¹, 1. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *University of Southern Denmark, Odense, Denmark*, 3. *National Institute on Aging, Bethesda, Maryland*, 4. *University of Tennessee, Memphis, Tennessee*

Lower extremity quadriceps strength is an important risk factor for falls and may be related to fall injury. We examined baseline quadriceps strength with a Kin-Com isokinetic dynamometer in 1997–98 for 2,058 Health ABC Study participants (52% women, 37% black; aged 73.4 ± 2.8 years) and total fall injuries (28.3%), non-fracture fall injuries (6.7%) and fractures (21.6%) in Medicare Fee-For-Service Parts A and B claims over 8.7 ± 3.3 years. In Cox proportional hazards regression models adjusted for age and race, 1 Nm/kg lower quadriceps strength/kg was associated with higher fall injury risk (HR=1.7; 95% CI=1.4–2.0), though became non-significant with further adjustments for sex (HR=1.2; 95% CI=0.9–1.5), as well as height, site, education, diabetes, total medications and cognition (HR=1.1; 95% CI=0.8–1.4). Results were consistent for non-fracture fall injury (HR=0.9; 95% CI=0.6–1.5) and fractures (HR=1.1; 95% CI=1.0–1.1). Weaker quadriceps strength/kg body weight was associated with higher fall injury risk, though not independent of demographics and disease-related factors.

MEDICARE PAYMENTS FOR NON-FRACTURE AND FRACTURE FALL INJURIES: THE HEALTH ABC STUDY

E.S. Strotmeyer¹, R. Boudreau¹, L. Xue¹, J.A. Cauley¹, J.M. Donohue¹, T.B. Harris², A. Newman¹, T. Waters³, 1. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *National Institute on Aging, Bethesda, Maryland*, 3. *University of Tennessee, Memphis, Tennessee*

Fall injuries are prevalent in older adults. Whether higher costs occur after both non-fracture and fracture fall injuries is unknown. Medicare payments for 1,790 Health ABC participants (53% women, 37% black; 76.5 ± 2.9 years), were examined 12 months before and after incident fall injuries over 8 years. Non-fall injury participants were matched on utilization in fall injury claim month, with payments/month calculated for 12 months prior vs. after index date. Increased payments/month occurred after vs. prior to total (N=473, 26.4%; \$2,602 vs. \$1,530), non-fracture (N=102, 5.7%; \$2,520 vs. \$1,523), and fracture (N=371, 20.7%; \$2,624 vs. \$1,532) fall injuries (all $p < 0.01$). In generalized linear regression with centered outcomes and gamma distributions, fall

injuries (total, non-fracture or fractures) were not associated with higher increases in payments/month vs. other utilization, adjusting for demographic/lifestyle, body composition, medication and comorbidity factors. Fall injuries were not independently associated with higher Medicare payments after injury vs. other events.

SESSION 4080 (SYMPOSIUM)

DETECTING FRAIL OLDER PEOPLE: A VARIETY OF DOMAINS AND WHY WE SHOULD NOT FOCUS MERELY ON DEFICITS

Chair: J. Schols, *Maastricht University, Maastricht, Netherlands*

Co-Chair: G. Zijlstra, *Maastricht University, Netherlands*

Discussant: A.E. Stuck, *Department of Geriatrics, University Hospital, University of Bern, Bern, Switzerland*

Detection is a crucial first step in treating frailty in older people. Over the past decades, many screening tools have been developed to identify frailty in older people. Despite the importance of multiple domains, only a small number of instruments take different frailty domains into account. Nonetheless, by measuring frailty in a multidimensional manner, treatment plans could be more tailored. Therefore, instruments addressing multiple domains having good psychometric properties are crucial.

This international symposium with presenters from Belgium and the Netherlands will give an overview of the development and improvement of screening tools for multidimensional frailty. Our first presenter will present frailty profiles according to the Comprehensive Frailty Assessment Instrument (CFAI). This self-administering instrument measures physical, psychological, social, and environmental frailty. Our second presenter will explain why and how to add the domain of cognitive frailty to this instrument. Since frailty can be considered as a balance between deficits and resources, the third presenter will discuss the relevance of balancing factors in measuring frailty. The fourth presenter will compare performance-based assessments of physical frailty with questionnaire outcomes. Finally, our last presenter will discuss the administration of the Maastricht Frailty Screening Tool for Hospitalized Patients (MFST-HP) in an acute hospital setting, from a nursing point of view. Our discussant, Andreas Stuck from Switzerland, will reflect on the presented instruments and their added value for daily clinical practice. The audience will be invited to participate in the discussion.

CREATING INDIVIDUAL FRAILTY PROFILES USING THE CFAI

N. De Witte, 1. *Faculty of Education, Health and Social Work, University College Ghent, Ghent, Belgium*, 2. *Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium*

The Comprehensive Frailty Assessment Instrument (CFAI) was developed in 2013 in order to assess frailty in community dwelling older people. This multidimensional, self-administered instrument measures the physiological, psychological, social and environmental domain of frailty. Based on the dataset of the Belgian Ageing Studies,

performed in over 142 communities in Belgium, 22.9% of community dwelling older people was classified as 'very frail' and 33.9% as 'mild frail'. For the subdomains, 16.5% was very physically frail, and 9.0, 20.6% and 14.8% were very frail on the psychological, social and environmental domain, respectively. An innovative aspect of the CFAI is that for each individual, a specific frailty profile can be created, showing the total level of frailty and the level of frailty in the four domains (no, mild, high). As a consequence, tailor-made and individualized interventions can be developed, including preventative for those domains where the individual scores no or mild frail.

DETECTION OF COGNITIVE FRAILTY WITH THE COMPREHENSIVE FRAILTY ASSESSMENT INSTRUMENT

E.E. DeRoock^{1,2}, N. De Witte^{2,3}, S. Dury², M. Bjerke¹, P. De Deyn¹, S. Engelborghs¹, E. Dierckx², D. Consortium², 1. *University of Antwerp, Antwerp, Belgium*, 2. *vrije universiteit brussel, Brussels, Belgium*, 3. *HoGent, Gent, Belgium*

The Comprehensive Frailty Assessment Instrument (CFAI) measures four domains of frailty: physical, psychological, social and environmental frailty. The absence of cognitive frailty can be seen as a shortage. Therefore we conducted a study in which we administered to 355 older adults (mean age 77.62) the CFAI, The Montreal Cognitive Assessment (MoCA) and 6 questions about cognition that were chosen by an expert panel and based on the Informant Questionnaire on Cognitive Decline in the Elderly (IQCODE). Based on multivariate analysis with SIMCA software and Receiver operating curves two uninformative questions were excluded. The sum of the four remaining questions forms the new cognitive frailty domain. This domain shows good concurrent validity with the MoCA and with the added questions the reliability of the CFAI remains good (Cronbach's alpha: .789). So in sum, cognitive frailty can be added to the CFAI.

DEVELOPING AN INSTRUMENT TO MEASURE FRAILTY BALANCE IN COMMUNITY-DWELLING OLDER PEOPLE

A. van der Vorst¹, G. Zijlstra¹, N. De Witte^{2,3}, J. Schols^{1,4}, G. Kempen¹, D. Consortium³, 1. *Department of Health Services Research, Care and Public Health Research Institute (CAPHRI), Maastricht, Netherlands*, 2. *Faculty of Education, Health and Social Work, University College Ghent, Ghent, Belgium*, 3. *Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium*, 4. *Department of Family Medicine, Care and Public Health Research Institute (CAPHRI), Maastricht, Netherlands*

While existing frailty instruments focus merely on deficits, it is important to assess resources and competences as well to gain insight into the actual care needs of frail older people. To get more insight into possible 'balancing factors' in frailty, 121 community-dwelling people aged ≥ 60 years were interviewed. Multidimensional frailty was measured using the Comprehensive Frailty Assessment Instrument (CFAI), and subsequently a qualitative interview focusing on issues that matter for older people to maintain their quality of life, despite being frail, was held. Initial findings indicate that various coping mechanisms (e.g. optimization, selection,

and compensation; and reassuring thoughts), formal and informal care, the physical (e.g. home adaptations) and psychological (e.g. attachment to home) environment, social support, and spirituality may play an important role in this frailty balance. Future research is needed to specify the most important balancing factors, after which these can be incorporated into a frailty balance measurement tool.

CAN SELF-REPORT QUESTIONS REPLACE FRIED'S PHYSICAL FRAILTY PERFORMANCE MEASURES? A VALIDATION STUDY

L. Op het Veld^{1,2}, H. de Vet³, G. Kempen², E. van Rossum^{1,2}, A. Beurskens^{1,2}, S. van Kuijk⁴, 1. *Centre of Research Autonomy and Participation for Persons with a Chronic Illness, Zuyd University of Applied Sciences, Heerlen, Netherlands*, 2. *Maastricht University, Maastricht, Netherlands*, 3. *VU University Medical Center, Amsterdam, Netherlands*, 4. *Maastricht University Medical Centre, Department of Clinical Epidemiology and Medical Technology Assessment, Maastricht, Netherlands*

Fried's phenotype frailty criteria include three self-report questions (weight loss, exhaustion and low physical activity) and two performance-based measures (slowness (walk time) and weakness (handgrip strength)). The present study investigates whether the two performance-based criteria could be replaced by self-report questions. A cross-sectional validation study was conducted among 135 community-dwelling older people (65+) with different stages of frailty. Eleven questions related to walk time and ten questions about handgrip strength were selected. Both the self-report questions and performance-based measurements of walk time (time needed to walk 15 feet at own pace) and handgrip strength (maximum handgrip strength using a hand dynamometer) were assessed. Backward logistic regression analyses showed that four questions for walk time and two questions for handgrip strength were optimal. This indicates that it seems possible to replace the two performance-based measures by a small set of self-report questions, which can particularly be helpful in large-scale research.

THE MAASTRICHT FRAILTY SCREENING TOOL FOR HOSPITALIZED PATIENTS: A NEW SCREENING TOOL FOR NURSES

R.M. Warnier^{1,2}, E. van Rossum^{1,4}, S.M. Kuijk³, W. Mulder², J. Schols¹, G. Kempen¹, 1. *Department of Health Services Research, CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*, 2. *Department of Integrated Care, Elderly Care, Maastricht University Medical Centre, Maastricht, Netherlands*, 3. *Clinical Epidemiology and Medical Technology Assessment, Maastricht University Medical Centre, Maastricht, Netherlands*, 4. *Zuyd University of Applied Sciences, Heerlen, Netherlands*

Due to an aging society, nurses in acute hospitals care for increasing numbers of frail older patients. Early identification of potential frailty risks may help to improve the quality of geriatric care. To reduce registration burden of nurses in acute hospitals we developed a frailty screening tool that is fully integrated in the initial nursing assessment. We studied the inter- and intra-rater reliability and feasibility of this tool. The tool showed to be reliable and feasible in nursing

practice. The ICC was 0.92 (95% CI: 0.85 - 0.96) for inter-rater reliability, and 0.93 (95% CI: 0.87 - 0.97) for intra-rater reliability. The administration time of the tool was 2.6 minutes on average (sd = 0.9). Data on predictive validity in a cohort of 2,691 hospitalized older patients will be available soon and reported as well.

SESSION 4085 (SYMPOSIUM)

STRIDE: A PRAGMATIC TRIAL OF A MULTIFACTORIAL APPROACH TO REDUCE SERIOUS FALLS INJURIES

Chair: D.B. Reuben, *University of California, Los Angeles, Los Angeles, California*

Co-Chair: T.M. Gill, *Yale School of Medicine, New Haven, Connecticut*

Discussant: S. Lamb, *University of Oxford, Oxford, United Kingdom*

Among older adults, falls are the leading cause of both fatal and nonfatal injuries. In 2014, the Patient-Centered Outcomes Research Institute (PCORI) and the National Institute on Aging (NIA) funded a pragmatic trial to develop and test an intervention that would be integrated into the provision of clinical care in 10 US health care systems with the aim of reducing serious falls-related injuries.

Within the 10 health systems, 86 practices (43 intervention and 43 control) and 707 primary care physicians (348 intervention and 359 control) are participating. Both central and clinic-based screening are being utilized followed by centralized recruitment. By Spring 2017, STRIDE will have recruited 5322 participants aged 73 years or older and will follow them for an average of 2.5 years. The STRIDE intervention is patient-centered and based on identification and co-management of up to 8 personal risk factors (medications, postural hypotension, feet and footwear, vision, vitamin D, osteoporosis, home safety, and strength, gait, and balance impairment) by a registered nurse. Interventions for specific risk factors are evidence-based and can be implemented within health care systems and community-based organizations. Several approaches, including self-report, electronic health care records, and claims data, are being used to ascertain and verify the primary and several secondary outcomes.

At each step, barriers to conducting the study have surfaced and solutions to overcoming these barriers have been implemented. These study barriers and their solutions provide lessons for conducting pragmatic trials in older persons, implementing interventions, ascertaining outcomes, and diffusing research findings into clinical care.

STRIDE: EXPERIMENTAL AND STATISTICAL DESIGN CONSIDERATIONS

T. Trivison¹, M.E. Miller², H. Allore³, J. Dzura³, D. Esserman³, E. Greene³, 1. *Harvard University, Cambridge, Massachusetts*, 2. *Wake Forest Medical School, Winston-Salem, North Carolina*, 3. *Yale University, New Haven, Connecticut*

The cluster-randomized STRIDE trial features several design complexities warranting special attention to preserve validity, and to insure adequate statistical power to detect a hypothesized 20% reduction in serious fall injuries. The

relatively small number (n=86) and diversity of eligible practices necessitated a constrained randomization scheme preserving balance within and across healthcare systems. This scheme considered practice-level characteristics (e.g. practice size and geographic distribution) and participant-level characteristics (e.g. race and ethnicity). The resulting design and corresponding analytic plan take into account the estimated incidence of serious fall injuries in the target population; the prevalence of specific fall risk factors; the anticipated between-practice variation in number of participants eligible for enrollment; the intra-practice correlation in outcomes; and the potential for deaths and other competing risks to preclude event capture. Drawing upon the STRIDE framework, we will discuss implications for cluster randomized trials of practice-level interventions in older, at risk populations.

STRIDE: SCREENING AND RECRUITING OLDER PATIENTS AT RISK FOR SERIOUS FALL INJURIES

T.M. Gill¹, J. McGloin¹, P. Charpentier¹, K.L. Araujo¹, E. Skokos¹, N. Latham², A. Shelton¹, C. Lu¹, 1. *Yale University, New Haven, Connecticut*, 2. *Brigham and Women's Hospital, Boston, Boston, Massachusetts*

Age-eligible patients are recruited if they answer yes to: (1) have you fallen and hurt yourself in the past year? (2) have you fallen more than 2 times in the past year? and/or (3) are you afraid that you might fall because of balance or walking problems? Patients are screened via postal questionnaire at 9 of the 10 sites and in the clinic at the 10th site. Screen-positive patients are mailed a recruitment packet, and those who do not opt-out are called by study staff (blinded to practice intervention assignment) to confirm eligibility, obtain verbal consent, and complete the baseline assessment. Recruitment yield [(enrolled/screens attempted)*100] ranges from 2.9% to 8.8% across sites for central screening and is 2.9% for clinic screening. Strategies to increase the yield include sending out 2nd and 3rd postal questionnaires to non-responders, rescreening patients who were initially screen negative, and raising study visibility at the 86 participating practices.

THE STRIDE INTERVENTION: RISK FACTOR ASSESSMENT AND CO-MANAGEMENT TO REDUCE SERIOUS FALL INJURIES

D.B. Reuben¹, P. Gazarian², T. Storer², S. McMahon³, N.B. Alexander⁴, R.M. Leipzig⁵, P. Duncan⁶, 1. *Geriatrics, University of California, Los Angeles, Los Angeles, California*, 2. *Brigham and Women's Hospital, Boston, Massachusetts*, 3. *University of Minnesota, Minneapolis, Minnesota*, 4. *University of Michigan, Ann Arbor, Michigan*, 5. *Mount Sinai Hospital, New York, New York*, 6. *Wake Forest Medical School, Winston Salem, North Carolina*

The STRIDE multifactorial intervention consists of a co-management model using a registered nurse Falls Care Manager (FCM) and includes four major components: 1) standardized assessment of 8 modifiable risk factors (medications, postural hypotension, feet and footwear, vision, vitamin D, osteoporosis, home safety, and strength, gait, and balance impairment); 2) use of structured visit notes, protocols, and algorithms to develop an individualized Falls Care Plan that is presented to the patient's primary care physician for review, modification, and approval; 3) explanation of

identified risks to the patient (and caregiver) with a description of suggested interventions, using motivational interviewing to elicit patient preferences and readiness to participate in treatments; and 4) ongoing monitoring of response to treatment and reassessment of risk factors at scheduled intervals with revision of the Care Plan as needed. Custom-designed falls care management software facilitates recommendation and note generation, tracking of care, and implementation of recommendations.

STRIDE: ASCERTAINING SERIOUS FALL-RELATED INJURIES IN A PRAGMATIC TRIAL OF FALL PREVENTION

D. Ganz¹, A. Siu², J.S. Magaziner³, T. Trivison⁴, T.M. Gill⁵, N. Latham⁶, 1. *University of California, Los Angeles, Los Angeles, California*, 2. *Mount Sinai Hospital, New York, New York*, 3. *University of Maryland, Baltimore, Maryland*, 4. *Harvard University, Cambridge, Massachusetts*, 5. *Yale University, New Haven, Connecticut*, 6. *Boston University, Boston, Massachusetts*

The primary outcome in STRIDE is serious fall injury. We define and identify fall injuries that are important to patients, feasible to “pragmatically” ascertain and confirm, sufficiently frequent for power considerations, and free of ascertainment bias. Our definition of serious fall injuries combines evidence of a fall-related mechanism (generally based on the participant’s report) with clinical features of the injury (e.g., fractures, dislocation, etc.) and type of medical attention obtained. We are collecting data on falls, serious fall injuries, and other fall injuries every four months from all participants by telephone interview, which includes questions about the types of injuries incurred and medical attention received. To facilitate recall during the interview, participants are instructed to record their falls/injuries and related medical attention on a monthly fall calendar. Automated encounter information or medical records are obtained and reviewed to confirm participant reports and to identify injuries not reported by participants.

SESSION 4090 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: CONCURRENT GAIT AND COGNITIVE IMPAIRMENT AS AN EMERGING GERIATRIC SYNDROME

Chair: M. MonteroOdasso, *University of Western Ontario, London, Ontario, Canada*

Co-Chair: J.M. Hausdorff, *Tel Aviv Sourasky Medical Center, Tel Aviv, Israel*

Discussant: E. Marzetti, *Catholic University of the Sacred Heart School of Medicine, Rome, Italy*

Gait and cognitive impairments are ubiquitous in older adults and often coexist in the same individual, even in the clinical absence of overt neurological conditions. Both conditions represent independent risk factors for dementia, falls and disability. However, until recently, clinicians and researchers have evaluated and treated cognitive and mobility dysfunction in older individuals as separate problems. This approach has led to gaps in our understanding of the

motor-cognitive interactions and of the potential underlying mechanisms that can affect pathways to disability in aging. Emerging evidence indicates that gait is not a merely automated motor activity, but rather a task that requires executive function and attention as well as judgment of external and internal cues. Six recognized experts in the field from 3 different IAGG regions will participate in this symposium. First, we will examine clinical evidence from large-scale studies that demonstrate that individuals with cognitive and gait impairments in absence of overt neurological diseases may represent a phenotype with an increased risk of developing dementia, falls, and disability. Second, mechanistic evidence from brain structural and metabolic imaging studies and functional near infrared spectroscopy in healthy older adults and older adults with neurodegenerative diseases will be summarized. In conclusion, a roundtable debate will discuss whether there is sufficient evidence to support the idea that gait and cognitive impairments among older individuals in the absence of an overt neurological disease represent a distinct phenotype caused by shared mechanisms.

COGNITIVE AND GAIT IMPAIRMENT AND RISK OF DEMENTIA AND FALLS. LESSONS FROM THE MCR SYNDROME STUDIES

J. Verghese, *Albert Einstein College of Medicine, Bronx, New York*

This presentation will review evidence supporting the idea that Motoric-Cognitive Risk (MCR) syndrome (the combination of cognitive complaints with slow gait in the absence of dementia) may serve as a pre-dementia syndrome. Global pooled prevalence of MCR among older adults from countries around the world is 9.7%, with prevalence being similar in both men and women, but higher in those older than 75 years. Several studies have also revealed that those with MCR are about twice as likely as those without this diagnosis to develop dementia and they are also at increased risk of falls. Limitations, challenges and potential clinical applicability of the MCR concept will be discussed.

ALTERNATIVE FORMS OF GAIT AND COGNITION SYNDROMES. LESSONS LEARNED FROM THE GAIT & BRAIN STUDY

M. MonteroOdasso, *University of Western Ontario, London, Ontario, Canada*

This presentation will review longitudinal data which show that combining objective cognitive impairment with slow gait detect a group of older individuals at higher risk of progression to dementia syndromes, mobility decline and future falls. Appraisal of alternative forms of objective assessments of cognition and gait performance, including dual-task gait will be also presented to show variations of the “gait and cognition” combination as a distinct clinical entity.

Associations addressing the role of attention, memory, and executive problems with gait disturbances will be also reviewed. Comparison of “gait and cognition” syndrome, “cognitive frailty” construct, and MCR syndrome will be discussed with the goal to analyze overlapping, predictive validity for incident dementia and falls, and potential clinical applicability of the constructs.

GAIT AND COGNITIVE IMPAIRMENT SHARE COMMON MECHANISMS. BRAIN STRUCTURAL AND METABOLIC IMAGING STUDIES

C. Rosano, *University of Pittsburgh, Pittsburgh, Pennsylvania*

This presentation will review and update evidence from structural and metabolic (via PET) studies that supports a shared pathway underlying impairments in mobility and cognition. Focus will be on community-dwelling older adults free from clinically overt neurological complications or conditions. Age-related changes in the dopaminergic networks engaging fronto-striatal and medio-temporal areas will be examined in relationship to mobility and cognition. Brain areas related to motor control, spatial navigation and executive control function are known to be more vulnerable than other areas to changes in blood flow and oxygenation because of their localization within watershed areas; hence, associations between neuroimaging, gait and cognitive measures will be discussed in the context of cerebral microvascular dysfunction.

GAIT AND COGNITIVE IMPAIRMENT SHARE COMMON MECHANISMS. BRAIN FUNCTIONAL (FNIRS) STUDIES

J.M. Hausdorff^{1,2,3}, I. Maidan³, A. Mirelman^{3,4}, 1. *Department of Physical Therapy, Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel*, 2. *Sagol School of Neuroscience, Tel Aviv University, Tel-Aviv, Israel*, 3. *Center for the Study of Movement, Cognition, and Mobility, Tel Aviv Sourasky Medical Center, Tel-Aviv, Israel*, 4. *Department of Neurology, Tel Aviv University, Tel-Aviv, Israel*

Functional near infra-red spectroscopy (fNIRS) is an emerging neuroimaging technique that can be applied in situations that involve movement (i.e., walking/exercise) to examine brain activity in the pre-frontal cortex during walking. Investigations using fNIRS to study the role of the pre-frontal cortex during gait in healthy young, healthy older adults, and patients with neurodegenerative disease will be presented. The results demonstrate that different patterns of frontal activation are observed during walking in aging and disease. In addition, the recruitment and activation of this “cognitive” brain region appears to be related to the complexity of the walking task, at least in healthy adults. These findings support the role of the pre-frontal cortex in the regulation of even normal walking in aging and neurodegeneration and its increasing importance during challenging gait conditions.

CAN WE SEE GAIT AND COGNITION RELATIONSHIP AS AN EMERGING GERIATRIC SYNDROME?

A ROUNDTABLE DEBATE

M. Cesari², M. MonteroOdasso¹, E. Marzetti⁴, M.L. Callisaya³, J.M. Hausdorff³, C. Rosano⁶, J. Verghese⁷, 1. *University of Western Ontario, London, Ontario, Canada*, 2. *Université de Toulouse III Paul Sabatier, Toulouse, France*, 3. *University of Tasmania, Hobart, Tasmania, Australia*, 4. *Catholic University of the Sacred Heart School of Medicine, Rome, Italy*, 5. *Tel Aviv University, Tel Aviv-Yafo, Israel*, 6. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 7. *Albert Einstein College of Medicine, Bronx, New York*

IAGG 2017 World Congress

A roundtable discussion and debate will summarize the evidence in favor of and against considering “gait and cognition” as an emerging geriatric syndrome. Specifically, we will discuss whether there is sufficient evidence to support the idea that gait and cognitive impairments among older individuals in the absence of an overt neurological disease represent a distinct phenotype caused by shared mechanisms. Potential clinical applicability of the construct will be discussed.

SESSION 4095 (PAPER)

INNOVATIVE MODELS OF GERONTOLOGY AND GERIATRICS EDUCATION

THE SUCCESSFUL AND INNOVATIVE UNDERSTANDING DEMENTIA MASSIVE OPEN ONLINE COURSE (UD MOOC)

A.L. Robinson, J. Vickers, L. Goldberg, A. Canty, F. McInerney, *Wicking Dementia Research and Education Centre, University of Tasmania, Hobart, Tasmania, Australia*

The world’s population is rapidly ageing and dementia is set to escalate in prevalence. In response to documented dementia knowledge deficits in the community and in the healthcare workforce, the Wicking Dementia Research and Education Centre has developed the world’s first Understanding Dementia Massive Open Online Course – the UD MOOC. Unlike most existing dementia education, the 3-unit, 9-week UD MOOC begins by introducing participants to the brain, using a distinctly neuroscience focus. The second unit explores the disease processes underlying dementia; the third addresses the person, the progression of the condition, and evidence-based care. Within each unit, participants engage in a range of interactive learning strategies, consider authentic cases, and access “ask an expert” discussion forums. The course targets a broad range of learners and was designed specifically to appeal to, and support, adult learners with limited educational backgrounds. Since 2013, it has been offered four times. The course has reached 70,604 enrollees in 147 different countries with record-breaking completion rates from 38–45%. Participants’ level of education ranges from postgraduate study to elementary school. Those without a university education are as likely as those with a degree to successfully complete the course ($\chi^2 = 2.35$, $df = 6$, $p = 0.88$). Post-MOOC surveys indicate a significant increase in dementia knowledge across all participant groups with 76% of participants stating they already apply their MOOC learning in practice. This presentation argues our success is a result of both innovative learning design and the scale of unmet need for quality dementia education.

THE USE OF BLENDED LEARNING TO TEACH UNDERGRADUATE MEDICAL STUDENTS ABOUT THE MENTAL CAPACITY ACT

J. Pattinson¹, J. Mjojo¹, A. Gordon², A. Blundell¹, 1. *Nottingham university hospitals nhs trust, Nottingham, United Kingdom*, 2. *University of Nottingham, Nottingham, United Kingdom*

There are 850,000 people in the UK suffering from dementia. A challenge in management of these patients is the safeguarding of individuals who are no longer able to

make informed decisions. This led to the introduction of the Mental Capacity Act (MCA) in 2005. Mental capacity assessments are frequently carried out by junior doctors. Literature suggests they feel ill equipped to do so.

Delivery of MCA education within our Geriatric Medicine course has traditionally been via a didactic lecture as part of a wider ethics tutorial. This study, at a large UK hospital, introduced a blended learning program dedicated to delivering education about the MCA via e-learning plus bedside teaching. We compared the knowledge, skills and attitudes of students who had undertaken blended learning (n=54) with those experiencing the traditional approach (n=35). Knowledge was assessed using summative assessment scores. Mean marks were 12.4 and 13.3 for the control and intervention groups respectively (p=0.01; Mann Whitney rank sum test). Skills were assessed in the blended learning group using a pre-post open question answer format. Mean marks pre and post teaching were 10.95 and 16.36 respectively (p<0.001; Wilcoxon signed rank test). Attitudes were assessed using 5-point Likert scales and open feedback. Most students enjoyed the blended learning format with 100% agreeing that they had learnt a new skill. Attitudes to the topic remained similar across both groups.

Overall blended learning can be successfully deployed as a method of improving knowledge and skills in this important topic.

BUILDING INTRA-PROFESSIONAL COLLABORATION FOR OLDER ADULT PRACTICE THROUGH PROBLEM-BASED LEARNING

E.T. Jurkowski^{1,2}, S. Smaga^{1,2}, C. Kelly^{1,2}, M. Heitkamp^{1,2},
1. Southern Illinois University at Carbondale, Carbondale, Illinois, 2. SIU School of Medicine, Springfield, Illinois

Intra-professional collaboration across disciplines such as primary care medical practice, physician assistants, social workers and psychologists does not occur naturally, since educational programs are often taught in silos, or independently of each other. Ironically though, these professional disciplines are required to work collaboratively with each other. This poster presentation will illustrate a strategy employed within a rural based physician residency program which utilized case studies through a problem based learning approach to build intra-professional collaboration. Disciplines who participated in the process included Medical Residents, Social Work, Physician Assistant, Psychology and Nursing. Pre-Post test results indicated that there was some growth among participants and their awareness of how other disciplines viewed the case management and care planning process. Medical residents found the process useful in gaining understanding about the community based resources available and how to access these services. In addition, all groups found the process of understanding specific disciplinary goals and values helpful. This presentation will also address the process of building and establishing educational partnerships to build intra-professional collaborative activities on an ongoing basis, and as a part of an educational process.

INTERPROFESSIONAL GERIATRICS CASE COMPETITION FOR HEALTH PROFESSIONS STUDENTS

M.O. Little, H.W. Lach, M.L. Berg-Weger, *IM - Geriatrics, Saint Louis University, St. Louis, Missouri*

Health professions students often learn in professional silos, which reinforce the negative hidden curriculum of professional hierarchy, uni-disciplinary care, and fragmented communication. Team-based interprofessional (IP) care improves outcomes for older adults and is a major tenet of geriatrics practice. We describe a program that brought together students from eight health profession colleges to design a comprehensive care plan using a simulated geriatric patient case. Students attended an orientation and had access to a faculty mentor. Team presentations were scored on a rubric based on six of the core competencies for IP practice by a panel of IP faculty judges, representing the different colleges. Teams overall scored highest on 1) ability to identify patient and family as part of the care team, 2) identification of a "care manager" to ensure smooth team functioning, 3) use of humanistic language, and 4) presentation skills. Students rated experiences on a 5-point scale of poor to good (high). Ratings were positive: 76% good communication with team members, 80% good distribution of labor, 72% high commitment of team members, and 72% high rating of the experience. 92% of participants would recommend the experience to other students. Evaluations by judges, mentors and students indicated that students learned valuable lessons in group dynamics, team-based care, and geriatric care principles.

ENHANCING STUDENTS' LEARNING THROUGH FLIPPED WORKSHOPS IN A REQUIRED 4TH YEAR GERIATRIC CLERKSHIP

H.Y. Cheng, W. Chen, H. He, E. Bradley, M. Moody, *UVA, CHARLOTTESVILLE, Virginia*

Students favor active learning over traditional didactic teaching in our Geriatrics Clerkship. Accordingly, the authors have redesigned four traditional case-based didactic lectures/workshops via a flipped classroom format. The goal of this transformation is to improve students' satisfaction with their learning experiences and their learning performance.

A set of online learning modules was developed in MOODLE Learning Management System. This study adopted a retrospective cohort design. Students' ratings of the four geriatrics workshops and their OSCE scores were compared between the previous cohort(s) engaging in traditional learning and the Class 2017 students participating in the flipped classroom learning.

Results: Students' rated their satisfaction with each workshop on a scale of 1-5. Classes 2016 and 2017's average ratings for Workshop One were 4.22 and 4.08, respectively; their ratings for Workshop Two were 4.07 and 4.00; Workshop Three received the ratings of 4.30 and 4.27; and Workshop Four Class 2017 and 2015 was rated as 3.95 and 4.27. Although students' ratings tended to be slightly lower for flipped classroom than traditional didactic format, Class 2017's average OSCE score (85) after attending Workshop Four was superior to those of Classes 2016 (77), 2015 (77), and 2014 (80).

Conclusion: Flipped classroom teaching format did not seem to enhance students' workshop ratings. Through a recent expert evaluation of the online modules, some usability issues were identified, which might explain the result and inform our future instructional development. However, learners' OSCE performance has been significantly improved through engaging in flipped classroom format during one of the workshops.

SESSION 4100 (PAPER)

PHYSIOLOGICAL AND PERFORMANCE FACTORS AFFECTING COGNITION

SENIORWISE: BENEFITS OF MEMORY TRAINING FOR ADULTS WITH MILD COGNITIVE IMPAIRMENT

G.J. McDougall, I. McDonough, M. Larocca, *College of Nursing, The University of Alabama, Tuscaloosa, Alabama*

In the NIH-funded Senior WISE© (Wisdom Is Simply Exploration) trial, there were 265 individuals tested who had no dementia at baseline. The sample was mostly female (79%), 71% Caucasian, 17% Hispanic and 12% African-American with an average age of 75 and had 13 years of education. They were randomized to twenty hours of either memory or health training. An MCI group was created by taking participants that scored 1-SD below the mean on memory performance for either the Rivermead Behavioural Memory (RBMT) or Hopkins Verbal Learning Delayed (HVLT) and who scored less than the mean on the complaint scale. This amnesic-MCI group had 39 participants (20 in control, 19 in treatment). Using multi-level modeling, we calculated a treatment x time interaction (on all 5 time points) and found a significant interaction for HVLT Delayed ($p = .04$) and Complaints ($p=.01$) such that the MCI memory training group had greater improvements in verbal memory performance and had more stable perceptions of their memory. The MCI treatment group maintained memory performance over 2 years regardless of initial performance, whereas the MCI control group showed decreased memory performance over the two years and this effect was greatest for individuals starting at high levels of baseline performance. In summary, the higher performing controls had a more precipitous decline in memory. In conclusion, those adults with MCI who participated in the Senior WISE memory training reduced the negative consequences of declining cognitive ability and maintained the benefit over twenty four months.

SUBJECTIVE MEMORY IMPAIRMENT AND GAIT VARIABILITY: WHICH ASSOCIATION?

O. Beauchet¹, G. Allali², *1. Medicine, McGill University, Montreal, Quebec, Canada, 2. Geneva University, Geneva, Switzerland*

Gait disturbances, and more particularly increased stride time variability, have been associated with objective memory impairment in mild cognitive impairment (MCI). However, their association with subjective memory impairment (SMI) has not been reported yet. This study aims to examine the association of stride time variability while performing

single and dual tasking with SMI in cognitively healthy individuals. A total of 126 individuals (15 without SMI, 69 with SMI expressed by participants, 10 SMI expressed by participant's relative and 32 SMI expressed by both participants and participant's relative) were included in cross-sectional study. The coefficient of variation (CoV) of stride time and walking speed were recorded under usual condition and compared to walking while counting backwards, on an instrumented walkway. Age, gender, body mass index, number of drugs taken daily, use of psychoactive drugs, fear of falling, history of previous falls, and walking speed were used as covariates. Multiple linear regression models showed that CoV of stride time while backward counting, but not while single tasking, was associated with participant's relative SMI ($P=0.038$). This study found a specific association between SMI expressed by participant's relative and a greater CoV of stride time while dual tasking, confirming that gait variability may be considered as a marker of memory performance.

BRAIN VOLUMES AFTER RANDOM ASSIGNMENT TO TEN YEARS OF LIFESTYLE INTERVENTION

M. Espeland¹, K. Erickson², R. Neiberg¹, J. Jakicic², T. Wadden³, R. Wing⁴, L. Desiderio³, R. Bryan³, *1. Dept of Biostatistical Sciences, Wake Forest School of Medicine, Winston-Salem, North Carolina, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, 3. University of Pennsylvania, Philadelphia, Pennsylvania, 4. Miriam Hospital, Providence, Rhode Island*

Background: Adults with type 2 diabetes mellitus are at increased risk for brain atrophy and cerebrovascular disease that may lead to cognitive deficits, cognitive impairment, and dementia. Identifying effective prevention strategies for these individuals is critical: it is estimated that one of every 15 cases of dementia is attributable to diabetes.

Methods: We conducted an ancillary study in 3 sites in the Look AHEAD clinical trial. At baseline, participants had type 2 diabetes, were overweight or obese, and were aged 45–76 years. They were randomly assigned to an intensive lifestyle or a control condition of diabetes support and education. After 8–11 years of intervention, N=319 underwent standardized structural brain magnetic resonance imaging and standard tests of cognitive function, at one time-point, 10–12 years after randomization.

Results: Participants had achieved mean weight losses of -12.3% and -0.9% at year 1 and -7.1% and -5.7% at year 8 for intervention and control participants, respectively. Total brain and hippocampus volumes were similar between groups. The mean (standard error) white matter hyperintensity volume was 28% lower among lifestyle intervention participants compared to the control group: 1.59 (1.11) versus 2.21 (1.11) cc, $p=0.023$. The mean ventricle volume was 9% lower among these participants: 28.93 (1.03) versus 31.72 (1.03) cc, $p=0.037$. These differences were independent of apoE4 genotype and age, but were larger for those with longer duration of diabetes and who were heaviest at baseline.

Conclusions: Long-term weight loss intervention may reduce the adverse impact that diabetes and obesity have on brain structure.

BLOOD PRESSURE AND RISK OF COGNITIVE DECLINE IN A POPULATION SAMPLE

K.B. Rajan, *Internal Medicine, Rush University Medical Center, Chicago, Illinois*

The association of blood pressure with cognitive decline is of great public health significance. This association may be modified by the use of antihypertensive medications and the *APOEε4* allele. Using a large population-based sample of 3,857 participants (65% African Americans and 63% females), we examined the association of systolic and diastolic BPs with cognitive decline, and if the association was modified by antihypertensive medication use and the *APOEε4* allele. For every 20 mmHg increase in systolic BP, cognitive decline increased by 5% (95% CI= 2%-8%, $p=0.023$). However, the association of systolic BP with cognitive decline was nonlinear with an increase in cognitive decline by 17% (95% CI= 13%-21%) above systolic BP of 140 mmHg. This association appeared weaker among antihypertensive medication users, and stronger among those with the *APOEε4* allele. A similar pattern of association was observed for diastolic BP. The association of blood pressure with cognitive decline was nonlinear, and this association was modified by antihypertensive medication use and the *APOEε4* allele. Older adults with the *APOEε4* allele and not using any antihypertensive medications had substantially higher risk of cognitive decline.

MICROINFARCTS, MICROBLEEDS, AND CEREBRAL AMYLOID ANGIOPATHY: NEW KEY PLAYERS IN VASCULAR DEMENTIA?

G. Gold, C. Bouras, F.R. Herrmann, P. Giannakopoulos, E. Kovari, *Internal Medicine, Rehabilitation and Geriatrics, Geneva Medical School and Geneva University Hospitals, Geneva, Switzerland*

Recent findings in the XXIst century have revealed a high frequency of microscopic cerebral lesions including microinfarcts (MI) and microbleeds (MB). In order to determine their clinical impact on cognition, we have studied more than 300 cases that were evaluated cognitively and autopsied within 1 year.

We explored the correlation between global cognitive function rated according to the clinical dementia rating scale (CDR) and the presence of MI on post-mortem brain neuropathological examination of older individuals. We also assessed potential associations between MI, MB and cerebral amyloid angiopathy (CAA).

MI were a strong correlate of cognitive function explaining up to 36% of CDR variability. In mixed cases MI neuropathological scores and Braak neurofibrillary tangle stages predicted the presence of dementia with more than 80% accuracy. MB were extremely frequent (up to 93% of the cases) but less clearly related to cognition. MI were not related to CAA and many cases of MB, including lobar MB occurred in the absence of CAA.

Microscopic ischemic lesions, particularly MI are powerful determinants of cognition. They represent new and highly promising therapeutic targets and should lead us to review our understanding and current paradigms in vascular and mixed dementia.

SESSION 4105 (SYMPOSIUM)

HOW CAN ORGANIZATIONS PROMOTE PERSON-CENTERED CARE?: INTERNATIONAL AND CROSS-SETTING PERSPECTIVES

Chair: K. Wolf-Ostermann, *University of Bremen*

Co-Chair: M. Boltz, *Penn State University, Elkins Park, Pennsylvania*

Discussant: D. Edvardsson, *La Trobe University*

Person-centered care has emerged as a gold standard for aged care delivery. Experts have posited that this approach includes seeing the patient as a person, focusing on the person's strengths and capabilities, utilizing a bio-psychosocial perspective, and offering and respecting patient choices. As new organizational models offer the promise of improved quality of life for elders, there is growing international attention to the need to understand the measures, strategies, and organizational supports that promote the uptake and integration of a patient-centered philosophy. This symposium will offer four presentations that address this objective. The first presentation will address person-centered care in German shared-housing arrangements for people with dementia as an alternative non-residential care setting and investigates the relationship between care structures and quality of life. The second presentation will describe the organizational factors associated with person-centered care for elders in US hospitals. Next, a presentation will report on an oral care intervention for persons with dementia that evaluates emotional expression as an important (and innovative) person-centered, outcome measure in nursing homes. The final presentation will report on the Dutch "green farm" model as an alternative to nursing home care, describing outcomes with patient-centered measures. Finally, Dr. David Edvardsson will synthesize the research presentation findings, offer perspective on the conceptual similarities/dissimilarities across settings and geographies, and lead a discussion of future directions for policy and practice.

DOES PERSON-CENTERED CARE CONTRIBUTE TO QUALITY OF LIFE?: GERMAN SHARED-HOUSING ARRANGEMENT RESULTS

K. Wolf-Ostermann, A. Schmidt, J. Graske, *University of Bremen, Bremen, Germany*

German shared-housing arrangements (SHA) are alternative care settings, disconnected from traditional nursing homes and bound to the principle of normalization. They are often situated in ordinary apartment buildings and connected to the neighborhood. We investigated the amount and educational training of staff in relationship to residents' quality of life (QoL) which is hardly investigated yet. In a cross-sectional study in 58 SHA in Berlin/Germany with a total of 396 residents we assessed real data of present staff as well as residents' socio-demographics, QoL, challenging behavior and severity of dementia. Residents (78.4 years, 69.4% female) mostly (71%) had a medical diagnosis of dementia, predominantly with a severe stage. Nevertheless, QoL was on a moderate to good level. The staff-resident ratio for registered nurses was 0.2, for certified nursing assistants 0.6, which is

higher than in traditional nursing homes. Within SHA no association was found for QoL and staff-resident-ratio.

PERSON-CENTERED ACUTE CARE: WHAT ORGANIZATIONAL FACTORS MATTER?

M. Boltz¹, K. Lee², K. Van Haitma¹, 1. *Pennsylvania State University, Elkins Park, Pennsylvania*, 2. *Yonsei University, Seoul, Korea (the Republic of)*

The hospital continues to play a major role in the continuum of care for older adults. Unfortunately, their health and well-being is often adversely affected by the acute care environment. In response, there is a small but growing movement through nurse-led initiatives to incorporate principles of person-centered care into hospital operations. These principles are incorporated into the Aging-sensitive Care Delivery Scale and include incorporating knowledge of person's preferences and history into care planning and delivery, patient/ family engagement in decision making, and a biopsychosocial approach. An understanding of the organizational factors that support these principles will help advance quality initiatives. In a national sample of 7,840 nurses from 27 US hospitals, linear mixed models demonstrated the following organizational factors were associated with nurse-reported aging-sensitive care: knowledge about dementia and delirium care ($p < .0001$), access to elder-specific resources ($p = .013$), and institutionalized values specific to elder care ($p < .0001$).

EMOTIONAL EXPRESSION AS EVALUATION OF PERSON-CENTERED DEMENTIA-SPECIFIC ORAL CARE FOR VETERANS

K. Lee¹, L. Galkowski³, C.L. Downey², E.S. McConnell^{4,3}, 1. *College of Nursing, Yonsei University, Seoul, Korea (the Republic of)*, 2. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 3. *Durham Veterans Affairs Medical Center, Durham, North Carolina*, 4. *Duke University, Durham, North Carolina*

Understanding emotional expressions of persons with dementia is fundamental to implementing person-centered care because emotional expression provides information about needs, preferences, and responses to care. Oral care is the most seriously neglected aspect of ADL care among nursing home residents with dementia. The purpose of this pilot study was to explore whether emotional responses to oral care, as indicated by positive and negative affective displays, represents a person-level influence on implementing individualized oral care among persons with dementia. There were no significant differences in positive emotional expressions before, during, and after oral care; however, negative emotional expressions increased during oral care, returning to baseline afterwards ($p < .001$). Observing emotional response to oral care is feasible. Negative affective display may be an unrecognized patient-level barrier to oral care that could be targeted to inform design of a larger study to determine how to enhance adherence to oral hygiene program.

GREEN CARE FARMS AS NURSING HOMES: QUALITY OF LIFE AND SOCIAL INTERACTIONS

B. de Boer, J. Hamers, S. Zwakhalen, H. Verbeek, *Maastricht University, CAPHRI Care and Public Health Institute, Department of Health Services Research, Maastricht, Netherlands*

Dementia care models increasingly develop towards small-scale homelike environments aiming to provide person-centered care by enhancing residents' autonomy, social interaction and participation in activities. Green care farms (GCF's) as nursing homes combine agricultural with care activities. This study compared residents (N=115) living in GCF's with other nursing homes (large- and small scale) on several person-centered measures at baseline and 6-month follow-up. Questionnaires and ecological momentary assessments (16.860 observations) were conducted, assessing quality of life (QoL), affect, behavior and environmental factors. No differences were found between groups on overall QoL scores. Residents at GCF's scored higher than residents of traditional nursing homes on positive affect ($p < .05$). Furthermore, residents of GCF's had more positive social interactions during their days than residents of traditional nursing homes ($p < .05$), indicating that social interaction is more integrated in daily care practices at GCFs. Our results suggest that GCFs are a valuable addition to long-term care.

SESSION 4110 (PAPER)

GERIATRIC ASSESSMENTS

RELATIONSHIP BETWEEN CEREBRAL HEMODYNAMICS AND CEREBRAL WHITE MATTER HYPERINTENSITIES

K. Nagai, *Department of geriatric medicine, Kyorin University school of medicine, Tokyo, Japan*

Aim of Study: It is supposed that White matter hyperintensities (WMHs) in the brain occur as a consequence of cerebral small vessel disease. Thus, altered blood flow in the cerebral arteries may be related to development of cerebral WMHs. Transcranial Doppler (TCD) ultrasound is a non-invasive measure of cerebral blood velocity profile, which reflects cerebral hemodynamics in real-time processing. In the present study, we investigated the relationship between cerebral hemodynamics estimated by TCD and WMHs.

Materials & Methods: One hundred and fifty patients (83 Males and 67 Females, 79 ± 7 y/o) were enrolled excluding those with a history of stroke and a major infarction.

All patients underwent diagnostic magnetic resonance imaging (MRI) and TCD ultrasound. In regard to WMHs, the periventricular hyperintensities (PVH) and the deep white matter hyperintensities (DWMH) were graded according to Fazekas scale. TCD ultrasound was used to assess cerebrovascular hemodynamics including middle cerebral artery (MCA) blood velocity (MCAV), cerebrovascular resistance index (CVRi), and Pulsatility Index (PI). A multiple regression analysis was carried out using the grade of PVH and DWMH as dependent variables and cerebrovascular hemodynamics as an independent variable, adjusted for age, sex, status of hypertension, and smoking.

Results: Multiple regression analysis identified significant negative correlations between the PVH grade and MCAVmean ($\beta = -0.216$, $p = 0.007$), and CVRi ($\beta = 0.160$, $p = 0.049$). Also, there were significant correlations between the DWMH grade and MCAVmean ($\beta = -0.241$, $p = 0.003$), and CVRi ($\beta = 0.218$, $p = 0.007$).

Conclusions: These results indicate that impaired peripheral circulation in the brain evaluated by TCD was associated with the severity of WMHs, consistent with idea WMHs as a consequence of cerebral small vessel disease.

SARCOPENIA SCREENED WITH SARC-F QUESTIONNAIRE IS ASSOCIATED WITH QUALITY OF LIFE AND MORTALITY

T. Wu^{2,1,3}, C. Liaw^{4,5,6}, F. Chen¹, K. Kuo¹, W. Chie², R. Yang³, 1. *Department of Family Medicine, Renai Branch, Taipei City Hospital, Taipei, Taiwan*, 2. *Institute of Epidemiology and Preventive Medicine, College of Public Health, National Taiwan University, Taipei City, Taiwan*, 3. *Department of Preventive Medicine, Renai Branch, Taipei City Hospital, Taipei City, Taiwan*, 4. *Department of Orthopedics, School of Medicine, National Taiwan University Hospital, Taipei City, Taiwan*, 5. *Department of Orthopedics, Shin Kong Wu Ho-Su Memorial Hospital, Taipei City, Taiwan*, 6. *School of Medicine, Fu-Jen Catholic University, New Taipei City, Taiwan*

There is no gold standard in diagnosing sarcopenia. We aimed to assess the validity of screening sarcopenia using SARC-F. This is a prospective cohort study in a community hospital in Taiwan. Community dwelling senior citizens were interviewed with a structured questionnaire annually. The questionnaire items were recoded into the five items of SARC-F (sluggishness, assistance in walking, rise from a chair, climb stairs, falls). In the baseline year, a subgroup was tested for grip strength and body composition. Healthcare utilization and mortality were based on self-report and hospital records. Our main outcome was four-year-mortality. Secondary outcomes included hospitalization, emergency care use, and quality of life (QOL) measured using the CASP-12 scale. There were 670 participants. The mean age was 76.1 (SD 6.36). Half were men (n=340 (50.7%)). The prevalence of sarcopenia was 6.1% (n=41). SARC-F scores were inversely associated with grip strength (p=0.001) and skeletal muscle composition (p=0.045). Sarcopenic participants were mostly women (p=0.005) and older (p<0.001). In univariate analysis, sarcopenia was associated with one- to four-year mortalities (p=0.033, 0.001, 0.001, <0.001, respectively), one year hospitalization (p=0.017), QOL at two and four years (both p<0.001) but not subsequent use of emergency care. In multivariate model, sarcopenia (odds ratio (OR)=7.35, 95% confidence interval (CI)=2.67–20.18), age (OR=1.19, 95% CI=1.09–1.29 for each year) and taking vitamin D supplements (OR=0.29, 95% CI 0.11–0.74) were factors associated with mortality. Sarcopenia screened using SARC-F was associated with subsequent QOL, one-year-hospitalization, and four-year-mortality. SARC-F can serve as a quick screening tool of sarcopenia.

EFFECTS OF ETHNICITY AND GEOGRAPHICAL LOCATION ON SARCOPENIA AND HAND GRIP STRENGTH: A PILOT STUDY

A. Hayes^{1,2}, D. Scott^{3,2}, S. Dorgo⁴, 1. *Health and Biomedicine, Victoria University, Melbourne, Victoria, Australia*, 2. *Australian Institute for Musculoskeletal Science, Melbourne, Victoria, Australia*, 3. *School of Clinical Sciences at Monash Health, Monash University, Melbourne,*

Victoria, Australia, 4. *College of Health Sciences, UTEP, El Paso, Texas*

Sarcopenia is gaining clinical recognition, due to the recent establishment of an ICD-10-CM code, however there is lack of clarity as to whether a single definition will be able to universally applied. We aimed to investigate the influence of ethnicity and geographical location on body composition related to sarcopenia and hand grip strength (HGS). Middle aged and older adults (n=111; 70.9±7.9yrs; 40% Hispanic, one-quarter male; 60% Caucasian, one-third male) were screened prior to taking part in the Golden Age exercise program in El Paso, USA. There were no significant differences in body composition measures or HGS between the two ethnic groups. Despite no significant difference in mean appendicular lean mass/height squared (ALM/ht²) (P=0.92), more than one-third of Caucasian females (16/45) were below the European Working Group on Sarcopenia in Older People (EWGSOP) cut-off for low muscle mass (<5.67kg/m²), but no Hispanic females were below this level. In contrast, similar proportions of men (22%) had ALM/ht² below the EWGSOP cut-off (<7.26kg/m²). A sub-group of El Paso Caucasians compared to age- (70.4±6.6yrs) and sex- (18/56 male) matched Caucasians from Melbourne, Australia, were significantly taller (P=0.019) and tended to be lighter (P=0.18), such that the Australian cohort had significantly higher BMI (P=0.004), and higher ALM/ht² (P<0.001), with only 4/38 females demonstrating low mass. Strong correlations between ALM/ht² and HGS were observed (P<0.001), yet no HGS difference existed between the cohorts (P=0.827), illustrating the complex interplay between lean mass, obesity and muscle strength that needs to be considered for any universal diagnosis of sarcopenia.

THE ASSOCIATIONS BETWEEN HANDGRIP STRENGTH AND ITS CHANGE ON CARDIOVASCULAR INCIDENCE

O. Prasitsiriphon^{2,1}, W. Pothisiri¹, 1. *College of Population Studies, Chulalongkorn, Patumwan, Bangkok, Thailand*, 2. *International Institute for Applied Systems Analysis (IIASA), Vienna, Austria*

Handgrip strength (HGS) is increasingly becoming a vital factor in physical capability. The last decade has seen a renewed importance in the association between HGS and diabetes, hypertension, and cardiovascular mortality rather than disability and mortality. As far as I know it is not yet known whether the HGS and its change associated with cardiovascular incidence among older adults in European countries. Data are drawn from the first four waves of the Survey of Health, Ageing and Retirement in Europe (SHARE) with information on HGS, health and demographic characteristics from 7,232 participants aged 50–79 across 10 European countries. HGS was transformed as the low HGS (LGS), the fastest decline in HGS (FDGS), and the combination of the LGS and the FDGS (CBGS). Logistic regression models adjusted for the potential confounders showed that the FDGS and the CBGS were significantly correlated with cardiovascular incidence. However, the LGS as the lowest quintile HGS at baseline Wave was not significantly different from the normal HGS (NGS) on cardiovascular incidence. Both sexes with FDGS would have higher odds of experiencing cardiovascular development (all, P<0.02). In the CBGS, men

with NGS&FDGS ($P=0.008$) and women with LGS&FDGS ($P=0.000$) were likely to have higher odds of having cardiovascular diseases. In conclusion, the decline in HGS and the CBGS should be considered as an indicator of incidence of cardiovascular disease among older adults. The further studies on the current topic are therefore suggested in order to establish in clinical setting.

DETECTING SARCOPENIA IN LONG-TERM CARE RESIDENTS

M.P. Kotlarczyk, S. Perera, S.L. Greenspan, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Sarcopenia is characterized by decreased muscle mass with reduced strength and/or physical performance. Clinical assessment of sarcopenia is difficult in the elderly given the need for specialized testing for lean muscle mass and clinic time for functional testing. The SARC-F questionnaire, developed as a screening tool for sarcopenia, consists of five questions on physical abilities, and a summative score ≥ 4 indicates poor outcomes. We evaluated the accuracy of the SARC-F for identifying sarcopenia using the Foundation for the National Institutes of Health Sarcopenia Project (FNIH) and European Working Group on Sarcopenia in Older People (EWGSOP) clinical definitions as gold standards. In our preliminary cohort of 43 women (age 86 ± 5.1), 6 (14%) had SARC-F ≥ 4 , but only 1 met FNIH guidelines. Five additional women fit FNIH criteria, but had SARC-F < 4 . Only 8 women (19%) met the EWGSOP criteria, and all had SARC-F < 4 . Further refinement of the SARC-F may be necessary for better discrimination, but further study is needed for a more definitive recommendation.

SESSION 4115 (PAPER)

RISK, PREVENTION, AND MANAGEMENT OF DECLINE IN PHYSICAL FUNCTION AND FALLS

CHANGE OF FUNCTION AND PARTICIPATION DURING AND AFTER THE STAY IN THE NURSING HOME USING THE ICF

J. Okochi, 1. *Tatsumanosato Geriatric Facility, Ikoma, Nara, Japan*, 2. *Association of Geriatric Health Services Facilities, Tokyo, Japan*

ICF staging is a set of simple scales using ICF codes hierarchically arranged to a Guttman-type scale. The high validity of the scales with its high sensitivity and specificity to change enables us to measure the functional change of the elderly person over time; This study shows the change of function and participation for senior persons during their stay in the geriatric health services facilities in Japan (Roken facilities) after their return to home.

The participants were elderly persons newly admitted to the 177 Roken facilities that provides geriatric rehabilitation. The measurement included physical functions, activity and participation, behavior. This study measures continuously six times per person: on admission, just after returning home from the facility, after one week, one, three and nine months after returning home.

Related items are summed to obtain reference scores which were tested using the generalized linear model. Of

504 elderly person volunteered in the initial survey, 474 persons completed the one-month follow-up and 195 persons completed all five follow-ups. Although elder persons' functions and participations improved during their stay at Roken facilities, most of the functions began to deteriorate after discharge. In contrast, their social participation was maintained throughout the period after they returned home. Therefore, this study suggested the benefit and limitation of the geriatric rehabilitation. This result affirmed the sensitivity of the ICF scales to capture changes in various functional domains.

SOCIAL INEQUALITY IN DECLINE IN PHYSICAL FUNCTION AND MORTALITY AMONG OLDER ADULTS

T. Høj Jørgensen¹, R. Lund¹, V. Siersma², C. Nilsson¹, 1. *Section of Social Medicine, Department of Public Health, University of Copenhagen, Copenhagen, Denmark*, 2. *Section and Research Unit of General Practice, Department of Public Health, University of Copenhagen, Copenhagen, Denmark*

Due to differential vulnerability, low socioeconomic position (SEP) may lead to greater decline in physical function and mortality among older adults with few social relations. We investigated how older people's SEP combined with social relations was associated with decline in physical function and mortality. The study population included 4,060 older adults aged 75 or 80 years at baseline in 1998–1999. Information about social relations at baseline, and physical function at baseline and after 1.5, 3 and 4.5 years were obtained from questionnaires. SEP measured by financial asset at baseline and mortality during 5 and 10 years of follow-up were obtained from Danish nationwide registers. Generalized estimation equations and Additive hazard models were used to analyse associations between SEP combined with social relations and decline in physical function and mortality, respectively. Adjusted analyses showed that males, but not females, with low financial asset who lived alone or had no visits, no social activity, low family contact, or low social contact experienced the greatest decline in physical function. Yet, there was only significant interaction between financial asset and visits. Both males and females with low financial asset who lived alone, or had no visits, no social activity, low family contact, or low social contact had the highest mortality. Yet, there were only significant interactions between financial asset and visits for females and social activity for males. In conclusion, among older adults, especially males, low SEP implied a greater decline in physical function and higher mortality among those with few social relations.

A CONCEPTUALLY NOVEL PERFORMANCE-BASED BALANCE SCALE FOR USE WITH COMMUNITY-LIVING OLDER ADULTS

H. Chen¹, E.C. Wang-Hsu², J. Meiers², K. Mitchell¹, S.S. Smith¹, 1. *Physical Therapy & Rehabilitation Sciences, Drexel University, Philadelphia, Pennsylvania*, 2. *Penn Care at Home, Philadelphia, Pennsylvania*

Balance testing is critical for identifying fall risk and initiating preventive strategies for older adults. However, current balance assessments used with Community-Living Older Adults (CLOAs) have limitations, e.g., ceiling effects, lengthy administration time, and failure to include different postural

stability domains. Our objective was to develop a conceptually novel performance-based assessment to quantify balance ability of CLOAs that minimizes current limitations and decreases test time by using a non-fixed-item format that eliminates completing all items to obtain a score.

This methodological study consisted of 3 phases. In phase 1, we developed a 26-item, dichotomously-scored preliminary Performance-based Balance Scale (PBS) by (1) using an expert panel to build the scale by adapting items from existing balance measures and organizing items by difficulty into posture stability domains, (2) pilot testing, and (3) post-test revision. Phase 2 involved testing the preliminary PBS with 35 subjects (10 men, 25 women, mean age = 75.9, 60–91 yrs). Using Rasch dichotomous model analysis, we created a non-fixed-item PBS format and identified 2 items to serve as starting points for testing based on performance ability; thereby, eliminating the need to test all items. In phase 3, we re-tested the same subjects 4–8 weeks later. Spearman's rho was used to correlate the preliminary and non-fixed-item PBS to determine validity of the non-fixed-item format resulting in $r_s = 0.94$.

In conclusion, the PBS is a novel, 20-item, non-fixed format clinical balance test with 2 entry points for CLOAs that minimizes ceiling effects, assesses different domains, and reduces test time.

INBED: INEXPENSIVE NODE FOR BED-EXIT DETECTION: A WEARABLE FALL PREVENTION SYSTEM

N. Jaehne-Raden¹, U. Kulau², K. Wolf¹, H. Meyer zu Schwabedissen³, M. Marschollek¹, 1. *Peter L. Reichertz Institute for Medical Informatics University of Braunschweig - Institute of Technology and Hannover Medical School, Hanover, Lower Saxony, Germany*, 2. *Institute of Operating Systems and Computer Networks, Braunschweig, Lower Saxony, Germany*, 3. *Clinic for rheumatism and diseases of the elderly at the Municipal Hospital Braunschweig, Braunschweig, Lower Saxony, Germany*

Age-related falls are a widespread and expensive issue of society and with this a big challenge of gerontological research. Hence we present INBED - an inexpensive, modular and body-worn (medio-femoral) fall prevention system. Compared to existing solutions, INBED offers a more proper solution to prevent falls in clinical and elderly care environments.

The INBED detects several events such as getting up from a sitting or lying position. These events are broadcasted wirelessly to notify the nursing staff, so that they can assist the respective care recipient accordingly. In further consequence, highly critical fall events can be avoided due to the early alert of the nursing staff. The INBED can replace the commonly used belt or bed rail systems for high risk fall patients. Thus, the personal range of movement and the self-determination of the patient will be supported without reducing the sense of protection. INBED itself is a approx. 2x2cm wearable device that contains several sensors, a microcontroller unit and a wireless radio transceiver.

Development objectives were:

- development of a reliable and cost-effective solution for a sensor-based uprise-detection for fall prevention established by first research results with different sensor prototypes.

- apart from the function of immediate uprise-detection, the system can also recognize states of restlessness occurring in advance of patient's rising, so that the caregiver can intervene before the first uprise.

- in addition to above-mentioned functions, the system can be used to implement a virtual fence. Patients can be protected from risk areas, e.g. stairs, by sending a dedicated event.

SESSION 4120 (SYMPOSIUM)

THE INTERSECTION OF TRAUMA AND DISASTER BEHAVIORAL HEALTH

Chair: K.E. Cherry, *Louisiana State University, Baton Rouge, Louisiana*

Discussant: A. Gibson, *Winthrop University, Rock Hill, South Carolina*

Disasters bring catastrophic destruction with loss of life, homes, and property. The disaster science literature documents threats to health and well-being for directly affected individuals during the immediate impact period, although fewer studies have addressed psychological health among disaster survivors and indirectly affected disaster volunteers who assist with response and recovery in the years after a destructive environmental event. In this symposium, the intersection of trauma and disaster behavioral health will be examined from a lifespan perspective. Five papers will be presented that include behavioral data collected with samples of older adults exposed to four different environmental events: the 2015 South Carolina floods; the 2005 Atlantic Hurricanes Katrina and Rita, the 2007 wildfires in San Diego County, CA, and the 2010 BP Deepwater Horizon Oil Spill. Risk and resilience factors among survivors and disaster relief volunteers will be highlighted based on qualitative analyses of narrative text and quantitative analyses of survey and questionnaire data. Taken together, these five papers will provide new evidence concerning psychological and social factors that may lessen vulnerability and promote resilience for directly and indirectly affected older adults in the years after a natural disaster. Lessons learned from these prior disasters offer new insights into evacuation safety and the response and recovery phases of a disaster with an aging population. Implications for disaster preparedness and behavioral health and policy recommendations will be discussed.

AN INQUIRY INTO OLDER DISASTER RESPONDERS' SECONDARY TRAUMATIC STRESS

A. Gibson, *University of Kentucky's College of Social Work, Lexington, Kentucky*

Secondary Traumatic Stress (STS) symptoms are common among disaster responders. An exploratory study, using primarily qualitative methods was conducted to gain a better understanding STS in disaster response volunteers 60 and older. Fifty-eight older disaster responders involved with the 2015 South Carolina floods participated in this research effort. As part of this study, questions regarding STS were explored. STS levels among volunteer responders who provided care to victims of varying disasters varied substantially, but common themes emerged that represent both risk and protective factors for STS. Previous exposure

to trauma, availability of response organization's support post-deployment, previous experience responding to disaster, and availability of peer support were factors that influenced STS symptoms. Further, older volunteers may be an ideal population for disaster response work given their lifetime of developing coping skills resiliency. Presentation will conclude with recommendations for future research and suggestions for disaster mental health administration with older volunteers.

SOCIAL ENGAGEMENT AND HEALTH-RELATED QUALITY OF LIFE IN OLDER ADULTS AFTER MULTIPLE DISASTERS

K.E. Stanko¹, K.E. Cherry¹, L. Sampson², S. Galea², 1. *Psychology, Louisiana State University, Baton Rouge, Louisiana*, 2. *Boston University, Boston, Massachusetts*

Exposure to multiple catastrophic disasters, both natural and technological, is associated with extreme stress and long-term health consequences that are poorly understood. For older adults, vulnerabilities due to physical health, limited financial resources, and lack of social support may impact post-disaster well-being. We examined psychosocial predictors of health-related quality of life in 219 residents of south Louisiana who survived the 2005 Hurricanes Katrina and Rita and the 2010 BP Deepwater Horizon Oil Spill. Participants were non-coastal residents, current coastal residents, and current coastal fishers who were economically impacted by the oil spill. Logistic regressions indicated that age was inversely associated with SF-36 physical health scores. A reduction in perceived social support after Katrina was also inversely associated with SF-36 mental health scores. These results illuminate risk and protective factors that impact health after multiple disasters. Implications of these data for programs to mitigate adversity after multiple disasters will be discussed.

SOCIAL SUPPORT AND PSYCHOLOGICAL HEALTH OF ADULTS AFTER THE 2007 SAN DIEGO COUNTY WILDFIRES

J.M. Phillips, *Cal State Univ San Marcos, San Marcos, California*

Wildfires destroy property, plants, and animals, and may injure or result in the death of firefighters and community residents. Few studies have examined the impact of wildfires on those who live in the direct path of the wildfire or in a near-by area. This study addressed the long-term mental health consequences after the 2007 northern San Diego County wildfires. In all, 191 community-residing adults ranging in age from 30 to 94 years were assessed. Respondents varied in age, severity of exposure to the wildfire, and received social support. Analyses revealed that depressive symptomology differed among age groups, although prevalence of depressive symptoms was low overall. Received social support differed between the severity of wildfire exposure groups with primary victims receiving more social support than secondary or non-victims. Implications of these findings for promoting community-residing adults' long-term mental health recovery after a wildfire will be discussed.

A TRAUMA-INFORMED APPROACH TO DISASTER BEHAVIORAL HEALTH WITH OLDER ADULTS

M. Davis¹, N. Bellamy², K. Fountain¹, 1. *Social Work, George Mason University, Fairfax, Virginia*, 2. *Substance Abuse and Mental Health Services Administration (SAMHSA) Center for Mental Health Services (CMHS), Rockville, Maryland*

Older adults' experience during and post disaster may be impacted by traumatic events during their life course. Prior research suggests there are risks and protective factors associated with the number and timing of such events in the lives of older adults (Shrira, Shmotkin and Litwin, 2012). Pre-disaster life events also may have an impact on post-disaster physical and mental health. Shrira et. al (2014) describe vulnerabilities associated with lifetime trauma exposure in old age, while Eysenck's (1983) *inoculation hypothesis* suggests protective factors as a result of traumatic life events. Current disaster behavioral health content does not address these factors although some studies show a connection between traumatic life events and depression in old age and increased risk for PTSD post disaster (Shmotkin, 2003). A model for trauma informed approach to disaster behavior health will be presented. Perspectives from a Substance Abuse Mental Health Services Administration (SAMHSA) staff reflected.

PROMOTING DISASTER BEHAVIORAL HEALTH POLICY: LESSONS LEARNED FOLLOWING HURRICANE KATRINA

H.J. Osofsky, J.D. Osofsky, A.H. Speier, T.C. Hansel, *Louisiana State University Health Sciences Center, New Orleans, Louisiana*

Many lessons have been learned about how to successfully address evacuation, response and recovery phases of a disaster with aging population groups. Data collected in a 2011 study indicated that older populations reported more PTSD and physical health symptoms compared to younger populations. Experiences following Hurricane Katrina and Deepwater Horizon Oil spill, while providing interventions across the life span, suggest that a common factor associated with disaster preparedness and recovery includes a belief in one's self efficacy and sense of personal control among survivors. A major lesson learned is that if disaster relief personnel interact with survivors assuming incompetence, those people will demonstrate helplessness and begin to believe they cannot help themselves. Alternatively, if one assumes people are competent and recovery is supported, they are able to bounce back, showing resilient outcomes. Examples of response models for disaster behavioral health and policy recommendations will be presented.

SESSION 4125 (SYMPOSIUM)

THE PROMISE: HOT TOPICS

Chair: C.L. Estes, *University of California, San Francisco, Healdsburg, California*

Advances in biological, social, behavioral, and policy sciences challenge the limits of the health and lifespan globally for all ages. Breakthroughs render the unimaginable, possible. Yet, growing barriers exist, as science affirms deepening

health inequalities by risk factors of age, gender, race, ethnicity, (dis)ability, economic status, and education.

Dr. Koenig will open the panel discussing end of life and bioethics; Dr. Glymour will address lifecourse determinants of healthy aging and health disparities, suggesting improved data for causality; Dr. Covinsky will ask what is possible, given our hope for longevity free of disability and current knowledge of advanced-age elders, and Dr. Epel will address the achievability of healthspan extension, linking childhood experience and toxic stress, neighborhood health and behaviors, and social policies. Dr. Estes will close with observations on the intersection of science, policy and society in which aging is a women's issue.

MORTALITY IN AN AGING SOCIETY: MANAGING NEW PATHWAYS TO DEATH

B. Koenig, *Institute for Health & Aging, UCSF Bioethics; University of California, San Francisco, San Francisco, California*

California, Colorado, and Canada have recently enacted physician aid-in-dying (PAD) legislation. Almost one fifth of the US population now lives in a state where patients can ask their physician for assistance with ending their lives. How will that "option" play out in an aging society plagued by ever-increasing inequality? California is the most diverse locale to enact PAD as a routine practice. There are 1.75 million residents of color over the age of 65. A state-wide group convened by the UCSF Bioethics Program has worked to provide guidance about the End of Life Option Act's implementation to clinicians throughout the state. This presentation will report on these efforts, highlighting the unique ethical challenges for patients living in residential long term care facilities and for providers caring for an aging populace.

LIFECOURSE DETERMINANTS OF HEALTHY AGING AND HEALTH DISPARITIES: NEW DATA SOURCES TO IMPROVE CAUSAL EVIDENCE

M. Glymour, N. Adler, *University of California, San Francisco, San Francisco, California*

Strong evidence has accumulated to demonstrate that social and behavioral factors across the lifecourse predict cognitive and physical impairments in old age. Translating that evidence to practical applications to improve healthy aging requires evaluating whether those associations are causal and determining which exposures are most relevant. Opportunities for true randomization are limited and we will need to rely primarily on quasi-experimental studies. New approaches and data sources including large, representative samples with detailed residential histories are enabling rigorous quasi-experimental studies on the impact of social exposures on adult health outcomes. Our research program focuses on how educational experiences influence healthy aging of black and white adults. We discuss results in the REasons for Geographic and Racial Disparities in Stroke (REGARDS) cohort, where we are evaluating the influence of educational attainment, educational quality, and racial inequalities in education, on late life health and health disparities. We will show how extensions based on synthetic pooling of multiple data sets will improve statistical power and generalizability.

IS OLDER AGE DISABILITY REALLY PREVENTABLE?

K.E. Covinsky, *University of California, San Francisco, San Francisco, California*

Funding for geriatric research often focuses on preventing the syndromes and disabilities of aging. But is it logical to believe that age related disabilities are preventable? Does epidemiologic evidence support the contention that survival to advanced age free of disability is common? This talk will present evidence to suggest that our hope for longevity free of disability should be balanced by the actual experiences of elders of advanced age. The implications for clinical care, health policy, advocacy, and research funding will be discussed

EXTENDING OUR HEALTHSPAN: THE PROMISE OF BRIDGING BIOLOGICAL, SOCIAL, BEHAVIORAL AND POLICY SCIENCES

E. Epel, *University of California, San Francisco, San Francisco, California*

When we see the future demographics of our aging society, we see that many more of the children born today will likely live to 100.

What will those years be like, in terms of mental health, cognitive function, and physical health? This largely depends on the bridges we make between biological, social, and policy sciences. While radical life extension is out of reach, vibrant healthspan is achievable. This requires strong reliance on understanding the factors that promote healthy aging, including the biology of aging and how it interacts with childhood experience and toxic stress, neighborhood health, and behaviors. These in turn are shaped by social policies. We will have a discussion of how to most strategically achieve healthspan extension for population health.

SESSION 4130 (SYMPOSIUM)

THE PROJECT TALENT AGING STUDY: A NEW LIFECOURSE STUDY OF COGNITIVE, PHYSICAL, AND PSYCHOSOCIAL AGING

Chair: T.L. Gruenewald, *University of Southern California, Los Angeles, California*

Co-Chair: C. Prescott, *University of Southern California*

This symposium will showcase emerging findings and highlight research opportunities of the recently initiated Project Talent Aging Study. Project Talent began as a nationally-representative cohort study of over 375,000 high school students across the U.S. in 1960. Subsets of the original cohort were followed over an 11-year period to examine adolescent predictors of early adult economic, educational and occupational conditions and psychosocial and physical well-being. Our symposium will provide an overview of the reenvisioning of this original cohort study into a longitudinal study of socioeconomic, cognitive, physical and psychosocial aging. Gruenewald will provide an overview of the development of the Project Talent Aging Study. Achorn will detail findings from a pilot study designed to test the feasibility of computerized cognitive assessments and surveys of health and well-being via both the internet and tablet computers sent to, and retrieved from, older adult participants across the country. Prescott will share findings from

pilots of recently developed computerized adaptive assessments of cognitive function developed for use in the Project Talent Aging Study and other longitudinal studies of aging. Lapham will provide an overview of the recent linkage of over 200,000 Project Talent participant records to Centers for Medicare and Medicaid Services (CMS) records to assess how adolescent and early adult conditions predict health and health care utilization and cost in later life. Future plans for the Project Talent Aging Study and opportunities for use of the data by the greater scientific community will be shared.

COMPUTERIZED COGNITIVE, HEALTH AND PSYCHOSOCIAL ASSESSMENT IN OLDER ADULTS VIA THE WEB AND TABLETS

D. Achorn, D. Battle, M. Zhang, S. Lapham, *American Institutes for Research, Washington, District of Columbia*

The University of Southern California and American Institutes for Research are conducting a pilot study to determine the feasibility of conducting large-scale assessments of older adults by computer. Drawing from individuals who participated in Project Talent in 1960 and who are now aged 71–74, we sampled 500 participants to complete cognitive and survey assessments, either by web survey or a mail out/mail back tablet computer method. The sample was primarily selected based on computer usage survey in the 2011–12 pilot mail survey. Those with little or no computer experience were selected for the tablet, while those with experience were assigned to web. We recently completed the first of four waves of the tablet and web pilot study. Preliminary results indicate that older adults with limited computer experience are able to, and report a positive experience with, the use of tablets to complete cognitive assessments and lengthy health and well-being surveys.

SELF-ADMINISTERED ADAPTIVE TESTS OF COGNITIVE ABILITIES BY COMPUTER TABLET AND THE INTERNET

C. Prescott¹, T.L. Gruenewald¹, K. Peters¹, D. Achorn², M. Gatz¹, J. McArdle¹, *1. University of Southern California, Los Angeles, California, 2. American Institutes for Research, Washington, District of Columbia*

We developed adaptive versions of three cognitive measures used in the 1960 Project Talent assessment: Vocabulary, Abstract Reasoning, and 3D Spatial Visualization, representing markers of crystallized ability (Gc), fluid ability (Gf), and visuospatial reasoning (Gv). The adaptive measures have 6 items, take 5 minutes, and are self-administered via computer tablet or on the web to participants in the Project Talent Aging Study. Other measures include immediate and delayed memory, verbal fluency, and numeracy, providing a crosswalk between the 1960 measures and assessments used in other large-scale aging studies. We will provide an overview of results from pilot investigations designed to validate the psychometric properties of the assessments and testing for effects of administration mode (tablet vs internet) and participant characteristics. Our substantive goals include: characterizing current functioning on a profile of cognitive abilities; measuring 56-year change in measures of Gc, Gf, and Gv; and estimating change in other cognitive abilities.

PROJECT TALENT: INVESTIGATING EARLY-LIFE DETERMINANTS OF LATER LIFE MORBIDITY VIA MEDICARE LINKAGES

S. Lapham¹, D. Achorn¹, T.L. Gruenewald², C. Prescott², *1. American Institutes for Research, Washington, District of Columbia, 2. University of Southern California, Los Angeles, California*

AIR linked approximately 200,000 Project Talent (PT) records to Medicare data to obtain information about health, health care utilization and cost maintained by Centers for Medicare and Medicaid Services (CMS). We will provide researchers with an overview of this important new data resource and emerging findings from analyses examining early life predictors of later life health and healthcare utilization. Health-related PT measures from 1960 high school assessments include general health status, symptoms, BMI, musculoskeletal conditions, allergy and infectious diseases, dermatological symptoms, vision, hearing and speech conditions, accident history, sleep habits, diet and exercise, and prescription drug use. Medicare data include demographic, enrollment characteristics, chronic conditions, cost and utilization for each participant. The PT-Medicare linkage also provides claims data (e.g., inpatient, outpatient, skilled nursing, durable medical equipment). We will provide an overview of efforts to examine adolescent determinants of later life cognitive and physical health, morbidity and mortality.

SESSION 4135 (SYMPOSIUM)

IRVING S. WRIGHT & VINCENT CRISTOFALO “RISING STAR” AWARDS PRESENTATION, LECTURE, AND RECEPTION

Chair: S. Lederman, *American Federation for Aging Research*

Co-Chair: H. Herman, *American Federation for Aging Research, New York, New York*

AFAR presents two scientific awards annually to members of the aging research community whose outstanding work advances the field of aging research. The honorary scientific awards are named for visionary scientists whose leadership made AFAR and aging research what it is today.

2017 Irving S. Wright Award of Distinction Winner: Mark S. Lachs, MD, MPH, Psaty Distinguished Professor of Clinical Medicine, Weill Cornell Medical College

Talk Title: “*More Alike Than You Think: What Elder Abuse Research Has Taught Me About The Integration of Biological and Social Sciences In Aging*”

About the Wright Award: In 1981, Dr. Irving S. Wright, a noted cardiologist, brought together a group of far-sighted scientists and lay people to found AFAR. The Irving S. Wright Award of Distinction is named in honor of the founder of AFAR and is intended to honor exceptional contributions to basic or clinical research in the field of aging by member of the scientific community.

2017 Vincent Cristofalo “Rising Star” Award in Aging Research Winner: Dongsheng Cai, MD, PhD, Professor of Molecular Pharmacology, Albert Einstein College of Medicine

Talk title: “*Hypothalamic inflammation in neural control of aging*”

About the Cristofalo Award: The late Vincent Cristofalo devoted his professional career equally to two pursuits: Doing aging research, and encouraging younger scientists to investigate important problems in the biology of aging. Vince set an example of wise leadership, sophisticated judgment, and solid accomplishment that remain an inspiration to all who knew him. In his honor, AFAR established the Vincent Cristofalo “Rising Star” Award in Aging Research.

ELDER ABUSE RESEARCH: THE INTEGRATION OF BIOLOGICAL AND SOCIAL SCIENCES IN AGING

M.S. Lachs, *Weill Cornell Medical College, New York, New York*

In this lecture I will argue that elder abuse is a prototype for examining the intermittent but unnecessary tensions between august researchers who study the basic biology of aging and those who choose to study clinical and psychosocial determinants of aging and quality of life, as well as those researchers who fall in the continuum between those poles.

Many advisors and potential funders suggested that clinical and/or patient oriented research was “unscientific”. Soon this trend reversed, with my basic biology colleagues arguing that a growing emphasis on “patient oriented research” was a short-sighted strategy that would ultimately undermine the generation of new hypotheses and ideas that could revolutionize the science and medicine of human aging.

To improve quality of life for older people and the people who care about them we must stand should to shoulder, not only for political and pragmatic reasons, but for highly substantive scientific ones as well.

HYPOTHALAMIC INFLAMMATION IN NEURAL CONTROL OF AGING

D. Cai, *Albert Einstein College of Medicine, New York, New York*

In this talk, I will discuss the relationship between hypothalamic inflammation and neuroendocrine pathways in aging development as well as related metabolic syndrome. First, I will provide an overview on neuronal control of aging and lifespan in different species. Second, I will describe the involvement of hypothalamic pro-inflammatory IKK-beta and NF-kappaB pathway and related stress response in the development of aging and metabolic syndrome. Finally, I will discuss the impact of hypothalamic inflammation on hypothalamic neuroendocrine systems and therefore the influence on hypothalamic regulation of physiology which contributes to aging and lifespan changes. Altogether, inflammation-induced hypothalamic dysfunction represents a neural mechanism of aging.

SESSION 4140 (PAPER)

DISABILITY, CHRONIC CONDITIONS, AND PAIN

DISABILITY-FREE LIFE EXPECTANCY AMONG OLDER ADULTS IN HIGH LONGEVITY POPULATIONS

C. Payne¹, C. Chiu², L. Rosero-Bixby³, Y. Saito⁴, W.H. Dow⁵, 1. *Harvard University, Cambridge, Massachusetts*, 2. *Academica Sinica, Taipei, Taiwan*, 3. *University of Costa Rica, San Jose, Costa Rica*, 4. *Nihon*

University, Tokyo, Japan, 5. *University of California, Berkeley, California*

Japan has the highest life expectancy in the world, but Rosero-Bixby (2008) has surprisingly found that when examining remaining life expectancy at age 90, Costa Rican men outperform even Japan. The United States (U.S.) is well-known to under-perform in life expectancy, with Costa Rica having higher life expectancy at birth than the U.S., but at age 90 the U.S. reduces this gap and achieves similar remaining life expectancy as in Japan. Prior work suggests that these findings are not an artifact of poor data. In this paper we explore two alternative phenomena to help understand these surprising results. First, we exploit harmonized longitudinal surveys in Costa Rica (CRELES), Japan (NUJLSOA), and the U.S. (HRS) in order to extend these analyses to comparisons of Disability-Free Life Expectancy (DFLE). We compare DFLE by sex at age 65 and then among the oldest-old at age 90, in order to explore whether the relative life expectancy patterns also hold for DFLE. Second, we explore evidence on mortality selection in order to better understand the extent to which differential rates of early life mortality could affect these life expectancy comparisons.

EDUCATION AND ACCUMULATION OF CHRONIC CONDITIONS AFTER AGE 50 AMONG IMMIGRANTS TO THE U.S.

Z. Gubernskaya, *Sociology, University at Albany--SUNY, Albany, New York*

In 2014, 6.1 million (about 13%) of the Americans age 65 and over were foreign-born. An increasing diversity of this group calls for a better understanding of the health disparities among the older immigrants. The research uses 11 waves of the Health and Retirement Study (HRS) to explore patterns of accumulation of chronic conditions (hypertension, diabetes, cancer, heart disease, lung disease, stroke, psychiatric conditions, arthritis) after age 50 by nativity and age at migration. The results from the random intercept Poisson regression models show a sizable health advantage over the U.S.-born at age 50 for both non-Hispanic white and Mexican immigrants. Among the older non-Hispanic whites, those who migrated as young adults (age 18–34) were able to preserve their health advantage well beyond age 65, but older age at migration was associated with faster accumulation of chronic conditions. In contrast, among Mexicans, both young adult and early middle aged immigrants experienced faster accumulation of chronic conditions vis-à-vis the native-born Mexicans. Further analysis shows that these differences are explained by education. Poorly educated older foreign-born who migrated as young adults, both non-Hispanic white and Mexican, experience a steeper increase in the number of chronic conditions after age 50 compared to the native-born with similar levels of education. Because the majority of older Mexican immigrants came to the U.S. as young adults and are poorly educated, the pattern is present for the entire group.

RACE, SLOW WALKING SPEED, AND PAIN

J.L. Walker¹, L. Parker², S.L. Szanton¹, R.J. Thorpe², 1. *Johns Hopkins University School of Nursing, Baltimore, Maryland*, 2. *Johns Hopkins University Bloomberg School of Public Health, Baltimore, Maryland*

When older African Americans experience pain they often have higher rates of functional limitations and disabilities than older non-Hispanic Whites. There has been little work done on the relationship between pain and walking speed and if it varies by race. Slow walking speed is related to poorer quality of life and less independence in older adults. Using data from the 2011 National Health and Aging Trends Study we examined the relationship between pain and slow walking speed, and if this relationship varies by race among 6,689 community dwelling older adults. Slow walking speed was defined as walking speed 1.0 meters per second or below. Older adults who reported pain in the last month had a higher odds of slow walking speed (OR= 1.38, 95% CI= 1.10- 1.73) than those who did not report pain in the last month, after controlling for multiple chronic conditions, dementia, race, and other covariates of interest. Although 94% of older African Americans had slow walking speed, compared to 85% of older non-Hispanic Whites ($p < 0.001$), the relationship between pain and slow walking speed did not vary by race (interaction $p = 0.6$). This work provides evidence that addressing pain may improve walking speed.

TRENDS IN PAIN PREVALENCE AMONG OLDER ADULTS IN THE UNITED STATES: 1992 TO 2012

Z. Zimmer, *Family Studies and Gerontology, Mount Saint Vincent University, Halifax, Nova Scotia, Canada*

This analysis will first examine population trends in pain prevalence amongst older Americans across a twenty-year period and second assess the degree to which these trends are explained by changing socio-demographic composition and health characteristics. Pain is an important indicator of overall health among older adults and is related to many physical and psychosomatic conditions and disorders. While specific sources and proximate causes are not easy to identify, the negative consequences of pain for functional health are evident. Consequently, understanding trends in pain allows insight into changes in quality of life. Moreover, despite increased literature on trends in disability and other functional health disorders, few studies have monitored whether pain trends correspond with these. This study relies on over 150,000 observations from the Health and Retirement Study. This is an ideal data source since pain items have been measured consistently across most survey waves from 1992 to 2012. Deconstructing pain into mild, moderate and severe forms, the paper first evaluates trends in any and severity of pain over time. Preliminary results indicate rising trends for both males and females. Using binary and ordered logistic regression, the analysis then examines predictors of these rising trends. The conclusion will compare trends and predictors to the much more established literature on disability. In sum, despite presence of pain items in several national level surveys, little research has monitored trends over time, and as an indicator of population health, pain has been virtually ignored. The current study fills this gap.

HEALTH CARE STEREOTYPE THREAT AND INCIDENCE OF CHRONIC DISEASE IN THE UNITED STATES

F. Wheaton¹, C. Roman², C.S. Thomas³, C. Abdou Kamperveen², 1. *Aging Studies, Bethune-Cookman University, Daytona Beach, Florida*, 2. *University of*

Southern California, Los Angeles, California, 3. *University of California, Los Angeles, Los Angeles, California*

Healthcare stereotype threat (HCST), or the fear of being judged or personally confirming negative group-based stereotypes in healthcare settings, has been linked to poorer physical and mental health in cross-sectional studies. However, to date no studies have examined whether HCST predicts chronic disease incidence longitudinally. Using data from the 2012 and 2014 waves of the Health and Retirement Study (N=1,479), we examined whether experiences of HCST reported in 2012 were predictive of the development of chronic disease two years later using logistic regression models, which controlled for sociodemographic characteristics. We found that HCST, assessed in 2012, was predictive of development of diabetes and lung disease by the 2014 HRS wave among people who did not previously have these conditions. HCST, assessed in 2012, was not significantly associated with incidence of hypertension, heart conditions, or stroke, nor with mortality in 2014; nevertheless, odds ratios were in the expected direction and the relatively small sample size likely contributed to lack of significance. Findings demonstrate that HCST is negatively associated with poor mental and physical health not just cross-sectionally, but also with the development of certain chronic conditions over time.

SESSION 4145 (SYMPOSIUM)

POLICY AND PRACTICES FOR SUPPORTING SEXUAL EXPRESSION AMONG OLDER NURSING HOME RESIDENTS

Chair: G. Doll, *Kansas State University, Manhattan*
Discussant: P.A. Lichtenberg, *Wayne State University, Detroit, Michigan*

Contrary to societal beliefs, older people living in nursing homes continue to have desires for, and interest in, being sexual (Frankowski & Clark, 2009). However, the right and need to engage in intimate relationships are often ignored in nursing homes, which err on the side of safety and prohibiting intimacy. This is due to the complexities of sexual expression and dementia, lack of training/education, staff attitudes, and the lack of adequate or any policies to guide staff (Villar et al., 2014). Recent studies have shown great need for policy development in sexual expression that balances a right to autonomy with protection from oneself and others, particularly in the context of dementia (American Medical Directors Association, 2013; Tarzia, Fetherstonhaugh, & Bauer, 2012). Within this presentation, we will examine sexual expression practices and policy from international perspectives, highlighting the need for flexible approaches to support sexual expression among older people in nursing home care. First, we will discuss the status quo of sexual expression policy among nursing homes in Australia, contrasting the findings with “best practice.” Implications for development and training will be discussed. Second, we will emphasize the importance of resident-informed sexual expression policy; taking into account resident rights and wishes along with administrators and laws/regulations. Data from two studies conducted in the US will be highlighted. Third, we will present a clinical perspective showing how a sexual expression policy was developed and is being implemented in a healthcare

system in Canada. A description of policy development and illustration with case studies will be included.

HOW TO ADDRESS SEXUALITY IN AGED CARE? POLICIES—GOOD, BAD, AND NONEXISTENT!

M. Bauer, D. Fetherstonhaugh, *La Trobe University, Melbourne, Victoria, Australia*

Living in an aged care facility does not diminish the importance of sexuality or the need to express it. To promote an optimal quality of life for people living in aged care, aged care organizations need policies which clearly and consistently address the sexuality needs and activities of residents. This presentation reports data from a sexuality survey sent to all Australian aged care facilities (n = 2,766), which indicated that meaningful sexuality policies are lacking and policy frameworks inadequate. The policy landscape as depicted by our data will be examined in light of the introduction of a best practice Sexuality Assessment Tool (SexAT) for aged care facilities. Organizational support for sexuality with respect to policy development, residents' needs, staff education and training, information and support for residents and families and the environment, safety and risk management will be discussed.

RESIDENT-INFORMED SEXUAL EXPRESSION POLICY: AN EXAMINATION OF FUTURE CONSUMERS OF NURSING HOME CARE

M. Syme, G. Doll, L. Cornelison, E. Yelland, J.L. Poey, *Center on Aging, Kansas State University, Manhattan, Kansas*

There is a notable lack of sexual expression policy in nursing homes. Without formal policy, homes determine what is "best," which may not consider the rights/wishes of the resident. We will present two studies conducted in the US underscoring the importance of resident-informed sexual expression policy. The first study is a content analysis of public comments about sexual expression and dementia, in reaction to a *New York Times* article. Comments revealed what factors the public felt should be considered for their future care, including: status/history of the relationship, potential harm, assent, privacy, and others. The second study examines older adults' evaluations of hypothetical sexual activities among nursing home residents. Different levels of each factor (assent, relationship status, cognition) are randomly assigned within vignettes. Appropriateness ratings are examined via a series of ANOVAs. Results are compared with the public comments to further illustrate factors important in crafting policy that is resident-centered.

CLINICAL APPLICATIONS FOR SEXUAL EXPRESSION POLICY AND PROCEDURES IN LONG-TERM CARE HOMES

D. Steele, 1. *Providence Care Mental Health Services, Brockville, Ontario, Canada*, 2. *Lanark Leeds Grenville, Brockville, Ontario, Canada*

Sexual expression is a complex clinical issue within residential care. The noted lack of policies and training for staff and administration has resulted in practices that are often prohibitive with a nursing home setting, and may not support the resident(s) rights and needs for intimacy. This presentation presents a clinical point of view on sexual expression

in long-term care, highlighting case illustrations and the development of a resident-centered policy within a long-term care network in Ontario, Canada. Cases will review common challenges in supporting sexual expression for residents, such as resident-to-resident relationships (where one or both have a spouse/partner), a spouse/partner visiting the nursing home resident and engaging in sexual/intimate behavior, and examples of how different behavioural expressions are (mis)perceived as having sexual intent and suppressed by administration/staff. These cases will be discussed in light of the policy and procedures developed as part of the Lanark, Leeds, and Grenville working group.

SESSION 4150 (SYMPOSIUM)

INNOVATIVE INTERVENTIONS IN ELDER ABUSE PREVENTION AND MITIGATION

Chair: G.M. Gutman, *Simon Fraser University, Vancouver, British Columbia, Canada*

Discussant: C. Thomas, *National Academies of Sciences, Engineering and Medicine, Rockville, Maryland*

Since the mid-1970s when elder abuse first came to public attention in the most developed countries, many interventions have been developed by government agencies, NGOs, and other concerned bodies to address abuse and neglect of older adults. In this symposium researchers from Ireland, Israel and Canada will highlight innovative approaches to awareness raising, case identification, mitigation and prevention, training and tool development in their respective countries. In the case of Canada, there are two presentations. One focusses on the province of Quebec where there is no specific public agency to counter elder abuse. A project, funded by the Social Sciences Research Council of Canada, aimed at understanding the actions of NGOs and especially volunteer actions to counter elder abuse is described. The second Canadian presentation and those from Ireland and Israel highlight strengths and weaknesses and/or changes over time of selected interventions implemented in health-care and community-based settings and services.

INNOVATIVE INTERVENTIONS IN ELDER ABUSE PREVENTION AND MITIGATION: AN IRISH PERSPECTIVE

A. Phelan, *University College Dublin, Dublin, Ireland*

Responding to elder abuse in Ireland occurred relatively late as compared to other countries. The first national policy document, *Protecting our Future* was published in 2002 with a bespoke response service being established in 2007. One of the policy recommendations was the establishment of the National Centre for the Protection of Older People (NCPPOP) in University College Dublin to generate Irish based research on elder abuse. This presentation examines the work of the NCPPOP and will use selected studies including the piloting of elder abuse screening tools as both a preventative and intervention mechanism and the development of a multi-foci response system to financial abuse of older people. After attending this session, participants will be able to understand elder abuse as a defined problem in Ireland. In addition, participants will identify how baseline data from NCPPOP studies has contributed to the development of national responses to elder abuse.

MEANS OF PREVENTION OF ELDER ABUSE—THE ISRAELI EXPERIENCE

A. Lowenstein, *Max Stern Yezreel Academic College, Haifa, Israel*

Israeli society is unique among the worlds' developed countries. Comprised of Jews, Muslims, Christians and Druze, it is a modern country with developed education, health, technology and industry systems, but also with strong religious, traditional, familial and cultural values. Elder abuse and neglect (EA) were recognized only after data from the first National Community Study were released. This paper focusses on two innovations developed to cope with EA: 1) Interdisciplinary Violence Committees established in large hospitals, to receive information from all hospital departments, follow-up and report to the Ministry of Health, and devise links for continuity care after patients are released and 2) within Social Welfare services, Special Units established in each municipality to tackle EA, based on a multi-systematic model for treatment and prevention with interdisciplinary teams staffed by social workers, psychiatrists and medical geriatric experts who provide direct interventions to abusers and victims, raise awareness, and support professionals.

NON-GOVERNMENTAL ORGANIZATIONS AND VOLUNTEER ACTIONS TO COUNTER ELDER ABUSE

M. Beaulieu, *University of Sherbrooke, Sherbrooke, Quebec, Canada*

Non-Government Organisations (NGOs) play an important role in the province of Québec's continuum of services to counter elder abuse (EA) where there is no specific public agency to counter EA. They work in collaboration with police, public health services, victim's assistance centres, etc. This paper describes research aimed at understanding these NGOs and especially their volunteers' actions to counter EA. Multiple case studies (Yin, 2014) of 5 NGOs dedicated to EA including content analysis of administrative documents, 49 interviews (coordinators, practitioners, volunteers and older adults), 5 focus groups (board members) were conducted. Results: Although NGOs perform sensitisation, detection and follow-up of cases, volunteers are more involved in sensitisation/prevention activities. But, based on their past work experience (e.g. police officers, bank managers) volunteers play a crucial role in informing older adults of different possibilities of problem solving. Conclusion: Main challenges for NGOs are precarious funding, recognition of their mission, volunteer turnover.

INTERVENTIONS AND TRAINING TO PREVENT ELDER ABUSE: CANADIAN EXAMPLES

G.M. Gutman, *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

This presentation compares and contrasts federal government awareness raising campaigns conducted in 2009 under the banner "What Every Older Canadian Should Know About Elder Abuse" and in 2010 under the banner "Elder Abuse: It's Time to Face the Reality" with more recent initiatives delivered federally or by Provincial government agencies such as Elder Abuse Ontario which, while including print materials and videos, have tended to be more interactive whether delivered via the Internet or via face-to-face seminars. Selected campaigns delivered by NGOs

will also be highlighted including the "Be a Savvy Senior" campaign developed and delivered by the Canadian Centre for Elder Law in partnership with the Centre for Public Legal Education Alberta and the Government of Canada's Canadian Anti-Fraud Centre.

SESSION 4155 (SYMPOSIUM)

TERMINAL CHANGE IN WELL-BEING: FURTHER EVIDENCE AND NEW INSIGHTS

Chair: O.K. Schilling, *University of Heidelberg, Heidelberg, Germany*

Discussant: M.K. Diehl, *Colorado State University, Fort Collins, Colorado*

Research in geropsychology increasingly considered late-life development in terms of time-to-death-related changes in diverse areas of psychological functioning, including subjective well-being (SWB). By now, accumulated evidence confirmed terminal changes in SWB, so that time-to-death research might increasingly aim for differentiation of and closer insight into terminal processes that involve human well-being. This symposium brings together four papers which address current research questions in the study of terminal changes of SWB, concerning specific processes of time-to-death-related changes involved in SWB, as well as potential variability of the unfold of terminal change in well-being. Thus, the studies present methodological advancements and add to a more nuanced picture of terminal development of SWB.

Schilling & Deeg examined population heterogeneity of time-to-death-related trajectories of depressive symptoms and present a statistical model to include longitudinal study participants that have not died by the end of the study period into the estimation of time-to-death effects. Hülür et al. analyzed dyadic associations of SWB from a time-to-death perspective; i.e. the terminal change of well-being in couples approaching the death of one partner. Wettstein et al. examined differences between close-to-death changes in different facets of well-being within individuals that died at very old age. Palgi et al. addressed terminal change in affective experience in terms of changes of emotional complexity that associated with closeness to death.

Manfred Diehl will discuss the four presentations, highlighting their theoretical and methodological contributions, and considering challenges and opportunities of research on terminal development of SWB outcomes.

MODELING TRAJECTORIES OF TERMINAL DROP OF AFFECTIVE WELL-BEING WITH TIME-TO-DEATH RIGHT-CENSORED

O.K. Schilling¹, D.J. Deeg², *1. Institute of Psychology, Department of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany, 2. Vrije Universiteit Amsterdam, Amsterdam, Netherlands*

Recent findings suggest that affective development in old age unfolds more time-to-death- than age-related and promote the notion of terminal drop of affective well-being. However, this general picture might have been distorted by the exclusion of longitudinal study survivors in modeling time-to-death-related trajectories and the potential

heterogeneity of dying processes. Therefore, this study presents a longitudinal mixed modeling approach to analyze terminal drop of affective well-being, treating time-to-death as right-censored variable to include the study survivors, and an exploratory analysis of potential heterogeneity of time-to-death-related patterns. Depressive symptoms (CES-D) from the Longitudinal Aging Study Amsterdam ($N = 3107$, 6 measurement occasions, 3-year intervals) were analyzed. The findings confirm a crucial terminal drop dynamic even when those who survived the observation period are included. Moreover, the analyses revealed evidence of considerable heterogeneity of time-to-death-related trajectories, in terms of amount and shape of terminal change in depressive symptomatology.

DYADIC ASSOCIATIONS IN WELL-BEING IN THE LAST YEARS OF LIFE

G. Hülür¹, F.J. Infurna², N. Ram³, D. Gerstorf¹, 1. *Humboldt University, Berlin, Germany*, 2. *University of Arizona, Tempe, Arizona*, 3. *Pennsylvania State University, University Park, Pennsylvania*

Research on terminal decline has generally focused on how the last years of life are being experienced individually. Here, we take a different approach by studying how well-being changes in couples as one partner approaches death. Specifically, we examine how well-being trajectories of the surviving partner are associated with the well-being trajectories of the dying partner. We used annual longitudinal data obtained over 30 years in the German Socio-Economic Panel from 2,156 couples with 20,513 longitudinal observations. Results revealed that late-life well-being trajectories were indeed linked within couples: Yearly well-being fluctuations of the surviving partner were closely associated with yearly well-being fluctuations of the dying partner. The strength of such within-couple links differed between partners and follow-up analyses will target the contributing role of individual and partnership variables. We discuss factors that contribute to within-couple well-being associations and the role of close social relationships in the last years of life.

TERMINAL DROP OF WELL-BEING IN VERY OLD AGE

M. Wettstein, O.K. Schilling, *Institute of Psychology, Department of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany*

Those who survive into oldest-old age may expect and have developed resilience towards terminal processes, hence showing less terminal decline in well-being than evidenced with samples with a broader range of age-at-death. The present study analyzed time-to-death-related change in a broad range of facets of well-being (affective, eudaimonic, death-related fears), making use of longitudinal oldest-old data ($N=125$, aged 87–96 at baseline) that provides up to 18 measurements with short (3–6 month) intervals, hence enabling observation of changes in close proximity to death. Confirming our expectations, terminal drop did not unfold de-differentiated across all facets of well-being, but appeared pronounced only for indicators of positive affect. Further analyses suggest that this terminal drop was driven by loss of functional abilities. Altogether, the findings point at the oldest-olds' resilience towards terminal experiences – except

the interruption of positive affect due to terminal loss of behavioral competences which are needed for prohedonic activities.

AGE-RELATED AND DEATH-RELATED DIFFERENCES IN EMOTIONAL COMPLEXITY

Y. Palgi¹, A. Shrira², M. Ben-Ezra³, T. Spalter⁴, G. Kave⁵, D. Shmotkin⁶, 1. *University of Haifa, Haifa, Israel*, 2. *Bar-Ilan University, Ramat Gan, Israel*, 3. *Ariel University, Ariel, Israel*, 4. *University of Toronto, Toronto, Ontario, Canada*, 5. *The Open University, Raanana, Israel*, 6. *Tel Aviv University, Tel Aviv, Israel*

Emotional complexity, as seen in covariation between retrospective judgments of positive and negative affects, has shown mixed evidence. We propose that emotional complexity may remain intact or even increase in old age, and yet it decreases in light of functional deterioration shortly before death.

We used 3 large-scale databases: 2 cross-sectional (SHARE, $N=17,437$, $M_{age}=64$; HRS, $N=6,032$, $M_{age}=67$) and 1 longitudinal (CALAS, $N=1,310$, $M_{age}=83$). Hierarchical multiple regressions and multilevel models showed that respondents who perceived themselves as closer to death or were actually closer to death showed lower emotional complexity (a stronger negative correlation between positive and negative affects). Age and emotional complexity were unrelated or positively related, depending on the sample. The results indicate that both subjective and objective closeness to death are associated with lower emotional complexity. This death-related decrease in emotional complexity is discussed within current theories of aging.

SESSION 4160 (SYMPOSIUM)

UNDERSTANDING ALCOHOL USE IN OLDER ADULTHOOD: PSYCHOSOCIAL CORRELATES AND CONSEQUENCES

Chair: P. Sacco, *University of Maryland, Baltimore, Maryland*

Discussant: A. Kuerbis, *Hunter College/CUNY, New York, New York*

Alcohol is the most commonly used substance among adults aged 65 and older, and the prevalence of alcohol consumption is likely to increase in coming years as the baby-boom generation reaches older adulthood. Even though alcohol use ubiquitous among older adults, aging research specific to alcohol use is limited. In particular, limited research has evaluated factors that drive consumption among older adults as well as psychosocial correlates of use. This symposium will discuss psychological and social factors associated with alcohol use including qualitative data on use, the role of self-medication as a motive for drinking, the relationship of alcohol consumption and elder abuse and alcohol use in long term care settings.

Dr. Haighton will review research focused on self-identified reasons for drinking among older adults, and will discuss her qualitative research directed at understanding reasons for drinking among older adults in the United Kingdom. Using Dr. Haighton's work as a foundation, Drs. Canham and Mauro will delve specifically into the self-medication

theory of drinking among older adults with particular attention toward methodological challenges in studying self-medication. Drs. Teaster and Brossoie will discuss ways in which alcohol use and elder abuse may intersect with a specific focus on how alcohol can contribute to vulnerability to abuse, and Drs. Wolf and Castle will explore an understudied area, alcohol consumption in long term care settings. Discussant Alexis Kuerbis will reflect on current knowledge in psychosocial research focused on alcohol and aging, and identify future directions in research.

PSYCHOLOGICAL AND SOCIOLOGICAL REASONS FOR DRINKING IN OLD AGE: A QUALITATIVE STUDY FROM THE UK

K. Haighton, *Northumbria University, Newcastle upon Tyne, United Kingdom*

Alcohol problems occur in later life and are associated with notable social, psychological, physical and economic consequences. With an ageing population worldwide and a reported increase in alcohol consumption in older people there is growing concern over this public health issue. In order for health professionals to successfully intervene with older people who are experiencing alcohol problems it is important to understand the underlying factors that may increase consumption of alcohol. This presentation will combine data from a UK based qualitative study aimed at understanding older people's reasoning about drinking in later life with key academic literature in order to identify psychological and sociological reasons for drinking in old age. Alcohol use has been associated with stressful life events, self-medication, boredom, loneliness, isolation, and homelessness as well as enjoyment and socialization. The direction of causality in the relationship between alcohol use and many of these factors is often in doubt.

ALCOHOL SELF-MEDICATION AMONG MIDDLE-AGED AND OLDER ADULTS

S.L. Canham¹, P.M. Mauro², 1. *Gerontology Research Centre, Simon Fraser University, Vancouver, British Columbia, Canada*, 2. *Columbia University, New York, New York*

Middle-aged and older adults use alcohol for various reasons, including to self-medicate. Self-medication is the use of alcohol or other substances to relieve discomforting physical/mental health symptoms or to cope with negative affect. Understanding the reasons why middle-aged and older adults use alcohol and providing alternatives to alcohol are important steps toward reducing the morbidity of alcohol use disorders in this population. The goals of this presentation are to review: the prevalence of self-medication with alcohol among adults in mid- and late-life; reasons for self-medication with alcohol; and potential outcomes of self-medication with alcohol in later life. We propose a conceptual model to help synthesize the literature and aid in hypothesis development and testing. We then review measurement issues, including how to identify middle-aged and older adults who may be self-medicating with alcohol, and discuss treatment and prevention opportunities. This presentation concludes by highlighting avenues for future research.

EXPLORING THE INTERSECTION OF ELDER ABUSE AND ALCOHOL MISUSE

P.B. Teaster, N. Brossoie, *Human Development, Virginia Polytechnic Institute & State University, Blacksburg, Virginia*

Life experiences in older adulthood may be more heterogeneous than at any other time across the lifespan; adults' daily activities typically transition from full-time employment and family responsibilities to retirement and increased leisure activities. For some, older adulthood may be a time when persons are increasingly reliant upon others for help, especially if physical or mental health declines. One consequence of increased vulnerability may be a heightened increased risk for abuse, neglect, and exploitation, a vulnerability exacerbated if alcohol is being misused in the home setting. In this presentation, we explore the intersection of elder abuse and alcohol misuse, beginning with definitions of elder abuse followed by theoretical constructs and frameworks for conceptualizing both problems. Next, we examine settings of abuse and scholarly literature on victims and perpetrators, specifically what is known about the contribution of alcohol to the problem. We then discuss responses to the problems of elder abuse and alcohol misuse and conclude with recommendations for future for research and practice.

ALCOHOL USE DISORDERS (AUDS) AND MISUSE FOR SENIORS LIVING IN LONG-TERM CARE (LTC)

D.G. Wolf¹, N.G. Castle², 1. *Health Services Administration - PACE, Barry University, Delray Beach, Florida*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*

Alcohol use disorders (AUDs) and misuse for seniors living in long-term care (LTC) settings (i.e., assisted living facilities, nursing homes, and senior high-rise communities) will be examined during this session. AUDs among seniors has been called the "invisible epidemic" and have long been advocated as a priority area for attention and action. LTC residents with AUDs and misuse of alcohol are more likely to suffer from illness and may also have a higher mortality rate along with significantly greater use of health services. AUDs often goes undetected in these LTC populations, therefore detection will be discussed. Moreover, seniors with AUDs also present a variety of challenges for LTC staff, thus caregiving options will also be discussed. Given the potential importance of AUD and misuse on the health and quality of life for seniors, more research in this area is warranted and future implications for this research will also be examined.

SESSION 4165 (SYMPOSIUM)

TECHNOLOGY TO SUPPORT HEALTH, WELL-BEING, AND PRODUCTIVITY OF OLDER ADULTS: PERSPECTIVES FROM CREATE

Chair: W.R. Boot, *Florida State University, Tallahassee, Florida*

Discussant: C.C. Quinn, *University of Maryland School of Medicine, Baltimore, Maryland*

Technology enriches and enhances our everyday lives and can support health, wellbeing, and productivity. Unfortunately, barriers exist that prevent many older adults

from taking full advantage of the potential of technology. The Center for Research and Education on Aging and Technology Enhancement (CREATE) is dedicated to understanding and overcoming barriers to technology use so these benefits can be realized by everyone, regardless of age. This symposium will focus on technology to support older adults and factors related to older adult technology use and adoption in a variety of contexts. W. Rogers will present an overview of older adult technology use derived from representative U.S. samples and important factors influencing technology adoption. W. Boot will discuss the critical role of technology proficiency in adoption and how to quickly and easily assess proficiency with respect to desktop and tablet-based computers in older adult samples. In the domain of work, J. Sharit will discuss the implications of rapid changes in technology for older workers, and the promises and pitfalls of technology in the workplace. In the domain of medicine, N. Charness will present studies related to the successful adoption of telehealth devices in different populations (healthy older adults and older adults with heart failure). S. Czaja will present CREATE data related to the potential of technology to support social engagement and support for older adults at risk for social isolation. Discussant C. Quinn will highlight common themes across talks and provide additional insight into the potential of technology.

UNDERSTANDING INDIVIDUAL AND AGE-RELATED DIFFERENCES IN TECHNOLOGY ADOPTION

W.A. Rogers⁴, T.L. Mitzner¹, W.R. Boot², N.H. Charness², S.J. Czaja³, J. Sharit³, 1. *Georgia Institute of Technology, Atlanta, Georgia*, 2. *Florida State University, Tallahassee, Florida*, 3. *University of Miami, Miami, Florida*, 4. *University of Illinois Urbana-Champaign, Champaign, Illinois*

Older adults, as a group, tend to be slower than younger adults to adopt new technologies. These differences are well illustrated in the Pew data sets, which we will summarize briefly. However, within each age group, there are individual differences in rates of adoption. We will provide an overview of the factors that predict technology adoption early (i.e., related to perceptions of ease of use or usefulness) as well as over time. The PRISM trial provided a unique opportunity to assess predictors of use over the course of one year. We will present these data, as well as other examples, to identify predictors of technology adoption across and within age groups. Understanding these individual and age-related differences can provide guidance for the deployment of new technologies that may be beneficial to users in terms of health benefits, social interaction, or cognitive engagement.

OLDER ADULT TECHNOLOGY PROFICIENCY AND TECHNOLOGY ADOPTION

W.R. Boot¹, N. Roque¹, N.H. Charness¹, W.A. Rogers², T.L. Mitzner², S.J. Czaja³, J. Sharit³, 1. *Department of Psychology, Florida State University, Tallahassee, Florida*, 2. *Georgia Institute of Technology, Atlanta, Georgia*, 3. *University of Miami, Miami, Florida*

Older adults with low technology experience may not have the proficiency to take advantage of technology to support wellbeing, independence, and productivity. Low proficiency may then reinforce the decision not to adopt technology.

This talk will discuss the critical role of technology proficiency with respect to adoption and how to measure proficiency across common computing platforms (desktop and tablet computers). Data from two large intervention studies will explore the proficiency of socially isolated older adults and how proficiency relates to previous and subsequent technology use. New brief measures of proficiency designed for research and training purposes will be highlighted.

TECHNOLOGY AND WORK: IMPLICATIONS FOR OLDER WORKERS AND ORGANIZATIONS

J. Sharit, S.J. Czaja, *University of Miami, Miami, Florida*

Two demographic trends are shaping today's work environment: the rapid influx of technology and the increase in the number of older workers. Technology is reshaping work processes, the content of jobs, where work is performed, communication strategies, and the delivery of education and training. These workplace changes are creating both opportunities and challenges for older workers. For example, telework offers people the opportunity to work at home with more flexible work schedules. However, continual evolutions in technology mean that workers need to continually engage in training and update their skills. This presentation will discuss the potential impact of the continual deployment of technology in the workplace on older workers. Data will be presented from the Center for Research on Aging and Technology Enhancement (CREATE) on barriers older adults confront when seeking employment, studies examining training older workers to learn new technology skills, and managerial attitudes towards older workers as teleworkers.

CONSTRAINTS ON TELEHEALTH ADOPTION AND USE BY OLDER ADULTS

N.H. Charness¹, W.R. Boot¹, J. Evans¹, R. Best¹, J. Taha², J. Sharit², S.J. Czaja², 1. *Florida State University, Tallahassee, Florida*, 2. *University of Miami, Miami, Florida*

Telehealth technologies have the potential to deliver effective health care more affordably and conveniently than in-person delivery, particularly for managing chronic conditions affecting 75% of seniors age 65+ yr. We report on factors affecting acceptance (watch comfort study), system and human reliability (remote monitoring), and usability (health portal). For the watch comfort study, results suggest that designing for comfort and aesthetics can facilitate acceptability for all age groups. In the remote monitoring study, older adults with and without heart failure reliably used telehealth components daily at least 70% of the time over a 6-month interval and system availability exceeded 90%. For the health portal study, 86% of older adults indicated willingness to use a health portal and Individual differences in numeracy and Internet experience predicted their performance on simulated health portal tasks. Results underline the importance of design and training for telehealth adoption and use.

THE ROLE OF TECHNOLOGY IN SUPPORTING SOCIAL ENGAGEMENT AND SOCIAL SUPPORT AMONG OLDER ADULTS

S.J. Czaja¹, J. Sharit¹, W.R. Boot², N.H. Charness², W.A. Rogers³, 1. *Psychiatry and Behavioral Sciences, University of Miami, Miami, Florida*, 2. *Florida State*

University, Tallahassee, Florida, 3. University of Illinois, Champagne Urbana, Champagne Urbana, Illinois

Social isolation is prevalent among community dwelling older adults especially those who live in rural locations, have mobility restrictions and live alone. It is also common among older adults living in assisted living facilities or other types of residential institutions such as nursing homes. Technology applications such as the email, social media sites and online support groups hold promise in terms of enhancing engagement and providing support to older people in various contexts and enhancing their quality of life and ability to live independently. This paper will present findings from CREATE and other trials regarding the access to and use of these applications among older adults and the resultant impact on the social connectivity, loneliness and social support. Barriers to access and challenges regarding the use of these applications will also be discussed as well needed areas of future research to maximize the benefits for technology to enhance social engagement.

SESSION 4170 (SYMPOSIUM)

THE GERMAN AGEING SURVEY: RECENT FINDINGS FROM A COHORT SEQUENTIAL STUDY ON THE SECOND HALF OF LIFE

Chair: C. Tesch-Roemer, *German Centre of Gerontology (DZA)*

The German Ageing Survey (DEAS) is the most important study on individuals in the second half of life in Germany. DEAS is a nationwide representative, thematically broad survey of the German population aged 40 and older, combining cross-sectional and longitudinal data. The aim of the symposium is to present the diversity of topics and analytical opportunities of the DEAS-data which are available to the scientific community. Each presentation has a different approach to the data and will use a different analytical strategy. Wolff et al. present on cohort differences in several aspects of health over a period of 18 years. Huxhold et al. show how the dynamic interplay of health problems and successful ageing differs by socio-economic status. Mahne makes use of the three-generation perspective in DEAS to analyze financial transfers to grandchildren. Klaus and Baykara-Krumme develop a typology of late-life parent-child relationships comparing migrant and non-migrant families. Looking at the transition to retirement, Wetzel analyzes who has difficulties in adjusting to this central event in later life.

COHORT DIFFERENCES IN HEALTH: HOW HEALTHY ARE FUTURE GENERATIONS OF OLDER ADULTS IN GERMANY?

J.K. Wolff, S. Nowossadeck, S. Spuling, *German Centre of Gerontology, Berlin, Germany*

Whether the increasing life expectancy in countries experiencing population aging is accompanied by compression or expansion of morbidity is an ongoing debate. The current study investigates one important factor in this debate: the development of health status in subsequent generations. Data from four cross-sectional samples aged 40–85 of the German Ageing Survey were used to estimate cohort differences in

three health facets (number of diseases, functional health, and depressive symptoms) and one health behavior (physical activity) across 18 years (1996–2014). Logistic regression models showed positive trends for people currently aged 65 and older with better health and more physical activity in younger cohorts. However, for individuals aged 40–65 functional health decreased whereas depressive symptoms increased from 2008 to 2014. Results indicate that later-born cohorts do not necessarily show better health status. Possible explanations such as increases in work stress or multiple demands of family and work are discussed.

THE DOUBLE JEOPARDY OF HEALTH-IMPAIRED ADULTS OF LOW SOCIO-ECONOMIC STATUS

O. Huxhold¹, S. Spuling¹, M. Wetzel², J.K. Wolff¹, 1. *Research, German Centre of Gerontology, Berlin, Berlin, Germany*, 2. *University of Cologne, Cologne, Germany*

Numerous studies have found social inequality in health in older ages. Furthermore, a low socio-economic status also indicates limited access to resources for coping with health impairments. Thus, older adults of with a low socio-economic status may show more negative reactions to health problems across a variety of indicators of successful aging. Using data from the German Aging Survey (DEAS) we examined the interacting dynamics of physical health problems with self-rated health, positive affect, and activities. In line with our expectations, physical health influenced self-rated health more strongly in lower educated than in higher educated adults. Positive affect was increasingly impaired by health problems with advancing age but only in adults with low education. Similarly, health impairments in retirement limited the engagement in activities only if the education level was low. Summing up, multimorbidity may pose a particular threat for successful aging of older adults with a low socio-economic status.

TIGHT KNIT OR DETACHED? PARENT-CHILD RELATIONSHIPS IN MIGRANT AND NON-MIGRANT FAMILIES IN GERMANY

D. Klaus¹, H. Baykara-Krumme², 1. *German Centre of Gerontology, Berlin, Germany*, 2. *University of Duisburg-Essen, Duisburg, Germany*

We compared parent-adult child relationships in migrant and non-migrant families in Germany. Most research in this field considers single dimensions of the intergenerational solidarity paradigm, but little is known about family types based on multiple dimensions. The typological approach enabled us to test two opposing hypotheses about the impact of migration on families: Does migration enhance or weaken family ties? We used the German Ageing Survey (2008, 2014) which includes non-migrants and migrants aged 40 to 85. We aimed at replicating existing typologies of late-life parent-child relationships for migrants in Germany. Moreover, we tested whether differences in the prevalence of family types across our groups prevailed after controlling for socio-demographic and socio-economic variables. Preliminary findings suggest a similar structure of family types, but also strong impacts of origin and migration: In migrant families tight-knit relations are more common and rates of detached relationships are lower than in non-migrant families.

IS IT DIFFICULT TO ADJUST FOR EVERYONE? EXPLAINING RETIREMENT ADJUSTMENT WITH LIFE COURSE DATA

M. Wetzel, *Institute of Sociology and Social Psychology (ISS), University of Cologne, Cologne, Germany*

Adjustment to retirement is crucial for successful ageing. However, not everybody has the same chance to adapt well. Following a life course approach, different facets may predict the success, in particular previous life experiences, timing of retirement, interdependence with others, and access to resources. Using data of the German Ageing Survey (DEAS) allows us to use a broad range of life course characteristics for predicting whether or not a retiree reports difficulties in adjustment. Preliminary results show that about 30 percent of retirees age 60 to 75 reported difficulties in adjusting. While timing, disrupted employment biographies and access to resources showed high prevalences, early child adversity and having other people around did not predict difficulties. Different effects were found by gender and education, while effects differed only marginal by period. We discuss these findings in respect to other findings in retirement adjustment.

SESSION 4175 (SYMPOSIUM)

A SAMPLE OF QUALITY OF LIFE RESEARCH FROM THE CANADIAN CONSORTIUM ON NEURODEGENERATION IN AGING

Chair: K. McGilton, *Toronto Rehabilitation Institute - University Health Network, Ontario, Canada*

Discussant: K. Rockwood, *Dalhousie University*

The Canadian Consortium on Neurodegeneration in Aging (CCNA) provides the infrastructure and support that facilitates collaboration amongst Canada's top dementia researchers. By accelerating the discovery, innovation, and the adoption of new knowledge, the CCNA positions Canada as a global leader in increasing understanding of neurodegenerative diseases, working in the areas of prevention, treatment and quality of life.

The goal of the CCNA is to offer a collaborative and synergistic space that attracts the best researchers in the field. Together, researchers work on transformative ideas to positively impact the quality of life and the quality of services for individuals living with neurodegenerative diseases. In fact, seven research teams are dedicated to one of CCNA's overarching themes, quality of life.

This symposium will focus on showcasing the work of 5 teams within the Quality of Life theme all of whom focus on persons with dementia. Specifically, researchers from Team 16 will share a driving cessation decision-making and coping framework and toolkit. Team 17 will describe how dual sensory and cognitive loss influence every day functioning and quality of life. Team 18 will discuss a group psychotherapy intervention to support dementia family carers in managing work-life conflicts. Team 19 will present the impact of primary care interventions on the knowledge attitudes and practices of clinicians and their association with quality of dementia care. Finally, Team 20 will discuss the implementation of community based participatory action research to

improve approaches to dementia care in Indigenous populations in Canada..

A DRIVING CESSATION DECISION-MAKING AND COPING FRAMEWORK AND TOOLKIT FOR PEOPLE WITH DEMENTIA

G. Naglie^{1,2,3}, S. Sanford¹, M.J. Rapoport^{4,2}, 1. *Baycrest Health Sciences Centre, Toronto, Ontario, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*, 3. *Toronto Rehabilitation Institute, Toronto, Ontario, Canada*, 4. *Sunnybrook Health Sciences Centre, Toronto, Ontario, Canada*

We have developed an evidence-based intervention framework to support drivers with dementia and their caregivers when they make decisions about driving, and navigate the process of driving cessation. A range of knowledge creation and synthesis activities were employed, including reviews on relevant topics such as driving cessation interventions, and psychotherapeutic interventions for older adults with cognitive impairment. The study also employed qualitative methods to explore the perspectives of key stakeholders on strategies supportive of the transition to non-driving. Following a meta-synthesis of the findings, we have developed a framework to organize interventions according to different thematic content areas (e.g., awareness-raising, mobility support, emotional support). Tools and resources that address driving cessation have also been collected, reviewed and organized according to content areas. These will comprise a toolkit that can inform health professionals about how to support drivers and ex-drivers with dementia and their caregivers as they transition to driving cessation.

SENSORY AND COGNITIVE FUNCTION IN DEMENTIA: IMPLICATIONS FOR ASSESSMENT AND QUALITY OF LIFE (QOL)

N. Phillips¹, D.M. Guthrie², P. Mick³, M. Pichora-Fuller⁴, W. Wittich⁵, 1. *Psychology, Concordia University, Montreal, Quebec, Canada*, 2. *Wilfred Laurier University, Waterloo, Ontario, Canada*, 3. *University of British Columbia, Kelowna, British Columbia, Canada*, 4. *University of Toronto-Mississauga, Mississauga, Ontario, Canada*, 5. *Universite de Montreal, Montreal, Quebec, Canada*

Older adults with hearing loss (HL), visual loss (VL), and/or cognitive impairment (CI) have poorer health outcomes. There is a strong relationship between HL, VL, CI, and incident dementia. Potential mechanisms include common biological substrates, exhaustion of cognitive reserve, and/or increased social isolation from communication difficulties. Our team examines co-relationships between HL/VL and CI in persons with dementia in the Canadian Consortium for Neurodegeneration in Aging (CCNA). We will review our recent work which has: 1) examined the relationship between CI and sensory loss on quality of care in home care; 2) examined the relationship between HL, VL, social network diversity, social participation, social support, and loneliness in the Canadian Longitudinal Study of Aging (CLSA); and 3) examines the incidence of HL and VL and their relationship with CI in CCNA participants. We will discuss the

implications of our findings using these unique datasets for function and well-being.

A GROUP PSYCHOTHERAPY INTERVENTION SUPPORTING DEMENTIA FAMILY CARERS IN MANAGING WORK-LIFE CONFLICTS

M. Chiu^{1,2,3}, S. Meerai^{3,4}, J. Sadavoy^{3,1,2}, 1. *Department of Psychiatry, Mount Sinai Hospital, Sinai Health System, Toronto, Ontario, Canada*, 2. *Department of Psychiatry, University of Toronto, Toronto, Ontario, Canada*, 3. *Cyril and Dorothy, Joel & Jill Reitman Centre for Alzheimer's Support and Training, Mount Sinai Hospital, Toronto, Ontario, Canada*, 4. *Lunenfeld-Tanenbaum Research Institute, Sinai Health System, Toronto, Ontario, Canada*

The Reitman Centre Working CARERS Program (RCWCP) is an evidence-informed, small-group therapy intervention designed for individuals juggling employment and dementia caregiving. A series of research is underway to ascertain its clinical effectiveness, perceived impact, and rural adaptability. Here, we present a qualitative study employing the life-course role identity theoretical framework. In-depth interview data from 30 former RCWCP participants was analyzed using the narrative analysis approach. Findings indicated that the extent to which knowledge and skills acquired from RCWCP may be applied is related to the working carer's lived experience, which is shaped by gender-role identity, dyadic relationship, and work-life conflicts. Rich narratives also revealed conflicting demands across the roles of employee and carer. Targeted and tailored carer interventions such as the RCWCP can proactively respond to the shifting demographics and needs of this diverse sub-population of dementia family carers. Our findings will guide the national dissemination and adaptation of RCWCP.

ALZHEIMER'S PLAN: IMPACT ON CLINICIANS' KNOWLEDGE, ATTITUDES AND PRACTICE AND QUALITY OF DEMENTIA CARE

I. Vedel^{2,1}, G. Arsenaault-Lapierre², N. Sourial^{2,1}, H. Bergman^{2,1}, 1. *Department of Family Medicine, McGill University, Montreal, Quebec, Canada*, 2. *Lady Davis Institute, Jewish General Hospital, Montreal, Quebec, Canada*

In 2013, the Quebec government implemented an Alzheimer Plan (AP) to improve dementia patients' management in primary care. We aimed to evaluate the impact of this intervention on the clinicians' knowledge, attitudes, and practices (KAP) and their association with the quality of dementia care. To this end, clinicians' questionnaires were distributed between 2014 and 2015 to all clinicians in the 42 participating family medicine groups (FMGs) and two sets of retrospective patients' charts were extracted from 13 of those FMGs: one pre-AP (2011–2013) and one post-AP (2014–2015). Overall, clinicians showed excellent clinical knowledge and competency, positive attitudes toward dementia, patient care, and the AP while the chart review revealed a significant increase of the quality of dementia care after the AP. The association between those variables will be further discussed. Decision-makers plan to use these results to refine the AP before province-wide dissemination.

IMPLEMENTING COMMUNITY-BASED RESEARCH TO ADDRESS DEMENTIA CARE IN INDIGENOUS POPULATIONS IN CANADA

K. Jacklin¹, C. Bousassa², 1. *Human Sciences, Northern Ontario School of Medicine, Sudbury, Ontario, Canada*, 2. *First Nations University of Canada, Regina, Saskatchewan, Canada*

Dementia diagnoses have been increasing in Indigenous populations for over a decade and have now surpassed rates in non-Indigenous Canadians. This trend along with community-driven research priorities serve as the rationale for a program of research addressing dementia care in Indigenous communities that is embedded as "Team 20" within The Canadian Consortium on Neurodegeneration in Aging (CCNA). In this paper we describe the community-based participatory action research strategy we have implemented in Canada to begin to address this emerging health issue. We incorporate a health equity lens and "Two Eyed Seeing" in our strategy to address power imbalances between knowledge systems and to ensure the prioritization of Indigenous knowledge. At a time when concepts such as patient-engagement, patient-oriented research, community engagement and socially accountable medicine gain momentum internationally, the work of "Team 20" serves as a valuable example of community-based research informed by Indigenous knowledge within a national dementia research strategy.

SESSION 4180 (PAPER)

LONELINESS AND SOCIAL ISOLATION IN LATER LIFE

A THEORETICAL APPROACH OF SOCIAL ISOLATION: MECHANISMS OF EMERGENCE AND PERSISTENCE

A. Machiels, *University of Humanistic Studies, Utrecht, Netherlands*

In this paper a theory on social isolation is developed, that offers insight in the emergence and persistence of social isolation, and in the possibilities for solutions and improvements of the situation of socially isolated elderly. Giddens' structuration theory is used to unravel in which way the socially isolated perpetuate or even aggravate their situation. A deeper analysis is made of several basic concepts of Giddens' theory, which are very useful for a theoretical approach to social isolation. Selection of these concepts is based on theoretical considerations and on the knowledge and insights that empirical research into social isolation has produced. Concepts such as practical and discursive consciousness, rules and resources, routinization and unintended consequences of actions can offer a better understanding of the mechanisms on which the emergence and persistence of social isolation are based. It becomes clear that the emergence and persistence of social isolation is the unintended consequence of patterns that people follow in their actions. The socially isolated elderly act mainly on the basis of their practical consciousness, thus sliding further away from the goals they want to realize for themselves. This strategy often lands them in greater isolation. To arrive at a theory that provides points of reference for policy and interventions, this theoretical approach is as necessary as the very explanations and experiences of socially isolated of the socially isolated themselves.

OLDER ASIAN IMMIGRANTS' LONELINESS IN NEW ZEALAND

V.A. Wright-St Clair¹, S. Nayar², 1. *AUT Centre for Active Ageing, Auckland University of Technology, Auckland, New Zealand*, 2. *University of Greenwich, London, United Kingdom*

New Zealand operates a family reunification program for older adults, but without formal resettlement assistance. This grounded theory study explored how older Asian immigrants participate in communities. Seventy-four older Chinese, Indian, and Korean immigrants, resident in New Zealand for at least six months, were recruited through community intermediaries. Data were gathered in the participants' language of choice through nine ethnic-specific focus groups, three within each ethnic community. Then, fifteen participants who had engaged in the focus group interviews, five from each ethnic community, were theoretically-sampled for individual interview, Audio-taped data were transcribed and translated into English for analysis, using memoing and constant comparative analysis. Schatzman's dimensional analysis method was used to construct the substantive theory. When the theoretical components were observed as similar across the three ethnic-specific theories, one cross-cultural theory was developed using Berry's derived etic method. Alongside the data which explained how these older Asian immigrants participated in diverse ways to strengthen, particularly their co-ethnic, communities, were data disclosing social isolation as a common circumstance, and loneliness as an unintended consequence of living within the unfamiliar host community. One implication is for the host society to consider how it prepares local communities to actively engage in how they welcome new arrivals from disparate societies.

WHAT I FEEL AND DO WHEN I FEEL LONELY: A QUALITATIVE STUDY ON OLDER ADULTS' COPING WITH LONELINESS

E. Schoenmakers, I. Tindemans, *Fontys University of Applied Sciences, Eindhoven, Netherlands*

Loneliness is considered to be a highly individual experience, suggesting that dealing with loneliness requires a tailored approach. However, little is known about how older individuals react to feelings of loneliness. This study examines how older adults experience their loneliness and what they do when feeling lonely. Using a semi-structured topic list, interviews were held with community dwelling older adults (aged 74–91) who considered themselves to be lonely or lacking in contacts. Qualitative thematic analysis (Braun & Clarke, 2006) was performed to analyze the data. In line with previous studies, respondents considered loneliness to be a subjective, negative experience following the lack of (quality of) certain relationships. Loss of loved ones and loss of mobility were considered to be common causes. Feelings of inferiority and missing affection were considered to be common outcomes. Respondents indicated feeling lonely while being alone and in company. Winters and evenings were perceived to be lonelier than summers and daytime. Experiences with and reactions towards loneliness fit within coping theory (Lazarus & Folkman, 1984). All respondents considered their loneliness to be stressful (primary appraisal). Several respondents considered themselves unable to cope with their own loneliness, others tried problem-focused and

emotion-focused coping options for coping with their loneliness (secondary appraisal). Older adults are unsuccessful in coping with their loneliness. Some don't know how to cope and even those who try coping, still feel lonely. This study shows that coping theory can be a useful framework for understanding how older adults react to loneliness.

LONELINESS IN OLDER HISPANICS: WHO MATTERS MORE—FRIENDS OR FAMILY?

M.K. Peek, *Preventive Medicine and Community Health, University of Texas Medical Branch at Galveston, Galveston, Texas*

Loneliness in older adults has been shown in prior research to be predictive of increased morbidity and mortality and is a major public health problem among older adults in the US. Research has shown there to be a difference between subjective loneliness and objective loneliness (social isolation), in that older adults living alone are not necessarily lonely if they remain socially engaged. In addition, recent research shows that there is a difference in loneliness between cultures that are more family oriented and ones that are more individualistic, driving the theory that loneliness overall as a construct needs to be examined in culture-specific framework. We propose that loneliness in older Hispanics, despite their historically familial framework, will be more affected by friends rather than family. These hypotheses support prior cross-sectional research on an older Hispanic American population in which we wish to build upon with longitudinal analysis. Using four waves of the H-EPESE data (n=1682), we estimated discrete time hazard models to predict the onset of loneliness over a 10-year period. In fully adjusted models, we found that frequency of contact with friends was protective against developing loneliness (OR=0.53, 95% CI 0.38–0.75), while number of close family members was associated with increased likelihood of developing loneliness (OR=1.16, 95% CI 1.03–1.30). Our findings have important informal care implications with friends potentially having a greater role in the mental health of older Hispanics than previously thought.

OLDER ADULTS AND SOCIAL ISOLATION—IS THERE STILL A ROLE FOR COMMUNITY DROP-IN SENIORS' CENTRES?

N. Novik^{1,2}, B. Jeffery^{1,2}, J. Bacsu^{3,2}, 1. *Faculty of Social Work, University of Regina, Regina, Saskatchewan, Canada*, 2. *SPHERU, Regina, Saskatchewan, Canada*, 3. *University of Saskatchewan, Saskatoon, Saskatchewan, Canada*

Community drop-in centres offer social support for older adults by providing opportunities for social connection. Seniors' centres operate according to a self-help paradigm and are cost effective, functioning largely through volunteer contributions. Seniors' centres are found in rural communities across Canada, as well as within neighborhoods in cities. Health and social service system changes, including an emphasis on aging in place, have increased pressure on these organizations to provide more services and supports for seniors. As the population ages, there is an increased need for community-based social opportunities for older adults. As a result, seniors' centres will require support to stay relevant, maintain existing programs, and effectively deal with the increasingly complex needs of this growing population.

This presentation will discuss findings from a community-based study examining social isolation of rural older adults in Saskatchewan, Canada. Data was gathered through interviews with twenty-seven older adults; focus groups; and world cafe discussions facilitated as part of two community workshops attended by older adults and health providers.

Participants in this study identified barriers to regular attendance at community seniors' centres including the impact of exclusionary cliques, spatial and territorial claims of the membership, limited activities and hours of operation, and stigma associated with membership. These centres were also identified as an existing community resource that should be meeting social engagement needs of older adults. Participants discussed ideas to reduce stigma, increase interest and attendance, and re-establish seniors' centres as a positive source of social identity and interaction for older adults.

SESSION 4185 (SYMPOSIUM)

PSYCHOLOGICAL ADAPTION ACROSS RETIREMENT TRANSITIONS: RESULTS FROM THE HEARTS STUDY

Chair: M. Lindwall, *University of Gothenburg, Sweden*

Co-Chair: B. Johansson, *Goteborgs Universitet*

Retirement is a major life event representing the transition into a new period of life that signals aging at the individual and societal level. The retirement transition highlights the very basic challenge of psychological aging as the capacity to adapt, not only to biological changes but to changes, demands, and expectations in the environment that contribute to an altered lifestyle, including changes in physical, cognitive and social activities, which in turn can affect psychological health. Although continuity is the default expectation according to previous findings showing that people are actively managing their transition to create continuity, contentment, or reconciliation with their new status", retirement requires coping and adaptation in which psychological health can be challenged. Therefore, there is a need to better understand associations of continuity and change in psychological health before and following retirement because of its significance in defining the new life challenges to which older adults have to adapt when they enter the third age or retirement due to age. In the symposium, a recent longitudinal study highlighting psychological adaption across retirement transitions, the "Health, Aging and Retirement Transitions in Sweden" (HEARTS) study, will be described along with results from the first and second waves. The four presentations in the symposium will highlight: (a) a general overview of the HEARTS study design, along with possibilities for collaboration and access to data; (b) life-satisfaction from a resource perspective; (c) personality profiles and adaption to retirement; (d) if late retirement is a health risk.

THE HEALTH, AGEING, AND RETIREMENT TRANSITIONS IN SWEDEN (HEARTS) STUDY

M. Lindwall, B. Johansson, *University of Gothenburg, Gothenburg, Sweden*

The HEalth, Ageing and Retirement Transitions in Sweden (HEARTS) study was designed to study psychological health in the years before and following retirement and to examine

change and stability patterns related to the retirement event. Out of the recruited nationally representative population-based sample of 15 000 Swedish individuals between the ages of 60 and 66, 5 913 individuals completed the baseline sample of the HEARTS study in spring 2015. The majority of the participants (68.8%) completed a web-based survey, and the rest of the participants (31.2%) completed a paper-version of the survey. The baseline HEARTS sample represents the general population well in terms of gender and age. However, the HEARTS sample is better educated. Roughly 80% of the baseline sample completed wave two measurements in spring 2016. Results from the two first waves will be presented along with information concerning collaboration possibilities and how to get access to data.

THE ROLE OF PERSONALITY IN THE ADAPTATION TO RETIREMENT

G. Henning, M. Lindwall, B. Johansson, I. Hansson, A. Berg, *University of Gothenburg, Gothenburg, Sweden*

While personality has been believed to moderate individual adjustment to retirement, no prospective study has yet investigated this assumption. We used data from two waves of the HEARTS (Health, Aging, and Retirement Transitions in Sweden) study (N=5.913, Age 60–66). We applied latent profile analysis to find personality profiles based on the Big 5 personality traits with data from the first wave. The analysis supports a four class solution. In preliminary analyses, we find personality profile to predict depressive symptoms both cross-sectionally and prospectively. Furthermore, we find that involuntary retirement between waves is associated with an increase in depressive symptoms. Persons with a specific personality profile (so called "undercontrollers"), experience stronger effects of involuntary retirement. Further effects and possible pathways will be investigated next and presented at the conference.

LIFE SATISFACTION IN THE RETIREMENT TRANSITION: A RESOURCE-BASED DYNAMIC PERSPECTIVE

I. Hansson, S. Buratti, A. Berg, B. Johansson, *University of Gothenburg, Gothenburg, Sweden*

Applying a resource perspective, present study investigates how self-esteem, autonomy, social support and self-rated physical health contribute to life satisfaction in different retirement stages. In particular, effects of resource interdependency were analyzed before, during and after the retirement transition. The study was conducted using data from the HEalth, Ageing and Retirement Transitions in Sweden (HEARTS) study, including not yet retired (N=3195), partly retired (N=597) and fully retired (N=1125) individuals. Results from three separate regression analyses show that the four resources together accounts for 39–45% of the variation in life satisfaction. Further, multiple interaction effects (both positive and negative) was found for partly and fully retired individuals, indicating that the four resources play different roles in different retirement stages. Our findings show that the retirement transition is a turbulent period where the individual's well-being is influenced by the interaction between many factors.

IS LATE RETIREMENT A HEALTH RISK IN SWEDEN?

S. Koenig, M. Lindwall, B. Johansson, *University of Gothenburg, Gothenburg, Sweden*

Recent research argues that pension reforms increased social inequalities since some groups might need to work longer for financial reasons. Involuntary late retirement can play a role for changes after retirement with regard to health and wellbeing.

I use the first two waves from the “Health, Ageing and Retirement Transitions in Sweden” (HEARTS) survey to analyze retirement transitions and changes in health and wellbeing depending on the age of retirement. The cross-sectional results indicate that later retirement is related to worse health for lower educated, while there are no differences with regard to retirement age for higher educated individuals. This picture is even more pronounced among those with low control over their retirement timing.

This study aims to reach a better understanding of retirement effects on health by including retirement age. Discussions on increasing retirement ages should acknowledge health differences by educational level among those who (have to) retire late.

SESSION 4200 (SYMPOSIUM)**IMPROVING LONG-TERM CARE SERVICES WITH INTERNATIONAL STANDARDIZED INSTRUMENTS**

Chair: I. Chi, *University of Southern California, Los Angeles, California*

Co-Chair: V. Lou, *The University of Hong Kong, Hong Kong, Hong Kong*

This symposium will include speakers from Japan, Korea, Taiwan and Hong Kong and the focus of the symposium is on the adoption of international standardized instruments from interRAI to improve the long term care services in their respective countries and region. The presenters are researchers and/or clinicians from four Asian countries and region who have applied interRAI assessment instruments in their long term care settings for many years. The speaker from Japan will present the results of an evaluation study on the quality of Japanese home care planning agencies by the quality indicators developed from the interRAI Home Care assessment data. These results could be used to market the agency’s strengths and to focus the areas for total quality improvement. Guided by the Chronic Care Model, the Korean speaker will present the study design and preliminary results of evaluating the systems for Person-Centered Elder care management model in South Korea using interRAI LTCF and other assessment tools. The speaker from Taiwan will report the research findings on the interRAI LTCF’s Resident Assessment Protocol triggers as effective indicators for understanding the care complexity and predicting for physical functional decline of nursing home residents in Taiwan. Finally, speaker from Hong Kong will talk about applying interRAI instrument for screening and outcome measures to evaluate a Pleasant Mood and Active Life intervention to reduce the depressive symptoms among the long term care facility residents.

EVALUATING THE QUALITY OF JAPANESE HOME CARE PLANNING AGENCIES BY THE INTERRAI QUALITY INDICATORS

N. Ikegami¹, T. Ishibashi², *1. St Luke’s International University, Tokyo, Japan, 2. The Dia Foundation, Tokyo, Japan*

In 2000, Japan established a public long-term care insurance that provides benefits in kind up to the amount of US\$3,600 per month for those living in the community. However the evaluation of quality has been limited to structural aspects such as adherence to staffing standards. Systematic assessment of care recipients has not been mandated. In order to introduce an outcome-based evaluation of quality of care in home care planning agencies, we obtained interRAI 659 home care dual assessment data from 11 agencies to calculate quality indicators (QI) for the period 2013 to 2016. There are 23 QI, which can be grouped into either decline or improve in status. After comparing the risk-adjusted QI scores, some agencies had better decline scores, while others had better improvement scores. These results could be used to market the agency’s strengths and to focus the areas for total quality improvement.

EVALUATION OF THE SYSTEMS FOR PERSON-CENTERED ELDER CARE (SPEC) MODEL: STUDY DESIGN AND RATIONALE

H. Kim^{3,1,2}, S. Goh¹, S. Hwang¹, *1. Department of Public Health Science, School of Public Health, Seoul National University, Seoul, Korea (the Republic of), 2. SNU Institute of Ageing, Seoul, Korea (the Republic of), 3. Harvard University School of Public Health, Boston, Massachusetts*

Person-centered care management based on comprehensive needs assessment is widely known as an effective way to promote quality and outcomes of care for frail older people. Yet such evidence is still limited, especially for people with complex conditions and in Asia. We will present the context of long-term care delivery in Korea and introduce the SPEC, a technology-enhanced, multidisciplinary, integrated care management model for Korean nursing homes. Guided by the Chronic Care Model, the multifaceted SPEC consists of key five elements: comprehensive geriatric assessment and need/risk profiling using interRAI LTCF and other assessment tools; individualized, need-based care planning; optional multidisciplinary case conference meetings; coordination of care; and information and communication. We will also present our theoretical and methodological approaches for evaluating the newly developed model and early results of the evaluation study.

RAP TRIGGERS AS AN INDICATOR FOR CARE COMPLEXITY AND PROGNOSIS

L. Chen, *1. National Yang Ming University, Taipei, Taiwan, 2. Taipei Veterans General Hospital, Taipei, Taiwan*

Resident Assessment Protocol (RAP) triggers summarized the care problems after the primary assessment for the long-term care facility (LTCF) residents, and the related care plans would be triggered while each individual RAP trigger was generated. Aside from the triggers for care plan, RAP triggers

are also effective indicators to evaluate the complexity of care and have been shown to predict one-year mortality of LTCF residents independent from multimorbidity. Besides, the increase of RAP triggers was also predictive for physical functional decline of LTCF resident, as well as decline in cognitive function. A complex interrelationship between cognitive decline, mood conditions, malnutrition and decline of physical function was noted, and RAP triggers were significant indicators for these phenomena. Further intervention study should be conducted to evaluate whether current care plans successfully reduce the over care complexity and prevent functional declines.

REDUCING DEPRESSIVE SYMPTOMS IN A LONG-TERM CARE FACILITY: APPLYING THE MDS ASSESSMENT

V. Lou^{1,2}, T. Lum^{1,2}, G. Wong^{1,2}, H. Luo^{3,4}, M. Lau¹, I. Chi⁴, E. Chen^{2,1}, 1. *Sau Po Centre on Ageing, The University of Hong Kong, Hong Kong, Hong Kong*, 2. *Department of Social Work & Social Administration, The University of Hong Kong, Hong Kong, Hong Kong*, 3. *Tsing Hua University, Beijing, China*, 4. *University of Southern California, Los Angeles, California*

Objective: Applying MDS nursing home assessment for screening and outcome evaluation on a Pleasant Mood and Active Life (PMAL) intervention among long-term care facility residents. **Method:** A mixed methodology by applying secondary data analyses and cluster randomized clinical trial among 62 participants. The development of PMAL was guided by the pleasant event model of depression, together with a culturally embraced activity list generated by collaborative deliberation among residents and caregivers at residential setting. **Findings:** Secondary data analyses on ten-years of MDS data suggested inclusion criteria, which were 1) triggered mood problem based on clinical assessment; 2) cognitively intact; 3) voluntary participation. As compared to control group participants, experimental group participants showed significant changes on mood problem trigger as measured by MDS. **Conclusion:** MDS nursing home assessment was useful to screening residents with mood problems and sensitive to standardized intervention.

SESSION 4205 (PAPER)

CAREGIVING AND CARE VALUES

STUDENT-DELIVERED CAREGIVER RESPITE: A COMMUNITY-UNIVERSITY PARTNERSHIP PILOT PROGRAM

T. Washington, J. Tachman, *School of Social Work, University of Georgia, Athens, Georgia*

The current study describes a community-university partnership to support a student-delivered respite program, the Houseguest Program (Houseguest). Houseguest was designed using a community engaged scholarship (CES) model of integrating research, teaching, and service. We set out to explore two aims: 1) to examine the feasibility of Houseguest; and 2) to understand caregivers' experience with student-delivered respite. Houseguest was piloted with a small group of community-dwelling, co-residing caregivers and care

recipients. Thematic analysis produced eight themes: 1) respite from full time caregiving role; 2) information on caregiving strategies; 3) no-cost supportive services; 4) opportunity for care recipients to socialize; 5) tailored activities for care recipients; 6) rapport-building between students and family dyad; 7) reciprocity between students and the family dyad; and 8) program continuation. Through a community-university partnership, Houseguest reduced the impact of caregiver burden, and created an opportunity for students to serve dementia-affected families through respite and tailored activities. Based on these findings, the authors propose a model to guide future research in dementia caregiving embedded in CES frameworks.

DECREASING UNMET NEEDS FOR CAREGIVER RESPITE AND BRI CARE CONSULTATION

M.S. Rose¹, D.M. Bass¹, B. Primitica¹, K. Kearney¹, J.H. Rentsch¹, M. Kunik², J. Miller³, T. Hornick⁴, 1. *Center for Research and Education, Benjamin Rose Institute on Aging, Cleveland, Ohio*, 2. *Houston VA Health Services Research and Development Center of Excellence, Houston, Texas*, 3. *Alzheimer's Association Greater East Chapter, Canton, Ohio*, 4. *Louis Stokes Cleveland VA Medical Center, Cleveland, Ohio*

Respite for caregivers is underutilized as a preventative resource; more common is use late in caregiving and during crises. A goal of the partnership version of *BRI Care Consultation*, "Partners in Dementia Care (PDC)," is to facilitate timely use of respite support and services through telephone and computer coaching from trained care consultants. PDC was implemented via partnerships among Stokes VA Medical Center, Greater East Ohio Alzheimer's Association Chapter, and Western Reserve Area Agency on Aging. Hypothesizing that PDC use would reduce unmet respite need, the relationship between PDC and respite use was tested in a translational study of veterans with dementia and family caregivers. In research interviews before and 12 months after enrolling, caregivers responded to three items assessing unmet respite need: needing help getting someone to stay with the veteran so he/she would not be left alone, getting a break from care, and finding services to provide care when family are not available (range 0 to 3, $\alpha=.77$). Among 148 caregivers, unmet respite need declined significantly after 12 months in PDC ($t=4.71$; $p < .001$). Along with an overall decrease, multivariate analyses using predictors from the modified Andersen framework showed significantly greater decreases for white compared to African American caregivers; higher income caregivers; and caregivers of veterans who were more functionally impaired. Results suggested coaching from care consultants enabled caregivers to find solutions for respite needs, particularly in situations where veterans were more impaired. However, results also suggested economic resources may facilitate caregivers' ability to meet respite needs.

OLDER MEN AND COMMUNITY AGED CARE: BARRIERS TO ACCESS AND EFFECTIVE MODELS OF CARE

A.J. Brown, *Men's Health Information and Resource Centre, Western Sydney University, Kensington, New South Wales, Australia*

Older men do not access community aged care in the same numbers and proportion as older women. Existing literature theorised various explanations for this, including most especially negative masculine attitudes around help-seeking behaviour, yet no literature was identified that looked at men's experience of such services.

Barriers to accessing community care were identified through interviews and focus groups with both older men and providers of community aged care in New South Wales, Australia. While many of these barriers are common to men and women, however issues specific to men were observed. These included men's perception of services as 'feminised', male specific difficulties in accessing information, a lack of 'male friendly' programs and environments, and men being less familiar with aged and community services. Some service providers reported that men's high levels of self reliance and independence also prevented them from accepting services.

A number of services were identified that are successfully attracting older men as clients. The success of these services was largely due to the passion and commitment of a particular employee. While much was learnt from these services there is a very real the danger that these 'male friendly' approaches will not be sustained beyond the tenure of that employee.

Of concern to the researchers is the apparent absence, both within agencies and across the sector, of gender based policies, structures and resources that seek to ensure that gender is taken into account in the planning and delivery of community based aged care services.

SHARING CARING FOR OLDER ADULTS AND PAID WORK: COUPLES IN THE UK HOUSEHOLD LONGITUDINAL STUDY

E.A. Webb, A. McMunn, R.E. Lacey, *Research Department of Epidemiology & Public Health, University College London, London, United Kingdom*

In high income countries there has been an expansion of morbidity in older age. Much of the care this entails is provided informally. Women's increased participation in paid work and increasing retirement ages are, together, increasing employment rates in midlife and early older age, so that balancing paid work and informal caring responsibilities is of increasing importance. This paper investigates how caring responsibilities and paid work are shared by couples, and the extent to which this sharing is gendered and socially patterned.

Data from five waves (2009/10–2013/14) of the UK Household Longitudinal Study were analysed. Our analytic sample was restricted to married or cohabiting couples (aged 16+ years) where one or both partners had a caring responsibility for a sick, elderly or disabled adult (20,189 observations on 9106 couples). Partners were categorised according to hours per week spent in paid work and on caring.

Latent class analysis ascertained 8 classes of households according to how partners share their responsibilities for paid work and caring. Classes were characterised as: No paid work, female carer (29.3%); No paid work, male carer (14.4%); Dual earners, both carers (21.9%); Male breadwinner, both carers (15.9%); Male (part time) breadwinner, both carers (5.3%); Modified male breadwinner, female carer

(6.7%); Modified male breadwinner, both carers (1.2%); Female breadwinner, female carer (5.3%).

Multinomial regression analyses investigated the predictors of class membership, and found that age, education, incomes, health and the relationship to the person being cared for all predicted how caring and paid work were shared by couples.

TIME BANKING AND SOCIAL ISOLATION: PROVIDING INFORMAL CARE AND RESPITE

E.S. Cahn, 1. *TimeBanks USA, Washington, District of Columbia*, 2. *Univ. District of Columbia School of Law, Washington, District of Columbia*

Caregivers need care and respite. Social isolation is deadly. The scale is vast and growing. Approximately 34.2 million Americans have provided unpaid care to an adult age 50 or older in the prior 12 months. As baby-boomers age, both formal health and informal care systems will be challenged to meet the needs of a rapidly expanding elderly population. Informal care, often fragile and fragmented, continues to be the bedrock enabling the elderly and disabled to remain in their communities. Nonetheless, State Plans on Aging and responses to the *Olmstead* mandate consistently fail to designate strengthening that informal system as a priority.

Health care professionals need to learn about Time Banking as a cost-effective strategy proven to reduce social isolation, strengthen informal care systems, reduce resort to institutional care, engage seniors in their communities. Peer reviewed articles and studies have documented effectiveness. One study conducted by the Visiting Nurse Service of New York found that 100% of elderly members benefited from TimeBank membership; 79% reported their membership provided support needed to remain in their homes as they get older.

Presenters will provide TimeBanking basics: enlisting members, matchmaking, generating transactions, creating organizational infrastructure, liability and tax issues. We will share experience to date, design features and options, software to generate and track transactions, types of reports, range of applications, framing and acceptance by different ethnic groups, outcome measurements, network contacts, funding and sustainability strategies. Evaluation reports and sample grant applications will be made available.

SESSION 4210 (SYMPOSIUM)

CROSS-CULTURAL COMPARISON OF THE IMPACT OF HOME MODIFICATION AND ADAPTATION

Chair: S.M. Peace, *The Open University, Milton Keynes, United Kingdom*

Discussant: R.A. Darton, *University of Kent, Canterbury UK, Canterbury, Kent, United Kingdom*

The desire of older people to age in place suggests that future-proofing the home environment is fundamental to providing greater person-environment congruence at a time of global ageing. The emerging genHOME network, founded by the UK College of Occupational Therapists, promotes the health and well-being of older and disabled people and their families through the co-ordination and dissemination of international research on home modification or adaptation

and housing design. For environmental gerontologists this core resource network grounded in practice and driven by negotiation with users provides an important route for the dissemination of research with application. In this symposium researchers from more developed countries attached to the network use empirical work to debate common research priorities including participatory approaches in countries with diverse housing types, tenure, space standards, modification regulations and funding opportunities. Aiming to inform national and international policy through innovative research there is recognition of diversity in the evidence presented through language and cultural difference, and a need for consistent research methodology and outcome measures. Discussion will address similarities and differences in priorities and invite the audience to debate the value of this initiative and how it can be extended and made more inclusive. The symposium seeks to question how far current understanding of culturally specific home modification/adaptation could lead to wider discussion of more age-inclusive design and architectural practice for new build housing (individual and collective), and to learn from other countries how this relates to population growth in times of climate change questioning person-environment fit.

THE SWEDISH SYSTEM FOR HOUSING ADAPTATIONS: PROJECTIONS FOR THE FUTURE BY SIMULATED SCENARIOS

B. Slaug, C. Pettersson, M. Granbom, M. Kylberg, S. Iwarsson, *Lund University, Lund, Sweden*

In Sweden housing adaptations (HA) aim to support independent living, based on the needs and functional ability of the individual. HA grants covering the full costs are provided by the municipalities, irrespective of the applicant's financial situation and type of home ownership/tenure. As costs for HA are increasing and more accessible housing is needed overall, knowledge of environmental barriers (EB) generating problems would support cost-efficient solutions as well as benefit public health. The objective of this study was to project possible effects of targeted elimination of EB in the ordinary Swedish housing stock. Existing research databases were utilized (N=1,021). In simulations of EB removal, those corresponding to the most common HA were selected. The effects would be consistently larger for one-family houses, and for all types of dwellings built before 1960. Targeted elimination of EB has considerable potential to improve the conditions for independent living along the process of aging.

HOME MODIFICATIONS FOR FRAIL COMMUNITY DWELLING OLDER ADULTS IN THE U.S.

S.L. Stark, Y. Hu, *Washington University in St. Louis, St. Louis, Missouri*

Intensive home modification interventions are effective in improving functional ability, reducing fall risk, and improving caregiver outcomes among older adults with a variety of health conditions. Intensive home modifications involve a comprehensive assessment of an individual and their environment, tailoring the intervention to meet individual needs, facilitating environmental modifications and providing training to use the modifications. Few trials of home modifications

have been conducted in the US. We conducted a randomized controlled trial of intensive home modifications to examine functional outcomes of 115 frail, community dwelling older adults with an average age of 77.6 years. The manualized intervention resulted in improved functional performance (measured using performance based assessment and self-reported performance) at 6 months that was maintained at 12 months. Adherence to treatment was 91% at 12 months. Home modifications are currently not provided as part of health or social services in the US, despite evidence they are an effective intervention to improve function.

AUSTRALIAN CONSUMER PERSPECTIVES ON HOME MODIFICATIONS: CONSIDERATIONS FOR OUTCOME MEASUREMENT

E. Ainsworth, T. Aplin, *University of Queensland, Brisbane, Queensland, Australia*

Consumer directed aged care and disability sector reforms in Australia are currently impacting home modification service provision. With no guidance through consistent national policy, strategy or practice framework, there are service delivery challenges. A patchwork of differing services are based on geographical location, housing type and tenure. An in depth understanding of consumers' needs and values surrounding their home and modifications is required. This qualitative study gives a consumers' perspective of home modifications to inform policy and practice. In-depth interviews with 22 participants aged between 29 – 93 years were transcribed verbatim and analysed using an interpretative phenomenological approach. Findings indicated that home modifications were seen either as supportive or disruptive to people's lifestyles and activities. Important outcomes regarding home modifications included the impact on caregivers; affordability and appearance; capacity to remain in place and support valued roles and occupations; and the influence on sense of self, freedom and autonomy.

ARE WE PAYING HOUSING ADAPTATIONS OURSELVES?: ANSWERS FROM THE SPANISH ELDERLY OR DISABLED

F. Alonso-Lopez, *Acceplan Accesibilidad S. L., Barcelona, Spain*

In Spain, public social programs, administered at local, regional and national levels have led to housing adaptations, accessibility interventions, and supportive technologies for elderly and disabled people creating awareness of the needs for ageing in place. A nascent private market has advanced through the decline in public funding and several questions new arise: do families with disabled members (mainly old aged) spend their own money on adaptations when public support is not available? What conditions drive this private expense? Data from the Spanish survey EDAD 2008 (INE 2012) is used to run binary logistic models based on the underlying ecological theory of ageing to explain drivers of private expenditure on adaptations. Findings show how different sociodemographic, economic, health and housing variables impact on willingness to spend privately. These results can help public programs, awareness and funding in areas where needs are not being covered by households themselves.

HOUSING ADAPTATIONS IN THE UK: SCOPING THE EVIDENCE TO SUPPORT POLICY AND PRACTICE

R. Russell¹, R. Newton¹, S. Mackintosh², M. Ormerod¹,
1. *University of Salford, Salford, United Kingdom*, 2.
University of the West of England, Bristol, United Kingdom

In the UK there is a paucity of research evidence to underpin the implementation of housing adaptations' policy and practice with little knowledge of what works for whom, in what circumstances, and to what effect. While the UK Government has significantly increased financial support for adaptations, money may be wasted due to under-utilisation. A scoping review is presented outlining firstly, central government funding and secondly, the quality of research evidence. Findings indicate that housing design to meet the needs of older and disabled people requiring adaptations is under-researched; a lack of evidence for design recommendations, and whether they have been tested in-situ. The implications suggest the need for a rigorous testing of design guidance regarding housing adaptations such that installations are appropriate for the user and other family members to enable successful ageing in place. The findings provide important comparative information contributing to a body of international literature.

SESSION 4215 (SYMPOSIUM)

COMMUNITY-BASED CARE INITIATIVES FOR ELDERLY IN ASIA AND AUSTRALIA

Chair: Y. Yang, *Hankuk University of Foreign Studies, Seoul, Korea (the Republic of)*

Co-Chair: L. Thang, *National University of Singapore Department of Jap*

Discussant: I. Blackberry, *La Trobe University, Wodonga, Victoria, Australia*

Asia leads the global and rapid epidemic of aging population in terms of its absolute size. While increasing longevity is a blessing, it also poses many challenges for societies and requires system- and paradigm-changes in many aspects. Asia, being a region known for its lack of support on seniors' welfare and long-term care, also requires innovative thinking and sustainable approaches in response to these challenges. These challenges are further exacerbated with changes in family structure and living arrangements in old age, making community-based elderly care arguably an important long-term solution. This symposium highlights current issue across the Asian regions and presents innovations led by local community members (Japan), NGOs (South Korea), and governments (China, Singapore), and contrasts these with initiatives in our neighboring country (Australia). The symposium will share experiences, merits and challenges of elderly care in community across Asia. Active collaboration and partnership among different stakeholders to make aging in community possible will be discussed.

SUKETTO-TAI: A STUDY OF A VOLUNTEER GROUP OF THE ELDERLY, BY THE ELDERLY, FOR THE ELDERLY IN JAPAN

Y.O. Hirano, *Nagasaki University, Nagasaki, Nagasaki, Japan*

Japan, a super-aged society, is required to have a paradigm change in terms of caring elderly people in communities:

elder citizens are now expected to be not only as consumers but also as providers of the services of caring elderly. This case study draws upon activities of a volunteer group in T community of Nagasaki City, Japan. The group named "Suketto-tai", which can be translated literally, "We are the Supporters", is consisted of middle and old aged residents of the T community, and has actively involved in helping elderly citizens in the community. Quantitative and qualitative data analysis indicated that "Suketto-tai" is used not only by people who have rich in social capital, but also by people who are anxious about the human relationship in the community.

COMMUNITY-BASED AGING AND LOCAL NGOS: SELECTED OLDER PEOPLE'S SELF-HELP GROUPS IN SOUTH KOREA

Y. Yang, *International Development Studies, Hankuk University of Foreign Studies, Seoul, Korea (the Republic of)*

This paper focuses on local community efforts in urban South Korea, which is one of the most rapidly aging societies in the world. The Older People Self Help Groups (OPSHGs), supported by HelpAge Korea (HAK) and implemented in partnership with local NGOs, form one initiative fostering aging-friendly community changes in Korea. In helping poor and marginalized elderly people in selected (mostly deprived) sub-districts to form and organize a seniors' community, the ultimate goal of this initiative is to assist older people to age in their community and remain as active and contributing members. Based on the selected two 'best' cases of Silver Wings in Bucheon and Silver Love in Kwanak, Seoul, among others supported by the HAK-OPSHG initiative, the paper addresses issues of participation, generativity and partnership. Qualitative interviews and observations were carried out. Lessons may be drawn for other aging societies, particularly in Asia.

THE COMPARATIVE STUDY OF COMMUNITY-BASED ELDERCARE IN CHINA

L. Zhang, *Southwestern University of Finance and Economics, Chengdu, China*

Faced with the prospect of ascending demand of elder care and the shrinking role of family in contemporary China, how to create new elder care system beyond or supplement family care is crucial challenge. China has started the pilot practices of community based elder care in different locality during the past decades.

In this paper we firstly review the policy initiatives regarding the community eldercare and then examine the community old age care model emerging in the sub-national level. How to overcome the cultural dependence of filial piety and rebuild the social pact to provide elder care are prominent issue. Both the providers (government, third sector organization and community) as well as the customers (the elderly and their family members) should reach consensus of sharing the old age care. The boundaries and responsibilities of each actors within the elder care system as well as how they cooperate and interplay to delivery the elderly care service from the perspective of fiscal and administrative and regulative mechanism also should be studied to reveal the conditions of successful policy innovation.

The study will examine the development trajectory of community-based elder care system in China. After reviewing the pilot practice in different localities, this paper will

attempt to typology the models of community elder care in China context, and find out the diffusion trends of different model. Through the comparative study of community eldercare model and their governance mechanism, this paper will provide the policy implications for building the national community eldercare system.

THE EFFECTIVENESS OF SENIOR GROUP HOME IN PROMOTING AGING IN PLACE IN SINGAPORE

E. Lim¹, L. Thang², 1. *Research and Development, Fei Yue Community Services, Singapore, Singapore*, 2. *National University of Singapore, Singapore, Singapore*

For a country that is rapidly aging, Senior Group Home (SGH) was introduced in 2012 to meet the demand for more aged care initiatives to support seniors to age-in-place in Singapore (Ministry of Social and Family Development, 2012). It is a community-based assisted living facility that allows low-income seniors with limited support who cannot live alone, to age-in-place and delay institutionalization. As a new concept in Singapore, the SGH is relatively unknown among the aged care community. This presentation will discuss the first such study of the SGH with the aim of understanding how and to what extent is the SGH effective in promoting aging-in-place among the residents. Results gathered through a 20 month ethnographic fieldwork and interviews with residents and support personnel, demonstrated the challenges of implementing a theoretical concept at the policy level on the ground. Nonetheless, the SGH is effective to a certain extent in promoting age-in-place.

CURRENT TRENDS AND INNOVATIONS IN COMMUNITY CARE FOR OLDER AUSTRALIANS

I. Blackberry, *La Trobe University, Melbourne, Victoria, Australia*

Australia is among the longest living nations despite the growing burden of chronic diseases. Aged care reforms in Australia have progressed over the past decade to support older people to stay at home and be part of the community. Indeed, older people prefer to stay independently in the community as long as possible. The recent Consumer Directed Care initiative provides older people with greater flexibility to individualize their care package. However some challenges exists in the provision of community-based aged care in Australia including large geographical area, limited family support, shortage and disproportionate distribution of workforce. This presentation will highlight these challenges, outline government initiatives in community care and share potential sustainable innovations in response to these challenges.

After attending this presentation, participants will learn innovations in community care in Australia and contrast this to other learnings from our Asian neighbours.

SESSION 4220 (SYMPOSIUM)

QUALITY RATINGS OF U.S. NURSING HOMES ON NURSING HOME COMPARE: A REVIEW OF RECENT CMS INITIATIVES

Chair: P. Rowan, *Abt Associates, Wellington, Florida*

This symposium contains four individual presentations, all related to recent changes to the Nursing Home Compare

website, a public reporting tool intended to inform consumer choice and prompt nursing home quality improvement. This work has been conducted by staff at Abt Associates, and funded by the Centers for Medicare and Medicaid Services (CMS). The first presentation will discuss the incorporation of six new quality measures to the Five Star Quality Rating System, including how the measures have performed in their first year of public reporting.

The second and third presentations will go into more detail on two of the new measures being incorporated into the quality rating system - the 30-day outpatient emergency department visit measure, and the 100-day community discharge measure. These measures, the first quality measures to use Medicare claims as their data source, represent an important shift away from self-reported data and toward quality data that may be more accurate and transparent. The presentation will include how these measures have changed in the first year that they have been incorporated into the rating system.

Finally, the fourth presentation will discuss ways that the Nursing Home Compare website has been tested among nursing home consumers to improve the usability and functionality of the site. Since the website was designed as a consumer choice tool, the incorporation of consumer feedback has been an invaluable source of information over the past several years. This presentation will also discuss future plans for improving the website.

IMPROVEMENTS TO THE FIVE-STAR QUALITY RATING SYSTEM: INCORPORATION OF NEW QUALITY MEASURES

A. White, P. Rowan, A. Muma, C. Williams, *US Health, Abt Associates, Wellington, Florida*

In April 2016, CMS introduced six new quality measures on Nursing Home Compare, including three MDS-based and three claims-based measures. The introduction of these new measures greatly increases the number of short-stay measures on Nursing Home Compare and report on important domains not covered by existing measures. In addition, claims-based measures may be more accurate than MDS-based measures. The introduction of these claims-based measures reflects an important policy shift away from self-reported data and toward more objective and verifiable data sources.

Beginning in July 2016, CMS incorporated five of the measures in the calculation of Five Star Quality Ratings. This presentation includes an overview of the changes that were made to the rating system methodology to accompany the new measures. It also discusses the impact of the new measures, which are projected to result in changes to the QM rating for many nursing homes after full implementation in January 2017.

30-DAY OUTPATIENT EMERGENCY DEPARTMENT VISITS AMONG MEDICARE NURSING HOME RESIDENTS

I. Breunig, A. White, P. Rowan, J. Pettis, *US Health, Abt Associates, Wellington, Florida*

Better preventative care and access to physicians and nurse practitioners in an emergency may reduce rates of unnecessary emergency department (ED) visits. Public reporting of ED visit rates is important for informing nursing home placement and incentivizing providers to reduce these rates. We

developed a risk-adjusted, claims-based measure of outpatient ED visits that CMS incorporated into the Five Star Quality Rating System in 2016. This measure addresses a gap in the current measures, increasing the number of short-stay measures and adding a measure that does not rely on self-reported data. Overall, 9.5% of residents had an ED visit within 30 days of the start of their stay. Average risk-adjusted rates were lower at homes with better Five-Star ratings. They were higher among smaller, for-profit nursing homes not located in a hospital. We will present trends on the measure's performance during its first year of public reporting on Nursing Home Compare.

100-DAY COMMUNITY DISCHARGE RATES AMONG MEDICARE NURSING HOME RESIDENTS

I. Breunig, A. White, P. Rowan, *US Health, Abt Associates, Wellington, Florida*

Many nursing home residents enter skilled nursing facilities (SNF) for rehabilitation services. For many residents, return to the community is an important outcome. The IMPACT Act of 2014 requires the development and reporting of a measure of community discharges (CD) among SNF residents. We developed a risk-adjusted measure of successful CDs within 100 days of the start of a nursing home episode, which CMS incorporated into the Five-Star Quality Rating System in 2016. We used information on discharge date and status from the MDS to measure episode length and identify CDs. Overall, 62.5% of episodes resulted in a successful CD within 100 days. Average risk-adjusted rates were higher at facilities with better overall, staffing, and inspection ratings, but not quality ratings. Risk-adjusted rates were higher among facilities that are smaller, non-profit, and in a hospital. We will present trends on the measure's performance during its first year of public reporting.

USER INPUT IN IMPROVING THE NURSING HOME COMPARE WEBSITE: USABILITY TESTING OF WEBSITE ENHANCEMENTS

A. Edwards, A. Muma, *Abt Associates, Durham, North Carolina*

Consumer usability testing was conducted on the Nursing Home Compare (NHC) website to assess ease of use and clarity of information. Across four different tests, average user score for ease of use was 4.3 on a 5-point scale with a value of 5 considered 'very easy' and 0 considered 'very difficult.' Google Analytic data supported user testing findings, showing a significant decrease in the number of pages per visit from 7 to 3, an indicator of a reduction in steps necessary to find target content. Average score for clarity of the information was 4.2, where a value of 5 represents 'very clear. NHC website usability testing provides key lessons on how to disseminate information in ways that help improve healthcare decision-making for the target audience. Strategic analysis and planning for the website builds on the usability testing to further enhance the website and the consumer experience on the site.

SESSION 4225 (SYMPOSIUM)

DO ONLINE SUPPORT PROGRAMS CLICK WITH FAMILY CAREGIVERS? EVALUATING USAGE AND SATISFACTION

Chair: D.M. Benton, *University of Southern California*

Co-Chair: K. Kelly, *Family Caregiver Alliance, San Francisco*

To support the growing ranks of family caregivers attending to older adults, social services are looking to technology for solutions. Online support services are desirable because they offer the opportunity to reach broad swaths of family caregivers, who can then access supports that meet their needs on-demand. This symposium explores the potential of different online support services to meet the needs of family caregivers, including the characteristics of family caregivers who are most likely to use on-line support systems and the experiences of family caregivers who do so. The first paper focuses on the design of an on-line portal built for family caregivers in California, and provides results from a survey on caregivers' experiences using this portal. In addition, this research considers usage trends for the material provided to caregivers on the portal. The second paper delves into the who among caregivers is most likely to use the on-line portal introduced during the first presentation, as well as barriers preventing certain caregivers from utilizing this program. The final paper describes the results of an evaluation of an interactive online program designed for family caregivers in Seoul, South Korea, including feedback on the usability of the program and caregivers' satisfaction with the on-line system.

CARE COMPASS: DESIGN AND USE OF NATIONAL SELF-ADMINISTERED CAREGIVER INFORMATION AND SUPPORT SYSTEM

K. Kelly, *Family Caregiver Alliance, San Francisco, California*

This presentation will focus on the application of Care Compass by a national (U.S.) sample of family caregivers using the self-administered capabilities of the online portal. Evaluation results will be provided of unpaid caregivers (N=200) who use consumer information and state resources provided automatically through a uniform intake and scenario process. The presentation will provide an overview of the key design elements of the portal based on caregiver characteristics, online trend analysis and service delivery experience. The evaluation will examine characteristics of online users (geography, demographics, caregiving responsibilities); internal use pattern metrics (open rates on materials, time spent online) and number of users who requested brief telephone consultation after intake. Results from evaluation questionnaires on experience with portal, usefulness of targeted direct care, planning issues, caregiver self-care and resource information will be provided.

DO ONLINE SERVICES REALLY WORK FOR AND SUPPORT FAMILY CAREGIVERS?

K. Meyer, D.M. Benton, *University of Southern California, Los Angeles, California*

This presentation will provide preliminary results from the evaluation of a personalized on-line caregiver support program (N=200). Care Compass is an on-line portal allowing caregivers to access information & resources on demand, and care managers to quickly view client information including individualized care plans. The on-line multi-component support program was piloted as a collaborative project between two social service organizations supporting family caregivers in California. The focus of this evaluation

was on which caregivers were most likely to use on-line services and supports, and how these caregivers differed from those who did not use the on-line system. In addition, results will be presented regarding the frequency with which caregivers accessed various resources within the on-line system, identifying trends in usage associated with different caregiving situations. Finally, the analysis considered which barriers prevented certain caregivers from using Care Compass, including levels of satisfaction with the program and materials provided.

E-HOPE ACADEMY: ONLINE SUPPORT PROGRAM FOR DEMENTIA FAMILY CAREGIVERS IN KOREA

M. Park¹, S. Ja Lee², S. Hwa Kim², J. Ha Kim², H. Jung Kim², D. Young Lee³, 1. *College of Nursing, Chungnam National University, Daejeon, Korea (the Republic of)*, 2. *Seoul Metropolitan Center for Dementia, Seoul, Korea (the Republic of)*, 3. *Seoul National University Hospital, Seoul, Korea (the Republic of)*

The purpose of this study was to develop the online support program, e-Hope Academy for dementia family caregivers in Korea. The individualized web-based support program was developed collaboratively by the clinical experts, technical experts and family caregivers. The program consisted of interactive educational module, online group support, information board, and one to one consulting with experts. The educational contents were designed to cover a wide range of issues that frequently occur during caregiving. Core modules were provided to every user. Optional modules were provided according to the family caregiver's need. Formative evaluation was conducted to assess the usability of the program. Caregiver's need and stress were assessed at baseline and satisfaction of the program was post-evaluated. Family caregivers were satisfied with the content and the amount of information, the online activity, and the design of website. Further development of other services will broaden the impact of this program.

SESSION 4230 (SYMPOSIUM)

OPTIMIZING DRUG TREATMENT IN OLD AGE: TRANSLATIONAL AND TRANSDISCIPLINARY EFFORTS

Chair: K. Johnell, *Karolinska Institutet, Stockholm, Sweden*

A major challenge in health care is the lack of knowledge about effects of drug treatment in old age. Randomized clinical trials typically exclude patients at advanced ages who use multiple drugs and who have many co-morbidities. There is a need for evidence of the benefits and harms of drug treatment in old age to support balanced drug prescribing and to enhance patient safety. Therefore, new translational approaches are warranted where clinical and epidemiological data can be mimicked in experimental animal models.

In this symposium, we will outline our concept of integration of geriatric pharmacoepidemiology with biology of aging. Researchers from the US, Australia and Europe will present their findings. The symposium will start with pharmacoepidemiological results from large-scale real world human data about drug treatment in old age. Thereafter the novel polypharmacy mouse model and the mouse clinical

frailty index will be presented as well as other preclinical models relevant for geriatric pharmacology. Finally, we will end with healthspan in mice as a preclinical outcome in old age.

This international symposium has a unique transdisciplinary profile with the aim of improving treatment of elderly patients and ultimately their health and well-being. We argue that more studies of aging should employ a translational profile with integration of human data with animal data. This kind of collaboration between basic, clinical and epidemiological scientists has the potential to go beyond state-of-the-art aging research.

OLD AGE PHARMACOEPIDEMIOLOGY: SETTING THE SCENE

K. Johnell, *Karolinska Institutet, Stockholm, Sweden*

Over 80% of people aged ≥ 65 years use pharmacological drugs. Older people are more susceptible to adverse effects of drugs because of altered pharmacokinetics and pharmacodynamics combined with multiple diseases, impairments and polypharmacy. We analyze large Swedish national registers to investigate drug treatment among people aged ≥ 65 years with special focus on polypharmacy (≥ 5 drugs), inappropriate drug treatment, dementia and the risk of negative outcomes. The most commonly used drugs among older people are cardiovascular drugs, analgesics and psychotropics and their use vary with age, sex, residential setting and dementia status. At age 65 years, approximately 8 years of the 20 remaining years of life can be expected to be lived with polypharmacy. Inappropriate drug treatment is associated with negative outcomes such as hospitalization. These pharmacoepidemiological findings from large-scale human data will feed into experimental animal models to verify outcomes and identify mechanisms and biomarkers.

A TRANSLATIONAL MODEL TO UNDERSTAND THE IMPACT OF POLYPHARMACY ON ADVERSE GERIATRIC OUTCOMES

S.N. Hilmer^{1,4}, A. Huizer-Pajkos⁴, A.E. Kane^{1,4,2}, J. Mach^{1,4}, S.E. Howlett², R. de Cabo³, D.G. Le Couteur⁵, 1. *Medicine, The University of Sydney and Royal North Shore Hospital, St Leonards, New South Wales, Australia*, 2. *Dalhousie University, Halifax, Nova Scotia, Canada*, 3. *National Institute on Aging, Baltimore, Maryland*, 4. *Kolling Institute of Medical Research, Sydney, New South Wales, Australia*, 5. *Concord Hospital and University of Sydney, Sydney, New South Wales, Australia*

We developed a translational model to evaluate whether polypharmacy (use of ≥ 5 different medicines) causes adverse geriatric outcomes and whether these are reversible with deprescribing (withdrawal of medicines). Old (23–24 months) male C57BL/6 mice received control diet (no drugs) for eleven weeks, or diet containing therapeutic doses of five commonly used drugs (simvastatin, metoprolol, omeprazole, paracetamol, citalopram) for four weeks, which were gradually withdrawn over the next six weeks. Physical performance was assessed at baseline, four and eleven weeks and transformed into Frailty Intervention Assessment Values (FIIV): sum of standardised values for locomotor activity, rotarod performance and front paw hang. After four weeks, FIIV was unchanged in controls

and declined with polypharmacy ($p < 0.05$). At week eleven FIAV remained unchanged in controls and improved but did not return to baseline in the polypharmacy/deprescribing group. This model can assess the effects of polypharmacy on geriatric outcomes and provides opportunities to investigate mechanisms.

ARE ANIMAL MODELS VALUABLE FOR AGING RESEARCH? LESSONS FROM ALZHEIMER'S DISEASE

A. Cedazo-Minguez, *Karolinska Institutet, Stockholm, Sweden*

Our experience in the Alzheimer's disease field is that many therapeutic strategies tested in animal models have been successful, but these positive results have not been useful to patients. This deficit in translational research is causing an enormous frustration. The lack of translation can be expanded to several other disorders associated to aging, including complex clinical pictures related to multimorbidity and frailty. This presentation aims to review the current approaches in preclinical research for aging-related disorders, and to open a debate on how the preclinical phases of drug discovery should be designed to increase the possibility of translation.

THE MOUSE CLINICAL FRAILTY INDEX AS AN OUTCOME AND MODULATOR OF DRUG THERAPY

S.E. Howlett, *Pharmacology & Geriatric Medicine, Dalhousie University, Halifax, Nova Scotia, Canada*

Frailty can be quantified in people by counting the accumulation of deficits in health (signs, symptoms, diseases) to construct a "frailty index" (FI). We have quantified frailty in naturally-ageing mice by counting differences in >30 health-related variables (hemodynamics, blood work, activity, body composition). We showed that 30 month-old mice had higher FI scores than 12 month-old animals (0.43 ± 0.03 vs 0.08 ± 0.02 ; $p < 0.001$; $n = 12$). Similar results were obtained when FI scores were calculated based on clinically-apparent signs of deterioration in mice. Mice treated with known longevity interventions (caloric restriction, resveratrol) had lower FI scores than untreated controls. Importantly, the relationship between FI scores and age (normalized to 90% mortality) was similar in mice and humans; the highest scores were close to the submaximal frailty limit of 0.67 in humans. This ability to quantify frailty in animals will help understand the biology of frailty and provide a platform to test new clinical interventions.

HEALTHSPAN IN MICE AS A PRECLINICAL OUTCOME IN OLD AGE

R. de Cabo, *National Institute on Aging, Baltimore, Maryland*

The Baltimore Longitudinal Study of Aging (BLSA) is America's longest-running scientific study of human aging. BLSA is focused on the physical and cognitive changes associated with normal aging, free of disease in humans, as well as the interrelationship between disease and age-related changes. Although human studies should always be preferred, laboratory mice present important advantages for investigations on aging, late-life illness, and age-dependent physiological changes. However, to date, the evidence is insufficient to tell whether using the mouse as a model organism on aging

research is a valid approach to identify biomarkers translatable to human aging. We will present here the study design, some of the preliminary data from an extensive longitudinal study in two strains of mice aimed to identify shared biomarkers that could serve as predictive factors for increase mortality in both mice and humans.

SESSION 4235 (SYMPOSIUM)

ACTIVE ENGAGEMENT IN PRODUCTIVE ACTIVITIES: COMPARISON BETWEEN EAST ASIA AND THE WEST

Chair: K. Katagiri, *Kobe University, Kobe-shi, Hyogo, Japan*
Co-Chair: K. Chee, *Texas State University, San Marcos, Texas*

Discussant: R. Gupta, *San Francisco State University, San Francisco, California*

Recently, the Third Age period has become more important, and because of longer life expectancy and healthier physical conditions, older adults can enjoy this period longer. Though Rosow described old age as 'a roleless role', people nowadays are expected to engage in productive activities into later life. For purposes of this symposium, 'productive activities' refer to paid work, civic engagement, and caregiving. The goals of this symposium are 1) To illustrate how Third Agers in East Asia and the USA engage in productive activities, and which factors are related to these activities; 2) To identify differences and similarities in productive activities between East Asia and Western countries and how activities are constrained by norms, culture, and social system in different societies. The symposium begins with Huiying, who uses longitudinal data of CHARLS to examine differences caused by relationships with care recipients and effects of caregiving transitions on depressive symptoms in Mainland China. Mizuno-Shimatani explains how older Japanese mothers provide daughters with informal support to compensate for insufficient formal support from public sectors in Japan. Katagiri shows the positive effects of active engagement on mental health among Japanese, especially after retirement. Norstrand presents how societal perception of old age triggers civic engagement differently in Japan and the USA. Finally, Kim examines antecedents of productive activity: the role of human, social, and cultural capital in the USA. All panelists illustrate how actively Third Agers engage in productive activities, and that these activities are constrained by cultural contexts, norms and gender.

TRANSITIONS IN CAREGIVING AND MENTAL HEALTH OF CHINESE ELDERS: A PROSPECTIVE NATIONAL SURVEY

H. Liu, V. Lou, *The University of Hong Kong, Hong Kong, Hong Kong*

Objectives: Using two waves data from the China Health and Retirement Longitudinal Study (CHARLS), this study aims to examine the effects of caregiving transitions on mental well-being among three subgroups of elder caregivers (grandchild caregiver, parent caregiver, and spousal caregiver).

Methods: We used a sample of 2,398 urban residents who aged 60 or above at Wave 1 and who were interviewed in

both waves. The Generalized Estimating Equations (GEE) approach was used to estimate the impact of care transitions on depressive symptoms.

Results: In comparison with non-caregivers, grandchildren caregivers who continuously provided care and parent caregivers who stopped providing care reported lower levels of depressive symptoms; spousal caregivers who stopped or started to provide care reported higher levels of depressive symptoms.

Conclusions: This study revealed differential pictures of the effects of caregiving transitions among three subgroups of caregivers, which adds evidence to existing knowledge about the heterogeneity of elder caregivers.

MORE THAN JUST GRANDMOTHERS: SUPPORTING WORKING DAUGHTERS

I. Mizuno-Shimatani¹, K. Katagiri², 1. *Jissen Women's University, Tokyo, Japan*, 2. *Kobe University, Hyogo, Japan*

Recently, late middle-aged or elderly women (i.e., old mothers) who have grandchildren are expected to be more than just grandmothers. Because the public service system is inadequate to support working mothers in Japan, informal support from their older mothers is needed. This study investigated whether old mothers provided more informal support to working daughters than to non-working daughters with children. Using national representative data (National Family Research of Japan 2008), 329 women (aged 48–73 years) were analyzed. The chi-square test result was opposite to our hypothesis—old mothers provided significantly more informal support to non-working daughters in giving advice and helping with housework and grandchild care, controlling for old mothers' health status. Additionally, this tendency was stronger among old working mothers. Future investigation is needed to understand the difference in quantity and quality of informal support from old mothers to working and non-working daughters.

ACTIVE SOCIAL PARTICIPATION AS A SUBSTITUTE FOR PAID WORK AMONG JAPANESE SENIORS?

K. Katagiri, T. Kimura, *Kobe University, Kobe-shi, Hyogo, Japan*

The recent prolonged life expectancies require people to reconsider how to live after retirement. Social participation is one effective substitute for the work role. Literature on social participation has been examined dichotomously, i.e., participation versus non-participation, and has not examined people's degree of activeness.

This study aimed to examine the effects of active social participation on Japanese seniors. JGSS2012, a nationally representative data, was used for the analyses. Hierarchical multiple regressions were conducted to investigate main effects of work and active social participation on mental health, and subsequently interaction of working status and active social participation was added for two age groups, under or over 60. We found a positive effect of active participation for both groups. When not actively engaged socially, mental health was better for people who worked than those who did not. Results suggest that it is important for seniors to hold a meaningful role in society.

PERCEPTION OF OLD AGE AND CIVIC ENGAGEMENT

J. Norstrand¹, A. Glicksman², K. Katagiri³, 1. *Regis College, Newton, Massachusetts*, 2. *Philadelphia Corporation for Aging, Philadelphia, Pennsylvania*, 3. *Kobe University, Kobe, Japan*

Societal perception of old age may impact likelihood of civic engagement. Goal of this study was to compare two countries (Japan/USA) in terms of civic engagement. Old age was perceived to begin among men and women in Japan (at 43 and 42, respectively) and in USA (at 69 for both). Adults (22–82 y/o) were obtained from Generations of Talent dataset (2009), consisting of Japanese (N=2250) and Americans (N=976). Logistics regressions were run by gender for civic engagement (viz., volunteerism, caregiving, and financial assistance) accounting for education, marital status, hours worked in job, age 50 and older, and health in past month. Perceived old age was significantly associated with volunteering and financial assistance among both genders. However, when country (Japan/USA) was included only that variable remained significant predictor for civic engagement. Hence, perception of old age as well as knowledge of national norms may be important for understanding civic engagement.

SOCIAL ANTECEDENTS OF PRODUCTIVE ACTIVITY: THE ROLE OF HUMAN, SOCIAL, AND CULTURAL CAPITAL?

S. Kim, *Texas State University, San Marcos, Texas*

Using the productive aging model, the study investigates the relationship between human, social, and cultural capital and multiple types of productive activity. Analyzing data from two waves (2005–2010) of the National Social Life, Health, and Aging Project (NSHAP), I tested whether human capital (education, functional limitations), social capital (marital status, network size, social support), and cultural capital (religious service attendance) predict productive activities, consisted of volunteering, meeting attendance, employment, and caregiving. Results show that human capital predicted all four productive activities in cross-sectional and longitudinal analyses, while social and cultural capital was associated with meeting attendance and volunteering. Moreover, the link between social capital and productive activity was attenuated in the longitudinal analyses. Important implications of these findings are that productive activities occur in the context of available resources and that capital influences productive activities differently, warranting more investigations of multiple activities or 'activity profile' over the life course.

SESSION 4240 (SYMPOSIUM)

THE INTERPLAY OF DIVERSITY CHARACTERISTICS: DOES IT ENHANCE PARTICIPATION IN HEALTHCARE?

Chair: C. Meyer, *Royal District Nursing Service Institute, St Kilda, Victoria, Australia*

Discussant: M.G. Ory, *Texas A&M University*

The Right to Health (World Health Organization) premises access to timely, acceptable, and affordable healthcare of appropriate quality. Decision-maker and practitioner focus in healthcare has been on improving equity of access

for community members with particular individual diversity characteristics, to improve identified disparities in health outcomes. Diversity is what makes an individual unique, but it is the interplay of these diversity characteristics that provides both interest and challenge to the participation of the older person in their healthcare.

This symposium has three linked presentations exploring diversity through the lens of intersectionality; that diversity characteristics cannot be looked at in isolation, that participation in healthcare cannot be reduced to a single characteristic. This project is funded by Department of Social Services (Australia) and conducted through the Royal District Nursing Service (RDNS), a not-for-profit community organisation providing home nursing and healthcare services. The opening presentation sets the international policy stage for equity in healthcare, drawing on important work by the WHO, U.S. Institute of Medicine and Kings Fund U.K., linking to Australian diversity and inclusion policies. The second presentation expands the theoretical underpinnings of key concepts related to diversity, based upon meta-narrative systematic review findings. The final presentation will address implementing diversity concepts into practice from an expert in a particular 'diversity characteristic', highlighting how characteristics intertwine to provide context to a person's life, presenting barriers and opportunities to participation in healthcare.

CONNECTING INTERNATIONAL EQUITY AND ACCESS HEALTHCARE POLICY TO THE AUSTRALIAN CONTEXT

C. Browning, *Royal District Nursing Service Institute, St Kilda, Victoria, Australia*

Improved equity of access, and thus participation, in healthcare for older people with particular individual diversity characteristics is a key objective of higher income healthcare systems. A human rights framework and core values of respect, dignity and inclusion consistently guide work undertaken by organisations such as the World Health Organization, the U.S. Institute of Medicine and Kings Fund (U.K.). Health equity is seen as achievable through action on the social determinants of health, addressing bias and prejudice. However, policies and standards often focus on specific groups of people, risking the prioritisation of one aspect of an older person over another and growing fatigue related to the increasing number of 'care delivery' lenses. In response, the concept of intersectionality is considered, that human experience moves beyond a single characteristic, with interplay of characteristics highly variable. The Australian healthcare sector is strategically planning for informed practice that is responsive to diversity characteristics.

THEORETICAL UNDERPINNINGS OF KEY DIVERSITY CONCEPTS

C. Meyer, 1. *Royal District Nursing Service Institute, St Kilda, Victoria, Australia*, 2. *Centre for Health Communication and Participation, La Trobe University, Bundoora, Victoria, Australia*

A meta-narrative systematic review was undertaken to understand the key concepts relevant to enhancing participation in healthcare, specific to the array of diversity characteristics of older people beyond cultural diversity. This presentation will begin with an examination of perception

and awareness related to diversity characteristics, acknowledging the impact of bias and prejudice on participation in healthcare. Next, the WHO Rights to Health of available, accessible, acceptable and quality healthcare services will be addressed, as related to engaging the older person meaningfully in their healthcare. The final section will build these diversity concepts into the reality of community care practice, providing practical, but generic suggestions for community aged care workers.

IMPLEMENTING DIVERSITY CONCEPTS INTO PRACTICE

S. Edmonds, *National LGBTI Health Alliance, Sydney, New South Wales, Australia*

The final section of the symposium will hear from an expert in the area of specific diversity characteristics, namely, the Lesbian, Gay, Bisexual, Transgender and Intersex (LGBTI) community; importantly acknowledging the impact of other diversity characteristics in the policy and practice arena. Sam Edmonds from the National LGBTI Alliance will speak on ageing issues specific to older LGBTI people, what inclusion looks like for LGBTI elders and how health services can be truly inclusive. The presentation will demonstrate why there is a need to move from 'but we treat everyone the same' to 'how can we meet each person's individual needs'.

SESSION 4245 (SYMPOSIUM)

HOW GERONTOLOGISTS THINK ABOUT EVIDENCE: AN INTERNATIONAL COMPARISON

Chair: R.A. Kane, *University of Minnesota, Minneapolis, Minnesota*

Co-Chair: R.L. Kane, *University of Minnesota, Minneapolis, Minnesota*

Discussant: T. Lum, *The University of Hong Kong, Pokfulam, Hong Kong*

This symposium reports on Robert Kane's survey of 360 non-US IAGG members about their views on evidence and compares them to findings from his 2016 study with 240 GSA members. Both GSA and IAGG are eclectic scientific societies, with diverse membership in terms of disciplinary affiliation (e.g., basic sciences, clinical sciences, psychology, sociology, economics, political science, and the humanities, each with many subfields). Their research is theoretical and applied, quantitative and qualitative using a wide variety of designs. Topics studies include the phenomenon of aging, population aging, effects of treatments and interventions, and translation of effective approaches into practice. In an evidence-conscious yet increasingly specialized era, examining how gerontologists perceive, define and use evidence, and the evidence they trust is timely. Defining evidence as "information you believe is true and would act upon," respondents rated how various circumstances influenced their confidence in evidence the credibility of evidence gleaned from a variety of research designs; and their perceived adequacy of available evidence to guide their own work. Three papers present findings: 1) crosscutting review of methods, results, and themes; 2) a multivariate analysis of responses based on respondents' disciplines and primary function; and 3) patterns of difference between GSA and IAGG responders and the role of country of residence in the results. Commentaries

by 3 distinguished international experts, each with a different disciplinary perspective, ushers in a general audience discussion to explore the implications of the findings for cross-disciplinary and international research and knowledge development.

OVERALL PATTERNS OF VIEWS ON EVIDENCE

R.A. Kane¹, M. Whipple², R.L. Kane¹

1. *University of Minnesota, Minneapolis, Minnesota*, 2. *School of Nursing, University of Minnesota, Minneapolis, Minnesota*

This session reviews methods, sample frames, data collection, factor analytic approaches to quantitative data, and content analysis of the qualitative data. Preliminary work suggests that views about what increases trust in evidence, the credibility of evidence derived from different study designs and ratings on the adequacy of evidence to guide one's work are associated with disciplinary clusters. We will describe respondents' views, contrasting those who primarily conduct research with those who primarily teach, those who do any clinical work, and those who make policy or programmatic decisions. Preliminary qualitative analyses found contrasting views about the merits of quantitative and qualitative work, the value of theory-testing versus discovery through observation; advantages versus limitations of RCTs; the sufficiency or insufficiency of evidence for practice and policy decisions; and distinctions between evidence of no effect and no effect of evidence.

DRILLING DOWN: WHAT AFFECTS PERSPECTIVES ON EVIDENCE ACROSS THE GLOBE

E. Jutkowitz¹, M. Whipple², R.A. Kane¹, R.L. Kane¹,

1. *School of Public Health, University of Minnesota, Minneapolis, Minnesota*, 2. *School of Nursing, University of Minnesota, Minneapolis, Minnesota*

This sessions analyze characteristics of the respondents that are associated with their perspectives on what creates confidence in evidence, what designs have credibility, and how positively or negatively they view the available evidence to guide their own work, and their responses to a variety of agree-disagree questions, including those that query the extent to which researchers in aging share perspective about evidence, and whether researchers in aging they should share a perspective about evidence. Independent variables include: the respondent's disciplinary cluster, primary work activities (e.g. more than 50% + research, 50% education, or having any clinical practice), extent of multidisciplinary collaboration, and perhaps length of time from receiving their last educational degree.

COMPARING IAGG AND GSA MEMBERS' VIEWS OF EVIDENCE IN AGING

M. Whipple², E. Jutkowitz¹, R.A. Kane¹, R.L. Kane¹,

1. *School of Public Health, University of Minnesota, Minneapolis, Minnesota*, 2. *School of Nursing, University of Minnesota, Minnesota*

This presentation compares and contrasts GSA and IAGG respondents' views after controlling for discipline and primary activity. The IAGG sample is further divided by country of origin with a cluster, for example, from Africa, from Scandinavian countries, from Western Europe, from UK and Australia, from Asia, and New Zealand and from South

American countries and Spain. Although numbers by country are rather small we do expect to see some differences in perspective, and will also analyze qualitative data for further insights. In the IAGG sample, a large proportion of the same—amounting to at least 1/3, are physicians, perhaps a reflection of the way aging programmatic leadership and research evolves in various parts of the world.

WHAT DOES ALL THIS MEAN?

T. Lum¹, B. Vellas², D. O'Neill³, 1. *Hong Kong University, Hong Kong, Hong Kong*, 2. *Geriatric Department, University Hospital, Toulouse, France*, 3. *Tallaght Hospital, Dublin, Ireland*

International discussants Terry Lum, social worker and health services researcher, Bruno Vellas, internist, geriatrician and clinical trial expert, and Desmond O'Neill, geriatrician, humanist and ethicist, will discuss the findings and their implications for future gerontological research, and cross-national as well as cross-disciplinary gerontological research. Along with other presenters, they will serve as panelists for an audience discussion about what kind of common understanding of evidence is necessary or desirable for cross-disciplinary and cross-national gerontological research.

SESSION 4250 (SYMPOSIUM)

MULTIPLE CHRONIC CONDITIONS: A WORLDWIDE CHALLENGE

Chair: R. Pruchno, *Rowan University School of Osteopathic Medicine, New Jersey*

Discussant: C. Boyd, *Johns Hopkins University School of Medicine, Maryland*

Globally, the number of older people with multiple chronic conditions (MCCs) has increased dramatically in the past decades. It is not unusual for an 80-year old to be diagnosed with five or six conditions, each treated with multiple medications and complex therapeutic regimens. While some countries have developed innovative policies and programs designed to improve the lives of people with MCCs, other countries are just beginning to respond to these challenges. Typically, the onus is on individuals and families to manage the demands of MCCs. Yet knowledge about how people manage MCCs, what supports enable people with MCCs to cope effectively, and what role medical practitioners should play is unclear. This symposium includes presentations from scholars in Bulgaria (Stanimir Hasardzhiev), Canada (Walter Wodchis), Italy (Alessandra Marengoni), Lithuania (Rokas Navickas), and the United States (Maureen Wilson-Genderson & Allison Heid). Presenters will discuss the number of older people with MCCs, how older people cope with MCCs, the association between onset of MCCs and outcomes, the effects of social support on MCCs, the importance of person-centered care in the context of MCCs, the economic costs of MCCs, and responses of global health care systems in addressing the needs of people with MCCs. Discussant Cynthia Boyd will highlight the similarities and differences in the work of these international scholars, examine how findings can build on one another, and suggest how research can be used to change the way care is provided to older people, thereby improving the lives of older people with MCCs worldwide.

AGEING WITH MULTIMORBIDITY

A. Marengoni¹, G. Onder², 1. *University of Brescia, Brescia, Italy*, 2. *Department of Geriatrics, Centro Medicina dell'Invecchiamento, Università Cattolica del Sacro Cuore, Rome, Italy*

During the last two decades, research on multimorbidity (e.g., the evaluation of the coexistence of multiple chronic diseases in the same person, *whichever* the diseases are) has rapidly increased. Previous reports have clearly shown that multimorbidity affects a large proportion of older persons ranging from 55 to 98% across studies depending on definition, age of the population and data source, making this condition to be defined as the 'most common chronic disease'. A few possible risk factors for multimorbidity were identified, such as increasing age, whereas a large social network seemed to play a protective role. However, the exclusive use of a quantitative approach to this phenomenon fails to catch the nature and dynamics of the different patterns of co-existing diseases. Given that there are no clear boundaries between many diseases, studying the structure defined by the entire set of co-occurring morbidities might help to understand biological and medical questions.

ONSET OF MULTIPLE CHRONIC HEALTH CONDITIONS AND DEPRESSIVE SYMPTOMS

M. Wilson-Genderson², A. Heid¹, R. Pruchno¹, 1. *Rowan University School of Osteopathic Medicine, Stratford, New Jersey*, 2. *Temple University, Philadelphia, Pennsylvania*

This study sought to prospectively examine the association between the onset of five chronic health conditions (arthritis, diabetes, heart disease, hypertension, and pulmonary disease) and depressive symptoms in a community dwelling sample of older adults. Longitudinal multi-level modeling was used to examine the effects of illness onset on depressive symptoms. We found that, from 2006 and 2011, onset of each of the 5 conditions had independent effects that increased depressive symptoms for people with zero or one chronic condition at baseline, while controlling for a lifetime diagnosis of depression, age, gender, income, and race. The transition from no or a single chronic health condition to multimorbidity regardless of the type of illness of onset impacted older adults' depressive symptoms. Developing ways to prevent or delay the onset of additional chronic illnesses will impact the well-being of older adults.

HEALTH CARE OUTCOMES FOR PEOPLE WITH MULTIPLE CHRONIC CONDITIONS IN ONTARIO, CANADA

W. Wodchis^{1,2,3}, A. Gruneir⁴, K. Thavorn⁵, N.E. Lane¹, A. Kone⁶, S. Bronskill³, C.J. Maxwell⁷, 1. *Institute of Health Policy Management and Evaluation, University of Toronto, Toronto, Ontario, Canada*, 2. *Toronto Rehabilitation Institute, Toronto, Ontario, Canada*, 3. *Institute of Clinical Evaluative Sciences, Toronto, Ontario, Canada*, 4. *University of Alberta, Edmonton, Alberta, Canada*, 5. *Ottawa Hospital Research Institute, Ottawa, Ontario, Canada*, 6. *Lakehead University, Thunder Bay, Ontario, Canada*, 7. *University of Waterloo, Waterloo, Ontario, Canada*

This presentation will summarize evidence arising from a multi-year population-based study of over 6 Million people in Ontario, Canada who have one of 17 common chronic conditions, and particularly the more than 2.5 Million

individuals with multiple chronic conditions. Aside from the expected increases in health care utilization, adverse outcomes and health care costs associated with an increasing number of conditions, the results highlight several novel insights. For example: there are very few patterns of clustering of multiple chronic conditions; the increasing effect of additional conditions on health care use is attenuated for those aged 65 or over; the gradient in mortality associated with socio-economic status is not apparent after controlling for the number of chronic conditions that a person has. Results also indicate modifiable factors: having greater than median continuity of care was equivalent to having one less chronic condition in terms of hospitalization outcomes.

MULTIMORBIDITY: JUST A MATTER OF THE ELDERLY? LITHUANIAN NATIONAL DATA ANALYSIS

R. Navickas^{1,2}, E. Jureviciene^{1,2}, 1. *Faculty of Medicine, Vilnius University, Vilnius, Lithuania*, 2. *Vilnius University Hospital Santariskiu Klinikos, Vilnius, Lithuania*

Multimorbidity, defined as the coexistence of at least two chronic conditions in the same individual, is usually associated with older age. Interestingly, an upward trend in multimorbidity is related not only to the increasing life expectancy, but in addition, an increasing number of younger people suffering from multiple chronic diseases. Despite the obvious trend, the age effect on the occurrence of multimorbidity has not been well researched.

The presentation will focus on a national study, covering the whole Lithuanian chronically diseased population with at least one chronic condition from the 32 chronic disease list. The presentation will reflect on the age breaking points for the occurrence of multimorbidity and analyze the age effect on healthcare resources as well as medication usage. Based on 450,000 patients' data, results will suggest potential age groups, where interventions for chronic disease management could provide higher success rates.

SESSION 4255 (SYMPOSIUM)**A MUSIC PROGRAM FOR INSTITUTIONAL LONG-TERM CARE RESIDENTS WITH DEMENTIA: IMPLEMENTATION AND OUTCOMES**

Chair: K. Thomas, *Brown University, Rhode Island*

Discussant: R. Baier, *Brown University, Rhode Island*

With an increasing number of older adults affected by Alzheimer's disease and related disorders (ADRD), there is an emphasis on finding safe and effective non-pharmaceutical interventions to address behavioral and psychological symptoms of dementia (BPSD). This symposium presents the implementation and effectiveness of an international personalized music program, MUSIC & MEMORYSM (M&M) in institutional long-term care (LTC) settings. The first presenter, and founder of M&M, will describe his approach to leveraging technology to create the program and detail its current application in settings around the world. The second speaker will present findings from qualitative research with nursing homes in four states in the U.S., focusing on barriers and facilitators to successful program implementation. The third speaker will present results of an in-depth evaluation of statewide M&M implementation in Wisconsin nursing homes, including results from a crossover study in 10 facilities and statewide nursing

home survey. The fourth presenter will describe findings from a randomized control trial conducted with 20 institutional LTC residents in Germany. The fifth speaker will present findings from a national, retrospective difference-in-difference analysis of 98 U.S. nursing homes certified in the M&M program compared to 98 pair-matched controls. Evidence from these studies suggests that M&M is related to improvements in BPSD and anti-psychotic use among institutional LTC residents, but also that effectiveness is related to program implementation and fidelity. The discussant will weave together the findings and international experiences within a quality improvement framework and present implications for future research and the care of residents with ADRD.

USING TECHNOLOGY TO DELIVER PERSONALIZED MUSIC WORLDWIDE TO PEOPLE WITH DEMENTIA

D. Cohen, *MUSIC & MEMORY, Inc., Mineola, New York*

I describe my experience using inexpensive new technology (iPods) to create MUSIC & MEMORY, a personalized music program for people with Alzheimer's disease and related dementias. The program started in 2006 with a question: Why not use iPods to provide nursing home residents with music tailored to their personal preferences? Its potential is illustrated powerfully in the award-winning 2014 documentary, *Alive Inside*, which shows people with severe dementia begin to move, sing, interact with others, and even describe memories while listening to their music. What began as a simple idea piloted in a single nursing home has now spread into a worldwide program with more than 3,100 sites, including multiple care settings and eight countries. There are numerous research and demonstration projects underway, some of which will be detailed in this symposium. I describe the program and my process to continually incorporate best practices and research findings into its delivery.

BEST PRACTICES FOR IMPLEMENTING PERSONALIZED MUSIC WITH NURSING HOME RESIDENTS WITH DEMENTIA

B. Frank, C. Brady, *B&F Consulting, Warren, Rhode Island*

We focus on qualitative findings from site visits with 13 nursing homes in four states that implemented a personalized music program for residents with Alzheimer's disease and related dementias. Seven facilities were participants in a statewide demonstration project, selected by state leaders because of their apparent success. We retrospectively interviewed key informants to learn how staff implemented the program and what they perceived as facilitators or barriers. We found common themes, such as how easily accessible the music devices are and how interdisciplinary care teams incorporate the program into care planning and quality improvement. We then prospectively followed six facilities in three states as they implemented the program. Site visits with these facilities allowed us to identify the processes necessary to fully adopt the program and incorporate it into the culture of care. Our final qualitative findings will serve as a guide to others implementing or evaluating this intervention.

INDIVIDUALIZED MUSIC FOR PEOPLE WITH DEMENTIA IN INSTITUTIONAL CARE

G. Wilz, T. Heilmann-Stiegler, J. Deux, L. Weise, *Institute of Psychology, Friedrich-Schiller-Universität Jena, Jena, Germany*

IAGG 2017 World Congress

The study focuses on the investigation of individualized music for people with dementia in institutional care in Germany. It aims to improve well-being, quality of life and social participation and investigates the acceptance, efficacy and applicability of the intervention. A randomized controlled trial ($N = 20$ people with dementia, age $M = 85.20$, $SD = 5.98$, 80% female) was conducted. The intervention was implemented for 8 weeks (during the afternoon for 30 minutes, part one: 3 to 4 sessions in 4 weeks; part two: 2 sessions in 4 weeks) by the project team. Behaviour was observed with a modified version of the Observed Emotions Rating Scale for each inhabitant once a week ($r = .82$). Results after 4 weeks showed an increase in well-being ($t = -2.86$, $p = .019$), a marginal significant increase in participation ($t = -1.96$, $p = .081$) and decrease in resistance ($t = 1.96$, $p = .081$).

A STATEWIDE ROLL-OUT AND EVALUATION OF MUSIC & MEMORY IN NURSING HOMES: THE WISCONSIN EXPERIENCE

J. Kwak, M. Brondino, K. O'Connell Valuch, *University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*

Since 2014, the state of Wisconsin has funded over 300 nursing homes to become certified M&M facilities and provided equipment for nursing home residents. An evaluation of the statewide implementation of M&M in Wisconsin included a crossover study ($n=59$ residents from 10 nursing homes), pre- and post-survey of medication use of 1,500 residents from 100 nursing homes, comparison of nursing home resident outcomes using MDS data, and key administrative survey with 161 nursing homes. The overall evaluation found that although many facilities viewed M&M as valuable, noting enjoyment by and improved mood among residents, there was substantial variability in the music listening time duration and frequency across residents and facilities, and minimal or modest improvement on resident behavioral outcomes and psychotropic medication use. These findings provide important implications for improving the M&M program design and fidelity, targeting appropriate residents and outcomes, and future implementation and sustainability efforts.

INDIVIDUALIZED MUSIC PROGRAM IMPROVES OUTCOMES FOR U.S. NURSING HOME RESIDENTS WITH DEMENTIA

K. Thomas^{1,2}, C. Kosar¹, V. Mor^{1,2}, R. Baier¹, 1. *Brown University, Providence, Rhode Island*, 2. *U.S. Department of Veterans Affairs, Providence, Rhode Island*

The objective of this study was to compare the outcomes of U.S. nursing home (NH) residents with dementia in facilities that did and did not implement the MUSIC & MEMORY intervention (M&M) in 2013. Data come from Minimum Data Set assessments for residents with dementia residing in 98 NHs participating in M&M ($n=12,905$) and matched-pair control facilities ($n=12,811$). We measured 180-day improvement in antipsychotic use, behavior, communication, and mood in 2012 and 2013. Results from difference-in-difference analyses suggest 180-day improvement in antipsychotic medication use was greater in M&M facilities compared to residents in control facilities ($b=0.218$, $p<.05$). Residents in M&M facilities also had a greater reduction in frequency of behavioral problems compared to control sites ($b=0.268$, $p<.05$). No statistically significant differences were observed for improvement in communication

or mood. These results offer evidence that the M&M program may be associated with improvements among nursing home residents with dementia.

SESSION 4260 (PAPER)

EPIDEMIOLOGIC STUDIES: MORBIDITY, FUNCTION, AND HEALTH SERVICES

THE PREVALENCE AND NATURE OF PARAMEDIC ATTENDANCE TO OLDER ADULTS IN AUSTRALIA

L. Ross, B. Williams, P. Jennings, *Monash University, Melbourne, Victoria, Australia*

Given population aging and the prevalence of multiple biopsychosocial issues amongst older adults, it is not surprising that there is a corresponding increase in the demand on health and social services. This retrospective cohort study analysed all emergency paramedic attendances to patients aged 65 or older between 1 July 2011 and 30 June 2014 in Victoria, Australia. A total of 596,579 cases of emergency paramedic attendance to patients 65 years or older in a three year period for 2011 – 2014. The mean (SD) age of patients was 79.8(8.2), with a range of 65 – 112 years old. There were 235,483 (39%) patients aged between 75 – 84, and 327,070 (55%) were female. Of the 89,952 (15%) patients located at nursing homes or supported accommodation facilities 53,175 (59%) were in the 84+ years category. Of the ‘case nature’ variables, *medical* accounted for 348,482 (59%) cases. There were 32,900 (6%) *cardiovascular problems*, 20,822 (3%) *respiratory problems*, and 4,327 (1%) *mental health/behavioural problems*. Of the patients included in the study 493,788 (83%) were transported. A search of all ‘case descriptions’ for phrases indicating a patient *lives alone or lives by themselves*, resulted in 59,760 incidence. This research show us that emergency paramedics in Victoria attend approximately 200,000 older patients per year with a wide variety of conditions. The detailed case descriptions however give us a deeper understanding of the complexity of underlying and often secondary psychosocial ailments.

FRAILITY AND RISK FOR DEMENTIA: THE AUSTRALIAN LONGITUDINAL STUDY ON WOMEN’S HEALTH

P. Gardiner, M. Waller, G. Mishra, A.J. Dobson, *The University of Queensland, Woollongabba, Queensland, Australia*

Frailty is well established risk factor for adverse health outcomes such as falls, disability, hospitalisation and mortality. There is some conjecture about whether cognition and dementia are components of frailty and little evidence about whether frailty is a risk factor for dementia. We examined associations of frailty (assessed in 1999) with dementia status after 4 years and 13 years using Cox proportional hazard models. We repeated analyses with death as a competing event, using the competing risks model (proportional sub-hazards model). Participants were 7484 women born in 1921–1926 from the Australian Longitudinal Study on Women’s Health. Frailty was assessed with the FRAIL scale using self-report data: healthy (0), pre-frail (1–2), frail (3–5). Dementia was determined from linkage to administrative data sources: Medicare Benefits Scheme, Pharmaceutical Benefits Schedule, Aged

Care data, and the National Death Index. Death was determined from the National Death Index. Compared to healthy women, frailty was associated with a higher risk for dementia at 4 years (HR 2.43, 95% CI 1.61–3.65) and 13 years (HR 1.52, 95% CI 1.34–1.73). These associations remained significant when controlled for death as a competing risk at 4 years (HR 2.27, 95% CI 1.51–3.42) but not at 13 years (HR 1.14, 95% CI 1.00–1.30). Frailty is associated with dementia but these associations are attenuated over time.

GRIP STRENGTH, SHORT PHYSICAL PERFORMANCE BATTERY, AND ACTIVITIES OF DAILY LIVING (ADL) DEPENDENCE

P.H. Chaves^{1,2}, A. Frisoli³, J. Mora², E.R. Vieira³, Q. Xue⁴,
1. *Benjamin Leon Center for Geriatric Research and Education at Florida International University, Miami, Florida*, 2. *Department of Humanities, Health, and Society; Herbert Wertheim College of Medicine; Florida International University, Miami, Florida*, 3. *Department of Physical Therapy, Nicole Wertheim College of Nursing and Health Sciences, Florida International University, Miami, Florida*, 4. *Center on Aging and Health, Division of Geriatric Medicine and Gerontology, Department of Medicine, Johns Hopkins University, Baltimore, Maryland*, 5. *Cardiogeriatrics Division, Universidade Federal de Sao Paulo, Sao Paulo, SP, Brazil*

Introduction. Grip strength (GS) is an appealing measure mainly considered for sarcopenia/disability screening in lieu of other complex lower-extremity function measures directly reflective of the disability causal pathway (e.g., Short Physical Performance Battery [SPPB]). Contexts in which GS may be clinically useful above and beyond SPPB scores remain to be characterized. We examined the association of GS with incident ADL disability independently from SPPB.

Methods. Prospective study using Rounds 1 and 4 data from the National Health and Aging Trends Study, which enrolled a U.S. representative sample of Medicare beneficiaries 65 years and older. Nursing home subjects were excluded. Logistic regression estimated the odds of incident need for help in ADLs 3 years later as a function of both baseline GS and SPPB.

Results. Lower GS and SPPB scores were both independently associated with incident ADL dependence, as estimated by gender-stratified models including both GS and SPPB, and controlling for demographics, diseases, weight, and previous hospitalization. Per 3 kg higher GS, the adjusted odds of incident ADL dependence incrementally decreased 19.2% (95% CI: 11.5%–26.2%, $p < 0.001$) in women, and 12.5% (95% CI: 6.7%–17.8%, $p < 0.001$). No effect modification by prevalent ADL difficulty or age at baseline was observed.

Conclusion. Low GS might adversely impact ADL dependence risk above and beyond the effect of lower-extremity functioning captured by SPPB. Research assessing the extent to which ADL dependence prevention could be enhanced by intervention strategies concomitantly targeting lower- and upper-extremity function, and using SPPB and GS as tracking outcomes measures is warranted.

PRELIMINARY REPORT OF UNMET NEEDS IN COMMUNITY-DWELLING OLDER PERSONS IN QUEBEC, CANADA

M. Raiche^{2,1,3}, N. Delli Colli^{2,1}, J. Guilbeault³, I. Labrecque⁴, F. Dugas⁴, Y. Couturier^{2,1}, N. Dubuc^{2,5}, 1. *Faculty of Arts, Humanities and Social Sciences, Université de Sherbrooke*,

Sherbrooke, Quebec, Canada, 2. Research Centre on Aging, CIUSSS-Estrie CHUS, Sherbrooke, Quebec, Canada, 3. Sherbrooke Health Expertise Centre, Sherbrooke, Quebec, Canada, 4. Ministry of Health and Social Services, Quebec, Quebec, Canada, 5. Faculty of Medicine and Health Sciences, Université de Sherbrooke, Sherbrooke, Quebec, Canada

In Quebec, Canada, the standardized clinical assessments (quasi-mandatory) of older persons receiving public services are compiled into an integrated software. We conducted a descriptive analysis of disabilities and unmet needs in the population receiving services at home.

The population receiving at least one public service at home during 1 year (04/2014-03/2015) was studied. Disabilities were evaluated with the 29-item SMAF covering ADLs (7 items), mobility (6), communication (3), mental functions (5), and IADLs (8). Each item was scored on a 5-level scale from 0 (independent) and 0.5 (with difficulty) to 3 (dependent). For each disability item, available resources to compensate for it were evaluated and a handicap score representing unmet needs was indicated. The percentage of persons having unmet needs by items was examined.

A total of 129402 users were assessed during the period (80% of the total population). The non-assessed received very few services. Disabilities (score different than zero) were more frequent in IADL disabilities (60–98% of persons for the 8 IADL), followed by ADL (24–85%) and mental functions (37–66%). The unmet needs were globally more frequent in ADL, communication and mental functions. The highest rates of persons with unmet needs were for the items washing with 11.6%, followed by hearing (10.2%), behavior (10.0%), memory (9.9%), walking inside (9.5%) and judgment (8.7%).

While the higher rates of disabilities were IADL as expected, the unmet needs were surprisingly high in items related to ADL and mental functions. Planning of the population future services should address these dimensions in priority.

TIME TRENDS OF ALZHEIMER'S DISEASE: ADDRESSING CONTRADICTIONARY ISSUES

I. Akushevich, A.P. Yashkin, J. Kravchenko, A.I. Yashin, Duke, Durham, North Carolina

Recent research has reported that even though the incidence of Alzheimer's disease (AD) in the U.S. has been decreasing, prevalence of the disease has been increasing over the past 25 years. At the same time, studies based on nationally representative survey data have reported that the rates of cognitive impairment (CI), the natural outcome of AD, have been on the decline. In this study, we identify the reasons behind this ostensible contradiction through analysis of trends in AD-related epidemiologic characteristics. Using data from the Multiple Cause of Death database and the Health and Retirement Study we found that between 1999–2011 AD-specific mortality rate patterns show an annual percent change (APC) of 1.84% for males and 2.62% for females. The prevalence of AD has been increasing at an APC of 2.46% (3.04% for males and 2.32% for females) up to 2010 after which it begins to level off. Over the same time period, CI as measured by the Telephone Interview for Cognitive Status (TICS) shows that the time-trends in CI are highly sensitive to the threshold used to define CI. Under the

usually accepted cut-off score of 8 a decline in the time-trend was detected; however this trend reversed when the cut-off point was varied in either direction. This general pattern held for gender-, race-, and education level-specific analysis. We conclude that there is a high level of heterogeneity in the time-trends of AD and the measures representing CI; this heterogeneity is a strong contributor to the observed contradiction in time-trends.

SESSION 4265 (SYMPOSIUM)

INTERNATIONAL INTERVENTIONS SUGGESTED FOR REDUCING IMUP. IGRIMUP SYMPOSIUM NO. 3

Chair: A. Renom Guiteras, Barcelona, Barcelona, Spain

Co-Chair: M. Wehling, Medical Faculty Mannheim Ruprecht-Karls-University Heidelberg

Discussant: D. Fialová, Charles University, Prague, Czech Republic

This IGRIMUP symposium will discuss some of the methods suggested in our international war against inappropriate medication use and polypharmacy (IMUP) and its applicability. Methods and tools that have been suggested for assessing IMU are usually categorized as explicit (criteria-based) and implicit (judgment-based). Explicit tools usually represent lists of drugs to avoid, or indicators to avoid IMU for several drugs and/or diseases. The first well-known tool is the Beers list, developed in 1991 and updated by the AGS in 2015. In Europe, the START tool was developed to detect prescribing omissions of potentially beneficial drugs, and the STOPP tool as another explicit tool for screening IMU. Both have been updated in 2015. The Beers and START/STOPP methods are discussed by the figures leading these methods (IGRIMUP members) elsewhere in this conference. However, there are unsuccessful attempts to achieve global consensus for the Beers criteria and most other "Country specific Lists" that have been developed. This led several IGRIMUP members to assume that "drugs-to-avoid" criteria are insufficiently accurate to use as stand-alone measures of prescribing quality. Implicit Tools take into consideration both data from research and clinical circumstances as well as incorporating/recognizing preferences of the individual patient to judge drug appropriateness.

This symposium also address the FORTA (fit FOR The Aged) intervention and the PRIMA-eDS electronic support system project. The discussion will concentrate on the applicability of several explicit and implicit tools and compare their efficacy in assessing IMUP.

THE INFLUENCE OF THE FORTA INTERVENTION ON DRUG THERAPY IN HOSPITALIZED ELDERLY PATIENTS

M. Wehling¹, H. Burkhardt², H. Frohnhofen^{3,4}, F. Pazan¹,

1. Medical Faculty Mannheim Ruprecht-Karls-University Heidelberg, Mannheim, Germany, 2. IV. Medical Clinic (Geriatrisches Zentrum) University Hospital Mannheim, Mannheim, Germany, 3. Essen-Mitte Hospital, Knappschafts Hospital, Teaching Hospital at the University of Duisburg in Essen, Essen, Germany, 4. Faculty of Health, University of Witten-Herdecke, Witten, Germany

The absence of data regarding the efficacy and safety of many drugs for use in the elderly has been a major issue.

The FORTA categorization (A: Absolutely; B: Beneficial; C: Careful; D: Don't) was proposed as an aid for improving the appropriateness of pharmacotherapy in the elderly. To evaluate the usefulness of FORTA we conducted a prospective randomized trial (n=409). We determined the alterations in medication and over- and under-prescription rates between admission and discharge. Both over- and under-treatment were improved in the FORTA group as compared to the control group ($p < 0.0001$). In this study, we are going to identify the drugs which were the major determinants for the observed alterations and analyze the overall use of therapeutic groups in our cohort. Based on our results, FORTA is the first combined positive/negative labelling approach at the individual drug level which indeed ameliorates the drug treatment of the elderly.

THE PRIMA-EDS ELECTRONIC DECISION SUPPORT TOOL FOR POLYPHARMACY: A MULTINATIONAL EUROPEAN PROJECT

A. Renom Guiteras^{1,2}, I. Kunnamo³, D. Reeves⁴, J. Hoeck⁵, G. Piccoliori⁶, T. Johansson⁷, A. Soennichsen¹, 1. *Institute of General Practice and Family Medicine, Faculty of Health, Witten/Herdecke University, Witten, Germany*, 2. *University Hospital Parc de Salut Mar, Department of Geriatrics, Barcelona, Spain*, 3. *Duodecim Medical Publications Ltd, Helsinki, Finland*, 4. *Centre of Primary Care, Institute of Population Health, University of Manchester, Manchester, United Kingdom*, 5. *Institute of General Practice, Rostock University Medical Center, Rostock, Germany*, 6. *South Tirolean Academy of General Practice, Bolzano, Italy*, 7. *Institute of General Practice, Family Medicine and Preventive Medicine, Paracelsus Medical University, Salzburg, Austria*

The PRIMA-eDS study (FP7-Health-2012-Innovation-1-2.2.2.-2; grant agreement no 305388-2) is a randomized controlled trial underway in four European countries (Austria, Germany, Italy, United Kingdom). The aim is to develop and validate an electronic decision support system, the Comprehensive Medication Review (CMR) tool, for use by practicing physicians and nurses to reduce inappropriate prescriptions in older people. The EBMeDS clinical decision support system developed by Duodecim Medical Publications Ltd. (DMP) was used as the platform. To inform the CMR a series of systematic reviews were conducted leading to the development of 46 recommendations covering 17 drug classes. These were combined with existing decision support rules on medication reduction and safety produced by DMP, and drug databases developed by Medbase Ltd. (Finland). The tool receives coded patient data from a case report form and produces a report of the medication review. The potential clinical benefits of the CMR tool are being evaluated.

COMPARING THE EXPLICIT TOOLS VS. IMPLICIT EVALUATION AMONG TURKISH GERIATRIC OUTPATIENTS

G. Bahat¹, B. Ilhan¹, I. Bay¹, S. Avcı², F. Tufan¹, C. Kilic¹, M. Karan¹, 1. *Istanbul University Istanbul Medical School, Istanbul, Turkey*, 2. *Istanbul University Cerrahpasa Medical School, Istanbul, Turkey*

To reduce potentially inappropriate medication (PIM) use in the older adults, the explicit (criteria-based) tools and the implicit (judgment-based) tools are suggested. The reasons why multidisciplinary geriatric teams decide not to follow STOPP criteria have been studied scarce. We aimed to compare an explicit tool (STOPP) with the implicit comprehensive geriatric evaluation among the Turkish geriatric outpatients thereby analyzing the compliance with the recommendations of the STOPP criteria in older inpatients and the reasons underlying the non-compliance. Older patients (>65-years) admitted to outpatient clinic of a university hospital between June 2000-June 2014 were retrospectively and randomly evaluated for PIM with STOPP version 2 criteria and implicit geriatric evaluation on admission. We analyzed how many STOPP recommendations were accepted by the team, and if they were not accepted, the reasons are identified. We will present the results among a total of n=200 subjects.

CRITERIA-BASED VS. JUDGMENT-BASED TOOLS FOR APPROPRIATE PRESCRIBING—HOW TO CHOOSE?

D. Garfinkel, *Homecare Hospice & Geriatric-Palliative Service, Israel Cancer Association & Wolfson Medical Center &, Bat - Yam, Israel*

Professionals wishing to de-prescribe should first decide what means of fighting IMUP to choose. Tools to assess/fight IMUP may be explicit, criteria-based or implicit, judgment-based. For explicit lists of “drugs to avoid” (Beers, many “country specific lists”) global consensus will probably never be achieved. Implicit tools (eg. MAI, PATH, Garfinkel) take into consideration both data from research and clinical circumstances incorporating individual patient's preferences to judge drug appropriateness. Knowledge gaps are increasing and positive benefit/risk ratios for all drugs are decreasing/inverted in correlation to old age, comorbidity, dementia, frailty, limited life expectancy (VOCODFLEX). Heterogeneity in these subpopulations is huge; traditional statistical/computers' aids are useless. Doctors' unawareness of their knowledge gap represents high levels of risk for patients. Patients centered approach re-evaluating each drugs is preferable. As Polypharmacy is the main IMU predictor, Garfinkel method advocates simultaneous Poly-de-prescribing with patient/family consent; The anticipated improvement of IMUP symptoms may be relatively fast.

SESSION 4270 (SYMPOSIUM)

A CHINESE HOME CARE MODEL FOR FRAIL ELDERLY INTEGRATING GERIATRICS, HOME SERVICE, AND TECHNOLOGY

Chair: S. Leng, *Johns Hopkins University School of Medicine, Baltimore, Maryland*

Co-Chair: X. Liu, *Peking Union Medical College Hospital, Beijing, China*

Discussant: J.B. Halter, *University of Michigan*

As the oldest old and frail subset of older adult population grows most rapidly worldwide, quality and effective home care is essential for the assessment, prevention and treatment of medical, functional and behavioral problems commonly encountered in these vulnerable individuals, ensuring

successful aging in place. Through international collaboration and team work of geriatricians, home service providers and technology industry, we have developed an innovative home care model integrating geriatric medicine including frailty assessment, home service and technology serving metropolitan Beijing, China. After attending this symposium, participants will be able to learn and define: 1) critical components of this model; 2) application of advanced digital technology for off-site assessment and consultation and; 3) the importance of frailty assessment and research for risk stratification and targeted intervention; and 4) innovative approach for geriatrics interdisciplinary team working collaboratively with home service industry and technology. Geriatrics interdisciplinary team at Peking Union Medical College Hospital in collaboration with that at Johns Hopkins University provides geriatrics care. Geriatrics Center at Hua-xi Hospital collaborates on frailty assessment and research. Pinetree Care Group provides home services. Little Fish at Home (a.k.a. iNemo)[®] is a computer-based advanced digital technology (companion robot) that provides high definition audio/video remote connection between geriatrics care providers and patient/staff members at patient's home. While we continue to optimize its operation and assess the effectiveness, it is important to disseminate this innovative care model that will help improve the health and quality of life for frail older adults at home and reduce healthcare cost.

INTERNATIONAL COLLABORATION FOR GERIATRICS AND HOME CARE MODEL DEVELOPMENT IN CHINA

S. Leng¹, M. Bellantoni¹, M. McNabney¹, T. Finucane¹, W. Greenough¹, L.P. Fried², S. Durso¹, 1. *Division of Geriatric Medicine and Gerontology, Department of Medicine, Johns Hopkins University School of Medicine, Baltimore, Maryland*, 2. *Mailman School of Public Health, Columbia University, New York, New York*

China has the world's largest aging population that grows at a staggering rate. For example, the number of adults aged 80 years and over, the oldest and frail subset of the aging population currently grows at 1 million per year. Thus, the need for quality geriatrics and innovative care model development is unprecedented. Initially funded by the China Medical Board in 2006, the Division of Geriatric Medicine and Gerontology at Johns Hopkins University (JHU) has developed international collaboration with Peking Union Medical College (PUMC) and established a premier academic geriatrics program with an interdisciplinary geriatrics care team at PUMC Hospital. This international collaboration and other efforts have led to the funding from the Milstein Medical Asian American Partnership Foundation for the development of the innovative home care model program described in this symposium. The experiences and valuable lessons learned from such international collaboration will also be discussed during the presentation.

THE ROLE OF GERIATRICS INTERDISCIPLINARY TEAM IN HOME CARE FOR THE FRAIL ELDERLY IN BEIJING, CHINA

X. Liu, M. Zhu, L. Kang, *Department of Geriatrics, Peking Union Medical College (PUMC) Hospital, Beijing, China*

Healthcare for community-dwelling seniors in China is still disease-centered, with geriatric issues being largely neglected. Supported by the Irma and Paul Milstein Program for Senior Health of the Milstein Medical Asian American Partnership (MMAAP) Foundation, the Department of Geriatrics at Peking Union Medical College (PUMC) Hospital, together with Pinetree Care Group and Johns Hopkins University, has developed an innovative home care model that integrates geriatrics, community/home services, and computer-based digital technology. In this continuous home care model, the PUMC Hospital interdisciplinary team provides various geriatrics training for community/home service staff members, conducts real time clinical assessment and monitoring via computer-based digital technology called "Little Fish at Home", and develops personalized intervention plans for frail seniors at their home. The PUMC Hospital geriatric team plays a leading and integral role in ensuring quality and promoting geriatrics care in for frail older adults living in the community.

FRAILTY RESEARCH IN CHINA AND ROLE OF FRAILTY ASSESSMENT IN HOME CARE

B. Dong¹, N. Ge¹, D. Xiang¹, P. Du², 1. *The Center of Gerontology and Geriatrics at West China Hospital, Sichuan University, Chengdu, China*, 2. *Renmin University of China, Beijing, China*

Frailty is an important clinical syndrome highly prevalent among individuals aged 80 years and older. It is characterized by decreased physiologic reserve and increased vulnerability to stressors, leading to severe adverse health outcomes. The most widely utilized instruments for frailty assessment include Fried's frailty phenotype and Rockwood's frailty index. Because of serious medical, functional, psychobehavioral, and socioeconomic impact of frailty on older adults, it is imperative to understand its pathogenesis through frailty research so that interventional strategies can be developed. At the same time, frailty assessment is useful for risk stratification that helps identify those who need clinical intervention and monitoring. This is particularly important in the development of effective home care model as it will guide targeting limited resources to the most vulnerable older adults. We will provide an overview of frailty research in China and application of frailty assessment in this innovative home care model for Chinese seniors.

THE ROLE OF HOME SERVICE AND TECHNOLOGY IN HOME CARE FOR FRAIL OLDER ADULTS IN METROPOLITAN BEIJING

N. Wang, *Pinetree Care Group, Beijing, China*

The Pinetree Care Group, established in 2004, aims to provide restorative healthcare services for community-dwelling frail Chinese seniors. As the need of the oldest old and frail subset has increasingly become more complex, we have expanded our services to provide home visits by professional caregivers in urban and suburban parts of Beijing, Shanghai, Jiangsu and Guandong provinces. Geriatric services have been integrated since 2013 under the supervision of Department of Geriatrics at PUMC Hospital, a model of continuous home care for seniors. Application of the computer-based digital technology (companion robot) called "Little Fish at Home (a.k.a. iNemo)[®]" that provides high-resolution audio/video

remote connection between caregivers and patient/family/staff members at patient's home has made remote geriatric consultation possible, which will be demonstrated during the presentation. We continue to optimize its operation and expand this model to serve seniors in other parts of China, especially in remote areas where resources are scarce.

SESSION 4275 (PAPER)

FACTORS ASSOCIATED WITH FALL RISK

CLINICAL OSTEOARTHRITIS OF THE KNEE AND HIP ARE ASSOCIATED WITH AN INCREASED FALL RISK

N.M. van Schoor¹, P. Lips², D.J. Deeg¹, 1. *Department of Epidemiology and Biostatistics, VU University Medical Center, Amsterdam, Netherlands*, 2. *Department of Internal Medicine, VU University Medical Center, Amsterdam, Netherlands*

Osteoarthritis (OA) has been shown to be associated with decreased physical function and may therefore lead to an increased fall risk. The objective of this study was to examine whether clinical OA of the knee and hip are related to an increased fall risk in the general population.

Baseline and follow-up data from the European Project on Osteoarthritis (EPOSA) were used involving pre-harmonized data from five European population-based cohort studies (ages 65–85). Clinical OA was defined according to the American College of Rheumatology (ACR) criteria. At 1-year follow-up, falls were assessed using retrospective self-reports (n=2201).

The prevalence of knee OA was 19.2%; the prevalence of hip OA was 6.1%. During follow-up, 15.6% of the participants fell one time, and 8.1% fell two times or more. After adjustment for confounding, clinical knee OA was associated with recurrent falls (OR=1.5; 95% CI: 1.1–2.2), but not with falls (OR=1.2; 95% CI=0.9–1.5). Clinical hip OA was associated with falls (OR=1.5; 95% CI=1.0–2.2), but not with recurrent falls (OR=1.5; 95% CI: 0.9–2.7). Using multinomial regression analyses, a significant association for two or more falls versus no falls for persons with clinical knee OA versus controls was observed (OR=1.5; 95% CI: 1.0–2.2). No significant associations were observed for single falls versus no falls.

In conclusion, persons with clinical knee and hip OA had an increased risk for falls, but not for single falls. Attention should be paid to the prevention of falls in persons having clinical OA.

FALLERS AND CORTICAL BRAIN VOLUMES: CROSS-SECTIONAL ANALYSIS IN COGNITIVELY HEALTHY OLDER ADULTS

O. Beauchet¹, G. Allali³, J. Verghese², 1. *Medicine, McGill University, Montreal, Quebec, Canada*, 2. *Albert Einstein College of Medicine, New York, New York*, 3. *Geneva University, Geneva, Switzerland*

Fall is a consequence of gait instability. Cortical and subcortical abnormalities have been associated with gait instability but not yet with fall. This study aims to compare the global and regional brain subvolumes between healthy fallers and non-fallers. A total of 77 healthy older individuals

(23 fallers and 54 non-fallers, 69.8 ± 3.5 years; 45.5% female) were included in this study using a cross-sectional design. Based on an *a priori* hypothesis, the following brain subvolumes were quantified from three-dimensional T₁-weighted MRI using FreeSurfer: total white matter abnormalities, total white matter, total cortical and subcortical gray matters, hippocampus, motor cortex, somatosensory cortex, premotor cortex, prefrontal cortex and parietal cortex. Age, sex, body mass index, comorbidities, use of psychoactive drugs, far-distance vision, lower-limb proprioception, depressive symptoms and cognitive scores (Mini-Mental State Examination, Frontal Assessment Battery) were used as covariates. Multiple logistic regressions showed that subvolumes of the somatosensory cortex ($P < 0.042$) and the hippocampus ($P < 0.042$) were increased in fallers compared to non-fallers, even after adjustment for clinical and brain characteristics. The greater subvolumes of somatosensory cortex and hippocampus reported in fallers compared to non-fallers suggest a possible brain compensatory mechanism involving spatial navigation and integration of sensory information.

TIME AND ACTIVITY-NORMALIZED FALL RATES IN GLAUCOMA

P. Ramulu, A. Mihailovic, L.N. Gitlin, S. West, D. Friedman, *Ophthalmology, Johns Hopkins Medical Center, Baltimore, Maryland*

Fall risk factors are typically shown as rate ratios, with rates calculated as the ratio of documented falls over months/years of follow-up. However, many factors which increase fall risk are also associated with activity restriction, and may lower one's exposure to falls. Two-hundred forty-four patients with a range of visual field (VF) loss from glaucoma completed fall calendars to determine the association of VF loss severity (and other patient features) with fall rates over: (1) time, and (2) steps taken (inferred from annual 1 week accelerometry trials). The cumulative probability of falling was 0.45 among study participants. More severe VF loss was not associated with a higher rate of falls/year (RR=1.06 per 5 dB decrement in VF sensitivity, $p=0.45$), but was associated with a higher rate of falls/step (RR=1.18 per 5 dB decrement in VF sensitivity, $p=0.03$). Likewise, older age was associated with a higher rate of falls/step ($p < 0.001$), but not with a higher rate of falls/year ($p=0.28$). Men did not differ from women with regards to their rate of falls/year ($p=0.16$), but were noted to have fewer falls/step ($p=0.02$). Finally, African-Americans were noted to have fewer falls/year ($p=0.02$) as compared to Whites, but did not differ with regards to their rate of falls/step ($p=0.42$). Our results suggest that evaluating fall rates simply as rates over time can incompletely characterize risk factors for falls. Future research should strongly consider employing activity measures in order to characterize risk factors for falls normalized to both time and activity.

FALLS RISK-PREDICTION FOR OLDER INPATIENTS: NEW APPROACH

O. Beauchet, *Medicine, McGill University, Montreal, Quebec, Canada*

The study aims to examine performance criteria (i.e.; sensitivity, specificity, positive predictive value, negative predictive value and accuracy) for fall prediction resulting from a nurse assessment and an artificial neural networks (ANNs)

analysis in older inpatients hospitalized in acute care medical ward. A total of 848 older inpatients (mean age \pm standard deviation, 83.0 ± 7.2 years; 41.8% female) admitted to acute care medical wards in Angers University hospital (France) were included in this study using an observational prospective cohort design. Within 24 hours after admission of older inpatients, nurses performed a bedside clinical assessment. Participants were separated into non-fallers and fallers. Fallers were participants with one or more falls during their hospitalization. The analysis was conducted using three feed forward ANNs (multilayer perceptron [MLP], averaged neural network and neuroevolution of augmenting topologies [NEAT]). Seventy three (8.9%) participants fell at least once during their hospital stay. The specificity was high, regardless of which ANN was used, and the highest value reported was with MLP (99.84%). In contrast, sensitivity was lowest, with values ranging between 98.4 to 14.8%. MLP had the highest accuracy (99.7). Performance criteria for fall prediction resulting from a bedside nursing assessment and an ANNs analysis was associated with high specificity, but low sensitivity, suggesting that this combined approach should be used more as a diagnostic test than a screening test when considering older inpatients in acute care medical ward.

A STUDY OF EXECUTIVE FUNCTION (EF) AND PROSPECTIVE FALL RISK IN COMMUNITY-DWELLING OLDER ADULTS

C. Smith^{2,1}, C. Bula^{2,1}, H. Krief², L. Seematter-Bagnoud³, B. Santos-Eggimann³, 1. *Université de Lausanne, Lausanne, Vaud, Switzerland*, 2. *University of Lausanne Medical Center, Lausanne, Vaud, Switzerland*, 3. *IUMSP, Lausanne, Vaud, Switzerland*

Background: Recent findings suggest that older people with executive function (EF) impairment have an increased risk of fall. Prospective evidence with a long follow-up is however lacking.

Objective: To examine 1) whether EF impairment at baseline predicts fall over a 6-year follow-up; and 2) whether a potential dose-response relationship exists between EF impairment and the risk of falling at 6-year of follow-up.

Methods: Community-dwelling older adults (N=906, mean age 69 ± 1.4 , women 59.8%) were followed between 2005 and 2011 with measures of executive function: clock drawing test (CDT), verbal fluency (VF), TMT A and B and ratio (TMT B-A/A). Falls were collected prospectively using monthly calendars in 2011.

Results: At baseline, 5.5% were cognitively impaired (MMSE \leq 24), and 17.9% had abnormal CDT (score \leq 7). In 2011, 13% fell one time without injury and an additional 20.2% had multiple or injurious falls. In multivariable regression analysis, poor EF was significantly associated with reporting one non-injurious fall ($RR_{\text{worst quintile of TMTB}} = 0.43$, 95% CI=0.22–0.85, $p=0.015$); ($RR_{\text{worst quintile of ratioTMTB-AA}} = 0.37$, 95% CI 0.18–0.74, $p=0.005$). There was no significant association between poor EF and multiple/injurious falls, showing no dose-response relationship. Cognitive profiles of non-fallers and multiple/injurious fallers were very similar.

Conclusions: In this study, EF impairment at baseline did not predict future fall risk. Further investigations will examine whether the decline in EF increases fall risk during follow-up.

SESSION 4280 (PAPER)

FACTORS AFFECTING PHYSICAL ACTIVITY IN OLDER PERSONS

SITTING TIME IN OLDER ADULTS WITH AND WITHOUT ALZHEIMER'S DISEASE

A. Watts², P. Gardiner², M. Garnier-Villarreal³, 2. *University of Kansas, Lawrence, Kansas*, 2. *University of Queensland, Brisbane, Queensland, Australia*, 3. *Marquette University, Milwaukee, Wisconsin*

Older adults spend 65–80% of waking time sitting. Independent of physical activity, daily sitting time is a risk factor for poor glycemic control and type 2 diabetes which are inexorably linked to Alzheimer's disease (AD). Few studies have evaluated sitting in individuals with AD. In 100 older adults with (n=47) and without mild AD (n=53), we measured sitting posture using the ActivPAL™ postural monitor, worn on the thigh, over one week. Our aim was to characterize differences between groups with and without AD. The monitors estimated 64% of waking hours spent sitting, which did not differ by AD status. Although postural monitor estimates did not significantly differ by dementia status in the average number of hours per day of spent sitting (M(SD)= 9.7(1.5) AD vs. 9.4(2.3) controls), the AD group had significantly more daily bouts of sitting for durations of longer than 30 minutes (M(SD)=5.67(1.35) AD vs. controls (M(SD)=5.00 (1.58), $t(83)=-2.04$, $p<.05$). Those without AD, on average, transitioned from sitting to standing 6 more times per day than those with AD. Physiological and behavioural changes in AD may affect sitting bout duration even if the total amount of time spent in sitting does not change. Previous intervention research in non-cognitively impaired older adults suggest that reducing the duration of sitting bouts can have beneficial effects on glycemic control and insulin sensitivity. More research is needed to determine whether interventions to modify prolonged sitting is feasible and effective in people with AD.

EFFECTS OF A NEW COMPUTERIZED MOTOR-COGNITIVE MEMORY TRAINING IN OLDER PERSONS

K. Hauer, M. Günther, C. Werner, *AGAPLESION Bethanien Hospital, Geriatric Center at the University of Heidelberg, Heidelberg, Germany*

Decrease in memory performance and executive functions represent early markers of age-associated cognitive decline or neurodegenerative disorders while procedural memory is sustained.

The purpose of this randomised controlled trial (RCT) was to examine the effect of a newly developed computer-based memory training program (Physiomat®) using procedural memory support in older persons.

Patients (n=50, mean age: 78.8 ± 7.0) without cognitive impairment (MMSE 28.1 ± 1.7) took part in the RCT. The intervention group (IG: n=28) performed a computer-based motor-cognitive training including complex, machine-based balance tasks related to a memory tasks with and without procedural support presented at a computer display. The control group (CG, n=22) performed an unspecific exercise

program. Task without and with procedural support were tested at different performance levels for test duration and total number of conditions (total score).

Compared to the CG the IG significantly improved in 2 out of 4 conditions (total score: $p=0.002$, level 3: $p=0.001$, with a trend in level 2 [$p=0.09$] and 4 [$p=0.08$], effect sizes, η^2 ranging from 0.07–0.26) for the task without procedural support. With procedural support the IG improved in one out of two (level 2: $p<0.001$, $\eta^2=0.36$; level 3: $p=0.10$, $\eta^2=0.12$) but not in total score. Significant training gains sustained 3 months after training cessation. Increasing test complexity reduced number of participants thus decreasing statistical power.

Training increased complex motor cognitive performances related to dynamic balance and memory in cognitively intact older persons independent from procedural support. Test challenges seemed sensitive to detect early memory deficits during dual tasking.

TEMPORAL RELATIONSHIP BETWEEN PHYSICAL ACTIVITY, EXERCISE INTENSITY, AND MORTALITY IN OLDER MEN

B. Hsu^{1,3,4}, D. Merom², F. Blyth¹, V. Naganathan¹, D. Handelsman^{1,4}, R. Cumming^{1,3,4}, 1. *University of Sydney, Sydney, New South Wales, Australia*, 2. *Western Sydney University, Sydney, New South Wales, Australia*, 3. *ARC Centre of Excellence in Population Ageing Research, Sydney, New South Wales, Australia*, 4. *ANZAC Research Institute, Sydney, New South Wales, Australia*

Background: The objective was to examine the temporal relationship between changes in total physical activity, exercise intensity, muscle training, exercise duration and walking speed across three time-points with all-cause, cardiovascular and cancer-specific mortality in older men.

Methods: Community-dwelling men aged 70 years and older from the CHAMP study were assessed at baseline (2005–2007, $n=1705$), 2-years ($n=1367$) and 5-years follow-up ($n=958$). At all three time-points, physical activity was measured by the validated, self-administered PASE questionnaire and walking speed was measured over a 6 meter walk. Mortality was ascertained through the state death registry with a median follow-up of 7-years. Statistical modeling was by GEE with Poisson regression which is robust with missing data and loss to follow-up.

Results: In univariate analyses, the relative risk for the decline in one SD in PASE scores over the three study time-points was 1.66 (95%CI:1.49–1.85) for all-cause, 1.98 (95%CI: 1.69–2.33) for cardiovascular and 1.19 (95%CI: 1.02–1.38) for cancer mortality. These associations remained statistically significant in multivariate-adjusted models with all-cause and cardiovascular, but not cancer mortality. Furthermore, men undertaking strenuous exercise have 40% risk reduction in dying when compared to men with no exercise. For temporal increase in walking duration (hr/day), in both univariate and multivariate-adjusted models, statistically significant associations was observed with all-cause (RR:0.88, 95%CI:0.78–0.98) and cardiovascular (RR:0.79, 95%CI:0.65–0.96), but not cancer mortality. Increases in walking speed over the three time-points were associated with strong decrease in relative risk; 0.18 (95%CI:0.11–0.29) for all-cause, 0.11 (95%CI:0.05–0.22) for cardiovascular and 0.34 (95%CI:0.17–0.68) for cancer mortality.

Conclusions: Our findings suggest that older men who engaged in strenuous exercise and maintain or increase their walking duration and speed have lower the risk on incidence of all-cause, cardiovascular or cancer-specific mortality.

HEMOGLOBIN AND PHYSICAL FUNCTION AFTER EXERCISE INTERVENTION AMONG COMMUNITY DWELLING OLDER ADULTS

A. Ramel², M. Chang Gudjonsson^{1,3}, O. Geirsdottir², I. Thorsdottir², P.V. Jonsson^{1,2}, 1. *The Icelandic Gerontological Research Center, Landspítali University Hospital, Reykjavik, Iceland*, 2. *University of Iceland, Reykjavik, Iceland*, 3. *Reykjavik University, Reykjavik, Iceland*

Background: Hemoglobin facilitates oxygen transport in blood but its concentrations decrease frequently with age. The aim was to investigate whether hemoglobin concentrations predict physical function in community dwelling old adults.

Design: Intervention study.

Setting: Community.

Participants: Old adults ($N = 236$, 73.7 ± 5.7 years, 58.2% female).

Intervention: Twelve-week resistance exercise program (3 times/week; 3 sets, 6–8 repetitions at 75–80% of the 1-repetition maximum) designed to increase strength and muscle mass of major muscle groups.

Measurements: Body composition, muscular strength, timed up and go test (TUG in sec), six-minute walk for distance (6MWD in m) and blood chemical variables were measured at baseline, endpoint and after 10.7 months follow-up.

Results: The minority of around 4% of the participants was anemic. According to linear models baseline hemoglobin predicted TUG (0.14 to 0.36 sec improvement for an increase of hemoglobin by 10g/L) at all three time points, although this was of borderline significance for baseline ($P=0.57$) and endpoint ($P=0.062$). Hemoglobin predicted also endpoint 6 MWD (4.88m), but not at baseline (follow up 6 MWD was not available). Inclusion of compliance did not affect outcomes.

Conclusions: Hemoglobin is positively associated with physical function in old adults although only the minority or around 4% of the participants was anemic. Further, we found that baseline hemoglobin predicts responses to a 12-week resistance exercise training and subsequent changes in physical function after a period of follow-up. Compliance to exercise training does not explain these findings.

DOES LEAN RED MEAT ENHANCE THE EFFECTS OF EXERCISE ON MUSCLE HEALTH AND FUNCTION IN THE ELDERLY?

R.M. Daly¹, M.B. Formica¹, J. Gianoudis¹, K. Ellis², S. O'Connell¹, C. Nowson¹, 1. *Institute for Physical Activity and Nutrition, Deakin University, Melbourne, Victoria, Australia*, 2. *University of Melbourne, Melbourne, Victoria, Australia*

A combination of progressive resistance training (PRT), dietary protein (≥ 1.2 g/kg/d) and vitamin D (≥ 800 IU/d) are recommended to optimize muscle health and function in the elderly. Current Australian guidelines recommend 100–200g (raw weight) portion sizes of red meat, 3–4 times a week as

part of a healthy, balanced diet. Thus, the aim of this 24-week RCT was to evaluate whether lean red meat consumed on three training days per week could enhance the effects of a multi-modal exercise program on muscle health and function in the elderly. Community-dwelling adults ($n=154$) aged 65+ years (mean \pm SD 71 \pm 4) were randomised to Ex (PRT, aerobic and mobility training) plus red meat [2x110g portions (raw weight) cooked at lunch and dinner on each of the three training days] or Ex+pasta/rice. All participants received 1000 IU/d vitamin D3. 145 (94%) participants completed the study. Compliance with the meat and carbohydrate foods averaged 87% and 91%, respectively. Exercise compliance was similar between groups (~79%). After 24-weeks both groups experienced similar significant gains in femur muscle size (pQCT), leg strength and function (sit-to-stand and four-square step test), but those in the Ex+meat group experienced greater benefits in terms of appendicular lean mass (net benefit 0.2 kg), gait speed (0.06 m/s) and femur muscle density (marker of intramuscular fat) (all $P<0.05$). In conclusion, this study indicates that combining a multi-modal exercise program with the recommended portions of lean red meat three day per week can enhance the effects of exercise on muscle health and function in the elderly.

SESSION 4285 (SYMPOSIUM)

USING REALIST INQUIRY TO UNDERSTAND HEALTH CARE DELIVERY TO CARE HOMES—THE OPTIMAL STUDY

Chair: J. Meyer, *City University London*

Realist inquiry is a theory-driven approach to evaluation. It builds an understanding of real world phenomena that, by describing contexts and mechanisms explores the underlying multiple causal processes which are associated with particular outcomes in a population of interest. It allows understanding of complex systems in the real-world in a way that experimental methodologies do not. This symposium will describe a three-year programme to understand how health care is delivered to long-term care recipients living in UK care homes. In the UK there multiple, largely untested, ways that health care support is provided to care homes. We will describe an initial phase of work comprising a collation of national surveys and a scoping of the literature about current healthcare delivery in UK care homes, followed by stakeholder interviews and a realist review of the evidence to establish a programme theory positing the contexts and mechanisms that are associated with better health outcomes. These were then further explored in a 12 month study comprising case studies across 3 separate UK regions, 12 care homes and 242 residents which collated data on healthcare resource utilisation and costs, alongside a detailed interview study collating data on how healthcare was delivered, by whom and under what circumstances. Core recommendations focus on how continuity of care is established, the central role of effective primary medical care, recognising the importance of engaging with care homes at an institutional level and permissive models of commissioning which provide

health and social care practitioners with a legitimate space within which to establish optimal models of working.

AN INTRODUCTION TO REALIST APPROACHES IN THE EVALUATION OF CONTEXT-DEPENDENT INTERVENTIONS

C. Goodman¹, A. Gordon², S. Davies¹, M. Zubair², M. Handley¹, J. Schneider², J.R. Gladman², T. Denning², 1. *University of Hertfordshire, Hatfield, United Kingdom*, 2. *University of Nottingham, Nottingham, United Kingdom*

This session serves as an introduction to the symposium by providing a description of realist methodology. This is a theory-driven approach to evidence-review and evaluation, which seeks to explain why interventions work by identifying underlying mechanisms that can elucidate how outcomes are obtained and how contexts influence this process. Outcomes (O) are measurable and tangible effects of an intervention, mechanisms (M) are the generative forces that lead to outcomes and contexts (C) are background conditions that trigger or modify the behaviour of a mechanism. Realist methods can use data from literature alongside novel qualitative and quantitative data to understand these phenomena. The objective is to generate a mid-level Programme Theory specifying CMO relationships at a level of abstraction that allows transferability to other settings without claiming universality. This symposium will present examples of these concepts in action in a study of health care delivery in UK long-term care homes.

DEVELOPING A PROGRAMME THEORY OF HEALTH CARE IN UK CARE HOMES—REVIEWS, SURVEYS, AND INTERVIEWS

A. Gordon⁶, C. Goodman¹, S. Davies¹, M. Handley¹, S. Iliffe², C. Bowman³, C. Victor⁴, F. Martin⁵, 1. *University of Hertfordshire, Hatfield, United Kingdom*, 2. *University College London, London, United Kingdom*, 3. *City University London, London, United Kingdom*, 4. *Brunel University London, London, United Kingdom*, 5. *Kings College London, London, United Kingdom*, 6. *University of Nottingham, Nottingham, United Kingdom*

We aimed to develop a programme theory of health care delivery to UK care homes. A review of 15 surveys of care home health services completed since 2008 found working relationships lacking in structure and purpose and wide variation in provision of healthcare services. 58 stakeholder interviews with health and social care managers, providers, commissioners and regulators identified 3 overlapping approaches to health care in care homes: investment in relational working to foster continuity; provision of age-appropriate clinical services; and governance arrangements using incentives. A realist literature review identified important contextual factors as: care home readiness to work with health care staff; availability of structured assessment and care plans; involvement of health care staff to support learning; organisational endorsement of collaborative working; financial remuneration; and staff incentives. These findings acted as the focus of case studies in phase 2 of the study.

REFINING THE PROGRAMME THEORY CASE STUDIES IN CARE HOMES FROM THREE DISCRETE CARE ECONOMIES

A. Gordon¹, C. Goodman², S. Davies², M. Zubair¹, A. Mayrhofer², B. Bell¹, J. Jordan³, H. Gage³, 1. *Division of Medical Sciences and Graduate Entry Medicine, University of Nottingham, Derby, Derbyshire, United Kingdom*, 2. *University of Hertfordshire, Hatfield, United Kingdom*, 3. *University of Surrey, Guildford, United Kingdom*

To further develop the programme theory, three geographically discrete areas were identified with models of health care emphasising respectively: expertise in care of older adults organised around the care home; incentive-driven care using general practitioners (GPs) as co-ordinators; and mixed provision typical of usual UK care delivery. 242 residents from 12 care homes had baseline health status described using the InterRAI-LTC and their healthcare resource use and associated costs over 12 months collated. Interviews and focus groups with 181 health and social care professionals, residents and families described the care received. Healthcare costs per resident were greatest where provision was ad hoc and mixed. GP contacts and costs were greater where incentives emphasised GP contact. The most positive accounts were of models which recognised the pivotal role of homes in healthcare delivery, supported effective relational working between health and social care staff and allowed GPs to focus on medical care.

A SYNTHESIS: WHAT WORKS TO DELIVER OPTIMAL HEALTH OUTCOMES FOR UK CARE HOME RESIDENTS

C. Goodman², A. Gordon¹, S. Davies², A. Mayrhofer², M. Zubair¹, T. Denning¹, J. Meyer³, 1. *University of Nottingham, Nottingham, United Kingdom*, 2. *University of Hertfordshire, Hatfield, United Kingdom*, 3. *City University, London, United Kingdom*

The detailed reviews, interviews and subsequent longitudinal case studies structured around a unifying realist analytical framework allowed us to establish a theory of commissioning for health care provision to care homes which proposes health services will work better when: staff are explicitly tasked to work with care homes at an institutional level as well as individual residents; healthcare and care home staff are empowered to co-design their working models; where explicit expertise in dementia care is available; the role of GP as a medical care provider is supported by access to a wider array of services; and they incorporate care management. There was no evidence from our study that a short term focus on avoiding admissions to acute hospitals from care homes added any value to service specification or care delivery.

SESSION 4290 (PAPER)

IMPROVING CARE IN MINORITY AND DIVERSE POPULATIONS

HYPERTENSION MANAGEMENT BY OLDER SLAVIC IMMIGRANT WOMEN IN THE UNITED STATES

C.R. Van Son¹, O. Stasyuk², 1. *College of Nursing, Washington State University, Vancouver, Washington*, 2. *Ivan Franko National University, Lviv, Ukraine*

Older immigrants have a disproportionately higher incidence of hypertension (HTN) compared to their American-born counterparts. They experience frequent illness exacerbations and acute care utilization due to uncontrolled HTN. Interviews were conducted with a convenience sample of 25 older Slavic immigrant women with HTN. The analysis focused on describing the beliefs and behaviors surrounding HTN management decisions. A four-stage circular process emerged: 1) **Identification** of HTN symptoms (“feel bad” and/or headache); 2) **Assessment** of blood pressure (taking a blood pressure reading or recall of prior experiences); 3) **Intervention Initiation** (folk remedies used first) such as: a) herbs (rosehips, yarrow, hawthorn, fennel, and dill); b) dietary remedies (lemon, beets and raspberries); c) mineral substance (mumiyo); d) Slavic pharmaceuticals (Validol and Enap); and/or d) treatments (mustard plaster and hot or cold water therapy). 4) **Reassessment** of symptoms and/or elevated blood pressure reading. Based on reassessments, if symptoms continued and/or blood pressure readings remained elevated (definitions of elevation varied for each woman) then another folk remedy and/or prescribed medication would be implemented. Participant approach to managing their HTN was based on their belief it was an episodic and acute condition and was to be treated only in the presence of symptoms and/or elevated blood pressure measurement reading. Thus, a trial and error approach was used to manage their HTN resulting in an uncontrolled chronic condition. Older Slavic immigrant women continue to experience uncontrolled HTN and understanding beliefs and behaviors will support the development of culturally tailored blood pressure management interventions.

RACIAL AND ETHNIC DISPARITIES IN ADL DISABILITY AFTER HOSPITALIZATION AMONG OLDER HOME CARE RECIPIENTS

J. Chase^{1,2}, L. Huang², D. Russell³, A. Hanlon², M. O'Connor⁴, K. Robinson², K.H. Bowles², 1. *University of Missouri, Columbia, Missouri*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*, 3. *Visiting Nurse Service of New York, Manhattan, New York*, 4. *Villanova University, Villanova, Pennsylvania*

Older adults who experience new or worsening difficulties performing activities of daily living (ADL) after hospitalization have poorer prognoses within a year after discharge. Past research suggests racial/ethnic disparities exist in the development and progression of ADL disability. However, little research exists examining ADL disability disparities among racially/ethnically diverse older adults after hospitalization. Understanding differences in ADL disability across racial/ethnic groups may lead to targeted interventions reducing disparities and promoting ADL performance. This study's purpose was to determine if differences exist in ADL disability trajectories among racially/ethnically diverse adults age 65 years and older receiving home care following hospitalization. We used 2013–2014 Outcome and Assessment Information Set data ($n=21,473$) from a large non-profit home care agency to examine overall change in ADL disability, which was measured by summing the difference of admission and discharge scores from nine individual ADL. Associations between race/ethnic groups and overall ADL change scores were examined using general linear regression models, adjusting for personal, environmental, and health-related factors from the International Classification

of Functioning, Disability and Health framework. On home care admission, Asians, African-Americans, and Hispanics had poorer individual ADL scores compared to Non-Hispanic Whites (all $p < .05$). During the home care episode, Asians, African-Americans, and Hispanics experienced significantly less improvement in overall ADL disability compared to Non-Hispanic Whites (all $p < .01$). To increase generalizability, study replication is needed using a nationally-representative sample. Additional research is needed to determine mechanisms of ADL disability disparities in racial/ethnic subgroups.

BARRIERS AND MOTIVATORS TO ENGAGEMENT IN SELF-MANAGEMENT FOR JOINT PAIN IN OLDER AFRICAN AMERICANS

S. Booker, K.A. Herr, T. Tripp-Reimer, *The University of Iowa, Iowa City, Iowa*

Osteoarthritis represents one of the leading causes of chronic joint pain in older adults. Over 60% of older African Americans (AAs) attribute chronic pain to arthritis, and joint pain is more frequently reported than stiffness or swelling. A higher proportion of AAs (38.7%), experience severe osteoarthritis pain as compared to 36.4% of Hispanic Americans, 28.7% American Indians, 23.1% Caucasian Americans, and 18.5% Asian Americans. Managing osteoarthritis requires both self-management and provider management. Land- and water-based exercise, thermotherapy, pharmacological interventions, use of assistive and/or orthotic devices, and participation in self-management programs are key self-management strategies to manage osteoarthritis symptoms. Because older AAs have less control over pain, some suggest they may need more assistance with self-management; however, identification of barriers and motivators to engagement key strategies has been overlooked. A convergent, parallel mixed-methods study, using surveys and qualitative interviews, was conducted with 70 community-dwelling African American seniors (67.2 ± 13.2). The majority of AAs did not engage in water-based exercise, use assistive/orthotic devices, or ever participated in a self-management program, while most used thermotherapy and pharmacological interventions. Content analysis indicate major barriers to engagement as issues/work commitments, no motivation or interest to exercise and fear of falling, lack of knowledge on appropriate exercises, no access to pool and inability to swim, unaware of any osteoarthritis self-management programs, need to protect organs from side effects of pharmacological interventions, and the pain itself. Motivators were a need to maintain health, mobility and function, exercising with a group, and to obtain pain relief.

CORRELATES OF ADHERENCE TO DRUG REGIMEN AMONG UNDERSERVED OLDER AFRICAN AMERICAN ADULTS

M. Bazargan^{1,2}, J. Smith¹, M. Movassaghi², S. Mortazavi⁴, H. Yazdanshenas¹, D. Martins¹, G. Orum³, 1. Charles R. Drew University of Medicine and Science, Los Angeles, California, 2. UCLA, Los Angeles, California, 3. Keck Graduate Institutes, School of Pharmacy, Claremont, California, 4. School of Behavioral Sciences and Mental Health, Tebran, Iran (the Islamic Republic of)

Objectives: This study examines the association between adherence to drug regimens and an array of medication related factors, including polypharmacy, complexity of drug regimens, use of duplicate and potentially inappropriate

medications, and knowledge about the therapeutic purpose and instructions of medication use.

Methods: Four hundred African Americans aged 65 years and older were recruited from South Los Angeles. Structured, face-to-face interviews and visual inspection of participants' medications were conducted. This study employed the Medication Regimen Complexity Index (MRCI) to quantify multiple features of drug regimen complexity.

Results: Participants were taking an average of 5.7 prescription drugs. Over 54% were using more than one medication from the same pharmaceutical subclass. Almost 56% could not identify the purpose of at least one of their Rx medications. Two-thirds knew "how much" and "how often" they should take their medications. The result of multiple logistic regression shows that co-payment for Rx drugs, memory deficits, and medication related knowledge were all associated with adherence to frequency and quantity of medications. While the MRCI was associated with adherence, polypharmacy did not show a statistically significant association with the adherence with quantity and frequency of Rx medications.

Conclusions: We documented that knowledge about instructions to use drugs and knowledge about the therapeutic purpose of medications are far more important than other factors. In addition, connection between MRCI and adherence to medication points to additional attention to prioritization of fixed-dose combinations for the elderly population, particularly underserved African American older adults with history of poor adherence.

GAIT OF FALLER AND NON-FALLER OLDER HISPANICS DURING STREET CROSSING SIMULATIONS

E.R. Vieira, M.M. Severi, P. Chaves, I.L. Martinez, A. Baron, J. Mora, *Physical Therapy and Neuroscience, Florida International University, Miami, Florida*

Falls are significantly associated with gait alterations, but few studies have assessed this association in older Hispanics. Street crossing simulations are sensitive to evaluate functional dual-task gait. The objective of this study was to compare the ability of older Hispanics with and without history of falls in adapting their preferred speed gait to the increased demands of street crossing conditions. Sixty-four Hispanics 75 ± 7 years old (16 fallers and 48 non-fallers) walked 3 times on an instrumented mat at preferred speed, and during simulated street crossing with regular and with reduced time. Gait velocity, cadence, step length, base support, swing and stance time, single and double support time, knee flexion angle, and anterior tibialis and gastrocnemius lateralis muscle activity were measured. Data collected during the preferred speed gait condition was used to normalize the data collected during the street crossing simulations. Analysis was performed using chi-square, two-way ANOVA and independent t-tests at 5% significance level. Older Hispanics with a history of falls did not increase their gait speed ($p = 0.035$) and did not decrease their stance time ($p = 0.018$) and double support time ($p = 0.011$) as much as the non-fallers during the street crossing conditions. There were no significant differences between the other variables or between street crossing conditions and no interactions. Older Hispanics with history of falls did not adapt as well as those without falls to the increased demands of street crossing conditions compared to walking at preferred speed.

SESSION 4295 (PAPER)

SUPPORTING AGING IN PLACE INTERNATIONALLY

SUPPORTING OLDER PEOPLE TO AGE IN PLACE IN IRELAND: FRAILITY-RELATED HEALTH CARE USE AND OUTCOMES

L.D. Roe, A.M. O'Halloran, R. Kenny, C. Normand, *Centre for Health Policy and Management, Trinity College Dublin, Dublin 2, Ireland*

Background: Frail older people have both “depth and breadth” in their healthcare needs and require an integrated approach to service delivery but often experience poor service coordination in practice. Reforming service delivery models is a priority for this group, but the process is hindered by a dearth of evidence, particularly of current service utilisation patterns. This project aims to identify diverse service-utilisation patterns among frail older people, to examine these patterns over time and to ascertain their effect on key individual and service outcomes.

Methodology: Data were taken from The Irish Longitudinal Study on Ageing (TILDA), a prospective cohort study representing the Irish community-dwelling population aged ≥ 50 years. We sampled adults aged ≥ 65 years ($n=3,507$) in wave one (2009/11) who were classified as frail ($n=745$) on the Frailty Index (FI). FI scores of ≥ 0.25 indicated that participants were frail. Latent class analysis determined service-utilisation profiles across hospital, primary and community service indicator variables. Repeated measures cross-sectional analyses mapped transitions between service-utilisation profiles and mixed effects models determined the impact of transitions in service-utilisation profiles on health outcomes and social indicators.

Results: 24% (95% CI 23,26) of the Irish older population were frail at baseline. This group utilised 26–87% of services delivered by the Irish healthcare system. However, four heterogeneous service-utilisation profiles were identified; Non users (52%), Hospital users (20%), Community users (26%) and Community and Hospital users (2%).

Conclusions: These initial results illustrate quite diverse management strategies for frailty which occurs in the Irish healthcare system and warrants further investigation.

MAKING CAPE TOWN AN AGE-FRIENDLY CITY: AN EXPLORATORY STUDY

S. Kalula, T. Blouws, *Institute of Ageing in Africa, Cape Town, South Africa*

Living environments characterized by infrastructural and developmental deficits hamper older citizens' integration in society for an active and healthy life. This study investigated older citizens' experience and perceptions of the “age friendliness” of their communities in the City of Cape Town.

The methodology based on the Vancouver Protocol 2006 and advocated by the WHO's project on “Age friendly Cities,” was used. Low-income suburbs of Cape Town were selected and qualitative research methods (ten focus groups with members and interviews with managers of service centres) were used to collect and analyse the data.

A sample 97 participants, mean age 70 years (range 54–83) were recruited. Eight domains constructed for the assessment of age friendliness were: physical environment,

transport, housing, social participation, respect and social inclusion, civic participation, community support and health services, and communication and information.

Barriers to social inclusion and participation were: Government restriction in income generating activities for social pensioners; features of the physical environment particularly uneven, poorly lit and unsafe sidewalks; short timing at traffic light for pedestrian-crossings; public transport services that were inaccessible to commuters with disability and younger commuters not offering their seats to them. Ageistic attitudes of personnel and the unfriendly services at public healthcare facilities were widely reported. Services and support from religious and other community agencies and travel concessions from government were valued. Lack of exposure and inability to access pertinent electronic information was a concern for a large number.

A productive and inclusive society calls for relevant stakeholders to address the concerns.

WE WORK IT OUT BETWEEN US: DYADIC HEART FAILURE SELF-CARE IN COMMUNITY-DWELLING OLDER ADULTS

H. Buck, J. Hupcey, *The Pennsylvania State University, University Park*

Understanding *how* older adult patient and informal caregiver dyads mutually engage in heart failure (HF) self-care is imperative to assist aging in place. We examined dyadic HF self-care in a cross-sectional mixed methods study. Self-care was measured with the Self-care of Heart Failure Index (SCHFI) comprised of maintenance (day to day care), management (symptom evaluation and response), and self-efficacy scales. Scores were dichotomized- ≥ 70 adequate; < 69 inadequate; interviews were conducted, transcribed verbatim and underwent content analysis. Data integration involved information matrices for within/across-case analyses. In 27 dyads ($n=54$), the average patient was 77 years old, male with a 64 year old caregiver (spouse ($n=15$) or female adult child ($n=9$)). Mean scores on SCHFI maintenance, management, and self-efficacy scales were inadequate (range = 54–68). Dyads engaged in self-care according to life course patterns (“*we do everything together because that's the way we are*”); and/or according to whether it was maintenance (“*I go through my routine. I weigh myself.*”); or management (in response to symptoms, the previous person responded, “*We usually call right away*”); and/or by mobilizing the help of another (“*I called my sister.*”). Dyads, where the patient or caregiver scored ≥ 70 on self-efficacy and/or management, kept their maintenance (day-to-day care) pattern despite the patient's increased symptoms. However, dyads scoring < 69 , were more likely to mobilize help. Managing aging in place for older adults with HF must involve identifying life course patterns in self-care and supplementing them as needed. This has scientific, policy, and practice implications.

CENTENARIANS IN EUROPE

L. Teixeira^{1,2}, L. Arajo^{1,2}, O. Ribeiro^{1,2}, D.S. Jopp³, C. Paul^{1,2}, 1. UNIFAI, CINTESIS.ICBAS-UP, Porto, Portugal, 2. UNIFAI/ICBAS-UP, Porto, Portugal, 3. University of Lausanne, Lausanne, Switzerland

In the last decade, the number of centenarians worldwide has increased. Following this tendency, the number

of centenarian studies has also exponentially augmented. Given the complexity to conduct research with centenarians, elementary information on this specific age group remains unknown at a European level. This paper compares basic characteristics of centenarians from 32 European countries based on Census 2011. Results revealed that France is the country with higher ratio of centenarians, followed by Italy and Greece; on the other hand Croatia, Romania and Bulgaria present the lower ratio. The distribution according to gender is similar for all countries, with higher ratio of women reaching 100 years old. Different patterns of education level were found on countries where this information was reliable: Portugal and Greece are the countries with lower levels of education, with more than half without formal education; Finland, UK and Iceland are the countries with higher levels of education, with all centenarians having at least lower secondary education. Analysing the residence situation (living in the community or living in the institution), Romania, Bulgaria, Lithuania, Greece and Latvia are the countries that present higher percentages of centenarians living in the community; Iceland is the country with lower percentage of centenarians living in the community. A positive correlation between the number of centenarians and the percentage of Total Health Expenditure of GDP is observed. This study provides important information about the current profile of European centenarians, which is compared to general information on the centenarian population from EUA and Asia.

SESSION 4300 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: GERONTOLOGY AND METCHNIKOFF'S HYPOTHESES ON THE ROLES OF MICROBIOME AND INFLAMMATION IN AGING

Chair: V.D. Dixit, *Yale University, New Haven, Connecticut*
Co-Chair: L. Vkhanski, *Weizmann Institute of Science*

Ilya Metchnikoff received the Nobel Prize for laying out the foundation of innate immunity by discovering that phagocytes and macrophages play a critical role in defense against microbes. He also coined the term Gerontology and wrote in his famous book, "*Prolongation of Life: Optimistic Studies*" that "old age can be studied by methods of exact science, and there may yet be established some regimen by which health and vigor will be preserved beyond the age where now it is generally necessary to resort to public charity". The modern science and gerontology research at the interface of immunity and metabolism are making steady progress towards Metchnikoff's prediction. Among the topics being explored are how aging is linked with inflammation? Can molecular mechanism that control inflammation of age be targeted to enhance the healthspan? Age is the greatest risk factor for chronic diseases. Data from several clinical studies suggest an association between increase in pro-inflammatory markers and emergence of age-related degenerative changes. If aging is a common trigger for multiple diseases and if inflammation is a major pathway causing morbidity and mortality, then identification of specific mechanism of inflammation that is triggered with age should delay the onset of multiple chronic diseases. Translation of such basic research discovery into practice would be a major advance in achieving

the goal of extending human healthspan. The commemorative Metchnikoff symposium will highlight various aspects of interactions between metabolism, diet and microbiota in control of inflammation and healthspan.

IMMUNOMETABOLIC REGULATORS OF AGING

V.D. Dixit, *Yale School of Medicine, New Haven, Connecticut*

Evidence that innate immune sensor NLRP3 inflammasome links aging to functional decline supports Metchnikoff's original prediction that phagocytes or macrophages drive aging-associated degenerative diseases in an organism. Assembly of the NLRP3 inflammasome in macrophages in response to metabolic 'danger signals' controls the secretion of bioactive IL-1 β and IL-18. Here we detail a mechanism by which the macrophage-expressed Nlrp3 inflammasome controls age-related inflammation in periphery as well as brain. Ablation of Nlrp3 inflammasome protected mice from age-inflammation in multiple organs and improved their healthspan. The ketone metabolite β -hydroxybutyrate (BHB) that is elevated by caloric restriction, high-intensity exercise, or the low-carbohydrate ketogenic diet serves as an endogenous negative regulator of NLRP3-driven inflammation in aging. These studies suggest that NLRP3 inflammasome is a major driver of age-related inflammation and therefore dietary or pharmacological approaches to lower NLRP3 holds promise in reducing multiple chronic diseases of age.

IMPACT OF CIRCULATING FACTORS AND OF PERSISTENT VIROME ON IMMUNE AGING

J. Nikolich-Zugich, *Department of Immunobiology and the Arizona Center on Aging, University of Arizona College of Medicine, Tucson, Arizona*

Adaptive immune system is in charge of precise defense against a highly diverse array of microorganisms. For defense against new infections, the organism deploys naïve, previously antigen-unexposed, T and B lymphocytes, whose antigen-specific receptors recognize, and eventually orchestrate the removal of, the invading microorganisms. Naïve B, and even more so T, lymphocytes numerically diminish with aging. However, new data suggests that those that remain appear to have maintained their functional potential, contrary to an earlier dogma. These findings refocused our attention upon cell-extrinsic defects in immunity. Results will be presented showing that aging of circulating, most likely soluble, factors, as well as changes in persistent virome, critically modulate both homeostasis and function of the aging immune system. Implications for immune rejuvenation will be discussed.

AGING CHANGES MICROBIOME AFFECTING CROSSTALK AND ACTIVITY OF MONOCYTES AND B1A CELLS

A. Biragyn, *National Institute on Aging, Baltimore, Maryland*

Aging significantly dysregulates function and composition of immune cells. We recently reported that elderly humans, macaques and mice accumulate 4-1BBL+TNF+MHC class-II α CD86 α B cells 1. These cells (4BL cells) are innate B1a cells activated by monocytes 2. In response to microbiota change in aging, monocytes disable the immunosuppressive

and tumor-supporting functions of B1a cells while providing a new function – the induction of antitumor and auto-immune granzyme B (GrB)-expressing CD8+T cells via 4-1BBL/4-1BB, TNF/TNFR2 and IFN γ /IFN γ R1 axes. These results implicate microbiome/monocyte/B-cell crosstalk in understanding of aging-associated diseases.

SESSION 4305 (SYMPOSIUM)

QUALITATIVE APPROACHES AND INTERNATIONAL PERSPECTIVES ON AGING IN PLACE

Chair: P.A. Saunders, *Georgetown University, Washington, District of Columbia*

Aging in place (AIP) has been a well-researched topic in the gerontology literature but research has started to broaden the conversation to a more global view taking into consideration patterns of domestic and international migration. These migrations are related to life course events as well as other social and cultural factors. Rubinstein & Parmelee (1992) define AIP as older adults' place attachment for those who wish to remain in their communities as they age. This definition can be expanded to include new and old immigrants and the process of place making. This symposium brings together 5 qualitative studies that examine AIP in multiple settings from a variety of international perspectives.

Using participant observation, Ye describes how Asian elderly immigrants understand AIP in the context of the senior housing in the United States. From an ethnographic approach, Barnes Langendoerfer examines older adults' descriptions of why they AIP within a neighborhood experiencing urban decline. Dupuis-Blanchard conducts a descriptive study to understand human resources in community service organizations for AIP in minority French speaking older adults living in English dominant communities in Canada. Using grounded theory, Linhart studies the concept of independence while living at home among older German women living alone. Finally, Lewis examines elderly refugees aging out of place, far from where they were socialized to understand the meaning of being an older member of society. The breadth and depth of these papers provides a rich and varied picture of AIP in a global context.

GLOBAL DISPLACEMENT AND AGING: CAMBODIAN REFUGEE ELDERS' AGING OUT OF PLACE IN THE UNITED STATES

D.C. Lewis, *Human Development and Family Science, University of Georgia, Athens, Georgia*

This presentation illuminates experiences and expectations of elderly refugees who are aging out of place, far from the familiar cultural, social, and political landscape in which they lived and in which they developed an understanding of what it meant to be an elderly member of society. Experiences of aging refugees have been shown to be significantly different from elders who have not participated in forms of global migration; especially, forced migration (as is the case for refugees). This presentation is drawn from interviews and participant-observation with 125 Cambodian refugee families and includes 89 in-depth interviews with 38 elderly family members. Many of those interviewed felt that they were aging out of place, even when they had been residents of the

United States for many years. It is common for refugees to experience considerable trauma both in their home countries and in their journeys from their homelands to a receiving country. These refugee elders described long-term trauma and difficulties in U.S. society because of the effects of racism, marginalization, and stigmatization as they struggle to reconstruct and redefine lives and identities. Data revealed that an infrastructure that allows elderly immigrants to age in place should have a remarkably different set of parameters than an infrastructure that supports native-born elders. Information from this study could inform social service agencies, healthcare providers and policy makers of ways to address the needs of refugee and other immigrant elders in the United States that would allow them a more successful experience of aging in place.

AGING IN PLACE THROUGH URBAN DECLINE: ADAPTIVE STRATEGIES OF OLDER ADULTS IN CLEVELAND, OHIO

K.B. Langendoerfer, *Sociology, Case Western Reserve University, Shaker Heights, Ohio*

Despite the vast amount of research emphasizing the benefits of aging in place in later life, scant attention has been paid to the lived experiences of aging in place over the life course, particularly for minority, urban older adults (Golant, 2003). This study utilizes data from three years of ethnographic research with over thirty older (age 60+), African-American adults who have aged in place within Cleveland, OH. Their neighborhood has experienced an 80 percent decline in its population from 1950 to 2014 (1950: 39,280 residents; 2014: 6,239 residents). The community has also encountered deteriorating institutional supports and drastic increases in its crime and all-cause mortality rates. The presentation will focus on the older adults' descriptions of why they aged in place within a neighborhood experiencing urban decline, and how they continued to make a life for themselves and their families despite their changing neighborhood landscape.

ELDERLY CHINESE AND KOREAN IMMIGRANTS AGING IN PLACE IN SENIOR HOUSING

M. Ye, E. Kahana, *Case Western University, Shaker Heights, Ohio*

This study explores aging-in-place (AIP) among elderly Asian immigrants' living in government-supported senior housing (GSSH). Given increasing numbers of non-English-speaking elderly immigrants in the US, interpretations of AIP represent an important area of study. Observations of 42 Chinese and 17 Korean participants and in-depth interviews (4 staff and 5 older adults) were conducted in GSSH in Ohio. This study provides a rich description of how Asian elderly immigrants understand AIP. Findings show: participants can make satisfactory adjustments to life in GSSH; the familiar Asian cultural context in the SH and neighborhood helps compensate for language barriers; older adults' quality of life is related to immigration and welfare policies; and family, neighborhoods, and staff play central roles in facilitating AIP. The study suggests that AIP is a dynamic interaction between older adults and their environment. This study provides critical information to deliver culturally sensitive care in the context of AIP.

BRIDGING THE NEEDS OF LANGUAGE MINORITY SENIORS TO SERVICES AND HUMAN RESOURCES FOR AGING IN PLACE

S. Dupuis-Blanchard, *Nursing, Universite de Moncton, Moncton, New Brunswick, Canada*

Research has established that the majority of older adults want to age in place. Past research outlines the type of services required for aging in place; however, human resources may put these services at risk of disappearing. For minority French speaking older adults living in dominantly English speaking communities, lack of access to workers in their language could hamper their ability to age in place.

The goal of this descriptive study was to better understand human resources in community service organizations for aging-in-place in minority French speaking older adults living in English dominant communities in Canada. Forty-nine administrators of community service organizations in Eastern Canada participated in this study. An on-line survey along with semi-structured individual interviews were analysed to identify common themes related to study objectives. Results indicate that future services are at risk as a result of poor working conditions and difficulty recruiting workers in this industry.

INDEPENDENCE IN OLD AGE: OLDER GERMAN WOMEN LIVING ALONE

M. Linhart, *Bern University of Applied Sciences, Health Division, Bern, Switzerland*

Maintaining the ability to live independently is critical in old age. However, research on independent living is limited. The purpose of this study was to provide an understanding of 'Independent Living at Home' among older German women living alone.

The data collection comprised three data sets (n=55) that were collected in two phases. In the second phase data collection was performed according to preliminary findings and theoretical considerations from previous analyses. Grounded theory principles guided this study.

Findings include three dimensions that characterize the perceptions of independence: 'being able to be' -- the internal and mental factors; 'being able to do' -- the physical or 'external', environmental factors; and individual background factors like states of well-being. Findings suggest that independence in old age is a multi-layered. In contrast to the literature which emphasizes physical functioning, it was clear that 'being able to be' was more important than 'being able to do.'

SESSION 4310 (SYMPOSIUM)

PREDICTORS AND BENEFITS OF OLD AGE WISDOM

Chair: M. Ardel, *University of Florida, Gainesville, Florida*
Discussant: H.R. Moody, *Fielding Graduate University, Santa Barbara, California*

This symposium explores how culture, personality, resources, and life course experiences contribute to the development and conceptions of wisdom and how wisdom might be related to successful aging. A 60-year longitudinal study of 98 men indicates that early and midlife "seeds" and pathways to wisdom and well-being at age 80 differed, although

wisdom and well-being were correlated. Early personality predicted old age well-being, whereas social support during the formative years and/or personality appeared to promote growth in wisdom. Quality of life was also correlated with wisdom in a cross-sectional study of 164 older (age 60–85) and younger (age 18–25) Canadians and South Koreans. Yet religious experience and spirituality only predicted old age wisdom. The final presentation examines predictors of wisdom conceptions. A mixed-method study of 103 adults, age 65+, showed that sociocultural, socioeconomic, and geographical factors all affected conceptions of wisdom. Yet, despite the differences in wisdom understandings, wisdom was positively correlated with life satisfaction.

EARLY AND MIDLIFE PREDICTORS OF WISDOM AND SUBJECTIVE WELL-BEING IN OLD AGE

M. Ardel¹, K. Gerlach³, G. Vaillant², 1. *Sociology and Criminology & Law, University of Florida, Gainesville, Florida*, 2. *Brigham and Women's Hospital, Boston, Massachusetts*, 3. *Columbia University College of Physicians & Surgeons, New York, New York*

According to Erikson's theory of psychosocial development and Elder's life course paradigm, human development takes place throughout life and is shaped by linked lives and human agency. We explored whether the "seeds" of wisdom and well-being in old age might differ, although wisdom and well-being tend to be positively correlated. Using 60-year longitudinal data of 98 white male Harvard graduates born between 1915 and 1924, the study found that wisdom and subjective well-being at age 80 were indeed positively correlated. Yet, early life predictors differed. Extraversion and neuroticism in early adulthood predicted subjective well-being 60 years later. Two distinct pathways predicted old age wisdom: (1) Psychosocial growth facilitated by supportive social environments in childhood and adolescence, positive early personality traits, and midlife generativity and subjective health; (2) The motivation to grow through openness to experiences. Both social support during the formative years and personality appear to promote growth in wisdom.

DOES RELIGIOUS EXPERIENCE, SPIRITUALITY, AND QUALITY OF LIFE PREDICT WISDOM? A CROSS-AGE ANALYSIS

H. Bang¹, M. Ferrari², 1. *Educational Foundations, Leadership and Policy, Bowling Green State University, Bowling Green, Ohio*, 2. *University of Toronto, Toronto, Ontario, Canada*

Our on-going mixed-methods study examines the relationship between wisdom and other variables such as religiosity, spirituality, and quality of life among 75 Canadians and 89 South Koreans (total 164) in two age groups: 106 younger adults [age 18–25], and 58 older adults [age 60–85]). Multiple regression and bivariate correlation analyses reveal that these variables predict wisdom in both age groups, although quality of life is the only significant variable to predict wisdom in both groups. Only quality of life is correlated to the total wisdom score in the younger groups, whereas quality of life, religious experience, and spirituality are positively related to wisdom in the older age groups. Interestingly though, the elders' daily spiritual experience is negatively related to wisdom. The results show that elders

in both countries who seek spirituality, religious experience and belief are more likely wise, and their wisdom may link to their quality of life.

UNDERSTANDING THE PREDICTORS AND BENEFITS OF SOCIOCULTURAL FACTORS ON OLD AGE WISDOM

H. Oh, *School of Social Work, St. Ambrose University, Davenport, Iowa*

People develop wisdom in a sociocultural and geographical context. Their geographical place and socioeconomic position generate various relationships and memories with others, socioeconomic resources, educational opportunities, and professional/personal attributes. However, most contemporary scientific studies of wisdom have paid scarce attention to the sociocultural context in which wisdom ripens. This study examined sociocultural life course predictors and benefits of old age wisdom. Two independent samples (N=103, age 65+) from different geographical places and socioeconomic positions were recruited for a mixed-method study that used social network analysis and content analysis. Findings show varying wisdom understandings between the two samples based on various sociocultural factors, such as family dynamics, upbringing environment, socioeconomic status, profession, and living place and culture. Despite the variance, the reflective dimension of wisdom was positively related to life satisfaction in both elderly samples, indicating the pivotal role of reflectivity in the association between wisdom and well-being.

SESSION 4315 (SYMPOSIUM)

ELDER ABUSE IN A U.S. CHINESE POPULATION—A PROSPECTIVE COHORT STUDY

Chair: X. Dong, *Rush Medical College at Rush University*
Co-Chair: M. Simon, *Northwestern University*

Elder abuse is increasingly recognized as a global health concern. In U.S. minority and immigrant populations, the incidence, associations, and clinical implications remain poorly understood. Further population-based epidemiological studies using standard elder abuse measurements with longitudinal study design is required to advance the field. To address this gap and to challenge some prior assumptions, the purpose of this symposium is to improve our understanding of elder abuse epidemiology regarding incidence, risk factors and consequences. Data were drawn from the Population-based Study of Chinese Elderly in Chicago (PINE), a longitudinal, representative, population-based study of 3,157 community-dwelling Chinese older adults in the greater Chicago area. Additional data were drawn from the Piety Study, a survey of culture, health, and well-being among 548 adult children caregivers of PINE participants. Session 1 will examine the incidence of elder abuse and its subtypes among U.S. Chinese older adults by analyzing Wave 1 and Wave 2 data from the PINE Study. Session 2 will examine the sociodemographic and socioeconomic characteristics associated with incident elder abuse. Session 3 will explore the controversial association between physical function and elder abuse. Last, in session 4, we will investigate the consequence of elder abuse with respect to suicidal ideation. In

summation, this symposium aims to increase the practical and clinical relevance of elder abuse epidemiology in community, research, healthcare, and policy settings.

INCIDENCE OF ELDER ABUSE: FINDINGS FROM A POPULATION-BASED STUDY OF U.S. CHINESE OLDER ADULTS

X. Dong¹, M. Simon², 1. *Rush University Medical Center, Chicago, Illinois*, 2. *Northwestern University, Chicago, Illinois*

This paper aimed to examine the incidence of elder abuse over two years in a longitudinal population-based cohort of community-dwelling Chinese older adults in Chicago. We analyzed survey responses from 2,712 participants enrolled between 2011 and 2013 and conducted follow-up interviews after a two-year interval from 2013 and 2015. To determine elder abuse incidence, data was analyzed from Wave 1 and Wave 2 and only includes new cases of elder abuse at Wave 2. We also administered a 56-item questionnaire, assessing psychological, physical, and sexual abuse, caregiver neglect, and financial exploitation. Incidence for any type of elder abuse was 6.4%. Incidence of psychological abuse was 4.4%, financial exploitation was 2.6%, caregiver neglect at 0.9%, physical abuse at 0.5%, and sexual abuse was the least reported at 0.1%. To our knowledge, our findings are the first estimate of incident elder abuse among U.S. Chinese older adults.

RELATIONSHIP BETWEEN SOCIODEMOGRAPHIC CHARACTERISTICS AND INCIDENT ELDER ABUSE AMONG U.S. CHINESE

X. Dong, S. Bergren, *Rush University Medical Center, Chicago, Illinois*

We examined the correlations and associations of sociodemographic and socioeconomic characteristics with two-year incident elder abuse and subtypes of psychological, physical, sexual, caregiver neglect, and financial exploitation. Data were drawn from two waves of data from the PINE Study. Elder abuse was measured using a 56-item questionnaire. Data analysis examined the relationship between baseline characteristics and the incidence of elder abuse. After controlling for potential confounding factors, female gender was associated with caregiver neglect (OR: 2.97, 1.09–8.06), living longer in the U.S. with financial exploitation (OR: 1.02, 1.01–1.04), and preferring to speak Mandarin or English with physical and/or sexual abuse (OR: 3.97, 1.05–15.00). The traditional risk factors for elder abuse in prevalence studies (age, education, income, marital status, and number of children) are not shown to be risk factors for incident elder abuse in our study. Further research is needed to examine the potential mechanisms behind incident elder abuse.

IS PHYSICAL FUNCTION ASSOCIATED WITH ELDER ABUSE IN A COMMUNITY-DWELLING POPULATION?

X. Dong¹, G. Li¹, M. Simon², 1. *Rush University Medical Center, Chicago, Illinois*, 2. *Northwestern University, Chicago, Illinois*

Existing research has indicated that lower levels of physical function is a risk factor for elder abuse. This paper aimed at examining the association between physical function impairment and elder abuse among U.S. Chinese older adults. Data

were drawn from 3,157 Chinese older adults from the PINE Study from 2011–2013. We assessed physical function through both self-reported physical function (ADL, IADL, Nagi, Rosow) and directly observed physical performance tests (walk, tandem, chair stand). After controlling for potential confounding factors, higher levels of impairment in ADL (OR 0.85, 0.73–0.98) and IADL (OR 0.87, 0.82–0.92) was associated with lower risk of elder abuse. Similarly, lower levels of physical performance (OR 0.93, 0.89–0.97) are associated with lower risk of elder abuse. Contrary to previous findings, our study indicates that lower physical function may be protective against elder abuse. Further study is necessary to determine the temporal relationship between physical function and elder abuse.

ELDER ABUSE AND SUICIDAL IDEATION IN COMMUNITY-DWELLING CHINESE OLDER ADULTS

X. Dong, L. Pang, Y. Xu, *Rush University Medical Center, Chicago, Illinois*

Prior research indicates that figures for elder abuse prevalence depend on different definitional cut off criteria within the same instrument. However, definitional variation with respect to health outcomes remains unclear. This paper aims at exploring the association between different definitions of elder abuse and suicidal ideation. Data were drawn from 3,157 Chinese older adults through the PINE Study from 2011–2013. Elder abuse and subtypes were measured by using different definitional approaches from broad to strict criteria. Suicidal ideation was assessed over the past two weeks and the past twelve months. After controlling for potential confounders, broadly-defined abuse was associated with 2-week (OR 2.10, 1.34–3.28) and 12-month (OR 2.43, 1.66–3.55) suicidal ideation. Strictly-defined elder abuse was associated with 2-week (OR 2.24, 1.36–3.66) and 12-month (OR 2.34, 1.54–3.56) suicidal ideation. However, for financial exploitation, only the broad definition was associated with increased risk for 12-month suicidal ideation (OR 1.72, 1.71–2.96).

SESSION 4320 (SYMPOSIUM)

SOCIAL RELATIONS AND HEALTH IN AN INTERNATIONAL PERSPECTIVE

Chair: B. Suanet, *VU University Amsterdam, Amsterdam, Netherlands*

Co-Chair: L. Schaap, *VU University, Amsterdam, Netherlands*

Gerontological research has long acknowledged the salience of social relations for healthy aging as well as the importance of health for maintaining a solid support network. This symposium brings together five papers that show new insights in how social relations and health interact in later life. Aartsen and Veenstra use Norwegian NorLAG data to investigate whether qualitative and quantitative aspects of the network mediate the relationship between socio-economic position and health. Antonucci and colleagues study to what extent social relations influence health through interpersonal resources, such as trust, efficacy and forgiveness, on an ethnic and racial diverse Detroit sample. Schaap and Suanet examine the implications of pain for social functioning of older adults using data from the Longitudinal Aging Study Amsterdam. Düzel and colleagues investigate whether individual differences in

subjective loneliness are associated with differences in gray matter volume in brain regions employing data from the Berlin Aging Study. Zijlstra and colleagues evaluate a training among staff in a Dutch nursing home to enhance social relations between staff and informal carers of clients, with the aim to improve well-being and health of clients.

IS QUALITY OR QUANTITY OF THE SOCIAL NETWORK A PATHWAY FROM SEP TO HEALTH IN OLDER MEN AND WOMEN?

M. Aartsen, M. Veenstra, *NOVA Norwegian Social Research, Oslo, Norway*

The relation between social network and health, and Socioeconomic Position (SEP) and health is well-established. This research investigates whether the social network is a pathway in the SEP-health relationship. Data are from the second wave of the Norwegian NorLAG study, with 2,543 men and 2,715 women, aged between 40 and 85. A gender stratified multi-mediator model with bootstrapping is applied, with contact frequency and network size as quantitative mediators, and loneliness and number of people in the network on whom they can rely in periods of crisis as qualitative indicators. For men 8% and for women 15% of the variation in health was explained by the model. Only the indirect pathways through qualitative characteristics of the social network were statistically significant in both men and women. In explaining SEP differences in health, the quality of the network is more important than the quantity.

SOCIAL RELATIONS, INTERPERSONAL RESOURCES AND HEALTH: TRUST, EFFICACY, AND FORGIVENESS

T.C. Antonucci¹, K.J. Ajrouch^{2,1}, K. Birditt¹, N.J. Webster¹, *1. Institute for Social Research, University of Michigan, Ann Arbor, Michigan, 2. Eastern Michigan University, Ypsilanti, Michigan*

We examine the extent to which social relations influence health through interpersonal resources, specifically trust, efficacy and forgiveness. We hypothesize that social relations are an understudied influence of interpersonal resources which have a mediating effect on health. Data are from a probability sample of the Detroit metropolitan area of 1134 adult men and women (62% female), ages 18 to 94, including African Americans, Middle Eastern Americans and European Americans. Preliminary findings indicate that social network size, feelings of trust, efficacy, and forgiveness (with self, spouse, close others) are all positively associated. These variables, in turn, are positively associated with health. In this paper we examine how trust and efficacy mediate the associations between social relations, forgiveness and health. Additional analyses will examine these associations by race and ethnicity. Findings will be discussed from a life course perspective exploring how convoys of social relations influence interpersonal resources and health.

IN AGONY AND ISOLATED? A STUDY ON PAIN AND SOCIAL FUNCTIONING IN OLDER ADULTS.

L. Schaap, B. Suanet, *VU University Amsterdam, Amsterdam, Netherlands*

Few studies have looked at the association between pain and social domains of ageing. We investigated the association of pain with social functioning in 1757 older men and

women aged 57–97. We expected that more pain would be associated with less social functioning, as pain might reduce ability and willingness to move around and/or interact with others. Data from the Longitudinal Aging Study Amsterdam (2005–2006) was employed. Linear regression analyses, controlled for age, gender, educational level and partner status, revealed that more pain was associated with a smaller network size, less total given instrumental support, less volunteering and less participation in cultural activities and going out. Unexpectedly, we did not find an association between pain and total received instrumental and emotional support. Thus, pain seems to particularly influence participation in social activities that are more physically demanding. Pain treatment might be effective to remain socially active.

PERCEIVED LONELINESS AND ITS BRAIN STRUCTURAL CORRELATES AND ASSOCIATION WITH COGNITIVE PERFORMANCE

S. Duzel¹, J. Drewelies², I. Demuth³, D. Gerstorff², U. Lindenberger^{1,4}, S. Kühn^{1,5}, 1. *Max Planck Institute for Human Development, Berlin, Germany*, 2. *Humboldt University, Berlin, Germany*, 3. *Charité – Universitätsmedizin Berlin, Berlin, Germany*, 4. *Max Planck University College London Centre for Computational Psychiatry and Ageing, Berlin, Germany*, 5. *Clinic for Psychiatry and Psychotherapy, University Clinic Hamburg-Eppendorf, Hamburg, Germany*

The subjective perception of social support and integration plays a crucial role in human well-being. Psychological lifespan research has long shown that loneliness is a risk-factor closely associated with key outcomes of aging. However, its relation to cognition and its structural neural substrates remain largely unknown. Using a subsample of healthy older participants originating from the Berlin Aging Study II sample (BASE-II; $N = 341$ aged 61 – 82 years at baseline; 39 % women) that underwent Magnetic-Resonance-Imaging, we investigated whether individual differences in subjective loneliness are associated with differences in gray matter (GM) volume in brain regions that have been shown to be implicated in emotional processing and social cognition.

EVALUATION OF A PROGRAM TO IMPROVE SOCIAL RELATIONS BETWEEN NURSING HOME STAFF AND INFORMAL CARERS

G. Zijlstra¹, D. Smits², N. Salden², L. Hoek¹, 1. *Department of Health Services Research, CAPHRI Care And Public Health Research Institute, Maastricht University, Maastricht, Netherlands*, 2. *Vivantes Ouderenzorg (Care for the Elderly), Geleen, Netherlands*

A good collaboration between residents, informal caregivers and nursing home staff is essential for dependent nursing home residents in order to receive care that matches their preferences and contributes to their well-being and health. Social relations can contribute to this collaboration; yet, insight into these relationships is often lacking on wards. In this study we developed a program to increase the awareness of nursing home staff towards their role and the informal caregivers' role in the lives of residents. An initial pre-test post-test evaluation study was conducted with nursing home staff ($N=20$; 3 nursing homes). The process evaluation confirmed the feasibility of the program with a high fidelity

(most elements of the training were conducted as planned) and a high satisfaction of the staff (e.g. 90% rated the program good or very good). Generally staff reported greater awareness of the roles of staff and informal caregivers in the residents' lives.

SESSION 4325 (SYMPOSIUM)

NEGOTIATING BOUNDARIES IN LATE-LIFE STEPFAMILY: INTERNATIONAL PERSPECTIVES ON INTERGENERATIONAL TIES

Chair: C. Wexler Sherman, *University of Michigan, Ann Arbor, Michigan*

Late life repartnering and stepfamily formation is an increasingly common phenomenon around the world. Given greater longevity, health, and sustained divorce rates, more aging adults have complex marital and family histories. Research indicates that the intergenerational family and stepfamily ties created through late-life repartnerings are often complex. This symposium highlights five papers that examine late life stepfamily and intergenerational expectations and experiences from various international contexts (Europe, Israel, and the United States). First, **van Tilburg and van der Pas** will present a macro-level examination of cross-national differences in late-life stepfamilies in multiple European countries (e.g., Spain, Italy, Greece, Denmark, Sweden) and the US. **Hwang, Silverstein, and Brown** use the Longitudinal Study of Generations (US) to examine associations between religiosity and filial responsibility, and potential mediating effects of familism, among adult stepchildren. **Simhi-Meidani and Koren's** paper will present qualitative findings (Israel) on adult stepchildren's reactions to and experiences with parents entering late life repartnerings after widowhood. **Sanner, Coleman, & Ganong** present findings from a grounded theory study that explores outcomes of stepgrandchild-stepgrandparent relationships following the dissolution of a late life remarriage. **Sherman** will present findings on health and care-related decision making and relationship quality between remarried spouses and stepfamily members. Together, the papers in this symposium session, employ multiple methodologies to offer timely insight into late-life stepfamily in diverse national and cultural settings. Discussion will highlight the multifaceted nature of intergenerational ties in late life stepfamily, and consider implications for future aging and family research and practice.

UNDERSTANDING CROSS-NATIONAL DIFFERENCES IN LATE-LIFE STEPFAMILIES IN EUROPE AND THE UNITED STATES

T. Van Tilburg¹, S. van der Pas², 1. *Sociology, Vrije Universiteit Amsterdam, Amsterdam, Netherlands*, 2. *VU University medical center, Amsterdam, Netherlands*

With decreasing occurrence of early widowhood and increasing divorce rates, remarriage and repartnering has changed considerably within Western societies in recent decades. The study presented in this paper describes differences in late-life stepfamilies in Europe and in the United States, and attempts to explain differences from a macro-level perspective. We find a wide variety in prevalence of stepfamilies among people aged 50 years and older. For example,

data from SHARE shows 2% in Spain, Italy and Greece, and 17% in Denmark and 19% in Sweden have adult stepchildren. These differences are related to demographic factors, and social factors such as acceptance of non-marriage and non-cohabitating couples. Differences in gender roles, secularization and educational expansion are important in understanding differences among countries. It is discussed what these variations mean for the mobilization of intergenerational solidarity within stepfamilies in response to life course transitions among aging stepparents.

STEPARENT-CHILD INTERGENERATIONAL SOLIDARITY IN 11 YEARS: MODERATING ROLE OF RELIGIOUS DISCORDANCE

W. Hwang, M. Silverstein, M.T. Brown, *Syracuse University, Syracuse, New York*

Research has documented that religiosity is associated with filial responsibility directly and indirectly through familism. However, we know little about whether these associations produce different outcomes between biological and step-adult children. Therefore, we examined the association between religiosity and filial responsibility and the mediating role of familism on the abovementioned association for biological and step-adult children using the Longitudinal Study of Generations (LSOG). We selected 527 biological adult children and 83 step-adult children from the fourth generation (G4) in Wave 8 (2005). Models include controls for participants' age, race, gender, and education. Results of multiple group analysis show that religiosity was positively associated with filial responsibility among biological adult children and that familism fully mediated this association. Among step-adult children, although religiosity was positively associated with familism, neither religiosity nor familism was associated with filial responsibility. Heterogeneous and homogeneous characteristics of biological and step-adult children's religious contexts are discussed.

CONTINUITY AND CHANGE OF RELATIONSHIP WITH WIDOWED REPARTNERED PARENTS: ADULT CHILDREN'S EXPERIENCES

S. Simhi-Meidani, C. Koren, *University of Haifa, Hod Hasharon, ISRAEL, Israel*

Late-life repartnering and parental death change family structures. Although the pain, parental death is a normative life event for adult children, whereas late-life repartnering in Israel is not. Experiences of adult children after death of one parent and repartnering of their other parent, has scarcely been studied. Our aim is to explore such experiences. Data based on semi structured qualitative interviews with 29 adult children was drawn from a larger study on late-life repartnering from an intergenerational family perspective in Israel. Findings indicate continuity and change in three domains of the relationship: 1. The parent's priorities, 2. Family roles, and 3. Parent autonomy and adult child intervention. Findings are discussed using theoretical frameworks of the family life cycle and the life course while relating to cognitive, emotional, and behavioral experiences of adult children's relationship

with their widowed parents who repartnered in old age. Theoretical and practical implications are suggested accordingly.

RELATIONSHIPS WITH FORMER STEPGRANDPARENTS FOLLOWING REMARRIAGE DISSOLUTION

C. Sanner, M. Coleman, L.H. Ganong, *Human Development and Family Science, University of Missouri, Columbia, Missouri*

Due to increases in stepfamily formation and longevity, stepgrandparent-stepgrandchild relationships are increasingly prevalent. Because remarriages end in divorce more often than first marriages, many children experience the dissolution of stepgrandparent ties. Little is known about stepgrandparent relationships in general and even less is known about how these relationships are affected by divorce. Guided by symbolic interaction theory, the purpose of this grounded theory study was to explore what happens to stepgrandparent/stepgrandchild relationships after remarriage dissolution. Twenty-nine former stepgrandchildren (aged 18–37) were interviewed about their relationships with former stepgrandparents. Contact frequency and quality of post-dissolution relationships were contingent on efforts by middle-generation parents or stepparents to encourage or impede former stepgrandparents' endeavors to remain involved with stepgrandchildren. Losing connections with former stepgrandparents was upsetting to former stepgrandchildren, especially when their relationships with biological grandparents were not close. Individuals who maintained relationships with former stepgrandparents perceived positive benefits for themselves.

WHO SHOULD DO WHAT FOR WHOM?: CAREGIVING-RELATED DECISION MAKING IN LATE-LIFE STEPFAMILIES

C. Wexler Sherman, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Family conflict can surface in the face of illness and caregiving, and related decision making is often challenging for families with aging adults. Research has not, however, accounted for Americans' increasingly diverse and complex marital and family histories with respect to caregiving related decision making. This paper presents findings from a mixed methods study of late-life remarried spouses (n=36) providing care for a partner with dementia. Grounded in family systems and life course theories, this study examines remarried caregivers' expectations and experiences of engagement in decision making by adult children and stepchildren. Findings indicate a range of decision making dynamics across stepfamily members, including: collaborative, selective, divested, and disruptive. Collaboration was more common in response to arranging care assistance, while disruptive interactions commonly surfaced in response to financial decision making. Implications of how intergenerational relationship history and quality shape decision making support in late life stepfamilies will be discussed.

SESSION 4330 (SYMPOSIUM)

EVIDENCE FOR THE NEED TO DISRUPT AGING: IMPACT OF PERCEPTIONS OF AGING AND AGING STEREOTYPES

Chair: E. Tan, AARP, Washington, District of Columbia

Discussant: J. Stevens, AARP, Washington, District of Columbia

This symposium explores the potential health effects of negative stereotypes of aging and self-perceptions on aging. Prior research has linked self-perceptions of aging to self-reported health, health care utilization, functional status and cognitive status. Menkin, Seeman and Sarkisian examine the association between expectations regarding aging and health and walking in four diverse minority communities in Los Angeles. Prior research suggests that under stereotype threat conditions, older adults tend to underperform on tasks that emphasize memory performance. Gallant and co-authors from Canada report on a meta-analysis that shows a significant and robust impact of the of stereotype threat effect on memory performance. The authors report on the ability of age and level of education to moderate in the impact of negative age stereotypes on memory performance in old age. Mejía and Gonzalez report on the extent to which couples in middle age and older adulthood share positive and negative self-perceptions of aging. Using data from the 2008 through 2014 waves of the Health and Retirement Study they report how these shared perceptions predict future functional limitations above and beyond individual. Finally Sun and Smith use data from the Health and Retirement Study and the Health Care Mail Survey to determine the association between self-perceptions of aging and the likelihood of delaying medical care and older adults' decision-making processes when considering whether to seek medical care. Stevens concludes with an integrative discussion on AARP's "disrupt aging" agenda that seeks to improve self-perceptions on aging and combat stereotypes on aging.

AGE-EXPECTATIONS, PHYSICAL HEALTH, AND WALKING LEVELS AMONG MINORITY SENIORS

M. Josephine, C.A. Sarkisian, UCLA, Los Angeles, California

More positive perceptions of aging have been consistently linked to better physical health. Health behaviors are a possible mechanism; people with more positive self-perceptions of aging report more preventative health behaviors. However, extant research is limited by self-reporting of health behaviors or ethnically homogeneous samples. We tested whether more positive expectations regarding aging were associated with greater objective physical activity (average steps per day) using pedometer data from 240 African-American, Korean, Chinese or Latino seniors in Los Angeles with a history of high blood pressure. Although we replicated associations between aging expectations and self-reported health across all racial/ethnic groups (even after controlling for demographics and depression), we did not find an association between expectations and walking in adjusted regression models. An initial negative bivariate correlation between aging expectations and average steps was explained by racial/ethnicity differences in expectations and walking;

within each ethnicity subgroup, expectations were not associated with walking.

STEREOTYPE THREAT EFFECTS ON OLDER ADULTS' MEMORY: A META-ANALYSIS

L. Li, K. Patel, B. Armstrong, S.N. Gallant, B. Wong, Ryerson University, Toronto, Ontario, Canada

Stereotype threat describes instances in which an individual is at risk of confirming negative stereotypes about a group they identify with. In line with this, research suggests that exposure to negative age-based stereotypes can undermine the cognitive performance of older adults. The objective of the current meta-analytic review was to determine the magnitude of age-based stereotype threat effects on older adults' memory. Results revealed a significant and robust effect of stereotype threat induction on older adults' memory performance across reviewed studies. Specifically, when exposed to negative aging stereotypes, older adults showed consistent decrements in memory relative to control groups. The moderating roles of various demographic and methodological characteristics on stereotype threat effects will be discussed. Overall, these findings have implications for the interpretation of memory performance on lab-based memory tests and how self-perceptions of aging can influence test results..

COUPLES' SHARED SELF-PERCEPTIONS OF AGING AND IMPLICATIONS FOR FUTURE FUNCTIONAL LIMITATIONS

S.T. Mejia, R. Gonzalez, University of Michigan, Ann Arbor, Michigan

Self-perceptions of aging (SPA) are important for future health outcomes. Spouses in older adulthood are known to be linked in their health and well-being and may also co-construct beliefs about their own aging. This paper examines the link between spouses shared beliefs about their own aging and functional limitations six years later. HRS data from 8,760 couples (age range=51-96) were analyzed using latent variables that estimate shared and individual variance in SPA and functional limitations. Husbands' and wives' age, race, chronic illnesses (intraclass correlation [ICC]=.19), and physical activity (ICC=.17) were examined as contributors to shared SPA (ICC=.35) and future functional limitations (ICC=.21). Couples shared variance in SPA was significantly linked to their shared variance in functional limitations at follow-up ($p < .001$). Spouses' chronic illnesses and functional limitations contributed to the magnitude of shared SPA and future functional limitations, and suggest that couples' co-constructed environments are linked to their future health.

SELF-PERCEPTIONS OF AGING AND HEALTH CARE DELAY

J.K. Sun¹, J.E. Smith^{2,1}, 1. University of Michigan, Ann Arbor, Michigan, 2. Institute for Social Research, Ann Arbor, Michigan

While self-perceptions of aging (SPA) have been associated with a variety of health outcomes, few studies have examined how SPA influence older adults' health care-seeking behaviors. We use data from the 2010 Health and Retirement Study and the 2011 Health Care Mail Survey ($n = 2,866$) to examine whether SPA are associated the likelihood of delaying medical care. Over the 1-year follow-up,

17% of respondents reported at least one reason for delaying care. Every SD increase in positive SPA was associated with a lower likelihood of health care delay, adjusting for sociodemographic, economic, and health-related factors (OR = 0.80, 95% CI [0.71–0.90], $p < .001$). Latent class analysis revealed three groups characterized by different reasons for delay: 1) Health care access (58%) 2) Too busy (22%), and 3) Dislike going to the doctor (20%). Attitudes toward aging may affect older adults' decision-making processes when considering whether to seek medical care.

SESSION 4335 (SYMPOSIUM)

ADVANCES IN INTRAINDIVIDUAL VARIABILITY RESEARCH: IMPLICATIONS FOR ADULT DEVELOPMENT

Chair: G. Luong, *Colorado State University, Fort Collins, Colorado*

Co-Chair: A. Bielak, *Colorado State University, Fort Collins, Colorado*

Over the past decades, intraindividual variability research has gained momentum in lifespan developmental research. These lines of inquiry have shown that short-term changes can inform development that unfolds over longer periods of time. This symposium provides diverse perspectives from cognitive, affective, and personality research and highlights pressing questions that still need to be addressed. For example, what does intraindividual variability represent in various domains? What are the best ways to assess and analyze intraindividual variability? How can we incorporate the person and the situation in the study of intraindividual variability? Sliwinski and colleagues will discuss cutting edge methodological approaches to the study of intraindividual variability research. Bielak and Antsey will report how physical, mental, and life-style based health indices predict baseline intraindividual variability in cognitive speed and changes over time, and age moderated effects therein. Stawski and MacDonald will present research showing that various indices of psychosocial stress responses are associated with reaction time inconsistencies, and that these effects are greater with older age. Luong and colleagues will describe how various indices of fluctuations in affective responses may carry different implications for health and well-being, particularly for older adults. Finally, Nofle and colleagues will explore age differences in personality states and situational constraints and their implications for understanding trait personality development.

AMBULATORY APPROACHES TO MEASURING INTRAINDIVIDUAL COGNITIVE VARIABILITY IN EVERYDAY LIFE

M. Sliwinski, J.A. Mogle, J. Smyth, *Pennsylvania State University, State College, Pennsylvania*

Intraindividual cognitive variability can impede accurate measurement of cognitive status and obscure detection of cognitive decline indicative of normative aging or preclinical AD. This paper evaluates the advantages and challenges of using smartphones to measure cognitive function in real-time and in naturalistic settings to better measure intraindividual cognitive variability in order to 1) better model proximal

influences on cognitive function in ecological valid settings; and 2) improve the reliability of assessing cognitive status. Data are presented that illustrates the feasibility of using this approach in middle aged and older adults, as well as older adults with mild cognitive impairment (MCI). We show that brief (<1 minute) cognitive assessments made by smartphones have comparable, and in some cases superior, reliability and validity compared to standard neuropsychological tests. We discuss how this technology can be integrated into ongoing aging studies and general principles for designing ambulatory cognitive tests.

PSYCHOSOCIAL STRESS AND RESPONSE TIME INCONSISTENCY IN OLD AGE: A MEASUREMENT BURST APPROACH

R.S. Stawski¹, S.W. MacDonald², 1. *Oregon State University, Corvallis, Oregon*, 2. *University of Victoria, Oak Bay, British Columbia, Canada*

Psychosocial stress has been identified as an important modifiable risk factor for normal and pathological cognitive aging. Evidence exists showing psychosocial stress predicting poorer performance across multiple cognitive domains (e.g., working memory), with limited research considering stress effects on response time inconsistency (RTI). Using data from a measurement burst design, 111 older adults ($M_{age} = 80$, Range=66–95) completed a processing speed task on 6 occasions over a 14-day period, repeating this protocol every 6 months for 2.5 years. Participants also completed measures of daily and perceived stress. Results from multi-level models revealed that individual differences in emotional (affect) and psychosomatic (pain) reactions to daily stressors and global perceptions of stress were associated with greater RTI ($ps < .001$). Additionally, these associations increased with age ($p < .01$). Discussion will focus on the importance of different dimensions of psychosocial stress for understanding cognitive aging, and the utility of measurement burst designs for examining stress-RTI links.

EMBEDDING CONTEXT IN INVESTIGATIONS OF AFFECTIVE VARIABILITY: AGE DIFFERENCES IN AFFECT-HEALTH LINKS

G. Luong¹, C. Wrzus², G. Wagner^{3,4}, M. Riediger^{3,5}, 1. *Human Development and Family Studies, Colorado State University, Fort Collins, Colorado*, 2. *Johannes Gutenberg University, Mainz, Germany*, 3. *Max Planck Institute for Human Development, Berlin, Germany*, 4. *Berlin Technical University, Berlin, Germany*, 5. *Free University of Berlin, Berlin, Germany*

Context plays a potentially important role in explaining variability in affective experiences and yet, has often been overlooked in this line of research. The current study used data from a lifespan sample of 398 German participants ranging between 12–88 years of age ($M = 40$, $SD = 20$). Participants completed computer assisted personal interviews regarding health and well-being measures, as well as experience sampling assessments of daily affective experiences and events (e.g., uplifts). Three indices of positive affect (PA) were created: mean PA, PA reactivity to uplifts, and PA variability. In general, greater mean PA and lower PA reactivity and variability were associated with better health and well-being. These effects were more pronounced with older

age. The findings suggest the importance of considering both contextual and motivational factors that could contribute to affect-health links across the lifespan.

MORE INTERESTED BUT LESS EVALUATED: SITUATION CONSTRUALS' LINK TO TRAIT-RELEVANT BEHAVIOR IN OLD AGE

E.E. Nofhle¹, C. Gust¹, W. Fleeson², 1. *Willamette University, Salem, Oregon*, 2. *Wake Forest University, Winston-Salem, North Carolina*

Most research on personality development in later life uses trait questionnaires, which, despite their benefits, have several drawbacks. Trait questionnaires necessitate focusing on average behavior, often neglect context, and typically only track slow-moving processes over long periods. The current research employs two techniques which confront these obstacles. First, Big-Five personality states assessed across representative spans of daily life solves the problem of exclusive focus on averages. Second, inclusion of situational construals facilitates inquiry into context and chronic momentary processes. In two studies, older adults (aged 65–81) reported on situations and behavior using ESM and were compared with young and middle-aged adults (total N = 303). After attending this session, participants will appreciate that not only did older adults differ from other adults in trait-relevant behavior and situational construals, suggesting development in both traits and contexts, but they also differed in situation-behavior contingencies, suggesting changing strengths of processes in later adulthood.

SESSION 4340 (PAPER)

MENTAL HEALTH AND AGING

PATIENT-PROVIDER COMMUNICATION AND BENEFIT FINDING IN OLDER CANCER PATIENTS

M. Doherty^{1,2}, D. Gardner², 1. *CUNY Graduate Center, New York, New York*, 2. *Silberman School of Social Work, New York, New York*

Effective communication between medical providers and cancer patients plays a critical role in ensuring high-quality cancer care, and is associated with better treatment decisions, greater adherence, fewer unwanted medical interventions, and improved health outcomes. Provider communication may also be associated with positive coping and post-traumatic growth in cancer patients. This paper presents an analysis of a nationally representative dataset of the experiences of cancer survivors that examined the relationship between patient age and the experience of post-traumatic growth (i.e., benefit finding), and whether this relationship was mediated by the depth and quality of clinical communication (operationalized as: discussion of follow-up procedures, treatment side-effects, patient emotional and social needs, and lifestyle factors). The cross-sectional data were analyzed using multivariate regression models to examine the effects of a) patient age on benefit finding; b) depth of clinical communication on benefit finding; and c) patient age on depth of clinical communication. Findings supported previous evidence that

older adults with cancer have considerable unmet informational needs, and that attentive clinical communication may enhance psychological adaptation to cancer. In the absence of adequate clinical communication, older adults may not experience the opportunities for benefit finding that younger cancer patients are afforded. The authors discuss implications for social work practice, policy and future research in cancer care and health care for older adults. Social workers may benefit from greater appreciation of the informational needs of older adults, and the skills needed to support effective patient-provider communication and shared decision making for aging cancer patients.

DEPRESCRIBING ANTIPSYCHOTICS IN LONG TERM CARE RESIDENTS WITH NEUROPSYCHIATRIC SYMPTOMS AND DEMENTIA

H. Brodaty¹, T. Jessop¹, F. Harrison¹, M. Cations¹, A. Shell¹, L. Chenoweth², 1. *Dementia Collaborative Research Centre, University of New South Wales, Sydney, New South Wales, Australia*, 2. *Centre for Healthy Brain Ageing (CHeBA), Sydney, New South Wales, Australia*

Background

Antipsychotic medications continue to be used in the management of Behavioral and Psychological Symptoms of Dementia (BPSD) despite adverse effects and revised guidelines. The Halting Antipsychotic use in Long Term care (HALT) project aimed to deprescribe these medications and improve non-pharmacological behavior management.

Method

We recruited residents from 24 long term care facilities who were aged 60+ years, on regular antipsychotic medication, without a primary psychotic illness, and without severe neuropsychiatric symptoms. Consenting participants were assessed one month and one week prior to deprescribing. Training was provided for facility nurses on how to manage neuropsychiatric symptoms and a dose reduction schedule was sent to and approved by GPs before deprescribing commenced. Participants were re-assessed 3, 6 and 12 months later. The primary outcome measure was reduction of regular antipsychotic medication without use of substitute psychotropic medications. The secondary outcome measures were NPI total and domain scores and Cohen-Mansfield Agitation Inventory (CMAI) score.

Results

Of 157 residents recruited, 133 commenced deprescribing and 125 achieved antipsychotic cessation. Of these, 76% remain off the antipsychotic medication up to 12 months following initial reduction. NPI and CMAI scores remained stable from baseline to 6 month follow-up with a similar trend seen for those who have reached 12 month follow up.

Conclusion

Deprescribing of antipsychotics in long term care residents with previous BPSD is feasible without re-emergence of BPSD; however, challenges still exist regarding sustainability and culture of prescribing in aged care. The impact of facility and individual factors on outcomes and reasons for recommencement following deprescribing warrant further investigation.

IMPACT OF NEUROSENSORIAL DISORDERS ON MOOD IN OLDER PEOPLE

G. Prada^{1,2}, R. Nacu^{1,2}, L. Lungu^{1,2}, A. Prada², A. Ilie³, I. Alexa³, A. Herghelegiu², 1. *Clinical department, National Institute of Gerontology and Geriatrics "Ana Aslan", BUCHAREST, Romania*, 2. *University of Medicine and Pharmacy "Carol Davila", Bucharest, Romania*, 3. *"Gr.T. Popa" University of Medicine and Pharmacy, Bucharest, Romania*

Introduction

Prevalence of neurosensorial disorders increases with age, having multiple impact in elderly, including on mood. Study objective was to identify effects of neurosensorial disorders on mood in elderly, including their relationship with comorbidities.

Material and Methods

A total of 304 subjects, age-range 50–95 years, were included, divided into two groups: 152 adults (50–64 years) and 152 elderly (75–95 years).

Results

Visual impairments had highest prevalence in elderly, retinopathy being main cause. Glaucoma was more prevalent in women ($p < 0.01$), irrespective of age ($p > 0.05$) and it correlated with mood disorders ($r = 0.87$). Diabetic retinopathy, most prevalent visual disorders in men and correlated with mood disorders ($r = 0.67$). Depression severity decreased with age, presumably due to an adaptation effect. Other visual disorder: cataract, significantly more prevalent in older women ($p < 0.01$). It correlated with mood disorders ($r = 0.73$). Hearing disorders were significantly less prevalent in both groups and had less impact on mood disorders in elderly ($r = 0.51$). Comorbidities have been identified. Rheumatic diseases were most prevalent in elderly, followed by diabetes mellitus and cardiovascular disorders. Rheumatic disorders had more important impact on mood in elderly ($p < 0.01$), irrespective of gender ($p > 0.05$), and the effect increased when corroborated with neurosensorial disorders. This effect was less prominent in adults. Cardiovascular diseases had less effect on mood, being correlated mainly with mild depression ($r = 0.59$). Concomitant presence of neurosensorial disorders with somatic conditions reduces therapeutic compliance in elderly.

Conclusions

Comorbidities have a significant impact on mood disorders in elderly with neurosensorial disorders. Consequently the three conditions should be addressed concomitantly.

ARE HIV-INFECTED OLDER ADULTS AGING DIFFERENTLY?

S. Karpiak^{1,2}, R.J. Havlik¹, A. Ambroziak^{1,3}, 1. *ACRIA Center on HIV & Aging, New York, New York*, 2. *New York University College of Nursing, New York, New York*, 3. *Warsaw University, Warsaw, Poland*

Older adults with HIV are experiencing non-HIV related comorbidities. We evaluated the onset and frequency of multimorbidity in HIV infected older adults derived from a New York City cohort (N=914) ROAH (Research on Older Adults with HIV). ROAH data was compared, after matching, to

samples from the National Health and Nutrition Examination Surveys (NHANES & NYCNHANES). Comparisons were based on self-reported conditions (arthritis, cancer, depression, diabetes, CVD, hypertension, respiratory condition, stroke, HIV). When assessing the number of comorbid conditions (0-1,2,3,4,5,6+), older adults with HIV evidenced averages of 2.65/2.60 comorbidities, significantly higher than NHANES (1.65/1.48). Depression was the highest frequency in ROAH (52 & 62%) vs NHANES (17 & 21%). In multivariate logistic models, depression was best explained by younger age, HIV, morbidity number, unemployment. Analyses do not support hypotheses of accelerated aging. Increasingly the need for HIV care providers to embrace geriatric care principles optimized to manage multimorbidity and contributing risks emerges.

SESSION 4345 (PAPER)

SUCCESSFUL AGING: CROSS-NATIONAL AND LONGITUDINAL PERSPECTIVES

TRANSITIONING FROM SUCCESSFUL AGING: LONGITUDINAL ANALYSES OF PREDICTORS AND PATTERNS

T.M. Cooney¹, A.L. Curl², 1. *Sociology, University of Colorado--Denver, Denver, Colorado*, 2. *Department of Family Science & Social Work, Miami University, Oxford, Ohio*

Despite extensive research using Rowe and Kahn's model of successful aging, its application to representative national samples is rare. Longitudinal research permitting analysis of transitions to non-successful aging (NSA) over time at the individual level also is lacking. We apply event history analysis to 8 waves (2-year intervals from 1998–2012) of representative data for 11,346 individuals ages 50 and older from the Health and Retirement Study in the U.S. to examine influences on the transition into NSA. We extend prior research by considering the impact of factors present at birth (e.g., race, place of birth), as well as time-varying adult statuses (e.g. education, income) and lifestyle factors (e.g., smoking). Significant predictors of NSA include age and parents' longevity. Though the results also reveal that NSA is accelerated for Blacks, Hispanics, females, and those born in the Southern U.S., both race and ethnicity become insignificant once adult status factors and lifestyle variables are considered. High BMI and smoking positively influence transitions to NSA, while higher education and income delay NSA. Also examined are components of successful aging that are most often implicated in NSA transitions at distinct ages. For persons transitioning to NSA between ages 50 and 69, mobility problems and chronic disease are the most common NSA dimensions reported. But, for persons transitioning to NSA from age 70 on, lack of productive engagement is the most common dimension, followed by mobility problems and chronic illness. Implications of all of these findings for interventions promoting successful aging are addressed.

MODELING OLD AGE LIFE TRAJECTORIES—A JAPANESE-SWEDISH COMPARISON

M. Lagergren³, Y. Saito¹, N. Kurube², 1. *Nihon University, Tokyo, Japan*, 2. *Nihon Fukushi University, Aichi, Japan*, 3. *Stockholms lans aldrecentrum, Stockholm, Sweden*

Functional limitations and provision of long-term care for old persons is most often regarded from a systems level calculating and comparing proportions of old persons in different functional states and on different levels of long-term care. A simulation model has been developed which looks at this from the individual's point of view. The model calculates the distribution on level of functional limitations combined with level of LTC for a 78 year old man or woman after three, six, nine, twelve and fifteen years (in the Japanese case 5, 10 and 15) given the initial state expressed in those terms. Different assumptions can be made concerning the health development in the population and the structure of the LTC system and thus the effect of these assumptions on the individual level can be explored.

Longitudinal data for the model has been taken from the Swedish SNAC-study, baseline and three year follow up, and from the Japanese NUJLSOA-study, wave 2 and wave 4 five years later. Transition probabilities are calculated by relating individual states between waves. Changes over time are then calculated in the model by matrix multiplication using the Markov assumption. In this way it is also possible to compare individual prospects in the Swedish and Japanese old age populations with regard to expected future functional limitations and LTC care level at a certain age. Examples of results will be presented.

AGING WELL AMONG BLACK AND WHITE OLDER AMERICAN MEN: WHAT IS THE ROLE OF MASTERY?

K. Latham-Mintus, *Department of Sociology, Indiana University-Purdue University--Indianapolis, Indianapolis, Indiana*

Objectives: This research explores Black-White differences in aging well and investigates whether mastery acts as a buffer against poor health for Black and White older American men.

Methods: Using data from the Health and Retirement Study (HRS) (2008–2012) and the Psychosocial and Lifestyle Questionnaire (PLQ), a series of multinomial logit models were created to ascertain the odds of aging well over a two-year period. Because the PLQ is administered to half samples, the 2008 and 2010 samples were pooled and outcomes were assessed in the subsequent wave (i.e., 2010 or 2012). Respondents who rated their health favorably (good or better) and were free of disability at both waves were considered to be aging well. Mastery was lagged, and analyses (N=4,825) controlled for numerous risk factors including lifetime stressors.

Results: After introducing the controls, there were no significant differences in the odds of aging well among Black and White men. Mastery was associated with higher odds of aging well (OR=1.14 [1.05, 1.25]; $p=0.001$). Mastery moderated the relationship between race and aging well. The predicted probability of aging well was relatively flat across all levels of mastery among Black men, yet White men saw consistent gains in the probability of aging well as mastery increased.

Discussion: High levels of mastery are linked to positive health—often acting as a buffer against stressful life events. However, among Black men, higher levels of mastery did not necessarily equate to aging well. Yet, these analyses point to potential resiliency among Black men with low mastery.

POTENTIAL DETERMINANTS FOR SUCCESSFUL AGEING-POPULATION-BASED COURAGE FOLLOW-UP STUDY IN POLAND

A. Galas¹, T. Grodzicki², K. Zawisza¹, B. Tobiasz-Adamczyk¹, 1. *Chair of Epidemiology and Preventive Medicine, Jagiellonian University Medical College, Krakow, Poland*, 2. *Chair of Internal Medicine and Gerontology, Jagiellonian University Medical College, Krakow, Poland*

Rapid demographic changes increase interest in determinants associated with successful ageing closely linked to the ability to maintain good quality of life (QoL) by older people. Functional status, social and physical environment are considered as important contributing factors. The purpose was to assess whether functional status, social networks, social participation and the characteristic of surrounding build environment are predictors for better QoL among older (60+) and younger (<60) individuals.

Population based follow-up study in Poland, Europe was performed in two phases in 2011 and 2015–2016; the mean follow-up time was 4.3 years. Analyses included 769 at 60+ (54.7% males) and 884 individuals at age <60 (59.5% males). WHOQOL-AGE, WHODAS-2.0, COURAGE Social Network Index, COURAGE Subjective Build Environment were measured during face-to-face interviews.

Multiple linear regression used to find predictors for QoL revealed functional status and social participation as important predictors in both older (betas=0.34, 0.12) and younger groups (betas=0.30, 0.09). Additionally, quality of living place build environment and social networks predicted QoL in younger group (betas=0.14, 0.14). Analyses considering the change in functional status instead of the baseline status showed positive effect of social networks in both age groups.

Functional status, social and build environment should be considered as key predictors of quality of life among older adults, therefore these should be of interest for health promotion strategies in ageing societies.

Founded by the European Commission Seventh Framework Programme (FP7/2007–2013, Grant 223071), Jagiellonian University Medical College (K/ZDS/005241), ATHLOS: Ageing Trajectories of Health: Longitudinal Opportunities and Synergies, EU Horizon 2020 No635316

THE EFFECT OF SUCCESSFUL AGING ON THE LIFE SATISFACTION OF KOREAN OLDER ADULTS

M. Kim, 1. *Daegu University, Daegu, Gyungbuk, Korea (the Republic of)*, 2. *The Institute of Aging Society, Daegu University, Daegu, Korea (the Republic of)*

Description: Rowe and Kahn's successful aging model has long been used as a framework for studying older adults' well-being. This model consists of three parts: avoiding diseases and disability, high cognitive and physical function, and active engagement of life. Also according to Erikson's psycho-social theory of human development, relationships with adult children is important for their generativity. In Korea, Confucianism emphasizes the role of filial piety

between the adult children and their parents as an important role for older adults' well-being. This study examines this relationship between the older adults and their adult children as an important factor of successful aging.

Method: This study used the 4th and 5th wave of KLoSA (Korean Longitudinal Study of Ageing). The target population of this study was 1,385 who is older than 65. Data was analyzed using hierarchical multiple regression. Life satisfaction is the dependent variable (5th wave). Besides Rowe and Kahn's three parts of successful aging, other independent variables include the relationship between adult children and older adults such as distance of living area, meeting and contact with adult children (4th wave) were included.

Findings: Findings reveal married individuals were healthier, have better memory, and attend more social meetings compared to those who do not have spouse. Regular exercise, strong memory skills, meeting with friends, and contact with their adult children by mail or phone were significant factors affecting the older adults' life satisfaction. Thus, when we use the model of successful aging, we need to consider cultural context of other countries.

SESSION 4350 (SYMPOSIUM)

EXTENDING WOMEN'S WORKING LIVES... ALL THE WAY TO THE PRECARIAT?

Chair: D.A. Street, *SUNY at Buffalo, Buffalo, New York*
Co-Chair: Á. Ní Léime, *National University of Ireland Galway, Galway, Ireland*

Citing a variety of reasons, including population aging, burdensome public pension obligations, people's longer, healthier, lives and the presumed salutary effects of continued work, governments in wealthy countries have been exhorting citizens to work to older ages. This symposium turns a critical feminist political economy lens on theoretical issues (paper 1 by Vickerstaff, Krekula) and specific material circumstances (papers 2–4) to consider gendered opportunities and risks of policies intended to extend working lives. A country-specific case study (paper 2) from Australia (Brooke) and a comparative analysis of secondary data from three liberal countries - Ireland, US, UK (Ní Léime, Street, Loretto) use the theoretical model to frame the empirical analyses presented. The empirical papers show that, despite experiencing different national labour markets and policy regimes, older women's extended working lives are bifurcated into good and bad jobs. A small proportion of older women have good jobs—the professions, entrepreneurship, or high quality employment with flexible working arrangements prior to retirement. However, in each country, the “flexibilisation” that is necessary to extend working lives also incorporates many older women into the precariat of poor jobs. For many women, the only option for extending working lives is to work at ever older ages in low paid, low skills jobs, due to the accumulation of disadvantage over their lifecourses. The intersections created by the demands of unpaid caring, employment trajectories interrupted due to women's normative social roles, and higher levels of ill health contribute to structured disadvantages for many older women workers.

FROM HOMOGENIZATION OF OLDER WORKERS TO GENDERED POWER RELATIONS AND GOVERNMENTAL PRECARIZATION

C. Krekula¹, S. Vickerstaff², 1. *Social and Psychological Studies, Karlstads University, Karlstad, Sweden*, 2. *University of Kent, Canterbury, Cornwallis, United Kingdom*

The debate on extending working life has to a great extent described the ageing population as a challenge to welfare provision and benefits, and policy development has been based on economic perspectives. Unlike earlier policy on job opportunities for women, ethnic minorities and differently abled people extending working life (EWL) policies were not urged primarily by social movements. The argument for EWL has typically treated older workers as a homogenous category and only to a limited extent dealt with issues related to social relations beyond work organizations such as family and domestic arrangements. With help of the concepts biopolitics and governmental precarization and their focus on power by control of bodies and lives, this paper discusses extending working life as an element of intersecting power relations that brings consequences on a wider social level.

THE AUSTRALIAN GENDERED LANDSCAPE OF EXTENDED WORKING LIVES

E. Brooke, *Swinburne University of Technology, Melbourne, Victoria, Australia*

The objectives of researching the gendered Australian landscape are firstly, to understand patterns of gendered employment structured by globalised forces rendering women vulnerable to insecure low-end work. Secondly, to explain how cumulative employment patterns across the life course produce late life inequalities. Neo-liberal frameworks are built on gender gaps in wages, superannuation and Age Pension reliance which cascade to a low road ‘de-accumulation’ life course trajectory. Using national data from Australia, I show that low-road employment trajectories act as disincentives to extend working lives and continue to promote early exit to ‘retirement’. Flexibilisation of working time has resulted a fragmented labour force and precarity at the individual level. Patterns of gendered unemployability and workforce detachment mean that women are more likely to become discouraged workers and less likely to perform job seeking activities. Global forces affecting employment interact with reproductive responsibilities resulting in late career and post work inequalities.

GENDER, PRECARIOUS EMPLOYMENT, AND LONGER WORKING LIVES IN THE U.S., UK, AND IRELAND

A. NiLeime^{1,2}, W. Loretto³, D.A. Street⁴, 1. *Sociology, Case Western Reserve University, Cleveland, Ohio*, 2. *National University of Ireland Galway, Galway, Connacht, Ireland*, 3. *University of Edinburgh, Edinburgh, United Kingdom*, 4. *State University of New York at Buffalo, Buffalo, New York*

Based on comparative analysis of extended working life, family friendly policies and gendered employment and pension patterns in three liberal welfare states - Ireland, US, UK

- this research focuses on the implications for women workers in low-paid precarious employment of having to work longer. We compare gendered pension and employment outcomes to question whether the UK and Ireland should follow the policy path taken by the US (to raise state pension age) or whether extended working life policies that have been introduced in the UK and Ireland should instead be modified to take account of the situation of precarious workers. Empirical findings establish that women in low-paid and non-standard employment are much more likely to be dependent on state pensions and, further, that precarious employment is increasing in each country. Therefore, raising state pension ages disadvantages women in low-paid precarious jobs, especially if the jobs are physically demanding.

SESSION 4355 (PAPER)

LONG-TERM CARE III

NEGOTIATING CARE IN NURSING HOMES: THE EXPERIENCES OF FAMILY MEMBERS, RESIDENTS AND STAFF

J. Baumbusch¹, D. Beaton¹, M. Leblanc¹, A. Phinney¹, P. Rodney¹, D. O'Connor¹, C. Ward-Griffin², 1. *Nursing, University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Western University, London, Ontario, Canada*

In Canada, families will be contributing upwards of 60 million hours of care per year in nursing homes by 2018. Even though families are a cornerstone of care in this sector, their involvement, both with their relative and the broader functioning of the nursing home, is largely invisible. Past research has indicated that families often experience role ambiguity, perceive conflict with staff, and may feel excluded from the care of their relative. In this critical ethnographic study, we aimed to examine the negotiation of care among families, residents and staff, particularly around decision-making and 'hands-on' care within the broader institutional environment. The study is taking place at two homes in British Columbia, Canada. A purposive sample of 26 family members, 17 staff members, and 8 residents participated in in-depth interviews. Additional participants were included in 145 hours of participant observation. Key findings illustrate ways in which individuals are working towards the similar care goals of 'balancing risk and safety', 'navigating the boundaries of care practices, and 'supporting person-centered care'. However, individual's approaches to these care goals can be different, contributing to conflict among those providing and receiving care. These findings have implications for care processes that support effective communication and relational approaches to care in nursing homes.

A STUDY OF FACTORS AFFECTING CARE WORKERS' PERCEPTIONS TOWARD NEW POLICIES FOR FOREIGN CARE WORKERS

N. Tsukada, *College of Commerce, Nihon University, Tokyo, Setagaya-ku, Japan*

It is officially estimated that about 377,000 care workers will be needed by 2025 in Japan. The Japanese government is discussing this need, including the possibility of broadening

immigration status to encompass foreign care workers. Options include both developing a new immigration status, "LTC(Kaigo)" and adding a new LTC area to an existing immigration status, "technical-intern-training(Ginou-Jissyuu)." This study explores care workers' perceptions of these options and factors related to differences in their perceptions. Data were obtained from a nationwide survey of LTC institutions for the elderly in 2014. Structured questionnaires were sent to randomly selected 3,932 institutions. A total of 586 responses were obtained. Preliminary analyses revealed that 42.5% of care workers indicated that they supported the idea of a new immigration status, "Kaigo," and 55.5% said the same about adding LTC areas to already existing status, "Ginou-Jissyuu." The most cited reason(77.4%) for agreeing to add LTC areas to "Ginou-Jissyuu" immigration status was "to secure care workers because it will be inevitable to run out of them," and 64.6% of the care workers who disagreed with adding the area chose the reason, "there remains concerns, including declining salaries of and increasing turnover rates of care workers." There were statistically significant relationships between perceptions of care workers who agreed accepting foreign LTC workers and that of those who agreed broadening immigration status. It is suggested that the government and directors of LTC institutions pay attention to care workers' perceptions in order not to accelerate already higher turnover rates of care workers.

REGISTERED NURSE DELEGATION IN NURSING HOMES: THE ROLE OF DIRECTORS OF NURSING

E.O. Siegel¹, D. Bakerjian¹, K. Bettega¹, S.K. Sikma², 1. *University of California, Davis, Sacramento, California*, 2. *University of Washington, Bothell, Washington*

The need for improved care in U.S. nursing homes continues, and the role of RN delegation in nursing home quality is an area of ongoing interest. Nursing home RNs routinely lead nursing teams, with licensed practical/vocational nurses and unlicensed nursing personnel providing the majority of direct nursing care. Effective RN delegation of nursing activities is an essential component of nursing home care; yet, evidence suggests gaps in delegation practices, with implications for the quality of care. Directors of Nursing (DONs) are in key leadership positions to address gaps in delegation practices; however, few resources are available to guide DONs in this regard. As part of larger study to develop and test a delegation resource for DONs, this paper describes challenges DONs face in addressing gaps in RN delegation practices by the nursing staff under their charge. Using a descriptive qualitative approach, audio-taped semi-structured interviews were conducted with a convenience sample of 28 current/previous DONs and nursing home leaders. Thematic analysis was used to analyze the interview transcripts, revealing two key themes. First, DONs are commonly unprepared for the demands they face in this leadership position, in general and specific to RN delegation. Second, perceived and actual resource limitations in the DON's work environment (i.e., staffing, time) challenge their capacity to ensure effective and safe RN delegation practices. These findings provide directions for further research to understand and address the challenges faced by DONs as the nursing home leaders charged with ensuring effective and safe nursing practice and improved resident outcomes.

SESSION 4360 (SYMPOSIUM)

STRENGTHENING ADVANCE CARE PLANNING THROUGH INNOVATIVE POLICYMAKING, PRACTICE, AND RESEARCH

Chair: G. Stein, *Yeshiva University, New York, New York*

The National Academy of Medicine in its 2015 report, *Dying in America*, advocates advance care planning (ACP) as vital for people with serious, advanced illness to assure that health care decisions near the end of life are made according to their preferences and values. This allows the very ill to forego unwanted invasive procedures that might detract from the quality of their lives, and instead choose hospice and other palliative measures that focus on quality of life and comfort. This symposium presents policy, practice, and research strategies from social work perspectives. The first presentation from an author of *Dying in America* and of the 2016 Roundtable on Quality Care for People with Serious Illness, describes innovative legislative proposals and policies, resources, online registries, and evidence-based quality measures that promote ACP. The second presenter uses data from a national survey to describe the extent to which hospice and palliative care social workers facilitate, conduct, and lead ACP planning activities. The third presentation describes findings from interviews with bereaved caregivers on how ACP and ongoing communication influenced outcomes at the end of their loved one's life. Finally, the fourth presenter discusses attitudes and behaviors toward advanced directives among Chinese American older adults, and the importance of culture. Each of the presenters discusses the implications of these findings and potential strategies for policymaking, practice, and research.

ADVANCE CARE PLANNING: POLICY

J. Peres, *Private Clinical Practice, Chevy Chase, Maryland*

Advance Care Planning (ACP) is seen as a dynamic process that changes over time and involves a clarification of one's goals and wishes. Contentious issues such as the so-called 'death panels' or physician payment for discussion of advance directives are continually debated in public policy. In the midst of these debates there have been many new approaches developed to assist with advance care planning. New legislation and policies governing ACP, online resources and registries are beginning to be promoted. The National Academy of Medicine is establishing a Roundtable on Quality Care for People with Serious Illness inspired by the recent 2015 Institute of Medicine report *Dying in America: Improving Quality and Honoring Individual Preferences Near the End of Life*. As part of the Advance Care Planning Symposium, this presentation will focus on the policies being developed by the Roundtable and need for evidence based quality measures.

DOCUMENTING THE SOCIAL WORK ROLE IN ADVANCE CARE PLANNING

G. Stein^{1,2}, G. Christ^{2,3}, J. Cagel^{4,2}, 1. *Yeshiva University - Wurzweiler School of Social Work, New York, New York*, 2. *Social Work Hospice & Palliative Care Network, Seattle, Washington*, 3. *Columbia University School of Social Work, New York, New York*, 4. *University of Maryland School of Social Work, Baltimore, Maryland*

Social workers are core members of health care teams that support and educate their patients and families in developing advance care plans. This study documents the extent and breadth of social work participation in advance care planning. During the fall/winter 2015, researchers surveyed approximately 700 palliative social workers; over 90% were masters trained, many with clinical social work licenses, advanced training and credentials, and many years of experience. The 500 clinical respondents reported that among the social workers in their facility, 96% conducted advance care planning discussions; 80% ensured their patients and families were informed about planning options; 68% documented planning decisions; and 60% led planning discussions more than 6 times per month. Two-thirds rated themselves as very competent or expertly competent in facilitating advance care planning discussions. These results document that licensed and experienced social workers are facilitating, conducting, and leading advance care planning activities.

HOW ADVANCE CARE PLANNING INFLUENCES THE END-OF-LIFE EXPERIENCE: BEREAVED CAREGIVERS' PERSPECTIVES

D.P. Waldrop, J. McGinley, *University at Buffalo, Buffalo, New York*

Advance Care Planning (ACP) facilitates the expression of a dying person's wishes and guides decision-making. Yet, in near-death moments, caregivers are confronted with difficult realities. The purpose of this study was to investigate bereaved caregivers' perspectives on how ACP influenced outcomes at the end of a loved one's life. In-depth interviews were conducted with 108 bereaved caregivers 4 months after the death. The results indicated that 104 (96%) hospice patients had an advanced directive and 73 (68%) had spoken about their wishes with a healthcare provider. However, 42 (40%) caregivers did not discuss death with their loved one; 26 (25%) did not say goodbye, reporting significantly poorer physical health ($t[104]=-2.9, p < .05$) and more frequent grief ($t[103]=-1.9, p < .10$). Three themes illustrated the end-of-life experience: Peaceful-Expected; Difficult-Uncertain; and Shocking-Unexpected. The results suggest that ACP is not an event but a process and families need continuing preparation for what they experience.

ADVANCE CARE PLANNING ATTITUDES AND BEHAVIORS OF CHINESE AMERICAN OLDER ADULTS

C. Berkman, X. Liu, *Fordham University, New York, New York*

The study purpose is to describe advance care planning attitudes and behaviors of Chinese American older adults. Chinese American senior center members ($n=150$) were interviewed. If diagnosed with incurable cancer, most reported wanting to know (86.7%), and wanting their family to know (88.7%) about this diagnosis. Half wanted someone other than themselves to be told first. Almost all (94.0%) wanted to know about symptoms as the illness progressed, and about life expectancy (88.5%). With this diagnosis, 79.3% wanted to know about life-sustaining treatments and 90% wanted to know about palliative care. Most (92.4%) had never discussed their end-of-life treatment preferences with their doctor, including 89.5% who reported wanting to have

this discussion before they are ill. Most (94.3%) disagreed that discussing death and dying with their doctor could be harmful. The stereotype of Asian older adults not wanting to participate in advance care planning is not supported by these findings.

SESSION 4365 (SYMPOSIUM)

POLICIES RELATED TO AGEISM: PRESENTATIONS FROM COST IS1402 ON AGEISM

Chair: L. Ayalon, *Bar Ilan University, Ramat Gan, Israel*

Although ageism is the most commonly reported “ism” in society, research on policies related to ageism is only beginning to emerge. This symposium aims to provide a broad overview on specific policies associated with ageism. Dolberg et al. discuss migration policies in relation to ageism. They demonstrate how direct and indirect ageist policies impact the lives of older immigrants. Sourbati & Carlo stress the importance of not treating older adults as a homogenous group, but rather appreciating and addressing differences with regard to the use of ICT in relevant policies. Abduzel & Perek-Bialas demonstrate the direct association between employment policies and ageist attitudes towards older workers. Graziano & Fialova discuss potential policies to reduce ageism in prescriptions to older adults. Finally, Ayalon provides an integrative discussion on the need to acknowledge ageism in policy research. Discussion occurs within the context of an EU funded research group on ageism (COST IS1402).

AGEISM IN THE LABOUR MARKET—POLICIES INFLUENCE PERCEPTIONS OF OLDER WORKERS

L. Abuladze¹, P. Jensen², J. Perek-Bialas^{3,4}, W. De Tavernier²,
1. *Estonian Institute for Population Studies, Tallinn University, Tallinn, Estonia*, 2. *Centre for Comparative Welfare Studies, Aalborg University, Aalborg, Denmark*, 3. *Jagellonian University, Krakow, Poland*, 4. *Warsaw School of Economics, Warsaw, Poland*

We analyse the role labour and retirement policies play in promoting or counteracting ageism in the labour market. Data from the World Value Survey (Wave 6, n=27,264) show that in Romania (33.9%), Russia (20.8%) and Poland (16.4%), a 70-year-old boss is considered least acceptable – an opinion least found in Japan (1.2%) and Germany (1.9%). At the individual level, we find that the higher educated and individuals with higher satisfaction of life think a 70-year-old boss is more accepted; no relation with age is found. At the country-level, not only the country’s demographics but also labour and retirement policies (e.g. lower retirement ages) are shown to shape individuals’ perceptions of older people. We argue that law-makers should be aware of such unintended consequences of their policies, as they might undermine efforts to extend working lives.

ACTIVE AGEING AS DIGITAL MIGRATION: TIME TO THINK BEYOND AGEIST MYTHS

M. Sourbati, *University of Brighton, London, United Kingdom*

This paper draws on a study of digital inclusion and Active Ageing (AA) policies in the UK and Italy, two countries with similar trends in population ageing and different

ICT diffusion patterns (Carlo and Sourbati, 2015), to propose a framework for age-aware media/technology policy design. Our study found co-constructions of age and exclusion mirrored digital media diffusion. In Italy, a strong focus on generational ‘digital divides’ came with expectations ICT will facilitate AA, enhancing the social and economic inclusion of older groups. In the UK, ICT diffusion has modified ‘generational’ divisions: Technology use patterns reflected social-economic inequalities including sex/gender and race rather than generational divides. Our paper contributes a counter to conceptualizations of AA as digital migration, relating to popular generational digital native-immigrant binaries. Our paper makes a case for sensitivity to the diversity in experiences of age and technology engagement to promote age-friendly policy design for all.

AGEISM IN IMMIGRATION POLICIES

P. Dolberg¹, S. Sigurdardottir², U. Trummer³, 1. *Ben-Gurion University of the Negev, Beer-Sheva, Israel*, 2. *University of Iceland, Reykjavik, Iceland*, 3. *Center for Health and Migration, Vienna, Austria*

In the past few decades, the older immigrants’ population in Western countries has become wider. This population consists of two main distinctive groups: ageing individuals who migrated as labour migrants, who aged in the immigration country, and individuals who migrated in older age. Ageism is the complex and often negative social construction of old age, which frequently form as a double jeopardy.

Policy research findings indicate that age is a significant criterion in immigration policies mainly due to the labour market demands. Furthermore, different studies display older immigrants’ disadvantages, yet, most of them failed to observe it as practices of ageism.

In the current presentation, we will identify manifestations of ageism against older immigrants in policies, and discuss the straightforward expressions of ageism when it comes to immigrants. We will also discuss the roles of class and ethnicity in ageism against older immigrants.

AGEISM IN THE HEALTH CARE SYSTEM

G. Onder¹, D. Fialová², 1. *Universita Cattolica, Rome, Italy*, 2. *Charles University, Prague, Czech Republic*

Ageism in healthcare is a prevalent phenomenon with potential severe consequences for older patients. The “COST Action IS1402: Ageism - a multi-national, interdisciplinary perspective” reviewed possible definitions of ageism showing that the multidimensionality and complexity of the phenomenon, i.e. its multiple components and combinations between components, have not been fully assessed by existing definitions. In particular, self-directed and implicit components of ageism are rarely measured by existing definitions and assessed in clinical studies. Important health care aspect of ageism addressed by the COST Action include the assessment of ageism in the pharmacological treatment of older adults and their inclusion in clinical studies that prove the efficacy of pharmacological treatment. Priorities ageism include 1. provide a multidimensional and comprehensive definition of ageism; 2. measure and assess stereotypes and prejudices specifically directed towards older patients; 3. define interventions to reduce ageism and improve the health care of older people.

SESSION 4370 (SYMPOSIUM)

BRIDGING THE SERVICE GAP FOR OLDER ADULTS WITH MENTAL HEALTH NEEDS

Chair: D.L. White, *Portland State University, Portland, Oregon*

Co-Chair: M.B. Neal, *Portland State University, Portland, Oregon*

Discussant: G. McKenzie, *Oregon Health & Science University*

Although emotional well-being generally increases with age, many older adults are at risk for poor mental health. Declining physical health and increased social isolation place many at risk for depression and anxiety. Also, people who have been diagnosed with a serious mental illness (e.g., schizophrenia, bipolar disorder) are living longer, and they experience age-related changes prematurely. Brain injuries such as those related to falls and other trauma are on the rise. Dementia, the sixth leading cause of death, is increasingly recognized as a major public health concern. Multiple co-morbidities that often accompany these conditions further compromise well-being. U.S. health and social service systems have not prioritized the needs of older adults with these multiple and complex needs. Services are fragmented as agencies work in silos with different funding priorities, eligibility requirements and knowledge bases. As a result, we see high rates of health care utilization, poor quality of life, and increased mortality. The State of Oregon has launched several initiatives designed to build bridges between service systems and ultimately fill gaps in services to older adults. This symposium will report on results from three of these initiatives: 1) coordinating services across systems through a new workforce, "Older Adult Behavioral Health Specialists;" 2) implementing evidence-based programs for older adults with moderate depression using strength-based, problem solving approaches (e.g., PEARLS, Healing Pathways); and 3) a dementia training program that includes a focus on people with both serious mental illness and dementia, emphasizing person-centered thinking and planning.

OLDER ADULT BEHAVIORAL HEALTH INITIATIVE: BUILDING COMMUNITY CAPACITY

M.B. Neal, L. Dreyer, D.L. White, *Portland State University, Portland, Oregon*

The Oregon legislature funded positions for 24 Older Adult Behavioral Health Specialists (OABHS) to address the gaps in services for older adults with behavioral health needs (i.e., mental health and/or substance misuse). The OABHS are responsible for building community capacity by increasing coordination among stakeholders, conducting workforce training, and providing complex case consultation. This paper reports on the outcomes after the first two years of the program through analysis of OABHS quarterly reports and assessments by community stakeholders. Specifically, stakeholders (e.g., primary care providers, emergency responders, aging services providers, mental health providers, advocates) report on various outcomes, including coordination among

local organizations with processes in place for addressing gaps in services; increasing knowledge levels about older adults' behavioral health needs; increasing the use of best practices to screen, assess, and treat older adults; implementing evidence-based programs; and involving consumers, family members, and advocacy groups in planning and delivery of services.

EVIDENCE-BASED PROGRAMS TO ADDRESS DEPRESSION IN THE COMMUNITY: THE INTERVENTIONIST EXPERIENCE

S. Elliott, S. Hasworth, M. Rushkin, D.L. White, *Portland State University, Portland, Oregon*

Oregon's Aging and People with Disabilities funded each of the state's nine Aging and Disabilities Resource Centers (ADRCs) to implement evidence-based programs to address mild and moderate depression in older adults living in the community. Each ADRC selected the program that best fit the needs of the population served and the resources of the agency. Programs included PEARLS, Healing Pathways, Healthy Ideas, Project Hope, and more. Evaluation included assessment of program fidelity, pre and post-depression scores, and qualitative interviews with interventionists. Most programs adhered to fidelity. The most common deviation was expansion of eligibility criteria (age, presence of significant mental health issues). Depression scores improved across all programs ($p < .001$). Interventionists across programs reported that the programs' structure contributed to success and allowed them to expand services to an underserved population. Challenges included tough life circumstances of the participating consumers, stigma, and lack of services for those who need additional help.

EVIDENCE-BASED PROGRAMS TO ADDRESS DEPRESSION IN THE COMMUNITY: THE CONSUMER EXPERIENCE

S. Hasworth, D.L. White, *Portland State University, Portland, Oregon*

Evidence-based mental health interventions for mild to moderate depression implemented by ADRCs included a series of home visits (e.g., PEARLS, Healthy Ideas, Project Hope) or workshops (i.e., Healing Pathways). All interventions used some form of problem-solving techniques where consumers identified primary issues to work on, developed strategies for addressing issues, and learned new skills. Consumers received a pre-intervention survey during their first or second visit with the interventionists and a post-survey upon completion of the program. The survey included information on quality of life, health, health care utilization, anxiety, and satisfaction with the service. Consumer satisfaction surveys were also linked to PHQ-9 scores. Improvements were seen in all categories, including significant improvements in key outcome measures for anxiety and depression. Difficulties in conducting surveys with this population, including consistent distribution of surveys, limited literacy, and physical abilities to complete surveys are discussed. Overall, consumers expressed satisfaction with this intervention.

SERIOUS MENTAL ILLNESS AND DEMENTIA: TRAINING AGING AND MENTAL HEALTH SERVICE PROVIDERS

D.L. White, S. Hasworth, *Portland State University,
Portland, Oregon*

Behavioral expressions occurring frequently with dementia are challenging for the person as well as for those who support them. Most difficult are psychotic behaviors (e.g., hallucinations, aggressiveness, paranoia) which may be seen in people with and in people without a history of serious mental illness (SMI). Those who do not have SMI often receive erroneous diagnoses or are treated inappropriately with psychotropic medications. Dementia may not be recognized as contributing to behavioral changes in people with a history of SMI, resulting in treatment not adapted to meet changing needs. This paper describes Oregon's dementia capable workforce initiative which included training to address the needs of people with SMI who have dementia. Both aging services and mental health providers were targeted, because the expertise of each group is needed to establish supportive environments that enhance function and reduce distressing symptoms. Lessons learned by providers are presented, including intent to coordinate services.

SESSION 4375 (SYMPOSIUM)

HEALTHY AGING OF KOREAN/KOREAN AMERICAN OLDER ADULTS

Chair: J.L. Yoon, *Hallym University, Hwasung-si, Korea
(the Republic of)*

Co-Chair: L. Park, *University of Wisconsin-Madison,
Madison, Wisconsin, Afghanistan*

Discussant: Y. Suh, *Albert Einstein College of Medicine*

Although the life expectancy of Koreans average over 80 years in age, their health life expectancy is much lower than their longevity. This difference makes healthy aging an important factor to consider for the welfare of older adults. The first study will focus on factors affecting the Korean Centenarian's healthy life. The second study will focus on the long term care policy in Korea for older adults since its inception in 2008 and about 90% satisfaction rate of Korean older adults with that policy. The third study will focus on health disparities of Korean American older adults in the U.S.A. compared to other groups. Implications of these studies suggest ways to make older adults healthy and feel secure in their late life.

THE SECRET OF LONGEVITY OF KOREAN CENTENARIANS

S.C. Park, *Daegu Gyeongbuk Institute of Science, Daegu,
Korea (the Republic of)*

The Korean Centenarian Study has been successfully carried out through the collaboration of medical, genetic, psychological, nutritional, ecological, economic, family, social and anthropologic experts. Genetic traits of the Korean centenarians are unique. Gender ratio of centenarians is rather biased to female, and not uniformly but regionally

localized. Male centenarians are better off functionally. Centenarians with outdoor activities showed higher levels of serum albumin, as compared to the sedentary centenarians. The proportion of centenarians who scored high in dietary diversity was higher in mountainous areas. Based on the integration of these variables, a new model for human longevity is proposed, "Park's Temple Model for Human Longevity", consisting of fixed variables, personal variables, and the social variables. Therefore, this compensating, balancing, and comprehensive model for human longevity may provide a tool to explain the mechanism of human longevity and contribute to analyze the dynamic changes of population longevity.

LONG-TERM CARE POLICY OF KOREA

D. Sunwoo, *Korea Institute of Health and Social Affairs,
Seoul, Korea (the Republic of)*

Since its introduction in 2008, Korea's long-term care services for the elderly are provided through the Long-Term Care Insurance program supported by premiums (~70%) and governmental subsidies (~20%). In 9-years, the percentage of beneficiaries and care providers increased while individual service costs for the LTCI program and household care burdens decreased. However, the status of LTCI financing is in crisis as 2016 is expected to have a deficit. Analysis of the cause in expenditure growth found that expenses/service day (cost) affected institutional care and service days/beneficiary (quantity) affected home care benefits. Costs were also affected by increasing service unit cost paid to care providers. The rapidly increasing elderly population increases the prevalence of dementia and ratio of older persons living alone (majority of this long-term care population). In order to stabilize financing and improving quality of life, health policies should focus on healthy aging through health promotion and chronic disease control.

HEALTH DISPARITIES OF KOREAN AMERICAN OLDER ADULTS

Y. Jang, *University of Texas-Austin, Austin, Texas*

The present study examined the extent to which limited English proficiency (LEP) poses a risk to physical and mental health in older Korean Americans. The vulnerability of older Korean Americans with LEP in various health outcomes (activity limitations, self-reported health, and probable depression) was assessed in consideration of socio-demographic (age, gender, marital status, education, and financial status) and context (region, length of stay in the U.S., and health insurance) variables. Using pooled data from 1,301 Korean Americans (aged ≥ 60) surveyed in FL, TX, and NY during 2008–2013, comparative analyses and multivariate model estimations were conducted. More than 70% of the sample had LEP. Those with LEP presented higher odds of having adverse health outcomes compared to their English speaking counterparts. Findings identified LEP as a major source of health disparity and underscored the importance of LEP as an intervening agent in health planning and interventions for older ethnic minorities.

SESSION 4380 (SYMPOSIUM)**RECENT FINDINGS ON DISABILITY AND CARE FROM THE U.S. NATIONAL HEALTH AND AGING TRENDS STUDY (NHATS)**

Chair: J.D. Kasper, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Discussant: V. Mor, *Brown University, Providence, Rhode Island*

The National Health and Aging Trends Study allows examination of both clinical and family care to older persons in the U.S. from a national perspective. This on-going study of over 8,000 people 65 or older, interviewed annually since 2011, is a platform for studying disability trends and trajectories in late life and consequences for individuals and society. A last month of life interview focuses on quality of end of life care. Periodically caregivers of NHATS respondents are interviewed in the National Study of Caregiving (NSOC). The papers in this session contribute new information regarding ongoing challenges in addressing care for older adults – the profile of family caregivers to older adults with disability, long term care preferences of older adults, and the quality of end of life care. The session also features the first national profile of rehabilitation services provided to older adults. The individual presentations report analyses of:

how the composition and experience of late-life family caregiving is changing over a 10 year period using data drawn from prior waves of the National Long Term Care Survey and the 2011 NHATS and NSOC long-term care preferences of older adults across both family and institutional care options (in home care; family vs. paid care; assisted living; nursing home) use of rehabilitation services across settings, including variation in who uses rehab, for how long, reasons for use, and patient perceptions of improvement changes in quality of end of life care using multiple waves of the NHATS

A CHANGING PROFILE OF FAMILY CAREGIVERS TO OLDER ADULTS WITH DISABILITY

J.L. Wolff, J. Mulcahy, J.D. Kasper, *Health Policy and Management, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Little is known about changes in late-life family caregiving. This study describes community-dwelling older adults and primary family caregivers at three points in time, drawing from the 1999 and 2004 National Long Term Care Survey and the 2011 National Health and Aging Trends Study with linked caregiver surveys. Older adults were more racially diverse, better educated, and less physically impaired in 2011 than in 2004 and 1999. At all three points in time, about 85% of caregivers were spouses or adult children and ¾ lived with the older adult that they assisted. Men were incrementally more likely to serve as a caregiver. Average hours of assistance provided per week exceeded 30 hours at all 3 points in time. Caregiving arrangements were incrementally more likely to be of longer duration and there were modest increases use of respite care. A similar percentage of caregivers reported significant emotional, physical, or financial difficulty.

CARE PREFERENCES AND EXPECTATIONS FOR LONG-TERM SERVICES AND SUPPORTS: A U.S. PERSPECTIVE

J.D. Kasper, M. Skehan, J.L. Wolff, *Health Policy and Management, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Preferences for long-term services and supports involve judgements about who should provide help as well as in what settings. In a supplemental module (2012), NHATS asked older adults to select the best care option for an 80 year-old with health problems who needs help with bathing, dressing, and getting around inside. We examine variation in preferences for in-home care (family vs paid helpers), living with children, assisted living/CCRC, and nursing home settings. Overall, almost half selected aging in place as the best option, but over a quarter selected assisted living/CCRC. Preferences are examined by age, gender, race, SES, health and functioning, and current living arrangements. Congruence between care preferences and care provision in subsequent years (2013–2015) is analyzed. Expectations regarding ability to pay for future daily care are examined. Results have implications for care settings and sources of help, as the U.S. population ages.

USE OF PHYSICAL REHABILITATION SERVICES IN THE U.S. IN LATER LIFE: A NATIONAL PROFILE

V.A. Freedman¹, A.M. Jette², T. Keeney², *1. Institute for Social Research University of Michigan, Ann Arbor, Michigan, 2. Health & Disability Institute, Boston University, Boston, Massachusetts*

Using the 2015 National Health and Aging Trends Study, we provide a national profile of late-life physical rehabilitation service use. The sample includes adults ages 65 and older living in the community and in residential care settings other than nursing homes (N=7499; 1478 using services). Nearly 20% of older adults report receiving rehabilitation in the last year. Rates increase with age and are higher for women, non-Hispanics whites, and those in residential care settings. Among those using rehabilitation services, 46% used outpatient, 13% home-based, and 7% inpatient services exclusively. In addition, 26% used both inpatient services and services in another setting and 8% used both outpatient and home-based services. Patients receiving rehabilitation services in both an inpatient and another setting were nearly four times as likely as those using inpatient services alone to report a lot of improvement in functioning after controlling for differences in patient characteristics (AOR=3.9, 95% CI=1.7,8.9).

LATE TRANSITIONS AND BEREAVED FAMILY MEMBER PERCEPTION OF QUALITY OF END-OF-LIFE CARE

J.M. Teno¹, V.A. Freedman², P. Gozalo³, J.D. Kasper⁴, V. Mor³, *1. Cambia Palliative Care Center of Excellence, University of Washington, Seattle, Washington, 2. University of Michigan, Ann Arbor, Michigan, 3. Center for Gerontology and Health Care Research, Providence, Rhode Island, 4. Johns Hopkins University, Baltimore, Maryland*

The impact on transitions in the last 3 days of life on the quality of end of life care is unknown. Bereaved family member interviews National Health and Aging Trends Study

(N=1061; weighted 4.2 million deaths) about unmet needs and perception of the quality of care. Analysis with survey weights examined the association of late transitions and perception of quality of care after adjusting for age, gender, race, the relationship of the respondent, functional trajectory, and whether the patient had cancer. Eighteen percent experienced a late transition and respondents were more likely to report more unmet needs for spiritual support (AOR 1.8 95% CI 1.2–2.8), to report concerns with communication (AOR 1.9 95% CI 1.3–2.7), and rated the quality of care lower (AOR 0.74 95% CI 0.51–1.1). Late transitions are associated with more unmet needs and concerns about quality of care. Effort are need to improve these transitions.

SESSION 4385 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: THE HARTFORD AGING SOCIETY INDEX

Chair: J.W. Rowe, *Columbia University, New York, New York*

Co-Chair: D. Goldman, *USC, Los Angeles, California*

As the age distributions of our societies advance, we must shift from our prior sole focus on the characteristics of individuals and their immediate environments to also include a strategy that assures that the entire society is successfully adapting to population aging. For the United States, and other nations, failure to adapt is a risky strategy since the core institutions of our society, including education, social insurance, health care, work and retirement, housing and the like were not designed to support a population with our future age distribution.

To facilitate development, implementation and evaluation of policies the Aging Society Network, an interdisciplinary group of scholars assembled by the MacArthur Foundation and with the current support of the Hartford Foundation, developed a balanced, evidence-based interdisciplinary metric that can serve both as a reliable and sensitive estimate of current conditions and likely future trajectory of a society along the principal policy dimensions of interest, and permits comparison across the United States and other developed countries, principally in western Europe, which currently have population age distributions similar to what the US will have in twenty to thirty years.

The principal domains included in the index are SECURITY, PRODUCTIVITY, ENGAGEMENT, COHESION, and EQUITY. Within each domain, consideration has been given to some or all of the following: education, health, social factors and productivity. Readily available data sources have been employed. The principal, but not sole, focus is on measurable outcomes rather than processes.

STRATEGY FOR DEVELOPMENT OF THE HARTFORD AGING SOCIETY INDEX

C. Chen, J. Zissimopoulos, *University of Southern California, Los Angeles, California*

The Aging Society Network evaluated the principal characteristics that define the degree to which a society is effectively adapting to aging. Including equitable distribution of resources across and within generations, the productivity and engagement of older persons in society, the degree of

cohesion or tension between generations, security, including physical safety, economic and health security and the well being of older persons. Within each domain economic, health, education and social parameters are considered. Using data for the United States and several other developed countries, scores are created for each variable and collapsed into domain measures which in turn are summed in an overall Aging Society score. The strategy for construction of the index, including selection of domains, measures and weightings, will be discussed.

POLICY AND PROGRAM RECOMMENDATIONS FOR AN AGING SOCIETY

D. Goldman¹, J.W. Rowe², 1. *University of Southern California, Los Angeles, California*, 2. *Columbia University, New York, New York*

The Hartford Aging Index permits comparison of the age-readiness of the United States and several countries such as in Western Europe and Japan. As these countries have ‘aged’ ahead of the US, the opportunity is presented to analyze the effectiveness of various public policies and programs implemented in these countries across the key domains of equity, productivity, well being, cohesion and security. Approaches found to be effective in other countries and that may be applicable to the US are discussed, along with US –specific policies and programs that hold promise to enhance our performance as reflected in the index.

SESSION 4390 (SYMPOSIUM)

DELIBERATIVE DIALOGUES: OPPORTUNITIES FOR BRIDGING GERONTOLOGICAL RESEARCH WITH POLICY AND PRACTICE

Chair: S.L. Canham, *Simon Fraser University, Vancouver, British Columbia, Canada*

Co-Chair: M. Wada, *Simon Fraser University Gerontology Centre, Vancouver, British Columbia, Canada*

Discussant: A.J. Schwartz, *East Carolina University, Greenville, North Carolina*

Deliberative dialogues is a methodology that provides an integrated framework for concurrently generating and analyzing data, engaging participants, and synthesizing evidence. This methodology offers an important opportunity to bridge gerontological research with policy and practice and can lead to community investment and asset sharing by integrating the knowledge and experiences of multiple stakeholder groups. This symposium will present work from researchers representing the Behavioral and Social Sciences and Social Research, Policy, and Practice Research sections. The papers presented are based on a collection of research projects in Western Canada that explore different aspects of service and housing provision for seniors. Battersby et al. present World Café workshop findings from dialogues with housing providers who have had experience with mass inter-institutional relocations in long-term care. Fang et al. report on Perspectives Workshops with service providers that resulted in findings which informed services and programs offered to tenants of a low-income seniors’ rental property. Canham et al. discuss methods of engagement with Housing First seniors’ service providers during a Mapping Workshop

and will report findings of available Housing First resources and where there are service gaps. Finally, Wada et al. highlight findings from an interactive research engagement with knowledge users and research participants at the end of a two-year evaluation project during a Research Day. To conclude this symposium, our discussant will summarize the papers using an interdisciplinary perspective and will discuss the implications of using innovative methods in bridging policy and practice.

USING WORLD CAFÉS TO DEVELOP GUIDELINES FOR INTERINSTITUTIONAL RELOCATIONS IN LONG-TERM CARE

L. Battersby¹, S.L. Canham¹, M. Fang¹, D. Krahn², A. Sixsmith¹, 1. *Simon Fraser University, Burnaby, British Columbia, Canada*, 2. *Baptist Housing, Vancouver, British Columbia, Canada*

In many jurisdictions, seniors' residential care policies are requiring a higher standard of accommodation, such as increased proportions of single room occupancy in long-term care (LTC). Such policy changes, along with heightened care needs of older adults in residential care are leading to increased redevelopments of outdated LTC facilities. Transitioning residents and staff together from one facility into another can be a stressful and complex process. This presentation details the development of guidelines to inform LTC relocations that support staff and resident wellbeing. World Café workshops, an interactive data gathering and knowledge-sharing method, were conducted across Canada bringing together staff, administrators, and other stakeholders with experience of mass interinstitutional relocations. World Cafés allowed for knowledge sharing and new knowledge creation through a deliberative dialogue process. Results indicated how this technique contributed to the development of relevant guidelines and built relationships critical for the dissemination of the guidelines.

PERSPECTIVE WORKSHOPS: CO-CREATING SERVICE SOLUTIONS FOR SENIORS IN AFFORDABLE HOUSING

M. Fang^{1,2,3}, S.L. Canham¹, L. Battersby^{1,2}, R. Woolrych^{3,1}, J. Sixsmith^{4,1,2}, A. Sixsmith^{1,2}, 1. *STAR Institute, Simon Fraser University, Vancouver, British Columbia, Canada*, 2. *AGE-WELL NCE, Vancouver, British Columbia, Canada*, 3. *Heriot-Watt University, Edinburgh, United Kingdom*, 4. *University of Dundee, Dundee, United Kingdom*

Effective home and community services and supports can enable older adults to successfully age-in-place, enhancing physical, mental, and social health outcomes through improved social participation, heightened independence, autonomy, and choice. One challenge in affordable housing developments for seniors surrounds the integration of place-based services. This presentation reports on four Perspectives Workshops conducted with service providers that aimed to: (i) understand challenges and opportunities experienced by service providers when delivering senior-friendly services and (ii) determine actions that can be taken to enhance the needs (e.g. staffing and financial resources) of service providers, enabling them to serve seniors more effectively. These deliberative dialogues sessions were conducted with the goal of co-creating sustainable service provision solutions for tenants

transitioning into a newly built low-income seniors housing development. Results of the workshops included ideas for effective utilization of the shared amenity space, which generated resources for an on-site service delivery program.

COMMUNITY MAPPING WORKSHOPS TO IDENTIFY SENIOR-SPECIFIC HOUSING FIRST RESOURCES

S.L. Canham¹, L. Battersby¹, M. Wada¹, M. Fang², R. Bell³, A. Sixsmith², 1. *Gerontology Research Centre, Simon Fraser University, Vancouver, British Columbia, Canada*, 2. *STAR Institute, Simon Fraser University, Vancouver, British Columbia, Canada*, 3. *Greater Vancouver Shelter Strategy, Vancouver, British Columbia, Canada*

Guided by principles of community-based participatory research, this paper presents the methodological process of conducting a senior-focused community mapping workshop with Housing First service providers in Metro Vancouver, Canada. Research participants mapped community services and amenities available to support seniors in maintaining housing and identified barriers and facilitators for accessing Housing First services and supports. Community mapping is an interactive method that provided researchers and participants with visualization of how resources are distributed across municipal regions. Findings from the mapping workshop are rich as they captured participants' diverse descriptions and understandings of resource differences between and within communities; and revealed issues of accessibility, availability, and navigation of services and resources. Implications of this research include the utility of using mapping methods to identify the accessibility and availability of senior-specific housing resources as well as system gaps and weaknesses to inform policy recommendations and changes in practice.

USING KNOWLEDGE MOBILIZATION TO ADVANCE THE CREATION OF HOMELIKE RESIDENTIAL LONG-TERM CARE

M. Wada, L. Battersby, S.L. Canham, M. Fang, A. Sixsmith, *Simon Fraser University Gerontology Research Centre, Vancouver, British Columbia, Canada*

The development of homelike environments in residential long-term care (LTC) settings can lead to positive health and well-being outcomes for residents. Creation of 'home' in LTC requires input from residents and their caregivers. Following the completion of a two-year evaluation project that examined experiences of residents, their family members, and care staff in a LTC facility who had transitioned from an institutional to a homelike setting, practice implications and guidelines were presented during a Research Day. This Research Day was a unique methodological approach informed by iterative knowledge mobilization processes involving interactive data-presentation and data-validation stations. Participants included research participants, local community members, and decision-makers from government sectors and the regional health authority. This presentation provides an overview of findings from this innovative methodological approach and suggests implications for using effective knowledge mobilization strategies to collaboratively advance residential care practice and policy with research participants and professional and community stakeholders.

SESSION 4395 (SYMPOSIUM)

AGHE GERONTOLOGICAL COMPETENCIES, PROGRAM DEVELOPMENT, AND ACCREDITATION FOR GERONTOLOGY EDUCATION

Chair: H.L. Sterns, *The University of Akron, Akron, Ohio*
Co-Chair: M.R. Gugliucci, *University of New England, Biddeford, Maine*

It is essential that there is a well-educated and trained workforce in gerontology. A major step was taken with the development of AGHE Gerontological Competencies that are now being used to design courses and programs. International examples will be presented. In addition, these competencies are being used to develop dimensions of program evaluation for accreditation. To this end and in partnership with the Association for Gerontology in Higher Education the Accreditation for Gerontology Education Council in (AGEC) was formed. Four features of this process will be presented (1) the history of curriculum development starting with the Foundations Project, multiple iterations of the Standards Document, Competencies and how these have led to application in course and program design and the formation of the accreditation council; (2) the design of the accreditation council including its mission, vision, international outreach, organizational chart, Board of Governors, and its procedures for accreditation and reaccreditation; (3) the implementation of accreditation for gerontology degree granting programs by the AGEC including preparing for accreditation, curriculum mapping, and the council's focus on quality control; and (4) the outcome focusing on what accreditation does for the program regarding marketing and what it does for the students.

HISTORY, DEVELOPMENT, AND DESIGN OF THE FIRST GERONTOLOGY ACCREDITATION ORGANIZATION (AGEC)

H.L. Sterns^{1,2}, M.R. Gugliucci³, 1. *Psychology & Inst. Life-Span & Gerontology, The University of Akron, Akron, Ohio*, 2. *Northeast Ohio Medical University, Rootstown, Maine*, 3. *University of New England College of Osteopathic Medicine, Biddeford, Maine*

Throughout its history, accreditation has served as the nongovernmental process of educational quality assessment and enhancement, through educational institutions and programs, governed by the principle of voluntary commitment to self-evaluation and peer review, in a manner that engenders confidence and trust among the public it serves: by 1. fulfilling that purpose by requiring clear statements of objectives and thorough and candid self-evaluation reports of institutions and programs 2. providing due process in program reviews and appeals, 3. provide wide dissemination of information concerning the purposes, practices and decisions of accreditation, and 3. assuring competent personnel on accrediting bodies and site visit teams. The accreditation process is intended to be open and standardized. With this design plan in mind, the Accreditation for Gerontology Education Council (AGEC) was created in 2016 and is the only global accrediting body for gerontology degree programs. This

presentation provides the overview for this innovative new 5013c organization.

INTEGRATION AND ASSESSMENT OF THE GERONTOLOGY EDUCATION COMPETENCIES (GECs) INTO THE CURRICULUM

P. Elfenbein¹, J. Abushakrah², J.D. Damron-Rodriguez³, L.K. Donorfio⁴, 1. *Sociology and Human Services, University of North Georgia, Gainesville, Georgia*, 2. *Portland Community College, Portland, Oregon*, 3. *UCLA, Los Angeles, California*, 4. *University of Connecticut, Waterbury, Connecticut*

Educational outcomes must shift from knowledge acquisition to professional skill competence to develop a well-educated and trained workforce in gerontology to meet the issues and needs presented by the demographic imperative aging poses. A brief history of the development of the AGHE GERONTOLOGY COMPETENCIES for UNDERGRADUATE & GRADUATE EDUCATION will be followed by a discussion regarding the many ways that the competencies can be worked into existing course structures new courses, Degree, Certificate and Concentration programs.

At the conclusion of this session, participants will:

- (1) Know the reasons for and the consensus-based process for development of the GECs;
- (2) Identify important components, processes, and possible outcomes of competency based gerontology education as linked to professional competencies in the contexts within which gerontologists work;
- (3) Identify ways GECs can be integrated into curriculum and used as the basis for assessing programs, student learning, and student self-assessment.

ACCREDITATION IN THE EU: A FIRST STEP IN BENCHMARKING GERONTOLOGY PROGRAMS

J.S. Jukema^{1,2,3}, E. Schoenmakers⁴, 1. *Applied Gerontology, Windesheim University of Applied Sciences, Zwolle, Netherlands*, 2. *Huntington University, Sudbury, Ontario, Canada*, 3. *Saxion University of Applied Sciences, Deventer, Netherlands*, 4. *Fontys University of Applied Sciences, Eindhoven, Netherlands*

The Dutch and Flemish accreditation systems of higher education regulate educational quality of programs. Foundations include Dublin descriptors and ten general competencies of higher education. AGEC is an important body for benchmarking gerontology programs in an international context. This will enhance improve faculty and student movement and exchange. For that reason, a Dutch BSc program in Applied Gerontology applies Association for Gerontology in Higher Education (AGHE) competencies in 3 different ways: (1) as input of programs' core competencies; (2) as core for the development of learning outcomes; and (3) as input for learning objectives in classes. We present our method of mapping Dublin Descriptors; general competencies of higher education and the AGHE competencies on program and class levels. Our method promotes unequivocal use of AGHE competences in the international arena of gerontology education. It may serve as a point of reference for other European programs in gerontology.

ACCREDITING GERONTOLOGY PROGRAMS IN CANADA? LET'S DO IT!

B. Pianosi, *Gerontology, Huntington University, Sudbury, Ontario, Canada*

In Canada, no known efforts are currently being made to develop regulations of gerontology professionals. However, new innovations and actions on the behalf of aging individuals will, in future, require the organized development and utilization of gerontological competencies, knowledge, and education, spurring further action to 'move with the times' and develop a professional, gerontological identity and framework. It is our hope that this will occur sooner, rather than later. How can Canadian organizations work with the Accreditation for Gerontology Education Council (AGEC) to support the future development of gerontology as a profession in Canada? First steps in the initial process will be outlined and encountered opportunities and challenges will be discussed.

WHAT HAVING AN AGEAC ACCREDITATION CAN DO FOR YOU!

K.F. Kopera-Frye¹, J.C. Mendez², J. Masters³, D.E. Schafer⁴, J.L. Howe⁵, M.A. Guest⁶, 1. *Gerontology, University of Louisiana at Monroe, West Monroe, Louisiana*, 2. *Wayne State University School of Medicine, Detroit, Michigan*, 3. *University of Nebraska at Omaha, Omaha, Nebraska*, 4. *National Assoc for Professional Gerontologists, Healdsburg, California*, 5. *Icahn School of Medicine Mt. Sinai, New York City, New York*, 6. *University of Kentucky, Knoxville, Kentucky*

The innovative 5013c accreditation body, Accreditation for Gerontology Education Council (AGEC), is the first of its kind with its global purview of gerontology programs. The purpose of AGEAC is to serve as an accrediting entity for bachelors and masters programs, both nationally and internationally. AGEAC uses competencies involving skills, knowledge, and abilities necessary to educate a prepared workforce in the gerontological field. While this is a critical function, how is receiving an AGEAC accreditation perceived by academic institutions? This paper will discuss survey results examining perspectives from both students and administrators. The survey examining attributes of institutions which influence student attendance decisions involved a sampling of graduate students and administrators from the Association for Gerontology in Higher Education (AGHE) member institution directory. The discussion of results will highlight the perceived benefits and value-added to degree programs attaining an AGEAC accreditation.

SESSION 4400 (SYMPOSIUM)

A CROSS-SPECIES AND CROSS-NATIONAL EXAMINATION OF SEX DIFFERENCES IN HEALTHY AGING

Chair: E.M. Crimmins, *University of Southern California, Los Angeles, California*

Co-Chair: S.N. Austad, *The University of Alabama at Birmingham, Gardendale, Alabama*

Discussant: C.E. Finch, *University Southern California, Los Angeles, California*

Sex or gender is an important determinant of aging outcomes. However, the role of sex or gender is not well-understood as it represents both distinct biological and social differences in life circumstances. Within human populations, a widely accepted generalization is that men have higher mortality while women have worse health; however, researchers have recently questioned whether this is, in fact, true. While female-life expectancy exceeds male life expectancy in virtually every country, the gender differences in health and life expectancy are quite variable. Symposium participants Drs. Saito and Lee, relying on newly available data from national populations in a number of countries including Japan, the United States and India, will discuss gender differences in multiple aspects of human health. Animal research often points the way to understanding mechanisms underlying human health. Laboratory animals also show marked sex differences in aging and longevity, but until recently those differences have been virtually ignored. Dr. Austad will discuss these sex difference patterns across species and note how laboratory species can be employed to provide insight into human sex differences. Increasing numbers of animal studies have found that drug treatments that extend life and preserve health surprisingly have sex-specific effects. That is, males but not females may be affected or vice versa. Dr. Kennedy will describe a specific example, female mouse health and longevity being preferentially affected by manipulation of the TOR cellular network, and present data on the reason for this sex difference.

USING SEX DIFFERENCES IN AGING IN LABORATORY ANIMALS TO UNDERSTAND HUMAN SEX DIFFERENCES

S.N. Austad, 1. *Biology, The University of Alabama at Birmingham, Gardendale, Alabama*, 2. *American Federation for Aging Research, New York, New York*

Women live longer than men in virtually all places and at virtually all times. Often, if not always, women suffer more functional limitations and illnesses than men, however. This has been called the mortality-morbidity paradox. Common laboratory animal species from small roundworms to mice have been used historically to dissect general underlying mechanisms of aging. Yet because none of these commonly used species have a uniform survival advantage of one sex over the other, it has been assumed that they could not be useful for investigating mechanisms involved in the mortality-morbidity paradox. This assumption is false. I will present several new experimental paradigms that use the known conditional variability in sex-biased survival in laboratory species to understand mechanisms underlying the mortality-morbidity paradox.

SEX DIFFERENCES IN BIOLOGICAL AGE: JAPAN AND THE U.S.

Y. Saito², J. Kim¹, M. Levine³, Y. Zhang¹, E.M. Crimmins¹, 1. *University of Southern California, Los Angeles, California*, 2. *Nihon University, Tokyo, Japan*, 3. *University of California Los Angeles, Los Angeles, California*

Chronological age is a significant predictor of mortality; however, recent research indicates that biological age is a better predictor of mortality and once it is controlled chronological age no longer predicts mortality. Biological age may

be a summary indicator that better captures population health. We estimate biological age among older people in Japan and the US and compare sex differences in biological age within each country. Data for the US come from National Health and Nutritional Examination Survey conducted between 2010 to 2013 (NHANES); for Japan, National Health and Nutritional Surveys between 2010 and 2013 are used. To construct biological age, we include a set of biomarkers available in both data sets and known to associate with age including indicators of metabolic function, cardiac function, and immune function.

WHAT CONTRIBUTES TO FEMALE DISADVANTAGE IN LATE-LIFE COGNITION IN INDIA?

J. Lee, *University of Southern California, Los Angeles, California*

In developing countries, women exhibit substantially lower cognitive abilities than males. Using data from the national baseline of the Longitudinal Aging Study in India, we examine two hypotheses of the female disadvantage: lack of education and discriminatory experience in earlier life. We estimate regression models with and without education to assess what fraction of the gender gap in cognitive ability is explained by education. We perform a Blinder-Oaxaca decomposition to distinguish the gap attributable to sex differences in observable characteristics and the part attributable to differences in coefficients. The latter represents the gap unexplained by differences in “endowments” which may reflect the influence of other factors such as discrimination. To test the discrimination hypothesis, we introduce interaction terms between gender and caste and between gender and region of residence. This allows us to assess whether women in castes and areas where discrimination is greater, exhibit larger cognitive disparities.

SEX DIFFERENCES IN RESPONSE TO INTERVENTIONS IN THE MTOR NETWORK

B.K. Kennedy, *Buck Institute for Research on Aging, Novato, California*

Manipulation of the mTOR network, a cellular network that responds to food availability and stress, differentially affects the sexes. For instance, chronic treatment with the drug, rapamycin, an mTOR inhibitor, has larger beneficial effects in female compared to male mice. Additionally, when one key component of the mTOR network, S6K1, is genetically inactivated, female life- and health-span are enhanced, but males are unaffected. This latter genetic effect is particularly interesting because while sex differences in drug processing might underlie this sex difference, a gene when inactivated necessarily is inactivated in both sexes. My laboratory has been studying the impact of mTOR activity on health and longevity and we have discovered plausible mechanisms for these sex differences. Our work suggests that successful interventions for delaying or retarding aging may differ between the sexes.

SESSION 4405 (PAPER)

POLITICS, POLICY, AND HOUSING

DID THE AFFORDABLE CARE ACT CHANGE PREVENTIVE SERVICE USE FOR MEDICARE BENEFICIARIES IN POVERTY?

L. Bakk¹, T. Cadet³, S. Burke², O. Rostant⁴, J. Mitchell⁵, 1. *Social Work, University at Buffalo, West Henrietta, New*

York, 2. Florida International University, Miami, Florida, 3. Simmons College, Boston, Massachusetts, 4. National Institutes of Health, Baltimore, Maryland, 5. The University of Michigan, Ann Arbor, Michigan

Out-of-pocket costs can be a barrier to receiving preventive services, particularly for lower income older adults. In response to the emphasis on disease prevention, an Affordable Care Act (ACA) provision stipulated that cost sharing be eliminated for Medicare preventive services. Whether the provision changed utilization for lower income beneficiaries remains largely unknown. Using the 2008 and 2012 waves of the Health and Retirement Study, this investigation examined preventive service use before and after the ACA provision implementation. The sample contained 8,207 respondents age 65 and older and enrolled in Medicare. The outcome variables were five preventive service measures. A differences-in-differences approach was used to compare preventive service use between beneficiaries above and below the Federal Poverty Level (FPL) at both time points. Results indicated that uptake of all preventive services was significantly less for beneficiaries below the FPL before and after the ACA cost-sharing provision. Mixed-effects logistic regression analyses showed that receipt of a recent flu shot significantly increased over time for those below the FPL and in comparison to those above the FPL, they had a greater increase in use. Utilization did not significantly change between pre- and post-ACA provision implementation for any of the other preventive measures. However, cholesterol and prostate screening use slightly increased over time for those below the FPL. Findings suggest that some benefits were achieved through the ACA cost-sharing elimination for Medicare recipients. However, differences continue to persist between those above and below the FPL. Thus, affordability alone may not sufficiently increase use.

INVOLVING VOLUNTEERS IN OLDER PEOPLE'S HOUSING SCREENING: THE ACTIVE CARING COMMUNITY PROJECT

A. Smetcoren, L. De Donder, D. Duppen, B. Team, *Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium*

In 2013 the Flemish Government launched a call for innovative projects named ‘Care Living Labs’ to tackle future care challenges such as the rising demand for care, staff shortages and budgetary restrictions. The main objective of these care living labs was to create new care concepts, processes and products and to test them in daily practice. For this paper, the living lab of ‘Active Caring Community’ will be discussed with a specific focus on the ‘OPA-project’. OPA is a Dutch abbreviation for ‘Ouderen wonen PAssend’ which can be translated as ‘appropriate housing for older adults’. The OPA-project wants to examine the housing adequacy of older people's dwellings in the neighbourhood by including older volunteers in the housing-screening process.

The paper will discuss the results of the longitudinal data (12 focusgroups and 11 individual interviews with volunteers and older participants), which were administered during three phases of the project (2014, 2015, 2016). The results indicate that it is of significant importance to inform older people about their housing possibilities. While the OPA project operated in neighbourhoods with a high amount of low housing quality, the OPA project was able to empower older people in their housing situation by stimulating anticipative

behaviour. Older volunteers perform home visits with a professional checklist to offer older residents advice about the appropriateness and safety of their house. These volunteers, together with the older resident, search for possible solutions and provide tips and tricks concerning ageing safely at home.

QUALITY OF LIFE OUTCOMES OF HOUSING WITH CARE FOR OLDER PEOPLE IN ENGLAND

R.A. Darton¹, T. Atkinson², T. Bäumker³, S. Evans², A. Netten¹, 1. *University of Kent, Canterbury, Kent, United Kingdom*, 2. *University of Worcester, Worcester, United Kingdom*, 3. *(Formerly) University of Kent, Canterbury, Kent, United Kingdom*

Housing with care has become increasingly popular in recent years, and has been viewed by policy-makers and commissioners as offering a more enabling, homely and cost-effective alternative to care homes. However, most residents enter with fewer care needs than those admitted to care homes, and with different expectations. Although a previous study (Bäumker et al., 2011) compared the functional outcomes for matched groups of residents, most comparative studies have used unmatched groups.

This paper will compare the social care related quality of life (SCRQoL) obtained using the Adult Social Care Outcomes Toolkit (ASCOT) for residents in housing with care and those receiving home care. The housing with care residents were drawn from the ASSET (Adult Social Services Environments and Settings) project, which was commissioned and funded by the Department of Health's NIHR School for Social Care Research. The home care recipients were drawn from the OSCA (Outcomes for Social Care for Adults) project. Matched groups of 124 individuals in each were created using propensity score matching.

Residents in housing with care had less unmet need (current SCRQoL) than people receiving home care ($p < 0.0001$); similar expected SCRQoL in the absence of social services ($p > 0.05$); and a higher gain (current compared with expected) ($p < 0.0001$). The improvements in outcomes were achieved without increased costs in providing personal care.

Housing with care is relatively scarce, but this study adds further evidence for the value of developing more specialised housing and increasing the choice available to older people wishing to move from unsuitable accommodation.

LONG-TERM SERVICES AND SUPPORTS POLICY IN THE UNITED STATES AND CANADA: COMPARATIVE POLICY LESSONS

W. Dawson, *Oregon Health Care Association, Portland, Oregon*

This session will explore recent developments in long-term services and supports (LTSS) policy in Canada and the United States in light of an aging demographic in both nations. Based on the findings of a qualitative research study that included in-depth interviews with policymakers, advocates, researchers and other policy elites in the health and aging policy arena, this session will specifically explore the way current economic and political forces are shaping long-term services and supports policy in both countries. The findings suggest that political institutions, culture and cost concerns are key drivers of policy outcomes in both the United States and Canada, and in particular policy outcomes relating to the financing of long term services and supports.

IAGG 2017 World Congress

POLITICAL ECONOMIES OF AGING IN THE DEVELOPING WORLD—NEOLIBERALISM, SOCIAL EXCLUSION, AND GROWTH

L. Polivka¹, B. Luo², 1. *Claude Pepper Center, Tallahassee, Florida*, 2. *Western Washington University, Bellingham, Washington*

Population Aging is occurring across the world and the older populations of many countries are projected to grow at unprecedented rates over the next thirty years. Most of the growth in the 60+ population by 2050, however, will occur in developing countries mainly in Asia. Some of these countries, such as China, have experienced extraordinary economic growth since 1980, but even these countries will be strongly challenged to develop even minimal, by developed nations standards, income support, health and long-term care programs for their increasingly larger populations of older people. Any effort to address this growing tension between the increasing need for services generated by large increases in their older populations and the limited resources available to policymakers must occur in the context of concerns regarding economic policy and social justice. That is, what kind of political economy might give a developing nation the best chance of achieving enough sustained growth to meet the needs of its vulnerable populations, including elderly persons threatened by poverty and poor health? In addressing this fundamental public policy issue the authors will offer a critique of the neoliberal economic model that is currently dominant in the U.S. and European Union (EU) and in many developing countries and make the case for an alternative model based on Keynesian concepts of the role of the state in economic growth and social provision. The authors will argue that public investments in income support and health programs are essential to generating equitable economic growth and meeting social needs.

SESSION 4410 (SYMPOSIUM)

KEYNOTE: WHAT COULD COME FROM UNDERSTANDING THE BIOLOGY OF AGING?

Chair: F. Kuipers, *University Medical Center Groningen, Groningen, Netherlands*

Co-Chair: J.L. Kirkland, *Mayo Clinic*

Discussant: S.E. de Rooij, *Groningen, Netherlands*

Evidence is increasingly tying fundamental aging processes to the genesis of the major chronic diseases that account for the majority of morbidity, mortality, and health costs in developing and developed countries. These age-related chronic disorders include atherosclerosis, dementias, most cancers, diabetes, arthritis, blindness, and many others. By targeting basic aging processes, it could be feasible to delay, prevent, alleviate, or even cure these common chronic diseases as a group instead of one at a time, as well as the geriatric syndromes (frailty, sarcopenia, cognitive impairment, etc.) and age-related loss of resilience. Drugs and other interventions have recently been discovered that target basic aging processes. In a growing number of studies, these interventions not only enhance lifespan and healthspan in animals, they also appear to delay age-related chronic diseases and disabilities. If these interventions can be translated into clinical application, they could transform healthcare and even society as we know it. Funding for research in this

area is far lower than reasonable given the potential benefits should this approach be successful.

PROOF-OF-CONCEPT CLINICAL TRIALS OF INTERVENTIONS THAT TARGET FUNDAMENTAL AGING PROCESSES

J.L. Kirkland, *Mayo Clinic, Rochester, Minnesota*

Interventions targeted at fundamental mechanisms of aging hold promise for enhancing healthspan by delaying, preventing, or alleviating a range of age-related diseases and conditions—a theory termed the “geroscience hypothesis.” Early, proof-of-concept clinical trials will be a critical step in translating therapies emerging from cell culture and animal model preclinical studies into clinical practice. The goals of such proof-of-concept trials could include generating preliminary signals of efficacy in age-related diseases or outcomes that will test the value of proceeding to larger trials, contributing data and biological samples to support additional research through strategic networks, and furthering dialogue with regulatory agencies about registration indications. We will consider frameworks for proof-of-concept trials that target age-related chronic diseases, geriatric syndromes, or resilience to stressors. We propose that a strategic infrastructure and shared resources are needed to accelerate translation of therapies targeting fundamental aging processes into clinical treatments.

HOW CAN INTERVENTIONS BE TRANSLATED FROM THE LABORATORY INTO CLINICAL PRACTICE

S.E. de Rooij, *Department of Internal Medicine and Center for Geriatrics, University Medical Center Groningen, Groningen, Netherlands*

Individuals with a parental history of dementia often worry about their own risk of developing dementia. The average lifetime risk of developing Alzheimer disease (AD) is 10–12% and this risk doubles with the presence of a first-degree relative with AD. This increased risk has apparently more than one reason. Firstly, adult children of patients with AD are more often carrier of the apolipoprotein E (APOE) $\epsilon 4$ allele, a risk factor for AD, than those without a parental history of AD. Secondly, familial clustering of high blood pressure and vascular disease is seen among middle-aged offspring with a parental history of AD in old age. This study confirmed earlier findings that midlife hypertension is associated with the development of AD later in life. Thirdly, other vascular risk factors such as diabetes type 2, obesity and hypercholesterolemia cluster in families. Fourthly, the psychosocial behaviour runs in a family and affects health behaviour and contributes to dementia.

Recently was also demonstrated that the human microbiome is associated with neuroinflammation: the gut-brain axis. Secretory products of the GI microbiome and translocation of these signaling molecules via the lymphatic and systemic circulation throughout the CNS are just beginning to be identified. New insights of the etiology of neuroinflammation might help us to design new therapeutic strategies to prevent or delay dementia.

THE ECONOMIC RETURNS TO DELAYED AGING: PROMISE AND PITFALLS

D.P. Goldman, *USC Schaeffer Center for Health Policy & Economics, Los Angeles, California*

Most medical research remains focused on combating individual diseases, despite robust evidence that delayed aging remains a realistic goal. Using the Future Elderly Model—a microsimulation of future health and spending of older Americans—we compared optimistic “disease specific” scenarios with a “delayed aging” scenario to see their effects on longevity, disability, and Federal spending. We find that delayed aging is a particularly good investment, as it could increase life expectancy by an additional 2.2 years, most of which would be spent in good health. The value to society is \$7 trillion over fifty years. Disease-specific investments have more modest returns, mainly due to competing risks. The fiscal challenges of delayed aging are manageable through modest policy changes. Overall, more research to delay aging appears to be a highly efficient way to forestall disease, extend healthy life, and improve public health—albeit with the potential to exacerbate existing health disparities.

SESSION 4415 (SYMPOSIUM)

KEYNOTE: THE LONGEVITY REVOLUTION AND THE PRIVATE SECTOR—REDEFINING WORK, LEISURE, MONEY, PURPOSE, AND SUCCESS

Chair: K. Crain, *Bank of America, New York City, New York*

With the aging of a significant portion of the global population, and many people living and working longer, issues pertaining to longevity, funding for later years, and discussions of life priorities in the next phase of their lives are coming to the fore. In a series of national thought leadership studies, Bank of America Merrill Lynch and Age Wave conducted research to examine how Americans are preparing for retirement and reshaping their lifestyles during their later years.

Traditional dreams of retirement – a life of leisure and a home in the desert – are rapidly changing as a growing majority of older adults seeks lifelong work, learning, challenge and contribution. The changing culture of aging is generating exciting possibilities for individuals and opportunities for businesses and investors in the massive, growing and global longevity economy.

One of the most important underlying conclusions we found is that today’s ‘retirees’ are not simply retiring- they are exploring new options, pursuing old dreams, and living life to the fullest. They are taking advantage of longer life spans to devote energy to pursuits they may not have had the time or freedom to chase during the ‘career’ portion of their lives. They are staying active, engaging in new pastimes, and strengthening and expanding their social networks.

A new era of volunteerism, philanthropy and purposeful engagement is evolving. The emerging cohort of older adults is painting a very different picture of retirement than the tired visions of an earlier generation. How will the redefinition of retirement change our lives, communities and institutions? Every one of us and our families will be affected.

At a macro-economic level there is a revolution brewing as well. The longevity economy is becoming an increasingly powerful force, and the spending power of 60+ consumers is expected to reach US\$1.5tn by 2020E. The US longevity sector alone is currently estimated at US\$7.1tn, making it the world’s #3 economy. This section of the economy is expected

to account for over 50% of US and Japanese GDP by the 2030s. The longevity economy is becoming an increasingly powerful force – encompassing both the economic activity serving the needs and wants of the 50+ global population, as well as directly purchased products and services, and the knock-on economic activity that this generates.

Join these thought leaders for a stimulating conversation about our future as families, communities and economies.

THE LONGEVITY REVOLUTION AND THE PRIVATE SECTOR—REDEFINING WORK, LEISURE, MONEY, PURPOSE, AND SUCCESS

K. Dychtwald, *Age Wave, Emeryville, California*

One of the most important underlying conclusions we found is that today's 'retirees' are not simply retiring- they are exploring new options, pursuing old dreams, and living life to the fullest. They are taking advantage of longer life spans to devote energy to pursuits they may not have had the time or freedom to chase during the 'career' portion of their lives. SESSION 4420 (SYMPOSIUM)

KEYNOTE: DIETARY DETERMINANTS OF LIFELONG HEALTH

Chair: S. Maggi, *CNR, Padova, Italy*

Discussant: C. Bales, *Duke Med. Center, Durham, North Carolina*

J. Woo, *The Chinese University of Hong Kong, Hong Kong, Hong Kong*

IAGG 2017 World Congress

Existing knowledge suggests that major chronic conditions affecting older adults (CVD, diabetes, cancer, musculoskeletal disorders, dementia) can be largely prevented with appropriate, lifelong dietary habits. We will present results of observational and intervention trials, aiming to assess the efficacy of the Mediterranean Diet in preventing chronic diseases. Nutrition can make a substantial impact on the health and function of older individuals. Beyond dietary preventive measures, it is of utmost importance to identify biopsychosocial and cultural factors affecting the dietary behaviors, and, ultimately, the nutritional well-being of older individuals. The epidemic of obesity in older adults is bringing a new phenotype of frailty—the “fat-yet-frail” elderly person. New studies of diet- and exercise-based interventions for sarcopenic obesity are exploring safe approaches for restoring physical function. These interventions must protect lean and bone mass during body weight reduction and need to be scrutinized for their long-term impact on health and quality of life.

THE MEDITERRANEAN DIET: NEW EVIDENCE IN THE LIFELONG APPROACH TO HEALTHY DIET

S. Maggi, *CNR, Neuroscience Institute, Aging Branch, Padova, Italy*

The Mediterranean diet represents the heritage of millennia of exchange of people and their cultures throughout the Mediterranean basin. The work of Ancel Keys in the 1950s established the Mediterranean diet as the original prototype for current dietary guidelines. Keys conducted the “Seven Countries Study” (with centers in Finland, Holland, Italy, United States, Greece, Japan and Yugoslavia), in order to document the relationship between lifestyles, nutrition and cardiovascular disease in different populations, to prove scientifically the nutritional value of the Mediterranean diet and its contribution to the health of the populations that adopted it. Since then, it has been demonstrated that it can improve the health, well-being, lifestyle and quality of life in the general population, at any age. Growing evidence demonstrates that the Mediterranean diet is beneficial to health; the evidence is stronger for coronary heart disease, but it also applies to cancer and, more recently, also to cognitive decline. Results from recent studies, not only observational, but also interventional (eg. PREDIMED trial) provide a strong biomedical foundation for its beneficial effects. The main components of the Mediterranean diet are: high monounsaturated/saturated fat ratio (extra-virgin olive oil as the main source of fat); ethanol consumption at moderate levels and mainly in the form of wine during meals; high consumption of vegetables, fruits, legumes, and grains; moderate consumption of milk and dairy products, mostly in the form of cheese; and low consumption of meat and meat products. Physical exercise and active social interaction are also considered key components.

INTERVENTIONS FOR OBESITY IN FRAIL OLDER ADULTS: FINDINGS AND IMPLICATIONS FOR FUNCTION

C. Bales, *Duke University School of Medicine, Durham, North Carolina*

A high prevalence of geriatric obesity in many regions of the world has created a new phenotype of frailty—the “fat yet frail” older adult. For these individuals, obesity leads to a negative cycle of functional decline due to reduced physical activity and deleterious effects of inflammatory cytokines,

compounded by age-associated sarcopenia. Concerns about loss of muscle mass have limited obesity interventions in elders but recent studies of diet- and exercise-based interventions for “sarcopenic obesity” are exploring safe approaches for restoring physical function. This session considers findings to date, emphasizing nutritional interventions for those whose ability to exercise is limited. Interventions include increasing protein intake at meals and for the day to support lean mass retention and muscle function. While initial findings are promising, the benefits of these interventions need to be studied over the long-term to evaluate their lasting impact on functional independence and health-related quality of life.

BIOPSYCHOSOCIAL AND CULTURAL FACTORS INFLUENCING DIET AND NUTRITION: IMPACT ON AGE-RELATED DISEASES

J. Woo, *Centre for Gerontology and Geriatrics, Center for Nutritional Studies, Chinese University, Hong Kong, Hong Kong*

Studies of different dietary patterns across different cultures provide insight into the influence of dietary patterns on geriatric syndromes and diseases. Relationships between micronutrients and bone health, dietary pattern and obesity, cardiovascular diseases, may be different between Western and Chinese populations. Dietary pattern influences health-related quality of life and frailty. The use of functional foods (such as soy, tea, black rice) in different cultures may also contribute to ageing well in different cultures. Examination of oxidative stress in the same person after consuming four different cultural diets show the highest value for the hamburger/French fries/coca-cola combination, and lowest for the Southern Cantonese meal. Values for the Indian and Northern Chinese meals were in between. Dietary patterns have been shown to be associated with frailty, sarcopenia, cognitive impairment, depressive symptoms hypertension, diabetes, and successful ageing in older people in recent studies, and nutrition plays an important role in frailty intervention programmes.

SESSION 4425 (SYMPOSIUM)

KEYNOTE: WHERE WE GROW OLD— ENVIRONMENTAL PERSPECTIVES

Chair: G.D. Rowles, *University of Kentucky, Lexington, Kentucky*

Co-Chair: M.B. Neal, *Portland State University, Portland, Oregon*

Increased recognition of the role of physical and social contexts in shaping the experience of growing old has resulted in the emergent field of environmental gerontology. Initiatives by the World Health Organization and AARP have generated global awareness of the importance of creating age-friendly communities. There has been burgeoning interest, as well, in the design of individual neighborhoods and dwellings to fit the needs of an aging population. At all levels along the continuum of settings, an underlying focus has been on developing negotiable environments imbued with meaning for residents, that enable aging in place, and enhance health and well-being. This plenary session will provide fresh international and cross-cultural perspectives on contemporary theoretical and empirical research in

environmental gerontology. Speakers from different parts of the world will consider trends and future needs in relation to research, policy, planning and human service opportunities for enhancing the places where we grow old.

REDESIGNING COMMUNITIES FOR AN AGED SOCIETY

H. Akiyama, *Institute of Gerontology, University of Tokyo, Tokyo, Japan*

Currently 26% of Japan's population is 65+; in 2030 33% will be 65+. Redesign of both hard and soft infrastructure is required. This presentation describes a social experiment, organized by the Institute of Gerontology at the University of Tokyo, in Kashiwa, a bedroom community 30 km from Tokyo where a huge number of baby boomers recently retired. Age-friendly workplaces, flexible schemes of employment even for those age 80+, and products to provide a safe and productive work environment are being tested. Evidence shows that working after age 65 helps to maintain physical and cognitive functions and enhances social activities. Projects focused on life-long learning, frailty prevention, community-based health and long-term care, housing, transportation, and effective utilization of ICT are also in progress. Not only is collaboration among researchers in different disciplines required but also full collaboration with local governments, the business community, non-profit organizations, and residents.

FROM CITIES TO STATES AND COUNTRIES: THE AGE-FRIENDLY CITIES MOVEMENT

A. Kalache, *1. International Longevity Centre-Brazil, Rio de Janeiro, Brazil, 2. International Longevity Centre Global Alliance (ILC-GA), New York, New York*

The culmination of a two-year consultation with governments, civil society organisations and academia, the Active Ageing Policy Framework was launched by the World Health Organisation (WHO) at the 2nd UN Assembly on Ageing in Madrid, 2002. This holistic framework firmly established a life course perspective for the WHO's work while embracing the social determinants of health (giving them an ageing dimension) and bringing the environmental perspective to ageing policy development. To translate the framework into practice, WHO initiated the “age friendly cities global project” at the IAGG Congress in Rio in 2005. A common methodology was devised and simultaneous qualitative research in 33 cities was conducted, leading to the WHO's “Age-friendly Cities, a Guide” (October 2007). Since then, hundreds of cities have developed local projects and adapted the Guide. This presentation will focus on some examples of good practice and take the approach beyond cities - to states and countries.

KNOWLEDGE TRANSLATION BASED ON RESEARCH ON HOME, HEALTH, AND DISABILITY ALONG THE PROCESS OF AGING

S. Iwarsson, *Dept of Health Sciences, Lund University, Lund, Sweden*

Initiated as a cross-national European research endeavour 15 years ago, we have established a mixed methods research program with the overarching purpose to increase and deepen the knowledge on how aspects of home interplay with health and disability trajectories along the process of ageing. With a comparative ambition, samples representing

different age and diagnosis groups are studied longitudinally. More knowledge is needed to target problems related to societal planning for the ageing population, integrating housing provision with health care and social services development. Traditional dissemination of research findings is insufficient to achieve genuine impact from research. To contribute to societal and economic benefit, efforts moving results into the public domain are imperative. While maintaining high scientific standards, researchers must find ways to make their research more appealing and easier to access. Concentrating on user-oriented activities integrated in a complex research program, an emerging model for knowledge translation will be outlined.

SESSION 4430 (POSTER)

AGE-FRIENDLY COMMUNITIES AND NEIGHBORHOODS

OLDER ADULTS AS AGENTS OF NEIGHBOURHOOD CHANGE

C. Hand, D.L. Rudman, S. Huot, J. Gilliland, R. Pack, *School of Occupational Therapy, University of Western Ontario, London, Ontario, Canada*

Transactional perspectives emphasize that individuals and collectives engage in ongoing relationships with their environments, shaping and being shaped by the places in which they live. Understanding how older adults engage with their neighbourhoods can inform age-friendly practices and policy. This presentation reports on a study that explored ways in which older adults shape their neighbourhoods to support their social engagement, participation and connectedness. We employed an innovative, interdisciplinary methodology combining narrative inquiry, go-along interviews and GPS tracking with 16 older adults living in a medium-sized Canadian city. Analysis suggests that older adults engage in 'Active Shaping' and 'Being Present', but sometimes experience 'Powerlessness' in interactions with their neighbourhoods. 'Active Shaping' of the neighbourhood is characterized by inviting social engagement through a variety of strategies, for example, cutting down trees to allow visibility into a porch, greeting people and pets, and patronizing local businesses to support their sustainability as well as interact with others. 'Being Present' in a neighbourhood involves few social interactions in the neighbourhood combined with frequent use of local businesses and resources, gaining a sense of familiarity and providing others with a sense of familiarity. 'Powerlessness' identified areas where older adults feel unheard, for example, regarding unwanted neighbourhood growth. Study findings suggest that older adults are active agents in their communities and can be forces for change. Findings also highlight the potential to work with older adults to shape neighbourhoods to support inclusion and well-being, and point to areas for advocacy and education of community members.

CARE FROM YOUR COMMUNITY: A PILOT PROGRAMME TO BRING CARE CLOSER TO SENIORS

S. Wang, E. Phua, L. Sing Ai, W. Lim, W. Loong Mun, J. Cheah, *Agency for Integrated Care, Singapore, Singapore*

Care From your Community (CFC) modelled after the Naturally Occurring Retirement Community (NORC) Programme, coordinates various social and health care services to support seniors to age in place in Singapore. Unlike NORC, which is implemented in different communities (dense urban developments, sprawling suburbs and remote rural towns), Singapore's CFC is developed to address the needs of densely low income urban populations.

CFC is a 3-year pilot that provides home personal care and care coordination for the seniors. The programme leverages on existing Senior Activity Centres (SACs) that are drop-in centres situated within cluster of lower-income housing estates to provide social, wellness and recreational activities for lower-income seniors. This programme integrates health and social care between various community providers, capitalising on the strategic location and connection of SACs to provide care more efficiently. The patient-centric approach supports active ageing, chronic disease management and home care for residents in their own homes. The programme has rolled out to 11 SACs, enrolled 1060 seniors, is actively serving 468 seniors. 55% of the beneficiaries are female and approximately 61% have complex chronic conditions. Preliminary results showed that there have only been 10 nursing home referrals to date (self-reported) and 80% of participants are satisfied with the programme.

An evaluation framework has been developed to assess if this pilot lead to greater operational efficiency and better outcomes. A comparison of the outcomes (specifically quality of life, caregiver burden of carers and client satisfaction) will be performed to analyse the pre-enrolment and post-enrolment to the programme.

VILLAGE COALITIONS: POWER IN NUMBERS FOR PARTNERSHIPS AND VISIBILITY

R.F. Nicholson^{1,2}, A.E. Scharlach³, C.L. Graham³, 1. *Mather LifeWays, Evanston, Illinois*, 2. *University of Chicago, Chicago, Illinois*, 3. *University of California Berkeley, Berkeley, California*

The Village Movement has emerged as an innovative, nationwide, grassroots social movement that aims to support older adults aging in community by providing social engagement, referrals to services, and volunteer support. Because Villages tend to be relatively small (half have fewer than 110 members) and isolated, there is growing interest in the potential value of regional coalitions. Our 2016 National Villages Organizational Survey of 119 Villages found that 45% reported being part of a regional coalition or a coalition in formation. Qualitative follow-up interviews with these Villages revealed that a primary motivation for forming such coalitions was to attract partnerships with larger organizations that are not possible due to the smaller size of individual Villages. The larger population served by a coalition is thought to also potentially enable a stronger voice for the Village Movement on policy matters. Villages also view coalitions as a potential mechanism for creating greater visibility. However, as Villages have an average of only 1.73 paid staff, concerns remain about the additional demands that coalition participation and initiatives may place on organizations already heavily dependent on volunteer manpower to meet the needs of Village members. Despite the advantages that coalitions can potentially confer, balancing the priorities

of individual Villages with coalition priorities remains an ongoing concern. For Aging Services as a whole, this study sheds light on the potential of coalitions for increasing visibility and funding for smaller organizations, as well as the challenges that participation in such coalitions may pose.

REMOVING FINANCIAL BARRIERS TO MEMBERSHIP WITHIN THE VILLAGE MOVEMENT

R.F. Nicholson^{1,2}, A.E. Scharlach³, C.L. Graham³, 1. *Mather LifeWays, Evanston, Illinois*, 2. *University of Chicago, Chicago, Illinois*, 3. *University of California Berkeley, Berkeley, California*

The Village Movement has emerged as an innovative, nationwide, grassroots social movement that aims to support older adults aging in community by providing social engagement, referral to existing services, and volunteer support. One barrier to Village growth and sustainability is that Village membership is largely white and middle class. However, the results of our 2016 National Villages Organizational Survey show that many Villages are attempting to address potential economic barriers to membership. In this survey 71% of Villages reported offering discounted memberships or scholarships for lower income members. In addition to reduced cost memberships, 30% of Villages also provide other forms of discounts or assistance to help members with low or moderate incomes, ranging from payment plans, to discounts on events with a fee, to funds to help members pay for services that they cannot afford. Even with these efforts to accommodate lower income membership, 68% of Villages reported that fewer than 10% of members were impoverished, and another 10% of Villages reported that 10–24% of their members were impoverished. Half of the Villages had fewer than 10% of members economically vulnerable, and another 25% reported that 10–25% of their members were economically vulnerable. These data suggest that for Aging Services organizations like Villages looking to attract lower-income members, simply removing financial barriers may not be sufficient. These data and prior qualitative research suggest that additional outreach efforts addressing sociocultural differences may also be needed.

BUILDING HONG KONG INTO AN AGE-FRIENDLY CITY: RESULTS FROM A BASELINE ASSESSMENT

R. Yu¹, J. Woo¹, T. Lum², V. Lou², C. Ma³, M. Kwan³, A. Au⁴, D.W. Lai⁴, 1. *The Chinese University of Hong Kong Jockey Club Institute of Ageing, Shatin, Hong Kong*, 2. *Sau Po Centre on Ageing, The University of Hong Kong, Pokfulam, Hong Kong*, 3. *Asia-Pacific Institute of Ageing Studies, Lingnan University, Tuen Mun, Hong Kong*, 4. *Institute of Active Ageing, The Hong Kong Polytechnic University, Hung Hom, Hong Kong*

Funded by the Hong Kong Jockey Club Charities Trust, the baseline assessment, including a survey and focus groups, was conducted between July 2015 and February 2016 across Hong Kong. Community-dwelling adults aged 18+ were invited to respond to a structured questionnaire and give views on eight domains of age-friendliness (outdoor spaces and buildings, transportation, housing, social participation, respect and social inclusion, civic participation and employment, communication and information, and community

support and health services) as suggested by the World Health Organization. Socio-demographics, self-rated health, use of community center, and sense of community were also collected.

A total of 4,274 respondents completed the survey, with 63.6% aged 65+ (mean age, 66.9 years) and 68.8% being women. Mean scores of each domain ranged from 3.7 to 4.3 (scale of 1–6), with social participation and housing had the highest and lowest scores respectively. Multivariate analyses showed that respondents who were older, living in public rental housing, users of community center, had higher self-rated health and sense of community gave significantly higher scores in at least three domains (all $P < 0.01$). Data from 40 focus groups ($n=347$) were also analyzed to identify advantages, barriers and suggestions for improving age-friendliness in their community. For example, respondents reported satisfaction with variety of social activities available in the community but barriers in housing maintenance services.

The baseline assessment offered valuable information on the current age-friendliness of Hong Kong and gave evidence-based direction to inform community programmes. Follow-up assessment will be carried out to evaluate effectiveness of the programmes.

CREATING DATA REPORTS TO SUPPORT AGE-FRIENDLY EFFORTS IN THE NEW ENGLAND REGION OF THE US.

E. Dugan, F.W. Porell, N.M. Silverstein, C. Lee, H. Lee, B. Kim, *Gerontology, UMASS Boston, Boston, Massachusetts*

The aging of the population has raised interest in optimal aging. Across New England older adults, policymakers, service providers, philanthropists, researchers, and advocates are working together to promote healthy aging (see mahealthyagingcollaborative.org). This effort has championed the use of data to inform policy development, resource allocation, and service delivery. In MA approximately 14% of the state is age 65 or older. We developed community profiles reporting more than 120 indicators of healthy aging for the 351 cities and towns in the state and 16 Boston neighborhoods. In RI approximately 21% of the state's 1,052,567 residents are 60 or older. We created community profiles reporting 120+ indicators for the 41 cities and towns in RI. Rarely is data reported at such a local level. Analyses were conducted using data from CMS, BRFSS, US Census and other sources using small area estimation techniques to determine age/sex adjusted community rates. We compared community and state rates, and state rates to national rates. Interactive online maps show the distribution of disease. Selected results include state rates for MA/RI adults 65 or older ever being diagnosed with: diabetes (32%/36%), hypertension (78%/79%), stroke (13%/13%), Alzheimer's disease or related dementias (14%/14%), depression (29%/30%), and 4+ chronic conditions (59%/64%). This poster describes both the methodology and findings of the reports. We also report on how communities have used these data for developing new partnerships, identifying priorities and becoming more age-friendly at the state and community levels. Research supported by the Tufts Health Plan Foundation.

AN UPDATE ON PROJECT SOAR: THE EFFECTS OF COMMUNITY ENGAGEMENT AMONG COMMUNITY-DWELLING OLDER ADULTS

K. Murry, K. Ivey, D. Dragan, P. Payne-Foster, J. Oliver, C. Spencer, M.R. Crowther, R.S. Allen, *Psychology, University of Alabama, Tuscaloosa, Alabama*

Project SOAR (Sharing Opinions and Advice on Research), is examining issues of aging, ethnically-diverse, and underserved individuals facing health and mental health disparities. Using Community-Based Participatory Research (CBPR) enables research-community partnerships to address persistent problems of health care disparities among these populations. SOAR partnered with one rural community and one urban community, and recruited and trained 15 community members into Project Advisory Councils (PACs). PAC members show high levels of psychological flexibility ($M = 12$; $SD = 5.44$) in comparison with college-aged samples and international norms (Bond et al., 2011). On the CIROP measure (King et al., 2009), PAC members reported high levels of personal knowledge ($M = 22.5$ high of 35), group access to information ($M = 63$ high of 70), and community development ($M = 74.5$ high of 84). The urban site provides an example of a community engaging in healthier practices as a result of research community partnerships. CBPR has enabled the urban community PAC to allocate resources to implement a Potted Plant Project to meet the physical health concerns of their community. The project allows community members to grow healthy fruits and vegetables in their home, while promoting physical activity and nutrition education. The rural community PAC members have focused on increasing knowledge of diabetes and other chronic health conditions by enhancing the resources available to them at their local hospital. These initiatives have helped generate new research partnerships that address the specific needs of these communities.

SESSION 4435 (POSTER)

AGE-RELATED POLICY

DEVELOPMENT OF THE ADULT PROTECTIVE SERVICES VOLUNTARY CONSENSUS GUIDELINES

J. Kuhne², J. Bobitt³, M. Twomey⁴, J. Carter⁵, S. Whittier Eliason⁴, R. Mabe⁶, 2. *Department of Veterans Affairs, Columbus, Ohio*, 3. *University of Illinois at Urbana Champaign, Champaign, Ohio*, 4. *Administration for Community Living, Washington, District of Columbia*, 5. *Medicare Rights Center, Washington, District of Columbia*, 6. *Department of Veteran Affairs, Salt Lake City, Utah*

The Administration for Community Living (ACL), seeking to ensure that the policies and practices of Adult Protective Services Programs (APS) are consistent nationwide, opened a process of public and stakeholder input on draft Voluntary Consensus Guidelines for State APS Systems in 2015. This draft was created by a working group of experts in the abuse, fraud, and neglect of vulnerable adults, and is intended to provide a framework for state APS jurisdictions when updating, refining, or clarifying current APS rules and laws. Seven domains of APS Practice were identified that informed the Guidelines project: Program Administration, Time Frames for Response,

Reporting, Investigating, Interventions, Training, and Program Evaluation.

ACL received public comment on the draft Guidelines in 2015 and convened listening sessions to invite stakeholder input. In order to incorporate stakeholder ideas effectively, ACL engaged a Health and Aging Policy Fellowship (HAPF) team, to provide a qualitative research analysis of the public comments on the draft Guidelines. This analysis will inform efforts to revise the guidelines based on the stakeholder input. The Guidelines in final form will provide consensus expert recommendations, best practices when identifiable, and information regarding evidence-based interventions. This session will provide an overview of the development of the guidelines, including the stakeholder engagement process. We will then discuss the qualitative research methods used to analyze the public comments by the HAPF team. Finally, we will conclude by sharing updates to the guidelines based on the results of the data analysis.

REFRAMING PUBLIC POLICY OPTIONS FOR LONG-TERM CARE FINANCING: HAWAII'S EXPERIENCE AND ITS IMPLICATIONS

S. Yuan, E.L. Wegner, L.H. Nitz, *Center on the Family, University of Hawaii, Honolulu, Hawaii*

A public long-term care financing program was introduced during the 2016 Legislative Session in Hawaii. The proposed program was based on the recommendations of a Long-term Care Commission study and an actuarial study funded by the State Legislature. While Hawaii was the first state in the U.S. to introduce a public long-term care financing bill, it was Hawaii's second attempt to pass a similar bill since 2002. This paper will present public discourse analysis using testimonies submitted during the 2016 session, compared to those submitted 14 years ago. We will also examine a community awareness campaign that aims to increase knowledge of options for long-term care among the public. We will present the media message as well as describe community forums which have taken place and the impact of these efforts in shaping public's opinion on the proposed public long-term care financing program.

COMMUNITY-BASED ORGANIZATION INTEGRATION IN THE U.S. HEALTHCARE SYSTEM: BUILDING THE BUSINESS CASE

R.J. Schreiber^{1,2}, N. Super³, 1. *Hebrew Senior Life, Boston, Massachusetts*, 2. *Harvard Medical School, Boston, Massachusetts*, 3. *National Association of Area Agencies on Aging, Washington, District of Columbia*

As the global population ages, countries and health systems all over the world are struggling to adequately meet the unique and complex care needs of older citizens. In the United States, an increased emphasis on value-based care that will hold them accountable for quality and cost has led health care payers to focus on social services that can keep vulnerable populations out of high-cost, institutional settings. Traditional United States medical systems do not have much experiencing delivering these types of services, however, and the social service agencies that do have experience (such as Area Agencies on Aging) typically do not have contracting, billing, and infrastructure experience necessary to partner effectively with the health care system. The types of services these community based organization deliver include evidence

based self management programs, consumer education, care transition programs in addition to home and community based long term service supports. A new National Aging and Disability Business Center was established to provide training and technical assistance to enhance the business capacity of community-based organizations, positioning them to negotiate, secure, and successfully implement contracts with health care entities. This workshop will provide an overview of the Business Center – its goals, objectives, tools and resources. The symposium will show how this national approach will help these organizations make the business case for reimbursement for services that improve value, i.e, improve health, healthcare at lower per capita costs, Examples of successful partnerships will be described and the value proposition that exists as the result of these linkages.

PRIVATE INSURANCE VERSUS MEDICAID AND ADHERENCE TO MEDICATION IN OLDER ADULTS WITH FIBROMYALGIA

I.A. Vaughn¹, M. Laberge^{1,2}, N.M. Marlow¹, 1. *Health Services Research, Management & Policy, University of Florida, Gainesville, Florida*, 2. *Department of Operations and Decision Systems, Université Laval, Quebec City, Quebec, Canada*

Background: Fibromyalgia, defined as chronic, widespread musculoskeletal pain, affects 4 to 10 million Americans and up to 6% of the world population. Medication nonadherence results in \$100 to \$300 billion in US health expenditures annually. Previous studies have examined medication adherence in commercial health plans or public health plans, but relatively few have compared both populations. The purpose of this study was to estimate the effect of type of insurance on adherence to medication for older adults with fibromyalgia.

Methods: The retrospective cohort study analyzed medical claims of fibromyalgia patients collected between January 1, 2005 to June 30, 2011 from the Blue Cross Blue Shield South Carolina State Health Plan (BCBS) and Medicaid data. Older adults age 60 and older were included if they were prescribed duloxetine, milnacipran, or pregabalin (N=3,187). The primary outcome, medication adherence, was defined as having a medication possession ratio (MPR) of $\geq 80\%$. Independent variables included health insurance, FMS medication, selected comorbidities (FMS-related, musculoskeletal pain, or neuropathic pain), gender, age, and the interaction between health insurance type and treatment.

Results: Logistic regression showed older adults with fibromyalgia on Medicaid were over 3 times more likely to be adherent when compared to BCBS in both unadjusted (OR: 3.21, $p < 0.0001$) and adjusted models (OR: 3.74, $p < 0.0001$).

Conclusion: Most states do not require a Medicaid prescription co-pay; whereas, private insurers, like Blue Cross Blue Shield, require more out-of-pocket costs. Our study suggests that the co-pays for medications in private plans may present a barrier to patient adherence.

EVALUATING BASIC PENSION SCHEME IN SOUTH KOREA: FOCUSING ON ITS INTERGENERATIONAL EQUITY

H. Kang, 1. *School of Social Welfare, University of Kansas, Lawrence, Kansas*, 2. *Center for Research on Aging and Disability Options, University of Kansas, Lawrence, Kansas*

Basic Pension Scheme (BPS) in South Korea, which provides non-contributory pensions, was implemented in 2014 to ensure basic income security for older adults who below the poverty level. Since its implementation, the structural weakness and financial instability for the long term development has been pointed out. Taking note of intergenerational equity, this study conducts an analytic and detailed examination through Barusch's (2009) social justice framework as to whether BPS was established through fair and proper processes and will be implemented to equally benefit all generations. The social justice framework can explain whether BPS brings about inequitable distribution of power, resources, and individual access and how BPS resists inequity and unfairness. The four elements were evaluated: the fairness of the policy development process, the allocation rules, the effect on vulnerable populations, and policy's impact on social justice. The findings indicated that the process of making BPS did not proceed by an established rule and BPS focuses on only its short term effects for current older adults by ignoring its potential long-term consequences. Available funds for BPS is expected to be in danger of being exhausted and this will lead to either reducing the amount of payment or increasing contribution rates. Our findings also revealed that the financial resources for maintaining BPS do not disproportionately burden between current and future generations to fund. The government is required to prepare and provide the public with a long-term financial plan of BPS by designing a more equitable funding and benefit scheme.

THE AFFORDABLE CARE ACT'S MEDICAID EXPANSION: THE EFFECTS ON LOW-INCOME MID-LIFE ADULTS

S. Choi, *University of Tennessee at Knoxville, Knoxville, Tennessee*

Purpose: This study aimed to examine how the state Medicaid expansion under the Affordable Care Act affected insurance status and access to healthcare among low-income mid-life individuals in 2014, the first year of Medicaid expansion.

Methods: The 2012 and 2014 Behavioral Risk Factor Surveillance System data were linked to state-level data including Medicaid expansion status. The analysis included a nationally representative sample of 298,376 mid-life adults (50–64) from 50 states and Washington, DC. Among them, 23.1% were low-income with family income below \$25,000. Using multi-level modeling (individuals < states), this study compared low-income mid-life residents living in Medicaid expansion vs. non-expansion states. Additionally, pre- and post-Medicaid expansion data (2012 vs. 2014) were compared.

Results: Regardless of income status, U.S. mid-life adults' access to healthcare improved from 2012 to 2014. However, the rate of improvement was greater among low-income residents living in Medicaid expansion states. For example, the insured rate increased from 66.5% (2012) to 80.4% in 2014 (20.9% increase) among low-income mid-life residents in Medicaid expansion states, while it increased from 61.3% to 70.0% (14.2% increase) among their counterparts in non-expansion states. The conditional multi-level models indicate that after controlling for individual- and state-level covariates, low-income mid-life adults from Medicaid expansion states were more likely to have health insurance (OR=2.14, $p < .001$) and less likely to miss a doctor visit due to cost

(OR=0.79, $p=.003$) compared to their low-income counterparts residing in non-expansion states.

Implications. This study clearly demonstrates that state-level Medicaid expansion improved healthcare access among low-income mid-life residents.

PRODUCTIVE ENGAGEMENT FROM A SYSTEM DYNAMICS PERSPECTIVE: RESULTS FROM GROUP MODEL BUILDING

C. Halvorsen¹, N.L. Morrow-Howell¹, P. Hovmand¹, C. Lee², 1. *Washington University in St. Louis, Saint Louis, Missouri*, 2. *University of Bergen, Bergen, Norway*

Gerontologists have argued that the human capital of older adults can be marshalled through working, volunteering, and caregiving for the benefit of families, communities, and society at large. This active, purposeful engagement can also produce positive outcomes for older adults themselves. In this presentation, we propose that existing conceptual frameworks that articulate the antecedents and outcomes of productive engagement in a linear fashion can be improved using system dynamics. This approach offers a more complete understanding of the feedback loops between individuals, families, and society, as well as the impact of potential program and policy changes intended to increase the productive engagement of older adults. Using the qualitative method of group model building, seven experts in productive aging and system dynamics met weekly over five weeks for more than 10 hours of in-person discussion to model the facilitators and barriers to productive engagement of older adults and their impacts on human and social capital. First drawn on white boards, the models were then built using the Vensim PLE software package. Findings include a system dynamics model of productive engagement in later life that illustrates the reciprocal relationships between older adults' human and social capital and family resources, as well as societal attitudes and expectations about older adults, programs and policies to support productive engagement, and organizational capacity for engaging older adults. This unique, qualitative effort at developing a system dynamics model for productive engagement in later life advances theory and helps refine the productive aging research agenda.

DEPENDING ON WHOM? INCOME AND POVERTY OF OLDER ADULTS IN CHINA

N. Jiang, *Columbia University, New York, New York*

Objective: The goal of this study is to investigate elderly poverty and analyze the extent to which Chinese elders rely upon their employment, shared living, and pension plus other government transfers.

Method: Using the China Health and Retirement Longitudinal Study (CHARLS) Wave II in 2013 ($N=8,630$), I calculate pre- and post-transfer income-per-capita measures. Poverty rate is calculated based on the World Bank international poverty line of \$1.90/day. Regression analysis is conducted on poverty headcount ratio after controlling for individual characteristics.

Results: The poverty rates of post-transfer income for urban, rural, and migrant older population are 76%, 30%, and 74%, respectively. Pension has had a beneficial impact on poverty alleviation, especially on urban elderly ($\beta=-1.493$, -0.317 , and -0.582 for urban, rural, migrant elders,

respectively). For both urban residents and migrants, pension significantly decreases dependence on employment. For the rural elders, working still remains to be an important resource to alleviate poverty ($\beta=-0.634$). Multigenerational living arrangement has a statistically significant negative correlation with poverty status ($\beta=-1.966$, -0.381 , and -2.222 for urban, rural, migrant elders, respectively). Other public transfers have a moderate effect on antipoverty protection among all three groups.

Discussion: Work, co-residence, and pension support play key roles in financing income and in keeping older adults out of poverty, but functions differently among the three groups. These findings can be interpreted as the key roles played by the three factors (individual, family, and state) in aging policies and suggest welfare expansion on targeted low-income rural and migrant elders with supportive anti-poverty programs.

PROFILES OF SOCIALLY ISOLATED ELDERLY: A TYPOLOGY WITH INTERVENTION IMPLICATIONS

A. Machiels, *University of Humanistic Studies, Utrecht, Netherlands*

Recent statistics show a growing number of older adults who are living alone and are socially isolated. It is against this background that, in recent years, many interventions have been developed to address social isolation among the elderly. Evaluative studies show that most interventions are hardly effective, though. An important reason for this is the heterogeneity of the socially isolated. This paper offers insight into this heterogeneity by presenting a typology with different profiles of socially isolated older adults and the intervention implications of this typology. The typology is derived from an extensive qualitative study on socially isolated elderly individuals in the Netherlands. The typology imposes some degree of order to a diversity of circumstances, ambitions, and possibilities of the socially isolated elderly, thereby deepening the understanding of the heterogeneity of this population. The definition of social isolation used in this study starts from a societal angle of incidence, namely the current policy context of Western European welfare states, in which governments emphasize the importance of independence and self-reliance of their citizens. Developed from that perspective, the typology provides a theoretical basis for applying interventions aimed at increasing self-reliance of social isolated elderly.

HETEROGENEOUS EFFECTS OF RAISING SOCIAL SECURITY ENTITLEMENT AGE ON OLDER ADULTS

Y. Zhu, J. Zissimopoulos, *University of Southern California, Los Angeles, California*

One policy proposal at the center of discussions on how to address America's aging population and the corresponding threats to the solvency of the Social Security Trust fund is a policy aimed at increasing the age of eligibility for Old Age and Survivors Insurance (OASI) benefits. This change would impact older adults' well being by reducing their lifetime OASI and disability insurance (DI) benefits and delaying their retirement decision, which would expand their private savings. In addition, social security policy change would influence aged adults' private financial transfer such

as bequest and inter vivos gifts, and their non-market productive activities including volunteer and care provided to family members. Specifically, individuals vary by health and socioeconomic status (SES) may respond differently to the policy change. Consequently the policy effects can be heterogeneous.

In this study, we consider how increase in the social security entitlement age differentially impacts labor supply, claiming decisions, private financial transfer and engagement in unpaid productive activities of older adults with different health and socioeconomic status, especially how it affects the vulnerable adults. We utilize a dynamic microsimulation model, the Future Elderly Model that uses data from Health and Retirement Survey (HRS) to project the heterogeneous impacts of a change in the OASI eligibility age on the well being and contributions of workers differentiated by their health and socioeconomic characteristics from 2010 to 2050. This research provides insights into differential effects of Social Security policy change on different target population, particularly on the target population with lower SES.

POPULATION AGEING AND AGEING-RELATED POLICIES IN RUSSIA

G. Safarova¹, L. Kozlov², O. Mikhailova², A. Safarova¹, 1. Saint-Petersburg Institute for Economics and Mathematics, Saint-Petersburg, Russian Federation, 2. St.Petersburg Institute of Bioregulation and Gerontology, Saint-Petersburg, Russian Federation

Globally, the number of elderly grows faster than sizes of other age groups. For Russia, matters of ageing are also of great importance, especially because the country's total population size had been decreasing since the early 1990s for more than 15 years.

For the analysis, census and vital statistics data provided by Rosstat and Human Mortality Database were used. Computations of ageing indicators were made in Excel.

Our study shows that ageing in Russia is expected to continue, moreover, it is highly heterogeneous – it is characterized by significant gender imbalance and great regional differentiation. Progressing aging requires large-scale, adequate, and versatile actions.

Until recently ageing issues were not focused on sufficiently. The Concept of demographic policy of the Russian Federation for the period up to 2025 approved by the Order of the President of the Russian Federation N 1351 of 09.10.2007 includes few measures related to the elderly.

This year the Strategy of actions for the benefit of citizens of older generation in the Russian Federation until 2025 has been approved by the Decree of the Government of the Russian Federation N 164r of 05.02.2016. The Strategy, though not without shortcomings, means a step forward to building the society for all ages. When implementing the Strategy, it is crucial to take into account various heterogeneities of ageing process in Russia.

DEVELOPING A MODEL OF CARE FOR ELDERLY—A PIONEER PROJECT FOR AGE-FRIENDLY COMMUNITY IN S. INDIA

P. Pai¹, B.P. Gaspar², J. Augustine², B. James², S. Maduforo³, M. Meyers³, 1. VPS Lakeshore Hospital, Kochi, Kerala,

India, 2. Rajagiri College of Social Sciences, Kochi, India, 3. University of Maryland, Baltimore, Maryland

Ageing population in India is growing. Presently, 13.1% of Kerala population is above 60 years. The shift in age demographic could bankrupt India if appropriate measures are not taken and there is currently no coordinated program addressing the needs of elders.

As a result, we initiated an action research with two specific aims. First, to identify key areas of concern that is unique to elders in order to create age-friendly communities. Second: to develop appropriate action plan and programs that effectively address identified key problems.

In consultation with stakeholders, such as key governmental departments, NGOs, lay public - young and old, we used purposive sampling to conduct 13 focus groups in Ernakulam district.

Data obtained from the focus groups highlighted three key priority needs: safety and security, transport and mobility, developmental issues.

Next, we developed a model of intervention specific for the state using two theoretical frameworks. We reasoned that an effective and sustainable intervention is one that is owned by the communities. Second, understanding that crisis of old age are ever-present, we believe communities will naturally act to resolve their problems. It is only when their resources are exhausted that the members willingly seek outside help. Thus, we develop strong trained volunteers from the communities at grassroots for initial response and remedial action with the support of NGOs and governmental departments.

Using this model, we established an Elder-line for safety and security, Senior Taxi Program for transportation issues. The response to developmental need is the University of Third Age.

SESSION 4440 (POSTER)

AGING-IN-PLACE AND GEOGRAPHIC MOBILITY

INTEGRATED HOME AND DAY CARE PROGRAMME: A PILOT TO CARE FOR FRAIL ELDERLY IN THE COMMUNITY

L. Huang, L. Teo, W. Lim, J. Cheah, Agency for Integrated Care, Singapore, Singapore

In Singapore's current eldercare services landscape, frail seniors who require multiple services may be managed by different service providers, leading to high overall out-of-pocket costs and poorly coordinated care. Modelled after United States' Program of All-Inclusive Care for the Elderly and Australia's Home and Community Care Packages, Integrated Home and Day Care (IHDC) programme aims to provide better services integration by delivering a comprehensive and co-ordinated suite of services in a single package. A multi-disciplinary care team comprising healthcare professionals and support staff will personalise a care plan that consists of core services such as case management, personal care, and caregiver support. Other services such as nursing, rehabilitation and transportation will be added if required. The packages are funded on a capitated model, giving providers more flexibility in deploying resources, especially for

services such as care coordination and tele-consults, which are poorly resourced currently.

To date, the programme has benefitted 155 seniors (average age 77 years; assessed nursing home eligible and are moderate dependency on activities of daily living). Preliminary findings from the IHDC pilot have shown that the programme was effective in managing the care of the seniors, only 9.8% were discharged to nursing homes and a 75% decrease in hospital service utilisation was observed. 98% of the seniors and their caregivers are also satisfied with the IHDC programme. An evaluation framework will be used to determine the programme's effectiveness in increasing number of days spent within the community, improvements in quality of life and satisfaction with care arrangements.

EDUCATING HOME CONTRACTORS ON UNIVERSAL DESIGN MODIFICATIONS: AN ACADEMIA AND CORPORATE COLLABORATION

J. Overton¹, J. Pynoos¹, S. Enguidanos¹, A.N. Rahman¹, E. Nabors¹, B.H. Tracton-Bishop², J. Olshevski², C. Hellyar², 1. *Gerontology, University of Southern California, Carlsbad, California*, 2. *The Hartford, Simsbury, Connecticut*

The Hartford Center for Mature Market Excellence® collaborated with the University of Southern California Andrus Gerontology Center (USC) on a research and education effort to support policyholders' ability to live in their home for a lifetime. A 2012 study investigated whether educating homeowners about universal design (UD) to promote their independence and reduce accidents influenced repairs they made following a home claim. Home insurance policyholders who submitted claims for damage to bathrooms or kitchens received an educational brochure introducing UD features. Homeowners completed follow-up surveys from USC and descriptive and bivariate analyses were conducted. Thirty-three of 37 respondents (89.2%) had implemented UD modifications, making an average of 9.1 UD modifications. Most respondents rated the brochure positively and respondents' self-rated knowledge of UD improved after reading it. Due to these findings, in 2014, The Hartford and USC developed a voluntary 6-week online training program to educate contractors who work with customers of The Hartford to be able to discuss and promote UD with policyholders at the time of a claim. Goals include: 1) creating a value-added service for policyholders at the critical time of a claim; 2) increasing the likelihood that policyholders will make design changes to facilitate their staying in their homes longer; and 3) equipping contractors with unique skills that will give them a competitive advantage in the marketplace. Student evaluations have repeatedly shown increased knowledge level by contractors to meet customers' needs and the ability to upsell their services.

OBJECTIVE AND SUBJECTIVE VIEWS ON HOME SAFETY ACROSS HOUSING TYPES OF OLDER ADULTS

H.H. Ewen, M. Smith, T. Washington, A. Carswell, K.G. Emerson, *University of Georgia, Athens, Georgia*

It is well established that older adults prefer to age-in-place, but their ability to do so is dependent upon their health and functional abilities as well as the structure and safety of

their living environment. This study uses the second wave of data collected in the Pathways to Life Quality Study to investigate both the objective and subjective aspects of the living units among three types of residences: those within their own homes in the community (n=402), service-rich senior housing (e.g. CCRC; n=206), and service-poor senior housing (e.g. HUD subsidized apartments; n=160). Comparisons across housing types result in significant differences with service poor housing residents being older, taking more prescription medications, more hospitalizations, and poorer health. Differences in objective measures of home safety were evident among all three housing types, with service-poor housing having more safety features and community dwellings the least. Subjective perceptions of adequacy of the home features meeting needs and abilities differed, with community-dwelling residents reporting greater adequacy. Similarly, differing satisfaction with functional aspects of housing (e.g., function of built-in features, fixtures, and lighting). Greater satisfaction was seen in community-dwelling residents and least among service-poor housing residents. Conclusion: Service-rich communities entail access to healthcare and guarantees of remaining onsite for the remainder of life. Despite more safety features, residents of service poor housing had poorer health, insecurity about adequacy of essential features (e.g. lighting), and were more dissatisfied with the functional aspects of their homes. They are at greatest risk of being unable to age in place.

PLANNING FOR MOVES IN LATE LIFE: WHO PLANS AND HOW DOES PLANNING INFLUENCE OUTCOMES?

E. Kahana¹, M. Ye¹, B. Kahana², L. Chen³, C. Diaz-Spatharos¹, 1. *Sociology, Case Western Reserve University, Cleveland, Ohio*, 2. *Cleveland State University, Cleveland, Ohio*, 3. *Fudan University, Shanghai, China*

The gerontological literature has documented older adults' desire to age in place. Recently, focus has shifted to potential benefits of moving in order to "age in the right place" (Golant 2015). This research examined characteristics of older adults who undertake planned vs. unplanned moves from their independent community residence. We also explored the influence of planned vs. unplanned moves on post-move experiences of older adults. We used data from the ECRC longitudinal study of successful aging, waves 7 to 11 (Kahana, Kelley-Moore and Kahana 2012). During a four year period, 132 of the original 1000 participants relocated. We defined unplanned moves as those planned for less than 3 months (30%). T-test showed that poor health was the top reason for moving among those who spent less time on planning. The desire to live closer to adult children was the top reason for moving among those who were longer term planners. The latter group were more likely to move to life care communities. Those with less lead time for planning, also reported experiencing more difficulties after moving. Interestingly, satisfaction with post move neighborhood was not influenced by the length of time spent in planning the move. The current study illustrates the relative benefits of planned moves among older adults. While planning is not always possible, as in cases of sudden illness situations, older adults should be encouraged to engage in planning for

residential moves by healthcare professionals to help them better adjust to a new living environment.

AGING IN REMEMBERED AND IMAGINED PLACES: FINDINGS FROM AN ETHNOGRAPHIC STUDY OF AGING IN POLAND

J. Robbins-Ruszkowski, *Institute of Gerontology and Department of Anthropology, Wayne State University, Detroit, Michigan*

Aging in place is an influential global movement that aims to create possibilities for increasing numbers of older people to achieve a good old age. By growing old at home or in one's community, older people who age in place aim to avoid the negative effects associated with living in institutional care (e.g., increased costs, social upheaval, dehumanization). However, the concept of aging in place rests on an implicit moralized binary opposition between the categories of "home" and "institution," such that "home" is assumed to be the only option for a good old age, while "institution" is assumed to be the only option for a bad old age. In fact, the moral dimensions of homes and institutions are culturally and historically specific. Moreover, the focus on the physical location of the home itself belies the ways that other imagined and remembered places shape experiences of living a good life in old age. In this presentation, I draw on twenty months of ethnographic research among older people in a range of institutional and non-institutional contexts in Poland to argue that both homes and institutions can offer possibilities for a good old age, and that imagined and remembered places make important contributions to experiences of a good old age.

SEX DIFFERENCES IN PHYSICAL ACTIVITY AMONG OLDER ADULTS LIVING IN URBAN AND RURAL NEIGHBORHOODS

W. Li, L. Churchill, E. Procter-Gray, K. Kane, J. Cheng, A. Clarke, J. Ockene, *Preventive and Behavioral Medicine, University of Massachusetts Medical School, Worcester, Massachusetts*

A better understanding of sex differences in physical activity (PA) may inform sex-specific promotion programs. Between 2013 and 2015, we queried 111 men and 102 women 65 years and older living in urban and rural neighborhoods in Central Massachusetts about their PA and use of neighborhood resources. The participants wore an accelerometer and a Global Positioning System (GPS) device for 7 consecutive days. Level and location of self-report PA were validated against accelerometer/GPS measures. We evaluated level, type and location of PA by sex. Compared to men, women reported more frequent PA inside the home (mean (SD) 59.1 (25.2) vs. 47.8 (30.0) times per month, $p=0.004$), and similar frequencies of PA outside home and utilitarian and recreational walking. Daily step counts were highly correlated with reported frequency of recreational walking and PA away from home but not with PA in home. Men had substantially higher average daily step count (4339 (2131) vs. 3661 (1725), $p=0.01$), self-report weekly frequencies of all exercise (21.4 (13.8) vs. 16.9 (9.4), $p=0.007$) and moderate-high-intensity exercise activities (11.8 (9.4) vs. 6.8 (6.4),

$p<0.001$). Men had a higher monthly frequency of visiting private membership clubs (5.7 (8.3) vs. 3.5 (6.2), $p=0.037$), and were more likely to perform golfing, heavy housework, heavy gardening, and moderate-heavy strength training ($p<0.05$ for all). Women were more likely to perform yoga and aerobic dancing. These results suggest that level, type and location of PA differed substantially between older men and women, which should be considered when promoting PA in older populations.

EUSKADI LAGUNKOIA – AGE-FRIENDLY BASQUE COUNTRY

E. del Barrio, A. Tomasena, M. Sancho, J. Yanguas, *Matia Institute, Madrid, Madrid, Spain*

Euskadi Lagunkoia is a proactive strategy to make living spaces more age-friendly, without physical obstacles and barriers. Goals: Tapping the potential of seniors in villages and cities as welfare generators; promote community participation processes; create a Network of friendly initiatives; and facilitate changes in the environments.

First a Practical guide to implement in municipalities was developed with tools and best practices to build a friendly territory. Baseline assessment was made in 15 towns, with secondary data sources, an Age-Friendly Survey (N 1.447 people 16+), Citizen forums (345 participants) and other 77 stakeholders involved. It provides guidance on how to develop an age-friendly project.

In a second phase (2015–2016) it was scaled up to 18 new municipalities and the three main cities (36 in total). Elderly associations have created self-managed groups for qualitative assessment.

Some indicators:

Evaluation: Active Ageing Index score in 2014 was 36.6. The aim is to increase to 38.4 in 2020.

326 Stakeholders involved: 36 City councils, 4 Government Departments, 37 Elderly Associations, 24 Schools, 176 Business and 49 others. And 2044 Citizens in the survey, 420 in Forums.

Examples Actions:

Course how to improve the friendliness of businesses. 13 towns and 176 businesses. AF Business Guide: 2.075 downloads

Legacy: Intangible cultural heritage by elders 12 videos 2646 views.

Dementia Friendly Citizen awareness and guidelines. 16.850 distributed.

Acknowledgements:

2016: European Commission: EIP on AHA Reference Site 4 stars (good practice).

2014: International Federation on Ageing: Top ten overall in the Best Future Vision category of the Age-Friendly Innovation Competition.

FAMILY ELDER CARE AND ACTIVE CITIZENSHIP OF OLDER EUROPEANS: A CHALLENGING RELATIONSHIP

A. Principi¹, F. Balducci¹, R. Papa¹, M. Barslund², *1. Centre for Socio-Economic Research on Ageing, INRCA - National Institute of Health & Science on Ageing, Ancona, Italy,*

2. CEPS - Centre for European Policy Studies, Brussels, Belgium

Current European socio-demographic developments as population ageing and increasing care needs in older age, explain the current policy call to provide informal family care and to be active citizens in older age to the benefit of society. Since providing informal care may hinder, for instance by reducing time availability, being a fully active citizen in other social domains, these two policy calls may be conflicting. By using a longitudinal approach, this study aims to elucidate whether, in line with role extension and role enhancement theories, the provision of informal family care to older relatives affects positively active citizenship in other social domains, as measured by the Active Citizenship Composite Indicator (ACCI), or whether, on the contrary, it could be a risk factor for social exclusion. Data were drawn from waves 1 and 2 of the Survey of Health, Ageing and Retirement in Europe (SHARE), which address European people of 50 years or older. Results showed that informal family caregiving outside the household positively affects active citizenship and so it can be considered as concurring to the concept of active citizenship. However, interaction terms showed that this could be less true for women, which may have less opportunities than men to be active citizens in other social domains. To prevent social exclusion of older women informally caring for older family members, stakeholders and policy makers should support their active participation in the wider society, by helping them e.g. in terms of training, respite services, as well as volunteering and social opportunities.

RACIAL AND DISPOSITIONAL DIFFERENCES IN FUTURE CARE PLANNING AMONG COMMUNITY DWELLING OLDER ADULTS

B. Kahana², E. Kahana¹, T. Bhatta¹, K.B. Langendoerfer¹, N. Lekhak¹, 1. *Sociology, Case Western Reserve University, Shaker Heights, Ohio*, 2. *Cleveland State University, Cleveland, Ohio*

Although many older adults fear loss of autonomy in late life, relatively few make plans for their future care. Given the benefits of future care planning (FCP), it is important to understand factors that facilitate or hamper FCP in late life. Our study explored racial and dispositional influences on thinking about and engagement in FCP among 409 community dwelling older adults in Cleveland, OH (Mean age=78.47; SD=5.88). Logistic regression estimates suggest that racial and dispositional characteristics not only play a role in who thinks about FCP, but also who executes FCP. In terms of executing FCP, blacks had significantly lower odds of FCP ($\beta=0.36$, $p<.05$) when compared to whites. However, after the inclusion of education, disability status, optimism, and religiosity, the estimate for blacks becomes statistically insignificant suggesting the potential role of these variables in producing racial differences in FCP. We also found significantly higher odds of thinking and executing FCP among older adults who had at least high school education. In contrast, we observed significantly lower odds of thinking about FCP among married older adults. Moreover, our estimates indicate that an increase in the level of optimism leads to a decrease in the odds of FCP with similar results for religiosity and pessimism. Although certain demographic and

dispositional characteristics may be considered as resources in later life (optimism, marriage, religiosity), our findings highlight that these resources may serve as barriers to FCP for black and white community dwelling older adults.

A LONGITUDINAL STUDY ON THE EFFECTS OF PHYSICAL ENVIRONMENT ON BEHAVIORS OF RESIDENTS WITH DEMENTIA

S. Lee¹, H. Chaudhury², L. Hung³, 1. *Built Environmental Design for the Elderly, Research Center Design and Health, Stockholm, Sweden*, 2. *Simon Fraser University, Vancouver, British Columbia, Canada*, 3. *University of British Columbia, Vancouver, British Columbia, Canada*

The challenges in investigating the effects of the physical environment on residents with dementia include having a sample of comparable study groups and a lack of long-term follow-up evaluation. This study attempted to address these two challenges by carefully matching residents between groups in sample selection and including three points of time of evaluation in the study design. The main aim of the study is to examine whether residents with dementia living in different physical environment, focusing on large-scale institutional design and small-scale homelike environment exhibit a difference in health and behavioral outcomes. Physical environmental assessment of the two care facilities was conducted using the Therapeutic Environment Screening Survey for Nursing Homes. Behavior assessments of residents were performed using three tools at three assessments over a period of 1 year: (a) Multidimensional Observation Scale for Elderly Subjects, (b) Minimum Data Set, and (c) Dementia Care Mapping. The longitudinal results suggest that older adults with early to moderate stage dementia can be supported to become socially active and engaged with others in an optimal environment. It is possible that a small-scale, home-like unit makes it easier to socially relate with others, as fewer people in the setting are not as overwhelming or over-stimulating. A smaller home-like environment may also offer a sense of comfort, security, and belonging.

THE STUDY OF THE ELDERLY AND THE GUIDE BOARD SYSTEM

P. Chen, T. Hsieh, *National Cheng Kung University Institute of Gerontology, Tainan City, Taiwan*

Faced with the aging vision of the elderly, hospitals need to deal with a complicated issue that how the guide board system in the hospital can provide sufficient information and help the elderly find the location they are looking for.

The study is based on the spatial cognition theory by Kevin Lynch. Different attributes of spaces and guide board systems combinations are discussed. An in-depth interview and a questionnaire survey are adopted as research methods. Thirty-four elders survey the spatial organization and guide board system of two medical centers and then conduct comparative discussion.

Research result shows that the guide board system of the hospital should put emphasis on the following points: 1) the color contrast should be strengthened between the color of the text and the surrounding environment 2) the guide board system should have enough light and illumination 3) a common standard needs to be established for distinctive patterns and the texts should be added to them 4) walls and floor

use should be strengthened for the guiding sign 5) the differences of public channels and other areas should be marked clearly for directional sign and the current position should be enhanced 6) the text of descriptive sign should be bigger than 20 mm 7) the sign and guidance of the service counter need to be strengthened

Hospital guide board system affects the convenience of the patients' medical environment. It also has an influence on the evaluation of the elderly to the service quality. Hospitals should enhance the descriptive and directional signs and with the service training of the medical care providers, they would be able to provide the elderly better medical environments.

EFFECTS OF MIGRATION AND SETTLED LIFESTYLE ON THE PHYSICAL AND MENTAL ABILITIES OF CENTENARIANS

O.A. Poliakov, O.S. Tomarevska, *Department of Social Gerontology, Institute of Gerontology by D.F. Chebotarev of National Academy of Medical Sciences, Kyiv, Kyiv region, Ukraine*

The study involved 153 centenarians ages 90–105 years (43 migrant and 110 settled) using test Mini Mental State Examination. Mobility studied for the test, "Sit-to-Stand", hand grip strength - with the help of dynamometer, lifestyle, degree of self-service - on the Barthel Index. Contingency coefficient was used to assess the qualitative characteristics. Quantitative characteristics were evaluated by Student t-test. The results are summarized using the correlation and regression analysis. The amount of self-service (by Barthel index) in the migrated group was (71 ± 4)% and in the group do not change their place of residence - (80 ± 2)% (P < 0.05). It was found association between the indices of cognitive capacity in the migrants (r = -0.183, P < 0.05). According to the results of the MMSE, a moderate degree of dementia was observed less frequently in the group of migrated centenarians than not to change their place of residence in the group. In the group migrated average MMSE scale was (21 ± 1) points, non-migrant centenarians - (18 ± 1) points (P < 0.05). Hand grip strength of the right and left hands of migrants was (9.6 ± 1.06) kgF and (8.7 ± 0.95) kgF, and non-migrant group - (7.24 ± 0.5) kgF and (6.7 ± 0.41) kgF (P < 0.05). Elderly migrated subjects need greater amount of care and were less self-sufficient than sedentary individuals of the same age. In centenarians showed a trend toward migration, which is largely questioned the paradigm of their preferred residence.

SESSION 4445 (POSTER)

ASSESSMENT II

NATURAL ADULT WOMEN GAIT VARIABILITY: CADENCE AND STEP WIDTH PREDICTORS OF PREMATURE RISK OF FALLS

R.L. Menezes^{1,2}, D.M. Ribeiro^{1,3,4}, G.A. Santos^{4,1}, C.K. Formiga⁴, F.M. Gervásio⁴, *1. University of Brasilia, Brasilia, Brazil, 2. Brazilian Society of Geriatrics and Gerontology, Rio de Janeiro, Brazil, 3. Rehabilitation and Readaptation Center Henrique Santillo, Goiânia, Brazil, 4. State University of Goias, Goiânia, Brazil*

Aim: Gait variability is associated with future risk of falling. It's a gait instability indirect measure and its natural changes over years are not described in the literature. The aim was to describe and identify the age group of healthy women classified as: youngest, adult and older adults, which can predict early falls, through gait variability analysis. Methods: Cross-sectional study performed with 45 Brazilian women (20–67 years) at gait lab from Goias University, Brazil. Fifteen reflective markers were attached to specific anatomical landmarks on their lower limbs and they walked on an 8-meter way. Six infrared cameras and Peak Motus8.1® software were used. Coefficient of variability was applied to ten gait cycles for: step and stride length step; stride, stance and swing period; single and double support; stride width; all with right and left sides, as well as cadence and gait speed. Results: There was a statistically significant difference between youngsters and older adults for cadence (p = 0.003) as well as between adults and older adults for cadence (p = 0.003), right step width (p = 0.01) and left step width (p < 0.001). Linear regression demonstrated that, after a period of three years, there is an increase of one unit in cadence variability and after four years, for right and left stride width, which influences accidental falls risk. Conclusions: Cadence and stride width variability showed increased risk of falls from 30 years of age. Implementation of prevention programs for young women not considered at risk is suggested.

CORRELATION BETWEEN QUADRICEPS CROSS-SECTIONAL AREA, FAT INFILTRATION, AND TORQUE IN OLDER WOMEN

C.T. Silva¹, E.V. Rodrigues^{2,1}, L.H. Gallo¹, A.S. Wojciechowski¹, J. Melo Filho¹, M. Harris-Love³, A.R. Gomes¹, *1. Departament of Physical Education, Federal University of Parana, Curitiba, Parana, Brazil, 2. Institute Federal of Paraná, Curitiba, Brazil, 3. George Washington University, Washington, District of Columbia*

Aging is related to changes in the neuromuscular system that can lead to decrease muscle mass and strength (sarcopenia) and increase the fat infiltration. The aim of this study was to measure the quadriceps cross sectional area (CSA), the fat infiltration and to verify their correlation with knee extensor torque. Cross-sectional study, approved by the Research Ethics Committee of Federal University of Paraná (36003814.2.0000.0102), included 16 older women (70 ± 4 years-old; BMI: 27 ± 4 Kg/m²). The CSA was measured by Magnetic Resonance Image and the Image Pro plus software was used to calculate the quadriceps cross-sectional area (CSA) and fat infiltration (FI) in cm². The concentric and eccentric knee extensors peak of torque were evaluated by an isokinetic dynamometer (System4, Biodex®), range of motion 60° (start at 90° and stop at 30°), three repetitions each set performed at 60 /s. The data were analyzed as mean, standard deviation. To verify the association between variables the Spearman correlation test was used (p < 0.05). The mean quadriceps CSA was 34.4 ± 3.7cm² and the fat infiltration was 9.8 ± 4.8cm². The concentric PT was 104 ± 17N/m and eccentric 95 ± 15N/m. The following correlations were not statistically significant: PT Concentric and CSA (r=0.35, p=0.17); PT Eccentric and CSA (r=0.18, p=0.48); PT Concentric and FI (r=-0.22, p=0.39); PT Eccentric and FI

($r=-0.23$, $p=0.37$). It can be concluded that the fat infiltration represents one third percent of the quadriceps muscle total area. Muscle mass and fat infiltration were not associated with knee extensor torque.

DEVELOPMENT OF THE JAPANESE VERSION OF THE TILBURG FRAILTY INDICATOR

N. Yoshiyuki, A. Kono, *Department of Home Health Nursing, Osaka City University, Osaka, Japan*

The Tilburg Frailty Indicator (TFI), which has been translated to several languages, screens frailty in older adults by assessing their physical, psychological, and social domains. This study aimed to develop the Japanese version of the TFI (TFI-J) in older adults living at home and testing its internal consistency and concurrent validity. After we translated the TFI, the TFI-J surveyed 682 Japanese older adults (mean age = 81.3, SD = 6.7) who were ambulatory frail according to an in-home assessment conducted by care managers. To examine the concurrent validity, a comprehensive frailty index (Kaigo-Yobo-Checklist) developed in Japan, as well as unidimensional alternative measures including handgrip strength, body mass index, the Geriatric Depression Scale-5, the Rapid Dementia Screening Test, and two single questions regarding physical and social frailty were assessed. Cronbach's alpha of the TFI-J was .68. Total scores of the TFI-J were significantly correlated with the total scores of the Kaigo-Yobo-Checklist ($r = .55$, $p < .001$). The logistic regression analyses adjusted for demographic data showed that frailty, screened by the TFI-J, was associated with low handgrip strength (odds ratio (OR) = 1.8, 95% confidence interval (95%CI) = 1.14–2.73), depression (OR = 4.3, 95%CI = 3.04–6.15), difficulty in climbing stairs (OR = 2.1, 95%CI = 1.51–2.93), and not having neighbors to talk to (OR = 1.8, 95%CI = 1.28–2.57). The TFI-J showed acceptable internal consistency and concurrent validity, and it could be used for identifying multidimensional frailty in Japanese older adults living at home.

GRIP PERFORMANCE AGILITY MEASURED WITH A NEW DYNAMOMETER IN SUBJECTS OF ALZHEIMER'S DEMENTIA PATIENTS

Y. Matsui¹, R. Fujita², A. Harada², T. Sakurai², T. Nemoto², K. Toba², 1. *Department of advanced medicine, National Center for Geriatrics and Gerontology, Obu, Japan*, 2. *National Center for Geriatrics and Gerontology, Obu, Japan*

Background: We are developing a grip dynamometer with a time axis for older adults. The associations between proposed agility-related indices for this dynamometer and Alzheimer dementia severity were investigated.

Methods: 562 female memory disorder outpatients (mean 76.0 y.o.) were classified into groups of normal (N), mild cognitive impairment (MCI) and Alzheimer dementia (AD), which was sub-classified as Mild (ADmi), Moderate (ADmo), Moderate severe (ADms), and Severe (ADse) based on total MMSE score. The agility indices are 1) maximum grip strength (MS), 2) response time, 3) time to MS, 4) time to turning point (TP), 5) strength at TP, 6) inclination from start to TP, 7) time TP to MS, 8) inclination from TP to MS, and 9) ratio of strength (TP/MS).

We conducted age adjusted multiple comparisons of the above 9 indices among six groups by hand dominance.

Results: In the dominant hand, significant differences were seen in the items of 1) (ADse vs N, MCI, ADmi), 3) (ADse vs ADms), and 5) (ADse vs N, MCI, ADmi). In the non-dominant hand, significant differences were seen in 1) (ADse vs N, MCI, ADmi, and ADms vs ADmi), 2) (ADse vs N, MCI, ADmi, ADmo, and ADms vs N, ADmi), 5) (ADse vs N, MCI, ADmi) and 6) (ADms vs N, ADmi).

Conclusion: Multiple comparison of these agility-related indices and dementia revealed significant differences in the maximum strength and strength at TP in both hands, as well as in some time-related indices like reaction time in the non-dominant hand only.

MONTREAL COGNITIVE ASSESSMENT (HEARING IMPAIRED) (GERMAN VERSION) IN GERIATRIC COGNITIVE SCREENING

M. Lerch, N. Benz, *Helios Kliniken Schwerin, Schwerin, MV, Germany*

Introduction: Cognitive screening is a crucial part of the geriatric assessment. Up to now all current test rely on the subjects ability to follow auditory verbal instructions and therefore present a major pit-fall in the assessment of senior patients with a hearing loss leading to a probable false negative test result due to misunderstanding of the oral commands and requirements. Our objective was to adapt the "Development of a Cognitive Screening Test for the Severely Hearing Impaired" by Chung J, Shipp D, Friesen L, Black S, Masellis M, Lin V for the German language and to introduce it as a standard cognitive screening in our geriatric assessment.

Method: Subjects were recruited from our geriatric clinic. All volunteers first underwent a battery of cognitive screening tools (MMSE, clock completion test) in a standard environment and a hearing assessment (MAT). After that all were administered the MoCA-HI. 50 normal hearing and 100 hearing impaired (>40 dB(A)) subjects were tested. As an additional cognitive test the CERAD test battery was performed on all subjects in a hearing adjusted environment.

Results: There was a significant correlation between the test results of the MoCA-HI and the CERAD plus battery were as the normal cognitive test showed an inclination towards lower scores in the hearing impaired subjects. The MoCA-HI was introduced to our geriatric clinic as our standard cognitive screening test.

Conclusion: The MoCA-HI should be used in cognitive screening in geriatric patients to avoid false negative scores due to hearing impairment.

ASMI CUTOFF POINTS AND HEALTH-RELATED QUALITY OF LIFE IN KOREAN OLDER PEOPLE

Y. Kim, *Chonnam National University, Gwangju, Korea (the Republic of)*

Background. This study was conducted to determine the prevalence of a low appendicular skeletal muscle index (ASMI) using three cut-off points (mean ASMI-2SD of a gender-specific young reference group (aged 18–39 years), mean ASMI-1SD of a gender-specific young reference group, and the lower 20 percentile value of a gender-specific older group (aged ≥ 65 years)) in Korean older people and the

relationship between ASMI and subjective health-related quality of life.

Methods. This study utilized data acquired during the Korean National Health and Nutrition Examination Survey (KNHANES) from 2008–2011. Dual-energy X-ray absorptiometry body compositional data was obtained from a subsample of 6538 subjects (men 2804, women 3734) aged 18–39 and 4413 subjects (men 1872, women 2541) aged 65 years and older. The three definitions of low appendicular skeletal muscle and the EQ-5D-3L-Korean descriptive system were applied to Korean older people.

Results. For the ASMI cutoff points used, in men, the three cutoff points were ASMI 2SD (6.09 kg/m²), ASMI 20 (6.48 kg/m²), and ASMI 1SD (6.95 kg/m²). In women, ASMI 2SD (4.38 kg/m²) was the lowest, followed by ASMI 1SD (4.96 kg/m²) and ASMI 20 (5.33 kg/m²). By multivariate ordinal logistic regression analysis, men with a low ASMI had significantly high odd ratios for the three domains of mobility ($p < 0.001$), self-care ($p = 0.005$), and usual activities ($p = 0.004$) among the five domains of the EQ-5D and EQ-5D index ($p = 0.010$).

Conclusions. We suggest that the cut-off point of the lowest 20% of Korean older people (men: 6.48 kg/m², women: 5.33 kg/m²) be used for older Koreans.

EVALUATION OF NUTRITIONAL STATUS AND ITS RELATIONSHIP WITH FUNCTIONAL STATUS AND FRAILTY

M. Reos¹, C. Zubeldia¹, S. Goijman¹, F. Bergallo², J.R. Jauregui², L. Belen¹, 1. *Instituto de Geriatria Rodriguez Ortega, Secretaría de Salud y Desarrollo Humano, Municipalidad de Vicente López, Vicente Lopez, Buenos Aires, Argentina*, 2. *Secretaria de Políticas de Salud del Adulto Mayor, Secretaría de Salud y Desarrollo Humano, Municipalidad de Vicente López, Florida, Buenos Aires, Argentina*

MATERIAL AND METHOD: Cross-sectional observational study of patients over 60 years institutionalized during January and February 2016.

All patients were evaluated for: nutritional status with Mini Nutritional Assessment (MNA), degree of dependence based on the Barthel scale and fragility according to Fried criteria.

RESULTS: 70 patients, 41 women and 29 men were evaluated. The average age for women was 79.34 +/- 11 years and for men 70.72 +/- 8.9 years.

Regarding the nutritional assessment, 21.23% did not show nutritional risk, 32.85% presented risk of malnutrition and 45.71% were malnourished.

50% of the patients studied had full or severe dependence, the largest percentage in women (women 51% and men 41%), 28.5% showed no dependence, with a higher percentage in men. (34% men and 24% women).

70% of all cases observed were frail, being more frequent in the female population (women 78% and men 58%).

Statistical significant association was found between the nutritional status and the presence of frailty ($r: 0.56$ $p: 0.000$) as well as between nutritional status and degree of functionality ($r: 0.49$ $p: 0.000$).

CONCLUSIONS: Malnutrition showed statistical association with functionality and frailty in our patients

Our results emphasized the importance of including nutritional evaluation in the global geriatric assessment to raise multidisciplinary strategies and manage more efficiently the expenses in the third level of attention.

ICT IN COMPREHENSIVE GERIATRIC ASSESSMENT

A. Ilnitski, K. Prashchayeu, *Belarusian republican gerontological public association, Navapolatsk, Belarus*

Effective introducing and spreading of diagnostic technologies in geriatrics is possible on the base of ICT devices. **Aim** of the research is to work out and introduce into geriatric practice the ICT based comprehensive geriatric assessment.

Material and methods. On web-site www.gerontology.by we submitted the special original program for physicians for performing comprehensive geriatric assessment which can be downloaded into ICT device and allows to estimate automatically the risks of functional decline, problematic geriatric syndromes and targets of personalized coaching in rehabilitation process. In the same time such program gives possibility to perform the eLearning of physicians on better ways of rehabilitation and care of elders on the base of syndromatic approach in geriatrics.

Results. 537 physicians experienced work with original computer program. Using ICT for comprehensive geriatric assessment reduced time of diagnostic procedure on 23,5%, increased the number of correct prognosis of geriatric syndromes on 18,5%, decreased the number of mistakes in diagnosis and rehabilitation on 10,0%. Using ICT for consultations and eLearning of physicians was most important factor of positive changes in quality of geriatric care. As a result was observed the positive changes in occurring of acute functional decline, decreasing of functional ability, quality of life was increased ($p < 0,05$).

Conclusion. Introducing ICT technologies in comprehensive geriatric assessment improved quality of diagnostic process, geriatric care and health status of elderly patients.

USE OF AUTOMATIC SPEECH ANALYSES WITHIN A MOBILE APPLICATION FOR THE ASSESSMENT OF COGNITIVE STATUS

P. Robert¹, A. Konig¹, A. Saat², A. Sorin², R. David¹, 1. *Memory Center CoBTeK IA, Nice, France*, 2. *IBM research, Haifa, Israel*

Irregularities in the language domain could be a strong predictor of disease progression. Automatic speech processing and machine learning techniques, which enable extraction of dementia, relevant information from the speech audio signal may be of great interest

To evaluate the interest of using automatic speech analyses for the assessment of mild cognitive impairment (MCI) and early Alzheimer disease.

Participants $n = 165$ (Healthy elderly subjects (HC), MCI patients, Alzheimer' disease (AD) and mixed dementia (MD) patients) were recorded with a mobile application while performing several short vocal cognitive tasks during a regular consultation. These tasks included verbal fluency, picture description, counting down and a free speech task. The voice recordings were processed in two steps: in the first step, vocal markers were extracted using speech signal processing techniques; in the second, the vocal markers were tested to assess their 'power' to distinguish between HC, MCI, AD and MD.

The second step included training automatic classifiers for detecting MCI and AD, based on machine learning methods, and testing the detection accuracy.

The fluency and free speech tasks obtain the highest accuracy rates of classifying AD vs. MD vs. MCI vs. HC. Using the data, we demonstrated classification accuracy as follows: HC vs AD = 92% accuracy; HC vs. MD = 92% accuracy; HC vs. MCI = 86% accuracy and MCI vs. AD = 86%.

These results indicate the potential value of vocal analytics cognitive and the use of a mobile application for accurate automatic differentiation between HC, MCI and AD.

SARCOPENIA IN OLDER ADULTS: A NATIONALLY REPRESENTATIVE SAMPLE IN MEXICO

A. Salinas, B. Manrique-Espinoza, *Statistics, National Institute of Public Health, Cuernavaca, Morelos, Mexico*

Currently, sarcopenia is considered a geriatric syndrome of growing importance in the world. The European Working Group on Sarcopenia in Older People (EWGSOP) define sarcopenia as a syndrome characterized by progressive and generalized loss of skeletal muscle mass and strength with a risk of adverse outcomes such as physical disability, poor quality of life and death. The objectives of this study were: to estimate the national prevalence of sarcopenia in Mexico, and to identify the main risk factors that determine the presence of sarcopenia. Cross-sectional study conducted in 2014 with a nationally representative sample of 3263 older adults aged 50 and over in Mexico. Sarcopenia was defined according to the three dimensions suggest by the European Working Group on Sarcopenia in Older People (EWGSOP): muscle mass, muscle strength, and physical performance. Individuals were considered sarcopenic if they presented moderate or severe sarcopenia. Global prevalence of sarcopenia was 6.89%; for older adults aged 50–59 was 1.97%, and for those aged 60 and plus was 10.30%. Main risk factors associated with the presence of sarcopenia were: Sex (OR=1.66, $p<0.01$), Age (OR=1.08, $p<0.01$), and the following chronic conditions: diabetes (OR=1.38, $p<0.05$), Stroke (OR=1.95, $p<0.05$), and arthritis (OR=1.94, $p<0.01$). Observed prevalence of sarcopenia is similar to those found in other studies where prevalences between 5% and 10% have been observed. Chronic conditions associated with sarcopenia were also observed in other studies, mainly diabetes, which implies that an important emphasis must be put in older adults with both outcomes, sarcopenia and diabetes.

LIFE-SPACE MOBILITY IN OLDER STROKE SURVIVORS: A CROSS-SECTIONAL STUDY

A. Buss¹, S. Strupeit¹, K. Wolf-Ostermann², 1. *Munich University of Applied Sciences, Munich, Germany*, 2. *University of Bremen, Bremen, Germany*

To facilitate and maintain mobility in older adults suitable and effective measures and compounding assessments are needed. Life-space mobility assessment may contribute to a better understanding of mobility in old age. The aim of this study was to examine the relationship between life-space mobility and cognition, care dependency, activities of daily living, fall risk and sociodemographic factors.

A cross-sectional study design was used. The data were retrieved from the baseline data of a longitudinal study. The study was performed in an area of Berlin, Germany in

the living environments of the participants. The study sample consisted of stroke or TIA survivors with and without dementia age 55 or older. Data were collected from 2014 to 2015 using the Life-Space Assessment (LSA), the Barthel Index (BI), the Mini-Mental State Examination (MMSE), the Care Dependency Scale (CDS), the St. Thomas's risk assessment tool (STRATFY) for risk of falling as well as gender, age and the residential area and the living situation.

In total, 48 individuals participated in the study. The mean LSA score was 46.68, indicating restricted life-space. Statistical analysis could not reveal significant effects of variables on LSA scores.

Further studies are needed to examine the relationship between life-space and influencing factors using larger sample sizes and diverse old age populations. Future research on life-space should focus on longitudinal studies.

BIOMETRICAL QUALITY OF STRATEGIES TO ASSESS DUAL TASK PERFORMANCE IN PERSONS WITH DEMENTIA

K. Hauer¹, N. Lemke², S. Wiloth³, C. Werner¹, 1. *AGAPLESION Bethanien Hospital, Geriatric Center at the University of Heidelberg, Heidelberg, Germany*, 2. *Network of Aging Research (NAR), University of Heidelberg, Heidelberg, Germany*, 3. *Institute for the Study of Christian Social Service at the University Heidelberg, Heidelberg, Germany*

Attention-based cognitive functions have become a focus of interventional or diagnostic research as they represent early markers of cognitive decline, relevant for ADL autonomy. However, assessment methods have not been comprehensively validated including sensitivity data and feasibility for different assessment approaches, especially in the target population with cognitive impairment.

The study objective therefore was to investigate validity, test-retest reliability, sensitivity to change and feasibility of dual task (DT) assessment strategies in patients with dementia.

In geriatric patients ($n=105$) with dementia (age 82.7 ± 5.9 , MMSE score 21.9) motor and cognitive DT assessments were analyzed, including relative DT-Costs (DTC) calculated as percentages of single task performance for motor, cognitive, combined measures.

Construct validity (Spearman's rank correlations (r_s) of DT-tests was moderate to high for motor tasks ($r_s=.29-.90$), for cognitive tasks ($r_s=.12-.55$) for DTCs (motor $r_s=.02-.61$, cognitive $r_s=-.19-.06$, combined $r_s=-.11-.31$) as compared to the counting while walking test. Correlations with established external non-dual task assessment were small to high for motor tasks ($r_s=.25-.84$), cognitive tasks ($r_s=-.10-.46$) and for DTCs (motor $r_s=-.09-.17$, cognitive $r_s=-.03-.21$, combined $r_s=-.07-.26$). Test-retest reliability (ICCs) was low to excellent for motor tasks (.75-.96), cognitive tasks (.51-.88), and DTCs (motor:.10-.74, cognitive:.05-.65, combined:.15-.71). Sensitivity to change was acceptable to excellent for trained DT-tests ($p \leq .01$, Standard response means, SRMs=.30–1.12), large for cognitive tasks (.82-.95) and small to large SRMs for DTCs (motor:.15-.77, cognitive:.56-.98, combined: .40–1.10). Completion time ranged from 13.1 to 16.9 min. All patients could perform the assessment battery.

Dependent on DT-tests showed acceptable to excellent psychometric quality in cognitively impaired patients

ULTRASONIC ECHO INTENSITIES OF THE SKELETAL MUSCLE AND LIVER IN ELDERLY AND YOUNG INDIVIDUALS

K. Nishihara¹, H. Kawai², K. Hara¹, F. Hoshi¹, 1. *Department of Physical Therapy, Saitama Prefectural University, Saitama, Japan*, 2. *Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Tokyo, Japan*

Age-related changes in muscle tissue include muscle qualitative changes. Ultrasound devices can be used to estimate the muscle quality. Muscle tissue with fat mixed in will usually generate a spread of propagation time for the ultrasound wave and causes a deterioration of the ultrasonic image with an increase of echo intensity (EI) resulting from directional spread. Fat is also accumulated in large vacuoles of the liver in the form of triglyceride fat, which can lead to hepatic steatosis. In this study, ultrasound was used to record cross sectional images of the skeletal muscles and the liver of elderly and young persons. The EIs were calculated for the rectus femoris (RF) and vastus intermedius (VI). Moreover, the EI of an ultrasound image for the liver is calculated by comparing the EIs for the RF and VI. The EIs of RF and VI of elderly subjects were larger than the ones of young subjects. The EI of RF was larger than the one of VI in young subjects. However, EIs of the liver were not different between elderly and young subjects. The EIs of RFs had a significantly positive correlation with the EIs of livers in elderly and young subjects. These results suggest that the EIs of RFs and VIs of elderly subjects are larger than those of young subjects, whereas EIs of livers are not very different between elderly and young subjects. However, the EIs of RFs correlated with the EIs of livers.

A STUDY OF GAIT AND FALLS IN OLDER INDIANS

M. Subramanian, P. Chatterjee, A. Chakrawarty, A.B. Dey, *Geriatric Medicine, All India Institute of Medical Sciences, New Delhi, New Delhi., New Delhi, India*

Gait and balance changes with ageing and these changes predispose to falls. In this ongoing cross sectional study we are looking at the Gait and balance parameters in older adults and their association with falls. Gait parameters of ambulatory older patients (> 60 years) were assessed at their usual pace, using Biodex gait trainer-3, a validated electronic walkway. The patients also underwent comprehensive geriatric assessment and were further assessed for fall risk using the Tinetti POMA Scale. 28 Subjects (22 males and 6 females) were included in this preliminary analysis. Mean age was 74.53(± 10.05) years. Mean (±SD) values of gait speed was 0.48metre/second (±0.17), Step Cycle time 0.83 cycle/second,(±0.16), Stride Length (Right) 64.64 centimeter (±29.20), Stride Length (Left) 59.85 centimeter (+ 29.57). Around 1/5th of the patients had one or more indoor fall in past year and less than half(42.86%) also had Polypharmacy. The mean TUG score was 15.63 seconds (+ 5.08) and mean Performance Oriented Mobility Assessment score was 20.71(± 3.78). 20 subjects were having difficulty in balance and at risk of fall. The Hindi Mental State Examination score was 26.89 (±3.74) and 18 were Frail. This study group was having slow gait speed, low TUG score and polypharmacy which increases the risk of having a fall.

WOULD THE DIFFERENT POSTURAL KINDS IN UPRIGHT POSITION BE RELATED WITH AGING STABILITY PARAMETERS?

V. Fernandes^{1,3}, L.C. Fernandes^{1,3}, K. Tacon³, F.F. Rodrigues^{2,3}, F. Alves de Carvalho³, S. Santana Parreira³, E. Fachin-Martins¹, R.L. Menezes¹, 1. *UnB, Brasília, Brazil*, 2. *UEG, Ceres, Brazil*, 3. *UniEVANGELICA, Anápolis, Brazil*

Introduction: Posture undergoes changes with advancing age by changing the alignment in the sagittal plane and the mechanisms responsible for controlling the balance. Objective: To investigate the influence of different postural classes on the history of falls and balance in elderly people who are physically independent. Material and Methods: The sample had a convenience genre and composed of 50 elderly people with an average age of 71.9 years (±6.73), mostly women engaged in physical activity, with visual and multiple chronic diseases changes in 50% and 60%, respectively. The Timed Up and Go test and Unipedal Stance Test were used to evaluate balance, muscle strength in hand grip, and postural classes we used the model Nakada which classifies the elderly flexed posture, extended posture, S-shaped posture and hands-on-the-lap posture. Results: Statistically significant differences were observed with higher prevalence of falls in postural flexed type classes and extended where the elderly remained long in one-leg support in different sensory situations, compared with the normal posture type group. It was not found differences in age, BMI, manual strength and TUG, between postural classes. Conclusion: Elderly people with postural changes in the sagittal plane may adopt different mechanisms of postural adjustments to control and balance in Unipedal Stance Test, leading the falls.

ASSOCIATION BETWEEN SARCOPENIA WITH NUTRITION AND EXERCISE IN COMMUNITY-DWELLING OLDER CHINESE

S. Hai, L. Cao, H. Wang, J. Zhou, P. Liu, B. Dong, *West China Hospital, Sichuan University, Chengdu, Sichuan, China*

Sarcopenia is the age-related decline in skeletal muscle mass and function, which may result in falls and fractures, poor quality of life, and increased risk of death in older people. Our study was conducted on 836 community-dwelling Chinese individuals aged ≥60 years to evaluate sarcopenia using the Asian Working Group for Sarcopenia criteria. Sociodemographic characteristics and lifestyle habits were collected using a general questionnaire. Nutritional status was assessed using the Mini Nutritional Assessment (MNA) and biochemical parameters, whereas physical activity was assessed using the long form of the International Physical Activity Questionnaire (IPAQ). In addition, univariate and multivariate analysis was used to analyze the association between sarcopenia with nutritional status and physical activity. The total prevalence rate of sarcopenia was 10.5%, 47 (11.3%) men and 41(9.7%) women of whom were classified as sarcopenia. Compared with the participants with sarcopenia, those without sarcopenia had a higher levels of prealbumin (p<0.05) and hemoglobin (HGB) (p<0.05) for both sexes. The prevalence of sarcopenia was significantly lower among the participants in normal nutrition status. In the multivariate model, after adjustment for all covariates, the MNA score (adjusted OR 0.769, 95% CI 0.689–0.859,

$p < 0.001$) was statistically significantly associated with sarcopenia. The relationship between physical activity and sarcopenia was not significant.

In conclusion, the prevalence of sarcopenia in the Chinese community-dwelling population aged 60 years and older was high. There was significant association between sarcopenia and nutritional status. Maintaining a good nutritional status may be effective in lowering the risk of sarcopenia.

SESSION 4450 (POSTER)

ASSESSMENT III

MAKING FUNCTION PART OF THE CONVERSATION: PHYSICIANS' VIEWS ON MEASURING FUNCTION IN PRIMARY CARE

F.M. Nicosia^{1,2}, M. Spar^{1,2}, M. Steinman^{1,2}, R. Brown^{1,2}, 1. *Geriatrics, San Francisco Veterans Administration Medical Center, Oakland, California*, 2. *University of California, San Francisco, San Francisco, California*

The ability to perform basic daily activities ("functional status") is central to older adults' quality of life and strongly predicts health outcomes. However, data on function are seldom collected during routine clinical care in a way that can be used for clinical programs and research. Understanding clinician perspectives on barriers and facilitators to routine functional status assessment is critical to successful implementation of standardized measurement. As part of an initiative to introduce standardized functional status measurement in U.S. Department of Veterans Affairs (VA) outpatient clinics, we conducted a qualitative study to evaluate barriers and facilitators to implementation.

We identified 6 VA Medical Centers with varying strategies for documenting functional status. To date, we have completed 10 of 25 planned interviews with primary care geriatricians and internists. Interviews focus on provider experience and opinions about functional status assessment and are analyzed iteratively using a hybrid deductive/inductive thematic approach.

First, we found that contextual factors in the clinic strongly influence routine assessment, including team structure, roles and responsibilities, and documentation requirements. Second, the usability of assessment instruments is important, including benefits of structure versus flexibility, and integration in electronic health records. Third, provider experience and beliefs related to the use of functional status data impact readiness to embrace assessment, including utility of data for informing clinical decision-making, and familiarity with assessment.

Understanding providers' perspectives and contextual factors that impact functional status assessment will inform development of a robust intervention that can be implemented across varied practice settings.

THE EFFECTS OF EXERCISE TRAINING ON ACTIVITIES OF DAILY LIVING AND QUALITY OF LIFE IN FRAIL ELDERLY

U.K. Ertan², E. Bozoglu¹, N. Kirdi², A. Ozturk¹, G. Buyukturan³, H. Doruk¹, 1. *Gulhane Military Medical Academy, Division of Geriatrics, Ankara, Turkey*, 2. *Hacettepe University, Faculty of Health Sciences,*

Department of Physical Therapy and Rehabilitation, Ankara, Turkey, 3. *Gulhane Military Medical Academy, Turkish Armed Forces Rehabilitation Center, Ankara, Turkey*

Introduction: The decreasing level of physical activity in frail elderly effects negatively both physically and spiritually. The aim of the study to investigate the effect of exercise training on activities of daily living, quality of life, fatigue and depression in frail elderly.

Methods: Forty-eight frail elderly were included. Subjects were divided into three groups as control group (free exercise training), low intensity (40% of 1RM) and high intensity (70% of 1RM). Exercise training program included strengthening, balance and flexibility was applied 40–50 minutes a day, three times a week for 8 weeks with a physiotherapist. Activities of daily living, quality of life, fatigue, and depression assessment were recorded in the baseline and eighth week of the study.

Results: Mean ages of the control group, low and high intensity exercise groups were 85.4 ± 4.7 , 84.5 ± 4.8 , and 84.2 ± 6.9 years, respectively. After the exercise training program, it was shown that high intensity group had better results ($p < 0.05$) in quality of life and had similar increasing ($p < 0.05$) of activities of daily living, fatigue and depression.

Conclusion: In our study, it was recorded that the fatigue and depressive symptoms, which were often seen in frail elderly decreased and also the level of independence in activities of daily living and quality of life increased as a result of exercise training. Although this general evaluation, especially high-intensity exercise training was been found more effective. The high-intensity exercise training should be considered for prevention and treatment of frailty in elderly subjects.

EXTERNAL VALIDATION OF SAFES 6-WEEK MORTALITY-RISK INDEX ON AN AFRO-CARIBBEAN OLDER PATIENTS COHORT

C. Godard-Sebillotte¹, M. Drame², T. Basileu³, J. Fanon³, G. Lidvine³, 1. *McGill University, Montreal, Quebec, Canada*, 2. *University of Reims Champagne-Ardenne, Faculty of Medicine, EA 3797, Reims, France*, 3. *Martinique University Hospital, Fort-de-France, Martinique*

Geriatric guidelines recommend considering prognosis in the context of clinical decision making. Several mortality-risk indexes have been developed. While external validation is a recognized crucial step before implementation in clinical practice, few of these indexes have actually been externally validated. Our aim was to test the external validity of the SAFEs (*Sujets Ages Fragiles: Evaluation et suivi*) 6-week mortality-risk index developed from a multicentre prospective French cohort on an Afro-Caribbean cohort of older patients. This cohort was collected through a prospective study of 287 patients from the University Hospital of Martinique (French West Indies) from January to June 2012. Patients 75+ hospitalized for an acute condition were eligible. The SAFEs 6-week mortality-risk index of each patient was collected. It included assessments of delirium, risk of malnutrition and functional impairment. Mean age was 86 years. Six-week mortality rate was 19.9%, 52.1% were severely dependant for activities of daily living, 96.1% were at risk of malnutrition, 16.0% had a delirium. The external validity of the SAFEs 6-week mortality-risk index was poor in terms of calibration and discrimination: observed and predicted

probability of mortality differed of more than 10% for two out of three risk levels, and the area under the receiver operating curve was 0.58 [0.49–0.66]. Our results corroborate a recent literature review on external validation of risk prediction models showing that external validation is rarely done and often leads to poor results when performed. Clinicians should be aware of these limitations and exercise caution before implementing prognostic indexes in their practice.

USEFULNESS OF THE NEW SHORT COGNITIVE SCREENING TEST (STMT-R) IN ACUTELY ILL GERIATRIC PATIENTS

H. Yamamoto¹, K. Ogawa¹, H. Huaman¹, K. Yamamuro¹, T. Ishitake², 1. Yamamoto Memorial Hospital, Imari-city, Saga-ken, Japan, 2. Kurume University School of Medicine, Kurume-city, Japan

Introduction: Cognitive dysfunction is a prevalent condition in acutely ill geriatric patients, but often remains undetected. The MMSE (Mini-Mental State Examination) is broadly used, however a quicker clinical identification in acutely ill geriatric patients would be useful. We herein use a revised version (STMT-R) of STMT (Simplified Short-Term Memory Recall Test) (a maximum score 8) to evaluate its usefulness and compared with age, gender, underlying diseases and clinical outcome as comparative factors.

Method: Previously, MMSE and STMT-R scores were compared in 32 outpatients and we found a positive correlation ($r=0.625$ $p<0.001$). The inclusion criteria were to measure in STMT-R within one week after admission, age ≥ 50 yo and being non-critical ill. Among 1190 patients (between October 2014 and September 2015), 885 consented and were enrolled. STMT-R ≤ 4 was considered as cognitive dysfunction.

Result: Enrolled subjects had a mean age of 78.9, 52.2% were female. They had uncompleted cognitive testing with delirium and poor hearing ($n=159$), cognitive dysfunction (STMT-R ≤ 4 ; $n=460$) and non-cognitive dysfunction person (STMT-R >4 ; $n=266$). Statistically, the significant differences were recognized to age, history of dementia, internal medicine diseases, respiratory illness and clinical outcome (hospitalization death rate, the degree of serious illness and a hospitalization period) by cognitive dysfunction ($p<0.01$).

Conclusion: 1) STMT-R is expected to be a standard cognitive test in acute ill geriatric patients. 2) It was suggested that age, history of dementia, internal medicine diseases and respiratory illness had an influence on the cognitive functional decline, and the cognitive dysfunction could affect the clinical outcome.

SELF-REPORTED AND OBJECTIVE MEASURES TO ASSESS PERFORMANCE OF ADL IN COMMUNITY-DWELLING OLDER ADULTS

E. Duim, M.L. Ferrer, *Epidemiology, University of Sao Paulo, Sao Paulo, Sao Paulo, Brazil*

Disability and functioning assessments are indicated as a good option to check the health in aging process at community. Many instruments are proposed in order to assess functional conditions and to evaluate capacity or performance. Self-reports or objective assessment can be done during performance evaluation. **Objective:** To compare the evaluation

of performance in basic activities of daily living (ADL) by self-reported and objective measure in community-dwelling older adults. **Methods:** Cross-sectional study that evaluated 40 older adults. The assessment of functional performance was possible by Functional Independence Measure (FIM) and reported performance was observed from the use of a standardized questionnaire. Twelve ADL were assessed by both methods. To enable a comparison of obtained responses with each instrument, the subjects were classified as *independent*; *with difficulty* or *using adaptation to perform the activity*; or *who needing help from others*. We used the Kappa coefficient test to compare the agreement between the methods. **Results:** There were a moderate agreement between the methods at kappa=0.57. We observed a higher discrepancy between *assessed* and *reported* in activities related to the use and access to toilet (kappa<0.40). In general, the percentage of difference showed that older persons self-reported perform a better function than the activities they really do (clinical assessment). The study highlights that the evaluation of ADL by reported and measured performance had moderate responses in the study population. However, these methods are complementary and should be applied at the same time to guarantee coherent results.

THE ASSESSMENT OF UNMET HEALTH NEEDS AND CONSULTATION REASONS OF ELDERLY PEOPLE

A. Ari, H. Yaman, *Family Medicine Department, Akdeniz University, Antalya, Turkey*

Introduction: The aim of this study was to evaluate unmet health needs of elderly people living in community and the specialty consultation needs of family physicians caring this population.

Methods: Three hundred eighty volunteers, aged sixty-five and older participated in this study. Participants were asked at the outpatient setting of Akdeniz University to participate at a short comprehensive geriatric assessment (sCGA). The sCGA included 10-Minute Comprehensive Screening Test (WWHO-Aging-Friendly PHC Toolkit), Mini Nutritional Assessment (MNA) Scale, Oral and Dental Health Scale (DENTAL), Clock Drawing Test and Lubben Social Network Scale. Additionally a demographic and medical history questionnaire delivered information on demographic characteristics, health status and health needs of the participants.

Results: In our study 179 of the participants (47%) were female and 201 (53%) were male. The mean age was found as 71.6 (SD=5,25; min=65-max=91). Most of the participants (84%) had two and more non-communicable disease (NCD) (multi-morbidity group). They suffered in average of 3.6 (SS=2.28; min-max=0–12) diseases. Multi-morbidity, excess of BMI, urinary incontinence, depression, falls and lack of physical function was more frequently stated by women patients ($p < 0,05$). Participants stated that accessibility to health care facilities was at medium level (6.73 of 10 points). Almost one tenth (9.5%; $n=13$) did not apply, even they had a health problem, to any health institution during the last 1 month. Cognitive/ memory status, physical function, hearing and vision problems, oral-dental health problems and poly-pharmacy were the most frequent reasons for consulting a specialist outpatient clinic of a hospital by a family physician.

Conclusion: This study shows that despite well-structured hospital health care programs for elderly people, unmet health needs are still present in primary care setting. The detection of these needs in low-resourced settings are an important problem for family physicians. The sCGA might be an important instrument to overcome these challenges and it would be also an important tool for case finding and sending the appropriate patients for specialty care in hospital setting.

FEASIBILITY OF HOME MONITORING TO TRACK ACTIVITY PATTERNS IN OLDER ADULTS

H.W. Lach, R.A. Lorenz, W. Noimontree, J. Koedbangkham, Saint Louis University, St. Louis, Missouri

Physical activity and sleep are important outcomes in gerontological research, particularly where the researcher is interested in fear of falling among community-dwelling older adults. Self-report measures, however, have limited reliability and validity. Wearable devices are more accurate, but wearing over time may cause participant burden, thus, limiting the duration of monitoring. To explore a passive system for tracking physical activity and sleep over time, we evaluated the feasibility of a commercially-available home monitoring system to track activity patterns over three-months. The sample was community-dwelling women with fear of falling who lived alone in senior apartments (n=4; mean age 85.6). Passive monitors included a bed sensor, 3 motion detectors, and a door detector. Average physical activity and sleep profiles were generated for 4 participants using sensor data. Other measures were used to generate data for comparison with sensor data: actigraphy (MotionWatch 8) worn for 1 week to provide total sleep time and daytime activity counts and a modified CHAMPS questionnaire to examine current and changes in activity participation. Physical activity tracked similarly, indicating low activity levels and lower self-reported activity. However, there was consistently lower average total sleep time as measured by actigraphy compared to the bed sensor (452.5 minutes; 534.4 minutes, respectively). Challenges were encountered in recruitment, equipment, and data retrieval and analysis, which demonstrate the difficulty of conducting this type of research. Further development of systems that provide data may provide passive objective long-term physical activity data among community-dwelling older adults may be beneficial for future studies.

GAIT SYMMETRY AFTER STROKE: DO CEREBRAL HEMISPHERES INFLUENCE EQUALLY?

G.A. Santos^{1,2}, F.M. Gervásio², W. Herzog³, R.L. Menezes³, D.M. Ribeiro^{1,2,4}, 1. University of Brasília, Brasília, Brazil, 2. State University of Goiás, Goiânia, Brazil, 3. Brazilian Society of Geriatrics and Gerontology, Rio de Janeiro, Brazil, 4. Rehabilitation and Readaptation Center Henrique Santillo, Goiânia, Brazil, 5. University of Calgary, Calgary, Alberta, Canada

Stroke responds to a high death rate and is the world major impairment cause. The risk of going through this condition increases 22% after the age of 55 years and increases further 13% every 5 years. The brain damage brings loss of selective muscle control and primitive locomotor patterns may arise to reinforce stability. This adaptation causes asymmetry

and is related to the constant postural balance compensation need. It is known that the cerebral hemispheres have different motor tasks. The right one is responsible for the motor control while the left one controls the spacial orientation. The aim of this cross-sectional 3D gait analysis study was to assess stride width and gait speed symmetry among stroke survivors (SS), using the Symmetry Index (SI), and compare those with left (LBD) from those with right brain damage (RBD). A sample of 32 SS (47yo±17,32) and 32 able-bodied (25,09yo±3,77) were divided in three groups: LBD (16, 43,87yo±17,90), RBD (18, 49,76yo±16,83) and Able-bodied (32). Results showed less stride width symmetry and slower gait (0,5m/s±0,2) at RBD while LBD symmetry was not different from Able-bodied (p=0,074). The LBD group showed better recovery and motor compensation bringing their symmetry next to those able-bodied. Less stride width asymmetry leads to less center of mass sway and benefits dynamic postural balance. The more asymmetrical LBD group showed a slower gait as a compensation. Differences in symmetry bring diferente level of stability challenges. It is important to keep that in mind when managing stroke survivors in rehabilitation programmes.

EXPERTS' CONSENSUS ON ACCEPTABILITY OF EASYCARE (2010) INSTRUMENT: A DELPHI SURVEY FROM PORTUGAL

P. Brandao^{1,2}, C. Gonçalves¹, 1. Universidade de Aveiro, Aveiro, Portugal, 2. CENTER FOR HEALTH TECHNOLOGY AND SERVICES RESEARCH - University of Porto, Porto, Portugal

Background: Originally developed as a World Health Organisation project, EASYCare is today used in more than 40 countries involving all World Health Organization's regions.

Aim: To assess the acceptability of EASYCare Standard (2010) instrument by professionals and researchers that apply at the National Health Service (NHS) on older people.

Methods: This is a Delphi study using a two-Round mixed-methods design. A convenience sample of 18 experts from the all regions of Regional Health Administration in mainland Portugal were recruited. Two Rounds have taken place: the first Round of qualitative nature and the second Round was mostly of quantitative nature (with two open-ended questions). In the first Round it was collected 13 experts's responses (10 NHS professionals). Five experts that did not answer were withdrawn from the study. In the second Round it was collected 12 experts's responses.

Results: In the first Round, the response rate was 72% and the second Round was 92%. Consensus was obtained in 31 items (93.9%) items presented to the expert group. Of these, 43% of the items were obtained "consensus by unanimity" and 51% "consensus by majority". Only two items did not achieve consensus. More than half the experts consider that the application of the EASYCare Standard (2010) instrument is lengthy (62.5%) but important.

Conclusions: The Delphi study conducted herein reached a consensus concerning acceptability of EASYCare Standard (2010) in the context of primary health care in mainland Portugal by health workers and researchers. Items with lack of consensus provide excellent areas for future research.

INTERVENTION OF GERIATRIC MOBILE TEAM IN TRAUMATOLOGY DEPARTMENT OF NANCY UNIVERSITY HOSPITAL FRANCE

C. Perret-Guillaume, M. Zimlenoi, V. Bourdaire, M. Mangeot, M. Manciaux, D. Mainard, A. Benetos, B. Hanesse, *University Hospital, NANCY, France*

BACKGROUND: The annual number of surgical fractures among elderly people is growing in context of an average age that is increasing. Because of comorbidities, management of geriatric patients usually requires a multidisciplinary management.

In Nancy University Hospital elderly inpatients can benefit of a geriatric assessment by the Geriatric Mobile Team (EMLG).

Since April, 2015, a geriatric assessment is systematically proposed for elderly people, over 75 years-old, admitted in the Traumatology Department by the Emergency Department.

PURPOSE: Purpose of the study is to analyze the impact of the systematic assessment of the EMLG in the Traumatology Department by a comparative retrospective study of type before/after during 7 consecutive months (June to December) on 2014 (without systematic assessment by EMLG) and on 2015 (with systematic assessment by EMLG).

The main results concern: future of the patients (home, nursing home, rehabilitation department), rate of death and rate of rehospitalisation at a month, and follow-up of recommendations of EMLG.

PRELIMINARY RESULTS: During the seven consecutive months on 2015, 196 inpatients received geriatric assessment by EMLG. The main recommendations were therapeutic adjustments for 92 patients and advices for pain management for 65 patients. Recommendations were partly or completely followed for 109 patients.

122 inpatients were transferred by Nancy University Hospital to rehabilitation departments. During the first month of follow-up, 9 patients died and 19 patients were readmitted in Nancy University Hospital. Intervention of the Geriatric Mobile Team trend to reduce hospital readmissions.

The definitive results of two periods will be presented during the congress.

INCORPORATING FORMAL INTERPROFESSIONAL CASE DISCUSSIONS INTO A FAMILY MEDICINE GERIATRIC ROTATION

A.D. Halli-Tierney^{1,2}, D. Carroll^{1,3}, R. McKinney⁴, R.S. Allen^{5,2}, 1. *Department of Family Medicine, The University of Alabama College of Community Health Sciences, Tuscaloosa, Alabama*, 2. *Alabama Research Institute on Aging, Tuscaloosa, Alabama*, 3. *Auburn University Harrison School of Pharmacy, Auburn, Alabama*, 4. *Department of Psychiatry, The University of Alabama College of Community Health Sciences, Tuscaloosa, Alabama*, 5. *The University of Alabama Department of Psychology, Tuscaloosa, Alabama*

The majority of literature regarding interprofessional education involves only two health care professions and is associated within a formal classroom or a simulation setting. There are none published that report outcomes from family medicine residents' rotational activities, none that

involve more than two professions simultaneously, and none that utilize case discussions built from 'real world' scenarios. Our objective is to take advantage of a real world interprofessional teaching clinic and build upon relationships fostered from direct patient care in order to create an interprofessional case series where learners from medicine, psychology, pharmacy and social work collaborate to create a comprehensive care plan for selected patient cases. In a setting separate from clinic (where concern for patient flow may limit time for simultaneous whole team conversation) patient cases are presented to learners on their geriatrics rotation, and learners are encouraged to collaborate with each other in order to gain knowledge necessary to create an appropriate care plan. Learners are assessed by a baseline and followup Interdisciplinary Education Perception Scale before and after the case discussion, and are surveyed about educational merit of the exercise and their suggestions for improvement. At the time of this abstract the case series has met monthly for 9 months: it has been positively regarded by learners in all professions. It is our hypothesis that the interprofessional case series will positively influence learners' perception of interprofessional work, and will be a novel, rich learning opportunity for learners to work together to enhance a complex patient's care.

A COMMUNITY STUDY EXAMINING THE HEALTH NEEDS OF THE ELDERLY IN DUBAI, UNITED ARAB EMIRATES

S. Shaltoni^{1,2}, D. Shaltoni³, 1. *West Bay Health Center, Primary Health Care Corporation, Doha, Qatar*, 2. *Weill Cornell Medical College in Qatar, Doha, Qatar*, 3. *The Royal College of Surgeons in Ireland, Medical University of Bahrain, Muharaq, Bahrain*

With the improved health care, the percentage of elderly in the Middle East is expected to increase as the youthful masses work their way up the population pyramid. According to the WHO's Department of Aging 2000 report, most Middle Eastern countries will be entering the window of opportunity during this decade, and the window is expected to last until midcentury. It is during this lucrative period that the groundwork for future geriatric services should be firmly established and nurtured. Therefore, this cross sectional study aims to assess the health needs of the elderly in order to deliver solid data for providing future geriatric services that can improve the quality of life. Information was gathered from several facilities in Dubai, UAE. People who lived in the UAE and were 65 years old or above were included. Overall, the total elderly population in Dubai is estimated to be 32,000 people. With a margin of error of 5% and a confidence level of 90%, the recommended sample size turned out to be 269 people. Therefore, 300 individuals were included. The interRAI organization's community health assessment instrument (interRAI CHA) was used as a tool for gathering information. After filling in all the questionnaires, the data was entered into the SPSS Statistics program for analysis. The results obtained delineated which diseases need our support and improved prevention or management. By filling the gaps in elderly health care and by recognizing which aspects of care need our attention, we can ensure a better quality of life.

EFFECTIVENESS OF PEER-BASED REMINDERS TO SUSTAIN CARE PROVIDER PRACTICE CHANGE: A CLUSTER RCT

S. Slaughter, A. Wagg, C. Ickert, A. Jones, C.A. Estabrooks, *University of Alberta, Edmonton, Alberta, Canada*

Increasing demand for residential aged care has strained already tight healthcare budgets. Identifying novel strategies to optimize best-practice use in these settings may improve quality and efficiency of care and reduce caregiver burden. The purpose of this study was to assess the effect of peer-based and paper-based reminders targeting direct care providers to sustain a mobility innovation with older adults in residential care facilities. START (Sustaining Transfers through Affordable Research Translation) was a 23-site cluster-randomized controlled trial that took place in Alberta, Canada. A mobility intervention was introduced to 23 study sites; between March 2014 and April 2015, 11 sites were randomly assigned to receive paper reminders and a peer reminder intervention either monthly (n=5) or quarterly (n=6) for 1 year. The remaining 12 sites were randomly assigned to receive paper-reminders only either monthly (n=6) or quarterly (n=6) for 1 year. Direct care staff daily documented the uptake of the mobility intervention for 1 year in all 23 sites. Uptake data were analyzed using linear mixed models that mirrored the clustered repeated-measures factorial trial design. A statistically significant improvement was detected in sustainability of the mobility intervention in the sites receiving peer and paper reminder interventions, compared with sites receiving paper-only interventions ($p = 0.007$). No significant difference was detected in sustainability between monthly or quarterly implementation of either the paper or peer intervention ($p = 0.72$). This peer reminder intervention is an effective knowledge translation strategy to change and sustain care provider behaviour in residential care.

CHANGES IN OXYTOCIN AND MUTUALITY IN DIRECT CARE STAFF USING A CALMING INTERVENTION

D. Woods¹, L. Phillips², M. Brecht², 1. *Azusa Pacific University, Azusa, California*, 2. *University of California, Los Angeles, Los Angeles, California*

Behavioral symptoms of dementia (BSDs) such as restlessness, agitation, aggressive behavior, yelling, and nighttime awakenings, exhibited by more than 85% of nursing home residents, result in distress for the person with dementia (PWD) and fear and avoidance in caregivers. Teaching direct care staff (DCS) calming interventions (CALM), specifically therapeutic touch and the use of therapeutic communication skills, can potentially promote social “bonding” between residents and staff, strengthen relationships, decrease staff burnout and turnover and improve the quality of care. This pilot study tested the effect of the use of the CALM protocol by DCS on DCS urine oxytocin and mutuality. Seven of the 10 DCS who began completed the study. DCS training was completed over 4 months. Four of 7 (57%) showed an increase in urine oxytocin (30 – 60 min post treatment), and 5 of 7 (71%) showed an increase in mutuality compared to baseline, indicating increased social bonding. Direct care staff interview data supported positive experiences of relaxation during a resident treatment for the DCS and a reported decrease in BSD for the residents after treatment.

This pilot study provides beginning evidence for the effect of CALM on the DCS, increasing bonding and mutuality with persons with dementia, thus potentially minimizing stress and burnout in DCS as well as improving the quality of resident care.

DEMYSTIFY ELDERLY: MATERIAL, INSTRUMENTAL, EMOTIONAL AND COGNITIVE ASSISTANT IN AGING

N. Rodriguez¹, C. Escudero¹, C. Cano², 1. *Universidad Javeriana, Bogota, Colombia*, 2. *Pontificia Universidad Javeriana, Botogá, Colombia*

Aging perception seems to be related with dependence, illness, disability and loss of capacity for help others. This perception and the notable increased longevity population implies social and family dynamics that need to be elucidate. Even with aging involves changes like higher prevalence of chronic and degenerative diseases that may affect the independence of elderly population, it appears incoherent to related longevity with disability and dependence. In order to analyze the kinds of help or assistant (material, instrumental, emotional and cognitive) that give and receive elderly people, we recruit data from 2000 in Bogota (Colombia) citizens, taken from *Encuesta Salud Bienestar y Envejecimiento SABE*. Statistical analyzes were carried out. Lambda coefficient (symmetric) indicate an absence relationship between the different types of help and age, gender, schooling and social status; demonstrating that social concepts about the growing need of aid are wrong.

LOW BACK PAIN RISK AMONG OLDER TURKISH ADULTS

U. Cavlak, N. Yagci, E. Baskan, M. Oztop, *School of Physical Therapy and Rehabilitation, Pamukkale University, Denizli, Turkey*

Background and Aims: Low back pain is well documented to be an extremely common health problem. The aim of this study was to evaluate the low back pain risk among older Turkish adults.

Methods: Five hundred fifty six elderly people (279 females; 277 males; mean age: 71.45 ± 5.99 yr.) included the study. The pain intensity was measured with Visual Analog Scale (VAS). The risk of low back pain was evaluated with low back pain risk scale.

Results: The mean pain intensity was 4.43 ± 1.98 cm. Low back pain rate was found as 60.4% among the participants. While 36% of the sample were found as potential, the 34.2% of the participants were found as risky.

Conclusion: The findings indicate that mostly older Turkish adults are at risk in terms of low back pain. That's why older adults should be evaluated about a chronic low back pain to improve their quality of life.

GERIATRIC HEALTH SCREENING: AN INTERPROFESSIONAL EDUCATION OPPORTUNITY

G.A. Hudgins, 1. *Pharmacy Practice, University of Montana, Missoula, Montana*, 2. *Montana Geriatric Education Center, Missoula, Montana*

The Institute of Medicine, among other organizations, has established interprofessional education (IPE) as a goal for all health professions. Most academic accrediting agencies are now requiring activity in this area. Programs located

in largely rural areas without an academic medical center may have more difficulty in achieving IPE for their students.

The Montana Geriatric Workforce Enhancement Program at the University of Montana provides interdisciplinary student training through geriatric health screening. Pharmacy, nursing, medicine, physical therapy, social work, and speech pathology students from four Montana academic institutions participate. In a typical year, approximately 65 pharmacy students, 40 physical therapy students, 20 nursing students, 30 social work students, and varying numbers of students from other disciplines are involved in over 50 screening events held throughout the state.

Under faculty supervision, teams of students provide screenings for older individuals in rural communities, including counseling on the results and follow up of abnormal values. Screenings for lipids, hemoglobin A1c, bone density, blood pressure, hepatitis C, balance testing and fall risk assessment, caregiver stress, cognition and depression are provided. Barriers to participation include varying formats and schedules for clinical training, requirements for appropriate supervision of students and identification of community referral resources. Approaches utilized by pharmacy, two different nursing programs, physical therapy, social work, speech pathology, and medicine will be described and compared. Evaluation results from surveys of faculty and students will be included.

AGE-RELATED EAR ASYMMETRIES IN THE ASCENDING AUDITORY PATHWAYS EXPLAIN A BIGGER RIGHT EAR ADVANTAGE

A.G. Ianzewski^{1,2}, A. Fuente^{1,2}, J. Gagné^{1,2}, 1. *Médecine, Université de Montréal, Montréal, Québec, Canada*, 2. *Centre de Recherche de l'Institut Universitaire de Gériatrie de Montréal, Montréal, Québec, Canada*

Existing evidence suggests that the left-ear deficit exhibited by older adults in dichotic listening tasks using linguistic stimuli may be explained by either age-related declines in the inter-hemispheric transfer through the corpus callosum or age-related declines in the right hemisphere. Little is known about the possible effect of ear asymmetries at the peripheral level that may contribute to the right-ear advantage (REA) observed in older adults for dichotic listening tasks. This study aims to determine if an age-related asymmetry in the peripheral auditory system is observed, and if so, if it correlates with an increased REA for dichotic listening tasks in older adults. In this PhD research project, a number of participants aged between 60 and 79 years with mild to moderate age-related hearing loss will be selected. Pure-tone thresholds, distortion product otoacoustic emissions with and without contralateral stimulation and electrophysiological techniques (e.g. click-ABR and complex-ABR) will be used to investigate the peripheral auditory function. Binaural integration will be measured with single, double and triple dichotic digit and single dichotic syllable tests. We hypothesize that age-related ear asymmetries in the peripheral auditory pathways are associated with an increased REA observed in older adults for linguistic dichotic listening tasks. In this presentation the methodology and preliminary results will be addressed.

RELATION BETWEEN GLYCEMIC CONTROL WITH DEPRESSION, MCI, AND DEMENTIA IN ELDERLY WITH TYPE 2 DIABETES

T.A. Medina, D. del Águila Montemayor, G. Guajardo Álvarez, B.I. Gonzalez García, J.A. Hawing Zarate, D.G. Gamez Treviño, R. Salinas Martinez, *Servicio De Geriatria, Universidad Autonoma De Nuevo Leon, Monterrey, Nuevo Leon, Mexico*

Introduction: 26% of elderly people have diabetes mellitus and it will increase in the coming decades. Type 2 Diabetes Mellitus in the elderly is a risk factor for depression, cognitive impairment and dementia.

Methods: Observational, descriptive, longitudinal, retrospective study; 54 files from diabetic patients, from the Geriatrics Service, University Hospital in Monterrey, México; from January to June 2016. Divided in groups: Without cognitive impairment, with mild cognitive impairment (MCI) or dementia: Alzheimer (AD), Vascular (VD) and Mixed (MD) and with or without depression.

Results: mean age 76 (± 7) years of age. The glycosylated hemoglobin (HbA1c) mean results in the group without cognitive impairment was 8.0% ± 7 , VD 6.6% (± 0.9), AD 6.4% (± 0.4), MD 6.9% (± 0.5), MCI 8.6% (± 2); without depression 7.45% (± 1) and with depression 7.2% (± 1). The mean fasting glucose levels in patient without cognitive impairment were 136mg/dl (± 38); VD 150mg/dl (± 27), AD 142mg/dl (± 45) and MCI 146mg/dl (± 39), the group without depression showed 133mg/d (± 40) and with depression 148mg/dl (± 35). VD had low density lipoprotein (LDL) mean of 95.3mg/dl (AD 121mg/dl and MD 111mg/dl). Significant statistical difference was observed in depression having higher BMI than other groups (p: .01). There is a statistical tendency in the glycemic control in dementia (p: .01).

Conclusion: There is a tendency of greater glycemic control in MCI, dementia and depression groups. LDL levels in VD group meet the therapeutic goals unlike other subgroups of dementia. A high prevalence of obesity (42%), depression (51%) and both MCI and dementia (66%) in our diabetic population confirms the importance of geriatric assessment.

SESSION 4455 (POSTER)

CAREGIVING

SUPPORTIVE SUPPORT BROKERS: FAMILY CAREGIVERS' PERCEPTIONS

A. Milliken¹, E.K. Mahoney¹, L. Mata¹, K.J. Mahoney², 1. *Connell School of Nursing, Boston College, Chestnut Hill, Massachusetts*, 2. *School of Social Work, Boston College, Chestnut Hill, Massachusetts*

The "support broker" (also called "coach" or "counselor") is an essential element of participant directed (PD) programs. The primary function of the support broker is to help participants develop the skills to self-direct. This study explored caregiver perceptions of characteristics of effective support brokers. Family caregivers (n=53) with a range of developmental, physical, and aging-related disabilities enrolled in PD programs were interviewed (age 34–78, M

59.9 ± 8.8; male 19%; spouse 17%; parent 60%). Qualitative content analysis revealed rich information about the characteristics of supportive support brokers, and also about support broker characteristics that were not supportive. Support brokers directly influenced many of the challenges caregivers identified. A responsive, imaginative, and involved support broker was identified as a major source of effective support. Conversely, frequent support broker turnover, limited knowledge and involvement, and the perception that the support broker was simply there to “check boxes” became sources of additional stress. Support brokers are uniquely positioned to help caregivers navigate the complexities of the healthcare system, thereby decreasing stress and strain. For example, many of the roadblocks that caregivers identified as difficult could often be negotiated by a support broker. Support brokers can serve as an avenue for caregivers to find out about additional supports within the PD program, as well as organizations outside of PD, such as disease-specific support groups, which caregivers identified as an additional source of support. This research is part of the Family Support Research & Training Center.

THE CHALLENGES OF SHARED DECISION-MAKING IN DEMENTIA CARE NETWORKS

L. Groen - van de Ven¹, C. Smits¹, M. Span¹, J.S. Jukema¹, K. Coppoolse², J. de Lange², J. Eefsting^{3,4}, M. Vernooij-Dassen⁵, 1. *Research Group Innovating with Older Adults, Windesheim University of Applied Sciences, Zwolle, Netherlands*, 2. *Rotterdam University of Applied Sciences, Rotterdam, Netherlands*, 3. *Free University Medical Centre, Amsterdam, Netherlands*, 4. *Zonnehuisgroep IJssel-Vecht, Zwolle, Netherlands*, 5. *Radboud University Medical Centre, Nijmegen, Netherlands*

Background

People with dementia want to be involved in the many decisions they have to make over time in order to adjust care to their values and preferences. Involving informal caregivers in decision-making can promote autonomy for people with dementia by using their extant capacities. However, informal caregivers have their own interests in the decisions made. Our aim was to describe the challenges of shared decision-making in dementia care networks.

Methods

Our study involves a multi-perspective qualitative study using face-to-face interviews with 113 respondents in 23 care networks consisting of 23 people with dementia, 44 of their informal caregivers, and 46 of their professional caregivers. The interview guide addressed the decision topics, the decision-making participants, and their contributions to the decision-making. We used content analysis to delineate categories and themes.

Results

The three themes that emerged describe the challenges of shared decision-making for dementia care networks: (1) adapting to a situation of diminishing independence, including shifting roles in the decision-making; (2) tensions in network interactions, resulting from different perspectives and interests and requiring agreement about what constitutes a problem in the situation; and (3) timing decisions well.

Conclusion

The challenges described have consequences for a shared decision-making approach in dementia care networks. Such an approach should (1) be flexible regarding the changing capabilities of the person with dementia to preserve his or her autonomy; (2) work towards a shared view about what constitutes a problem in the situation; and (3) be adjusted to the decision-making pace of the care network.

INITIATIVE TO PROMOTE KNOWLEDGE OF GERIATRIC SYNDROMES IN MINORITY OLDER COMMUNITIES AND CAREGIVERS

K. Alexander^{1,2}, J. Nonailada¹, N. Gangai¹, R. Costas Muniz¹, B. Korc-Grodzicki^{1,2}, 1. *Geriatrics, Memorial Sloan Kettering Cancer Center, New York, New York*, 2. *Weill Cornell Medical College, New York, New York*

In addition to the ageing of the population, a significant sociodemographic change in the United States is the growth in the number of minorities. Minorities and older adults are particularly vulnerable to receiving suboptimal healthcare. The Health Resources and Services Administration (HRSA), is the primary Federal agency for improving and achieving health equity. Queens County in New York City is the most ethnically diverse urban area in the world. Funded by a grant from HRSA, in collaboration with various local community organizations, the Geriatric Resource Interprofessional Program (GRIP) at Memorial Sloan Kettering Cancer Center (MSKCC) spearheaded a multi-prong educational initiative on geriatric syndromes targeting minority communities in Queens County. To date, 13 sessions were conducted at 7 community centers in Queens. A total of 521 people who spoke 13 different primary languages attended. The mean age of the participants was 63 (27–99, median 67); 53% were women, 8% were born in the USA, 56% were born in Bangladesh, 22% in India. Consecutive interpretation of the lectures was performed to the predominant language of the group; written materials were translated. Pre and post test questionnaires were administered to measure understanding. A focus group was set up to identify the needs of caregivers of older adults, and educational sessions have been offered based on those needs at main Community Centers. Main challenges included differences in literacy, multiple cultures and languages. Successes and barriers faced in implementing the educational initiative, as well as pre and post-test results will be presented.

CULTIVATING FAMILY CAREGIVER RESILIENCE AND PREVENTING AVOIDABLE HOSPITALIZATIONS IN DEMENTIA

T. Sadak², E. Ishado¹, B. Gaster³, L.N. Gitlin⁴, K.C. Buckwalter⁵, S. Borson^{3,1}, 1. *University of Washington School of Nursing, Mountlake Terrace, Washington*, 2. *University of Washington School of Nursing, Seattle, Washington*, 3. *University of Washington School of Medicine, Seattle, Washington*, 4. *John Hopkins University School of Nursing, Baltimore, Maryland*, 5. *University of Iowa School of Nursing, Iowa, Iowa*

Enhancing and maintaining family caregiver (CG) self-care is a national priority for long-term societal wellbeing. The National Alzheimer's Plan Act recognizes widespread

deficiencies in detecting and addressing the needs of CG of PWD and identified CG assessment and interventions as one of its five key goals. Additionally, CG who are better prepared to manage their care recipient's health and maintain their own wellness may be more effective in preventing potentially avoidable hospitalizations, thereby meeting a key dementia-related objective of Healthy People 2020. This poster describes efforts towards improving characterization of CG "jobs" for managing PWD's health at home and designing the tools and interventions to support clinicians and family CGs working together to avoid preventable health crises of both CGs and PWD. We recruited 100 CG of PWD recently hospitalized for Ambulatory Care Sensitive Conditions and triangulated data from CG interviews and assessments, and PWD medical records in order to map the chain of events leading to hospitalization, identify missed opportunities for prevention, and create a repository of CG descriptions of early symptoms of conditions that lead to PWD hospitalization. We create a CG self-care inventory to identify and monitor CG self-care practices and how such practices change during PWD health crises and stratified CG into those with high vs. low risk for experiencing difficulties in responding effectively to a PWD health crisis and maintaining self-care. The ultimate goal of this work is to enable CGs to manage health of their care recipients without sacrificing their own health and wellness.

USABILITY TEST OF WEB BASED PROGRAM FOR FAMILY CAREGIVERS

M. Park, M. Lee, H. Jeong, *College of Nursing, Chungnam National University, Daejeon, Korea (the Republic of)*

In the area of healthcare intervention, an interactive web-based program gains popularity with the development of computer technology. The purpose of this study is to develop a web-based program to support family caregivers who are taking care of patients with dementia and to test its usability. This web-based program included interactive contents as animation formats. The program consisted of 4 modules including understanding dementia, understanding family caregiving, reducing caregiving stress, and networking social support. Family caregivers were recruited for a pilot evaluation. Usability test was comprised of learnability, efficiency, satisfaction and errors. Learnability was tested to see the easiness of the web program for new users. Efficiency was tested to see how quickly users could complete tasks on the site. Satisfaction was tested to see whether users enjoyed the design of the website and errors was tested to identify the number of errors users make. After receiving the results of the website usability tests, the researcher analyzed the common issues that testers had in using the website and the amount of time the family caregivers to complete various tasks on the web. The narrative feedback from family caregivers were analyzed. The results in the pilot test suggested that the animation's speed and texts' difficulty level need to be adjusted to increase learnability and to reduce error rate to facilitate effective online support for family caregivers.

THE IMPLICATIONS OF THE TIMING OF DEMENTIA DIAGNOSIS ON THE DEMENTIA CAREGIVER—A SYSTEMATIC REVIEW

K.K. Ng^{1,2}, T. Mooney², M. Martin-Khan¹, *1. Centre for Research in Geriatric Medicine, The University of*

Queensland, Nambour, Queensland, Australia, 2. Sunshine Coast Hospital and Health Service, Nambour, Queensland, Australia

To provide relevant and effective support, it is important to understand caregiver perspectives of the implications of the care-recipient receiving a diagnosis of dementia in earlier stages as compared with later stages of dementia.

A systematic literature search of four computerised data bases of published literature was conducted. Two researchers independently assessed abstracts and full text articles for eligibility. 4335 articles were found. Removal of duplicates and applying inclusion and exclusion criteria to titles and abstracts left 152 articles. Full text assessment of eligibility left 25 articles (reporting on 22 studies). Qualitative and quantitative studies were eligible. Quality criteria were applied.

Five primary issues at diagnosis relevant to the care-giving experience were identified: 1. dealing with the immediate and subsequent emotional impact of the diagnosis; 2. dealing with grief, loss and the uncertain future course of the dementia; 3. coping on an on-going basis with care-giving responsibilities; 4. the importance of acceptance of the diagnosis to assist adaptation and adjustments in the caregiving role; 5. the need for post-disclosure follow-up with practical information, guidance and advice relevant to their situation and expectations rather than generic information.

Caregivers require person-centred advice, guidance and information that are relevant to their needs and expectations at diagnosis and at follow-up. No study has been done to demonstrate the differential needs of earlier stage dementia caregivers compared with later stage caregivers at diagnosis. This review has identified the importance of exploring caregiver needs at diagnosis and their expectation for post-diagnostic follow-up

THE ROLE OF CARERS FOR PEOPLE LIVING WITH MULTIPLE COMORBIDITIES

S.P. Hammond, L. Biggart, *Norwich Medical School, University of East Anglia, Norwich, United Kingdom*

Within an era of austerity in which rhetoric regarding a 'grey tsunami' are intensifying (Stevens, 2016), the need to future proof procurement of health and social care services worldwide is paramount. The widespread re-engineering of such services remains economically implausible (McNulty & Ferlie, 2004). In this context, the role carers have in supporting patients experiencing multi-comorbidities, to help them to live independently and well, emerges as economically, socially and culturally important. In the United Kingdom unpaid carers, such as family members and members of voluntary sector organisations, have come to play a vital role. A wide variety of research has highlighted the impact of caring for patients with multiple comorbidities in terms of carer physical and mental health and well-being (Pinquart & Sörenson, 2003; Sörenson, Duberstein, Gill & Pinquart, 2006).

As reliance upon carers continues to grow, this paper will outline analysis from quantitative and qualitative data and provide recommendations regarding ways to reshape existing services to better interconnect and communicate with carers. Drawing upon data from a survey of 90 carers measuring levels of depression, anxiety and coping and rich in-depth qualitative interviews with an additional 6 carers,

the paper will illustrate carers' vulnerability for experiencing anxiety-depression. Adaptive coping styles to mitigate against this vulnerability will be discussed with recommendations to address a current disconnect between health and social care information provision and carers/patients communicative needs.

CHRONIC DISEASES, ADLS, AND SOCIAL NETWORKS PREDICT RECEIPT OF WEEKLY CARE AMONG OLDER SWEDISH TWINS

M. Ernsth Bravell¹, A.D. Foebel², N.L. Pedersen², 1. *Jonköping University, Jönköping, Sweden*, 2. *Karolinska Institutet, Stockholm, Sweden*

Population aging is increasing the need for formal care services. As demand for these services increases, older adults with more health problems may remain at home and increasingly rely on help from their social networks. This study explored the role of social networks, as well chronic disease burden and physical function, on receipt of care among older adults. Data were collected from 3 questionnaire waves of the Swedish Adoption/Twin Study of Aging (1987, 1990, 2007). A total of 1065 individuals older than 55 years at baseline were included. The outcome was self-reported receipt of weekly care. Physical function was measured using 5 self-reported Activities of Daily Living (ADL) and chronic disease burden was measured using a modified Cumulative Illness Rating Scale. Social networks were measured by the number of relatives, friends, neighbors, and caregivers. Results: At baseline, older age, higher chronic disease burden and worse function were all associated with receiving care. After three years, older age and worse ADLs predicted receipt of care for all participants. However, among women, more chronic disease and having friends with similar interests also increased the likelihood of care, while for men, having a caregiving friend increased this likelihood. Finally, at 20 years, older age at baseline and higher chronic disease burden increased the likelihood of receiving care. Conclusion. Factors associated with receiving formal care changed over time, but increasing chronic disease burden was a consistent predictor for women. Social network factors were only associated with receipt of care in short-term follow-up.

IMPACT OF EFFORT-REWARD IMBALANCE ON PSYCHOLOGICAL DISTRESS IN JAPANESE CARE STAFF

A. Honda¹, Y. Date², S. Maeta², S. Honda¹, 1. *Graduate School of Biomedical Sciences, Nagasaki University, Nagasaki, Japan*, 2. *Chikushi-minamigaoka Hospital, Onojo, Japan*

In 2005, the proportion of care workers in the Japanese labor force was 1.7%. By 2025, the proportion is projected to increase to 3.4–4.4%. However, many care workers are leaving their jobs because of low wages and/or excessive burden. Therefore, this study aimed to investigate the work-related stress and mental health status of care workers and elucidate the impact of work-related stress on psychological distress. The study participants were care staff who were working at care facilities. Self-administered questionnaires were used to collect information about demographic factors, working conditions, self-rated health status, work-related stress,

and psychological distress. The Effort-Reward Imbalance Questionnaire was used to assess work-related stress, while the K10 scale was used to examine psychological distress. Responses from 173 participants (45 men, 128 women; mean age, 41 years; age range 18–70 years) were analyzed in the study. The proportion of participants with psychological distress was 17.9% (n=31). Among all participants, 27 care staff (16%) rated their health as poor, 82 (47%) rated it as fair, and 64 (37%) rated it as good. Regarding the effort-reward imbalance, the effort-reward ratio was significantly associated with psychological distress ($p < 0.001$). These findings indicate that to prevent psychological distress in care workers, it is important to focus on reducing work-related stress, especially the effort-reward imbalance in the workplace.

INDIAN CAREGIVERS' PERCEPTIONS OF FORMAL LONG-TERM SUPPORTIVE SERVICES: A MIXED-METHODS STUDY

B. Capistrant¹, S. Ghosh², 1. *Division of Epidemiology & Community Health, University of Minnesota, Minneapolis, Minnesota*, 2. *Tata Institute of Social Science, Mumbai, Maharashtra, India*

In India, a greater burden of chronic disease related care and smaller families question the sustainability of traditional family-based, in-home long term supports and services (LTSS). This study used data from the Jodhpur Elder Caregiving Study, a mixed-methods study of caregivers in Jodhpur, Rajasthan, to 1. explore family caregivers' perceptions about formal care services, and 2. identify which kinds of services caregivers report needing and likely to use. 30 one-on-one semi-structured in-depth interviews and 100 quantitative surveys of family caregivers were collected in 2015. Interview data were transcribed and translated into English and coded with content analysis approaches. Adjusted poisson and logistic regression models were used to estimate average total number of LTSS and probabilities of self-reporting wanting individual LTSS, respectively. Respondents expressed: 1. a neutral to negative sentiment about formal LTSS, especially residential options, and 2. a "duty" to provide care to one's family that "others" and those "doing it for money" could not meet. Of 10 LTSS and caregiver supports, caregivers reported on average needing and being likely to use 2.8 (95% CI: 2.5, 3.2). More caregivers reported higher probabilities of needing caregiver services, like caregiver education (34%) and self-care activities (44%). Despite providing intensive amounts of informal LTSS and care for their family members, Indian caregivers consistently reported disinterest in using formal LTSS alternatives in both qualitative and quantitative data. Caregivers reported stronger desire for services that support their ability to carry out their caregiving roles in-home.

HEALTH CARE STAFF'S PERCEPTION OF EXISTENTIAL LONELINESS AMONG OLDER PEOPLE

M. Sundström^{1,2}, A. Edberg¹, M. Råmgård², K. Blomqvist¹, 1. *Health and Society, Kristianstad University, Kristianstad, Sweden*, 2. *Malmö University, Malmö, Sweden*

Loneliness and thoughts about existential aspects are common among older people and unmet needs to share their thoughts can lead to existential loneliness. Knowledge

about how health care staff perceive existential loneliness in older people and what they do to meet their needs is scarce. The aim of the study was thus to explore health care staff's perception of older persons' existential loneliness. Ten focus group interviews were performed with staff (n=55) representing different professions, such as nursing aids, nurses, physicians, occupational therapists, physiotherapists, social counselors and social workers. Different care contexts were included to reach variation; home care, nursing homes, palliative care, primary care, hospital care and prehospital care. Data was analyzed using a qualitative content analysis. The results show that existential loneliness appears in various forms depending on the older person, their life experiences and the situation at hand and seems to be connected to issues about time and place. Staff perceived that existential loneliness emerged when physical disabilities became barriers, when they felt excluded by people in their vicinity or when they themselves excluded others from their life-world. Existential loneliness also emerged when they felt alienation, guilt or regret for situations in the past. Preparedness among staff to identify and deal with existential loneliness varied while the care environment seems to hinder or support their possibility to discover and encounter existential loneliness.

SESSION 4460 (POSTER)

CAREGIVING AND CARE VALUES II

FAMILY CAREGIVERS IN ORGANIZATIONS: THE HIDDEN CAREGIVER

S. Resnizky¹, Y. Cohen¹, R. Ledany², T. Bassewitz³, 1. *Center for Research on Aging, MYERS-JDC-BROOKDALE Institute, Jerusalem, Israel*, 2. *Caregivers Israel, Zichron Yaakov, Israel*, 3. *JDC-Eshel, Jerusalem, Israel*

There is growing recognition of the implications of caring for a family member while employed. Nevertheless, studies conducted in Israel have found that there is no structured organizational policy addressing this issue. Awareness of this issue is one of the biggest challenges.

Method: A survey was administered at 4 large organizations (400+ employees), 2 NGOs and 2 industrial plants. Altogether, 851 employees responded to the survey (34% response rate).

Findings: Fifty-five percent reported that they were family caregivers. A third of them reported that they had spoken to someone in the organization about caring for their relative: 28% with their direct supervisor and 10% with human resources.

A multivariate analysis revealed that family members who refer to someone in the organization provide more than 8 hours of weekly care (OR 2.88), are caring for a patient with a diagnosed illness (e.g., cancer) (OR 2.66), and work in social organizations (as opposed to industry) (OR 2.71). Moreover, even when employees have to take days off work, have their daily schedule and concentration interrupted, and even consider leaving work, they do not talk about it more than those who have not experienced such interruptions. They talk about it more only when they declined a promotion or report that "work helps me to keep my sanity".

Conclusion: In order to have "Caregivers Friendly workplaces," the first step is to develop organizational awareness and legitimacy to this issue (e.g. through workshop for managers). The next stage is developing organizational policy to support caregivers.

AGEING CHINESE ADULTS' CARE EXPECTATIONS: A PHOTOVOICE STUDY IN HONG KONG

X. Bai, D.W. Lai, C. Liu, *The Hong Kong Polytechnic University, Hong Kong, China*

Changing family structures and values form great challenges to traditional family dynamics and care arrangements in Hong Kong. This study adopted a qualitative and empowering approach by using Photovoice techniques, aiming to investigate ageing Chinese adults' future care expectations and the determinant factors. To examine a possible cohort differences, the study included both older adults aged 65 or above and younger baby boomers in late middle age (50 to 64). With data collected from 36 ageing Chinese adults in Hong Kong, it was found that Hong Kong older adults have a broader range of care expectations beyond the popular perceptions. Their major expected care domains can be categorized as financial and material care, emotional care, medical care, long-term care, residential care and social engagement. The expected care sources differ in every care domain. Government is most needed in providing financial and medical care; family and friends are most frequently chosen to meet emotional care needs; community services and public residential care homes are most voted as long-term care solutions. Cohort differences were identified as younger baby boomers conveyed more independent care values. The findings also indicated that demographic characteristics, intergenerational relationship and previous life experiences have influence on care expectations. The study results could support a broader and improved awareness of the care needs and challenges facing ageing adults in Hong Kong, and further inform the development of targeted policies and services to ensure that different support sources can effectively respond to the spectrum of future care requirements.

DISTANCE CARE: CHALLENGES AND POTENTIALS BEYOND NATIONAL DISTANCES AND INTERNATIONAL BOUNDARIES

B. Kramer², A. Franke², U. Otto¹, I. Bischofberger¹, H. Kunz², M. Kindl², 1. *Careum Forschung, Kalaidos University of Applied Sciences, Department of Health Sciences, Zürich, Switzerland*, 2. *Protestant University of Applied Sciences, Ludwigsburg, Ludwigsburg, Germany*

In the course of demographic dynamics, increased labor market mobility and changing family patterns caring for a family member far away becomes more of a challenge. In this context "distance caregiving" is a new and so far under researched field. The binational Distance Caregiving "DiCa" project (2016–2019) with an interdisciplinary German and Swiss research team aims to investigate different dimensions and involved parties of distance caregiving: caregivers, employers and health care services. The focus is on distance caregivers who have a national but in some cases also a cross-border long distance to overcome to identify challenges and

areas of burden for these caregivers. The aim of this study is on one hand to identify strategies to help both employed and unemployed caregivers with this particular challenge and burden. On the other hand the project aims to sensitize employers and health care services so that they are able to provide adequate help and communication.

In this paper, results for Germany and Switzerland from a secondary data analysis from the Survey of Health, Aging and Retirement in Europe (SHARE) and the German Ageing Survey (DEAS) will be presented as well as first results from qualitative expert interviews with employers from different sectors (e.g. automobile, insurance company, healthcare institution). Supporting distance caregivers with appropriate actions and instruments is important to relieve these employees and to maintain their employability. Offering support with caregiving over a larger distance can also be seen as a strategic instrument for recruitment in the long term.

MATCHING CAREGIVER SUPPORT NEEDS WITH CHARACTERISTICS OF PARTICIPANT-DIRECTED PROGRAMS

E.K. Mahoney, K.J. Mahoney, M. Cano, *Nursing, Boston College, Chestnut Hill, Massachusetts*

The purpose of this study is to learn how the design and implementation of services and supports within participant-directed programs compare with facilitators versus barriers to support experienced by family caregivers. This study uses a sequential mixed methods design. First, telephone interviews with a purposive sample of family caregivers (n=53) explored their perceptions of challenges they face and the usefulness, effectiveness and gaps in family support resources in participant-directed programs across the caregiving trajectory. The second phase involves describing participant-directed program policies and procedures in Medicaid waivers (n=240) identified as important by caregivers including family assessment, hiring restrictions for caregivers, budget authority, training requirements, accessible resources and qualifications of support brokers. Descriptive statistics are used to identify trends across programs and compare their alignment with best practices and gaps in supportive characteristics identified by family caregivers. Results show variability in the frequency of facilitators and barriers within and across programs, discrepancies between resources available and caregiver perceived gaps and inconsistencies in qualifications of support brokers whose role was perceived as essential. Qualitative data were used to enrich the interpretation of quantitative results, shedding light on barriers to the ability to benefit from program resources such as respite that are designed to be supportive, the impact of policies on caregivers and the benefits of budget, as well as employer, authority enabled through participant direction. This research is part of the Family Support Research & Training Center to inform practice and policy to support family caregivers.

SUPPORTING CARING AND CARERS IN LATER LIFE

M. Larkin, *Open University, Milton Keynes, United Kingdom*

In common with many other countries, around three quarters of carers in the UK now care for older people and a third of carers are aged 65+. Although internationally there is a wealth of material about carers, evidence is fragmented and

dispersed. This impedes the capacity of existing knowledge to inform research and practice. This paper outlines a unique scoping review and how it is being used to promote the wellbeing of those caring for older people and older carers. Funded by the UK's National Institute for Health Research, this review - *for the first time* - synthesised international carer-related research and evidence. It has also been used to underpin an internationally accessible web-based repository of research and resources about carers. During the review, in consultation with the project's interdisciplinary and interprofessional Advisory Group, vertical and horizontal approaches to analysis were developed and integrated using a matrix that allowed cross-reference between different elements. Outcomes of the resultant synthesis include comprehensive summaries of existing evidence about the needs of those caring for older people and older carers, and effective ways of supporting these groups of carers. This summary is available through the repository. It can play an invaluable role in supporting caring and carers in later life as it can be used by many stakeholders, not only in the development of research but also for the development of high quality practice with carers of older people, older carers and importantly too, the older people for whom they care.

WHAT MATTERS TO OLDER CARERS: EVIDENCE FROM PRACTICE-RELATED RESEARCH

A. Milne¹, M. Larkin², 1. *School of Social Policy, Sociology & Social Research, University of Kent, Chatham Maritime, Kent, United Kingdom*, 2. *Open University, Milton Keynes, United Kingdom*

A third of the UK's six million carers are aged 65 years and over. Older carers disproportionately provide intensive care to their relative, care over many years and yet receive very limited support from care agencies. Research with older carers suggests that one of the key reasons for this failure is that policy and service models do not take account of 'what matters' to older carers. Older carers tend to protect the cared for person by resisting framing what they are doing as 'caring' nor identify as a 'carer'. As a consequence they are less likely to recognise the impact of caring on their health and wellbeing or seek help. The 'emotional work' older carers are involved in e.g. bolstering their relative's identity, tends to dominate how they 'become' carers. It is not instrumental care tasks that defines their role and yet this is how most agencies conceptualise caring and what often determines service allocation. That care is embedded in a relationship and a shared life-course is also important to older carers which is at odds with a model of assessment focused on an individual 'user' or 'carer'. There is also emerging evidence that the shift towards direct payments in UK welfare policy is linked not only to devolving responsibility for care decisions to carers but is also associated with the devolution of stress and increased anxiety. Until more of what matters to older carers informs policy and service development they will continue to be marginalised and unsupported.

HEALTH INFORMATION TECHNOLOGY FOR RURAL CAREGIVERS: INTERSECTING SCIENCE, POLICY AND PRACTICE

N. Ruggiano¹, E. Brown², P. Clarke², L. Roberts², V. Hristidis³, 1. *School of Social Work, University of*

Alabama, Tuscaloosa, Alabama, 2. Florida International University, Miami, Florida, 3. University of California - Riverside, Riverside, California

More than 5.4 million people in the U.S. are affected by Alzheimer's disease and other dementias (AD), most of whom receive care and support from family caregivers and are medically managed by their primary care provider (PCP). However, there are a number of barriers to providing care to those with AD: PCPs report difficulty in communicating with AD patients, their caregivers, and their in-home providers; in addition, caregivers experience compromised health and psychiatric and physical consequences to the burden associated with caregiving. AD caregivers in rural settings experience additional unique challenges, given local limitations in services, significant distance of services, and limited availability of information regarding AD and available services. To address these issues, a multi-disciplinary team, along with community partners, has developed CareHeroes, a bilingual (English/Spanish), internet and Android-based App that has multiple functions aimed to: improve disease management; provide case managers, caregivers, and PCPs with the ability to share critical health-related information in real time; and increase access to caregiving information and resources. This presentation will summarize pilot data from several studies of CareHeroes to highlight: perceptions about usability and satisfaction among users (caregivers, home care case managers, PCPs) and lessons learned about developing health information technology for a diverse population of dementia caregivers. Then, it will discuss specific policy, practice, and technical considerations that present opportunities and challenges for extending CareHeroes to rural AD caregivers as a cost-effective, sustainable mechanism for providing them with ongoing support, caregiving information and ability to communicate with healthcare providers.

CHINESE OLDER ADULTS' PREFERENCES FOR CARE PROVISION: DO THEY DEVIATE FROM TRADITIONAL FAMILIAL CARE

J. Zhang, *Department of Social Work, Fudan University, Shanghai, China*

In Chinese tradition, the responsibility for elder care belongs to adult children. However, traditional family model is less sustainable nowadays. This study aims to provide timely information of Chinese older people's care preferences. Two research questions are addressed: What type of care provision do Chinese older people prefer? What factors affect their care preferences? Data came from a survey completed in Shanghai and Hong Kong between 2014–2015. Respondents (aged 55 and older) were sampled through a stratified multistage probability sampling design. A total of 1,400 were sampled and 1,041 completed, with a response rate of 74.35%. Multinomial probit models were employed to study care preferences, which were coded as: family care provided by children, family care provided by spouse, community care, and residential care. Three sets of explanatory variables were examined: socioeconomic resources, perception of children's filial piety, and practicality factors. Results show that family care provided by spouse and family care provided by children were most preferred by Shanghai elders and Hong Kong elders, respectively. Community care and residential care were least preferred by Shanghai elders and

Hong Kong elders, respectively. Older people who experienced more filial piety from children, and provided grandchild care were more likely to prefer care from children. Living in a relatively aging-friendly community enabled elders to choose community care. The study suggests that modernization does not necessarily result in less traditional familial care preferences. Developing aging-friendly communities encourages community care preference and thus could ease the family burden of increasing demand for elder care.

EMPLOYMENT OUTCOMES OF CAREGIVING ACROSS THE COUNTRIES: A REVIEW AND ANALYSIS

Y. Lee¹, E. Gonzales², L. Li¹, 1. *University of Calgary, Calgary, Alberta, Canada*, 2. *Boston University, Boston, Massachusetts*

There is general consensus that informal caregiving results in negative outcomes on caregivers' employment. While a rich body of research has investigated the differences in the outcomes in terms of gender, race, and income, there is scant research that explain differences at a macro level such as structural arrangements that may enhance or mitigate these outcomes. This study asks whether cross-national variation in patterns of employment outcomes of informal caregiving can be explained by national demographic and socioeconomic differences between individuals, or whether structural and cultural factors are more important. Studies were limited to original quantitative research, written in English and published from January 2000 through December 2015. The countries examined included Australia, Canada, China, Denmark, Germany, Italy, Japan, Netherlands, Norway, Korea, Spain, Sweden, UK, and US. Results are summarized with respect to different care regimes such as family-based care model vs. de-familialised, and with respect to different regions such as European, North American, and Asian countries. Macro-level factors were significant in attenuating the effects of caregiving on employment-related outcomes. Findings suggest clustering eldercare models helps to focus on some important aspects and identify similarities and differences among countries in terms of the outcomes of informal caregiving. Cultural and institutional differences might explain the differences among countries. Different systems of eldercare have been shaped over time by a complex array of historical, cultural, social and economic factors. Many of these factors are not directly part of care systems but nonetheless have important implications for different caring regimes.

IT TAKES A COMMUNITY: IDENTIFYING SUPPORT FOR RURAL-COMMUNITY DEMENTIA CAREGIVERS

S.D. Holmes¹, A. Gibson², S. Barnhart², N. Fields³, V.E. Richardson⁴, 1. *Department of Gerontology, University of Maryland Baltimore and Baltimore County, Baltimore, Maryland*, 2. *College of Social Work, University of Kentucky, Lexington, Kentucky*, 3. *School of Social Work, The University of Texas at Arlington, Arlington, Texas*, 4. *College of Social Work, The Ohio State University, Columbus, Ohio*

Dementia is one of the costliest and most time-consuming diseases among older persons. Although informal caregivers provide the majority of care for persons with dementia, little is known about experiences of dementia caregivers in rural

communities. Based on Putnam's social capital framework, this study examined dementia caregivers' familial and community supports in rural communities of Ohio and Kentucky. After systematic training in culturally-sensitive methods, researchers interviewed 11 rural caregivers of persons with dementia. Multiple coders used a theoretically-based tool to conduct a content analysis of participants' responses with an acceptable inter-rater reliability. Although similarities with other dementia caregivers were found, important differences suggesting unique issues among these rural dementia caregivers were uncovered. In contrast to non-rural dementia caregivers, these participants more often acted as primary care providers although they supplemented caring with traditional services. Their investments in their communities (i.e. workplace, church, neighbors, immediate family) offered unique supports and respite that differed from how respite services typically are provided in more urban areas. Resources and services were compared based on whether participants identified them as helpful or not helpful. Many participants found strength in their community, which often served as a safety net of support. Some participants expressed financial concerns, geographic barriers and lack of dementia-specific services when using formal services. The need for more specialized formal services in rural areas to supplement existing informal care networks is discussed. Policies and services based on rural caregivers' unique concerns and challenges and that build upon their existing care networks are recommended.

DETERMINING THE RETURN ON INVESTMENT: SUPPORTIVE POLICIES FOR EMPLOYEE CAREGIVERS

A. Holzapfel, *ReACT, Devon, Pennsylvania*

Employee benefits have become a major topic of discussion in the field of human resources as job-seekers rank employment benefits, workplace programs, and work/life balance as increasingly important. Despite a recent upswing in employee programs and workplace flexibility, elder caregiver policies remain largely unimplemented. This situation is problematic. With 17% of the workforce providing care for an elderly person and almost half of them also caring for children under 18 at home, this "sandwiched" generation has become overburdened with caregiving responsibility. In 2013, an estimated 40 million adults spent 37 billion hours caring for adults, resulting in \$470 billion of unpaid contributions. Today's rapidly aging society will only exacerbate the problem; by 2030, there will be 54.5 million adults 65 and older and 8.5 million adults 85 and older in the U.S.

This study investigates the hitherto scarcely explored effects of elder caregiver workplace policies' costs and benefits. Using all available evidence from the past two decades on the costs and benefits of such practices, this report calculates the return on investment (ROI) for two case studies: flextime and telecommuting. These two workplace policies yield a potential ROI of up to \$4.34 and \$4.45, respectively, for every dollar invested. Furthermore, this report delineates the positive effects of these policies on the employee and business in terms of recruitment, retention, absenteeism, and productivity. Workplace policies for elder caregiver employees, though underutilized, ultimately make business sense and provide viable options for the employee and employer in an aging society.

EFFECTIVE COMMUNITY-BASED PROGRAM FOR MULTIGENERATIONAL CYCLICAL SUPPORT SYSTEM

M. Kuraoka¹, M. Hasebe^{2,1}, K. Nonaka¹, M. Yasunaga¹, Y. Fujiwara¹, 1. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 2. *Seigakuin University, Age, Japan*

2015 National Census preliminary report indicates that the population of Japan decreased for the first time since Japan started the census in 1920. Japanese communities face a rapid increase in elderly population, and creating a system in which communities can support the elderly in a sustainable way is key. To achieve this goal, the concept of a Multigenerational Cyclical Support System(MCSS) was proposed in the study funded by a Research Institute of Science and Technology for Society (RISTEX) grant. In this study a semi-structured interview was conducted to examine what types of multigenerational programs are necessary to enhance intergenerational coherence and sustain the MCSS. The interview was conducted with 14 organizations that promote multigenerational involvement in community to identify how each program or project was developed; the techniques for managing the program; how the program collaborates with other organizations; the issues in running the program; and how the program can be incorporated in the proposed cyclical system. The result indicates how the program can be incorporated in the MCSS in five points: a) the importance of environment or place that enables collaboration, b) the staff who can coordinate the program and the community, c) voluntary management by the participants, d) sustainable funding, e) training staff with multigenerational point of view. The issues with running programs indicate that the programs often started with a person with strong passion and effort, thus adopting such programs in a different setting would require careful strategies without the same human resources available.

MEASURING THE COSTS OF INFORMAL CAREGIVING: A REVIEW OF RESEARCH ON ECONOMIC BURDEN

J.C. Greenfield, C. Neary, *Graduate School of Social Work, University of Denver, Denver, Colorado*

In the United States (US), much has been written in the mainstream media about the costs of caregiving among informal caregivers for older adults, but there is conflicting empirical evidence about the extent of these costs and their impact on caregivers' financial security and perceptions of burden. We conducted a scoping review of the peer-reviewed literature to better understand how caregiving costs are measured and to assess the current state of knowledge about caregiving costs and perceptions of financial burden among caregivers for older adults in the US. A systematic examination of literature from 2000 to 2015 in four relevant academic databases resulted in an initial review of 394 articles and a comprehensive review of the 42 of these that offered unique contributions to knowledge about financial costs of caregiving for older adults. In this body of literature, two basic approaches to measuring financial effects were used: a) valuing of costs through measurement of expenses related to caregiving, calculation of opportunity costs, or calculation of

replacement costs; and b) measurement of perceived financial burden without an attempt to quantify that burden. Financial burden was associated with longer caregiving experiences and caregiving for people with dementia, but there was conflicting evidence about effects among financially vulnerable populations such as caregivers of color. Very few studies sought to quantify the costs of caregiving, and findings offered a wide range of actual costs. Gaps in the literature will be identified with discussion of implications and directions for future research.

MEMORIAL SOCIAL WORK FOR THE DEAD AND THEIR LIVING FAMILIES: MAPPING THE FIELD AND RESEARCH AGENDA

H. Park, *Western Sydney University, Sydney, New South Wales, Australia*

Death is likely to be regarded as a taboo topic in social work with older people. When it occurs, client engagement does come to an end. There is also an insufficiency of intercultural understanding about posthumous reputations and ancestor remembrance in the social work context. Challenging such a prevailing 'passive' approach to death and the dead, this paper discusses how the practice of ancestor respect was perceived and experienced among Korean people living in different regional settings. Data were collected from interviews with 61 participants, mainly older people and social workers, from Korea, New Zealand and Australia, and then analysed using a thematic analysis approach in the bilingual context in which two languages, Korean and English, were used interchangeably.

The findings from this qualitative study show that ancestors and other late relatives are important parts of people's lives and relationships in Korean culture. Most participants perceived ancestor respect as a core aspect of filial piety requiring some action, not necessarily worship but more likely an expression of veneration and remembrance. This traditional filial practice has allowed family members to gather together to share memories, and maintain connections with relatives and ancestors. The thematic analysis of findings indicates that the memorial aspect of filial piety has significant implications for social work practice, training and research. A potential area of social work, namely 'memorial social work', is proposed to cover the issues concerning death and the hereafter, such as images of death and ancestors, loss and grief, after-life planning and legacy-helping practice.

FILIAL PIETY (XIAO): PERSPECTIVES ON INSTITUTIONAL ELDER CARE AMONG COLLEGE STUDENTS IN CHINA

J. Tan, *Bridgewater State University, Bridgewater, Massachusetts*

China has the largest net aging population in the world along with a rapid aging pace. Historically, the family has been the source of support and care for their elders, and filial piety has been a fundamental tenet in Chinese culture. However, increased geographic mobility and reduced family size have made more adult children unavailable for elder care. Very little empirical research has examined the perspectives among college students in China towards institutional elder care.

A mixed method approach was used with both quantitative and qualitative data collection. A convenience sample (N= 380) was collected through anonymous, self-administered survey questionnaires. In addition three one-hour long English focus groups were conducted. Survey data were inputted and analyzed using SPSS. Focus groups were transcribed and analyzed using content analysis methods.

Results from questionnaires found that 35.4% of the participants would choose institutional care for their parents, and 15% more (50.4%) of the participants would choose institutional care for themselves. Results from focus groups suggests filial piety, although considered very important and defined in traditional terms of obey, respect and duty, may have new interpretations of how it is practiced for the younger generation. In addition, how to care for elder parents reflects these new interpretations by including possibilities of hired and institutional care.

Findings from this study provide important and meaningful information for gerontological educators, service providers, and policy makers. With the one-child policy in place for a generation, China is facing an ever-growing need for trained professional service providers to address the needs of older adults, and institutional elder care is likely to become a more acceptable option for parent care.

POWER AND AMBIVALENCE IN INTERGENERATIONAL COMMUNICATION: DECIDING TO INSTITUTIONALIZE IN SHANGHAI

L. Chen¹, L. Levy-Storms², 1. *Fudan University, Shanghai, China*, 2. *University of California Los Angeles, Los Angeles, California*

Filial piety or China's tradition of taking care of one's aging parents continues to evolve as evidenced by a growth in nursing home residents in Shanghai. The reason for this increase in institutional care remains unclear and calls for an exploration on how these elders and their children decided to institutionalize. More specifically, understanding the communication dynamics between generations when they decide to institutionalize would provide insights into whether and how the decision is mutual. Using a phenomenological approach, this study draws on power relations to examine intergenerational communication dynamics during the decision-making process around institutionalization. Twelve matched dyads of elderly residents and their children participated in face-to-face, in-depth interviews in a government-sponsored nursing home in Shanghai (N = 24). Both generations reported how they proposed to institutionalize, initiated intergenerational communication, and finalized the decision, as well as how they reacted to the other generation's stance during the decision-making process. The findings reveal that more children made the decision for their elderly parents (decision-making power) than did their frail parents for themselves. Adult children's stronger power evoked their elderly parents' ambivalent feelings of filial piety. Older adults were simultaneously disappointed about and obliged to their children's decision to institutionalize. Furthermore, in the power trajectory, one difference may exist that the children's end matches up with tangible caregiving resources, whereas the elders' stay at the emotional end. The ongoing aging of Chinese baby boomers requires future research on longitudinal caregiving trajectories between generations. This study also illuminates the

needs for comparisons with caregiving expectations between generations to inform the development of long-term care infrastructure in urban China.

WORK MADE (IN)VISIBLE: MAPPING INTERSECTIONS OF INFORMATION WORK AND CARE WORK

N. Dalmer, *The University of Western Ontario, London, Ontario, Canada*

With government endorsement of aging in place, a growing reliance on family caregivers who provide unpaid care for aging family members prompts further investigation. Seeking, interpreting, creating, and sharing information (examples of information work) are one such facet of unpaid care. Information work saturates every facet of caregiving, providing tools for coping, problem solving, and dealing with uncertainty through knowledge, affirmation, and support.

Data from three separate institutional ethnographic studies trace the degree to which family caregivers' information work are made invisible or obscured in policy, scholarship, and by caregivers themselves. Findings from interviews with family caregivers of community-dwelling older adults living with dementia, analyses of aging in place policies, and a scoping review of caregiving literature collectively map out the social organization of informal caregivers' information work. In each study, an institutional ethnographic approach is implemented, examining usages of language and power, organizational interests, and indications of unstated assumptions to uncover how families' own discourses, policy documents, and academic thinking regulate understandings of caregivers' information work.

Findings from this study signify an innovative shift in the ways the complexities of searching for and using information on behalf of an aging family member are understood. Findings speak to the trend towards informatization of care, that is, how government and health care systems are using the provision of information to gradually marginalize care. Results of this study bring visibility to the concept of information work as a means to more responsively support the evolving information needs of family caregivers.

SESSION 4465 (POSTER)

DELIRIUM

EFFECTIVENESS OF NON-PHARMACOLOGICAL INTERVENTION IN PREVENTING ACUTE DELIRIUM IN OLDER INPATIENTS

S. Wong, D. Yeung, *Pamela Youde Nethersole Eastern Hospital, Hong Kong, Hong Kong*

Delirium is a complex neuropsychiatric syndrome characterized by acute onset of disturbance of consciousness, fluctuation of cognition and attention, and perceptual disturbance, and it is common in older hospitalized patients. It has adverse impacts on patients and healthcare outcomes: longer hospital stays, cognitive and functional decline and increased institutionalization rate. Up to one third of delirium in older patients could be prevented.

Patients in geriatric wards in a regional HKSAR hospital who were at risk of developing acute delirium were recruited.

They were randomized either into the intervention or the control group. The intervention was led by an Advance Practice Nurse (APN), and it comprised of education to family caregivers about delirium, reality orientation, correction of sensory deprivation, and the control group would receive usual care. The primary outcome was occurrence of delirium. The secondary outcomes were length of stay, fall, use of physical restraint and 28-day unplanned readmission rate after hospital discharge.

Fifty four patients were studied, 27 in the intervention group and 27 in the control group. The average age was 80.9. No patient in the intervention group developed acute delirium, while 3 patients (11%) developed delirium in the control group, but the difference was not statistically significant ($p=0.236$). There was no difference in the length of stay in both groups, and there was no incident of fall or use of physical restraint in both groups. The unplanned readmission rate was 22.2% in the intervention group and 37.0% in the control group ($p=0.186$).

EVALUATION OF A BRIEF PROGRAM FOR DELIRIUM ASSESSMENT AND INTERVENTION

D. D'Avolio¹, K. Barba², P. Fitzgerald², L. Carraci², A.J. Guarino³, *1. Florida Atlantic University, Boca Raton, Florida, 2. Massachusetts General Hospital, Boston, Massachusetts, 3. MGH Institute of Health Professions, Boston, Massachusetts*

Delirium is a serious health issue which is under recognized and misdiagnosed. It can lead to increased healthcare costs, morbidity, mortality, use of restraints and falls. The purpose of this study was to determine the feasibility of a brief educational intervention on nurses' delirium knowledge, assessment and intervention skills. We used a quasi-experimental, one-group pretest-posttest quasi-experimental design ($O_1 \times O_2$) design.

One hundred percent of the nurses reported a lack of delirium education in their core curriculum and lack of delirium knowledge. The educational intervention consisted of a delirium packet distributed prior to attending a one hour program. After the intervention, nurses participated in bedside teaching rounds and demonstrated delirium assessment and interventions on three patients.

Results-52 nurses screened 643 patients for delirium. During the initial screenings, 12% of patients were found positive for delirium. Patients diagnosed with delirium compared to non-diagnosed patients were statistically significantly older ($M_{\text{delirium}} = 79.41$, $SD_{\text{delirium}} = 11.02$ and $M_{\text{non-delirium}} = 64.16$, $SD_{\text{non-delirium}} = 16.28$). Logs were kept of evidence based non-pharmacological interventions. Interventions were grouped into categories; review of medications, diagnostic tests, orientation, sensory, nutrition, toileting, sleep, pain, mobility, social needs, safety, and consultation. Over 3,000 non-pharmacological interventions were implemented on patients found to be delirium positive and at risk.

The lack of delirium education in core nursing curriculum is an area that has not yet been addressed. Additionally, these results have implications for healthcare organizations to provide delirium education and practice guidelines to improve patient care.

A COST-EFFECTIVE SOLUTION IN MANAGING SEVERE BEHAVIOURAL AND PSYCHOLOGICAL SYMPTOMS OF DEMENTIA

T. Rees, H. Gillespie, V. Rae, J. Powell, *Mona Vale Hospital, Sydney, New South Wales, Australia*

The Northern Beaches area of Sydney, Australia has a population of 268,000 and has one of the highest ageing demographics in the state of NSW. Dementia and Delirium are common. Although the majority of patients experiencing symptomatic cognitive impairment are treated in the medical and surgical wards of Mona Vale Hospital, this environment is not suitable for patients with severe BPSD. This project defined severe BPSD as Brodarty tier five and six. The Agency of Clinical Innovation (ACI), program called CHOPs (Care of the Confused Hospitalised Older Person) recommends seven key principles of care. Principle seven is a supportive care environment. The Mona Vale COB is based on this principle providing a safe, continued close observation therapeutic area.

A Close Observation Bay was set up in 2016. COB occupies a four bed area in an acute medical ward, staffed within current nursing numbers. The COB has capacity for future expansion, patient isolation and family overnight stays. Mona Vale Hospital set up costs were approximately \$16,000 (AUD) including paint, sensor lights, new doors, new floors, orientation equipment, signage and general fittings.

The ACI Patient Experience Tracker (PET) evaluated antipsychotic use and non-pharmacological interventions including family, carer, and staff satisfaction. In addition the number of falls and Aggression Response Team calls (ART) were measured.

Patients with severe BPSD are increasingly treated in medical and surgical wards. This COB could provide a template for a low cost solution for smaller hospitals with limited access to specialist Geriatric care.

PREDICTIVE MODEL OF DELIRIUM IN INSTITUTIONALIZED PATIENTS

S. Baixauli-Alacreu², P. Pérez-Ros², F.M. Martínez-Arnau², F. García-Gollarte³, F.J. Tarazona-Santabalbina¹, 1. *Geriatric Medicine, Hospital Universitario de la Ribera (Alzira, València, Spain)*, Alzira, València, Spain, 2. *School of Nursing, Universidad Católica de València San Vicente Mártir, València, València, Spain*, 3. *Grupo Ballelos, València, Spain*

Introduction: Between 22 and 70% of residents in long term facilities experience Delirium.

Objectives: To establish a predictive model of delirium in an institutionalized elderly people.

Methods: A case-control study was designed with a 12 months follow-up period. The recruitment period was comprised between February and April 2015. The cases were subjects with at least one Delirium episode during the follow-up period, control were subjects without delirium in the same period. Dependent variable was delirium episodes detected with CAM scale. Independent and adjusting variables were sociodemographic, clinical and functional.

Results: 193 cases and 123 controls were identified. Delirium incidence was 60.5%. Presence of infections (excluding those affecting to urinary tract) was the variable most predictive (OR = 7.1, 95% CI 3.3 to 15.0; $p < 0.001$).

In addition were also Delirium predictors, previous dementia diagnosis (OR = 3.1, 95% CI 1.8 to 5.5; $p < 0.001$), anticholinergic activity prescription drug (OR = 3.0, 95% CI 1.3 to 6.6; $p = 0.007$), depression diagnosis (OR = 1.9, 95% CI 1.0 to 3.6; $p = 0.039$) and urinary incontinence (OR = 1.7, 95% CI 1.0 to 3.0; $p = 0.065$). The predictive model had a sensitivity of 61.5% and a specificity of 78.3% with a R^2 of Nagelkerke of 0.341. The area under the curve was 0.794 (95% CI: 0.745-0.844; $p < 0.001$).

Conclusion: Delirium can be predicted in elderly institutionalized patients. Identify institutionalized patients at high risk of developing delirium could allow implement measures to prevent delirium in nursing homes.

IMPROVING THE RECOGNITION OF DELIRIUM IN NURSING HOMES

C. Kosar, *Brown University, Providence, Rhode Island*

Delirium is often undetected by nursing staff and may go untreated. In Medicare- and Medicaid-certified nursing facilities the presence of delirium may be indicated by certain responses to the Minimum Data Set (MDS) component of the Resident Assessment Instrument called Care Area Triggers (CAT). CATs identify residents who have or are at risk for developing various clinical conditions that by law require further assessment or treatment in the care plan. Thus, if during the resident assessment the Care Area for delirium is triggered, this may be interpreted as recognized delirium. The revision to the MDS in October, 2010 included the Confusion Assessment Method (CAM) for detecting delirium. The CAM, while not a CAT, is considered a gold-standard instrument for delirium recognition. In our study we compare outcomes for residents with recognized delirium at admission (as indicated by the delirium Care Area being triggered) and patients with unrecognized and possibly unaddressed delirium (as indicated by the CAM algorithm, but no delirium CAT) to patients without delirium. In addition, we investigate whether the rate of recognized delirium is associated with facility quality. We find that residents with both recognized and unrecognized delirium had higher rates of 30-day hospital readmission and mortality, lower rates of discharge to home and lower rates of functional improvement. Lower quality nursing facilities were much less likely to recognize delirium than higher quality facilities. These findings suggest that including the CAM as a CAT in the MDS assessment may be essential for delirium care in nursing homes.

OUTCOME OF EARLY GERIATRIC INTERVENTION FOR SEVERELY AGITATED INPATIENT ELDERLY PATIENTS

A. Pajaro, A. Bourke, M. Callary, *Royal Adelaide Hospital, Adelaide, South Australia, Australia*

Aggressive and challenging behaviors in elderly patients are difficult to manage in the hospital. The benefit of early geriatric intervention in severely agitated patients in the hospital is not known.

The aim of this study was to determine the outcome of early geriatric intervention for severely agitated geriatric patients requiring code blacks (standard emergency code for violent patients/ behavioral situation) at a tertiary hospital.

A retrospective study of severely agitated geriatric patients was conducted using existing medical records and electronic database comparing a group who received early geriatric intervention with a group of patients who received standard of care.

Forty-six patients were analyzed, 24 patients received early geriatric intervention and 22 patients received standard care. There was reduced number (1.42 versus 2.54, $p = 0.002$) and types of antipsychotic medications used in the early geriatric intervention group compared with the control group. The use of behavior chart was higher in the early geriatric intervention group (100% versus 41%, $p < 0.01$). There were more patients who required 5 or more code blacks in the control group. There was no significant difference in length of hospital stay, total number of code blacks, institutionalization, mortality, use of restraints, and safety incidents.

Early geriatric intervention in severely agitated patients showed better outcome in reducing the use of antipsychotic medications and ensuring their appropriate use. Non-pharmacologic strategies were emphasized as the mainstay of treatment in managing patient's behavioral disturbance.

A RANDOMIZED, DOUBLE-BLIND, PLACEBO-CONTROLLED STUDY OF A CHOLINESTERASE INHIBITOR IN DELIRIUM

M. Verny^{1,4}, A. Breining^{2,5}, A. Meziere^{2,5}, C. Thomas^{3,5}, A. Grancher^{6,5}, A. Raynaud-Simon⁷, S. Greffard^{1,5}, L. Zerah^{1,5}, 1. Geriatric Center, Universite Pierre et Marie Curie and Hopital de la Salpetriere, Paris, France, 2. hopital Charles Foix, Ivry sur Seine, France, 3. hopital Saint Antoine, Paris, France, 4. (2) CNRS, DHU FAST and UMR 8256 B2A, F-75005, Paris, France, Paris, France, 5. APHP and DHU FAST, Paris, France, 6. hopital rothschild, Paris, France, 7. hopital Bichat and APHP, Paris, France

The aim of this study is to evaluate the efficacy of an anticholinesterase treatment (Rivastigmine transdermal patch) in patients aged 75 and over, hospitalized with delirium and to describe at one year the percentage of these patients who have a diagnosis of Alzheimer's disease and associated disorders. This study is multicenter, randomized, double-blind controlled study with two parallel arms: a transdermal patch rivastigmine group and a placebo group. The study includes a maximum treatment period of one month and a follow-up of 11 months. 23 patients were included (75 y and over) hospitalized with delirium not correlated to surgery, with CAM criteria and DRS R-98 > 10, not using cholinesterase inhibitor or memantine and having any contraindications to a cholinesterase inhibitor treatment. Evaluation of the delirium severity was conducted with DRS-R98 severity each day from day one to day 14. The lengths of hospital stay were not statistically different between the 2 groups: median stay duration of 10 days in the placebo group and 14.5 days in the Rivastigmine group (Log-Rank test: $p=0.2$). We did not show any difference between groups in the percentage of patients with delirium symptoms at day 14 or day 30 and the percentage of patients with a dementia diagnosis at one year. The main aim as secondary endpoints showed no statistically significant difference between the group treated with rivastigmine and placebo. The interpretation of this study is however difficult because of the number recruited well below the necessary theoretical calculated effective.

ASSOCIATION BETWEEN ED-INDUCED DELIRIUM AND COGNITIVE AND FUNCTIONAL DECLINE IN SENIORS

M. Giroux^{1,2,3}, M. Émond^{1,2,3}, M. Sirois^{1,2,3}, V. Boucher^{1,3,2}, R. Daoust^{4,5}, E. Gouin⁶, M. Pelletier⁷, S. Berthelot^{1,2}, 1. Readaptation, CHU de Québec, Québec, Quebec, Canada, 2. Université Laval, Québec, Quebec, Canada, 3. Centre d'excellence vieillissement de Québec, Québec, Quebec, Canada, 4. CIUSSS Nord-de-l'île-de-Montréal, Québec, Quebec, Canada, 5. Université de montréal, Québec, Quebec, Canada, 6. CIUSSS Mauricie-Centre-du-Québec, Québec, Quebec, Canada, 7. CISSS lanaudière, Québec, Quebec, Canada

Background: Delirium is a common medical complication among senior in the emergency department (ED). Delirium is associated with increased mortality & longer hospital stay. It is also associated with functional & cognitive decline in hospitalized seniors and institutionalization. No data is currently available for ED patients.

Aim: To evaluate the association between ED-induced delirium and functional & cognitive decline in seniors at 60 days.

Method: This study is part of the ongoing multicenter prospective cohort *MIDI-INDEED* study. Patients were recruited after 8 hours in the ED and followed up to 24h after admission. A follow-up phone assessment was conducted 60 days later. Delirium was measured by the validated CAM. Functional status was measured by the validated OARS. Cognitive status was measured using the validated TICS-M. Functional and cognitive decline were obtained by comparing the baseline and 60-days follow-up scores.

Results: 370 seniors were recruited. 280 had follow-up data available. ED-induced delirium was 8.4%. There was a difference in mean functional decline among seniors with and without: 2.95(1.23-4.67) vs 1.55(1.20-1.91), $p_{\text{wilcoxon}} = 0.05$. Proportion of seniors showing a decline ≥ 2 points on the OARS was significantly higher in those with delirium ($p=0.03$). Seniors with delirium also showed a significant decline in mean TICS scores: 3.31 (0,82-5.84) vs -0.01(-.071-0.75), $p_{\text{wilcoxon}} = 0.009$. There was no significant difference in the proportions of seniors showing a decline ≥ 3 OARS points ($p=0.06$).

Conclusion: ED-induced delirium seems to be associated with poor functional and cognitive outcomes in older patients 60 days after discharge from the hospital.

SESSION 4470 (POSTER)

DEMENTIA

LASTING IMPROVEMENT OF ASSOCIATIVE MEMORY IN OLDER ADULTS THROUGH TRANSCRANIAL MAGNETIC STIMULATION

W. Ren^{1,2}, Z. Zheng¹, J. Li¹, M. Wang³, 1. Institute of Psychology, Chinese Academy of Sciences, Beijing, China, 2. College of Education, Hebei Normal University, Shijiazhuang, Hebei, China, 3. Key Laboratory of Brain Aging and Cognitive Neuroscience, Shijiazhuang, Hebei, China

Associative memory is one of the cognitive domains most vulnerable to cognitive aging. Repetitive transcranial magnetic stimulation (rTMS) is one of the commonly used brain

stimulation method to enhance cognition. Multiple-session rTMS has been used as neurological assistant treatment for MCI and AD patients. However, whether rTMS could ameliorate memory decline in healthy older adults remains unknown. The dorsolateral prefrontal cortex (DLPFC) is critically involved in associative memory, and is accessible by the rTMS. Hence we wondered whether application of rTMS to the DLPFC improve associative memory in older adults. In addition, we were also concerned about the lasting effects of memory improvement after the rTMS.

Here we applied ten sessions of rTMS (10 Hz) to the right DLPFC of normal older adults in a double blind design with well-matched experimental and sham groups. The cognitive performances including executive function, working memory, and associative memory were assessed before and after the rTMS or sham stimulation. In addition, the follow-up assessment of the cognitive performances was examined one month after the last session of stimulation. Results showed that rTMS selectively improved associative memory performance. Importantly, the memory enhancement persisted one month after the brain stimulation. Our findings offer a promising neuroenhancement technique to counteract cognitive aging in the healthy aging people.

IMPLEMENTING FALLS AND DEMENTIA CASE IDENTIFICATION PROTOCOLS IN PRIMARY CARE

Z. Tan¹, R. Richter Lagha¹, L.R. Guerrero¹, N. Weintraub¹, W. Hamade², A. Woodard², D.B. Reuben¹, 1. *University of California, Los Angeles, Los Angeles, California*, 2. *Riverside University Health System, Moreno Valley, California*

Dementia and falls are common, costly and under-recognized conditions afflicting older adults who are seen in primary care settings. Effective, high-quality management of these conditions hinges on systems-based approaches to case identification and diagnosis. We report on the development and implementation of a protocol to identify and diagnose older persons with dementia or at high-risk for falls as part of a novel geriatric registered nurse (RN) care co-management program.

The UCLA Geriatrics Workforce Enhancement Program (GWEP) Cognition and Mobility Care Management (CMCM) Program was embedded in a busy primary care clinic in Riverside County, CA to systematically identify patients 70 years or older with unrecognized dementia and/or high risk for falls. Beginning March 2016, the CMCM RN Care Manager trained clinic staff on the administration and interpretation of two validated screening instruments for dementia (Mini-Cog) and falls (STEADI). Patients who screened positive were provided comprehensive falls and/or dementia care co-management between the CMCM RN Care Manager and the primary care provider. To date, 90 patients have been screened and 73 patients (81%, 73/90) have been referred to the program for dementia and/or high falls risk. Of the patients identified through this case identification protocol, 35 have thus far enrolled in the program (50%, 35/73). Implementation of the program has revealed systems-based challenges including staff and time constraints and primary provider reluctance to make a diagnosis of dementia. As enrollment grows, we will track CMCM program outcomes, including changes in patient (falls rate, behavioral symptoms), and caregiver (stress scores, engagement and support provided) measures.

TECHNOLOGY AND PHENOMENOLOGY IN DEMENTIA-FRIENDLY COMMUNITIES IN IRELAND AND THE UK

K. Morrissey, K. Brittain, *Northumbria University, Newcastle upon Tyne, United Kingdom*

The lived experience of people with dementia is rarely included in design for public spaces, and when it is, considerations tend to focus on 'making up' for the cognitive deficits identified as a primary part of the condition. Beyond this, the sensitive and cooperative design of digital technologies has been implicated as a way to connect with cultural and emotional aspects of ageing in place. We argue that exploring what it means for people with dementia to experience a sense of place is integral for designing public spaces in a way that is emotionally and sensually meaningful for this population. Drawing from phenomenological work by Malpas (1999), Merleau-Ponty (1945), Bachelard (1958), and McCarthy & Wright (2004; 2010; 2015), we articulate a picture of belonging-in-place for people with dementia that is described through a series of design-focused case studies from the south of Ireland and the North East of England. These qualitative case studies use ethnographic and interview methods to document the experiences of people with dementia and their carers as they engaged in the co-creation of technological responses to larger challenges surrounding the founding and maintenance of dementia-friendly communities and places. Using thematic analysis, this study contributes a sensory account of living with dementia in a way which is future-focused, socially-responsible, and appraising of technological interventions which aim to engage with larger goals surrounding living in the community with dementia.

TRANSCENDING TRAGEDY: MAINTAINING ENGAGEMENT AND RETAINING SELFHOOD OF PEOPLE LIVING WITH DEMENTIA

P.S. Reed, J. Carson, *University of Nevada, Reno, Reno, Nevada*

A central goal in supporting people living with dementia is maintaining selfhood, relationships, and well-being to preserve their innate human rights, which requires transcending the common focus on disease and disability. Prioritizing the person, rather than the disease, requires a shift away from the ubiquitous tragedy discourse. This presentation will describe research listening to people living with dementia and engaging them as partners. It will review perspectives on dementia gathered from among hundreds of people living with dementia in a series of listening sessions. Then, recognizing that people living with dementia are the true 'experts' and are capable of participating actively in supportive relationships, it will describe a research-based approach that uses *authentic partnerships* to include people living with dementia as equal partners in care and support. The presentation will conclude with eight catalyzing principles for transcending the tragedy discourse of Alzheimer's.

MAKING A COMMUNITY MORE DEMENTIA-FRIENDLY THROUGH PARTICIPATION IN AN INTERGENERATIONAL CHOIR

P.B. Harris, *Sociology, John Carroll University, Cleveland, Ohio*

A dementia friendly community is one that is informed about dementia, respectful of people with dementia and their families, provides support, and fosters quality of life.

A societal challenge people with dementia and their families face is misunderstandings about dementia and the person's capabilities, resulting in both the person and family members experiencing stigma, which affects their quality of life. This qualitative study reports findings from an intergenerational choir of 3 cohorts of college students (N= 44) and 3 cohorts of people with dementia and their family members (N=33) formed to lessen dementia stigma in college students and thus help to develop a more dementia friendly community. Data were gathered for each cohort of students through semi-structured open-ended questions on attitudes about dementia and experiences in the choir, collected at three points over 9 weeks of rehearsals. Data about experiencing dementia stigma were collected from the people with dementia and their family members through 3 focus groups. Results across all three student cohorts showed: a decrease in negative attitudes about dementia, increased understanding about the remaining strengths of people with dementia, and a better awareness of the need to educate the community about dementia. People with dementia and their family members expressed less feelings of social isolation. This resulted in the development of a meaningful bond between the students and the people with dementia and their family members, which continued beyond the choir rehearsals.

SUPPORTING LATER LIFE LEGAL PLANNING OF PEOPLE WITH DEMENTIA

H. Nikumaa¹, E. Koponen², 1. *University of Helsinki, Helsinki, Finland*, 2. *Memory Disorders Expertise in Finland, Helsinki, Finland*

The primary aim of the study is to scrutinize how people with dementia use legal planning and how their legal capacity is supported.

The data was gathered in a project of Society for Memory Disorders Expertise in Finland where 94 professionals were interviewed in 24 group interviews. The participants were from different social and health care units, legal aid offices, banks, local register offices and the third sector. The material was analyzed using deductive content analysis.

The participants reported that most of the people recently diagnosed with memory illness do not consider later life planning relevant at the moment and different options are unfamiliar. People have very rarely made advanced directives, powers of attorney or continuing powers of attorney. This usually leads to a situation where their legal capacity has already weakened to the point where planning is no longer possible. Afterwards, many wished their client had made the plans when they still could. Social and health care professionals' role in supporting the legal planning is crucial: giving basic guidance and encouragement.

In conclusion, successful planning requires that the person is informed about different options and gets enough support. People with memory illness are not well-informed of the available measures supporting their autonomy when they still have enough legal capacity to plan for their future. Legal means are reported complicated and the terminology complex. Incorrect beliefs towards continuing power of attorney are common.

ENGAGEMENT OF PERSONS WITH DEMENTIA ON DECISION MAKING BODIES

S. Opachan, M.J. Splaine, *Splaine Consulting, Columbia, Maryland*

The purpose of this study is to review the engagement of persons living with dementia in policy and decision making bodies. The first section is a review of the involvement of persons with dementia in the development of national and sub-national dementia plans. The second section is a review of qualitative information gathered from five experts working in the field of dementia concerning how professionals in the field are approaching what persons with dementia want in their lives, and how they hope and expect their lives will change with a disease modifying treatment. This study demonstrates that there are difficulties reaching out to and engaging the average person living with dementia. Qualitative information suggests that there is a lack of empirical studies on what persons with dementia want in their lives, and what they hope and expect from a disease modifying treatment. There also appears to be a grey area where professionals are trying to discern how to involve persons with dementia, but there are discrepancies in how people think this should be done. For instance, some may feel participation is enough, whereas others may stress the importance of involvement by way of decision-making opportunities. This is evident in the national and sub-national dementia plans as well, as it appears that some plans had persons living with dementia participate but not necessarily make decisions about the development of the plan. The engagement of persons living with dementia in decision making bodies represents a gap in the field that needs attention.

SUNDANCE—EVALUATION OF AN INNOVATIVE PROGRAM FOR INDIVIDUALS WITH LATE-STAGE DEMENTIA

I. Wernher, S. Elliott, M.B. Neal, *Portland State University, Portland, Oregon*

Behavioral expressions associated with dementia are among the main reasons why individuals with late-stage dementia are excluded from regular adult day-care programs, as both the setup and client-staff ratio of most programs do not allow for the person-centered interaction necessary to adequately support these individuals. Behaviors experienced as challenging by both professional and family caregivers, such as aggression, irritability, and agitation, are among the leading causes of institutionalization. The "Sundance" program, developed by the Volunteers of America Oregon, is an innovative, person-centered approach designed specifically for community-dwelling individuals with late-stage dementia. Through individualized music therapy, horticulture therapy, and other therapeutic elements focusing on multisensory integration, Sundance aims to mitigate participants' behavioral expressions and to reduce family caregivers' perceived stress. During the nine-month-long pilot phase, quantitative and qualitative data were collected from participants, staff, and family caregivers to evaluate the implementation and effectiveness of the program. Survey results indicated that, over time, Sundance positively influenced the severity of several behaviors observed among the participants. There was also a trend toward a reduction in the family

caregivers' perceived overall stress. Due to the small sample size, however, only one behavioral change (decreased apathy) reached statistical significance. In addition to the quantitative findings, focus group data revealed a variety of benefits of the program as perceived by staff and family caregivers. Respondents strongly emphasized the positive impact of Sundance on both the participants (e.g., social inclusion, stimulation, communication) and their families (e.g., respite, peace of mind, relief).

EFFECTS OF DEMENTIA SYMPTOMS ON MEDICARE EXPENDITURES AND HEALTHCARE UTILIZATION

E. Jutkowitz, R.L. Kane, B. Dowd, J.E. Gaugler, R.F. MacLehose, K.M. Kuntz, *University of Minnesota, Minneapolis, Minnesota*

We used cross-sectional data from the Aging, Demographics, and Memory Study linked to CMS Medicare data to examine the effect of three clinical features of dementia - cognition, function, and behavior - on Medicare expenditures and healthcare utilization (skilled nursing facility covered days, number of inpatient admission claims, and physician office visit claims). Cognition was evaluated using the Mini-Mental State Examination (0 - 30). Function was evaluated as the number of functional limitations (0 - 10). Behavior was evaluated as the number of behavioral symptoms (0 -12). Medicare expenditures were estimated with a generalized linear model (log-link and gamma distribution). Measures of healthcare utilization were estimated with a negative binomial regression. All models controlled for age, gender, race, education, marital status, and number of comorbidities. Following estimation, we calculated average marginal effects of clinical features on the outcomes of interest. On average, a one-unit increase in the measure of function (i.e., worse function) was associated with \$160 (95% CI: \$11 - \$309) additional Medicare expenditures per month. Cognition and behavior were not significantly associated with expenditures or healthcare utilization. A one-unit increase in the measure of function was associated with 0.17 (95% CI: 0.03 - 0.31) more skilled nursing days per month. Function is an important predictor of expenditures/utilization and should be targeted by interventions.

COST AND UTILIZATION OF DEMENTIA CARE ECOSYSTEM AND GENERAL MEDICARE DEMENTIA PATIENTS

L. Wilson², Y. Chen², T. Lin², S. Laohavanich¹, K. Possin¹, W. Chiong¹, S. Bonasera³, B. Miller¹, 1. *Memory and Aging Center, University of California, San Francisco, San Francisco, California*, 2. *Department of Clinical Pharmacy, University of California, San Francisco, San Francisco, California*, 3. *Department of internal medicine, University of Nebraska, Medical Center, Omaha, Nebraska*

The Dementia Care Ecosystem (DCE) is a CMS funded program in three states (CA, NE, and IA) to provide supportive dementia care and reduce Medicare costs. Medicare savings will depend on careful comparisons of the DCE sample and larger dementia population. We compare Medicare costs one year before participating in DCE with general Medicare dementia population.

We use 100% 2014 Medicare claims data in 3 states. Patients enrolled in DCE or control group in 2015 were

identified by Medicare number in 2014 claims. We compared cost among general Medicare dementia and DCE study dementia groups prior to 2015 enrollment using Chi-square, T-test and multivariable Poisson regression adjusted costs.

Of 3,266,867 Medicare beneficiaries, 7% had dementia. DCE enrollees were significantly younger ($p < 0.0001$), white ($p = 0.0004$), and had twice as many diagnosed with Alzheimer's (62.1% vs 32.4%). The dementia DCE patients 2014 costs were 1/3 less than general Medicare dementia patients (\$8,294 vs \$24,977; $p < 0.0001$). Except for outpatient, DCE participants consumed significantly fewer annual resources; inpatient (\$2,772 vs \$9,430; $p < 0.0001$), non-institutional providers (\$2,906 vs \$4,401; $p < 0.0001$), home health (\$888 vs \$2,116; $p < 0.0001$), hospice (\$209 vs \$2,767; $p < 0.0001$), skilled nursing (\$720 vs \$5,451; $p < 0.0001$), and durable medical equipment (\$147 vs \$263; $p = 0.0037$). General dementia patients in metropolitan areas had higher costs than rural areas (\$26,285; \$16,656; \$14,493; \$15,100) for metropolitan, large, small, isolated rural compared with the DCE dementia group (\$8,788; \$5,251; \$759; \$2,214) with California costs highest.

Medicare patients enrolled in DCE were already more cost-efficient than general Medicare dementia beneficiaries. These differences reflect early recruitment efforts at tertiary metropolitan medical centers and make it more difficult to demonstrate savings.

DOES SOCIAL SUPPORT PROTECT AGAINST COGNITIVE DECLINE AMONG THE OLD?:

A 10-YEAR FOLLOW-UP STUDY

C. Murata¹, T. Saito-Kokusho¹, T. Suzuki^{3,1}, K. Kondo^{2,1}, 1. *Social Science, National Center for Geriatrics and Gerontology, Obu, Aichi, Japan*, 2. *Chiba University, Chiba, Japan*, 3. *Obirin University, Tokyo, Japan*

Dementia-related wandering is a global issue. People missing in community often end up in tragedies like serious injury or death due to accidents. As such, preventing dementia is of common interest among societies. Studies demonstrated that larger social ties protect against cognitive decline. However, it is unclear whether quality or quantity of such ties is important. Purpose of this study is to assess such associations.

The data is from the AGES (Aichi Gerontological Evaluation Study) Project, covering 15313 persons aged 65 years and over (51.8% women). Respondents were followed for 10 years and dementia onset was ascertained under Long-term Care Insurance System in Japan. Cox proportional hazard models were employed to assess the association between baseline social support and dementia after adjusting for age, health status, education, and marital status. Quantity of support was measured by adding respondents' support network (family, friends, and neighbors) numbers, while quality is assessed by nature of support (emotional, instrumental, and appraisal). During the follow-up, 14.6% of men and 18.7% of women developed dementia. Common factors associated with dementia across gender were advanced age, fewer social ties, not being married, lower education, and poor health status. Availability of appraisal support (having someone who value or respect you) was associated with lower incidence of dementia among men with hazard ratio of 0.74 ($p < 0.10$), but not among women. Our results indicated that among men, quality of social ties is stronger protector

against dementia, while among women quantity (larger social ties) seems more important.

MORE THAN WORDS: AN ICF-BASED COMMUNICATION TRAINING PROGRAM FOR CAREGIVERS OF PEOPLE WITH DEMENTIA

S. Brose, S. Zank, *University of Cologne, Faculty of Human Science, Rehabilitative Gerontology, Cologne, NRW, Germany*

Living with a person suffering from dementia implies different challenges for family caregivers. One of the most stressful is the ongoing inability to communicate. Because of the decline in their cognitive functioning people with dementia are unable to understand their communication partner or express themselves adequately. The patients' decline of communicative skills cannot be stopped and is one major reason for the development of subjective caregiver burden. Therefore, it is important to train family caregivers of people with dementia to maintain communication as long as possible in order to reduce subjective caregiver burden.

An individualised training course has been developed comprising 16 ICF-oriented modules. Its effects are evaluated in a pilot study by using a control group design. Selected scales from the BICS-D (Berlin Inventory for Caregiver Stress – Dementia) have been used to measure caregiver burden at baseline, after the training and in a follow-up after three months. Additionally, each participant of the training group has participated in a telephone interview. A self-administered questionnaire has also been used to evaluate participants' satisfaction with the training.

The results of the qualitative content analysis show that communication can be enhanced at least in certain areas (for example: asking wh- questions or giving the partner with dementia more time to formulate answers). In the quantitative analysis modified social coping strategies mark positive changes in caregiver behaviour.

An individualised approach helps caregivers to modify their communicative behaviour and to gain a deeper understanding of the dementia-related difficulties experienced by their relatives suffering from the condition.

SUPPORTING COGNITIVE HEALTH IN RURAL COMMUNITIES: STIGMA AND IMPLICATIONS

J. Bacsu¹, M. Viger¹, S. Abonyi¹, B. Jeffery², S. Johnson², N. Novik², 1. *University of Saskatchewan, Saskatoon, Saskatchewan, Canada*, 2. *University of Regina, Prince Albert, Saskatchewan, Canada*

Literature suggests that there is significant stigma attached to poor cognitive health and memory loss in older adults. However, there is a paucity of research on influences and consequences of stigma in a rural context. This presentation will address two objectives: 1) to examine the influences of stigma surrounding poor cognitive health in rural communities; and 2) to identify the implications as well as opportunities for interventions to challenge stigma in a rural context.

Using a community-based research approach, data was collected through two waves of semi-structured interviews with 42 older adults in rural Saskatchewan, Canada. Guided by lay theory and cultural schema theory, data was compiled and coded using thematic analysis.

Influences on stigma surrounding poor cognitive health included: lack of awareness and information, ageism, conflicting messages in the media, limited information and training among health professionals and long term care workers, and inadequate access to health and support services. Key implications of stigma included: denial, spousal hiding, delayed or no dementia diagnosis, social exclusion, and limited opportunities for dialogue to discuss issues of cognitive health within the community. Through increased awareness, education, and research, on cognitive health, rural older adults, policy makers, and health practitioners can play important roles in reducing stigma in rural communities.

LIFE EXPECTANCY, TOTAL COST, AND NET COST OF DEMENTIA: RESULTS FROM A DEMENTIA MICROSIMULATION MODEL

E. Jutkowitz, R.L. Kane, J.E. Gaugler, R.F. MacLehose, B. Dowd, K.M. Kuntz, *University of Minnesota, Minneapolis, Minnesota*

We developed a comprehensive US dementia microsimulation model to estimate life expectancy, total cost, and the net cost of dementia. The model simulated an incident dementia patients' disease progression using cognition, function, and behavior (clinical features). The trajectories of the clinical features were derived from regression analyses using data from the National Alzheimer's Coordinating Center. The clinical features were used to predict transitions between place of residence (community or long-term care facility), insurance status (Medicare or Medicare-Medicaid), and resource utilization (informal caregiving, out-of-pocket expenditures, Medicaid long-term care facility expenditures, and Medicare expenditures). At any time, a person with dementia could die of dementia-related or other causes. Individual incident cases were simulated to estimate mean life expectancy and the total value of care. To determine the net cost of dementia, we compared expenditures for a simulated person with dementia against a simulated person who did not exhibit cognitive deficits, functional limitations, or behavioral symptoms. A sub-analysis evaluated outcomes by age of dementia onset (75 and 90). Costs were discounted by 3%. Mean life expectancy was 70 months (mean age of dementia onset was 83 years). Discounted total value of care was \$378,682. Individuals who experienced the clinical features of dementia incurred \$282,436 (\$48,420 annually) more care than those who did not. Total and net cost decreased with older age of dementia onset. A 90-year-old incident case had a life expectancy of 48 months and received \$248,968 worth of care (\$196,280 net). There is value in delaying the time to dementia onset.

DO WE NEED A GLOBAL DEMENTIA-FRIENDLY SYMBOL?

L. Booi¹, C. Walton³, K. Newman⁴, W. Hu², 1. *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*, 2. *Emory University, Atlanta, Georgia*, 3. *Alzheimer's Society of the UK, London, United Kingdom*, 4. *Ryerson University, Toronto, Ontario, Canada*

Dementia Friendly initiatives are emerging around the world and many of them use a symbol or a brand to promote their activities. Some dementia advocates have highlighted the need for a Dementia Friendly symbol that has global recognition. The World Young Leader in Dementia (WYLD)

have completed a scoping review of Dementia Friendly symbols currently in use around the world and collected attitudes towards the concept of developing a global Dementia Friendly symbol.

Survey responses were received from 21 representatives of 16 countries, 15 of which have at least one Dementia Friendly initiative in place. A wide range of symbols are already in use. The concept of “not forgetting” can be found in symbols using the forget-me-know flower, the elephant and a knot. Three main colour groups are represented: orange (mostly in Asian nations), purple, (mostly in North America) and the blue/yellow combination (forget-me-not).

No survey responders rejected the idea of a global Dementia Friendly symbol. Fewer people favoured a global symbol (29%) than a global theme or element (67%), i.e. a colour, logo or design that can be incorporated into existing symbols or adapted for different regions. A second consultation in April 2016 gave an opposite view, with 65% of responders favouring a global symbol and 28% favouring a global element or theme. A key reason for this difference could be a separation of views between nations that already have a well-established symbol and those that do not. Further results from WYLD’s scoping review will be presented.

THE PRINCIPLES OF MEDICAL DECISION-MAKING FOR ELDERS LACKING MENTAL CAPACITY: A DELPHI SURVEY

P. Chen^{1,2}, H. Yang³, I. Hou⁴, W. Hsieh¹, M. Wang⁵, 1. *Department of Geriatrics & Gerontology and Palliative Care Center, Chi-Mei Medical Center, Tainan City, Taiwan*, 2. *Program of Senior Service, Southern Taiwan University of Science and Technology, Tainan City, Taiwan*, 3. *Institute of Public Health, National Yang-Ming University, Taipei City, Taiwan*, 4. *Department of Law, National Cheng-Kung University, Tainan City, Taiwan*, 5. *Department of Medical Research, Chi-Mei Medical Center, Tainan City, Taiwan*

BACKGROUND: In Taiwan, Hospice Palliative Care Act 2000 and Patient Self Determination Act 2016 have endorsed the advance directives (AD) and lasting power of attorney (LPA) in health care. For the elderly patients lacking of mental capacity but not having AD or LPA, especially for patients with dementia, the principles of medical decision-making is deficient in the clinical, ethical, legal and social context in Taiwan.

METHODS: We aim to develop a conceptual framework for evaluating mental capacity and promoting proper decision-making. A 2-round Delphi survey was conducted via the E-mail with 74 national experts in medicine, law and ethics. Experts reviewed a list of proposed statements, based on the domains of medical evaluation and management (EM), patients’ preferences and substitute judgement (PS), social and cultural context (SC), mechanism of dispute resolution (DR), and rated each proposition from 1 to 5 (disagree to agree) with modifying statements or adding propositions. Consensus was achieved when the rating was 4 points or more.

RESULTS: In first round, of the 72 originally-proposed practice principles, the experts modified 24, added 3, and achieved consensus on 37. In second round, a total of 39 propositions were presented, of which experts achieved consensus on 31 statements categorized across 3 domains: 13 in

EM, 8 in PS, 10 in SC. No consensus was achieved in domain of DR.

CONCLUSION: The interdisciplinary consensus on practice of decision-making for the incompetent elders was established. Our findings will provide a strong evidence of developing guidance to clinicians, lawyers, researchers and policymakers.

FACTORS ASSOCIATED WITH OLDER ADULTS’ USE OF ALZHEIMER’S DISEASE SCREENING

Y. Choi, *University of Washington School of Social Work, Seattle, Washington*

Alzheimer’s Disease management becomes a public health priority. In the US, there are about 5.3 million people with AD and \$226 billion spent on caring them. Since there is no perfect cure for AD, early detection of AD is highly recommended for enabling further treatments to delay cognitive impairment and psychiatric symptoms.

Recognizing benefits from early AD detection, policy efforts have been made to promote use of AD screening, such as providing cost-free cognitive status test. For successful policy implementation, it is necessary to understand what socioeconomic factors might affect older adults’ use of AD screening. Yet, only little is known about what factors associated with likelihood of having AD screening.

Using Health and Retirement Study of 2012 dataset, current study explores individual level factors might affect older adults’ willingness of future use of AD screening. There are several key findings from multivariate logistic regression analyses. First, older adults who have health insurance showed higher likelihood of having AD screening. Second, higher level of self-perceived risk of AD was positively related with use of AD screening. Third, aging is negatively associated with likelihood of having AD screening that indicates the older people aged, the less people likely to get AD screening.

The findings indicate that older adults’ likelihood of AD screening service is associated with combination of aging itself, personal attitude toward AD, and enabling factor to access to health services. Policy efforts needed to consider those factors, especially within AD awareness campaigns, for successful implementation of AD management policy.

NATIONAL DEMENTIA PLANS: EARLY DETECTION AND DIAGNOSIS

S. Opachan, M.J. Splaine, *Splaine Consulting, Columbia, Maryland*

In 2012, Alzheimer’s Disease International (ADI) released the report, “National Alzheimer and Dementia Plans Planned Policies and Activities: Early Detection, Access to Diagnosis, and Stigma Reduction.” The purpose of this study was to compare and contrast policy directions and commitments concerning diagnosis, detection, and stigma reduction. Since this 2012 report, some of the countries have updated their national plans and several countries have created new plans. The purpose of this study is to compare and contrast and provide an analysis of the updated and new national plans about policy commitments with diagnosis and detection. Each country describes and commits to early detection and diagnosis in diverse ways. After reviewing national plans, the countries displayed a series of commitments and actions to

improve early detection and diagnosis in the following topic areas: awareness and education of society; awareness, education, and training of professionals; role of general practitioners; primary healthcare; hospital and acute care settings; specialist assessments and services; chain of care/network; care homes, care at home, and adult day care services; support of multi-disciplinary teams; tools to support the diagnostic process; and research/data. Common themes and action areas are discussed in order to better understand how nations are addressing the issue of improving early detection and diagnosis.

HUA MEI DEMENTIA CARE SYSTEM: A HOME-BASED, PHYSICIAN-ENHANCED DEMENTIA CARE MANAGEMENT SERVICE

W. Ng, C. Lim, Y. Wong, *Tsao Foundation, Singapore, Singapore*

Dementia care has traditionally been provided by specialist clinics and centre-based services. These services sometimes do not fully address the seniors' needs for emotional wellbeing, personal care, emergency support, home safety and caregiver support. To respond to this challenge, Hua Mei Dementia Care System, a home-based care management service was designed by a Singapore-based NGO, Tsao Foundation, to provide person-centred support for persons with dementia (PwD). The HMDCS team comprises a physician, a social care manager, a nurse clinician, an assistant social worker and two therapy assistants. **Methods and Results:** In the first two years of implementation, HMDCS enrolled a total of 84 clients. 75% of the clients were of FAST (Functional Assessment STaging of Alzheimer disease) Stage 4 and 5 upon enrolment. Majority of them were of acute need for care based on InterRAI MAPLe 5 Score. Out of a total of 84 patients, a preliminary evaluation was conducted on 30 patients who had participated in HMDCS for a minimum of three months and were assessed at least twice. 90% of these 30 patients showed an average improvement of 60.8% in challenging behaviours as measured by RMBPC (Revised Memory and Behavioural Problem Checklist). Meanwhile, 60.7% of 28 PwD had an average improvement of 38% in caregiver stress as measured by ZBI (Zarit Burden Interview). **Conclusion:** Insight gained from HMDCS suggests that dementia care requires an appropriately trained-interdisciplinary team that addresses PwD's, as well as their caregivers', biopsychosocial needs in a coordinated approach.

DECISION-MAKING SUPPORT TO ELDERLY PEOPLE WITH DEMENTIA IN DAILY LIVES BY CERTIFIED NURSES

K. Yamaji, T. Nagahata, *Osaka Prefecture University, Habikino-shi, Osaka, Japan*

Decision-making support to elderly with dementia in crucial moments is becoming systemized. However, we feel that such support in their daily lives is also important. This study focuses on daily lives of elderly with dementia at elderly care facilities, and defines their decision-making support.

We conducted a semi-structured interview survey with nine Certified Nurses working in elderly care facilities and analyzed it qualitatively. This study was conducted with permission of the research ethics committee of our university.

The decision-making process support to elderly with dementia in the daily lives were 6 categories and 19 subcategories. The nurses <created an environment that is easier for one to express an intention>for elderly who cannot express themselves. They also<collected information preparing for a decrease of cognitive function>, predicting future conditions of elderly with progressive disease or showing ageing phenomena. The nurses prioritized conversation with the elderly, and<supported them to form their intention by communicating in a suited way for each person>. When an elderly made an irrational decision, the nurses changed ways to communicate, or tried to understand the intention to <guide the elderly to a best interest>.

Decision-making support in the daily lives of elderly with dementia is crucial for avoiding uniform care in a facility where these elderly spend long period in groups, and to have them continue to live in dignity, even when symptoms worsen.

SESSION 4475 (POSTER)

EPIDEMIOLOGY II

IL-10 TO CRP RATIO IS ASSOCIATED WITH BETTER PHYSICAL FUNCTIONING DURING MIDLIFE

C.A. Karvonen-Gutierrez¹, S. Harlow¹, Q. Peng¹, P. Mancuso², D. McConnell¹, *1. Department of Epidemiology, School of Public Health, University of Michigan, Ann Arbor, Michigan, 2. Department of Nutrition, School of Public Health, University of Michigan, Ann Arbor, Michigan*

The relative balance of pro- and anti-inflammatory markers has been postulated to be an important determinant of healthy aging, but few studies have investigated this relationship with respect to physical functioning, a hallmark of healthy aging. Using data from 197 middle-aged women from the Michigan site of the Study of Women's Health Across the Nation with 12 years of follow-up, we tested the longitudinal associations between performance-based physical functioning (grip strength, quadriceps strength, 40-foot walk, stair climb, chair rise, 2-pound lift, and forward reach) and the levels and rates of change in interleukin-10 (IL-10), an anti-inflammatory biomarker, C-reactive protein (CRP), a pro-inflammatory biomarker, and the IL-10 to CRP ratio (IL-10/CRP). The median baseline age was 51 years (inter-quartile range 48–53 years). After adjusting for age, sociodemographic factors, menopausal status, exogenous hormone use, body mass index and comorbidities, higher IL-10/CRP ratio at baseline was associated with significantly higher weight-normalized grip strength, weight-normalized quadriceps strength, faster timed walk, stair climb, chair rise, and 2-pound lift times, and greater forward reach distance ($P < 0.001$) throughout follow-up. A faster increase in the IL-10/CRP ratio was also significantly associated with higher quadriceps strength and faster 2-pound lift times. Neither baseline IL-10 nor its rate of change was associated with objective physical functioning measures when considered. These results support the importance of a balance between anti- and pro-inflammatory biomarkers for better physical functioning in midlife.

SCREENING FOR VULNERABLE ELDERLY: IS THE PROBABILITY OF REPEATED ADMISSION A USEFUL TOOL?

M. Perez¹, R.A. Lourenço^{1,2}, V.G. Moreira¹, 1. *Medical Science, Rio de Janeiro State University, Rio de Janeiro, Brazil*, 2. *Pontifícia Universidade Católica - Rio de Janeiro, Rio de Janeiro, Brazil*

The “Probability of repeated admission” (*Pra*) is a validated tool used worldwide to screen vulnerable elderly for adverse outcomes. Despite its extensive use, there is little evidence for its utility as a risk-prediction instrument. The aim of this study was to analyse the performance of *Pra* in predicting healthcare utilization and dependence in daily living. This was a longitudinal prospective study and the sample was composed by individuals 65 years old and older from Rio de Janeiro city, Brazil, who participated in the three waves of the Frailty in Brazilian Older People study. At the baseline, carried out in 2009/2010, 764 elderly were assessed. Three years later, data of healthcare utilization and functional capacity were collected. In order to evaluate the *Pra* predictive performance, ROC curves were plotted against the healthcare outcomes and dependence in daily living. The accuracies were 0.62 (95%IC 0.57–0.68), 0.53 (95%IC 0.53–0.64) and 0.66 (95%IC 0.59–0.74) for hospital admission, emergency room visit, and dependence in daily living, respectively; sensitivity and specificity were 8,8 and 94,5%, 8,3 and 94,8%, 19,2 and 95,5%, respectively. These results suggest that the *Pra* is not reliable for excluding vulnerability in those individuals stratified as low risk. Also, in order to improve tool performance, future research should test another item composition.

RISING TREND IN THE INCIDENCE OF HIP FRACTURES IN LITHUANIA FROM 2006 TO 2010

M. Tamulaitiene, V. Alekna, A. Mastaviciute, R. Martinaityte, *Faculty of Medicine of Vilnius University, Vilnius, Lithuania*

Objective. The present study aimed to assess the incidence and trend of hip fractures in Lithuania among individuals over 40 years for 2006 – 2010.

Material and Methods. This population-based study was based on the data from all orthopaedic-traumatology inpatient departments in Lithuania. Subjects over 40 years with primary hip fracture (ICD-10 codes S72.0, S72.1 and S72.2) were included. Exclusion criteria were re-admissions for the same fracture, non-residents of Lithuania, and individuals without identified place of residence. The incidence was calculated using the population data from Statistics Lithuania. Multivariate regression analysis was performed to evaluate the impact of gender, age, fracture circumstances and localization, type of treatment, urban and rural regions.

Results. It was found that the incidence per 100,000 persons was 118 in the year 2006 and 151.1 in the year 2010, and increased by 28%. Women suffered from hip fracture 2.4 times more often and at the elder stage of life than men. The incidence in urban and rural residents was respectively 112.9/100,000 and 129.2/100,000 in 2006, and the same in the year 2010 – 151/100,000. Over the period of 2006–2010 the higher incidence of hip fractures was in rural residents aged 50–74 years. After the age 75, the fracture incidence was higher in urban than in rural residents: 538.5

and 430.4 /100,000 in 2006 and 685 and 555 /100,000 in 2010; $p < 0.001$).

Conclusion: In Lithuania, hip fracture incidence increased by 28% between the years 2006 and 2010, among individuals aged over 40.

LOW GRIP STRENGTH PREDICTS INCIDENT DIABETES: THE MICHIGAN STUDY OF WOMEN'S HEALTH ACROSS THE NATION

C.A. Karvonen-Gutierrez¹, Q. Peng¹, M. Peterson², K. Duchowny¹, B. Nan³, S. Harlow¹, 1. *Department of Epidemiology, School of Public Health, University of Michigan, Ann Arbor, Michigan*, 2. *Department of Physical Medicine and Rehabilitation, Medical School, University of Michigan, Ann Arbor, Michigan*, 3. *Department of Biostatistics, School of Public Health, University of Michigan, Ann Arbor, Michigan*

Low muscle strength is an important risk factor for early, cardiovascular, and all-cause mortality among older adults but little is known about the association of muscle strength and cardiometabolic disease during mid-life. In the Michigan Study of Women's Health Across the Nation, a longitudinal study of the menopause and its health consequences, grip strength was measured annually from 1996–2012 using a handheld dynamometer. Diabetes incidence was assessed near-annually as self-reported doctor's diagnosis of diabetes, use of anti-diabetic medications, or measured fasting glucose ≥ 126 mg/dL. The 16-year diabetes incidence was 37%. Among the 424 women grip strength assessment at baseline, a 10% increase in body weight-normalized grip strength was associated with 18% decreased risk of incident diabetes ($p=0.006$) after adjustment for age, race, socioeconomic status, smoking, menopause status, hormone use, physical activity, and waist-hip ratio. In race/ethnic stratified models, a 10% increase in body weight-normalized grip strength was associated with 54% decreased risk of incident diabetes ($p < 0.0001$) among White women in fully adjusted models (described above). Among Black women, the association of weight-normalized grip strength was not statistically significant in fully adjusted models. In models without adjustment for waist-to-hip ratio, a 10% increase in body weight-normalized grip strength was associated with 16% decreased risk of incident diabetes among Black women ($p=0.03$). The rate of change in grip strength was not associated with diabetes incidence. Improving muscle strength during mid-life women, particularly white women, may be an efficacious strategy to prevent future diabetes.

NONRANDOMIZED STUDIES: THE HAZARDOUS PRACTICE OF TESTING FOR BASELINE IMBALANCES

N. Sourial^{1,2}, I. Vedel^{1,2}, M. LeBerge², T. Schuster¹, 1. *Department of Family Medicine, McGill University, Montreal, Quebec, Canada*, 2. *Lady Davis Institute, Jewish General Hospital, Montreal, Quebec, Canada*

Nonrandomized studies are increasingly used to evaluate interventions where randomization is not feasible or desired such as with policy reforms or practice change. A common practice is to statistically compare baseline characteristics between the control and intervention group to determine imbalances and confounders for model adjustment. This practice, however, has been shown to be inappropriate since

false positives and negatives are not controlled. Moreover, the use of this practice to select confounders for model adjustment can introduce rather than protect against bias. The goals of this assessment were 1) to assess current publishing guidelines regarding baseline testing and 2) to elaborate recommendations. The guidelines from 16 high-impact journals were assessed. The journals did not provide direct guidance and referred authors to one or more of the following guidelines: ICMJE (International Committee of Medical Journal Editors), STROBE (Strengthening the Reporting of Observational Studies in Epidemiology) and the Equator Network, including TREND (Transparent Reporting of Evaluations with Nonrandomized Designs). ICMJE provided no specific guidance and referred to STROBE. While STROBE did correctly recommend choosing confounders at study design stage; no guidance on specific analytical methods were given. Finally, TREND actually promoted baseline testing. Experts recommend that adjustment variables should be chosen at the design stage based on clinical knowledge. Sensitivity analyses, such as the use of doubly-robust methods, are also recommended. In conclusion, reporting guidelines need to be updated to offer more appropriate methods. Journal editors have the power to promote good research by explicitly discouraging baseline testing in nonrandomized studies.

THE ROLE OF VES-13 AS A PREDICTOR OF ADVERSE OUTCOMES IN ELDERLY ASSISTED BY PRIMARY CARE, BRAZIL

D.B. Ferreira^{2,1}, L.M. Santiago³, I.E. Mattos², 1. Augusto Motta University Center, Rio de Janeiro, Brazil, 2. National School of Public Health/ Oswaldo Cruz Foundation, Rio de Janeiro, Brazil, 3. Medicine School, Federal University of Rio de Janeiro, Rio de Janeiro, Brazil

The aim of this study is to evaluate the role of Vulnerable Elders Survey (VES-13) as a predictor of functional capacity decline and death in elderly people of low socioeconomic status. This is a cohort study developed between 2013–2015 and included aged ≥ 60 years who lived in two assisted areas by Primary Health Care Services, Rio de Janeiro, Brazil. There were interviewed 958 elderly and followed for six months. The independent variable (vulnerability) was measured by VES-13, validated in Brazil. The outcomes analyzed were death and functional capacity decline evaluated by Lawton and Katz instruments. Logistic regression was performed considering the 5% significance level. In the baseline, 958 elderly were evaluated and a complete follow-up was obtained for 635. Of these, the mean age of 70.3 years (± 8.27), 65.1% were women and 35.9% were classified as vulnerable. The functional capacity decline to perform ADL was observed in 5.7% of participants and 25.8% for IADL. Deaths were observed in 3%. In assessing the VES-13 as a predictor of these factors, logistic regression indicated that among vulnerable there was a greater chance of functional capacity decline in performing ADL (OR=7.36; CI95% 3.27–16.58) and IADL (OR=1.95; CI95% 1.49–2.54). For death, there was an increase in risk with a borderline interval (OR=2.44; CI95% 0.99–5.99). The results indicated that the VES-13 works as a tool that predicts outcomes of functional capacity decline and death of the elderly in Brazil,

being an important instrument in primary care for screening and monitoring of the elderly.

VITAMIN D METABOLITES AND SARCOPENIA IN OLDER MEN: THE CONCORD HEALTH AND AGEING IN MEN PROJECT

V. Hirani^{1,2}, R. Cumming^{3,2,4}, F. Blyth², V. Naganathan², M. Seibel², 1. School of Life and Environmental Sciences Charles Perkins Centre, Faculty of Science, University of Sydney, Sydney, New South Wales, Australia, 2. Centre for Education and Research on Ageing, Concord Hospital, University of Sydney, Sydney, New South Wales, Australia, 3. School of Public Health, University of Sydney, Sydney, New South Wales, Australia, 4. ARC CEPAR, Sydney, New South Wales, Australia

The link between vitamin D metabolites and muscle mass or strength remains controversial. We therefore explored associations between serum 25-hydroxyvitamin D (25D) and 1,25-dihydroxyvitamin D (1,25D) levels and incidence of sarcopenia over time in older Australian community-dwelling older men.

Men aged ≥ 70 years (2005–07) from the Concord Health and Ageing in Men Project were assessed at baseline (n=1705), two (n=1367) and five years (n=958). The main outcome measurement was the incidence of sarcopenia defined by The Foundation for the National Institute of Health Sarcopenia Project as appendicular lean mass: body mass index ratio < 0.789 and grip strength < 26.0 kg. Covariates included serum 25D and 1,25D levels measured at baseline categorized into quartiles, age, income, season of blood collection, physical activity, vitamin D supplement and medication use, measures of health, parathyroid hormone, renal function, albumin and white blood cell count.

Sarcopenia was present in 9.2% of men at the 2-year follow-up and in 14.3% at the 5-year follow-up. Excluding men with sarcopenia (n=140) at baseline, vitamin D levels in the lowest quartiles (25D < 40 nmol/l; 1,25D < 62 pmol/l) were independently associated with the incidence of sarcopenia over 5 years after adjustment (25D: OR 2.52 (95% CI 1.13, 5.62) $p=0.02$; 1,25D: OR 2.70 (95% CI 1.29, 5.67) $p=0.01$).

Low serum 1,25D and 25D concentrations at baseline are independently associated with the incidence of sarcopenia over the subsequent five years. It is conceivable that maintaining vitamin D sufficiency may reduce the incidence of sarcopenia in ageing men.

THE ASSOCIATION BETWEEN CHRONIC LOW BACK AND/OR KNEE PAIN AND OVERWEIGHT IN JAPANESE ELDERLY

A. Kitamura¹, H. Jinnouchi², H. Kakihana², H. Imano², M. Kiyama³, H. Iso², 1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Osaka University Graduate School of Medicine, Suita, Japan, 3. Osaka Center for Cancer and Cardiovascular Disease Prevention, Osaka, Japan

Chronic low back pain (CLBP) and knee pain (CKP) has been understood as aggravating factors for essential locomotive functions such as gait or stair climbing among old age population. Several studies in the western countries have indicated the association between CLBP and/or CKP and obesity, however these relationships have remained

unclear in Asian countries, where the prevalence of obesity has been relatively low. The aim of the present study was to investigate the associations of CLBP and/or CKP with overweight among Japanese elderly. We performed a cross-sectional study of 2,270 people in two Japanese communities, aged 40 to 74 years in 2015–2016. CLBP and CKP were defined as pain which had been at least weekly recognized in the previous 4 weeks, and had persisted beyond three months. Overweight was defined as 25 kg/m² or higher. Logistic regression analysis was used to calculate multivariable adjusted odds ratio (OR) for overweight status. The multivariable included age, sex, area, current smoker, current drinker, hyperglycemia, hypercholesterolemia, and depression. The prevalence of overweight among each pain pattern was as follow: Neither (n=1576), 26%; CLBP alone (n=332), 28%; CKP alone (n=209), 34% (P<0.01 vs. Neither-group); and Both (n=153), 32%. Compared to Neither-group, multivariable adjusted ORs (95% confident intervals) for overweight were as follows: CLBP alone, 1.06 (0.81–1.39); CKP alone, 1.51 (1.10–2.08); Both, 1.39 (0.97–2.01). The stratified analysis revealed the stronger positive association was observed among elderly (65–74 years), which suggested that weight control for elderly would be effective in reducing CKP at community level.

VISUAL IMPAIRMENT PREDICTS POOR PHYSICAL FUNCTIONING AMONG MIDDLE-AGED WOMEN

N. Chandrasekaran^{1,2}, S. Harlow¹, S. Moroi², D. Musch^{2,1}, Q. Peng¹, C.A. Karvonen-Gutierrez¹, 1. *Department of Epidemiology, School of Public Health, University of Michigan, Ann Arbor, Michigan*, 2. *Department of Ophthalmology, University of Michigan Health System, Ann Arbor, Michigan*

Disability and poor physical functioning leads to a substantial burden on the individual and the health system. Emerging evidence suggests that poor functioning and disability rates are increasing among middle-aged individuals. Visual impairment is associated with poor functioning among older adults. But little is known about the impact of vision on functioning during mid-life despite increasing prevalence of both visual impairment and functional deficits during this life-stage. This study assessed the impact of visual impairment on future physical functioning among 483 middle-aged women enrolled in the Michigan site of the Study of Women's Health Across the Nation. At baseline, women were 42–56 years of age when distance and near vision were measured using a Titmus vision screener. Physical functioning was measured up to 10 years later, using performance-based measures including a 40-foot timed walk, timed stair climb and forward reach. The association of visual impairment and future physical functioning was analyzed using multivariable linear regression. Women with visual impairment for distance vision at baseline had 2.81 centimeters less forward reach distance (95% confidence interval (CI): -4.19, -1.42) and 4.26 seconds longer stair climb time (95% CI: 2.73, 5.79) at follow-up compared to women without distance visual impairment. Women with near visual impairment also had less forward reach distance (2.26 centimeters, 95% CI: -3.30, -1.21) versus those without near visual impairment. Among middle-aged women, visual impairment is predictive of poor physical functioning. Routine eye testing and vision

correction may help improve physical functioning among midlife individuals.

EFFECTS OF DUAL ANTIPLATELET THERAPY ON THE ELDERLY: RETROSPECTIVE COHORT STUDY.

Y. Harano, A. Babazono, *Kyushu University, Fukuoka, Japan*

Introduction: Recently, patients with coronary disease have increased to take both aspirin and clopidogrel. This combination therapy is called Dual Antiplatelet Therapy (DAPT). DAPT has some benefits for prevention of stent thrombosis, especially that of drug-eluting stents. However, this combination therapy theoretically could induce bleedings. To assess the risks and the benefits of DAPT, we evaluated incidences of traumatic intracranial injury and cerebral infarction requiring admission of the patients aged 75 years or older.

Method: A retrospective cohort study was conducted with administrative database in Japanese Late Elderly Medical Service System in Fukuoka Prefecture. We compared the patients with DAPT with those with monotherapy of aspirin. We analyzed the incidences by multiple logistic regression model. Independent variables included sex, age and the comorbidities; atrial fibrillation, diabetes mellitus, hypertension, chronic kidney disease and dyslipidemia and other medications; cilostazole, ticlopidine. The subjects were followed for 3 years.

Results: We employed 35,343 patients in this study. There were 46.1% (N=16,293) males. The mean age was 82.9 years old. The incidence of traumatic intracranial injury was significantly increased in the patients with DAPT (Odds ratio (OR):1.53 [1.063–2.21], p=0.022). Those of cerebral infarction showed no significant difference (Odds ratio (OR):1.08 [0.91–1.28], p=0.367).

Conclusion: Our study suggests that DAPT could increase incidence of traumatic intracranial injury among elderly patients and this therapy might not have inhibitory effect on cerebral infarction. Intracranial injury has high mortality and could remain long-lasting disabilities. We had better introduce DAPT selectively and cautiously to elderly patients with high risk of fall.

THE IMPACT OF SES ON THE ASSOCIATION BETWEEN PHYSICAL ACTIVITY AND HRQOL OVER A 3-YEAR PERIOD

H. Vasiliadis, *Dep't of Community Health Sciences, University of Sherbrooke, Longueuil (QC), Quebec, Canada*

More research is needed on whether socioeconomic status influences physical activity and health related quality of life (HRQOL). Such information may inform health policies on improving healthy ageing in all strata of the population. The aim of this study is to assess, in an older adult community living sample consulting in primary care, the effect of socioeconomic status, based on a validated index score, on the effect of physical activity and health related quality of life. The study population included a sample of 1,801 community living older adults recruited in primary care clinics, of which 1,040 were also interviewed at follow-up, 3 years later. Health related quality of life was measured with the EQ-5D-3L. Physical activity was assessed with the following question: "How many times a week do you exercise for more than 20 minutes (for example, walking at a rapid pace)".

Responses were then categorized into 4 categories as follows: 0 times (never); 1 to 3 times; 4 to 7 times; 8 times and more a week. Generalized linear models (GLM) with repeated measures was used to study the change in HRQOL as a function of physical activity, stratified by socioeconomic status, controlling for potential important confounders such as gender, smoking status, alcohol consumption at least twice a week every week in past 6 months (yes/no), self-perceived physical and mental health status and number of chronic disorders. The results showed that HRQOL decreases with time and this decrease may be mitigated with physical activity in those with lower socioeconomic status. Promoting physical activity may limit social inequalities in health among low socioeconomic status populations.

LONGITUDINAL ASSOCIATION BETWEEN SERUM ADIPONECTIN AND SARCOPENIA IN A COMMUNITY-LIVING POPULATION

H. Shimokata^{1,2}, F. Ando^{3,2}, R. Otsuka², 1. *Graduate School of Nutritional Sciences, Nagoya University of Arts and Sciences, Nisshin-city, Japan*, 2. *National Center for Geriatrics and Gerontology, Nisshin-city, Japan*, 3. *Aichi Shukutoku University, Nagakute-city, Japan*

Although high circulation adiponectin levels have been reported to disturb physical performance, the association between adiponectin and sarcopenia has not been reported. The aim of this study is to clarify the effects of adiponectin on muscle mass and risk of sarcopenia in a community living population. Data were derived from the National Institute for Longevity Sciences - Longitudinal Study of Aging. Subjects comprised 2023 men and women aged 40 to 88 who participated in the 5th wave (2006–2008) examination without sarcopenia and also participated in the 6th (2008–2010) and/or 7th wave examination (2010–2012). Muscle mass was accessed by dual-energy x-ray absorptiometry and skeletal mass index (SMI) was calculated by total muscle mass of arms and legs / square of height (kg/m²). Sarcopenia was determined by the algorithm of the Asian Working Group of Sarcopenia. Serum adiponectin was significantly higher in sarcopenia comparing with normal subjects (9.72 ± 0.57 vs $6.21 \pm 0.09 \mu\text{g/dL}$). Age and sex- adjusted odds ratio of developing sarcopenia by 1SD increase in adiponectin was 1.273 (95%CI: 1.047–1.550) by generalized estimation equation. However, the odds ratio was not significant after controlling for SMI at the baseline. Adiponectin level was significantly different by CDH13 rs3865188 genotype (TT: 7.36 ± 0.15 , TA: 5.90 ± 0.16 , AA: $4.18 \pm 0.34 \mu\text{g/dL}$ in the subjects), but prevalence of sarcopenia did not differ by the genotype. From these results, it is suspected that decrease in muscle mass causes increase in adiponectin, and adiponectin does not reduce muscle mass.

DEPRESSION, COGNITIVE SYMPTOMS, AND THEIR FUNCTIONAL IMPACT: NOT JUST A GERIATRIC PROBLEM

S. Schussler-Fiorenza Rose^{1,2}, N.T. Bott^{2,1}, E. Heinemeyer^{1,2}, N. Hantke^{1,2}, C.E. Gould^{1,2}, R. Hirst³, S.A. Beaudreau^{1,2}, R. O'Hara^{2,1}, 1. *VAPAHCS, Palo Alto, California*, 2. *Stanford University, Stanford, California*, 3. *Palo Alto University, Palo Alto, California*

This study compared the prevalence of cognitive symptoms and their functional impact across age groups and depression status. We used the Behavioral Risk Factor Surveillance System 2011 cognitive impairment module which was part of a population-based cross-sectional random-digit-dialed telephone survey administered to non-institutionalized adults in 21 US States (n = 129, 510). Participants were stratified by depression status and the logistic regression analysis assessed the relationship between age and cognitive symptoms controlling for demographic characteristics and a number of other health conditions. The functional impact of cognitive symptoms by age group and depression status was also assessed. The adjusted depression model showed comparable levels of cognitive symptoms across age groups with the exception of a peak in the 45–54 age group which had a 60% greater odds of reporting cognitive symptoms compared to the reference (oldest age group). In contrast, the adjusted model for adults without depression demonstrated that with the exception of the 45–54 year old age group, the younger age groups had a lower odds of cognitive symptoms than the oldest age group. In those with depression and cognitive symptoms, over half of working age adults reported that the symptoms interfered with life activity compared to just over a third of those 65 years and older. Depression is associated with cognitive symptoms in all age groups, not just older adults. Given that younger adults report greater functional impact of cognitive symptoms than older adults, it is important to inquire about and address cognitive complaints in younger adults with depression, particularly middle-aged adults. Adults with cognitive complaints should be assessed for depression.

NUTRITIONAL STATUS AND ACTIVE LIFE EXPECTANCY IN A GENERAL POPULATION OF OLDER JAPANESE

S. Shinkai¹, Y. Yokoyama¹, M. Narita¹, Y. Taniguchi¹, S. Seino¹, H. Amano¹, H. Murayama², A. Kitamura¹, 1. *Tokyo Metropolitan Institute of Gerontology, Itabashi, Tokyo, Japan*, 2. *The University of Tokyo, Bunkyo, Tokyo, Japan*

We reported previously that low nutritional status was an independent risk for all-cause and cardiovascular mortality in a general population of older Japanese. This study further examined its association with active life expectancy. A total of 1,620 older persons participated in the annual health assessments in Kusatsu, Gunma prefecture, Japan from 2002 through 2012. They were followed until June 2013 for death, moving out from the town, and new certification under the public Long-Term Care Insurance (LTCI). Baseline nutritional status of participants was evaluated by BMI, serum albumin and total cholesterol, and blood hemoglobin. The outcome events included new certification under the LTCI and death without prior certification. Cox proportional analysis was used for multivariate adjustment. Out of 1,546 participants who had not been certified under the LTCI at baseline, 284 events (new certification 202, death without prior certification 82) occurred during the follow-up period. After adjustment for age, baseline year and history of medical condition (hypertension, diabetes mellitus, stroke, heart disease, or cancer), those in the lowest quartile of BMI, albumin, total cholesterol or hemoglobin compared with those

in the respective highest quartile showed the hazard ratio of 1.94 (95%CI; 1.14–3.33), 3.41 (1.77–6.59), 1.80 (1.03–3.14), or 2.03 (1.14–3.61) for males, and 0.74 (0.48–1.16), 2.38 (1.29–4.39), 1.03 (0.66–1.60), or 1.63 (1.05–2.51) for females, respectively. In summary, the effect of nutrition on active life expectancy differed slightly depending on sex and biomarkers, but low nutritional status had significantly negative effect on active life expectancy in a general population of older Japanese.

CAROTENOID AND ITS INTERACTION WITH SMOKING EFFECTS ON MUSCLE MASS DECLINE WITH AGING IN ELDERLY MEN

F. Ando^{1,2}, Y. Kato^{1,2}, R. Otsuka², H. Shimokata^{3,2}, 1. *Aichi Shukutoku University, Nagakute, Japan*, 2. *National Center for Geriatrics and Gerontology, Obu, Japan*, 3. *Graduate School of Nutritional Sciences, Nagoya University of Arts and Sciences, Nisshin, Japan*

Although smoking is a well-known risk factor of sarcopenia, the mechanism remains unclear. If inflammation or hyper-oxidants influences the etiology, anti-oxidants such as carotenoids might have preventive effects on sarcopenia. The aim of this study is to clarify the effects of carotenoids on muscle mass decline with aging, and whether there are some interactive effects between carotenoids and smoking.

The subjects were 490 males aged 65 and over who have participated in the 5th wave examination (baseline) of the NILS-LSA (National Institute for Longevity Sciences – Longitudinal Study of Aging). Serum carotenoids were measured after overnight fast. Carotenoids intakes were assessed by 3-day dietary records. Skeletal muscle mass index (SMI) was defined as appendicular muscle mass (kg) divided by square of height (m). Mixed effects models adjusted for covariates were used to estimate whether carotenoids or the interaction of carotenoids and smoking state at baseline effected on SMI at the sequential examinations (the 5th-7th), taking the 2nd tertile of carotenoids as the reference.

The 1st tertiles of serum alpha-carotene, beta-carotene and beta-cryptoxanthin showed significantly lower SMI than the references, respectively (-0.12, -0.26, -0.27kg/m²; p<0.05). There were interactive effects of beta-cryptoxanthin intake and smoking on SMI, i.e. smokers in the 1st tertile of beta-cryptoxanthin showed lower SMI than non-smokers in the reference (-0.58kg/m²; p<0.05).

The effects of carotenoids on SMI were mainly 'main effects' on muscle mass decline with aging. This work was supported by JSPS KAKENHI Grant Number JP15K00857.

DISTRIBUTION OF THE SEMIHEALTH CONDITION AMONG COMMUNITY-DWELLING ELDERLY IN JAPAN

H. Yamasaki¹, S. Sakabe², Q. Xiao⁴, M. Danbara³, J. Zhang⁵, H. Yamazaki⁶, 1. *Faculty of Health Promotional Sciences, Tokoha University, Hamamatsu, Shizuoka, Japan*, 2. *Soka University, Hachioji, Tokyo, Japan*, 3. *Kiryu University, Kiryu, Gunma, Japan*, 4. *Care Service Inc., Ota City, Tokyo, Japan*, 5. *Nanjing Normal University, Nanjing, China*, 6. *Mito Girls' High School, Mito, Ibaraki, Japan*

Purpose: Chronic diseases have become a global epidemic among many developed countries. Japan has some chronic

diseases as serious causes of death. They are called life-style related diseases and will be also risk factors of broken health. Furthermore, they have been steadily increasing. The purpose of the present study was to examine the semihealth condition which evaluated a level of dynamic state in a susceptibility phase based on the natural history of disease, and to reveal a distribution of them among the community-dwelling elderly in Japan. The authors have reported on findings about the semihealth index elsewhere. In this study, we discussed on a multidimensional structure of the semihealth condition and its distribution among them.

Methods: The self-reported questionnaire, which consisted of 54 items, was administered to 1,531 the community-dwelling elderly in Japan between 2013 and 2014. A principal components analysis was applied to the valid data in order to extract indices which evaluated structural characteristics on the semihealth condition.

Results: By this analysis, four principal components were extracted. Especially, the first principal component was extracted as an index which indicated a quantitative aspect of the semihealth condition. Every eigenvector of its component had a mark of plus. Therefore, this component was used as the semihealth index. Furthermore, a distribution of the community-dwelling elderly with the semihealth condition was determined by using this index.

Conclusions: It is likely that the first principal component shows a good level of discriminating the semihealth from good health conditions.

SESSION 4480 (POSTER)

FRAILITY III

SCREENING FOR FRAILITY IN COMMUNITY-DWELLING ELDERLY SUBJECTS: VALIDATION OF THE SEGAM INSTRUMENT

N. Oubaya¹, M. Drame¹, J. Novella¹, E. Quignard², C. Cunin³, D. Jolly¹, R. Mahmoudi¹, 1. *Reims Teaching Hospitals, Reims, France*, 2. *Hospital of Troyes, Troyes, France*, 3. *Caisse d'Assurance retraite et de Santé au travail du Nord-Est, Mission RELAIS – Actions collectives gérontologiques, Nancy, France*

Introduction: We aimed to validate the modified version of the Short Emergency Geriatric Assessment (SEGAm) frailty instrument among elderly community-dwelling subjects.

Method: A longitudinal, prospective study was conducted in four French departments (Ardennes, Marne, Meurthe-et-Moselle, Meuse) and subjects aged 65 years or more and living at home were included.

We assessed demographic characteristics, comprehensive geriatric assessment, and the SEGAm instrument. During follow-up visits at home at 6 and 12 months, vital status, level of autonomy and occurrence of hospitalisation were recorded. For psychometric validation, feasibility and acceptability, internal structure validity, reliability, discriminant validity and predictive validity of the SEGAm instrument were studied.

Results: Overall, 167 patients were included. Average age was 77 ± 7 years, the majority were women (70.7%). Feasibility and acceptability of the SEGAm instrument were excellent: no refusal to participate, no drop-out

during administration, no missing items, no ceiling or floor effects were noted. Administration time was short (5.0 ± 3.5 min). By factor analysis, the instrument proved to be unidimensional. It showed good internal consistency (Cronbach's alpha coefficient: 0.68) and good test-retest (intra-class correlation: 0.88) at 7 days interval. Discriminant validity showed a significant difference, mainly for nutritional status, fall risk, dependency, mood and depression risk, and comorbidities. And frailty status at baseline was significantly associated with loss of autonomy during the 12 months of follow-up (OR=4.52, 95% CI=1.40–14.68; $p=0.01$).

Conclusion: The SEGAm appears to be an easy-to-use instrument that is particularly suitable for use in the community to identify frail elderly people who could benefit from early targeted interventions.

A COMMON CONDITION IN AN UNCOMMON CASE: SPONTANEOUS HIP FRACTURE ON A BEDRIDDEN ELDERLY WOMAN

L. Andrade¹, J. Yopez-Kuri², A. Francisco¹, D. Smith¹, 1. *Family Medicine/ Geriatrics, Texas Tech University Health Science Center, Odessa, Texas*, 2. *Lourdes Health network, Pasco, Washington*

Hip fracture is one of the major causes of morbidity and mortality, 95 % are related to falls and 5 % are spontaneous. Spontaneous hip fractures are more common on the frail bedridden elderly individuals who reside in long term care facilities.

We present a case of a 91 year-old female patient that who resides with her daughter. She had cerebral vascular accident that occurred three years ago which resulted on left sided hemiparesis with subsequent body contraction, deconditioning, and bed confinement. Patient developed an acute episode of pain on her left lower extremity for which she was transferred to the emergency department. An X-ray of the left femur revealed a closed left subtrochanteric femoral shaft fracture. The decision to repair the fracture was taken to ease the pain. Patient underwent procedure for open reduction, cephalomedullary nailing, left subtrochanteric femoral shaft fracture repair. Further studies reported evidence of osteopenia. Patient went home with no rehabilitation therapy.

Spontaneous hip fractures in immobile patients are very rare, and when reported, more than 85% are intracapsular or trochanteric. Subtrochanteric femoral fracture in immobile elders accounts for less than 10% of the cases.

In patients with a combination of lower limb contractures and osteoporotic bones, a simple twisting force or mild contusion is sufficient to cause fracture. Although we believe that our patient did not experienced physical abuse, unexplained fracture should also prompt physicians to investigate possible abuse. Identifying high-risk patients and providing meticulous nursing care, like methods for lifting and transferring patients, are paramount.

FRAILITY AS A PREDICTOR OF ADVERSE OUTCOMES IN ELDERLY USERS OF PRIMARY HEALTH CARE IN BRAZIL

L.M. Santiago^{1,2}, D.B. Ferreira², I.E. Mattos², R.J. Gobbens^{3,6}, M.A. van Assen^{4,7}, C.N. do Carmo³

1. *Federal University of Rio de Janeiro, Rio de Janeiro, Rio de Janeiro, Brazil*, 2. *National School of Public Health/ Oswaldo Cruz Foundation, Rio de Janeiro, Brazil*, 3. *Inholland University of Applied Sciences, Amsterdam, Netherlands*, 4. *Tilburg University, Tilburg, Netherlands*, 5. *National School of Public Health / Oswaldo Cruz Foundation, Rio de Janeiro, Brazil*, 6. *Zonnehuisgroep Amstelland, Amstelveen, Netherlands*, 7. *Utrecht University, Utrecht, Netherlands*

This study aims to evaluate the role of frailty as a predictor of adverse health outcomes in elderly users of Primary Health Care services in Rio de Janeiro, Brazil. Between 2013 and 2015, a study was conducted with 958 individuals aged ≥ 60 years users of the Family Health Strategy in the city of Rio de Janeiro, to assess the predictive validity of the Brazilian version of the Tilburg Frailty Indicator (TFI) to fall, fracture, hospitalization, functional dependence and death, in a follow-up period of six months. The characteristics of the study population were described and the incidences of the outcomes were estimated. The risk of each adverse outcome was calculated according frailty status. The follow-up was performed for 635 individuals (66.3% of total sample). The study population was predominantly female (65.1%), mean age=70.5 (SD=8.1). At the end of the follow-up, 35 (5.7%) lost functional capacity in basic activities of daily living (ADL) and 157 (25.9%) in instrumental activities of daily living (IADL), 67 (10.9%) experienced hospitalization, 60 (9.8%) suffered fall and 9 (1.5%) fracture, and 18 (2.9%) died. There was a higher risk of functional dependence in ADL (OR= 3.01 CI95% 1.45–6.27) and in IADL (OR= 1.50 CI95% 1.04–2.16), fall (OR= 2.08 CI95% 1.21–3.58) and death (OR= 3.35 CI95% 1.18–9.53) for frail when compared to non-frail elderly. Frailty assessed by the TFI is a good predictor of adverse health outcomes among elderly users of primary care services in Brazil, and would be an alternative tool for monitoring the health conditions.

PRESSURE ULCERS ARE ASSOCIATED WITH SIX-MONTH MORTALITY IN HIP FRACTURE IN ORTHOGERIATRIC CARE

E. Magny², H. Vallet¹, J. Cohen-Bittan¹, M. Verny¹, J. Boddaert¹, A. Meziere², B. Riou¹, 1. *Pitié Salpêtrière University Hospital, Paris, France*, 2. *Pitié Salpêtrière-Charles Foix University Hospital, Ivry sur seine, France*

Pressure ulcers (PU) in hip fracture are associated with poor outcomes. Orthogeriatric management reduces PU incidence in hip fracture in the elderly. However, remaining factors and prognostic associated with PU in hip fracture patients managed in orthogeriatric care pathway are unknown. The objectives were to determine the prognostic of PU in the hip fracture in UPOG, and their associated factor.

From June 2009 to April 2015, all consecutive patients, > 70 years old, with hip fracture admitted to an (UPOG) were screened. Patients were included if they were hospitalized for hip fracture and were excluded in presence of pathological fracture or if they were already hospitalized at the time of the fracture. In our unit, orthogeriatric principles are implemented, including a multicomponent intervention to improve PU prevention and management. Patients were followed until 6 months after discharge.

567 patients were included, with an overall 14,4 % 6-month mortality (95% CI: 11.6–17.8%). Of these, 67 patients (12 %) experienced at least one PU. Despite orthogeriatric management, PUs were significantly associated with a low albumin level (RR 0.90, 95% CI:0.84–0.96; $p=0.003$) and history of atrial fibrillation (RR 1.91, 95% CI:1.05–3.46, $p=0.033$), coronary artery disease (RR 2.16, 95% CI:1.17–3.99; $p=0.014$) and diabetes (RR 2.33, 95% CI:1.14–4.75; $p=0.02$). PU was associated with 6 month mortality (RR 2.38, 95% CI: 1.31–4.32, $p=0.044$).

In elderly patients with hip fracture managed in an orthogeriatric care pathway, PU remained associated with poorly modifiable risk factors and long term mortality.

BALANCE CHANGES ASSOCIATED WITH SIX-MONTH FRAILTY STATUS CHANGES

R. Peterson, H.R. Stocker, N. Toosizadeh, C. Wendel, M. Fain, J.J. Mohler, *University of Arizona, Tucson, Arizona*

Background: Frailty is the cumulative decline of physiologic systems contributing to adverse health outcomes. Our objective was to examine motor performance associations with changes in frailty status in the community Arizona Frailty Cohort (AZFC).

Methods: Fried frailty index was assessed and body-worn sensor balance measured six months apart. Associations between % change in balance and categorical change in frailty were examined using multiple linear regression, controlling for sex and BMI. Balance parameters included hip sway, ankle sway, and mean, medial-lateral and anterior-posterior center of gravity (COG) in eyes-open and eyes-closed conditions. Frailty status (frail, pre-frail and non-frail) was categorized as those with non-changing frailty status (NFS), progressing frailty status (PFS) and regressing frailty status (RFS).

Results: There were 58 NFS, 10 PFS and 21 RFS with balance measures. We found a 266% ($p<.001$) increase in eyes-open hip sway, a 50% increase ($p<.05$) in eyes-closed hip sway, and 159% increase ($p<.001$) in eyes-open ankle sway ($n=81$) among PFS compared to NFS. Among RFS, we found 70% decrease ($p<.01$) in eyes-open mean COG sway, and 59% decrease ($p<.05$) in eyes-closed mean COG sway when compared to NFS.

Conclusion: We previously reported hip sway as the best discriminator between pre-frail and frail in the AZFC. Here, we found eyes-open and eyes-closed hip sway, and eyes-open ankle sway were most sensitive in identifying PFS, whereas mean eyes-open and eyes-closed COG sway was more sensitive than hip or ankle sway in identifying RFS.

FUNCTIONAL CONDITIONS OF FEEDING AND FRAILTY IN ELDERLY OF DIFFERENT SOCIODEMOGRAPHIC BACKGROUNDS

L.H. Tôrres¹, A.L. Neri¹, J.F. Antunes², M. Sousa¹, C. Milagres¹, *1. University of Campinas, Piracicaba, Brazil, 2. University of São Paulo, São Paulo, Brazil*

The findings from this study will allow participants to acknowledge the relationship between oral health and frailty. Besides that participants will be able to identify if functional conditions of feeding are associated with frailty in independently-living older Brazilians.

In Brazil, the FIBRA Study (Frailty in Brazilian Elderly Individuals), is a multicenter, multidisciplinary research dedicated to studying frailty and its association with sociodemographic variables, health status, cognition, oral health and psychosocial function. For this cross-sectional study, it was used data from a convenience sample of six municipalities with different sociodemographic characteristics and from 2343 randomly selected subjects aged 65 or more without cognitive impairment. The outcome was frailty. The functional conditions of feeding was assessed by self-report and was created by the sum of ten questions regarding problems with mastication and swallowing. The cut-off point was the identification of three or more difficulties regarding these conditions. Almost ten percent of older subjects (9.1%) were classified as frail and 51.8% as pre-frail. The multilevel analysis showed that older people who were frail were more likely to have three or more problems with functional conditions of feeding (OR=2,06), to be older (OR = 2,88), not to work (OR = 2,31), to be depressed (OR = 2,31) and to self-report poor overall health compared to peers (OR = 3,91). The results suggest that functional conditions of feeding are associated with frailty considering the individual level. The contextual level did not show any variation due to the lower number of municipalities included.

URINARY INCONTINENCE IS ASSOCIATED WITH FRAILTY AND GAIT AMONG COMMUNITY-DWELLING ELDERLY IN CHINA

J. Chu, X. Chen, S. Shen, T. He, Z. Liu, L. Xu, L. Chen, H. Guan, *Department of Geriatrics, Zhejiang Hospital, Hangzhou, Zhejiang, China*

Objective: To examine the association between urinary incontinence and frailty in community-dwelling elders.

Methods: A cross-sectional study was conducted in the city of Hangzhou, which leads the growing speed of aging population in China. Severity and symptoms of urinary incontinence (UI) were measured using ICIQ-SF. Participants with positive answer of the question “Did you have problems of urinary incontinence in recent 4 weeks” were categorized as UI positive. Status of frailty was defined by Clinical Frailty Scale (CFS). Participants also completed comprehensive geriatric assessment. Multiple linear regression models were used to determine the associations between UI and frailty.

Results: Of the 171 participants (74.8±6.0 years with 45.6% females), 57 individuals (33.3%, with 64.9% females) were UI positive. Elders with UI were more likely to have comorbidity (64.9% vs 45.6%, $p=0.023$) and polypharmacy (47.4% vs 27.2%, $p=0.01$), higher risk of malnutrition (MNA-SF: 12.47±1.58 vs 12.98±1.30, $p=0.036$), poorer hand grip (27.35±8.93 vs 33.49±8.95, $p<0.01$) and higher CFS (3.47±1.05 vs 3.03±0.60, $p<0.01$). Among UI positive participants, females and males got similar ICIQ-SF score ($p=0.282$). As self-reported possible reasons of UI, females leak more often when cough or sneeze (67.6% vs 10.0%, $p<0.001$), less often after urinating (2.7% vs 45.0%, $p<0.001$) than males. Multivariate analysis showed that frailty (OR, 2.051; 95%CI, 1.120~2.981; $p<0.001$) was associated with UI in elderly male. Meanwhile, grip (OR, -0.238; 95%CI, -0.400~-0.076; $p=0.005$) was associated with UI in elderly female.

Conclusion: Frailty and low gait are of great importance for older adults, and may be associated with urinary incontinence.

TACKLING FRAILITY AT PRIMARY CARE SETTINGS: COMPARISON OF IDENTIFICATION TOOLS: BASELINE RESULTS

I. Vergara^{1,2}, F. Rivas-Ruiz^{3,2}, M. Machon^{1,4}, M. Padilla-Ruiz², K. Vrotsou^{1,4}, E. Contreras-Fernández⁵, A. Isabel Diez^{1,6}, 1. *Biodonostia Health Research Institute; Osakidetza, Donostia-San Sebastian, Spain*, 2. *REDISSEC, Malaga, Spain*, 3. *Distrito Atencion Primaria Costa del Sol, Malaga, Spain*, 4. *REDISSEC, Donostia-San Sebastian, Spain*, 5. *Distrito Sanitario Costa del Sol, Malaga, Spain*, 6. *OSI Donostialdea, Donostia-San Sebastian, Spain*

The aim of the project is to provide insight information about the capacity of different tools to detect the presence of frailty in primary care settings. This abstract focuses on the description of the baseline assessment of included individuals.

This is a multicentric (two regions of Spain: Basque Country and Andalucia) prospective cohort study of community dwelling autonomous individuals aged 70 or more. A two year follow up period is proposed. At baseline, the following variables were collected via face to face interviews: sociodemographic, frailty (TFI, GS and TUG), lifestyle habits and health status. The study has been supported by the Spanish Institute of Health Carlos III (grant PI14/01905 and PI14/01003) and authorized by the corresponding Ethics Committees.

By now, 275 included patients have a mean age of 78,3 (SD 5,1) and were almost equally distributed considering sex. The prevalence of frailty was 28,1%, being higher among women (35,4%, $p < 0,001$) and in Andalucian participants (37,7%, $p = 0,001$). They presented a mean Gait Speed of 0,99 m/s. (DE 0,8) and a mean of 12,4 s. (SDE 4,0) on the Timed up and go test, with worst performance among women (13,3 DS 4,5; $p < 0,001$) and Andalucian participants (13,1 DS 4,3; $p = 0,005$).

Frailty is highly prevalent in the studied sample. Significant differences are found considering gender and habitat. Sociocultural differences could determine these differences. The current findings made evident the need to introduce, in a systematic way in primary care settings, assessment tools able to capture frailty.

THE ASSOCIATION OF BLOOD PRESSURE WITH FRAILITY AMONG COMMUNITY-DWELLING OLDER PEOPLE

M. Kabayama¹, K. Kamide¹, Y. Gondo², K. Sugimoto³, Y. Masui⁴, T. Ishizaki⁴, Y. Arai⁵, H. Rakugi³, 1. *Division of Health Sciences, Osaka University Graduate School of Medicine, Suita, Japan*, 2. *Osaka University Graduate School of Human Sciences, Suita, Japan*, 3. *Department of Geriatric and General Medicine, Osaka University Graduate School of Medicine, Suita, Japan*, 4. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 5. *Division of Geriatric Medicine, Keio University School of Medicine, Tokyo, Japan*

Background: The benefit of strict blood pressure (BP) control is controversial considering the adverse outcome

particularly in poor-functioning older people such as being frail. The purpose of this study is to investigate the association of BP level with frailty status among older people.

Method: Participants in age 70, 80, 90 (± 1) years ($n = 1000$, 973, 272 respectively) were randomly recruited from general population participated in the survey called Septuagenarians, Octogenarians and Nonagenarians Investigation with Centenarians (SONIC) study. We interviewed medical histories and medications. BP, grip strength and 8-feet gait speed was examined on site. The frailty was assessed based on the CHS criteria.

Results: Among the participants with antihypertensive treatment, there was the significant difference of the proportion of frailty between the level of diastolic BP (DBP) (-70, 70-79, 80-89, 90-mmHg: 72.7, 66.5, 56.9, 49.2%, respectively). No significant difference was observed in participants without antihypertensive treatment. In the logistic regression analyses considering age, DBP, history of cardiovascular diseases and antihypertensive treatment, advanced age and lower DBP was independently associated with frailty status. When stratified by treatment with or without antihypertensive drugs, only the antihypertensive treatment group showed the significant association between low DBP and frailty in addition to the advanced age. There was no association of the systolic BP with frailty.

Conclusions: In the older population with hypertensive treatment, there was the significant independent association of the lower DBP with frailty. The causal relationship should be clarified whether the frailty is caused by excessive reduction of BP in the further longitudinal study.

THE IMPACT OF FRAILITY IN OUTCOMES OF HIP FRACTURE SURGERY IN ELDERLY PATIENTS

R. Kandel, S. Basnyat, S. Dahal, *Patan Academy of Health Sciences (PAHS), Lagankhel, Lalitpur, Nepal*

Elderly individuals always have a high rate of falls, which is one of the major causes of hip fracture. Early surgical intervention is the mainstay of hip fracture management. Surgeries to repair fractures despite being relatively simple, post-operative complications can be dangerous. Frailty, impaired functional status, co-morbidities and various geriatric syndromes are also a part of ageing. The objective of this study was to assess the impact of frailty on various outcomes of hip fracture surgery. 100 patients more than 75 years of age, undergoing operative intervention were included in this study. Patients were classified as frail, pre-frail and robust based on FRAIL scale. The patients were followed up for 1 month duration. The outcomes were observed and then analyzed. 54 patients were frail, 26 pre-frail and 20 were robust. Among the frail, pre-frail and robust patients, 45(83.3%), 14(53.8%) and 5(25.0%) were bed-bound for a period of 1 month respectively. Similarly, among the groups, 40(74.1%), 14(53.8%) and 5(25%) developed health care associated pneumonia respectively ($P = 0.001$). Similarly, 40(74.1%), 10(38.46%) and 2(10.0%) developed bed-sore of grade 3 or more respectively. Similarly, 33(61.1%), 12(46.1%) and 2(10.0%) patients died in frail, pre-frail and robust groups respectively by the end of 4 weeks. Kaplan Mayer analysis revealed that frail status had significant association with mortality at 1 month (Log rank test, $P = 0.004$). Thus, elderly hip fracture patients are vulnerable to many

postoperative complications. Frailty is seen to significantly contribute to augmentation of this burden which can have many medical as well as economic implications.

HEAD-TO-HEAD COMPARISON OF FRAILTY PREVALENCE BY INSTRUMENT IN THE 5 DO-HEALTH COUNTRIES

M. Gagesch^{1,2}, P. Chocano-Bedoya², S. Schietzel^{1,2}, O.M. Meyer^{1,2}, R.W. Kressig³, B. Vellas⁴, H.A. Bischoff-Ferrari^{1,2}, 1. *University Hospital Zurich, Zurich, ZH, Switzerland*, 2. *Centre on Aging and Mobility - University of Zurich, Zurich, ZH, Switzerland*, 3. *University of Basel, Basel, Switzerland*, 4. *University of Toulouse, Toulouse, France*

Introduction: Early screening for physical frailty among the growing segment of senior adults may help prevent disability and loss of autonomy. However, to date, an internationally accepted operational definition of physical frailty is lacking. **Methods:** We assessed the prevalence of frailty in all 2158 community-dwelling DO-HEALTH participants age 70 and older (mean age 75 years, 62% women) from 5 European countries and based on 5 instruments: Fried phenotype, SOF-index, FRAIL-scale, SHARE-frailty criteria and SHARE-frailty index. The DO-HEALTH countries are Switzerland (n=1008), Germany (n=350), France (n=300), Austria (n=200), and Portugal (n=300). **Results:** Frailty prevalence varied across countries and definitions with the highest prevalence of frailty detected among Portuguese DO-HEALTH participants (range 3.1 to 30.3%), and the lowest prevalence detected among Austrian DO-HEALTH participants (range 0 to 2.5%). **For Austria**, frailty prevalence by instrument was: 0% (Fried, SOF), 1% (FRAIL-Scale) 1.5% (SHARE) and 2.5% (SHARE-FI). **For Switzerland**, frailty prevalence by instrument was: 0.8% (SOF), 1.2% (Fried), 2% (FRAIL-Scale), 3.8% (SHARE) and 4.2% (SHARE-FI). **For France**, frailty prevalence by instrument was: 1.1% (Fried), 1.5% (FRAIL-Scale), 1.9% (SOF), 4.5% (SHARE) and 5.2% (SHARE-FI). **For Germany**, frailty prevalence by instrument was: 0% (SOF), 0.6% (Fried), 1.2% (FRAIL-Scale), 3.7% (SHARE) and 7.4% (SHARE-FI). **For Portugal**, frailty prevalence by instrument was: 3.1% (SOF), 13.1% (Fried), 15% (FRAIL-Scale), 22.8% (SHARE) and 30.3% (SHARE-FI). **Conclusion:** Our analysis provides a first insight on the prevalence of physical frailty in the DO-HEALTH cohort. Notably, within countries prevalence of frailty may differ by a factor of 10 depending on the instrument.

ORTHOSTATIC HYPOTENSION AND ITS RELATIONSHIP WITH FRAILTY

H. Indani, R. Bansal, P. Chatterjee, A. Chakrawarty, S. Dwivedi, A.B. Dey, *Geriatric Medicine, All India Institute of Medical Sciences, Delhi, Delhi, India*

Orthostatic hypotension (OH) is the most common disorder of blood pressure regulation after essential hypertension, with prevalences increasing with age. Biologically, it is plausible that OH, reflecting disordered haemodynamic equilibrium, could be a manifestation of a wider process of multisystem dysregulation of frailty. Despite suggestions in the literature that OH may be a sign of frailty, few studies have been able to validate this hypothesis. In this cross-sectional observational study, we recruited 150 subjects from

three different settings (apparently healthy, outpatient and inpatient). OH was defined as a drop of ≥ 20 mmHg in systolic blood pressure or a drop of ≥ 10 mmHg diastolic pressure and frailty was assessed using both the phenotypic (FP) and frailty index (FI) models. The frequency and correlates of OH in the three different settings were identified. OH was significantly related to the both FP and FI models. This study suggests that OH may be a marker of the system dysregulation seen in frailty and further assessment of frailty in patients of OH can be a potential opportunity for early intervention to delay functional decline.

FRAILTY SYNDROME IN OLDER ADULTS WITH AND WITHOUT FEAR OF FALLING

S.M. Borges, M.M. Monteiro Bezerra, J. Rosa, J.E. Uchida, *Santa Cecilia University, Santos, Sao Paulo, Brazil*

The aim of this study was to determine the presence of frailty syndrome between elders with and without a fear of falling (FoF). A cross-sectional study was conducted with 203 older adults, divided into two groups: with FoF (n=91) and without FoF (n=112). The FoF was assessed using the yes/no question, "Are you afraid of falling?". Frailty syndrome was evaluated by the *Edmonton Frail Scale (EFE)*, which has a maximum score of 17 points, representing the highest degree of frailty. The scores for the frailty analysis are: no frailty (0-4), visibly vulnerable (5-6), mild frailty (7-8), moderate frailty (9-10), and severe frailty (11 or over). The groups did not differ in age, gender or general health conditions. The Mann-Whitney test showed a significant difference in EFE scores ($p < .001$) between the groups without FoF (mean: 3.5; SD: 1.94; 95% CI: 3.16-3.95; minimum-maximum: 0-8 points) and with FoF (mean: 4.88; SD: 2.36; 95% CI: 4.32-5.43; minimum-maximum: 0-12 points). The chi-square test showed that most of the elderly group without FoF was considered not frail (n=72; 64.3%, $p < .001$), 30 were visibly vulnerable (26.8%, $p < .001$) and only 10 were classified as mildly frail (8.9%, $p < .001$). Of the group with FoF, 46.2% (n = 42, $p < .001$) were considered not frail, 19 were visibly vulnerable (20.9%, $p < .001$), and 30 were frail (32.9%, $p < .001$). Of the older adults considered frail, 17 were mildly frail, seven were moderately frail, and six were severely frail. Thus, we conclude that older people with FoF have increased frequency and intensity of frailty syndrome than the elderly without FoF.

DEVELOPMENT OF A COMMUNITY SUPPORT SYSTEM BY ACTION RESEARCH TO SUPPORT THE ELDERLY IN FRAILTY

F. Fujita¹, S. Yamada³, T. Matumoto², 1. *Nursing, Kobe Women's University, Kobe, Hyogo-prf, Japan*, 2. *Rokko Island Konan Hospital, Kobe, Japan*, 3. *Kobnan Long-Term Care Health Facility, Kobe, Japan*

The population aging rate of A Marine City (5.8 ha/20,000 people), born 30 years ago in Japan, is 17.2%; 50.4% of which are 75 or older. (July, 2016) Yet, there is no support system for the people of the community that allow early intervention to prevent frailty. The purpose of this research is to prevent frailty of the elderly who live in A Marine City and to develop an early intervention system. This will be done through action research with nursing manager and certified nurse specialists in gerontological

nursing as core members of the team. Clarification of the issues that the elderly of the area face, planning of educational campaigns of frailty, and post-implementation evaluation were repeated. We gradually called the clinic nurses and the local residents for participation. The activities in the first year included information exchange meetings among nurses, creating nursing information booklets, lecture meetings and questionnaire surveys. The investigation showed that the elderly in frail are unlikely able to take part in the community. The activities in the second year involved interviews to clinic nurses about the elderly in frail, cooperative projects between local residents and corporate members, and planning of events and creating leaflets to raise awareness of frail. In conclusion, it is necessary for this project to promote local awareness to create supportive communities for the elderly.

DISENTANGLING FRAILTY FROM DISABILITY AND DISEASE: AN EMPIRICAL ANALYSIS OF FRAILTY INSTRUMENTS

B. Buta^{1,2}, Q. Xue^{1,2}, R. Kalyani^{1,2,3}, J.D. Walston^{1,2}, K.J. Bandeen-Roche^{1,4}, R. Varadhan^{1,5}, 1. *Medicine, Division of Geriatric Medicine, Johns Hopkins Center on Aging & Health, Baltimore, Maryland*, 2. *Department of Medicine, Johns Hopkins University School of Medicine, Baltimore, Maryland*, 3. *Welch Center for Prevention, Epidemiology, & Clinical Research, Johns Hopkins University, Baltimore, Maryland*, 4. *Department of Biostatistics, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 5. *Department of Oncology, Division of Biostatistics and Bioinformatics, Sidney Kimmel Comprehensive Cancer Center, Johns Hopkins University, Baltimore, Maryland*

Frailty is conceptualized as an increased vulnerability of older adults to develop adverse health outcomes when encountering a stressor. However, operationalization has proven challenging, with numerous frailty instruments that include a wide range of age-related domains, such as physical capacity, disease, and disability. Inclusion of diseases and disability in frailty instruments obfuscates the frailty construct. Fried (2004) has argued that frailty, disability and comorbidity are interrelated but distinct entities. This distinction is critical for understanding the etiology and consequences of frailty, and for devising prevention and treatment strategies. Here we conduct a literature review to identify articles that examined: a) risk factors (such as inflammatory diseases) for frailty; and b) frailty as a risk factor for disability. We then categorize frailty instruments (n=67) used in the identified articles into 4 categories by their measures: 1) Physical Capacity plus other domains, sans disability or disease (n=26); 2) Disease plus other domains, sans disability (n=7); 3) Disability plus other domains, sans disease (n=17); and 4) Disease and Disability plus other domains (n=17). This review will provide empirical data on the use of different categories of frailty instruments in studies of upstream risk factors and of subsequent disability. Preliminary results show that 33% (10/30) of studies on risk factors for frailty used a frailty instrument containing measures of diseases and/or disability. We suggest that studies seeking to examine etiologic factors of frailty or consequences of frailty, such as disability, should not use operational definitions of frailty that include these overlapping but distinct domains.

INITIAL EVIDENCE ON FRAILTY ASSESSMENT IMPROVING RISK PREDICTION AMONG PACE PARTICIPANTS

Q. Xue^{2,1}, J. Barron², M. McNabney², 1. *Johns Hopkins Center on Aging and Health, Baltimore, Maryland*, 2. *Johns Hopkins University School of Medicine, Baltimore, Maryland*

The Program for All-inclusive Care for the Elderly (PACE) is a community-based model serving high-risk older adults who meet their state's nursing home eligibility criteria but prefer living in the community. Despite some population-level evidence of benefits of the PACE in reducing health-care utilization and expenditure, nursing home transition, and mortality compared to the usual fee-for-service care models, the question of who would benefit the most remains unclear. We hypothesize that frailty as a measure of late-life vulnerability is a better risk predictor of certain types of health care utilization than disease burden alone. To test this, a pilot study was conducted to assess the associations of frailty (vs. the Hierarchical Condition Categories (HCC)) for predicting number of ED visits and days of hospitalization among PACE participants. Of the 27 subjects selected from the Hopkins PACE program, 82% were female, 70% were African Americans, and 4% (n=1), 52% (n=14), 44% (n=12), were identified using Fried's physical frailty phenotype as non-frail, pre-frail and frail, respectively. Using Poisson regression, we found that the incidence rates of ED visits and hospitalization in the frail were respectively 4.3 (p=0.026) and 4.2 (p=0.027) times the corresponding incidence rates in the pre-frail after adjusting for age. The associations remained significant after additionally adjusting for HCC. In contrast, HCC alone was not significantly associated with the same outcomes. These findings suggest that incorporating frailty assessment in the PACE program may improve risk prediction, thereby offering new opportunities for improving patient-specific outcomes and controlling health care expenditures.

PRE-FRAILTY IN COMMUNITY-DWELLERS: AN UNATTENDED CONDITION THAT WE HAVE MISSED

A. Leung^{1,2}, I. Leung¹, 1. *School of Nursing, The Hong Kong Polytechnic University, Hong Kong, Hung Hom, Hong Kong*, 2. *The Centre for Gerontological Nursing, The Hong Kong Polytechnic University, Hong Kong, Hong Kong*

Background. Attention given to frailty or pre-frailty in community-dwelling older adults is limited. Pre-frail is the condition in which individuals either have low handgrip strength (HGS) or low physical activity. This study aims to investigate the prevalence of pre-frailty in a community-dwelling aged population in Hong Kong and identify factors associated with pre-frailty. **Methods.** This was the analysis of the baseline data of an interventional study in physical activity. Low handgrip strength was defined as ≤ 14.35 kg for female or ≤ 22.00 kg for male. Energy consumption per week was measured by accelerometers. Energy consumed less than 270 Kcal/week for female or 383 Kcal/week for male was considered as pre-frail. Correlations and logistic regression models were used. **Results.** A total of 199 subjects were included. Mean (SD) of age was 73.4 (7.5). The prevalence of pre-frailty of this sample was 27.1%. Gender (OR=1.1, p<.001), high blood pressure (OR=1.747, p<.01),

and number of chronic illnesses (OR = 1.458, $p < .05$) were associated with pre-frailty. **Discussion.** One-third of community-dwellers suffered from pre-frailty but they have never been informed. Pre-frail condition has seldom been given attention in Chinese society, assuming that physical weakness is the norm to aged population. Assessment of frailty should be carried out in the community and strategies to prevent frailty are worthy to be developed.

EFFECT OF THE DIVISION OF ATTENTION ON MOBILITY PERFORMANCE OF FRAIL ELDERLY

J.R. Bacha, G. Gomes, L. Viveiro, E.M. Varise, G.C. Bueno, J. Greve, J. Pompeu, *Department of Physical Therapy, Speech Therapy and Occupational Therapy, School of Medicine, University of Sao Paulo, São Paulo, São Paulo, Brazil*

Objective: To evaluate the effect of the division of attention on mobility performance of frail elderly. **Methods:** It is a cross-sectional study. We assessed 30 elderlies, 15 diagnosed with Frail syndrome according to the Fried criteria, mean age of 82.6 (5.6) years, and 15 robust elderlies, mean age of 70.4 (5.2) years. Patients were included if they did not present any neurological or orthopedic disease that impossibilities the capacity to maintain the independent orthostatic position and signed the consent term. Mobility performance was assessed in single and dual task conditions using the Timed Up and Go Test (TUG). Sociodemographic data were collected (gender, marital status, height, weight, number of medications and number of diseases). Statistical analysis was performed using the mixed ANOVA with repeated measures. **Results:** The performance of frail elderly was worse compared to the robust elderly in single and dual task conditions [simple tasks: frail 20.07 (2.39), robust 6.82 (2.39); dual task: frail 26.91 (2.85) robust 9.49 (2.85)]. **Conclusion:** Frail elderly presents worse mobility performance in single and dual task conditions when compared with robust elderly.

FRAILTY TRANSITIONS IN COMMUNITY DWELLING OLDER PEOPLE

N. Bentur¹, S. Sternberg², J. Shuldiner³, 1. Myers-JDC-Brookdale Insitute, Jerusalem, Israel, 2. Ministry of Health, Jerusalem, Israel, 3. University of Toronto, Toronto, Ontario, Canada

Background: Frailty is a dynamic process with transitions over time.

Objectives: To examine frailty transitions and their relationship to health service utilization.

Methods: Frailty status using the Vulnerable Elders Survey (VES-13) was determined for 608 community dwelling older people interviewed in a 2008 national survey and for 281 re-interviewed in 2014. The effect of frailty on death at 6 years was assessed using Cox proportional hazards analysis. Participants were divided into four groups based on their frailty transition. Demographic, functional and health characteristics were compared between the four groups using the Kruskal-Wallis and paired t-test. The independent association between the four frailty groups and health service utilization was assessed using logistic regression.

Results: Between 2008 and 2014, 24% of 608 participants were lost to follow up, 9% were non frail, 37% were frail and 30% died. The Cox ratio showed that 86% of the

non-frail in 2008 were alive six years later vs. 52% of the frail(HR 3.5 (CI 2.2–5.4)). Frailty transitions in the 281 participants interviewed at both time points revealed that 19% stayed non frail, 22% became frail, 22% stayed frail and 37% become more frail. Becoming frail, staying frail or becoming more frail compared to staying non frail was independently associated with a greater risk for requiring help on a regular basis, having a formal caregiver, and requiring home care.

ADHERENCE TO THE MEDITERRANEAN DIET AND RISK OF SARCOPENIA IN CHINESE COMMUNITY OLDER PEOPLE

Y. Wang, Q. Hao, B. Dong, *The Center of Gerontology and Geriatrics, West China Hospital, Sichuan University, Chengdu, Sichuan, China*

Recent studies have showed an increasing adherence to the Mediterranean diet (MD) was related with decreasing risk of frailty. However, this relationship was not confirmed by Chinese cohort studies. Our study examined the association between the MD and risk of sarcopenia in 946 Chinese community-dwelling older people(482 women, mean age 68.8±6.5, range 60–92 years). Baseline dietary data were collected using daily food intake records of 8 food groups. Adherence to MD was measured by the Mediterranean Diet Score (MDS). Incident sarcopenia was defined using SARC-F scale. Binary Logistic regression models were employed to assess the effect of adherence to Mediterranean diet on sarcopenia. The prevalence of sarcopenia between lower and higher MDS was statistically significant in both gender (Male: $X^2=6.45$ $P<0.05$; female: $X^2=8.50$ $P<0.05$). Compared to subjects with a lower MDS, subjects with a higher MDS were inversely associated with sarcopenia (OR: 0.325, 95%CI 0.186–0.567, $P<0.05$). After adjusted age, sex, smoking status, BMI, exercise, GDS-15 score, self-rated health and chronic diseases, this association was attenuated but still significant (OR: 0.510, 95%CI 0.269–0.967, $P<0.05$). Our study showed that a higher adherence to Mediterranean Diet was associated with lower risk of sarcopenia among Chinese community-dwelling older people.

FRAILTY IN COMMUNITY-DWELLING SOUTHWEST OLD CHINESE: PREVALENCE AND RISK FACTOR ANALYSIS

K. Tan^{1,2}, S.S. Nie¹, Q. Sun¹, H. Qin^{3,1}, L. Wang^{4,1}, S. Wang¹, 1. The Center of Gerontology and Geriatrics, West China Hospital, Sichuan University, Sichuan, China, Chengdu, China, 2. Department of Epidemiology and Health Statistics, West China School of Public Health, Sichuan University, Chengdu, China, 3. Pingyi Community Health Service Center of Dujiangyan City, Chengdu, China, 4. The Fifth People's Hospital of Chengdu, Chengdu, China

Objective: As frailty is a predictor of variety poor outcomes in old populations, we conducted a survey from January through June 2014 to estimate the prevalence and risk factor of frailty in community-dwelling Chinese aged 65 and over.

Methods: In this cross-sectional study, 20 communities were selected from total 60 communities which covered by Pinyi Community Health Service Center by cluster sampling method and residents aged 65 years and over participated

this survey. Frailty was measured by "FRAIL", demographic characteristics, medical history and drug using and ADL, IADL, MMSE, mood disorder, MNA, polypharmacy, pain scale, were also assessed.

Results: Up to 1117 residents participated in this survey. Average age were 73.25 ± 6.51 (range 65 to 103), and 436(39%) were male. The prevalence of frailty, pre-frailty and robust were 5.7% (64), 36.8% (411), 57.5% (642), respectively. Aging (OR 1.037 for every 1 year old), with pain (OR 2.089), vision decreasing (OR 2.567), MNA<12 (OR 1.657) and ≥ 4 medicine (OR 2.694) were associated with pre-frailty, While with pain (OR 1.946), MMSE<18 (OR 2.262), vision decreasing (OR 2.438) and MNA<12 (OR 6.164) were associated with frailty.

Conclusion: Using "FRAIL" scale, the prevalence of frailty and pre-frailty in southwest China was lower than Australia, but was similar with the United States. Pain, cognitive impairment, vision decreasing and malnutrition were risk factors for the both pre- frailty and frailty.

THE ASSOCIATION BETWEEN FRAILTY AND SLEEP QUALITY IN OLDER ADULTS LIVING IN SELF-PAID CARE HOMES

H. Peng, C. Hsieh, *National Taipei University of Nursing and Health Science, Taipei, Taiwan*

To determine the correlation between frailty and quality of sleep in institutionalized elderly people living in self-paying care homes. This was a cross-sectional study of 158 institutionalized elderly tenants in a self-paying care home in northern Taiwan. The research tools include Chinese version of Edmonton Frail Scale, and Pittsburgh Sleep Quality Index. Results showed 48.7% of Frailty syndrome, and 40% of poor sleep qualities. We found highly significant correlation ($p < 0.001$) between the scores of ADL, IADL, IPAQ, MMSE, GDS-15 and the scores of EFS, and highly significant correlation ($p < 0.001$) between the scores of ADL, IPAQ, GDS-15 and the scores of PSQI. The degree of frailty and sleep quality were shown to be highly correlated ($r = 0.282, p < .001$). The significant predictors of sleep quality were identified as depression, activities of daily living, self-perceived visual function status, and source of income.

REGIONAL DIFFERENCES IN FUNCTIONAL CAPACITY OF FRAIL OLDER PERSONS IN ISLAND, URBAN, AGRICULTURAL

T. Inoue^{1,2}, A. Kono¹, *1. Osaka City University, Osaka, Japan, 2. Kwassui Women's University, Nagasaki, Japan*

This study aimed to clarify the regional differences in the functional capacity of frail older persons living in an island area, urban area, and agricultural area. In total, 742 frail older persons (average age: 83.3 ± 6.24 years; 180 males and 562 females; island: 241 people, agricultural: 251 people, urban: 250 people) were selected at community comprehensive care centers in 12 areas. An interview survey was conducted using a questionnaire on the functional capacity of the senior citizens (Tokyo Metropolitan Institute Gerontology Index of Competence: score area 0-13 points). ANOVA was conducted using the total functional capacity score as the dependent variable and the type of area (island area, urban area, and agricultural area) as an independent variable. Frail older persons from the urban area exhibited

the highest mean score on the functional capacity (mean=9.2, SD=2.8), followed by those from the island area (7.6, 3.1) and agricultural area (8.7, 2.9), respectively. and the functional capacity scored the average low points of functional capacity of the senior citizen who will live in island part later by which the difference was judged ($p < .01$) more significantly than the score of the urban area ($p < .01$) and the agricultural area ($p < .01$) by an area. The functional capacity of frail older persons living in an island area was lower as compared to those living in an urban or agricultural area. Thus, it is important to develop programs for the maintenance and improvement of the functional capacity of frail older persons based on their regional characteristics.

PERCEPTION OF RISK OF ADVERSE OUTCOMES OF OLD PEOPLE IN NURSING HOMES, DAY CENTERS AND HOME CARE

C. Paul^{1,2,3}, L. Teixeira^{1,2,3}, *1. Behavioural Sciences, University of Porto, Porto, Portugal, 2. Instituto de Ciências Biomédicas Abel Salazar, Porto, Portugal, 3. CINTESIS, ICBAS, Porto, Portugal*

Purpose: In Portugal, the three main kinds of services available for older people are nursing homes, day centers and home care services. The admission of old people to these services is mostly based on socioeconomic criteria. However, it is not clear if admission in one of these three types of services corresponds to a higher/lower risk of adverse outcomes (institutionalization, hospitalization and death). The objectives of this work were: i) to characterize customers of each type of service; ii) to estimate the proportion of individuals at perceived risk of each adverse outcome according to each type of service; iii) to assess the ability of RISC to differentiate the types of services for each adverse outcome. **Methodology:** The sample comprised old people with 65 or plus years, that receiving care at home, in day centers or in a nursing home. The identification of individuals at risk within a year was realized using a short, reliable and valid pre-screen instrument, the RISC (Risk Instrument for Screening in the Community). **Findings:** The findings of this research suggest that the three types of services differ according to percentage of mental health problems, but do not differ according to functionality and medical problems of customers. **Value:** The RISC can be used to discriminate people in different settings of care and help selecting the groups at risk that will benefit more from available services

THE POTENTIAL OF FAT DIETARY AND CARDIOVASCULAR DISEASES IN THE SARCOPENIA OF AGING

Y.S. Handajani¹, Y. Turana², N.T. Widjaja¹, *1. Public Health, Faculty of Medicine, Atma Jaya Catholic University, DKI-Jakarta, Jakarta Utara, Indonesia, 2. Department of Neurology of Faculty of Medicine, Atma Jaya Catholic University, DKI-Jakarta, Indonesia*

Objective: This study investigated the relationship between sarcopenia and the chronic disease, dietary intake in aging as well as the potential factors.

Material And Methods

This was a cross-sectional study evaluated one hundred and thirty eight from nursing home elderly. Data were collected during a face to face interview using a standardized

questionnaire. Self reported respondents in the study involved the completion of all measurements after signing the informed consent form. This study was approved by the Research Ethics Committee of the Faculty of Medicine, Atma Jaya Catholic University.

Chi squared were used according to the analyzed variables. Multivariate logistic regression model were created to analyze the association between the independent variables and sarcopenia.

Results

The majority of the subjects were female (45%), 72 ± 7.9 years, had undertaken formal education for <6 years (56.2%). The prevalence of Sarcopenia in this study was 45% and the prevalence of chronic diseases (diabetes mellitus, hypertension and cardiovascular disease) were 51.4%, 51% and 8.7%. There were a significant relationship between several factors (gender, level of education, cardiovascular disease, depression, protein and fat intake ($p < 0.05$) and OR 1.1–6.6, CI 95% (1.00–42.9). The potential factor of sarcopenia were fat dietary and cardiovascular disease, those with less fat intake and cardiovascular disease were at risk of 6.3–6.6 times to experience sarcopenia.

Conclusion

Cardiovascular disease among elderly was potentially adding a complementary condition that compounds the risk of poor health outcomes, especially sarcopenia. The sufficient fat intake will reduce morbidity of sarcopenia.

SESSION 4485 (POSTER)

GERIATRIC WORKFORCE II

HORIZONTAL CAREER MANAGEMENT IN ELDERCARE ORGANISATIONS

F. Frerichs, T. Gruener, L. Naegele, *Universitat Vechta, Vechta, Germany*

In the course of demographic developments especially in the eldercare service sector it becomes more important to promote the employability of older employees and to increase attractiveness of this occupational field for junior staff. Against this background the paper provides findings from a research project that aimed at the analysis of the nursing work system from a competence-related perspective as well as at the exemplary implementation of a competence-based and horizontal, cross-lifespan career planning.

The identification of application fields for horizontal careers and the development of competence-based career paths is based on an analysis of framework conditions regarding labour organisation and skill requirements in eldercare organisations (literature review, workshops and expert interviews), a quantitative study of age- and occupation-specific competences and workloads (questionnaire, self-report and evaluation by third parties) and a qualitative survey of non-occupational competences (face-to-face interviews).

Implementation of 19 individual competence-based career paths took place in selected eldercare organisations (home care and nursing homes alike). The quantitative competence-analysis showed that a longer job-tenure provides a better basis to seize a horizontal career and bring in experience knowledge. Furthermore, the process evaluation showed

that older employees could reduce physical workloads and/or compensate for physical impairments.

It is concluded that despite several risks and obstacles that are involved in implementing horizontal career paths in the eldercare sector, the advantages such as reductions in physical strains and mental stress prevail. Overall, horizontal careers for nursing personnel contribute to a better work motivation, commitment and flexibility.

EMPLOYMENT HOPE AS AN EMPOWERMENT PATHWAY TO ECONOMIC SELF-SUFFICIENCY AMONG LOW-INCOME BABY BOOMERS

S. Choi, *Social Welfare, Soongsil University, Seoul, Korea (the Republic of)*

This study empirically investigates the relationship among psychological strength traits (i.e., self-esteem, self-efficacy, resilience, and grit), employment hope, and economic self-sufficiency among low-income baby boomers. This study uses 288 low-income baby boomer cases, collected from 26 South Korean social service agencies providing self-sufficiency programs in 2016.

The Rosenberg Self-Esteem Scale (Blaskovich & Tomaka, 1991), the New General Self-Efficacy Scale (Chen, Gully, & Eden, 2001), the Short Grit Scale (Grit-S) (Duckworth & Quinn, 2009), and the Connor-Davidson resilience scale (CD-RISC) (Connor & Davidson, 2003) were used to measure personal psychological strength traits, respectively. The Employment Hope Scale by Hong et al. (2013) was used to measure the psychological dimension of self-sufficiency. We measured the economic self-sufficiency using the WEN Economic Self-Sufficiency Scale (ESS; Gowdy & Pearlmuter, 1993).

Structural equation model (SEM) was constructed to identify the impact of psychological traits on economic self-sufficiency, with the mediating effect of employment hope. Maximum likelihood (ML) was employed to estimate models, and missing data was treated with Full information maximum likelihood (FIML) method. The current study employed Bootstrapping method to test the mediating effect of employment hope.

SEM analysis showed that the effects of self-esteem, self-efficacy, and grit on employment hope are statistically significant, as hypothesized. Subsequently, employment hope is positively associated with economic self-sufficiency.

The results of this study imply that psychological traits such as self-esteem, self-efficacy, and grit are important factor of self-sufficiency among low-income baby boomers and motivation and hope for employment mediates the pathway from psychological strength toward economic self-sufficiency.

ARE BAD JOBS INEVITABLE? A COMPARATIVE STUDY OF AGED-CARE OCCUPATIONS AND TRAINING

J.C. Morgan¹, C.M. Kelly², C.L. Kemp¹, S. Haviland⁴, M. Fossum³, 1. *Georgia State University, Atlanta, Georgia*, 2. *University of Nebraska at Omaha, Omaha, Nebraska*, 3. *University of Agder, Kristiansand, Norway*, 4. *Rutgers University, New Brunswick, New Jersey*

As the population ages globally, the care of older adults with chronic disease and physical and cognitive impairment will require a significantly larger and more skilled direct

care workforce than currently exists. Many countries have migration policies to encourage workers to leave home and perform this important work. Others relegate the majority of the labor to vulnerable populations including women of color and immigrants. Do these jobs have to be “bad jobs” with poor compensation, few benefits and heavy workloads? This study comparatively examines the demographic composition and extrinsic characteristics of entry-level aged care jobs in select countries: U.S., Canada, United Kingdom, Australia, Denmark, Norway and China, paying particular attention to the social welfare, immigration and training policies for workers in home and community based settings. Data for this study come from country-specific interviews with the aging and employment context experts and publicly available data. Findings indicate there are similarities across these countries in the increasing demand for workers in both institutional and residential settings, particularly in localities with older and more rural populations. There is wide variability across countries in training pathways for aged care workers, in the structure of these programs (i.e. from on the job to 36 month long training requirements) as well as in specific competency areas (e.g. basic healthcare skills, observations and recordings, emergency training, communication and dementia-specific care). Social welfare policies have significant impact on the extrinsic rewards of these jobs across country setting. Implications for recruitment, retention, and social policy will be discussed.

ARTICULATING AGE: DIFFERENT PERSPECTIVES FROM EMPLOYERS AND UNIONS

M. Flynn, *Business School, Newcastle University, Newcastle upon Tyne, United Kingdom*

This paper will address the role of advocacy groups (specifically trade unions and employers (a.k.a social partners) articulate age as a workforce issue. As pension ages rise and older workers are being compelled to work longer, age inclusive HRM is increasingly becoming a topic of collective bargaining. Employers and unions have historically colluded to create early retirement pathways in order to push older workers out of work in order to make way for younger ones. Now, ‘social partners’ across Europe are developing joint programmes to support older workers in maintaining employability through lifelong learning, flexible retirement and healthy work environment. But have social partners shifted from a paradigm which ‘confirms the economic uselessness of older people’ does collective bargaining represent a new approach to workplace ageing? Using discourse analysis to examine 45 submissions to a review of retirement ages in the UK health services from unions and employers, this paper examines how social partners conceptualise age both in supporting and resisting extended working lives. The paper shows that although both sides recognise the need to create extended work pathways, they maintain both individually and a collective way arguments both favouring early retirement and expressing scepticism over the maintained viability of older people’s employability.

THE INFLUENCE OF THE GREAT RECESSION ON EMPLOYMENT OUTCOMES IN EUROPEAN OLDER WORKERS

H. Axelrad, E. Sabbath, S.S. Hawkins, *Boston College, Chestnut Hill, Massachusetts*

IAGG 2017 World Congress

The Great Recession in 2008–2009 affected the US and Europeans’ labor markets. This study examined whether the Great Recession was associated with employment status and indicators of job quality among older workers.

The data came from 4,917 respondents (16,090 observations) in 13 countries participating in the Survey of Health, Ageing and Retirement in Europe (SHARE). Annual data on Gross Domestic Product (GDP) per capita, life expectancy and quarterly unemployment rates were assigned to health and employment assessments from 2004–2013. Using fixed effect models, we assessed the recession’s implications on individual employment outcomes while isolating cyclical variation within countries and individual changes over time.

Results indicated that among older workers, decreases in GDP were associated with an increase in the likelihood of being unemployed and a decrease in the likelihood of being retired. Increasing country-level unemployment rate had no effect on the employment status but had a significant effect on aspects of job quality among those employed: an increase in hours worked per week, lower prospects for job advancement, lower job security and less satisfaction with salary or income.

We conclude that economic recessions affect employment outcomes of older workers. Socio-demographic factors can be affected by policy measures, to limit the negative employment and job quality consequences of a recession.

AGE SMART EMPLOYER AWARDS: DEMONSTRATION OF EFFECTIVE EMPLOYER ENGAGEMENT

R. Finkelstein, C. Adams, *Robert N. Butler Columbia Aging Center, New York, New York*

On December 9, 2015, a standing-room-only crowd of more than 250 employees, policymakers, researchers and advocates, gathered for breakfast as 11 employers were honored with Age Smart Employer Awards. The Awards began in 2012 as a strategy to identify employers who use evidence-based practices that promote working longer, honor employers who effectively engage and retain older workers, and provide resources and support to encourage others to follow. These 11 finalists were chosen from among 52 applicants through an extensive review process overseen by a selection committee of experts in workforce development, human resources, executive education, small business services, diversity, aging, and communications. Age Smart practices include: flexible hours and telecommuting; phased retirement; encouraging mentor/mentee relationships; wellness programs; recruiting older workers; cross-training workers; internal advancement opportunities; enlisting older workers to strategically retain and transfer the business’s networks and knowledge across generations; and engagement, training and development opportunities for workers of all ages. An example can be seen at 2015 finalist Brooks Brothers – LIC Factory, where their employees are given 1400 minutes off to use however they choose in addition to regular vacation time and sick days. Following the ceremony, finalists, who also included The NYU Langone Medical Center and NYC Small Businesses like Amy’s Bread and Metro Optics, received significant coverage in the business press, including the *Wall Street Journal*, *Forbes*, *Business Week*, *TIME Magazine*, and *Fortune*. The popularity of the Awards has

grown significantly since their inception and strategies for the future will be discussed.

ELDERCARE: CHALLENGES FOR HEALTH PROFESSIONALS AND FAMILIES

D.J. Monahan, V.L. Greene, *Social Work, Syracuse University, Syracuse, New York*

Eldercare is challenging when you are providing care to a relative and simultaneously providing care as a health care professional. This poster session examines factors associated with care burden in the home and in the workplace as a health care professional. Understanding the impact of eldercare is becoming increasingly important as adults are living longer and care responsibilities are increasing for family caregivers. Nurses employed in a skilled nursing faculty (N=72) were surveyed and the data were entered anonymously for SPSS analysis. Respondents mean age was 38.7 years (SD=.19), 95% were female (SD=.61), 48% were married (SD=.83), and 17% had children (SD=.38). Using "hours you are employed per week," as the dependent variable in the linear regression analysis, respondent's age, number of children, income, and years in current position were significant predictors. Factors in the workplace that were statistically significant predictors were as follows: years in your current position, income, and whether they missed work due to eldercare. However, work stress and hours providing eldercare were not statistically significant predictors. The adjusted R Square was .242 and was statistically significant (.006). Understanding which factors are predictive of workplace burden that are associated with longer hours employed will help employers/supervisors adjust work load to compensate for eldercare responsibilities. Workplace practice and employment policy decisions have implications for the well-being of eldercare family members and employees. This study raised important issues for human resource administration and the challenges associated with intergenerational care obligations for the family, the workplace, and society.

VIEWS ON TRADITIONAL RETIREMENT AMONG PEOPLE IN ENCORE CAREERS

C. Halvorsen, Y. Chen, *Washington University in St. Louis, Saint Louis, Missouri*

Although the topic of encore careers – work, past midlife, for the social good – has been featured extensively in published books, white papers, and the media, academic efforts to understand and quantify this type of work are in their nascent stages. Further, the association between encore careers and views of retirement – meaningful information that adds context to discussions about longer working lives – is unknown. Using data from the 2014 Encore Career Survey, a nationally-representative survey of 1,000 Americans between the ages of 50 and 70, this study asks a fundamental question about retirement: How do those in and not in encore careers view the traditional model of retirement – namely, a time to enjoy a well-deserved rest and pursue leisurely activities? Conducting four logistic regression models that incorporate propensity score weighting and one without, this study takes age, gender, ethnicity, education, perceived health, total household income and assets, employment status, and geographic location into consideration. Findings show that near-convergence was accomplished, with four out of five models indicating that those in encore careers were about half as likely to agree with

a more traditional view of retirement as those not in encore careers. By using propensity score weighting to control for the selection of observed factors that lead to being in an encore career, this study suggests that the act of being in an encore career may cause one's view of retirement to shift. Limitations to this approach, as well as implications of these findings and possibilities for future research, are discussed.

SESSION 4490 (POSTER)

GERONTOLOGY AND GERIATRICS EDUCATION

DEVELOPING ACADEMIC-COMMUNITY PARTNERSHIPS IN GERONTOLOGY: FROM CONCEPT TO PRACTICE

C.M. Flores^{1,2}, D. Yee-Melichar¹, 1. *Gerontology, San Francisco State University, San Francisco, California*, 2. *Eldercare Advocacy Bay Area LLC, San Francisco, California*

Social research, policy and practice related to academic and community partnerships for gerontology in higher education are reviewed, and practical ideas are offered to help educators move toward partnership. It is a concept of partnership that enables San Francisco State University's Gerontology Program to implement an innovative partnership with Eldercare Advocacy Bay Area and other community-based organizations. This session describes how gerontology students benefit from partnerships established by SF State's Gerontology Program with reliable and reputable community partners. Gerontology students often benefit from internship placement experiences that may enhance their ability to fully develop and engage in the learning necessary to be successful. By establishing partnerships with community-based organizations, we have provided our students with a variety of internship placements and learning environments to meet the changing needs of emerging gerontologists. We also collaborate with State approved vendors to provide students with the required internships and training necessary to enter the field of Long Term Care Administration as Assisted Living Administrators and Nursing Home Administrators. For 20+ years, we have measured student success with a variety of indicators including academic success, student satisfaction, and job placement. Data collected from internship students, preceptors and vendors has shown that the academic-community partnerships have improved in their ability to become learning opportunities committed to education, community service and quality assurance. By discussing the relationship between education and practice, our model has been shown to promote the development of mutually beneficial interactions for our students and the community partners with whom they learn.

BUILDING A THEORETICAL FOUNDATION FOR COMMUNICATIVELY-DRIVEN CULTURE CHANGE IN LONG-TERM CARE

J. Carson¹, S.L. Dupuis², S. Arai², 1. *Community Health Sciences, University of Nevada, Reno, Reno, Nevada*, 2. *University of Waterloo, Waterloo, Ontario, Canada*

The culture change movement is an international effort to transform inhumane health care institutions into person- and relationship-centered homes and communities. Recent decades have seen a proliferation of approaches, ranging from implementation of expert-developed models

to grassroots community organizing. However, theories to guide specific approaches remain underdeveloped. This session addresses this theoretical gap by elucidating key differences between communicatively-driven and expert-driven approaches, offering clear and compelling support for the former. Schlegel Villages, a long-term care organization with 12 communities in Ontario, Canada, embarked on organization-wide culture change guided by critical participatory action research (CPAR) based on Habermas' theory of communicative action and Foucault's power/knowledge theme. The research component of this initiative spanned 4 ½ years. Among other CPAR activities designed to engage all Village members, the research concluded with a series of critical reflections including active interviews with 29 members of the CPAR team. Using the requirements of communicative action as a framework for analysis of these interviews, findings demonstrate the relevance of these requirements for culture change, including: 1) generality: inclusion of all affected parties in discussion and action; 2) autonomy: assurance of equal possibility to present and critique ideas; 3) ideal role-taking: willingness and ability to empathize with another's perspective; 4) power neutrality: protection against power differences in decision making; and 5) transparency: full disclosure of intentions and suspension of individual agendas. This session provides a theoretical foundation and highlights how a group of people, committed to collaborative reflection and action, can co-create effective and sustainable culture change.

HOUSEHOLD ARRANGEMENTS AND PSYCHOLOGICAL HEALTH AND SATISFACTION WITH FAMILY OF BRAZILIAN ELDERLY

L.F. Araujo¹, D. Firmino Rabelo², A. Liberalesso Neri³, 1. *Psychology, Universidade Federal do Piauí, Parnaíba, Piauí, Brazil*, 2. *Universidade Federal do Recôncavo da Bahia, Santo Antonio de Jesus, Bahia, Brazil*, 3. *Universidade Estadual de Campinas, Campinas, Brazil*

The aim of the present study was to analyze the relationship between family configuration, the physical and psychological health conditions of the elderly and their satisfaction with family relationships. A study was undertaken of 134 older people from Bahia-Brazil, measuring Family Configuration (living arrangements, head of household, financial contribution of the elderly); Physical (diseases and self-reported symptoms and signs, performance of basic and instrumental activities of daily living, social involvement) and Psychological health conditions (depression and anxiety); Family APGAR. Cluster analysis was performed by the partition method (three groups). The majority of the elderly persons were heads of household (72.4%), who contributed to the financial upkeep of their family (total: 49.2%; partially: 44%), lived in multigenerational arrangements (64.9%), had good physical functionality, did not suffer from depression (82.9%) or anxiety (76.9%) and judged their family to have good functionality (85.8%). The variables that most contributed to the formation of clusters were basic activities of daily living ($R^2 = 0.725$) and family functionality ($R^2 = 0.757$). Clusters were: 1) elderly persons who needed help to perform instrumental activities of daily living, who suffered from anxiety and were dissatisfied with family relationships; 2) elderly individuals who were dependent

for the performance of activities of daily living, who suffered from anxiety and were satisfied with family relationships; 3) independent elderly persons who were satisfied with family relationships. There were reciprocal relationships between the satisfaction of the elderly individuals with their family relationships and their levels of physical functionality and mental health.

THE IMPACT OF FAMILY DIFFICULTIES ON HEALTH TRAJECTORY AMONG MIDDLE-AGED AND ELDERLY IN TAIWAN

S. Che¹, D. Chen², 1. *Institute of Health Policy and Management, College of Public Health, National Taiwan University, Taipei city, Taiwan*, 2. *Institute of Health Behaviors and Community Sciences, College of Public Health, National Taiwan University, Taipei city, Taiwan*

Studies have shown that difficult life events in family have adverse impact on family members. However, most studies focused on a particular health outcome at certain point of time, usually the endpoint of a follow-up period. This study aims to understand: 1) the trajectories of self-rated health change from 2005 to 2014 in a sample of middle-aged and elderly subjects in Taiwan, 2) the impact of family difficulties on the trajectories of self-rated health change, and whether there are age and gender-specific pattern of health change trajectories.

The study analyzes the data of Panel Study of Family Dynamics from 2005 to 2014. Multilevel growth models were conducted. Subjects aged above 40, have at least one family member in 2005, and at least three time points of data were included. A total of 1955 subjects were included.

Results indicated that, for all subjects, self-rated health deteriorated as time went by. However, only for subjects who were aged 65 or above in 2005, self-rated health problems became worse as time went by from 2005 to 2014. Low quality of family relationship, widowhood and parental loss are the factors that predicted the poor health trajectory. For men, widowhood and parental loss are crucial predictors, yet poor quality of family relationship can predict poor health trajectory for women.

The results suggest that poor health trajectory is associated with family difficulties, and there are age and gender differences. We should be aware of the differences when implementing interventions, to fulfill different needs of different individuals.

REINFORCING THE GERIATRIC RESOURCE NURSE MODEL: ASSESSING THE IMPACT OF INNOVATIVE TRAINING

P. Rosenfeld, M. Lopez, *Nursing, NYU Langone Medical Center, New York, New York*

The growing proportion of older adults in this academic medical center, up to 83% on some services, underscores the need for unit-based providers trained in geriatrics. Since 1997, this institution has sustained a Geriatric Resource Nurse (GRN) program to ensure patient-centered care and serve as interdisciplinary team resources. Currently, 88 GRNs are distributed across 14 patient care units, including ER and ICU. Quality measures, such as falls and pressure injuries, indicate strong associations between the presence of GRNs and positive outcomes.

Our structured GRN training program blends elements of the national Nurses Improving the Care of HealthSystem Elders (NICHE) program -- which offers on-line self-paced modules -- with unique supplemental resources and activities. Two innovative educational modalities reinforce geriatric knowledge and competence: (i) SHARING tool (acronym for 7 geriatric conditions) provides guidance on patient assessments tools and (ii) Geriatric Jeopardy, inspired by the TV show, advances knowledge from novice to expert and also used for inter-professional training. Analysis of NICHE national data on on-line training performance found statistically significant differences ($p < .001$) in completion and time to completion rates among RNs using our blended model (100% in 90 days) and RNs using NICHE on-line training (54% completion in 252 days). These findings suggest that combining innovative learning resources and structured training strengthens RN geriatric knowledge and competencies beyond on-line training.

This presentation will demonstrate the SHARING tool and Geriatric Jeopardy in addition to a full discussion of the elements of the GRN program and associated outcome data.

MAINTAINING VOICE, MINIMIZING BIAS: USING QUALITATIVE METHODS TO PRODUCE ME AND MY WISHES VIDEOS

G.L. Towsley, L. Ellington, A. Harris, N. Wigdor, W. Hull, *University of Utah, Salt Lake City, Utah*

Technology use in long-term care settings can facilitate person-centered care. *Me & My Wishes* are facilitated, person-centered video-recorded conversations to communicate everyday living and end-of-life (EOL) care preferences. Four 5-minute video modules (about me, preferences for today, preferences for end of life, and afterthoughts) provide long-term care residents an opportunity to talk about their wishes in a way that facilitates conversations with staff and family. *Me & My Wishes* videos are a way to present resident preferences in an objective way that facilitates conversation about preferences and maximizes adherence, but family members and staff may not view a lengthy video. In addition, bias and misrepresentation of resident wishes can be introduced through the editing process. To minimize potential bias we consulted our advisory panel about the interview questions and editing process. On average, raw footage videos were 55 minutes and edited to 17 minutes. We utilized qualitative methods (e.g. viewing videos in entirety, directed coding, member checks) to develop a systematic, 3-step video editing process to maintain the resident's voice. In Step 1 we viewed each video in its entirety. Step 2: We evaluated each video for redundancy, relevancy, and context using our novel flowchart of comparison and consensus codes. Step 3 consisted of having the resident view the edited video and provide feedback. Our procedure demonstrates a systematic process which illustrates how employing qualitative methods facilitated the production of a video that maintained the resident's voice and is time-sensitive to those who view it in long-term care settings.

EXPLORING GRANDPARENTING IN THE CONTEXT OF CHILDHOOD DISABILITY: INTERGENERATIONAL RESEARCH METHODS

H. Merrick¹, S. Moffatt¹, L. Pennington¹, J. McLaughlin², *1. Institute of Health and Society, Newcastle University, Newcastle upon Tyne, United Kingdom, 2. School of*

Geography, Politics and Sociology, Newcastle University, Newcastle upon Tyne, United Kingdom

In Europe and elsewhere the majority of men and women aged over 50 are grandparents and play a vital role in providing grandchild care. Age, gender, health status, living arrangements, employment and welfare state policies are known to influence grandparental involvement. Available evidence indicates that grandparents can play a crucial role in the care of disabled grandchildren, their adult children and the entire family unit. The lived experience of grandparenting in this context has received scant attention in research, policy or practice, yet advances in neonatal and paediatric care have resulted in more children surviving with disabling conditions. This study aims to explore the relationships between grandparents, their adult children and their disabled grandchildren from an intergenerational perspective. Initial recruitment of grandparents will take account of age, gender, social class, employment status, retirement age and reasons, health status, adult child's partnership status, grandchild's disability and 'intensity' of grandparental care. Grandparents will be recruited through 'gatekeeper' organisations. Narrative interviews with 30 grandparents generating data about intergenerational family dynamics and the meaning and value participants give to the caring relationships are the first stage, then adult children and grandchildren where possible. Involving multiple generations in the context of disability is challenging, but will give voice to hitherto under-researched groups. We will explore life course influences, as well as life trajectories and explore what happens as grandparents, adults children and grandchildren age. The study will inform key debates, such as how extending working life policies, can impact on families with disabled children.

ASSESSING EFFECTIVENESS AND PREFERRED FEATURES OF ONLINE EDUCATION FOR GRANDFAMILIES PROFESSIONALS

J. Crittenden, A. Mitchell, D. Wihry, L.W. Kaye, *UMaine Center on Aging, Bangor, Maine*

Online education is increasingly becoming the vehicle of choice for continuing education opportunities in the field of aging. In response to this trend, the University of Maine Center on Aging recently facilitated an online certificate program designed for frontline providers and administrators who support grandparents raising their grandchildren. Certificate curriculum, administered using an online open source platform, included both program administration and clinical topics related to serving this population. The program was administered over a twelve-week period and consisted of nine content delivery modules. A final evaluation survey was administered to participants to assess the program, identify topic areas readily translated into practice by participants and to identify curriculum gaps. Respondents ($N = 22$) represent 11 states and job titles generally reflect program management/leadership positions and direct service provision roles within the nonprofit sector. Participants noted self-reported improvements in their knowledge ($M = 4.41$), skills ($M = 4.36$), and comfort level ($M = 4.50$) serving grandfamilies based on a five-point likert scale. Program features rated highly on a four-point likert scale include: quality of training content ($M = 3.95$), module quizzes ($M = 3.95$), pace and duration ($M = 3.82$) and the ease of learning platform

use ($M = 3.68$). Features receiving lower ratings include discussion forums ($M = 3.27$), and use of a cohort model ($M = 3.57$). Needed curriculum enhancements included localized resource content-specific clinical guidelines related to children and families, and legal and medical resources.

AUTISM SPECTRUM DISORDER IN MID AND LATER LIFE

S.D. Wright¹, C. Wright², 1. *University of Utah, Salt Lake City, Utah*, 2. *Family and Consumer Studies, University of Utah, Salt Lake City, Utah*

Even though many people perceive autism spectrum disorder (ASD) as a childhood disorder, ASD is in fact a lifelong condition. There is the need to create greater awareness of the convergence of trends in relation to ASD and aging, especially in relation to the demographic, social, economic, and health care systems. The scholarship and research activity, as well as the *understanding*, of autism issues in adulthood and aging can be considered the discovery of new territory slowly being mapped and catalogued. Yet there is a demonstrated gap representing what we *do not know* regarding the array of gerontological issues with ASD. This presentation represents a step to address that gap with a review of where we stand and an examination of several dimensions (using a bioecological model) that are relevant to “bridge-building,” which is the metaphor for increasing and expanding services and resources for autism issues and the aging experience. This presentation is based on the completed scholarship that has brought together an international range of personal, research, and clinical perspectives of ASD in mid and later life. The presentation will take a multidisciplinary approach and cover the historical and contemporary perspectives of aging with ASD, including diagnosis, developmental outcomes, and life course issues. In addition, the presentation will examine not only the challenges of growing older with ASD, but also describe the positive ways in which the future for older individual with ASD may be improved.

THE MENTORING SWITCH: TWO-WAY MENTORSHIP PROGRAM 2ND ROUND

L. Jiang¹, C. Brown², M.R. Gugliucci³, 1. *University of Denver, Denver, Colorado*, 2. *Duke University, Durham, North Carolina*, 3. *University of New England, Biddeford, Maine*

Mentorship is important in the field of aging. Traditional mentorship is a one-way consultation process, in which the emerging scholars learn from senior scholars. However, mentoring partnerships work best as a two-way exchange. In this session, referred to as the Mentoring Switch: Two Way Mentorship Program, seasoned scholars will be the recipients of mentorship from emerging professionals. This session was first held at the 2015 GSA Annual Scientific Meeting and based on survey results were quite successful. The key aim is to have international emerging professionals share personal and professional insights and experiences with international senior scholars on specifically chosen topics. The rationale of this program is to continue the cycle of learning by providing current mentors (often senior scholars) a chance to learn from emerging professionals (often recipients of mentorship). Twelve (12) invited senior scholars will be matched with 12 emerging scholars. The topics include: (1) international aging,

(2) minority culture, (3) technology/social media, (4) interdisciplinary research, (5) teaching methods, and (6) student needs. This session will challenge the prevailing paradigms of mentorship including mentee and mentor roles, expand the depth and breadth of mentorship, and foster intergenerational and international communication. The Mentoring Switch was designed to be sustainable through establishing a work plan to foster future mentee/mentor “Two Way” collaborative efforts within GSA among students, emerging scholars, and senior scholars. Event participation is by invitation only. The grant from The Mentoring Effect is pending.

AERONAUTS 2000 PILOT INTERGENERATIONAL PROJECT: SENSITIVITY TRAINING

A. Johnson^{1,3}, M. Milidonis², 1. *Center for Intellectual Property, Technology and Telecommunications, Inc., Beachwood, Ohio*, 2. *Cleveland State University, Cleveland, Ohio*, 3. *University of Akron, Akron, Ohio*

This pilot program engages a diverse group of high school and college students in a creative learning process to become more sensitive to the challenges of aging and improve intergenerational communication. Sensitivity training occurred through classroom work, online work, and engaged experiences with older adults. Engaged experiences included 1) student-lead focus groups with 34 older adults, ages 55–95, from diverse, racial and socioeconomic status, with fair to excellent health; 2) sensory and cognitive ability challenge exercises; and 3) collaboration on 30-second YouTube videos on effective communication with older adults for social media. Student learning activities also included “walking in the shoes exercises,” communication strategies, empathy skills, and reflective exercises. Program outcome measures demonstrate applied reasoning, problem solving and team work, as well as changes in student attitudes about seniors through empathy scales, aging myth scales, and development of gerontechnology tools for aging in place. Measurements were evaluated through pre and post-tests, and reviewed by external evaluators. Interns completed an online workbook with customized content that provides formative assessment. Fourteen participating student interns are ages 17–30, of average and above average aptitude, interdisciplinary study interests, and diverse racial and gender status: 65% male (9), 35% female (5); 29% African American (4), 29% Asian (4), and 43% Caucasian (6). The goal is to validate learning methodologies for skill-based learning and outcomes to scale the project for half-day workshops targeting underserved public middle and high school students to promote civic engagement.

UNIVERSAL CARE: IS THERE A COMMON GLOBAL TRAINING CURRICULUM FOR ELDER CARE STAFF?

U. Borjesson², M.E. McCall¹, 1. *Nursing, Samuel Merritt University, Oakland, California*, 2. *Jonkoping University, Jonkoping, Sweden*

As many countries are facing similar demographic changes and aging populations, the question of meeting these needs is a global one. As an increasingly global village, there is much to learn from each other in terms of education and training of those who support our older people. Although the idea of a common knowledge base has been questioned and debated (e.g., Payne), the issue of whether this is feasible and

desirable remains. With examples from educational efforts within a municipality in Sweden, as well as an examination of certificate programs available to elder care staff in the United States, various ways of supporting professional staff working with older people is described and discussed. We explore the idea of finding a core of knowledge for staff and how this can be elaborated for professionals.

DEMENTIA CONNECTIONS: A COLLABORATIVE APPROACH TO LEARNING TO BE PRESENT

K. Niles-Yokum¹, R. Harrison^{2,1}, 1. *Gerontology, University of La Verne, La Verne, California*, 2. *Hillcrest Retirement Community, La Verne, California*

The World Health Organization (WHO, 2015) estimates that the number of persons living with Dementia is expected to increase worldwide to 75.6 million by 2030. Gerontologists play a key role in addressing many of the challenges facing persons with dementia, including feelings of isolation and loneliness common in this population. As a way to address and better understand these issues the University of La Verne and Hillcrest Retirement Community have been piloting a new program entitled “Dementia Connections” (DC). This program incorporates the concept of “being present” as a meaningful approach to working with feelings of isolation and loneliness. The DC program connects masters level gerontology students with residents living in a memory care environment. Students learn to “be” with their partners (rather than doing something *to* or *for* them). In the process, students explore person-centered memory care, their own attitudes about dementia, and learn about providing important social, psychological, and emotional connections to this population. This poster will provide information about Dementia Connections including the program format as well as details and preliminary findings from a variety of perspectives. We will discuss this challenging yet rewarding program and how to overcome barriers, and embrace opportunities.

THE TEACHING OF GERIATRIC DENTISTRY IN SOUTH AMERICA COUNTRIES

A.S. Ferreirade Mello, M. Ruiz Nunez, H. Godoi, *Universidade Federal De Santa Catarina, Florianopolis, SC, Brazil*

The Geriatric Dentistry (GD) is the area of dentistry that deals with the knowledge and skills required to provide oral health care for the elderly. This study aimed to characterize the teaching of GD in dental schools in countries of South America. It is an exploratory research, descriptive with qualitative approach. Was held in public universities of five countries of South America: Brazil, Peru, Argentina, Colombia and Chile, 9 intentionally selected by the type, nature and hours of GD discipline. The participants were 20 teachers affiliated to GD disciplines and 30 students of the last year. Data were collected through open interviews, conducted by one researcher, recorded in digital form and analyzed by the Content Analysis technique. It was identified six categories of analysis: GD teaching features in undergraduate dental schools; Teacher training for GD teaching; Teacher motivation in relation to the phenomenon of aging of the population and its consequences; Teacher of GD in undergraduate dental schools; The student in the GD teaching-learning process; and Difficulties in the GD teaching-learning process. It was

observed the relevance of the presence of GD discipline in the curriculum. Inserting content on gerontology and geriatrics in the dental curriculum will enable students to be better prepared to assist this population. The study also underscores the need for graduate students to have the opportunity of developing skills related to the management of oral health of the elderly population, from practical classes and in diverse scenario.

SESSION 4495 (POSTER)

HOME CARE

PERSONAL HEALTH INFORMATION MANAGEMENT OF OLDER ADULTS IN THE HOME HEALTH CARE SETTING

Y. Kang, K. Osterhage, A. Turner, *University of Washington, Seattle, Washington*

Demand for home health care services for older adults is rapidly increasing. Older adults have the greatest number of chronic diseases and consequently are the largest consumers of home health care services in the US. Patient-centered technologies that support personal health information management for patients, such as patient portals, are being developed; however, little is known about how older adults and their caregivers use patient portals and whether health information is exchanged between patients and home health care providers. Home health care nurses represent the largest group of home health care providers. The purpose of our qualitative study is to gain insight into the health information exchange between older adults and home health care nurses. We are conducting semi-structured interviews with approximately 15–20 home health care nurses employed by two home health care agencies located in Philadelphia and in Seattle. We have completed nine interviews and intend to continue enrolling participants until we reach saturation. We will discuss the results of our qualitative interviews including the role of home health care nurses in personal health information management of older adults, specifically with regard to patient portal use. We will analyze barriers and facilitators to health information exchange between older adults and home health care nurses. These findings will contribute to the development of design criteria for a tool to support the health information management needs of older adults, their caregivers, and their providers.

EXPLORING SUITABLE HOME CARE MODEL FOR COMMUNITY-DWELLING DISABLED OLDER ADULTS IN BEIJING

M. Zhu¹, X. Liu¹, L. Kang¹, N. Zhang¹, X. Ning¹, P. Zeng¹, N. Wang², 1. *Geriatric, Peking Union Medical College Hospital, Beijing, Beijing, China*, 2. *Pinetree Senior Health, Beijing, Beijing, China*

Background: China is experiencing a rapid growth of elder people which demands suitable health care models for the disabled community seniors to meet the government’s “aging at home” policy.

Objective: To establish the geriatric care model for “home based” health care for the disabled or frail seniors in urban communities.

Methods: 1207 urban community seniors were screened and the volunteered disabled or frail seniors were enrolled. The geriatric team and community health care works were organized to provide geriatric health care services for the intervention group.

Results: 103 seniors who were frail or disabled were selected for intervention, with 105 similar seniors as control. The mean age of the intervention group was 78.8 ± 8.3 , as well as 79.4 ± 8.2 of the control group. After 1 year intervention, the improvement of ADL score has no difference between two groups, but the health status of the intervention group were more stable or improved than control (73.7% vs 57.1%, $p=0.023$). We also found that, in the intervention group, it is likely that the seniors with poor family or social support may have more ER visits and hospitalizations, which may also affect the medical intervention.

Conclusion: For the disabled seniors in urban community of Beijing, the in-door health care services might be more doable. Only health care services without the supports of assist living may reduce the effectiveness of home medical services. It is important for the government to combine assist living with medical services for the seniors.

FACTORS RELATED TO QOL AND WELL-BEING OF THE ELDERLY WHO NEED HOME CARE AND THEIR CAREGIVERS

T. Yamanaka¹, Y. Hirota¹, A. Oda³, T. Furuta², S. Yoshie¹, Y. Matsumoto¹, K. Iijima⁴, M. Akishita⁵, 1. *Center for Home Care Medicine, Faculty of Medicine, The University of Tokyo, Tokyo, Japan*, 2. *Furuta Clinic, Chiba, Japan*, 3. *Home Clinic Kashiwa, Kashiwa, Japan*, 4. *Institute of Gerontology, The University of Tokyo, Tokyo, Japan*, 5. *Department of Geriatric Medicine, Graduate School of Medicine, The University of Tokyo, Tokyo, Japan*

Aim: For the elderly with reduced life function, it is desired to maintain the quality of life (QOL) and well-being as possible as they can. In this study, we aimed to elucidate QOL and well-being status of the elderly who needed home visits by physicians and their caregivers, and to examine the factors related to them. **Methods:** We registered the elderly patients living in the community who needed home visits by physicians in Kashiwa-city, Chiba, Japan. We conducted a questionnaire survey of them and their caregivers. The survey items were ESAS-r-J, EQ-5D-5L-J, WHO-5-J, SDM-Q-9-J for the elderly patients, EQ-5D-5L-J, WHO-5-J, SDM-Q-9-J and J-ZBI_8 for the caregivers. **Results:** We got answers from sixty elderly patients and fifty-three their family caregivers. For the questionnaire "Are you living worthwhile lives?", only 15.8% elderlies answered "Yes". We examined the correlation between each survey item. WHO-5-J score of the elderly was positively correlated with their health status ($r=.4550$, $p=.00070$), EQ-5D-5L-J score was negatively correlated with the level of certification of care needs ($r=-.4321$, $p=.00071$). For the caregivers, WHO-5-J score was positively correlated with EQ-5D-5L-J score ($r=.4189$, $p=.00222$), health status ($r=.5706$, $p=.00002$), and was negatively correlated with J-ZBI_8 score ($r=-.5796$, $p=.00001$). **Conclusions:** The health status felt by the elderly themselves was supposed to have the relationship with the mental health. To sustain the caregivers' own health status and to reduce care burden

were important for maintaining well-being and QOL of the caregivers.

SESSION 4500 (POSTER)

INVOLVEMENT IN THE COMMUNITY THROUGH VOLUNTEERING AND CIVIC ENGAGEMENT I

THAI VILLAGE HEALTH VOLUNTEERS: CAPACITIES FOR PROVIDING COMMUNITY-BASED AGED CARE

P. Vatcharavongvan, J. Kummabutr, *Thammasat University, Pathum-Thani, Thailand*

Village health volunteers have a long history in Thailand. Their major roles are to provide self-care and to communicate health information to people, including the elderly, in a community. This study aimed to assess their capacities in providing community-based aged care using empowerment assessment rating scales. The instrument qualitatively assessed nine community empowerment domains: participation, leadership, organizational structure, program management, problem assessment, asking-why (critical assessment of a problem), resource mobilization, links with others and roles of outside agents. Each domain comprised five phrases representing levels of capacities. Two groups of village health volunteers participated and were separately assessed for the capacities using a workshop approach, in which the participants actively engaged in the assessment. The phrases in each domain that closely reflected the capacities were chosen and could be altered to describe actual situations. Both groups demonstrated their most developed strengths in program management and resource mobilization. For example, they received sufficient support for their community projects, such as social visits to the elderly. The least developed capacities included participation, problem assessment and asking-why. For example, community members did not have an active role in defining community health problems of the elderly. This study suggests that involving community members in problem assessment and promoting effective information sharing among village health volunteers are key strategies to improve capacities of village health volunteers, especially in the least developed domains, in providing aged care in a community.

REACHING ALL CORNERS OF A RURAL STATE TO INFUSE GERIATRICS INTO PRIMARY CARE PRACTICE

C. Clarke, E. Schneider, T.E. Shubert, E. Roberts, J. Busby-Whitehead, *School of Medicine, Division of Geriatrics, University of North Carolina, Chapel Hill, North Carolina*

Critical shortages in Geriatricians, especially in rural areas, require innovative training models. Building upon its strong partnerships across the state with various agencies, the University of North Carolina at Chapel Hill (UNC-CH) reaches rural communities through numerous methods. These include targeted webinars; statewide symposia on behavioral health and falls prevention; regional trainings; and quarterly coalition meetings that can be attended in person or via teleconferencing. Using these mixed methods to deliver education on geriatric topics provides the opportunity to reach

rural audiences where they are and at convenient times for them.

Evaluation metrics include participant evaluations; attendance at training events; satisfaction with educational products; and outside funding. Coalition longevity and attendance are also indicators of value.

As a result of our combined efforts, statewide policy and funding in addressing geriatric issues have both been enhanced. Evaluation results of trainings indicate that attendees gained new ideas and strategies to address geriatric topics in their organizations and increased their understanding of evidence-based programs. The success of the coalitions has attracted additional grant funds to rural North Carolina such as the Administration on Community Living falls prevention grant to deliver evidence-based falls prevention programs. Additionally, funders such as the Kate B. Reynolds Charitable Trust have sponsored numerous behavioral health coalition and statewide program initiatives.

Reaching rural areas that have limited resources requires a variety of distribution channels and strong partnerships. Educational trainings and products create concrete value that can then be leveraged into statewide action, which impacts policy and funding.

WHY HAS OLD-AGE POVERTY BECOME WORSE IN SOUTH KOREA? RESULTS FROM DECOMPOSITION ANALYSIS

I. Ku, C. Kim, *Social Welfare, Seoul National University, Seoul, Korea (the Republic of)*

Unlike most western welfare states, lately industrialized countries in East Asian region have faced a serious problem of elderly poverty. Particularly, the recent South Korean experience is very suggestive in that it evidently shows what would happen to the elderly in the world without mature old-age income security programs. As a case study of Korea, this study aims to show which factors worsen old-age poverty in the era of population aging and assess their contributions quantitatively. By applying the Oaxaca-Blinder decomposition method, we examine contributions of changes in both characteristics of the elderly and their income structure to the worsening elderly poverty. Furthermore, we develop a budget incidence simulation model to decompose effects of income structure changes into changes in income components such as market income, private transfer, and public transfer. Data come from the Household Income and Expenditure Survey administered by Korea Statistical Office. Results show that the worsened elderly poverty since the mid-1990s was largely explained by two factors: the rapidly increasing number of elderly households living apart from their adult-child and the growth of the old elderly. The gradually rising public transfer income, although it more than offset the decline in both private transfer and market income, was found to be insufficient to prevent the rising poverty trend due to the drastic demographic changes.

PROTECTIVE FACTORS FOR SUICIDE THAT ARE COMMON ACROSS AREAS WITH LOW SUICIDE INCIDENCE

M. Oka, *Wakayama Medical University, Wakayama, Japan*

The purpose of this research was to identify the protective factors for suicide in the areas with low suicide

incidence (ALSI). This research was conducted in ALSI and the areas with high suicide incidence (AHSI) within Kyoto Prefecture Japan, based on interviews, followed by questionnaire surveys of a stratified random sample of residents per area (930 surveys distributed with a 91.7% response rate).

Compared to AHSI, ALSI showed a weak sense of exclusion and class-consciousness, with an evaluation system of others based on personality and ability, plus little reluctance to seek help, showing an overall low tendency toward vulnerability against suicide risk factors (feeling of giving up easily or having an inclination toward suicide). The phenomenon appeared more strongly in the elderly. These points also coincided with the protective factors for suicide identified in our previous research.

The increase of suicide rate of ALSI after the collapse of bubble economy was the smallest in the neighborhood.

DIFFERENCES OF HEALTH LITERACY WITH COUNTRY OF ORIGIN AMONG ELDERLY PEOPLE LIVING IN JAPAN

Y. Aihara, *Kobe City College of Nursing, Kobe, Japan*

In Japan, the ageing rate is high among the ethnic minority groups. However, health literacy within the scope of ageing and ethnocultural diversity is limited. This study aimed to assess and explore the associated factors of health literacy with respect to multiplicity of languages among the elderly people living in Japan. Face-to-face interviews were conducted to 40 non-Japanese native speakers (Vietnamese, Korean, and Chinese). Health literacy was measured with the 14-item health literacy scale which assesses three dimensions of health literacy (functional, communicable, and critical). Health literacy scores were the highest among Chinese speakers, followed by Korean and then Vietnamese speakers. A Kruskal-Wallis test showed that the critical health literacy scores differed significantly with the country of origin (p -value = 0.004). A linear regression model showed that higher education, younger age, good Japanese language skills, and multiple sources of health information were associated with adequate health literacy. The open-ended questions explored that 85% of the participants did not face any difficulty in communication with health workers, as they had either an interpreter or translation support within their family. Chinese speakers reported that they tried to get health information from Japanese, as they could assume the meaning from Chinese characters (*Kanji*). Korean participants said they were too old to learn and seek health information. The Vietnamese participants said that they relied on doctors or that "God gave health". This study suggests that healthcare workers should realize the complexity of providing services and information to these minority sections of the population.

LOCAL NETWORKS CAN MANAGE DEMOGRAPHIC CHANGE AND KEEP UP THE QUALITY OF LIFE FOR SENIOR CITIZENS

M. Wegner, 1. *Munich University of Applied Sciences, Munich, Germany*, 2. *Federal Ministry for Family, Seniors, Women and Youth, Berlin, Germany*

In Germany demographic change is already visible: especially in rural areas population is decreasing and at the same time the remaining population is getting older which is connected

to new requirements regarding their quality of life. Local policies thus have to bundle resources and initiate tri-sectoral cooperation as well as cooperation with other communities in order to be able to maintain adequate and socially just living standards. In this respect the problems of building and maintaining the relevant networks will be the topic of this paper referring to network theory as well as practical experience in community projects. One focus will be on a project that the author has been managing since January 2016 for the German Federal Ministry for Family, Senior Citizens, Women and Youth as part of a part-time delegation from university. The so-called “Demography Repairshop for Communities” is designed to fix problems resulting from demographic change by monitoring and providing consulting advice to eight selected communities of various sizes and (geographical, economic, social, demographic) backgrounds. As part of the project the entire range of potential problems a community might have as part of demographic change are dealt with: mobility, care, welfare services, leisure time activities, shopping facilities etc. The communities try to find innovative solutions to demographic challenges by forging alliances and networks, between social actors as well as between local entities.

RELATIONSHIP BETWEEN PARTICIPATION IN SALON ACTIVITIES AND HEALTH FOR ELDERLY PEOPLE

S. Murayama^{1,2}, T. Takahashi^{1,3}, E. Kobayashi¹, M. Yasunaga¹, M. Hasebe^{1,4}, S. Ogawa^{1,5}, Y. Fujiwara¹,
 1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Aoyama Gakuin University, Graduate School of Education, Psychology and Human Studies, Tokyo, Japan, 3. Yokohama National University, Graduate School of Environment and Information Sciences, Yokohama, Japan, 4. Seigakuin University, Faculty of Human Welfare, Kamio, Japan, 5. Chuo University, Graduate School of Letters, Psychology Course, Hachioji, Japan

In Japan, some elderly people do voluntary group activities (for example, tea party or physical exercises) in order to prevent isolation from their local community. The places that provide such activities are typically called “salon”, and social welfare councils support them by providing subsidies or conducting public relations campaigns. The purpose of our study is to examine how participation in salons relates to the health of mind and body for elderly people who have less commitment to region activities. We conducted a questionnaire survey for 230 general public participants aged 65 and above belonging to salons in Itabashi Ward, Tokyo (211 women, 19 men, mean age 77.8 years \pm 6.5). The subjects usually take part in both neighborhood community associations and volunteer activities less than twice in six months, but attend salons once a month or more. As a result of factor analysis, we found that the participants felt two kinds of changes through belonging to salons: (a) personal changes such as increasing frequency to go out and (b) changes in connection with local community such as growing attached to regions. Moreover, as a result of correlation analysis, we found that both (a) and (b) had positive correlation with the following variables: the degree of desire to participate in salons continuously, satisfaction for the salon activities, and subjective assessment of physical and mental health. We have

concluded that salon activities may have positive effects for the health of elderly people who have less commitment to other region activities.

OLDER ADULTS' PERCEPTION OF SUCCESSFUL AGING IN SOUTHERNMOST PROVINCES OF THAILAND

M. Adulyarat, 1. Miami University, Thasala district, Nakhon Si Thammarat, Thailand, 2. Mahidol University, Phuttamonthon, Nakhon Pathom, Thailand

Thailand is experiencing an increase in its proportion of older adults. For more than a decade, the southernmost provinces of Thailand, namely Yala, Pattani and Narathiwat, have experienced social and political unrest, which has impacted the older adults residing in these regions. Using a phenomenological approach, this study examines older adult's perceptions of successful aging in the area. This research aims to 1) understand how older adults living in these areas perceive successful aging in relation to Rowe and Kahn's successful ageing model, and 2) describe the experiences of older adults living in areas of violent social and political unrest. Data were collected using in-depth interviews with eight local older adults and analyzed data using content analysis technique.. The local older adults did not view the situation as a threat to their life for they viewed that they are not the targets of the unrest situation. Additionally, participants identified their religious beliefs and a strong sense of community belonging as coping strategies. Thus, according to them, the violence did not affect their perception of successful aging. While the results were generally consistent with aspects identified in the successful aging model proposed by Rowe and Kahn, a theme of “financial stability” emerged. The results can be divided into four interrelated themes, which are; 1) engaging with others; 2) religiosity; 3) financial stability; and 4) health. Understanding the older persons' view of successful aging in vulnerable situations should add more depth and enhance the conceptualization of the successful aging concept.

THE INTERRELATION OF INSTITUTIONAL CARE AND SUCCESSFUL AGING

N. Sapsopha, 1. Institute for Population and Social Research, Mahidol University, Salaya, Nakornpathom, Thailand, 2. Miami University, Oxford, Ohio

This qualitative research investigates the relationship between institutional care and successful aging among the institutionalized Thai older adults at a non-profit facility in Bangkok, Thailand. Specifically, it examines: a) How do institutionalized older adults define successful aging?, b) What factors do they believe contribute to successful aging?, and c) Do their beliefs vary by gender? Data was collected using open-ended questions with focus groups and in-depth interviews, conducted on 10 institutionalized older adults (5 men and 5 women) ages 60 or over. Interview transcripts were coded and analyzed using grounded theory methodology. The participants varied in terms of gender, education, occupation, and life background. The results revealed that Thai institutionalized older adults viewed successful aging as a result of multiple interrelated factors: maintaining physical health, good mental and cognitive abilities. Remarkably, the participants identified as successful aging include independence for self-care and financial support, adhering to moral

principles and religious practice, seeing the success of their loved ones, and making social contributions to their community. In addition, three primary themes were identified as a coping strategy to age successfully: self-acceptance by being sufficient and satisfied with all aspects of life, preparedness and adaptation for every stage of life, and self-esteem by maintaining their self. These beliefs are shared across gender and age differences. However, participants highlighted the importance of the interrelationship among these attributes similar to the need for a secure environment, the thoughtfulness and social support of institutional care in order to maintain positive attitude and well-being.

PEER COACHING FOR DAILY PHYSICAL ACTIVITY IN OLDER PEOPLE

D. Van Bodegom^{1,2}, P. van de Vijver¹, J. Slaets¹, 1. *Leyden Academy on Vitality & Ageing, Leiden, Netherlands*, 2. *Leiden University Medical Centre, Leiden, Zuid-Holland, Netherlands*

Daily physical activity has proven effective for the prevention and treatment of many age-related diseases and can improve balance, mobility and quality of life. Unfortunately, most older people do not meet recommended daily levels of physical activity. Interventions by professionals are successful in improving daily physical activity during the intervention but are too labor and budget intensive to be employed on a population scale.

In peer-coaching, peers coach each other towards a common goal, as applied successfully in the Weight Watchers and Alcoholics Anonymous. We questioned if peer-coaching could be used for delivering daily physical activity to older people. We studied the Freewheel Club, in the Netherlands where a large group of older adults have been gathering daily for a one hour training with a peer coach for almost 6 years.

We analyzed the format of the Freewheel club using participatory observation and focus groups. We also set out a detailed questionnaire to study the motivations of the participants and the social and health effects they experienced. Finally, we collected 6 minute walking distance tests to substantiate the health effects.

We identified both individual and group level determinants of success and motivation. Participants reported both social and health benefits. In the six minute walking test, participants of the Freewheel club improved with an average of 13 meter per year while in the general population people decrease with 5 meter every year.

This study provides a proof of concept of how peer coaching could be a successful format to deliver substantial physical and social benefits to large numbers of older people.

THE EFFECT OF DISABILITY ON SUBJECTIVE WELL-BEING ACROSS ADULTHOOD: THE MODERATING ROLE OF AGE

N. Fraire, F.J. Infurna, *Developmental Psychology, ASU, Chandler, Arizona*

Lifespan developmental psychology postulates that development reflects a combination of processes guided by age, pathology, mortality, and non-normative events. Pathology-related processes refer to changes causally linked to chronic

illness and disability. Given the increased likelihood of disease and disability in adulthood and old age, these changes can drive development during this stage of the lifespan. Most studies show that disability can lead to significant declines in subjective well-being (SWB), but few have simultaneously examined multiple indicators of SWB. Furthermore, it is less clear whether age of disability onset and the type of disability have a differential effect on SWB. We applied multilevel models to data from the HILDA study to examine the impact of disability onset across the adult lifespan on three components of SWB (life satisfaction, negative affect, and positive affect) and the moderating role of age and disability type. We found that life satisfaction and positive affect show substantial and sustained declines following disability, and negative affect shows substantial and sustained increases following disability. Individuals who were in young adulthood and old age were more likely to show the strongest changes. Disabilities characterized by health conditions were associated with the strongest declines across all indicators. Our findings show that the effects of disability onset occur across multiple facets of SWB, with age and type of disability moderating such effects. Our discussion focuses on research designs to examine mechanisms leading to these changes following disability.

REWORKING NORMS IN GERIATRIC CARE: EXPLORING AN LGBTQ-SENSITIVE AND INTERSECTIONAL APPROACH

J. Bromseth, *ERG, gender studies dep, Stockholm university, Stockholm, Sweden*

Several international studies show that many elder non-heterosexual and transgender persons have experienced or are anxious of experiencing mistreatment, harassment or heteronormativity if they are open with their deviant sexuality or gender identity (Fredriksen-Goldsen et al 2011, Heaphy et al 2003). The result is that many chose to not be open, or postpone getting the help that they need. In Sweden LGBT-people are protected by strong anti-discrimination laws, but according to a recent study there are very few communes workings with integrating a knowledge-based lgbt-perspective in geriatric care (Socialstyrelsen 2013).

But what is the knowledge that is needed and how? This presentation is based on an action-research project of creating awareness of gender- and sexuality norms for a group of social workers in the elder care services in a Swedish commune. Using a queerpedagogical and intersectional approach to professional health communication, we worked to combine different strategies of change, focusing on two main subjects. Firstly, an awareness of how heteronormativity is produced in the specific context of care, and secondly, knowledge and reflections on the specific history and ageing conditions of lgbt-people as a diverse group. The approach we used was a combination of content-based lectures, workshops and roleplay, aiming at both creating a knowledge-ground as well as analyzing existing values and practices in order to problematize normative effects. Finally, we focused on re-working communicational practices to be more inclusive and anti-discriminatory. What characterized the learning process following this approach and what were the outcomes for the professional practice and work environment?

SESSION 4505 (POSTER)

LONG-TERM CARE: INSTITUTIONS AND IN-HOME SERVICES II

BIG OR SMALL STORIES? TWO WAYS TO APPROACH NARRATIVE CARE IN CANADIAN LONG-TERM CARE SETTINGS

C. Berendonk, V. Caine, *Faculty of Nursing, University of Alberta, Edmonton, Alberta, Canada*

Presenting subjective experiences through stories is of great importance to the identities of human beings. Therefore, persons can be considered to be 'narrative beings'. However, residents living in nursing homes often experience barriers expressing their stories – partly due to cognitive or physical impairments, partly due to a lack of persons stimulating their stories or listening to them. This threatens residents' narrative identities. Care providers can use approaches, such as life story work or narrative care to support residents in remembering and continuing to compose their stories. These approaches honor residents' life stories and foster identities.

We were interested in how nursing homes in Canada have taken up the practice of narrative care. In a qualitative study we engaged in conversations with ten experts in narrative care and five long-term care providers. We analyzed the data using content analysis and identified two key approaches to foster residents' narrative identity development in practice. One approach, which we refer to as the 'big story' approach, focused on gaining whole life stories and producing life story books and DVDs about residents' lives. Other approaches reflected 'small stories'; here narrative care is seen as the co-composition of identities that grows through the interactions of care providers and residents, fostering the ongoing and ordinary communications necessary for identity development.

We will highlight characteristics, possibilities and challenges of big and small story approaches, particularly in relation to the implementation and sustainability of narrative care in nursing home settings.

CONSUMER QUALITY INDEX—NURSING HOME VERSION: MEASURING CONSUMER-FOCUSED QUALITY OF CARE

R. Milte^{1,2}, J. Ratcliffe¹, G. Chen¹, M. Crotty^{1,2}, 1. *Flinders University, Adelaide, South Australia, Australia*, 2. *NHMRC Cognitive Decline Partnership Centre, Sydney, New South Wales, Australia*

While measurement of the quality of nursing homes has developed significantly, the incorporation of consumer opinions into evaluations remains limited. To begin to address this gap, this study aimed to generate a preference-weighted scoring algorithm for the newly developed Consumer Quality Index – Nursing Home version (CQI-NH). The instrument has the intended application to measure the benefits of new and innovative models of nursing home care for incorporation into economic evaluation frameworks. We utilised discrete choice experiment methodology to elicit preferences for characteristics of nursing home care from people living in nursing homes or their family members (n=545). Data was analysed using mixed and conditional logit regression models.

The findings indicate that all six attributes of nursing home quality investigated were statistically significant determinants of preferences for nursing home care for participants ($p < 0.05$). Feeling at home in their own room was the most important characteristic to residents and family members (coefficient = 0.885, $p < 0.001$). Care staff taking enough time to meet individual needs with residents, residents feeling at home in shared spaces, and staff being very flexible in care routines, were also identified as highly preferred by participants. Preferences of resident and family member respondents were combined and rescaled to develop a weighted-scoring algorithm for the CQI-NH instrument for measuring quality of nursing home care.

This study provides important information about characteristics of nursing home care that are most valued by consumers. The weighted scoring algorithm generated can be usefully applied in the evaluation and design of future long-term care services.

AGING IN PLACE UNDER ASSISTANCE OF FOREIGN DOMESTIC HELPER: A TRIAD STUDY

A. Chong, D. Busiol, *City University of Hong Kong, Kowloon, Hong Kong*

This study investigates why aging-in-place with the assistance of a foreign domestic helper (FDH) is a popular choice for long term care among Hong Kong Chinese families and the role of FDH.

A total of 20 matched triads of elders, primary caregivers (PCs), and FDHs from the same families were interviewed. A grounded theory approach was adopted. Findings from the interviews indicate that aging-in-place with the assistance of a foreign domestic helper is a preferred alternative to institutional care, due to a few contextual factors: a) societal (insufficient nursing home beds); b) cultural (Confucian filial piety expects family members especially adult children to take care of their elderly); c) psycho-social (sharing a small place with others [i.e. FDH] is not a main concern); d) economic (hiring a FDH is affordable to most families; while FDHs earn a much higher salary than they could in their countries); and, e) lifestyle (PCs normally have long working hours). Finally, this option seems to accommodate the needs of all parties involved. However, most FDHs did not receive specific training, so they could not provide adequate care for elders with severe physical or cognitive impairment. Furthermore, communication problems between elders and FDHs were reported.

Besides more objective variables (e.g. environmental, economic), culture, personal distance, boundaries in relationships and understanding of privacy greatly influence the demand and implementation of this long term care option. Results from this study provide reference to societies with similar socio-cultural characteristics (e.g., busy life style, Confucian values).

IMPROVING RESIDENTIAL DEMENTIA CARE THROUGH STAFF

K. Anderson^{1,3}, M. Bird^{2,3}, S. MacPherson^{1,3}, A. Blair^{1,3}, 1. *Aged Care Evaluation Unit, Southern NSW LHD, Queanbeyan, New South Wales, Australia*, 2. *Dementia Development Services Centre, Bangor University*,

Bangor, United Kingdom, 3. NHMRC Cognitive Decline Partnership Centre, Sydney, New South Wales, Australia

Common sense suggests and research indicates relationships between staff factors in residential dementia care and the quality of life for residents, with poor care increasing resident suffering. However, we do not have a coherent picture of which interventions with staff have a sustained impact on quality of care and consequent resident quality of life. From a comprehensive search of published peer-reviewed literature from the last 20 years, only 44 studies met the inclusion criteria. Conclusions from these limited data are further compromised because a quarter of the studies failed to measure effects on residents and only half overall assessed effects after the project team withdrew. Of those that did, excellent studies produced change over the medium or longer term, including reduction in challenging behaviour and restraint use but this applied only to a significant minority. A number of studies failed to measure effects on quality of care, limiting conclusions about the mechanisms underlying change. Generally, level of intervention required depended on the target. For outcomes like restraint use, structured education sessions with some support appear adequate. For complicated issues like challenging behaviours, detailed, long-term, supportive, on-site interventions are required. The most promising findings were improvements in restraint and staff/resident interactions.

INTEGRATING OLDER ADULTS BACK INTO THE COMMUNITY: THE IMPACT OF COMPREHENSIVE CASE MANAGEMENT

M. Pardasani¹, D. Guishard², W. Dionne², 1. *Social Work, Fordham University, New York, New York*, 2. *The Carter Burden Center for the Aging, Inc., New York, New York*

A primary contributor to the quality of life for any individual is their ability to remain independent and in their homes for as long as possible. Home-based, case management is increasingly used to reintegrate older adults in to the community and assists in maximizing their health outcomes and efficiency. In-home case management services have also shown positive health outcomes such as reduced isolation and depression, lower frequency of hospitalizations, delay in institutionalization, and an increase in program satisfaction. This presentation will highlight an evidence-based model of care coordination that was designed to assist in the reintegration of 175 older adults discharged from long-term care facilities to community-based housing. Participants were independently housed in a new residential facility and a wide array of case management services, health interventions and home-based services were offered on-site. A quasi-experimental, longitudinal study evaluated the impact of these services and programs on the health and quality of life of the participants. Residents who enrolled in the case management program (n=35) and those who refused services (n=14) were interviewed upon entry into the independent residence and again after 8 months. Those receiving case management services reported statistically significant reductions in hospital visits ($p < 0.01$), increased social support ($p < 0.001$), enhanced life satisfaction ($p < 0.001$) and a decrease in social isolation ($p < 0.001$). Focus group sessions with residents receiving case management services revealed greater confidence in living

independently and handling one's personal matters, as well as an increase in self-esteem and hope.

OCCUPATIONAL STRESS AND HEALTH AMONG HOME HEALTH CARE WORKERS

J.M. Zoeckler, *Aging Studies Institute, Syracuse University, Lafayette, New York*

Responding to an urgent need for cost-effective long-term care solutions as the baby boomers face their final years, home health care workers serve the elderly by providing a wide variety of domestic, personal care, and medical services. Home health care is physically and emotionally exhausting. In addition, home health care workers frequently experience precarious work arrangements for low wages in conditions that are difficult to regulate. Little is known about how sources of job strain in the social context of home care work might be reduced in order to better protect worker's health. Furthermore, extant research rarely takes into account agency-level characteristics that can be shaped by policy changes. In this research, multinomial logistic regression models estimate the health impacts of occupational stressors among home health care workers using data from the CDC's National Home Health Aide Survey (n=3,235). Drawing on existing public health theories on occupational stressors and sociological stress theory, this study specifically explores how socio-demographic factors, workers' experiences, and agency characteristics are related to home health care worker's occupational health and self-rated health. Findings from all analyses strongly support the established theoretical frames, but also demonstrate that health outcomes are significantly linked to other salient policy-relevant factors. Results from the fully-specified models indicate that self-rated health is related significantly to ethnicity, age, marital status, income and perceived agency support. Ethnicity, job tenure, training, agency type, and exposure to discrimination impact workers' occupational health. Strategies for elevating the well-being of the home health care workforce are discussed.

UNDERSTANDING AND MEASURING MECHANISMS OF ADULT DAY SERVICES: A MIXED METHODS STUDY

J.E. Gaugler, *Center on Aging, School of Nursing, University of Minnesota, Minneapolis, Minnesota*

Many evaluations of long-term services and supports (LTSS) have approached these programs as a "black box," and it remains unclear how LTSS operate to benefit older clients. Utilizing an exploratory sequential design (qual-QUAN), this mixed methods study developed new measures to better capture the mechanisms of adult day service (ADS) use. The first phase was an ethnographic study of the process of ADS use. Items were extracted from the qualitative data generated to develop items. In the quantitative phase, the psychometric qualities of this newly developed measure were tested in a national sample of family members of ADS clients (N = 250) utilizing descriptive, bivariate, and exploratory and confirmatory factor analyses. The qualitative component yielded four domains of ADS use (the policy/environmental context of ADS; reasons why ADS was used; how ADS is used; and pathways to positive or negative outcomes for families and clients). Content validity was established with expert review, and face validity was enhanced following pilot

testing with 27 family members. Goodness of fit indices and factor loadings generated from principal components and confirmatory factor analyses suggested the empirical integrity of the empirical measure. The study of complex phenomena in gerontology continues in methodological silos. Rigorously designed evaluations of LTSS or other interventions cannot best inform practice if it is not understood *how* and *why* such approaches do or do not benefit older adults or their families. Mixed methods are well-positioned to address this critical scientific and practice gap.

ADMINISTRATIVE FUNCTIONS OF NURSING HOMES: COMPARATIVE ANALYSIS ON MODEL CASE IN THE U.S. AND JAPAN

S. Katagiri, *Kagoshima University, Kagoshima, Kagoshima, Japan*

This paper is considered commonalities and differences on the administrative functions of nursing facilities for frail elderly in the U.S and Japan managed by nonprofit organizations to provide good care services. In order to make it clear, this research had a comparative approach of nursing homes in both countries. Research objects are the model facilities which have good reputations to improve quality of care services and to have a person-centered-care with trial and errors, toward care culture change. As a result of the content analysis, commonality of an administrative functions in both countries were firstly to overcome the wall of sectionalism, in other words, to induce a team approach among different professional staffs inside of the organizations. So both of administrators put efforts into training of their staffs. Secondly this function was to supply some resources and to make some engagement with neighbors or other organizations in local communities with some kinds of events which were opened outside of the nursing homes. On the other hand the differences were the methods and the kinds to supply resources. In the U.S. the administrators firstly had a vision what kinds of care they should provide and after that they prepared the financial resources, but in Japan the administrators would try to achieve good care financially within nursing care compensation, no fundraising. But some Japanese care workers made efforts themselves by Extended-professionalism and utilized Group-power among the residents on the care spot under middle management to compensate shortage of financial resource.

NURSING STUDENTS' PREFERENCES FOR CLINICAL PLACEMENTS IN RESIDENTIAL AGED CARE FACILITIES

E. Lea, A. Marlow, E. Altmann, H. Courtney-Pratt, *Wicking Dementia Research and Education Centre, University of Tasmania, Hobart, Tasmania, Australia*

The residential aged care sector worldwide is facing difficulties with attracting and retaining nursing staff, in a climate of an ageing population with complex care needs. Nursing student experiences of clinical placements in aged care facilities shape attitudes towards working in this sector. However, there is little research about why students choose particular placement areas throughout their studies. This study examines nursing students' preferences for clinical placements in

residential aged care facilities. Data were 6,610 student comments provided as part of Bachelor of Nursing student entries in an Australian university's Student Placement Management System (2007–2014 enrolments). Aged care was mentioned in 612 (9.3%) comments, with thematic analysis used to examine underlying reasons. Most (71%) comments related to a preference for their next placement to be located outside residential aged care, primarily due to a desire to broaden previous experience obtained in this setting. Some students referred to a placement outside aged care better suiting their career aspirations and to the aged care setting offering limited learning opportunities. A minority (15%) of comments only referred to aged care to specify facilities where they had a conflict of interest. A similar proportion (14%) related to a desire to be placed in residential aged care for the upcoming placement, often either as part of a range of specialties of interest to the student, or because aged care was perceived to offer relevant learning opportunities. The findings suggest ways to better meet the needs and desires of the future nursing workforce.

WELL-BEING OF NURSING HOME PROFESSIONAL CAREGIVERS: TESTING A POSITIVE PSYCHOLOGICAL INTERVENTION

N. Kloos, H.R. Trompetter, E. Bohlmeijer, G.J. Westerhof, *Psychology, Health and Technology, Twente University, Enschede, Netherlands*

With major job demands such as workload, professional caregivers in nursing homes are at increased risk for stress related problems like burnout. As such job demands will most likely not decrease in the near future, attention should be shifted towards resilience of all professional caregivers by focusing on increasing personal resources. The purpose of this study was to test a generic online positive psychology intervention in increasing both general wellbeing and work related wellbeing for professional caregivers of somatic units of four nursing homes.

This study had a group-randomized controlled design (intervention group $n = 74$, control group $n = 47$). The intervention consisted of reading information and doing exercises of 8 themes of positive psychology (e.g. strengths, positive relations) in 12 weeks. Questionnaires on work related wellbeing (Utrecht Work Engagement Scale), general wellbeing (Mental Health Continuum) and burnout (Utrecht BurnOut Scale) were filled out online at baseline and 3 months later (T1).

Mixed ANOVAs showed no significant increase in work related wellbeing ($p = .61$) or general wellbeing ($p = .37$) of the intervention group compared to the control group. Burnout and engagement at baseline were not significant moderators (p 's $> .40$).

Providing professional caregivers of nursing homes with an online generic positive psychological intervention did not increase work related wellbeing or general wellbeing, even for caregivers most at risk for stress related problems. Possible alternative explanations such as ceiling effects, lack of intrinsic motivation and high workload as well as practical implications are discussed.

EXPLORING SOCIAL CONNECTEDNESS AND VIDEOCONFERENCING FOR OLDER ADULTS' IN A LONG-TERM CARE FACILITY

A.M. Schuster, J.T. Giger, *Graduate Center for Gerontology, University of Kentucky, Lexington, Kentucky*

Guided by a transactional ecological perspective, this pilot study explored how older adults residing in a nursing facility (NF) conceptualized their social connectedness and technology use. Ten cognitively intact (MMSE > 24) older adults (female, $n = 6$; male, $n = 4$) ranging in age from 69 to 90 ($M = 80.3$) reported on their relationships with family members and friends and their technology usage and intention to use technology in the future. Using a semi-structured interview protocol, older adults in this study reported that they seek out and benefit from social interactions with family and friends. However, participants reported an overall decrease in social connectedness (less frequent family/friend in person visits and telephone calls) with those important to them since they were admitted to the long-term care facility. Family and friend death, distance from family and friends, and change in medical service providers contributed to this reduction. Two common technology themes emerged: technology use (computer and mobile phone) was common and videoconferencing technology was underutilized. A majority of the older adults voiced interest in videoconferencing capabilities and identified specific individuals (friends and family) they would contact using the technology if they had the opportunity and access to the technology. Findings have the potential to inform gerotechnology theories related to reducing barriers that can impede the ability of older adults to remain socially connected with their family, friends, and communities. Future research should explore the perspectives of NF staff and administrators regarding older adult technology use and technology programing.

SESSION 4510 (POSTER)

MENTAL HEALTH OF OLDER ADULTS

ADVERSE CHILDHOOD EXPERIENCES AND LIFETIME MENTAL AND SUBSTANCE USE DISORDERS AMONG OLDER ADULTS

N.G. Choi, D.M. DiNitto, *School of Social Work, University of Texas, Austin, Texas*

Despite the increasing rates of mental and substance use disorders (MSUDs) among older adults, little research has been done to investigate the influence of adverse childhood experiences (ACEs) on older adults' MSUDs. Using the life course perspective, we examined the relationship between ten types of ACEs and six lifetime MSUDs among those age 50+ and gender differences in the relationship. Data came from the 2012–2013 United States National Epidemiologic Survey on Alcohol and Related Conditions (NESARC-III) ($N=14,738$ for the 50+ age group). We employed multi-variable logistic regression analyses to test main effects of ACEs and gender-ACEs interaction effects on lifetime major depressive disorder (MDD) and anxiety, post-traumatic stress, alcohol use, drug use, and nicotine use disorders. Of the sample, 53.2% of women and 50.0% of men reported at least one ACE. For both genders, parental/other adults'

substance use problems were the most prevalent (22.6%), followed by physical abuse and emotional neglect. Child abuse and neglect and parental/other adults' substance use problems had small but consistently significant effects on all three mental disorders and all three substance use disorders (e.g., $OR=1.28$, 95% $CI=1.12-1.46$ for parental/other adults' substance misuse on MDD). While the total number of ACEs had gender-neutral, cumulative effects on MSUDs, the effects of physical abuse, sexual abuse, and emotional neglect, as well as parental separation/divorce, were stronger among men. This study underscores the long-lasting negative impacts of ACEs and the need to further investigate why ACEs seem to have greater effects on older men than women.

OUTDOOR ACTIVITIES, COMMUNITY COHESION, AND MENTAL HEALTH OF OLDER ADULTS DISPLACED BY DISASTER

S. Chao, *Department of Social Work, National Taiwan University, Taipei, Taiwan*

The first aim of this investigation was to examine the effects of outdoor activities and community cohesion on depressive symptoms in older adults displaced by Typhoon Morakot in Taiwan. The second aim was to explicate whether community cohesion mediates or moderates the relationship between outdoor activities and depressive symptoms. This study included 292 adults aged 65 years or older who were relocated to permanent houses after Typhoon Morakot damaged their homes on 8th August 2009. Face-to-face interviews were conducted four years after relocation. Multiple regression analysis was applied to test the hypothesized relationships among study variables. The analytical results found:

1. The sample of displaced older adults displayed higher prevalence of depressive symptoms than the average for community dwelling older people in Taiwan.

2. Controlling for demographic characteristics,

(1) Outdoor activity involvement and community cohesion were both associated with fewer depressive symptoms.

(2) Community cohesion fully mediated the relationship between outdoor activities and depressive symptoms.

(3) Community cohesion also moderated the relationship between outdoor activities and depressive symptoms.

Community cohesion occupies a key role on the link between outdoor activities and depressive symptoms. Participation in outdoor activities was associated positively with community cohesion, while high community cohesion was related negatively to depressive symptoms. Moreover, the benefit of outdoor activities to fewer depressive symptoms only manifested in older adults with high community cohesion. Programs and services should be designed to enhance community cohesion in order to maximize the benefit of outdoor activities to the mental health of displaced older adults after natural disasters.

STORYTELLING INNOVATIONS: IMPROVED MOOD, FAMILY AND COMMUNITY CONNECTEDNESS IN LATINO AND VIETNAMESE ELDERS

S. Diwan¹, A. Eliazar², D. Pham³, M. Fuentes⁴, 1. *San Jose State University, San Jose, California*, 2. *Gardner Family Care Corp, San Jose, California*, 3. *Asian Americans for Community Involvement, San Jose, California*, 4. *Santa*

Clara County Behavioral Health Services Dept, San Jose, California

Reminiscence Therapy has documented success in alleviating depression and improving life satisfaction among elders, yet less is known about its ethnic specific efficacy. We report on the County of Santa Clara Behavioral Health Services Department's Innovation Project of combining storytelling (simple reminiscence) with three innovative elements: including family members in the process; conducting community events to showcase artwork and life-story books to family and community attendees; and utilizing ethnically and linguistically matched community workers.

73 Hispanic and 92 Vietnamese clients completed the 12-week intervention with pre and post-test assessments. Clients were mostly female (62%), foreign-born, mean age 75 years, 27% lived alone, and the majority had limited English proficiency.

Paired t-test analyses indicated clinically significant change scores in depression (5+ points on PHQ-9) for 32% of clients and smaller improvement in depression scores (1 – 4 points) for 54%. A few clients experienced no change or worse PHQ-9 scores at post-test. Statistically significant improvements were observed in scales measuring loneliness (Hughes, 2004), and life satisfaction (Pavot/Diener, 1993).

43% had a family member participate in the intervention. Yet, 62% reported improved relationships with family/friends through improved communication and shared understanding of the client's life story. 50% of clients participated in a community event and reported improved connection with their community through listening to others' life experiences and sharing their own. Client perceptions of culturally matched workers were uniformly positive but many indicated they could work with someone from a different cultural background. Successes and challenges to implementation will be discussed.

ARE AGE AND DEPRESSIVE SYMPTOMS RELATED? CROSS-SECTIONAL DATA FROM THE 2010 HRS ON THE 8-ITEM CES-D

M. Hurwicz¹, Y. Wang², H. Shen¹, 1. *University of Missouri - Saint Louis, St. Louis, Missouri*, 2. *Washington University in St. Louis, St. Louis, Missouri*

The relationship between aging and depressive symptomatology remains of interest to professionals who work with older adults; however empirical research results continue to be inconsistent. This research adds to the ongoing discussion, using nationally representative data from the 2010 Health and Retirement Study. The sample includes 19,616 community-dwelling adults who self-identify as Hispanic, non-Hispanic white and African American. Factor Analysis confirmed the 3 expected factors (subscales) in the 8-item Center for Epidemiologic Studies - Depression Scale (CES-D): Depressed mood (depressed, lonely, sad), psychomotor retardation (everything an effort, restless sleep, couldn't get going), and lack of wellbeing (reverse-coded happy, enjoyed life). Alpha reliability scores were .78 for the total CES-D scale, and .77, .59 and .73 respectively for the subscales. Controlling for gender, race/ethnicity, marital status, education level and self-related health (SRH), multivariate regression models were used to assess the association between age-cohort groups (40–54, 55–69, 70+) and depressive symptoms. Results for the total

CES-D score showed depressive symptoms decreasing with age. As for the control variables, women, ethnic/racial minorities, non-married and individuals with less education and poorer SRH were more likely to report depressive symptoms than men, non-Hispanic whites, married and individuals with more education and better SRH. Results for the subscales showed the same trends. Depressive symptomatology does not inevitably accompany aging. Although this finding is inconsistent with some recent literature, the size and selection criteria of the 2010 HRS database lend credibility to the results.

MEASURING DEPRESSIVE SYMPTOMS WITH 8-ITEM AND 9-ITEM CES-D: DOES RACE/ETHNICITY MATTER?

Y. Wang¹, H. Shen², M. Hurwicz², 1. *School of Social Work, Washington University in St. Louis, Saint Louis, Missouri*, 2. *University of Missouri-St. Louis, Saint Louis, Missouri*

Several shortened versions of the Center for Epidemiologic Studies Depression Scale (CESD) have been developed to screen depressive symptoms. Studies relating to the different versions of CESD measures usually focus on the reliability of the overall scale without considering possible racial differences in these versions. This study examines the psychometric qualities of 8-item CESD (CESD-8) and 9-item CESD (CESD-9), and explores possible racial/ethnic differences in overall depressive symptoms. Using data from the 2010 Health and Retirement Study, 19,592 community-dwelling adults (40+) who self-identify as White, African-American, and Hispanic are included. Confirmative Factor Analysis results indicated 3 expected factors (subscales) in both CESD-8 and CESD-9 versions: depressed mood (depressed, lonely, sad), lack of well-being (reverse-coded happy, enjoyed life), and psychomotor retardation (everything an effort, restless sleep, couldn't get going, and the 9th item, reverse-coded full of energy). ANOVA results demonstrated that both versions differed among racial/ethnic groups: the average scores of CESD-8 and CESD-9 were lowest among Whites and highest among Hispanics. Two Ordinary Least Squares regression models were used to explore whether racial differences existed in both CESD-8 and CESD-9. When socio-demographic characteristics (age, gender, marital status, education and self-related health) were controlled, African-Americans and Hispanics had higher CESD-8 scores than their White counterparts; however, racial difference disappeared when the CESD-9 version was used. Findings suggest that different versions of the CESD may better capture depressive symptoms among different racial/ethnic groups, and further exploration of the psychometric properties within racial and ethnic groups is encouraged.

NURSING DIAGNOSTICS RELATED TO RATES OF DEPRESSION AND COGNITIVE DEFICIT IN OLD PEOPLE IN BRAZIL

C.G. Volpe, M.M. Stival, L.B. Aguiar, L.R. Lima, S.S. Funghetto, W.S. Santos, *University of Brasilia, Brasilia, DF, Brazil*

The object of this study is identify the nursing diagnoses (ND) more important in geriatrics patients in a geriatric clinic of Distrito federal, Brazil, according to NANDA taxonomy two, list the ND found according to the depression

scales and cognition. A descriptive and observational study done with 40 (forty) old people above 65 (sixty five) years old. The data collect occurred in march of 2010, during 60 (sixty) days. Were used the geriatric depression scales and the little exam of mind state. The P (Pearson) value was used in association with level of significance $p < 0,05$. That study was accept by ethic department commission in health of the Distrito Federal. The Nursing diagnostics more prevalents were: sensory perception disturbed, heart debit decreased, dentition impaired, impaired memory, fall risk and insomnia. The rates of depression symptoms were about 35% and the cognition changes by the little exam of mind state of 60%. We can see significative association to the social isolation ND, loneliness risk, chronic sadness, desperation associated to depression rates shown by the scale. The ND associated to cognition changes by the little exam of mind state were: deficient knowledge and impaired memory. The old people have tendency to show cognition deficits and depression symptoms, eventually to the older people and dependence to the daily activities. The most prevalent factor with the ND impaired memory, were around environmental changes excessive, about the deficient knowledge was the limited cognition.

CORRELATES OF DEPRESSION AMONG LOWER-INCOME MINORITY OLDER ADULTS LIVING IN URBAN SUBSIDIZED HOUSING

J.G. Gonyea¹, A. Curley², K. Melekis³, 1. *Social Work, Boston University, Boston, Massachusetts*, 2. *The American City Coalition, Boston, Massachusetts*, 3. *Skidmore College, Saratoga Springs, New York*

Research examining the distribution of major depressive disorders, depressive symptoms and other mental health disorders in community samples suggest that lower-income, minority adults age 50 and older, particularly those with chronic diseases and disabilities, face a greater risk for depression. Furthermore, research seems to support loneliness as a risk factor for mental health problems in older adults. Despite the fact that within the U.S. older adults living in urban subsidized housing are likely to be minority residents with reduced incomes, relatively little is known about their mental health status. This study addressed this gap through a study of the rates and correlates of depressive symptoms among primarily Black and Latino adults age 55 and older residing in a large urban subsidized housing development in Northeastern USA. Further, as loneliness has been defined as a major public health problem, a particular interest was exploring the prevalence and association of loneliness to depression in this population. In-person interviews were conducted in English and Spanish in 216 residents' homes. Results revealed a significant percentage of residents age 55 and older experienced loneliness (28%) and depression (22%). Hierarchical regression analysis was used to explore correlates of depression, including demographic characteristics, environmental factors, health status, and loneliness. The analysis found that perceived loneliness was a significant factor in understanding depression even when other factors were statistically controlled for. The findings underscore both the importance of mental health screening and community-based interventions to strengthen social

connection and engagement of older residents in subsidized housing developments.

SESSION 4515 (POSTER)

NEUROLOGICAL MANIFESTATIONS OF AGING

THE ROLE OF SHBG IN EXECUTIVE FUNCTION IN OLDER PERSONS: THE PIVUS STUDY

M. Maggio¹, F. Lauretani², R. Aloe², L. Lind³, T. Cederholm³, G. Ceda¹, 1. *Universita degli Studi di Parma, Parma, Italy*, 2. *Azienda Ospedaliero-Universitaria di Parma, Parma, Italy*, 3. *Uppsala University, Uppsala, Sweden*

Introduction- Changes in executive function are an early marker of dementia. The metabolic determinants of executive function have however not been fully elucidated. Sex-Hormone Binding-Globulin (SHBG) is not merely a transporter but also acts as a metabolic mediator. Thus, our aim was to investigate the association between SHBG levels and Trail-Making Test (TMT), a measure of executive function, in older individuals.

Methods- This cross-sectional analysis involved 534 seventy-year-old community-dwellers (284 males) from the Prospective Vasculature in Uppsala Seniors (PIVUS) Study. Univariate and multivariate regression models were built to assess the association between SHBG and TMT performance. Sex, comorbidities, smoking habits, BMI, total cholesterol, fasting insulin, total testosterone, estradiol, Mini-Mental State Examination (MMSE) and Endothelium-Independent Vasodilation (EIDV) were considered as potential confounders.

Results- Median SHBG levels were 47.3 nmol/L (IQR 35.4–60.5), while TMT-A and TMT-B scores were 53 (IQR 43–67) and 130 (IQR 101–188), respectively. TMT-A score was positively associated with EIDV, fasting insulin, diabetes and smoking and negatively with MMSE, but was not significantly associated with SHBG ($\beta \pm SE$ 0.04 \pm 0.04, unadjusted $p=0.31$). Conversely, TMT-B was positively associated with fasting insulin, stroke and diabetes, and negatively associated with MMSE, EIDV and SHBG ($\beta \pm SE$ -0.59 \pm 0.22, unadjusted $p=0.007$). The association between TMT-B and SHBG was confirmed in a multivariate model considering sex and MMSE (-0.51 \pm 0.21, $p=0.02$), but not in a fully-adjusted model including EIDV (-0.35 \pm 0.20, $p=0.08$).

Key conclusions- SHBG levels are positively and independently associated with executive functions, measured through TMT-B, in older individuals. This association is however not independent of EIDV.

APPLICATIONS OF GENETIC STOCHASTIC PROCESS MODEL IN STUDIES OF DEVELOPMENT OF ALZHEIMER'S DISEASE

I.Y. Zhbannikov, K. Arbeev, O. Bagley, M. Duan, A.I. Yashin, S.V. Ukraintseva, *Social Science Research Institute, Duke University, Durham, North Carolina*

Among age-specific diseases, Alzheimer's disease (AD) is the most common type of disorder in the elderly populations. Recognizing genes involved in developing of AD using latest achievements of modern GWAS, statistical modeling and

data management systems is among of the top priorities in modern human genetic studies.

Stochastic Process Model offers a plethora of applications in analysis of longitudinal data. In general, such data contain various physiological variables, time to event outcomes and other relevant variables. Often longitudinal data contain genetic information available for all or a part of participants. Analyzing jointly both genetic and non-genetic data can provide insights into processes of aging-related changes and disease developing in the organism.

We applied a multi-dimensional Genetic Stochastic Process Model (GenSPM) using a newly developed software tool, an R-package *spm*, to study development of AD. We performed an analysis based on a set of candidate genes, which potentially involved in developing of AD and longevity. The analysis was performed on the following datasets: (i) Late Onset Alzheimer's Disease Family Study (LOADFS); (ii) Framingham Heart Study (FRAM); (iii) Health and Retirement Study (HRS) and (iv) Cardiovascular Health Study (CHS). In addition, we conducted a statistical analysis of survival traits and compared results to findings above. We found that carriers of different alleles have different dynamics of physiological indices, which propagates to the observed different risks of the traits. We will also discuss possible biological mechanisms of the observed findings.

PATHOPHYSIOLOGICAL AND BEHAVIORAL EFFECTS OF SYSTEMIC INFLAMMATION IN RODENT MODELS FOR DELIRIUM

L. Schreuder¹, S.E. de Rooij¹, B. Eggen¹, K. Biber², J. Laman¹, R. Schoemaker³, 1. *University Center for Geriatric Medicine, University Medical Center Groningen, Groningen, Groningen, Netherlands*, 2. *University of Freiburg, Freiburg, Breisgau, Germany*, 3. *Department of Neurobiology, GELIFES, University of Groningen, Groningen, Netherlands*

Aging and neurodegeneration are the major predisposing factors for delirium and systemic inflammation is a frequent trigger. The aim of this review is to analyze and discuss potential animal models for delirium of inflammatory origin. We systematically reviewed animal studies using systemic inflammation superimposed on animal models of aging, accelerated aging, or neurodegenerative disease. Causative agents of systemic inflammation employed by these studies include lipopolysaccharide (LPS), live infection or surgery. Our search was conducted in PubMed and EMBASE and identified 79 studies, including 65 studies using aged animals and 14 studies using diseased animals. In 46 studies animals were challenged with LPS, 7 studies challenged animals with a live infection, and in 26 studies animals underwent a surgical intervention. Outcomes of behavioral assays from animal studies were compared to features and symptoms that can be demonstrated in delirious patients. We found that some surgery models and the ME7 model of prion disease mimic several features of delirium including acute, fluctuating, and transient cognitive dysfunction and disturbance of psychomotor behavior. However, the key neuropsychological feature inattention has not been demonstrated in these models yet. Therefore, further refinement of these model systems is an important priority for future research.

ROLE OF THE INNATE IMMUNE RESPONSE IN THE PROGRESSION OF ALZHEIMER'S DISEASE

A. Le Page¹, G. Dupuis¹, E.H. Frost¹, G.P. Pawelec², J.M. Witkowski³, A. Larbi⁴, T. Fülöp¹, 1. *Medicine, Universite De Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *Center for Medical Research, University of Tubingen, Tubingen, Germany*, 3. *medical University of Gdansk, Gdansk, Poland*, 4. *Aging and Immunity Program, Singapore Immunology Network (SIgN), Agency for Science Technology and Research (A*STAR), Singapore, Singapore*

Alzheimer disease (AD) is a progressive irreversible neurological brain disorder. Inflammation and immune alterations have been linked to AD, suggesting that the peripheral immune system plays a role during the asymptomatic period of AD. NK cells and neutrophils (PMN) participate in innate immune surveillance against intracellular pathogens and malignancy but their role in AD remains controversial. We have investigated changes in peripheral NK cell and PMN phenotypes and functions in amnesic mild cognitive impairment (aMCI, $n = 10$), patients with mild AD (mAD, $n = 11$), and healthy elderly controls ($n = 10$). Patients selected according to NINCDS-ADRDA criteria were classified using neuropsychological assessment tests. Phenotype analysis revealed differences in expression of CD16 (increased in mAD), NKG2A (decreased in aMCI), and TLR2 and TLR9 (both decreased in mAD) for NK and CD14 (increased in MCI). Functional assays revealed that NK cell killing activity and degranulation (CD107 expression) were unchanged in the three groups. In contrast, expression of the CD95 receptor was increased in aMCI and mAD. Granzyme B expression and cytokine production (TNF α , IFN γ) were increased in aMCI but not in mAD. Similarly, PMN phagocytosis and free radical production were differentially modulated in MCI and mAD patients. Our data suggest that the number of alterations observed in peripheral NK cells in aMCI represent an activation state compared to mAD patients and that may reflect an active immune response against a still to be defined aggression.

BETAHYDROXYBUTYRATE SUPPRESSES EPILEPTIFORM SPIKES AND IMPROVES COGNITION IN ALZHEIMER'S MOUSE MODEL

J.C. Newman^{1,2,3}, F. Kroll^{3,4}, S. Ulrich⁵, J.J. Palop³, E.M. Verdin^{1,2,3}, 1. *Buck Institute for Research on Aging, Novato, California*, 2. *Geriatrics, UCSF, San Francisco, California*, 3. *Gladstone Institutes, San Francisco, California*, 4. *Université de Liège, Liège, Belgium*, 5. *Ithaca College, Ithaca, New York*

Disruption of normal network activity and associated epileptiform spikes from dysfunctional inhibitory interneurons are important for the pathogenesis of cognitive decline in Alzheimer's disease mouse models. Treatments that reduce epileptiform spikes improve cognition in these models and represent a promising new therapeutic approach for Alzheimer's disease. Ketogenic diet and fasting have been used for centuries to treat certain forms of epilepsy, including those mechanistically related to disrupted network activity in Alzheimer's models like Dravet syndrome. We found that ketogenic diet, but not fasting, consistently reduced epileptiform spikes in the APPJ20 Alzheimer's mouse model. This reduction in spikes was independent or downstream of

inhibitory interneuron function. The effect on spike reduction was sustained through several months of treatment. Long-term treatment resulted in cognitive improvement in the water maze and in habituation to the open field, and in the more severely affected male APPJ20 mice also improved survival. Finally, treatment with a novel compound that is metabolized to the ketone body beta-hydroxybutyrate immediately reduced epileptiform spikes in both APPJ20 and a model of Dravet syndrome to a similar degree as ketogenic diet. We suggest that therapies utilizing such ketomimetic agents, including agents that increase blood levels of beta-hydroxybutyrate or act on downstream targets of beta-hydroxybutyrate, may have therapeutic potential in Alzheimer's disease through improving network function and ameliorating epileptiform activity.

IMPROVED MOBILITY AND BRAIN NETWORKS AFTER 5 MONTHS OF AEROBIC EXERCISE IN OBESE OLDER ADULTS

B. Neyland, R.A. Kraft, M. Lyles, P.J. Laurienti, S.B. Kritchevsky, B.J. Nicklas, C.E. Hugenschmidt, *Internal Medicine-Gerontology and Geriatric Medicine, Wake Forest School of Medicine, Winston-Salem, North Carolina*

It is well established that aging-related changes in brain structure such as white matter lesions and atrophy are linked with changes in gait and mobility. However, changes in neural function may precede irreversible changes in brain structure. Previous work has shown that functional brain networks are associated with mobility function in older adults. Here, we sought to extend that work by replicating previous associations between mobility function and brain networks, and testing whether improving mobility through an exercise intervention produced concomitant improvements in brain networks. Short Physical Performance Battery (SPPB) and resting state functional magnetic resonance imaging (fMRI) were collected in 66 obese, sedentary adults 65–80 years old before and after a randomized trial adding weight loss to a 5-month aerobic exercise intervention. Graph theory-based methods were used to characterize brain network organization and compare participants in the highest (SPPB=12, n=22) and lowest (SPPB=3–9, n=21) tertiles of SPPB score. We replicated findings that the community structure of somatomotor cortex was less consistent in the Low SPPB group compared to the High SPPB group ($p=0.15$). The Low SPPB group improved SPPB significantly after the intervention (mean=1.73, 95%CI [1.02–2.45], $p<0.001$). Improved mobility scores were accompanied by improved consistency of the somatomotor network ($p=0.059$). These data demonstrate that functional brain networks add important information to the understanding of how the brain contributes to mobility function. Modification of brain networks may be a useful target to show efficacy of mobility interventions, and may provide further insights into the development of mobility disability.

THE EMERGING ANTIMICROBIAL PROTECTION HYPOTHESIS OF ALZHEIMER'S DISEASE

R.D. Moir, D. Vijaya Kumar, S. Choi, R.E. Tanzi, *Neurology, Massachusetts General Hospital and Harvard Medical School, Charlestown, Massachusetts*

A considerable body of data suggests the beta-amyloid peptide (Abeta) plays a key role in Alzheimer's disease

(AD) pathology. The physiological role for Abeta has been unclear. We recently showed that synthetic Abeta has potent *in vitro* antimicrobial activity against CNS pathogens. We have since generated *in vivo* evidence showing that A β protects against fungal and bacterial pathogens in transgenic mouse, *Drosophila*, *C. elegans*, and culture cell infection models, doubling host survival in some cases. Consistent with a protective role for A β *in vivo*, APP-null mice with low A β expression also show attenuated infection resistance. Oligomerization of Abeta is key for the protective antimicrobial actions of the peptide and mediates the agglutination and eventual entrapment of microbes in beta-amyloid deposits. The emergence of role for Abeta as an antimicrobial peptide (AMP) and recent identification of innate immune genes as AD risk factors has lead us to propose a new disease model we call the "Antimicrobial Protection Hypothesis" of Alzheimer's disease. Here we present data on how Abeta activities mediate the peptides AMP actions against fungal, bacterial and viral pathogens. We describe how our new model provides a framework for understanding Abeta activities, including host cell cytotoxicity, metal binding and oxygen radical generation, carbohydrate binding, and immune modulatory activities.

ACCELERATED COGNITIVE AND PHYSICAL FUNCTION AGING IN MIDDLE AGED PATIENTS WITH TYPE 1 DIABETES

C. Rosano, *Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania*

With increasing incidence and survival rates in T1D, the number of patients who is aging is also rapidly increasing. As people with diabetes grow older, they continue to be exposed to chronic hyperglycemia, and experience other medical conditions that accompany very long duration diabetes as well as the normal aging process. A striking feature of people with T1D is that they develop brain abnormalities similar to those observed in much older adults without diabetes. Features of accelerated brain aging include psychomotor slowing, brain small vessel disease and atrophy. These brain abnormalities are known to increase the probability of developing disability and dementia in population without diabetes; therefore, they cannot be considered benign. There is an urgent need to quantify the impact of these abnormalities on measures of cognitive and physical health, including clinically relevant cognitive impairment, physical performance, falls and disability. We review here the findings of our neuroimaging, cognitive and mobility study in a cohort of 109 patients with childhood-onset T1D, with retrospective data on microvascular complications (eye, kidney, nerve) since time of diagnosis in 1989 through 2006–08 (mean age of onset 8.6+4.2 years, current age 47.6 +5.9, 46% women). In 2006–2008 these patients received a neuroimaging test, an extensive cognitive evaluation, and measures of gait speed at usual pace. Self-reported measures of falls and difficulties with instrumental activities of daily living were obtained concurrently.

TAU, P-TAU 181, AND γ -SECRETASE LEVEL: BLOOD-BASED MARKER FOR AD AND MCI

S. Shekhar, N. Rai, S.K. Yadav, A. Dey, S. Dey, *All India Institute of Medical Sciences, New Delhi, Delhi, India*

The overexpression of cerebrospinal fluid (CSF) Tau and phosphorylated Tau₁₈₁ (p-Tau₁₈₁) proteins are well established

hallmarks of Alzheimer's disease (AD). Elevated level of p-Tau₁₈₁ can differentiate AD from other neurodegenerative disease. However, the expression level of these proteins in serum of AD patient is not well set up. This study sought to evaluate the level of Tau, p-Tau₁₈₁ and γ -secretase in serum of AD, and mild cognitive impairment (MCI) patients for an alternative approach to establish protein-based markers by convenient approach. Blood samples were collected from 39 AD patients, 37 MCI patients and 37 elderly individuals as controls. The level of Tau, p-Tau₁₈₁ and γ -secretase in the serum of the different groups were measured by label free real time Surface Plasmon Resonance technology by using specific antibodies and were further confirmed by the conventional western blot method. An appropriate statistical analysis, including Receiver Operating Characteristic (ROC) was performed. The concentration of serum Tau, p-Tau₁₈₁ and γ -secretase were significantly higher ($p < 0.0001$) in AD as compared to MCI and elderly controls. A significant ($p < 0.0001$) downhill correlation was found between Tau as well as p-Tau₁₈₁ levels with HMSE and MoCA score and there was strong uphill correlation between Tau and p-Tau₁₈₁. This study, first time reports the concentration of Tau, p-Tau₁₈₁ and γ -secretase in serum of AD patients. The cutoff values of Tau and p-Tau₁₈₁ of AD and MCI patients with high sensitivity and specificity reveals that serum level of this protein can be used as a predictive marker for AD and MCI.

NEURODEGENERATIVE EFFECT OF NANOSIZED URBAN AIRBORNE PARTICULATE MATERIAL (NPM)

M. Cacciottolo², T. Morgan², A. Saffari¹, C. Sioutas¹, J. Chen³, C.E. Finch², 1. USC Viterbi School of Engineering, University of Southern California, Los Angeles, California, 2. USC Leonard Davis School of Gerontology, University of Southern California, Los Angeles, California, 3. Department of Preventive Medicine, Keck School of Medicine, University of Southern California, Los Angeles, California

Particulate air pollutants are increasingly recognized for their neurotoxic impact in human populations and in experimental rodent studies, but the mechanisms involved and interaction with the APOE $\epsilon 4$ risk factor for Alzheimer disease (AD) remain unknown.

To evaluate the mechanism behind air pollutant neurotoxicity were examined female EFAD transgenic mice (5x*FAD*+/*-*human APOE $\epsilon 3$ or $\epsilon 4$ +/*+*) with long-term exposure to nanosized urban PM (nPM). nPM exposure increased cerebral β -amyloid, exacerbated by APOE $\epsilon 4$. Moreover, nPM exposure increased A β oligomers, caused selective atrophy of hippocampal CA1 neurites and decreased glutamate GluR1 subunit. nPM-induced CA1 atrophy was confirmed in wildtype female mice. Pro-amyloidogenic APP processing was also increased in neuroblastoma cells (N2a-APP/swe) with *in vitro* exposure to nPM, and correlates with alteration of lipid raft. We suggest that airborne PM exposure promotes pathological brain aging, with potentially greater impact in $\epsilon 4$ carriers throughout increased cerebral A β production and glutamatergic remodeling.

CALCIUM INFLUX ACCELERATES NEURITE DEGENERATION VIA MITOCHONDRIAL-DEPENDENT OXIDATION

K. Fukui¹, S. Nakamura¹, A. Nakanishi¹, S. Okihiro¹, H. Takatsu², 1. Shibaura Institute of Technology, Saitama, Japan, 2. Waseda University, Tokyo, Japan

Reactive oxygen species (ROS) induce neuronal cell death in a concentration- and time-dependent manner. However, treatment with a low concentration of ROS, such as hydrogen peroxide induced neurite degeneration prior to the cell death. Previously, we found microtubules alteration and autophagy dysfunction in ROS-treated cultured cells and aged-mice brain. However, the detailed mechanism of ROS-derived neurite degeneration has not been elucidated. In order to verify the mechanism of this morphological alteration, we considered a possibility of calcium homeostasis alteration in ROS-treated neuronal cells. Treatment with calcium ionophore ionomycin rapidly enhanced calcium influx and induced mitochondrial superoxide production. Furthermore, we found mitochondrial lipid peroxidative products. These fluorescent emissions were detected by a time-lapse live cell imaging system. Cytochrome C protein expression significantly increased in ionomycin-treated neurons. However, caspase 3 protein expression did not change of all samples. These results indicated that over influx of calcium ions induces neurite degeneration via mitochondrial dependent oxidative damage. Neurite degeneration is well known in a development and progression of several severe neurodegenerative disorders. These phenomena via calcium-related pathway may be important event in these neurodegenerative disorders.

ALCOHOL CONSUMPTION AND LONGITUDINAL CHANGE IN WHITE MATTER TRACKS

S.L. Willis¹, J.A. Blaskewicz Boron², 1. Psychiatry and Behavioral Sciences, University of Washington, Seattle, Washington, 2. Department of Gerontology, University of Nebraska, Omaha, Nebraska

While alcohol abuse has many detrimental physical and mental effects, there is considerable debate on whether moderate alcohol use, as compared to abstainers, might have a positive effect on health and cognitive functioning in old age. A metaanalysis of 15 studies reported that alcohol abstainers had an increased risk of Alzheimer's disease (AD) compared to light to moderate drinkers (Anstey et al, 2009); AD risk reduction for moderate drinkers were also found by Deckers et al., 2014. However, findings regarding neural function and alcohol use have been mixed and shown nonlinear patterns. Several cross-sectional studies have reported some positive effects of moderate drinking associated with white matter hyperintensities, gray matter, and cerebral infarction. Longitudinal studies regarding association of neural function and moderate alcohol consumption are lacking. This study examined 8-yr longitudinal change (DTI) in white matter tracts, comparing alcohol use in cognitively normal abstainers vs moderate alcohol consumers, aged 50 – 80+ yrs from the Seattle Longitudinal Study (SLS; N = 163). Moderate alcohol use defined as in other studies as 1 – 14 drinks per week. Significant differences in white matter integrity for abstainers vs moderate drinkers were found in white matter tracts: Cingulate (CN), inferior longitudinal fasciculus (ILF), superior longitudinal fasciculus (SLF), and fornix (FX). Effects were primarily found for radial diffusivity (ILF, CN) and axial diffusivity (SLF, CN), compared to FA. Effects were moderated negatively by age in SLF, CN and FX. Effects were moderated by negatively APOE $\epsilon 4$ allele in ILF and CN.

CCT AND BDNF DURING BED REST: PROTECTING AGING INDIVIDUALS FROM ACUTE STRESS

C. Soavi¹, U. Marusic², M.L. Morieri¹, S. Lazzer³, R. Pisot², E. Dalla Nora¹, G. Zuliani¹, A. Passaro¹, 1. *University of Ferrara, Ferrara, Italy*, 2. *University of Primorska, Koper, Slovenia*, 3. *University of Udine, Udine, Italy*

During acute stress (such as 14 days of horizontal bed rest, BR) plasma level of the neurotrophin brain-derived neurotrophic factor (pBDNF) was demonstrated to increase in older, but not younger adults. We hypothesized that this increase might represent a mechanism of brain protection, and that performing computerized cognitive training (CCT) would alter this pBDNF increase. Thus 16 older adults (healthy volunteers) were divided into two groups: CCT (59.1 ± 3.6 years old) and control (C) group (59.1 ± 2.5 years old). All subjects underwent 14-day BR; the CCT group performed 45 min/day of spatial navigation task. PRE- and POST-BR pBDNF, muscular mass, neuromuscular function and metabolic parameters were measured.

There was a significant interaction effect between time and group ($p=0.011$) on pBDNF levels, that increased POST-BR for C ($p=0.009$) but not for CCT ($p=0.281$) group. CCT group showed anti-insular modifications in metabolism (increase in plasma glucose) whereas C group showed an increase in fat mass and decrease in plasma triglycerides. Muscle mass decreased in both groups. There was a negative correlation ($r=-0.821$) between POST-BR maximal explosive power of lower limbs and pBDNF in CCT group and a positive correlation in C group ($r=0.810$). Finally, only in C group, the variation of maximal voluntary contraction of knee extensors negatively correlated with pBDNF variation ($r=-0.905$). Our data seem to support the concept that if an external protection for brain occurs (i.e. CCT) there is no pBDNF increase, however if no CCT takes place pBDNF increase is associated to a certain preservation of neuromuscular function.

ASSOCIATIONS BETWEEN APOE GENOTYPE AND PSYCHOLOGICAL CONSEQUENCES POST STROKE

C. Donnellan¹, N. Redha², M. Al Banna², A. Al Jishi², I. Al Sharqi², S. Taha³, M. Bakhiet³, F. Abdulla², 1. *University of Dublin, Trinity College, Dublin, Ireland*, 2. *Department of Clinical Neurosciences, Salmaniya Medical Complex, Salmaniya, Bahrain*, 3. *Department of Molecular Medicine, Princess Al Jawhara Center for Genetics and Inherited Diseases, College of Medicine and Medical Sciences, Arabian Gulf University, Salmaniya, Bahrain*

The contribution of genetic factors such as the presence of ApoE E4 allele and its association with cognitive impairment post stroke remains inconclusive generally and is unknown within Middle-Eastern regions. This study examined the association of ApoE genotype with cognitive impairment and mood in stroke patients and compare these functions to healthy older adults.

A prospective stroke sample of $n=50$ patients (case group) and $n=50$ healthy ageing individuals (control group) were recruited from the largest Medical Complex in Bahrain. A neuropsychological battery of cognitive assessments (including pre-morbid, global and executive cognition), were conducted on all participants, and then stratified by cognitive function: no cognitive impairment, mild cognitive impairment and moderate to severe cognitive impairment. Anxiety and depression were assessed using the Hospital Anxiety and Depression Scale (HADS).

The most frequent ApoE genotype was E2/3 in both case (44%) and control groups (63%). No statistical significant association was found by cognitive impairment stratification and ApoE genotype for either case or control groups. ApoE genotype E2/4 had worse cognitive function ($\chi^2(3) = 8.29$, $p<.05$) in the control group. A statistical significant difference was found between ApoE genotype and total anxiety scores in that ApoE genotype E3/3 were highly anxious in the case group ($\chi^2(2) = 6.77$, $p<.05$).

The presence of ApoE genotype E4/3 and E4/4 was low to non-existent in this Bahrain sample explaining why no significant associations were found with cognitive impairment. Further examination of mood dysregulation and ApoE genotype polymorphism may be warranted.

DEVELOPMENTAL PROGRAMMING ACCELERATES BRAIN AND CARDIAC AGING IN THE NONHUMAN PRIMATE

P. Nathanielsz^{1,2}, K. Franke³, C. Gaser³, R. Dahnke³, A. Kuo⁴, C. Li¹, J. Li⁴, G. Clarke^{4,2}, 1. *University of Wyoming, Laramie, Wyoming*, 2. *Southwest National Primate Research Center, San Antonio, Texas*, 3. *Jena University Hospital, Jena, Germany*, 4. *University of Texas Health Science Center San Antonio, San Antonio, Texas*

Decreased fetal nutrient delivery leads to developmental programming. We hypothesized that programming predisposes to premature brain and cardiac aging. We developed baboon offspring of mothers fed *ad lib* (control) or with reduced nutrition of 70% control diet during pregnancy and lactation, resulting in intrauterine growth restriction (IUGR). MRI data from 29 control (CTL) baboons (aged 4–22y; human equivalent 16–88y) were used to construct a reference curve for brain aging. We also studied IUGR baboons (8 male, 8 female) age 5.7 y and CTL offspring (8 male, 8 female), age 5.6 y with MRI to evaluate left ventricular (LV) and right ventricular (RV) functional parameters, normalized to body surface area. Premature brain aging by +2.7 y ($p<0.01$) occurred in young adult female IUGR offspring vs. CTL. Cardiac data are presented for CTL, IUGR, OLD, mean ± SEM: left ventricular ejection fraction (58 ± 3%, 45 ± 2%, 50 ± 3%), filling rate (88.8 ± 7.1 mL/sm², 63.5 ± 7.0 mL/sm², 62.0 ± 7.3 mL/sm²), right ventricular ejection fraction (49 ± 2%, 32 ± 3%, 39 ± 3%) and stroke volume (26.5 ± 1.8 mL/m², 20.0 ± 1.8 mL/m², 17.5 ± 2.2 mL/m²) were all decreased ($p < 0.05$) similarly in IUGR and OLD. To our knowledge these cohorts are the first to reveal both premature brain and cardiac functional aging by young adulthood resulting from developmental programming and IUGR in any species. Further studies across the life-course will determine progression of cardiac dysfunction. These and other multi-organ non-invasive *in-vivo* aging related biomarkers we are developing will reveal determinants of premature aging and aid the development of preventive interventions and pharmacological treatments on an individualized basis.

SESSION 4520 (POSTER)

PHARMACOLOGY

APPROPRIATENESS OF PROTON PUMP INHIBITOR USE IN A PSYCHOGERIATRIC POPULATION

I. Hendrix^{2,1}, R. Visvanathan^{2,1}, 1. *The University of Adelaide, Adelaide, South Australia, Australia*, 2. *The Queen IIAGG 2017 World Congress*

Elizabeth Hospital, Woodville South, South Australia, Australia

Inappropriate medication use is the use of a medication where the potential risks associated with use outweigh the potential benefits. Inappropriate medication use among older people is known to contribute to adverse health outcomes including hospitalisation and death. Proton pump inhibitors (PPIs) are medications which are commonly used to treat gastric-acid related disorders. Long-term use of PPIs has been associated with several risks including *Clostridium Difficile* infection, pneumonia, kidney disease and potentially dementia. Inappropriate PPI use is common in older people with up to 80% of patients using a PPI inappropriately. This study explored the appropriateness of PPI prescribing in an inpatient psychogeriatric population which is a vulnerable and understudied patient cohort. Pilot data obtained from 67 inpatients showed that 33% of patients were using a PPI at the time of admission. PPI use was found to be potentially inappropriate in 68% of cases. Un-investigated GORD was the most commonly identified inappropriate indication with 41% of patients using a PPI for this reason. The average frailty score was increased by 10% and the Katz index for independence in activities of daily living was reduced by 15% in PPI users compared to non-users. Both nationally and internationally, PPIs are listed as the most commonly prescribed medications and the costs to the government and the individual are significant. This study demonstrates that there is an opportunity to deprescribe PPIs in psychogeriatric patients which would not only reduce the risk of adverse health outcomes but also result in significant cost saving.

PHARMACOLOGICAL IMPACT OF HOSPITALIZATION IN AN ACUTE GERIATRIC UNIT

N. Martínez-Velilla¹, M. Gutiérrez Valencia², B. Larrayoz Sola², J. Renedo¹, M. Gasque², M. López-Sáez de Asteasu¹, F. Zambom Ferraresi¹, A. Casas Herrero¹, 1. *Servicio de Geriatria, Complejo Hospitalario de Navarra, Pamplona, Navarra, Spain*, 2. *Servicio de Farmacia, Complejo Hospitalario de Navarra, Pamplona, Navarra, Spain*

The impact of hospitalization on the treatment of elderly patients has not been widely studied. Previous studies examine some treatment characteristics in an isolated way and also provide mixed results and few until now have explored the modification of treatments during hospitalization with a mixed comprehensive approach. We have conducted a retrospective observational study in 235 admitted patients, and compared polypharmacy (≥ 5 and ≥ 10 drugs), potentially inappropriate prescribing or potentially omitted prescription (PIP-POP), drug interactions, the use of drugs with impaired renal function and the anticholinergic load of the treatments before and after admission to hospital. Their relationship with mortality, readmissions and emergency visits after a six-month follow-up were also analyzed by multivariate logistic regression. We found that the total number of drugs increases (9.1 vs. 10.1 $p < 0.001$), without increasing chronic drugs (8.5 vs. 8.3). There were no significant variations in the number of patients with polypharmacy (86.5% vs. 82.2%), those who presented inappropriate prescribing criteria (68.5% vs. 71.5% STOPP; 58% vs. 58% START) or those presenting interactions (82.5% vs. 83.5%). Those receiving drugs with

anticholinergic effect tend to increase but without reaching statistical significance (39.5% vs. 44.5%; $p = 0.064$). An association was found between hyperpolypharmacy and the risk of readmission (OR 2.302; 95% CI 1.197–4.425), and emergency visits (OR 1.928; 95% CI 1.049–3.546).

PREDICTIVE FACTORS FOR THE PRACTICAL MANAGEMENT OF THE ANTICOAGULANT THERAPY IN FRAIL OLD PATIENTS

Y. Yamada, M. Eto, T. Kojima, Y. Umeda-Kameyama, S. Ogawa, M. Akishita, *Department of Geriatric Medicine, Graduate School of Medicine, The University of Tokyo, Tokyo, Japan*

Purpose: Preventing embolic cerebral infarction is important since it decreases activity of daily living and quality of life in old people. However, appropriate use of anticoagulants is difficult in frail old people because of increasing risk of bleeding events. Thus the present study examined the predictive factor for practical management of anticoagulants in older patients.

Methods: 835 patients aged ≥ 65 who were admitted to the geriatric ward of The University of Tokyo Hospital between 2013 and 2015 were enrolled. 100 patients (men 48%, mean age 84.4 ± 7.4 years) had atrial fibrillation. We followed the patients ≤ 3 years after baseline. Major gastrointestinal bleeding, stroke and all cause mortality were investigated for outcome. Comprehensive geriatric assessment was performed and frailty was evaluated by BMI, IADL scale and Barthel index, MMSE, vitality index, GDS15, fall risk index, history of fall and by living alone or not.

Results: Among them, 44% were taking anticoagulant therapy. There was no significant difference between with or without anticoagulant therapy in all three outcomes. The fall risk index had an increased risk of major gastrointestinal bleeding (adjusted hazard ratio 1.8, 95% confidence interval 1.1 to 4.5) and MMSE was increased risk of stroke (adjusted hazard ratio 0.8, 95% confidence interval 0.6 to 1.1), a history of fall was increased risk for all cause mortality (adjusted hazard ratio 5.6, 95% confidence interval 1.1 to 26.7).

Conclusions: Fall risk index, MMSE and history of fall might be the predictor factors for practical management of anticoagulants in frail old people with atrial fibrillation. Further studies are needed to clarify the medical appropriateness of anticoagulants.

CHANGES OF NITRIC OXIDE SERUM LEVELS WITH SSRI USE IN GERIATRIC OBSESSIVE COMPULSIVE DISORDER

K. Eslami¹, A. Torbati², 1. *Abvaz Jundishapur University of Medical Sciences, Abvaz, Iran (the Islamic Republic of)*, 2. *UCLA Health, Los Angeles, California*

Nitric oxide (NO) is an inflammatory mediator, shown to have a possible role in pathophysiology of some psychiatric disorders such as obsessive compulsive disorder (OCD). Some studies on animal models have shown that increased NO production could lead to reversed effect of selective serotonin reuptake inhibitors (SSRIs). This study tries to assess the correlation of NO serum levels with the use of SSRIs in geriatric OCD.

Patients aged 60 and older, diagnosed with OCD and candidates of receiving an SSRI drug; entered this study voluntarily. For assessing NO serum levels, blood samples were drawn from subjects before starting drug therapy and when the patient had shown signs of response to the drug. NO concentrations were measured by Nitrate/nitrite colorimetric assay kit (Griess method).

27 patients met our inclusion criteria. Mean serum concentration of NO prior to drug therapy was 29.94 ± 18.9 $\mu\text{mol/L}$. This value was 17.55 ± 2.75 $\mu\text{mol/L}$ when the symptoms showed signs of improvement. With a p-value of 0.041, there was a significant correlation between NO levels and the use of SSRIs. Mean duration of therapy for these cases was 4.03 ± 0.5 months. Type of the SSRI, duration of disease, gender and severity of OCD did not have any relationship with NO levels.

Our results show that geriatric patients on SSRI drugs had lower NO serum concentrations when their OCD symptoms started to resolve. Such data can be helpful in finding a predictive factor of response to therapy, and augmentation therapy with future drugs that target NO synthesis.

POLYPHARMACY E-CONSULTS: A METHOD TO ASSESS MEDICATIONS AND ADDRESS POLYPHARMACY IN RURAL PATIENTS

M.I. Rossi^{2,1}, U. Feske², S. Shaffer², J. Kreutzer², 1. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *VA Pittsburgh Healthcare System, Pittsburgh, Pennsylvania*

The Geriatric Polypharmacy E-consult began in 2015 to address issues of polypharmacy among older Veterans in rural community based outpatient clinics (CBOCs) outside Pittsburgh, Pennsylvania.

Methods: Completed a telephone medication reconciliation of all prescription and non-prescription medications plus review of medical records. A geriatrician and pharmacist reviewed collected information to provide recommendations to VA and non-VA physicians via medical chart and letter.

Results: 82 Veterans & caregivers contacted (average age 76 years (range 59–92)). Most had more than one physician providing care and many had cognitive decline. Reviewed 1,215 medications across 82 Veterans, averaging 14.8 medications/person (range 5–29). Medications in medical record did not correspond with the medications actually taken by patient in 68 of 82 cases (83%). Recommended discontinuing medication (including supplements) - 308 times, for an average of 3.8 medications/ person. Potentially problematic prescribing and medical practices found: no indication for drug (147 instances), drug use without adequate monitoring (n=123), potential adverse drug event (n=102), wrong /ineffective drug given (n=89), adverse drug-disease interactions (n=64), diseases remained untreated (n=55), patient not adhering to drug regimen (n=41), dose of drug too low to be effective (n=30), dose of drug too high (n=30), therapeutic duplication (n=21), problematic drug-drug interactions (n=20), drug taken for too long (n=4), wrong directions for drug (n=4). E-consults saved Veterans 9,597 miles of driving (117 miles/Veteran), 204 hours of driving (2.5 hours/Veteran).

Conclusion: Complete medication reconciliation involves additional effort beyond the usual clinical practice especially

with cognitive decline. Potential to avoid adverse medication events is significant.

RELATIONSHIP BETWEEN POLYPHARMACY, GAIT SPEED AND FUNCTIONALITY IN ELDERLY OUTPATIENT DEPARTMENT

R.A. Heredia Ramirez^{1,2}, S. Hoyos Porto^{1,2}, 1. *Facultad de Medicina, Instituto de Envejecimiento, Pontificia Universidad Javeriana, Bogotá, Colombia*, 2. *Geriatrics Unit, Hospital Universitario San Ignacio, Bogotá, Colombia*

Polypharmacy is the concurrent use of more than five different medications consumed by a person at the same time. It is related to adverse drug reactions, increased morbidity and mortality. The present descriptive study analyzed 126 patients over a period of 6 months in elderly outpatient department at the San Ignacio University Hospital in Bogotá Colombia. All patients must have polypharmacy criteria to be included. Barthel index, mini nutritional assessment and gait speed (GS) were carried out. At baseline, 68.2% were female. Polypharmacy (to use between 6 to 10 medications) was met for 103 patients (81.8%). In addition, there was extreme polypharmacy (use of more than 10 medications) in 23 (18.2%) patients. Besides, normal GS was reached only for 13% (standard measure of normality is faster than 0.8m/s). Functional evaluation measured by Barthel index demonstrated independence at the ADL only for 29 (23%) subjects. Finally, in terms of comorbidities and nutritional status, 92% had more than 5 clinical conditions and only 35% had normal nutritional status. In conclusion, polypharmacy is a risk factor that could impair functionality, nutritional status and be associated with decreased GS. New studies are needed to get more information on the impact of polypharmacy in the elderly population.

UPDATE OF A VALIDATED CLINICAL TOOL FOR IMPROVEMENT OF DRUG TREATMENT IN THE ELDERLY

F. Pazan, M. Wehling, *Medical Faculty Mannheim Ruprecht-Karls-University Heidelberg, Mannheim, Germany*

Many studies have revealed that elderly people are frequently the victims of inappropriate drug treatment. The major problem is that for most of the drugs there is no evidence regarding efficacy and safety in the elderly. This dilemma is intensified by the high incidence of multimorbidity and therefore polypharmacy in this group of patients. To increase the appropriateness of pharmacotherapy in the elderly we have developed a clinical aid called the FORTA List. FORTA was originally created by Wehling and validated and expanded by experts in a Delphi consensus procedure. Later on, we evaluated FORTA's usefulness in a pilot clinical study as well as in a controlled prospective trial. Both of them confirmed that FORTA significantly ameliorates the quality of pharmacotherapy and reduces the incidence of adverse drug reactions. As an evidence-based tool the FORTA List needs frequent updates as the field of geriatric pharmacology advances rapidly. Therefore, we conducted a new Delphi survey to update this useful clinical tool. This Delphi consensus procedure involved 21 experts who evaluated the proposal of 4 initiators. The new FORTA List now contains 48 (21.3%) additional items as compared to its

previous version and 3 new indications (nausea and vomiting, hypothyroidism, obstipation) were added to the list resulting in 29 indications in total. Besides, all medications used to treat dementia associated depression ($n=3$) and anti-cancer medications ($n=27$) received a less positive classification than before. All in all, the updated list now covers more illnesses and contains more medications used to treat elderly patients.

SESSION 4525 (POSTER)

PHYSICAL ACTIVITY: PRECURSORS AND BENEFITS

EFFECTS OF SELF-EFFICACY ON PHYSICAL ACTIVITY, FUNCTIONING, AND AUTONOMY IN MULTIMORBID ADULTS

R. Schwarzer^{1,2,3}, L.M. Warner¹, 1. *Psychology, Freie Universität, Berlin, Germany*, 2. *SWPS University of Social Sciences and Humanities, Warsaw, Poland*, 3. *Australian Catholic University, Sydney, New South Wales, Australia*

Multimorbidity poses a threat to autonomy in older adults in line with less activity and compromised functioning. This study examined effects of self-efficacy on three outcomes: subjective physical functioning, physical activity, and perceived autonomy. The longitudinal study was conducted with 309 multimorbid older adults (aged 65–85) including three measurement points over 6 months.

First, subjective physical functioning was regressed on health-specific risk perception and general self-efficacy. The latter two factors interacted in a way that risk perception predicted physical functioning only for individuals with low self-efficacy.

Second, received friend support as well as self-efficacy were specified as predictors of exercise frequency. Besides main effects of social support and self-efficacy, an interaction between them emerged. Persons with low support were less likely to be active even if they were highly self-efficacious.

Third, we tested effects of perceived self-efficacy and instrumental received social support on autonomy. Low self-efficacy and low support were jointly associated with lack of autonomy. However, the relation of self-efficacy with autonomy was also moderated by received support. The combination of high self-efficacy and low support yielded the highest level of autonomy. This is explained with higher need of support in multimorbid older adults who need outside help and who are competent in mobilizing such help. Receiving social support bolstered autonomy in lower self-efficacious individuals, but in highly self-efficacious individuals support threatened autonomy.

MOVING BEYOND WALKING: ENCOURAGING SENIORS TO DO MORE VARIED PHYSICAL ACTIVITY

S. Pettigrew¹, M.I. Jongenelis¹, N. Biagioni¹, Z. Talati¹, R. Newton², B. Jackson³, J. Warburton⁴, C. Worrall¹, 1. *Psychology, Curtin University, Perth, Western Australia, Australia*, 2. *Edith Cowan University, Perth, Western Australia, Australia*, 3. *University of Western Australia, Perth, Western Australia, Australia*, 4. *La Trobe University, Perth, Western Australia, Australia*

Physical activity guidelines for later life often recommend engaging in varying forms of exercise, including cardiovascular, resistance, flexibility, and balance training. Unfortunately these guidelines are rarely promoted effectively and many older people are unaware of optimal types and duration of physical activity. Health promotion communications designed to improve knowledge and motivation relating to physical activity need to build on current beliefs and behaviours to ensure they are perceived to be reasonable and achievable by the target audience. The objectives of the present study were to (1) assess older Australians' beliefs and behaviours relating to physical activity and (2) provide recommendations for future health promotion communications targeting this group. Interviews were conducted with more than 250 Australians aged 60+ years, with an approximately equal gender split. Interviewees discussed their physical activity beliefs and behaviours, with a particular focus on the types, duration, and intensity of activity currently undertaken and believed to be ideal. The interview transcripts were imported into NVivo11 for coding and analysis. Overall, attitudes to physical activity were ambivalent and the most commonly undertaken and endorsed form of activity was walking. Most interviewees were unaware of guidelines relating to frequency, duration, and intensity of activity. In particular, very few appreciated the benefits of resistance training and only a small number regularly engaged in some form of strength exercise. Even fewer participated in balance or flexibility training. There appears to be a need for strategies to improve older people's knowledge of current guidelines and their motivation to comply with them.

AEROBIC EXERCISE ACCELERATES WOUND HEALING AMONG STRESSED OLDER WOMEN, BUT NOT STRESSED OLDER MEN

C.F. Emery, J. Kiecolt-Glaser, R. Glaser, W.B. Malarkey, S. Devor, *Psychology, Ohio State University, Columbus, Ohio*

Aging and psychological stress are associated with impaired wound healing. Aerobic exercise (AE) has been associated with accelerated rates of wound healing among healthy older adults. This study evaluated the influence of AE on wound healing among healthy, stressed older adults. 77 community-residing older adults (mean age=65.0±7.9 years; range: 55–84 years; 64% women) reporting elevated daily stress were randomly assigned to an AE group or a balance and flexibility (BF) control group. Both groups attended sessions 3x/week for 12 weeks. Participants completed comprehensive assessments prior to randomization and at study conclusion, including exercise capacity (VO_{2peak}) and psychological stress (Perceived Stress Scale-10), as well as additional self-report and biological markers. After 2 weeks of group sessions (AE or BF), participants underwent a standardized experimental wound procedure, and wounds were measured 3x/week until healed to calculate wound healing rate. Repeated measures analysis of variance (ANOVA) revealed a time by group interaction for VO_{2peak} [$F(1,66)=10.07, p=.002$], with a 13% gain in AE versus 2% in BF. As expected, in the full sample older age was associated with slower wound healing ($r=.24, p=.040$). Surprisingly, ANOVA revealed no difference in wound healing rate across groups, but wound healing was faster among men than

among women [$F(1,67)=5.46, p=.022$]. Also, there was a significant sex by group interaction [$F(1,67)=6.15, p=.016$]: among women, wounds healed faster in the AE group, but among men wounds healed faster in the BF group. Thus, among stressed older adults, AE may be more relevant for wound healing of women than of men.

THE BENEFITS OF LIGHT-TO-MODERATE PHYSICAL ACTIVITY FOR OLDER ADULTS

S. Musich¹, S.S. Wang¹, K. Hawkins¹, C. Greame², 1. *Optum, Ann Arbor, Michigan*, 2. *AARP Services, Inc., Washington, District of Columbia*

The benefits of physical activity (PA) for older adults have been demonstrated in reduced prevalence of common chronic conditions (e.g., heart problems, diabetes or hypertension), improved mental health and quality of life, decreased probability of cognitive decline and reduced mortality. Less is understood concerning the health impacts of light-to-moderate intensity PA among older adults. In this study the purpose was to estimate prevalence of light-to-moderate PA levels (low, moderate and high) among AARP® Medicare Supplement insureds (insured by UnitedHealthcare), identify characteristics associated with PA levels and estimate the impact of PA levels on healthcare utilization and expenditures. In 2015, surveys were sent to a random sample of insureds in three states. Physical activity was determined from survey responses querying days per week of at least 30 minutes of light-to-moderate PA. Multivariate regression models, adjusting for confounding covariates and survey non-response bias, were utilized to determine characteristics associated with PA levels and the impact of PA levels on healthcare utilization and expenditures. Among survey respondents ($n=17,676$), low (0–2 days), moderate (3–4 days) and high (5 or more days) PA levels were 23.3%, 33.9% and 42.9%, respectively. The strongest predictors of moderate and high PA included being male, younger, self-reporting better health, using fewer prescription drugs and being less likely to be diagnosed with common chronic conditions or depression. Those engaged in moderate and high PA had significantly lower medical utilization and lower healthcare expenditures. Efforts to increase all levels of PA among older adults should be encouraged.

CHANGES IN PHYSICAL ACTIVITY AND DEPRESSIVE SYMPTOMS AMONG CHINESE OLDER ADULTS

Z. Cheng, X. Ye, *Institute of Population Research, Beijing, Beijing, China*

The protective effects of physical activity on depressive symptoms among older adults have had conflicting results. The study investigated the effects of changes in amount of time for physical activity each day and purpose for doing physical activity on depressive symptoms among the elderly. Data came from Chinese Health and Retirement Longitudinal Study (CHARLS, 2011–2013) longitudinal data a nationally representative sample. The analytic sample contained 1497 older adults aged 60 and above. The CESD-10 was used to measure depressive symptoms with a score from 0 to 30. We used multiple linear regression. Respectively, 14.7%, 25.1%

and 29.6% of the elderly increased the amount of time each day for vigorous, moderate and low physical activity from 2011 to 2013. After controlling demographic and socioeconomic variables, when increasing the amount of time for vigorous or low physical activity, the elderly tended to have more depressive symptoms. However, when adding the purpose for doing physical activity (job demands, entertainments, exercise and other), we found compared to job demands exercise was significantly associated with less depressive symptoms. The purpose for doing physical activity might be much more important than the amount of time for physical activity to mental health of the elderly. When we encourage productive engagement among older adults, we should pay attention to the health results of the increase of work related physical activity. And we suggest that environment should be perfected to increase exercise participation for the elderly.

PHYSICAL ACTIVITY ENGAGEMENT AMONG URBAN-DWELLING CHINESE OLDER ADULTS: A GROUNDED THEORY STUDY

H. Wang, B. King, *University of Wisconsin-Madison, School of Nursing, Madison, Wisconsin*

Background: Maintaining well-being of older adults has been identified as a critical public health concern in China. Physical activity (PA) produces many health benefits; however, for urban Chinese community-dwelling older adults' PA levels are still low. There is limited in-depth understanding of psychosocial processes that are important for engagement of PA among urban Chinese community-dwelling older adults.

Method: This study used grounded dimensional analysis, a variant of grounded theory to explore how participants' engaged in physical activity and conditions which influenced their engagement. Twelve urban community-dwelling Chinese older adults age over 60 participated. Semi-structured interviews were used for data collection. Open, axial and selective coding was used to analyze the data along with constant comparative analysis.

Findings: Four preliminary categories identified in the data include "Knowing Self", "Keeping Motivation", "Gaining and Building Support", and "Making PA as a Part of Life". Participants describe experiencing physical (stronger, decrease in pain, and less chronic disease symptoms), mental (more energetic, refreshed and joyful) and social (new friends and encouragement) benefits as important motivators to continue physical activity. Conditions which seemed to influence initiating and continuing physical activity were being part of groups and having structured community activities.

Conclusion: Understanding the meaning of PA for older adults could be important prerequisites for developing interventions to improve PA engagement. The importance of support systems and how to create these systems for urban dwelling Chinese older adults should be studied further.

ASSOCIATION OF ACUTE EXERCISE AND FINE MOTOR LEARNING IN OLDER ADULTS

L. Huebner¹, B. Godde², C. Voelcker-Rehage¹, 1. *TU Chemnitz, Chemnitz, Germany*, 2. *Jacobs University Bremen, Bremen, Germany*

An acute bout of high intensity physical exercise, as compared to a resting condition, led to enhanced improvement in fine motor performance 24h after physical exercise in young adults, indicating that acute exercise can boost motor learning [1]. In older adults, cardiovascular fitness level is positively associated with fine motor performance [2]. We examined whether an acute bout of moderate intensity exercise affects motor learning in older adults. Thirty older adults (65–74 years of age) were assigned to an experimental group ($n = 15$, acute exercise: 20 min cycling at 65 % of maximum Watt performance level) or a control group ($n = 15$, rest: listening to an audio book). Groups were matched with respect to cardiovascular fitness level (assessed by use of spirometry (VO_2 -peak) on a bicycle ergometer). Motor learning was assessed with a visuomotor precision grip tracking task. Participants had to track a sine wave pattern with their right dominant hand at baseline (immediately before acute exercise/rest: 8 trials of 15 sec (i.e., 1 block)) and for practice (immediately, 30 min, and 24h after exercise/rest: 4 blocks each). Tracking variability was operationalized as the root mean square error (RMSE: at baseline and last practice block). Preliminary analyses revealed that the experimental group performed better 24h after intervention as compared to the control group, indicating improved motor consolidation processes. These findings are promising, as they indicate potential applications for motor rehabilitation.

LEISURE-TIME PHYSICAL ACTIVITY AND AFFECT IN MIDDLE-AGED AND OLDER WOMEN

C.K. Holahan¹, C.J. Holahan², Y.T. Chen¹, X. Li¹, 1. *Kinesiology and Health Education, University of Texas at Austin, Austin, Texas*, 2. *Department of Psychology, University of Texas at Austin, Austin, Texas*

Previous literature on exercise and mood has emphasized relatively short-term affect in the context of acute exercise or structured exercise interventions. The present study investigated exercise and mood in a more ecologically-relevant way, reflecting longer-term affect in the context of regular leisure-time physical activity. We focused on middle-aged and older women, an underrepresented group in the study of physical activity. The sample included 861 women ranging in age from 40 to 75 ($M = 56$) from the second wave of the MacArthur Studies of Midlife (MIDUS2). A composite measure of moderate and vigorous leisure-time physical activity approximated meeting CDC physical activity guidelines. Following Ekkekakis and Petruzzello's (2002) recommendation to use the affective circumplex to tap both emotional valence and activation in research on exercise and affect, four scales indexed high and low activated positive and negative affect ($\alpha = .84$ to $.92$). A 30-day time frame was used to reflect broader factors influencing mood (Mroczek & Kolarz, 1998). In multiple regression analyses controlling for socio-demographic factors and health status, leisure-time physical activity was positively associated with high-activated positive affect ($B = .15$, $p < .001$) and low-activated positive affect ($B = .10$, $p < .002$); and negatively associated with high-activated negative affect ($B = -.07$, $p < .038$) and low-activated negative affect ($B = -.08$, $p < .015$). These results demonstrate potential benefits of regular leisure-time physical activity for longer-term affective

responses encompassing high and low activated positive and negative affect among middle-aged and older women.

PSYCHOSOCIAL MEDIATORS BETWEEN SOCIOECONOMIC STATUS AND PHYSICAL ACTIVITY IN OLDER JAPANESE ADULTS

H. Sugisawa¹, K. Harada², Y. Sugihara³, S. Yanagisawa⁴, M. Shimmei⁵, 1. *J.F. Oberlin University, Machida-shi, Tokyo, Japan*, 2. *Jissen Women's University, Shibuya-ku, Japan*, 3. *Tokyo Metropolitan University, Hachioji-shi, Japan*, 4. *Tokushima University, Tokushima-shi, Japan*, 5. *Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Japan*

Empirical studies conducted in developed countries have indicated differences in physical activities among older adults according to their socioeconomic status (SES). However, few studies have examined the mediators between SES and physical activity, and therefore, limited knowledge is available regarding the relation between SES and physical activity. This study examined the psychological mediators between SES and physical activities among older Japanese adults. Data were obtained from a probability sample survey conducted with 739 participants living in two wards of Tokyo, Japan. Physical activity was divided into active (engaged in 60 min or more per week) and inactive (not engaged in 60 min or more per week). SES was evaluated by educational attainment and household income. The following three dimensions of psychological mediators were assessed: control expectancy for physical activity, self-efficacy of physical activity, and social support for physical activity. Age, sex, and daily activities were included as control variables. A multiple mediator model was used to evaluate the indirect effects of SES through the mediators. Educational attainment was found to influence physical activity significantly. In addition, the relation between educational attainment and physical activity was mediated by two mediate variables: self-efficacy and social support; in particular, self-efficacy had the strongest mediating effect. These two significant variables explained the majority of differences in physical activity resulting from different educational attainment levels. Household income did not influence on physical activity significantly. Therefore, it is necessary to enhance self-efficacy and social support to promote healthy physical activities among SES-disadvantaged older adults in Japan.

CAN A LATIN DANCE PROGRAM IMPACT PHYSICAL ACTIVITY AND SEDENTARY BEHAVIOR AMONG OLDER LATINOS?

S. Aguiñaga¹, D. Marquez², 1. *Kinesiology and Community Health, University of Illinois at Urbana-Champaign, Urbana, Illinois*, 2. *University of Illinois at Chicago, Chicago, Illinois*

Low levels of physical activity (PA) and sedentary behavior (SB) are associated with obesity, cardiovascular disease and cancer. Older Latinos are 46% less likely to engage in leisure-time PA than older non-Latino whites and spend an average of 11.11 hours/day in SBs. Interventions that concomitantly improve PA and reduce SB among older Latinos have yet to be conducted. Thus, the purpose of this study was to determine if a Latin dance program infused with discussions about SB information would have an impact on PA and SB among older Latinos. Spanish-speaking older Latinos [$N=21$, 75.4 ± 6.3 years old, 76.2% female, 22.4 ± 2.8 MMSE

score] were randomized into a 16 week, twice-weekly dance intervention or to a wait-list control group; the wait-list control group crossed over at week 17 and received the dance intervention. Participants were given a GT3X+ accelerometer to wear over their non-dominant wrist and an ActivPAL inclinometer on their non-dominant thigh for 7 days. The Sedentary Behavior Questionnaire (SBQ) was administered. Data was collected at baseline, month 2, 4, 6, and 8. Repeated measures ANOVA were used to determine overall time and interaction effects. Results revealed no time or interaction effects for accelerometer data or ActivPAL data. There was a significant time effect for the SBQ weekday sedentary time, $F(1.70, 32.27) = 5.73, p < .01$. These results warrant further research in the study of the impact of a Latin dance program and its impact on PA and SB related outcomes among older Latinos.

PHYSICAL LITERACY: A MODEL TO ENGAGE AND SUPPORT OLDER ADULTS IN PHYSICAL ACTIVITY AND SPORT

G.R. Jones¹, L. Stathokostas², A. Wister³, S. Chau¹, B. Young⁴, C. Patricia⁵, M. Duggan⁶, P. Norland⁷, 1. *Health and Exercise Sciences, University of British Columbia - Okanagan, Kelowna, British Columbia, Canada*, 2. *Western University, London, Ontario, Canada*, 3. *Simon Fraser University, Vancouver, British Columbia, Canada*, 4. *University of Ottawa, Ottawa, Ontario, Canada*, 5. *Active Living Coalition for Older Adults, Toronto, Ontario, Canada*, 6. *Canadian Society for Exercise Physiology, Ottawa, Ontario, Canada*, 7. *Canada 55 Plus Games, Cornwallis Park, Nova Scotia, Canada*

Physical literacy (PL) is a promising strategy to increase physical activity and sport participation across the lifespan. This presentation outlines the developmental process of creating a PL model for older adults, by an expert team of multi-disciplinary academics, non-profit organizations and user groups. The process began with an iterative consensus development process which identified the use of the adopted International Physical Literacy Association within an ecological model approach, reflecting a full range of key characteristics proposed to influence physical literacy in older adults. The model is anchored with the individual (intrapersonal factors) and depicted to have influences from inter-personal, organizational, community, and policy factors. Broader consensus for the PL model was reached using an online Delphi survey. An international group of multi-disciplinary and multi-sectoral Delphi participants who encapsulate the scope of the proposed physical literacy model were invited to participate. Twenty-nine Delphi invitees participated in the first round of the survey with significant consensus being reached for each of the elements of our model (i.e., % responding agree, somewhat agree, or strongly agree). Open-ended feedback from Round 1 was discussed by the expert team and a modified model was distributed in Round 2 of the survey. Twenty-three out of the original 29 respondents completed the second round (79%) and a significant consensus was again achieved. Next steps include determining methods to assess physical literacy in older adults and dissemination of the model.

DYNAMIC COMPLEXITY OF PHYSICAL ACTIVITY PATTERNS: NEW CONCEPTS FOR GERIATRIC ASSESSMENT

A. Paraschiv-Ionescu¹, K. Major², C. Lenoble-Hoskovec², C.M. El Achkar¹, H. Krief², K. Aminian¹, C. Bula², 1. *Biomedical Engineering, Ecole Polytechnique Federale de Lausanne, Lausanne, Switzerland*, 2. *University of Lausanne Medical Center (CHUV), Lausanne, Switzerland*

Background: An important dimension of physical activity (PA) behavior is the temporal pattern reflecting how movement features, postures and activities are interwoven in daily life. This pattern reflects a subject's ability to timely respond to environmental demands and adapt to internal states (physiological, mental). Beyond traditional measures such as accumulated activity levels, the focus is therefore on dynamic complexity of PA patterns, quantified in terms of diversity and moment-to-moment variations of activities/movement features. We hypothesized that higher complexity levels would indicate better functioning, (i.e., ability to perform a wide range of movements/actions and to timely respond to environmental demands) and, inversely, that lower complexity levels would indicate worse function, resulting from frailty, fear of falling, or previous falling experience.

Methods: 70 older persons, aged 65–95 years, were monitored over two days using an accelerometer fixed on the chest. PA patterns were sequences of various bouts (locomotion, sedentary, active) characterized by timing, duration and movement intensity (cadence, trunk acceleration). Embedded complexity was quantified with dynamic entropy measures. Frailty condition, fear of falling, fall history and clinical/demographic covariates were assessed for each participant.

Results: Statistical analysis revealed that severity of frailty condition, low fall self-efficacy scores and fall history were significantly ($p < 0.05$) associated with lower complexity levels. Between-group comparisons revealed that fall self-efficacy has much stronger impact on pattern complexity ($p = 0.006$, Cohen's $d = 0.94$) than on accumulated locomotion time ($p = 0.9$, Cohen's $d = 0.05$).

Conclusions: Complexity of physical activity provides new insight on health, functional status, and mobility, as well as on their intertwined relationships.

ACTIVE AND HEALTHY AGEING - IMPLEMENTING A FALL AND FRACTURE PREVENTION CARE PATHWAY AT SCALE

I.F. O Byrne- Maguire, *National Treasury Management Agency, Dublin, Dublin 2, Ireland*

Background: AFFINITY, a population health improvement project, is implementing a national strategy on the prevention of harmful falls and fractures in older persons. AFFINITY is also a commitment within a pan European programme on active and healthy ageing that aims to increase the average healthy lifespan of citizens by 2 years by 2020.

Methods: AFFINITY has adopted a whole system and multi-stakeholder collaborative approach. Key implementation elements: empowering citizen self-management, robust governance, integrated service delivery model and change management supports. AFFINITY is a joint project of the national service provider and its indemnifier. AFFINITY is

being embedded within new service provider structures and processes, using enablers: digital technologies, funding and human resources. Four early adapter sites are developing evidence-informed integrated care pathways (ICP) since 2014 to address the needs of their older populations: timely access, quality multidisciplinary interventions with measurable outcomes. Learnings are used to identify and scale up additional sites to ensure spread.

Results: Full implementation will mean that persons 65 years and older will: proactively co-produce their own health & wellbeing, access quality ICP, according to need, have less harmful falls & fracture sequelae enjoy safer age friendly environments and improved quality of life years.

Conclusions: AFFINITY will be an exemplar of a coordinated, sustainable and effective model of care for older persons. Cooperation between AFFINITY and its European partners will enhance and enrich the underlying information and process models, embedding practices and upscaling. Change management success factors will be transferable to similar large scale implementation projects.

PROSTATE CANCER SURVIVORS: PERCEIVED MOTIVES, BENEFITS, AND BARRIERS FOR PHYSICAL ACTIVITY

A. Patel^{1,2}, G.M. Schofield¹, J.J. Keogh^{1,3}, 1. *Human Potential Centre, Auckland University of Technology, Auckland 1071, New Zealand*, 2. *New Zealand College of Chinese Medicine, Auckland, New Zealand*, 3. *Bond University, Gold Coast, Queensland, Australia*

Regular physical activity can result in a number of health-related benefits for prostate cancer survivors. The aim of this study was to identify perceived motives, benefits and barriers for physical activity in prostate cancer survivors.

Sixteen prostate cancer survivors from the Auckland region of New Zealand were individually interviewed. Participants ranged in age from fifty seven years to eighty eight years of age. Time since diagnosis ranged from one year to seventeen years. Six men were currently on androgen deprivation treatment. The remaining ten men were in complete remission and were treatment free. Interviews were audiotaped and transcribed. Data were analyzed using an inductive thematic approach.

Four main themes were identified regarding perceived motives for physical activity post diagnosis: health-related reasons, stress management social reasons, and past history of physical activity. Three main themes were identified relating to perceived benefits for physical activity post diagnosis: health-related benefits, psychological benefits, and cognitive benefits. Four main themes were identified relating to perceived barriers for physical activity post diagnosis: incontinence and bowel issues, pre-existing chronic health conditions, lack of time, and age-related decline.

These findings indicate that some prostate cancer survivors are engaging in physical activity to obtain both physical and psychological health-related benefits. With increases in survivorship, lifestyle-related advice and interventions that focus on physical activity can be beneficial in improving the health-related outcomes of prostate cancer survivors.

SESSION 4530 (POSTER)

QUALITY OF LIFE AND SUBJECTIVE WELL-BEING

THE RELATIONSHIP BETWEEN FREQUENCY OF SOCIAL INTERACTION AND EMOTIONAL WELL-BEING AMONG OLDER ADULTS

M. Miyake¹, M. Kimura¹, Y. Watanabe², 1. *Faculty of Health and Medical Sciences, Kyoto Gakuen University, Kameoka-city, Kyoto, Japan*, 2. *Doshisha University, Kyoto, Japan*

The effect of social interaction on the well-being of elderly people has been discussed in the literature. We examined the effect of the frequency of social interaction on the emotional well-being of the elderly.

The data were collected from a survey of community-dwelling elderly over 65 years in age living in Kameoka City in 2012. The study population was adjusted to eliminate those who needed long-term care or other special support. The 8,272 subjects of the study (3,889 male, 4,383 female) were divided into three groups based on the frequency of their social interaction with friends –Low, Middle, High, and the prevalence of social interaction differences were analyzed by sex, age, and participation in leisure activities. The three group differences of their mean WHO-5 scores and GDS scores were assessed using multi-factor analysis of variance adjusted by age, sex, and participation in leisure activities. Overall, 40.7 % of women showed high frequency of social interaction and 37.1% of men showed low frequency ($p < 0.001$). By age, 52.8 % of those over 90 years old showed low frequency and 37.1 % of those in their 70s showed high frequency ($p < 0.001$). For those participating in physical activity, 46.6 % showed high frequency ($p < 0.001$). With respect to measures of emotional well-being, the high-frequency group showed a higher WHO-5 score (50.37 ± 23.69 , 60.07 ± 20.75 , and 66.67 ± 18.21 , $p < 0.001$) and a lower GDS score (7.16 ± 2.11 , 6.61 ± 1.91 , and 6.28 ± 1.69 , $p < 0.001$).

THE INFLUENCE OF INTEGRATED HEALTHCARE GOVERNANCE ON IMPROVING THE LIFE QUALITY OF STROKE PATIENTS

L. Zhang, C. Liu, Z. Sheng, H. Zhou, J. Hu, Y. Chen, *rehabilitation physiotherapy department, The Affiliated Hospital of School of Medicine of Ningbo University, Ningbo, Zhejiang, China*

Objective To explore the influence of Integrated Healthcare Governance on the Quality of life of stroke patients in Rehabilitation Clinic. **Method** 60 stroke patients were randomly divided into intervention group and control group equally. During the research process, 1 case died in intervention group. In control group one case died of recurrent cerebral infarction and another case was sent to ICU ward. Eventually, 29 cases were included in intervention group and 28 in control group. Integrated Healthcare Governance was carried out in Rehabilitation Clinic for the intervention group. The control group patients received traditional discharge nursing and follow-up. ADL were compared in two groups at 1 month, 6 months and 12 months after intervention.

Results A month after intervention treatment, ADI total score of self-care ability was 30.67 ± 24.55 points in the intervention group and 34.11 ± 27.35 points in the control group. The differences between the two groups had no statistically significant ($P > 0.05$). Six months after intervention, ADI total score was 46.38 ± 22.75 points in the intervention group, the score was 33.04 ± 26.95 points in the control group, $P < 0.05$. 12 months after intervention, ADI total score of self-care ability was 52.41 ± 21.45 points in the intervention group, compared with 38.82 ± 26.23 points in the control group, $P < 0.05$.

Conclusion The Integrated Healthcare Governance can increase the self-care ability and quality of life effectively for outpatient stroke patients.

EFFECT OF COUPLE-BASED REMINISCENCE THERAPY ON ELDERLY STROKE SURVIVORS AND THEIR SPOUSE CAREGIVERS

Y. Mei^{1,2}, Z. Zhang¹, 1. School of Nursing, Zhengzhou, Henan Province, China, 2. First Affiliated Hospital of Zhengzhou University, Zhengzhou, Henan Province, China

Purpose: The aim was to evaluate the effectiveness of couple-based reminiscence therapy on reducing anxiety and depression of patients with stroke, burden of spouse caregivers, and improving benefit-finding of caregivers.

Design: A quasi-experimental design with a control group with pre- and post-tests.

Method: 62 elderly stroke couples were recruited from two communities in Zhengzhou, China. They were randomly assigned into two groups: 32 couples in intervention group received 8-week couple-based reminiscence therapy designed according to caregiving situation, 30 couples in control group received only 2-week health education sessions. Data were collected in two time points: pre-intervention and post-intervention. The study instruments included: demographic sheet, Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS) for stroke survivors, Caregiver Burden Inventory (CBI) and Positive Aspects of Caregiver (PAC) for caregivers were used to evaluate the effect of intervention. Data were analyzed using the descriptive statistics, chi-square and T test with SPSS21.0.

Results: The findings showed that elderly patients with stroke in intervention group had lower score in SAS and SDS than that of control group, the difference was statistically significant ($P < 0.01$); caregivers in intervention group had lower score in CBI and better score in PAC than that of control group with the statistical significance ($P < 0.01$).

Conclusions: Couple-based reminiscence therapy in this study decreased anxiety and depression of elderly stroke survivors, reduced burden and improved benefit-finding of spouse caregivers. Further study is required to provide more evidences on the effect of the couple-based reminiscence therapy for stroke survivors and their spouse caregivers.

OLDER RE-MIGRANTS' EXPERIENCES OF INTEGRATION AND INCLUSION FROM A LIFESPAN PERSPECTIVE

G.E. Kulla¹, A. Sarvimaki², S. Ekman³, 1. Nord University, Bodo, Norway, 2. Age Institute, Helsinki, Finland, 3. Karolinska Institutet, Stockholm, Sweden

All over the world streams of refugees and migrants seems to increase. Thus, will actualize increased migration

of older people. Development of integration programs in the culture for older migrants seems to be a necessity. The aims of this paper is to deepen the understanding of how Older Sweden-Finns (65+), experiences integration and inclusion, when living in Sweden, and why they re-migrated to Finland after retirement. Sweden-Finns belongs to minority groups. A theoretical framework based on ethno-gerontology is used, to understand ageing from a minority group's point of view. The study is a part of a larger project "Ageing between two cultures". Data was collected by 21 narrative lifespan interviews, 8 men and 13 women, analyzed by inductive thematic content analysis. The interviewees told about their childhood and youth, when and why they had moved to Sweden, how they had experienced their lives in Sweden, and why they had moved back. Results shows integration is due to good working and social conditions, benefits of linguistic proficiency in both countries languages, a better life in Sweden. Due to communication problems, cultural differences, lack of close relations, longing for Finland, lack of integration is experienced. Reasons to re-migrate, return to relatives, childhood home, back to origin, to be buried in country of birth. Ageing seems to activate plans to return "home". However, "feeling at home" seems to be more than to be integrated. Further analysis is needed to deepen the understanding of meaning of ethnicity, language and migration from an ageing perspective.

PRE-TREATMENT QUALITY OF LIFE IN OLDER CANCER PATIENTS: A PERSISTENT PREDICTOR OF SURVIVAL

J. Banerjee, A. Dey, P. Chatterjee, A. Ambashtha, *Geriatric Medicine, All India Institute Of Medical Sciences, New Delhi, India*

A prospective, longitudinal, study was done to investigate the predictive role of HRQoL and other domains captured by the EORTC QLQ C-30 Questionnaire on the survival of older cancer patients. QLQ C-30, Hindi version, was filled up by 300 patients attending the Geriatric clinic with a tissue diagnosis of malignancy on index visit. The patients were followed up and their survival status at 24 weeks noted. High scores for functioning dimensions and low scores for symptom dimensions on the questionnaire indicated better QoL. Cox regression modelling was used to identify predictive factors for survival. Out of 300 patients, 260 questionnaires could be used for analysis as 25 had to be abandoned due to incomplete filling and 15 due to non-cooperation. For the functioning dimensions, the highest mean score was for cognitive functioning (74.6 ± 25.9) and the lowest was for role functioning (47.2 ± 34.1). For symptom dimensions, the lowest score was for diarrhea (11.5 ± 24.2) and highest for fatigue (59.7 ± 27.7). Functionality (p value- < 0.001), Role play (p value- < 0.001), Emotional domain (p value 0.005) and self rated QoL (0.0008) were related significantly to survival. Among symptoms, Fatigue (p value-0.004) and Pain (p value-0.0002) had significant relationship with survival. Adding to previous knowledge about factors that may influence patients QoL like functional impairment, this study shows a persisting relationship between Pre-treatment global QoL, emotional condition and symptoms like persistent fatigue and pain in older individuals and survival. This knowledge can help in prognostic prediction, treatment planning and enhancing QoL.

SELF-RATED HEALTH AND ITS ASSOCIATIONS WITH QUALITY-OF-LIFE IN HETEROGENEOUS OLDER POPULATIONS

K.H. Pitkala^{1,2}, H. Liira^{1,3}, 1. *Department of General Practice, University of Helsinki, University of Helsinki, Finland*, 2. *Helsinki University Hospital, Helsinki, Finland*, 3. *University of Western Australia, Perth, Western Australia, Australia*

Self-rated health (SRH) is a strong predictor of morbidity, mortality and health-care utilization. Although SRH generally deteriorates with age, older people are heterogeneous in this sense. The aim of this study is to explore the heterogeneity in SRH in different samples of older people and its associations with health-related quality-of-life (HrQOL).

We studied SRH in patient data from eight study samples (all >65y; total N=3231). SRH was inquired with four options (very good, good/ poor, very poor). Same clinical methods were used to assess all samples.

The mean age ranged from 75 (spousal caregivers; N=209) to 85 (population sample; N=901). In six samples 2/3 were females whereas in Helsinki Businessmen Study (HBS; N=733) all were men and 65% of patients with dementia (N=214) were men. Good SRH ranged from 48% in hospitalized delirium sample (N=171) to 97% in HBS. HrQOL (by 15D) ranged from 0.60 (nursing home sample; N=326) to 0.88 (HBS). Overall, SRH was associated with HrQOL. However, in the clinical cohort of cardiovascular patients (DEBATE study; N=394) with high number of comorbidities and among delirium patients the SRH was not associated with HrQOL. Life satisfaction was lowest among spousal caregivers (74%) and lonely older people (N=208) (82%). The predictive value of SRH on 2-year mortality varied between samples.

Older people are heterogeneous socioeconomically, psychosocially and in their health which has important consequences to their SRH, HrQOL and prognosis.

IMPACT OF THE QUALITY OF LIFE ON INFLAMMATORY BIOMARKERS IN BRAZILIAN OLDER ADULTS

M.d. Roediger, M.N. Marucci, E. Duim, Y. Duarte, M. Lebrao, *University of São Paulo - USP, São Paulo, Brazil*

Scientific evidences show a relationship between chronic inflammation and quality of life (QoL). This study verified the impaired quality of life, in different domains, associated with elevated inflammatory biomarkers levels, in older adults. Cross-sectional population-based study (SABE Study), including older adults (≥ 60 years-old). The inflammatory biomarkers used were uric acid, fibrinogen e C-reactive protein serum levels determined by using sensitive regular immunoassays (ELISA). QoL was assessed using the SF12 questionnaire. Socio-demographic information and health conditions were: sex, age and educational level; number of non-communicable diseases, self-reported conditions (chronic pains, hypertension, diabetes and cardiovascular disease), functional capacity, body mass index and waist circumference, respectively, identified using questionnaire and specific measures. Multiple logistic regression was used to analyze this association. From the 1.344 older adults, 1255 were eligible to be part of this study. There was no association of uric acid and fibrinogen with QoL. When we regarded

the levels of CRP, men showed a higher average, being that older men (≥ 75 years) had a decrease in levels of CRP. Older adults with one or more chronic diseases, hypertension and BMI higher than 30kg/m² presented low values in the physical domain of SF12 and were associated with high levels of CRP. The adjusted model showed a strong relationship with the worst ratings in physical domain of SF12 and high BMI values. The joint associations of physical domain of quality of life and inflammation in older adults have a significant effect in chronic inflammation.

SESSION 4535 (POSTER)

QUALITY OF LIFE AND SUBJECTIVE WELL-BEING IN LATER LIFE II

INDEBTEDNESS OF THE ELDERLY IN SOUTH BRAZIL – A STUDY OF RISK FACTORS

J. Doll¹, C.S. Buaes², E.D. Schmitz³, D. Fontoura⁵, 1. *Federal University of Rio Grande do Sul, Porto Alegre, Brazil*, 2. *Ministry of Education, Brasília, Brazil*, 3. *Social Service of Commerce, Porto Alegre, Brazil*, 5. *Federal Institute of Rio Grande do Sul, Veranópolis, Brazil*

The traps of the consumer society created from the access facilities of credits represent a constant danger of excessive debt, up to an indebtedness, in which a person loses the conditions to repay their debts. These constellations bring very specific threats to the elderly. On the one hand there is a constant appeal of credit institutions to make a payroll loan, on the other hand, the elderly have become important sources of funds for many Brazilian families. Thus, the financial risk of violence against older people is also increasing significantly. In this scenario it becomes important to know in more detail the mechanisms that can boost elderly hiring credits and thereby jeopardize often drastically, their income.

This paper presents the first results from a study realized in seven cities of Rio Grande do Sul, South Brazil, interviewing older persons (n=350) about their consumer practices, their relation to money and to indebtedness as well as sociodemographic e financial data of the participants.

Results show that there are big differences among the participants, going from extremely cautious dealing with money on to cases of overindebtedness. There is a strong influence of the cultural context (immigrants from different cultures). During their life, many elderly experienced critical financial situations, mostly caused by health problems or unemployment in the family. And in about 30% of the cases, the debts were made to help other people, basically the own children. The results point out to the necessity of specific financial education for elderly.

EFFECTS OF OLDER ADULTS' SUBJECTIVE LIFE EXPECTANCY ON SOCIAL RELATIONSHIPS AND WELL-BEING

K. Lee, G. Hong, P. Martin, *Iowa State University, Ames, Iowa*

The perception about the remaining length of life potentially influences attitudes toward social relationships and well-being in older age (Charles and Carstensen, 2010). This study aimed to assess the direct and indirect effects of

older adults' subjective life expectancy (SLE) on their social relationships and well-being. Two waves of data (2008 and 2010) from 1,057 older adults participating in the Health and Retirement Study (HRS) were analyzed using the SEM with bootstrap sampling. The hypothesized model included marital quality, frequency of visiting with adult children, number of friends they have, and volunteering in the community. Participants' well-being was measured with the number of depressive symptoms and life satisfaction. The model fit the data well, $\chi^2 (df = 6, N = 1,057) = 13.6, p = .01$, CFI = .98, RMSEA = .05. The results of the study revealed that older adults with higher SLE scores were more likely to participate in volunteering ($\beta = .07, p = .019$) and had a close relationship with their spouse ($\beta = .06, p = .047$). Higher SLE scores predicted higher level of life satisfaction ($\beta = .09, p = .003$) and fewer depressive symptoms ($\beta = -.09, p = .003$). Finally, there were marginally significant indirect effects from SLE to life satisfaction via closeness to spouse ($\beta = .02, 90\% \text{ CI } [.00, .03]$), and from SLE to depressive symptoms via volunteering ($\beta = -.01, 90\% \text{ CI } [-.02, .00]$). We conclude that older adults' SLE influences their well-being directly and indirectly through social relationships.

CONSIDERATION OF ORAL HISTORY STORYTELLING AS ESSENTIAL TO SUBJECTIVE WELL-BEING AFTER 100

G. McCall, A.J. Bishop, T. Wolf, T. Finchum, *Human Development and Family Science, Oklahoma State University, Stillwater, Oklahoma*

The purpose of this exploratory study was to examine the intervening link between engagement in oral history storytelling and change in reported indicators of subjective well-being. Participants for this study included $N = 112$ community-dwelling centenarians ($M = 100.89, SD = 1.52$) residing in private homes and care facilities in the state of Oklahoma. Preliminary and post assessments of subjective well-being indicators were conducted relative to completion of a 60-minute oral history interview. IBM/SPSS 23.0 was used to conduct paired sample t-tests to determine any evidence of change in statistical mean scores between preliminary and post subjective well-being scores. No significant mean change was evident between pre and post mean scores involving life satisfaction, negative affect, sense of personal growth, or gerotranscendence. However, significant mean differences were detected between preliminary scores of purpose-in-life ($M = 33.47, SD = 8.03$) and post scores of purpose-in-life ($M = 34.82, SD = 8.42; t(95) = -1.99$); preliminary scores involving sense-of-self ($M = 40.81, SD = 5.84$) and post scores of sense-of-self ($M = 41.98, SD = 5.25; t(98) = -2.95$); and preliminary scores of positive affect ($M = 32.96, SD = 8.38$) and post scores of positive affect ($M = 34.88, SD = 8.83; t(108) = -3.17$). Results indicate that engagement in oral history storytelling helps improve sense of purpose, strengthens self-identity, and increases positive emotional expression among persons living 100 years or longer. Further insight into the therapeutic benefits of oral history storytelling relative to quality-of-life for long-lived adults will be addressed.

PSYCHOLOGICAL WELL-BEING IN ITALIAN ELDERS WITH AND WITHOUT PARKINSON'S DISEASE: A PRELIMINARY STUDY

M.C. Fastame, P. Hitchcott, M. Pau, F. Corona, M. Penna, *University of Cagliari, Cagliari, Italy*

Chronic degenerative conditions characterized by motor dysfunction such as Parkinson's disease may impact the determinants of quality of life in late adulthood, such as psychological well-being (PWB) and affective status. Nonetheless, this issue has not been substantially investigated in the Italian population. Here in a preliminary study we explored relationships between several mental health and motor functions in a group of 30 cognitively healthy community-dwelling Italian elderly with and without Parkinson's disease (mean age = 74.3 years, $SD = 7.1$). Each participant was individually presented with a battery of psychological and motor tests assessing cognitive efficiency, PWB, affective status, lifestyle, handgrip strength, three-dimensional gait analysis, and static balance (through postural sway analysis). In particular, kinematics of gait was characterized by means of Gait Profile Score (GPS), a synthetic measure of the deviation of the gait from physiologic conditions. Statistically significant Pearson's product-moment correlations were found between maximal handgrip strength and several PWB indexes. Moreover, patients with Parkinson's disease reported lower perceived physical health and personal satisfaction, as well as increased values of GPS than controls, however greater depressive signs were not found in the former group. Finally, a linear regression analysis revealed that the occurrence of Parkinson's disease explains 26% of the variance relative to a self-reported personal satisfaction index. These preliminary outcomes highlight a general link between motor and psychological outcomes and the impact of Parkinson's disease on both.

THE IMPACT OF YOGA ON PHYSICAL FUNCTIONING AND QUALITY OF LIFE IN SEDENTARY OLDER ADULTS

E. Groessl¹, M. Maiya², L. Schmalz¹, *1. UC San Diego / VA San Diego, San Diego, California, 2. UC San Diego, La Jolla, California*

Reduced mobility in older adults has been linked to general disability and limitations in daily activities that enable independent living. To test whether sedentary older adults would attend and benefit from yoga, we compared participant outcomes from a Hatha Yoga intervention and a health education (HE) intervention. Participants were randomized to either yoga (twice weekly instructed yoga classes plus daily home-practice sessions), or HE (10 weekly informational lectures). Pre and post intervention, participants completed physiological assessments evaluating various aspects of gait, stability, strength, and balance, as well as questionnaires evaluating quality-of-life (SF-36) and adverse events (AE). A total of 371 older adults aged 60–89 were screened and 46 (63% female, 83% white, mean age=74) met the selection criteria of no exercise in the past 3 months and low/moderate physical functioning (Short Physical Performance Battery score 3 - 9). Mean attendance was 71% for yoga and 58% for the HE group. No serious AEs were reported,

and qualitative data indicated high levels of satisfaction. Compared to HE participants, yoga participants showed significantly greater improvements ($p < .05$) in vestibular balance, left leg lift, and rhythmic weight shift. Trends ($p < .10$) were observed for multiple SF-36 subscales, chair stands, and grip strength. The median effect size for physiological variables was 0.31. Our results show that recruiting and retaining inactive older adults for a physical activity trial can be accomplished with adequate resources. Noting the small sample size, we observed significant results on multiple outcome measures.

CONTRAST IN THE PERCEPTION OF QUALITY OF LIFE: CAREGIVERS AND CARE RECIPIENTS WITH DEMENTIA IN CHILE

J.M. Aravena¹, J. Gajardo², 1. Bernardo O'higgins University, Santiago, Chile, 2. University of Chile, Santiago, Chile

Quality of life (QoL) of persons with dementia (PwD) and family caregivers is a fundamental and usual treatment outcome. To learn about the difference in the perception of the PwD's QoL as perceived by both the person and caregiver, a cross-sectional study was conducted in subjects with mild and moderate dementia and their caregivers, who assisted a day-care center for dementia in Santiago, Chile, from September 2013 to August 2014. Data were collected using QoL-AD to assess the perception of the person with dementia and using Caregiver-QoL to evaluate the caregiver's perception of QoL of care recipient. Total sample consisted of 73 PwD and 73 family caregivers. Analysis involved t-student (ordinal) and Wilcoxon (categorical) test, considering $p < 0.05$ and 95% CI.

63% (43) of PwD were women, mean age 76.8 ± 8.46 . Dementia severity was 61,6% mild, 30,1% moderate and 8,2% moderate-severe. For caregivers, mean age was 54 ± 13.42 , 84,9% (62) were woman. 47,9 % (35) of caregivers were sons/daughters of care recipient, while 28,8%(21) were spouses. Caregiver's perception of care recipient's QoL scores were lower than those reported by the PwD (Caregiver-QoL= 26.2 ± 5.69 PwD-QoL= 28.8 ± 6.29 , dif= 2.59 ; IC= $1.4-3.7$), particularly on energy level ($p=0,007$), memory ($p=0,035$), relationship with friends ($p=0,009$), daily life activities capability ($p=0,004$), and situation with finance ($p=0,005$). Care recipients perceived a better QoL than their family caregivers. This study shows the discrepancy of perceptions of quality of life between care recipients and caregivers and highlights the caregivers need to learn about the factors that relate to QoL in care recipients.

UNDERSTANDING PICKLEBALL AS A NEW LEISURE PURSUIT IN OLDER ADULTS

J. Ryu¹, H. Yang¹, A.C. Kim³, Y. Rhee⁴, K. Kim², J. Heo¹, 1. Texas A&M University, College Station, Texas, 2. University of Miami, Miami, Florida, 3. Florida State University, Tallahassee, Florida, 4. University of Florida, Gainesville, Florida

Pickleball has recently emerged as the fastest growing sport in the U.S. Pickleball is a paddle sport that combines elements of tennis, badminton, and table tennis, and played on a badminton-sized court with a perforated plastic ball.

Despite the increasing popularity among older adults, no previous research has examined the behavior of older adults in pickleball settings. This study explored the characteristics of pickleball participants, including lifestyles and psychosocial benefits. The study participants were 153 older adults who competed in pickleball tournaments in a Southern and a Southeastern state in the U.S. Hotelling's T^2 test and MANOVA were employed to determine differences in age (50–59, 60–69, and 70+ years), gender, occupational and marital status in outcome variables (i.e., life satisfaction, optimism, social integration). The results showed a significant difference among the age groups, gender, and occupational status on the outcome variables. To be specific, participants in the oldest group (70+) reported significantly higher life satisfaction than the 50–59 years age group. In addition, female participants scored significantly higher on social integration. With regard to employment status, retired participants scored significantly higher on life satisfaction than the employed participants. Our findings suggest that playing pickleball is: (1) suitable for older women who feel lonely or in need of extended friendships through exercise, and (2) recommended for older adults who are searching for a productive and fruitful retirement. Taken together, this initial empirical study showed that playing pickleball can be a key leisure pursuit that contributes to well-being of older adults.

LIVING ARRANGEMENT PREFERENCES, REALITIES AND SUBJECTIVE WELL-BEING OF ELDERLY CHINESE

T. Chen, Renmin University of China, Beijing, China

Objectives. The purposes of this article were a) to investigate the determinants of preference for intergenerational coresidence and b) to examine the effects of living arrangement concordance (i.e., having a match between preference and reality) on the subjective well-being (SWB) of older Chinese after controlling for personal characteristics and actual living arrangements.

Methods. Data derived from the China Health and Retirement Longitudinal Study (CHARLS) national baseline conducted in 2011. Multivariate imputation by chained equations technique was applied to deal with missing data issues. A total of 6461 samples aged 60 and older from 28 Chinese provinces were analyzed using multivariate regression models.

Results. Living arrangement preference is indicative of need, cultural norms and current living arrangement experiences. The results support the hypothesis of discrepancy theories that having living arrangement concordance improves older parents' SWB (i.e., depressive symptoms and happiness). In addition, the previously predictive effects of actual living arrangement lost significance when we added actual living arrangement and concordance simultaneously.

Discussion. Living in a preferred arrangement appears to be more important than living in a traditional arrangement from the point of view of older adults' SWB. Programs designed to improve well-being in later life may not assume that there is a one-size-fits-all model for all; instead, older people should be given more choices of living arrangements.

THE EFFECT OF MUSIC ON DAILY STRUCTURES OF NURSING HOME RESIDENTS

R. Dahms, M. Haesner, E. Steinhagen-Thiessen, *Geriatrics Research Group, Charité - Universitätsmedizin Berlin, Berlin, Germany*

Music-based interventions, like regular musical activities, music therapy or listening to music can help maintain physical and mental health and cognitive abilities of older adults. Studies have shown that singing and music listening increase cognitive performance, improve mood, orientation and the coordination of motor movements. In nursing homes, musical leisure activities are rarely offered and immobile older adults are often not able to participate. Moreover, residents are normally not included in the decision making process, at which time and how often music is played in the institution. Little is known about the effect of music, when accompanying the daily routines of residents of nursing homes.

The aim of the presented study was to investigate the effect of music on daily structures of nursing home residents. For this purpose, together with caregivers, relatives and residents, we developed a concept of a “nursing home of music”. During the three months intervention phase, we equipped a nursing home with several music systems, e.g. karaoke, individual headphones, and offered various musical leisure activities in regular intervals.

For our analysis, we used various instruments to measure changes in the emotional well-being of the residents during their daily routine with electronic generated sensor data and with qualitative data via standardized observation protocols and semi-structured interviews. In our speech, we will present results about the usage, the effectiveness and acceptance of the music interventions both from residents, relatives and caregivers.

COUPLES COPING AND QUALITY OF LIFE IN PATIENTS WITH MILD-TO-MODERATE DEMENTIA AND CAREGIVERS

M. Saprà^{1,2}, T. Savla³, K. Luci¹, *1. Salem VAMC, Roanoke, Virginia, 2. Virginia Tech Carilion School of Medicine, Roanoke, Virginia, 3. Virginia Tech, Blacksburg, Virginia*

Quality of life (QOL) is an important outcome measure in dementia trials and a major goal in care of patients with mild to moderate Alzheimer's disease (AD). Coping strategies that both partners' utilize influences the ways couples deal with the stressors associated with cognitive deficits and have an impact on the patient's quality of life. Although couples' coping has been explored in other literatures of chronic illnesses, there is limited understanding of the couples' joint coping in families dealing with AD. Thus, the primary aim of this study is to examine the relationship between severity of neuropsychiatric symptoms and quality of life and the buffering role of couples' coping among AD patients and their partners. Thirty community dwelling AD patient/caregiver dyads recruited from an outpatient memory clinic completed the Quality of Life in Dementia scale (QOL-AD) and the Neuropsychiatric Inventory (NPI-Q). Clinicians reported on the coping strategies both partners used. Higher depression in patients was found to be associated with lower QOL reported by patients ($b=-0.76$, $p<0.01$). In response, couples utilized greater positive dyadic coping strategies to help patient cope with the depression ($b=0.86$, $p<0.05$). The

findings of this study have implications for designing couple interventions for families coping with dementia.

RISK FACTORS FOR LOW HEALTH LITERACY AMONG FEMALE ADULTS

C. Huang, *1. Department of Family Medicine, E-DA Hospital, Kaohsiung City, Taiwan, 2. School of Medicine for International Students, I-Shou University, Kaohsiung City, Taiwan*

Introduction: Low health literacy is associated with poor physical and mental health. The purpose of the study is to measure health literacy in female adults and determine the predictive factors for health literacy.

Method: The cross-sectional survey was conducted in the community setting of Southern Taiwan. 353 females were recruited and interviewed in person. Basic characteristics included age, education, income, unhealthy behaviors (smoking, alcohol consumption, betel nuts chewing), physical and community activity, and occupation. Health literacy was measured by the Chinese version of European Health Literacy Survey Questionnaire. Respondents were classified into four different literacy levels (i.e., inadequate, problematic, sufficient, and excellent).

Results: Mean age of participants was 61.56 ± 8.35 (77.3%), ranging from 38 to 89 years old. 47% of participants ended education below senior high school level and 10.5% had college or above education. More than half of all had inadequate (17.6%) or problematic (49.3%) general health literacy. In multinomial logistic regression analysis, females with elementary school education (OR= 2.78, 95% CI 1.28–201.05) and those living on farms (OR=2.69, 95% CI 1.74–124.13) were at higher risk for inadequate health literacy. In addition, females with elementary school education (OR=1.92, 95% CI 1.74–26.97) and junior high school (OR=1.59, 95% CI 1.24–19.39) were more likely to have problematic health literacy. Furthermore, participation in community activity was a protective factor of having problematic health literacy (OR=0.97, 95% CI 1.19–5.83).

Conclusion: Among community-dwelling females, education level, occupation, participation in community activity were significantly associated with health literacy after adjusting for covariates.

THE NEEDS AND ASPIRATIONS OF VISION IMPAIRED OLDER PEOPLE LIVING IN ENGLAND

S.M. Peace, J. Katz, C. Holland, R.L. Jones, *School of Health, Wellbeing and Social Care, Faculty of Wellbeing, Education and Languages, The Open University, Milton Keynes, United Kingdom*

Sight loss affects people of all ages but in the UK is more common in late old age, with older women and people from minority ethnic groups particularly affected. This is an area that is still under-researched. Specific vision impairment (VI) conditions including age-related macular degeneration (AMD), glaucoma, cataracts and diabetic retinopathy can be disabling especially where treatment varies. The research supported by the Thomas Pocklington Trust (TPT) considered how older people with VI express their preferences for where and with what kinds of support they would like to live; understand choices over lifestyle and living arrangements; consider how control and autonomy can be maintained or delegated; address

issues of risk-taking and responsibility, and convey the impact of VI on personal identity. In-depth qualitative research through interview and observation was undertaken involving a purposive sample of 50 English older people focusing on the oldest age groups, except in relation to black and Asian minority ethnic (BAME) groups where life expectancy is slightly lower, plus a smaller group of relatives, friends and professionals. Findings show how VI can lead to learning new skills, accepting interdependency, learning to benefit from technology; how access to appropriate services relates to location and availability of statutory and voluntary organizations; how staying in your own home is key to wellbeing even though issues of isolation and loneliness can occur; practical knowledge and cultural approaches to life can be essential, and for some responsible risk-taking helps to retain a sense of self.

CITY LIVABILITY AND THE WELL-BEING OF OLDER AMERICANS

J. Settels, M. Schafer, *Sociology, University of Toronto, Toronto, Ontario, Canada*

Quality of life is a multidimensional construct often conceptualized in terms of social connectedness, happiness, and independence. Because of the common physical and mental declines associated with aging, older persons' quality of life might be especially sensitive to their social and physical environments. Ecological theories of aging suggest that the well-being of older persons is a function of their competencies and of the challenges and stressors of their environments, yet insufficient attention has been given to macro-level city environments. Buffel and her associates (2012) propose that city environments matter for the happiness of older persons, and these authors have encouraged more comparative research on age-friendly cities. The present study combines two sources of data, individual-level survey data (Wave 1 of the National Social Life, Health, and Aging Project (n=3,005)) and official records about demographic, economic, crime, weather, and arts and leisure characteristics of metropolitan statistical areas in the United States (n=57). Analyses utilize hierarchical linear modelling techniques to study how a diverse set of city-level factors are related to a diverse set of measures of the well-being of older persons. Our results show that measures of income, employment, education, and crime at the city-level are particularly consequential for a diverse set of measures of the well-being of older persons, including mental health, self-esteem, happiness, depression, anxiety, and stress. This macro-level analysis suggests the importance of identifying why these measures of city-level quality of life are particularly influential for the well-being of older persons.

ENHANCING AUTONOMOUS MOTIVATION MEDIATES WELL-BEING IMPROVEMENT IN HIV-INFECTED OLDER ADULTS

K.N. Shah¹, Z. Majeed¹, D. Walck², F.V. Lin¹, 1. *University of Rochester, Rochester, New York*, 2. *Warner School of Education, Rochester, New York*

We previously demonstrated the effect of a self-determination theory (SDT) guided physical activity (PA) counseling intervention on emotional well-being among HIV-infected older adults (HOA). However, the mechanism underlying the intervention's effect on psychological well-being is unclear. Here we investigated whether the intervention effects on

autonomous motivation and autonomy mediates the intervention's effect on psychological well-being. Community-dwelling HOA with mobility impairments ($N = 67$) were randomized to a 12-week PA of counseling intervention grounded in self-determination theory (SDT) or a usual care control group. Autonomous motivation for PA, autonomy for PA and emotional well-being were assessed at baseline and post-intervention. Fifty-nine participants completed the study (M age = 55 years; M CD4 count = 675 cells/mm³; duration since HIV diagnosis = 17 years; 39% female). The two groups were similar in their demographic and clinical characteristics. Autonomy and autonomous motivation for PA improved in the intervention group compared to the control group. Emotional well-being was higher in the intervention group compared to the control group post-intervention ($p < 0.05$). Increased autonomy and autonomous motivation for PA mediated the interventions effect on emotional well-being. Our findings suggest that increases in autonomy and autonomous motivation for PA mediated the effects of the intervention on emotional well-being. These results underscore the role of PA interventions enhancing autonomy and autonomous motivation in improving emotional well-being in HOA with the end-goal of promoting successful aging.

SESSION 4540 (POSTER)

RETIREMENT PROCESSES AND POLICIES

FISCAL VULNERABILITY AND ADJUSTMENT TO RETIREMENT

D. Carr¹, P. Moen², M. Perry-Jenkins³, L. Powell⁴, M. Smyer⁵, L.B. Wilson⁶, 1. *Sociology, Florida State University, Tallahassee, Florida*, 2. *University of Minnesota, Minneapolis, Minnesota*, 3. *University of Massachusetts-Amherst, Amherst, Massachusetts*, 4. *Rush University, Chicago, Illinois*, 5. *Bucknell University, Lewisburg, Pennsylvania*, 6. *University of Maryland, College Park, Maryland*

Much research examining adjustment to retirement overlooks the unique experiences facing individuals who do not have sufficient resources while they are working to accumulate fiscal stability post-retirement. Although retirement serves as a major transition for all individuals, the working poor and those who are financially vulnerable prior to retirement likely experience a different trajectory when they go on to retire than those who have the resources needed to maintain a high standard of living when they stop working. This study uses the 2004–2014 waves of the Health and Retirement Study to examine change in life satisfaction pre- versus post-retirement for three groups of full-time workers who go on to fully retire: those with incomes in ranges that qualify for social welfare programs (i.e., <250% of poverty – poor/near poor), those who are financially vulnerable but above qualifying thresholds (i.e., 250%–399% of poverty – financially vulnerable), and those who have sufficient fiscal resources (i.e., 400% of poverty or greater – financially stable). Controlling for baseline differences in overall life satisfaction, demographic factors, health status, job characteristics, social support and engagement, results show that although all groups experience an increase in overall life

satisfaction, financially vulnerable individuals experience significantly less increase relative to poor/near poor and financially stable individuals. Sensitivity analyses reveal that the degree to which financially vulnerable individuals experience constraints over sense of personal control prior to retirement explains this increased loss. In this session we will discuss implications of these results for policy and programs that might support retirement adjustment processes.

RECENT AND FUTURE PENSION REFORMS IN RURAL CHINA: A REVIEW OF SEVERAL OPTIONS

J.B. Williamson, *Sociology, Boston College, Chestnut Hill, Massachusetts*

In 2009, the Chinese government began introducing the New Rural Pension System (NRPS). The goal has been to rapidly extend pension coverage for rural residents who currently make up 45% of the total population. In 2008 less than 70 million out of 730 million rural residents were covered by any sort of pension and even a smaller fraction of those age 60 and over were receiving pensions. Most of the elderly were, entirely dependent on support from their children, land, and personal savings. During the following six years, NRPS coverage was successfully extended to cover 477 million by the end of 2014, achieving coverage for about 77 per cent of the rural population and pension benefits were by then being paid to almost the entire rural population over age 60. This entirely new program in just six years grew to cover more people, than any other pension program in the world. In this poster (and the related paper) describe the huge success of the NRPS, but the focus will be on the needed next steps, merging the rural pension scheme with a similar urban pension scheme and several other reforms under discussion by pension policy analysts that could help deal with some of current and likely future limitations of the current scheme. We will emphasize proposals for dealing with the issues of adequacy (which is currently big problem), coverage, (which could become a big problem) and sustainability (which could also become a big problem) in the decades ahead.

THE ASSOCIATION BETWEEN PENSION PLAN TYPES AND FINANCIAL LITERACY AMONG OLDER ADULTS

Y. Li, J.A. Burr, E.A. Miller, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

In the U.S., employers are increasingly offering defined contribution (DC) pension plans in place of defined benefit (DB) pension plans to their employees. Yet, research shows that many older employees are financially illiterate and unprepared to manage their pension funds, especially when confronted with a wide variety of financial instruments. The central thesis of this study is that participating in DC plans provides the motivation and opportunity for employees to educate themselves to maximize their pension plan returns. The same motivation is not present for employees participating in DB plans. Cross-sectional analyses of the 2010 Health and Retirement Study (n=1,281) investigated the association between different types of pension plans and multiple indicators of financial literacy. We also examined

the moderating effect of gender. Regression results showed respondents with DC plans were more likely to correctly answer a set of financial literacy questions, in comparison with respondents with DB plans. Men with both DC and DB plans scored significantly higher on a financial literacy index than women with both plans, relative to respondents with DB plans only. Results from this study suggested that traditional financial education programs may not be the only means of achieving financial literacy. Our conclusion is that older adults have higher financial literacy if they were incentivized by participation in DC plans to manage financial resources, including deciding where to invest pension funds. This is especially important as research demonstrates that the effectiveness of traditional financial education programs is limited.

SUBJECTIVE RETIREMENT TRANSITIONS AND DEPRESSIVE SYMPTOMS: AN ACTOR-PARTNER INTERDEPENDENCE MODEL

S. Han, K. Kim, J.A. Burr, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

Retirement marks an important life transition that affects not only the individual retiree but also his or her spouse. Based on the life course perspective on “linked lives,” this study added to the growing body of literature on retirement and mental health by employing a dyadic perspective to examine relationships of subjective retirement transitions and depressive symptoms over time. Five waves of nationally representative panel data from the Health and Retirement Study (2004–2012) were utilized. The study sample included 6,652 co-residing, community-living couples. Retirement transitions were measured by examining self-reported retirement status at each wave. Respondents were considered to have experienced a transition if the status at a subsequent wave changed from the status at the previous wave. We used longitudinal actor-partner interdependence models to examine effects of one’s own and spousal retirement transitions on depressive symptoms over the study period. Models were adjusted for individual- and couple-level covariates known to influence depressive symptoms in later life. Results indicated that one’s own transition to retirement was associated with more depressive symptoms only for husbands when compared to staying in the labor force. Further, husbands whose wives transitioned to retirement or continued in the retirement status showed fewer depressive symptoms compared to husbands whose wives remained in the labor force. However, wives were largely unaffected by their own or their spouse’s retirement status transitions. Our findings suggest that there are differential effects of subjective retirement transitions on mental health for wives and husbands, in the context of their linked lives.

EDUCATIONAL ACTIVITIES IN THE SECOND HALF OF LIFE: AGE-RELATED CHANGES AND COHORT DIFFERENCES

M. Wiest¹, M. Hoffmann¹, S. Widany^{1,2}, K. Kaufmann¹, 1. *Freie Universität Berlin, Berlin, Germany*, 2. *FernUniversität in Hagen, Hagen, Germany*

Participation in educational activities (e.g. go to lectures, take classes) decreases with age. Previous research shows

educational activities are associated with better health and well-being throughout the lifespan, therefore, it is important to understand how age affects educational participation. However, it remains an open question, if changes in educational behavior reflect age or cohort differences or primarily indicate changes in opportunity structures, e.g. transition into retirement. Using data of two national representative surveys of Germany, this study aims at disentangling cohort differences and age-related changes in educational activities. Participation in educational activities will be analyzed using cohort-sequential data of the German Ageing Survey (N = 20.113, 40–85 years old, samples assessed in 1996, 2002, 2008, 2014) and longitudinal data of the National Educational Panel Study (N = 13.115, 40–70 years old, annually assessed since 2009).

Analyses of the cohort-sequential data show age differences in educational activities consistent with previous findings: Participation in educational activities in adulthood is more common than in old age. However, individuals around the retirement age (58–69 years) increased their participation over time. Preliminary analyses indicate that generations approaching old age now are more active than generations before them. Those results will be complemented by examining age-related changes using longitudinal data. Findings will be discussed with regard to implications of age-related changes and cohort differences in educational activities as well as to what extent changing opportunity structures, e.g. being employed vs. being retired, account for differences in educational activities in the second half of life.

THE UNBEARABLE LIGHTNESS OF BEING RETIRED: A QUALITATIVE STUDY OF RETIRED CHIEF EXECUTIVE OFFICERS

M.P. Silver, *University of Toronto, Toronto, Ontario, Canada*

There is a lightness that can be associated with relinquishing the responsibilities of work in retirement, which for some individuals can be unbearable. This study explored the work and retirement transitions of retired Chief Executive Officers (CEOs) from healthcare organizations to examine their perceptions about being retired. In-depth, in-person interviews were conducted with 26 retired CEOs of healthcare organizations using an interview guide that was informed by the life course theoretical perspective to explore participants' career trajectories and retirement experiences. Verbatim transcripts, notes, and career trajectory maps were analyzed making use of thematic analysis. In the wake of trailblazing careers, participants associated feelings of unbearable lightness and ennui with being retired. Participants acquiesced to societal pressures to retire, either by choice or force, despite their desires to continue to achieve personal fulfillment through work. These findings diversify knowledge of contemporary retirement by illustrating how anachronistic and ageist notions of retirement as an age-graded exit from employment can threaten an individual's sense of self and foreshortened workforce contributions. Participants desire to be fulfilled employed instead of retired reinforce the notion that retirement is better understood as a liminal or threshold stage where an individual contemplates his or her next step and even whether the status will hold.

POST-RETIREMENT MIGRATION: A CASE STUDY IN ALICANTE, SPAIN

M. Repetti, *University of Lausanne, Lausanne, Switzerland*

In most European countries, welfare state systems rely on families as first providers of solidarity, with public provisions being considered as additional. In this context, retired people are considered to comprise a great potential pool of volunteer workers, through different kinds of gendered contributions for men and women. In this way, they contribute to the social contract that is based on the implicit idea that most family members live in close enough proximity to be able to maintain solidarity through regular concrete help. But this principle is increasingly challenged through transnationalization of family relations, such as is the case for late life migration. Indeed, when they decide to retire under the sun, post-retirement migrants are not able to contribute their labor to the everyday life in their community of origin – especially to their families – in the same ways as if they were still living there. At the same time, this shift in context might also lead to different forms of unpaid work for both men and women.

This research is a case study in Alicante, Spain. I present a preliminary analysis based on qualitative and semi-structured interviews with post-retired migrants from northern Europe as well as observations and informal interviews. I discuss how these post-retirement migrants negotiate the terms of the social contract from which they benefit as retirees, in a context wherein ensuring concrete and regular intergenerational help within family is not possible.

THE SILVER TRAVELER PROFILE AND PRODUCT PREFERENCES

C. Goh, *Temasek Polytechnic, Singapore, Singapore*

Similar to many countries, Singapore's population is aging rapidly. By 2030, 1 in 5 Singaporeans will be aged 65 and above. This unprecedented demographic shift will redefine many aspects of our country. Government policy makers have started preparing for this and businesses, including the tourism industry, are increasingly aware of the many opportunities relating to the 'silver market'. Consequently, Temasek Polytechnic and the National Association of Travel Agents Singapore (NATAS) have collaborated on a three year research study to better understand the needs and profile of the Silver Traveller.

The research consisted of a pilot phase and a full-scale research phase. The quantitative survey targeted respondents aged 48 years and above and investigates, life stages (e.g. retirement), health status, income level, travel history, preferences, and purchasing decisions. Asian cultural traditions such as filial piety are also noted. The findings from more than 1000 respondents, shed light on older adults travel preferences, and the consumer products which may better target inbound Asian senior travellers, especially as over 80% of the respondents in the pilot are ethnic Chinese. Silver Travellers as consumers of tourism services all of their lives, at 50 years and beyond, are dealing with empty nests, pre/retirement, grandchildren, and other factors. They are also more educated and affluent than previous generations. Hence, they make different travel decisions compared to their younger days and compared to previous cohorts. The Silver Traveller is on the move in Asia – we need to be ready for them.

SESSION 4545 (POSTER)

SEXUALITY AND SEXUAL IDENTITY IN THE OLDER POPULATION

SEX, DEMENTIA, AND LONG-TERM CARE: DOES DEGREE OF INTIMACY AFFECT PUBLIC PERCEPTIONS?

E. Yelland, *Family Studies and Human Services, Kansas State University, Manhattan, Kansas*

Healthy sexual expression can occur among individuals with dementia as cognitive decline does not always reduce the desire to engage in sexual behavior. However, persons with dementia may face relentless scrutiny from long-term care staff for showing interest or engaging in sexual behavior, particularly when that behavior is deemed erotic. Research has shown that LTC staff members are more accepting of less physical displays of affection, which are often perceived as caring or loving behaviors, compared to more erotic or implied sexual behaviors, such as intercourse or viewing pornographic material. Attitudes of the public were examined using a multiple segment factorial vignette with a probability sample of 329 respondents from a southern state. Because sexual intercourse and heavy petting is often considered taboo, it was hypothesized that a greater proportion of respondents would expect staff intervention for residents who engage in erotic versus less physical behaviors. Nearly 80% of respondents indicated that long-term care staff should intervene in an attempt to stop the relationship, however, the degree of intimacy had no statistical bearing on responses. Respondents who were opposed to the behavior generally cited the individual's lack of consent capacity while those who were supportive commonly cited adult autonomy as their rationale. The findings from this study can inform long-term care staff sensitivity training content and can be used to initiate further discussion on attitudes of long-term care staff toward sexually active residents who reside in their facilities.

INTIMACY, SEXUALITY AND DEMENTIA: THE LAST TABOO

S. Davidson¹, M. Schulz², 1. *Occupational Therapy, Baycrest Health Sciences, Toronto, Ontario, Canada*, 2. *Alzheimer Society of Canada, Toronto, Ontario, Canada*

The subject of intimacy and aging remains one of our last taboos. Factor dementia into this mix and one confronts many challenging practice dilemmas, often influenced by strong opinions, values and beliefs. Health care providers in all settings, but most notably in care environments where there may be privacy, consent and capacity concerns, face these challenges with very little support, few resources and much misinformation.

A collaboration of clinical practice and dementia subject matter experts in one major metropolitan area has identified a need to help health care providers address issues of intimacy in their dementia care practice. Gaps exist in knowledge related to the appropriate application of consent and capacity laws as well as in a structured approach to assist health care providers in understanding what triggers, including a desire for intimate contact, might be influencing an individual's behaviour and to offer a systematic approach to

intervention. Resources have been developed to help health care providers to:

a) reflect on their values, attitudes and beliefs in considering the rights of adults living with dementia to express their sexuality and need for intimacy;

b) understand how personal beliefs may influence practice;

c) learn person centred strategies to enhance the quality of life of persons with dementia in their care.

This poster presentation will highlight the application of person-centred strategies and resources to increase staff skill and sensitivity when approaching challenging situations involving persons with dementia and the expression of their sexuality and need for intimacy.

BRINGING SEXY BACK: EXPLORING INTIMACY AND SEXUALITY AMONG OLDER RESIDENTS IN LONG-TERM CARE

B.A. Meisner, M.R. Malone, *Dalhousie University, Halifax, Nova Scotia, Canada*

Continued intimate and/or sexual expression in later life improves health and well-being. However, older adults may not experience the many health-promoting and disease-preventing benefits of intimacy/sexuality as a result of a complex series of biopsychosocial and behavioural factors. Further, older adults who live in long-term care (LTC) settings often have additional barriers related to intimacy/sexuality, but relatively little is known on this topic. This study explored first-hand perspectives of 10 older residents of a LTC facility in Nova Scotia, Canada on how intimacy and sexuality are defined, perceived, and experienced in their present living environment. Data collection consisted of a two-phase qualitative interview process. First, a life review approach was used to establish rapport with each resident and to situate their perspectives on intimacy/sexuality in the context of their life histories. Second, semi-structured interviews were conducted. Thematic constant comparison analysis was used to extract central themes from these data. Results demonstrated that: a) LTC residents have diverse definitions of intimacy/sexuality, and that the language choices used to discuss these terms are significant; b) while age may be perceived as a factor for continued intimate/sexual expression, it is not the determining factor; c) LTC residents experience and engage in intimacy/sexuality through many forms, and these experiences vary across individuals and over time. Ultimately, findings emphasize the importance of giving voice to older residents' perspectives of intimacy/sexuality, and the value of using these voices to inform future relevant aging-related research, policies, and practices in LTC settings.

MENTAL HEALTH CARE AND THE LGBT POPULATION IN LONG-TERM CARE: COMPETENCY, TRAINING, AND BARRIERS

R. Smith, J. Altman, S. Meeks, *University of Louisville, Louisville, Kentucky*

The study describes results of survey data on providers' competency, training, and barriers encountered in delivering mental health care to LGBT older adults in nursing homes. Fifty-seven providers completed the survey: 47% psychologists, 12% social workers, 11% psychiatrists, and 4% nurses. Providers had practiced in nursing homes for about 12.5 years. 39% of providers reported they provided no care to LGBT residents the past year, while most of the

61% of providers who did reported working with 1–6 LGBT residents. 62% of providers reported the services they provided were focused on LGBT issues, while 38% reported that the focus was not at all related. For training, 86% of providers reported no formal coursework in LGBT issues or left the item blank; 81% reported no continuing education hours and 70% of providers reported no self-study hours. Providers reported that LGBT issues were relevant to their practice (83%), that they felt somewhat or well prepared to work with this population (76%), and were also somewhat or very willing to learn more (90%). Reported barriers included lack of training in LGBT issues, (85%) lack of familiarity with or availability of evidence-based treatments (76% and 79% respectively), resident unwilling to identify as LGBT (94%), and stigma (91% definitely or probably). Only 21% reported that their personal comfort could be a barrier. Results from this sample indicate facilities need more training, more evidence-based treatments, and less stigma to provide mental health care for the LGBT population.

DEVELOPMENTAL PERSPECTIVES OF ATTITUDES TOWARD THE LGBT COMMUNITY: AN ANALYSIS OF THE LGB-KASH

K. Murry, L. Beck, M.R. Crowther, R.S. Allen, *Psychology, University of Alabama, Tuscaloosa, Alabama*

The broadening acceptance of LGBT individuals has led to significant generational cohort differences in identity development, experiences of discrimination, and social structure (Dentato et al., 2014). Research into how these generational differences impact perceptions of the LGBT community has not been well documented. As knowledge and awareness of the community continues to grow, measures designed to assess these perceptions have failed to keep up. The LGB-KASH is composed of five factors (internalized affirmativeness, civil rights attitudes, knowledge, religious conflict, and hate) designed to assess knowledge and attitudes towards LGB individuals (Worthington et al., 2005). In an effort to improve this measure, focus groups were conducted utilizing two LGBT+ campus organizations from different age cohorts. Group A was comprised of undergraduate students including three females, one male, one FTM transgender, and one “other”. Each of these individuals self-identified as gay or queer, with ages ranging from 20–22 ($M = 20.83$; $SD = .98$). Group B was comprised of five female faculty and staff who self-identified as lesbian, queer, or bisexual. The mean age for Group B was 33.5 ($SD = 7.55$; Range = 27–41). Qualitative analyses revealed thematic differences in perceptions of the LGB-KASH. Group A primarily focused on the measure’s outdated terminology and lack of inclusivity. Comparatively, consistent themes of Group B included issues related to religious assumptions, assessment of LGB history, and the broader implications of the items. These findings highlight the importance of acknowledging LGBT cohort differences in an effort to understand generational influences on the LGBT community.

GENERATIVITY AMONG LGBT OLDER ADULTS

K.L. Bower, D.C. Lewis, *Human Development & Family Science, University of Georgia, Athens, Georgia*

In this poster we explore social, cultural, and personal influences that inform the meaning of generativity among aging

individuals who identify as LGBT. This exploration took place within the context of historical, individual, familial, and relational culture. We interviewed aging individuals who identified as LGBT to understand how societal structures influenced their lives. We met with individuals, agencies, and LGBT-centered organizations across multiple regions of the United States. Using qualitative methodology, we engaged in in-depth interviews and participant-observation to gather the richness of narratives across individual and organizational realms. This research was important because it addressed the need for recognizing individuality that exists within a broad LGBT older population. In order to understand who LGBT individuals are in old age, we sought to understand their cohorts and how one’s past, present, and future were all components of identity. By addressing the social influences and cultural context, we discerned the individuality that constitutes the LGBT population. By exploring personal aspects of past experiences, we provide an important context for understanding present decisions and future generativity. Moreover, this poster provides a venue for meaningful conversation about the heteronormativity within gerontology and how we can continue to expand traditional ideas to include everyone, not only majority populations.

VARIABILITY IN OLDER ADULT SEXUALITY: A FEMINIST GERONTOLOGICAL PERSPECTIVE ON HEALTH AGING

C. Barmon², E.O. Burgess¹, J.C. Morgan¹, 1. *Georgia State University, Atlanta, Georgia*, 2. *Central Connecticut State University, New Britain, Connecticut*

As the baby boom generation ages, more scholars are examining the sexual behavior of older adults. A sometimes explicit, but often implicit assumption in this research, is that sex is good for you—that it is an integral part of a full and healthy life or successful aging. However, the direction of the relationship between sex and health is still elusive. Moreover, much of this research measures sexual behavior as frequency of vaginal intercourse. Narrow definitions of sexual behavior disregard sexual minorities, people with disabilities, and older adults who lack opportunity or interest. Coming from a feminist gerontological perspective, this research explores differences in what counts as sex and how gender and social location influence the relationship between health and sexual activity. Using a nationally representative sample of community-dwelling older adults (3005) from the first wave of the National Social Life, Health, and Aging Project (NSHAP 2014), we find that older adults engage in a wide variety of sexual activity which differs by social location (e.g. gender, race, and class). In addition, using more inclusive definitions of sex, partnered sexual behavior is associated with health even after accounting for demographics and relationship factors. In conclusion, existing models of aging and sexuality, relying on limited definitions of sex, may limit our understanding of the experiences of women and sexual minorities. Moreover, a more nuanced understanding of the relationship between health and continued sexual activity better addresses the heterogeneity of the aging population.

ATTITUDES OF OLDER ADULTS TOWARDS DISCUSSING SEXUALITY WITH SOCIAL WORKERS

M. Salisu, *Social Welfare, Graduate Center, CUNY, Bay Shore, New York*

As the older population in the U.S is increasing, so does their sexual activity (Goodson 2010). Increased sexual activity is associated with successful ageing (Gott & Hinchliff, 2003), as evidenced by positive physical, social, and emotional health indicators (Bash, Mortimer, VandeWeerd, & Corvin, 2013). However, older adults face double jeopardy with regard to their sexual health: they view their sexuality as private while providers often view them as asexual (Eldred & West, 2005). Many healthcare professionals are involved with the care of older persons, yet little is known about with whom this older population is most comfortable discussing their sexual needs and concerns.

Possibly, far more than most professional groups, social workers have had the highest level of comfort with discussing sexuality and behaviors with older adults. Nonetheless, there is dearth of research available to assess whether older adults are comfortable discussing their sexual health concerns with social workers.

This paper describes surveys that were gathered to uncover older adults' attitudes about discussing sexual health issues with social workers. It also discusses barriers to initiating this conversation relating to their sexual health and the efforts being made to address the barriers.

“THERE’S NO NICE MEN HERE”: THE GENDERED CONTEXT OF REPARTNERSHIP IN ASSISTED LIVING

E.O. Burgess³, A.A. Bender¹, C. Barmon², 1. *Emory University, Atlanta, Georgia*, 2. *Central Connecticut State University, New Britain, Connecticut*, 3. *Georgia State University, Atlanta, Georgia*

Re-entering the dating marketplace after the death of a spouse is challenging for both men and women because of uncertainty about how to negotiate the changing landscape of dating and intimacy. A complicating factor for understanding issues of partnership, sex, and intimacy for older adults is the use of long-term care. Using a feminist gerontological perspective and guided by a grounded theory perspective, we examine how the context of Assisted Living (AL) shapes the opportunities and experiences of residents seeking to experiment with dating, cross-sex companionship, and repartnering in six AL facilities. We found individuals express desires which are further mediated by social patterns and interactions with other residents and staff members. The ability for AL residents' to engage in dating, intimacy, and repartnering in the AL setting was controlled by individual and community factors. Although sexuality and intimacy are framed as intensely personal decisions, we found that the gendered context of assisted living shaped residents' sexual decision making. What is unique to AL is how desire and lack of desire are expressed, the environment in which relationships take place, and the individual and institutional barriers and opportunities that influence the ability to date and/or repartner. This research expands previous studies of sexuality and

older adults by examining not only opportunity structure for repartnering but also explaining how the gendered social climate of AL influences individual behavior.

ADAPTING SEXUAL SCRIPTS FOR OLDER ADULT INTIMACY AND RELATIONSHIP INITIATION: A FEMINIST FRAMEWORK

A. Farnham¹, B. Muruthi², J. Muruthi¹, 1. *Human Dev. and Family Science, The University of Georgia, Athens, Georgia*, 2. *Virginia Tech, Falls Church, Virginia*

Sexual intimacy plays a significant role throughout every developmental life stage, and is incredibly important in the later stages of life when relationships with loved ones are vital, and there is increased risk of social isolation, loneliness and high rates of depression. The desire for sexual expression is often ignored or even actively discouraged in older adults. This avoidance could be partially caused by sexual scripts about sexual intimacy that deter intimacy in older people. Practitioners must recognize individual factors that impact the interest, need, or desire for sexual expression in later life stages.

Sexual intimacy is beneficial in older adults, nevertheless, barriers can exist to intimate and sexual expression for some older adults due to scripts about sexuality that deter physical intimacy and sexual encounters in later life. A theoretically-based conceptualization of sexual intimacy and aging is useful to inform practitioners and researchers where support and advocacy may be implemented to foster health intimacy for older adults. Understanding the sexual scripts within the levels of cultural/historical, social/ interactive, and personal/ intra-psyche provides a unique opportunity for clinicians to assess the experience of sexuality as social and learned interactions. The experience of relationship initiation can be deconstructed to examine how relationships evolve to be sexually intimate. These learned scripts can then be re-constructed to aid older clients to increase the level of sexual intimacy to their desired level.

RANDOMIZED CONTROL TRIAL WITH FOLLOW-UP TO IMPROVE HEALTHY WEIGHT IN OLDER LESBIAN/BISEXUAL WOMEN

J.A. McElroy¹, E. Hair², A. Williams¹, K. Mathews³, S. Pereira¹, C. Robinson⁴, S. Redman⁵, 1. *University of Missouri, Columbia, Missouri*, 2. *Truth Initiative, Washington D.C., District of Columbia*, 3. *St Louis University, St Louis, Missouri*, 4. *University of Missouri-St Louis, St Louis, Missouri*, 5. *NORC at University of Chicago, Atlanta, Georgia*

In recent years obesity has reached epidemic proportions. In 2012, the U.S. Centers for Disease Control and Prevention reported that more than two-thirds of U.S. adults over the age of 20 were overweight (69%) and more than one-third of U.S. adults (32% - 37.9%) were obese. Sexual minority women are heavily represented in these obesity statistics. Project LOLA utilized a 3-arm randomized control trial design of 16-weeks to test the effectiveness of achieving healthy weight among approximately 100 lesbian and bisexual women aged 40–69 in Columbia and St. Louis, MO. Participants were randomly assigned to a gym membership plus personal trainer group, smart pedometer use group, or a health education group (attention control group). All

groups had weekly meetings. Using analysis of variance, significantly more participants in the gym and pedometer groups met physical activity (PA) guidelines at the 8 month follow-up, and the attention control group reverted back to pre-intervention values. Mediators or moderators, such as PA motivation, self-efficacy, social support, resilience, stress, depressive symptoms, general health status and demographics, were considered in the statistical models. Evaluation of several health-related behaviors to achieve healthy weight, such as weight loss, waist-to-height ratio reduction, increased aerobic fitness, decreased sugar-sweetened beverage consumption, increased fruit and vegetable consumption, and decreased alcohol consumption will be presented. These data support a tailored and activity focused approach to improving the health of older sexual minority women.

SLEEP AND INSOMNIA IN LATER LIFE

FACTORS OF SLEEP AND NAPPING AMONG OLDER SINGAPOREANS: A LONGITUDINAL STUDY

G. Cheng¹, A. Chan^{1,2}, J. Lo¹, 1. *Duke-NUS Medical School, Singapore, Singapore*, 2. *National University of Singapore, Singapore, Singapore*

Extreme nighttime sleep duration and elevated nighttime sleep disturbance are associated with poorer well-being and higher risk for mortality in older adults. Daytime napping is also related to an increased risk of death in this age group. Thus, it is important to identify factors that influence elderly's sleep and napping. However, longitudinal data of determinants of nighttime sleep in older adults mostly comes from Western countries, and there is a dearth of relevant data of daytime napping. To fill these gaps, the present study addresses the impact of demographic, psychosocial and health factors on sleep duration and disturbance as well as napping duration in Singapore. We utilized two waves of data (N > 2500) from the Panel on Health and Ageing of Singaporean Elderly (PHASE). Regression results showed that short sleep 2 years later was predicted by Malay (relative to Chinese and Indian), and long sleep was predicted by weaker social networks with friends and relatives. Also, being unmarried and weaker social networks predicted more future sleep disturbance via higher level of depression. Furthermore, an older age, female gender, Malay or Indian (relative to Chinese), cognitive impairment, obesity, and smoking contributed to longer napping duration. Interventions addressing elderly's sleep and napping should take their ethnicity into account as sleep and napping patterns vary across ethnic groups. Extending older adults' social network may benefit their sleep.

THE STUDY OF THE ELDERLY'S SLEEP QUALITY AND THE EFFECTS OF MUSIC THERAPY ON SLEEP DISTURBANCES

X. Li¹, J. Li¹, D. Wang², Q. Wang³, R. Gao¹, 1. *Faculty of Nursing, Xi'an Jiao tong University, Xian, Shaanxi, China*, 2. *Liverpool School of Tropical Medicine, Liverpool, United Kingdom*, 3. *The Chinese University of Hong Kong., Hong Kong, China*

This study is to investigate the sleep quality of the elderly in urban communities of China, and to explore the effects of music therapy on sleep disturbances.

The research has two stages. first, a cross-sectional design was utilized to investigate the sleep quality of the elderly. A stratified cluster sampling method was used to recruit 431 elderly. Pittsburgh Sleep Quality Index is used for data collection. Second, a randomized controlled trial was utilized. 68 elderly with the PSQI \geq 8 were recruited, and were randomly allocated to the intervention and control group. The control group received only the sleep health education, while the intervention group received music therapy and health education. All the interventions lasted for 3 months. Sleep quality was retested at the end of each month after the interventions.

The Results shows the average PSQI score of the elderly was 7.76 ± 4.51 (0~20). There were 202(46.9%) elderly with poor sleep quality (PSQI \geq 8). The elderly went to bed at 7pm~2am, and got up at 4am-10am, with 6.10 ± 1.54 (1~10) hours being actually asleep at night.

After the interventions, comparison between groups revealed that all the other six components and total scores of PSQI at each post-test points showed no statistically differences between groups (P>0.05), except for the significant differences in daytime dysfunction component at the first month(P<0.05). Compared with the changes between pre-test and post-test, there was significant difference in groups at each time, and the PSQI scores of the intervention group reduced more than those of the control one(P<0.05).

ECONOMIC HARDSHIP AND INSOMNIA IN OLDER ADULTS: DATA FROM THE NATIONAL HEALTH AND AGING TRENDS STUDY

L. Anderson, J.M. Parisi, A.P. Spira, *Mental Health, Johns Hopkins Bloomberg School of Public Health, Reisterstown, Maryland*

Older adults are at increased risk for insomnia symptoms as they age and are at increased risk for poorer health. They may also be at increased risk for economic hardship. Previous studies have shown that both economic hardship and insomnia are associated with poor health outcomes; however few studies have examined these relationships in older adults. Sleep may be one of the mechanisms through which economic hardship exerts negative effects on health in aging populations. Using data collected from 7,075 survey respondents in 2012 of the National Health and Aging Trends Study, we examined the association between economic hardship and insomnia in a nationally representative sample of Medicare beneficiaries aged 65 and older. Logistic regression models were developed to predict the association between economic hardship and insomnia in older adults. Results indicated higher levels of economic hardship were associated with a greater odds of insomnia, after adjusting for race, age, gender, and education (Model 1) (OR=2.62, 95% CI: 1.81,3.79), plus number of health conditions (Model 2) (OR=2.24, 95% CI: 1.52,3.30), plus anxiety and depression (Model 3) (OR= 2.14, 95% CI: 1.44, 3.18), (p < 0.001 for all three models). These findings indicate that after accounting for potential confounders, those with higher levels of economic hardship were twice as likely to have insomnia as those without economic hardship. By reducing economic

hardship in older adults, insomnia symptoms may decrease, and hence improve the overall health of older adults.

INSOMNIA AMONG COUPLES, MARITAL RELATIONSHIP QUALITY, AND METABOLIC SYNDROME IN LATER LIFE

Y. Shih², S. Han¹, J.A. Burr¹, 1. *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*, 2. *National Chung Cheng University, Min-Hsiung Township, Taiwan*

Clinical research has linked sleep disorders, including insomnia, to a higher risk of cardiometabolic outcomes, such as hypertension, diabetes, and the metabolic syndrome (MetS). However, very little research on this issue has been conducted with nationally representative samples of older American couples. We adapted a dyadic approach to investigate the interdependence of older adults and their partner's sleep problems with their corresponding risk of incident MetS. Further, for co-sleeping older adults, marital relationship quality has been prospectively associated with the incidence of MetS and subsequent coronary heart disease. We hypothesized that both insomnia among partners and marital relationship quality viewed from the perspective of actors and their partners would be related to the incidence of MetS. Data from the 2006 and 2010 Health and Retirement Study were utilized to examine these relationships (n=2,146 or 1,073 couples). Longitudinal multi-level (mixed) regression models were employed to estimate actor and partner effects. We found for wives that the risk of MetS increased over the observation period but not for husbands. We also found that insomnia at baseline was related to increased risk for MetS for both partners but risk increased over time only for husbands. For wives only, spouse's insomnia was related to an increased risk of incident MetS. For marital quality, we found marginally significant relationships once controls were added to the model. This study demonstrated the importance of sleep problems for MetS and how co-sleeping older adults are potentially impacted in terms of their MetS risk.

SESSION 4555 (POSTER)

SOCIAL ENGAGEMENT AND SOCIAL NETWORKS

IMPACT OF HEARING LOSS ON SOCIAL CONTACT AMONG KOREAN OLDER ADULTS: PLACE OF RESIDENCE AS MODERATOR

Y. Shin, S. Baik, E. Chung, S. Heo, J. Ha, *Seoul National University, SEOUL, Korea (the Republic of)*

Using data from the Korean Longitudinal Study of Aging (KLoSA), we examine (1) the impact of hearing loss on social contacts with friends, relatives, or neighbors among Korean older adults aged 60 and over, and (2) the extent to which the place of residence moderates the relationship between hearing loss and social contacts.

Analyses were based on data from the 2014 wave of KLoSA, with a sample of 4,971 older adults. The level of hearing loss was assessed with a question asking how participants would evaluate his or her hearing ability on a five point scale. The place of residence was determined according to the region where each individual lived, and it was categorized dichotomously into rural and urban areas.

The results indicated that higher levels of hearing loss were associated with fewer social contacts among older adults in Korea. The place of residence was found to be a significant moderating factor; the negative impact of hearing loss on social contacts was more pronounced among those who live in urban areas.

Assuming that community in rural areas have more inclusive atmosphere towards neighbors than urban areas, these findings point to the important role of social cohesion of a community in reducing social isolation of older adults experiencing hearing loss. They also call for community building efforts in urban areas, providing older adults with hearing loss and other community residents opportunities to better understand and befriends with each other.

SOCIAL HEALTH OF KOREAN RURAL ELDERLY: WITH A FOCUS ON AGE-GROUP DIFFERENCES

J. Lee, *Family environment and welfare, Chonnam National University, Gwangju, Korea (the Republic of)*

The purpose of this study was to examine the differences in social health among three distinctive age groups – young-old (65~74), middle-old (75~84) and old-old (85+). In this study, social health is defined as the amount of interaction an individual has with their community, and it consists of 3 aspects: social networks size (family/relatives, friends/neighbors), social activity and sense of community (trust, norms, and participation). For the purpose, this study examined how age groups assessed their social health and whether there are any actual differences among the three age groups. Data was gathered from 320 rural elderly who live in rural villages using a structured questionnaire. The statistical methods used for data analysis were descriptive statistics, t-test, ANOVA and correlations and regression.

The major findings of this study are as follows: differences among the three groups in terms of social network size, social activity and sense of community seem to be apparent. The respondents belonging to the old-old group perceived their family/relatives network size to be smaller than the young-old and middle-old groups. Reports of social activity in community centers, senior meetings and other private meetings of old-old group is also lower than the other groups. However, the actual frequency of visiting community centers shows no differences between the age groups. Old-old group's participation level of sense of community is lower than the other age groups. A regression analysis of the social health variables shows that the age of respondents has a significant influence on the social health of the elderly along with gender, educational level, subjective health status and subjective economic status. It can be seen that the old-old, the oldest old age group in this study, is the most vulnerable when it comes to social health. On the basis of this analysis, various methods for supporting the rural elderly's social health are discussed.

THE FUNCTIONS OF LEISURE IN LATER LIFE: BRIDGING INDIVIDUAL AND COMMUNITY-LEVEL PERSPECTIVES

C.H. Hennessy, *Visiting Professor, Bournemouth University, Plymouth, United Kingdom*

Older people's leisure has been an enduring research topic in gerontology with current interest focused on its benefits

and role in successful aging. Leisure participation in older age has principally been researched from individual-level theoretical perspectives that view leisure as reflecting adaptations to aging-related losses and change. Recent orientations to later life leisure participation, such as innovation theory, emphasize positive developmental aspects and uses of older individuals' leisure pursuits, driven by personal agency. Moreover, the potential of later life leisure activities to contribute to community is conceptualized in social capital theory perspectives that bridge individual and community-level functions of leisure participation. This presentation uses findings from qualitative thematic analysis of oral histories on leisure conducted with 58 persons aged 60 and over in rural southwest England, to examine the personal uses and functions of their leisure occupations in older age, and the role that these activities play in connecting older individuals to their communities. Findings indicate that while participants described lifetime patterns of leisure characterized by a core set of activities and interests, later life was a period of significant leisure transitions in which they actively used new and continuing pursuits and pastimes to adapt to changing personal circumstances, abilities, and aspirations. The findings also demonstrate how participants' leisure activities—ranging from avidly pursued hobbies to formal volunteering—served both individual adaptive and developmental purposes, and as a means of fostering social connectivity and contributing to rural community life. Implications of these findings are discussed in regard to leisure theory.

SOCIAL NETWORKS AND SOCIAL SUPPORT OF OLDER MIGRANTS

J. Fietz, J. Kaschowitz, M. Brandt, *Chair for Social Structure & Sociology of Ageing Societies, Institute for Sociology, Dortmund, Germany*

European societies are changing going along with new ways of life, different age compositions and increasing shares of migrants. Simultaneously, all across Europe we see a withdrawal of welfare states. These changes affect relationships between generations and cultures, and social support. Especially marginalized groups such as older migrants might adversely be affected. Using the German Socio-Economic Panel (SOEP) we compare social support networks among older Germans and Turkish, Greek, Italian, Yugoslavian, Rumanian, and Polish immigrants, as well as migrants from the former Soviet Union. We focus on changes of social relationships and social support over life course attributing this to the context of country of origin, generations and age, controlling for intra-individual effects by using panel data. Our results show significant inter-ethnic and inter-generational differences of social capital and social support: older Turkish migrants integrate more persons of the same origin into their networks than younger Turkish migrants; Polish and Rumanian networks consist of most Germans. Further, network compositions are rather inter-generationally than ethnically determined in terms of inter-ethnic ties, family members, and availability of support, e.g. by relatives living abroad. Nevertheless, Yugoslavian generations differ less across life course than Turkish, Greek, and Italian. Expectations of social support by family members, e.g. in terms of expected long term care givers are likewise affected by age. We conclude with a discussion on how network

compositions determine different needs of social support in life course and by national contexts.

MARITAL QUALITY AND LONGEVITY: UNDERSTANDING THE IMPACT OF JOINT DECISION MAKING AND MARITAL RISK

P.S. Mehta, N.M. Silva, N.A. Turiano, *Psychology, West Virginia University, Morgantown, West Virginia*

Married individuals experience less disability and live longer than those who are unmarried. However, the quality of the marriage is also an important factor to consider since there are some aspects of marriage that can be either protective or detrimental. We utilized data on 4,569 married/partnered participants (ages 25–75, 689 deceased) from the Midlife Development in the U.S. Study (MIDUS) to examine how joint decision making and marital risk score (index of disagreement and subjective opinion of pending relationship dissolution) were related to 20-year mortality risk. We hypothesized that greater joint decision making scores would predict a decreased risk of dying while a higher marital risk score would predict an increased risk of dying. We tested hypotheses using Survival Analysis controlling for age, gender, marital status, race and education. In this first model, analyses revealed that joint decision making did not significantly predict mortality risk (HR = 1.00; CI = 0.99–1.01; $p = 0.917$). However, in our second model, the marital risk score was a significant predictor of mortality (HR = 1.16; CI = 1.03–1.30; $p = 0.014$). Examining both variables in the same model revealed that marital risk still predicted mortality while joint decision making did not. Findings suggest that even though being married is protective in terms of health, the quality of the marriage is still important. Further research in the area is needed to better understand the association between marital status and health since the quality of the marriage may impact this association.

THE LONGITUDINAL IMPACT OF SOCIAL NETWORK SIZE AND SATISFACTION ON LATE-LIFE WELL-BEING

H.R. Fuller, M. Toyama, *Human Development and Family Science, North Dakota State University, Fargo, North Dakota*

Links between social support networks and health have been well documented across the life course; however, to continue to understand the nuanced influence of social networks in late-life further multi-faceted and longitudinal research is warranted. The current study extends this line of research by examining how both structure and quality of social networks impact change in late-life psychological, physical, and functional health. Using longitudinal data from a community-based sample of 301 adults aged 60 – 98, the purpose of the present study was to examine whether social network size and satisfaction impact well-being (i.e., depressive symptoms, life satisfaction, self-rated health, number of diseases, and ADLs) over time. Multiple regression analyses were conducted with Wave 1 network size and satisfaction predicting Wave 2 well-being while controlling for Wave 1 well-being to assess change over a two-year period. Age, sex, education, and marital status were included as covariates to account for demographic variation. Network size was not associated with change in self-rated health or number of diseases, but smaller network size was associated with increased depressive

symptoms, decreased life satisfaction, and increased ADLs over time. Lower network satisfaction was associated with increased depressive symptoms, decreased life satisfaction, and decreased self-rated health over time. Findings suggest that a lack of social network support (both quantity and quality) has negative implications for older adults' psychological well-being over time; whereas, access to social support may promote functional health. Implications for older adults' well-being will be discussed along with avenues for intervention and future research.

NEIGHBORHOOD SOCIAL SUPPORT AND COMPANIONSHIP AMONG THE VERY OLD LIVING IN AN URBAN AREA IN JAPAN

I. Sugawara¹, M. Takayama², Y. Ishioka², M. Suganuma³, Y. Masui⁴, M. Ogawa⁵, 1. *Institute of Gerontology, University of Tokyo, Tokyo, Japan*, 2. *Keio University, Yokohama, Japan*, 3. *Tokai University, Hiratsuka, Japan*, 4. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 5. *Hokkaido University, Sapporo, Japan*

Neighbors should play a significant role in our social network, especially when we become very old and have a limitation in mobility. However, little is known about the functions of neighborhood relationship and its impact on well-being of the very old. In this study we focused on the availability of emotional support, tangible support, and companionship with non-kin neighbors of the very old and examined its effect on the well-being of the older people. Interviews were conducted in 2015 in Kawasaki, Japan. Respondents were randomly selected community dwelling adults aged 75 years and older ($n = 873$). It was found that 59.7% of the respondents had acquaintances or friends in their neighborhood. Among them, about a half replied they could rely on their neighbors emotionally or instrumentally. Also about 70% answered they enjoyed companionship with their neighbors. No gender or age differences were found for the proportion of having close neighbors. Respondents who used sports facilities or community centers in their neighborhood were more likely to have close relationship with neighbors. Analyses on the association between neighborhood relationship and well-being found that having close neighbors and companionship with neighbors were associated with life satisfaction and QOL measures positively. These correlations were larger for the older age groups. These results suggested that neighborhood social network, especially having companions in the neighborhood might gain its importance in our life as we age. Strategies for promoting neighborhood companionship should be considered for better community life for the very old.

LONELINESS AND SOCIAL SUPPORT OF JAPANESE OLDER ADULTS WITH SENSORY IMPAIRMENTS

E. Takagi¹, Y. Saito², 1. *Towson University, Towson, Maryland*, 2. *Nihon University, Tokyo, Japan*

We investigated the prevalence and associating physical and social factors of loneliness of Japanese older adults with self-reported hearing and/or vision impairments. Our analyses used longitudinal data of the nationally representative Japanese older adults of 65 years and older ($n=4997$) in the Nihon University Japanese Longitudinal Study of Aging

(NUJLSOA) collected between the years of 1999 and 2009. The study sample was constructed by pooling longitudinal data collected between each five waves of the survey period. Over 30% of the study sample reported some levels of hearing or vision impairments. Compared to those with no sensory problems, a higher portion of older adults with sensory impairments reported that they had felt lonely. They also rated their overall health poorer and reported more problems of physical functions. The larger percentage of older adults with sensory impairments lived with their children and received relatively more support from children. The results of the logistic regression analysis showed that having more difficulty with activities of daily living was a significant associating factor of loneliness among older adults with sensory problems. In addition, the frequency of contact with non-resident children tended to have a weaker association with loneliness of older adults with sensory problems compared to those with no sensory problem. Based on these results, we discuss the issues pertinent to Japanese older adults with sensory impairments and ways in which social support and services need to be provided to alleviate the loneliness of this group of older adults.

ALTERATIONS IN SOCIAL NETWORKS OF THE ELDERLY ACCORDING TO CHANGES IN THE DEPENDENCY PROFILE

T. Brito⁶, D. Pires Nunes³, L.P. Corona⁴, T. Alexandre⁵, Y. Duarte¹, M. Lebrao¹, 1. *University of São Paulo, São Paulo, Brazil*, 3. *Federal University of Tocantins, Tocantins, Brazil*, 4. *UNICAMP, Campinas, Brazil*, 5. *UFSCar, São Carlos, Brazil*, 6. *Federal University of Alfenas, Minas Gerais, Brazil*

Aim: Verify the alterations in the configuration of social networks of the elderly according to changes in the dependency profile. **Method:** Longitudinal population-based study that used the 2006 ($n = 1,413$) and 2010 ($n = 990$) cohorts of the Health, Well-being and Aging Study (SABE). To establish the different levels of elderly dependence a hierarchical scale of reported difficulties was used, constructed by the Guttman scaling method. To characterize the social networks the following variables were used: number of network members; living arrangement; sex and age of the members; co-residence with children or only with elderly individuals; satisfaction with the relationship; receiving and offering social support (financial, material, emotional, performing tasks inside and outside the home, company and personal care). The differences between the structural and functional characteristics of the social networks in 2006 and 2010 were estimated using the McNemar and Wilcoxon tests. **Results:** The elderly people who decreased their level of dependency from 2006 to 2010 and those who maintained the same condition from 2006 to 2010 received and offered more support in 2006. Those who presented an increased level of dependency began to receive more personal care and support to perform household chores in 2010. **Conclusion:** Health professionals should encourage the formation of social networks where the elderly can effectively exchange support, since these networks may be a possibility for meeting the needs of elderly care in situations of dependency.

LONGITUDINAL IMPLICATIONS OF SOCIAL INTEGRATION FOR HEALTH AND WELL-BEING IN LATE-LIFE

H.R. Fuller¹, K.L. Fiori², 1. *North Dakota State University, Fargo, North Dakota*, 2. *Adelphi University, Garden City, New York*

Distinct components of social integration have documented links to late-life well-being. Recent research highlights the value of not only addressing these components separately, but of examining social integration comprehensively. The purpose of the present study was to examine the longitudinal health implications of social integration as assessed by the multi-faceted and comprehensive Social Integration in Later Life Scale (SILLS). Specifically, using a community-based sample of 301 adults aged 60 – 98, multiple regression analyses were conducted with Wave 1 social integration (including 4 subscales assessing frequency and satisfaction of social ties and community interaction) predicting Wave 2 well-being 2 years later (depressive symptoms, life satisfaction, self-rated health, number of diseases, and ADLs) while controlling for Wave 1 well-being. Age, sex, education, and marital status were included as covariates. Greater overall social integration (and specifically frequency of community interaction) was associated with a decline in depressive symptoms, an increase in life satisfaction, and an increase in self-rated health over time. Lower satisfaction with social ties predicted increased depressive symptoms over time. Overall social integration did not predict change in diseases over time; however, greater satisfaction with community was associated with increased ADLs over time, likely indicating the increased community integration within senior long-term care facilities. These findings highlight the importance of social integration, particularly within the community, for perceptions of well-being in late-life. Implications for research and intervention promoting late-life social integration and well-being will be discussed.

AGE DIFFERENCES IN THE EFFECTS OF PREFERENCE FOR SOLITUDE ON EMOTIONAL WELL-BEING

A. Toyoshima, S. Sato, *Osaka University, Suita, Osaka, Japan*

Time being alone increases with age, and older adults have higher preference for solitude (PS) than younger adults (Toyoshima & Sato, 2014). People with high PS more often choose to spend time by themselves. High levels of PS do not indicate that the person spend most of their time alone; rather, they perceive greater potential benefits in spending time alone. This study examined age differences in the effects of PS on emotional well-being. We conducted an Internet survey of 1500 people: 500 younger adults (aged 29–31), 500 middle-aged adults (aged 49–51), and 500 older adults (aged 69–71). We administered a questionnaire including variables regarding preference for solitude, emotional well-being (positive and negative affect), loneliness, and frequency of being alone in daily life. We examined the effect of PS using hierarchical multiple regression analysis. The results showed a significant negative effect of PS on negative affect for older ($\beta = -2.39, p = .017$) and middle-aged ($\beta = -2.08, p = .038$) adults, but not for the younger adults ($\beta = -1.81, p = 0.72$).

There were no significant PS effects on positive affect for any of the groups. These results suggested PS decreases negative affect and promotes emotional well-being. Moreover, the effect is stronger for older adults. PS levels may potential explain why older adults maintain their well-being even though they spend more time alone.

SUBJECTIVE EXPERIENCE OF (DIS)ABILITIES: A QUALITATIVE APPROACH TO PHYSICAL ABILITY OF NONAGENARIANS

K. Lumme-Sandt^{1,2}, S. Fried³, O.H. Jolanki^{1,2}, 1. *University of Tampere, Tampere, Finland*, 2. *Gerontology Research Center, Tampere, Finland*, 3. *Age Institute, Helsinki, Finland*

About one third of oldest old resides in the community and is relatively independent in their daily activities. However, we know more about the disabilities of the nonagenarians than about their everyday abilities of these independent but very old individuals.

In this research we report the results of qualitative life course interviews of the Vitality 90+ Study from Tampere, Finland. Forty-five (20 men) nonagenarians were interviewed in their homes in 2012 and interview themes included questions about everyday activities such as shopping and main features of the living environment. The analysis focused on subjective experiences of own ability to perform everyday activities and reflections on how the living environment affected these experiences.

Results show that doing grocery shopping is a valued activity and for those who are able to go shopping it is also part of their daily exercise regimen. Relatives, friends and neighbors often had a significant role in enabling shopping activity. Subjective experience of physical functioning therefore relied on successful interplay of personal physical ability, features of the environment and relationships with other people.

Studying subjective functional ability offers an important perspective for understanding the quality of everyday life of nonagenarians. To fully comprehend the physical functioning of nonagenarians, it is necessary to study the interplay of social relationships, living environment and mundane activities like shopping.

SELF-IMAGES OF CHILDLESS AND SINGLE ELDERS FROM A BIOGRAPHICAL PERSPECTIVE

K. Alert¹, S. Zank¹, F. Oswald², 1. *University of Cologne, Cologne, Germany*, 2. *Goethe University Frankfurt, Frankfurt am Main, Germany*

Aging without children as well as without partner are associated with loneliness and missing support, when it comes to the need of care. While previous findings show that childless elders do not have significantly less intergenerational ties than older parents, they are more concerned about care dependency and generativity. There is little known about how they develop resilience over the life-course to cope with old age. This presentation conceives childlessness as a result of multiple biographical decisions instead of a 'one time only' decision. The qualitative approach of biography research was chosen to focus on individual and societal aspects of being childless throughout the life course and in the present. Data is drawn from ten in-depth interviews with childless and single older men and women (63–80 years old). First findings from the reconstruction of two cases allude to

a positive self-image, in their narratives they actually seem to avoid negative references to stereotypes of childless elders. The interviewees perceive themselves as in whole embedded in their social networks, which consists mostly of long-standing relationships. They do not regret being childless, although participants with lesser intergenerational contacts address the lack of grandchildren. Along with this, missing social and intergenerational ties are linked to negative subjective well-being. These first findings from an ongoing Ph.D. study reveal the accumulated resources and risks of childless and single persons in old age. Besides, the biographical approach helps to gain a deeper understanding of childlessness as a lifelong process.

SOCIAL NETWORK FUNCTIONS RELATED TO CO-ENGAGEMENT IN SOCIAL ACTIVITY AND PSYCHOLOGICAL WELL-BEING

S. Ashida¹, D.K. Sewell¹, E.J. Schafer², A.L. Schroer¹, J.E. Friberg¹, 1. *University of Iowa College of Public Health, Iowa City, Iowa*, 2. *University of South Florida, Tampa, Florida*

Socially engaging with others has been shown to be important for the well-being of older adults. However, little is known about how co-engaging in activity with someone may facilitate well-being. This study investigated whether network functions (i.e., social support, companionship, social influence) are more likely to occur in relationships involving co-engagement in activities, versus relationships without co-engagement, and whether these functions may explain well-being.

Adults ages 60 years and older were interviewed once in-person or by phone in a rural US Midwestern city. A total of 133 respondents provided information on 1,740 relationships within their social networks.

Respondents identified 68% of enumerated network members as someone they interacted with at least once a month. Focusing on those who interacted at least monthly, 57% co-engaged in social activities with the respondent. Results of the generalized linear mixed model analyses showed the relationships involving co-engagement were more likely to also involve emotional support ($OR=3.69$, $p<0.001$), informational support ($OR=2.91$, $p<0.001$), companionship ($OR=9.38$, $p<0.001$), and encouragement for healthy behaviors ($OR=2.55$, $p=0.002$) than those not involving co-engagement. Having more members providing companionship was associated with better psychological well-being: Ryff's environmental mastery ($p=0.01$) and positive relations with others ($p<0.01$) scales.

Co-engagement in social activity brings social benefits like support, companionship, and encouragement. Companionship may contribute to the psychological well-being of older adults. Future research may explore how other aspects of older adults' well-being, such as physical health and health behaviors, may be facilitated by functions like social influence and support arising from co-engagement in social activity.

IMPACT OF SOCIAL DISENGAGEMENT ON PHYSICAL PERFORMANCE IN JAPANESE COMMUNITY-DWELLING ELDERLY STUDY

K. Iijima¹, A. Kuroda¹, T. Tanaka², K. Takahashi¹, M. Akishita², T. Tsuji¹, 1. *Institute of Gerontology, The*

University of Tokyo, Tokyo, Japan, 2. *Geriatric Medicine, The University of Tokyo, Tokyo, Japan*

Aim: Study on the pathways between social disengagement and sarcopenia or its diagnostic physical functions remains inadequate. This study aims to examine the relationship between social engagement and physical functions with a particular focus on two components of social engagement – social participation and social relations – and their differential pathways to physical performance.

Methods: Large-scale longitudinal health-check cohort study, 'Kashiwa study', was conducted with subjects of a total of 1,205 community-dwelling older adults aged 65 years or older, who was randomly selected from the resident register in Kashiwa city, Japan in 2012. Timed up-and-go (TUG), time to rise from a chair 5 times and maximum gait speed were used to assess physical performance. The indicators used to assess social participation were organizational attendance and frequency of going out. Eating alone, reciprocity of social support and social network were used to assess social relations.

Results: The model that linked social engagement and physical performance via two pathways showed a significantly good fit (GFI=0.971; AGFI=0.958; RMSEA=0.043; AIC=342.876; CFI=0.952). Psychological pathway connected social relations with physical performance via loneliness, mental health and nutritional deficiency. Behavioral pathway linked social participation with physical performance via physical inactivity.

Conclusion: Social participation and social relations were related to physical performance via differential pathways. Social preventive measures against physical frailty, especially sarcopenia, need to involve comprehensive assessment of their social engagement and composite interventions to that target both the behavioral and psychological pathways.

THE EFFECT OF SOCIAL ENGAGEMENT AND ITS CHANGE ON INCIDENT DEMENTIA AMONG CHINESE OLDER ADULTS

Z. Zhou^{1,2}, P. Wang^{1,2}, Y. Han^{1,2}, Y. Fang^{1,2}, 1. *State Key Laboratory of Molecular Vaccinology and Molecular Diagnostics, School of Public Health, Xiamen University, Xiamen, Fujian, China*, 2. *Key Laboratory of Health Technology Assessment of Fujian Province University, School of Public Health, Xiamen University, Xiamen, Fujian, China*

Purpose of the study: To examine the effect of social engagement (SE) and its change on incident dementia among older adults in China.

Design and Methods: Data were drawn from the 2002, 2005, 2008/2009, and 2011/2012 waves of the Chinese Longitudinal Healthy Longevity Survey (CLHLS), we used generalized estimating equations (GEE) for repeated measures log-binomial regression to examine the effect of SE and its change on the incidence of dementia, and the incident dementia was modeled on the exposure of SE lagged one wave to ensure the exposure preceded the outcome, hence, three occasions (2002–2005, 2005–2008/2009, and 2008/2009–2011/2012) were conducted in this study. Sensitivity analysis was conducted to test the robustness of findings.

Results: During 9-year follow-up, 338 developed dementia among 7511 Chinese older adults aged 65 or over. SE was

associated with incident dementia after adjusting for social demographic characteristics, life styles and baseline health status (Relative Risk (RR) =0.35, 95% Confidence Interval (CI)=0.16–0.78), and the interaction of SE and time was statistically significant (RR=1.13, 95% CI=1.02–1.24). The risk of incident dementia was reduced among participants with stable high (RR=0.29, 95% CI=0.19–0.44) or an increased (RR =0.20, 95% CI=0.10–0.37) SE compared with those with stable low SE. The findings remained robust to sensitivity analysis.

Implications: A high level of SE could prevent or delay the incidence of dementia and the effect is stronger over time. Furthermore, sustaining a stable high or increasing SE is associated with lower risk of dementia.

YOU'VE GOT A FRIEND IN ME: CAN SOCIAL ENGAGEMENT MEDIATE THE RELATIONSHIP BETWEEN MOOD AND MCI?

J.A. Yates¹, L. Clare², B. Woods³, 1. *Institute of Mental Health, University of Nottingham, Nottingham, Nottinghamshire, United Kingdom*, 2. *University of Exeter, Exeter, United Kingdom*, 3. *Bangor University, Bangor, United Kingdom*

Social networks can change with age, for reasons that are adaptive or unwanted. A larger social network is beneficial to both mental health and cognition. Consequently this study explored this association and assessed the mediation of the relationship between mild cognitive impairment (MCI) and mood problems by social network size. This study includes an analysis of data from the Cognitive Function and Ageing Study Wales (CFAS Wales). CFAS Wales data were collected by conducting structured interviews with older people aged over 65 years of age living in urban and rural areas of Wales, and included questions that assessed cognitive functioning, mood, and social networks. This study demonstrates that having a larger social network is beneficial to both mood and cognition. Correlation analyses suggest that as social network increases, symptoms of anxiety and depression decrease. Regression analyses reveal that social network size is a significant mediator of the relationship between MCI and mood problems. These findings are important, as mood problems are a risk factor for progression from MCI to dementia, so interventions that increase and strengthen social networks may have beneficial effects on slowing the progression of cognitive decline. Social network size represents a potentially modifiable variable, in that more opportunities to socialise can be explored and implemented. For example, many older people struggle to access transport to attend social situations, which could be acted upon, and additionally, advances in technology could be utilised to provide social opportunities for older people.

DEPRESSION AND SOCIAL MEDIA USE AMONG MIDDLE AGED AND OLDER U.S. ADULTS

A.A. Guzman, J.C. Mentis, *University of California Los Angeles, School of Nursing, Los Angeles, California*

The growth of social media (SM) use is evident in the middle age and older adults, and its association with mental well-being remains unclear. This study used data from the third wave of the National Survey of Midlife Development in the United States to examine SM use and its association

with depression to answer whether the presence of past year depressive episode can be predicted from SM contact. This study surveyed 3,294 adults ages 35 and above about their frequency of SM use to contact friends or family and depression. SM use was assessed by self-reported time with eight responses, ranging from 1= "several times a day" to 8= "never or hardly ever." Depression was assessed using self-report of past 12 months' depressive episode. Logistic regressions were performed. The weighted sample was 54.9% female and 89.5% White. Accounting for baseline depression and other important potential confounders, this study did not demonstrate that frequency of social media use to contact friends and family predict depressive episodes, as opposed to other studies done on a young adult cohort. Results were robust to all sensitivity analyses. SM use is not associated with increased depression. Given the proliferation of SM, further studies should look at the possibility of social media use in offering middle age and older adults a medium to connect and engage, develop a sense of community and possibly offset the risk of depression and isolation.

THE RELATIONSHIP BETWEEN SOCIAL SUPPORT AND DISTANCE TO THE PARENTS' HOUSE IN JAPAN

T. Nakata¹, M. Nakata², 1. *Hokusei Gakuen University, Sapporo, Japan*, 2. *Sapporo Gakuin University, Sapporo, Japan*

The purpose of this study is to reveal whether size of the gap between the respondent's house and their parents' house affect the amount of the exchange of social support when parents and their children are living apart.

This study utilized data collected in Sapporo, Japan, in January 2015. Respondents to the survey were men and women from 35 to 60 years of age whose parents were still alive (n=510). This survey was conducted in Sapporo, the prefectural capital of Hokkaido.

The dependent variable was delivery and acceptance of sentimental and tangible support. And the independent variables were the distance from respondent's house to their parents' house and basic attributes and attitude concerning family of the respondents, ADL and living arrangements of their parents.

The results of the analysis are as follows. 1) The distance to their parents' house reduced only tangible support delivery for the respondents. 2) The relationship between mothers and their daughters seemed to be very strong. 3) The interaction of parents with their neighbors tend to decrease social support from respondents. 4) The parents' physical situation that measured by ADL increased care that respondent provided.

Though social support delivery from children is based on the traditional family structure and the mother-daughter relationship, but it seems to give by somewhat rational choice, which is opposite to the traditional criterions, because care decrease by the distance of the houses and parents' interaction with the neighbors.

SOCIAL RELATIONSHIPS AMONG ADULT THEATER AUDIENCE MEMBERS

S.K. Shryock, S. Meeks, *University of Louisville, Louisville, Kentucky*

Research suggests that social networks decrease in size as individuals grow older and that older adults perceive more positivity and less negativity associated with their social

relationships (English & Carstensen, 2014). In the context of a larger study of well-being associated with theatre audience involvement, we hypothesized that theatre patrons age 60 and above would report attending the theatre with fewer companion types than younger patrons, but would also report greater social engagement, positive relations, and sense of belonging. Data were from an online survey of 841 theater patrons of a nationally-recognized repertory company. We determined that individuals aged 60 and over attended performances with significantly fewer companion types ($M=1.23$, $SD=.71$) than did younger individuals ($M=1.45$, $SD=.84$), $t(664) = -3.59$, $p < .001$, $d = .28$. Older individuals also reported significantly higher social engagement with the people they generally attend performances with, $t(665) = 2.72$, $p = .007$, $d = .21$, and higher scores on the Ryff Well-being: Positive Relations with Others scale, $t(628) = 2.52$, $p = .012$, $d = .20$. Despite attending the theater with fewer types of companions, older adults did not differ from younger adults in their sense of belonging when attending performances, $t(654) = .63$, $p = .531$, $d = .05$. These results suggest that older adults continue to gain social benefits through engagement with the performing arts, even as the makeup of their social network changes, and are consistent with socioemotional selectivity theory.

English, T., & Carstensen, L. L. (2014). Selective narrowing of social networks across adulthood is associated with improved emotional experience in daily life. *International Journal of Behavioral Development*, 38(2), 195–202.

SESSION 4560 (POSTER)

SUCCESSFUL AGING

PERSPECTIVES ON SUCCESSFUL AGING: INSIGHT FROM THE JIRELS IN EASTERN NEPAL

S.J. McLaughlin¹, J. Subedi¹, S.S. Thapa², M.K. Shrestha³, M. Johnson³, S. Williams-Blangero³, 1. *Miami University, Oxford, Ohio*, 2. *Tilganga Institute of Ophthalmology, Kathmandu, Nepal*, 3. *The University of Texas Rio Grande Valley, Brownsville, Texas*

Concerns have been raised about existing definitions of successful aging. In particular, it has been argued that they are influenced by the values of researchers and lack input from the populations studied. Efforts have been made to address the issue by asking older adults what they deem to be important elements of successful aging. The majority of these studies, however, have been conducted in developed countries. We, therefore, know little about how aging in a developing nation shapes beliefs about successful aging. The objective of this study is to expand understanding of what it means to age successfully by investigating the phenomenon in Nepal, a developing country with a median age of approximately 23 years and per capita GDP of 2,500 US dollars. To permit comparison with data gathered in the United States and Japan, we used a modified version of an existing questionnaire. The questionnaire captures 13 potential attributes of successful aging and includes an open-ended item designed to elicit other perceived elements of successful aging. The study sample includes 1,750 members of the Jirel population, an ethnic group located in the Dolakha District

in eastern Nepal. To date, a total of 250 in-person interviews have been completed, with an additional 500 to be completed by February 2017. Findings from this study serve to enhance understanding of how the sociocultural context in which one grows old shapes beliefs about successful aging.

MEANING OF LIFE IN OLD AGE AND THE PRESERVATION OF COGNITIVE ABILITIES

H. Erel^{1,2}, A. Kaplan¹, 1. *NAC, Netanya, Israel*, 2. *IDC, Herzliya, Israel*

Cognitive decline is considered one of the most feared changes that occur as people age (Lustig et al., 2009; Morley, 2004). It affects elders' quality of life and can limit their participation in social interactions, in the labor market, and their independence in general (Salthouse, 2004). Although a decline in some cognitive aspects is considered a robust phenomenon of aging (Craik & Salthouse, 2011), large variance implies that in some cases cognitive abilities are preserved. In this study we test the possibility that adapting to the changing circumstances of aging and deriving new meaning in this stage of life may be one of the factors predicting preserved cognitive abilities. In two experiments we tested the influence of meaningful aging on cognitive abilities in later life. Meaning in life levels (high, mild, low) were assessed for ninety-five older adults (67–85) who had already retired. Cognitive abilities were assessed by a Flanker task (Erikson & Erikson, 1999) considered to measure inhibition and by a lexical decision task considered to measure vocabulary. Experiment 1 demonstrated that participants who engaged in meaningful activities (either high or mild) showed superior performance compared to the performance of participants reporting low meaning in life. In Experiment 2 we compared the performance of participants who reported high meaning in life to the performance of young adults (20–28). Older adults' performance was preserved in both cognitive tasks. The findings presented here imply that a meaningful aging may be an important factor in preserving cognitive abilities in later life.

EXCEEDING GENERATIVE SELF-EXPECTATIONS WITH AGE IS LINKED TO BETTER COGNITIVE-AFFECTIVE STATES

M. Grossman, T.L. Gruenewald, *University of Southern California, Davis School of Gerontology, Los Angeles, California*

Generativity, or concern with contributing to others, is an important aspect of middle and later life. Greater self-perceptions of generativity are associated with more favorable well-being over time. The aim of this study is to examine how perceptions of generativity and realizations of generative expectations are linked to individuals' cognitive-affective well-being. Data from Waves 2 and 3 of the National Survey of Midlife Development in the United States (MIDUS) were used to examine how individuals' predicted and achieved generative contributions, and any deviation between them, relate to their cognitive-affective states, including social connectedness, self-enhancement, and positive affect. In demographically-adjusted regression analyses, both perceived generative contributions and more positive expectations regarding future generativity, were significantly ($p < .05$) associated with higher levels of each cognitive-affective state,

concurrently, and ten years later (generative contributions: positive affect $\beta=.18$ & .14; self-enhancement $\beta=.18$ & .14; social connectedness $\beta=.23$ & .17, respectively; generative expectancies: positive affect $\beta=.20$ & .16; self-enhancement $\beta=.19$ & .16; social connectedness $\beta=.22$ & .17). Examination of the discrepancy between self-reported generativity at follow-up and the level of generativity participants predicted for themselves ten years prior indicated that more positive deviations were associated with better well-being at follow-up (positive affect $\beta=.15$; self-enhancement $\beta=.13$; social connectedness $\beta=.14$). A Johnson-Neyman analysis indicated these associations were strongest in those in their mid-40's to mid-70's. Findings suggest that greater feelings of generativity, and more positive expectations for future contributions, are associated cross-sectionally and over time with better well-being. Enhanced well-being is particularly linked to greater than expected generativity in middle, and young-old, ages.

WHO IS MOST LIKELY TO PLAN FOR FUTURE CARE NEEDS?

C. Speirs, C.A. Konnert, *University of Calgary, Calgary, Alberta, Canada*

Planning for future care needs is an important but often neglected aspect of aging well. Decisions about care are often made reactively after a catastrophic health event, leading to significant stress for older adults and their family members. The purpose of this study was to use a well-established theory of behavior, the Theory of Planned Behavior (TPB), to predict planning, including the avoidance of planning and stages of planning behavior. Predictors from the theory (i.e., attitudes, norms, perceived control) were combined with other variables supported by the literature (i.e., age, future self-continuity, perceived future financial status, work experience with older adults, caregiving experience, contact with nursing homes) to determine who is most likely to engage in planning behavior, and who may be at risk for lack of planning. A sample of 83 participants (aged 18–70) completed questionnaires assessing these variables. Hierarchical regression analyses, with age entered in step 1, were used to determine which factors predicted overall planning, the avoidance of planning, and four stages of planning (awareness, gathering information, decision-making, and concrete planning). Taken together, these predictors explained a significant amount of variance in planning behavior, for example, 64% of the variance in concrete planning. Moreover, TPB predictors (attitudes, norms, and perceived control) were significant predictors of all stages of planning. These findings suggest that: a) the TPB has utility in predicting who is most likely to plan across a wide age range, and b) interventions designed to promote planning should target predictors of planning (e.g., perceived control).

AGING WITH PURPOSE: A REVIEW OF THE LITERATURE

J. Irving, *Health Sciences, Flinders University, Stirling, South Australia, Australia*

Purpose in life can provide a sense of intentionality and goal directedness, guide behavior to achieve personal aims and living objectives, foster resilience against life obstacles, and may offer insight into how and why certain people remain healthy over time. A review of the literature was undertaken to identify

and consider contemporary research pertaining to purpose and older adults. Thirty two studies were selected for evaluation. Research outcomes were generally consistent in showing that a higher sense of purpose is related to a range of better health and wellbeing outcomes for older adults. Social and environmental factors such as residence and marital status appear to influence the experience of purpose, with community dwelling older adults reporting greater purpose than older adults within a residential or similar type setting, and those married reporting higher purpose than widowed adults. The present research into age and purpose suggests strongly that purpose declines over time. Conversely, it is argued that the potential to experience purpose persists across the life span, by providing opportunities for older adults to continue contributing roles, participate in meaningful activities and sustain their social value and sense of relevance. Further research could target purpose experienced by the oldest old age group, those living within non-community settings, and people with age related cognitive impairment such as dementia, to ensure greater research inclusivity and that benefits associated with purpose can endure throughout one's life span.

SUCCESSFUL AGING AND COGNITIVE FUNCTIONING IN OLDER ADULTS

N.M. Mendoza Ruvalcaba¹, E. Arias-Merino², M. Flores Villavicencio², I. Díaz-García², M. Rodríguez Díaz¹, *1. University of Guadalajara, Cutonala, Guadalajara, Mexico, 2. University Of Guadalajara, Cucs, Guadalajara, Jalisco, Mexico*

The cognitive functioning, as a general measure, is a criterion commonly used to define and operationalize successful aging. (Project-Conacyt-256589)

The aim of this study is to analyze the prevalence of successful aging and its relationship with specific domains of cognitive function in older adults.

A total of 201 older adults 60-years and older (mean age=71.88, SD=7.07 years, 84% women). Successful aging was operationalized in accordance with no important disease, no disability, physical functioning, cognitive functioning, and being actively engaged. Cognitive functioning was assessed by a battery including learning potential (RAVLT), episodic memory (Subtest-RBNAS), working memory (Digit Span BackwardWAIS-IV), metamemory (self-report), processing speed (Symbol DigitWAIS-IV), attention (TMT-A), executive functioning (TMT-B), semantic fluency (vegetables, animals, fruit), phonetic fluency (FAS), visuospatial skills (Block Design WAIS-IV). Sociodemographic and health data were also asked. Pearsons correlation test and linear regression models were performed.

5.5% met the five criteria for being considered successful agers, 21.4 four criteria, 37.3% three criteria, 24.9% two, and 10.4% only one criteria. No important disease 13.4%, no disability 80.6%, physical functioning 27.9%, cognitive functioning 92%, and being actively engaged 30.8%. Differences by gender and age were not observed. Better performance on all cognitive domains were positively related to successful aging ($p<.05$), except for metamemory.

Knowledge generated by this study reveals the role of specific domains of cognitive functioning in successful aging, and sets a scenario to promote successful aging, through

alternatives centered in the improvement of cognition in the older adults.

SUCCESSFUL AGING: VARIABILITY AND PREDICTORS

N.M. Mendoza Ruvalcaba¹, E. Arias-Merino², M. Flores Villavicencio², M. Rodríguez Díaz¹, 1. *University of Guadalajara, Cutonala, Guadalajara, Mexico*, 2. *University Of Guadalajara, Cucs, Guadalajara, Jalisco, Mexico*

The concept of successful aging (SA) lacks a precise universally agreed definition and is commonly used to mean “all things to all people”. (Project-Conacyt:256589).

Aim: To analyze the variability in the proportion and predictors of successful aging in the same sample when applied different theoretical criteria.

638 older adults were assessed with a comprehensive battery and classified as successful agers if they met the criteria proposed by nineteen different definitions of SA, proposed and published by different authors. Prevalence and predictors for each definition were calculated.

Range in the proportion of participants meeting the criteria for SA varied between 1.7–97% (Mean=33.6%;SD:30.7). Major variations were observed when definitions included “without disease” as criterion for SA (Mean:3%:DS:1;median:3.1;percentile:25–75=2–4). Among the studies including “functional ability” mean proportion was 29.9% (SD: 28.1;median:17.3;percentile:25–75=5.1–57.8) and doubles when this criterion was not included (mean:64.7%;SD:45.9;median:64.7;percentile:25–75=32.2–97.2). When cognitive ability was not included as criterion 54% of successful agers were reported (SD:33.7;median:70;percentile:25–75=23.3–76.4) and when it was included decreased to 21.4% (SD:21.8;median:10.8; percentile:25–75=3.6–44.4). When criteria were exclusively biological, mean proportion of successful agers was 63.8%; according to the only definition merely psychological, proportion was 97.2%. Stronger predictors for SA were age, education, disease, functionality, depression, cognitive status, being active.

The nature of definitions results in a wide variability in the proportion of successful agers in the same population. It is necessary to establish criteria to define the concept of successful aging. “Tell me how do you define SA and I tell you how many successful agers there are”.

THE EFFECTIVENESS OF TEMPORAL COMPARISON IN OLD AND VERY OLD AGE: EVIDENCE FROM THE SWISS CONTEXT

V. Ryser¹, S. Pin^{2,3,4}, D. Spini^{3,2}, 1. *FORS- Swiss Centre of Expertise in the Social Sciences, Lausanne, Switzerland*, 2. *Life Course and Inequality Research Center, Lausanne, Switzerland*, 3. *Swiss national Centre of Competence in Research LIVES, Lausanne, Switzerland*, 4. *Centre for Public Health Practice & Evaluation, Institute of Social and Preventive Medicine, Lausanne, Switzerland*

Despite increasing frailty in old and particularly in very old age, the majority of old people maintain however a positive sense of subjective well-being and identity continuity. Subjective well-being is influenced by processes of temporal comparisons in which individuals compare themselves to themselves at a previous point in time. Our communication examines how temporal comparisons are effective

compensatory mechanisms that stabilize octogenarians and nonagenarians' subjective well-being.

The sample included 717 individuals living in Switzerland, aged 80 to 84 at baseline and followed over 10 years. We performed hierarchical linear regressions for analysing the effect of temporal comparison on self-rated health and on affective well-being, controlled by sociodemographic and frailty. Separate analyses were run among older (aged 80 to 85) and oldest old (aged 86 to 94) people, as well as among people who died during the follow-up (n=211).

Temporal comparison has a significant, independent and positive influence on self-rated health for both age groups as well as for deceased people: people who rated themselves in better health than in the previous wave have higher levels of self-rated health. The temporal comparison has a positive effect on affective well-being among survivors, whatever their age group, but has no effect among deceased people.

Results highlight the meaningful role and effectiveness of temporal comparison as a resource for promoting well-being and continuity for octogenarians and nonagenarians. They suggest that this adaptive strategy remains effective along the frailty process, but its efficacy appears to decrease with the proximity of death.

DEAR ANNA AND AL: GIVING ADVICE INCREASES OLDER ADULTS' SUBJECTIVE WELL-BEING

C. Roman^{2,1}, A. Duckworth², R. White^{2,3}, 1. *University of Southern California - Davis School of Gerontology, Los Angeles, California*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*, 3. *Hamilton College, Clinton, New York*

Many people view successful aging as an oxymoron because they associate the aging process with decline and impending death (Vaillant, 2002). However, there are ways to improve aging and to increase older adults' well-being. This study investigated the impact of older adults giving advice to others. I believe that older adults who give advice to others will have higher subjective well-being (as measured by mental well-being, life satisfaction, and positive affect), generativity, and meaning. Furthermore, I believe meaning and generativity may mediate the relationship between giving advice and subjective well-being. In a randomized controlled intervention, members of several senior centers (N = 81) recruited to participate in a psychology study were randomly assigned to one of three conditions. The experimental group responded to letters asking for advice from community members in an activity, called the “Dear Anna and Al: Advice Column Workshop.” The active control group wrote letters detailing different parts of their daily routines and the no-treatment control group simply filled out questionnaires. Compared to participants in the active and no-treatment control groups, older adults who gave advice had improved measures of meaning, generativity, mental well-being, positive affect, and life satisfaction (*ds* > 0.86). These findings suggest that sense of generativity and meaning promotes increased subjective well-being in older adults.

AGED WELL IN PLACE: A MIXED-METHODOLOGY EXAMINATION OF 10 YEARS OF CENTENARIAN AUTOBIOGRAPHIES

T.W. Draper, J.B. Yorgason, M. Nielson, H. Bronson, *Brigham Young University, Provo, Utah*

Becoming a centenarian with an autobiography is a fair indicator of having aged well in place: One has arrived at a rare age with the wherewithal and support to tell one's story. This study uses both text analytics and illustrative vignettes from standardized two-page autobiographies of 218 Utah centenarians collected over a ten-year period. The autobiographies were collected by the Utah Division of Adult and Aging Services. The biographical information was initially analyzed using LIWC (linguistic inquiry and word count) and elements of the SAS text analysis package. Additional compression and sorting of the data was done by blind interns from the Utah Centenarian Study (Spearman's $r = .81$). The topics that will be examined for both overall relative importance and temporal shifts in importance are: Do's and don'ts; Education and experience; Family, friends and caregivers; Fears and concerns; Health and nutrition; Innovations and technology; Love and loneliness; Money and success; Physical activity and work; Politics and war; Religion and spirituality; Roles and employment; Service and sacrifice.

SUCCESSFUL AGING IN OLDEST-OLD ADULTS: ROLE OF PHYSICAL AND SOCIAL FACTORS

K.E. Stanko¹, K.E. Cherry¹, S. Kim², S. Jazwinski², 1. *Psychology, Louisiana State University, Baton Rouge, Louisiana*, 2. *Tulane University, New Orleans, Louisiana*

Social and non-health related behaviors are associated with aging successfully, operationalized by self-perceived health. The authors examined relationships among social engagement, physical activity, frailty, and health in a lifespan sample ($N = 732$) drawn from the Louisiana Healthy Aging Study (LHAS). Four age groups were compared: younger (21–44 years), middle-aged (45–64 years), older (65–84 years), and oldest-old adults (85 to 101 years). Linear regression analyses indicated that, after controlling for sociodemographic factors, physical activity and hours spent outside of the house were positively associated with self-reported health. Importantly, physical activity and hours out remained significant when frailty was accounted for. These data indicate that social and physical activities remain an important determinant of self-perceived health into very late adulthood despite variations in physical frailty. Implications of these data for current views on successful aging and strategies to promote health and wellness in later life are discussed.

THE WITHIN-PERSON COUPLING OF HEALTH GOAL PURSUIT AND AFFECT OVER 100 DAYS

S. Choun¹, K.A. Hooker¹, S.T. Mejia², 1. *Oregon State University, Corvallis, Oregon*, 2. *University of Michigan, Ann Arbor, Michigan*

Goals and self-regulation have important roles for achieving and maintaining resources that are meaningful for adaptation in the face of multiple losses with aging. Despite the fact that goals and affect likely drive one another, relatively little empirical research has examined the processes involved in self-regulating health goals and emotional states. We explored whether health regulatory processes are associated with emotional states on a daily basis to understand how goals and self-regulatory strategies change through the process of working toward a meaningful health goal. Using data from the microlongitudinal Personal Understanding of Life and Social

Experiences (PULSE) project ($N = 76$, $Mage = 62.6$, $SD = 7.3$), we examined within-person coupling of daily health-goal progress and affect by estimating these processes over a 100-day study period. Multilevel random coefficient models revealed that on days when individuals reported higher positive affect than their own average, their health-goal progress was significantly higher while on days when individuals reported higher negative affect than their own average, their health-goal progress was significantly lower. Importantly, the within-person coupling of health-goal progress and negative affect, and positive affect both dampened over time. These changes in patterning over days may be an important part of the long-term regulation process, as older adults change their goals over time to reflect new realities in the aging process. Our findings in microlongitudinal measures of daily intraindividual variability provide enhanced knowledge of the self-regulation of goal pursuit in the domain of health and could lead to better behavioral health strategies.

DOES SOCIAL ENGAGEMENT MITIGATE DECLINES IN COGNITIVE FUNCTIONING OVER TIME?

J. Brustrom, T. Liu, A.A. Greek, G.W. Hougham, *Battelle Memorial Institute, Seattle, Washington*

We investigated whether social engagement mitigates declines in cognitive functioning in older adults over time. We used a nationally representative sample of 6,902 Medicare beneficiaries age 65 and older who completed the 2011 National Health and Aging Trends Study (NHATS). We used multilevel mixed effect models (growth curve models) to examine effects of social engagement on both initial levels and change in cognitive functioning over 4 annual surveys, controlling for age, gender, race, education, vigorous physical activity and social network size. We used two measures of social engagement: an aggregate sum of number of types of social activities completed in the past month (e.g., visiting with family, going out for enjoyment; range 0–6) and the effect of each of these considered separately. Cognitive functioning was a summed measure of immediate and delayed word recall (range 0–19). Results showed that both measures of social engagement were positively correlated with level of cognitive functioning, with baseline activities having a stronger effect than changes in engagement between survey waves. However, their effects on the rate of cognitive decline were not significant, with the exception of the effect of visiting friends and family ($b=0.48$ on the measure of cognitive function over all years; overall model pseudo $R^2 = 15.8\%$). That there are (only) modest effects of social engagement on amelioration of cognitive decline add to debates about both the tractability of cognitive decline in older adults, as well as ongoing debates about what measures and study designs will be most helpful in understanding these processes.

THE ASSOCIATION BETWEEN POSITIVE EMOTIONAL EXPERIENCE AND SELF-ESTEEM IN OLDER ADULTS

Y. Murayama¹, M. Hasebe², J. Yamaguchi¹, M. Yasunaga¹, Y. Fujiwara¹, 1. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 2. *Seigakuin University, Saitama, Japan*

Background

In an aging society, it can increase the risk of social isolation and the loneliness among elderly which causes low self-esteem. Several reports have shown that positive emotional experience through intergenerational exchange with children is positively associated with the development of self-esteem of elderly. However, very few studies have investigated the mechanism.

Objective

The objective was to construct an Intergenerational Exchange Emotional Scale (IEES) for elderly to measure the degree of positive emotional experience through intergenerational exchange with children, and investigate the association with self-esteem of elderly.

Methods

In 2014, we conducted survey among local residents in Kanagawa Prefecture in Japan. 2,500 residents, aged 20–84 years, were randomly selected from the basic resident register. Of these, 978 residents responded the survey (39.1%). Finally, the data of 275 residents (over 65 years) were analyzed. Self-esteem was measured by the Two-Item Self-Esteem scale (TISE). As for IEES, we gathered episode on positive emotional experience of intergenerational exchange through interview research for 47 elderly, and constructed 9 items of Index.

Results

Factor analysis show that IEES consisted of 3 factors: approval feeling(AF), self-sufficiency feeling, (SSF) and self-enhancement feeling(SEF). Furthermore, structural equation modeling clarified that AF and SSF have positive effect and SSF have negative effect on self-efficacy of elderly($P < .05$). The model fits the data well ($X^2(80)=131.4, p=0.0$; CFI=.95, RMSEA=0.5).

Discussion

Based on the results, it is important to experienced approval feeling and self-enhancement feeling through intergenerational exchange with children to develop the self-efficacy.

THE FUMANET EXERCISE PROGRAM TO PREVENT AND POSTPONE DEMENTIA—A CROSS CULTURAL COMPARISON

M. Tanaka¹, A.D. Wilson¹, K. Kitazawa², F. Yata¹, 1. Faculty of Nursing and Nutrition, Yamaguchi Prefectural University, Yamaguchi, Yamaguchi, Japan, 2. Hokkaido University of Education, Kushiro, Japan

This research investigates the use of the Japanese FumaNet Exercise Program in Hawaii, to investigate its use as a means of preventing or delaying dementia by providing an easy but challenging set of multiple tasks in an enjoyable atmosphere of community, as well as giving seniors an active role in teaching the activity.

Used in Japan for over 10 years, the FumaNet Exercise program takes advantage of Japanese group dynamics which encourages seniors to work in self-initiated groups to work together to promote health and prevent dementia in an enjoyable manner that can be easily continued for a long period of time in each community.

Results from a survey of 92 seniors in Hawaii participating in a sample class showed that while over 80% of respondents felt that the exercise was enjoyable, good for improving strength, good for improving psychological

health, and beneficial in strengthening informal social support networks, only 54% felt they would continue to participate in the FumaNet program on a regular basis.

While showing obvious popularity in Hawaii, the results for continuity were not as high as previous research in Japan, thus indicating the need for further research. In this globally aging society, seniors supporting seniors and seniors working together to maintain their health and longevity will become a vital necessity, and this exercise program is one effective step in “helping seniors to help others”.

VALIDATION OF DIFFERENT SUCCESSFUL AGEING CONSTRUCTS AND COMPARISON OF THEIR PREDICTORS

M. Thoma¹, L. Kleineidam², A. Maercker¹, W. Maier², M. Wagner², 1. Psychology, University of Zurich, Zurich, Switzerland, 2. Universitätsklinikum BONN, Bonn, Germany

The lack of consensus on what constitutes successful aging (SA) has triggered over 100 different operational definitions. This heterogeneity hinders the straightforward identification of modifiable predictors of SA. It remains to be clarified whether predictors of SA differ as a function of varying constitutes of SA and whether reserve models from dementia research can be used to predict SA. It was therefore the aim of the current study to replicate and validate existing SA constructs and compare their predictors in a German subsample of a prospective longitudinal multicenter study.

The sample consisted of 1995 individuals ($M_{AGE} = 83.9$ years; $SD = 3.36$; 66% females). Health-related parameters were measured repeatedly every 1.5 years over 12 years. Data assessed at follow-up 3 and 5 were used for current analyses. A confirmatory factor analysis (CFA) was performed to test whether different constitutes of SA, such as physical and cognitive health, functioning, well-being and social integration, form a uniform SA construct or represent separate aspects.

Preliminary analyses revealed that the best model fit could be achieved with a SA model that combines all SA constitutes (SA-ALL). If the SA model lacks the constitute for well-being, it showed a lower correlation with GP-rated health status. If the SA construct lacks constitutes for physical health, prediction of mortality over a three years period was significantly worse. Motivational reserve and age were significant predictors of SA-ALL and a pure physiological SA construct. Final results will be presented at the congress.

ACCELEROMETER PHYSICAL ACTIVITY AND SEDENTARY BEHAVIOR AND MORTALITY RISK IN OLDER WOMEN: THE OPACH STUDY

M.J. LaMonte¹, E. Rillamas-Sun², K.R. Evenson³, I. Lee⁴, J. Bellettiere⁵, D.M. Buchner⁶, C. Di², A. LaCroix⁵, 1. Epidemiology, University at Buffalo - SUNY, Buffalo, New York, 2. Fred Hutchinson Cancer Institute, Seattle, Washington, 3. University of North Carolina Chapel Hill, Chapel Hill, North Carolina, 4. Harvard University, Boston, Massachusetts, 5. University of California San Diego, San Diego, California, 6. University of Illinois Urbana-Champaign, Urbana-Champaign, Illinois

The consistently observed associations for self-reported physical activity (PA) and sedentary behavior (SB) with mortality

may be underestimated by exposure measurement error, especially in older adults. We examined accelerometer measured PA and SB with all-cause mortality in 6,385 women ages 63–91 followed a mean of 2.5 years. Vector magnitude counts/15-second epoch from hip worn triaxial accelerometers (required ≥ 4 of 7 days with ≥ 10 hr/day wear time) were used to define time in SB (0–18 counts/15 sec) and total PA (≥ 19 counts/15 sec; all intensities combined) based on cutpoints determined from a calibration study among similarly aged women. Cox regression was used to estimate hazard ratios (HR) and 95% confidence intervals (CI) for these associations. There were 271 (4.2%) deaths during 14,212 person-years follow-up. An inverse gradient in mortality rates was observed across incremental PA quartiles: 38.2, 16.5, 13.9, 8.5 per 1,000 person-years (trend, $p < .001$). Adjusting for accelerometer wear-time, age, and race, corresponding HRs (CI) for PA quartiles were 1.00 (referent), 0.50 (0.37–0.69), 0.52 (0.37–0.73), 0.36 (0.24–0.54), trend $p < .001$. Mortality rates for incremental SB quartiles were 10.5, 13.8, 23.1, and 29.3 per 1,000 person-years ($p < .001$). Corresponding adjusted HRs (CI) for SB quartiles were 1.00 (referent), 1.19 (0.78–1.82), 1.90 (1.29–2.81), 2.25 (1.53–3.33), trend $p < .001$. Preliminary additional adjustments for smoking, alcohol, comorbidities and measured physical functioning did not substantively change the pattern of association with mortality for PA or SB. Total PA and SB measured by accelerometry are associated with mortality in older women. Intervening on both behaviors could improve longevity at older ages.

MEANING OF LIFE AND PRESERVATION OF COGNITIVE ABILITIES: LINKAGE TO THE PLACE OF LIVING IN OLD AGE

A. Kaplan¹, H. Erel^{1,2}, 1. Behavioral Science, NAC, Netanya, Israel, 2. IDC, Herzliya, Israel

An old person's identity in the present decade is the identity of a person rejected by the society in which he lives, and one who society determined should abandon his social functions because of chronological age (Hazan, 1996). In such a situation, the question of meaning in life becomes central and dominant (Ryff, 2013). Our work presents a study combining quantitative and qualitative methodologies, which explore the effect of the nature of one's type of residence on a meaningful lifestyle and the capability to maintain cognitive abilities in old age. Based on the concepts of meaning, presented by Frankl (1946) and categorization performed by Fontana (1977), we created three levels of significance, which examined using multi-qualitative indicators. Along with these, performance capabilities were also examined with emphasis on cognitive inhibition, which is age-sensitive cognitive competence. The research was based on 60 participants who lived at home and another 57 living in different types of residential settings outside their home. Our findings indicate that there is dependence between the residential style and the ability to lead a meaningful life during old age. We found more people with high meaning among those who lived in their own homes, compared to others living in other residential settings. In addition, their inhibition capabilities were clearly better. Our work inspires new thinking about the appropriate style of living for elderly persons in a postmodern society, and thoughts on the importance of further integration into the existing social system.

SESSION 4565 (POSTER)

TECHNOLOGY AND AGING

HUMANIZING TECHNOLOGY FOR TELEREHABILITATION OF STROKE PATIENTS

C. Tan^{2,1,3}, V. Lou², G.C. Koh¹, 1. NATIONAL UNIVERSITY OF SINGAPORE, Singapore, Singapore, 2. The University of Hong Kong, Hong Kong, Hong Kong, 3. SIM University, Singapore, Singapore

Background: Telerehabilitation innovates rehabilitation of stroke patients in active aging context. With the growing need of healthcare workers in a tight labour market and rising demand for more effective means of rehabilitation which can improve patients' outcomes, there is a pressing need for modernized solutions. Such an improved approach which leverages on the widespread confluence of technology and service innovation can better alignment of financial incentives for both patients and service providers to promote wiser spending. The key element of telerehabilitation is a humanizing technological framework which the stroke patients and their caregivers enjoy the intuitiveness and friendly engagement of the solution.

Method: This paper will touch on the challenges and needs which are unique to stroke patients. For them to perform rehabilitation on their own with a new technological intervention. The system has been developed by a team of inter-disciplinary background with regular meetings, seamless communication and continuous revisions from patient trial and feedback before the formal implementation. It consists of an iPad for Facetime with therapists and motion sensors to track the patients' movements.

Findings: The system was found to be user friendly with high level of cognition. The design of technology, the user interface, and its seamless integration into the patients' rehabilitation regime, illustrating the need to consider human factors in system design and implementation from the perspectives of practitioners, systems team and eventually, the policy makers.

Implications: The effectiveness of telerehabilitation will depend a lot on humanizing the technology, including its user friendliness and cognition.

PROMOTING MENTAL WELL-BEING AMONG OLDER PEOPLE: AN EVIDENCE REVIEW OF TECHNOLOGY-BASED INTERVENTIONS

A.K. Forsman¹, J. Nordmyr¹, T. Matosevic², A. Park², K. Wahlbeck³, D. McDaid², 1. Åbo Akademi University, Faculty of Education and Welfare Studies, Developmental Psychology, Vaasa, Finland, 2. London School of Economics and Political Science, Personal Social Services Research Unit, London, United Kingdom, 3. Finnish Association for Mental Health, Helsinki, Finland

Given a changing demographic landscape, the promotion of older adults' wellbeing and independence is a public health issue. In recent years, the potential of technology-based resources for the promotion of wellbeing in later life has been highlighted. This systematic review analysed the effectiveness of technology-based interventions for the promotion of mental wellbeing among adults aged 65 and over

without extensive health or social care needs. The data originates from an evidence review project commissioned by the National Institute for Health and Care Excellence (NICE) in the UK on the effectiveness of different actions to promote the mental wellbeing of older people. Systematic searches were performed in 8 bibliographic databases. Publications from the period 2003 onwards were considered. From the original review data material, 25 intervention studies were selected for this review, covering technology use for educational purposes, computer/internet exposure or training, telephone/internet communication, or computer gaming. The number of studies employing an RCT design and looking at comparable outcomes was low, resulting in the strength of the evidence being moderate and somewhat inconsistent. When considering the six studies with higher quality ratings, four of them - all focused on computer/internet training - reported significant favorable effects on one or several outcomes among intervention recipients (e.g. increased life satisfaction, experienced social support). While the review results highlight a lack of methodologically rigorous studies evaluating the effects of technology-based interventions for optimal ageing, they also present promising examples of effective interventions that can serve as best practice examples in this emerging field.

TELEHEALTH INTERVENTION FOR MOOD AND CHRONIC ILLNESS IN OLDER HOME HEALTH PATIENTS: RANDOMIZED TRIAL

Z. Gellis¹, B. Kenaley², 1. *University of Pennsylvania, Philadelphia, Pennsylvania*, 2. *Boise State University, Boise, Idaho*

Approximately 25% of older home health patients with chronic diseases are readmitted to hospital within one month of discharge underscoring health system challenges. Depression is highly prevalent among older adults with chronic diseases. Delivering telehealth services may provide an effective approach to improving outcomes and reducing readmissions by monitoring physical and mental health symptoms, increasing communication with primary care, and delivering evidence-based depression care. This is the first study to report the results of a randomized trial of I-TEAM© (Integrated Telehealth Education and Activation of Mood), a telehealth nurse-delivered intervention model for chronic illness and co-morbid depression vs nurse-delivered in-home health care augmented with psychoeducation. The 3-month intervention included telemonitoring of biometrics, problem-solving treatment for depression, and communication with the primary care physician for antidepressants. The two groups were compared at baseline, 3, and 6-months post-baseline on depression, health status, problem solving, self-efficacy, and health utilization (number of readmissions, patient episodes of care, and ER visits). At 3 and 6 months post-baseline, depression scores decreased by 50% in the I-TEAM group as compared to controls. The I-TEAM group reported significant improvement in problem solving skills and self-efficacy in managing their medical condition compared to controls. The I-TEAM group had significantly lower ER visits ($P < .03$) at 12-month post-baseline compared to usual care. Patients reported that telehealth services were feasible and satisfactory. After attending this activity, participants will be able to discuss the I-TEAM integrated

health and mental health model and associated benefits with telehealth technology services.

ACTIVE AGING AND INTERNET USE: DOES INEQUALITY EXIST ACROSS AREAS AND OLDER ADULTS?

H. Hsu, H. Tung, J. Wang, S. Hsu, S. Chuang, *Department of Health Care Administration, Asia University, Taichung, Taiwan, Taiwan*

Purpose: Internet use is one indicator of active aging index, which represents the opportunity to social connection social participation, learning, receiving information and service application. The study was to examine the internet use and area difference and related individual factors for the middle-aged and older adults in Taiwan. **Methods:** The data were from the 2013 Digital Divide Survey (Middle-aged and Elderly Adults), with $n=7157$ persons. The samples were drawn from the middle-aged and older adults aged 50 years old or more population. The interviews were collected by telephone in 2013. Descriptive analysis, Chi-square test, and generalized linear models with binary logistic response were applied. **Results:** There were 43.0% of the participants using internet. The participants who lived in the towns with higher digital development and wealthier income cities/counties were more likely to use internet. Sex, age, education, income, and occupations (professions, housewives/unemployed/students, and retiree) were significantly different in internet use. For those internet users, 12.2% used instant communication app, 11.0% used social media, 35.4% used both, and 41.3% did not use any. Only 5.5% of the users expressed their political opinions online. For the internet users, being female, younger, higher educated, and working in service industry were more likely to use social communication or social media apps. **Discussion:** There were area- and individual socioeconomic inequalities in internet use for the current middle-aged or older cohorts in Taiwan. The structural barriers need to be removed to promote active aging.

THE INFORMATION AND COMMUNICATION TECHNOLOGIES UTILIZATION PATTERNS AND CHANGES IN SELF-RATED HEALTH

J. Jeon¹, B. Kim², K. Cox², M. Kimura², 1. *Eastern Connecticut State University, Willimantic, Connecticut*, 2. *University of New Hampshire, Durham, New Hampshire*

Objective: Information and communication technologies (ICT) has increasingly become a major resource for individuals improving their health-related quality of life. This study aims to identify ICT utilization patterns among middle- and old-aged adults, and to examine how these patterns influence self-rated health.

Methods: We used 2012 and 2014 Health and Retirement Study, a nationally representative sample of Americans aged 51 and older. Our sample was restricted to individuals who responded to questions about technology use asked to a subsample of 2012 interviews ($N=1,504$). Latent Class Analysis were used to identify ICT utilization patterns based on the use of email, social networking sites, online video call, instant messenger, smartphone, exercise equipment, health monitoring device, and online health information. OLS regressions were used to examine the effects of ICT utilization patterns at the baseline on self-rated health at the follow-up.

Results: Four ICT utilization patterns such as multifarious (16%), ecommerce-oriented (13%), fundamental (29%), and minimal users (41%) were identified. Even after controlling for socio-demographic attributes and health conditions, multifarious users were most likely to have better self-rated health, and minimal users tended to have the worst self-rated health overtime. Compared to ecommerce-oriented users, fundamental users had worse self-rated health.

Discussion: This study demonstrated different ICT utilization patterns, positive effects of various ICT utilization, and the advantages of ICT utilization among middle- and old-aged adults. Improving ICT access and education programs will help to improve health outcomes among middle- and old-aged adults.

ACTIVITY MONITORS TO ASSESS EFFECTS OF MEDICATIONS ON OLDER ADULTS-USABILITY TESTING

N. Thompson, I. Maravilla, S. Garrigues, K. Patel, C.S. Ritchie, *University of California San Francisco, San Francisco, California*

The optimal ways to use “wearables” and assess them in older adults has not been fully delineated [TOPIC]. We sought to test the usability of an accelerometer. [RQ]. Healthy older adults over 65 years with no more than one chronic disease were invited to use an accelerometer at home for 5 days and take part in a follow-up focus group (FG). Participants were trained on wearing, charging and handling of the accelerometer and charging dock. The semi-structured focus groups utilized a usability conceptual framework and were conducted using “think aloud” interviews. The FGs were audio recorded and analyzed, looking for themes related to usability in the context of aging [Methods]. Ten (10) older adults (age range 65–91 years, mean 76.7, SD 7.9) were trained in the wearing and charging of the accelerometer. Of the ten (10) devices tested, two were lost when the waist clip came off and one stopped collecting data due to charging dock issues. During the cognitive interviews, two themes emerged: wearability and process. Wearability themes were: comfort of monitor on waist and the challenge of keeping the monitor attached. Process themes were: challenges associated with charging the monitor and the high dexterity needed to manipulate the accelerometer [Results]. **The feasibility testing indicated that the accelerometer used was not adequately adapted to the users’ strength and dexterity to be worn. [Conclusions]. Usability testing for “wearables” in older adults must take into account specific physical challenges more common in older adults.**

A SYSTEMATIC REVIEW ON APP-BASED INTERVENTIONS RELATED TO ALZHEIMER’S DISEASE OR DEMENTIA

W. Tang, *College of Social Work, University of South Carolina, Columbia, South Carolina*

Hundreds of smartphone applications are available to support people with Alzheimer’s disease or dementia (AD/dementia) and their caregivers. Smartphone applications may provide a unique and effective means of administering interventions. The purpose of this study was to systematically search and describe the literature on mobile apps used

in interventions on AD/dementia and to evaluate the potential of apps to be implemented in AD/dementia interventions.

A systematic review was conducted in April 2016 using a set of predetermined search terms in several scientific journal databases. Only English articles pertaining to interventions using smartphone apps were included in the final sample. App functions, target user groups, country, app platform and study design were coded for each study in the final sample.

A final sample of 11 studies identified for this review were primarily feasibility and pilot studies with small sample sizes. Studies were mostly conducted in Europe, with Android being the preferred platform. Functions of the mobile apps mainly focused on occupational therapy to support people with AD/dementia, and cognitive assessment to allow early screening of cognitive impairment.

Findings of the review provide support for the use of app-based interventions on AD/dementia. The lack of large sample studies with rigorous research design using mobile phone apps may signal a need for additional studies on the potential use of mobile apps to assist individuals with mild or moderate AD/dementia, their family caregivers and health professionals. Additional concerns include the reliability and validity of cognitive assessment tool administered by mobile apps.

DIABETES EDUCATION AND INTERGENERATIONAL TECHNOLOGY TRANSFER

C. Senteio^{1,2}, D. Hershey², T. Campbell³, 1. *Library and Information Science, Rutgers University School of Communication and Information, New Brunswick, New Jersey*, 2. *Michigan State University, East Lansing, Michigan*, 3. *YOUR Center, Flint, Michigan*

This paper will describe how the implementation of an intergenerational diabetes and technology knowledge transfer program, which utilized a proven intervention for increasing health literacy for HIV/AIDS, resulted in: 1) participants’ increased health literacy and self-efficacy for diabetes self-management (DSM), and 2) intergenerational technology knowledge transfer for the skills necessary to access health information to support DSM. There are 2 groups of participants: 1) African Americans aged 65 or older diagnosed with type 2 diabetes and, 2) adolescents aged 18 – 25 connected to the diabetic participants via family or social-relationships. The 2 project sites were located in Flint and Detroit, Michigan.

The paper chronicles a research approach to improve DSM by accessing, then enhancing the technology skills necessary to use digital resources. The approach was informed by the potential to use intergenerational technology skills transfer for DSM, which represents 80% of recommended diabetes management and have been shown to improve self-efficacy, knowledge, and adherence to prescribed regimens. Across various settings, intergenerational technology transfer activities increase learning for both adolescents and older adults.

The paper describes the current level of digital knowledge, technology readiness, and self-efficacy for African Americans aged 65 or older, with respect to DSM. Further, we will describe the impact African American adolescents have on older African American’s perception of relevance, knowledge, and self-efficacy concerning digital skills, access, and resources that can support DSM. This paper discusses

the targeting of a very important research problem, addressing health disparities by enhancing DSM skills via intergenerational technology transfer.

IPAD USE AMONG OLDER WOMEN WITH LOW VISION: FOLLOW-UP FOCUS GROUP FINDINGS

S. Smallfield¹, J. Kaldenberg², S.E. Berger², 1. *Program in Occupational Therapy, Washington University in St. Louis, St. Louis, Missouri*, 2. *Boston University, Boston, Massachusetts*

There is a growing need for older adults with low vision to use mainstream technology to enhance performance of daily activities and social connectedness. The purpose of this presentation is to describe the findings of a qualitative focus group examining the long term use of the iPad by older women with vision loss who, 22 months prior, received small group iPad instruction to enhance the performance of daily activity and social engagement. Five older women (mean age: 70.2 years) with moderate to severe visual impairment participated in the focus group. They reported using the iPad a mean 4.3 hours per day [range: 1–8 hours]. Key applications and accessibility features that were used most often include email, the camera, applications for listening to or reading books, the alarm, and access to the Internet for general information gathering. Participants consistently reported that the initial instruction in the use of the iPad and ongoing integration of it into daily activities has decreased social isolation and depressive symptoms while increasing sense of purpose, connection to others, and empowerment. As one participant stated, “the iPad gave us hope to come out from the dark”. Features of this iPad training course that were instrumental in teaching and sustained use of the iPad to enhance daily activities include a structured class format, group instruction, and teaching strategies that maximized use of remaining vision. Access to the use of tablet technology by older adults with vision loss and issues related to health disparities will be discussed.

NEW MEDIA AT OLDER AGES: EVERYDAY CHALLENGES

K. Quinn¹, R. Smith-Ray², 1. *Communication, University of Illinois at Chicago, Chicago, Illinois*, 2. *University of Illinois at Chicago, Chicago, Illinois*

Social well-being is important to cognitive health, but maintaining social relations often becomes more difficult in later life due to retirement, chronic disease, and the death of spouses and friends. Social media platforms, such as Facebook and Twitter, are accessible and relatively low cost communication technologies that enhance feelings of social connection and reduce loneliness. Yet, usage and adoption of these platforms remains low among older adults, in part due to challenges in deploying them for everyday use. Using data gathered in two focus groups (n=16), participant observation of six four-week social media training workshop interventions (n=47), and two post-workshop participant debriefing sessions (n=14), we investigate the attitudinal and practical challenges associated with social media adoption at older ages. As prior studies suggest, we find that age-related declines in physical and cognitive abilities and reduced perceptions of benefit inhibit the use of these media, especially when using the small mobile devices

for which they are designed. Importantly however, we find that social factors, such as the under-valuation of weak and informational relationships or token levels of social reinforcement, and insufficient conceptual knowledge related to the internet and platform interoperability significant impair older adults' ability to deploy these media in everyday contexts. We conclude with practical strategies to assist older adults in gaining social media competence and suggest ways in which these findings might be applied in training older adults to use other communication technologies and applications.

POLICY PRACTICE OF TECHNOLOGY FOR SENIORS AT WORK IN A SINGAPORE HOSPITAL: A QUALITATIVE STUDY

T. Tan¹, K.K. Mehta², 1. *KK WOMEN'S AND CHILDREN'S HOSPITAL SINGAPORE, Singapore, Singapore*, 2. *SIM University, Singapore, Singapore*

Singapore is facing a rapidly ageing population. In 2015, the band aged 65 years and above was about 13% of the total population, and this is likely increase to approximately 20% by 2030. There are policy and practice implications for an ageing and diverse workforce adopting new technology. Studies show that prior experience with information technology at work can boost literacy and self-efficacy in adapting to technological change. This paper uses mixed methods research design to examine the effects of social-cultural capital on technology adoption, as opposed to economic and bodily capital in Bourdieu's Practice Theory. Fourteen focus group discussions each consisting of 7–12 participants aged 55–75 years, were conducted to identify the issues relating to information technology. The findings are triangulated with a case study in a Singapore hospital focussed on E-portering smartphone application by 44 porters. The median age of the porter sample was 53 years and they had an average of 8 years basic education. This case study examines the experimental implementation practice of incremental adaptation to technology adoption. Starting with basic touch-screen smartphone for basic operational use; advancing to e-portering application for smart use; and eventually using smartphone torchlight and facetime applications for operational contingency use. The consolidated findings showed that support and learning at workplace and from social networks were critical factors motivating seniors to adopt technology experientially and incrementally. The paper concludes with implications and recommendations for policy implementation and practice of adopting and adapting information technology for seniors.

ACCEPTANCE OF WEARABLE TECHNOLOGIES BY OLDER PEOPLE: FINDINGS FROM A SYSTEMATIC REVIEW

A. Schlomann, C. Rietz, *University of Cologne, Cologne, Germany*

New digital media and wearable technology are gaining in importance in everyday life. Facing ageing societies there is a growing need to understand how those devices are accepted by older people. There are various models aiming to explain technology acceptance (e.g., TAM, UTAUT). Those models were developed in a time before digitization. It is therefore

unanswered how those models can be utilized to predict acceptance of wearable technologies and whether their application in the target group of older people is reasonable.

We conducted a systematic literature review to provide a comprehensive overview about research in the field of wearable technology acceptance by older adults. Our aim was to identify relevant factors in this context. Considering quantitative and qualitative research, Web of Science, MEDLINE, and Psycinfo were searched. Data extraction focused on the operationalization of outcome variables and determinants of acceptance.

28 out of 635 identified articles were judged as relevant. The majority either did not refer to a theoretical model or was based on the classic TAM. As a result, behavioral intention was the most commonly analyzed outcome variable. In the synthesis of data, we identified different clusters of determinants, including technology-, person-, and environment-related factors. A common research approach was to extend existing models of technology acceptance by adding other determinants of acceptance depending on research interest and context. As a result, the models often only apply to single use cases under specific conditions. Based on this we claim for new parsimonious models which rethink the conceptualization of acceptance.

TECHNOLOGY ADOPTION AMONG OLDER ADULTS: RESULTS FROM ENGLISH-AND SPANISH-SPEAKING FOCUS GROUPS

R.W. Berkowsky, S.J. Czaja, J. Sharit, J. Taha, M.A. Hernandez, *Psychiatry and Behavioral Sciences, University of Miami Miller School of Medicine, Miami, Florida*

There exist a number of technology applications with the potential to improve the quality of life of older adults (aged 65+) across numerous domains including transportation/mobility, health/wellness, socialization/communication, recreation, lifelong learning, and home support. However, despite the potential rewards use of technology applications can provide, older adults are less likely to adopt new and emerging technologies. We propose a model for technology adoption and investigate the potential factors associated with adoption specifically among older age groups. Our study is a two-phase study focusing on identifying factors associated with technology adoption among older adults (including the “oldest old”) and understanding the decisions older adults make when choosing or not choosing to use a technology. This presentation summarizes and presents results from the first phase of the study which involved six focus groups. Focus groups were conducted where groups of 8–10 participants were introduced to a variety of new and emerging technologies (nine technologies total) through formal presentations. Participants were asked to rate the technologies on such factors as perceived value, effort to learn, need for and availability of assistance in learning, willingness to pay, and privacy concerns, among others; after the ratings were complete, participants then informally discussed the advantages and disadvantages of each technology. In this presentation we discuss factors identified in these focus groups as significant predictors of technology adoption and discuss differences among participants on variables such as age, language/culture, technology experience, and self-assessment of

abilities. We also present data on identified challenges and barriers to technology adoption.

THE QUANTITATIVE ANALYSIS OF MULTIMODAL COMPREHENSIVE CARE BASED ON VIDEO ANALYSIS TECHNOLOGY

S. Ishikawa¹, M. Honda², Y. Takebayashi¹, Y. Gineste³, 1. *Shizuoka University, Hamamatsu-city, Shizuoka, Japan*, 2. *Tokyo Medical Center, Meguro-ku, Tokyo, Japan*, 3. *Instituts Gineste-Marescotti, Perpignan, France*

There is social concern about rapid increase of people with dementia. One of triggers of behavioral psychological symptoms of dementia (BPSD) is inappropriate care by caregivers. The development of adequate training system for professional caregivers is crucial. Previous study showed multimodal comprehensive care methodology Humanitude; which consists with verbal and non-verbal comprehensive structured communication skills, has shown significant improvement of BPSD in long-term care facilities in Japan. Following this result, a quantitative study of dementia care using video analysis was conducted. Informatics researchers created a tool of multimodal behavior analysis system, which supports 1) video annotations, 2) visualization of annotation data, 3) quantitative analysis, 4) create a query of expert's interpretation. Four professional caregivers enrolled the study. Two caregivers were trained for Humanitude as intervention arm, and others applied conventional care as control arm. Caregivers in both arms provided care to the same residents in a nursing home. While control arm failed all the care due to refusal by the residents, the care to the same residents by intervention arm were calmly accepted. The cares were video recorded and analyzed. The elements performed during the care was eye contact 0.0%, verbal communication 28.4%, and touch 0.2% in control and 12.5%, 54.8%, and 44.5% in intervention arm, respectively. The average of positive attitudes during care was 0 in control and 35 in intervention arm. In conclusion, this quantitative analysis system can be used as objective description of cares and contribute to educations for caregivers to improve the quality of care.

THE IMPACT OF SELECTIVE PARTICIPATION IN EHEALTH RESEARCH ON INEQUALITY AND EXCLUSION IN OLD AGE

A. Poli, M. Abramsson, A. Motel-Klingebiel, *Department of Social and Welfare Studies (ISV), Linköping University, Norrköping, Sweden*

High expectations and large investments support research on innovative solutions for health delivered via information and communication technologies (ICTs). Several studies demonstrated promising results confirming the potentials of ICT-based tools for self-care in improving the quality of life of older people with long-term conditions and their family caregivers. However, a crucial gap between a tool tested as successful and its implementation exists. In this respect, little attention has been paid to the impact of selective participation on the development and evaluation of ICT-based tools and the subsequent consequences on their deployment. A transverse analysis on social selectivity has been conducted in four randomized controlled trial (RCT) studies in Sweden, testing different ICT-based tools for self-care addressing older people and family caregivers. The analysis is based on

multivariate quantitative modeling in a multi-step and -level perspective and aims at quantifying effects of selective sampling and study participation. Preliminary results suggested some social selectivity biases are possible in the research process between end-users involved in the studies and those who were excluded, particularly in relation to level of educational attainment, familiarity with technology and perception of usefulness of ICT-based tools, as well as level of dependency of older patients. Several challenges face research and the implementation of eHealth, among which is the risk of exacerbating disadvantages and social exclusion for some groups. In order to promote better outcomes of eHealth studies and contribute to successful implementations and equal provision of services, it is essential that research considers the diversity of individuals targeted.

FACTORS IMPACTING ON OLDER AND YOUNGER PEOPLES' PERCEPTIONS OF ELDERLY ROBOT USERS

S. Baisch, T. Kolling, M. Knopf, *Goethe University Frankfurt am Main, Frankfurt/Main, Hessen, Germany*

Elders have been reported to distance themselves from robot user groups when attributing negative age-related characteristics to these elderly users. The extent to which robots elicit such negative age-related user perceptions in elders might be due to robot design, whereas interindividual differences in elders' user perceptions could be due to differences in elders' general images of ageing (IoA). Moreover, as IoA are known to vary with age, older and younger people are likely to differ in their user perceptions. To investigate these assumptions, an online experiment was conducted, in which three emotional robots (Pleo, Paro, Zoomer) were introduced to $N = 93$ participants by film and text. Participants' perceptions of the prototypical elderly robot user were assessed regarding core dimensions of social perception, i.e., competence (e.g., health-related and psychosocial functioning) and warmth, followed by assessment of IoA. The results show a significant effect of robot design, indicating that excessive cuteness (i.e., in Paro) could negatively stereotype elderly robot users. Perceptions of elderly robot users also differ regarding positive IoA and age: Elders with low positive IoA attributed worst health-related and psychosocial functioning to robot users, whereas younger as opposed to older participants perceived elderly robot users as warmer, independent of IoA. No effect of negative IoA was observed. Consequentially, age differences, differences in positive IoA, and robot design could contribute to disagreement on robot use between caregivers or robot developers, and elders. Thus, elders' ageing stereotypes have to be considered thoroughly in order to successfully develop and implement robots in eldercare.

SOCIAL NETWORK AND GENERATIVITY: THE EXPERIENCE PROGRAM OF ELDERLY ONLINE

G.M. Carvalho, *Universidade Federal de Ouro Preto, Ouro Preto, Minas Gerais, Brazil*

The Elderly Online project is a digital inclusion space for seniors that allow the meeting intergenerational and generative actions. This study tried to identify the indicators in old age and the possible impact and repercussions generated by the network of social relations participants to participate in this workshop. Applied a Sociodemographic questionnaire,

a semi structured questionnaire on the use of computer and Generativity Scale. The Treatment and analysis were performed using the program use SPSS. The results show that most participants are women over 70, and with incomplete primary education. On the generative actions of twenty items Scale six statistically significant differences between the means of two surveys carried out (before and after the participation in Module III), 1. *I have developed actions that have had an impact on other people*; 2. *I think that will be remembered for a long time after death*; 3. *Seeking to share and teach others what I can do*; 4. *others say that I am very obliging*; 5. *People come to me for advice*; 6. *I feel I have done nothing that will survive my death*. Most of the participants (95%) have home computers with internet access and were interested in news, research and fun. It was found that these tools played an important role in the lives of older people as a source of communication, ease to rescue their life stories and establish new social support networks, virtual mode.

USING IPADS TO PROMOTE PATIENT SAFETY AND REDUCE STAFF INJURIES IN DEMENTIA CARE

L. Hung¹, C. Helmer², A. Au-Yeung², L. Elijah², C. Bartkovsky²

1. *Nursing, University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Vancouver General Hospital, Vancouver, British Columbia, Canada*

Background: The changes associated with dementia can lead to mood alterations and behavioral and psychological symptoms of dementia (BPSD). BPSD are common, affecting up to 90% of persons with dementia over the course of their illness. Not only do BPSD cause distress for the patients with dementia, but also place hospital staff at risk for injury. This project examines whether using an iPad to play a video purposely created for the patient by his or her family may contribute to preventing and reducing BPSD of patients with dementia.

Methods: We used a single case study design and mixed methods. With an ABAB withdrawal design, a patient was observed in four phases, A_1 (baseline, no intervention), B_1 (intervention), A_2 (withdrawal, no intervention) and B_2 (intervention again). Also, we conducted staff interviews and video analysis to investigate contextual factors and staff experiences.

Results: Our preliminary findings support positive effects of the intervention. Staff described the benefits and barriers of integrating iPad into everyday care activities on the hospital unit.

Conclusions: This research contributes to the knowledge base of using technology (iPad) as a non-pharmacological intervention in dementia care. The iPad has great potential to be a safe, easy and low cost solution for supporting patient safety and reduction of staff injuries in clinical settings.

SESSION 4570 (POSTER)

TECHNOLOGY AND ROBOTICS

MOBILE HEALTH INITIATIVES IN GERIATRICS: THE NEEDS, ATTITUDES AND EXPECTATIONS OF OLDER INDIANS

G.R. Desai¹, S. Singh², P. Chatterjee¹, A.B. Dey¹, 1. *Geriatric Medicine, AIIMS, New Delhi, New Delhi, India*, 2. *JNU, New Delhi, New Delhi, India*

mHealth is a novel and promising tool to improve and support effective care for the elderly. However significant challenges remain, primary of which are the older individuals resistance to and suspicion of modern technology. It is therefore imperative to modify and adopt mHealth technology after understanding the needs and attitudes at a local level. We carried out a study based on a specially designed questionnaire to assess the needs among 260 elderly individuals from both the outpatient department at AIIMS and the community settings in Delhi. The study is ongoing and preliminary analysis of 75 elderly individuals revealed certain trends. Around 90% of the individuals either owned a mobile phone or had accessibility to one. Nearly 70% of the individuals had a favorable attitude towards mHealth services. The mHealth services preferred were Health services (appointments etc), educational content and social isolation and security (in that order). Amongst the medical issues; Dementia, Cancer and visual loss were their greatest fears. The most preferred medium for service delivery were telephone calls followed by SMS and social media. Among the more important factors associated with support of mHealth services were lower education status, lower middle class, ownership of a mobile phone and regular users of mobile internet. To conclude, preliminary analysis has revealed a favorable trend in terms of both mobile phone usage and attitudes towards their use in healthcare. This can promote further “mAgeing” strategies in future.

IMPROVING USABILITY AND SAFETY OF WALKERS THROUGH THE DEVELOPMENT OF A SMART WALKER FOR OLDER ADULTS

B. Lester, S. Wolter, C. Johansson, *Elon University, Elon, North Carolina*

With an increasing percentage of our population entering the 65-and-over demographic in coming years, assistive technologies are more important than ever. Enhancing and promoting the autonomy of the elderly can be accomplished in part through the development of such product. We report on the development of a smart rolling mobility walker employing a user-centered design process whereby users and other potential stakeholders are integral in all stages of the creation of the product. During each stage of the design process, the researcher met with older adults, some of whom used walkers and some of whom did not, and a team of retirement community administrators, physical therapists, and occupational therapists. The overarching outcome of this research examines opportunities that exist for integrated smart devices for enhanced user mobility and safety. The smart elements of the walker, prototyped using programmable microcontrollers and sensor devices, include a gyroscope that detects declination angle and passive infrared (IR) and acoustic sensors that detect user position relative to the walker. The gyroscope controls application of friction to the rear wheels by way of stepper motors to aid in safe movement when going downhill, while the IR and acoustic sensors provide feedback for safe user position using auditory and visual cues. We also report on functional changes to our smart walker including retractable seating, changeable

handle positions, and multi-directional folding. We focus on integrated functionality such as wheel locking when the seat is deployed, eliminating the need for users to manually lock the loop breaks.

CONNECTING GENERATIONS THROUGH TECHNOLOGY: EVALUATING OLDER ADULT AND STUDENT MENTOR PROGRAM OUTCOMES

S.N. Leedah¹, H. Kotzian², E. Estus³, M.S. SerenyBrasher⁴, S. Clark⁵, T. Bishal², B. Rusnak⁶, 1. *University of Rhode Island, Human Development & Family Studies Department, Kingston, Rhode Island*, 2. *Cyber-Seniors: Connecting Generations, Toronto, Ontario, Canada*, 3. *University of Rhode Island, College of Pharmacy, Kingston, Rhode Island*, 4. *University of Rhode Island, Sociology & Anthropology Department, Kingston, Rhode Island*, 5. *University of Rhode Island, Psychology & Gerontology, Kingston, Rhode Island*, 6. *Best Part Productions, Toronto, Ontario, Canada*

Cyber-Seniors®: Connecting Generations is an international, intergenerational program that connects college students and/or high school students with older adults. The program helps older adults learn to use technological devices and programs while providing students valuable skills in teaching and communicating. Four programs implemented the program from January-May 2016 at various settings including a 4-year university, volunteer agency, boys and girls club, and a career technical center in Rhode Island, Florida, Washington DC, and Michigan, respectively. All student mentors and older adult participants completed pre- and post-surveys that included both quantitative and qualitative questions. University students also maintained in-depth observation logs of their sessions and completed reflection papers based on their experiences. This enabled the gathering of in-depth qualitative data about the program and the experiences of those involved. Preliminary quantitative (e.g., paired *t*-tests) results show that older adult participants reported higher social engagement scores ($t=-15.35, p<.001$) and improved social isolation scores ($t=-7.94, p<.001$) following program participation. Nearly all student mentors (between 85–93%) reported learning about helping others, gaining communication skills, and learning to be patient with others. Rich qualitative data shows that the program helped to break down negative generational stereotypes and reduced the generation gap, and that all involved particularly valued the personal bonds and relationships that develop. This program is sustainable and transferable, and it is currently being implemented in locations across North America. It is particularly beneficial for educating future health and human services professionals who will increasingly be serving and interacting with older adults.

TECHNOLOGY DEVELOPMENT FOR THE WAY THAT WE ARE: COMMUNITY BASED HOLISTIC INDIGENOUS ELDER ENGAGEMENT

K. Pitawanakwat¹, L. Jones^{2,3}, M. Blind^{2,3}, K. Jacklin⁴, W. Warry^{2,3}, 1. *Wikwemikong Health Centre, Wikwemikong, Ontario, Canada*, 2. *Laurentian University, Sudbury, Ontario, Canada*, 3. *Centre for Rural and Northern Health Research, Sudbury, Ontario, Canada*, 4.

Northern Ontario School of Medicine, Sudbury, Ontario, Canada

AGE-WELL NCE is a Canadian centre of excellence dedicated to improving quality of life for older adults. The Rural/Remote and Indigenous Technology Needs Exploration (RRITE) is a multisite AGE-WELL project with research sites in Saskatchewan and Ontario, Canada. The Indigenous research explores how older Indigenous adults with dementia might be supported, through technology, to age in place. Using a combination of Indigenous research methodologies and community-based participatory action research, the research teams work continually, from proposal to dissemination, with community advisory groups to develop, direct and refine the research process. Advisory groups are composed of health care providers and Indigenous people with lived experience, as well as Elders. This multisite study considers qualitative data from focus groups and interviews with older Indigenous adults, their family members, care providers, and natural helpers from First Nations communities in Ontario and Saskatchewan. This paper presents the results related to technology needs, the accessibility of assistive technology within Indigenous communities, and the role technology may have in fulfilling the health and social needs of older Indigenous adults in Ontario and Saskatchewan. Understanding the unique needs of Indigenous older adults and their communities can lead to the development of culturally safe and appropriate cognitively assistive technology, which can greatly add to the literature on prevalence and perceptions of assistive technology use by Indigenous people.

LIFE SITUATION TYPOLOGIES AS BASIS FOR PARTICIPATORY DIGITAL NEIGHBORHOOD PLATFORM DEVELOPMENT

M.G. Grates, M. Vukoman, A. Kotschate, A. Kroen, H. Ruessler, *Applied Social Sciences, University of Applied Sciences and Arts Dortmund, Dortmund, North Rhine-Westphalia, Germany*

The neighborhood people live in as well as the existence of neighborhood networks can have a crucial impact on their quality of life. These neighborhood networks can be complemented and strengthened by digital neighborhood platforms, which additionally can enable people with mobility limitations to participate in social life and live self-determinedly. Therefore, the trans-disciplinary research project "QuartiersNETZ" ("Neighborhood NET") aims to develop networks and digital platforms in four urban neighborhoods in the Ruhr area in Germany. User participation in technology development processes has become more important. However, these involved users are often not representative of the heterogeneous potential user groups so that the actual circumstances and requirements are not met. To overcome this problem the project has explored different life situation types. On the basis of a representative survey within the case study neighborhoods with a random sample of in total 4,000 residents aged 50 years and older (response rate 29.7%, N=1,186) a hierarchical cluster analysis was conducted. Eight life situation types were identified based on the following characteristics: socioeconomic status, health, social relationships and housing conditions. In a next step, local actors selected three to four representatives for each cluster who were willing to participate in the digital platform development process. Qualitative interviews were

performed in order to get to know their challenges and thus generate authentic requirements. Furthermore, the participants are involved in the iterative platform evaluation process. The significant differences between the life situation types with respective specific demands emphasize that current technology development approaches need modification.

ROBOTS FOR THE ELDERLY? RESULTS FROM THE BERLIN AGING STUDY II WITH PERSONS OLDER THAN 60 YEARS

C. Fricke¹, S. Meyer¹, G. Wagner^{3,2}, *1. SIBIS Institute for Social Research and Technology Consulting, Berlin, Germany, 2. Max Plank Institute for Human Development, Berlin, Germany, 3. Berlin University of Technology, Berlin, Germany*

Our research focuses on the question of whether robotics could pose a promising strategy to support the independent living of elderly people whilst relieving relatives from their anxiety. Such a strategy could be the integration of robots into smart home environments.

The question arises of how elderly people perceive the potential of robotics. As part of the Berlin Aging Study BASE-II (Bertram, Lars et al., *International Journal of Epidemiology*, 2014) we have investigated elderly people's acceptance of robotics using a sample of participants aged older than 60 years (n=1463), as well as a comparative group of 20 - 30 year old participants (n= 241).

The complexity of the data gathered, encompassing detailed socio-economic background characteristics as well as personality traits (such as the personal attitude to risk, the locus of control and the Big Five), proves as highly valuable and beneficial. Results show that participants' expressions of resentment against robots are comparatively low considering, that participants' personality traits statistically have a significant impact on the acceptance of robots in the household.

Only 15 percent of participants encounter robots in the household with great scepticism. Participants aged older than 70 years, express greatest rejection of a robotic assistant, however the effect sizes account for only a few percentage points. Overall, a surprisingly great openness with regards to the usefulness of robots can be observed.

ROBOT COMPANIONS FOR STROKE THERAPY-THE ACCEPTANCE OF ASSISTIVE ROBOTICS AMONG 80 PATIENTS

S. Meyer, C. Fricke, *SIBIS Institute for Social Research and Technology Consulting in Berlin, Berlin, Germany*

In Europe 1 Mio persons suffer from stroke annually (Germany: ca. 262,000), strokes make up a total of 2-5% of health care expenditure. Current forecasts predict that the number of patients will continue to increase due to demographic changes. The need for innovative, effective and sustainable therapies, is growing enormously. The German ROREAS project aims to develop a self-directed training for stroke patients based on an autonomous robot companion who guides an independent gait-training program, encourage cognitive abilities and motivate self-paced exercise.

A number of thirty patients (N=30) tested the autonomously navigating robot-companion on the clinic floors; another fifty (N=50) had the opportunity to encounter

the robot in the context of group discussions. The project results show that both patients and fellow patients accepted the developed robotic trainer. The results show the acceptability of the use of robotic companions in rehabilitation clinics, about patient-specific fears vis-à-vis robots as well as about the factors that support the later introduction of robotic assistants on the patient's side. According to informants, the robot motivates patients to train independently and to leave their room, despite orientational difficulties, as well as encouraging patients to engage with robotic company and expanding their movement around the clinic. The robot seems to bridge the gap between therapeutically assisted training, independent training in the clinic and additional training at home.

A video presentation of this project is presented here: <https://www.youtube.com/watch?v=D7OpgPaLXCc>

PERCEPTION AND UTILIZATION OF TELEHEALTH SERVICES AMONG HOME HEALTH CARE AGENCIES: A NATIONAL SURVEY

E. Kim¹, Z. Gellis¹, R. Brennan², 1. *university of pennsylvania, Philadelphia, Pennsylvania*, 2. *National Association for Homecare and Hospice, Washington, District of Columbia*

Despite the widely known effectiveness of telehealth services in screening and treating both chronic disease and depression in older adults, their adoption among home health care agencies has been slow. This study examined home health care staff perceptions and use of telehealth for chronic disease and depression care among older patients. Five hundred and sixteen staff from member home health care agencies of the National Association for Homecare and Hospice (NAHC) completed an online survey. The survey comprised of 33 questions and was informed by the Unified Theory of Acceptance and Use of Technology Model. HHC agencies that reported using telehealth, telephone (63%) and remote-monitoring devices (56%) were the most utilized technology. Telehealth services included monitoring of health services (64%), chronic disease management (58%), and patient health education (43%). Overall, there was a positive perception towards telehealth for patient care. However, telehealth was perceived more positively for chronic disease management (90.7%) than for depression care (53%). A majority of participants (74%) reported having the knowledge necessary to use telehealth for chronically ill patients while only 32% did for depressed patients. Results suggest that although there is a positive perception towards telehealth for patient care, however, there are other factors (e.g. lack of resources and reimbursement, training and buy-in) that affect agencies' adoption of telehealth. Therefore, further education and training is needed to support telehealth use for depression care. Future studies may consider comparing existing telehealth programs and identifying policies and regulations that are supportive of such programs.

APPLYING KNOWLEDGE TRANSFER STRATEGIES IN THE DEVELOPMENT OF RESOURCES FOR OPTIMAL AGING

L. McDonald, A. Hussain, R.M. Mirza, A. Liu, M. Lamanna, S. Chaffey, M. Zerebecki, A. Cooper-Reed, *Institute for Life Course and Aging, University of Toronto, Toronto, Ontario, Canada*

Effective knowledge transfer (KT) of research findings into practical applications may allow users to make informed health decisions (Boström et al., 2012). Increasingly, KT strategies are utilizing technology and the digitization of health-related resources. Currently, little is known about KT within aging populations, specifically those that are in digital format. Using the *Conceptual Model of Knowledge Exchange* (Meagher et al., 2008) as a guiding framework, a multi-phase KT initiative was implemented to promote and evaluate paper and digital resources developed by the National Initiative for the Care of the Elderly (NICE). Results from the initiative's first phase indicate that ideas/recommendations from the tools were adopted by users (40%), the tools improved users' knowledge and understanding on the topic (42%), and information presented in the tools is often favoured over other resources providing similar content (60%). Results on the KT format indicate that both professionals/clinicians and older adults prefer the paper-based format of the resources. These findings suggest that the challenge for effective KT is to ensure that the digitization of KT resources does not outpace their adoption by end-users and key stakeholders. For KT to be successful, the process must include the development of evidence-based resources, include the perspectives of stakeholders, and be easy to apply in various settings. Given that little is known about KT with aging populations, the described initiative provides stakeholders serving this population with practical approaches for assessing the impact of their own digital KT initiatives.

ONLINE ACTIVITIES AND DETERMINANTS OF INTERNET USE AMONG ELDERLY PEOPLE

D.A. Reinwand¹, R. Crutzen², S. Zank¹, 1. *University of Cologne, Faculty of Human Sciences, Rehabilitative Gerontology, Cologne, Germany*, 2. *Maastricht University, Department of Health Promotion, Maastricht, Netherlands*

The Internet can be used as a source of information or support under highly demanding circumstances like those encountered in providing informal care. Informal caregivers are usually elderly people, and in order to provide tailored web-based support for this at-risk group a nuanced understanding of Internet usage among elderly people needs to be obtained.

We used data of the Dutch LISS panel from 2014 which includes people aged 65 and older ($M=72,0$ $SD=5,89$, $n=1565$). The panel is based on a true probability sample of Dutch households. First, with regard to 16 different Internet activities, it was assessed whether any difference could be observed in Internet usage among elderly people with and without caregiver obligations. Second, regression analysis was used to determine whether sociodemographic characteristics, satisfaction and amount of social contacts, and having caregivers' obligations determine Internet use.

Among participants aged 65+ we found significant differences with regard to information seeking, reading news, and playing online games between informal caregivers ($n=407$) and people without caregiving tasks. The regression analysis revealed that being younger, and being married are significantly positively related to Internet use, while having a lower level of education and providing informal care are negatively associated with Internet use.

As caregivers make less use of the Internet, further research must try to identify impeding and beneficial factors for Internet use in order to enable usage of online based information and interventions for informal caregivers with greater need of information and support

GOOGLE GLASS FOR OLDER ADULTS-A FIELD TEST EVALUATION

A. Steinert, M. Haesner, *Geriatrics Research Group, Charite, Berlin, Germany*

Google Glass is a wearable device, placed in eyeglass frames, operated by voice or touch. Therefore, an intuitive, hand-free operation of the device should be possible. Several reminder, fitness or health apps can be integrated in the device. Thus, especially older adults can benefit from the new technology as Google Glass can for instance remind them to take the medication or post reminders for important appointments. Furthermore, the device facilitates communication with other persons, for example adult children or distant relatives and can therefore be a useful assistant in everyday life.

In a three year project we developed an app with assistive functions for older adults. In a field test with adults aged 65 years and over, the subjects had to solve different everyday tasks, e.g. start a phone call, navigate to a specific place in Berlin or follow the instructions for a cooking recipe. Additionally, the participants were asked to rate the device regarding usability and acceptance.

The results of the study show, that the operation of Google Glass is not as intuitive as the developers promise. The gestures and voice commands have to be learned repeatedly by older adults. Therefore, an intensive training and continuous support is necessary. However, after the first testing, the older adults showed a strong disposition and acceptance towards the new technology. To address older adults' needs Google Glass should be adapted to their specific requirements, especially regarding usability and training concepts. To increase the acceptance of older adults, particular requirements, such as the integration of Google Glass in their own glasses, must be met.

SESSION 4575 (POSTER)

TRANSPORTATION ISSUES IN LATER LIFE

BEHAVIORAL DIFFERENCES BETWEEN OLDER AND YOUNGER DRIVERS ASSOCIATED WITH AUTOMATED VEHICLES

L.J. Molnar, A.K. Pradhan, D.W. Eby, L.H. Ryan, C. Bingham, *University of Michigan, Ann Arbor, Michigan*

Motor vehicle crashes represent a significant public health problem, with elevated rates for both older and young drivers. Advances in automated vehicle technology hold promise for increasing vehicle safety. However, at least in the early stages, vehicle automation may lead to new or yet unstudied risks or errors, especially for vulnerable groups such as older drivers. The purpose of this study was to examine differences in how older and younger drivers react to the transfer of control between automated and manual driving. A total of 72 participants are being recruited from three age groups (16–19, 65–75, and 25–45). Participants are presented with

a simulated driving environment containing manual driving modes with multiple transition scenarios. They also complete a questionnaire on their experience/comfort with various technologies, as well as a structured interview to explore perceptions about the drive (e.g., expectations, acceptance, and trust in the automation). To date, 26 participants have been enrolled: 52% are age 65–75 and 48% age 25–45. All are active drivers (65% drive every day and 87% at least 5 days per week). Most report using various technologies for communication (email, 100%; smart phones, 96%; social networks, 91%; online chatting/instant messaging). In addition, most are very satisfied with these technologies (87%), report that they save time and give more flexibility (96%), and were easy to learn how to use (91%). Fuller detail on results from the questionnaires, simulated drives, and structured interviews are reported in this presentation as well as differences identified between older and younger drivers.

RELATIONSHIP BETWEEN OBJECTIVELY MEASURED TRANSPORTATION BEHAVIOR AND HEALTH VARIABLES IN OLDER ADULTS

M. Takemoto¹, J.A. Carlson², K. Moran³, S. Godbole¹, K. Crist¹, J. Kerr¹, *1. Family Medicine and Public Health, University of California, San Diego, San Diego, California, 2. Children's Mercy Hospital, Kansas City, Missouri, 3. Northwestern University, Chicago, Illinois*

This study used objective Global Positioning Systems (GPS) to investigate the relationship between pedestrian and vehicle trips to physical, cognitive, and psychological functioning in older adults living in retirement communities. Older adults (N=279; mean age=83±6 years) wore a GPS and accelerometer for 6 days. Participants completed standard health measures. The Personal Activity and Location Measurement System (PALMS) was used to calculate the average daily number of trips, distance, and minutes traveled for pedestrian and vehicle trips from the combined GPS and accelerometer data. Linear mixed effects models explored relationships between these transportation variables and *physical, psychological and cognitive functioning*. Number, distance, and minutes of pedestrian trips were positively associated with physical and psychological functioning but not cognitive functioning. Number of vehicle trips was negatively associated with fear of falls; there were no other associations between the vehicle trip variables and functioning. Vehicle travel did not appear to be related to functioning in older adults in retirement communities except for fear of falling and number of vehicle trips. Pedestrian trips had moderate associations with multiple physical and psychological functioning measures, suggesting that supporting walking could benefit many aspects of health in older adults.

PERFORMANCE AT INTERSECTIONS: ASSOCIATION WITH NEUROPSYCHOLOGICAL DOMAINS IN DRIVERS WITH DEMENTIA

A. Stinchcombe^{2,3}, S. Yamin¹, S. Paquet², S. Gagnon², *1. Saint Paul University, Ottawa, Ontario, Canada, 2. University of Ottawa, Ottawa, Ontario, Canada, 3. Lakehead University, Thunder Bay, Ontario, Canada*

Driving is considered as one of the most complex daily activities. In some driving situations, such as at intersections, it has been clearly demonstrated that cognitive load is elevated, which could explain the higher incidence of crash

among older drivers when left turns are executed. Individuals with dementia, specifically, Alzheimer's disease (AD), may have the most difficulty negotiating intersections due to their specific cognitive impairments, including impairments in attention. In this study, the performance at specific intersections of 17 older drivers with mild AD tested in a simulator was compared with the performance of healthy older adults. Driving reactions at intersections were scored using an evaluation scheme capturing different types of errors that could occur during preparation (i.e., prior to the intersection), execution (i.e., during the intersection), and recovery (i.e., after the intersection) phases. In addition, both groups were assessed using neuropsychological measures examining attention, visuospatial/perceptual functioning, and global cognition. Drivers with mild AD exhibited the greatest number of errors, and those errors were most prominent during the preparation phase leading up to the intersection. Crashes were significantly more frequent in the AD group. Measures of attention and global cognition, but not visuospatial/perceptual abilities, correlated significantly with the errors committed.

PATTERNS OF DRIVING IN OLDER AMERICANS OVER 14 YEARS: FINDINGS FROM THE HEALTH AND RETIREMENT STUDY

E. Dugan, Y. Shih, C. Lee, *Gerontology, UMASS Boston, Boston, Massachusetts*

The US population is aging and there are increasing numbers of older adults driving. Driving cessation has been associated with negative outcomes (e.g., depression, isolation, death). Qualitative research suggests driving status may change abruptly after an acute health event, change slowly over time, or not at all. In this study we analyzed 8 waves of data (1998–2012) from the Health and Retirement Study to determine patterns of driving status observed in older drivers (e.g., drive with no limits, limited driving, ceased driving, not driving due to death). First, we examined a sample aged 65–74 ($N=11,114$) and who drove with no limits at baseline ($n=2,981$). These respondents provide 2,981 unique raw sequences of driving status that changed over the eight waves without any gap in driving status (nonresponse or missing). Next, optimal matching and cluster analysis were conducted and seven patterns emerged. From these MNL results, the biggest differences were between those who continue to drive (cluster 1) vs. those cease driving sometime after the baseline (cluster 2–7). For example, those who were older, less educated, had lower net worth, had more cognitive deficit/emotional problems, or poor health were more likely to fall into any of the clusters that represent driving cessation. A deeper, empirical understanding of the complex process of driving, limiting driving, or ceasing driving will suggest interventions that may promote safe mobility. Research is underway to explore what other processes (instead of baseline characteristics) may be more important for people to limit driving or to gradually cease driving.

DRIVING-RELATED RISKS AND MOBILITY IN ELDERLY DRIVERS WITH MCI.

N. Kawano^{1,2}, K. Iwamoto², N. Ozaki², *1. Institutes of Innovation for Future Society, Nagoya University, Nagoya,*

Japan, 2. Department of Psychiatry, Nagoya University, Nagoya, Japan

The impact of cognitive decline on driving safety and mobility in drivers with mild cognitive impairment (MCI) remains unclear. Therefore a cross-sectional study was carried out, to clarify the risk of elderly drivers with MCI compared to controls and to clarify whether MCI affects personal mobility on elderly drivers. 133 community-dwelling elderly drivers applied to baseline survey, 8 were excluded following exclusion criteria: (1) general cognitive impairment (MMSE < 21: $n=1$), and (2) driving cessation at baseline ($n=7$). And 125 participants were divided into control group ($n=93$) or MCI group ($n=32$). At baseline, participants were assessed individually cognitive and psychiatric state, driving-related risks based on performances of driving simulator (DS) and self-reported driving event (crashes, traffic citations, and unrecorded mistakes), driving behavior, and mobility. The frequency of traffic citation is larger in the control group compared to the MCI group, whereas there were no statistically significant differences between groups in a frequency of crashes and unrecorded driving mistakes. Both the number of miles driven/week and travel distance/week showed no different between groups, but the area of driving and travelling were reduced slightly in elderly drivers with MCI. Moreover, there were no statistically significant differences of DS performance between groups. These results support the finding from other studies showing that cognitive decline is associated with scale-down of personal mobility in elderly people. The current study could not demonstrate pronounced decline of driving ability in drivers with MCI. Prospective studies will need to clear driving-related risks in elderly drivers with MCI.

FRAMEWORK FOR DEVELOPING A MOBILITY MANAGEMENT PROGRAM FOR AGING DRIVERS; A CONSENSUS STUDY

P. Vaucher^{1,2}, I. Margot Cattin¹, S. Pihet¹, C. Unsworth⁵, B. Vrkljan³, B. Favrat^{2,4}, *1. School of Health Sciences Fribourg - Division of Osteopathy, University of Applied Sciences Western Switzerland (HES-SO), Fribourg, Switzerland, 2. Lausanne University Hospital (CHUV), Lausanne, Switzerland, 3. McMaster University, Hamilton, Ontario, Canada, 4. University of Lausanne, Lausanne, Switzerland, 5. Central Queensland University, Rockhampton, Queensland, Australia*

Determining the most effective means to help older people maintain their mobility and social participation once they cease driving has garnered increased attention due to the known health and social consequences of losing one's license in later life. Our aim was to convene an international expert consensus panel to establish a conceptual framework for a Mobility Management Program. Eighty-five experts from six countries were invited to participate of which fourteen scientists and eight occupational therapists contributed. Using a secure, web-based portal, participants' comments were entered anonymously then reviewed and summarized by four independent researchers. These summaries were taken forward to the next round for further consideration. The study ended once the majority of participants ($n=16/22$) indicated an additional round would not improve the framework, which occurred after four rounds.

The consensus group agreed upon two core goals of a Mobility Management Program: facilitating a person's transition from driver to using alternative means of transport and guiding persons through associated lifestyle adjustments. This program is to ensure mental and physical well-being, social and community participation, road safety, and maintain meaningful engagements. The theoretical models relevant to the construction of the program are: Trans-theoretical Model of Behavior Change, Health Action Process Approach (self-efficacy), Transactional Model, and Client-Centered Goal Setting Approach. The consensus group agreed on a person-centered approach that respects individual attitudes towards driving retirement through four critical phases: consideration, acceptance, action, and autonomy. A successful transition is achieved when emerging needs are met and managed by the individual/caregiver involved.

DISTRACTED DRIVING IN OLDER ADULTS: PRACTICES AND ATTITUDES

L. Hill, J. Rybar, A. Engler, J. Jahns, U. Al-Wahab, J. Chukwueke, *Family Medicine and Public Health, University of California, San Diego, San Diego, California*

Distracted driving is a prevalent problem in the US, with estimates of 30–90% varying by definition and demographics. Yet drivers have been shown to be four times as likely to be involved in a car crash while using a cell phone. Studies have shown distraction mitigation strategies can be effective in middle-aged and older populations, but more data is needed to understand which behaviors present the greatest danger to adult drivers and what methods would most effectively reduce the dangers. The UCSD Older Adult Distracted Driving Survey is the third survey to assess distracted driving attitudes and behaviors. This anonymous survey of drivers 65 years and older collected data using in-person (paper) survey methodology, as well as online (through Survey Monkey). Variables included health data, knowledge, practices, and attitudes. As in the previous surveys of younger and middle aged drivers, older drivers are using both hands free and hand held options, though with less texting than their younger counterparts. Strategies for deterring distracted driving thought to be effective by the participants have been identified, including technology, laws, and education.

OLDER ADULTS USING DRIVING SIMULATORS: WHAT IS THE LEARNING CURVE FOR THIS TECHNOLOGY?

A.E. Dickerson, J. Mullet, A. Avanesova, L. Keyes, *East Carolina University, Greenville, North Carolina*

Driving simulators are generating interest for their use in driver evaluation and rehabilitation in older adults. Evidence is necessary before a more widespread adoption of driving simulators in clinical practice. Issues include: No standardization for the adaptation process; Outputs of the simulator is often used as the sole measures - which may be faulty since studies have found that expert observation is more important; and simulator or observational measures are not standardized. This study was designed to examine the performance of current older drivers on the simulator, especially in terms of the "learning curve" with this technology. Older drivers (N=49, ages 60–79 years) were tested on the simulator with some returning after one week. There are

three outcome measures: data extracted from the simulator report (e.g., reaction time, speed, crashes, lane maintenance) and skilled observation scores (e.g., overall, scores for critical incidents). The data was analyzed to examine differences between the groups in terms of age, gender, or technology. To examine the learning curve, scores from one scenario were compared against the same scenario. Preliminary results show that although there are some specific differences in performance, overall performance is likely not based on age, gender or familiarity with technology. Evidence supports using the driving simulator as a tool to assess older adults' fitness to drive and intervention. However, even healthy older adults made significant errors, including crashes. For the repeaters, performance improved with familiarization/practice, illustrating that use of the simulator as a final determinant of fitness to drive may be unwarranted.

VARIABILITY IN THE DISTRACTED DRIVING BEHAVIORS OF OLDER ADULTS

S. Freed¹, D. Stavrinou², L.A. Ross¹, *1. Human Development and Family Studies, Penn State University, State College, Pennsylvania, 2. University of Alabama at Birmingham, Birmingham, Alabama*

Naturalistic driving technologies are increasingly utilized to objectively assess driving in a real-world setting. However, use of such technologies often requires extensive data reduction efforts which may limit important information about how one's driving behaviors differ from trip to trip. This study aimed to describe driving behaviors (i.e., distracted driving behaviors) in a sample of older adults, as well as the variability of these behaviors within a person. We analyzed data from 72 healthy community-dwelling older adults (55% female, mean age=72.3 years, range 65–85 years) from the Senior and Adolescent Naturalistic Driving Study (SANDS). Information on participant distracted driving behaviors was collected from driving trips taken over a two-week period via photos taken of the vehicle interior. Distracted driving behaviors included cell phone use, talking with a passenger, reaching, eating, drinking, and grooming. Results from intraclass correlation coefficients obtained from multilevel models indicated that a large proportion of the variance in distracted driving behaviors was related to differences within driving trips, compared to differences between participants. The amount of variance attributable to within-person differences varied depending on behavior, ranging from 1% (talking on cell phone) to 19% (eating). Future work in older adult driving should consider within-person variability of distracted driving behaviors and examine how context and timing, such as time of day, weather, or physical function, may influence the likelihood of a person performing a certain behavior in the moment. Further implications and future directions will be discussed.

APPLYING LOCATION QUOTIENT TO ANALYZE DISTRICT ELDERLY ACCIDENT CHARACTERISTICS IN METROPOLITAN AREAS

P. Tseng², C.E. Wu³, C. Chang⁴, Y. Dong², C. Wan Hui¹, *1. Tamkang University, New Taipei City, Taiwan, 2. Central Police University, Taoyuan, Taiwan, 3. National Taiwan Ocean University, Keelung, Taiwan, 4. Institute*

of Transportation, Ministry of Transportation and Communications, Taipei City, Taiwan

A location quotient (LQ) is an analytical statistic that measures a district's or region's industrial specialization relative to a larger geographic unit (usually the nation) in economic base analysis. While an LQ over 1.0 means that the area has a higher concentration for specific industry than the nation. In Taiwan, the population over the age of 65 of total population was 12.51% in the end of 2015. And from 2009 to 2015, the elderly population death rate of the total population in traffic accidents are 27.20%, 25.89%, 25.27%, 26.62%, 28.73%, 30.02% and 31.43% respectively. As the result of high elderly death rate, the traffic safety of seniors has become an important issue in Taiwan. Because the area accident characteristics are different by the local socio-economic conditions and resources and the area countermeasures must depend on local accident characteristics, this study applies the LQ index to analyze the accident characteristics by area. The LQ index were calculated by the district accidents share divided the metropolitan accidents share by different category such as accident severity, traffic mode, gender, occurrence time, occurrence location and causes of accident. The data of Taoyuan metropolis in Taiwan which are divided into 13 districts and with spatial and regional characteristics including urban, suburban and rural areas were used. The results showed that the application of LQ could easily identify the elderly safety issues of each districts. Moreover, this study developed the educational propaganda strategies for different districts to reduce the traffic accident rate and severity in seniors based on the traffic accident characteristic analysis.

SESSION 4580 (POSTER)

WORK AND VOLUNTEER ROLES IN LATER LIFE

EXPLORING AND DEVELOPING THE MAINSTAY VOLUNTARY ELDERLY IN THE COMMUNITY

P. Inchai¹, S. Jamkrajang¹, S. Yodnil¹, N. Camrae², S. Saowakontha¹, 1. *Burapha University, Mueng Chonburi, Thailand*, 2. *Maharakham University, Kantarawichai, Maharakham, Thailand*

Thailand is becoming an aging society and needs to encourage the elderly to show their potential to help society and to be proud of their life through voluntary activities. This study explored the characteristics of senior volunteers living in Saensuk Municipality, Chonburi, Thailand. We also created a sustainable model of senior volunteer mainstay development. Our sample comprised 16 elderly people, aged over 60, who have had experience in voluntary work for at least three months. We used a phenomenological research methodology by conducting in-depth interviews and focus group discussions. Then, we analyzed the raw data with a content analysis. The results revealed that most of the senior volunteers were persuaded to volunteer by their peers and also a family model. Their missions included acting as an information provider, demonstrator, coordinator and donator. Their important qualities were integrity, flexibility, energy, reliability and responsibility. As volunteers, they felt happy, valued, and healthy, with increasing friendships and

self-empowerment. A sustainable model of senior volunteer leader development was proposed, consisting of a qualified senior volunteer, the support of a local organization and effective communication.

THE ROLE OF PARA-COUNSELLOR IN THE PROVISION OF INTEGRATED PSYCHO-EMOTIONAL CARE FOR OLDER PERSONS

J. Wang, L. Yong, W. Chan, G. So, Y. Loh, K. Peh, *Tsao Foundation, Singapore, Singapore*

Background: Loneliness, boredom and helplessness caused by social isolation often affect the emotional well-being of older persons in the community. Besides professional psychological intervention, trained volunteers can be an important resource to enhance meaningful interaction and emotional support for older clients. The use of 'para-counselors' saves cost and promotes volunteerism. This presentation describes the experience of, and lessons learned from, establishing a para-counselor team in a context where volunteerism is under-experimented. **Intervention:** an approximately 57 para-counselors were recruited and trained over a period of 3 years. Majority of para-counselors were seniors themselves. This facilitated more effective rapport and relationship building, because of shared values and common languages spoken. The latter was especially critical in a context where fewer younger generations were able to speak local dialects and/or non-English languages. Training was conducted by professional gero-counselors. After training, para-counselors were able to provide emotional support to older persons through active listening, individual life review session and engagement in meaningful activities, which helps them to review, reflect, explore, appreciate their life experiences and have greater sense of meaning of life.

Lessons learned: Key success factors for establishing a para-counselor programme include the setting up of: a volunteer management system; strategic recruitment and screening; age-friendly training methods; continuous guidance and supervision; and various options for development paths. **Conclusion:** Senior volunteerism can be activated to fill in the human resource gaps in psycho-emotional care for older persons. Sustainable para-counselor programmes can be established by integrating such programmes into existing professional and organisational framework.

VOLUNTEERING AND HEALTH AMONG OLDER KOREANS: A LONGITUDINAL ANALYSIS

H. Lee, *Gerontological Social Welfare, JoongBu University, Suwon, Gyeonggi-do, Korea (the Republic of)*

Purpose: This study examined whether volunteering activity has the positive effects on the health of Korean older persons which is defined as physical health (self-rated health) and mental health (depression and self-respect). Also, the study determined the threshold effects of volunteering on physical and mental health of older volunteers, as role strain theory predicted. Additionally, we investigated if the moderating effects of social contexts on the relationships between volunteering and health among older people exists. **Background:** As the Korean baby boomers have entered retirement era, the volunteer participation rate has gradually increased every year. The importance of a study about benefits of volunteer participation for aging individuals has been

much stressed recently. Method: The study used the three waves (2006–2008) of panel data from the Korean Welfare Panel Study, and the samples were composed of 5,768 older volunteers who were aged 55 years over in the base year of 2006 and completed it during three-year periods of the panel survey. The Generalized Estimating Equations (GEEs) were employed to estimate the regression coefficients of explanatory variables, and to control autocorrelations. Results: Volunteering among the elderly came to be positively related to physical health ($\beta = .204$, $p < .05$), to be negatively related to depression ($\beta = -1.786$, $p < .001$), and to be positively related to the self-respect ($\beta = .140$, $p < .001$). The regression coefficients of threshold effects were statistically significant only for the mental health ($\beta = -1.255E-5$, $p < .001$). However, the moderators of social contexts were not associated with the effects of volunteering on health among Korean older adults. Implications: These findings suggest that volunteering increased the health of older volunteers, but excessive volunteering activities could worsen the mental health. Also, the results indicate that social contexts did not affect volunteering effects especially in this study. We need to use more lengthy panel data set in the future to examine clearly the threshold and social contexts effects.

GOVERNANCE, LABOR FORCE PARTICIPATION RATES AND LIFE SATISFACTION FOR THE ELDERLY

H. Weng, T. Ho, Y. Zhu, S. Huang, L. Lu, *Institute of Gerontology, National Cheng Kung University, Tainan City, Tainan, Taiwan*

Given promotion of the concept of “productive ageing”, most studies indicate that having job in later years is associated with better health and well-being for the elderly. This study examine how gender differences on effects of governance, labor force participation rates on life satisfaction through national and individual level variables, respectively. The total sample of this study is 6,498 people of the age of 65 from 28 countries. The individual attributes are obtained from the World Values Survey. National level variables are from the World Bank, International Labor Organization, Organization for Economic Cooperation and Development, and Legatum Prosperity Index. Hierarchical Linear Modeling method of analysis was used for statistical analyses. We found that those who are men over 65 years of age who are of a higher age, have a married status, belong to a higher social class, have better health and attitudes toward aging are positively correlated with higher life satisfaction. Women who sees more importance in work is also shown to be positively correlated with life satisfaction. Moreover, with regards to the national level, we found that governance correlates positively with a higher score of life satisfaction. And labor force participation rate correlates positively with a higher score of female’s life satisfaction. Lastly, for women only, the national labor force participation rate weakens the impact of social class on personal life satisfaction.

EXPLORING THE FACTORS OF DIFFERENT COPING BEHAVIORS OF PSYCHOSOCIAL HAZARDS AMONG HOME-CARE WORKERS.

L. Chen, *Hungkuang University, Taichung City, Shalu District, Taiwan*

The purpose of this study is to explore the factors of different coping behaviors of psychosocial hazards among home-care workers. This research applied the cross-sectional survey method. Samples were selected from 14 home care providers in Taichung City, and 450 (response rate 74.6%) valid samples were collected by a self-administered structured questionnaire, and analyzed by using SPSS 21.0 software. The results showed that, the top three of psychosocial hazards were work domination, workload and pace, workplace justice. Workers with higher work domination, home-work conflict were significantly more likely to take problem-focused and emotional-focused strategy. Workers with poor perceived health, higher level of target fatigue, were significantly more likely to not to take any coping behavior. The study suggests that should provide appropriate workload by worker’s condition, given the opportunity to express their opinions and discretion, and providing on-job training about interaction, communication and management for supervisor, who can help home care workers.

EFFECTS OF JOB RESOURCES ON WORK ABILITY IN HIGH QUALIFIED MANAGEMENT POSITIONS

J. Voltmer, J. Deller, *Leuphana University Lueneburg, Lüneburg, Germany*

The prolongation of work lives could attenuate the challenges of the demographic change. In order to maintain and improve the productivity of the workforce, work ability is gaining increasing importance in both, research and practice. On average, age leads to a decline in work ability, and, consequently, work force participation. However, age also leads to an increase in work ability score variance, indicating the presence of moderating effects with an impact on the relationship of age and work ability. In line with the Job-Demands Resources Model and the Conservation of Resources Theory, we evaluated direct and possible moderating effects of job resources, i.e., characteristics of the supervisor, discrimination, respect, and autonomy on the relationship between age and work ability.

Data of 1,093 managers of the chemical industry in Germany were used. Managers not only are subject to factors of their work environment, but are also important role-models for their direct reports, and are therefore of twofold interest.

In hierarchical regression analyses, we found direct impact on work ability for all job resources. Additionally, the analyses indicated moderating effects of advancement discrimination, control of work, and skill usage on the age-related decline of work ability. The findings are discussed regarding relevant literature. Our research can help employers facing demographic challenges to effectively employ interventions to improve health and work ability of their aging work forces, especially when mere individual-focusing interventions fail to do so.

WORK LIMITING HEALTH AND DIVORCE BEHAVIOR: A RETROSPECTIVE ANALYSIS WITH SIPP DATA

P. Yu¹, K. Couch², *1. Stonehill College, Easton, Massachusetts, 2. University of Connecticut, Storrs, Connecticut*

In this paper, we consider the role of all work limiting health conditions on divorce behavior but we distinguish between less (exogenous) predictable versus more (endogenous) predictable shocks. We divide the reported health conditions in the 2004 Survey of Income and Program Participation (SIPP) into those that appear to arrive randomly conditional on age for married men and women versus those that appear to be more predictable. The six work limiting health conditions that appear to arrive largely exogenously are cancer, carpal tunnel syndrome, deafness or serious trouble hearing, paralysis, thyroid trouble and tumor cyst or growth. How the onset of work limiting conditions then affects divorce is studied across different demographic groups. The primary result of the study is that the onset of health problems that are unpredictable generally does not increase the likelihood of divorce while the divorce behavior is closely related to the onset or evolution of a broader, arguably endogenous set of health conditions. However, the patterns of response are shown to vary by race and ethnicity. For example, the onset of health conditions that do appear to be statistically related to demographic factors known to correlate with poor health behaviors appear to be associated with a statistically significant increase in the probability of divorce particularly among minority (Black and Hispanic) groups. The data used in the study are drawn from the SIPP, particularly from the topical module on “work disability history”, and the retrospective histories are used to construct a panel over the individuals’ lives. The primary estimation method is a panel linear probability model with fixed-effects.

BLENDED WORK AMONG OLDER WORKERS: A MULTI-LEVEL PERSPECTIVE

M. Damman, 1. *Netherlands Interdisciplinary Demographic Institute (NIDI-KNAW), The Hague, Netherlands*, 2. *University of Groningen, Groningen, Netherlands*

In the retirement literature, the concept of “blended work” has been introduced recently as a form of work that may enable older workers to prolong their working lives. Blended work refers to time- and location-independent working, which is made possible by the increasing reliance on ICTs in organizations. Empirical insights on this issue are still limited though, especially with regard to the question which older workers actually have the opportunity to blend work. This paper aims to fill this gap, by paying attention to the role that both organizational and individual level factors play for explaining perceived blended work opportunities. Multi-level data collected in 2015 among a sample of about 5000 older workers (age 60–65 years) employed in more than 400 organizations from the government, education, construction, care, and welfare sectors in the Netherlands were analyzed. The results show a large variety between sectors in blended work opportunities (as measured by four items). For instance, among employees working in government organizations almost 30 percent agrees with the statement “I can decide myself where I work,” and this is only the case among less than 10 percent of employees in educational and care sector organizations. Higher educated older workers have more opportunities to blend work as compared to the lower educated, and men report having more opportunities for blended work than women. The findings suggest that blended work

is only available to a select group of older workers, which raises questions about its potential effectiveness for prolonging working lives more generally.

GENDER AND EXTENDING WORKING LIFE FOR WORKERS IN LOW-PAID PRECARIOUS EMPLOYMENT IN THE US

A. NiLeime, 1. *Sociology, Case Western Reserve University, Cleveland, Ohio*, 2. *National University of Ireland Galway, Galway, Connacht, Ireland*

Concerns about pension sustainability means that many governments including the US are advocating longer working lives for all workers. Policy changes encouraging flexible work and increased social security age reflect this. However, there has been limited investigation to date of how these policy changes affect differentiated groups (by gender and occupation) of older workers. While longer working lives may be attractive and beneficial to workers in sedentary, well-paid jobs, those engaged in physically demanding low-paid occupations typically face health challenges earlier than other workers. There is a need to explore how this affects their ability to continue working past traditional retirement age and their financial security.

This presentation is based on analysis of evidence from Phase 1 of an EU-funded cross-national research project involving work-life history interviews conducted with twenty older workers in low-paid precarious employment in the US in 2015 – early 2016. A life-course approach is used to analyse interview data with ten women in a low-paid, physically demanding occupation – home health aides – and compare them with the accounts of ten men in a similar occupation – janitorial work. Participants discussed early influences, work-life history and health concerns. The paper analyses how gender, occupation and health across the life course affect options around late work and retirement.

It concludes that certain gender differences regarding norms of care-giving are important. Yet it appears that extending working life exacerbate existing financial and health disadvantages for both men and women in precarious employment. The implications for future research and policy are discussed.

PROTECTED OR DEFLECTED? IMPACT OF EMPLOYMENT PROTECTION LEGISLATION ON FORCED CAREER EXIT IN EUROPE

E. Dingemans^{1,3}, M. Hyde², 1. *Netherlands Interdisciplinary Demographic Institute (NIDI-KNAW), The Hague, Netherlands*, 2. *Swansea University, Swansea, United Kingdom*, 3. *University Medical Center Groningen (UMCG-RUG), Groningen, Netherlands*

Extended working lives are now becoming the norm in many Western countries. However, it is not always easy to do so. A substantial number of older adults are pushed out of the labor force at the end of their work careers. In this study, we explore whether older workers are forced to leave their careers through retirement routes or become unemployed or disabled prior to retirement. We take a cross-national perspective, using data from 14 European countries, to examine whether the national labor market context impacts on how individuals leave their careers, especially focusing on the strictness of employment protection legislation. We use

a country fixed effects approach to control for country-level heterogeneity. Our results show that there is wide variation in the rates of forced exit (between 20 and 50%). We have found that weak employment protection legislation results in an increased likelihood of forced exit through unemployment or disability, whereas in countries with strict employment protection, older workers are particularly likely to be forced out through retirement arrangements ($b=0.86$, $p<0,01$). This latter case could be seen as a form of hidden unemployment as people are forced to leave the labor market through retirement, while they might have been willing and able to extend their working lives up until higher ages. The results of this study imply that the choice to extend or leave work in later life is not always an individual one, but is also determined by country-level factors.

PREDICTORS OF RETURNS TO WORK FOLLOWING RETIREMENT IN GERMANY, RUSSIA AND THE UNITED KINGDOM

L.G. Platts¹, K. Glaser², 1. *Stress Research Institute, Stockholm University, Stockholm, Sweden*, 2. *King's College London, London, United Kingdom*

Individuals may return to paid work following retirement, a phenomenon described as “unretirement”. By following recent retirees over time in Germany, Russia and the United Kingdom (UK), we examined whether unretirement is more common for people facing financial hardship. Data are drawn from four surveys: German Socio-Economic Panel Study (1991–2013), Russian Longitudinal Monitoring Survey (1994–2013) and, for the UK, British Household Panel Survey (1991–2008) and Understanding Society (2010–2014), harmonized *ex post*. Unretirement behaviour was examined using Cox regression in relation to demographic covariates, education, health, and financial adequacy. Unretirement was common, affecting around 42% of Russian retirees, 25% of British retirees, and 17% of German retirees. In each country, retirees with more education, higher income, and better health more often returned to work. While recently retired people may represent a pool of potential labour, there was little indication that those in financial need were unretiring.

DOES A SUPPORTIVE ORGANIZATIONAL CLIMATE MAKE OLDER WORKERS WANT TO RETIRE LATER?

J. OudeMulders, K. Henkens, *Netherlands Interdisciplinary Demographic Institute, The Hague, Netherlands*

Retirement intentions are commonly studied and explained by job-related factors at the individual level, since measures of organizational factors that are measured through one employee are susceptible to bias. In this study, we apply a multilevel approach to study to what extent organizational climates are perceived as supportive for older workers, and whether a supportive organizational climate affects older workers' retirement intentions. The organizational climate towards older workers is measured through multiple employees from the same organization. The data stem from a survey, conducted in 2015, among 4410 older workers aged 60–65 from 409 Dutch organizations. Multilevel regression analysis is performed to account for variance in retirement intentions at the organizational and individual levels. The results show that when the organizational climate encourages working after retirement, when task accommodation for older workers is possible, when there is more attention for employees' health,

employees intend to retire later. Conversely, an organizations' support for gradual retirement leads to earlier retirement intentions. At the individual level, younger employees, those who started their career at a later age, those who have worked for their current organization shorter, and those who work more hours per week intend to retire later. We discuss how a supportive organizational climate for older workers can have contrasting effects on retirement intentions.

GENDER AND EDUCATIONAL DIFFERENCES IN HEALTHY WORKING LIFE EXPECTANCIES IN AUSTRALIA

K. Kiely, *Centre for Research on Ageing Health and Wellbeing, The Australian National University, Canberra, Australian Capital Territory, Australia*

Current social policy and public discourse strongly encourages older adults to remain in the workforce. While there are health benefits associated with employment and productive ageing, poor health may also limit labour-force participation, particularly in low skill and labor intensive occupations. This study investigates ‘healthy-working life expectancies’ in Australia using the nationally representative HILDA survey. The sample comprised 6,164 respondents aged 45–100 at baseline (2001). One-fifth of respondents deceased over the 14-years of annual follow-up. Poor health was defined by long-term health conditions that restrict everyday activities. Multistate models estimated health transitions, employment transitions, and mortality rates. Life expectancies were partitioned into years: working in good health, working in poor health, retired in good health, and retired in poor health. At age 50 healthy-working life expectancies were 8.9 years (95%CL=8.6,9.2) for men, and 7.0 years (95%CL=6.7,7.2) for women; unhealthy-working life expectancies were 3.4 years (95%CL=3.2,3.6) for men, and 2.6 years (95%CL=2.4,2.7) for women; healthy-retirement expectancies were 6.1 years (95%CL=5.8,6.5) for men, and 9.4 years (95%CL=8.9,9.8) for women; unhealthy-retirement expectancies were 10.5 years (95%CL=10.1,11.0) for men, and 13.8 years (95%CL=13.2,14.3) for women. Lower education levels were associated with shorter healthy-working life, shorter healthy-retirement (but only among men), and longer retirement in poor health. Findings will be discussed in relation to the rising pension age in Australia, challenges faced by those who wish to remain in the workforce, as well as the moral imperative and social pressure felt by those who are unable to work or fulfil their ‘active ageing’ obligations.

AGE AND JOB SATISFACTION WITHIN A CANADIAN CONTEXT

M.P. Silver, M. Schafer, J. Settels, *University of Toronto, Toronto, Ontario, Canada*

This study examines the relationship between age and job satisfaction using data from the 2015 Canadian Work, Stress, and Health Study (CANWSH), a national sample of Canadian workers. The extent to which job satisfaction can be attributed to age versus factors such as more favorable job characteristics or enhanced general well-being remains relatively unexplored within the Canadian context. The theoretical basis for anticipating that with age individuals are more likely to experience positive emotions stems from socioemotional selectivity theory. Using multivariate logistic

regression models, we estimate the influence of measures of general life satisfaction on job satisfaction relative to other factors such as income and job characteristics at different age periods. Findings indicate that levels of job satisfaction are higher among older workers, overall life satisfaction increases the likelihood of higher job satisfaction among older women, and that job control is associated with increases the likelihood of higher job satisfaction for younger workers. Given that the gap between average retirement age and life expectancy has widened in Canada and worldwide, findings highlight the need to examine factors that may foreshorten the careers of more mature workers, particularly when levels of job satisfaction are relatively high.

RECRUITING VOLUNTEERS BY FOCUSING ON EMOTIONAL MEANING: THE ROLE OF FRAMING AND EXPERIENCE

Y. Shavit, L.L. Carstensen, *Psychology, Stanford University, Stanford, California*

Not only do societies benefit from volunteer efforts of its citizens, evidence is accruing that volunteering is beneficial to the health and well-being of older adults. To date older adults volunteer in similar rate to other age groups, but contribute more hours when they do volunteer. Although research on the effects of volunteering has grown in recent years, only limited attention has been paid to the factors that contribute to older adults' decision to volunteer.

Socioemotional selectivity theory (SST) posits that goals change with age. As time horizons grow increasingly limited – as they typically do with age - people prioritize emotionally meaningful goals. Reasoning from SST, we hypothesized that interest in volunteering may be heightened when volunteer activities were described in emotionally meaningful terms. We also reasoned that being able to make a real difference by expressing relevant experience would be motivating when time horizons are limited.

150 participants aged 18–82 answered an online survey in which they were presented with one of two advertisements for a hypothetical volunteer opportunity in a local children's library. One advertisement highlighted the ability to make a difference in a child's life. It was contrasted with another that framed the opportunity as a way to gain valuable skills. Participants also reported their prior experience working with children. Results from a linear regression analysis supported the hypotheses, suggesting that each of the two avenues contributed independently to the likelihood of volunteering among people who also report time horizons as limited.

SESSION LB4585 (POSTER)

LATE BREAKER POSTER SESSION 5

AGING AND THE SOCIAL CONTEXT OF FOOD INSECURITY IN AN URBAN MINORITY NEIGHBORHOOD

A. Costley¹, B. Collier², L. Demarinis², S. Susseran¹, 1. CUNY--York College, New York, New York, 2. JSPOA, New York, New York

Recent AARP (2015) and the USDA (2011) reports reveal increasing rates of “food insecurity” (lack of access and nutrition) among older adults in the U.S. In many urban minority communities, the existence of “food deserts” (lack of food infrastructure), increases the risks across the lifespan. Survey research (N=423) and asset-mapping in a documented “food desert in New York City, were used not only to see the challenges facing older adults in a predominantly African-American and Caribbean community (67.5%), but also to explore important differences in behavior, attitudes, and resources among older and younger residents (62.5% vs 37.5%, respectively). Preliminary findings suggest that while older adults are more likely to live alone (46% vs 31%), with higher rates of poverty (less than \$15,000/year) (40% vs. 34%), we see slightly higher rates of younger residents with larger households having “difficulty” paying rent and utilities each month (28% vs 25%) and buying preferred “healthier foods” (34.5% vs. 23%). While many older residents live somewhat closer to food stores, difficulty in walking (45%), using stairs (36%), and carrying bags (32%), make it harder to reach them. Other data on the extent of social isolation suggest that food insecurity is not just a matter of access to food, but access to social networks as well. This is part of a larger effort by the Aging in New York Fund, the State Society on Aging, and local service providers to identify unique issues of food insecurity across New York City.

INTERNET USE AND PREVENTIVE HEALTH BEHAVIORS AMONG COUPLES IN LATER LIFE

S. Nam¹, S. Han², 1. Iowa State University, Ames, Iowa, 2. UMass Boston, Boston, Massachusetts

The link between internet use and well-being in later life is gaining increasing support in the literature. One of the mechanisms in which internet use may exert influence on well-being is through an increased access to health-related information, which include information related to preventive health behaviors. The objective of this study was to examine whether internet use was associated with preventive health behaviors in later life. Especially, we focused on couples to examine whether there are cross-partner associations between internet use and preventive health behaviors. The study sample consisted of 1,765 pairs of coupled individuals drawn from the 2012 wave of the Health and Retirement Study. Preventive health behaviors included cancer screenings (mammogram, prostate tests & colonoscopies), cholesterol tests, and flu shots. Logistic multilevel actor-partner interdependence models were employed. Our findings indicated that internet use was associated with a higher likelihood of receiving a mammogram or cholesterol tests for women, and a prostate exam, cholesterol tests, and flu shots for men, net of sociodemographic and health characteristics, as well as insurance status. Also, we found that wives' internet use was associated with a higher likelihood of receiving a flu shot among husbands, over and beyond the effects of husbands' own internet use. Our findings demonstrate that health-promoting screenings and tests in later life are associated with internet use. Research linking internet use and preventive health behaviors is important because such behaviors are not only linked with health of the older population but also with substantial reductions in health care expenditures.

SOCIAL ISOLATION AMONG OLDER JAPANESE: DO REGIONAL ATTRIBUTES MATTER?

E. Kobayashi¹, K. Harada², H. Murayama⁴, T. Fukaya¹, J. Liang³, 1. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 2. *Jissen Women's University, Tokyo, Japan*, 3. *University of Michigan, Ann Arbor, Michigan*, 4. *The University of Tokyo, Tokyo, Japan*

Although social isolation (SI) has shown to impede health and well-being, there is little knowledge about regional factors affecting SI. While urban life may hinder close contact with neighbors, advance in public transportation can make contact with friends and relatives easier. This study examined how the two aspects of urbanization affect SI among older adults when ADL declines. Data came from the National Survey of Japanese Elderly, a nationwide longitudinal study of Japanese older adults aged 60 and older. We analyzed 3132 respondents who lived in 192 municipalities (regions) and responded to 2–5 waves' interviews between 1996 and 2012, through hierarchical generalized linear models (three-level model). SI was defined as having less contact than once a week with anyone outside the household. Regional level explanatory variables were "close-knit neighborhood" represented as median number of neighbors with whom one has close contact among respondents in the region, and availability of public transportation assessed by interviewers. Key individual time-varying or baseline attributes included gender, age, ADL/IADL, family/financial status, and number of close neighbors. Results showed that living in regions with close-knit neighborhood lowered probability of SI even after controlling for the individual characteristics, while availability of public transportation did not. Functional decline increased the probability of SI, but this negative impact was buffered by living in regions with higher availability of public transportation. Our findings indicate that urbanization does not necessarily promote SI, and that various resources are required to prevent SI according to phases of functional decline in later life.

FACTORS AFFECTING EARLY DETECTION OF MENTAL HEALTH PROBLEMS OF THE ELDERLY AND SERVICE USE IN KOREA

Y. Park¹, D. Son², K. Park³, E. Park⁴, Y. Choi⁵, 1. *Kangnam University, Yongin, Gyunggido, Korea (the Republic of)*, 2. *Yongin Songdam College, Yongin, Gyunggido, Korea (the Republic of)*, 3. *Yonsei University SSK Research Group, Seoul, Korea (the Republic of)*, 4. *Kangnam University Graduate School of Social Welfare, Yongin, Gyunggido, Korea (the Republic of)*, 5. *Yonsei University Graduate School of Social Welfare, Seoul, Korea (the Republic of)*

Recently South Koreans over the age of 65 committed suicide at a highest rate among the OECD countries. Therefore, there is a growing interest in early detection of depressive symptoms and other mental health problems in community settings. In order to analyze the factors influencing the competency of care providers regarding mental health issues, 324 family caregivers and 291 service providers working in facilities for elderly were surveyed using a structured questionnaire in 2016 in three cities in Korea. The average score for understanding mental health of older people was 3.29(5-point scale). Service providers had slightly higher score than the family caregivers. Family members were more reluctant

than service providers towards seeking professional help for mental issues. However, service providers had more negative perception about current mental health service delivery system. Implications for improving the accessibility to early detection and prevention of mental health problems are discussed.

USE OF PRIMARY CARE HOME VISITS FOR OLDER ADULTS IN MONGOLIA

A. Bagaajav¹, A. Ghesquiere¹, E. Tumenjargal², D. Gardner¹, 1. *Silberman School of Social Work, City university of New York, New York, New York, Mongolia*, 2. *National Center of Gerontology, Ulaanbaatar, Mongolia*

Older adults comprise 7% of the Mongolian population and it is projected that they will account for 25% by 2050. Health care for older adults was greatly impacted by Mongolia's transition from a centrally planned to a free market economy. In 1998, the government established universal health insurance centralized around primary health care. A key focus for older adults involved mandatory home visits by multidisciplinary teams of family doctors, nurses, and social workers. Although several studies have described the health status of Mongolian older adults, no work appears to have examined the utilization of home visits, even though this is a central component of health care. Therefore, we sought to describe the utilization of home visits among Mongolian older adults. We also examined whether use varied by socio-demographic or clinical factors. We analyzed 319 de-identified home visit questionnaires collected from all nine districts in Ulaanbaatar from older adults age 60 and above by multidisciplinary teams from the National Gerontology Center in 2016. We found that 23.9% of older adults utilized home care more than once a month, 48.1% once a month, and 28.0% less than once a month. Regression analyses indicated that those with lower incomes and those not hospitalized in the last year had the most home visits. Results imply that home visits are being accessed as intended by policy, but that older adults with low incomes have the greatest need for such visits. These trends could be explored in other health care services in Mongolia.

IMPACT OF GLUCOSE METABOLITES ON HISTONE MODIFICATIONS AND GLYOXALASE ACTIVITY IN TROPHOBLAST CELLS

T. Seeling¹, K. Grybel¹, M. Pendzialek¹, A. Imhof², I. Forné², A. Navarrete Santos³, A. Simm⁴, A. Navarrete Santos¹, 1. *Department of Anatomy and Cell Biology, Halle/Saale, Sachsen-Anhalt, Germany*, 2. *Department of Medical Biology, München, Bayern, Germany*, 3. *Center for Medical Basic Research, Halle/Saale, Sachsen-Anhalt, Germany*, 4. *Clinic for Cardiac Surgery, Halle/Saale, Sachsen-Anhalt, Germany*

The relevance of Developmental Origins of Health and Disease (DOHaD) hypothesis, defining fetal origins for long-term health and risk of disease in adult life, has been well established. Particularly, the uterine environment and placental development encountered in fetal and neonatal life exerts a profound influence. In western society the first-birth age for women increases leading in part to higher risk of suffering from metabolic diseases like diabetes mellitus. Diabetes mellitus is characterized by high concentrations of glucose and metabolites like methylglyoxal (MGO) and glyoxal (GO).

The aim of this study was to analyze the influence of a diabetic environment associated with high levels of MGO and GO on histone protein modifications in placental cells and their cellular defense system towards glucose metabolites, the glyoxalase system.

Histone modifications were examined by LC-MS/MS. Therefore, the human trophoblast cell line AC-1M88 was cultured with 100 μ M MGO and GO for 72 hours. The exposition to MGO and GO changed the modifications on histone H3, especially on lysine 9. The functionality and regulation of glyoxalase system were examined by western blot and enzymatic assay. Trophoblast cells exposed with MGO and GO showed an increase in glyoxalase 1 protein amount and enzyme activity, indicating an active metabolic stress defense in placental cells.

Our data show that trophoblast cells challenged by aging factors (MGO and GO) changed epigenetic background to support survival through alterations in histone modifications. These changes may promote metabolic programming with consequences in later life.

ON YOUR SIDE: ONLINE SUPPORT AND EDUCATION FOR INDIVIDUALS WITH PRIMARY PROGRESSIVE APHASIA

D.J. Morhardt¹, R. Khayum², B. Kathryn², S. Marie¹, E. Rogalski¹, 1. *Northwestern University, Chicago, Illinois*, 2. *MemoryCare Corporation, Chicago, Illinois*

Primary Progressive Aphasia (PPA) is a clinical syndrome characterized by progressive loss of language affecting other cognitive domains over time. There are no approved drug treatments for PPA; however, psychoeducational support programs have been shown to improve quality of life and well-being for persons with neurodegenerative cognitive decline and their families. Persons with PPA and their families rarely have the opportunity to benefit from this type of intervention, largely due to difficulty recruiting enough members with PPA in one geographic region. A pilot online/videoconference psychoeducational support program was launched in Spring/Summer 2016 specifically for persons living with PPA to circumvent geographic limitations and improve healthcare access. Five couple dyads from the United States and Canada were recruited into the study including persons with PPA mild (n=4) to moderate (n=1) expressive and receptive language impairments and their spouse care-partners. Dyads met by videoconference for 8-weekly 2-hour sessions. Sessions included dyad education on PPA, communication strategies, psychosocial interventions followed by separate consecutive support groups for diagnosed persons and care-partners. Pre-post questionnaires measured confidence for communication abilities, life participation, mood, well-being and perceived stress. Pre-post interviews with dyads and care-partners were documented and all videoconference sessions were audio-recorded. Audio recordings and field notes were reviewed for emerging themes through inductive content analysis. Results suggest that an online videoconference psychoeducational support program for persons with mild PPA and their care partners is feasible and represents a novel solution to connect individuals with rare diseases such as PPA. Participants appreciated the opportunity to meet each other however, the variability among symptoms, age and disease knowledge impacted satisfaction, particularly for care partners. Further

research is needed to identify the ideal group composition and content.

C-REACTIVE PROTEIN PARTIALLY MEDIATES THE RELATIONSHIP BETWEEN MODERATE ALCOHOL USE AND DEPRESSION

D. Paulson, M. Shah, D. Herring, R. Scott, M. Herrera, D. Brush, R.E. Bassett, *University of Central Florida, Orlando, Florida*

Moderate alcohol use has been broadly associated with health benefits among older adults, including cardiovascular benefits, reduced frailty risk, and improved mood. Reduced inflammation has been one identified mechanism by which these benefits are obtained. This study aims to: (1) evaluate the relationship between moderate alcohol use and depressive symptomatology over a period of eight years; and (2) examine inflammation, indicated by C-reactive protein, as one mechanism by which this relationship functions. The study sample included 3,177 community-dwelling respondents over the age of 65 in 2006 drawn from the Health and Retirement Study. Data from the 2006, 2008, 2012, and 2014 waves were used. Alcohol use was measured via self-report and was dichotomized as abstinent (0 drinks per week) and moderate (1–14 drinks per week); respondents who reported consuming 15 or more drinks per week were excluded. Inflammation was measured using C-reactive protein (CRP), which was collected and made available. Control variables included gender, age, body mass index, and medical burden. A latent growth curve model with full information maximum likelihood was used, with results revealing that moderate drinkers endorsed fewer depressive symptoms at baseline and a steeper rate of change over time. Abstinent respondents' depressive symptomatology was characterized by a more linear change rate. Further, moderate drinkers had lower CRP levels suggesting that inflammation partially mediates the relationship between moderate alcohol use and depressive symptomatology. Future research should identify additional mechanisms relating alcohol to positive health outcomes and less depressive symptomatology.

HOME HEALTH NURSES EXPERIENCES WITH FINANCIAL EXPLOITATION OF OLDER ADULTS WITH COGNITIVE IMPAIRMENT

J. Wilson, *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Older adult maltreatment often goes unrecognized and unreported in health care. Financial exploitation (FE), a type of older adult maltreatment, is increasing in prevalence as our population ages. Older adults diagnosed with cognitive impairment (CI) who live at home are uniquely at risk for FE due to dependency on caregivers and diminishing financial, cognitive capacities.

The purpose of this qualitative descriptive study was to explore how home health registered nurses' (HHRNs) manage the care and safety of financially exploited older adults with CI. Purposive, sequential, and snowball sampling was used to recruit 20 HHRNs who cared for older adults in the home setting in 44 out of 77 rural and urban Oklahoma counties. Qualitative 45–60 minute telephone interviews were recorded, transcribed, and analysed.

Conventional content analysis of the interviews identified five core themes: 1) Investigating FE: Compelled to Keep Looking 2) Familiar Offenders 3) FE Consequences for Older Adults with CI

4) Encountering Facilitators and Barriers and, 5) Frustrations with Systems Gaps. Overall, the HHRNs stressed that systems gaps among health care, law enforcement, and social services blocked communication and collaboration to facilitate the safety of this vulnerable group of exploited older adults with CI. This study showed that HHRNs have expert knowledge of detection, assessment, and reporting of FE of the older adult with CI. HHRNs are an untapped resource to help systems coordinate and improve detection and reporting FE of older adults with CI.

UNDERSTANDING THE ENROLLMENT TRENDS AMONG OLDER LEARNERS IN HIGHER EDUCATION IN OHIO

J. Brown¹, N. Mehri¹, P. Cummins¹, P.R. Bahr², P. Timilsina¹,
1. *Miami University, Oxford, Ohio*, 2. *University of Michigan, Ann Arbor, Michigan*

Middle aged and older adults represent an increasingly important segment of the U.S. labor force. Lifelong learning is necessary to improve employment outcomes among these workers, who face rising demands for new and improved skills. Despite these trends, little is known about their patterns of enrollment at community colleges. We use data from Integrated Postsecondary Education Data System (IPEDS), which is collected by the National Center for Education Statistics. Higher education institutions provide information on enrollments, program completions, graduation rates, and other institutional data. We examine age-based enrollment trends of older learners by part-time and full-time enrollment status for students enrolled in Ohio baccalaureate colleges and community colleges from 2005 to 2015. Unlike previous research that considers all age 25+ students as a homogenous group, we divide older learners into three distinct age groups: 25–39, 40–64, and 65+. Our results show that, following the great recession, which ended in 2009, enrollments for working age older learners (age 25–39 and 40–64) increased substantially. At four-year institutions, this enrollment “bump” was largely the result of increased full-time enrollment within the age 25–39 group. At community colleges, much of this increased enrollment was driven by increases in part-time enrollment by the age 40–64 group. These increases appear to be temporary, as enrollment levels in both cases return to near pre-recession levels by 2015. Enrollment patterns for the age 65+ group generally remained consistent over this same period. We discuss the implications of these trends and their relevance to education, employment, and retirement.

AGING-IN-COMMUNITY: AGE-FRIENDLY BUSINESS BEST PRACTICES

N. Pope, 1. *The Institute for Sustainable Health & Optimal Aging, Louisville, Kentucky*, 2. *The University of Louisville, Louisville, Kentucky*

Age-friendly business practices are a vital part of an age-friendly city, especially in relation to the social participation, respect and social inclusion and civic participation and employment topic areas of the World Health Organization

Age-Friendly City model (Gonzales & Morrow-Howell, 2009). Age-friendly business practices represent a key way in which individuals can remain active and contributing members of society for as long as possible, which in turn strengthens the economic and social vitality of themselves and the larger community. This evidenced-based project will highlight age-friendly practices that enable older adults to fully access and engage with organizations as both customers and employees in the areas of built environment, visual/print/digital platforms, customer service, organizational culture, and employment practices. Beyond specific practices, however, this presentation will explore the importance of viewing aging-in-place at the level of community through the lens of age-friendly businesses and organizations. Just as we adapt our homes to accommodate our changing needs, so too must agencies adopt practices that support individuals’ ability to participate as fully as possible. In leveraging this integration of the social and economic benefits of age-friendly business practices, age-friendly cities can prove to be sustainable and viable social constructs over the long-term.

Gonzales, E. & Morrow-Howell, N. (2009). Productive engagement in aging-friendly communities: A natural intersection. *Journal of American Society on Aging*, 33(2), 51 – 58.

BENEFITS OF A MULTICOMPONENT EXERCISE PROGRAM ON MULTIPLE DIMENSIONS OF FITNESS IN OLDER ADULTS

K.L. Fisher¹, H. Michels², M. Martinez¹, D.J. Rose¹,
1. *California State University, Fullerton, California*, 2. *Graefliche Kliniken, Bad Driburg, Germany*

There is strong evidence that regular participation in physical activity produces major health benefits in older adults. Unfortunately, current statistics show that the majority of older adults do not participate in sufficient physical activity and a large proportion (42%) are experiencing functional limitations that adversely affect the performance of everyday activities. The purpose of this study was to examine whether participation in a 12-month, twice weekly multicomponent exercise program resulted in improved functional fitness. Participants included 40 independent older adults (mean age = 67.7 ± 5.4 yrs; 57.5% females) who were regularly participating in a twice weekly multicomponent exercise program. Functional fitness parameters were assessed at the beginning and end of participants’ first year in the program using the Senior Fitness Test. This battery includes 6 tests that measure muscular strength and endurance (Chair Stand, Arm Curl), flexibility (Chair Sit and Reach, Back Scratch), dynamic balance and agility (8 Foot Up and Go), and aerobic endurance (2-Min Step Test). Paired samples t-tests or the Wilcoxon Signed Rank Test were used to analyze differences in SFT scores. Significant improvements in scores were found on the arm curl test (16.6%, p<.001), chair stand (11.9%, p<.01), up and go (7.2%, p<.05), and 2-min step test (6.6%, p=.05). There were no significant differences in flexibility scores across the 12-month period. Regular participation in a multicomponent exercise program led to positive improvements in multiple dimensions of fitness except flexibility. Positive changes in risk stratification were also evident for some measures of fitness.

IMPACT OF ADVANCED VEHICLE TECHNOLOGIES ON PERCEPTIONS OF DRIVING COMFORT AMONG OLDER DRIVERS

B. Vrkljan¹, L. He², J. Gish¹, A. Paez¹, A.M. Grenier¹, R. Sangrar¹, 1. *McMaster University, Hamilton, Ontario, Canada*, 2. *Xi'an Jiaotong University, Xi'an, China*

There is a strong emphasis around the world for older drivers to maintain their independent mobility. Although drivers, as they grow older, more often report using self-regulatory strategies, such as not driving at night, on highways, or in bad weather, they continue to have one of the highest crash rates. Advanced Vehicle Technologies (AVTs) have much potential to improve safety, however, little is known about their impact among older drivers who actually own vehicles equipped with these systems. In this pilot study, fifteen participants (aged 50–89; 7 females, 8 males) who drove vehicles with certain AVTs were compared using the Driving Comfort Scales; a valid and reliable measure that tracks perceptions of safety in challenging driving situations. Non-parametric statistical analysis using Average Treatment Effects (ATE) showed that Adaptive Cruise Control (ACC; ATE=0.343, $p=.001$) and Blind Spot Monitoring (BSM) systems (ATE=0.272, $p=.033$) significantly impacted perceptions of driving comfort during bad weather, such as heavy rain. However, other AVTs such as Lane Departure Warning (LDW; ATE=0.222, $p=.113$) and Navigation Assistance (NA; ATE=0.158, $p=.427$) did not reach statistical significance. In terms of manoeuvres, having LDW was found to significantly influence perceptions of comfort in high pressure driving situations, such as being tailgated (ATE=0.382, $p<.001$) whereas other technologies (i.e., ACC, BSM, NA) were not found to be significant per se. These results will be discussed in the context of large cohort studies of older drivers where their comfort and self-regulatory practices in association with health and GPS patterns have been tracked across time.

POLYPHARMACY AND ASSOCIATED FACTORS IN OLDER ADULTS WITH NON-DIALYTIC CHRONIC KIDNEY DISEASE

S.M. Soares^{1,2}, P.A. Silva^{1,2}, J.F. Guimarães Santos³, L.B. Silva^{1,2}, 1. *Basic Nursing, Federal University of Minas Gerais, Belo Horizonte, Minas Gerais, Brazil*, 2. *School of Nursing, Belo Horizonte, Minas Gerais, Brazil*, 3. *Hospital Israel Pinheiro, Belo Horizonte, Minas Gerais, Brazil*

Introduction: Polypharmacy is an important problem to be considered in the care of the elderly. Older adults group presents greater risks to develop adverse effects of medication, considering they developed more chronic diseases, fragility and low functionality. The number of medications is the main risk factor for iatrogenesis and reactions in this population. Objective: To estimate the prevalence of polypharmacy and associated factors in a representative sample of older adults. Method: A cross-sectional study was conducted in 2014–2017 in 300 older adults residents in Belo Horizonte, Brazil. Polypharmacy was defined as the use of five or more medications. A multivariate regression logistics was used. Results: Of the 300 older adults, 66.3% were women, median age 71.0 years (IQ 65.0–79.0), 83.7% were hypertensive and 38.3% diabetics. The prevalence of polypharmacy was 48.3% (95% CI: 42.7%–54.0%), and increase with age ($p<0.001$). Only 8.3% did not use medications, and 5.7%

used more than 11 medications. Hypertension (OR = 6.7; CI 95%: 2.7%–16.9%), dyslipidemia (OR = 5.5; CI 95%: 2.3%–12.9%), diabetes (OR = 2.7%; CI 95%: 1.6%–4.7%), caregiver presence (OR = 3.7%; CI 95%: 1.5%–8.7%) e serum creatinine level ≥ 1.3 and ≥ 1.2 mg/dL among men and women (OR = 3.2%; CI 95%: 1.1%–10.22%) were associated positively with polypharmacy. Conclusion: The results suggest a high rate of polypharmacia in the older adults. It is related to chronic health conditions, and identifying the groups of the elderly most vulnerable to polypharmacy can avoid complications arising from drug interactions.

DELAYED ULTRASOUND-GUIDED REGIONAL ANESTHESIA (USGRA) IN HIP FRACTURE PATIENTS

J.M. Estrada, J.S. Lee, *Emergency Medicine Research, Sunnybrook Research Institute, Toronto, Ontario, Canada*

Background: Delirium develop in 30- 63% of hip fracture patients. Severe pain increases delirium nine fold. A recent meta-analysis showed patients who received Ultrasound-Guided Regional Anesthesia (USGRA) had a lower incidence, severity and duration of delirium. However, no studies describe the time to USGRA are effects of delays on outcomes in hip fracture patients. Objectives: To describe the time to administration of USGRA and any impact on delirium in hip fracture patients. Methodology This is a secondary data analysis of a clinical trial where ED MDs were randomized to training in use of USGRA vs. standard of care opioid analgesics. We reviewed medical charts for all hip fracture patients from January 2014 to October 2016 and collected the estimated time of injury. The primary outcome was the delay from triage to receiving USGRA. Secondary outcomes included ED length of stay, hospital length of stay, delays to surgery and delirium rates. Results: We enrolled 130 patients of which 97 were female (74%). The average age was 79 and 45 received USGRA. The average time to USGRA was 4:39 hours (h), with a range of 1:27h to 11:11h. Block time was not recorded. in 9 (20%) - 33 (64%) patients received the block in < 4:39h, and 2/33 (6.1%) developed delirium. Blocks occurred after 4:39h in 13 (34%), with delirium in 1/13 (7.7%). $\chi^2=0.035$, $df=1$, $p=0.85$). The average ED length of stay was 12:17h, the average time to OR from block was 35:00 hours, and the average hospital length of stay was 8.56 days. 88/130 patients waited > 24 hours before surgery (66.2%). Of the total 130 patients, 17 developed delirium overall. Of the 17, three received USGRA (18%) and fourteen did not (82%, $\chi^2=2.469$, $df=1$, $p=0.116$). Conclusions: The average time from triage to block of 4:39h represents a significant delay in the provision of analgesia in hip fracture patients, although this was not associated with increased delirium in our small sample. Given that delays to OR of > 24h occurred in 2/3rd of patients, ED USGRA would ideally be followed up by reassessment and potential top-up blocks by in-patient acute pain services. Future larger multi-center trials should test the impact of USGRA and time to block on delirium

THE ROLE OF MACROPHAGES IN NAD+ HOMEOSTASIS DURING AGING

A.J. Covarrubias, E.M. Verdin, *The Buck Institute for Research on Aging, Novato, California*

Nicotinamide adenine dinucleotide (NAD⁺) is a coenzyme for metabolic enzymes involved in glycolysis and mitochondrial respiration. Additionally, NAD⁺ is also an important co-enzyme for other NAD⁺ dependent enzymes (such as Sirtuin and PARP enzymes) which regulate multiple cellular processes including metabolism and stress adaptation that protects against aging. Chronic inflammation promotes and/or exacerbates aging-associated diseases such as type 2 diabetes, cognitive decline and arthritis, and may be linked to declines in NAD⁺ that have been observed during aging. In our study, we investigated the role of macrophages, key immune cells found in every tissue and organ in our body, and their link to the declining NAD⁺ levels that occur during aging. We found that treatment of macrophages with the pro-inflammatory endotoxin LPS leads to the high expression of the NAD⁺ consuming enzyme CD38 and enhanced consumption of NAD⁺. Furthermore, we found that macrophage polarization is highly sensitive to NAD⁺ levels and that blocking key pathways that regulate NAD⁺ homeostasis in macrophages has deleterious effects on macrophage activation and gene expression. Thus, we posit that in the aging process chronic inflammation is characterized by enhanced M1 macrophage activation, high expression of CD38 by inflammatory M1 macrophages and lower activation of the Sirtuin family of enzymes due to low NAD⁺ levels. We hope our project will provide important insight into how our bodies regulate important metabolites such as NAD⁺ and will provide a therapeutic approach ailments associated with aging.

SOCIAL SUPPORT, SOCIAL PARTICIPATION AND DEPRESSION AMONG CAREGIVERS AND NON-CAREGIVERS IN CANADA

J. Sibalija, M.Y. Savundranayagam, J.B. Orange, M. Kloseck, *Health & Rehabilitation Sciences, Western University, London, Ontario, Canada*

Caregiving is associated with negative health outcomes, including high depression rates. Depression is a major concern as it is a predictor of poor health status. Poor caregiver health results in an inability to provide care, affecting the care of the ill family member and increasing the risk of institutionalization. Social support and social participation have been shown to influence depressive symptoms in caregivers. Low social support and restriction in social activities are associated with higher depression scores. Previous studies used non-Canadian samples and had small sample sizes. The objective of this study was to use population-level data from the Canadian Longitudinal Study on Aging (CLSA) to investigate the relationships among social support (measured as affectionate support, emotional support, positive social interaction, and tangible support), social participation, and depression in caregivers and non-caregivers. Data from 6,674 CLSA participants was analyzed. Analysis of variance was used to assess differences in the means of social support, social participation, and depression. Path analysis was used to examine the relationships between the social variables and depression. Significant differences were found in the means of the social support domains of affectionate support, emotional support, positive social interaction, and social participation with caregivers reporting higher levels

than non-caregivers. Affectionate support and social participation were significant mediators of the relationship between caregiver status and depression. Higher levels of affectionate support and social participation were associated with lower depression scores. The study provides insight into the type of social support that is beneficial to caregivers.

SUPPRESSION OF SHC ADAPTOR PROTEIN AS A PHARMACOLOGICAL INTERVENTION TO AMELIORATE AGE-STRESS

T.H. Peiris, P. Kapahi, *Buck Institute for Research on Aging, Novato, California*

Advanced glycation end products have pathogenic implications towards diabetes, liver diseases and various other neurodegenerative diseases. In particular vascular complications that arise due to diabetes involves neuropathy, nephropathy, retinopathy and vitreopathy that lead to renal diseases and blindness. AGEs are endogenous products created by maillard reaction and several pathways including the glyoxalase I and aldo keto reductases are involved with detoxification of the AGEs. A recent study showed less circulating and tissue AGEs in p66Shc knockout mice compared to WT mice. A candidate genetic screen for worm orthologs of human genes associated with diabetic complications identified *C. elegans* SHC-1 as a strong modulator of pathogenic phenotypes in *glod-4* mutants (*C. elegans* model lacking a functional glyoxalase gene). These *glod-4* mutants maintain elevated AGEs, sensitivity to touch, and decreased lifespan. However RNAi against the *Caenorhabditis elegans* *shc-1* gene and Acarbose and Idebenone discovered as SHC protein binders increases the lifespan of these *glod-4* mutants. Thus we hypothesize that inhibition of SHC-1 may play an indispensable role in preventing AGE accumulation and AGE-stress. Thus in this study we propose to establish the mechanism by which *shc* modulates AGE accumulation and lifespan in *C. elegans*. Further we will study SHC inhibitors (and or diets that modulate SHC) as pharmacological intervention to ameliorate AGE-stress and increase healthspan and lifespan.

GAIT VARIABILITY AND LONGITUDINAL COGNITIVE CHANGE IN AGING

Q. Tian, S. Resnick, W. Bair, L. Ferrucci, S.A. Studenski, *National Institute on Aging, Baltimore, Maryland*

Age-related brain changes affect timing and coordination of gait as well as cognition. Gait variability is strongly associated with cognitive function, particularly executive function, but longitudinal studies of associations between baseline gait variability and subsequent cognitive declines are rare. A sample of 141 older participants from the Baltimore Longitudinal Study of Aging (mean age=75.9±7.2; female 32.6%) underwent gait assessment including temporal (double support time, swing time, stance time, gait cycle time, step time) and spatial (step width, stride length) gait variability. They had cognitive assessments of memory, executive function, and attention concurrent with and subsequent to gait assessment. Longitudinal associations of gait variability with rate of change in cognitive function were examined using linear mixed effects models, adjusted for age, sex, education, and body mass index. To assess association independence

from gait speed, models were further adjusted for gait speed. Higher variability in all temporal gait characteristics and stride length variability were associated with a steeper rate of decline in memory (all $p < 0.05$). Higher double support time variability was also associated with a steeper rate of decline in executive function ($p < 0.05$). Longitudinal associations remained significant after further adjustment for gait speed (all $p < 0.05$). Step width variability was not associated with cognitive decline (all $p > 0.05$). Among community-dwelling older adults, temporal gait variability and stride length variability may predict memory decline independent of gait speed. Double support time variability may also predict executive function decline.

PHYSIOLOGICAL MEASURES OF FATIGUE TO QUANTIFY OLDER ADULTS' MUSCLE ACTIVITY DURING EVERYDAY TASKS

V. Raichur, S.T. Mejia, K. Nielsen, A. Piszker, R. Gonzalez, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Muscle atrophy associated with aging leads to a decline in physical abilities that adversely affects quality of life. Understanding muscle activity during everyday tasks could enable the design of more accommodating products and environments. Fatigue is defined as a reduction in a muscle's ability to exert force following repeated use such as during exercise. Electromyography (EMG) technique is used to measure a muscle's electrical activity and recent studies have demonstrated the use of EMG in measuring fatigue during more ecologically valid tasks involving healthy and young adults. We use EMG-based methods to derive a physiological measure of muscle fatigue experienced by older adults during an everyday task, namely dishwashing.

Sixty women aged 60 years and older with self-reported arthritis in the hands participated in this study. Surface EMG technique was used to collect electrical activity data from participants' Flexor and Extensor muscles in both forearms as they completed a standardized task of washing 15 dishes in a controlled environment. We analyzed EMG data using the Joint Assessment of Spectrum and Amplitude (JASA) method, which simultaneously considers changes in frequency spectrum and amplitude over time. This method allowed us to categorize participants' muscle activity into either fatigue-induced states of fatigue and recovery or force-induced states of force increase and force decrease. Results indicated that the muscle activity profiles of nearly 55% of the participants fell under one of the fatigue-induced states. Informative differences in grip strength, gait speed, and self-reported functional limitation were found between participants experiencing fatigue-induced and force-induced states.

FATIGABILITY: A WINDOW ON ANEMIA OF CHRONIC DISEASE?

E.M. Simonsick, J. Schrack, S.A. Studenski, L. Ferrucci, *Intramural Research Program, National Institute of Aging, Baltimore, Maryland*

Fatigue is a hallmark symptom of anemia which in older adults typically signifies underlying disease processes and not iron-deficiency. Subjectively measured fatigue, however, may be an unreliable symptom as individuals typically equilibrate their activity levels to remain below their fatigue threshold.

Fatigability, in contrast, overcomes this limitation by providing context for fatigue and has been operationalized as the level of exertion experienced during a standardized task. Recent evidence shows that fatigability is superior to fatigue symptoms in predicting mobility decline; whether fatigability is a more sensitive indicator of prevalent and incident/persistent subclinical and clinical non-iron-deficient anemia is unknown. We evaluated the association between perceived fatigability (Borg rating of perceived exertion (RPE; range 6–20) following 5 minutes of treadmill walking at .67m/s) in 855 mobility-intact men (48%) and women aged 60–89 participating in the Baltimore Longitudinal Study of Aging. Adjusting for age, age-squared, sex, race and body mass index, each RPE increment was associated with 10% ($p = .02$) and 19% ($p < .001$) greater likelihood of prevalent age- and race-specific subclinical (24.8%) and clinical non-iron-deficient anemia (10.2%). Fatigue symptoms – tiredness and energy level – also predicted concurrent anemia status. After an average follow-up of 2.2 years, each RPE increment was associated with 9% ($p = .037$) greater likelihood of incident/persistent subclinical or clinical anemia (41.2%). No associations were found with tiredness or energy level (both $p > .4$). Fatigability appears superior to fatigue symptoms for identifying emerging or chronic non-iron-deficient anemia which may facilitate identification of persons with worsening health earlier in the disease trajectory.

OUTCOMES OF THE HEALTHY BRAIN, HEALTHY MIND PROGRAM FOR URBAN AND RURAL OLDER OKLAHOMANS

K.H. Sorocco^{1,2}, M. Mohon², J. Azzarello¹, J. Wilson¹, K.L. Kleszynski¹, J. Hoffmeister¹, L. Ford¹, A.N. Dentino¹, *1. University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Oklahoma VA Health Care System, Oklahoma City, Oklahoma*

The Oklahoma Healthy Aging Initiative (OHAI) developed the Healthy Brain, Healthy Mind (HBHM) program to improve mental and physical well-being of older adults living in rural and urban areas across the state of Oklahoma. HBHM is a four-week group intervention, with accompanying workbook containing 12 additional monthly lessons and exercises in health promotion. Based on accepted psychological principles of behavior change, HBHM addresses the impact of perceptions and mood on the desire to adopt and maintain health behaviors. The aim of this pilot project was to quantify the effect of HBHM on outcome variables such as mood, social support, sleep, and cognition as measured by the Patient Reported Outcomes Measurement Information System (PROMIS). We hypothesized mood, sleep, social support, and cognition will improve following participation in HBHM. A total of 31 community dwelling older adults across three OHAI sites in Oklahoma consented to participate in this pre post design. Post-participation change was assessed for each PROMIS measure in separate covariance structure models that accounted for correlated outcomes. All measures changed in a direction that supported our hypothesis. A significant improvement seen in scores for companionship ($p = .02$) after completion of HBHM. Regardless of demographic background, participants showed an increase in sense of companionship, suggestive of an increase in feelings

of social support. The role of demographic factors, including sex, ethnicity, and income, will be highlighted.

RESILIENCE AND SELF-ADVOCACY: AFRICAN AMERICAN AND LGBT PERCEPTIONS OF PROVIDER INTERACTIONS

R. Tadesse¹, A. Kuglin Jones¹, S. Rosenkranz², K. Cloyes¹, 1. *University of Utah, Salt Lake City, Utah*, 2. *Oregon Health & Science University, Portland, Oregon*

Despite differences in African American (AA) and lesbian, gay, bisexual, and transgender (LGBT) older adults, both vulnerable populations experience poorer health outcomes and barriers to care. This study's purpose is to examine resilience and self-advocacy as mediators of minority-specific sources of stress in AA and LGBT older adults. Participants self-identifying as AA (n=12) or LGBT (n=14) as older adults aged 60 or more were interviewed about their experiences in receiving care and interacting with the healthcare system for their chronic illnesses. Interviews were audio-recorded, transcribed, and deductively coded using Wagnild's definition of resilience. Per Wagnild, the elements of resilience have five essential characteristics: 1) Meaningfulness; 2) Perseverance; 3) Self-reliance; 4) Equanimity; 5) Existential aloneness. The determination to persevere was strongly evident in both the AA and LGBT older adults. Preliminary results indicate that there were examples of resilience that did not fit the definitions; in particular, the "self-reliance" and "existential aloneness" categories seemed ill-fitted to describing the family and community-oriented responses of AA and LGBT participants, and many of the examples of self-advocacy might be seen as challenging or negative behaviors by providers. While both AA and LGBT have traits of resilience signifying the ability to navigate stressful situations, the data suggests they take more actions consistent with the concept of self-advocacy. Both groups demonstrate that conventional definitions of resilience, such as Wagnild's, may not be well-aligned with their experiences. AA and LGBT older adults have learned ways of interacting with their healthcare providers that are protective, proactive, and healthy.

FACTORS ASSOCIATED WITH LONELINESS AMONG OLDER ADULTS LIVING IN LOW-INCOME INDEPENDENT HOUSING

R.P. Bonifas, R. Garbe, C. Vang, M. Casalean, *Arizona State University, Phoenix, Arizona*

Among older adults the experience of loneliness can negatively influence physical health, mental health, and psychosocial functioning. Although considerable literature provides a foundation for understanding loneliness among diverse older population groups, limited work has focused on loneliness among older adults living in independent low-income housing. As part of a larger study examining health and social outcomes among residents in one urban setting, an interactionist theoretical lens was used to assess relationships between loneliness and emotional well-being, health and physical functioning, social connectedness, and sense of community among older adults in the sample (n =44). The primary aim of analysis was to identify promising points of intervention to address loneliness. Findings reveal high levels of loneliness with 48 percent endorsing frequent to severe loneliness per the UCLA Loneliness Scale. Multiple linear regression results

indicated that the four independent variables predict 28.2 percent of the variance in loneliness ($f = 5.142$; $p < .002$), but neither social connectedness, as measured by the Lubben Social Network Scale, or sense of community, as measured by the Sense of Community Index II, were associated with loneliness. However, lower quality of life due to dissatisfaction with health and physical functioning (via Ferrans and Powers Quality of Life Index) and low emotional well-being (via SF-36) were both associated with higher reported loneliness. Findings suggest that loneliness reduction interventions focused on expanding social network connections and community integration might achieve greater leverage if residents are also supported to better cope with health issues, functional limitations, and emotional distress.

CARING FOR ABUSIVE PARENT AND MENTAL HEALTH: THE MEDIATING ROLE OF SELF-ESTEEM

J. Kong, *Penn State University, University Park, Pennsylvania*

Background and Objectives: This study aims to examine a sample of filial caregivers in order to investigate whether and how a history of childhood abuse affects caregivers' mental health (i.e., depressed affect, psychological well-being, and life satisfaction). This study also purports to examine the mediational role of self-esteem between caring for an abusive parent and mental health outcomes.

Research Design and Methods: Using the 2004–2006 National Survey of Midlife Development in the United States, data from 219 filial caregivers were analyzed. A series of ordinary least squares (OLS) regression and mediational analyses were conducted to estimate the direct and indirect effects of providing care for an abusive/non-abusive parent on negative affect, psychological well-being, and levels of life satisfaction.

Results: Key results showed that providing care to an abusive parent was associated with greater depressed affect and lower levels of life satisfaction. In addition, self-esteem served as a significant mediator: providing care to an abusive parent was associated with lower self-esteem, which was, in turn, ultimately associated with greater depressed affect, diminished psychological well-being, and lower levels of life satisfaction.

Discussion and Implications: Filial caregivers with a history of childhood abuse should be acknowledged as a high-risk group of caregivers so that they may gain attention and support for targeted interventions. Additionally, evidence-based intervention programs (e.g., improving self-esteem issues) should be designed and implemented to address this group's unique challenges and concerns.

SARCOSINE IS UNIQUELY MODULATED BY AGING AND DIETARY RESTRICTION IN RODENTS AND HUMANS

R.O. Walters¹, L. Fontana², I. Kurland¹, A. Diaz¹, E. Arias-Perez¹, A. Cuervo¹, D. Promislow³, D. Huffman¹, 1. *Molecular Pharmacology, Albert Einstein College of Medicine, Bronx, New York*, 2. *Washington University in St. Louis, St. Louis, Missouri*, 3. *University of Washington, Seattle, Washington*

A hallmark of aging is a decline in metabolic homeostasis, and these adverse changes can be attenuated by dietary

restriction (DR). However, the impact of aging, DR and their interaction on the metabolome, is not clear.

Fischer 344 x Brown Norway F1 rats were provided ad libitum (AL) or DR (60% AL) access to food from 3 to 6 months of age (YAL and YDR), or lifelong until 22 months (OAL and ODR, n=8/group). Additionally, serum was obtained from dwarf mice and a cohort of younger and older humans consuming a western or DR diet, and metabolomic analyses were performed.

In rat plasma and tissues, several metabolites changed with aging, particularly glycerophospholids and sphingolipids, which were markedly prevented with DR. Interestingly, a comparative screen of metabolite changes in rodents and humans identified circulating sarcosine as similarly reduced with aging, while DR prevented this age-related decline in both species ($P<0.05$). Furthermore, we identified sarcosine as markedly elevated in long-lived Ames dwarf mice ($P<0.05$). Finally, we show that sarcosine can directly and potently activate macroautophagy in mouse fibroblasts in a dose-dependent fashion ($P<0.05$).

In summary, these data provide a unique perspective on the complexity of metabolomic changes with aging and DR in mammals, and the potent ability of DR to oppose age-related shifts to the metabolome. Furthermore, we have identified circulating sarcosine as uniquely elevated in rodents and humans by DR, as well as in dwarf mice. Finally, we confirm this biogenic amine may be an activator of macroautophagy by DR.

PREDICTORS OF END-OF-LIFE PLANNING: HEALTH AND RETIREMENT STUDY

M. Herrera, R.E. Bassett, D. Paulson, *University of Central Florida, Orlando, Florida*

Previous end of life (EOL) research found that White elders were more likely than non-Whites to have advanced care plans, but generalizability of those findings may be limited by sampling characteristics. Goals were to replicate these findings using a large nationally representative sample of older adults. Sample included 1625 proxy-respondent dyads from the Health and Retirement Study (mean age=80.1 years; mean education=12.1 years). Dichotomized demographic variables included gender (52% female), race (82% White), ethnicity (7% Hispanic), and religion (95% religious). Other variables were relationship status, cancer diagnosis, and medical comorbidity as defined by the presence of one or more of the following: hypertension, heart disease, lung disease, diabetes, stroke and arthritis. The criterion variable was presence of EOL instructions. Results of a binary logistic regression were that respondents who were older ($b= 0.004(0.001)$, $p<.001$), more educated ($b= 0.28(0.04)$, $p<.001$), non-Hispanic ($b= -0.79(0.23)$, $p=.001$), non-religious ($b= -0.77(0.29)$, $p=.01$), less healthy ($b=0.10(0.04)$, $p=.01$), White ($b= -1.48(0.68)$, $p=.03$), or had a cancer diagnosis ($b=0.46(0.12)$, $p=.003$) were more likely to have provided EOL instructions. The main effects of gender ($b=0.07(0.12)$, $p=.53$) and relationship status ($b= -0.05(0.12)$, $p=.68$) as well as the interaction of race with religion ($b= 0.54(0.70)$, $p=.44$) did not significantly predict whether the respondent had a living will. Primary findings that cultural and health-wise considerations are relevant for EOL planning support past work. Further studies need to

evaluate possible mediators that might influence the relation between multiple demographic variables resulting in different outcomes for EOL planning among different groups with diverse clinical presentations.

RESILIENCE AND SELF-ADVOCACY IN AFRICAN AMERICAN AND LGBT OLDER ADULTS CHRONIC ILLNESS CARE

R. Tadesse¹, A. Kuglin Jones¹, S. Rosenkranz², K. Cloyes¹, 1. *University of Utah, Salt Lake City, Utah*, 2. *Oregon Health & Science University, Portland, Oregon*

Despite differences in African American (AA) and lesbian, gay, bisexual, and transgender (LGBT) older adults, both vulnerable populations experience poorer health outcomes and barriers to care. This study's purpose is to examine resilience and self-advocacy as mediators of minority-specific sources of stress in AA and LGBT older adults. Participants self-identifying as AA (n=12) or LGBT (n=14) as older adults aged 60 or more were interviewed about their experiences in receiving care and interacting with the healthcare system for their chronic illnesses. Interviews were audio-recorded, transcribed, and deductively coded using Wagnild's definition of resilience. Per Wagnild, the elements of resilience have five essential characteristics: 1) Meaningfulness; 2) Perseverance; 3) Self-reliance; 4) Equanimity; 5) Existential aloneness. The determination to persevere was strongly evident in both the AA and LGBT older adults. Preliminary results indicate that there were examples of resilience that did not fit the definitions; in particular, the "self-reliance" and "existential aloneness" categories seemed ill-fitted to describing the family and community-oriented responses of AA and LGBT participants, and many of the examples of self-advocacy might be seen as challenging or negative behaviors by providers. While both AA and LGBT have traits of resilience signifying the ability to navigate stressful situations, the data suggests they take more actions consistent with the concept of self-advocacy. Both groups demonstrate that conventional definitions of resilience, such as Wagnild's, may not be well-aligned with their experiences. AA and LGBT older adults have learned ways of interacting with their healthcare providers that are protective, proactive, and healthy.

SEX DIFFERENCES IN HERITABILITY-BY-AGE INTERACTION ON DEMENTIA RISK IN THE SWEDISH TWIN REGISTRY

C. Beam¹, C.A. Reynolds³, N.L. Pedersen², M. Gatz¹, 1. *University of Southern California, Los Angeles, California*, 2. *Karolinska Institutet, Stockholm, Sweden*, 3. *University California-Riverside, Riverside, California*

Heritability estimates describe the proportion of variability in a trait attributed to genetic differences in a population in a given context. Secular improvements in environmental conditions across the 20th century may interact with genotype, thus leading to our hypothesis that genetic influences on dementia risk would be greater in recently born men and women versus earlier born men and women. We drew a sample of 5,970 complete sets of monozygotic (MZ) and dizygotic (DZ) twin pairs (MZ Male: 610; DZ Male: 971; MZ Female: 933; DZ 1,571, and DZ Opposite Sex: 1885) who met criteria for dementia or were cognitively intact in 4 aging studies of the Swedish Twin Registry. Dementia diagnosis was determined based on

in-person workup and medical records (using DSM-IV criteria for dementia, and NINCDS-ADRDA criteria for AD) or individual-level data from the Swedish National Patient Register and Cause of Death Register. Twin correlations were calculated using a modified twin-correlation model that allowed birth year to moderate MZ, same-sex DZ and opposite-sex DZ twin correlations to explore sex differences in underlying genetic and environmental influences on dementia risk. In women, heritability estimates ranged from .52 to .79 from earliest to recent birth years. In men, heritability estimates ranged from essentially 0 to .72 from earlier to more recent birth years. Overall, twin correlations were lower at earlier than at more recent birth years. Genetic influences on dementia risk appeared to be greatest in recently born men compared to all women and earlier born men.

IMPACT OF AGE GROUP AND PSYCHOSOCIAL FACTORS ON QUALITY OF LIFE AMONG PERSONS LIVING WITH HIV

H. Jang², M.J. Silverberg², W. Leyden², A. Leibowitz², D. Satre^{2,1}, 1. *University of California, San Francisco, San Francisco, California*, 2. *Kaiser Permanente Division of Research, Oakland, California*

As persons living with HIV (PLWH) live longer, HIV care has transitioned to chronic disease management with an important objective of maintaining satisfactory quality of life (QOL). The goal of this study was to compare mental and physical QOL between older and younger PLWH, and to identify factors associated with improved QOL within each age group. This cross-sectional study was conducted in a sample of PLWH enrolled in a randomized clinical trial in Kaiser Permanente Northern California evaluating a behavioral intervention to reduce alcohol use (N=614) and used both medical record and survey data. QOL was assessed by the SF-12 and included physical health summary (PHS) and mental health summary (MHS) scores, both with values between 0–100, with higher values representing better QOL. Multivariable linear regression was used to investigate the association between QOL and demographic, clinical, and psychological factors by age (18–50 and 50+ years). Participants were predominantly male (97.1%), non-Hispanic white (62.7%), and included 304 participants age 50+ and 310 participants <50 years of age. For PLWH age 50+, significant predictors of physical QOL were employment status ($\beta=-6.3$, $p<0.0001$) and depression ($\beta=-6.0$, $p<.001$), and significant predictors of mental QOL were alcohol or other substance use ($\beta=-6.5$, $p<0.0001$), depression ($\beta=-7.9$, $p<0.0001$), and anxiety ($\beta=-13.4$, $p<0.0001$). Depression was significantly related to QOL among PLWH in both age groups. Results highlight age group differences in predictors of QOL, as well as the importance of treating depression and substance use in order to maintain QOL for older PLWH.

HEALTH AND DISABILITY INSURANCE AMONG PERSONS WITH MULTIPLE SCLEROSIS

C.M. Musil¹, D. Miller², S. Givens¹, S. Planchon², S. Cofield³, H. Schmidt⁴, M. Mercer², 1. *Case Western Reserve University, Cleveland, Ohio*, 2. *Cleveland Clinic, Cleveland, Ohio*, 3. *The University of Alabama at Birmingham, Birmingham, Alabama*, 4. *The Accelerated Cure, Boston, Massachusetts*

Persons with Multiple Sclerosis (MS) have a life expectancy 6–7 years less than those without the disease, but disability increases with disease duration and often limits ability to work. Access to personal insurance, including health (HI), short- and long-term disability income (STD, LTD), long-term care (LTC), and life insurance (LI), is largely employer-based or purchased out of pocket from earnings. Maintaining or losing employment can cause concern regarding the cost and coverage of insurance, especially for those over 50 years of age, for whom keeping employment may be challenging at best.

US residents, diagnosed with MS (18–65) were surveyed through the North American Research Committee on MS (NARCOMS), iConquerMS, and the NMSS about current types and sources of insurances, employment status, and concern about maintaining insurance.

2507 eligible respondents completed an online survey regarding current insurance and demographic information: mean 53.5(8.5) years old, 82.9% female, 3.8% Hispanic/Latino, 91.2% Caucasian, 65.4% married, mean disease duration 16.4 years; 61% of those under 50 years old were employed (vs. 34% >50 years). Most (96.3%) had HI, 58.8% LI, 35.9% LTD. Those under 50 were more likely to have STD (27% vs. 14%) and attend a MS Center (41% v. 33.5%), and less likely to have LTC insurance (7.5 vs. 10.5%). Respondents (56%) reported concern over maintaining employment to keep insurance, with no difference by age group. The concern of maintaining employment in order to ensure continuing coverage of all insurance types may impact employment decisions and lead to stress within families of people with MS.

INVESTIGATING PROTEIN HOMEOSTASIS IN C. ELEGANS AND C. BRIGGSÆ STRAINS USING MASS SPECTROMETRY

B. Schilling, D. Bhaumik, K.J. Dumas, R.K. Quinn, G.J. Lithgow, *Chemistry Core, Buck Institute, Novato, California*

Protein homeostasis is highly relevant in the context of aging and several age-related diseases. We are interested in monitoring changes in the insoluble protein compositions, the insolubome, in worms at different stages of the adult worm starting from Day 2. We are analyzing samples from different *C. elegans* and *C. briggsæ* strains, including long-lived and ‘wild’/non-laboratory strains. These include N2 and JU775 strains from *C. elegans* and AF16 and HK104 from *C. briggsæ*. We chose these strains as the median life span of these strains are very different with N2 having a median life span of 16 days and HK104 having a median life span of 30 days. Protein lysates are harvested from worms at days 2, 10 and at the day corresponding to the median life span (e.g. at 17 or 20 days etc.). Each time point is processed in multiple biological replicates. We analyze the 1% SDS insoluble fraction and prepare them for mass spectrometric analysis on a TripleTOF 6600. Our mass spectrometric workflow uses a combination of data-dependent acquisition (DDA) and data-independent acquisitions (DIA/SWATH), which allows for both protein identification and quantification. With these datasets many comparisons can be made, the insolubome pattern can be compared between different

days for each worm strain and in addition determining differences between strains.

CONTENT VALIDITY OF THE PROFESSIONAL GOOD PRACTICES SCALE IN NURSING HOMES

C. Noriega¹, G. Perez-Rojo¹, J. Lopez¹, I. Carretero¹, C. Velasco¹, P. Lopez¹, A. Chulian², 1. *CEU San Pablo University, Madrid, Spain*, 2. *Official Professional Association of Psychologists, Madrid, Spain*

There is a lack of research regarding institutional older people's abuse. The few studies developed to date have mainly focused on explicit forms of abuse, such as physical, financial and psychological. However, subtle forms of abuse have not received a suitable attention, especially in institutional settings.

The objective of this study was to develop a preliminary version of an innovative scale that evaluates professionals' good practices in Spain, since the lack of them can be considered as an indicator of abuse.

An extensive literature review of the instruments that assess older people's abuse was done. 58 items were developed, including reverse-scored and direct-scored items. The items were divided into 4 subscales, based on Kayser and Jones' (1990) types of violence: Personalization, Humanization, Not Infantilization, and Not Victimization.

The adequacy of the items to the instrument was assessed by a panel of 5 experts in gerontology. We used Rovinelli and Hambleton's index of item-objective congruence to analyze items' inclusiveness in the assigned category, and the paired comparison task to assess the level of item relevance and clarity. Values over .70 were considered adequate. The results showed that 91.37% items were clear, 93.19% were relevant and 98.28% fitted in the assigned category. Considering this, two items were deleted and six were re-written. As a result, the scale Not Infantilization contained 6 items, Personalization 12, Humanization 16, and Not Victimization 22 items. This scale will contribute to the detection and development of intervention programs that promote good practices in nursing homes.

ADVANCED GLYCATION ENDPRODUCTS (AGES) AT THE NEXUS OF AGING, DIABETES, AND NEURODEGENERATION

N. Bose, S. Kumar, K. Ghosh, *The Buck Institution for Research on Aging, Novato, California*

Aging and hyperglycemia results in an accumulation of a series of reactive α -dicarbonyl compounds (α -DCs, e.g. glyoxal/GO, methylglyoxal/MGO, 3-deoxyglucosone/3DG) and α -DC-derived metabolites, called advanced glycation end products (AGEs). AGEs form due to the reaction of α -DCs with proteins, lipids, and DNA causing cellular stress linked with specific age-related processes, diabetic complications and neurodegeneration. Therefore, preventing α -DC and AGE buildup is of quintessential importance for slowing aging and limiting the progression of various age-related diseases. A major bottleneck in understanding the biochemistry behind the progression of these complications, and hence rapid drug development, is the lack of genetically tractable models that can recapitulate the

effects of α -DC and AGE accumulation in a short time frame. To that end, we have established a *Caenorhabditis elegans* model based on an impaired glyoxalase gene to study α -DC and AGE-related pathologies. These animals exhibit several phenotypes reminiscent of diabetic complications, such as accumulation of MGO and AGEs, and hyperesthesia (or hyper sensitivity to touch), within two weeks of adulthood. Most interestingly they demonstrate increased age-related neuronal damage and shortened lifespan. Using this model we have identified a critical role for TRPA-1, a transient receptor potential (TRP) channel in sensing MGO and activating Nrf2 (Nuclear factor erythroid-2 like 2, or NFE2L2) to counteract the effects of AGEs. A preliminary drug screen using this model has resulted in 2 promising compounds that can ameliorate AGE-related pathologies in *C. elegans* through TRPA-1/SKN-1 activation. We propose to use *C. elegans* as an invertebrate model to study the effects of AGE accumulation within two weeks which can take years to develop in humans, to allow rapid discovery of genetic and pharmacological targets relevant to aging and age-related diseases where AGEs play an important role.

FACTORS SHAPING CARIBBEAN NURSE MIGRATION AND THE IMPACT ON LONG-TERM CARE

R. Thompson, E.S. McConnell, K.N. Corazzini, *Duke University, Durham, North Carolina*

Current and projected shortages of nurses in long term care (LTC) settings in the United States, have resulted in increasing employment of foreign educated (FE) nurses (Redfoot & Houser, 2008); an estimated 31% (18,290) of FE RNs and 88% of FE LPNs (5,280), worked in LTC facilities (Smith & Crawford, 2004). The Caribbean is one of the top regions in Low and Middle Income Countries (LMIC) sending nurses to supply the U.S. LTC workforce (MacLean et al., 2014). To advance our understanding of factors shaping this migration, a systematic review was conducted. PubMed and CINAHL were searched between September-November, 2016, supplemented with the snowball method, and gray literature retrieved from key stakeholder organizations (e.g., ICN, WHO). Article reviews were conducted using the matrix method by Garrard (2014). Themes identified included push and pull factors, and economic impact of nurse migration. Pull factors were better remuneration, improved working conditions, and opportunities for professional advancement while push factors included poor remuneration, lack of professional development and stressful working conditions. Migration resulted in a loss of US\$ 15–20 million invested by Caribbean countries in training nurses. Evidence suggests that among foreign-born nurses, lapses in patient safety are linked to breakdowns in communication in destination countries. Nurse migration creates a chasm between health systems of developed and developing countries and failure to address this issue will result in growing health disparities and greater challenges in meeting the health needs of the growing elderly populations in both developed and developing countries.

DECISION-MAKING INVOLVEMENT AND CARE VALUES OF AFRICAN AMERICAN PERSONS WITH DEMENTIA

K. Bonds¹, C.S. Lee¹, C.J. Whitlatch², K.S. Lyons¹, 1. *Oregon Health & Science University, Portland, Oregon*, 2. *Benjamin Rose Institute on Aging, Cleveland, Ohio*

Decision-making involvement of persons with dementia (PWD) has been associated with the PWD's quality of life, underlines personhood and can reduce ethical dilemmas for family caregivers (CG) and clinicians (Menne, Judge, & Whitlatch, 2009; Miller, Whitlatch, & Lyons, 2016). Previous research has found the CG's perception of the PWD's care values are significantly associated with how involved the PWD is in decision-making (Reamy, Kim, Zarit, & Whitlatch, 2011; Reamy, Kim, Zarit, & Whitlatch, 2013). Yet, no known study has examined the relationship of care values and the older adult within African American (AA) culture. Using multivariate linear regression, we examined cross-sectional data collected from 57 AA dementia dyads (PWD and CG). The PWDs, on average, were 77.4(7.7) years old and CGs were 60.4(13.2) years old. Twenty nine percent of the dementia dyads were spousal caregivers. Results indicate the PWD was significantly more likely to perceive themselves as having greater involvement in decision making when the CG reported that the PWD valued autonomy ($\beta = 0.38 \pm 0.16$, $t = 2.42$, $p = .19$) and when the PWD valued not being a burden ($\beta = 0.53 \pm 0.19$, $t = 2.76$, $p = .008$). Type of CG and living status were not significantly associated with the PWD's perception of decision-making involvement. Our findings suggest the importance of understanding the perception of both the PWD and CG. Future research is needed to examine decision-making within the context of the AA dementia dyad and the impact on the quality of life of both the PWD and CG.

LONGITUDINAL EFFECTS OF OWN AND PARTNER DEPRESSIVE SYMPTOMS ON MULTIMORBIDITY IN AGING COUPLES

C. Polenick², B.N. Renn¹, K. Birditt², 1. *University of Washington, Seattle, Washington*, 2. *University of Michigan, Ann Arbor, Michigan*

Multimorbidity (i.e., multiple chronic conditions) among middle-aged and older adults is an increasingly prevalent public health concern. Depressive symptoms are linked to a heightened risk of multimorbidity, yet little is known about mutual influences between depressive symptoms and chronic health conditions that may occur within aging couples. Utilizing a U.S. sample of 1,038 consistently married heterosexual couples ($M = 63.51$ years at baseline) drawn from five waves (1996 – 2014) of the nationally representative Health and Retirement Study (HRS), we examined the effects of wives' and husbands' baseline depressive symptoms (as assessed by the 8-item CES-D) on their own and their partner's number of chronic conditions across an 8-year period. We also considered whether these links varied by gender. Dyadic growth curve models controlled for baseline length of marriage and marital quality along with age, education, minority status, body mass index, disability status, alcohol use, smoking status, and physical activity. For wives and husbands, elevated depressive symptoms at baseline were

significantly linked to an overall higher number of chronic conditions. Beyond these associations, when wives had elevated depressive symptoms at baseline, husbands reported significant increases in their number of chronic conditions over time. This study demonstrates that depressive symptoms are linked to multimorbidity within aging couples, and that wives' depressive symptoms may have long-term negative health consequences for husbands. Findings highlight the value of considering the health effects of depressive symptoms in middle and later life from both individual and couple perspectives.

MIDLIFE BMI TRAJECTORIES AND RISK OF FRAILITY AMONG ELDERLY IN TAIWAN: A 8-YEAR COHORT STUDY

H. Ho^{1,2,3}, W. Chu^{1,4}, C. Yeh⁵, M. Lee^{1,6,7}, 1. *Institute of Medicine, Chung Shan Medical University, Taichung, Taiwan*, 2. *Taichung Armed Forces General Hospital, Taichung, Taiwan*, 3. *National Defense Medical Center, Taipei, Taiwan*, 4. *Department of Family Medicine, Taichung Veterans General Hospital, Chia-Yi Branch, Chia-Yi, Taiwan*, 5. *School of Public Health, Chung-Shan Medical University, Taichung, Taiwan*, 6. *Department of Family Medicine, Taichung Hospital, Ministry of Health and Welfare, Taichung, Taiwan*, 7. *Institute of Population Sciences, National Health Research Institutes, Miaoli, Taiwan*

In previous studies, the relationship of body weight and frailty was under debate. Obesity paradox was noted in some studies and most of them used traditional cohort study ignoring the weight change effect during the follow-up years. This is the first study in Asia using group-based model of trajectory to estimate body mass index trajectories among elderly and the association with frailty. Data were retrieved from the Taiwan Longitudinal Study on Aging. This study was conducted from 1999 to 2007. Analysis was restricted to respondents who were not frail in 1999 and still survived in 2007 ($n=1609$). Frailty was defined using Fried criteria. Four trajectory classes were identified and each remained no change across 8-year follow up. There were 316 participants (20.3%) in the low-normal weight group with mean final BMI=20.25kg/m², 737 participants (44.7%) in the high-normal weight group with mean final BMI=23.4kg/m², 449 participants (28.4%) were in the overweight group with mean final BMI=26.7kg/m² and 107 participants (6.6%) in the obesity group with mean final BMI=31.4kg/m². After adjustment of gender, age, level of education, income, social participation, self-rated health, health behaviors and major comorbidities, consistent low-normal weight group [Odds ratio (OR) = 1.839; 95% confidence interval (CI) = 1.072–3.155] and obesity group [Odds ratio (OR) = 2.038; 95% confidence interval (CI) = 1.023–4.058] were associated with increased frailty compared to high-normal weight group. Our results showed that consistent low-normal weight group and obesity group are associated with risk of frailty.

SOCIAL CARE-RELATED QUALITY OF LIFE IN OLDER PEOPLE WITH MULTIMORBIDITY

A. Stoop^{1,2,3}, R. Hendrikx³, H. Drewes¹, G. Nijpels², C. Baan^{1,3}, S. de Bruin¹, 1. *The Netherlands Institute for Public Health and the Environment, Bilthoven*,

Netherlands, 2. VU University Medical Center, Amsterdam Public Health research institute, Department of General Practice and Elderly Care Medicine, Amsterdam, Netherlands, 3. Tilburg University, Tranzo, Tilburg, Netherlands

Many instruments are available to evaluate outcomes of care and support services for older people living in the community. These instruments focus predominantly on health-related quality of life (e.g. Short Form 12 Health Survey). Recently, alternative perspectives on measuring outcomes of care and support services have gained more attention. An example is the Adult Social Care Outcomes Toolkit (ASCOT) assessing social care-related quality of life (SCRQoL). With this tool, SCRQoL is measured across eight domains considered relevant to older people, such as control over daily life, personal safety, social participation and dignity. So far, insight in the impact of socio-demographic and lifestyle factors on SCRQoL in older people is still limited. To increase our knowledge, we used cross-sectional data from the Dutch study 'National Monitor Pioneer sites', consisting of 2,724 older people with multimorbidity living at home, of whom 2,221 completed the ASCOT. The study participants were on average 81.4 years old, and 42.9% of them were male. They had an average SCRQoL score of 0.793 (scores between -0.171 and 1.00, with higher scores reflecting better SCRQoL). Multiple regression analyses demonstrated an effect of physical activity (beta = 0.318, $p < 0.001$), age (beta = -0.143, $p < 0.001$) and education (beta = -0.046, $p = 0.039$) on the SCRQoL score, with less active, older and lower educated participants reporting lower scores. These findings may help professionals and policy-makers to tailor interventions to specific groups of older people based on their socio-demographic and lifestyle characteristics, in order to optimize their SCRQoL.

FOOD INSECURITY, DEPRESSION, AND DIABETES AMONG U.S. OLDER ADULTS

M. Park, M. Kochman, I. Bardhan, A. Spinder, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Food insecurity is a global problem. Access to sufficient nutrition is essential components of physical and emotional health. Those who are experiencing food insecurity are at high risk for poor blood glucose control and diabetes. Food insecurity is also a risk factor for depression. Additionally, a body of research has shown strong associations between depression and diabetes. Unfortunately, limited data is available to conclude how food insecurity may impact the association between diabetes and depression.

Using a nationally representative sample of U.S. older adults (age 65 and greater) from the 1999–2014 National Health and Nutrition Examination Survey ($n = 71,916$), we examined the association between food insecurity, depression, and diabetes among the U.S. older adults. Experiencing food insecurity was strongly associated with increased odds for diabetes (OR 1.41; 95% CI: 1.11–2.24), and elevated risk for depression (OR 1.20; 95% CI: 1.10 – 4.43). Having food insecurity increased the likelihood of having both depression and diabetes by 2-fold (OR 2.34, 95% CI: 1.35–4.42). Considering the negative impact of food insecurity on diabetes and depression, identifying older adults who experience

food insecurity may be an important step to managing diabetes and depression better.

PRESENCE OF ELDER INJURY IN CRIME: FINDINGS FROM 2014 NIBRS DATA

G. Galdamez, Z.D. Gassoumis, *University of Southern California, Los Angeles, California*

Emergent research in elder abuse has sought to understand the occurrence of physical injury among older victims of abuse, specifically focusing on categorization of abuse and comparison of injuries in intentionally injured versus accidentally injured older adults. Driven by a focus on forensic markers and justice system outcomes, these findings have been pushing forward the understanding of abusive injuries in older adults by justice and law enforcement practitioners. This growing body of knowledge has revealed one important missing piece: the frequency with which injuries surface in older adults who have been victimized. This study uses 2014 NIBRS data ($N = 1,070,147$) to evaluate how frequently crimes reported to law enforcement in the United States have resulted in visible, physical injury to victims aged 60 years and older. The data used in this study are based on law enforcement reports from 33 states, and have been modified to include crimes that are likely to result in injury: rape/sexual assault, robbery, aggravated assault, simple assault, burglary, purse-snatching. Preliminary results indicate that 4.34% of all criminal incidents reported had older adult victims. Among older victims ($n = 530,574$), injuries were reported in 44.32% of cases as opposed to 51.54% of cases involving adults less than 60 ($p < .0001$). Although the field has experienced progress in terms of categorizing injuries when they appear as a result of abuse, there is dire need to understand the prevalence of these injuries. This has the potential to improve criminal justice practice and improve outcomes for older victims of elder abuse.

COMPARISON OF SURVIVAL AMONG OLDER ADULTS TREATED VERSUS NOT TREATED WITH CHRONIC DIALYSIS

H. Tam-Tham, R. Quinn, R. Weaver, J. Zhang, C. Thomas, K. Fruetel, K. King-Shier, B. Hemmelgarn, *Community Health Sciences, University of Calgary, Calgary, Alberta, Canada*

Background: Treatment options for older adults with kidney failure generally include chronic dialysis or non-dialysis (conservative) care. Previous comparisons of survival for dialysis and non-dialysis care patients have been limited to those referred to nephrology, with considerable differences in characteristics between those treated and not treated with dialysis.

Objective: To compare time to all-cause mortality among older adults with kidney failure treated versus not treated with chronic dialysis.

Methods: We conducted a population-based retrospective cohort study, using administrative and laboratory data to identify adults aged ≥ 65 in Alberta who experienced kidney failure from 2002 to 2012. Kidney failure was defined by ≥ 2 consecutive outpatient estimated glomerular filtration rate (eGFR) of $< 10 \text{ ml/min/1.73m}^2$ spanning a period of ≥ 90 days. The index date was the first eGFR that met

the 90-day criteria. The exposure-outcome relationship was examined using Cox regression modelling with propensity score matching to account for baseline differences in demographics and comorbidities between treatment groups.

Results: 838 patients met cohort inclusion criteria. 386 (46.1%) were included in the final propensity score matched cohort (mean age 80.2, 44.8% male, mean eGFR 7.8ml/min/1.73m²). 78.2% of adults in the non-dialysis group and 67.9% in the dialysis group died. The hazard ratio within 3 years of follow-up was 0.62 (95% CI 0.45–0.84), suggesting a potential survival benefit among those treated with dialysis.

Conclusions: Among older adults with similar characteristics treated and not treated with chronic dialysis, dialysis may confer a survival benefit. These findings have important implications for informing clinical decision-making.

THE ROLE OF SOCIAL CONTACT IN THE ASSOCIATION OF AGE AND WELL-BEING

T. Ikeuchi, E. Kobayashi, Y. Fujiwara, *Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

Social network structure has been found to change across the lifespan. Particularly in later life, emotional well-being could benefit from smaller social networks comprised of familiar and close social partners, as suggested by socioemotional selectivity theory. This study examined the potential role of social contact in psychological well-being in different age groups. Data were collected in 2016 in a suburb of Tokyo's metropolitan area in Japan via mail surveys. The sample consisted of 3,852 Japanese adults (55% female) ranging in age from 18 to 93 ($M = 54.5$, $SD = 17.7$). Participants in four age groups (under 40, 40–64, 65–74, and 75 plus) were used as comparisons. The potential interaction of social contact with age and psychological well-being was tested using PROCESS macro for SPSS. Among three age groups (under 40, 40–64, and 75 plus), age was associated with a significant decrease in the frequency of social contact with friends or neighbors. However, only among older age groups (65–74 and 75 plus), age was associated with a significant decrease in the frequency of social contacts with family members who are not living together. Interestingly, despite the decreases in the frequency of contact, among all four age groups, social contact with friends or neighbors was a stronger predictor of psychological well-being than social contact with family members. Our findings suggest that fewer social contacts with familiar social partners, such as friends and neighbors, can still contribute to maintaining psychological well-being, particularly in older age.

THE FEMALE SURVIVAL ADVANTAGE DIMINISHES PROGRESSIVELY WITH AGE IN GENETICALLY HETEROGENEOUS MICE

C. Cheng, J. Gelfond, J.F. Nelson, *University of Texas HSC at San Antonio, San Antonio, Texas*

The female survival advantage is one of the most robust characteristics of human longevity, but the underlying biological mechanisms are unknown. Inbred mice are overwhelmingly used in biogerontological research, but their susceptibility to strain-specific diseases and lack of a consistent female survival advantage limit their usefulness to

understand sex differences in aging. Genetically heterogeneous mice can be used overcome the limitations of strain-specific pathology and other traits. Our objective was to determine whether genetically heterogeneous mice exhibit a female survival advantage similar to that of humans. We therefore examined mortality in >3000 male and female UMHET3 mice -- a 4-way cross of genetically divergent inbred strains: Balb/cByJ, C57BL/6J, C3H/HeJ, and DBA/2J. These mice were the control populations for testing potential lifespan extending drugs in the NIA Intervention Testing Program. Median lifespan was greater in female mice in every cohort (6) examined. Moreover, the decreased mortality risk of females was not uniform across age groups; it peaked around 400 days and diminished progressively thereafter--becoming negligible after attainment of median lifespan. This progressive diminishment of the female survival advantage parallels that of humans. Of note, age-specific mortality of males differed significantly across the 3 sites of drug testing, whereas that of females did not. These results indicate that genetically heterogeneous UMHET3 mice have sex differences in mortality that parallel those in humans and that this model can be used to probe the mechanisms for sex differences in aging and responses to interventions. (Supported by NIA and Glenn Foundation Fellowship (CJC)).

THE RELATIONSHIP OF AGE, LONGEVITY AND COMORBIDITY IN OLDER ADULTS

P. Lockhart¹, P. Martin¹, L.W. Poon², *1. Iowa State University, Ames, Iowa, 2. University of Georgia, Athens, Georgia*

The number of older adults living with multiple disease conditions is increasing. The purpose of this study was to investigate the relationship of age, longevity, and comorbidity in 319 participants (103 men and 216 women), 60 to 107 years of age ($M = 85.27$), from the Georgia Centenarian Study. Of those participants, 232 were White, 87 were Black. Of the 319 participants, this study has 295 confirmed death dates. A comorbidity index was calculated for each participant based on the Charlson Comorbidity Index (Charlson, 1987). Two blocked multiple regression analyses were computed to first examine the relationship of comorbidity as the dependent variable and age, gender and race/ethnicity as independent variables. Second, the relationship of comorbidity as the dependent variable and age at death as a longevity index, gender and race/ethnicity as independent variables was assessed. In the first regression, age ($\beta = .73$, $p < .001$) was positively associated with comorbidity, whereas gender and race/ethnicity were not significant. In the second regression, age at death as a measure of longevity was positively associated with comorbidity ($\beta = .40$, $p < .001$) suggesting that comorbidity is a consequence of longevity. Once again, gender and race/ethnicity were not significant. These findings are important in our understanding of comorbidity in older adults. As age-specific mortality rates decline and the average life expectancy nears 80 years, understanding the influence of chronic conditions is more imperative than ever before.

OLDER WORKERS: CHANGES IN EMPLOYMENT ARRANGEMENTS, JOB CHARACTERISTICS, AND HEALTH

J. Grosch, *NIOSH/CDC, Cincinnati, Ohio*

The aging of the workforce in the U.S. and many other countries is having a profound impact on how we conceptualize and approach occupational safety and health. The purpose of this study was to examine how work arrangements, job characteristics, and health vary across the working life. Data came from the 2014 General Social Survey (GSS) which is conducted as a face-to-face interview and provides a representative sample of the U.S. adult population. In 2014, a 76-item quality of work life module was administered to a sample of 1,240 workers in order to examine a broad range of working conditions and health measures. Analyses compared 5 age groups (18–34, 35–44, 45–54, 55–64, 65+), controlling for other demographic factors. Older workers (i.e., 55+ years) were more likely to be part-time employees, independent contractors, work mainly from home, or in small businesses. They were less likely to be permanent employees or in jobs that required mandatory overtime. In terms of perceived job characteristics, older workers reported less job stress, higher levels of job satisfaction, greater autonomy, and more supervisor support than young or middle-age workers. For health measures, older workers were less likely to be injured at work and reported fewer days missed because of mental health issues. However, they were more likely to miss work because of physical health issues. No consistent pattern emerged for back or arm pain. Results are discussed in terms of implications for the field of occupational health and the goal of designing “age-friendly” workplaces.

ASSOCIATIONS BETWEEN THE NOVEL JUMP TEST, GRIP STRENGTH AND PHYSICAL PERFORMANCE: THE MROS STUDY

M. Winger¹, P. Caserotti², J.A. Cauley¹, R. Boudreau¹, S.R. Piva¹, P.M. Cawthon³, E. Orwoll⁴, E.S. Strotmeyer¹,
1. *Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *University of Southern Denmark, Odense, Denmark*, 3. *California Pacific Medical Center Research Institute, San Francisco, California*, 4. *Oregon Health and Science University, Portland, Oregon*

Novel task-based and body-weight bearing jump tests assess maximum muscle power capacity and may differentially relate to physical performance vs. standard muscle function tests, though these are not well-studied. We evaluated these relationships in the Osteoporotic Fractures in Men (MrOS) Study. Muscle function tests included hand-held dynamometry grip strength (kg) and jump peak power (Watts/kg body weight), force (Newton/kg body weight) and velocity (m/s) at peak power. Physical performance included 400m walk completion (seconds), 6m usual walk (m/s), and 5 repeat chair stands (seconds). Of men attending clinic visits (N=1,841; aged 85.0 ± 4.5 years; 10% minorities), 68% had valid jumps (N=1,242). In age, race, site and height adjusted Pearson correlations, jump power/kg was moderately correlated with all performance measures (range: r=0.42–0.48). Jump velocity was moderately correlated with 400m walk time (r=0.43). All other correlations were weak including grip strength with all jump and performance measures (r<0.40; all p<0.001). In linear regression with standardized β coefficients adjusted for age, race, site, height, falls history, hip/joint pain, cognition and comorbidities, 1 SD lower jump power/kg was associated with worse: 400m walk ($\beta=0.48$), 6m walk ($\beta=0.43$), and chair stands ($\beta=0.41$) (all p<0.001).

Lower jump velocity results were similar (400m walk: $\beta=0.45$; 6m walk: $\beta=0.40$; chair stands: $\beta=0.37$), whereas lower jump force/kg and grip strength were more weakly associated with performance (range: $\beta=0.21$ –0.25) (all p<0.001). Compared to grip strength and force/kg, stronger associations with performance for jump power/kg and velocity may indicate these are more sensitive predictors for functional loss in the oldest men.

MOBILITY AND NEUROMUSCULAR ATTRIBUTES AMONG OLDER ADULTS WITH OBESITY, DIABETES, AND HYPERTENSION

M.E. Jacob^{3,2,1}, A.J. Jor'dan^{3,2}, E. Leritz^{3,2}, J. Bean^{3,2}, 1. *Health and Disability Research Institute, Boston University, Brookline, Massachusetts*, 2. *Harvard Medical School, Boston, Massachusetts*, 3. *New England GRECC, Boston, Massachusetts*

Metabolic syndrome (MetS) is an independent risk factor for mobility decline among older adults. However, the mechanism by which MetS causes mobility disability remains unclear. We aimed to (1) investigate the association between the absence/presence of two MetS conditions (diabetes, hypertension) and obesity and mobility measures (i.e., gait speed, Short Physical Performance Battery [SPPB] and Late Life Function and Disability Instrument [LLFDI]), and (2) determine whether this potential association is mediated by neuromuscular attributes (i.e., strength, velocity, trunk extensor endurance, knee and ankle range of motion [ROM] impairment and sensory loss). Participants from the Boston RISE study (n=430) were assessed for neuromuscular attributes and mobility measures at baseline. We further classified participants as having none, one, two, or three of the following conditions: diabetes, hypertension, and/or obesity. Regression models revealed those with a greater number of conditions had worse performance on the SPPB (p=0.01), slower gait speed (p=0.0003) and lower LLFDI basic and advanced lower limb function (p<0.003). These associations were independent of age, race, sex, depression, and cognition scores. Additionally, the number of conditions were found to be independently associated with lower limb strength (p=0.0002) and knee ROM (p<0.0001). Mediation analysis revealed that lower limb strength and knee ROM partially mediated the association between the number of conditions and mobility outcomes. These results indicate that prevention of mobility disability among older adults with MetS and/or obesity may need to integrate rehabilitative interventions to improve leg strength and knee ROM.

THE SUSTAINABILITY OF SENIORS' EXERCISE BEHAVIOR THROUGH FAMILY SUPPORT

J. Park, S. Jo, J. Bae, *Yonsei University, Seoul, Korea (the Republic of)*

The purpose of this study was to investigate the sustainability of seniors exercise behavior through family support applying the theory of planned behavior (TPB). More specifically, family support was incorporated in the TPB to better comprehend seniors' exercise behavior and provide practical implications for older adults to participate in the exercise consistently. Convenience sampling was employed to collect data from seniors (N = 214) who are over 65 years old. The researchers collected data using the convenience sampling

method. The on-site survey was carried with seniors aged over 65 years old who live in Seoul, Ilsan, Cheonan, Daejeon, and Jeonju, South Korea. Total 250 questionnaires were distributed, and 214 valid questionnaires were collected after eliminating 36 respondents with missing and dual information. Based on the result of CFA, it found that the model fit did not fulfil the scientific criteria: $\chi^2(260) = 521.04$, $\chi^2/df = 2.21$, CFI = .91, TLI = .89, RMSEA = .07 (Hair, Black, Babin, & Anderson, 2010). The results found that attitude, subjective norm, and perceived behavioral control had positive influences on seniors' exercise intention, which is, in turn, positively affected their exercise behavior. Moreover, perceived behavioral control had a positive effect on seniors' exercise behavior. Also, perceived behavioral control positively predicted exercise behavior. Finally, family support had a positive influence on seniors' attitude, yet had no direct effect on their exercise intention.

FACTOR STRUCTURE OF THE SHORT-FORM HEALTH SURVEY (SF-36) IN A SAMPLE OF OLDER ADULTS IN COSTA RICA

M. Ivanisevic, E. Valdivieso, M. Garnier, Z. Green, R. Smart, D. Johnson, *Psychology, University of Kansas, Shawnee, Kansas*

The Short-Form Health Survey (SF-36) is a self-administered questionnaire that consists of physical health component cluster and a mental health component cluster (Ware and Kosinski, 2001). Research using a Spanish version of the SF-36 instrument have been conducted in Spanish-speaking countries (Augustovski et al., 2008), however, the applicability of the SF-36 has not been examined in Costa Ricans. Given the heterogeneity of sociocultural differences among in Latin America, we aim to examine perception of health-related quality of life using the SF-36 in a sample of neurotypical older adults residing in Costa Rica. 254 participants (Male=611; Female=193) completed the Spanish-version of the SF-36 questionnaire. Participants were older adults residing in San Jose (n = 176) and Guanacaste (n = 78). Participants were neurotypically healthy. Those with history of neurological conditions and major psychiatric disorders were excluded. Results showed a statistically significant correlation ($r=0.938$; $p<.001$) between the Physical Composite Summary (PCS) and Emotional Composite Summary (ECS). Confirmatory Factor Analysis (CFA) indicated that using lower level constructs had an acceptable fit (RMSEA = 0.039) which suggests that a single factor model is a feasible representation of the SF-36 in this sample. These data suggest that older adults in Costa Rica did not differentiate between physical and emotional well-being. Our findings indicate that in the CR sample the two-factor model (mental and physical composite health) does not hold up, instead, it appears that individuals in CR perceive health as a single construct. Exploring the role of cultural factors is essential in understanding the results.

CLINICIAN INSIGHT ON INJURY CHARACTERISTICS SUGGESTIVE OF PHYSICAL ELDER MISTREATMENT

J. YonashiroCho, Z.D. Gassoumis, K.H. Wilber, D.C. Homeier, *University of Southern California, Los Angeles, California*

INTRODUCTION: Physical elder abuse can be difficult to identify and substantiate, particularly if victims are physically or cognitively unable to report the abuse. Although recent work has progressed the field, the field remains underdeveloped compared to other family violence (FV) fields. The purpose of this study is draw upon the expertise of FV experts to identify injury characteristics suggestive of physical elder mistreatment.

METHODS: Data were collected from physically-abused Adult Protective Services (APS) clients (n=52) and a comparison group of non-abused elders (n=97). Physical exams were conducted to identify injuries and collect data on their diagnosis, location, and characteristics. FV reviewed data and commented on whether they believed injuries were attributable to abuse. Content analysis was used to analyze clinician comments to identify injury characteristics suggestive of abuse.

RESULTS: Injury location was commonly cited in clinician abuse determinations with those occurring in protected areas being deemed highly suggestive of abuse, as were injuries to the ear, torso, and neck. Defensive injuries were often attributed to the upper extremities. Among individuals with multiple injuries, clinicians also considered injury planes and healing stages, such that those on multiple planes and in multiple stages of healing were suggestive of abuse.

CONCLUSION/IMPLICATIONS: Study implications are applicable to all aging service providers. Elders presenting with injuries to protected or defensive areas, over multiple planes, and in multiple stages of healing may be victims of physical elder mistreatment. If abuse is suspected, providers may contact local APS or law enforcement for assistance with intervention and investigation.

AGE DIFFERENCES IN SOCIAL INTERACTIONS AND SOMATIC SYMPTOMS IN DAILY LIFE

R. Zhaoyang², M. Sliwinski², J. Smyth^{3,1}, 1. *Center for Healthy Aging, The Pennsylvania State University, University Park, Pennsylvania*, 2. *Center for Healthy Aging, The Pennsylvania State University, University Park, Pennsylvania*, 3. *Department of Biobehavioral Health, University Park, Pennsylvania*

Social interactions exert influences on health in daily life. Less is known, however, about age differences in the associations between different aspects of social interactions and daily health. This study examines how daily within-person fluctuations in the quality and quantity of social interactions relate to fluctuations in somatic symptoms for adults from different age groups. For seven consecutive days, participants (n=179; aged 20–79) reported on their most recent social interaction at five random times throughout the day and completed a checklist of somatic symptoms at the end of the day. Data were analyzed using multilevel models, controlling for demographics, overall health and perceived social support, as well as the momentary physical health and affect. The results suggested that social interaction quality was associated with fewer health symptoms for older and middle-aged adults but not for younger adults. That is, for older and middle-aged adults, on days when they experienced more pleasant or less unpleasant social interactions than usual, they also reported fewer health symptoms at the end of that day. In addition, when people did report one or

more symptoms (as opposite to no symptom), the quantity of social interactions (frequency) was associated with reduced severity and frequency of symptoms that day, albeit only for younger adults and not for middle-aged and older adults. Together, these results highlight the influence of different aspects of social interactions on daily health for adults from distinct age groups: for younger, it's the quantity; for older, it's the quality.

FAMILY CAREGIVING AND CHANGE OF RETIREMENT PLAN AMONG CANADIAN FAMILY CAREGIVERS

Y. Zhang¹, L. Li², 1. *School of Social Science, University of Shanghai for Science and Technology, Shanghai, China*, 2. *University of Calgary, Faculty of Social Work, Calgary, Alberta, Canada*

As one critical consequence of family caregiving for aging people, the literature of its impact on retirement is growing. Evidence has shown that considerable number of family caregivers changes their retirement plan to better perform caregiving tasks, but more work is needed to explore this relationship. Current study, based on the General Social Survey 2012 (Cycle-26)- Caregiving and Care Receiving, tries to build more knowledge of the effect of family caregiving on retirement planning. As a result, about 11% family caregivers change their retirement time due to caregiving responsibilities. The result of binary logistic regression (with standardized weight) shows that, when controlling the demographic information of both caregiver and care recipients, family caregivers with higher level of life accommodation (e.g. less time with children and spouse, adjustment in leisure activities and social participation, etc.), work accommodation (e.g. reduce working hours, take extra un-paid leave, etc.) and caregiving intensity are more likely to make change of retirement plan. Among those caregivers who change their retirement plan, about 57% retire earlier than their expectation, and 43% retire later. Results of binary logistic regression (with standardized weight) indicate that family caregivers who are female, with lower level of education and personal income, less workplace support are more likely to retire earlier than expectation. The findings of current study emphasize the importance to support the family caregivers with risk of retiring earlier, since retire earlier may increase their life burden in the aspects of financial competency and social activity.

EVALUATIONS OF TRAFFIC-RELATED COGNITIVE FUNCTION OF JAPANESE OLDER ADULTS BY VIRTUAL REALITY SYSTEM

N. Takehara¹, R. Sasakura¹, N. Ohno¹, Y. Tamura², R. Varadhan³, H. Uchida¹, 1. *Graduate School of Simulation Studies, University of Hyogo, Kobe, Hyogo, Japan*, 2. *Konan University, Kobe, Japan*, 3. *Johns Hopkins University, Baltimore, Maryland*

The purpose of this study was to examine whether there is a reduction in traffic-accident-related cognitive function of older Japanese adults compared to that of young people. We developed a traffic simulator for the CAVE-type virtual reality system. The simulator enables its user to feel immersed in 3D CG by tracking sensors and multiple screens surrounding him/her, and thus we are able to safely investigate people's behaviors in various traffic situations. The participants

were 20 older adults (14 males and 6 females) and 20 young adults (18 males and 2 females). The average age of the older adults was 70.6y (sd=3.4y), and that of the young adults was 23.1y (sd=1.8). We measured the minimum safe distances (MSD) between the participants and an approaching vehicle when they crossed a street. Student t-test was used to determine any significant differences between two groups. The results of this study were: (1) Regardless of the color (white or blue), size of vehicle (average-sized or truck) or time (daytime or evening), there are differences between the MSDs at the speed of 30km/h and 50km/h for young adults ($P<0.01$). (2) there were no differences between the MSDs at the speed of 30km/h and 50km/h for older adults except that of white average-sized vehicle in daytime ($P<0.01$). We conclude that there is a significant decline of the cognitive function of elderly adults compared to young adults.

UNSETTLING CHRONOMETRIC AGE AND DESERVINGNESS: TRACING OLDER REFUGEES' AGE DOCUMENTS INTO US SYSTEMS

K. Seibel, *Institute of Gerontology; Department of Anthropology, Wayne State University, Detroit, Michigan*

Chronometric definitions of old age in U.S. welfare policy govern access to resources. When applied to older refugees, such metrics obscure the losses of displacement and challenges of resettlement in later life. In this poster, I trace the trajectory of age documents of refugees from overseas into U.S. systems. My purpose is to unsettle the logic of using chronometric age in bureaucracy, which contributes to the problem of older refugees failing to meet US age norms of employability or deservingness. My findings are based on 20 months of ethnographic fieldwork at a program for refugee "seniors" (60+) in Chicago, Illinois. Refugees become categorized by birthdates found in their documents acquired in a variety of bureaucratic contexts. Despite its frequent use among bureaucracies, chronometric age references implicit local and national cultural norms. Thus, refugees arriving in the US become subject to a process of translation into understandings of later life that affect their economic conditions. Refugees with limited resources waiting to become eligible for Supplemental Security Income at age 65 demonstrate the violence of a "joyless and indifferent regime" by which in "a single tick of the clock, one finds oneself in another category" (Baars 2012:32). As scholars of critical gerontology have suggested, the institutionalization of the life course is a major dimension of social inequality (Kohli 2007:261). These issues apply acutely to older refugees and point to a need for more critical attention to the enrollment of chronometric age standards in processes of inequality.

MAINTENANCE OF THE LONGEVITY FACTOR, HSF1, IN LONG LIVED MICE

D.A. Jurivich, M. Lizakowski, S. Rakoczy, H.M. Brown-Borg, *University of North Dakota, Grand Forks, North Dakota*

Exceptional longevity in humans and other species appear to be linked to a vigorous cellular stress response that is otherwise suppressed with normal aging or frailty. Most studies thus far have evaluated serum and tissue levels of the heat shock proteins. Centenarians exhibit low levels of plasma hsp 70 whereas frail elderly manifest high hsp 70 plasma

levels. In addition to altered baseline heat shock protein levels with age, the transcriptional induction of the heat shock response is profoundly attenuated by age. Most notably, the transactivator of the heat shock response, HSF1, appears to decline in its DNA binding properties with normal aging.

To further understand the effect of age on HSF1 regulation, various tissues from normal and long-lived mice were analyzed for HSF1 protein levels, mRNA transcripts, and HSF1 - protein interactions. Through semi-quantitative Western blot analysis, different levels of HSF1 protein were expressed in various organs, with heart, kidney, and liver exhibiting the highest protein levels and muscle and brain the lowest. In liver and brain, Wild Type (normal) mice lost, on average, 20% more HSF1 protein with age in comparison to Ames Dwarf mice, indicating HSF1 levels were sustained in Dwarf mice. Unlike other rodent models, baseline HSF1-DNA binding complexes were not observed in either normal-aged or Dwarf mice, suggesting that neuro-endocrine stress during animal sacrifice does not influence HSF1 dynamics in the mouse model of exceptional longevity. To understand preservation of HSF1 levels in long lived mice, protein-protein interactions and post-translational modifications were assessed. These data indicate for the first time that healthy lifespans are linked to HSF1 levels, thus raising the question whether the rate of aging can be reduced by sustaining a critical threshold of functional HSF1.

PREDICT - PREDICTING EMERGENCY DEPARTMENT INCIDENT DELIRIUM WITH AN INTERACTIVE COMPUTER TABLET

J.S. Lee^{1,2}, M. Chignell¹, T. Tong¹, M. Émond³, M. Sirois³, J. Goldstein⁴, K. Rockwood⁴, M.C. Tierney^{1,2}, 1. *Medicine, Div of Emergency Medicine, University of Toronto, Toronto, Ontario, Canada*, 2. *Sunnybrook Research Institute, Toronto, Ontario, Canada*, 3. *Laval University, Quebec, Quebec, Canada*, 4. *Dalhousie University, Halifax, Nova Scotia, Canada*

Background: Delirium is common and potentially lethal. Unfortunately, delirium recognition is poor- 75% of Emergency Department (ED) cases are missed.

Objectives: We previously developed a “serious game” using participants’ game performance to evaluate delirium risk. Our goal is to validate this algorithm against the delirium severity index (DSI).

Methods: This is multi-center prospective observational trial included an English and French version. We included patients ≥ 65 years of age and excluded those with critically illness, pain $\geq 6/10$, or communication difficulties. Consenting participants played the serious game and then had DSI and Montreal Cognitive Assessment (MOCA) assessed by trained research assistants. We used logistic regression to assess the relationship between a game score based on > 800 data points and DSI ≥ 4 , controlling for age and sex.

Results: We enrolled 306 participants from 3 Canada provinces -92.3% of completed the game. Their average age was 75.9 and 48.7% were women. Their median MOCA score was 23. There were 24/306 patients with a DSI ≥ 4 out of a possible 21 points. Their mean game score was 0.70 (95% CI 0.63–0.78) vs. 0.61 (95% CI 0.60–0.63) for participants with a DSI < 4 . The odds of having a DSI ≥ 4 increased 1.89 for

each 0.1 increase in game score (95% CI for OR = 1.4–2.7, $p < 0.001$).

Conclusions: The odds of having a DSI ≥ 4 significantly increased with game scores. The vast majority of older ED patients could use our game. Given current poor clinical delirium recognition, our “serious game” may help improve delirium recognition.

HOSPITALIZATION COSTS OF FAILURE TO THRIVE PATIENTS

V. Shiao^{2,1}, C.A. Sarkisian¹, N. Barragan^{2,1}, T. Kuo^{2,1}, 1. *University of California, Los Angeles, Los Angeles, California*, 2. *Los Angeles County Department of Public Health, Los Angeles, California*

Failure to Thrive (FTT) has been referred to as a general diagnosis that can pre-emptively end efforts to treat what may be modifiable conditions. Manifestations of FTT can include weight loss, poor nutrition, physical inactivity, and decreased appetite. There is currently a shortage of literature examining the costs of acute hospitalizations for FTT. To better understand the hospitalization costs of FTT as a primary diagnosis versus as a secondary diagnosis, we compared patients 50 years and older with FTT using the Healthcare Cost and Utilization Project’s National Inpatient Sample (NIS) data from the Agency for Healthcare Research and Quality. NIS represents all-payer, encounter-level hospital care data and is weighted to yield national estimates of hospital inpatient stays. A total of 10,000 patients were coded as having a primary diagnosis of FTT and 278,900 with a secondary diagnosis of FTT. The mean hospital stay costs were \$8,515.08 for patients with a primary diagnosis of FTT and \$13,344.00 for those with FTT as a secondary diagnosis. Among all patients diagnosed with FTT, males had higher total mean cost of hospital stay than females; Asian/Pacific Islanders had the highest costs between races; costs increased as estimated median household income of residents in the patient’s zip code increased. Study results have health policy implications and may help inform hospital practices related to the care of FTT patients.

AGEING, IMMUNE SYSTEM AND LIFE SATISFACTION

J. Rinaldi, M. Chaves, *Neurology, Universidade Federal do Rio Grande do Sul - UFRGS, Porto Alegre, Brazil*

Immunosenescence is characterized by functional and cell components restructuring, whereas the T cells are the most harmed. To understand the connection of peripheral inflammatory markers to brain health and neuroinflammation may help in the comprehension of the inflammatory markers’ role in brain ageing process decay or brain health decay. In this study, we analyzed immune function markers, cognitive performance and life satisfaction on 87 community elderly, age $M=75,62$ (11,63), schooling $M=7,92$ (4,05). The cognitive performance was tested by a battery (MMSE, CDR, Clock Drawing, Semantic and Phonetic Fluency, CERAD’s Word List, evocation and recognition, WAIS-III Digit Span, Trail Making B, Boston Naming–Reduced), depressive symptoms were measured by GDS-15, and life satisfaction, by the SWLS scale. Mononuclear cells of peripheral blood were isolated and the lymphocytic subtypes, CD3+, CD4+, CD8+, CD45+ and CD4/CD8, assessed by flow cytometry. There was negative correlation of T cells CD4/CD8 relation with

age ($r = -0.445$; $p < 0.05$), i.e., the older the lesser immune system activity. Participants' age increase is associated with CD4 ($r = -0.473$; $p < 0.01$); CD3 ($r = -0.401$; $p < 0.01$); CD45 ($r = -0.399$; $p < 0.01$) activity decrease. Life satisfaction correlated positively with age ($r = 0.266$; $p < 0.05$), the same occurred to the CDR scale ($r = 0.530$; $p < 0.01$). It was not observed direct correlation between life satisfaction and CDR with lymphocytic activity. This small sample's findings evidenced that age alters the immune system's lymphocytic subtypes activity. The age increase related to immune activity decrease and better life satisfaction, but there was no relation between life satisfaction and lymphocytic activity or cognitive status.

NEUROIMAGING OF FACE PROCESSING IN CLINICALLY DIAGNOSED EARLY STAGE DEMENTIA OF THE ALZHEIMER TYPE

J.W. Culberson, R. Rajmohan, H. Reddy, *Texas Tech University Health Sciences Center, Lubbock, Texas*

In Alzheimer's disease (AD), non-verbal skills often remain intact for far longer than verbally mediated processes. Four (1 female, 3 male) participants with early-stage Clinically Diagnosed Dementia of the Alzheimer Type (CDDAT) and eight neuro typicals (NT) (4 females, 4 males) completed the emotional valence determination test (EVDT) while undergoing bold BOLD fMRI. We expected CDDAT participants to perform just as well as NTs on the EVDT, and to display increased activity within the bilateral amygdala and right anterior cingulate cortex (r-ACC). We hypothesized that such activity would reflect an increased reliance on the structures to compensate for ongoing neuronal loss in the frontoparietal regions due to the disease. We used DTI to determine if white matter damage had occurred in frontoparietal regions as well. CDDAT participants had similar behavioral performance and no differences were observed in brain activity or conductivity patterns within the amygdala or r-ACC. Decreased fractional anisotropy values were noted, however, for the bilateral superior longitudinal fasciculi and posterior cingulate cortex. We interpret these findings to suggest that emotional valence determination and nonverbal skill sets are largely intact at this stage of the disease, but signs foreshadowing future decline were revealed by possible white matter deterioration. Understanding how nonverbal skill sets are altered, while remaining largely intact, offers new insights into how nonverbal communication may be more successfully implemented in the care of AD patients and highlights the potential role of DTI as a presynaptic biomarker.

BRIDGING COMMUNITY AND CLINICS TO STRENGTHEN LATE-LIFE DEPRESSION COLLABORATIVE CARE

M.M. Gosdin¹, T. Nguyen¹, L. Hinton¹, T. Hoeft², A. Heald³, J. Unützer², S. Henderson¹, 1. *UC Davis, Davis, California*, 2. *University of Washington, Seattle, Washington*

Background: Late-life depression is common and comes at a high cost to patients and their families. While collaborative care is effective in reducing depression among older adults, much remains to be learned about how to reach and engage this population in depression care. This study examines an innovative approach (Care Partners) that partners primary care clinics, community-based organizations, and family when implementing collaborative care. Methods: In-depth

interviews were conducted with 33 key informants (e.g. care managers, physicians, project leads) from seven Care Partners sites in California. Additionally, focus groups were held at annual meetings and documents from sites (e.g., quarterly and annual progress reports) were reviewed. The goal was to understand the challenges and successes associated with implementing the innovative collaborative care model while focusing on how care delivery occurs within and vary across sites. Data Analysis: Researchers identified preset and emergent codes using NVivo qualitative software. Using qualitative thematic analysis, major themes relating to collaborative care implementation and delivery were developed. Results: Data from year one of a two-year study found that successful implementation and care delivery are contingent upon a variety of factors including: depression care as an organization's core value, buy-in from key stakeholders, existing infrastructure. Additionally, ongoing communication, role negotiation and flexibility of key staff and integration of services are essential components of successful collaborative partnerships. Implications: Recommendations on best practices for building collaborative partnerships across primary care clinics and community organizations will be presented to stakeholders potentially shaping the future direction of mental healthcare.

PSYCHOLOGICAL WELL-BEING IN ELDERLY AFRICAN AMERICAN WOMEN VOLUNTEERS

H. Hendrie¹, B. Steve¹, S. Gao¹, E. Brown², J. Beaven⁵, Y. Lu³, C. Carvell⁴, M.G. Austrom¹, 1. *Indiana University, Indianapolis, Indiana*, 2. *Catholic Charities Indianapolis, Indianapolis, Indiana*, 3. *Indiana University, Indianapolis, Indiana*, 4. *Franciscan Health, Indianapolis, Indiana*, 5. *CICOA, Indianapolis, Indiana*

One of the goals of a community-based participatory research project, "Engagement and quality of life in underrepresented older adults" involving the Senior Companion Program (SCP) and IU School of Medicine, was to assess the psychological wellbeing of the senior companions (SC). We used the NIH Toolbox measurement of psychological wellbeing because of the comprehensive nature of the questionnaire consisting of 3 subdomains--positive affect, general life satisfaction and meaning and purpose as well as allowing comparison with age and gender matched cohort from the NIH Norming Study.

Questions from the psychological domain were tested for acceptability with a small group African American SC. Of the original 33 items, SC recommended 14 as most useful. 60 SC participated (n=1 male), therefore, only women were included in this comparison. Mean age was 70.1 (SD.7.6 years), 48 were African American.

Results from the SC responses to the 14-item questionnaire were compared to a cohort of 261 women >60 years (mean=71.5) from the NIH Norming Study. Scores on psychological wellbeing and all subdomains from the SC group were significantly higher ($p < .0001$) than those from the Toolbox cohort. When the responses of the 48 African American SC were compared to a subsample (n=24) of Toolbox African American women >60 years, the SC had higher scores in all domains but reached significance for the meaning and purpose subdomain only ($p < 0.0005$).

Volunteering in SCP appears to have beneficial effects on elderly African American women. We invite discussion of the implications of our results.

FREQUENCY OF FOOD GROUPS CONSUMPTION IS RELATED WITH FRAILTY IN ELDERLY: FROM KASHIWA STUDY

U. Suthutvoravut^{1,2}, T. Tanaka¹, K. Takahashi¹, Y. Yoshizawa³, M. Fujisaki¹, M. Akishita¹, K. Iijima¹, 1. *The University of Tokyo, Tokyo, Tokyo, Japan*, 2. *Mahidol University, Bangkok, Thailand*, 3. *Tokyo Women's Medical University, Tokyo, Japan*

Inadequate nutrition intake is considered as an important factor for developing frailty which lead to poor health outcomes in elderly. Recently whole diet approach and food diversity studies were conducted instead of focusing on a single nutrient since food and meals contain interacting elements. However, it is still unknown what kind of food consumption pattern is influential to frailty. Thus, the purpose of this study is to assess the relationship between food groups consumption and frailty in community-dwelling elderly. We used baseline data from a cohort study in Kashiwa city, Chiba prefecture, Japan. The participants were randomly selected from elderly aged 65 years old and over who were non-eligible for long-term care. We assessed frequency of each food group consumption by self-administered questionnaire. Food was divided into 10 groups: meat, fish, eggs, dairy products, soy beans, vegetables, fruits, seaweed, potatoes and fried foods. Frailty was defined using Kihon checklist (a Japanese Frailty Index). Binary logistic regression analysis was run to examine the association between food groups and frailty. Among 2,003 participants (mean age was 73.0±5.6), 186 (9.3%) participants were classified as frail group. In logistic regression model, low consumption of meat (OR 1.46, 95%CI 1.05–2.04), fish (OR 1.46, 95%CI 1.06–2.01) and soy beans (OR 1.52, 95%CI 1.05–2.22) were positively associated with frailty. Frail elderly tended to eat less meat, fish and soybean which are among protein foods group, suggesting that increasing frequency of regular protein foods group intake might be essential in prevention of frailty progression.

IMPROVING CHRONIC DISEASE MANAGEMENT FOR LOW INCOME ELDERS VIA FEDERAL INTERAGENCY COLLABORATION

L. Simon-Rusinowitz¹, E. Fazio², K. Kulinski², J. Weiss³, 1. *Health Services Administration School of Public Health, University of Maryland College Park, Kensington, Maryland*, 2. *Administration for Community Living, Washington D.C., District of Columbia*, 3. *Health Resources and Services Administration, Rockville, Maryland*

While “livable communities,” also called “communities for a lifetime,” have expanded recently, they have not focused on low-income populations. This project, started during a Health and Aging Policy Fellowship, encouraged collaboration among federal agencies providing health, housing, transportation, and social services to improve chronic disease self-management education (CDSME) programs serving low-income under-served communities. Based at the Administration for Community Living, the project team partnered with the Departments of Housing and Urban Development and Transportation, and Health

Resources and Services Administration (via Federally Qualified Health Centers [FQHCs] and Health Workforce Development). All of these agencies serve vulnerable populations and have an opportunity to expand service to elders. Each agency serves people with chronic diseases (e.g. diabetes, heart disease, asthma, depression, anxiety), who would benefit from chronic disease self-management education (CDSME) programs. The project focused on evidence-based CDSME programs serving affordable housing residents, and aimed to expand the capacity of federal agencies to deliver these programs to elders and adults with disabilities. Steps included: reviewing literature on inter-agency partnerships, conducting stakeholder discussions, developing a webinar to highlight exemplary CDSME partnerships, as well as identifying facilitators and barriers to successful partnerships. The webinar highlighted exemplary evidence-based CDSME programs serving affordable housing residents in partnership with FQHCs, transportation, and social services. Approximately 1,360 people from multiple disciplines registered for the webinar, indicating significant interest in this current topic. The webinar included audience polling questions about facilitators and barriers to successful collaboration. The poster will present polling data as well as policy and practice recommendations.

ASSISTIVE TECHNOLOGY NEEDS AND EXPERIENCES OF FAMILY CAREGIVERS

B. Mortenson¹, F. Routhier², L. Demers³, A. Wister⁴, C. Auger³, J. Fast⁵, P.W. Rushton³, 1. *University of British Columbia, Vancouver, British Columbia, Canada*, 2. *University of Laval, Quebec City, Quebec, Canada*, 3. *University of Montreal, Montreal, Quebec, Canada*, 4. *Simon Fraser University, Vancouver, British Columbia, Canada*, 5. *University of Alberta, Edmonton, Alberta, Canada*

Family caregivers provide 75% of care needed for individuals with disabilities to remain in their communities. Many family caregivers in Canada experience negative health, social and financial outcomes. Innovative solutions (or interventions) are needed that can ameliorate the deleterious aspects of caregiving and foster positive ones. Therefore, we conducted a study with the following objectives: (i) to identify the specific needs of family caregivers, especially aspects of caregiving situations that caregivers find most difficult to manage or would like improved; and (ii) to identify preferences and priorities of caregivers for the development of technological solutions to address these areas. We conducted qualitative interviews with a purposive sample of 47 family caregivers of older adults or older adults who are family caregivers. Participant age ranged from 43 to 76, with a mean age of 63, and 75% were women. Our analysis identified three main themes: i) caregiver responsibilities explored their day-to-day caregiving activities; ii) strategies to address identified technologies that could potentially help caregiver needs; and iii) caregiver challenges revealed the physical and psychological struggles associated with caregiving. These findings emphasize the complexity of care provision, problems identifying and accessing solutions, and the need to develop effective and innovative approaches. This study offers a framework for future user-centred design research that involves

caregivers as active partners. Our findings will inform the development of novel interventions and support policy changes to make care provision easier.

P49/STRAP TARGETS PGC-1 GENE AND MODULATES MITOCHONDRIAL FUNCTION IN AGING

X. Zhang, G. Azhar, S. Rogers, J.Y. Wei, *University of Arkansas for Medical Sciences, Little rock, Arkansas*

Introduction: p49/STRAP (SRFBP1) is a serum response factor (SRF) binding protein, which regulates many genes. p49/STRAP has a SRF binding domain and a BUD22 domain (which modulates growth and cell size). In addition, p49/STRAP alters the intracellular NAD/NADH ratio and induces protein deacetylation.

Hypothesis: Alteration of NAD/NADH ratio by p49/STRAP might affect acetylation and deacetylation of histone proteins, which may impact the transcription of a number of genes that are involved in energy metabolism and mitochondrial respiration, thereby affecting cardiac function in aging.

Methods and Results: p49/STRAP overexpression or knockdown was performed using plasmid or siRNA. Seahorse XF96 Flux Analyzer was used to measure mitochondrial respiration and glycolysis.

p49 overexpression caused deacetylation of histone H4 on lysine 16 (H4K16); knockdown of p49/STRAP increased H4K16 acetylation. PPAR gamma (PPAR γ) Coactivator-1 (PGC-1) is an important regulator of mitochondrial genes. P49 repressed PGC-1 α expression, while P49 siRNA increased the PGC-1 α expression. p49/STRAP also repressed mitofusin 1 and 2 genes. Knockdown of p49/STRAP increased the expression of mitofusin 1 and 2 genes. MitoTracker staining revealed that p49/STRAP reduced the mitochondrial membrane potential and the mitochondrial size. Furthermore, p49/STRAP repressed mitochondrial basal respiration, maximal respiration and spare respiration capacity.

Conclusion: p49/STRAP caused the deacetylation of histone H4K16 and repressed the expression of multiple genes related to mitochondrial structure and function, including the PGC-1 α gene. Repression of PGC-1 α could affect PGC-1 transcriptional networks in the cardiac muscles. The age-associated increased cardiac expression of p49/STRAP may contribute to mitochondrial functional decline in the heart during senescence.

LEFT VENTRICULAR FUNCTION IN CENTENARIANS: FINDINGS FROM THE DANISH 1915-WEST BIRTH COHORT STUDY

S.H. Rasmussen^{1,2}, K. Andersen-Ranberg^{1,2}, K. Christensen^{1,3}, S. Gill⁴, *1. Danish Aging Research Center, Department of Public Health, University of Southern Denmark, Odense, Denmark, 2. Department of Geriatrics, Odense University Hospital, Odense, Denmark, 3. Max-Planck Odense Center on the Biodemography of Aging, University of Southern Denmark, Odense, Denmark, 4. Department of Cardiology, Odense University Hospital, Odense, Denmark*

Heart failure (HF) is prevalent in old age and associated with functional declines. Data from echocardiographic centenarian studies are scarce. A previous centenarian study found that approximately 20% and 70% had impaired systolic and diastolic functions, respectively. Studies of 85+ year olds

using in-home echocardiography found similar frequency of diastolic dysfunction. However, different settings and classification methods were applied in the studies.

With the demographic shift towards an increasing proportion of oldest-old, the prevalence of HF is forecasted to increase further, leading to a rise in morbidity, mortality, and societal costs.

The 1915-West Birth Cohort study is population-based with no exclusion criteria: Eligible were all persons turning 100 years old from January to December, 2015 and living in the western part of Denmark. In-home, including nursing home visits were carried out. Out of 185 eligible to in-home echocardiography, 125 (68%) participated, of whom 94% (n=117) had normal left ventricular ejection fraction. Diastolic function was defined as in current guidelines (2016) and persons with atrial fibrillation/flutter were excluded. Among persons with sinus rhythm (n=105, 84%), diastolic dysfunction was present in 60%.

Our study confirms earlier findings that diastolic dysfunction is highly prevalent in the oldest-old. Furthermore, this study extends these findings, as it reflects a population-based representative sample of centenarians. The current treatment of diastolic dysfunction is symptomatic. Cardiac assessment in the very old is important to improve our understanding of cardiac function during ageing and to initiate preventive treatment, which can be beneficial even initiated at old age.

ELECTROCARDIOGRAPHIC ABNORMALITIES AND ALL-CAUSE MORTALITY IN CENTENARIANS

T. Hirata¹, Y. Arai¹, M. Takayama², Y. Abe¹, N. Hirose¹, *1. Center for Supercentenarian Medical Research, Keio University School of Medicine, Tokyo, Japan, 2. Center for Preventive Medicine, Keio University School of Medicine, Tokyo, Japan*

Data on electrocardiographic (ECG) characteristics in centenarians are scarce. Our aim was to examine ECG and its clinical relevance in a cohort of centenarians. The Tokyo Centenarians Study took place from 2000 to 2002, and 304 centenarians living in the Tokyo metropolitan area were recruited based on the basic resident registry. All participants were assessed to determine their socioeconomic status, previous medical histories and present medical conditions by trained geriatricians. Among them, a total of 171 centenarians (43 male, 128 female), who were performed standard 12-lead ECG was included in the analysis. Non-fasting venous blood sample was obtained and N-terminal pro-brain natriuretic peptide (NT-proBNP) and asymmetric dimethylarginine (ADMA) were measured with standard procedures. We followed them for all-cause mortality by annual telephone contact or mail survey by December 2016. As a result, 22.2% of centenarians had major ECG abnormalities, which included old myocardial infarction (1.2%), left-ventricular hypertrophy (11.7%), pacemaker rhythm (1.8%), atrial fibrillation (8.2%), and second degree AV block (1.2%). In contrast, 23.4% of centenarians had normal ECG. Those who had major ECG abnormality had significantly higher levels of NT-proBNP and non-significant higher levels of ADMA compared to their counterparts. By using Kaplan-Meier survival curve analysis, centenarians with major ECG abnormality had higher all-cause mortality

(the log-rank $p=0.047$), while those who had normal ECG had a significantly lower mortality (the log-rank $p=0.003$). In conclusion, centenarians who have major ECG abnormality had higher levels of NT-proBNP and higher mortality, while those who exhibited normal ECG had survival advantage.

BEHAVIORAL THERAPIES FOR INSOMNIA IMPROVE NOCTURIA IN OLDER WOMEN VETERANS

C. Fung^{2,1}, C.A. Alessi^{2,1}, Y. Song¹, C. Pedigo-Vaughn^{3,4}, A. Markland^{5,6}, A. Huang⁷, S. McGowan², J. Martin^{2,1}, 1. *University of California, Los Angeles, Los Angeles, California*, 2. *VA Greater Los Angeles, Los Angeles, California*, 3. *Atlanta VA, Decatur, Georgia*, 4. *Emory University, Atlanta, Georgia*, 5. *Birmingham VA Medical Center, Birmingham, Alabama*, 6. *University of Alabama, Birmingham, Alabama*, 7. *University of California, San Francisco, San Francisco, California*

Background: Nocturia is common in older women with chronic insomnia disorder. Few studies have examined nocturia symptoms and treatments in older women veterans. This study assessed changes in nocturia frequency associated with behavioral interventions for insomnia in older women veterans. **Methods:** In the context of an ongoing comparative effectiveness trial of two behavioral interventions for insomnia conducted at a VA medical center among women veterans, data from baseline, post-intervention, and 3-month follow up for participants aged ≥ 55 years were analyzed. Measures included self-reported nocturia frequency in the past month (0–5+/night) and degree of bother from nocturia (4-point scale; 0=not at all, 3=a lot). Nocturia frequency responses were categorized as nocturia (≥ 2 times/night) versus no nocturia (< 2 times/night). Differences in the proportion of participants with nocturia and degree of bother (post-intervention vs. baseline; 3-month follow-up vs. baseline) were examined with two-sample test of proportions and t-tests, respectively. **Results:** 36 participants (mean age 63, range 55–91 years) completed all or part of their assigned intervention. At baseline, 23 (64%) participants had nocturia. Nocturia decreased post-intervention (11 [33%], $p=.011$) and at 3-month follow-up (7 [25%], $p=.002$ vs. baseline). Degree of bother mean scores decreased from baseline to post-intervention (1.43 vs. 0.75, $p=.014$) and 3-month follow-up (1.56 vs. 0.89, $p=.031$). **Conclusions:** Nocturia frequency and degree of bother improve with behavioral interventions for insomnia. These results suggest that a sleep-focused, non-pharmacological strategy for treating nocturia may be effective and indicate a need for a trial examining such a strategy.

MORTALITY AND ASSOCIATED RISK FACTORS IN COMMUNITY-DWELLING PERSONS WITH EARLY DEMENTIA

B. Barrett^{1,2}, T. Bular^{1,2}, S.K. Schultz¹, S. Luther¹, 1. *HSR&D Center of Innovation on Disability and Rehabilitation Research, Department of Veterans Affairs, Tampa, Florida*, 2. *Patient Safety Center of Inquiry, Department of Veterans Affairs, Tampa, Florida*

This study examined mortality in relation to baseline characteristics amongst participants in a longitudinal study of persons diagnosed with early dementia (N = 143). Department of Veterans Affairs' health records were used to collect participant mortality outcomes, for a standardized

six-year observation period. Study measures assessed participant: demographics; functioning (Inventory of Activities of Daily Living; Tinetti Gait and Balance); cognitive- (Mini-Mental State Examination [MMSE], Trails-Making Test B) and dementia-related (Clinical Dementia Rating [CDR]) factors; as well as medication use (categorized into cholinesterase-inhibitors and confusion-related medications). Bivariate analyses examined associations with baseline characteristics and mortality. A series of Cox proportional hazard models were conducted examining associations with baseline variables, both in univariate as well as multivariable models (controlling for age and gender, where appropriate). Over the six years of study follow-up, 48.3% of participants died. The mean time to death was 2.98 years (SD = 1.44), with a minimum of 54 days and a maximum of 5.91 years. Across all univariate models, only the model including the MMSE was statistically significant. Multivariable model results indicated female gender and higher cognition (as measured by the MMSE) were associated with a reduced likelihood of death, controlling for other factors. This study examined mortality in persons with early dementia living in the community, and associations with baseline factors. Cognitive decline was significantly associated with mortality, even amongst persons early in the course of dementia. Findings underscore the terminal nature of dementia, frequently underappreciated by family and caregivers in the community.

HEALTHSPAN MEASURES IN A WESTERN DIET CONDITIONED, IRRADIATED RODENT MODEL OF ACCELERATED AGING

K. Fanning, C. Sherrill, A. Davis, K. Kavanagh, *Pathology, Wake Forest School of Medicine, Winston-Salem, North Carolina*

Deteriorating metabolic and physical function play significant roles in declining healthspan, however most animal models of aging rely on single gene mutations and few demonstrate translationally relevant multi-system decline. This study is the first to compare healthspan measures (metabolic and physical function) in rodents on a high-fat diet exposed to sub-lethal doses of whole body irradiation (IR). Four week old male and female C57/BL6 mice consuming a western diet (17% protein, 35% fat, 48% carbohydrate) were randomized as IR or control (CTL). At 8 weeks, IR mice received 7 Gy total body irradiation (Cobalt60, divided as 2 fractions delivered at 357 rad/min), with metabolic assessments evaluated at early (4 weeks) and late (12–16 weeks) post-exposure time-points ($n=6$ /group/time-point). Delayed effects of irradiation included significantly higher fasting glucose at both time-points ($p\leq 0.01$) and worse insulin sensitivity (AUCITT; $p=0.10$) with comparable body weights between groups. Physical function outcomes were assessed late, with IR resulting in functional deficits that were 23% lower on average across 6 function tests ($n=8-12$ /group). IR mice scored significantly worse on the 4-limb hang time test measuring muscular endurance ($p=0.02$) and on a composite performance score ($p<0.05$). Measures were co-varied by body weight which was comparable between groups. As hypothesized, IR mice demonstrated poorer glucose metabolism and physical function relative to control non-irradiated mice. This work adds support to the use of IR mice as a model of accelerated aging.

MODULATION OF P300 FUNCTION IMPROVES HEALTHSPAN AND LIFESPAN IN *C. ELEGANS*

T. Tezil, C. Ng, E. Verdin, *Buck Institute for Research on Aging, San Francisco, California*

Aging causes a gradual decline in normal physiological functions and represents a significant risk factor for several key diseases. Key environmental factors, including diet, play an important role along with genetic factors in determining lifespan. The sirtuins are a family of histone deacetylases that target histone and non-histone proteins for removal of acetyl groups from lysine residues. A gain of function of Sir2 (*S. Cerevisiae*), or its orthologs in other species, is associated with increased lifespan and healthspan. We asked whether the enzyme controlling the opposite reaction, the histone acetyltransferase p300/CBP might also influence lifespan. We indeed observed that a p300/CBP inhibitor and/or loss of p300/CBP function changes specific acetylation patterns and influence lifespan, muscle function, stress response and reproductive fitness in aged *C. elegans*. These findings highlight the potential regulatory role of p300/CBP on the aging process.

ATTITUDES TOWARDS BURDENSOME MEDICAL INTERVENTIONS IN NURSING HOME RESIDENTS WITH ADVANCED DEMENTIA

F. Riese^{1,2}, S. Eicher², 1. *Department of Old Age Psychiatry, Psychiatric University Hospital Zurich, Zurich, Switzerland*, 2. *University of Zurich, Zurich, Switzerland*

Advanced dementia is a terminal condition. Foregoing burdensome interventions such as artificial nutrition or admission to hospital at the end of life is part of high-quality palliative care. In advanced, decisions regarding such interventions are made by health care proxies (HCPs). Different attitudes in HCPs and nurses regarding burdensome interventions might influence decision making and thus indirectly the resident's wellbeing.

We therefore investigated if HCP and nurses differ in their attitudes towards burdensome medical interventions in nursing home residents with advanced dementia. The Zurich Life and Death with Advanced Dementia (ZULIDAD) study addresses the last phase of life of nursing home residents in Switzerland by asking HCPs (N = 126) and primary nurses (N = 99) quarterly with comprehensive questionnaires about the resident's health, quality of life and current treatment during three years. At baseline, HCPs and nurses were asked whether antibiotics, artificial administration of fluids, artificial nutrition, artificial respiration, cardiopulmonary resuscitation and admissions to hospital should be foregone even though this can potentially shorten the resident's life expectancy. Overall, HCPs and nurses were found to favor foregoing burdensome interventions in residents with advanced dementia. However, a minority of participants supports their implementation. Interestingly, nurses were found to be significantly "less palliative" in their attitudes than HCPs except for the subcutaneous administration of fluids. Further research needs to elucidate why a minority of HCPs and nurses favor a more aggressive treatment approach and how this impacts decision making at the end of life in dementia.

TWO-MINUTE ONLINE ANIMATIONS SIGNIFICANTLY REDUCE FEARS OF MEMORY LOSS IN OLDER ADULTS

S.C. Brennan, U. Geary, S.E. Gallagher, *The University of Dublin, Trinity College Dublin, Dublin, Ireland*

Misinformation and lack of understanding of memory loss, dementia and brain health are barriers to dementia risk reduction and timely health seeking behaviour. Online video technology for health promotion has been popularised with the increase in online networks, improved access to technology, and the rise of online health seeking behaviour. However, an understanding of the efficacy of this technology in the context of brain health awareness in older adults is lacking. This research explored whether three short animated brain health videos could reduce worry, impart new knowledge, and promote behavioural change in older adults. Participants (8,179) completed a survey pre- and post-engagement with three animated films that we had developed. Participants' level of worry significantly decreased, and over half of the participants indicated that they intended to change their behaviour after watching the videos. The majority of participants indicated they had learned something new from the videos, and found the videos enjoyable. Regression analysis described how participants who reported learning from the videos were more likely to report behavioural change. In addition, enjoyment significantly predicted outcomes of learning and behaviour change. This research contributes a novel understanding of the use of online video technology to change perceptions of brain health in older adults.

VITAMIN D PROMOTES PROTEIN HOMEOSTASIS AND LONGEVITY VIA STRESS RESPONSE GENES SKN-1, IRE-1, AND XBP-1

K.J. Dumas, K.A. Mark, D. Bhaumik, S. Davis, R. Brem, B. Schilling, G.J. Lithgow, *Buck Institute, Novato, California*

Vitamin D has multiple roles including the regulation of bone and calcium homeostasis. Deficiency of 25-hydroxyvitamin D, the major circulating form of vitamin D, is associated with an increased risk of age-related chronic diseases including Alzheimer's disease, Parkinson's disease, cognitive impairment, and cancer. In this study, we utilized *Caenorhabditis elegans* to examine the mechanism by which vitamin D influences aging. We found that Vitamin D3-induced lifespan extension requires the stress response pathway genes SKN-1, IRE-1, and XBP-1. Vitamin D3 (D3) induced expression of SKN-1 target genes, but not canonical targets of IRE-1/XBP-1. D3 suppressed an important molecular pathology of aging, that of widespread protein insolubility, and prevented toxicity caused by human β -amyloid. Our observation that D3 improves protein homeostasis and slows aging highlights the importance of maintaining appropriate vitamin D serum levels, and may explain why such a wide variety of human age-related diseases are associated with vitamin D deficiency.

ORALLY ADMINISTERED UROLITHIN A IS SAFE AND MODULATES MUSCLE AND MITOCHONDRIAL BIOMARKERS IN ELDERLY

A. Singh¹, P. Andreux¹, W. Blanco-Bose¹, D. Ryu¹, P. Aebischer², J. Auwerx², C. Rinsch¹, 1. *Amazentis SA, Ecublens, Switzerland*, 2. *EPFL, Lausanne, Switzerland*

Background: Age associated muscle and physical decline that leads to frailty and sarcopenia has become a significant public health concern. This has fueled a growing interest to identify novel interventions that can mitigate the process of muscle aging. Urolithin A (UA), is a natural metabolite derived from ellagitannins, compounds found in pomegranates, nuts and berries. UA has been shown to improve mitochondrial function by stimulating mitophagy, resulting in enhanced exercise capacity that was observed in two separate models of age-related decline in muscle function (*Nature Medicine* 22, 879–888 (2016)). **Objective:** To investigate the safety of UA and its impact on biomarkers in a first-in-human Phase 1 clinical trial in elderly.

Methods: A single center, multi-part (single and 4-week multiple ascending doses) Phase I, double-blind, randomized, placebo controlled study in 60 healthy elderly subjects was conducted (NCT02655393). All of the subjects were between 61 to 85 years of age and sedentary with a BMI range of 18–32 kg/m². The subjects modified their diet to exclude pomegranates, berries and nuts as well as dietary supplements for the duration of the study. Plasma samples and muscle biopsies from the vastus lateralis muscle were collected to investigate the effects of UA on the plasma metabolomics profile and the skeletal muscle transcriptome.

Results: The primary endpoint of safety was successfully met as no serious or product related non-serious adverse effects were recorded. No clinically significant changes were observed in a battery of safety tests (vital signs, physical examination, ECG, serum biochemistry, haematology and urinalysis), indicating a favourable safety profile for UA in humans. The impact of UA on plasma and muscle biomarkers following a 4-week dosing were assessed, and this revealed that UA modulated both genes and metabolites linked to mitochondrial and muscle function.

Conclusion: UA is well tolerated and has an attractive safety profile when orally administered in single and multiple doses to elderly. Importantly, UA is bioavailable in both human plasma and muscle and modulated biomarkers of muscle and mitochondrial function. Our results hold promise for the use of advanced dietary interventions involving UA to manage mitochondrial and muscle health during aging.

ROLE OF PHARMACOLOGICALLY INDUCED-TFEB IN AGING AND AGE-RELATED NEURODEGENERATION

M. Chamoli¹, S. Chinta^{1,2}, M. Schmidt¹, G.J. Lithgow¹, J. Andersen¹, 1. *Buck Institute for Research on Aging, Novato, California*, 2. *Touro University California, Vallejo, California*

An important characteristic feature of aging and many age-related neurodegenerative diseases is a loss of protein homeostasis (proteostasis), which is accompanied by increased accumulation of damaged, misfolded and aggregated proteins. One of the vital components of proteostasis, autophagy, mediates the breakdown and recycling of proteins and other cellular components within the lysosome. Our central hypothesis is that age-related dysfunction in autophagy establishes a prodromal process resulting in decreased protein homeostasis which causes neurodegeneration. Age-related failure in autophagy could result from down regulation of transcription factor EB (TFEB), the master regulator of lysosomal biogenesis. This in turn would impact the cell's ability

to process damaged proteins. Recent studies from our labs reported that up-regulation of TFEB by either rapamycin or trehalose prevented neurodegeneration. Encouraged by these results, we conducted a small molecule screen to identify novel candidates that could induce TFEB and its target genes to levels far exceeding than already existing inducers (e.g. rapamycin and trehalose). Since then, we have discovered new class of compounds that gratuitously induce TFEB and its targets and are protective in in vivo proteotoxic models of neurodegenerative diseases. I will be discussing findings related to this study and potential implication of TFEB in preventing aging and age-related neurodegenerative diseases.

A NOVEL INTEGRATED APPROACH TO AGE-RELATED GAIT CHANGE: PLANAR COVARIATION OF ELEVATION ANGLES

W. Bair, S.A. Studenski, *National Institute on Aging, Translational Gerontology Branch, BLSA, Baltimore, Maryland*

While innumerable indicators of age-related gait change exist, almost none integrate or summarize segmental coordination during movement. Planar Covariation of Elevation Angles (PCEA) was developed to study gait changes during development, but may help characterize age-related changes. PCEA reflects coordination among leg segment angles relative to vertical (thigh, shank and foot), resulting in a loop that lie in a plane and rotate with increasing walking speed. We assessed PCEA features among Baltimore Longitudinal Study of Aging adults without diagnoses known to affect gait, comparing young (n=35, age 40.1 ± 6.8) and old (n=36, age 84.5 ± 3.0) at usual and fast walking speeds. Principle component analysis of EAs yields 3 eigenvectors (u1~3) with corresponding variance (v1~3) that describe the degree of planarity, the shape of the loop and the orientation/rotation of the plane. We also assessed the segmental phase differences underlying PCEA. Degree of planarity did not differ by age or speed. Age affected loop shape; older adults had wider loops than young at both speeds. In older adults compared to young, the plane rotated less during fast walking, with less tightly-coupled thigh-shank segments. Older adults showed greater variability in the thigh's contribution to the 1st eigenvector and in the shank-foot phase difference. PCEA provides a new integrated perspective on multi-segment coordination during gait and detects age effects. Decreased plane rotation with aging may indicate higher energy cost and less tightly coupled thigh-shank segments during walking. PCEA characteristics may help identify and profile age-related gait impairments and target intervention strategies.

EFFECTIVENESS OF INTERVENTIONS TO REDUCE ACUTE CARE TRANSFERS FROM NURSING HOMES: A META-ANALYSIS

D. Cetin-Sahin², O. Lungu^{4,2}, M. Peretti^{1,2}, G. Gore⁶, B. Gore², P. Voyer⁵, M. Wilchesky^{1,2,3}, 1. *McGill University, Department of Family Medicine, Montreal, Quebec, Canada*, 2. *Donald Berman Maimonides Centre for Research in Aging, Montreal, Quebec, Canada*, 3. *Lady Davis Institute for Medical Research, Montreal, Quebec, Canada*, 4. *Université de Montréal, Montreal, Quebec, Canada*, 5. *Université Laval, Québec, Quebec, Canada*, 6. *McGill University, Montreal, Quebec, Canada*

Transferring patients from the nursing home (NH) to the acute care setting is associated with increased mortality and morbidity. To date, several types of interventions seeking to reduce potentially avoidable hospital transfers have been proposed, yet there is a lack of systematic evidence regarding their effectiveness. In response to this knowledge gap, we conducted a systematic review to assess the effectiveness of interventions aimed at reducing emergency department (ED) transfers and hospital admissions (HA) from NH. MEDLINE, CINAHL, EMBASE, Social Work Abstracts, and other relevant scientific literature databases were searched from inception until July 2016 for primary studies using quantitative and mixed methods. Forward and backward citation tracking techniques and a grey literature review were also conducted. A random-effects model meta-analysis was conducted for each outcome (rate ratio reduction in ED and HA rates per 100 resident-days). In total, 17 unique studies provided 26 usable samples pertaining to ED and/or HA rates. For both outcome types there was a significant reduction in transfer rates across studies (RR=0.82; 95%CI=0.68–0.99; overall effect $Z=2.07$, $p=0.04$ for ED and RR=0.73; 95%CI=0.65–0.83; overall effect $Z=4.76$, $p<0.00001$ for HA) despite high statistical heterogeneity ($I^2>75\%$ in both cases). Although studies targeted a variety of transfer-related factors, interventions appeared more effective in reducing HA than ED transfers. This suggests that HA could be a better target for these interventions. Importantly, our systematic review has also revealed a lack of consistency across studies regarding outcome operationalization, measurement and data reporting.

STAKEHOLDER PERSPECTIVES ON FAMILY-CENTERED DEPRESSION TREATMENT FOR OLDER MEN

L. Hinton¹, E. Elizarraras², E. Delgadillo Alfaro¹, E. Apeso-Varano¹, J. Unützer³, 1. *Psychiatry and Behavioral Sciences, University of California, Davis, Sacramento, California*, 2. *San Francisco State University, San Francisco, California*, 3. *University of Washington, Seattle, California*

Background: Family members often play important roles in the lives of depressed older men and frequently attend primary care visits with their loved ones, but surprisingly little is known about how to effectively engage and include such family members in depression treatment. **Objective:** To describe key considerations and challenges in engaging family members in older men's depression treatment and describe their implications for the development of family-centered depression interventions. **Methods:** A cross-sectional qualitative interview study conducted in a safety-net, federally qualified health center in California's central valley. Participants were 37 stakeholders, including 15 depressed older (i.e. age ≥ 60) men, 12 family members, and 10 clinic staff. Depressed men were identified through mail outreach, waiting room screening, and referral. Depressed men identified family members who were later approached to participate. We recruited a purposeful sample of clinic staff. Interviews were conducted using a semi-structured interview guide, tape-recorded, transcribed and translated (for Spanish language interviews). **Results:** Four themes were identified: engaging men at the right time; preserving men's sense of autonomy; managing privacy

concerns; and navigating family tensions. Stakeholders also provided practical suggestions on how each of these challenges might be addressed. **Conclusions:** Development of family centered depression interventions for older men in primary care might benefit from attention to specific barriers and how to address them.

DIAGNOSING METABOLIC SYNDROME IN INDIVIDUALS WITH MOTOR DISABILITIES

P.C. Heyn^{1,2}, Z. Pan^{1,2}, A. Tagawa², J. Carollo^{2,1}, 1. *Physical Medicine and Rehabilitation, University of Colorado Anschutz Medical Campus, Arvada, Colorado*, 2. *Children's Hospital Colorado, Aurora, Colorado*

People with disability are subject to increased Metabolic Syndrome (MetSyn). There is strong evidence supporting the adoption of the MetSyn criteria to capture cardiovascular disease (CVD) risk factors in the general population. However, there has been controversy about its definition and its utility, especially in populations that are younger and/or disable. The prevalence of MetSyn within individual cohorts varies with the definition used. The aim of this study was to compare the prevalence of MetSyn between IDF and revised NCEP ATP III definition in a group of individuals with Cerebral Palsy (CP). 72 participants (47.2% female, 52.8% male) were recruited. The prevalence of MetSyn was 26.5% and 23.5% by IDF and NCEP ATP III definitions, respectively. The IDF waist circumference criteria (>94 cm male, >80 cm female) identified 40% of the sample while the NCEP criteria (>102 cm male and >88 cm female) identified 23.5%. Abnormal levels of insulin were prevalent in 36% of the sample, lower HDL in 43%, and high BMI in 38.5%. There was a moderate association between insulin ($p=.03$), glucose ($p=.08$), WHR ($p=.02$), CHO ($p=.05$) and the level of motor function. Based on this study results, MetSyn was common in this cohort group regardless of the definition used, however the IDF definition was dominant. This study supports the notion that adults with CP are at higher risk for CVD. While these results are important findings, more studies are needed to determine the suitability of the currently used MetSyn cut-offs for waist circumference in individuals with disabilities.

VALIDATION OF THE ST. LUKE'S-SHORT GERIATRIC SCREENING TOOL FOR COMPREHENSIVE GERIATRIC ASSESSMENT

E.S. Poblete, *St. Luke's Medical Center, Quezon City, Metro Manila, Philippines*

The St. Luke's Medical Center recommends that patients 70 and above should undergo comprehensive geriatric assessment to improve clinical outcomes. However, not all older patients in the hospital need a comprehensive geriatric assessment (CGA). The St. Luke's - Short Geriatric Screening (SL-SGS) tool was developed as a pre-determined criteria in order to identify patients who will most likely benefit from the multi-disciplinary CGA.

The aim of the study is to validate the SL-SGS Scoring System using the Fried Frailty phenotype criteria as gold standard in recognizing frail and pre-frail patients who will need CGA.

Ninety-one patients aged 63–104 years old (48% males and 52% females) were included in a month long pilot

longitudinal study. The SL-SGS was performed upon admission by the bedside nurse, while the Fried Frailty Criteria based validation was done by a group of doctors on the second day of admission who were blinded to the results of the SL-SDS.

The prevalence of FFC- frailty was 45.1% among geriatric inpatients and as high as 80% among nonagenarians. Pre-frailty was found in 41.8% of patients. SL-SGS was found to have a 69.6% sensitivity and a 58.3% specificity in detecting frail and pre-frail patients. It has a 91.7% positive predictive value and a 77.4% negative predictive value.

The SL-SGS scoring system is an acceptable screening tool to determine older in-patients who will benefit from an extensive CGA. These patients should be referred to a mandatory consultative multidisciplinary CGA team headed by a geriatrician.

ANTIRETROVIRAL THERAPY DRIVES MITOCHONDRIAL DYSFUNCTION-ASSOCIATED SENESCENCE, PROMOTING LIPOATROPHY

C.D. Wiley¹, C. Kuehnemann^{1,3}, J. Campisi^{1,2}, 1. *Campisi lab, Buck Institute for Research on Aging, Novato, California*, 2. *Lawrence Berkeley National Laboratory, Berkeley, California*, 3. *University of Southern California, Los Angeles, California*

Patients infected with HIV have enjoyed greatly extended life spans in the years following the use of highly active antiretroviral therapy (HAART). However, as patients enter their second and third decades of infection and HAART, many are now afflicted with pathologies that collectively resemble premature aging. One such pathology is lipoatrophy – the loss of fat tissue from select (often subcutaneous) depots. Components of HAART, especially the early nucleotide reverse transcriptase inhibitors (NRTIs), inhibit mitochondrial DNA polymerase (polymerase gamma; PolG) and thereby deplete mitochondrial DNA, resulting in mitochondrial dysfunction. We recently showed that multiple inducers of mitochondrial dysfunction drive cellular senescence – a state of permanent cell cycle arrest that is accompanied by chromatin reorganization, morphological alterations, and the secretion of a myriad of biologically active molecules. This mitochondrial dysfunction-associated senescence (MiDAS) was accompanied by a distinct secretory phenotype that prevented adipogenesis. MiDAS occurred in a mouse model of mitochondrial dysfunction-induced premature aging, including lipoatrophy, caused by a PolG mutation. To determine whether NRTIs might drive lipoatrophy by inducing MiDAS, we cultured human fibroblasts in the presence of multiple NRTIs, several of which induced senescence as determined by expression of p21WAF1 and p16INK4a and senescence-associated beta-galactosidase. Importantly, NRTI-induced senescent cells expressed a secretome that matched the secretome observed during MiDAS. Thus, NRTIs may drive lipoatrophy and possibly other premature aging phenotypes by inducing MiDAS and its anti-adipogenic secretory phenotype. Our findings suggest that targeting the MiDAS secretome, or MiDAS cells, might provide a novel strategy for treating NRTI-based premature aging phenotypes.

RECOMMENDATIONS FOR POLICYMAKERS TO IMPROVE OLDER ADULTS' CLIMATE CHANGE PREPAREDNESS

R. Shih, J. Acosta, E. Chen, L. Xenakis, *RAND Corporation, Arlington, Virginia*

Age Friendly Initiatives (AFIs) including the World Health Organization/AARP Age Friendly Communities at the city- and county-levels support aging-in-place efforts. These AFIs represent a promising strategy for U.S. communities to build community resilience to mitigate the effects of climate change. However, few AFIs have wholly incorporated the critical element of emergency or public health preparedness for climate change-related events into their activities. We report the role that local health departments (LHDs) and AFIs play in improving emergency and public health preparedness for older adults, and provide guidance to LHDs for improving their engagement with AFIs. Qualitative analyses of nearly 40 interviews conducted with AFI and LHD staff found AFIs and LHDs perceive the greatest needs of older adults to prepare for climate change-related events to be tailored information sharing, increasing awareness of the need to prepare, developing emergency plans, and communication between older adults with supporting community organizations. Multi-agency structural processes that incentivize engagement from AFI staff can most comprehensively prepare older adults for future climate change-related events. Coordinated services from the AFI and LHD can include city/county alert systems, training for community emergency response teams, provision of emergency preparedness supplies, and delivering educational programs. We report the structural, economic, political, and social barriers and facilitators to engagement between AFIs and LHDs to inform stronger and more efficient alignment to meet the needs of aging adults in the face of climate change. The implications of lessons learned from U.S. communities are applied to other AFIs around the world.

DECLINE IN MEDICAID WAIVER SERVICES AFTER HURRICANE SANDY INCREASES RISK-ADJUSTED HOSPITALIZATION

L.P. Sands¹, Z. Jin¹, R. Pruchno², K.A. Roberto¹, Y. Hong¹, 1. *Virginia Polytechnic Institute & State University, Blacksburg, Virginia*, 2. *Rowan University, Stratford, New Jersey*

Medicaid 1915(c) waivers allow nursing home eligible older adults to avoid institutionalization by providing personal care services (PCS) in their homes. Prior studies have not determined how 1915(c) waiver recipients fare after a hurricane. We identified 26,015 New York (NY) Medicaid 1915(c) beneficiaries age 65 and older who received waiver services six months before Hurricane Sandy. We extracted demographics, chronic conditions, and hospital admissions in the year prior to, and three months after, the hurricane from Medicare data and amount of PCS in the three months prior to, and after, the hurricane PCS from NY Medicaid data. Seven percent of the sample were from high hurricane impact counties that experienced the greatest structural damage and where 20% of the population had power out for three or more days. High hurricane impact was associated with higher rates of hospital admissions after the hurricane (Incidence Ratio (IR))=0.17; 95% CI=0.004–0.344; p=0.042) and post-hurricane change in Personal Care services (p<0.001). A negative binomial model

that included demographics, chronic conditions, rural location, prior hospitalizations, and high vs. low hurricane impact revealed that post-hurricane change in personal care services was associated with hospital admissions in the three months after the hurricane. Compared to no change in personal care services, decrease in personal care services was associated with increased incidence of hospital admissions (IR = 0.549; 95%CI=0.435,0.663;p<0.001), whereas increase in personal care services was associated with decreased incidence of hospitalization (IR=-0.61; 95%CI=-0.714,-0.508;p<0.001). Disaster-related reduction in PCS increases vulnerable older adults' risk for hospital admissions.

HOW DO PATIENTS WITH MILD COGNITIVE IMPAIRMENT PERCEIVE THE POTENTIAL UTILITY OF AMYLOID IMAGING?

J.A. Lingler¹, L. Hu², M. Mattos¹, H. Kim¹, J. Morris¹, 1. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *New York University, New York, New York*

Background: The proliferation of biomarker testing in Alzheimer's disease (AD) research has spurred questions about the clinical and/or personal utility of such tests. We explored how patients with mild cognitive impairment (MCI) and their family care partners view the potential personal utility of PET amyloid imaging (AI).

Methods

Participants included 20 patients with MCI and their respective care partners who were actively deciding whether to pursue AI. All participants underwent pre-testing counseling (PTC) including: overviews of MCI, AD, and AI, potential pros/cons of AI, and implications for AD risk. Following PTC, participants were encouraged to carefully consider whether to pursue AI. Within 2 weeks of PTC, qualitative interviews were conducted using a semi-structured interview guide with open-ended questions about the decision making process, including which factors were considered during the decision. Interview transcripts were coded and categorized using content analysis.

Results

Patients and care partners consistently reported the potential to gain more information about the underlying cause, or likely course, of their MCI as a major motivator for pursuing AI. Many were actively anticipating their emotional and behavioral reactions to AI results. Upon probing, most acknowledged the limitations and potential drawbacks of AI (e.g., "They aren't going to find something on the scan and give me a pill and I'll be better."). Yet, there were 11 instances of misunderstanding or overstating the potential value of AI (e.g., "It will tell me how far along I am.").

Conclusion

Even with PTC, some individuals may disproportionately emphasize potential benefits when considering AI.

COMPARISON OF TWO MODALITIES OF EXERCISE ON THE HEALTH PROFILE IN OLDER WOMEN WITH ABDOMINAL OBESITY

I. Boukabous^{1,2}, T. Amamou^{1,2}, A. Marcotte-Chenard^{1,2}, P. Boulay^{1,2}, M. Brochu^{1,2}, D. Tessier², I.J. Dionne^{1,2}, E. Riesco^{1,2}, 1. *Faculty of physical activity sciences, University of Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *Research Center on Aging, CIUSSS de l'Estrie CHUS, Sherbrooke, Quebec, Canada*

The impact of high-intensity interval training (HIIT) compared to the current exercise recommendations (moderate intensity continuous aerobic exercise; CONT) has to be verified in obese older women before being used by health professionals. **Objective:** The purpose of this study is to compare the effect of HIIT to CONT on body composition, metabolic profile and affective responses in obese elderly. **Methods:** A total of 20 older and sedentary women (60–75 years) with abdominal obesity (waist circumference \geq 88 cm) are currently recruited and randomized to one of the following group: 1) HIIT (n=10); 2) CONT (n=10). All variables are measured before and after 8 weeks of intervention: Anthropometry (weight, height, body mass index), body composition (fat mass [FM], lean body mass [LBM], visceral adipose tissue [VAT]; DXA), metabolic profile (fasting lipid profile, glucose and insulin) and physical capacity (senior fitness test). Affective responses are measured before and after each training session. **Preliminary Results:** VAT tend to decrease in HIIT group only (p=0.07) while total FM remained unchanged. Moreover, HDL-C tend to increase in HIIT only (p=0.09) while LDL-C decreased (p=0.01) in both groups. Finally, while HbA1c tend to increase, total cholesterol tend to decrease in HIIT and CONT (both, p=0.08). Finally, affective response before and after each training were similar between HIIT and CONT (both p>0.48) and remained unchanged. **Conclusion:** Our preliminary results suggest that HIIT could provide better improvements (VAT and HDL-C) compared to the current exercise recommendations in physically inactive older women.

GWAS REVEALS NOVEL GENETIC REGULATORS OF DIET-RELATED LONGEVITY OR HEALTH IN DROSOPHILA MELANOGASTER

K.A. Wilson^{1,2}, C.S. Nelson¹, J.N. Beck^{1,3}, R. Brem^{1,2,4}, P. Kapahi^{1,2,3}, 1. *Buck Institute for Research on Aging, Novato, California*, 2. *Davis School of Gerontology, University of Southern California, Los Angeles, California*, 3. *Department of Urology, University of California, San Francisco, San Francisco, California*, 4. *Department of Plant and Microbial Biology, University of California, Berkeley, Berkeley, California*

Aging is a root cause of many chronic diseases and associated morbidity and mortality. A number of interventions have been suggested to improve overall lifespan and health, with one of the most successful being dietary restriction. Despite the generally well-demonstrated health and longevity benefits of dietary restriction, cases remain in model organisms where some genotypes are not affected or are negatively impacted. With the use of the *Drosophila* Genetic Reference Panel, we have identified a new set of genes that regulate health or longevity either diet-dependently or diet-independently. Associated with longevity are the genes CG34351 and Fdxh. We have also revealed CG33690, a previously uncharacterized gene, as being a regulator of health in response to diet. Through alteration of the expression of these genes via RNAi and gene disruption, we have validated their roles in impacting on lifespan or climbing ability independently. In addition to ascribing novel functions to these genes, our results demonstrate that lifespan and healthspan depend on a complex set of inputs including genetic polymorphisms and diet.

THE ASSOCIATION BETWEEN CARDIOVASCULAR SYMPTOMS AND TCM USE AMONG GREATER CHICAGO AREA OLDER ADULTS

K. Zhang, X. Dong, *Rush Institute of Healthy Aging, Rush University, Chicago, Illinois*

Traditional Chinese Medicine (TCM) encompassing herbal medicine, acupuncture, massage therapy and tai chi, among others have been in use for thousands of years. Even with the advancement of modern medicine, it continues to be a popular choice owing to its suspected advantages. Half of the older population suffers from chronic conditions including cardiovascular specific types. The prevalent cardiovascular aging manifests with symptoms of chest pain, tightness, palpitations, dyspnea and edema. These symptoms are usually chronic and are likely to occur in multiples, signifying a community health burden. This study aims to examine the association of TCM use and the presence of cardiovascular symptoms leveraging the population-based PINE study. Participants included 3,157 Chinese older adults from the greater Chicago area age 60 and older. Clinical review of systems (ROS) was used to assess for presence of chest pain, edema, tightness, palpitations and shortness of breath in the past two years. The frequency of each TCM subtype use was also assessed. The association between them was analyzed using logistic regression. Results indicated that participants with cardiovascular symptoms were more likely to use any one type of TCM (OR: 1.38 (1.14–1.66)), herbal medicine (OR: 1.74 (1.47–2.05)), acupuncture (OR: 1.78 (1.42–2.24)) and massage therapy (OR: 1.88 (1.50–2.36)). The significant results corroborate with previous research the wide practical uses of TCM. It also provides evidence the importance of TCM among older adults with cardiovascular symptoms. Future research may further investigate the causal relationship between them.

IMPACT OF SOCIAL NETWORK TYPE ON DEMENTIA RISK IN THE CONTEXT OF COGNITIVE RESERVE

F.S. Then^{1,2}, A. Pabst², S.G. Riedel-Heller², 1. *USC Edward R Roybal Institute on Aging, Los Angeles, California*, 2. *University of Leipzig, Leipzig, Germany*

Social isolation and lack of social support come with a high risk for mortality, cardiovascular disease, and apparently also for dementia. The aim of the study was to investigate to what extent social network type increases the risk to develop dementia. As education - in sense of a cognitive reserve - is an important protector against dementia, we also explored whether the impact of social network type on dementia risk could be overcome by higher education. Data analyses are based on the Leipzig Longitudinal Study of the Aged (LEILA75+, n=1,265), a representative population-based cohort study examining individuals aged 75+ years. Social networks were assessed using the practitioner assessment of network type instrument (PANT). Time-series regression modeling adjusted for age, gender, cardiovascular risk factors and history of depression revealed individuals with restricted network types had a significantly greater risk to develop dementia than individuals with socially integrated network types. The probability to develop dementia over the follow-up period was almost twice as high for individuals with low education than for individuals with high education. Our findings imply that social integration is an important

protective factors against dementia in the elderly population. Particularly, individuals with low education, and hence a low cognitive reserve, may benefit from community interventions that foster social integration of older population groups.

CULTIVATION OF SOCIAL NETWORKS AND DIURNAL CORTISOL PROFILES IN HEALTHY CHINESE ELDERS

J.C. Lai¹, P. Evans², 1. *Applied Social Sciences, City University of Hong Kong, Hong Kong, Hong Kong*, 2. *University of Westminster, London, United Kingdom*

Psychobiological research on aging in humans is confounded by individual differences that have not been precisely characterized. Examining the impact of a proactive social behavior, network cultivation on diurnal cortisol profiles in healthy Chinese elders, Lai et al. (2012) showed that elders who invested more time and efforts in cultivating their social ties exhibited a more salient cortisol awakening response and a faster diurnal decline of salivary cortisol. However, as waking and saliva sampling times were not monitored objectively by appropriate electronic devices, the impact of the aforementioned findings is delimited. The present study re-examined the relationship between network cultivation and diurnal cortisol rhythms more precisely by a secondary analysis of the data reported by Lai et al. (2012) using multilevel modeling, focusing on the diurnal decline in cortisol from 3 to 12 hours post-awakening. This involved data from 82 healthy elders, with an equal number of men and women (mean age = 73.09 yrs.). Results show that socially less proactive elders exhibited a higher diurnal cortisol level than their peers with either average or high scores on network cultivation. This suggests that a low motivation in cultivating social ties in the elders accentuates cortisol secretion, which may increase susceptibility to age-related diseases. These findings are consistent with recent evidence showing the health benefits of a lower cortisol output over the day. Further research is warranted to explore possible psychophysiological mechanisms translating social network cultivation to altered functioning of the hypothalamic-pituitary-adrenocortical axis.

ARE SOCIETAL FACTORS INFLUENCING CANADIAN POLICIES FOR INFORMAL CARE PROVISION?

K. Zawaly, V.H. Menec, *University of Manitoba, Winnipeg, Manitoba, Canada*

BACKGROUND AND AIM: Examining the policies for informal caregiving is relevant as the global community faces the challenges of an aging population due to lower fertility rates and rising life expectancies. Canada's universal health-care ensures free access only to clinical care. It does not include support with activities of daily living which means family is expected to play a key role in providing care for older adults. This demonstrates there has been a lack of national response to providing their care. The aim of this analysis was to assess Canadian Federal, Provincial and Territorial informal care policies to reveal whether they align with demographic changes affecting the provision of informal care.

METHODS: Canadian policies regarding informal care providers were evaluated using the following criteria: exclusivity of caregiver tax credit programs, limits of care leave

compensation, and the availability of direct financial support for informal caregiving. This was examined alongside societal trends to see if the restraints in the policies align with the prominent trends of informal caregiving.

RESULTS: Canadian policy surrounding informal care does not take into account the last fifty years of sociodemographic changes that have altered family trajectories and ability to provide high-levels of care.

DISCUSSION: The results demonstrate a discrepancy between informal care policies and societal trends. If policies are not altered there is potential that the care of older adults will be negatively impacted. Thus there is an urgent need to proactively address these policy gaps to ensure the wellbeing of the rapidly aging population.

COGNITIVE STATUS AND OUTCOME IN ELDERLY PATIENTS WITH HIP FRACTURE IN AN ORTHOGERIATRIC CARE PATHWAY

L. Zerah^{1,2}, J. Cohen-Bittan¹, M. Raux³, A. Meziere⁴, M. Verny^{1,2,5}, F. Khiami⁶, J. Boddaert^{1,2,5}, 1. *Department of Geriatrics, Unit of Peri-Operative Geriatric care, Pitie salpetrière hospital, Paris, France*, 2. *Sorbonne University, University Pierre and Marie Curie (UPMC) Paris 06, University Hospital Department Fight Aging and Stress (DHU FAST), Paris, France*, 3. *Departments of Anesthesiology and Critical Care, GH Pitié-Salpêtrière, Paris, France*, 4. *Department of Rehabilitation, GH Charles Foix, Ivry sur Seine, France*, 5. *Centre National de la Recherche Scientifique (CNRS), UMR 8256, Paris, France*, 6. *Departments of Orthopedic Surgery and Trauma, GH Pitié-Salpêtrière, Paris, France*

Dementia is associated with a worse prognosis of hip fracture, but the impact of a dedicated geriatric care pathway on the prognosis of these patients has not been evaluated.

According to the cognitive status before surgery, our main objective was to compare mortality rate at 6 months; secondary outcomes were to compare in-hospital complications, the risk of new institutionalization and the ability to walk at 6 months.

Between 2009 and 2015, all patients (> 70 years) admitted after hip fracture surgery into a dedicated unit of peri-operative geriatric care were included: patients with dementia (DP), without dementia (NDP) and with cognitive status not determined (CSND). Data are expressed as Hazard Ratio (HR) for multivariate cox analysis or Odds Ratio(OR) for multivariate logistic regression analysis and their 95% confidence interval (CI).

We included 650 patients (86 ± 6 years): 168 DP, 400 NDP and 82 CSND. After adjustment for age, sex, comorbidities, polypharmacy, pre-fracture autonomy, time-to-surgery and delirium, there were no significant differences for 6-month mortality (DP vs NDP: HR=0.7[0.4 – 1.2], DP vs CSND: HR=0.6[0.3 – 1.4], CSND vs NDP: HR=0.8[0.4 – 1.7]); but DP and CSND were more likely to be newly institutionalized after 6 months compared to NDP (OR DP=2.6[1.4 – 4.9], p=0.003, OR CSND=2.9[1.4 – 6.1], p=0.004). 92% of population was walking after 6 months (63% with assistance): no difference was found between the 3 groups.

In a dedicated geriatric care pathway, DP and CSND undergoing hip surgery have the same 6-month mortality and walking ability as NDP.

PREOPERATIVE ASSESSMENT IN OLDER CANCER PATIENTS: EVALUATION OF A NEW TOOL

Y. Pollock, C. Chan, K.E. Hall, M. Englesbe, K. Diehl, L. Min, *University of Michigan, Ann Arbor, Michigan*

Background: Comprehensive geriatric assessment prior to oncologic surgery can help predict surgical outcomes. We tested whether an abbreviated geriatric assessment, the Vulnerable Elderly Surgical Pathways and Outcomes Assessment (VESPA) would also predict post-operative surgical, geriatric, functional, and discharge complications among older adults undergoing oncologic procedures.

Methods: From 2008 to 2011, geriatric assessment was completed using VESPA for patients age≥70 years in an university pre-operative clinic. The VESPA assessed functional status, mood, cognition, and mobility, and can be completed in <10 minutes. We selected the subset of patients who underwent oncological procedures and evaluated association of the VESPA score with post-hospital functional status needs, surgical complications, geriatric complication, and complicate discharge planning. We used t-test, χ^2 , or fisher's exact test to compare the complication rates between high and low VESPA score (\geq vs.<9) and tested the full VESPA score in a multivariable, multinomial outcome model.

Results: A total of 476 patients who underwent oncologic procedures received the assessment using VESPA, which included and controlled for surgical complexity. Compared to patients with low VESPA score, patients with high VESPA score had longer length of stay (mean 6.6 vs. 2.0 days; p<0.001), more geriatric (39.5% vs. 3.7%; p<0.001), surgical (29.5% vs. 11.8%; p<0.001), and functional complications (76.0% vs. 31.7%; p<0.001). Each additional point on the VESPA scale was associated with surgical/geriatric complication or complex discharge planning. (OR=1.3 [95%CI: 1.3–1.4])

Conclusions: The VESPA identifies patients who need peri-operative surveillance for surgical and geriatric complications, as well as discharge planning for post-hospitalization rehabilitation and nursing needs.

COGTEL: A NOVEL TOOL TO ASSESS INDIVIDUAL DIFFERENCES IN COGNITIVE FUNCTIONING IN HEALTHY AGING

M. Kliegel¹, E.R. Gouveia², B.R. Gouveia², D.L. Freitas², J. Jurema³, A. Ihle¹, 1. *University of Geneva, Geneva, Switzerland*, 2. *University of Madeira, Funchal, Portugal*, 3. *Amazonas State University, Manaus, Brazil*

The Cognitive Telephone Screening Instrument (COGTEL) is a novel test battery that allows the assessment of performance in six cognitive domains (prospective, short-term, long-term, and working memory, verbal fluency, and reasoning). It can be applied in a face-to-face session, but also over the phone and takes only about 15 minutes. The COGTEL has been optimized to be a detailed measure of cognitive functioning that can be included in large-scale epidemiological and aging studies. The present study set out to evaluate the psychometric properties of the COGTEL in two different samples of older adults. We assessed COGTEL in 116 older adults (mean age = 68.3 years) from Apuí, Fonte Boa, Manaus, and Tonantis, Brazil, with retest after seven days to evaluate test-retest reliability. Moreover, we assessed COGTEL in 868 older adults (mean age = 70.1 years) from Apuí, Fonte Boa, Manaus, and Tonantis, Brazil, to evaluate convergent validity to the MMSE.

Results showed that test-retest reliability of the COGTEL score was good at .85 ($p < .001$). Latent variable analyses revealed that COGTEL and MMSE correlated by .84 ($p < .001$), indicating convergent validity of the COGTEL. In conclusion, the present analyses suggest COGTEL as an instrument for capturing interindividual differences in cognitive functioning in large-scale epidemiological and aging studies with the advantage of covering more cognitive domains than traditional screening tools such as the MMSE and differentiating also in the healthy older adults.

CORRELATION BETWEEN NUTRITIONAL STATUS AND SARCOPENIA IN ELDERLY FALLERS FROM PREVQUEDAS BRAZIL

M.Z. Magalhes, E.Y. Ishigaki, A. Passos, S. Paschoal, M. Perracini, L. Leme, *Prevquedas Brasil, Hospital das Clinicas da FMUSP, São Paulo, Brazil*

Introduction: Nutritional assessment determines the nutritional status, which results from the balance between food intake and caloric expenditure. Sarcopenia is the simultaneous decline of muscle strength and function, often seen in the aging process. This loss can lead to hospitalization, decreased functionality, fragility syndrome and consequently increases the risk of falls in the elderly. **Objective:** Examine prevalence of sarcopenia in elderly fallers through the Muscle Mass Index (MMI ≤ 8.87 kg/m). **Secondarily,** examine the relationship among sarcopenia and gender, number of falls, MAN® (Mini Nutritional Assessment) scores, functional status. **Methods:** Transversal data from Prevquedas Brazil, a Multicenter parallel-group randomized controlled trial that evaluates the effectiveness of a multifactorial falls prevention program in reducing rate of falls in community-dwelling elderly. Sarcopenia were classified according to the MMI, people were classified in normal nutritional status MAN® (≥ 24), risk of malnutrition ($17 \leq$ or $\geq 23,5$) and malnourished (< 17). Functional status was based on Lawton and Katz scales. **Statistical Analysis:** Data analyzed through Chi-Square test, Fisher's test, frequency chart, Box-and-Whisker plot, using Stata® and MedCalc®. **Results:** $n=62$, 77.4% female ($N=48$) and 54.9% of the total sample presented sarcopenia. The majority of the elderly with sarcopenia presented MAN without nutritional risk and without correlation with alteration of the functionality. Statistical homogeneity found between elderly with sarcopenia and non-sarcopenic ones, by fall event number. Statistical correlation found among sarcopenia, Body Mass Index and gender. Statistical significance found between the presence of sarcopenia, gender ($p=0.037$) and BMI ($p=0.004$). **Conclusion:** Sarcopenia prevalence confirmed in elderly fallers.

ISOPRENOID METABOLISM AS A TARGET IN TOCOTRIENOL-MEDIATED DOWNREGULATION OF AMYLOID B PROTEIN

H. Mo¹, C. Shen², W. Xia^{3,4}, 1. *Nutrition, Georgia State University, Atlanta, Georgia*, 2. *Texas Tech University Health Sciences Center, Lubbock, Texas*, 3. *ENR Memorial Veterans Hospital, Bedford, Massachusetts*, 4. *Boston University, Boston, Massachusetts*

The lack of cure for Alzheimer's disease (AD) calls for novel intervention approaches. Amyloid β protein ($A\beta$)-containing neuritic plaques is one of the neuropathological

hallmarks in brains of AD patients. Prenylation of proteins regulating neuronal functions requires mevalonate-derived farnesyl pyrophosphate (FPP) and geranylgeranyl pyrophosphate (GGPP). GGPP stimulates γ -secretase and increases the production of $A\beta$. The observation that the levels of FPP and GGPP are elevated in AD patients is consistent with the finding that statins, competitive inhibitors of 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, reduce FPP and GGPP levels and $A\beta$ production in preclinical studies. Epidemiological evidence suggests inverse correlation between the incidences of AD and mild cognitive impairment and plasma tocotrienols; the latter inhibit the transcription of HMG CoA reductase and accelerate its degradation. We hypothesized that d- δ -tocotrienol reduces $A\beta$ via mevalonate pathway downregulation. Forty-eight male C57BL/6J mice were assigned to four groups ($n=12$ /group): high fat diet (HFD) and HFD supplemented with 400 mg d- δ -tocotrienol/kg diet, 400 mg geranylgeraniol/kg diet, and a blend of the two agents for 14 weeks. Brain $A\beta$ levels were measured by ELISA. Dietary d- δ -tocotrienol reduced brain $A\beta_{40}$ and $A\beta_{42}$ ($P < 0.05$). Dietary geranylgeraniol reversed the effect of d- δ -tocotrienol on $A\beta_{40}$ and $A\beta_{42}$, suggesting that GGPP downregulation mediates the tocotrienol effect. Mevalonate pathway may offer a new target for tocotrienols and natural products without the dose-limiting toxicity of the statins.

GENETIC INFLUENCE ON AGE OF MENOPAUSE IN LONG-LIVED INDIVIDUALS

H. Bae¹, F. Sun², S.L. Andersen², N. Schupf³, T.T. Perls², P. Sebastiani², 1. *Oregon State University, Corvallis, Oregon*, 2. *Boston University, Boston, Massachusetts*, 3. *Columbia University, New York, New York*

Several studies have observed that women who are able to naturally have children later in life tend to live longer. We hypothesize that the evolutionary pressure to extend the period of time in which women can bear children and therefore have the opportunity to have more of them could be a mechanism for the selection of genetic variants that slow aging and decrease risk for age-related diseases. We performed a genome-wide association study (GWAS) for age of menopause (AOM) in 1,317 women in the Long Life Family Study (LLFS), using approximately 1.5M single nucleotide polymorphisms (SNP). We used Cox proportional hazard regression to model AOM accounting for censoring of 1,127 women, with a robust variance estimator to adjust for within familial relations. No SNP reached genome-wide significance, but SNPs rs10957156 ($p=0.00043$) in CHD7, rs4886238 ($p=0.00051$) in TDRD3, rs16991615 ($p=0.00080$) in MCM8, rs16858210 ($p=0.013$) in PARL/POLR2H, rs11668344 ($p=0.033$) in BRSK1, and rs8070740 ($p=0.036$) in RPAIN previously associated with AOM replicated in the LLFS GWAS. Several top SNPs in the LLFS ($p < 10^{-4}$) also replicated the results in a large meta-analysis of AOM published in 2015. Among these, rs10239340 is a significant expression quantitative loci (eQTL) of IRF5, a gene whose function is involved in promotion and inhibition of inflammation, in multiple tissue types. Additionally, rs10455038 is a significant eQTL of PPIC, which participates in many biological processes such as metabolism, apoptosis, redox, and inflammation. This study is the first GWAS of AOM in a sample enriched for longevity.

THE ASSOCIATION OF DIETARY PATTERN WITH OVERALL MORTALITY, AND OTHER LIFESTYLES IN JAPANESE ELDERLY

W. Zhao¹, S. Ukawa¹, E. Okada¹, K. Wakai², T. Kawamura³, M. Ando⁴, A. Tamakoshi¹, 1. *Department of Public Health, Hokkaido University Graduate School of Medicine, Sapporo, Hokkaido, Japan*, 2. *Department of Preventive Medicine, Nagoya University Graduate School of Medicine, Nagoya, Aichi, Japan*, 3. *Kyoto University Health Service, Kyoto, Japan*, 4. *Center for Advanced Medicine and Clinical Research, Nagoya University Hospital, Nagoya, Aichi, Japan*

Objectives: There was less evidence particularly focused on dietary patterns and subsequent overall mortality in the elderly and no data for the interaction between dietary patterns and other lifestyle factors. We examined the association between dietary pattern and all-cause mortality in the younger-elderly Japanese, and explored the modifiable effect of lifestyles on this association.

Methods: A total of 2949 community-dwelling residents aged 64 or 65 from the New Integrated Suburban Seniority Investigation Project, were included. Dietary patterns were derived by factor analysis based on validated food frequency questionnaires, and cox proportional hazard regression was used to estimate hazard ratios and 95% confidence interval. The confounders included survey year, gender, marital status, working status, education, smoking, drinking, daily walking time, sleeping duration, social participation, living arrangement, BMI, functional capacity, history of heart disease, cerebrovascular disease, cancer, hypertension, hyperlipidaemia, and diabetes mellitus.

Results: Meat-fat, healthy, and dairy-bread dietary pattern were identified. The significantly positive association between met-fat pattern and mortality was observed in the subgroups of never smokers (HR, 2.90; 95% CI, 1.41–5.96); the same association between dairy-bread pattern was observed within never smokers (HR, 2.25; 95% CI, 1.22–4.13), heavier drinkers (HR, 1.62; 95% CI, 1.09–2.39). For healthy pattern, the inverse association was further observed within never smokers (HR, 0.43; 95% CI, 0.24–0.78), heavier drinkers (HR, 0.63; 95% CI, 0.42–0.93), and those who walked more than 1hours/day (HR, 0.48; 95% CI, 0.29–0.80).

Conclusions: We found smoking and drinking status, and daily walking time could modify the association between three patterns and overall mortality.

DELAYED MOBILIZATION AND LENGTH OF STAY IN ELDERLY SURGICAL PATIENTS: PROSPECTIVE COHORT STUDY

J.L. Pederson¹, R.S. Padwal^{2,3}, A. Wagg⁴, J. Holroyd-Leduc⁵, X. Wang⁶, S.R. Majumdar^{2,3}, R.G. Khadaroo^{1,7}, 1. *Department of Surgery, Faculty of Medicine & Dentistry, University of Alberta, Edmonton, Alberta, Canada*, 2. *Division of General Internal Medicine, Faculty of Medicine & Dentistry, University of Alberta, Edmonton, Alberta, Canada*, 3. *Alberta Diabetes Institute, Edmonton, Alberta, Canada*, 4. *Capital Health Chair of Healthy Ageing, Department of Medicine, University of Alberta, Edmonton, Alberta, Canada*, 5. *Faculty of Medicine, University of Calgary, Calgary, Alberta, Canada*, 6. *Research Facilitation, Research Priorities & Implementation, Research Innovation & Analytics, Alberta Health Services, Edmonton, Alberta,*

Canada, 7. *Division of Critical Care Medicine, Faculty of Medicine & Dentistry, University of Alberta, Edmonton, Alberta, Canada*

Surgical admissions are increasing in older and frailer patients, who are vulnerable to post-operative morbidity and mortality. Early post-operative mobilization may reduce adverse events and length of stay (LOS), but little is actually known about the impact of delayed mobility. Therefore, we assessed the independent association of delayed mobilization with LOS in elderly surgical patients. Overall, 306 consecutive survivors of emergent abdominal surgery aged ≥ 65 y who required help with <3 activities of daily living were prospectively enrolled at 2 tertiary-care Canadian hospitals. Time until post-operative mobilization (out of bed) was attained from hospital records and a priori defined as ‘delayed’ (≥ 36 h) or ‘early’ (<36 h) and analyzed with multivariable negative binomial regression. Mean age was 76 ± 7.7 years, 45% were women, and 22% were frail according to the Clinical Frailty Scale. Gallstones (23%), intestinal obstructions (21%), and herniae (17%) were the most performed surgeries. Median time to post-operative mobilization was 19h (interquartile range [IQR] 9–35) and median LOS was 9 days (IQR 6–14). One-quarter ($n=74$) of patients had delayed mobilization, which was associated with much longer median LOS vs early mobilization (14 days [IQR 10–28] vs 7 days [IQR 5–11] $p<0.001$). After multivariable adjustment, delayed mobilization was still independently associated with longer LOS (adjusted ratio 1.25, 95%CI 1.05–1.44, $p=0.03$). Additionally, delayed mobilization was associated with greater use of homecare ($p=0.1$) and discharge to higher levels of care ($p=0.02$). Potentially preventable delays in mobilization following surgery frequently occur in elderly patients and are associated with 25% longer LOS and more complex discharge transitions.

GLOBAL FORCES IN THE FUTURE OF LGBT AGING: DISCRIMINATION, IDENTITY, AND HEALTH OVER TIME

K.I. Fredriksen-Goldsen, H. Kim, *University of Washington, Seattle, Washington*

Worldwide the population of older adults is growing in complexity and diversity, including by sexual orientation and gender identity. Based on an innovative life course equity framework, this study reveals new cutting-edge findings on the interplay between marginalization, identity, health behaviors, quality of life and health of lesbian, gay, bisexual, and transgender (LGBT) older adults, and assesses key differences by sex and age group. Based on three most recent waves of longitudinal data ($N = 2,450$) from Aging with Pride: National Health, Aging, and Sexuality/Gender Study (NHAS), this study applied fixed effect models examining within-subject changes in experiences of discrimination, identity stigma and affirmation, and health behaviors over time on quality of life and cognitive and functional impairment. Within-subject increases in day-to-day discrimination, identity stigma, and poor nutrition across time points predicted lower levels of physical, psychological, social, and environmental QOL. Within-subject increases in day-to-day discrimination and poor nutrition and decreases in physical activity predicted higher levels of cognitive and functional impairment, while an increase in microaggressions

and decrease in identity affirmation predicted higher levels of cognitive impairment. Gender and generational differences were found. Change in day-to-day discrimination had a greater impact on men; poor nutrition had a greater impact on the oldest old. As the population ages, it is imperative to identify groups at highest risk and those aging well to ascertain modifiable mechanisms so that global research, practices, and policies can be tailored to improve the health and well-being of our growing worldwide demographically diverse older adult population.

STRATEGIES USED BY PRIMARY CARE PRACTITIONERS TO SUPPORT PEOPLE WITH DEMENTIA WITH DRIVING CESSATION

T.L. Scott¹, G. Mitchell¹, J. Liddle¹, E.R. Beattie², N.A. Pachana¹, 1. *School of Medicine, The University of Queensland, Brisbane, Queensland, Australia*, 2. *Queensland University of Technology, Brisbane, Queensland, Australia*

This research addresses dementia and driving cessation, a major life event, and an immense challenge in primary care. In Australia it is general practitioners (GPs) who identify changes in cognitive functioning and monitor driving issues with their patients. Doctors are advised not to base their fitness to drive decisions solely on disease duration, and without clear guidelines or tests, it is a complicated area of practice. We aimed to gain an understanding of the barriers and facilitators that primary care practitioners experience in managing driving cessation with their patients with dementia, and the strategies implemented to address these. A qualitative study was undertaken to understand how GPs transition a patient with dementia to non-driving status. Data were collected through five focus groups with GPs in practices across S.E. Queensland, Australia. Discussions were audio recorded, transcribed verbatim and thematically analyzed taking a phenomenological approach. Preparation and education were identified as key. Because loss of insight into declining driving abilities exacerbated the challenges of stopping, timing of the discussion was regarded as critically important. However, it was complicated with the difficulty of identifying early dementia; and concern for the negative impact that raising the driving issue had on the doctor-patient relationship. A number of in-room tests were reported as somewhat useful, however no single test satisfactorily predicted fitness to drive, and these lacked face validity with patients. GPs noted that involving supportive family members and providing strategies for accessing alternative transportation were helpful. The findings clarify a need for programs to support GPs and their patients to manage the complex issues around dementia and driving cessation.

OLDER ADULT GHANAIS AND HEALTH CARE ACCESS

Y. Nyameazea, *University of North Carolina at Pembroke, Pembroke, North Carolina*

Health-seeking behavior studies have found that many older adult Ghanaians delay or do not seek health care services for their health symptoms. Self-rated health studies show that many of them experience poor health and functional disability. Morbidity data also indicate a high incidence of ill health among them. Currently numbered about one million,

older adult Ghanaians are expected to increase to almost six million by 2050. Their health situation may be compounded by their increasing numbers, hence the importance of understanding their utilization of health care services.

This study examined the factors that mitigate health care usage among older adults in Ghana. The study sample was drawn from the second wave of the Ghana national survey conducted as part of the World Health Organization's SAGE Project. The inclusion criteria for the study yielded an analytic sample of 3947. The analysis showed that older adults who have positive perception of their overall health status, reside in rural areas, and are members of Indigenous religion are less likely to use health care services. It also showed that the risk to health care affordability for older adults comes not from the size of their income, but from their exposure to income irregularity, high household debt, high number of dependents, and lack of health insurance. The projected increase in the Ghanaian older adult population underscores the importance of identifying those who are not using health care services when needed, and designing effective strategies and programs to better serve them.

A LONGITUDINAL STUDY OF SOCIAL CONNECTEDNESS AND HEALTH AMONG SEXUAL MINORITY OLDER ADULTS

H. Kim, K.I. Fredriksen-Goldsen, *University of Washington, Seattle, Washington*

Guided by the Health Equity Promotion Model, Aging with Pride: National Health, Aging and Sexuality/Gender Study examined the influence of changes in social connectedness (structure, quality, and function) on cognitive and mental health over time among lesbian, gay, and bisexual (LGB) older Americans by race/ethnicity. We analyzed data collected in 2014, 2015, and 2016 from the first longitudinal study of LGB and transgender Americans born in 1964 or earlier (N=2,450), using fixed and random effect models. Compared with non-Hispanic Whites, Hispanics and Blacks showed lower social support ($b = -28, p < .01$; $b = -.20, p < .01$) and higher cognitive impairment ($b = 7.02, p < .001$; $b = 3.04, p < .01$) at baseline although they had stronger community engagement ($b = .29, p < .01$; $b = .22, p < .05$); Hispanics had a smaller network size ($b = -.98, p < .05$) and higher depressive symptomatology ($b = 1.65, p < .001$). Within-subject increase in social support and community engagement across time was significantly and negatively associated with cognitive impairment ($b = -.90, p < .01$; $b = -.53, p < .05$) and depressive symptomatology ($b = -.91, p < .001$; $b = -.25, p < .05$). Unexpectedly, for Blacks the increase in community engagement within subjects was positively associated with cognitive impairment ($b = 1.58, p < .05$). The findings have implications for translational intervention studies. Promoting social network quality and community engagement considering racial/ethnic heterogeneity is essential for improving cognitive and mental health among LGB older adults.

LONGITUDINAL EFFECTS OF OWN AND PARTNER PAIN INTENSITY AND DEPRESSIVE SYMPTOMS IN AGING COUPLES

C. Polenick¹, J.M. Brooks², K. Birditt¹, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *Dartmouth College, Hanover, New Hampshire*

Chronic pain is widespread in later life and linked to depression among individuals and their partners. Nevertheless, little is understood about mutual influences between pain intensity and depressive symptoms within couples as they age. Utilizing a U.S. sample of 940 heterosexual married couples aged 50 years and older ($M = 64.45$, $SD = 7.72$) drawn from five waves (2006 – 2014) of the nationally representative Health and Retirement Study (HRS), we examined individual and cross-partner associations between pain intensity and depressive symptoms across an 8-year period. Dyadic growth curve models controlled for baseline length of marriage and marital quality, along with sociodemographics, self-rated health, chronic health conditions, and functional disability. For wives and husbands, their own greater baseline pain intensity was significantly linked to higher overall levels of depressive symptoms. Unexpectedly, however, wives with more intense baseline pain reported significant decreases in their own depressive symptoms over time. Finally, husbands' greater baseline pain intensity was significantly associated with increases in wives' depressive symptoms over time; but the reverse association was not found. Findings underscore the value of considering both individual and spousal links between pain intensity and depressive symptoms in middle and later life. Elucidating how individual and couple processes unfold over time may generate critical insights for the development of interventions to improve and maintain the mental health of older chronic pain patients and their spouses.

THE EFFECTS OF EMPLOYMENT ON DEPRESSION AMONG OLDER ADULTS: MEDIATING ROLE OF SELF-ESTEEM

S. Song, E. Lee, H. Jun, K. Lee, D. Yoon, *Dep. of child and family studies, Yonsei University, Seoul, Korea (the Republic of)*

The purpose of this study was to examine the effects of employment on depression among Korean older adults, with the mediating role of self-esteem. Considering gender differences in the workplace, separate analyses were conducted according to gender. Using the 8th to 10th (2013–2015) waves of the Korea Welfare Panel Study with Mplus 7.4, the direct longitudinal pathways testing the effects of employment (wave 8) to depression (wave 10), and indirect longitudinal pathways which include the mediating effect of self-esteem (wave 9) were analyzed. The final sample included 5,340 older adults (male=2,049, female=3,291) aged 60 and over. The results indicated that the longitudinal indirect effects of employment on depression were negatively significant for both men ($\beta = -0.074$, $p < .01$) and women ($\beta = -0.109$, $p < .001$), which signify that employment contributes to lowering levels of depression through the positive effects it has on increasing levels of self-esteem. The results also showed that there was a significant direct effect of employment on subsequent levels of depression for older women, whereas it was not significantly relevant for older men. It suggests that employment itself may decrease depression levels, but that this may differ depending on gender. This study implies that employment may significantly contribute to lowering older adults' depression and that, it may be important to consider mediating mechanisms, as well as the effects of gender, when examining the relationship between the two. Therefore, it is

necessary to actively encourage the productive contribution of older adults because it not only increases self-esteem but also ultimately reduces depression levels.

GENDER DIFFERENCES AND SIMILARITIES AMONG OCTOGENARIANS AND CENTENARIANS

M. Harrison Joynt¹, P. Martin¹, L.W. Poon², *1. Gerontology, Iowa State University, Ames, Iowa, 2. University of Georgia, Athens, Georgia*

Studies of longevity have a somewhat short history compared to many other areas of study within gerontology and even less research has been conducted on gendered similarities and differences in health and well-being in oldest-old populations. This study assessed gender similarities and differences among octogenarian and centenarian women ($n = 250$) and men ($n = 71$) from the Georgia Centenarian Study. We evaluated gender differences in resources (i.e., education and perceived economic status) and physical, functional, mental, and cognitive health. Results indicate gender similarities in education level, perceived economic status, physical health and levels of depression. But there were mean gender differences in functional health, $t = 2.25$, $p < .03$ and cognitive health, $t = 3.48$, $p < .001$ indicating that women have lower mean scores than men. For both women and men, education is a significant predictor of perceived economic status ($\beta = .271$, $p < .001$ and $\beta = .275$, $p < .05$, respectively). Perceived economic status marginally predicted physical health for both women and men ($\beta = .168$, $p < .06$ and $\beta = .253$, $p < .08$, respectively). Perceived economic status also predicted functional health but only for women, $\beta = .30$, $p < .001$. This research brings us closer to understanding the gendered similarities and differences among the oldest old.

PERCEPTIONS OF HEALTHY AGING: EXPLORING AGING WELL FOR HIV-INFECTED AND NON-INFECTED OLDER PEOPLE

L.K. Manning¹, R. Shah², A. Jimenez³, M. Wolfe¹, *1. Concordia University Chicago, River Forest, Illinois, 2. Rush Alzheimer's Disease Center, Chicago, Illinois, 3. Director of Operations at Community Outreach Intervention Projects, UIC, School of Public Health., Chicago, Illinois*

While living longer, older persons with HIV are prematurely experiencing many of the chronic conditions commonly seen in non-infected persons over the age of 70. Emerging data suggest that minorities are disproportionately affected by these premature chronic conditions, yet few studies have examined these chronic conditions for older adults who are HIV positive. This research examined older adults' views on behavioral and social factors that promote and/or hamper wellness as people with HIV age. We explore various barriers that older adults face, as well as the types of information and assistance that may aid aging adults, thus maximizing their health and well-being. Furthermore, we compare these perceptions between those who are HIV positive and HIV negative for older adults. Findings indicate the perceptions of healthy aging, for both HIV positive and negative participants include the reliance on a trusted social support system, the importance of self-care, access and utilization of healthcare resources, include the importance of spirituality, and maintaining an identity as someone who is aging well.

HIV positive participants did not perceive living with HIV as a barrier to aging well or as a limitation to healthy aging, but did report challenges associated with stigma. Additionally, we explore how these themes compare for minorities and non-minorities. This research addresses gaps in knowledge of older persons who HIV-infected. Implications for practice are considered.

FEASIBILITY OF A FAMILY-CENTERED PRIMARY CARE DEPRESSION INTERVENTION IN A SAFETY-NET CLINIC

L. Hinton¹, E. Rivas¹, E. Delgadillo Alfaro¹, E. Elizarraras¹, A. Smith², A. Jafri², R. Kravitz¹, E. Apesoa-Varano¹,
1. *Psychiatry and Behavioral Sciences, University of California, Davis, Sacramento, California*, 2. *San Joaquin General Hospital, Stockton, California*

Background: Mobilizing family members to support depression treatment is a novel and promising approach to improve outcomes for older men, a group at higher risk for depression under-treatment and suicide. The goal of this study was to test the feasibility and acceptability of a family-centered depression intervention in primary care. Methods: A randomized controlled trial comparing enhanced usual care to a manualized family-centered depression intervention in a safety net, federally qualified health center in California's Central Valley. Inclusion criteria: male, age ≥ 50 , PHQ-9 score of ≥ 10 , speak Spanish or English, and willing to involve a family member in treatment. The intervention was delivered over 3–6 months by a bilingual social worker who engaged both men and family members in depression psychoeducation, behavioral activation, medication management, and supporting patients during primary care physician visits. Results: Of the 45 men referred for the study, 31 were eligible and 23 agreed to randomization (2:1 allocation to active intervention vs usual care). 57% of the enrolled men were Hispanic. Among the 23 men randomized, 2 dropped out prior to their first intervention session. Of the 13 men who completed 1 or more intervention sessions, 11 (85%) successfully engaged a family member, 7 (54%) had ≥ 4 joint family sessions, and 8 (62%) experienced a significant reduction in symptoms (i.e. PHQ-9 score ≤ 10). The mean number of intervention sessions was 6.8. Conclusions: Engaging family members to support depression treatment appears feasible in a sub-group of low-income, depressed, and predominantly Hispanic older men.

CONTRIBUTION OF OBESITY AND PERFORMANCE FACTORS TO 6 MINUTE WALK TEST IN OLDER ADULTS WITH DIABETES

K. Son¹, E. Twardzik², M.L. Nabozny², D. Strasburg², N. Alexander², 1. *Seoul National University Hospital, Seoul, Korea (the Republic of)*, 2. *University of Michigan, Ann Arbor, Michigan*

6-minute walk distance (6MWD) is widely used as a measure of walking endurance and cardiopulmonary impairment. Little is known about the influence of obesity and performance factors such as lap time and rate of perceived exertion (RPE) in providing more insight into walking endurance in older adults with Type 2 diabetes.

Sedentary older adults (n=144, mean age 69) who were recruited to participate in an exercise study underwent baseline exercise treadmill (mean peak oxygen uptake 18 mL/kg

min) and 6MW testing (mean 391 m) along a 40 foot corridor. Participants also reported fatigue and RPE at baseline and subsequent 2 minute intervals.

Mean lap time (the time to walk 40 feet and return 40 feet) increased in the first few laps, plateaued and then decreased for the last few laps ($p < 0.001$). More than half of the fatigue and RPE increase occurred in first 2 minutes and BMI was associated with RPE change only in the first 2 minutes ($p < 0.001$). 6MWD of the severely obese (SO, BMI $> 40 \text{ kg/m}^2$) was lower than the other BMI groups ($p < 0.02$). RPE change was most prominent among SO ($P < 0.001$) and peak RPE was most consistent with peak treadmill RPE in SO ($p < 0.001$).

In these older adults with Type 2 diabetes mellitus, aspects of 6MW performance such as first few lap performance and rate of perceived exertion provide additional insight on walking endurance beyond the distance measure, particularly among the most severely obese subgroup.

SATISFACTION WITH QUALITY OF LIFE IN NURSING HOMES WITH PERSON-CENTERED CARE

J.L. Poey¹, L. Hermer², L. Cornelison¹, M.L. Kaup¹, R.I. Stone², G. Doll¹, 1. *Kansas State University, Manhattan, Kansas*, 2. *LeadingAge Center for Applied Research, Washington, District of Columbia*

A major goal of implementing person-centered care (PCC) practices in nursing homes is to improve residents' quality of life (QOL). However, to date no large-scale studies have evaluated the effects of adopting PCC practices on resident QOL. Existing studies that examined this relationship have had small sample sizes, lacked a standardized definition of PCC, and did not clearly differentiate between homes at varying levels of PCC adoption. Studies have also shown that objective measures of quality (e.g., clinical outcomes) can differ from residents' reported satisfaction with quality. This study filled these evidence gaps by evaluating a government sponsored program to promote PCC in nursing homes. Residents' satisfaction with their quality of life, care, and service was assessed in 281 facilities in Kansas spread across 5 objectively determined levels of PCC adoption, ranging from non-adoption to comprehensive adoption. Data from a custom-designed My InnerView survey of satisfaction with quality of life, care, and service were collected face-to-face from residents in participating and non-participating homes and aggregated to the home level. Beta mixed regression models were used to analyze the data, with propensity score adjustment to control for demographic differences among facilities at different levels of adoption. The findings showed that comprehensive, sustained adoption of PCC improved residents' satisfaction with quality of life and care, but that partial adoption brought relatively few gains over non-adoption. Policymakers and practitioners should consider replicating this program to promote the implementation of PCC practices in nursing homes.

EPISTATIC EFFECTS ON AGING TRAITS IN SETS OF GENES SELECTED WITH DIFFERENT BIOLOGICAL ASSUMPTIONS

S.V. Ukraintseva, I.Y. Zhbannikov, K. Arbeev, M. Duan, A. Kulminski, I. Akushevich, A.I. Yashin, *Duke University, Durham, North Carolina*

Several hundred genes have been associated with aging and longevity in various studies. There are also genes and

SNPs that do not show individual effects on aging-related traits; however, they may still influence such traits as result of genetic interactions (GxG), also referred to as epistasis. Proper selection of biologically justified candidate genes may help increase chances of capturing the GxG effects on aging and longevity traits and improve interpretation. In this study we estimated GxG effects on aging-related phenotypes in three sets of genes selected based on different assumptions about their biological connections, and compared results across these sets to see how they are influenced by prior biological knowledge. The three sets of genes were selected based on results of our own association studies with phenotypes of physical aging, and on current knowledge about gene functions and their involvement in aging and health, as follows: (i) 53 “aging” genes from the literature, including key genes from known interacting aging pathways (IGF-1/AKT, TP53 and mTOR mediated); (ii) 43 “disease” genes from the NHGRI GWAS Catalog, including genes located in genomic regions enriched for genome-wide significant effects on complex diseases, such as cancer, AD, CHD, diabetes; (iii) 12 genes corresponding to the top SNPs that influenced multiple phenotypes of physical aging in our own analyses of CHS, MESA, FHS and ARIC studies. We selected all SNPs in these three groups of genes available in data, and estimated the effect of pairwise SNPs epistasis on longevity (survival 85+) and phenotypes of physical aging, such as Rosow-Breslau physical ability (R-B), age at BMI maximum, age at menopause, eGFR and hematocrit. Then we compared results of analyses among the groups. No significant GxG effects were found for genes from group (ii) representing major diseases. We identified significant GxG effects on longevity and age at menopause for BCL2 and IGF1R from ‘aging’ group (i), and on longevity and R-B for NRG1 and NRG3 genes from group (iii). The latter genes are located on different chromosomes but both code for ligands of ERBB4, and are both involved in neurons recovery, so they are closely biologically related. These results support pre-selecting biologically relevant and interacting candidate genes for estimating statistical epistasis effects on aging and longevity.

MOTIVATION TO EXERCISE IN MID-AGE AND EARLY SENIORS: THE ROLE OF TEMPORAL WORLDVIEW

J. Henry², A. Ferguson¹, 1. University of Arkansas, Fayetteville, Arkansas, 2. Iniversity of Arkansas, Fayetteville, Arkansas

Little research exists that explores attitudes and beliefs of middle-age adults in relation to motivation to continue physical activity into older adulthood. Evidence suggests inactivity increases with age; however, evidence shows active lifestyles persist into older adulthood. It is critical to identify new approaches to combat trends of decreased activity with age. Purpose: to explore motivations to exercise in middle-age and early senior adults. Method: Exploratory qualitative interview design: n=40 participants, 35–60 years old; 2 groups: organized fitness participant (n=15), self-identified non-exercisers (n=25). Four researchers conducted inductive analysis of transcripts, identifying convergent and divergent themes. Results: Exercisers and non-exercisers identified similar motivating factors, though frequency ranking differed between groups. Both identified physical limitations

and competing demands as top de-motivators, though rank order was opposite. Perception of aging was associated with motivation; majority of participants in both groups identified exercise as a positive influence on aging. Discussion: Successful exercise in middle age may reinforce intent to exercise in older age, and may improve beliefs regarding likelihood of a positive personal aging journey. A future-oriented approach, emphasizing relationships between exercise and positive aging, may be useful when working with middle-age and early senior adults. Such approach would focus on evidence-based improved health outcomes of regular exercise, vs. an immediate gratification approach emphasizing aesthetics or solely considering current health status. Future studies should examine motivation to exercise as a variable of a more global facet of personal and cultural worldview, such as future-orientation or preparation, as opposed to present-oriented constructs.

ROTAVIRUS VACCINATION OF INFANTS MAY REDUCE ACUTE GASTROENTERITIS RATES IN THE ELDERLY IN ENGLAND

T. Verstraeten, T. Cattaert, M. Riera, P95, Leuven, Belgium

Rotavirus is the main cause of severe acute gastroenteritis (AGE) in children under 5 but has not been considered an important cause of AGE in the elderly. This study aims to evaluate the impact of rotavirus infant vaccination introduction in the UK on all cause AGE episodes in primary care across all age groups using the Clinical Practice Research Datalink (CPRD) database.

We included all persons registered in CPRD between 1st July 2010 and 30th June 2016. Cut-off date to define pre- and post-vaccination periods was 1st July 2013. AGE GP episodes were defined using AGE related Read codes. We calculated crude AGE episode rates, overall and stratified per age group and calendar time.

Overall, there were 29 AGE episodes per 1,000 person-years in the pre-vaccination period compared to 24 post-vaccination (18.3% reduction, 95% CI: 17.7–18.8). The largest decrease was observed in children < 5 years (27.4% reduction, 95% CI 26.4 – 28.4). However, a significant decrease was also observed among the elderly, particularly among 65 to 74 year olds: from 29 to 24 AGE episodes per 1,000, a 16.7% (95% CI: 14.9–18.4) decrease. AGE episode rates in this age group in the 3 years prior to vaccine introduction were stable between 28 and 29 AGE episodes per 1,000.

This ecological analysis suggests that the introduction of rotavirus vaccination in the UK may have resulted in a significant impact on all cause AGE episodes among the elderly, similar to what has been seen following the introduction of pneumococcal vaccination among infants.

PHARMACOLOGICALLY TARGETING AGING SLOWS AGE-RELATED BONE LOSS

S. Melov¹, D. Evans², J. Andersen¹, P. Kapahi¹, G.J. Lithgow¹, 1. Buck Institute for Research on Aging, Novato, California, 2. California Pacific Medical Center, San Francisco, California

There is considerable interest in determining whether chemical compounds or interventions shown to significantly increase longevity in invertebrate models will also affect aging in mammals. To explore this concept, we tested three

compounds and one element for their ability to slow age-related bone micro-architecture and functional decline in older mice. We chronically treated mice from 19 months of age and used a repeated measures experimental design to evaluate a number of structural and functional indices over late life. We focused on the aging skeleton, particularly the femur, because it can be accurately observed by computed tomography (CT) in living animals. Findings in this tissue may provide important insights into a major health issue, age-related bone loss and fracture in humans. We observed that with age there was increased inter-animal variation in bone structure despite the genetically identical nature of the test population. We also discovered complex changes in femoral bone loss and architecture during late life; the latter, osteopenic changes being similar to those observed in humans. In addition, we were able to document that the incidence of spontaneous fractures in aged mice is similar to that for humans. Finally, we report that one of the four interventions tested reduced the rate of bone loss in mice to a level similar to that seen with anti-osteoporotic drugs in humans. Our results demonstrate that selecting interventions on the basis of lifespan extension in invertebrates may be predictive of positive healthspan effects in aging mammals.

RELIABILITY AND VALIDITY OF THE DEMENTIA HEALTH LITERACY SCALE: A PILOT STUDY

Y. Kim¹, H. Lee², Y. Oh¹, E. Kang³, 1. *Kyunghee University, Yongin-si, Korea (the Republic of)*, 2. *University of Minnesota, Minnesota, Minnesota*, 3. *Korea Institute for Health and Social Affairs, Sejong-si, Korea (the Republic of)*

Background

In spite of the high prevalence of dementia (9.19%) in South Korea (CRCO, 2017), little is known about Dementia Health Literacy (DHL) among Korean older adults. The current study aimed to develop a DHL scale culturally competent and tailored to Korean older adults. To develop this scale, this research adopted the Integrated Model of Health Literacy (Sørensen et al., 2012) as a theoretical framework with four dimensions: (1) Access; (2) Understand; (3) Appraisal; and (4) Apply.

Methods

The data is from the 2016 Dementia Literacy Survey (DLS) utilized a probability sampling method. From the DLS, 440 participants of the survey were used for the final analysis. This study used an exploratory factor analysis with a principal-components analysis and a confirmatory factor analysis to evaluate the factorial validity of the DHL's Apply dimension.

Results

In the exploratory factor analysis, the KMO and Bartlett's test of sphericity indicated that the DHL items are factorable. With an eigenvalue of 2.98, the extracted factor explained 74.5% of the variance in the four items (Cronbach's alpha = .886). In the confirmatory factor analysis, all of the factor loadings were statistically significant. All of the fit indices showed adequate fit to the data as well.

Conclusions

Our findings indicated that the Apply dimension showed a good construct validity and internal consistency. The results support the idea that Apply dimension in the DHL

scale adequately measures the construct of interest by applying dementia health information to seek and use health care services in dementia care settings.

PREVALENCE AND ASSOCIATED FACTORS OF MULTIMORBIDITY IN ADULTS WITH INTELLECTUAL DISABILITIES

S. Murthy, K. Hsieh, T. Heller, *University of Illinois at Chicago, Chicago, Illinois*

Older adults with intellectual disabilities (ID) are at higher risk of chronic multimorbidity (≥ 2 chronic health conditions) and there is need to improve their health and healthcare by gaining more knowledge on the complex relationships of intellectual disability, morbidity, and associated factors. This study aims to investigate the prevalence and associated factors of multimorbidity in older adults with ID (≥ 41 years). Data from a subset (N=630) of the Longitudinal Health and Intellectual Disability Study (LHIDS) were examined. Compared to those without multimorbidity, adults with ID with multimorbidity were more likely to be ≥ 51 years, live independently or in a foster/group home, unemployed, and have mobility limitation; and less likely to have a diagnosis of Down syndrome. There were no group differences in sex, level of ID, urban or rural status, health insurance status, general physical screening, and obesity. The findings show that living in a group home/foster home (OR = 2.37, 95% CI = 1.23 – 4.56) and having mobility limitation (OR = 2.54, 95% CI = 1.33 - 4.86) are associated with multimorbidity in this population after controlling for other factors, whereas living with family (OR = 0.41, 95% CI = 0.26– 0.64) is inversely associated with multimorbidity. The findings suggest that multimorbidity may result in mobility limitation and unemployment. Therefore, interventions should focus on comorbidity management to improve health and function. There is also a need for clearer understanding of the mechanisms explaining the relationship between multimorbidity and type of residence.

LIVING ALONE WITH ALZHEIMER DISEASE: DATA FROM SVEDEM, THE SWEDISH DEMENTIA REGISTRY

D. Religa^{1,2}, P. Cermakova¹, M. Nelson¹, J. Secnik¹, S. Garcia-Ptacek¹, K. Johnell¹, B. Winblad¹, M. Eriksson¹, 1. *NVS, Karolinska Institutet, Stockholm, Sweden*, 2. *Karolinska University Hospital, Stockholm, Sweden*

Background: Many people with Alzheimer's disease (AD) live alone in their own homes. There is a lack of knowledge about whether these individuals receive the same quality of diagnostics and treatment for AD as patients who are cohabiting.

Objectives: To investigate the diagnostic work-up and treatment of community-dwelling AD patients who live alone.

Methods: We performed a cross-sectional cohort study based on data from the Swedish Dementia Registry (SveDem). We studied patients diagnosed with AD between 2007 and 2015 (n=26 163). Information about drugs and comorbidities was acquired from the Swedish Prescribed Drug Register and the Swedish Patient Register.

Results: 11 878 (46%) patients lived alone, primarily older women. After adjusting for confounders, living alone

was inversely associated with receiving computed tomography (OR 0.90; 95% CI 0.82–0.99), magnetic resonance imaging (OR 0.91; 95% CI 0.83–0.99) and lumbar puncture (OR 0.86; 95% CI 0.80–0.92). Living alone was also negatively associated with the use of cholinesterase inhibitors (OR 0.81; 95% CI 0.76; 0.87), memantine (OR 0.77; 95% CI 0.72; 0.83) and cardiovascular medication (OR 0.92; 0.86; 0.99). On the other hand, living alone was positively associated with the use of antidepressants (OR 1.15; 95% CI 1.08; 1.22), antipsychotics (OR 1.41; 95% CI 1.25; 1.58) as well as hypnotics and sedatives (OR 1.09; 95% CI 1.02; 1.17).

Conclusion: Solitary living AD patients do not receive the same extent of care as those who are cohabiting.

NORDIC WALKING TRAINING AND INDIVIDUALISED NUTRITIONAL SUPPLEMENTATION IN PRE-FRAIL OLDER INDIAN

P. Chatterjee, A. Dey, *GERIATRIC MEDICINE, AIIMS, New Delhi, India*

Identifying and treating people in the pre-frail state may be an effective way to prevent or delay frailty and preserve the reserve capacity.

Our objective was to assess the effect and compliance of 12 weeks of Individualized Nutritional Supplementation (INS) and Nordic walking (NW) in pre-frail elderly in India.

Primary output measurement was physical performance by Fried's Frailty scale and secondary output were cognition (by HMSE), mood (Geriatric Depression Scale) and nutrition by MNA.

Approval taken from Institute Ethics committee (ref no-IEC/NP-350/2012/RP-26/2012) at All India Institute of Medical Sciences, New Delhi.

It was an open-labeled experimental pre-test and post-test pilot study from October 2012 to December 2014, where of 66 Pre-frail elderly (>65) subjects were included and randomly allocated into three intervention arm group A NW, Group B INS, Group C NW and INS intervention.

The mean age was 76.381 ± 5.344 years; 95 percent of the subjects completed the study.

Frailty score decreased by 100 %, 52.4 % and 40% in Group C, A and B respectively (P < 0.001) from baseline. Gait speed increased by 50.63%, 51.24%, 22.6 % in group C, A and B respectively (P < 0.05). Grip strength decreased by 9.14 % and 5 % in group A and B respectively where as increased by 16.67 percent in group C from baseline (P < 0.05). There was no significant changes in cognition and mood in all three group (P < 0.10).

Nordic walking and nutritional supplementation in combination was simple, pragmatic intervention model to maintain the functionally vulnerable older adults (Pre-frail) independent.

Multicentre RCT with longer follow up is needed.

CITP: SCREENING CHEMICALS FOR REPRODUCIBLE AND ROBUST EFFECTS ACROSS DIVERSE GENETIC BACKGROUNDS

M. Lucanic¹, M. Guo², G.J. Lithgow¹, M. Driscoll³, P. Phillips⁴, 1. *Buck Institute for Research on Aging, Novato, California*, 2. *Division of Aging Biology, National*

Institute on Aging, Bethesda, Maryland, 3. *Rutgers University, Dept. of Molecular Biology and Biochemistry, Nelson Biological Laboratories, Piscataway, New Jersey*, 4. *Institute of Ecology and Evolution, University of Oregon, Eugene, Oregon*

The Caenorhabditis Intervention Testing Program is a multi-institutional effort to screen promising chemicals for pro-longevity effects across diverse genetic backgrounds. Chemicals that act robustly, across diverse genetic backgrounds, are likely to target conserved pathways and will be promising leads to test in higher organisms, including vertebrates. This project makes use of the short-lived and genetically diverse *Caenorhabditis* genus to rapidly assess the robustness of pro-longevity chemicals. The project further emphasizes reproducibility of results as a primary goal. Towards this end, all experiments are performed in parallel at each testing site. Additionally all research sites perform multiple replicates of each assay, with large cohorts. By utilizing this rigorous approach we expect to facilitate and expedite the identification of promising drug leads for eventual use in treating human age-related diseases. Here we describe lifespan results for the 22 *Caenorhabditis* strains utilized, as well as our results from the first set chemical assays. While many of these chemicals extended the lifespan of at least one strain, the amyloid dye ThioflavinT was the only chemical to promote longevity across all strains tested. The CITP has demonstrated the ability to identify chemicals that act robustly across diverse genetic backgrounds. Currently we are focused on screening more chemicals for similar robust effects, as well as testing the most promising chemicals for their efficacy in mitigating age-related declines in physiology. In parallel we are investing in and developing automated assays in an effort to increase the throughput of the CITP.

SESSION 4590 (SYMPOSIUM)

KEYNOTE: TECHNOLOGY AND AGING—PROMISING SOLUTIONS, GLOBAL CHALLENGES

Chair: D.A. Lindeman, *University of California, Berkeley*

Technology has become a driving force throughout the globe in improving the well-being and health of older adults, their family caregivers, and the long-term care work force, and holds the promise of innovative solutions to improve social engagement and maximize independence. This symposium will serve as a platform for discussion and exchange between diverse stakeholders who share an interest in technology solutions to support older adults, with the further intent of identifying frugal technology innovations that can meet the emerging, rapidly evolving needs of older people globally. The symposium will also address the disparity of technology solutions and the future needs of older adults in low- and middle-income countries as well as solutions proposed for global innovation. Ensuring that rapidly ageing populations remain healthy, productive, socially engaged and independent for as long as possible requires technology innovations that meet their greatest needs, and which are safe, effective, affordable, appropriate, accessible and available.

HOW DO WE MOVE FROM GADGETS TO ECOSYSTEMS?

S. Johnston, *Aging 2.0, San Francisco, California*

In the light of the increasing need to scale new tech-enabled care models, Stephen Johnston will talk about what it takes to build an innovation ecosystem for aging, using examples drawn from the Aging2.0 global chapter network. He will also highlight some examples of innovative technologies and show how to succeed they need to be paired with user-centric design, which puts the individual at the center of decision making, as well as innovative business models, many of which are introducing technology companies into the healthcare continuum.

AGING AND TECHNOLOGY—TURNING RESEARCH INTO REAL-WORLD IMPACT

A. Sixsmith, *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

AGE-WELL is a Canadian research network that aims to help older people to maintain their independence, health and social participation through accessible technologies. While these are compelling arguments for public and private investment in this area, there are still a number of key challenges in turning the research outputs into real world products and services. This talk will explore and evaluate some of these challenges and will discuss AGE-WELL's approach to strengthen efforts in this sector.

TRANSFORMING PARADIGMS FOR AGEING POPULATIONS: NEW ECOSYSTEMS FOR TECHNOLOGY AND INNOVATION

A. Ross, *Centre for Health Development, World Health Organization, Kobe, Hyogo, Japan*

Central to ensuring the continued functional capacities, social engagement, and independence of older persons, and meeting their specific needs, are diverse assistive health and information/communication technologies. Yet many obstacles can prevent equitable access to or use of the most basic of these technologies. A few include not including older persons in design, ignoring affordability and appropriateness (environment, culture) considerations, literacy levels, or not planning for how technology can be integrated into the home and health/social care systems. A new ecosystem must engage multiple stakeholders and disciplines. For example, innovators, producers, regulators, and financiers must work together to identify the nature and role of health technology assessments & evaluations, which government will use to make resource allocation decisions in finite environments. The WHO Kobe Centre leads work in exploring various technological innovations and related issues for ageing populations, persons with disabilities and health systems; and the relationship to planning for sustainable universal health coverage.

SESSION 4595 (SYMPOSIUM)

MORE THAN COUNTS AND CUTPOINTS: INNOVATIONS IN ACCELEROMETRY DERIVED METRICS FOR OLDER ADULTS

Chair: J. Schrack, *Johns Hopkins University*

Co-Chair: V. Zipunnikov, *Johns Hopkins Bloomberg School of Public Health*

Discussant: T. Harris, *NIA/Intramural Research Program, Bethesda, Maryland*

The advent of wearable devices has introduced a new layer of complexity to assessing physical activity and mobility in older adults. These devices collect and produce data with an unprecedented level of detail that can be managed, analyzed, and interpreted in multiple dimensions. This symposium focuses on new methodology to analyze and interpret accelerometry data in older adults using data from participants of the Baltimore Longitudinal Study of Aging, the Developmental Epidemiological Cohort Study, the Women's Health Initiative, and the National Health and Nutritional Examination Survey. We will discuss methods to assess and interpret physical activity in older adults using methodologies beyond daily summaries, including: (i) analyzing raw activity data to determine stride-to-stride gait variability, (ii) summarizing raw accelerometry metrics into an activity index that is comparable across studies and devices, (iii) discriminating between patterns of driving a car versus ambulating, (iv) demonstrating how heart rate defines individual differences in physiological intensity of daily activities, and (v) examining circadian rhythms of activity in relation to mortality. Collectively, these presentations will address the potential of objective activity monitors to further our understanding of physical activity and mobility in an aging population. Further development and application of the methodology presented in this symposium will: (i) provide a new level of detail to analyses of daily activity, (ii) ultimately transform the way data is utilized across research disciplines, (iii) be widely used in the implementation of prevention efforts, and (iv) contribute to efforts to optimize interventions that extend healthy aging and improve longevity.

STRIDE VARIABILITY MEASURES DERIVED FROM WRIST AND HIP-WORN ACCELEROMETERS

J. Urbanek², J. Harezlak¹, N.W. Glynn³, T. Harris⁴, C. Crainiceanu², V. Zipunnikov², 1. *Indiana University School of Medicine, Department of Biostatistics, Indianapolis, Indiana*, 2. *Johns Hopkins Bloomberg School of Public Health, Department of Biostatistics, Baltimore, Maryland*, 3. *University of Pittsburgh, Center for Aging and Population Health, Department of Epidemiology, Graduate School of Public Health, Pittsburgh, Pennsylvania*, 4. *Laboratory of Epidemiology, Demography, and Biometry, National Institute on Aging, Bethesda, Maryland*

Many epidemiological and clinical studies use accelerometry to objectively measure physical activity using the activity counts, vector magnitude, or number of steps. These measures use just a fraction of the information in the raw accelerometry data as they are typically summarized at the minute level. To address this problem we define and estimate two gait measures of temporal stride-to-stride variability based on raw accelerometry data: Amplitude Deviation (AD) and Phase Deviation (PD). We explore the sensitivity of our approach to on-body placement of the accelerometer by comparing hip, left and right wrist placements. We illustrate the approach by estimating AD and PD in 46 elderly participants in the Developmental Epidemiologic Cohort Study (DECOS) who worn accelerometers during a 400 meter walk

test. We also show that AD and PD have a statistically significant association with the gait speed and sit-to-stand test performance.

AN ACTIVITY INDEX FOR RAW ACCELEROMETRY DATA AND ITS APPLICATION IN OLDER ADULTS

J. Bai¹, C. Di², L. Xiao³, K.R. Evenson⁴, A. LaCroix⁵, C. Crainiceanu¹, D.M. Buchner⁶, 1. *Department of Biostatistics, Johns Hopkins University, Baltimore, Maryland*, 2. *Fred Hutchinson Cancer Research Center, Seattle, Washington*, 3. *North Carolina State University at Raleigh, Raleigh, North Carolina*, 4. *University of North Carolina – Chapel Hill, Chapel Hill, North Carolina*, 5. *University of California, San Diego, La Jolla, California*, 6. *University of Illinois at Urbana-Champaign, Champaign, Illinois*

Accelerometers have been widely deployed in public health studies in recent years and research has mainly focused on summarized metrics provided by accelerometers manufacturers, such as the activity counts (AC). Such measures do not have a publicly available formula and can vary by device manufacturer. To address these problems, we developed the activity index (AI), a new metric for summarizing raw tri-axial accelerometry data, and compared the AI to AC's performance for distinguishing various types of activities and estimating energy expenditure. The analysis was conducted using data from the Women's Health Initiative, in which tri-axial raw acceleration data and energy expenditure were collected at the same time. ROC analyses indicated that AI better distinguished between different types of activities than AC. AI better associated with METs as well. The proposed AI provides a transparent and reliable way to summarize densely sampled raw acceleration data.

PHYSICAL EXERTION AND ACTIVITY: AGE AND RELATIVE EFFORT IN THE BALTIMORE LONGITUDINAL STUDY OF AGING

A. Leroux¹, J. Schrack¹, J. Fleg³, E.M. Simonsick², V. Zipunnikov¹, S.A. Studenski², L. Ferrucci², C. Crainiceanu¹, 1. *Johns Hopkins University Bloomberg School of Public Health, Baltimore, Maryland*, 2. *National Institute on Aging, Baltimore, Maryland*, 3. *National Heart, Lung, and Blood Institute, Bethesda, Maryland*

Commonly used measures of physical activity (PA) fail to account for heterogeneity in maximal capacity between individuals. Utilizing the concept of heart rate reserve, we estimated minute level physical exertion (PE) among BLSA subjects with at least 3 days of Actiheart data ($n = 411$). Subjects' average time spent in each of sedentary, light, moderate and vigorous PE was associated with age adjusting for demographics, chronic conditions, and PA. Despite a significant decline in total PA with age ($p < 0.001$), time spent in moderate and vigorous PE is positively associated with age in both women ($p_{\text{moderate}} < 0.001$, $p_{\text{vigorous}} < 0.001$) and men ($p_{\text{moderate}} = 0.137$, $p_{\text{vigorous}} = 0.222$). Chronic conditions are also generally associated with increased average PE. Our results suggest that individuals with decreased capacity are, on average, engaging moderate and high relative intensity activities at a rate comparable to, or higher than, that of healthier individuals.

AUTOMATIC CAR DRIVING DETECTION USING RAW ACCELEROMETRY DATA

M. Straczekiewicz², J. Urbanek³, W. Fadel¹, C. Crainiceanu³, J. Harezlak¹, 1. *Biostatistics, Indiana University Fairbanks School of Public Health, Indianapolis, Indiana*, 2. *AGH University of Science and Technology, Krakow, Poland*, 3. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Measuring physical activity using wearable devices has gained popularity in older populations. Raw data collected from them is summarized as "activity counts", which combine information of human activity with environmental vibrations. Driving is a major sedentary activity that can artificially increase these counts. Thus, it is important to identify periods of driving and quantify the bias induced by driving in activity counts. To address these problems, we propose a Detection Algorithm of Driving via Accelerometry (DADA), which is based on short-time Fourier transform applied to the raw accelerometry data identifying the frequencies' ranges specific to car driving. We test DADA's performance on data collected using wrist-worn ActiGraph devices in an experiment conducted on 24 subjects. The median AUC for predicting driving periods was 0.94. The activity count bias induced by driving per unit of time was on average equal to 16% of the average activity counts generated during walking.

TOTAL PHYSICAL ACTIVITY AND ITS CIRCADIAN ALLOCATION ARE INDEPENDENT PREDICTORS OF MORTALITY

V. Zipunnikov, D. Dey, A. Leroux, J. Di, J. Urbanek, J. Schrack, C. Crainiceanu, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

We examine whether the distribution of physical activity during the day acts as an independent predictor of mortality in National Health and Nutrition Examination Survey 2003–2006. Time of day analyses were conducted using 12 time windows of 2 hours represented by the percentage of the total log-transformed activity count (pTLAC) spent in each. In models adjusted for age, sex, race/ethnicity, education, body mass index, comorbidities, and the total log-transformed activity count, a higher percentage of total physical activity between 10am–12pm (HR: 0.96, $p\text{-value} = 0.003$) and a lower percentage of total physical activity between 8pm–4am (HR: 1.03, $p\text{-value} < 0.01$) were significantly associated with lower risk of mortality. These findings help define patterns of physical activity that are beneficial to health, and hold significant implications for future interventions aimed at increasing physical activity and enhancing sleep quality.

SESSION 4600 (SYMPOSIUM)

IAGG SECRETARIAT: THEORETICAL AND POLICY PERSPECTIVES FOR HEALTHY AGING

Chair: Y. Lee, *Ajou University School of Medicine, Suwon, Korea (the Republic of)*

Co-Chair: D. Lee, *Seoul National University College of Medicine, Korea (the Republic of)*

Discussant: J.L. Yoon, *Hallym University, Hwasung-si, Korea (the Republic of)*

Populations are aging and most older adults suffer from multiple chronic diseases, raising the risk of functional limitations and dependency. This phenomenon is worldwide, and poses to the world a challenge of poor quality of life and increased healthcare costs. Healthy aging framework is a solution to counter such dismal prospects. Although we should consider diverse aspects of healthy aging, such as physical, cognitive and emotional aging, there has been great progress in understanding healthy aging theoretically, resulting in convergent principles on healthy aging. Despite these converging principles of healthy aging, setting up and implementing policies to enhance healthy aging is a challenge as we should take into account of diversities of the population, community, and environment. In this symposium, the authors will review theoretical aspects of healthy aging, and then will introduce practical applications and experiences of policymaking pertaining to frailty and dementia, two major barriers to healthy aging.

THE WHO MODEL OF HEALTHY AGEING AND ITS IMPLICATIONS

J. Beard, *World Health Organization, Geneva, Switzerland*

In 2016, the World Health Organization released the *World report on ageing and health*. The Report outlines a public health framework for action on ageing built around a reconceptualization of *Healthy Ageing* that focuses on an older person's ability to do the things they have reason to value, rather than the absence of disease. In 2016, the 194 Member States of WHO used this framework as the basis for the *Global strategy and action plan on ageing and health*, and numerous initiatives linked to the strategic priorities outlined in this plan are now underway. This presentation will explore the theoretical basis of WHO's approach and its implications for global policy.

HEALTHY AGEING: A CHALLENGE TO KOREA

B. Cho, 1. *Family Medicine, Seoul National University, Seoul, Chongno-gu, Korea (the Republic of)*, 2. *Seoul National University Hospital, Seoul, Korea (the Republic of)*

The world population is growing really fast, both in the developed countries and even more in the less developed regions. More remarkable ageing changes are happening in Korea.

The prevalence of chronic disorders is very high (88.5% of total older persons have at least 1 chronic disorder), and combined with highest poverty rate of the elderly, Korean elderly's suicide rate is the highest in the world. And the number of the oldest old aged 80 or over has been increasing more rapidly than that of the older population as a whole. This means that ageing demographics could trigger a high prevalence of chronic disorders and functional impairments.

The appropriate continuum of care should be a seamless preventive intervention to reduce the speed and slope of the deterioration process with aging. There should be specific roles of health care providers in each practical position with an organic connection system: active health promotion in the community primary care, elderly-friendly geriatric care system in acute hospitals, intensive functional rehabilitation in

post-acute care, and finally various long-term care services in the community or facilities.

There are many problems with continuous care for the elderly in acute and post-acute care settings in Korea. The bottom line in the community primary care is to provide a designated physician for an older patient.

In acute care phase, a geriatric center or an elderly-friendly geriatric ward with a geriatric care interdisciplinary team should be provided.

And, the biggest problem with post-acute care in Korea is that there is no hospital or facility to take a role for sub-acute care.

Comprehensive and continuous care for the elderly should be geared to achieve an ultimate goal of successful ageing and improvement of their quality of life.

Individualized services based on a proper assessment of each patient should be carefully selected and provided.

PREVENTION OF FRAILITY FOR HEALTHY AGING

Y. Lee, 1. *Dept. of Preventive Medicine and Public Health, Ajou University School of Medicine, Suwon, Korea (the Republic of)*, 2. *Institute on Aging, Ajou University Medical Center, Suwon, Korea (the Republic of)*

Frailty is a hallmark of vulnerability in older adults predisposed to adverse health outcomes, posing as a major threat to healthy aging. Community-based interventions targeting the pre-frail and frail elderly tend to show beneficial effects on frailty status. A growing body of evidence suggests that exercise interventions may be effective in enhancing physical function and performance. Evidence on the benefits of nutrition by itself is, however, inconclusive. A combined exercise and nutritional intervention appears to be more effective. More recently, multi-component interdisciplinary interventions that combine exercise, nutrition, cognitive training, and comprehensive geriatric assessment appear promising. To enhance our understanding of effective preventive interventions for frailty, larger scale clinical trials are needed. This will help to develop individually tailored prevention programs and evidence-based clinical practice guidelines, and to prioritize frailty prevention as one of the key policy agenda for healthy aging.

IMPLEMENTATION OF SYSTEMS FOR DEMENTIA MANAGEMENT IN RAPIDLY AGING SOCIETY-KOREAN EXPERIENCE

D. Lee, *Department of Psychiatry, Inje University Sanggye Paik Hospital, Seoul, Korea (the Republic of)*

Korea is one of the most rapidly aging societies in the world. The Rapid aging poses many healthcare problems for which the society should cope with within short periods. Dementia is a typical disease which increases rapidly with rapid aging.

Koreans have designed and implemented systems for dementia management over the previous 10 years.

In the year 2008, Korean government has declared "war against dementia" and set up 21st of September as "Dementia-overcoming Day". In the same year, Korean long-term care service was launched. Early detection and early treatment service for dementia has been launched the year before.

In the year 2015, Korean government has set up “Law for Dementia Management.” and many “Dementia support centers” has been set up by this law.

Such an experience can shed light on providing systems for dementia management in rapidly aging societies.

SESSION 4605 (SYMPOSIUM)

ELDERLY ANESTHESIA AND ANALGESIA

Chair: H. Zhang, *Chinese PLA General Hospital, Beijing, China*

Co-Chair: C. Tong, *Wake Forest Baptist Medical Center, Winston-Salem*

Since the 1990 s, China’s aging process was accelerated. 65 and older elderly population increased from 1990 in 62.99 million to 2000 in 88.11 million. The proportion of the total population increased from previous 5.57% to present 6.96%. It is predicted that by 2040, 65 and older elderly population will account for over 20% of the total population. At the same time, the elderly population aging trend is increasingly obvious: the number of people at the age of 80 and older is increasing at an annual rate of 5%, and by 2040 it will increase to more than 7,400, ten thousand people. Due to the special physiological and pathological physiology change of old people, there are different sorts of diseases that have impact on perioperative treatment. Elderly patients with age increase, the risk of surgery becomes more and more serious. Therefore, for every anesthesiologist, more attention should be paid to the anesthesia in elderly patients, in the preoperative evaluation, on the choice of anesthetic methods and the anesthetic, intraoperative monitoring and physiological regulation, postoperative analgesia, etc., especially to consider its particularity, to do a good job in every detail to make them through surgery.

OVERVIEW OF THE ANESTHESIA PRACTICE IN GERIATRIC PATIENTS IN CHINA

Y. Huang, *Peking Union Medical College Hospital, Beijing, China*

China has the largest and most rapidly growing elderly population in the world, and has entered the stage of a rapid growing aging society. The percentage of elderly people in China is projected to triple, from 8% in 2006 to 24% in 2050. The elderly population continues to grow rapidly, resulting in the increasing number of geriatric patients requiring surgery, which has become a huge challenge for anesthesiologists. Multiple organ function failure caused by aging, limited organ function reserve due to complex comorbidities, and the possible drug interactions between anesthetics and daily medication, together contribute to a challenging scenario for anesthesiologists to perform anesthesia practice in geriatric patients. Therefore, the Section on Anesthesia for Geriatric Patient of Chinese Society of Anesthesiology composed “Guidance on perioperative anesthesia management for Chinese geriatric patients” in 2014, aimed at improving the surgical outcome of these patients.

GERIATRIC ANESTHESIA FOR ORTHOPEDIC SURGERY IN CHINA-CHALLENGE VS. EXPLORATION

X. Guo, *Department of Anesthesiology, Peking University Third Hospital, Beijing, China*

Currently, geriatric anesthesia for orthopedic surgery is facing grave challenges in China. In order to cope with the challenges, we strengthen the anesthesia safety through popularizing the advanced technology, such as ultrasound and visualization technique, new airway devices, anesthesia depth and brain oxygen monitoring facilities. We also advocate the collaboration of anesthesiologists, orthopedists and physicians as a multidisciplinary team (MDT), and establish the experts consensus, carry out specific research, individualize patient management and promote ERAS in elderly orthopedic patients. Up to date, several academic platforms and training centers have been constructed, and a variety of training programs, including key doctor training courses, workshops, and case reports, etc., periodically conducted by the CSA to improve the long term outcome after orthopedic anesthesia in China.

THE EFFICACY ANALYSIS OF MORPHINE AND HYDROMORPHONE IN IDDS FOR GERIATRIC INTRACTABLE CANCER PAIN

K. Ma, *Xinhua Hospital, Medical School, Shanghai JiaoTong University, Shanghai, China*

The aims of this study were to observe the effects, security and pharmacoeconomics of morphine and hydromorphone in the treatment of geriatric intractable cancer pain. 240 geriatric patients with intractable cancer pain are enrolled. Participants are randomly allocated to one of the two groups. Those in group 1 were given hydromorphone via an intrathecal catheter. Those in group 2 were given morphine via an intrathecal catheter. The pain experienced after treatment is assessed for each patient every day for the next 3 months. After administration of intrathecal drug delivery system (IDDs), VAS both dramatically decreased ($P<0.05$). SF-36 scores were all improved in the two groups. Patients in group 1 with hydromorphone represented a slower increase rate in drug requirements ($P<0.05$). Intrathecal administrations of hydromorphone and morphine have comparable analgesic effects. However, Hydromorphone represents a slower increase rate in drug requirements and might have better toleration.

SESSION 4610 (SYMPOSIUM)

FRONTIERS IN HIGH-RISK AND POTENTIALLY INAPPROPRIATE MEDICATIONS FOR OLDER ADULTS

Chair: M. Steinman, *University of California, San Francisco School of Medicine, San Francisco, California*

For more than 2 decades, clinicians who care for older adults have known about the concepts of high-risk and potentially inappropriate medication use. Yet, use of these medications has in many cases remained stubbornly high. In this symposium, we will explore emergent approaches to defining what constitutes high-risk and potentially inappropriate prescribing, and describe research on high-value opportunities

to reduce use of these medications in vulnerable older adults. The symposium will feature 4 presentations of research in these areas by internationally-known experts on the topic from Ireland, Australia, Israel, and the United States. This will include 2 presentations on outcomes and opportunities to reduce prescribing of sedative-hypnotics, and presentations on the START-STOPP criteria and Drug Burden Index, two approaches to identifying potentially inappropriate and high-risk prescribing that have gained substantial interest in recent years. The final 30 minutes of the symposium will be devoted to a panel discussion with audience participation, where we will discuss how results of recent research inform how individual clinicians and health systems can best reduce the burden of high-risk and potentially inappropriate medications in older adults.

THE DRUG BURDEN INDEX: A TOOL TO ASSESS THE FUNCTIONAL BURDEN OF MEDICATIONS IN OLDER ADULTS

S.N. Hilmer^{1,2,3}, L. Kouladjian O'Donnell^{1,2}, D. Gnjidic¹,
1. *The University of Sydney, Sydney, New South Wales, Australia*, 2. *Kolling Institute of Medical Research, Sydney, New South Wales, Australia*, 3. *Royal North Shore Hospital, Sydney, New South Wales, Australia*

Medicines with anticholinergic and sedative effects impair physical and cognitive function in older adults and are widely used by older adults internationally, often in combination. The Drug Burden Index (DBI) uses pharmacological principles to measure a person's total exposure to these medicines. Higher DBI is associated with impaired function, falls, frailty, higher health care utilisation and mortality in pharmaco-epidemiological studies of older people from the USA, Australia, New Zealand, UK, Canada and Europe. Observational studies have shown that review of anticholinergic and sedative medicines is not often performed with provision of health care. Interventional studies are now being conducted in Australia, New Zealand and Europe using the DBI in computerized clinical decision support systems in a range of health care settings (general practice, community pharmacy, hospital, nursing home) to reduce the functional burden of medications in older adults.

STOPP/START CRITERIA AS A CLINICAL TOOL IN PRACTICE: CLINICAL TRIAL EVIDENCE OF EFFICACY

D. O'Mahony, *University College Cork & Cork University Hospital, Cork, Ireland*

The STOPP (Screening Tool of Older Persons Prescriptions) and START (Screening Tool to Alert to Right Treatment) criteria were designed and validated as explicit criteria to help clinicians detect common instances of potentially inappropriate medicines (PIMs) and potential prescribing omissions (PPOs). The intention of STOPP/START criteria has always been to assist prescribers to identify potentially harmful PIMs/PPOs and associated adverse drug reactions and events (ADRs, ADEs). One valid criticism of all sets of explicit PIM criteria up to recently has been the lack of evidence of efficacy from randomized controlled trials (RCTs). In this presentation, we will review evidence from 4 recent RCTs about

the START/STOPP criteria. In doing so, we will discuss RCT evidence that demonstrates that STOPP/START criteria *as an intervention* deliver highly significant improvements in (i) medication appropriateness, (ii) falls incidence, (iii) medication costs and (iv) ADR incidence among older people in the clinical care facility environment.

USE OF BENZODIAZEPINES AMONG OLDER ADULTS IN ISRAEL: EPIDEMIOLOGY AND LEVERAGE POINTS FOR IMPROVEMENT

M. Steinman¹, M. Low², R. Balicer^{2,3}, E. Shadmi^{4,2}, 1. *Medicine (Geriatrics), University of California, San Francisco School of Medicine, San Francisco, California*, 2. *Clalit Research Institute, Tel Aviv, Israel*, 3. *Ben Gurion University of the Negev, Beersheva, Israel*, 4. *University of Haifa, Haifa, Israel*

Benzodiazepines and benzodiazepine-receptor agonists (BDZRAs, often known as "Z-drugs") are commonly used in older adults despite well-documented harms. In this presentation, we will present results of a national study of 56,808 older Israeli adults that explored the epidemiology of benzodiazepine and BDZRA use in this population, which is extraordinarily high. The presentation will place particular focus on potential leverage points to reduce use of these drugs, and highlight how our results can inform targeting of quality improvement efforts to reduce benzodiazepine/BDZRA use. These focus areas include the role of hospitalization in starting older adults on the path toward chronic benzodiazepine/BDZRA use, transitions from short-term to long-term use of these agents, and the potential value of focusing interventions on high-prescribing clinicians and clinics.

IS USE OF SEDATIVE-HYPNOTICS DURING HOSPITALIZATION ASSOCIATED WITH ADVERSE FUNCTIONAL OUTCOMES?

A. Zisberg¹, M. Agmon¹, E. Gil^{2,3}, 1. *University of Haifa, Haifa, Israel*, 2. *Bnei Zion Hospital, Haifa, Israel*, 3. *Technion University, Haifa, Israel*

More than one-quarter of hospitalized older adults consume sedative-hypnotics, but their adverse effects on mobility and function during hospitalization are unknown. We will present results of a prospective cohort study of 177 adults which examined the effects of sedative-hypnotic consumption on in-hospital mobility and functional decline. A daily step count was monitored using an Actical monitor, and function was assessed at admission and discharge using objective and subjective indexes. Patients consuming sedative-hypnotics (28.7%, n=50) were significantly less mobile than patients who did not use these drugs (mean step count 1400 (SD 1620) vs 2200 (SD 2328), p=0.023). However, after controlling for age and basic functioning the difference between groups was not significant. Additionally, sedative-hypnotic consumption was not significantly associated with changes in functional outcomes. We will discuss future steps for research in this area, including the influence of different hypnotic drugs' groups as well as their sedative load effects.

SESSION 4615 (PAPER)**RISK FACTORS FOR FUNCTIONAL DECLINE AND MOBILITY LIMITATIONS****RHYTHMIC INTERLIMB COORDINATION IMPAIRMENTS AND THE RISK FOR DEVELOPING MOBILITY LIMITATIONS**

E. James¹, S.G. Leveille², J.M. Hausdorff³, T. Trivison⁴, S. Al Snih⁵, K.S. Markides⁵, J.F. Bean^{6,7}, 1. *University of Massachusetts Lowell, Lowell, Massachusetts*, 2. *University of Massachusetts Boston, Boston, Massachusetts*, 3. *Tel Aviv Sourasky Medical Center, Tel Aviv, Israel*, 4. *Institute for Aging Research, Boston, Massachusetts*, 5. *University of Texas Medical Branch, Galveston, Texas*, 6. *Harvard Medical School, Boston, Massachusetts*, 7. *New England GRECC, VA Boston Healthcare System, Boston, Massachusetts*

The identification of novel targets that are risk factors for mobility limitations may improve the ability to prevent and treat mobility impairments among older adults. We tested the hypothesis that impaired rhythmic interlimb ankle and shoulder coordination are risk factors for subsequent mobility limitations among older adults. We conducted a 1-year prospective cohort study of community-dwelling older adults (N = 99) aged ≥ 67 years who did not have mobility limitations (Short Physical Performance Battery score > 9) at baseline. Participants performed antiphase coordination of the right and left ankles or shoulders while paced by an auditory metronome. Using multivariable logistic regression, we determined odds ratios for mobility limitations at 1-year follow up as a function of coordination variability and asymmetry. Adjusting for age, sex, body mass index, Mini Mental-State Examination score, and number of chronic conditions, odds ratios were significant for developing mobility limitations associated with a 1 standard deviation difference in the variability of ankle (OR = 1.88; 95% CI: 1.16–3.05; P = 0.011) and shoulder (OR = 1.96; 95% CI: 1.18–3.26; P = 0.009) coordination. Odds ratios were significant for asymmetry of shoulder (OR = 2.08; 95% CI: 1.23–3.51; P = 0.006), but not ankle (OR = 0.96; 95% CI: 0.60–1.55; P = 0.870) coordination. The results support our hypothesis that impaired interlimb ankle and shoulder coordination are risk factors for the development of mobility limitations. These findings indicate that the treatment of impaired coordination may be a means for preventing mobility limitations among older adults.

PHYSICAL DECONDITIONING IN OLDER PERSONS WITH PROLONGED FEAR OF FALLING-INDUCED ACTIVITY RESTRICTION

N. Deshpande¹, E.M. Simonsick², E.J. Metter³, L. Ferrucci², S.A. Studenski², 1. *School of Rehabilitation Therapy, Queen's University, Kingston, Ontario, Canada*, 2. *National Institute on Aging, Baltimore, Maryland*, 3. *The University of Tennessee Health Science Center, Memphis, Tennessee*

The negative impact of fear of falling (FoF) in older persons is postulated to be due to FoF-induced activity restriction (FoF-ActRes) leading to physical deconditioning. However, there is sparse direct evidence to support this. Therefore, we identified

differences in key factors representing physical deconditioning between older adults who reported prolonged FoF-ActRes defined as reporting FoF-ActRes on 2 successive visits, and those who did not. Further, we examined if physical deconditioning could independently explain poor physical function of those who reported prolonged FoF-ActRes. In 557 cognitively intact Baltimore Longitudinal Study of Aging older participants (age ≥ 65 years and visited between 2010–15), 29 (5%) reported prolonged FoF-ActRes. They were significantly worse in the physical deconditioning factors, namely, standing balance, coordination, aerobic capacity, knee extensor torque and ankle proprioception as well as on the physical function measures including gait speed (usual pace, fast pace and on a narrow path), Short Physical Performance Battery, Walking Index and SF-12 Physical Component. However, in the ANCOVA performed for each physical function variable, the differences in physical function did not abolish after adjusting for relevant physical deconditioning variables. Nonetheless, specific physical deconditioning variables were found to be significant covariates. In fully adjusted regression analyses these physical deconditioning variables were independent determinants of physical function (all $p < 0.05$) albeit with only a small reduction in the weighing (β) associated with FoF-ActRes. In conclusion, FoF-ActRes related physical deconditioning may partially contribute to poor measured and self-reported physical function in older persons; however, it does not fully explain it.

FUNCTIONAL DECLINE IN BRAZILIAN NURSING HOMES: A SURVIVAL ANALYSIS

J. Jerez-Roig^{1,2}, L. Ferreira¹, J. de Araújo¹, K. Lima¹, 1. *Universidade Federal do Rio Grande do Norte, Natal, RN, Brazil*, 2. *Hospital Can Misses, Ibiza, Illes Balears, Spain*

The objective was to estimate the probability of maintaining functional capacity in basic activities of daily living in institutionalized older adults. Besides, we aimed at identifying the prognostic factors of functional decline. A 2-year longitudinal study with 5 waves applied every 6 months was carried out. Individuals aged ≥ 60 in 10 nursing homes in the city of Natal-RN (Brazil) were included. Functional capacity was assessed by the items 'eating', 'personal hygiene', 'dressing', 'bathing', 'transferring', 'toileting' and 'walking', through a 5-item Likert scale. Sociodemographic, institution-related and health-related variables were considered at baseline. Time dependent variables were continence decline, cognitive decline, increase in the number of medication, and incidences of falls, hospitalizations and fractures. The actuarial method, the log-rank test and Cox's regression were applied. The cumulative probability of functional maintenance was 78.2% (CI 95%: 72.8–82.7%), 65.1% (CI 95%: 58.9–70.5%), 53.5% (CI 95%: 47.2–59.5%) and 44.0% (CI 95%: 37.7–50.2%) at 6, 12, 18 and 24 months, respectively. Predicting factors for functional decline were severe cognitive impairment (HR=1.98; $p=0.003$), continence decline (HR=1.70; $p=0.013$), and incidence of hospitalizations (HR=1.65; $p=0.023$), adjusted by Parkinson's disease, kidney failure, education level, reason for institutionalization 'by own choice', tobacco consumption, marital status, private health plan, low weight, and incidence of depression. It can be concluded that the cumulative probability of maintaining functional capacity in this sample of Brazilian institutionalized older adults was only 44% at 2 years. Prognostic factors for functional decline were severe cognitive impairment

at baseline, and continence decline and incidence of hospitalizations during the period.

BETWEEN-PERSON AND WITHIN-PERSON VARIABILITY IN VITAMIN D, PHYSICAL ACTIVITY, PAIN, AND FALLS RISK

S. Balogun¹, T. Winzenberg¹, M.L. Callisaya^{1,2}, D. Scott^{2,3}, K. Wills¹, G. Jones¹, D. Aitken¹, 1. *Menzies Institute for Medical Research, University of Tasmania, Hobart, Tasmania, Australia*, 2. *Department of Medicine, School of Clinical Sciences at Monash Health, Faculty of Medicine, Nursing and Health Sciences, Monash University, Clayton, Victoria, Australia*, 3. *Melbourne Medical School (Western Campus) and Australian Institute for Musculoskeletal Science, The University of Melbourne and Western Health, St Albans, Victoria, Australia*

Aims: To describe the associations between falls risk, and between-person and within-person variability in 25-hydroxyvitamin D (25OHD), physical activity (PA), knee pain and dysfunction in community-dwelling older people.

Methods: Data for 1099 participants (51% women; mean age 63 ± 7.5 years) studied at baseline, 2.5, 5, and 10 years were analysed. Falls risk (Z-score) was measured using the validated physiological Profile Assessment. Knee pain and dysfunction were assessed using the Western Ontario and McMaster Universities Osteoarthritis index (WOMAC). Moderate and vigorous PA (MVPA) was measured using accelerometer. Mixed effect regression analysis was used to model the association between falls risk and between-person and within-person variability in PA, 25OHD and WOMAC score.

Results: Between-person effect showed that 10-year average falls risk was lower in participants who had a higher 10-year average 25OHD ($\beta = -0.006$ per nmol/l, 95% CI: $-0.009, -0.004$, $P < 0.001$), MVPA ($\beta = -0.07$ per 10 minutes, 95% CI: $-0.01, -0.04$, $P < 0.001$) and lower mean WOMAC score ($\beta = 0.005$ per-unit score, 95% CI: $0.004, 0.007$, $P < 0.001$). Within-person effect showed that a higher falls risk was associated with higher than average WOMAC score ($\beta = 0.003$ per-unit score, 95% CI: $0.001, 0.005$, $P = 0.003$) and lower than average MVPA ($\beta = -0.12$ per 10 minutes, 95% CI: $-0.17, -0.08$, $P < 0.001$) but not 25OHD.

Conclusion: Having knee pain and dysfunction above an individual's average increases the risk of falling, whereas, increasing one's own MVPA level further reduces their risk of falling. The presence of between-person but not within-person associations for 25OHD suggests the former may be confounded by other factors.

CHANGE OF FUNCTIONAL STATUS AND QUALITY OF LIFE IN COMMUNITY LIVING CHINESE ELDERLY WITH FRACTURES

S.C. Ho¹, J. Woo², A. Sham¹, 1. *The Jockey Club School of Public Health and Primary Care, the Chinese University of Hong Kong, Hong Kong SAR, China*, 2. *Department of Medicine and Therapeutics, the Chinese University of Hong Kong, Hong Kong SAR, China*

To investigate the impact of fractures on subsequent functional status and quality of life, we conducted both cross-sectional and longitudinal analyses based on data collected from a population-based elderly cohort (N=2032) aged ≥ 70 years

and above recruited through stratified random sampling based on the Old Age Allowance Scheme in Hong Kong. The baseline analysis showed that elderly subjects with history of fractures in the past years, compared to those without, had two-fold increased risk of having limitations in activities of daily living (ADL, Barthel index), mobility (ability to walk 50 feet and moving up and downstairs), and lower score in satisfaction with life (below 70 out of 100). The 36-month followup data also revealed that subjects with no limitations in ADL at baseline but with fractures occurring during the followup period had increased risk of developing limitations in ADL [Odds ratio (OR) = 1.2; 95% CI: 1.0–2.0], mobility problem (OR=1.8; 95% CI: 1.2–2.8), and having lower satisfaction with life score (OR=1.24; 95% CI: 0.94–1.62), after adjustment for age, sex, baseline history of fractures and number of diseases. They were also significantly more likely to be depressed, have higher utilization of community and medical resources, and poorer self-evaluated health at the 36-month followup visit. The increased risk ranged from 30% to 100% compared to those with no fracture occurrence during the followup period.

Population preventive strategies, including lifestyle modifications, for the reduction of fractures are important for the maintenance of mobility and quality of life in the elderly population.

SESSION 4620 (PAPER)

DISABILITY AND DEMENTIA IN LONG-TERM CARE

LOW DISABILITY AT ADMISSION PREDICTS FASTER DISABLEMENT IN LONG-TERM CARE RESIDENTS

N.E. Lane¹, T.A. Stukel², C. Boyd³, W. Wodchis¹, 1. *Institute of Health Policy, Management and Evaluation, University of Toronto, Toronto, Ontario, Canada*, 2. *Institute for Clinical Evaluative Sciences, Toronto, Ontario, Canada*, 3. *Johns Hopkins School of Medicine, Baltimore, Maryland*

Background: Disablement is when people lose their ability to perform activities of daily living (ADLs) like bathing and dressing over time. This study examines whether high versus low disability, balance impairment, cognitive impairment and pain at admission to long-term care are predictive of residents' subsequent rate of disablement over two years.

Methods: Longitudinal study of 12,334 residents admitted to 633 Ontario long-term care homes between April 1st 2011 and March 31st 2012. Eligible residents received an admission assessment of disability using the RAI-MDS 2.0 ADL long-form score (range 0 – 28) and two subsequent disability measures in the home they were admitted to. Regression models estimated the adjusted association between high versus low disability, pain, balance impairment and cognitive impairment at admission with residents' rate of disablement over two years.

Results: Residents had a median disability score of 13 at admission. Residents with disability scores below or equal to the sample median experienced disablement at a rate of 0.43 (95% CI: 0.42, 0.45) points per month, whereas those with above-median disability at admission became disabled at a rate of 0.17 (95% CI: 0.15, 0.18) points per month. Pain,

balance impairment and cognitive impairment at admission had negligible effects on resident disablement over two years.

Conclusions: Residents who are more disabled at admission experience slower disablement over two years than residents who are less disabled at admission. This rate difference may reflect an untapped opportunity for slowing disablement among residents who are admitted to long-term care with lower disability.

FACTORS ASSOCIATED WITH ANTIPSYCHOTIC MEDICATION USE IN LONG-STAY NURSING HOME RESIDENTS

L.J. Phillips, G.F. Petroski, M. Rantz, N.M. Birtley, C. Siem, *University of Missouri, Columbia, Missouri*

Nationally, 17% of nursing home residents without qualifying diagnoses of schizophrenia, Huntington's Disease, and/or Tourette's Syndrome receive antipsychotic medications. Identifying factors associated with antipsychotic use could reveal targets for alternative interventions. Using the Missouri Minimum Data Set collected between 1/1/2015 and 12/31/2015, variables correlated with antipsychotic use in long-stay nursing home residents age ≥ 65 years, lacking a qualifying diagnosis, and not comatose, were examined. Among 36,307 residents meeting inclusion criteria, 18% received an antipsychotic. After dividing the sample into 10 random equivalently-sized subsets, logistic regression with forward selection of candidate variables associated ($p < 0.01$) with antipsychotic use was run for each data subset. Variables selected in $\geq 50\%$ of subsets were included in a final logistic regression model using 36,307 cases. Statistically significant predictors of antipsychotic use, in ascending order of absolute magnitude ranging from odds ratios of 0.96 to 6.22, were fewer late-loss activities of daily living, lower age, non-Alzheimer's dementia, antidepressant medication, cognitive impairment, wandering, antianxiety medication, behavioral symptoms, psychosis symptoms, psychotic disorder, and manic depression. The area under the receiver operator characteristic curve was 0.81, indicating good discrimination between residents receiving and not receiving antipsychotics. This study identified characteristics of residents most at risk for antipsychotic use; these findings could guide nursing homes in proactively planning need-based interventions. By implementing interventions targeted toward younger, higher-functioning dementia residents, and including relaxation and cognitive behavioral therapy techniques for anxiety and depression, antipsychotic use may be reduced, thereby mitigating harm caused by medication side effects and complying with federal regulations.

PATTERNS OF NEW PHYSICAL PROBLEMS EMERGING IN LONG-TERM CARE RESIDENTS WITH DEMENTIA

C. Kovach^{1,2}, J. Ellis¹, C. Venes¹, 1. *Nursing, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*, 2. *Jewish Home and Care Center, Milwaukee, Wisconsin*

People receiving skilled nursing care have multiple comorbid conditions that impact comfort and resource utilization. This longitudinal study describes variations in the trajectories of new physical problems emerging over 8 weeks and the predictive value for future health and behavior in residents from two nursing homes with dementia. The sample of

72 had 668 new physical problems with a range of 2 to 37 occurring over eight weeks. Sixty-five percent of the sample ($n = 47$) had 5 or more new problems and were identified by three unstable trajectories. Thirty-nine percent ($n = 28$) had a spike in new problems of 4 or more in one week. Spikes, new physical problems, and the problem-free duration predicted 23.6% of the variance in both new physical problems and new agitation occurring in the subsequent month ($p < .001$). Common problems, acute illness, and symptoms accounted for 28.2% of the variance in subsequent new physical problems ($p < .001$) and 25.7% of the variance in subsequent agitation ($p < .001$). The frequency of new problems and differences in the patterns of how these problems emerged over a relatively short time period suggests instability and variability in physiologic health that has not been previously identified. The possible existence of different pathways of decline may have important implications for health care delivery. Findings suggest a higher intensity of need for skilled assessment and treatment than may be available in many long-term care organizations.

THE EFFECT OF ENVIRONMENTAL ADAPTATIONS ON SELF-REPORTED BATHING DISABILITY AND INSTITUTIONALIZATION

W.K. Graham, M. Bilger, *Duke-NUS Medical School, Singapore, Singapore*

Disability in bathing, an activity of daily living, has been shown to be an independent predictor of long-term nursing home (LTNH) admission. It is theorized that environmental adaptations (EA) in the home can reduce the physical demands of bathing and hence delay the development of this disability. This study aims to examine the effect of home environmental adaptations (EA) on bathing disability and subsequently on the probability of LTNH admission among older Americans with bathing disability.

This study uses data from Waves 8 to 11 (years 2006–2012) of the Health and Retirement Study (HRS). The analysis, based on responses to the experimental survey module on Characteristics of the Home Environment ($N = 1616$), is conducted in the framework of logistic models explaining self-reported disabilities as functions of related impairments and EAs. The mitigating effect of EAs on self-reported disabilities is measured via interaction terms between impairments and EAs and their significance tested using the t statistic.

Findings show that among people who have difficulty walking across a room, the presence of grab bars in the shower or tub area and of separate shower stalls is associated with lower probability of self-reported bathing disability. Among people who have difficulty stooping, kneeling and crouching, those who have separate shower stalls are also less likely to report having bathing disability. These results suggest that, by reducing disability rates, grab bars in the shower or tub area and separate shower stalls can facilitate aging-in-place and lower LTNH admission rates.

A COMMUNICATION INTERVENTION TO REDUCE RESISTIVENESS IN DEMENTIA CARE

K.N. Williams², Y. Perhounkova³, R. Herman², A.L. Bossen³, 2. *The University of Kansas Medical Center, Kansas City, Kansas*, 2. *University of Kansas, Lawrence, Kansas*, 3. *The University of Iowa, Iowa City, Iowa*

Background: Nursing home (NH) residents with dementia exhibit challenging behaviors or resistiveness to care (RTC) that increase staff time, stress, and NH costs. RTC is linked to elderspeak communication. Communication training (CHAT) was provided to staff to reduce their use of elderspeak.

Hypothesis: We hypothesized that CHAT would improve staff communication and subsequently reduce RTC.

Methods: Thirteen NHs were randomized to intervention and control groups. Dyads ($n = 42$) including 29 staff and 27 persons with dementia (PWD) were videorecorded during care before and/or after the intervention, and at a three month follow-up. Videos were behaviorally coded for 1) staff communication (normal, elderspeak, or silence) and 2) resident behaviors (cooperative or RTC). Linear mixed modeling was used to evaluate training effects.

Results: On average elderspeak declined from 34.6% ($SD = 18.7$) at baseline by 13.6 percentage points ($SD = 20.00$) post-intervention and 12.2 percentage points ($SD=22.0$) at 3-month follow-up. RTC declined from 35.7% ($SD = 23.2$) by 15.3 percentage points ($SD = 32.4$) post-intervention and 13.4 percentage points ($SD=33.7$) at 3-months. Linear mixed modeling determined that change in elderspeak was predicted by the intervention ($b = -12.20$, $p = .028$) and baseline elderspeak ($b = -0.65$, $p < .001$) while RTC change was predicted by elderspeak change ($b = 0.43$, $p < .001$); baseline RTC ($b = -0.58$, $p < .001$); and covariates.

Conclusions: A brief intervention can improve communication and reduce RTC, providing an effective nonpharmacological intervention to manage behavior and improve the quality of dementia care. No adverse events occurred.

SESSION 4625 (SYMPOSIUM)

HOSPITAL AT HOME-A DELIVERY MODEL FOR 21ST CENTURY GERIATRICS CARE

Chair: J.M. Jacobs, *Hadassah-Hebrew University Hospital, Jerusalem, Israel*

Co-Chair: G. Caplan, *Prince of Wales Hospital*

The primary purpose of Hospital at Home (HaH) is to enable the delivery of complex care at home as an alternative to in-patient care. Traditional in-patient care for older people frequently has numerous negative repercussions, and the rising number of HaH models from different Healthcare systems bears witness to this developing niche in health care delivery. Compared to usual hospital care, HaH has proven high patient satisfaction, quality of care outcomes, and evidence favors reduced mortality and overall costs. Furthermore, innovative and available technological advancements are expanding the range of treatment options available at home, and facilitating the delivery of care to a wide spectrum of increasingly more complex patients.

Yet, HaH dissemination has been limited by numerous barriers, including challenging logistics, bias towards facility-based care, and lack of payment models. Recent advances in HaH models seek to ameliorate such barriers, but they still exist. Moreover, the implementation of HaH on a widespread basis has not been well described in the research literature.

In addition to a critical review and meta-analysis of current literature, this symposium will present innovative models

of HaH providing a wide platform of care for older adults, and technologies facilitating care for specific patient groups with acute heart failure, or requiring long term mechanical ventilation. Challenges facing the implementation of widespread HaH will be addressed.

Understanding the impact of new modes of Hospital at Home care delivery, and ways at promoting implementation, is of critical importance to geriatric health service delivery in the 21st century.

A META-ANALYSIS OF HOSPITAL IN THE HOME

G. Caplan¹, N. Sulaiman¹, D. Mangin⁴, N. Aimonino Riccauda², A. Wilson³, L. Barclay¹, 1. *Department of Geriatric Medicine, Prince of Wales Hospital, Sydney, Sydney, New South Wales, Australia*, 2. *Unit of Geriatrics and Metabolic Bone Diseases, Molinette Hospital, "AOU Città della Salute e della Scienza" of Torino, Torino, Italy*, 3. *Universtiry of Leicester, Leicester, United Kingdom*, 4. *University of Otago, Christchurch, New Zealand*

This meta-analysis of Hospital-in-the-Home (HITH) compared to in-hospital care identified 61 Randomised Controlled Trials from MEDLINE, Embase, Social Sciences Citation Index, CINAHL, EconLit, PsycINFO and the Cochrane Database of Systematic Reviews. HITH care led to reduced mortality (odds ratio [OR] 0.81;95% CI, 0.69 to 0.95; $p = 0.008$; 42 RCTs; 6992 patients), readmission rates (OR 0.75;95% CI,0.59 to 0.95; $p = 0.02$; 41 RCTs; 5372 patients) and cost (mean-difference 1567.11; 95% CI, 2069.53 to 1064.69; $p < 0.001$; 11 RCTs; 1215 patients). The number needed to treat at home to prevent one death was 50. Mortality data was homogenous, but heterogeneity was observed for readmission rates and cost. HITH had higher patient and carer satisfaction (21/ 22; 6/8 studies respectively); carer burden was nonsignificantly lower (8/11 studies).

HITH is associated with reductions in mortality, readmission rates and cost, and increases in patient and carer satisfaction, but no change in carer burden.

THE HOSPITAL AT HOME/MACT 'PLATFORM' MODEL—A SPECTRUM OF FACILITY-LEVEL CARE PROVIDED AT HOME

B.A. Leff¹, L. De Cherrie², A. Wajnberg², A. Federman², T. Soones², A. Brody³, A. Siu², 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland*, 2. *Icahn School of Medicine, Mount Sinai, New York, New York*, 3. *New York University, New York, New York*

To date, Hospital at Home (HaH) care has focused on substitutive admission avoidance or early discharge models. In the context of a U.S. Federal innovation award program for the Center for Medicare and Medicaid Services, we have evolved the HaH model into a care "platform" for older adults. In addition to providing substitutive admission avoidance care, the platform includes: 1) "observation" stay at home; 2) acute palliative care at home; 3) acute care for hospital adverse patients (people who refuse hospital admission under all circumstances) at home; and 4) subacute rehabilitation care at home as a substitute for admission to inpatient subacute rehabilitation. This platform evolved in recognition of the evolving health care delivery system, the need to create greater demand for HaH resources, provide adequate patient

volumes for HaH operations, and the needs and preferences of patients. Results from the first 2 years of the platform will be presented.

HOW TECHNOLOGIES CAN HELP HOSPITAL-AT-HOME CARE FOR ELDERLY PEOPLE WITH ACUTE HEART FAILURE

V. Tibaldi², A. Ricauda Nicoletta², M. Rocco², I. Giovanni Carlo¹, 1. *Professor of Medicine; Director, Unit of Geriatrics and Metabolic Bone Diseases, Molinette Hospital, "AOU Città della Salute e della Scienza" of Torino; Director, School of Geriatric Medicine, University of Torino, Torino, Italy*, 2. *Hospital at Home Service Unit of Geriatrics and Metabolic Bone Diseases - Molinette Hospital A.O.U. Città della Salute e della Scienza of Torino, Torino, Italy*

Advances in the miniaturization and portability of diagnostic technologies, information technologies, remote monitoring, and long-distance care have increased the viability of home-based care, particularly for patients with serious conditions.

The Hospital at Home Service (HHS) of Torino is a multidisciplinary, physician-led unit, established in 1985. About 15% of HHS patients have Acute Heart Failure (AHF), requiring on occasion intravenous diuretics and dopamine. A Randomized Controlled Trial of telemonitoring, was initiated in 2014 for patients with AHF receiving home management as an alternative to hospital care. Through the web-platform "Nuvola IT HomeDoctor", physicians and nurses remotely monitor vital signs (blood pressure, heart rate, oximetry, weight), treating accordingly. The technology is simple, and well accepted by patients and caregivers.

We will present an overview of our model of care, and the impact of telemonitoring upon frequency of home visits by HHS staff, and quality of life of patients and caregivers.

HOME HOSPITAL FOR LONG TERM MECHANICALLY VENTILATED PATIENTS

J.M. Jacobs^{2,1}, A. Cohen^{2,3}, J. Stessman^{2,1}, 1. *Clalit Health Services, Jerusalem, Israel*, 2. *Hadassah -Hebrew University Hospital, Department of Geriatrics and Rehabilitation, Jerusalem, Israel*, 3. *Ministry of Health, Geriatric Division, Jerusalem, Israel*

As technologically advanced respiratory care becomes increasingly available, home ventilation within the Home Hospital (HH) setting is a viable alternative to specialized long-term care facilities (LTCF) for many patients needing Persistent Mechanical Ventilation (PMV).

The Jerusalem HH treats 300 medically complex patients, currently including 65 patients requiring PMV. Multidisciplinary care includes 24-hour on-call physician, logistic and respiratory backup. Between 2005 -2015 the average number of HH-PMV patients increased from 34 to 66 simultaneously, while PMV patients in LTCF declined from 94 to 72. Average annual mortality in HH versus LTCF was 14% versus 38%, and formal monthly cost of HH: LTCF was 1:4.

We present data comparing PMV patients treated with HH versus LTCF, including sociodemographic characteristics, clinical parameters, mood, quality of life, caregiver stress, length of treatment, mortality rates, and costs.

Our findings confirm that HH for PMV is a cost effective, feasible and safe alternative to LTCF.

HOSPITAL IN THE HOME: WHAT'S HAPPENING IN THE UK 2017

R. McCrea, *Amie Healthcare, London, United Kingdom*

A Narrative appraisal of history of "Hospital In The Home" in the UK with descriptions of services ranging from subacute to acute. The talk will highlight barriers and enablers to progress within the National Health Service, the UK's socialised medical provision model.

SESSION 4630 (SYMPOSIUM)

INSTRUMENTING GERIATRIC ASSESSMENT WITH BODY-WORN SENSORS—POTENTIAL AND LIMITATIONS

Chair: C. Becker, *Robert Bosch Hospital*

Co-Chair: C. Bula, *University of Lausanne Medical Center (CHUV)*

Discussant: K. Taraldsen, *Norwegian University of Science and Technology, Trondheim, Norway*

Geriatric assessment historically has been based on observation, stopwatches and questionnaires. The rapid development of computational and ubiquitous sensing capacity has only been slowly absorbed by geriatric medicine and gerontological research. The symposium will showcase examples of the added value of body worn sensors for outcome evaluation, diagnosis and hypothesis generation in the areas of frailty classification, mobility disability and hip fracture treatment. Study groups from Lausanne, Trondheim, Stuttgart and Tucson, Arizona will present their work. The clinical and technical presentation will include the strength but also weaknesses of the current methodology. New models of complexity analysis will be presented to explore future research directions.

The state-of-the art research demonstrates that it is possible to quantify walking, turns, sit-to-stand transfers and physical activity. Gait variability, quality of transfers and complex walking bout and sedentariness analysis are getting more accessible for advanced mobility analysis. While the role of sensor based assessment is being established open question remain on optimal sensor configuration, multisensor applications, sensor fusion, real-time feedback. The symposium will give an overview of cutting edge research and the relevance of this hot topic.

PHYSICAL ACTIVITY PROFILES IN HIP AND PELVIC FRACTURE PATIENTS

K. Kampe, J. Klenk, K. Pfeiffer, C. Becker, *Department of Clinical Gerontology, Robert-Bosch-Hospital, Stuttgart, Germany*

Hip and pelvic fractures are one of the most serious consequences of a fall. A multifactorial intervention to improve physical activity and falls efficacy was evaluated with 124 community-dwelling elderly after hip or pelvic fracture (Mean age = 82.5 years; 76.6 % female). Components of the intervention were (a) relaxation, (b) meaningful mobility goals, (c) falls-related cognitions and emotions, (d) an individual physical exercise program, (e) integration of training and physical activities in daily life, (f) fall hazards. The

intervention was delivered in 8 face-to-face sessions during inpatient rehabilitation plus 4 telephone contacts and one home visit over ten weeks after discharge. There were significant between-group effects ($p < .05$) in favor of the training group on physical capacity and self-efficacy. No effect was seen for sensor based measurements on several physical activity post discharge. This demonstrates the relevance to add instrumented objective tests for outcome measurements.

MEASURING DAILY LIFE PHYSICAL ACTIVITY USING SENSORS FOLLOWING HIP FRACTURE

K. Taraldsen, P. Thingstad, J. Helbostad, *Norwegian University of Science and Technology, Trondheim, Norway*

Older people suffering from a hip fracture are at increased risk of functional decline. In The Trondheim Hip Fracture Trial we monitored activity the fourth day and 4 and 12 months post-surgery ($n = 397$). Patients randomised to receive treatment in an orthogeriatric ward spent more time upright than patients treated in a traditional orthopaedic ward. The differences lasted at 4/12 months. In the EVA-Hip study ($n = 143$), we assessed the effect of 10 weeks individualised, task oriented home-exercise delivered four months after hip surgery and compared this to usual care. Results demonstrated an improvement in gait speed in the intervention group, but with no change in time spent upright between the two groups.

SENSOR-BASED ASSESSMENT OF PHYSICAL ACTIVITY FOR DISCRIMINATION OF FRAILTY STATUS

M. Schwenk^{2,1}, J.J. Mohler³, C. Wendel³, B. Najafi⁴, *1. Geriatric Research, Robert-Bosch-Hospital, Stuttgart, Germany, 2. Heidelberg University, Heidelberg, Germany, 3. University of Arizona, Tucson, Arizona, 4. Baylor College of Medicine, Houston, Texas*

Instrumented physical activity (PA) assessment for determination of frailty status has not been adequately validated. This study aimed to examine the ability of sensor-based PA assessment to discriminate between frailty levels (nonfrail, prefrail, frail). In a cross-sectional study, PA measures were completed in 125 older adults (nonfrail: $n = 44$, prefrail: $n = 60$, frail: $n = 21$). Detailed PA characteristics including percentage of walking, standing, sitting, lying and duration and variability of single walking, standing, sitting, and lying bouts were calculated. PA parameters related to walking best discriminated between nonfrail and prefrail individuals, with highest effect sizes found for number of steps (Cohen's $d = 0.83$) and percentage of walking ($d = 0.75$). Interestingly, walking bout duration variability emerged as the most sensitive PA parameter to separate three frailty groups. Our results may suggest that the 'loss of complexity paradigm' related to frailty is reflected by everyday PA behavior.

MOVEMENT COMPLEXITY IN REHABILITATION OF GERIATRIC INPATIENTS

K. Aminian¹, A. Ionescu¹, C.M. El Achkar¹, K. Rapp², J. Klenk², C. Becker², *1. Ecole Polytechnique Federale de Lausanne, Lausanne, Switzerland, 2. Department of Clinical Gerontology, Robert-Bosch-Hospital, Stuttgart, Germany*

Daily activity can be characterized by metrics such as duration, intensity, frequency. Combining these activity metrics into a temporal pattern (barcoding), and calculating its

complexity can provide a global view of physical behaviour. We hypothesize that complexity increases following rehabilitation ($n = 524$ inpatients). Using an accelerometer fixed on the thigh, the activity of one full day was recorded at the beginning of the rehabilitation and at follow-up 14 days later. The activity profile (i.e. time spent sitting, standing, and walking) was obtained. Activity patterns were built considering 14 different levels of intensity and the entropy of these levels was calculated (Lempel-Ziv metric). Complexity increased significantly, confirming its consistency with the activity profile. Complexity was correlated with Barthel Index, age, gender, and severity of mobility impairments. Complexity analysis of daily activity is deemed suitable to assess rehabilitation outcome and it is highly correlated with a standard clinical score.

REHABILITATION OUTCOMES IN OLDER INPATIENTS AFTER HIP FRACTURE USING INSTRUMENTED SHOES: PILOT STUDY

K. Major¹, C.M. El Achkar², C. Lenoble-Hoskovec¹, H. Krief¹, A. Paraschiv-Ionescu², K. Aminian², C. Bula¹, *1. Geriatrics and geriatric rehabilitation, University Hospital of Lausanne, Epalinges, Switzerland, 2. Ecole Polytechnique Fédérale de Lausanne, Lausanne, Switzerland*

Wearable activity monitoring in clinical setting has shown promise in evaluating rehabilitation outcomes in elderly inpatients. In this study, patients aged >65 years admitted to post-acute care after hip fracture were monitored using an instrumented shoes system consisting of 3D accelerometer and gyroscope, and a pressure sensing insole. Activity data were collected over 8 hours at admission and 14 days later. Daily activity was profiled and gait parameters, load symmetry, and activity barcodes were obtained using dedicated algorithms. Among participants (4 men, 4 women), percent time sitting decreased whereas walking and standing increased, with significant increase of maximum locomotion period duration ($p = 0.028$). Load symmetry and LZ complexity revealed significant improvements ($p = 0.01$ and $p = 0.04$, respectively). Complexity and load symmetry proved to be highly sensitive to functional improvements compared to classical activity metrics, even though all metrics evolved in the expected direction. These results demonstrate the suitability of instrumented shoes for rehabilitation monitoring.

SESSION 4635 (PAPER)

INTERNATIONAL PERSPECTIVES ON PREDICTING AND MANAGING FRAILTY

PREDICTORS OF FUNCTIONAL IMPROVEMENT IN GERIATRIC REHABILITATION UNITS. A MULTICENTER STUDY

A. Calle^{1,2}, G. Onder^{3,4}, A. Morandi⁵, E. Ortolani^{3,4}, G. Bellelli^{5,6}, L. Perez^{1,2}, A. Sanniti⁵, M. Inzitari^{1,2}, *1. Parc Sanitari Pere Virgili, Barcelona, Spain, 2. Universitat Autònoma de Barcelona, Barcelona, Spain, 3. Centro Medicina dell'Invecchiamento, Agostino Gemelli Hospital, Rome, Italy, 4. Università Cattolica Sacro Cuore, Rome, Italy, 5. Department of Rehabilitation and Aged Care of the Fondazione Camplani, Ancelle Hospital, Cremona, Italy, 6.*

School of Medicine and Surgery, University Milano-Bicocca, Milan, Italy

Frailty-related characteristics, such as sarcopenia, malnutrition and cognitive impairment, are often overlooked, both in practice and research, as potential contributors to functional recovery in patients admitted to geriatrics rehabilitation units.

We evaluated the association of these characteristics with functional improvement using data from a multicenter cohort study including patients ≥ 65 years with orthopedics conditions or stroke from three geriatric rehabilitation units (Barcelona, Spain, and Cremona and Rome, Italy) (December 2014-April 2016). Assessment at admission: demographics, main diagnosis, comorbidity (Charlson Index (CI)), polypharmacy (≥ 4 drugs), malnutrition (MNA-SF ≤ 11), functional status (Barthel Index), cognitive impairment (MMSE ≤ 23), sarcopenia (EWGSOP definition) and its sub-items (muscle mass through BIA, handgrip strength and gait speed). Outcome: functional Improvement (FI) (Barthel discharge-admission ≥ 20 , cutoff selected for clinical significance and for identifying upper tertiles Vs lowest). We used logistic regression to test the association between admission variables and FI, introducing sarcopenia and its sub-items in different models.

We enrolled 461 patients (mean age \pm SD=80.6 \pm 9.7 years), 34% women, 70% with orthopedic conditions (fractures or prosthesis). Comorbidity (CI=3.76 \pm 2.6) and disability (Bla=42.2 \pm 21.5) were moderate, sarcopenia was highly prevalent (82%). Better admission Barthel (OR[95%CI]=0.984[0.97–0.99]), admission for stroke (OR[95%CI]=0.357[0.23–0.56]) and cognitive impairment (OR[95%CI]=0.565[0.37–0.87]) independently reduced the likelihood of functional improvement. No other variables were independently associated with the outcome.

In conclusion, in our sample, only cognitive impairment, among frailty-related characteristics, is associated to worse functional recovery. A very high prevalence of sarcopenia suggests to better explore this condition and to evaluate possible alternative definitions that better suit rehabilitation settings.

FEASIBILITY AND POTENTIAL EFFICACY OF HIGH INTENSITY WALKING IN FRAIL OLDER ADULTS

M. Danilovich², G. Hornby¹, D. Conroy³, 1. *Indiana University, Indianapolis, Indiana*, 2. *Northwestern University, Chicago, Illinois*, 3. *Penn State University, University Park, Pennsylvania*

BACKGROUND: Walking is an effective and preferred mode of exercise for older adults, yet limited evidence exists on the optimal walking intensity for frail older adults. The purpose of this study was to investigate the feasibility and efficacy of a high intensity walking training (HIWT) intervention for pre-frail and frail older adults in an assisted living facility.

METHODS: Using a pre-post test design, we enrolled 5 participants aged 85–89 years who completed 12, 30-minute sessions of HIWT at 70–80% of heart rate reserve or ratings of 15 to 17 (hard to very hard) on the Rating of Perceived Exertion scale. HIWT included walking at fast speeds, directional changes, stairs, outdoor surfaces, and without an assistive device. The primary outcome was feasibility assessed

through program evaluations. Secondary outcomes included frailty, self-reported health, balance, endurance, gait speed, and strength.

RESULTS: HIWT is feasible in pre-frail and frail older adults. Participants viewed HIWT as highly satisfactory (mean rating 9.6/10) and 100% recommended that HIWT continue as part of the assisted living services. Participants had significant changes in frailty (p=0.001), fast gait speed (p=0.003), six minute walk test (p=0.03), and balance (p=0.01). There were no adverse events and all participants reached target training intensity in all 12 sessions.

CONCLUSIONS: This study offers the first evidence of the feasibility and potential efficacy of HIWT for frail and pre-frail older adults. Initial results suggest that HIWT significantly lessens the degree of frailty, but also contributes to improved mobility and balance.

HEALTHY LIFESTYLES AND ITS ASSOCIATION WITH FRAILITY

A. Salinas, B. Manrique-Espinoza, *Statistics, National Institute of Public Health, Cuernavaca, Morelos, Mexico*

Frailty is a clinical syndrome that increases vulnerability, disability and premature death among the elderly. Many studies have identified risk factors associated to the occurrence of frailty, but just a few have put emphasis in the association of frailty and healthy lifestyles indicators. The objective of this study was to determine the association between the presence of frailty and the following indicators associated with healthy lifestyles in mid-life: Body mass index (overweight / obesity), physical activity, smoking, alcohol consumption, consumption of fruits and vegetables, and social participation. Longitudinal study conducted in 2009 and 2014 with a nationally representative sample of 4189 older adults aged 50 and over in Mexico. Frailty was measured using the Fried's approach and three groups were formed: Non-frail, pre-frail, and frail groups. Our results suggest the presence of frailty in younger subjects; which supporting the hypothesis that in older Mexicans adults frailty is occurring at younger ages. Also support the evidence that some unfavorable life styles excessive alcohol consumption (RR=1.74, p<0.01), low physical activity (RR=4.5, p<0.01), and low social participation (RR=1.49, p<0.01) are closely associated with the prevalence and incidence of frailty. Finally, there is also a strong association between the presence of frailty and sarcopenia, particularly in octogenarians (1 in 4 is frail and/or presents sarcopenia). The results confirm the association of frailty with some indicators of healthy lifestyles, and highlight the importance of looking this association from a life course approach.

HEALTH ASSETS CAN DECREASE MORTALITY AND LENGTH OF STAY FOR HOSPITALIZED FRAIL OLDER ADULTS

K.J. Gregorevic^{2,1}, N.M. Peel³, W.K. Lim⁴, M. Tacey⁴, R. Hubbard³, 1. *Department of Medicine, North West divisionf, University of Melbourne, Collingwood, Victoria, Australia*, 2. *Northern Hospital, Epping, Victoria, Australia*, 3. *Princess Alexandra Hospital, Woolongabba, Queensland, Australia*, 4. *Royal Melbourne Hospital, Parkville, Victoria, Australia*

Background: Health assets are resources that individuals or communities have at their disposal, which protect against negative health outcomes and promote wellbeing. Health assets may mitigate the effects of frailty for hospitalized older adults and decrease mortality and other adverse outcomes.

Methods: This secondary analysis was performed on data collected on 1418 inpatients aged over 69 using the interRAI assessment system for acute care tool. Potential health assets present in the dataset were chosen based on a literature review and expert opinion. The factors examined were gender, living arrangement, days the person left the house prior to becoming unwell, marital status and primary language. Outcomes included inpatient mortality, mortality 28 days after discharge, readmission and length of stay. Multivariate analysis was performed for all factors that had an association with a p value of <0.2 in univariate analysis in a model that accounted for frailty status.

Results: Mean age of patients was 81 and 55% were women. Patients who were able to walk further had decreased mortality with OR 0.06(0.01,0.53). Patients who did not leave the house prior to admission had increased mortality with an OR 6.82(3.09,15.05). Living arrangement, person supportive of discharge and distance walked prior to hospitalisation were all associated with a decreased length of stay. None of the health assets examined were protective against readmission.

Conclusion: Health assets improved outcomes across the frailty spectrum. Elucidating factors associated with recovery for hospitalized older adults can improve prognostication and guide development of interventions.

SESSION 4640 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: UNDERSTANDING THE IMPACT OF OBESITY ON HEALTHY LIFE EXPECTANCY THROUGH CROSS-NATIONAL COMPARISONS

Chair: C. Jagger, *Newcastle University*

The rising trends in obesity and overweight worldwide are a major public health concern. The continued increases in life expectancy from falling mortality rates, even at very old ages, are also reflected worldwide but the effect of obesity on mortality, is equivocal. A recent meta-analysis found that obesity and overweight were associated with an increased risk of all-cause mortality, however other evidence suggests this may only be true for the young old (75–84) whilst in the very old overweight has little effect or may be protective. Nevertheless how obesity impacts healthy life expectancy, the remaining number of years spent healthy, is even less well researched, despite the possibility that reduction of obesity could result in compression of morbidity.

In this session we aim to consolidate the sparse knowledge of whether obesity affects healthy life expectancy more or less than life expectancy. We use longitudinal studies from both Western and Eastern populations as well as both physical and mental health measures. The first presentation examines whether obesity has a greater or lesser effect on Active Life Expectancy (ALE) than two decades ago in the US, whilst the second presentation uses the same measure of ALE to compare the effect of obesity on ALE in Japanese

older people. The final two presentations focus on Australian data. The third presentation provides a link between health measures by investigating the effect of obesity on ALE compared to its effect on cognitive impairment-free life expectancy. Finally we report how obesity impacts dementia-free life expectancy.

EFFECT OF OBESITY ON ACTIVE LIFE EXPECTANCY IN THE UNITED STATES: CHANGES OVER TIME

E.M. Crimmins, Y. Zhang, *University of Southern California, Los Angeles, California*

In recent decades, life expectancy increase has slowed in the United States. Also, there have been striking increases in the prevalence of obesity, decreases in the age of obesity onset, and increases in the length of time people are living with obesity. In addition, the link between obesity and mortality appears to have weakened in more recent years. These trends indicate value in revisiting the links between obesity and active life expectancy. Building on earlier work using HRS data from 1993 to 1998 for the 70 plus population in the United States, we use HRS data from 2004 through 2008 to examine how the links between obesity, mortality, disability and subsequent active life expectancy have changed. We find that in the later cohort obesity is less related to mortality, more to disability, and remains a strong determinant of active life.

EFFECT OF BMI ON ACTIVE LIFE EXPECTANCY AMONG OLDER ADULTS IN JAPAN

Y. Saito¹, Y. Sugawara-Minagawa², 1. *Nihon University, Tokyo, Japan*, 2. *Sophia University, Tokyo, Japan*

Previous studies conducted in Western countries suggest that obesity at older ages affects length of life as well as active life expectancy (ALE). However, we know little of the relationship between BMI and ALE among older adults in Asian countries partly because lack of studies. We use the Nihon University Japanese Longitudinal Study of Aging, a nationally representative sample of older adults age 65 and over at baseline with interviews conducted in 1999, 2001, 2003, 2006 and 2009, and a mail survey was conducted in 2013. We compute BMI based on self-reported height and weight at baseline in 1999 and ALE as no difficulty in any of 5 ADLs (bathing, eating, walking, transferring and toileting) or 5 IADLs (preparing own meal, using a telephone, managing own money, shopping personal items and medication). Using multistate life tables we estimate life expectancy and ALE by sex and BMI category.

IMPACT OF OBESITY ON ACTIVE AND COGNITIVE IMPAIRMENT: FREE LIFE EXPECTANCIES IN OLDER AUSTRALIANS

A. Kingston¹, J. Byles³, K. Anstey², C. Jagger¹, 1. *Newcastle University, Newcastle upon Tyne, United Kingdom*, 2. *Australian National University, Canberra, Australian Capital Territory, Australia*, 3. *University of Newcastle, Newcastle, New South Wales, Australia*

As many, if not all, lifestyle factors are risk factors for both disability and mortality, it is important to assess the impact of them on both outcomes together, in a measure such as active life expectancy (ALE). In this way we can judge whether promotion of a healthy lifestyle will indeed increase

ALE more than life expectancy, so the extra years are all healthy ones. We use a unique data set, DYNOPTA, which combines Australian longitudinal studies of ageing, to evaluate the impact of obesity (from BMI at baseline) on ALE using multistate life tables and adjusting for level of education. We have previously published similar analyses but with cognitive impairment-free life expectancy (CIFLE) as the outcome rather than ALE. We showed that, in comparison to smoking and physical activity, obesity reduced total life expectancy the least but that the increase in years with cognitive impairment were non-significant.

IMPACT OF OBESITY ON DEMENTIA: FREE LIFE EXPECTANCIES IN OLDER AUSTRALIAN WOMEN

P. Gardiner¹, C. Jagger², M. Waller¹, G. Mishra¹, A.J. Dobson¹, 1. *The University of Queensland, Woollongabba, Queensland, Australia*, 2. *Newcastle University, Newcastle, United Kingdom*

A number of studies have calculated active or cognitive impairment-free life expectancies but there are limited data on years that people will live with dementia though this is crucial for policy development and service planning. Given that a cure for dementia remains elusive, it is important to assess the impact of potential risk factors, one of which is obesity. Women born in 1921–26 from the Australian Longitudinal Study of Women's Health were surveyed every three years from 1996 until 2011. Body mass index was calculated at baseline and dementia was identified from the self-report surveys and linked administrative datasets. Using multistate life tables, we examined the impact of obesity on life expectancy and dementia-free life expectancy. We found that obese women had lower life expectancy than women who were not obese though these differences were non-significant. Additionally obesity appeared to have little impact on years lived with or without dementia.

SESSION 4645 (PAPER)

PSYCHOLOGICAL DISTRESS, SOCIAL CAPITAL, DEPRESSION AND COGNITIVE DECLINE

PROTECTIVE EFFECT OF MASTERY AGAINST PSYCHOLOGICAL DISTRESS IN FAMILY CAREGIVERS OF OLDER PERSONS

E. Chan^{1,2}, G.F. Glass¹, Q. Qi¹, K. Chua³, N. Ali¹, W. Lim¹, 1. *Tan Tock Seng Hospital, Singapore, Singapore*, 2. *National University of Singapore, Singapore, Singapore*, 3. *King's College London, London, United Kingdom*

Family caregivers are often unprepared for and face considerable psychological distress from their caregiving role. Caregiver's sense of mastery may protect against the negative impact of caregiver burden. This study aims to examine the relationship between caregiver mastery and burden in predicting psychological distress.

We conducted a cross-sectional survey on 150 family caregivers of hospitalized older persons aged ≥ 65 . The main outcome was Hospital Anxiety and Depression Scale (HADS) total score ($\geq 15/42$ cutoff). We conducted hierarchical logistic regression adjusted for the caregiver's relationship with patient, caregiving hours/week, and neuropsychiatric symptom,

entering caregiver burden (Zarit Burden Interview (ZBI)) in the first step, and caregiver mastery (Pearlin Mastery scale) (model 1) and interaction term between mastery and ZBI (model 2) in second step. We repeated analyses using HADS depression and anxiety subscales ($\geq 8/21$, respectively) as outcomes.

After adjusting for covariates in step 1 ($R^2=0.46$), ZBI significantly predicted higher HADS total score (OR=1.12; $p<.01$). For model 1 ($R^2=0.52$), mastery independently predicted lower HADS-total score (OR=0.76; $p<.01$), accounting for additional 6% variance. Similarly, for model 2 ($R^2=0.52$), the interaction term was significant (OR=0.997; $p<.01$). ZBI remained significant in both models (OR=1.10 and 1.16, respectively). Subgroup analysis revealed that the observed results with HADS-total scores were largely driven by depression rather than anxiety scores.

Our study suggests the dual protective effect of caregiver mastery against psychological distress by its direct impact independent of burden, and modulating effect on burden. This supports the role of interventions targeted at mastery to protect against deleterious effects of caregiving.

POSITIVE AND NEGATIVE ASSOCIATIONS OF SOCIAL CAPITAL FACTORS WITH HEALTH

M. Kabayama¹, C. Watanabe², H. Ryuno¹, K. Kamide¹, 1. *Osaka University Graduate School of Medicine, Suita, Osaka, Japan*, 2. *Occupational Health Center, Fuchu Complex Toshiba Corporation, Fuchu, Japan*

It is critical to develop and strengthen community-based support to sustain super aged society. Because accumulating evidence suggests social capital is an important social determinant of health, the success of a sustainable society may depend on the development of social capital in the community.

This paper examines the variety in individual cognitive social capital by factor analysis and investigates the association between the detected sub-dimensions of an individual's cognitive social capital and their health in community dwelling older Japanese. We distributed self-administered postal questionnaires to people aged 60 to 89 who were randomly selected from the residential registration in a mid-sized urban city in western Japan. In the questionnaire, we asked participants to answer questions about their cognitive social capital in their main activity group. We created a set of 12 questions asking about cognitive social capital that was developed from previous studies.

Factor analysis identified three components from these twelve questions on cognitive social capital, which we named "harmonious", "hierarchical", and "diversity". Multiple regression analysis adjusted for gender, age, marriage status, equivalent income and present illness revealed the following to be independent factors associated with two health outcomes measured by the Medical Outcomes Study Short Form-36 (SF-36), Japanese version 1.2: "harmonious" social capital was positively associated with physical and mental health, "hierarchical" was negatively associated with mental health, and "diversity" was positively associated with mental health.

For the practical application of promoting a healthier society, it is important to consider both positive and negative sides of social capital.

IS COGNITIVE DECLINE SIMILAR AMONG PARKINSON'S DISEASE MOTOR SUB-TYPES?

A PROSPECTIVE STUDY

L. Arie⁴, T. Herman⁴, S. Shema-Shiratzky⁴, N. Giladi^{1,2,5}, J.M. Hausdorff^{4,2,3}, 1. *Tel Aviv Sourasky Medical Center, Tel Aviv, Israel*, 2. *Sagol School of Neuroscience, Tel Aviv University, Tel Aviv, Israel*, 3. *Department of Physical Therapy, Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel*, 4. *Center for the Study of Movement, Cognition and Mobility, Neurological Institute, Tel Aviv Sourasky Medical Center, Tel Aviv, Tel Aviv, Israel*, 5. *Department of Neurology, Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel., Tel Aviv, Israel*

Parkinson's disease (PD) is traditionally classified into the postural instability gait difficulty (PIGD) and the tremor dominant (TD) sub-types. Mild cognitive deficits are increasingly recognized as a common non-motor symptom in PD, however, cognitive differences among the two motor sub-types have not been well-described. We investigated whether changes over time in cognitive functions differ across the PIGD and TD sub-types. 57 non-demented patients with PD who were previously classified into PIGD (n=30) and TD (n=27) were followed for an average of 60 months. At baseline and follow-up, participants underwent cognitive testing (on medications): the Montreal Cognitive Assessment (MoCA) and a computerized neuropsychological battery (NeuroTrax™) that generated index scores of executive function (EF), attention, memory, and a global cognitive score. At baseline, the groups were similar with respect to age (PIGD: 69.31 ± 7.6 yrs; TD: 70.5 ± 12 yrs; p=0.652), disease duration (PIGD: 10.6 ± 3.8 yrs, TD: 10.1 ± 2.9; p=0.628), and all cognitive functions (p>0.29). At follow-up, the global cognitive score declined by 9.5% in the PIGD group (from: 94.5 ± 11.7 to 85.3 ± 13.6, p<0.001). This decline was significantly larger (p=0.03) than the 4.5% decrease observed in the TD group (from: 96.3 ± 10.4 to 91.93 ± 14.3, p=0.047). Similar group differences (p=0.006) were observed in the decline of EF, where a significant GroupXTime interaction effect was also seen (p=0.008). MoCA, memory and attention indices declined similarly in the two sub-types. The present findings demonstrate that PIGD patients experience greater cognitive decline, compared to TD patients, in specific domains of cognitive function, suggesting that treatment should be tailored to the motor sub-type.

MEDICALLY SERIOUS AND NON-SERIOUS SUICIDE ATTEMPTS IN PERSONS AGE 70 AND ABOVE

S. Wiktorsson, P. Olsson, M. Waern, *University of Gothenburg, Göteborg, Sweden*

High rates of suicide are observed among older adults in many countries worldwide. In clinical settings, suicide attempters with medically serious attempts are generally considered to be at higher risk of subsequent suicide than their peers with less serious attempts. Medically serious attempts are however relatively little studied in older clinical cohorts. The aim was to compare older adult suicide attempters (70+) with and without medically serious attempts. Participants (n=101) were recruited in hospitals in the aftermath of a suicide attempt; they took part in an interview with a research psychologist. Attempters with (n=28) and without (n=73)

medically serious attempts were compared regarding a number of clinical factors. Major depression was common in both groups, and scores on the Geriatric Depression Scale did not differ. However, older adults with medically serious attempts scored higher on the Brief Scale of Anxiety and lower on the Mini Mental State Examination than their peers with less serious attempts. Reasons for attempting suicide differed in the two groups; those with medically serious attempts more often reported problems related to functioning and autonomy, as well as social problems. Findings may help to inform clinicians who meet and treat older suicidal persons.

GENDER DIFFERENCES OF DEPRESSION TRAJECTORIES AND RISK FACTORS IN LATER LIFE

J. Lee¹, S. Jang², S. Cho¹, 1. *Department of Public Health Science, Graduate School of Public Health, Seoul National University, Seoul, Korea (the Republic of)*, 2. *Red Cross College of Nursing, Chung-Ang University, Seoul, Korea (the Republic of)*

This study investigated the changes in depression trajectories and discovered related risk factors affecting these changes among the elderly by gender. Data were obtained subsample who participated in Korean Longitudinal Study of Ageing (KLoSA) from 2006 to 2012. A total of 3,667 individuals (1,566 men and 2,101 women) aged 60 or more were included in the analysis. We used a group-based trajectory model in order to determine the appropriate number of groups and observe the change in the depression according to research year. After trajectory analysis, multinomial regression analysis was performed to examine depression-related risk factors influencing different trajectory group membership. Distinctive differences in the depression trajectories were found; four groups (normal-melancholic-worsening-depressed) in men and five groups (normal-melancholic-worsening-improved-depressed) in women. Chronic diseases, self-rated health (SRH), and somatic pain were associated with depression in both gender. Statistically significant differences were observed in employment among older men, and social integration among older women. In conclusion, maintaining physical health status play an important role in preventing depression. In addition, gender differences were found that employment in men and social integration in women showed beneficial effect on prevention of depression.

SESSION 4650 (SYMPOSIUM)

INNOVATIVE APPROACHES TO ENHANCE COGNITIVE AND EMOTIONAL FUNCTIONING IN AT-RISK OLDER ADULTS

Chair: D. Jimenez, *University of Miami Miller School of Medicine, Miami, Florida*

Discussant: R. Schulz, *University of Pittsburgh*

This session will describe innovative ways to deliver mental health services to three high-risk, older adult populations: (1) racial/ethnic minorities; (2) socially isolated older adults; and (3) older adults with severe mental illness. Treatment alternatives addressing the cognitive, physical and mental

health needs will be discussed. Particular attention will be paid to the use of technology and paraprofessionals in delivering non-traditional psychotherapeutic interventions (e.g. health promotion, cognitive remediation therapy). In addition, the role of increased social connectivity and reduced social isolation – as main outcome and potential moderating variable – will also be presented.

THE HAPPY OLDER LATINOS ARE ACTIVE (HOLA) HEALTH PROMOTION AND PREVENTION STUDY

D. Jimenez¹, S. Bartels², M. Alegria³, C. Reynolds⁴, 1. *Psychiatry, University of Miami Miller School of Medicine, Miami, Florida*, 2. *Geisel School of Medicine at Dartmouth, Lebanon, New Hampshire*, 3. *Massachusetts General Hospital, Boston, Massachusetts*, 4. *University of Pittsburgh Medical Center, Pittsburgh, Pennsylvania*

Happy Older Latinos are Active (HOLA) is a newly developed intervention that uses a community health worker (CHW) to lead a health promotion program in order to prevent common mental disorders among at-risk older Latinos. HOLA is a multi-component, health promotion intervention. This prevention approach will be tested against a fotonovela, an enhanced psychoeducation control condition, in a sample of Latino elderly with minor or subthreshold depression or anxiety. A total of 60 older Latinos (aged 60+) were randomized to receive HOLA or the fotonovela. The primary outcomes of interest are recruitment, adherence, retention, and acceptability. The results of this study could have implications for other high-risk, highly disadvantaged populations. The development of a health promotion intervention designed to prevent common mental disorders could be a means of addressing multiple disparities (for example, mental health outcomes, mental health service use, stigma) among racial/ethnic minority elderly.

AN INTERVENTION TARGETING PATIENTS WITH AD AND THEIR CAREGIVERS

S.J. Czaja, D. Loewenstein, C. Lee, *University of Miami Miller School of Medicine, Miami, Florida*

The prevalence of Alzheimer's Disease (AD) is increasing with a related increase in burden on family members and society. There is a need to identify interventions that decrease the cognitive/behavioral manifestations of the disease in the patient, and the distress and health-related consequences experienced by family caregivers (CGs). This paper will present data from a pilot project that is evaluating the feasibility and acceptability of an integrated innovative technology-based dyadic intervention (DT). The patient component is designed to train both cognitive and real world functional skills. The CG component is designed to enhance the CG's skills, preparedness for the caregiver role, available resources, and reduce known areas of CG risk. The sample includes Hispanic and White American individuals with mild AD and their CGs who are randomly assigned to the DT intervention or a control condition that combines cognitive stimulation exercises for the patient and nutrition/wellness counseling for the CG.

AGING & ENGAGING: AN AUTOMATED PROGRAM TO IMPROVE SOCIAL COMMUNICATION FOR DEPRESSED OLDER ADULTS

K. Van Orden, M.E. Hoque, M.R. Ali, P.R. Duberstein, Y. Conwell, *University of Rochester School of Medicine, Rochester, New York*

Social communication deficits—lack of eye contact, flat affect/little smiling, monotone and soft voice—are maintaining factors in late-life depression, but are rarely treated effectively. We will describe an intervention using Human Computer Interaction technology to teach effective social communication to depressed older adults. LISSA (Live Interactive Social Skills Assistance) is an automated, portable program—a computerized “coach”—that provides subjects with oral and visual (text, pictograms) feedback on communication. Data demonstrate that LISSA is effective in improving social communication in younger adults. We are adapting LISSA for older adults by compensating for aging-related challenges and capitalizing on aging-related strengths. Pilot data from 18 subjects provides initial feasibility data. Subjects with greater anxiety were more likely to report that they would use the program in their own homes ($r = .43$). We will present qualitative data on subjects' experiences with the program and discuss implications for improving emotional functioning in later life.

IMPROVING COGNITIVE AND FUNCTIONAL SKILLS IN OLDER ADULTS WITH SMI

P. Harvey, S.J. Czaja, *University of Miami Miller School of Medicine, Miami, Florida*

Cognitive and functional skills training interventions have been shown to improve the everyday functioning of people with severe mental illness, but little attention has specifically been directed at older patients. In two studies, we used technology-based interventions aimed at treatment of cognitive and functional deficits in older patients with severe mental illness to determine whether abbreviated technology oriented training could reduce cognitive and functional skills deficits. In the first study, 40 older patients with schizophrenia were treated with either 15 sessions of cognitive remediation therapy with the Brain HQ program from Posit science or a computer games control. In the second study 20 older schizophrenia patients and 20 healthy older controls were treated with a computerized skills training program. The skills training program led to substantial gains in performance with healthy controls and SMI patients reducing their time to completion of both by over 50% tasks in 4 training sessions.

SESSION 4655 (SYMPOSIUM)

CIRCULATING IMMUNE CELLS AND THEIR CONTRIBUTION TO AGE-RELATED DISEASES

Chair: A. Akbar, *University College London, London, United Kingdom*

T. Fülöp, *Universite De Sherbrooke, Sherbrooke, Quebec, Canada*

The bulk of data in the field of biological aging are derived from blood analysis. Blood has three main roles during perfusion i) oxygen supply (red blood cells) ii) nutrient

supply (plasma) and iii) immune surveillance (white blood cells). Cells that circulate in the bloodstream, the leukocytes, are very reactive to their environment and many studies have shown these immune cells' characteristics to be different in older adults. Changes in the immune response underline the increase in many diseases with aging such as infections, cancer and autoimmune diseases. These last years tremendous advances have made in our understanding of the changes of the immune functions with aging and how they can contribute to the major age-related diseases. This symposium will aim to update the scientific community on 1) how the immune system is shaped during aging 2) how immune cells contribute to diseases 3) mechanisms (signalling, metabolic) explaining those observations 4) the role of inflammation.

THE CONTRIBUTION OF THE ADAPTIVE IMMUNE SYSTEM TO AGEING

G.P. Pawelec, *3Second Department of Internal Medicine, University of Tübingen, Tübingen, Germany, Tübingen, Germany*

The human adaptive immune system is particularly sensitive to the effects of ageing because the physiological process of thymic involution at puberty severely reduces the output of naïve T cells in adulthood. As a result, older adults consistently show low levels especially of CD8+ and to a lesser extent also CD4+ naïve T cells. This renders them highly susceptible to infectious disease caused by pathogens to which they were not previously exposed. Moreover, the accumulation of pro-inflammatory late-stage differentiated CD8+ T cells reactive to latent viruses, especially Cytomegalovirus, may contribute to the low-level enhanced chronic inflammatory state in older people, which is thought to facilitate the development of age-associated non-infectious degenerative diseases. These and other age-related changes to adaptive immunity in older adults conspire to reduce fitness to face new antigenic challenges at the same time as having to deal with chronic infections causes damage to the soma.

THE REGULATION OF T CELL SENESENCE AND METABOLISM BY P38 MAPKINASE SIGNALING

A. Lanna, S.M. Henson, A. Akbar, *Division of Infection and Immunity, University College of London, London, United Kingdom*

Persistent viral infections, ageing and inflammatory syndromes induce the accumulation of senescent human T cells. However the mechanism that regulates the function of these end-stage cells is unclear. Human CD8+ effector memory T cells that re-express CD45RA (CD27-CD45RA+; EMRA) express surface KLRG-1 and CD57, exhibit reduced replicative capacity and telomerase activation, decreased survival and high expression of nuclear gH2AX after T cell receptor (TCR) activation. We investigated the involvement of p38 MAP kinase signalling in these senescence characteristics of these cells. The expression of both total and phosphorylated p38 was highest in the EMRA compared to other CD8+ T cell subsets. Furthermore, the inhibition of p38 signalling, especially in CD4+ EMRA T cells, significantly enhanced their telomerase activity and survival after TCR activation. EMRA T cells preferentially utilize glycolysis to fuel their effector functions. The inhibition of p38 enhances mitochondrial function, reduces

reactive oxygen species production and increases proliferation and telomerase activity, however, these cells still utilize glycolysis instead of oxidative phosphorylation for energy. The precursors for glycolysis are generated by autophagy, that is increased after p38 blockade. Thus activation of the p38 MAPK pathway is directly involved in the senescence characteristics of highly-differentiated CD4+ T cells and this pathway also regulates the metabolic function in this population.

AGE-RELATED CHANGES IN INNATE IMMUNE CELL FUNCTION

R. Montgomery, *Yale University School of Medicine, New Haven, Connecticut*

A progressive decline in immune function with aging leads to increased susceptibility to infectious diseases and decreased response to vaccination. In our investigations of the molecular mechanisms of immunosenescence in primary human, we have shown broad age-associated decreases in surface expression of Toll-like receptors in innate immune cells that is associated with reduced production of cytokines and vaccine responses. Notably, levels of TLR5 in monocytes of older subjects were elevated, which may be relevant for vaccine strategies. Reduced levels of TLR1 in neutrophils of older donors, accompanied by lower activation across multiple pathways, may be mediated by reduced bioenergetics and suggests potential therapeutic opportunities. Recently, we have examined high-dimensional single-cell data using mass cytometry (CyTOF) to simultaneously evaluate effects of aging on phenotype and function of natural killer (NK) cells. Ongoing studies address the complexity of aging in human populations and detailed mechanisms of increased susceptibility of innate immune cells.

SIGNAL TRANSDUCTION CHANGES IN IMMUNE CELLS WITH AGING

T. Fülöp¹, A. Le Page¹, C. Fortin¹, J.M. Witkowski³, G. Dupuis¹, A. Larbi², *1. Medicine, Université De Sherbrooke, Sherbrooke, Quebec, Canada, 2. Aging and Immunity Program, Singapore Immunology Network (SIgN), Agency for Science Technology and Research (A*STAR), Singapore, Singapore, 3. Medical University of Gdansk, Gdansk, Poland*

Ageing induces alterations in the immune response called immunosenescence. However, the causes of these immune alterations remain largely to be established. Efficient function of the immune system requires homeostatic regulation from receptor recognition of antigenic challenge to cell responses. One of the most important molecular causes of immunosenescence is alteration in regulation of signalling pathways. Indeed, alterations in feed-forward and negative feedback (inhibitory) signalling have been highlighted in all cells involved in the immune response, especially neutrophils and T lymphocytes. Besides these intrinsic molecular changes there are alterations in the membrane composition as well in the functionality of the microclusters (lipid rafts) in the membrane. These dysregulations tip the balance in favor of altered (less efficient) function of the immune system. Modulation of these pathways with aging represents a major challenge to restore the immune response to functional levels.

FROM BASIC RESEARCH TO COHORT STUDIES: UP-SCALING IMMUNE-PHENOTYPING FOR UNDERSTANDING OF AGING

A. Larbi, *Aging and Immunity Program, Singapore Immunology Network (SIgN), Agency for Science Technology and Research (A*STAR), Singapore, Singapore*

Data from our laboratory and others have shown that aging and persistent stresses to the immune system are key factors influencing T cell profiles. For instance, we have focused our interest in a subset of T cells that shows impressive stemness (Stem Cell Memory T cells). We will present data on their dysregulation during aging and the possible clinical implications. From this deep molecular and proteomics study performed on a limited number of individual we expanded our analysis to other T cell populations on a larger set of older adults. One reason for this is the huge inter-individual variability observed in T cell characteristics in older adults. We performed T cell naïve/memory phenotyping in >600 individuals aged 53–84 years old and stratified based on various demographic, clinical and lifestyle values. We will show published and novel data on the importance of stratifying older adults to better link biological readouts to clinical phenotypes.

SESSION 4660 (SYMPOSIUM)

TRANSITIONS IN THE DEMENTIA CARE CONTINUUM: OPPORTUNITIES FOR PERSON- CENTERED APPROACHES

Chair: M. Roes, *German Center for Neurodegenerative Diseases (DZNE), Witten, Germany*

A ‘Transitions can be understood as ‘a change from one state or status to another’. Therefore transitions encompass transitions in *levels of care* and in *locations of care*, which integrates a psychosocial and a health care service perspective. In this symposium we will present a variety of research, which exemplify these two perspectives.

Two presentations address transitions regarding *levels of care*: The focus of the 1st speaker is on transition being a carer, within the caregiving journey presenting data from 370 family south Asian and white British caregivers; the focus of the 2nd speaker is on transitions over the course of families living with fronto-temporal dementia and how families adapt and cope with transitions in this conditions. Two presentations address transitions regarding *location of care*: the 3rd speaker will present person-centered approaches from a RCT testing transitional care interventions for persons with dementia, especially those living in highly-disadvantaged US areas. The 4th speaker will present results regarding transitions from nursing homes to hospitals for residents with Ambulatory Care Sensitive (ACS) conditions, with a specific focus on early detection of ACS. The focus of the 5th speaker is on the role of cross-setting communication for people with dementia in facilitating high quality, person-centered transitions, presenting results from a retrospective cohort study (N = 343).

Transitions in the Dementia Care Continuum include attention to individuals’ needs and psychosocial contexts. Research about opportunities and challenges for person-centered approaches need to focus explicitly on these transitions.

OBLIGATION, WILLINGNESS AND PREPAREDNESS FOR TRANSITIONS IN CAREGIVING FOR A PERSON WITH DEMENTIA

S. Parveen¹, G. Fry¹, R.H. Fortinsky², V. Morrison³, J.R. Oyebo¹, 1. *University of Bradford, Bradford, West Yorkshire, United Kingdom*, 2. *University of Connecticut, Mansfield, Connecticut*, 3. *Bangor University, Bangor, United Kingdom*

As the population continues to age, an increasing number of family members will be required to provide care for relatives with dementia. However, little is known about how willing and prepared individuals are to provide care; additionally, service providers often assume that family members are willing to provide care. The aim of this study is to explore how changes in the sense of obligation, willingness, and preparedness influence south Asian and white British carers’ wellbeing. A cohort of 370 family caregivers completed a questionnaire at three time points over 12 months. In addition 10 south Asian and 10 white British carers have participated in in-depth interviews. The main themes to emerge from initial interviews include: carer motivations and willingness to provide emotional, instrumental and nursing care and preparedness for diagnosis, seeking information and services, coping with behavioral problems, selecting a care home and end of life care.

TRANSITIONS IN FAMILY ADJUSTMENT TO LIVING WITH BEHAVIORAL VARIANT FRONTO-TEMPORAL DEMENTIA

J. La Fontaine¹, J.R. Oyebo¹, M. Larkin², 1. *University of Bradford, Bradford, West Yorkshire, United Kingdom*, 2. *University of Birmingham, Birmingham, West Midlands, United Kingdom*

Behavioral variant fronto-temporal dementia (bvFTD) is distinctly different as empathy, awareness and social relationships are affected early. Almost no research has explored how FTD is experienced by the whole family. We aimed to develop a detailed understanding of inter-generational family experience of bvFTD over time. We took a social constructionist approach based on interviews with seven families, including the person with bvFTD at up to 3 time points every 6–9 months. Families faced four major challenges: The whole family was challenged around developing awareness and understanding of the changes, and managing everyday life. Those directly living with bvFTD wrestled with maintaining their identity, and those closely involved in care struggled with changes in their relationship. Families’ coping lay on a continuum from adjustment through to being stuck, with this influenced by connectedness prior to bvFTD, individual ways of coping, the ongoing changes, and the context of family life over time.

FACILITATING PARTICIPATION BY PERSONS WITH DEMENTIA AND THEIR CARERS IN A TRANSITIONAL CARE RCT

A.J. Kind^{1,2}, A. Gilmore-Bykovskiy^{1,2}, E. Schmitz², J. Mineau², P. Troller³, C. Hermann², M. Brenny-Fitzpatrick³, 1. *William S Middleton Memorial VA Hospital, Madison, Wisconsin*, 2. *University of Wisconsin-Madison, Madison, Wisconsin*, 3. *University of Wisconsin Hospitals and Clinics, Madison, Wisconsin*

For persons with dementia, especially those living in highly-disadvantaged US areas, transitions from the acute care hospital to home are high-risk. Yet, few transitional care interventions are designed to be feasible and sustainable in these highly-disadvantaged US regions. The Coordinated-Transitional Care (C-TraC) program was designed specifically to fill this gap, has decreased rehospitalizations in preliminary testing, and now is being rigorously assessed via a 5-year NIH-funded prospective randomized controlled trial for hospitalized patients with mild, moderate and severe dementia (and their carers) discharging to the community. The peri-discharge period is a challenging recruitment window for this population, but, thus far, enrollment has been near-target with well over 125 patient-carer dyads randomized. In conducting this trial, person-centered approaches have been employed by all study personnel and have facilitated subject participation and retention to the 90 day end-assessment time-point. Future prospective interventional trials in this population may benefit from employing similar techniques.

REDUCING RATES OF AVOIDABLE TRANSITIONS TO HOSPITAL FOR NURSING HOME RESIDENTS

M.G. Downs¹, A. Blighe¹, C. Powell¹, A. Feast², K. Froggatt³, B. McCormack⁴, E.L. Sampson², 1. *School of Dementia Studies, University of Bradford, Bradford, Yorkshire, United Kingdom*, 2. *University College London, London, United Kingdom*, 3. *Lancaster University, Lancaster, United Kingdom*, 4. *Queen Margaret University, Musselburgh, United Kingdom*

Reducing transitions from nursing homes to hospitals for residents with Ambulatory Care Sensitive (ACS) conditions is a government priority in the UK. ACS conditions are those, which if not actively managed in the community, can lead to unplanned or avoidable hospital admissions. Early identification of changes in residents' health is essential to ensure active management of ACS conditions in nursing homes. The purpose of this paper is to describe the development and feasibility testing of a multi-component, complex intervention for early detection of ACS conditions. Six key components were identified including: an adapted early warning tool; a care pathway for the 4 conditions; a knowledge and skills competency framework; structured communication tool for nurses and primary care; family involvement; and implementation support. The feasibility of introducing and embedding this complex intervention and gathering data on outcomes was tested in 2 nursing homes. Findings have implications for policy, practice and research.

COMMUNICATION OF DEMENTIA SYMPTOMS AND CARE NEEDS DURING HOSPITAL TO NURSING FACILITY TRANSITIONS

A. Gilmore-Bykovskyi¹, M. Hovanes¹, R. Johnson³, A.J. Kind^{2,1}, 1. *University of Wisconsin-Madison, Madison, Wisconsin*, 2. *William S. Middleton Memorial Veterans Hospital, Madison, Wisconsin*, 3. *UC Berkley, Berkley, California*

Transitions from hospitals-to-Skilled Nursing Facilities (SNFs) are frequently poorly in quality. SNF providers have identified under-communication of dementia-related symptoms and associated care needs as a major barrier to

facilitating safe, effective and person-centered transitions. The extent of discharge communication between hospitals and SNFs regarding these care needs has not been previously examined. This retrospective cohort study identified omission rates for behavioral symptoms in hospital discharge communication as compared to medical record documentation for stroke/hip fracture PwD discharged from one of two hospitals to a SNF (N=343) between 2003–2008. High rates of omission were found across all symptoms and care needs, anxiety (94%), agitation/aggression (79%), hallucinations (86%), need for 1:1 supervision (90%) and high fall risk (78%). Consistent with other research, these findings underscore the urgent need for additional research on the role of cross-setting communication for PwD—who often cannot communicate their care needs—in facilitating high quality, person-centered transitions.

SESSION 4665 (SYMPOSIUM)

SOCIAL JUSTICE AND AGING

Chair: J. Baars, *University for Humanistic Studies, Netherlands*

Social Justice refers to normative discussions (including their presuppositions, logical structures and practical outcomes) about issues that are crucially important for society and its institutions. In this symposium some issues will be discussed that are vital for the well being of older people. First, Joachim Duyndam will analyze the question whether there should be a United Nations Convention on the Rights of the Elderly, analogous to the 1989 UN Convention on the Rights of the Child. Next, Harry Moody will address the role of elders in the environmental challenges that are facing the world population in connection with climate change, thus changing central terms of the debate about intergenerational justice. Finally, Peter Derkx will discuss the ambitions of 'Geroscience' and inquire whether fighting obesity might not only be more efficacious in extending life span and health span, but also more ethically just than developing sophisticated and expensive technology to delay processes of senescence.

GENERATIONAL DIFFERENCES AND COMMUNICATIVE ETHICS

H.R. Moody, *Fielding Graduate University, Santa Barbara, California*

Gerontologists seem reluctant to discuss openly justice and intergenerational politics. In the case of Brexit vote, as well as in the U.S. Presidential election of 2016, there were substantial differences in political behavior based on age. In both cases, older people commonly felt "this is no longer my country" and were supportive of right-wing political views hostile to immigration and globalization. By contrast, academics, in both the USA and other countries, tend toward progressive or left-wing political outlook favorable toward multiculturalism and globalization. Although recognized this disparity in political outlook is almost never openly discussed in gerontology. In this session, we look at specific policy challenges related to social justice, including immigration, climate change, and public pension programs. Instead of silence about political differences across age-groups, we

adopt the communicative ethics of Jürgen Habermas with the aim of promoting intergenerational solidarity by more open discussion of challenges affecting us all.

SOCIAL JUSTICE AND EXTENDING HEALTH SPAN: GEROSCIENCE OR FIGHTING OBESITY?

P. Derkx, *University of Humanistic Studies, Geldermalsen, Netherlands*

Before 1995 biogerontology came down to description of specific age-associated diseases. The last twenty-five years biomedical gerontology has started to aim at explanation of underlying processes of senescence and at (genetic, dietary, and pharmacologic) interventions and technology to delay those processes. ‘Geroscientists’ such as Brian Kennedy and Felipe Sierra have been writing about the ‘Prospects for Life Span Extension’ and have argued that ‘it is critical to expand geroscience research directed at extending human healthspan’. They pay attention to social effects that might occur, but issues of social justice are mostly ignored. In this paper an ethical-philosophical argument is developed. It makes plausible that fighting obesity might be more efficacious in extending life span and health span and also more ethically just than developing sophisticated and expensive technology to delay processes of senescence. It is not a matter of one or the other, but priorities should be debated.

SESSION 4670 (SYMPOSIUM)

NEW METHODS FOR STUDYING AGING AND SOCIOEMOTIONAL PERCEPTION

Chair: D.M. Isaacowitz, *Northeastern University, Boston, Massachusetts*

Co-Chair: U. Kunzmann, *Leipzig University*

Discussant: J.T. Stanley, *University of Akron, Akron, Ohio*

A large body of research has investigated age differences in the ability to accurately perceive emotional expressions on faces. This work has generally found consistent age-related declines in such emotion perception abilities, though it has been limited by the particular paradigm most commonly used: a participant sits in front of a computer and makes judgments about the emotion expressed on a static face. This session highlights cutting-edge methods that bring the study of aging and emotion perception into more everyday, ecological contexts. Moving away from making simple judgments about a static face may allow older adults to display more of their experience not only in making accurate emotion assessments, but also in social judgments more broadly. Talks in the session will consider to what extent computer-based emotion perception tasks lead to similar conclusions as in-person assessments about other individuals (Vicaria), the nature of more complex socioemotional judgments like personality and rapport (Castro), the cues that lead to empathic accuracy (Wieck), and the nature of emotion-oriented perception in the context of emotion regulation in couples (Rohr). Together, these talks highlight methods that can be used to give a more ecological perspective on the types of socioemotional judgments typically made by older adults, and when they are (and are not) accurate.

AGE-BASED PERFORMANCE DIFFERENCES IN THREE INTERPERSONAL JUDGMENT TASKS

I. Vicaria, D.M. Isaacowitz, *Psychology, Northeastern University, Boston, Massachusetts*

Older adults have traditionally performed poorly on computer-based assessments of emotion perception skills. However, they report experiencing emotionally satisfying relationships in real life. The current study assesses the difference between computer and interaction-based interpersonal judgments in younger and older adults. Participants complete a computer-based emotion perception task, then interact with someone of their age or the opposite age group for 20 minutes. Afterwards they judge their partner’s personality traits and ratings of rapport, which are later correlated with partners’ self reports to obtain accuracy scores. Analyses of 19 younger and 37 older adults revealed that older adults’ accuracy on the computer-based tasks was significantly poorer ($p < .001$) than younger adults’, but their performance on the interaction-based judgments was as good (rapport; *n.s.*) or even better (personality traits; $p < .05$) than younger adults’. The interaction-based judgments better approximate real life judgments and may draw on experience obtained with age.

AGE DIFFERENCES AND SIMILARITIES IN PERCEPTIONS OF PERSONALITY AND RAPPORT IN DYADS

V. Castro, I. Vicaria, D.M. Isaacowitz, *Psychology, Northeastern University, Boston, Massachusetts*

This study examined young, middle-age, and older adults’ accuracy in perceiving personality and rapport in young and old dyads. Participants were presented with twelve videos depicting two young adults or two old adults interacting. Perceivers were randomly assigned to one target within each dyad and asked to judge the target person’s personality traits and level of rapport. Videos varied in length (i.e., 10 secs, 20 secs, 20 secs) and location (i.e., second vs. third minute of the interaction). Results were mixed: age differences were found for the perception of some social qualities (e.g., agreeableness, satisfaction) but not others (e.g., extraversion, openness, conscientiousness, rapport). Accuracy was higher for shorter videos and videos from earlier rather than later portions of the interaction. These findings augment recent studies on social perception and aging to consider the myriad aspects of the perceptual process that may contribute to social perception accuracy across the lifespan.

AGE DIFFERENCES IN EMPATHIC ACCURACY: A BRUNSWIKIAN APPROACH

C. Wieck, S. Nestler, U. Kunzmann, *University of Leipzig, Leipzig, Germany*

Previous research has shown that older adults perform worse than younger adults at recognizing others’ emotions accurately. The goal of the present study was to better understand the processes underlying these age-related differences in empathic accuracy. Applying a Brunswikian approach, we tested age differences in the utilization of multiple facial, prosodic and semantic cues selected to reflect three emotions: anger, sadness, and happiness as experienced and expressed by twelve targets who were videotaped while they relived an emotional memory. Facial, prosodic and semantic cues were measured objectively

as well as by independent groups of experts. A sample of 100 younger and 100 older adults rated each target's emotions. Empathic accuracy was computed as correspondence between targets' self-reports and perceiver's other-reports. Preliminary analyses suggest that older adults use less valid cues than young adults. As predicted, age differences in cue utilization were associated with age differences in empathic accuracy.

A SORROW SHARED IS A SORROW HALVED—AGE DIFFERENCES IN EXTRINSIC EMOTION REGULATION

U. Kunzmann, M. Rohr, *University of Leipzig, Leipzig, Germany*

Previous work suggests age-related improvement in emotion regulation. Although emotion regulation is embedded in social contexts, the majority of studies has adopted an individual approach examining how well individuals regulate their own emotions. Extending this work, the goal of this study was to test age differences in the ability to regulate one's partner's emotions. In each trial, one partner relived negative emotions associated with an acute personal problem, while the other engaged in a control task. Subsequently the couple came together and talked about the problem. Immediately after each conversation, both partners rated the conversation according to multiple respects (e.g., quality and satisfaction with the conversation, success of regulatory attempts). Preliminary analyses using actor-partner-interdependence models revealed that older couples were more successful at down-regulating each other's negative emotions. They further reported higher agreement on regulatory efforts and success. Implications for research on socio-emotional aging and social competence are discussed.

SESSION 4675 (SYMPOSIUM)

AGEING AND HEALTH IN THE CARIBBEAN

Chair: N. Quashie, *Chulalongkorn University, Bangkok, Thailand*

The Caribbean is undergoing rapid population ageing. Increasing proportions and numbers of older persons require states to strengthen institutional systems of care and support, and to re-frame the roles of older adults in society in order to mitigate the health and socio-economic challenges associated with ageing. The health of older adults is of primary concern as increasing longevity is typically associated with increased morbidity and disability due to chronic diseases. Research on the health of older adults within the Caribbean region is burgeoning with much attention given to patterns and correlates of chronic conditions such as obesity and hypertension, and based on a limited number of countries, for which data are available. Many aspects of older adults' health and quality of life, however, remain unexplored such as dementia and factors associated with ageing well.

The symposium brings together scholars resident within the Caribbean and internationally, to discuss their research on this demographic challenge of increasing significance to the region. Furthermore, the symposium introduces research on increasingly relevant aspects of population health that are

critical to different stages of the life course. The papers in this symposium will address considerations of alternative demographic approaches to measuring population ageing in the Caribbean based on health indicators; quality of life of older adults in Trinidad and Tobago; sexual health among older Jamaicans; and risk factors for dementia among older adults in Cuba and Barbados.

EXPLORING AGEING PARAMETERS FOR SELECTED CARIBBEAN COUNTRIES: TOWARDS A NOVEL APPROACH

G. St. Bernard, *University of the West Indies, St. Augustine, Trinidad and Tobago*

Ageing has traditionally been measured as the proportion of a nation's population aged at least 65 years, ignoring age distribution dynamics. Alternative measures such as median age and the ageing index have also been used. This paper explores a novel conception of ageing as a change in human populations' cumulative exposure-time to lifetime rewards and challenges in impacting individual and by extension, the collective wellbeing, whether positively or negatively. This exploratory paper targets four Caribbean countries – Barbados, Belize, Jamaica and Saint Lucia, for the 1980s, 1990s, 2000s and 2010s. Ageing parameters are estimated and compared for the respective populations including disaggregation according to sex. The paper discusses likely implications of unexpected findings from the standpoint of interpreting ageing dynamics, reflects upon challenges associated with data availability, and offers some direction for refining proposed measurement strategies.

POPULATION ATTRIBUTABLE RISK OF DEMENTIA IN TWO CARIBBEAN COUNTRIES

K. Ashby-Mitchell, *Australian National University, Canberra, Australian Capital Territory, Australia*

This study aimed to 1) determine the proportion of dementia explained by three common modifiable factors in Barbados and Cuba, and 2) estimate the effect of risk factor reduction on future prevalence of dementia. Levin's Attributable Risk formula which assumes independence of risk factors was used to calculate the proportion of dementia attributable to diabetes mellitus, physical inactivity and smoking in Barbados and Cuba. Using a modified formula and survey data, non-independence of risk factors was accounted for. Finally, the effect of a 5%-20% reduction in each risk factor on future dementia prevalence was computed. Accounting for non-independence of risk factors, the proportion of dementia attributable to these three risk factors was estimated to be 21.9% in Barbados (658 cases) and 26.2% in Cuba (39,366 cases). A 5% - 20% reduction in each risk factor every 10 years to 2050, would reduce dementia prevalence by between 1.3% and 16.3% in the countries under study. Dementia is a progressive condition with no known cure. Developing countries like those of the Caribbean are known to be ageing more rapidly than their developed counterparts. Any intervention able to delay or prevent dementia onset by targeting modifiable lifestyle factors can significantly reduce future dementia prevalence.

SEXUAL HEALTH AMONG MIDDLE-AGED AND OLDER WOMEN ATTENDING GYNAECOLOGY AND UROLOGY CLINICS IN JAMAICA

D. Tyndale, W. Aiken, D. Eldemire-Shearer, *University of the West Indies, Mona Campus, Kingston, Jamaica*

We sought to 1) determine the prevalence of sexual activity and disorder symptoms; 2) identify sociodemographic and health factors associated with sexual activity; 3) describe views regarding seeking sexual healthcare services. Data on socio-demography, medical history, menopausal status, and sexual activity were obtained from 272 clinic attendees, ≥ 50 years old. Forty-one percent reported sex in the last 12 months. The majority who did not have sex cited 'no partner' as the reason. Low desire and weak/absent orgasm were the most common disorders. Nine percent would not tell the doctor about a sexual problem if asked. Every 1 year increase in age was associated with 7% reduction in odds of sexual activity. Married women were 2.72 times as likely as unmarried women to report sexual activity. Needs of middle-aged and older women should be considered when designing and delivering sexual health services. Reluctance in seeking these services may warrant provider-initiated approaches.

AGING WELL IN THE CARIBBEAN: SOCIO-DEMOGRAPHIC AND PSYCHOLOGICAL PREDICTORS OF WELL-BEING

N.L. Alea, S. Ali, M. Arneaud, *University of the West Indies, St. Augustine, Trinidad and Tobago*

Research on Caribbean older adults has focused mostly on the absence of ill health as a proxy for aging well. However, well-being is not the opposite of ill-being. Thus, this work brings together data ($N = 104$) which examined socio-demographic (gender, ethnicity, income, education) and psychological (personality, locus of control) predictors of hedonistic and eudaimonic well-being in older Trinidadians. Higher income was associated with higher levels of hedonistic well-being (i.e., lower negative affect), whereas higher education and being female predicted eudaimonic well-being (i.e., environmental mastery and personal growth, respectively). Psychological variables explained additional variance. Neuroticism was detrimental to hedonistic well-being (i.e., higher negative affect), but having an internal locus of control was beneficial for eudaimonic well-being (i.e., personal growth). The discussion encourages researchers in the region to move beyond socio-demographic predictors of well-being to also consider how psychological variables may enhance the likelihood of aging well in the Caribbean.

SESSION 4680 (SYMPOSIUM)

ISUPPORT: ONLINE SUPPORT PROGRAM FOR CAREGIVERS OF PEOPLE WITH DEMENTIA

Chair: A. Pot, *Switzerland*

Co-Chair: T. Dua, *World Health Organization, Geneva, Switzerland*

The number of people with dementia is expected to increase to over 130 million in 2050 globally. Regardless of age or level of capacity, older people have a right to a dignified and meaningful life. For people with dementia, this is possible only with care, support and assistance of

others. Responsibility typically falls on family members, and presents them with significant psychological, social and economic costs. Therefore, efficient support for family and other caregivers is needed more than ever. The Internet offers opportunities to provide available, accessible, and affordable support for them.

In the last two years, the World Health Organization (WHO), health agency responsible for providing leadership on global health matters, has partnered with international experts in caregiving and dementia to develop a comprehensive e-program to enhance self-help, skills, and support for caregivers of people with dementia, recognizing this urgent need. In this session, we address its development, preliminary results and future directions.

After presenting the development and of the iSupport program by Pot, Gallagher-Thompson will continue by presenting the results of US focus groups that contributed to development of content. Holroyd-Leduc will address the preliminary results of an evaluation of one iSupport module ('Caring for Me') in Canada. Varghese will speak to the field-testing of iSupport in Bangalore, India, and present first results of that trial. Finally, Dua will discuss the development of iSupport and future directions to improve dementia care worldwide from a WHO perspective.

INTRODUCTION OF ISUPPORT: DESIGN AND CONTENT

A. Pot, *World Health Organization, Geneva, Switzerland*

This first presentation provides more details on the design of iSupport, the way in which the program works, and how the World Health Organization (WHO) supports adaptation and implementation in different resource settings.

The generic field-testing version of iSupport consists of 5 modules: Introduction to dementia, Being a caregiver, Providing everyday care, Caring for me and Dealing with Challenging Behaviours. These modules contain 23 interactive lessons in total, all based on small exercises with feedback. An adaptation and implementation guide for countries is available.

The iSupport program has been developed by WHO in collaboration with the Netherlands Institute on Mental Health and Addiction and many experts from around the world, including experts from Stanford University (U.S.), NIMHANS (India), and the University of Calgary (Canada), who will give the next presentations.

HEALTH PROFESSIONAL AND FAMILY CAREGIVER FOCUS GROUPS: INTERNET SUPPORT FOR PEOPLE WITH DEMENTIA

D. Gallagher-Thompson, K.M. Mehta, *Stanford University, Stanford, California*

There are 35 million people living with dementia worldwide; this number will triple by 2050. Families are the cornerstone of care despite mounting research on the cumulative stress of long term dementia caregiving (depression, burden, loss of roles and social connectedness). In many countries (India, China), in person support is not available at scale due to lack of trained workers.

We describe results from two US focus groups contributing to iSupport content development. Methodology included facilitation by a trained interviewer using a structured

interview guide and thematic analyses of transcript data. Several key themes emerged: needing basic information about dementia, self-care, and how to manage challenging situations. Examples of how this information was used for content development of iSupport will be presented.

EVALUATION OF ISUPPORT IN CANADA: THE USABILITY AND EFFECTIVENESS OF THE “CARING FOR ME” MODULE

J. Holroyd-Leduc², A. Huhn¹, N. Jette², 1. *Alzheimer Society of Alberta & NWT, Canada, Edmonton, Alberta, Canada*, 2. *University of Calgary, Calgary, Alberta, Canada*

The objective of this research is to evaluate the evidence-informed support program (iSupport) developed by the World Health Organization, within the Canadian context. Specifically, using grant funding from the Canadian Institute of Health Research, we are evaluating the effectiveness of the iSupport module focused on caregiver self-efficacy and self-care ('Caring for Me'). We are testing the overall usability of iSupport with family caregivers. This will be followed by a randomized controlled trial to determine the impact of the iSupport 'Caring for Me' module on caregiver outcomes such as self-efficacy and burden. Preliminary results of the usability study will be presented.

ISUPPORT FOR FAMILY CAREGIVERS OF PEOPLE WITH DEMENTIA IN INDIA-A RANDOMIZED CONTROLLED TRIAL

M. Varghese, S. Loganathan, P. Shivakumar, *NIMHANS, Bangalore, India*

The generic version of iSupport was culturally adapted for Indian caregivers. To assess the effectiveness of the adapted version of the iSupport program, a randomized controlled trial (RCT) is conducted all over India by inviting family caregivers to participate in the study. Caregivers who use the interactive iSupport programme are compared with caregivers who receive education only, on the following outcomes: perceived burden, symptoms of depression and anxiety, mastery, feelings of competence, and quality of life in family caregivers. Measurements take place at baseline, directly after the 3-month intervention period and at follow-up, 3 months after post-measurement. First results of this RCT in India will be presented.

SESSION 4685 (SYMPOSIUM)

AGEISM IN A GLOBAL CONTEXT: COMBINING SOCIETAL AND INDIVIDUAL PERSPECTIVES ON AGE DISCRIMINATION

Chair: K. Rothermund, *FSU Jena*

Co-Chair: L. Ayalon, *Bar Ilan University, Ramat Gan, Israel*

Discussant: G.J. Westerhof, *University of Twente*

This symposium examines based on research from 22 countries the operation of ageism at the individual and societal levels. Papers stress the multi-faceted nature of ageism, its differential manifestation over the life course and how it can be addressed. Chasteen et al. consider how older adults respond to different types of ageism. Levy et al. present evidence that older adults with positive age stereotypes may be able to ward off cumulative stress. Rothermund &

Voss suggest that perceived group-level age discrimination may originate from an increased sensitivity towards age discrimination due to high levels of societal awareness or to an impending individual transition into old age. Ayalon & Rothermund introduce indicators of relative age disadvantage at a national level. Westerhof discusses the findings from the perspective that aging is a construction in which societal and individual influences interact.

THE UTILITY OF NATIONAL INDICATORS OF RELATIVE AGE DISADVANTAGE

L. Ayalon¹, K. Rothermund², 1. *Bar Ilan University, Ramat Gan, Israel*, 2. *Jena University, Jena, Germany*

We introduce new indicators measuring relative disadvantage of older compared with younger people at a national level. Drawing on data from 19 European countries, our study shows that (a) older people are consistently disadvantaged with regard to health, income, education, and employment, (b) relative age- disadvantages (i.e., the status of those aged 30–45 divided by the status of older adults aged 60–75) predict the situation of older people over and above age-matched status of living conditions within a country (i.e., the mean for the absolute status of those 60–75 year-old and 30–45 year-old). Results of our study highlight the relevance of age-related inequalities for diagnosing, understanding, identifying, and changing the situation of older people in modern societies.

UNWANTED HELP: REACTIONS TO BENEVOLENT VS. HOSTILE AGEISM

A.L. Chasteen¹, M. Horhota², E. Haseley², 1. *Psychology, University of Toronto, Toronto, Ontario, Canada*, 2. *Furman University, Greenville, South Carolina*

Although prejudice towards other groups is often expressed hostilely, bias toward older adults can take different forms. Specifically, older adults may sometimes encounter hostile ageism, but at other times face benevolent, patronizing ageism. In this talk I will examine those types of age prejudice more closely by comparing young, middle-aged, and older adults' perceptions of benevolent and hostile ageism. I will present findings from both general survey responses and reactions to specific ageism incidents. Across these studies, I will show that hostile ageism is viewed as more inappropriate than benevolent ageism, and I will discuss the consequences for older adults of either confronting or failing to confront these different types of ageism. In combination, the findings from this research demonstrate the difficulties older adults face when having to decide whether or not to oppose a form of bigotry that often goes unrecognized.

CUMULATIVE STRESS BUFFER: POSITIVE AGING SELF-STEREOTYPES PREDICT LOWER CORTISOL ACROSS THIRTY YEARS

B. Levy¹, S. Moffat³, S. Resnick², M. Slade¹, L. Ferrucci², 1. *Social and Behavioral Sciences, Yale University, New Haven, Connecticut*, 2. *National Institute on Aging, Baltimore, Maryland*, 3. *Georgia Institute of Technology, Atlanta, Georgia*

Prolonged elevation of cortisol, a primary stress biomarker, is associated with worse cognitive and physical health. Cortisol tends to increase in later life among most, but not all, older individuals. The current study considered whether this pattern could be explained by more-positive

age stereotypes acting as a stress-buffer. The 439 participants, drawn from the Baltimore Longitudinal Study of Aging, provided 1,789 24-hour cortisol measurements across 30 years. Among those aged 50 or greater, the cortisol of those in the more-negative age-stereotype group increased by 44%, whereas those with more positive age-stereotypes tended to show no increase. Also, as expected, no association of age stereotypes and cortisol level was found among the younger participants, for whom the age stereotypes were self-irrelevant. The findings suggest the important contribution positive age stereotypes can make to older individuals' well being.

PERCEIVED GROUP-LEVEL AGE DISCRIMINATION: FINDINGS FROM THE AGING AS FUTURE STUDY

K. Rothermund, P. Voss, *FSU Jena, Jena, Germany*

Using data from the international Aging as Future study conducted in the USA and Germany, we assessed group-level perceptions of age discrimination in a large age-heterogeneous sample (35–85 years, N=1,340). Highest levels of perceived discrimination of older people were found among the US participants (compared to German participants) and among the age group of people facing retirement (55–65 years). Perceived group-level age discrimination was related to low levels of perceived provision for and societal participation of older people, and to negative age stereotypes. Although we found country and age group differences also with regard to these predictor variables, they did not explain the country and age group differences in perceived age discrimination. Our findings thus indicate that perceived group-level age discrimination reflects not only a perceived lack of available resources for older people within a society but may also originate from an increased sensitivity towards age discrimination due to high levels of societal awareness or to an impending individual transition into old age.

SESSION 4690 (SYMPOSIUM)

THE BROADER PICTURE: A MULTIDIMENSIONAL APPROACH TO FRAILTY

Chair: J. Schols, *Maastricht University, Maastricht, Netherlands*

Co-Chair: N. De Witte, *Vrije Universiteit Brussel, Brussels, Belgium*

Discussant: R.J. Gobbens, *Inholland University of Applied Sciences, Amsterdam, Netherlands*

Although an increasing number of studies consider frailty as a multidimensional phenomenon, frailty is still often conceptualized and measured as a merely medical or physical concept. In this international symposium with four presenters from Belgium and the Netherlands, we address the importance of a multidimensional approach to frailty. Several frailty domains will be discussed thoroughly and attention will be given to balancing factors in frailty. The first presenter will focus on cognitive frailty and its relationship with other frailty domains. Our second presenter will discuss the results of in-depth analyses of socio-demographic factors and their connection with psychological frailty. Thereafter, the third presenter will illustrate why and how the environmental domain is related to frailty. Despite its importance, research

regarding environmental factors (e.g. (bad) housing condition) is still lacking. Finally, our last presenter will discuss balancing factors in frailty, as frailty cannot be considered as only an individual attribute of deficits, but might be considered as a balance between deficits and resources. Our discussant, Robbert Gobbens from the Netherlands, will reflect on the presentations.

COGNITIVE FRAILTY AND ITS RELATION WITH PHYSICAL, PSYCHOLOGICAL, SOCIAL AND ENVIRONMENTAL FRAILTY

E.E. DeRoock^{1,2}, A. van der Vorst³, S. Engelborghs¹, E. Dierckx², D. Consortium², 1. *University of Antwerp, Antwerp, Belgium*, 2. *Vrije Universiteit Brussel, Brussels, Belgium*, 3. *Maastricht University, Maastricht, Netherlands*

Recently, cognitive frailty was added as a new domain to the Comprehensive Frailty Assessment Instrument (CFAI). The CFAI is a well-studied instrument that measures physical, psychological, social, environmental and cognitive frailty. Nevertheless little is known about the interaction between cognitive frailty and the other domains. The goal of this study was to investigate the relationship between cognitive frailty and the other frailty domains. Therefore, the CFAI was administered to 475 older adults between 51 and 101 years old recruited from the community. Cognitive frailty correlated significantly with environmental, physical, and psychological frailty. Contrariwise there was no correlation with social frailty. In addition 52.2% of the older people were cognitive frail in combination with one or more other frailty domains. The most common combination was cognitive frailty together with physical frailty. Gaining insight in the relationship between cognitive frailty and the other domains can help to develop appropriate therapeutic interventions.

PSYCHOLOGICAL FRAILTY: A QUANTITATIVE STUDY ON THE BELGIAN AGING STUDIES

L. Hoeyberghs^{1,2}, N. De Witte^{1,2}, J. Schols^{3,4}, D. Consortium², 1. *Faculty of Education, Health and Social Work, University College Ghent, Ghent, Belgium*, 2. *Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium*, 3. *Department of Health Services Research, CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*, 4. *Department of Family Medicine, CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*

The rationale of this study is a quantitative search for factors related to psychological frailty. This search was done on the dataset of the Belgian Aging Studies (BAS). First, second order factor analysis was conducted on the Comprehensive Frailty Assessment Instrument (CFAI) which is incorporated in the BAS. This resulted in the following factor-loadings: .80 for psychological factors, .36 for physical factors, .32 for environmental factors and .33 for social factors, pointing towards frailty as rather a psychological problem. Therefore, a more in-depth exploration of data from the BAS, administered among 32,481 older community dwelling adults, was conducted. After identifying the high psychologically frail group, we investigated which factors are associated

with psychological frailty. Findings reveal that psychological frailty is not equally distributed within the older population, and that the following factors may contribute to psychological frailty: ageism, difficulties in executing household tasks, and social activities.

FRAIL AND AGEING IN PLACE. WHAT ABOUT THE ENVIRONMENT?

N. De Witte, 1. Faculty of Education, Health and Social Work, University College Ghent, Ghent, Belgium, 2. Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium

Research on frailty has mainly focused on ageing individuals and populations. Less attention is given to the environment an ageing individual lives in. Some researchers call this tendency the “decontextualization of human ageing away from the environment”. However, when ageing in place, older people highly depend on the sustainability of their own housing conditions and environment. As a consequence, the environmental domain was introduced in the Comprehensive Frailty Assessment Instrument (CFAI), besides physiological, psychological and social frailty. The environmental domain contains 5 items assessing older people’s housing conditions and neighborhood. Based on a second order confirmatory factor analysis on the CFAI, the factor loading for this domain was .32, pointing towards the fact that environmental problems contribute to frailty. Hereby, the concept of frailty is extended towards a more holistic approach. In order to support frail older people aging in place, screening with CFAI enables tailor made interventions, including environmental.

BALANCING FACTORS IN COMMUNITY-DWELLING PEOPLE AGE 60 YEARS AND OVER

A. van der Vorst¹, G. Zijlstra¹, N. De Witte^{2,3}, G. Kempen¹, J. Schols^{1,4}, D. Consortium³, 1. Department of Health Services Research, Care and Public Health Research Institute (CAPHRI), Maastricht University, Maastricht, Netherlands, 2. Faculty of Education, Health and Social Work, University College Ghent, Ghent, Belgium, 3. Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium, 4. Department of Family Medicine, Care and Public Health Research Institute (CAPHRI), Maastricht University, Maastricht, Netherlands

Since not all frail older people experience negative outcomes, we aimed to examine which factors contribute to quality of life (QoL) and self-control in older people, despite being frail. 121 community-dwelling people living in Belgium were assessed using a mixed-method approach. Multidimensional frailty was measured with the Comprehensive Frailty Assessment Instrument (CFAI). QoL and self-control were measured using a visual analogue scale, and were assessed more in-depth during a qualitative interview. Initial analyzes were performed in overall frail older people with lowest (n = 15) and highest (n = 10) scores on QoL and self-control. Groups were compared and relationships were investigated based on socio-demographic characteristics and frailty levels per domain. However, no clear explanations for the differences in outcomes were found. Future research is going to include in-depth analyzes of the qualitative interviews to

search for explanations for the discrepancies in the outcomes QoL and self-control in frailty.

SESSION 4695 (SYMPOSIUM)

RECENT ADVANCES IN OLDER DRIVER RESEARCH: METHODOLOGY AND OUTCOMES FROM THE AAAFTS LONGROAD STUDY

Chair: L. Hill, University of California, San Diego, San Diego, California

The over 65 population is the fastest growing group in the US, including 35 million drivers. Older adults are more likely to experience health and functional impairments than their younger counterparts, which may interfere with their ability to drive safely, and have been found to be associated with driving cessation. Older drivers made up 17% of the traffic fatalities in the US in 2012. However, there are methodological challenges to older driver research, including recruitment barriers (e.g. distrust, health issues precluding participation, lack of mobility), the inaccuracy of self-reported data, limited stamina for research assessments, and multiple confounding variables (e.g. disease, medications, cognitive impairment). This symposium will present four papers addressing older driver research. The presentations will be based on the experiences and preliminary results of the AAA Foundation for Traffic Safety’s LongROAD Study. This five-city prospective study enrolling 6000 older adults drivers across the country. This study been designed to collect data using validated car instrumentation, including the types and timing of trips, driving safety issues, and changes with time. Baseline and annual testing assesses cognitive, physical and medical status of participants, diagnoses and medications. Methodological issues will be discussed, with potential solutions. Challenges and solutions to obtaining driving information on study participants from motor vehicle departments will be presented. Outcomes will include recruitment results, department of motor vehicle data, the driving habits and patterns based on GPS data monitors, with the identification of potential interventions to reduce unsafe driving, and safely delay driving retirement.

LONGITUDINAL RESEARCH ON AGING DRIVERS (LONGROAD): STUDY DESIGN AND METHODS

G. Li, Columbia University, New York, New York

The Longitudinal Research on Aging Drivers (LongROAD) project is a prospective cohort study designed to generate empirical evidence for understanding the dynamics, mechanisms, and determinants of driving safety in older adults. A total of 3,000 active drivers aged 65–79 years will be recruited through clinics in five study sites located in CA, CO, MD, MI and NY. Consented participants are assessed at baseline with standardized protocols and instruments, including vehicle inspection, performance-based tests, questionnaires, and “brown-bag” medication reviews. The primary vehicle of each participant is instrumented with a small recording device to collect real-time driving data. Annual follow-up is conducted with questionnaire survey and with in-person assessment in alternate years. Driving records, including crashes and violations, are collected through state

motor vehicle departments. Pilot-testing was conducted on 56 volunteers during March-May 2015. Enrollment started in July 2015. As of June 30, 2016, the investigators have enrolled 1745 study participants.

RECRUITMENT OF OLDER DRIVERS INTO LONGROAD: EXPERIENCES FROM A MULTI-STATE STUDY

M. Betz¹, C. DiGuseppi², L. Hill³, L.J. Molnar⁴, V. Jones⁵, L.H. Ryan⁶, D. Strogatz⁷, G. Li⁸, 1. *Emergency Medicine, University of Colorado--Denver, Denver, Colorado*, 2. *Colorado School of Public Health, Aurora, Colorado*, 3. *University of California San Diego, San Diego, California*, 4. *University of Michigan Transportation Research Institute, Ann Arbor, Michigan*, 5. *Johns Hopkins University, Baltimore, Maryland*, 6. *University of Michigan Institute for Social Research, Ann Arbor, Michigan*, 7. *Bassett Research Institute, Cooperstown, New York*, 8. *Columbia University, New York, New York*

Eligible LongROAD participants were 65–79 years old; drove \geq once/week with a valid license; received primary care at the site's healthcare system; lacked significant cognitive impairment; spoke English; and primarily drive one car (1996 model or newer) with an empty port for the study GPS device. Potentially-eligible individuals (sampled from healthcare system patients) received letters and subsequent calls. Over 12 months, the sites mailed 18,078 letters. On average, 25% of those reached by phone declined to eligibility questions; among those giving a reason, being "too busy" or "don't like research" were most common. Among those screened for eligibility, the most common reasons for ineligibility were not driving (38%) or having an ineligible residence (26%) or vehicle (17%). Recruitment yield (enrollments per letters mailed) was 9.8% (range: 5.4%-17%). This presentation highlights recruitment challenges and offers strategies to overcome recruitment barriers.

THE OBJECTIVE MEASUREMENT OF DRIVING AMONG OLDER ADULTS

D.W. Eby, L.J. Molnar, D. LeBlanc, M. Gilbert, S. Bogard, R. St. Louis, N. Zanier, S. Stanciu, *University of Michigan, Ann Arbor, Michigan*

One of the challenges of conducting research on aging and driving is the measurement of driving behavior. Many studies rely on older drivers themselves to report how much, where, and when they drive. While these data are useful, research shows that drivers have difficulty accurately reporting not only their driving exposure, but also their driving patterns. The Longitudinal Research on Aging Drivers (LongROAD) study employed an innovative system to objectively measure all driving done by participants in their primary vehicle. As of May, 2016 there were 1,477 participants who had collectively taken more than 650,000 trips and driven more than 4,000,000 miles. On average, trip length was 6.3 miles, trip duration was 14.2 minutes, and 6.1 percent of trips were taken at night. About 65 percent of trips occurred within 15 miles of home. Further detail on the data collection system and driver behaviors will be provided in this presentation.

COMPARISON OF THE ACCESSIBILITY AND CONTENT OF DRIVING RECORDS FROM MULTIPLE STATES

D. Strogatz¹, V. Jones², H. Andrews³, C. DiGuseppi⁴, D.W. Eby⁵, L. Hill⁶, T. Mielenz³, G. Li³, 1. *Bassett Research Institute, Cooperstown, New York*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 3. *Columbia University, New York, New York*, 4. *University of Colorado School of Medicine, Denver, Colorado*, 5. *University of Michigan Transportation Research Institute, Ann Arbor, Michigan*, 6. *University of California at San Diego, San Diego, California*

Research examining driving among older adults suggests driving records can be used to measure moving violations and crashes as outcomes. Much of research on driving records in the United States is from a single state and therefore can't address extent and impact of interstate differences in accessibility and content. Sources of variability may include request procedures (e.g. written, online, free or fee), timeline for obtaining data, mode of driving record information (e.g. electronic or paper files) and type of information in driving records (e.g. crash details). The Longitudinal Research on Aging Drivers (LongROAD) Study is obtaining driving records of approximately 3000 adults 65–79 years old in 5 states; initial data on 1,080 participants revealed 65 crashes and 162 violations in recent years. From this experience we compare states on process and cost of obtaining past and future driving records and differences in content of reports on crashes and moving violations.

SESSION 4700 (PAPER)

VOLUNTEERING: PRECURSORS AND OUTCOMES

VOLUNTEERING ENGAGEMENT IN SENIORS: BARRIERS AND FACILITATORS

M.I. Jongenelis¹, N. Biagioni¹, S. Pettigrew¹, J. Warburton³, R. Newton⁴, B. Jackson², 1. *Curtin University, Perth, Western Australia, Australia*, 2. *The University of Western Australia, Perth, Western Australia, Australia*, 3. *La Trobe University, Melbourne, Victoria, Australia*, 4. *Edith Cowan University, Perth, Western Australia, Australia*

Engaging in regular volunteering has been proposed as a strategy to facilitate healthy and productive ageing. Evidence suggests that engaging in volunteering activities can provide beneficial social, physical, and cognitive outcomes for older people including, but not limited to, improvement in quality of life, reduced depression, higher levels of self-rated health, lower mortality rates, and improved psychological well-being. Given these benefits, engagement in volunteering activities should be encouraged in seniors. The present study, part of a broader randomized control trial examining the effects of volunteering on the health and well-being of Australian seniors, examined the perceived barriers to and facilitators of involvement in volunteering in over 200 participants aged 60 years and older. NVivo11 was used to code and content analyze the interview transcriptions. Several intrapersonal and environmental barriers were reported including being time poor, lack of mobility, lack of available transport, health issues, lack of relevant information and knowledge about

where to seek volunteer work, and organizational “red tape” and inflexibility. Interviewees believed that increasing flexibility of positions, making the commitment easier to manage within existing lifestyles, making resources pertaining to possible volunteering positions readily accessible, and finding positions of interest would assist in facilitating involvement in volunteer work. Results suggest that although there are several barriers that prevent seniors from engaging in volunteer work after retirement, motivation to undertake such activities can be enhanced if organizations understand the specific needs of seniors and improve the ease with which seniors can engage in this work.

THE VOLUNTEERING-IN-PLACE PROGRAM: MEANINGFUL VOLUNTEER ACTIVITY FOR ASSISTED LIVING RESIDENTS

J. Klinedinst, B. Resnick, *University of Maryland School of Nursing, Baltimore, Maryland*

The Volunteering-in-Place (VIP) Program was developed to provide individualized meaningful volunteer activities matched to interests and capabilities for older adults in assisted living (AL). The purposes of this study were to (1) establish feasibility of the VIP Program based on treatment fidelity (design, treatment, delivery, enactment); and (2) evaluate preliminary efficacy via improvement in psychological health (depressive symptoms, usefulness, purpose, resilience, and life satisfaction) and decreased sedentary activity (survey and Fitbit) at 3 and 6 months.

Guided by the Social Ecological Model and Social Cognitive Theory, the VIP Program addressed barriers to volunteering through innovative motivational techniques and making volunteer opportunities accessible to residents. A Volunteer Coordinator facilitated the VIP Program using a four step approach: 1) Environmental Scan and Staff Education; 2) Assessment of Residents Abilities and Interests; 3) Ongoing Implementation of the VIP Program; and 4) Individualized Reassessment of the Volunteer Activity.

This was a single group, single-site, repeated measures study. Residents were eligible if they were ≥ 65 years old, scored ≥ 2 on the three-item recall, and could sign consent. Survey and Fitbit data were collected at baseline, three and six months post volunteering.

Ten residents participated. The majority was white, female, educated, and on average 88 years. The VIP Program was feasible and most participants continued to volunteer at 6 months. There were non-significant improvements in depressive symptoms, usefulness, purpose, resilience and recreational physical activity.

The results of this study provide support for the feasibility of the VIP Program. Further study is necessary to examine efficacy.

EARLY LIFE COURSE EVENTS AND VOLUNTEERING IN LATE LIFE

M. Hogerbrugge, I.R. Jones, *Wales Institute for Social and Economic Research, Data & Methods (WISERD), Cardiff University, Cardiff, United Kingdom*

Besides highlighting heterogeneity in life courses and the impact of socio-historical time, geographical location, human agency, and linked lives, the life course perspective underlines

the significance of [the timing of] transitions and events earlier in the life course in shaping the later life of individuals – a principle also known as path dependency. Employing data from the life history interview and subsequent waves of the English Longitudinal Study of Ageing (ELSA), we test to what extent the experience of negative events earlier in the life course, as well as the timing of ‘normal’ events (e.g., leaving the parental home, marriage, [first] child birth) affect the frequency of, and reasons for volunteering in late life (age 50 and over). Ordered logistic regressions revealed that the frequency of volunteering was positively affected by the experience of negative events in the life course, especially when they were first experienced at a young age. When ‘normal’ events, such as marriage and parenthood, were experienced at ages outside normative social timetables (i.e., too early or too late), the frequency of volunteering in late life was found to be lower. Examining the reasons for volunteering, individuals who had experienced negative events in their life course, or who experienced ‘normal’ events off-time, were found to report socially related motivations for volunteering more often and motivations related to personal development less often. We discuss the relevance of our findings in light of the notion of ‘active ageing’ and related policies.

VOLUNTEERING BUFFERS NEGATIVE IMPACT OF LONG-TERM UNEMPLOYMENT ON OLDER ADULTS’ MENTAL HEALTH

J. Yang, Y. Wang, *Boston College, Allston, Massachusetts*

Research abounds in demonstrating the negative impact of unemployment on older adults’ mental health. However, few studies examined the protective factors that buffer the negative impact of long-term unemployment (over six months) on older adults’ mental health. Using a framework of resilience and productive aging, this study explores the buffering effect of volunteering on the relationship between unemployment and depressive symptoms for older adults.

A longitudinal design with 7 models using the first difference approach was adopted. Two waves (2010, 2012) of panel data from the Health and Retirement Study were used with a sample of 9,421 older adults age 50–85. Independent variable was a four-way interaction between two waves of unemployment and volunteering status. Control variables included change in self-reported health, change in difficulties in activities of daily living, change in total household income, and change in marital status.

Results demonstrated that for long-term unemployed older adults, those who did not volunteer in wave 1 but volunteered between 100 to 200 hours in wave 2 had a significant decrease in depressive symptoms compared to those who were unemployed but did not volunteer in either wave.

This study demonstrated a buffering effect of volunteering on depressive symptoms for long-term unemployed older adults. This finding is important because current unemployment interventions lack attention to both the long-term unemployed and people’s mental health. The finding from this study provides insights to inform future intervention development around creating volunteering opportunities for unemployed older adults in order to enhance their mental wellbeing.

SESSION 4705 (SYMPOSIUM)

PATTERNS OF (IN)FORMAL CARE IN THE COMMUNITY: DETERMINANTS AND OUTCOMES

Chair: M.I. Broese Van Groenou, *VU University, Amsterdam, Netherlands*

Due to increased policy on and preferences for ageing in place, many health impaired older adults living at home and in home-like settings are in need of (in)formal care. This situation raises questions and calls for more research about the variety in patterns of care and the dependency between formal and informal care use. Moreover, more information is needed on the quality of (in)formal care and how this affects quality of life and ageing in place. This symposium explores patterns of (in)formal care in relation to various determinants and outcomes. The first contribution focuses on the formal-informal care linkage and examines how changes in national home care expenditures affect individual informal care provision in nine European countries. The next study shows how social networks contribute to care patterns among Danish older adults, and whether care patterns differ in overall and care-related quality of life. The third contribution examines whether a larger proportion of informal caregivers increases the perceived quality of care and the overall quality of life of Dutch older care recipients. The fourth study uses a qualitative longitudinal design and adds how patterns of informal care influence residents' quality of life and ability to age in place in assisted living over time. Together, these studies show that linkages between formal and informal care vary over time and place, and that advancing complementary models of (in)formal care is essential to understanding and improving care quality for older individuals who are required or prefer to age in place.

CHANGES IN HOME CARE EXPENDITURE AND THE COMBINATION OF INFORMAL CARE AND PAID WORK

D. Verbeek-Oudijk, *Labour and Public Services, Netherlands Institute for Social Research, The Hague, Netherlands*

In this paper we examine the relationship between rising home care expenditure and the combination of informal care and paid work among the independent community-dwelling persons aged over 50 in nine European countries. We use data from 2004–2013 – a period characterised by rising expenditure and investments in home care. The nine countries studied are Austria, Belgium, Denmark, France, Germany, The Netherlands, Spain, Sweden and Switzerland. We analyse the effect of a change in home care expenditure using logistic regression with fixed effects on the longitudinal data from the *Survey of Health, Ageing and Retirement in Europe*, combined with national data on home care expenditure from the OECD. Preliminary results show that, when home care expenditure in a country rises, fewer over-50s provide informal care. However, the effects seem to differ for those who work and for those who do not. (140)

VARIATIONS IN CARE PROFILES AMONG DANISH OLDER ADULTS: DETERMINANTS AND CONSEQUENCES

A.A. Kjaer^{1,2}, A. Siren¹, 1. *Social Policy and Welfare, the Danish National Centre for Social Research, Copenhagen, Denmark*, 2. *Department of Political Science, University of Copenhagen, Copenhagen, Denmark, Denmark*

This study investigates variations in the combination of formal and informal care amongst community dwelling older adults in Denmark, and its determinants and consequences. Using data from the fourth wave of the Danish Longitudinal Study on Ageing, we first classify recipients of municipal home-care into four different *care-profiles* based on 1) the intensity of formal care and 2) the level of assistance from informal care-givers. Conducting multivariate regression analysis we next investigate the role of *social network*, in terms of proximity and contact, in explaining care-profile membership while adjusting for age, gender, health and physical functioning. Last, we examine the *overall* and *care-related quality of life* associated with each care-profile. Preliminary results indicate that social network has a role in explaining individuals' care-profiles. Thus, older adults with a poor social network may be in risk of a care deficit despite the dominant formal care regime of the Danish welfare state.

HOW DO PATTERNS OF CARE AFFECT THE QUALITY OF CARE AND QUALITY OF LIFE AMONG DUTCH OLDER ADULTS?

M.I. Broese Van Groenou, *Sociology, VU University, Amsterdam, Netherlands*

This study examines how quality of life of community-dwelling older adults is associated with the composition of the care network, the intensity of care provided and the perceived quality of care. Preliminary multivariate regression analyses were conducted using 491 respondents of the 2012 wave of the Longitudinal Aging Study Amsterdam, who received help with at least one of five tasks. Results show that, adjusted for background variables, health status and levels of mastery, a lower proportion of informal caregivers and lower satisfaction of care contributed to higher depressive symptoms. Also, respondents who evaluated the cooperation among the caregivers as more negative reported higher levels of loneliness. Results suggest that the use of informal care and perceived quality of care adds to quality of life. This calls for better working linkages between formal and informal caregivers in order to increase the quality of life of those ageing in place.

FAMILY INVOLVEMENT IS THE KEY: INFORMAL CARE IN ASSISTED LIVING

C.L. Kemp¹, M.M. Ball², J.C. Morgan¹, E.O. Burgess¹, P.J. Doyle³, M.M. Perkins², 1. *Gerontology, Georgia State University, Atlanta, Georgia*, 2. *Emory University, Atlanta, Georgia*, 3. *Brightview Senior Living, Baltimore, Maryland*

This paper presents findings from a 5-year longitudinal qualitative study involving 50 residents and their informal and formal care network members (n= 225) in eight diverse assisted living (AL) communities in the southern US. Previous analysis of data from four settings identified variability in

informal care and generated a typology of care patterns. Here, we expand this analysis to examine data from all eight settings and focus on outcomes. We ask: What implications do informal care patterns have for residents and their care providers? Findings show that the quality and quantity of informal care influences AL residents' ability to age in place, and directly and indirectly influences their overall care quality and well-being. Informal care can influence the well-being and quality of life of those providing it and also can impact direct care workers' work satisfaction and perceptions of care quality. Findings have implications for improving care and care relationships.

SESSION 4710 (PAPER)

END-OF-LIFE/PALLIATIVE CARE/PAIN MANAGEMENT/CHRONIC DISEASE MANAGEMENT

PHYSICIAN ORDERS FOR LIFE-SUSTAINING TREATMENT (POLST): ARE FORMS COMPLETE? CAN THEY BE IMPROVED?

A.N. Rahman, S. Enguidanos, *Davis School of Gerontology, University of Southern California, Santa Monica, California*

Background: The Physician Orders for Life Sustaining Treatment (POLST) form allows seriously ill individuals to express their preferences for end-of-life treatments. Despite increased POLST use, little is known about the quality of completed forms. Missing or conflicting information can invalidate the forms, rendering them ineffective.

Objective: We examined whether POLST forms prepared for nursing home residents were actionable and therefore effective in communicating residents' preferences.

Design: We reviewed POLST forms for a sample of nursing home residents in California.

Setting/Sample: We completed POLST audits for 938 residents in 13 nursing homes in Los Angeles.

Measures: Forms were deemed actionable if they were signed by both the patient (or proxy) and the physician, and the patient's treatment choices regarding resuscitation and medical intervention were consistent, as required by the California form.

Results: Overall, 69.6% of audited POLST forms were deemed actionable. Those not actionable typically lacked a required signature. Of the 855 POLST forms that were dated, roughly half were prepared at least six months prior to our review, with 17.4% prepared 18 months to 3 years earlier.

Conclusion: We found a concerning percentage of POLST forms for nursing home residents were not actionable. Implementing a statewide registry could ensure POLSTs are actionable, but some forms will likely be lost to the vetting process. A checklist of required items on POLST forms could prompt practitioners to audit forms for compliance. Space to document that standing orders have been reviewed would help ensure that POLST forms reflect patients' current treatment preferences.

KNOWLEDGE INTO PRACTICE: IMPROVING ADVANCE CARE PLANNING FOR OLDER PEOPLE IN AUSTRALIA

D. Parker, 1. *Faculty of Health, University of Technology Sydney, Sydney, New South Wales, Australia*, 2. *University of Queensland, Brisbane, Queensland, Australia*

Decision Assist is a national program that aims to enhance the provision of palliative care and advance care planning (ACP) services to older people.

This presentation reports results from a blended learning program (online modules and two face to face workshops approximately 2 months apart) delivered to clinical staff working in long term care and community aged care services. The aim was to promote participation in advance care planning discussions with residents/clients. Participants were asked to practice ACP between workshops and report their activity.

The homework activity was completed by 1489 staff long term care and 259 community staff. Almost half (47.3%) of long term care and community (49.0%) aged care staff had a ACP discussion with new residents/clients and approximately two thirds of participants had ACP discussions with existing residents/clients (66.2% long term care, 62.9% community). Completion of an Advance Care Directive (32.4% vs 19.3%, $p < 0.001$) or Advance Care Plan (37.1% vs 21.6%, $p < 0.001$) was significantly more likely to have been practiced by long term care participants compared to their community counterparts.

A blended approach to education has improved staff's ability to provide advance care planning for older adults. Further research to understand differences in long term care and community staff ACP and palliative care case conferences opportunities is indicated.

EFFECTS OF PATIENT CENTERED MEDICAL HOMES ON MEDICARE BENEFICIARIES WITH MULTIPLE CHRONIC CONDITIONS

J.M. Wiener, L. Lines, A. Kandilov, *RTI International, Washington, District of Columbia*

The Centers for Medicare & Medicaid Services (CMS) Multi-payer Advanced Primary Care Practice (MAPCP) Demonstration tested the effect of patient-centered medical homes (PCMH) on Medicare and Medicaid beneficiaries in eight states. Using multivariable linear and logistic regression models, the evaluation assessed how people with multiple chronic conditions performed on 7 utilization measures (e.g., all-cause hospitalizations), 7 process quality measures (e.g., receipt of total lipid panel); and 4 health outcome measures (e.g., avoidable catastrophic events) relative to a comparison group of beneficiaries in non-PCMH practices. Medicare fee-for-service beneficiaries in demonstration states with 3+ chronic conditions present in 2+ consecutive years of Medicare claims who were in the high-risk category of the CMS Hierarchical Condition Category index were defined as beneficiaries with multiple chronic conditions. Roughly a quarter of beneficiaries met inclusion criteria. Over the first two years, the MAPCP Demonstration was not associated with many statistically significant outcomes relative to the comparison group. Several states' significant outcomes were mostly in an unexpected direction (i.e., favored

the comparison group). No consistent patterns emerged in terms of which outcomes most improved across the demonstration states or which states had the best outcomes. Of the 18 selected measures, no state had significant results in more than 3 outcomes. Overall, the Demonstration does not appear to have had a significant positive effect on Medicare beneficiaries with multiple chronic conditions in the first two years of the demonstration. Final analyses spanning all three years of the demonstration will be available at the time of the conference.

DISRUPTING NARRATIVES OF LOSS: REFLECTIONS ON END-OF-LIFE CARE FOR PEOPLE WITH ADVANCED DEMENTIA

G. Puurveen, *School of Nursing, University of British Columbia, Vancouver, British Columbia, Canada*

Current discourse in research that examines end-of-life (EOL) care for people with advanced dementia is predominated by biomedicine that constructs a storyline of an experience dominated by the decline of the body. However, the focus on the dying body obscures the social, emotional, and spiritual elements of the dying experience. If we accept that the EOL is more than an experience of a deteriorating body, then research must take a holistic perspective and offer a counter narrative that attends to the depth of human experience.

This paper presents findings from ethnographic case study research exploring how care staff and family understood the needs and experiences of women with advanced dementia nearing the EOL. In-depth interviews with 23 care staff (nursing, management and allied health) and 2 family members, over 600 hours of participant observation, and 30 hours of video observation were conducted in one nursing home. Informed by a dialogical perspective, thematic and narrative analyses revealed that while family and staff's reflections were undergirded by a storyline of deterioration, their narratives were dominated by an ethical obligation towards the residents that went beyond fulfilling instrumental tasks and caring for the dying body. Rather, analysis showed that (1) encountering and acknowledging the residents' personhood, (2) nurturing relationship, (3) negotiating contextual factors, and (4) acting out of love and compassion were central to provide responsive person-centred EOL care. Findings suggest that staff and family have a nuanced understanding of EOL care, which has important implications for practice and education of care providers.

DO NURSING HOME RESIDENTS WITH DEMENTIA RECEIVE PAIN ASSESSMENTS AND INTERVENTIONS?

T. Nakashima^{1,2}, Y. Young², W. Hsu³, 1. *Rutgers University, Camden, New Jersey*, 2. *SUNY at Albany, Albany, New York*, 3. *New York State Department of Health, Albany, New York*

Purpose: This study compares the pain assessments and pain interventions received by nursing home residents both with and without dementia.

Methods: Study subjects were nursing home residents age 65 or older in New York State (n=51,224). Minimum Data Set (MDS3.0) in 2012 was used to address the study aims. Descriptive and categorical analyses were performed to quantify the differences in pain assessments/pain interventions between residents with and without dementia.

Results: Preliminary results show that pain assessment interviews were conducted in 80% of nursing home residents. Residents with dementia received significantly fewer pain assessments than their counterparts (74.3% vs. 92.4%; $P<.000$). Among those who had pain assessments, dementia residents had significantly less pain presence than those without dementia (14.8% vs. 30.1%; $P<.000$). Of those who had pain presence, dementia residents received significantly less pain medication (91.2% vs. 93.7%; $P<.000$) or non-medication intervention (18.0% vs. 21.8%; $P<.000$) than their counterparts.

Implications: Our results suggest that dementia residents were less likely to receive pain assessments and pain interventions. Assessment of pain in residents with dementia is challenging due to the loss of language, and the ability to communicate raises the risk of unmet needs. There is a possibility that patients with dementia may experience pain but are unable to articulate or complain about it, and thus get overlooked. It is important to solicit the assistance of knowledgeable hands-on caregivers to identify typical pain behaviors for residents with dementia using appropriate pain assessment tools, thus pain interventions can be administered.

SESSION 4715 (SYMPOSIUM)

LEADING GLOBAL CHANGE AT HOME: EXPERIENCES FROM THE HEALTH AND AGING POLICY FELLOWS

Chair: R. Mabe, *Sale Lake City VA Healthcare system*

Discussant: H.A. Pincus, *Columbia University*

The Health and Aging Policy Fellows (HAPF) Program has provided over 100 fellows the opportunity to learn about and contribute to aging policy. Each year, fellows have access to leading experts and policy makers via their placements, program orientations, and networking opportunities. The fellowship boasts significant diversity and exposure to both national and international aging policy opportunities. The significant contributions of current and former fellows to US and international aging policy through research, policy making, and industry are a testament to the vital role the fellowship plays in augmenting the potential of promising aging policy leaders. This is the second of a two-part symposium series by the 2015–2016 cohort. The symposium will highlight projects and experience from fellows who participated in non-profit advocacy group placements. Stephanie Firestone discusses her work with the American Planning Associate and US HUD on appropriate housing options for older adults. Rebecca Mabe will present her project with the Eldercare Workforce Alliance. Gina McCaskill will consider key informants and their contribution to consumer centered models of care. Jacquelyn Kung will offer insights on how caregivers can navigate federal government agencies. The symposium will conclude with a panel discussion where fellows will expound upon their experiences, offer insights on advancing aging policy in the US and abroad, and reflect about how their experiences might be adapted for use in settings abroad. Individuals affiliated with the fellowship will be invited to participate in the discussion. Fellowship director, Harold Pincus, will moderate the discussion.

**APPROPRIATELY HOUSING OLDER ADULTS:
A MANDATE WITHIN OUR CAPACITY TO FULFILL**
S.K. Firestone, *AARP International, Washington, District of
Columbia*

Universities and communities are effectively working in partnership to advance age-friendly principles espoused by the World Health Organization's Age-Friendly Cities and Communities Program, designed to provide policies to prepare for trends in population aging and urbanization. Such communities are walkable, visitable, and accessible, providing opportunities for residents of all ages to be active participants in their communities. This session will present findings from a symposium exploring examples of successful age-friendly university/community partnerships and will identify common elements and policies found amongst model collaborations.

**IMPLICATIONS OF FINANCING LONG TERM CARE
SERVICES AND SUPPORTS AND THE DWINDLING
ELDERCARE WORKFORCE**

R. Mabe, *Salt Lake City VA Health Care System, Salt Lake
City, Utah*

As the United States works toward improving the ability of the aging and disabled population to afford needed care, the expansion of long term care services and supports across settings calls for an expansion of the Workforce in greater numbers than currently exist. Integrating financing and delivery of Medicare, Medicaid and Long Term Care Services and Supports will require a highly educated and well compensated workforce. All stakeholders in the Aging and Disability arena will need to become active participants in the implementation of quality and process improvements as value and outcome based payments for care delivery impact the changing landscape of care delivery in the home and community.

**DISCOVERING BRIGHT SPOTS: THE ROLE OF KEY
INFORMANTS IN IDENTIFYING CONSUMER-
CENTERED MODELS OF CARE**

G.M. McCaskill, *Birmingham Veterans Affairs Medical
Centers, Birmingham, Alabama*

A national health advocacy group presented a unique opportunity for a Health and Aging Policy Fellow to identify exceptional models of consumer-centered, integrated care and services for low-income populations with an emphasis on older adults in America's Deep South states of Georgia, Alabama, Mississippi, and Louisiana. The primary objective of this presentation is to discuss the role of key informants, laypersons and professionals with knowledge about communities in which they may live and work, in identifying these exceptional models. The Fellow will discuss the political, social, and cultural challenges in establishing relationships with key informants across the miles to identify local bright spots. The secondary objective is to discuss the quality indicators that can be used in a global context in under-resourced communities to identify exceptional models of consumer-centered, integrated care and services for low-income older adults. Examples of these models will be highlighted.

**FROM THE PERSPECTIVE OF FAMILY CAREGIVERS:
WHAT DO DIFFERENT FEDERAL AGENCIES DO FOR
ME?**

J. Kung, *Family Caregiver Alliance, San Francisco,
California*

Federal agencies can often be a confusing set of organizations (and accompanying acronyms) for non-political professionals. Yet many of these agencies deliver incredibly important resources and services to older adults and their family caregivers in the U.S. Taking the perspective of a family caregiver, this presentation will address the "need to know" information about a dozen Federal agencies, including CDC, OSG, ONC, ACL, CMS, and others. This session will be informative to international policy makers, U.S. professionals who work with older adults and their families, and others interested in the complex but critical set of U.S. Federal policy making organizations.

SESSION 4720 (SYMPOSIUM)

**FIGHTING AGAINST ELDER ABUSE IN
COLLABORATION WITH ADULT PROTECTIVE
SERVICES**

Chair: P. Liu, *UCSF, Walnut Creek, California*

Co-Chair: A.E. Navarro, *University of Southern California*

Discussant: B. Penhale, *University of East Anglia, Norwich,
United Kingdom*

In the United States, the Adult Protective Services (APS) program is responsible for investigating reports of abuse, exploitation, and neglect among mostly vulnerable older adults. Data on APS clients, perpetrators, and interventions are not widely available, as each state operates APS independently and defines their service populations differently. Nonetheless, whether at the federal, state, or local level, working with APS to collect and analyze data is important. Researchers, APS staff, and policymakers are prepared to help older adults, when they know who the clients are and what they need, as well as who the perpetrators are and why they commit the crime. Person-centered services and remedies can be designed when client and perpetrator information is available. This symposium includes four presentations on researchers' experiences working with APS. Drs. Kendon J. Conrad and Madelyn Iris will discuss their multi-year collaboration with APS agencies in Illinois, and with the Illinois Department on Aging as they developed the Elder Abuse Decision Support System. Dr. Adria Navarro will present California APS' feedback on having a screening tool designed for efficient undue influence risk assessment among vulnerable adults. Dr. David Burnes will present findings from a prospective project that examines the development and feasibility of goal attainment scaling as a way to measure APS client outcomes. Lastly, Dr. Pi-Ju (Marian) Liu will discuss California APS' journey in collecting client and perpetrator data as a state. Following the presentations, Dr. Bridget Penhale will open up the discussion regarding protective agencies' operations across the globe, focusing on protective agencies in European countries.

ELDER ABUSE DECISION SUPPORT SYSTEM

K.J. Conrad², M. Iris³, P. Liu¹, 1. UCSF, Walnut Creek, California, 2. University of Illinois at Chicago, Chicago, Illinois, 3. Leonard Schanfield Research Institute, Chicago, Illinois

Objectives. The Elder Abuse Decision Support System (EADSS) was designed to meet the critical need for improved methods for assessment and substantiation of elder mistreatment, using a web-based system with standardized assessment measures. **Methods.** Six Illinois agencies participated in the field test. One-year pre/post analyses assessed substantiation results, using Illinois' standard investigation procedure as a comparison. Pre/post acceptability was assessed with caseworkers. Focus groups with APS staff examined users' experiences. Validity of measures was assessed using Cronbach's alpha and receiver operator characteristic curve analyses with final substantiation decision as criterion. **Results.** Increased substantiation of abuse was found. Regarding acceptability, the two systems were found to have differing strengths and weaknesses. Outcome measures had high validity estimates while focus groups indicated directions for improvement. **Significance.** This study was a successful proof of concept that data collected in the field would be useful for clinical purposes as well as for research.

EVALUATING CALIFORNIA'S READINESS TO PARTICIPATE IN THE NATIONAL ADULT MALTREATMENT REPORTING SYSTEM

P. Liu¹, T. Hedani⁸, L. Delagrammatikas², J. Nielsen³, S. Lindberg⁴, C. Alire⁵, S. Skezas⁶, R. MacKenzie⁷, 1. UCSF, Walnut Creek, California, 2. California Department of Social Services, Sacramento, California, 3. City/County of San Francisco, San Francisco, California, 4. Orange County, Orange, California, 5. San Diego County, San Diego, California, 6. Santa Cruz County, Santa Cruz, California, 7. Sacramento County, Sacramento, California, 8. Institute on Aging, San Francisco, California

California's Adult Protective Services (APS) program investigates approximately 15% of all elder abuse, neglect, and exploitation reports in the country. However, as a county-based system, each of the 58 counties operates independently. Collecting and submitting state level data to the National Adult Maltreatment Reporting System (NAMRS) will be a challenge for the state. Two surveys were launched to investigate data systems used and data elements collected in each county. Moreover, in-depth interviews were conducted with 14 counties' 24 APS supervisor, manager, or/and director. Six more interviews are scheduled for the remainder of July. Preliminary findings revealed that one third of the counties track data without any technological support, and expressed the desire to acquire help. Other counties using a case management system vary in the system used and often differ on data elements collected. Challenges including administrative, budgetary, and political issues will be summarized, and a blueprint for next steps in California will be outlined.

GOAL ATTAINMENT SCALING: MEASURING CHANGE IN APS ELDER ABUSE INTERVENTION

D. Burnes¹, M.S. Lachs², 1. University of Toronto, Toronto, Ontario, Canada, 2. Weill Cornell Medical College, New York City, New York

Adult protective services (APS) involvement with elder abuse cases carries the primary objective to reduce risk of re-victimization. Knowledge of effective APS intervention in elder abuse cases is scant. Intervention research is constrained by an absence of outcome measures that can assess change on re-victimization risk status over the course of intervention. Re-victimization risk is difficult to measure due to its multifarious/heterogeneous nature across cases. This presentation will present findings from a prospective study with the State of Maine APS to examine the feasibility of goal attainment scaling (GAS). GAS is a client-centered measure of client change that accommodates case heterogeneity. Based on qualitative interviews with APS caseworkers/management, we will present themes of GAS implementation challenges, feasibility, and best practices. We will also present caseworker focus group findings on constructing a menu of pre-worded GAS scales, which span several areas of risk including living arrangement, safety planning, and social support/engagement.

DEVELOPING AN UNDUE INFLUENCE SCREENING TOOL FOR ADULT PROTECTIVE SERVICES

A.E. Navarro¹, M. Joy², L. Nerenberg³, 1. University of Southern California, Los Angeles, California, 2. Superior Court (ret.), San Francisco, California, 3. California Elder Justice Coalition, San Francisco, California

In 2020, California baby boomers start turning 85, increasing by 143% (CDA, 2012). Given the added risk of experiencing cognitive decline and physical fragility, the need for Adult Protective Services (APS) efficiencies will be critical. Training and screening tools that recognize financial abuse have also been recommended within the APS field. In a report—Recommended Minimal Program Standards—published by the National Adult Protective Services Association (2013), the importance of APS training in evaluating clients' capacity to manage, use, and preserve assets is highlighted.

This qualitative project examined the diffusion of knowledge about undue influence among 33 APS personnel in two California county-based service organizations to determine the need for a screening tool. Among diverse personnel, 6% had knowledge of the state definition (effective 1/1/2014), while 94% had previous training. Participant feedback of a drafted screening tool designed to screen undue influence risk among vulnerable adults was positively received.

SESSION 4725 (SYMPOSIUM)**LONG-TERM CARE IN ASIA, THE U.S., AND EUROPE**

Chair: L. Polivka, *Claude Pepper Center, Tallahassee, Florida*

Co-Chair: B. Luo, *Western Washington University, Bellingham, Washington*

Long-term care (LTC) is rapidly emerging as a major public policy issue in countries across the developed and developing worlds as their older populations grow at unprecedented rates. Nations vary widely in the kinds of LTC services they provide, how they pay for them and in how they are administered. The presenters in this symposium will demonstrate this variance in their analyses of LTC policies and administrative structures in several countries from Asia to Europe and

the United States. Pamela Nadash will compare the efforts of three countries with relatively advanced systems of socially insured LTC to address the cost pressures that are emerging along with big increases in the number of older citizens who need LTC services. Larry Polivka will compare trends in LTC policy in the US and several northern European countries in terms of publicly supported LTC services and financing strategies and their implications for the future of individual (family) responsibility for sharing the costs of LTC services. Jung Kwak will describe the current public LTC system in South Korea and discuss the options available to policymakers confronting the large gap between the current system and the services that will soon be needed by the country's rapidly increasing older population. Baozhen Luo will describe China's urgent effort to develop a LTC system designed to accommodate the continuing growth of the world's largest population of older citizens. Dr. Luo will discuss the need for a more balanced approach to LTC financing based on social insurance.

HOW ARE SOCIAL INSURANCE MODELS OF LTSS FARING? ADAPTATIONS IN GERMANY, JAPAN, AND THE NETHERLANDS.

P. Nadash, *University of Massachusetts Boston, Boston, Massachusetts*

Germany, Japan, and The Netherlands represent the most mature systems of financing LTSS through a social insurance model – that is, via premiums deducted out of wages. The Dutch introduced their program in 1968, Germany in 1995, and Japan in 2000. This paper explores adaptations made by the programs over time, and their implications for systems design. All are facing concerns about the increasing cost burden of the programs. The Dutch program has seen the most extensive overhaul, moving nursing care into the health system, devolving much home-based care to localities, and restricting its cash for care program. The German public LTSS program has also undertaken significant reforms to ensure its sustainability, by increasing its premium, index-linking its benefit, and revising its eligibility criteria. While to date Japan has made smaller changes to its program, a 2013 government report suggested significant cuts, including income-testing, increasing copayments, and cutting benefits.

NEEDING A MORE BALANCED APPROACH—A CRITIQUE OF CHINA'S RECENT DEVELOPMENT IN LONG-TERM CARE

B. Luo¹, Y. Wan², 1. *Sociology, Western Washington University, Bellingham, Washington*, 2. *Jiangxi University of Finance and Economics, Nanchang, China*

China's elderly population (60+) is projected to exceed 440 million by 2050. With the world's largest population of older citizens, the country, however, has yet developed a systematic approach to address its pressing need for long-term care. During the past decade, Chinese governments, at both central and local levels, have aggressively increased their efforts to experiment with various models to finance and deliver long-term care service, with a special focus on including more non-governmental resources such as proprietary corporations and small businesses. Such aggressive experiments were at times poorly designed and executed, and without a clear and well-articulated mission. This paper

offers a critique of the current fragmented and investor-oriented approach and discusses the need for a more balanced approach by including more community-based resources and the nonprofit sector and developing a financing base through some form of social insurance.

POPULATION AGING AND LONG-TERM CARE IN SOUTH KOREA

J. Kwak, *Social Work, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*

The rate of population aging in South Korea is projected to accelerate rapidly over the next three decades, causing South Korea to join Japan and a few European countries as one of the oldest countries in the world after 2050. South Korea does not yet have an extensive long-term care (LTC) infrastructure in place to serve as a foundation for meeting the growing needs for LTC. The presentation will describe these demographic trends and the current LTC system and the growing gap in services that will soon need to be addressed. The presentation will analyze the economic, political and cultural constraints that policymakers will have to overcome to meet the LTC challenge, especially cultural constraints regarding the roles of women and the political challenge of generating enough revenues to support a much more extensive public LTC system than exists today.

SESSION 4730 (SYMPOSIUM)

AGING POLICIES GLOBAL PERSPECTIVES: TOWARD A NEW HORIZON

Chair: U.M. Staudinger, *Columbia University, New York, New York*

Discussant: S.H. Harper, *The Oxford Institute of Population Ageing, Oxford, United Kingdom*

This symposium will discuss aging policies for the 21st century which we will argue need to strive toward a new horizon for at least three reasons: (i) the global nature of demographic change, (ii) the systemic nature of demographic change and its impact on society, and (iii) the potential synergy of increasing sustainability and responding to demographic change.

(1) The whole world is aging now. The world-average life expectancy has changed from 47 in 1900 to 70 in 2015, and 79 years by 2060. The global nature has repercussions for national policies in as much as economies have turned global quite some time ago. What are the implications? (2) Aging policies traditionally have been discussed in three major policy areas: health/disability/long-term care, pensions, human rights. We will ask whether there is more when it comes to aging in the 21st century? (3) Besides, global demographic change, there is another major challenge for our planet and that is, climate change and finite resources. We will ask whether and if so how demographic change and questions of sustainability may go hand in hand?

Jack Rowe will present the results of a NAS task force that investigated some of these questions for the United States. Ruth Finkelstein will focus on her conception of new aging policies that emphasize the importance of built environment, infrastructure, and neighborhood. Maurizio Bussolo will discuss the recent World Bank report on Aging in Europe.

Finally, Angelique Chan presents perspectives from Asia. Finally, Sarah Harper will serve as discussant.

POLICY RECOMMENDATIONS TO ENHANCE HEALTH AND HEALTH CARE OF OLDER PERSONS IN THE US

J.W. Rowe, *Columbia Aging Center, Columbia University, New York, New York*

The US health care system is unprepared to provide the medical, public health and support services needed for the future sick and frail elderly is also not investing sufficiently in keeping people healthy late in life. The US National Academy of Medicine has offered a series of evidence-based affordable policy recommendations in four specific areas: 1) development of new models of care delivery with a special emphasis on people with multiple chronic conditions; 2) strengthening the elder-care workforce by increasing the number of individuals with special geriatric expertise in the professional workforce and increasing the numbers and geriatric competence of all primary care and direct care workers; 3) fostering social engagement, including work for pay and volunteering, in late life; and 4) improving care for advanced illness and at the end of life.

This presentation will discuss the specific NAM recommendations.

GOLDEN AGING: PROSPECTS FOR HEALTHY, ACTIVE, AND PROSPEROUS AGING IN EUROPE AND CENTRAL ASIA

M. Bussolo, J. Koettl, E. Sinnott, *World Bank, Washington, District of Columbia*

Aging societies are not destined to experience stagnation or decline in living standards. The "Golden Aging" report shows that slower population growth offers some opportunities and not just challenges. By taking into account behavioral adaptation, the report finds that: (i) with improved longevity, people are increasing their labor participation at older ages; (ii) their skills do not inexorably deteriorate, but rather shift; (iii) firms can adapt and take advantage of the new demographic reality of an older workforce.

However, the behavioral changes that help reduce dependency and sustain productivity do not necessarily happen automatically. Bold adaptive action is needed across many policy areas, well beyond reforming the intergenerational transfer and pension systems. These encompass, among others, shifting health systems toward preventive care, primary care, and more diagnostics; reforming educational systems to bolster the cognitive skills needed for productive employment along longer working lives; and reforming labor market institutions to allow women to reconcile family and career goals and older people to work more flexible hours.

SUPPORTING SUCCESSFUL AGING IN SINGAPORE: RECENT POLICY INITIATIVE AND DIRECTIONS

A. Chan, *Duke-NUS Medical School, Singapore, Singapore*

Singapore is the most rapidly aging country in Asia. At present, 11% of the population is aged 65 and above and this percentage is projected to increase to 23% in 2030. In January 2016 the Singapore government announced the Action Plan for Successful Ageing in which ten areas for policy change were highlighted; employability, lifelong learning, senior volunteerism, health and wellness, social engagement

and inclusion, aged care services, housing, transport, public spaces, and research on aging. The Action Plan builds in a strong link between research and policy which puts Singapore in a unique position to evaluate policies and programs as they are implemented. To facilitate this linkage, the National Research Foundation has set aside up to \$200 million for a national innovation challenge on active and confident ageing. This paper will discuss some of the policy changes and current research being conducted under the Action Plan.

THE CENTRALITY OF PLACE

R. Finkelstein, *Robert N. Butler Columbia Aging Center, New York, New York*

Public policy is challenged to assimilate global aging. Income support policies for people who live longer than they can work are primary; health and social supports typically follow. These policy issues have been conceptualized as relationships between individuals and the state. The concepts of place and community are often neglected, increasingly important as globalization scatters generations as people move in search of opportunity. Institutions and policies must replace the role of family. Transportation systems must work for drivers and non-drivers and be accessible; public spaces should encourage social interaction across generations; places to walk and sit must be safe as people attend to daily needs; and communities need work, volunteer, education, and engagement opportunities for people of all ages. Housing is particularly complex and should allow families to live close to one another OR live well separately. By ignoring place, we have inadvertently made it more difficult to retain community.

SESSION 4735 (SYMPOSIUM)

GERONTOLOGICAL HIGHER EDUCATION AROUND THE WORLD: COMPETENCIES AND PROFESSIONS

Chair: E. Schoenmakers, *Fontys University of Applied Sciences, Eindhoven, Netherlands*

Co-Chair: J.C. Frank, *University of California, Los Angeles*

Discussant: J.D. Damron-Rodriguez, *University of California, Los Angeles*

With an ageing population worldwide, there is a need for professionals with specialized knowledge and skills in gerontology. Competency-based education (CBE) is a way to assure the development of a workforce that has obtained the know-how to serve older adults. CBE is increasingly recognized as the new pedagogy by accrediting bodies for higher education because of its clear definition of learning goals and accountability for outcomes. In this session, different perspectives on CBE and the consensus and difference in gerontology international competencies are presented. The Association for Gerontology in Higher Education (AGHE) developed a competency framework that can serve as a guideline for developing educational programs in gerontology, which is presented in the first presentation. These competencies, as well as others, are used to a different extent across the world. Educational program development are described and discussed from a European and Pan-American perspective in presentations two and three. Presentation 4

explores the current international job market in gerontology and the competencies required as identified in job postings.

THE ASSOCIATION OF GERONTOLOGY IN HIGHER EDUCATION (AGHE) GERONTOLOGY EDUCATION COMPETENCIES

J.C. Frank, J.D. Damron-Rodriguez, *University of California, Los Angeles, Los Angeles, California*

The Association of Gerontology in Higher Education (AGHE) is a global leader in education on aging and has revitalized competencies for gerontology education programs at the Associate, Bachelor's and Master's degree levels over a 3-year iterative process. This presentation will review the consensus-building process that used a tiered "circle of influence" method, the foundations and organization of the competencies, and the final set of AGHE gerontology education competencies. This presentation will include examples of utilizing the competencies for curricula development, application of a newly designed curriculum mapping tool and approaches to competency-based outcome evaluation. Discussion will include how the AGHE competencies are now being integrated into the Accreditation of Gerontology Education Council as one international program review criterion for programmatic accreditation of gerontology education programs.

COMPETENCIES IN EUROPEAN GERONTOLOGICAL HIGHER EDUCATION. AN EXPLORATIVE STUDY ON CORE ELEMENTS

E. Schoenmakers¹, J.D. Damron-Rodriguez², J.C. Frank², B. Pianosi³, J. Jukema⁴, 1. *Applied Gerontology, Fontys University of Applied Sciences, Berkel-Enschot, Netherlands*, 2. *UCLA, Los Angeles, California*, 3. *Huntington University, Sudbury, Ontario, Canada*, 4. *Windesheim University of Applied Sciences, Zwolle, Netherlands*

This study explores whether there is a common core of competencies in European gerontology education programs by doing a cross-comparison of five undergraduate level programs. Content analysis of competency profile documents at the five European educational programs were studied using thematic analysis. Study results document that there indeed is a common core of elements in gerontological educational programs. Three clusters which included a total of fifteen categories were identified. The clusters were labeled professional attitude, communication skills and service provision. Clusters and categories varied across the five programs. One program in particular included less clusters and categories. This may reflect a difference in focus in the program, but could also reflect a less elaborately formulated competency profile document. The results of this study show that, at the level of formulating competencies, there is a strong agreement on the major components that are important for a gerontologist at the undergraduate level.

IMPROVING LEADERSHIP COMPETENCIES IN PUBLIC HEALTH AND AGING: THE LATIN AMERICA EXPERIENCE

E. Vega¹, J. Parodi², J. Menendez³, L. Rodriguez⁴, 1. *Life Course, Pan American Health Organization (PAHO)*,

Washington, District of Columbia, 2. *University of San Martin de Porres, Lima, Peru*, 3. *Centro Colaborador OPS-OMS en Salud Publica y Envejecimiento, La Habana, Cuba*, 4. *ALMA, La Habana, Cuba*

This study evaluates the certificate program "The Specialization in Management of Health Programs for Older Persons". Under the coordination of Pan American Health Organization (PAHO) and the World Health Organization (WHO), several academic institutions in the America's Region developed a competency-based program to respond to the need for increased skills, knowledge and abilities in public health and aging. After nine generations and more than 250 graduates participating in the 10 month virtual education certificate, results indicated positive outcomes and areas for program improvement. Analyses included change levels using the Kirkpatrick model (reaction, learning, behavior / transfer and impact / outcome). The results provide an opportunity to refine and improve the model initially utilized to foster potential country implementation and to promote the scaling up of the Specialization certificate program and training experience.

COMPETENCIES INCLUDED IN GERONTOLOGY JOB POSTINGS: AN INTERNATIONAL COMPARISON

B. Pianosi, *Gerontology, Huntington University, Sudbury, Ontario, Canada*

As society is ageing, experts from a wide range of professions will work with and for older adults. Some of these professionals are specifically trained to work with older adults, some have a different training with a specialization in older adults or ageing, while others have an occupational training without specific competencies in gerontology. This is true for most industrialized countries, including those located in Europe and North America.

In this study, the job market in the field of gerontology is explored internationally and the competencies as described in the job postings are identified.

SESSION 4745 (SYMPOSIUM)

THE CONSEQUENCES OF GENTRIFICATION AND DISPLACEMENT FOR OLDER ADULTS IN THE U.S.

Chair: A.J. Lehning, *University of Maryland, Baltimore, Maryland*

Discussant: A. DeLaTorre, *Portland State University, Portland, Oregon*

A major focus of U.S. aging policies and programs is supporting the ability of older adults to age in place, based on evidence that neighborhoods become increasingly important in later life due to place attachment and the belief that aging in place can lead to optimal health and well-being. Gentrification, which occurs when more affluent residents move into a neighborhood that was previously occupied by lower-income residents, has received limited attention in gerontological scholarship. The percent of neighborhoods experiencing gentrification has increased in the U.S., and therefore the ramifications of gentrification are receiving more attention from policymakers, researchers, and the media, yet the potential repercussions for older adults are often ignored. To address this gap, this symposium will

examine the consequences of neighborhood renewal for two groups of older adults: those who are involuntarily displaced, and those who continue to age in place. The first two papers will discuss a qualitative study of low-income senior housing residents in Detroit, Michigan who have been involuntarily relocated because of their building's conversion to market rate rents in a deliberate strategy of neighborhood gentrification. The third paper will present findings from a study combining data from the National Health & Aging Trends Study and the U.S. Census to examine the quality of life of older adults living in gentrifying neighborhoods, particularly for those with limited financial resources. The co-coordinator for Age-Friendly Portland, a city experiencing particularly high rates of neighborhood gentrification, will serve as the discussant.

PERSPECTIVES FROM BELOW: OLDER ADULTS' LENSES ON DISPLACEMENT AMID REVITALIZATION IN DETROIT

T.E. Perry¹, J. Mah², 1. *Wayne State University, Detroit, Michigan*, 2. *University of Toronto, Toronto, Ontario, Canada*

As U.S. "declining cities" undertake efforts to revitalize their inner-city neighborhoods, gentrification can result in the direct displacement of vulnerable populations, including older adults. Combining urban planning and anthropological perspectives, this presentation integrates spatial analysis of gentrification processes in Detroit, Michigan with qualitative data collected from a study of low-income seniors who were involuntarily relocated as their building went market rate (n=43). We examine how these perspectives on changes in social networks and their communities shed light on the effects of gentrification for older adults. In particular, we explore how these individual stories collectively increase our conceptual understanding of gentrification-induced displacement. Findings include 1) older adults' challenges with information flow on moving processes and relocation options and 2) perceptions that the city's revitalization does not include low-income seniors. The presentation will conclude with policy and practice implications for understanding the particular concerns of urban older adults experiencing displacement.

PRESERVING SENIOR HOUSING IN A CHANGING CITY: REFLECTIONS ON A COALITION'S EFFORTS

T.E. Perry, *Wayne State University, Detroit, Michigan*

The revitalization of Detroit, Michigan's urban core has invigorated interest to live in these areas of the city. An unintended consequence has been the displacement of seniors whose low-income housing is being converted to market rate apartments. A coalition, Senior Housing Preservation-Detroit, formed to address immediate needs of older adults and advocate for policies that promote a city for all ages and income levels. This presentation offers reflections on lessons learned in the coalition's history, including concerns of membership, messaging, mission and goals and tangible outcomes. One lesson learned was to gain the coalition members' views on development, and fit goals of the coalition within these views. Excerpts from the documentary as well as related research (n=43) will be featured. This presentation will conclude with next steps for preserving senior housing in

Detroit, and how this coalition's efforts may be aligned with other preservation efforts around the United States.

AGING IN PLACE IN GENTRIFYING NEIGHBORHOODS: IMPLICATIONS FOR PHYSICAL AND MENTAL HEALTH

R. Smith², A.J. Lehning¹, K. Kim¹, 1. *Social Work, University of Maryland, Baltimore, Maryland*, 2. *Wayne State University, Detroit, Michigan*

In response to the emphasis on aging in place, some commentators have noted the potential deleterious effects for older adults who are living in neighborhoods experiencing either gentrification or disinvestment. Because little gerontological research on gentrification has focused on older adults who stay, we examined health and well-being among older adults living in gentrifying neighborhoods, with particular attention to the economically vulnerable. We used data from the National Health & Aging Trends Study, a representative sample of Medicare beneficiaries ages 65+, combined with U.S. Census data. Employing both matching and multivariate methods, initial findings indicate low-income respondents in gentrifying neighborhoods had significantly higher self-rated health compared to their counterparts in poor neighborhoods, while there was no difference for higher-income respondents. This suggests potential benefits for remaining in a neighborhood undergoing a transformation in residents and amenities, and has implications for addressing the displacement of older residents that often accompanies gentrification.

SESSION 4750 (SYMPOSIUM)

ACTIVE AGING OF KOREAN/KOREAN AMERICAN OLDER PERSONS

Chair: G. Han, *Seoul National University*

Co-Chair: N.S. Park, *University of South Florida, Florida*

Discussant: M. Kim, *Daegu University, Korea (the Republic of)*

The first study will focus on Korea's employment policy of older adults after retirement. With the retirement age of Korea as the lowest among OECD countries, it is important for older Korean adults to find meaningful purpose, not just economically but also for their social identity. The second study will examine the volunteer experiences of older adults as a substitute for their job after retirement. The third study will focus on the successful aging of Korean Americans as immigrants and minority in the U.S. Implications of these studies suggest policy and practice how to adapt well and live actively in their long life expectancy.

EMPLOYMENT POLICY FOR KOREAN OLDER ADULTS

S. Choi, *Korea Labor Force Development Institute for the Aged, Seoul, Korea (the Republic of)*

While Korean society has undergone unprecedentedly high rate of individual and population aging for over three decades, due to late institutionalization of a public pension system and setting a mandatory retirement age at 60, those who receive pensions are less than 50% and the amount of pension on average is too low to maintain the minimum level of living. Hence, almost 50% of older Koreans aged 60 and over want to work mainly to supplement their low income. However, employment policies for older Koreans have not

been so active mainly due to the inattention to social impact of rapid aging and ageism deeply pervasive in Korean society. Moreover, active employment policies are needed to ease the increasing social burden of population aging. This presentation will examine current employment policies for older Koreans and suggest measures to improve current policies in light of the perspective on rapid individual and population aging.

VOLUNTEERING AS ACTIVE AGING OF KOREAN OLDER ADULTS

J.S. Hwang, *Korea Labor Force Development Institute for the Aged, Seoul, Korea (the Republic of)*

Since longevity of Korea is increasing and Korea moves rapidly from an aged society to a super aged society, older adults are becoming very active. Older adults attempt to find their social role after retirement and after entering into the empty nest syndrome. To compensate for their lost role, they try to contribute their experience, knowledge, and skills for Korean society. For analysis, volunteer activities, which were performed in the Korean Senior Citizens Association, were used focusing on how long and how many older adults volunteer. Additionally, each volunteer program was evaluated also. This study focused on the volunteering experiences of older adults and examined volunteerism as an active aging perspective. Based on findings that the types of volunteering depended on the provinces people lived in, their class status, and age, a volunteer model was established as a new role for older Korean adults in the super aged society.

SUCCESSFUL AGING OF KOREAN AMERICAN OLDER ADULTS

S. Kang¹, J. Kim², *1. Binghamton University State University of New York, Binghamton, New York, 2. Kangnam University, Yongin, Korea (the Republic of)*

Purpose: This study presents a utility assessment of two different definitions of successful aging for predicting psychological well-being measured by depressive symptoms. **Design and Methods:** We assessed the following definitions of (a) self-rating of life satisfaction and (b) Rowe's and Kahn's criteria: the absence of illness, disability, and risk factors; maintaining physical and mental functioning; and active engagement with life. We explored these associations with depressive symptoms for each definition using data from 238 Korean immigrant participants living in the US, aged 65–98 years. **Results:** The percentage of those rating themselves as aging successfully is higher than the percentage classified according to Rowe's and Kahn's criteria. Many Korean immigrant elders with chronic medical conditions did not belong to Rowe and Kahn's Successful aging criteria, but still rated themselves as aging successfully. **Implications:** The conceptualization and measurement of successful aging needs to be applied differently.

SESSION 4755 (SYMPOSIUM)

IN SEARCH OF QUALITY ELDERCARE WORKERS: ISSUES AND CHALLENGES FROM AN INTERNATIONAL PERSPECTIVE

Chair: C.T. Hayashida, *St. Francis Healthcare System of Hawaii*

Co-Chair: R. Stone, *LeadingAge, Washington, District of Columbia*

Discussant: L. Yancey, *Elder Stay At Home, Inc., Little Rock, Arkansas*

As one of the most critical challenges for the 21st Century, population aging will have wide-ranging societal and economic ramifications for every nation. As the older population rapidly expands, there will be a burgeoning need for more eldercare workers. Various strategies are being used to moderate the demand from encouraging immigration, postponing retirement age, increasing women in the workforce, increasing birth rates to the use of technology to supplement worker shortages. This session will address another strategy - the importation of migrant healthcare workers. It will provide a global overview of this human migration to address this shortage and its implications. While the importation of migrant workers is seen as one of the most critical to resolve this growing crisis, there are also numerous issues that need to be addressed. This is not just an acculturation challenge. There is a need to address questions related to exploitation, livable wages, permanent residency, opportunities for advancement and consequences for the sender nations. There are differences in the classification of job taxonomies and the certification and training requirements cross-nationally. Is it possible to create international standards regarding eldercare training requirements? As the leading edge of this demographic revolution, Japan's experience will shed important light through this symposium. This session will also reflect on the experiences and pioneering work of the Arkansas-based Schmieding Center for Senior Health and Education. Recommendations and dos and don'ts for policy and curriculum design will be shared.

FOREIGN-BORN AND MIGRANT DIRECT CARE WORKERS: A SOLUTION TO THE GLOBAL DEMAND FOR ELDERCARE

R.I. Stone, *LeadingAge, Washington, District of Columbia*

This presentation critically reviews issues related to the increasing reliance on foreign born/migrant workers to address the eldercare workforce crisis in high and middle income countries. It begins with a brief discussion of the factors underlying the growing demand for and lack of direct care workers in most of the developed world, followed by a description of the percent and countries of origin of foreign-born workers employed in Europe, the United States, Canada, Australia and Asia. The benefits of and challenges to this growing reliance on a foreign-born workforce for elderly consumers, their families, workers and the host and origin countries are identified. This session concludes with examples of how organizations such as the WHO, the ILO and the OECD are attempting to address the challenges to this global transfer of human capital through the development of standardized recruitment/retention practices, ethical guidelines, training programs and employer registries.

SOME JAPANESE MEASURES FOR SECURING LONG-TERM CARE WORKERS

T. Ogawa, *1. Active Aging Consortium Asia Pacific (ACAP), Fukuoka, Japan, 2. Fukuoka City Planning Committee*

for *Advanced Healthy City, Fukuoka, Japan*, 3. *Kyushu University, Fukuoka, Japan*

In Japan, the long-term care for the elderly is distinct and defined separately from nursing care. Professional paid employment in long-term caring requires specialized training and a national qualification as “Certified Care Worker. Unlike nurses who are part of the medical and health care system, Certified Care Workers are aligned with the social welfare system under Japanese law. Given this legal arrangement, it is difficult to recruit the quantity and the quality of long-term care workers. International migrant care workers in Japan are not permitted under current law to be recruited as “Certified Care Workers”. Consequently, Japan is developing additional strategies to recruit a new long-term care workforce. The national strategy entails: (1) Stratifying LTC competencies, knowledge and skills; (2) International agreements call for Economic Partnerships that permit technical internships in long-term care by migrant workers; (3) Long-term care will be added as a new entry work category and (4) Promoting the standardization of training for long-term care and nursing care.

QUALITY CARE: BETTER TRAINING FOR BETTER DIRECT CARE WORKERS

L. Wright, 1. *Schmieding Center for Senior Health & Education, Springdale, Arkansas*, 2. *University of Arkansas Medical Sciences, Little Rock, Arkansas*

The recruitment of a sufficient number of workers to address the growing workforce shortage of direct care workers in home care is imperative. Also critical will be the development of training standards to ensure that these workers have adequate skills and knowledge to provide high quality care in the home setting, the real focus of long-term caring. Training curriculum with a strong focus on (1) the fundamental caregiving skills (cognitive and physical), (2) a tiered training approach from personal care to the CNA level and (3) Advanced Aide preparation given the increased complexity of client needs have proven successful. This approach as exemplified by the Schmieding Model will be discussed. Based on decades of experience in field tested curriculum design and on-going training in several states, suggestions for national standards for training to prepare direct care workers to serve an expanded role within the home care team will be made.

SESSION 4760 (SYMPOSIUM)

INTEGRATIVE ANALYSIS OF LONGITUDINAL STUDIES ON AGING AND DEMENTIA (IALSA)

Chair: J. Kaye, *Oregon Health & Science University, Por, Oregon*

Co-Chair: S.M. Hofer, *University of Victoria*

Cross-validation of research findings across independent longitudinal studies is essential for building the most effective evidence base for successful cumulative science in gerontology. In many cases, cross-study differences in measurements and sample composition (e.g., ability level, education, language) impede the utility of pooled data analysis, particularly in the case of longitudinal studies. Harmonization can occur at the levels

of research question, statistical models, and measurements, permitting synthesis of results for understanding ways in which birth cohort, country, culture, and issues of mortality and selection relate to outcomes and differences across studies. The goal of the Integrative Analysis of Longitudinal Studies of Aging and Dementia (IALSA: NIH/NIA P01AG043362) research network encompassing over 100 studies from around the world is to maximize opportunities for international reproducible research and cross-validation across heterogeneous sources of evidence by evaluating comparable statistical models, with comparison of the pattern and magnitudes of effects at the construct level. This symposia describes network activities and methods and provides multiple examples for rigorous cross-study comparison based on the coordinated analysis approach.

INTEGRATIVE DATA ANALYSIS AND HARMONIZATION OF LONGITUDINAL STUDIES OF AGING AND DEMENTIA

S.M. Hofer, 1. *Psychology, University of Victoria, Victoria, British Columbia, Canada*, 2. *Oregon Health & Science University, Portland, Oregon*

The Integrative Analysis of Longitudinal Studies of Aging and Dementia network (IALSA; ialsa.org; NIH/NIA P01AG043362) facilitates interdisciplinary, cross-national research on determinants and dynamics of within-person aging-related changes in cognitive and physical capabilities, health, personality, and well-being. A key feature of the IALSA network is the optimization and evaluation of the reproducibility through a coordinated analysis approach based on comparable statistical models and measurements. Affiliated studies are catalogued on the IALSA-Maelstrom Metadata and Harmonization Platform to permit the identification of studies for answering particular questions. Network activities encourage the examination of cross-cultural and cross-cohort effects and provide a strong basis for synthesizing evidence across longitudinal studies. Merits of coordinated analysis and current approaches and challenges for quantitative harmonization are discussed.

CORRELATED DYNAMICS ACROSS PHYSICAL AND COGNITIVE FUNCTIONING IN 12 LONGITUDINAL STUDIES

A.M. Piccinin¹, G. Muniz², 1. *Psychology, University of Victoria, Victoria, British Columbia, Canada*, 2. *University of Edinburgh, Edinburgh, United Kingdom*

Maintaining independence in older age depends on adequate levels of physical and cognitive functioning. Numerous studies, both longitudinal and cross-sectional, describe progressive declines although few studies report on the dynamics within and across these domains of functioning. In a coordinated analysis of 12 longitudinal studies, we examined associations between changes in physical functioning (i.e., grip strength, pulmonary function) and changes in cognitive functioning (i.e., speed, memory, reasoning, executive functioning) using multivariate latent growth curve models analyses with adjustment for baseline age, sociodemographic factors, health behaviors, diabetes, and cardiovascular disease. Overall, initial levels of pulmonary and cognitive functioning were related across many measures of cognitive functioning for both men and women. Multivariate patterns of change across physical and cognitive

variables were less consistent. We provide a research synthesis of the findings across studies and describe study-level differences in terms of country, cohort, and measurements.

ACTIVE COGNITIVE LIFESTYLE AS A PROTECTIVE FACTOR FOR COGNITIVE DECLINE AND DEMENTIA?

G. Muniz¹, A. Robitaille², I. Cukic¹, E.O. Hoogendijk⁵, J. Skoog³, A. Koval², S.M. Hofer², A. Van den Hour⁴, 1. *Centre for Dementia Prevention, University of Edinburgh, Cambridge, United Kingdom*, 2. *University of Victoria, Victoria, British Columbia, Canada*, 3. *University of Gothenburgh, Gothenburgh, Sweden*, 4. *University College London, London, United Kingdom*, 5. *VU University, Amsterdam, Netherlands*

There is considerable evidence to support a link between an active cognitive lifestyle and a decreased risk of cognitive decline and dementia. Further, it has been shown that an active lifestyle is associated with a decreased risk of cognitive decline, an increased risk of cognitive recovery and a reduced risk of mortality, though results are inconsistent across studies. These inconsistent results may be explained by sample and study differences, but also differences in the methodologies employed.

Our aim here was to evaluate replicability of results when investigating the independent and combined impact of cognitive lifestyle factors on transitions between the following clinically relevant cognitive states: non- impaired cognitive health, mild impairment and moderate-to- severe impairment, and thereafter, death. With this aim, we used a coordinated analysis where the same multi-state model was fitted to MMSE scores from participants of 7 studies of ageing, to assess the relationship between separate and combined measures of cognitive lifestyle to forward and backward transitions between cognitive states over time.

We used data from LASA (Netherlands), the Lothian Birth Cohort 1936 (Scotland), MAP (US), H70 (Sweden) study, the OCTO Twin (Sweden) and the MAP (US).

Results indicate an independent protective effect of some of the factors examined, but not consistently across states and samples.

PERSONALITY AND SMOKING-RELATED MORTALITY: A MULTI-STUDY ANALYSIS WITH 15 REPLICATIONS

E. Graham, D.K. Mroczek, *Psychology, Northwestern University, Evanston, Illinois*

Background: Psychological characteristics such as personality traits are independent predictors of mortality risk. Health-detrimental behaviors such as smoking are mechanisms (mediators) that connect psychological factors such as traits to downstream outcomes such as disease and mortality. Personality traits may be a behavioral “vital sign” that physicians can use to predict long term health risks for individuals. We used 15 studies from around the world to test whether smoking mediated the effect of personality traits on mortality, and to evaluate the overall effect of traits on mortality risk.

Methods: Subjects were 44,455 participants in 15 separate longitudinal studies. Survival analysis in a structural equation modeling framework simultaneously assessed the

association between the Big 5 personality traits and mortality risk and smoking as a mediator.

Results: A gradient (standard deviation) of extraversion (OR=0.95, 95%CI .91-.99), conscientiousness (OR=0.90, 95%CI .86-.94), and agreeableness (OR=0.95, 95%CI .93-.98), was associated with lower mortality, and a gradient of neuroticism with higher mortality (OR=1.06, 95%CI 1.02–1.09), even when accounting for smoking as a mediating factor. This is much wider array of associations between personality traits and mortality risk than had previously been known. Smoking mediated the conscientiousness- and neuroticism-mortality relationships, partially explaining those associations.

Conclusions: Providers, patients, and policymakers alike may benefit from taking personality traits into account when assessing health risks. Results also point to the benefits of multi-study, coordinated data analysis in promoting reproducibility, replicability, and cumulative science

CARDIOVASCULAR BENEFITS TO EDUCATIONAL ATTAINMENT: INTERNATIONAL EVIDENCE FROM FOUR BIRTH COHORTS

S. Clouston, *Public Health, Stony Brook University, Stony Brook, New York*

Cardiovascular disease (CVD) is the main cause of death in the U.S. and Europe, and results in significant medical comorbidities including dementia. Educational attainment is highly correlated with social inequalities in adult health, and with CVD, though reasons for such an association are unclear. Observational data from four birth cohorts with cognition measured in adolescence were used to examine midlife hypertension, CVD, and stroke, as well as incidence of CVD and stroke. Logistic regression and Cox proportional hazards regression were used to model associations between adolescent cognition, education, and CVD risk. Having a university degree and higher childhood cognition were independently associated with lower risk of incident CVD. Despite a documented selection effect linking cognition to improved education, strong educational benefits remained after adjusting for educational propensity, an association that was mediated in part through improved health behaviors.

SESSION 4765 (SYMPOSIUM)

IMPROVING HOSPITALIZATION OUTCOMES: THE TRANSITION FROM OBSERVATION TO INTERVENTION

Chair: A. Zisberg, *University of Haifa, Haifa, Israel*

Co-Chair: M. Agmon, *University of Haifa, Haifa, Israel*

Negative functional outcomes following hospitalization are widely described; yet, the role of a variety of in-hospital processes that increase the risk for adverse hospitalization outcomes is poorly understood. The goal of this symposium is to discuss research findings from the Hospitalization Process Effects on Functional Outcomes and Recovery (HoPE-FOR) and to introduce the transition of its findings to an intervention study that focuses on improving mobility, the Walk-FOR (Functional Outcomes and Recovery) study.

The first presentation will summarize the main findings from the HoPE-FOR study emphasizing the modifiable

factors and barriers toward the development of future interventions to improve functional outcomes. The second presentation will describe the contribution of organizational factors such as staff skill mix and patients' complexity to hospitalization outcomes, demonstrating how functional status of all hospitalized patients at the unit is related to individual outcomes. The following presentation will focus on a rarely described topic, disruption of patients' routine during hospitalization and its adverse effect on hospitalization outcomes. Recommendations to take into consideration patients' personal routine into interventions aimed at improving hospitalization outcomes will be proposed. The fourth presentation will discuss the dose-response effect of mobility on functional decline. This presentation will present a suggested cut-point for in-hospital step count. Finally, we will introduce the Walk-FOR intervention, developed in accordance with the above mentioned processes aimed to improve hospitalization outcomes.

HOSPITAL ACQUIRED FUNCTIONAL DECLINE: THE ROLE OF IN-HOSPITAL PROCESSES BEYOND PERSONAL RISK FACTORS

A. Zisberg¹, G. Sinoff², N. Gur-Yaish³, O. Tonkikh¹, E. Shadmi¹, 1. *The Cheryl Spencer Department of Nursing Faculty of Social Welfare and Health Science, University of Haifa, Israel, Haifa, Israel*, 2. *Department of Gerontology, Faculty of Social Welfare and Health Sciences, University of Haifa, Israel, Haifa, Israel*, 3. *Center for Research and Study of Aging, Faculty of Social Welfare and Health Sciences, University of Haifa, Israel, Haifa, Israel*

To test a comprehensive model accounting for individual risk factors and hospitalization processes that lead to functional decline (FD) at discharge and one-month follow-up, a prospective cohort study was conducted in two medical centers. A total of 684 participants (70+) interviewed at-admission, during hospitalization, at-discharge and one-month follow-up. In-hospital mobility, continence care, sedative-hypnotic consumption, satisfaction with the hospital environment and nutrition consumption were assessed to model FD from pre-morbid to discharge and one-month post-discharge. In-hospital mobility ($\beta=-.48$, $p<.001$) and continence care ($\beta=-.12$, $p<.001$) were the most dominant process factors directly related to FD at discharge and one-month post discharge, together with personal risk factors accounted for 64% and 32% of the variance, respectively. In-hospital mobility and continence care were inter-correlated ($p=.49$, $p<.001$) proposing shared risk factors and need to address them simultaneously in future interventions. These are potentially modifiable hospitalization risk factors for which practice and policy should be targeted.

TEAM SKILL-MIX AND PATIENT CASE-MIX: ARE THEY RELATED TO HOSPITALIZATION FUNCTIONAL OUTCOMES?

E. Shadmi³, O. Tonkikh³, G. Sinoff¹, Z. Oleg², A. Zisberg³, 1. *Department of Gerontology, Faculty of Social Welfare and Health Sciences, University of Haifa, Israel, Haifa, Israel*, 2. *University of Washington, Seattle, Washington*, 3. *The Cheryl Spencer Department of Nursing, Faculty of Social Welfare and Health Science, University of Haifa, Israel, Haifa, Israel, Israel*

We aimed to test the association between nursing skill-mix and patient case-mix on the functioning of older adults hospitalized in internal medicine wards of general hospitals. We performed a retrospective study of 463 participants of the HoPE-FOR study. The number of nurses/patients and the percent of patients with low functioning of all patients at the unit was assessed for the duration of hospitalization for each participant. Survey data was used to elicit information on participants' functioning and personal risk factors. A total of 224 (48.3%) patients experienced FD. Number of patients at the unit with low functioning and the number of nurses was positively correlated ($r_p=0.69$, $p<0.001$). Percent of unit patients who had low levels of functioning was associated with increased odds of FD of study participants (OR=1.60, 95% CI=1.18–2.16), controlling for all known risk factors. We conclude that nursing skill-mix should account for the functioning levels of hospitalized patients.

OLDER ADULTS' PERSONAL ROUTINE AT TIME OF HOSPITALIZATION

N. Gur-Yaish¹, A. Zisberg², 1. *Center for Research and Study of Aging, Faculty of Social Welfare and Health Sciences, University of Haifa, Israel, Haifa, Israel*, 2. *The Cheryl Spencer Department of Nursing Faculty of Social Welfare and Health Science, University of Haifa, Israel, Haifa, Israel*

This study is the first to explore whether hospitalization disrupts the daily routines of dependent and independent older adults. Data were collected as part of a prospectively designed study from 330 hospitalized older adults age 70+. Patients reported prehospitalization frequency, duration, and timing of basic activities of daily living and leisure activities at hospital admission. Hospital routine was assessed on day of discharge. Results indicated that frequency and duration of most activities decreased during hospitalization; the sharpest decrease was in getting dressed. Showering occurred two hours earlier in the hospital, and getting dressed an hour and a half later. For dependent respondents, the greatest change was in duration; for independent respondents, the greatest change was in frequency. Given the importance of personal routine maintenance to health and well-being, it should be considered a key component for intervention to minimize the adverse functional outcomes and impact recovery.

"NO ONE SIZE FITS ALL": DEVELOPING A SITE-SPECIFIC, IN-HOSPITAL MOBILITY INTERVENTION—THE WALK FOR®

M. Agmon¹, E. Gil^{2,3}, A. Zisberg¹, N. Gur-Yaish⁴, 1. *The Cheryl Spencer Department of Nursing Faculty of Social Welfare and Health Science, University of Haifa, Israel, Haifa, Israel*, 2. *Bnei-Zion Medical Center, Haifa, Haifa, Israel*, 3. *Faculty of Medicine, Technion, Haifa, Haifa, Israel*, 4. *Center for Research and Study of Aging, Faculty of Social Welfare and Health Sciences, University of Haifa, Israel, Haifa, Israel*

The few protocols aimed to improve in-hospital mobility require further work to response to site-specific needs and available resources. The presentation will describe a process of developing a site-tailored mobility intervention

considering local barriers and resources followed by an adoption of aspects from the MOVE-ON® intervention. A Mixed-methods study included in-depth interviews (n=10), assessment of medical team's (n=90) and patients (n=200) attitudes, behaviors and knowledge toward mobility in two internal medical units was conducted. Findings show that patients walked less than their ambulation at home and below their ability during hospitalization. Surprisingly, patients' attitudes toward mobility were more positive than the medical staff's. Mobility was not considered essential to the standard of care. Nursing assistants were recognized as a competent sector to promote patients' mobility. Preliminary results show high satisfaction from the Walk FOR® intervention and mobility increased by more than 50%.

HOW MANY STEPS ARE NEEDED TO PREVENT HOSPITALIZATION FUNCTIONAL DECLINE?

M. Agmon^{1,4}, A. Zisberg¹, E. Gil^{3,4}, D. Rand², 1. *The Cheryl Spencer Department of Nursing Faculty of Social Welfare and Health Science, University of Haifa, Israel, Haifa, Israel*, 2. *Department of Occupational Therapy, Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel, Tel-Aviv, Israel*, 3. *Bnei-Zion Medical Center, Haifa, Haifa, Israel*, 4. *Faculty of Medicine, Technion, Haifa, Haifa, Israel*

Mobility during hospitalization is a modifiable predictor of hospitalization acquired functional decline (HAFD). However, the dose-response effect of mobility is yet to be proposed. Prospective cohort study conducted in two internal-medical units in Israel identified steps number that older adults need to walk to prevent HAFD. The number of daily steps walked by 177 older participants was monitored using an activity-monitoring device (Actical®) for 1–3 days. Change in functional ability during hospitalization was assessed objectively and subjectively on admission and discharge. Analysis of covariance compared five theoretically proposed step counts groups (<300, 300–599, 600–899, 900–1999, >1999) identified 900 steps threshold cut-point. Multivariate logistic regression revealed that less than 900 steps per day increases the odds of objective HAFD by 4 folds (95%CI 1.2–13.0) and by 5.6 on subjective HAFD (95%CI 2.4–13.2). To conclude, the 900 steps per day recommendation can serve as a significant cut-off threshold to prevent HAFD.

SESSION 4770 (SYMPOSIUM)

HEALTH STATUS OF OLDER ADULTS AND CAREGIVERS IN DEVELOPING COUNTRIES: INTERNATIONAL SURVEY RESULTS

Chair: H. Xu, *Duke University, North Carolina*
Co-Chair: B. Wu, *Duke University, Durham, North Carolina*

This symposium examines the health status among older adults and their family in developing countries using national and international surveys. The first three papers used the WHO's Study on global AGEing and adult health (SAGE) Wave-1 data in 2010 and the last paper used the Chinese Longitudinal Healthy Longevity Survey 2005 wave and the Family Dynamics Survey. The first paper assessed the association between migration and cognitive function among older adults in China across six groups of residents: urban, rural,

urban-to-urban, rural-to-urban, rural-to-rural, and urban-to-rural. The results demonstrated urban-to-urban residents showed the highest level of cognitive function, followed by urban residents, while rural-to-rural residents showed the poorest cognitive function. The second study investigated the role of migration on the disparities in prevalence of hypertension across different populations in China and found rural-to-rural and rural residents were more likely, whereas urban-to-urban residents were less likely to have hypertension compared to urban residents. The third paper is a cross-national study that explored factors that influencing quality of life (QoL) among older adults in China, India, Russia, Ghana, and South Africa. This study found that not living in South Africa and Ghana (ref: China), better SES, higher level of cognitive and functional status, absence of diabetes, and higher level of social support were positively associated with QoL. The last paper examined association between filial piety and caregiving burden among Chinese adults children caregivers. The results showed filial piety is negatively related to caregiving burden. Urban-rural disparities in perceived caregiving burden were also found.

ASSOCIATION BETWEEN MIGRATION AND COGNITIVE FUNCTION AMONG OLDER ADULTS IN CHINA

H. Xu¹, M.E. Dupre², T. Ostbye², A. Vorderstrasse¹, B. Wu¹, 1. *Duke University School of Nursing, Durham, North Carolina*, 2. *Duke University Department of Community and Family Medicine, Durham, North Carolina*

The objective of this study was to assess the association between migration status (urban, rural, urban-to-urban, rural-to-urban, rural-to-rural, and urban-to-rural) and cognitive function among older adults. We used data from the World Health Organization Study on global AGEing and adult health (SAGE) that included adults aged 50 and older from China (N=12937). Global cognitive function was measured by Digit Span Tests, Verbal Fluency, Immediate, and Delayed Recall Tests. Controlling for socioeconomic status and health conditions, significant differences in cognitive function were found across the six migration groups, with urban-to-urban residents having the highest level of cognitive function, followed by urban residents. Rural-to-rural residents had the poorest global cognitive function. The results suggest that early-life migration is independently associated with cognitive function in older age in China.

DISPARITIES IN PREVALENCE OF HYPERTENSION ACROSS DIFFERENT POPULATIONS IN CHINA

Z. Ni¹, H. Xu¹, B. Wu², 1. *School of Nursing, Duke University, Durham, North Carolina*, 2. *Rory Meyers College of Nursing, New York University, New York, New York*

The purpose of this study is to investigate the role of migration on hypertension among older adults in China across six groups of residents: urban, rural, urban-to-urban, rural-to-rural, rural-to-urban, and urban-to-rural. The study was conducted among adults aged 55 years and older from the Study on Global Aging and Adult Health (SAGE) (N=12,937). The study found that rural-to-rural residents had the highest prevalence of hypertension (30.97%), followed by rural residents (29.17%). Urban-to-urban residents had the lowest

prevalence of hypertension (23.37%). Controlling for demographics and health behaviors, rural-to-rural and rural residents were more likely to have hypertension compared with urban residents, whereas urban-to-urban residents were less likely to have hypertension. Other factors related to hypertension were older age, lower level of education, higher income, smoking, and heavy drinking. This study suggests that migration in early life may have an impact on the development of chronic disease in later life.

FACTORS INFLUENCING QUALITY OF LIFE AMONG OLDER ADULTS IN LOW- AND MIDDLE-INCOME COUNTRIES

K. Lee¹, H. Xu², B. Wu³, 1. *College of Nursing, Yonsei University, Seoul, Korea (the Republic of)*, 2. *Duke University, Durham, North Carolina*, 3. *New York University College of Nursing, New York, New York*

Although quality of life (QoL) is an important component for successful aging, contributing factors on QoL among old adults in Low- and Middle- Income Countries (LMICs) have not been fully examined. We examined factors influencing QoL using the WHO's Study on global AGEing and adult health (SAGE) Wave-1 data (2007–2010). Based on the literature reviews, a set of variables were selected as independent variables. The study sample consisted of 19625 participants age 60+ in China, Ghana, India, Russia, and South Africa. Hierarchical multiple linear regression analyses were performed with WHOQoL scores as the dependent variable. Country, married, higher income, having medical insurance, higher level of cognitive and functional status, absence of diabetes, and higher level of social support were positively associated with QoL. There is a need to develop programs to enhance cognitive and functional status and social support, and ultimately to improve QoL among old adults in LMICs.

ASSOCIATION BETWEEN FILIAL PIETY AND CAREGIVING BURDEN AMONG CHINESE ADULTS' CHILDREN CAREGIVERS

J. Wang¹, H. Liang², B. Wu^{1,3,4}, 1. *Duke University School of Nursing, Durham, North Carolina*, 2. *Nanjing University School of Social and Behavioral Sciences, Nanjing, Jiangsu, China*, 3. *Duke University Center for the Study of Aging and Human Development, Durham, North Carolina*, 4. *Duke Global Health Institute, Durham, North Carolina*

The aim of this study was to examine filial piety among Chinese adult children caregivers and its relationship with their self-perceived caregiving burden. We used the data from the Chinese Longitudinal Healthy Longevity Survey 2005 wave and the Family Dynamics Survey. This study included 661 dyads of older adults with functional limitations and their adult children caregivers (417 from rural areas and 244 from urban areas). Caregiving burden was measured by the Zarit's Burden Interview (Chinese) and the filial piety perception was measured by the filial piety scale. The results showed that compared with those in urban areas, caregivers in rural areas tended to report a higher level of caregiving burden ($p < 0.05$). The greater sense of filial piety the adult children reported, the lower level of the caregiving burden they perceived ($p < 0.05$). This study suggests that valuing filial piety might be positively associated with reducing level of caregiving burden.

SESSION 4775 (SYMPOSIUM)

INTERNATIONAL TRANSLATIONAL CARE RESEARCH

Chair: C. Fox, *University of East Anglia, Norwich, Norfolk, United Kingdom*

Co-Chair: M. Boustani, *Indiana University, Indiana, Indiana*

Discussant: M. Austrom, *Indiana University, Indiana, Indiana*

Cognitive impairments, including dementia and delirium are one of the greatest challenges facing the global health and social care community. Dementia is a major risk factor for delirium. Compelling evidence now shows that episodes of delirium constitute a significant risk factor for new onset dementia and more rapid progression of existing dementia. The interrelationships between dementia and delirium mean that these conditions are being viewed as a much more of a continuum. Additionally, delirium superimposed onto dementia is common, serious and a medical emergency.

The exceptional vulnerability of the population affected means they are at high risk of poor standards of health and social care as well as poor physical and mental health management. The challenge of developing innovative sustainable services to support cognitively vulnerable, elderly patients relies on developing good practice care delivery options into integrated pathways capable of transcending health and social care divides. Critical and central to this is the activation of, or opportunity for activation of, carers and patients in partnerships towards creating good and meaningful working relationships.

This symposium will provide a platform for the interrelated work of three international collaborative care research groups (German DZNE, USA-IU and UK (UEA-DRC). Working together since 2010, presenters will showcase how an activation orientation is being used to develop internationally transferable care research. The four papers presented will provide research findings from across primary, acute and community care sectors and demonstrate how activation of patient/carer stakeholder partnerships, amplifies integrated working.

WHAT DO WE LEARN FROM A CLUSTER-RANDOMISED CONTROLLED TRIAL OF DEMENTIA CARE MANAGEMENT IN GERMANY?

J. Thyrian, *German Center for Neurodegenerative Diseases (DZNE), Greifswald, Germany*

In Germany, there is a lack of evidence-based models of healthcare provision for people with dementia (PWD) in primary care. Within the DelpHi- trial (Dementia-life-and-person-centred-help) we adapted and evaluated a collaborative care model into the German health care system.

DelpHi is a two arm General Physician-based, cluster-randomized, controlled intervention trial. The intervention arm received Dementia Care Management (DCM). DCM aims to provide optimum care for PWD. It consists of (a) a comprehensive assessment of the care situation, needs and resources, (b) a computer-assisted development of an individually tailored treatment and care plan (c) a systematic and documented communication with treating GP, (d) support in and monitoring of achieving treatment and care goals. DCM

is provided by specifically trained nurses. Control was usual care.

This paper will discuss findings from the DelpHi-trial, focusing on its efficacy in primary care, translation and activation of patient/carer stakeholder opportunities and subsequent implementation efforts.

USING POPULATION HEALTH MODELS TO IMPROVE PATIENT CARE, REDUCE HOSPITAL STAYS AND ER VISITS

M.A. Boustani, *Indiana University, Indiana, Indiana*

More than 4.7 million Medicare beneficiaries and their families live with dementia. To address their needs and reduce their cost of care, Eskenazi Health (Indianapolis) employs re-envisioned model of care that includes two important distinctions. It provides care for the whole person – mind, body and family – and it expedites the translation of best practices from lab to patient care. This orientation recognises the role and activation opportunities that working closely with family members plays in enabling cognitively impaired individuals to live in the community rather than nursing facilities.

Physicians, nurses, social workers and other staff members work closely with the older adult and family caregivers to deliver care and improve both brain and physical health.

This paper will present results from this research programme, illustrating how reductions Emergency Department visits, in hospitalization stays and annual net cost were achieved and amplified by closer integrated working with patients and their families.

CARING FOR PEOPLE WITH HIP FRACTURE AND COGNITIVE IMPAIRMENTS: FINDINGS FROM PERFECTED

C. Fox, B. Penhale, J. Cross, F. Poland, T. Smith, S.P. Hammond, *Norwich Medical School, University of East Anglia, Norwich, United Kingdom*

The risk of hip fracture for people living with dementia is four times greater than for those without. Providing care for this group of people is challenging, but elements of good care do show beneficial patient and economic outcomes. Specific care treatment pathways which acknowledge differences the presentation and care needs of this complex patient group are proposed to improve clinical and process outcomes for this population.

Within the United Kingdom, the role of family members and informal carers in acute settings has become foregrounded through the innovative research methodologies of the Peri-operative Enhanced Recovery hip Fracture Care of patients with Dementia (PERFECTED) research programme. This paper will report findings from; an international telephone survey, ethnographic observations in acute settings and focus groups with healthcare professionals, patients and carers to discuss activation opportunities for involving patient and their carers in integrated care practices across the continuum of cognitive impairment.

DEVELOPING A NEW WORKFORCE TO PROVIDE GERIATRIC DEPRESSION AND DEMENTIA CARE IN COMMUNITY SETTINGS

M. Austrom, *Department of Psychiatry, Indiana, Indiana*

Depression and Behavioural and Psychological Symptoms of Dementia (BPSD) commonly occur outside of long-term care facilities. BPSD can be extremely physically and psychologically draining for people living with dementia and the family members/carers. However, little research evidence exists regarding the development and training for care workers in community settings. This paper will report on a research programme which developed and evaluated a workforce intervention for community dwelling patients with dementia and/or depression and their caregivers.

Sixteen Care Coordinator Assistants (CCAs) were trained in person-centred, collaborative care. CCAs made on average 15 home and phone visits to over 1200 patients. From a qualitative analysis of CCAs case reports themes emerging included patient familiarity and continuity of care. These themes illustrate how interventions can be effectively implemented by well-trained CCAs in the community to improve outcomes for patients and their caregivers.

SESSION 4780 (SYMPOSIUM)

NEW INSIGHTS INTO IMMUNOLOGIC MECHANISMS OF PROTECTION THROUGH VACCINATION IN OLDER ADULTS

Chair: J.E. McElhane, *Health Sciences North Research Institute, Sudbury, Ontario, Canada*

Co-Chair: G. Kuchel, *University of Connecticut*

Discussant: A. Akbar, *University College London, London, United Kingdom*

A decline in immune function is a hallmark of aging that leads to complicated illness from a variety of infectious diseases and may limit the ability to appropriately respond to vaccination. This decline can be attributed not only to the changes associated with immune senescence, but also the contributions of multiple chronic conditions, chronic infections including cytomegalovirus, and related frailty that are often present in older adults, and increase the risk for functional decline with many infectious diseases. Identifying changes in immune (B and T cell) responses that lead to loss of protection and how vaccines might alter the senescent immune response and defined immune correlates of protection are key to improving vaccine efficacy and preventing disability in older adults.

B CELL SENESENCE IMPAIRS THE INFLUENZA VACCINE RESPONSE

D. Frasca, M. Romero, A. Diaz, B. Blomberg, *University of Miami Miller School of Medicine, Miami, Florida*

The capacity of an individual to mount protective antibody responses after influenza vaccination decreases with age. Objectives We characterized novel contributors to phenotypic and functional changes in aged B cells, which may be associated with a protective antibody response. We determined the percentages of the major peripheral B cell subsets in the peripheral blood of young and older adults, as well as their level of immune activation according to senescence-associated secretory phenotype (SASP) markers, such as pro-inflammatory cytokines, inflammatory micro-RNAs and cell cycle regulators. We found that only memory B cells express SASP markers, and especially the late memory (LM) B cell

subset, which is increased with age. LM B cells also show spontaneous activation of AMP-activated protein kinase (AMPK), the energy sensing enzyme ubiquitously expressed in mammalian cells. LM B cells activate a p38MAPK signaling pathway leading to the expression of SASP mediators, while class switch recombination is downregulated.

ROLE OF IMMUNOSENESCENCE, FRAILITY, CMV AND VACCINE DOSE IN IMMUNE RESPONSES TO INFLUENZA VACCINATION

G. Kuchel¹, L. Haynes¹, J.E. McElhaney², 1. *University of Connecticut School of Medicine, Farmington, Connecticut*, 2. *Health Sciences North Research Institute, Sudbury, Ontario, Canada*

Nearly 90% of flu-related deaths and most new disability occurs in older adults. Beyond chronological age, CMV status and frailty both contribute to decreased influenza vaccine responses and worsening clinical outcomes. Aging, frailty and CMV status have been associated with declining immune function in older adults. Through the validation of our biomarkers of influenza vaccine responses, we wish to identify older adults more likely to benefit from high dose formulations of the influenza vaccine. We show that HAI antibody responses are age-dependent with the standard dose vaccine, resulting in lower responses with aging. High dose vaccine is able to overcome some of these age-related declines. Although basal granzyme B (bGrzB) levels are higher in CMV-positive subjects, inducible (iGrzB) responses are dependent on vaccine dose and are independent of CMV status. Moreover, poor iGrzB responders to flu vaccination are at greater risk of developing influenza illness.

DECREASED ZOSTER VIRUS SPECIFIC T CELL RESPONSES LINKED TO EXCESSIVE INFLAMMATION IN AGED SKIN

A. Akbar, *University College London, London, United Kingdom*

The incidence of varicella-zoster virus (VZV) re-activation increases during ageing. Although the effects of VZV re-activation are observed in the skin (Shingles) the number or functional capacity of skin resident VZV specific T cells have not been investigated. VZV-specific CD4⁺ T cells were significantly increased in the skin compared to the blood, with no age associated differences. In contrast, the number of FoxP3⁺ regulatory T cells (Tregs) and expression of the inhibitory receptor PD1 on CD4⁺ T cells were significantly increased in the skin of older humans. Therefore skin resident VZV-specific CD4⁺ T cells are functionally competent in older but may be restricted by multiple inhibitory influences *in situ*. Excessive baseline inflammation in the skin of older individuals correlates significantly with the decreased cutaneous response to VZV injection. This increased propensity to cutaneous inflammation during ageing induces multiple anti-inflammatory mechanisms that preclude the optimal manifestation of antigen-specific immunity.

MECHANISMS OF PROTECTION AGAINST HERPES ZOSTER AND POST-HERPETIC NEURALGIA THROUGH VACCINATION

J.E. McElhaney, 1. *Health Sciences North Research Institute, Sudbury, Ontario, Canada*, 2. *Northern Ontario School of Medicine, Sudbury, Ontario, Canada*

Herpes zoster (or Shingles) is a painful blistering rash resulting from the reactivation of latent Varicella-zoster virus (VZV), the agent that causes chickenpox. With the resolution of chickenpox, VZV-specific cytotoxic T lymphocytes (CTL) access the dorsal root ganglion where VZV lives, to keep viral replication in check. VZV-specific CD4⁺ and CD8⁺ T cells are believed to play a central role in latency and reactivation of the virus within the dorsal root ganglion. Reactivation of latent VZV is associated with marked inflammation of the sensory ganglion leading to nerve cell damage and pain that often precedes the onset of the dermatomal rash and persists after the rash resolves. The risk of developing zoster the disabling complication of post-herpetic neuralgia (PHN) dramatically increases with age. These observations highlight the importance of designing vaccines to stimulate cell-mediated immunity to prevent reactivation of VZV and protect against zoster and PHN, rather than the usual focus on antibody responses to prevent infection. Vaccines designed to prevent zoster reactivation and PHN present a significant opportunity for vaccine preventable disability in older adults.

SESSION 4785 (PAPER)

FACTORS IN CARDIOVASCULAR HEALTH

MAPPING LONGITUDINAL BLOOD PRESSURE CHANGE AND ASSOCIATED FACTORS AMONG VERY OLD INDIVIDUALS

B. Weidung, A. Toots, B. Carlberg, P. Nordström, Y. Gustafson, *Umeå University, Umeå, Sweden*

Declining systolic blood pressure (SBP) is common in very old age and it is associated with adverse events, such as dementia. Knowledge of factors associated with SBP change could be used to formulate preventive strategies. This study investigated SBP change and associated factors in a representative sample of very old individuals followed-up after 5 years. The study was based on data from the Umeå85+/GERDA cohort study, containing cross-sectional and longitudinal data on participants aged 85, 90, and ≥95 years. Follow-up was 5 years. Main outcome was absolute SBP change. Factors associated with SBP change were assessed using multivariate linear regression models. Baseline SBP was measured in 1136 first-time participants. Within 5 years, 711 had died. Of the surviving participants, 297 were followed up with SBP measurement. Mean SBP change was -12 mm Hg ± standard deviation 25 mm Hg. Among survivors followed-up with SBP measurement, SBP change was independently associated with changing Barthel p-ADL score during follow-up, and inversely associated with investigation year, baseline SBP level, baseline antidepressant prescription, incident acute myocardial infarction during follow-up, and discontinued or new diuretic prescription during follow-up. In conclusion, SBP seems to be declining among very old individuals. The decline seems to depend on SBP level, investigation year, and health-related factors.

FRAILITY ASSESSMENT AND 6-MONTH FUNCTIONAL STATUS AND MORTALITY AFTER AORTIC VALVE REPLACEMENT

D. Kim^{1,2}, C. Kim¹, F. Grodstein², J. Popma¹, K. Khabbaz¹, R.J. Laham¹, J. Afalalo³, L.A. Lipsitz¹, 1. *Medicine, Beth*

Israel Deaconess Medical Center, Boston, Massachusetts, 2. Brigham and Women's Hospital, Boston, Massachusetts, 3. Jewish General Hospital, Montreal, Quebec, Canada

Preoperative frailty assessment may be useful to predict functional status and mortality in older adults undergoing aortic valve replacement (AVR). We conducted a single-center prospective cohort study to compare frailty phenotype versus comprehensive geriatric assessment-based frailty index (CGA-FI) in predicting 6-month functional status and mortality after transcatheter and surgical AVR. Between February 2014 and December 2015, we assessed frailty phenotype and CGA-FI in patients 70 years or older who underwent transcatheter AVR (N=124) or surgical AVR (N=88). Telephone interviews were performed at 1, 3, and 6 months to assess the ability to perform 22 functional activities. The composite poor clinical outcome, defined as death or functional decline with the New York Heart Association class 3 or 4, occurred in 31 (26%) of 120 transcatheter AVR patients (drop-out: 4) and 8 (11%) of 76 surgical AVR patients (drop-out: 12). The risk of poor clinical outcome did not differ between patients with and without frailty phenotype undergoing transcatheter AVR (24 of 96 [25%] versus 7 of 24 [29%]; $p=0.68$) and surgical AVR (5 of 27 [19%] versus 3 of 49 [6%]; $p=0.11$). However, the risk increased with CGA-FI (≤ 0.20 , $0.21-0.40$, >0.40) in transcatheter AVR (1 of 12 [8%], 12 of 64 [19%], 18 of 44 [41%]; $p=0.01$) and surgical AVR (1 of 29 [3%], 5 of 42 [12%], 2 of 5 [40%]; $p=0.04$). In conclusion, CGA-FI predicts 6-month functional status and mortality after transcatheter and surgical AVR, but frailty phenotype has a limited role in this population with high prevalence of frailty.

THE ELECTROCARDIOGRAM IN CENTENARIANS

S. Frank¹, A. Frank², 1. Department of Internal Medicine (Cardiology), Southern Illinois University School of Medicine, Springfield, Illinois, 2. Department of Family and Community Medicine University of Missouri, School of Medicine, Columbia, Missouri

The electrocardiograms in centenarians utilizing current recommended standards, guidelines and nomenclature were reviewed. All hospitalized patients whose age was 100 years or greater were examined. One hundred eighteen patients and two hundred fifteen ECGs were included in this study. "Normal" or "near normal" ECGs were infrequent and were seen in only 7 patients (5.9%). Approximately one third of patients had PACs and 30% had PVCs seen on their initial or follow up ECGs. Atrial fibrillation was common and was present in about one third of all patients. Conduction abnormalities were prevalent. First degree AV block was seen in about one third of the patients and left anterior fascicular block in about 50%. Right and left bundle branch block were present in about 15–20% of patients studied. Acute infarcts were rarely seen, present in only two patients, but "old" or "age undetermined" infarcts were present in approximately 75% of patients. Bradycardia and tachycardia were more a reflection of concurrent medications or the underlying illness and were noted in approximately 10–20% of patients. Arrhythmias, including atrial fibrillation, PACs and PVCs, conduction abnormalities and "old" or "age undetermined" are common in this age group and "normal" or "near normal" ECGs and acute infarcts were infrequent.

PUBERTAL TIMING AND CARDIOVASCULAR AGEING IN MEN AND WOMEN

R. Hardy¹, J. Maddock¹, A. Ghosh², J. Deanfield³, A. Hughes³, D. Kuh¹, 1. MRC Unit for Lifelong Health and Ageing at UCL, London, United Kingdom, 2. Barts Heart Centre, St Bartholomew's Hospital, London, United Kingdom, 3. Institute of Cardiovascular Science, UCL, London, United Kingdom

Adolescence, a time of rapid physiological and behavioural change, may be a sensitive period in the life course for the development of later life health. Early menarche has been associated with higher rates of cardiovascular disease and type 2 diabetes in women. The mechanisms underlying such associations remain unclear, and the long-term effects of pubertal timing have been much less studied in men. We use data from 1653 men and women from the MRC National Survey of Health and Development, a birth cohort study of individuals born in Britain in 1946, to investigate whether prospectively collected measures of pubertal timing are associated with markers of cardiovascular ageing at 60–64 years. Women reaching menarche early (11 years or younger) had poorer cardiac structure (including higher left ventricular mass) and cardiac function (lower ejection fraction), assessed using echocardiography, than women reaching menarche later, even after adjusting for their higher body mass index (BMI). There was no evidence of any such relationships among men or, for both sexes, with vascular outcomes (carotid intima-media thickness, pulse wave velocity). This was despite associations between earlier puberty and higher BMI in both sexes, poorer lipid profiles in women and higher blood pressure in men which persisted from midlife. Pubertal timing appears to be more important for cardiovascular ageing in women than men. Our findings are consistent with evidence that increased health risks only occur among women with a particularly early menarche, rather than there being a linear relationship across the full range of pubertal age.

STATINS AND INCIDENT DISABILITY IN COMMUNITY-DWELLING OLDER ADULTS—A LONGITUDINAL STUDY

A. Perlman¹, R. Shah², D.A. Bennett², A. Buchman², I. Matok¹, 1. Hebrew University of Jerusalem, Jerusalem, Israel, 2. Rush Alzheimer's Disease Center, Rush University Medical Center, Chicago, Illinois

There are conflicting views regarding the safety of statin use among older adults. Statins have been implicated with diverse adverse effects with potential negative consequences on muscular function, balance, vision, and cognitive function. This study aimed to evaluate whether statins are associated with incident disability in older adults, using a longitudinal cohort design.

Participants of two ongoing cohort studies of community dwelling older adults were recruited between 1993–2015 (n=3091). Self-reported disability was assessed using three scales: basic activities of daily living (ADL), mobility, and functions required for independent living (IADL). All medications received by participants were inspected and identified. Demographic characteristics and medical history were obtained by detailed interview and medical examinations.

We used time varying multivariable cox models to assess the association between lipid-lowering medications and incident disability. Models included adjustments for differences in demographics, and cardiovascular comorbidity. Analyses excluded participants with dementia or disability at baseline.

Our study found that individuals receiving lipid-lowering medication, predominantly statins, had reduced risk for the development of disability in ADL and IADL compared with individuals not receiving these medications, after adjusting for differences in age, sex, and education (Hazards Ratios [95% Confidence Interval]: ADL 0.86 [0.76–0.98], IADL 0.85 [0.7–0.98], Mobility 0.91 [0.79–1.04]). Further analyses demonstrated these associations were strengthened after controlling for cardiovascular risk factors and comorbidity (HRs [95% CIs]: ADL 0.74 [0.65–0.86], IADL 0.81 [0.7–0.93], Mobility 0.83 [0.7–0.96]). And remained consistent in analyses specifying exposure to statins, and in analyses restricted to participants aged 80 and over.

SESSION 4790 (PAPER)

IDENTIFYING AND MANAGING DELIRIUM IN OLDER ADULTS II

COGNITIVE ACTIVITIES FOR DELIRIUM SUPERIMPOSED ON DEMENTIA: A RANDOMIZED CONTROLLED TRIAL

A.M. Kolanowski¹, D.M. Fick¹, M. Litaker², P. Mulhall¹, L. Clare³, N. Hill¹, M. Boustani⁴, J.A. Mogle¹, 1. *Penn State University, Kingston, Pennsylvania*, 2. *University of Alabama, Birmingham, Alabama*, 3. *University of Exeter, Exeter, United Kingdom*, 4. *Indiana University, Bloomington, Indiana*

Delirium is common in post-acute care (PAC) patients with dementia; its treatment is not established. We hypothesized that cognitive activities would reduce the duration and severity of delirium and improve cognitive and physical function to a greater extent than usual care. This was an NIH-funded single-blind randomized clinical trial conducted in eight PAC facilities. Participants were 283 community-dwelling older adults with dementia and delirium randomized to intervention or control. The intervention group received cognitive activities daily for up to 30 days. The control group received usual care. Primary outcomes were delirium duration (Confusion Assessment Method), and delirium severity (Delirium Rating Scale). Secondary outcomes were cognitive function (Digits Forward, Montreal Cognitive Assessment and CLOX) and physical function (Barthel Index). There were no differences between the groups for mean percentage of delirium-free days or delirium severity. Significant differences for secondary outcomes favoring intervention were found: executive function: 6.58 (95% CI: 6.12–7.04) vs. 5.89 (95% CI: 5.45–6.33), a difference of -0.69 (95% CI: 1.33– -0.06, p=0.03); and constructional praxis: 8.84 (95% CI: 8.83–9.34) vs. 7.53 (95% CI: 7.04–8.01), a difference of - 1.31 (95% CI: 2.01– -0.61, p=0.0003). After adjusting for baseline constructional praxis the group comparison was no longer significant. Average length of stay was shorter in intervention (36.09 days vs. 53.13 days, SE = 0.15, p = 0.01, negative binomial regression. Cognitive activities did not

improve delirium but did improve executive function and reduced length of stay. Resolution of delirium may require more intense non-pharmacological management when the patient has dementia.

IMPROVING RECOGNITION AND SCREENING OF DELIRIUM IN REHABILITATION AND ACUTE CARE SETTINGS

A. Mills^{1,2}, G. Johnstone¹, M. Levinson², M. Harley¹, 1. *Cabrini Health, Malvern, Victoria, Australia*, 2. *Monash University, Melbourne, Victoria, Australia*

This study examined the effectiveness of a delirium intervention on nurse recognition, screening and documentation of delirium; patient outcomes; and hospital remuneration in the acute care and rehabilitation settings. Nursing staff participated in an awareness program aimed at increasing delirium knowledge, recognition and management. Nurses were trained in the use of a combined delirium screening tool to be integrated into patient notes, consisting of the Delirium Risk Assessment Tool and the 4AT. A multimodal awareness campaign provided information and resources about delirium to patients, families, carers and staff members. An Inouye chart review was conducted, and ICD-10 codes for delirium noted on hospital administrative data were collated before and after the intervention to calculate a prevalence estimate of delirium in the wards, and assess the efficacy of the intervention. Patient outcomes (medication, specialist referral, environmental modification) for those with delirium were compared before and after the intervention. Nursing staff knowledge and satisfaction was evaluated at the conclusion of the project. Finally, by comparing the frequency of ICD-10 codes for delirium pre and post intervention, billing remuneration for the hospital and an estimate of lost revenue was calculated.

RISK FACTORS FOR PREVALENT DELIRIUM IN OLDER MEDICAL INPATIENTS IN TANZANIA

E.G. Lewis^{2,1}, J.E. Banks³, S. Paddick^{4,1}, C. Dotchin^{4,1}, W. Gray¹, R. Walker^{4,1}, S. Urasa⁵, 1. *Education centre/ Geriatrics, Northumbria Healthcare NHS Foundation Trust, Newcastle Upon Tyne, North Shields, United Kingdom*, 2. *Charite -Universitätsmedizin, Berlin, Germany*, 3. *The Medical School Newcastle University, Newcastle upon Tyne, United Kingdom*, 4. *Newcastle University, Newcastle upon Tyne, United Kingdom*, 5. *Kilimanjaro Christian Medical Centre, Moshi, Tanzania, United Republic of*

The risk factors for prevalent delirium in older adults in Sub-Saharan Africa have been poorly characterised thus far. Delirium in older adults is a common, serious and preventable condition. In this low-resource setting, the ability to identify patients at risk of delirium may allow targeting of limited resources towards expedient prevention.

Consecutive admissions of adults aged ≥60 years were recruited to participate in the study. Patients' demographic details, physiological observations and a range of self-reported and objectively measured potential risk factors were measured. Delirium was diagnosed according to the Diagnostic and Statistical Manual of Mental Disorders, 5th Edition (DSM V) criteria. The study setting was the acute medical wards of Kilimanjaro Christian Medical Centre, a

tertiary referral centre in northern Tanzania. Data were collected between January and July 2015.

Five hundred and seven patients were recruited to the study. Multivariate logistic regression was used to analyse the independent risk factors for prevalent delirium. Older age and self-reported reduced mobility were significant risk factors for delirium on univariate analysis, however became non-significant on multivariate analysis. Male gender, current alcohol use, dementia and illness severity (measured by physiological parameters) remained significant on multivariate analysis.

In conclusion, the risk factors for delirium in the inpatient setting in Tanzania are in keeping with established risk factors in higher income settings. This data could be used to develop a screening tool for older adults in Sub-Saharan Africa, which may lead to improved risk stratification for delirium prevention, improved diagnosis rates and management.

RISK SCREENING FOR DELIRIUM IN THE EMERGENCY DEPARTMENT: THE EDDI TRIAL

G. Arendts, *University of Western Australia, Perth, Western Australia, Australia*

Delirium (acute brain failure) is a medical emergency which is poorly identified and managed in many hospitals. The aim of this study was to test whether a standardised delirium screening algorithm in the emergency department (ED), and use of a risk warning card containing a recommended series of actions, increases delirium diagnosis. We conducted a prospective adaptive trial in patients aged 65 or over presenting to the ED of two tertiary hospitals. At baseline, delirium screening was implemented to determine standard delirium rates. Interventions were then progressively introduced, and rates of delirium detection as well as morbidity and mortality outcomes were measured over time and compared using descriptive statistics. There were 3891 patients enrolled across three phases of the trial, of which 414 (10.6%) were diagnosed with delirium. Patients with delirium had higher mortality (7% vs 3%); more falls, sedation use and rates of new discharge to an aged care facility; and longer hospital stays. A positive ED screen significantly increased the odds of being diagnosed with delirium (OR = 8, LR+ 3.3). The ED warning card increased the rate of delirium detection from 10.1% to 12.1%, but this was not statistically significant (p 0.12) and likely associated with other hospital processes rather than the intervention.

MULTIDISCIPLINARY INTERVENTION MODEL TO PREVENT POSTOPERATIVE DELIRIUM IN A CHINESE HOSPITAL

Y. Jirong, Y. Wang, B. Dong, *West China Hospital, Sichuan University, Chengdu, China*

OBJECTIVES

Postoperative delirium is a common, life-threatening problem in older adults. However, research on multidisciplinary prevention of delirium in China is limited. We adapted the Hospital Elder Life Program (HELP) for using it on six surgical wards in a Chinese hospital and assessed its effect and feasibility by conducting a cluster randomized trial.

METHODS

We modified the HELP mode by adapting it to Chinese medical environment and culture. It included personnel composition, assignment of responsibility, multidisciplinary intervention protocols, implementation procedure, and personnel training. A total of 261 patients aged 70 and older undergoing elective surgery were recruited. After baseline assessment, eligible patients, in clusters, were randomly assigned to the multicomponent intervention group or usual care group.

RESULTS

Delirium occurred in 12/140 (8.6%) intervention group, versus 25/121 (20.6%) usual-care patients ($P < 0.05$). The length of hospital stay in the control group was significantly longer than that in the intervention group (16.41 ± 4.69 vs. 12.15 ± 3.78 $P < 0.05$). The score of satisfaction towards hospital service in the intervention group was significantly higher than that in the control group (94.44 ± 6.29 vs. 85.07 ± 5.72 $P < 0.05$). The severity of delirium between the intervention group and control group showed no difference ($P > 0.05$). The adherence of early movement was highest 74.3%.

CONCLUSIONS

This perioperative multidisciplinary intervention was successfully implemented in a Chinese hospital and it was effective for the prevention of postoperative delirium.

SESSION 4795 (SYMPOSIUM)

INTERPROFESSIONAL GERIATRIC EDUCATION: A TEXAS EXAMPLE

Chair: J. Knebl, *University of North Texas Health Science Center, Fort Worth, Texas*

Co-Chair: J.J. Severance, *University of North Texas Health Science Center, Fort Worth, Texas*

Older adults are among the fastest growing age group in the United States and use many health care services, have complex conditions, and require professional expertise to meet their health care needs. Having a geriatric workforce capable of carefully managing the medical conditions of seniors to assist with healthy independent lifestyles is important. This symposium presents collaboration among a health science center in North Texas, a private university, a county hospital system, and an Area Agency on Aging in creating the Workforce Enhancement in Healthy Aging and Independent Living (WE HAIL) Program. As the only HRSA Geriatric Workforce Enhancement Program awarded in Texas, WE HAIL advances health professional education by aligning learning objectives and activities with community needs. Presentations will provide an overview of the strategy, the multiple learner groups, and lessons learned in the first year of planning and implementation. Jennifer Severance will introduce WE HAIL partnerships and activities. Donald R. Smith will present evidence based programs provided by community organizations. Janice Knebl will address opportunities and challenges of geriatric training for health care students and professionals. Tom Fairchild will focus on leadership training for practicing primary care professionals necessary in emerging healthcare systems. This symposium presents cross-sector approaches of integrating evidence base programs into geriatric health professional training, while

expanding training opportunities for rural areas and underserved populations.

MOBILIZING PARTNERS TO INCREASE THE GERIATRIC WORKFORCE

J.J. Severance, *Center for Geriatrics, University of North Texas Health Science Center, Fort Worth, Texas*

Applying the Plan-Do-Study-Act continuous improvement method, the Workforce Enhancement in Healthy Aging Program develops geriatric training for 1) undergraduate and graduate students; 2) family medicine residents; 3) practicing health care professionals, including physicians, nurses, physician assistants, pharmacists, physical therapists, social workers, and dietitians; and 4) caregivers of older adults. Teams of interprofessional faculty and community organizations build upon existing training programs to integrate geriatric topics and unique learning experiences with community based organizations, and to expand caregiver training in rural communities. Training enhancements focus on community needs in health literacy, falls prevention, medication management, chronic disease self-management and dementia. New programs are proposed for a Geriatric Certificate for Family Medicine Residency Programs, and a Geriatric Professional Leadership Institute. Program evaluation demonstrates expanded partnerships that increase the number of geriatric-trained primary care providers to meet the needs of older adults at individual, community and population levels.

LINKING COMMUNITY NEEDS AND PROGRAMS TO GERIATRIC EDUCATION

D. Smith, *1. United Way of Tarrant County, Inc., Fort Worth, Texas, 2. Area Agency on Aging of Tarrant County, Fort Worth, Texas*

The United Way of Tarrant County's LIVE WELL Initiative addresses the health issues of the aging population and those who care for them. The three core values based on community needs include: 1) 'Care for Caregivers' to provide support for people who take care of loved ones with ongoing health concerns, 2) 'A Healthier Me' to provide services to adults with ongoing health concerns, and 3) 'A Healthier Community' that helps educate and provide information for a healthier community. This presentation reports on the continuation of evidence based programs and programmatic relationships to embed LIVE WELL values across collaborating institutions, and thereby provide the best outcomes for older adults.

GERIATRIC TRAINING FOR INTERPROFESSIONAL TEAMS

J. Knebl, *University of North Texas Health Science Center, Fort Worth, Texas*

The 2008 IOM Report: *Retooling for an Aging America* identified the number of adults in the US aged 65 and older would almost double from 12% to 20% of the population, placing increased demand on the patchwork of US health care services for older adults. The Reynolds Geriatric Education and Training in Texas (Reynolds IGET-IT) Programs were developed as a proactive effort to address the lack of training in medical professionals on geriatric syndromes. The following programs and innovative modules were implemented over an eight year period to address the goals of geriatrics education: an integrated geriatrics curriculum, faculty

development in geriatrics, interprofessional geriatric skills lab and senior mentoring program, a capstone course for senior level health professions students, and E-learning modules for residents and practicing physicians. This presentation will address the impact on medical professions students and professionals, the community partnerships that were built, and advancement of interprofessional education.

GERIATRIC LEADERSHIP TRAINING FOR HEALTH PROFESSIONALS IN EMERGING HEALTH SYSTEMS

T.J. Fairchild, *University of North Texas Health Science Center, Fort Worth, Texas*

The Geriatric Practice Leadership Institute was designed for healthcare professionals including physicians, physician assistants, nurses, pharmacists, physical therapists, dietitians, and social workers. The participants learn about concepts needed to effectively work in and take leadership roles in the emerging health care environments for older adults in primary care. Driven by team project goals, five domains are addressed by the GPLI curriculum: 1) Leading Self, 2) Leading Teams, 3) Leading Organizational Change, 4) Population Health Science, and 5) Aging Network and Healthcare Delivery for Older Adults. The curriculum for each of these areas will be developed with the aim of enhancing each participant's understanding of personal leadership skills and how to create and participate in effective interprofessional teams that provide value-based patient-focused care to older adults in the developing primary healthcare systems.

SESSION 4800 (PAPER)

GERIATRIC ASSESSMENT AND MANAGEMENT IN VARIOUS SETTINGS

GERIATRIC CO-MANAGEMENT PROGRAMS: HOW ARE THEY ORGANIZED AND EVALUATED? A SYSTEMATIC REVIEW

B. Van Grootven¹, J. Flamaing^{2,1}, K. Milisen^{1,2}, M. Deschodt^{1,2,3}, *1. Department of Public Health and Primary Care, University of Leuven, Leuven, Belgium, 2. University Hospitals Leuven, Leuven, Belgium, 3. University of Basel, Basel, Switzerland*

This systematic review determined what program structure, intervention processes and outcomes have been reported by in-hospital geriatric co-management programs. Primary studies reporting on geriatric co-management of inpatients aged 65 years or older (or mean age of study sample ≥ 75 years), published in English, Dutch, German, French or Spanish were eligible for inclusion. An independent literature search using databases (MEDLINE, EMBASE, CINAHL, Cochrane Central Register of Controlled Trials), reference lists, citation searching and ClinicalTrials.gov was performed in May 2016. Forty-four articles from 6 randomized controlled trials (RCT), 1 non-RCT, 5 prospective before-and-after studies, 18 before-and-after studies with a historic cohort, and 10 cohort studies. The majority of programs consisted out of medical/surgical staff, a geriatrician, physical therapist and social worker. Program interventions focused on early rehabilitation, medical care review and discharge planning, but only 4 studies reported a post-discharge intervention. Around half of the programs reported performing ward rounds for co-management purposes, but only

one third reported using protocols or multidisciplinary team meetings. The majority of studies evaluated length of stay and mortality. Despite a large body of evidence, only a minority of programs were evaluated using a valid design, and the description of interventions were poor. There is substantial clinical heterogeneity between programs and process evaluations are currently missing to adequately explore these differences and their potential for impacting outcomes. For future directions, programs should clearly describe their program theory: which intervention components affect which outcomes in relation to their context.

FUNCTIONAL AND PSYCHO-SOCIAL ISSUES IN ACUTE CARE: DATA FROM THE “NEW” INTERRAI ACUTE CARE

L.C. Gray, N.M. Peel, *Centre for Research in Geriatric Medicine, The University of Queensland, Brisbane, Queensland, Australia*

The interRAI Acute Care is a new assessment system designed to identify functional and psychosocial problems among adult patients admitted to acute care. It comprises 52 clinical observations and a series of algorithms that perform diagnostic and risk screening, measure problem severity (scales) and assess quality of care.

We undertook a study to determine the frequency distributions of the clinical observation among adult patients across 4 hospitals in Australia: A large tertiary hospital, a medium size community hospital, and 2 small rural hospitals. Assessments were performed by trained nurses with 12 hours of admission to an inpatient unit. The sample comprised 837 subjects, of whom 359 (43%) were aged > 70 years.

While the prevalence of these problems was high, as expected, among older patients, there were some problems that were unexpectedly prevalent among younger patients. For example, short term memory problems were present in 6% of patients aged 18–29 and 22% among those aged 40–49, compared to 37% among older patients. Similar patterns of high prevalence was present for mood disturbances, balance problems, falls, pain, sleep disorders and basic activities of daily living.

We concluded that functional and psychosocial problems are sufficiently prevalent among younger hospitalised patients that universal screening is warranted for all adult patients.

VALIDATION OF A COMPUTERIZED, GAME-BASED ASSESSMENT STRATEGY IN PERSONS WITH DEMENTIA

K. Hauer¹, S. Wiloth², N. Lemke³, C. Werner¹, 1. *AGAPLESION Bethanien Hospital, Geriatric Center at the University of Heidelberg, Heidelberg, Germany*, 2. *Institute for the Study of Christian Social Service at the University Heidelberg, Heidelberg, Germany*, 3. *Network of Aging Research (NAR), University of Heidelberg, Heidelberg, Germany*

Exergames are increasingly established for training purpose; however, newly assessment strategies based on the internal data flow are hardly developed and validated. Such assessment strategies provide high-class data with strict focus on applied training goals and programs.

In this study we analyzed construct validity, test-retest reliability, sensitivity to change, and feasibility of the Physiomat[®] training device, which combines challenging postural motor tasks with cognitive tasks based on established neuro-psychological assessments such as trail making test (TMT) in patients with dementia.

Assessments of 105 multi-morbid patients with mild to moderate dementia (mean age 82.7 ± 5.9) were tested in conditions with increasing complexity level (simple, moderate, complex) for construct validity, test-retest reliability, sensitivity to change of trained Physiomat[®] tasks, and for feasibility.

Analyses showed moderate to high correlations between established motor as well as cognitive tests and simple ($r_s = .22-.68$, $P \leq .001-.03$), moderate ($r_s = -.33-.71$, $p \leq .001-.004$), and complex motor-cognitive Physiomat tasks ($r_s = -.22-.83$, $P \leq .001-.30$) indicating a good construct validity. Moderate to high correlations between test and retest assessments were found for simple, moderate, and complex motor-cognitive tasks ($ICC = .47-.83$, $p \leq .001$) indicating good test-retest reliability. Sensitivity to change was good to excellent for Physiomat assessment reproducing significant improvements during an intervention trial (RCT) ($p \leq .001$) with moderate to large effect sizes ($SRM = 0.5-2.0$). Completion time averaged 25.8 minutes, with high completion rate (96%) for initial Physiomat measures. No adverse events occurred during assessment.

The Physiomat[®] assessment proved a reliable, valid, responsive, and feasible game-based assessment strategy in multi-morbid persons with mild to moderate dementia.

PILOTING THE ADAPTED KIMBERLY INDIGENOUS COGNITIVE ASSESSMENT TOOL WITH INDIGENOUS SENIORS IN CANADA

M. Blind¹, K. Pitawanakwat², K. Jacklin³, M.E. O’Connell⁴, J. Walker¹, J.E. McElhaney⁵, W. Warry¹, 1. *Centre for Rural and Northern Health Research, Laurentian University, Sudbury, Ontario, Canada*, 2. *Wikwemikong Health Centre, Sudbury, Ontario, Canada*, 3. *Northern Ontario School of Medicine, Sudbury, Ontario, Canada*, 4. *University of Saskatchewan, Saskatoon, Saskatchewan, Canada*, 5. *Health Sciences North Research Institute, Sudbury, Ontario, Canada*

Dementia has become a growing public health issue in an aging Indigenous population in Canada. The Canadian Consortium on Neurodegeneration in Aging (CCNA) includes a research team specifically addressing issues related to quality of life for Indigenous people with dementia and their caregivers. A key component of the work encompasses development of a culturally relevant and psychometrically sound cognitive assessment screening tool. Current cognitive assessments present varying degrees of cultural, educational and language bias, impairing their application in Indigenous communities. This paper reports on the piloting and evaluation of an adapted Indigenous cognitive assessment tool in First Nations communities in Canada.

Using community-based participatory methods and a “two-eyed seeing approach,” researchers worked closely with community partners to adapt the Kimberly Indigenous Cognitive Assessment (KICA) for use with Indigenous populations in Northern Ontario, Canada. The KICA was developed to address the gap of culturally appropriate assessment

tools for older Indigenous people in Australia. The adaptation involved an iterative process where an advisory group, expert Anishinaabe language speakers, team members, and a key expert panel analysed each assessment domain and adjusted the questions to reflect the local cultural understandings and nuances within the Anishinaabe language. The adaptation of the KICA produced a culturally relevant cognitive assessment tool that was piloted with Indigenous participants from seven First Nations communities in Ontario, Canada. The assessment was provided in English or Anishinaabemowin. Culturally appropriate diagnosis and screening may lead to earlier, more accurate diagnosis and improved health outcomes for Indigenous people with dementia in Ontario.

UPTAKE AND EFFECTIVENESS OF PREVENTIVE HEALTH ASSESSMENTS: A STUDY OF 11,726 OLDER AUSTRALIAN WOMEN

J. Byles¹, X. Dolja Gore¹, K. Nair¹, M. Tavener¹, C. Chojenta¹, G. Mishra², 1. *Research Centre for Generational Health and Ageing, The University of Newcastle, Newcastle, New South Wales, Australia*, 2. *The University of Queensland, Brisbane, Queensland, Australia*

In 1999 the Australian Government introduced health assessments for people aged 75 years and older, allowing family doctors to evaluate older patients' health. This study evaluates the uptake of assessments over time by a large cohort of older women, and the impact of the assessments on survival and physical functioning.

Data are for 11,726 women from the 1921–26 birth cohort of Australian Longitudinal Study on Women's Health, who have completed three-yearly postal surveys since 1996, and allowed linkage to universal national administrative data on health care use (Medicare Benefits Scheme), residential aged care, and the National Death Index. The women were aged between 73–78 years when assessments were introduced in 1999, with follow-up to 2013 when surviving women were aged 87–92. Time to event models were used to evaluate uptake of assessments, with death included as a competing event. Time-period and propensity score matching was applied to provide balanced groups of women who did and did not have assessments for comparison of survival and physical function scores.

By December 2013, 61.8% of women had at least one health assessment, with widowed, socioeconomically advantaged women, and those with more doctor visits, being more likely to have assessments and to have them earlier. After propensity-matching, women who had assessments had an advantage for survival, and for survival with higher physical functioning scores.

Our data suggest that health assessments afford benefits in terms of survival and physical functioning.

SESSION 4805 (PAPER)

DEMENTIA/ALZHEIMER'S RISKS AND INTERVENTIONS

MAINTAINING EVERYDAY PRACTICAL AND COGNITIVE COMPETENCIES IN DEMENTIA SUFFERERS IN A HOME SETTING

R. Stemmer, *Catholic University of Applied Sciences, Mainz, Germany*

The project focuses on the effect of everyday practical and cognitive activation at home on the activities of daily living and cognitive abilities of dementia sufferers.

Intervention: Six days a week, practical activation was performed by relatives based on an individual, tailor-made activation plan. Cognitive activation took place once a week and was done by an external person. The relatives received continuous training and were comprehensively counselled by trained nurses.

Evaluation: A multicentric, randomised controlled trial with total sample size of 72 participants suffer from irreversible dementia (MMSE ≤ 24 and ≥ 12 , SIDAM incl. HIS ≤ 4). 36 participants received everyday practical and cognitive activation and 36 were in the control group: intervention and follow up periods took six month each. Outcome variables: primary: ADL-abilities (E-ADL-test) and cognitive abilities (ADAS-cog); secondary: care dependency (PAS-scale) and geriatric symptoms incl. instrumental abilities (NOSGER-Scale incl. IADL-test), quality of life (WHOQOL-BREF) and strain for the informal caregivers (HPS). The evaluation was made as a pre-postal analysis (t_0/t_1) with multivariate statistical procedures.

Results: After six months persons showed better or stable, but no significant ADL-abilities in the intervention group. Comparing t_0 and t_1 no differences occur in the intervention group, but there was a significant decrease in the control group ($p=0,01$). Area of cognition: no differences between both groups; positive effects regarding care dependency ($p=0,048$) and geriatric symptoms ($p=0,019$); no effects regarding relatives, neither to strain nor to life quality.

Conclusion

Activation of persons suffering from dementia by relatives is possible and effective without increase of strain.

POST-PRANDIAL CHANGES IN ALZHEIMER-RELATED PROTEIN LEVELS IN HEALTHY OLDER ADULTS

E.J. Amella¹, V. Padmaraju², P. Chinnakkannu², K. Martin², M. Mueller³, K. Sambamurti², 1. *College of Nursing, Medical University of South Carolina, Mt. Pleasant, South Carolina*, 2. *College of Medicine, Medical University of South Carolina, Charlestong, South Carolina*, 3. *College of Nursing, Medical University of South Carolina, Charleston, South Carolina*

Accumulation of the 42 aa amyloid b protein (Ab42) is a defining feature of Alzheimer's disease (AD). A 1.5 fold increase in Ab precursor (APP) expression is sufficient to cause familial AD (FAD). We hypothesize that the post-prandial increase in limiting nutrients – aa and glucose – will transiently stimulate protein synthesis and by extension APP. Our interprofessional team determined the post-prandial APP and Ab42 changes in plasma of 20 fasting healthy older adults with a normal Mini-cog and without metabolic disorders after consuming a protein-rich beverage. A Comprehensive Metabolic Panel analysis demonstrated that total plasma protein, glucose and liver function markers were not increased 2h after the meal. APP levels increased significantly starting at 1h ($p=0.024$ for difference to 4h). Fasting APP measures were compromised by dehydration-induced platelet

lysis. Post-prandial Ab42 levels increased with a peak at 2 h ($p=0.004$) and dropped at subsequent time points. In agreement with literature, fasting Ab42 levels trended to reduce in subjects with a family history of AD/dementia. Subjects with a family history of AD/dementia showed a larger increase in Ab, but the levels also dropped more rapidly, a phenomenon that needs to be systematically evaluated. These data suggest that periodic postprandial increases in APP that saturate the turnover pathways may facilitate the accumulation of Ab associated with AD pathology. Systematic analysis of diets that limit such increases may be useful in prevention of age-related dementia and other proteinopathies.

DEMENTIA AND ALZHEIMER'S DISEASE AMONG OLDER KIDNEY TRANSPLANT RECIPIENTS

M. McAdams De Marco¹, S. Bae², A. Gross¹, J.D. Walston², D. Segev², 1. *Johns Hopkins University School of Public Health, Baltimore, Maryland*, 2. *Johns Hopkins School of Medicine, Baltimore, Maryland*

Kidney transplantation (KT) is a growing treatment option for older ESRD patients. Older recipients may develop dementia and Alzheimer's disease (AD) from their long-standing kidney disease and/or neurotoxicity of immunosuppressant agents. We studied 40,918 older (aged ≥ 55) KT recipients (1/1/99-12/31/11) linked to Medicare claims through United States Renal Data System. We estimated the risk (cumulative incidence) of dementia and AD and studied recipient, transplant, and donor factors associated with developing these sequelae using a competing risks model. We estimated the risk of death-censored graft loss and mortality after developing dementia and AD using an adjusted Cox proportional hazards model. Older KT recipients have an estimated 10-year dementia risk ranging from 5% (recipients aged 55-60) to 17% (recipients aged ≥ 75); the 10-year AD risk ranged from 1%-6.7%, respectively. The strongest predictors for dementia and AD were recipient age (5-year increase: dementia HR=1.50, 95%CI:1.45-1.55; AD HR=1.69, 95%CI:1.59-1.80) and diabetes (dementia HR=1.64, 95%CI:1.50-1.78; AD HR=1.32, 95%CI:1.11-1.56). The CNI inhibitors were associated with increased dementia risk: tacrolimus (HR=1.25, 95%CI:1.03-1.51); cyclosporine (HR=1.26, 95%CI:1.05-1.50). The 10-year risk of graft loss (43.1% vs. 28.8%) and mortality (86.7% vs. 46.2%) were greater for those with dementia. Recipients with dementia were at increased risk of graft loss (HR=1.52, 95%CI:1.39-1.68) and mortality (HR=2.74, 95%CI:2.59-2.89); similar results were observed for AD. Among older KT recipients, there is a great burden of dementia and AD and they have profound impact on patient and graft survival. Discussion of dementia and AD should be part of the clinical-decision making process for older KT candidates.

SESSION 4810 (SYMPOSIUM)

WORK, RETIREMENT, AND HEALTH

Chair: D. Segel-Karpas, *University of Haifa, Haifa, Israel*
Co-Chair: S. Agrigoroaei, *Université catholique de Louvain, Belgium*

Discussant: H. Zacher, *University of Leipzig, St Lucia, Queensland, Australia*

Work and retirement are complex processes with important implications for emotional, physical, and cognitive health. Studies tapping into the relationship between work, retirement and health often use different perspectives aiming at measuring similar outcomes. While some studies investigate these relationships from the perspective of the worker/retiree, other studies focus on organizational level predictors, or suggest that national policy has an imminent effect on workers' and retirees' health. Our goal is to allow a better understanding of the interplay between work, retirement and the three facets of health (that is – physical, emotional and cognitive), studied from varied perspectives: macro/national policy level, meso/organizational level, and micro/individual level. This symposium integrates four presentations followed by a discussion. Starting with a macro-meso perspective, Sarah Vickerstaff will present her work examining how employers manage their employees' health, and how recent national policy affects employees' health-related behaviors. From a meso-micro perspective, Florian Kunz and colleagues will present their findings regarding the effects of organizational age diversity and subjective age on employees' psychological health. Focusing on the individual-micro level, Grotz and Adam will present their work about the effect of retirement and adjustment processes on cognitive health, and Segel-Karpas and Agrigoroaei will discuss the effect of work to family spillover on physical health and the moderating role of personality. Hannes Zacher, who is well known for his work on older workers and the transition to retirement, will discuss the different presentations offering his broader perspective on the issues of work, retirement, and health.

MANAGING THE HEALTH ISSUES OF OLDER WORKERS: EXPERIENCE FROM FOUR UK ORGANIZATIONS

S. Vickerstaff, *University of Kent, Kent, United Kingdom*

This paper examines how UK employers are responding to health issues of older workers in the context of rising state pension ages and the abolition of the default retirement age. The discussion is based on four in-depth case studies in very different organizations. Organizational policy interviews were held with HR, pension and line managers, trade unions and a range of employees at different grades. The study shows that the management of health is perceived distinctly according to the setting and diversely for different groups of employee. In some cases the raising of the state pension is encouraging employees to hide health concerns to their personal detriment and potentially that of the organization.

SUBJECTIVE AGE DIVERSITY, AGE DISCRIMINATION CLIMATE AND PSYCHOLOGICAL HEALTH

F. Kunze¹, S.A. Boehm², H. Bruch², 1. *University of Konstanz, Konstanz, Germany*, 2. *University of St. Gallen, St. Gallen, Switzerland*

Age diversity has been shown to be detrimental for organizational performance, as an increasingly age diverse workforce is prone to create mutual discrimination processes, which ultimately lower organizational performance (Kunze et al., 2011). In this study we integrate the discussion on organizational-level age diversity with findings on subjective-age structures in organizations (Kunze et al., 2015). We propose that subjective age structures (i.e., how

old the employees perceive to be) shape the formation of age-based subgroups in organizations more strongly than the chronological age of employees does. Shared perceptions of an age discrimination climate are in turn expected to be positively related to the average level of reported psychological health (measured through burnout perceptions) in organizations, with stronger effects for older compared to younger employees, proposing a moderated-mediation model. Our study hypotheses are tested and supported in a sample of 96 German small and medium-sized companies with more than 16,000 employees.

RETIREMENT AND COGNITIVE FUNCTIONING: A TRICKY ASSOCIATION

C. Grotz, S. Adam, *University of Liège, Liège, Belgium*

While different types of activities are associated with cognition, regardless of past activities, people aged over 60 can still have some control over their cognition through the maintenance of activities (e.g., a 60-year-old individual can delay his cognitive aging by 1.75 year if he engages in charity/voluntary work, or by 1.38 year if he continues employment). Later retirement ages could also delay the onset of neurodegenerative diseases. However, the transition from work to retirement is not simply an objective life event but is also a major life process that is marked by numerous changes (e.g., social networks). Individuals experience the retirement transition and adapt to it in different ways. In this respect, we examined the influence of psychological transition and retirement-related adjustment processes on cognition. Results showed that positive consideration towards work and development of new activities after retirement are determinants of good cognitive functioning at retirement.

SPILLOVER AND 10-YEAR CHANGE IN HEALTH: THE ROLE OF PERSONALITY

D. Segel-Karpas¹, S. Agrigoroaei², 1. *Gerontology, University of Haifa, Haifa, Israel*, 2. *Université catholique de Louvain, Louvain-la-Neuve, Belgium*

Balancing between the work and family demands is psychologically demanding, and the transfer of negative affect and worries from work to home was found to harm workers' health and well-being. We used data from two waves of the Midlife in the US national longitudinal study (N=3411) to examine whether work-to-family spillover has negative consequences in terms of 10-year change in physical health, and whether this association is moderated by the Big 5 personality traits. As expected, spillover was significantly associated with residual change in health, operationalized as the number of chronic conditions. Moreover, the negative consequences on health were higher for those with higher levels of Conscientiousness and Agreeableness. In contrast, higher levels of Openness to Experience reduce the effects of spillover on health. The results are discussed with regard to the individual differences in terms of abilities to cope with work to family spillover.

RETIREMENT AND TRAJECTORIES OF CHANGE IN SPEED OF INFORMATION PROCESSING

R. Anđel¹, P. Butterworth², N. Cherbuin³, K. Anstey³, 1. *School of Aging Studies, University of South Florida, Tampa, Florida*, 2. *University of Melbourne, Melbourne, Victoria, Australia*, 3. *Australian National University, Canberra, Australian Capital Territory, Australia*

IAGG 2017 World Congress

Retirement signifies a key transitional period. We examined retirement and change in processing speed, a prime indicator of cognitive aging, in 1405 Australians from the community-based Personality and Total Health (PATH) Project. Baseline age was 63 (SD=2) years, 36% were women, average education was 14 years. Symbol Digit Modalities Test was administered four times over 12 years to measure speed. Retirement was a time-varying variable. In random effects models adjusted for baseline age, retirement age, sex, education, self-rated health, and work complexity, retiring was associated with accelerated decline in speed (Estimate=-0.15, $p<.001$). This effect was about 7 times greater than the corresponding effect of years of age (Estimate=-0.02). Retiring due to illness, being laid off, or the desire to pursue other activities did not explain the results. Retirement age did not modify the effect. Transition into retirement may be an important period with respect to the trajectory of cognitive aging.

SESSION 4815 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: NEW EVIDENCE ON COGNITIVE AND BRAIN AGEING FROM THE DISCONNECTED MIND PROJECT

Chair: T. Wright, *Age UK, London, United Kingdom*

Discussant: J. Goodwin, *Age UK, London, United Kingdom*

Building a detailed picture of cognitive and brain ageing is imperative for predicting and ameliorating functional decline in later life. This symposium showcases recent work from the Disconnected Mind project. It centres around the Lothian Birth Cohort 1936, a group of Scottish older people who sat a cognitive test at age 11 in 1947. They were followed up on three occasions, aged 70, 73, and 76 years, the latter two waves including an MRI scan. First, Stuart Ritchie asks whether there is structure in declines across many different cognitive abilities, assessing which lifestyle, genetic, socioeconomic, and health measures are the best predictors of these declines. Second, Simon Cox asks a similar question regarding brain measurements: which variables make predictions of later-life changes in important brain parameters, and how do they interact with one another? Third, Benjamin Arribasala zooms in more deeply on the brain, reporting new analyses of the hippocampus. This memory-linked structure can be imaged in multiple ways, some of which provide better information regarding cognitive decline than others. Finally, Sherif Karama discusses links between cognitive abilities and the thickness of the brain's cortex in later life. He makes a more general point about aging research, one on which the Disconnected Mind project can make a unique contribution: researchers must take into account pre-existing cognitive ability before drawing conclusions regarding later-life cognitive-brain associations. Overall, the seminar gives an overview of recent developments in understanding the process, biology, and determinants of cognitive aging – and their implications for policy and practice.

STRUCTURE AND PREDICTORS OF COGNITIVE CHANGE IN THE EIGHTH DECADE OF LIFE

S. Ritchie¹, E. Tucker-Drob², I.J. Deary¹, 1. *University of Edinburgh, Edinburgh, United Kingdom*, 2. *University of Texas, Austin, Texas*

'Does it all go together when it goes?' In this study, we addressed this classic question about whether cognitive abilities change together in later life. In detailed longitudinal cognitive testing data from the Lothian Birth Cohort 1936 study (initial $n = 1,091$), we factor-analysed the aging of thirteen different tests taken at ages 70, 73, and 76 years. We found evidence for a general factor of cognitive ageing explaining around 50% of the variation in change: individuals who declined more in one ability tended to decline in all of them. Next, we tested for predictors of this general cognitive aging process. From a wide variety of potential predictors—including genetic, health, lifestyle, and socioeconomic variables—we found that physical fitness and possession of the *APOE* $\epsilon 4$ allele were the most promising predictors of the general cognitive ageing process.

CONTRIBUTIONS OF APOE VASCULAR RISK AND CORTISOL TO STRUCTURAL BRAIN PARAMETERS IN OLDER AGE

S.R. Cox, *University of Edinburgh, Edinburgh, United Kingdom*

It is of the utmost importance to identify possible determinants of brain ageing. Using valuable data from the Lothian Birth Cohort / Disconnected Mind study, and complementary data from UK Biobank, we report results from several studies investigating associations between key brain MRI and DTI parameters and potential risk factors (genetic status, vascular risk, cortisol). We use the large cross-sectional UK Biobank data to accurately characterise age differences in white matter tract microstructure (WMTM) and brain macrostructure, and identify selective relationships between these measures with *APOE* status and vascular risk. In the Lothian Birth Cohort studies, WMTM mediated associations between elevated reactive cortisol and cognitive ageing differences across 60 years. Additionally, selective vascular risk factors interacted with *APOE* status to predict 3-year growth in white matter hyperintensity volume. These results highlight potential targets for the amelioration of specific aspects of brain ageing.

HIPPOCAMPAL INTEGRITY AND COGNITIVE ABILITY IN AN AGING POPULATION USING QUANTITATIVE MRI TECHNIQUES

B.S. Aribisala, *Lagos State University, Ojo, Nigeria*

The hippocampus is involved in cognitive tasks such as learning, memory, emotional behaviour, stress regulation and spatial navigation. The structural integrity of hippocampus is commonly quantified using volumetric measurements derived from conventional anatomical brain Magnetic Resonance Imaging (MRI) techniques. Previous investigations of hippocampal volume and its association with age-related cognitive decline have produced inconsistent findings. Quantitative imaging techniques such as relaxometry, magnetization transfer and diffusion tensor MRI can detect subtle brain tissue changes not identifiable on conventional structural MRI. Here we investigate hippocampal integrity, characterised using multiple quantitative MRI techniques, and its association with cognitive ability in a large group of community-dwelling subjects in their 70s. Quantitative multi-modal MRI revealed stronger association between

imaging biomarkers in the hippocampus and age-related cognitive decline than the conventional volumetric approach. This suggests that quantitative MRI techniques are more sensitive at detecting age-related cognition-hippocampal integrity associations than are volumetric measurements.

ASSOCIATIONS BETWEEN CHILDHOOD COGNITIVE ABILITY AND BRAIN CORTICAL THICKNESS IN OLD AGE

S. Karama, *McGill University, Montreal, Quebec, Canada*

Preservation of cortical brain tissue is often viewed as the foundation of successful cognitive aging. However, this association could instead reflect a lifelong association between cognitive ability and cortical tissue. We analyzed cortical data on 588 subjects from the Lothian Birth Cohort 1936 who have IQ scores from the same test available at 11 and 70 years as well as brain MRI at 73 years. Childhood IQ accounted for more than two-third of the association between IQ and cortical thickness in old age. This warns against ascribing a causal interpretation to the association between cognitive ability and cortical tissue in old age based on assumptions about, and exclusive reference to, the aging process. Without early-life measures of cognitive ability, it would have been tempting to conclude that preservation of cortical thickness in old age is a foundation for successful cognitive aging when, instead, it is a lifelong association.

SESSION 4820 (SYMPOSIUM)

IMPACT OF CHRONIC VIRAL INFECTION IN HUMAN IMMUNOSENESCENCE: A GLOBAL HEALTH PROBLEM

Chair: R.B. Effros, *University of California, Los Angeles, Los Angeles, California*

G.P. Pawelec, *University of Tübingen, Tuebingen, Germany*

It is becoming increasingly apparent that infection with agents that establish latency may have serious occult impacts on health and longevity, many of which may be mediated by effects on host immunity. At one extreme, HIV can establish latency in elite controllers or by virtue of anti-viral treatment but nonetheless appears to accelerate the ageing process. At the other extreme, the recently-discovered torque-teno viruses require constant immune surveillance but development of viremia in immunosuppressed individuals appears symptom-free. In contrast, persistent CMV rarely causes any symptoms in healthy adults but can be a powerful and fatal acute pathogen in immunosuppressed people. Epidemiological and other studies suggest that long-term effects of controlled persistent infection with CMV, as well as HIV and other agents may 1) not be trivial and 2) may be additive. This Symposium addresses these important issues in presentations covering the impact of replicative senescence/telomere-telomerase dynamics in HIV disease, persistent immune activation and carotid atherosclerosis in HIV-Infected people receiving antiretroviral therapy, the long-term immune and non-immune impacts of CMV infection in humans, and the impact of chronic multi-pathogen infection (CMV, HSV, HBV, Helicobacter) on health and longevity

IMPACT OF REPLICATIVE SENEESCENCE AND TELOMERE-TELOMERASE DYNAMICS IN HIV DISEASE

R.B. Effros, *Pathology and Laboratory Medicine, University of California, Los Angeles, Los Angeles, California*

The presence of CD8 T cells with multiple features of replicative senescence is associated with accelerated immunological aging in HIV-infected persons. Moreover, the abundance of senescent T cells early in the infection is predictive of the rate of disease progression. This presentation will review the features of replicative senescence, including *in vivo* modulators of the senescence trajectory. The role of senescent T cells in bone loss and cardiovascular changes in HIV disease will also be discussed. Finally, data will be presented showing that immune features detected in peripheral blood, which contains only approximately 2% of the total body lymphocyte population, may differ from characteristics in gut-associated lymphoid tissue (GALT), the most extensive lymphoid organ in the body and houses up to 60% of total body lymphocytes.

HIV INFECTION, CO-INFECTIONS, IMMUNE ACTIVATION, AND CHRONIC COMORBIDITIES IN RURAL UGANDA

M. Siedner, *1. Medicine, Massachusetts General Hospital, Boston, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts*

In the United States and Europe, suppressed HIV infection is associated with persistent chronic immune activation, systemic inflammation, and an approximately 50% increased risk of atherosclerosis and other pro-inflammatory states. In sub-Saharan Africa, home to over 25 million people with HIV infection, differences in the prevalence of co-infections and lifestyle characteristics are likely to alter the mechanisms of immune activation, as well as the resulting co-morbidities for HIV-infected persons. Soil transmitted helminth and cytomegalovirus infections, which are highly prevalent, induce immune dysregulation and chronic inflammation independently of HIV infection. Similarly, biomass cooking fuel exposure and dietary-induced alterations in the gut microbiome are both correlates of immune activation. We present data from a mixed cohort of treated HIV infected persons and matched HIV-uninfected comparators in rural Uganda to help define the pathophysiology of immune dysregulation and chronic comorbidities, and to discern how region-specific factors impact aging in this population.

CAN CYTOMEGALOVIRUS INFECTION ACT AS A MAJOR DRIVER OF VASCULAR PATHOLOGY IN OLDER PEOPLE?

P. Moss, *University of Birmingham, Birmingham, United Kingdom*

Cytomegalovirus (CMV) is a member of the human herpesvirus family and establishes a state of chronic infection which is present in most humans. The CMV-specific immune response is exceptionally strong and increases further with age such that the T cell immune response to CMV can represent over 10% of all T cells.

CMV infection increases the risk of death from vascular disease in older people. We showed that infection leads to a stiffening of arteries in a process termed 'arteriosclerosis' and

this increases systolic blood pressure by 3mmHg in people aged 70+ years. This increases the risk of vascular disorders and we have been investigating the use of anti-viral medication to suppress viral replication and suppress immunopathology. Initial results indicate that this has the potential to limit the development of arteriosclerosis and could thus have a significant impact on improving health in the elderly.

THE IMPACT OF PATHOGEN BURDEN ON HEALTH AND LONGEVITY

A.E. Aiello, *UNC Gillings School of Global Public Health, Chapel Hill, North Carolina*

Numerous persistent pathogens, including cytomegalovirus and other herpesviruses, have been implicated in chronic disease and associated mortality. Some research suggests that multiple herpesviruses may synergistically cause damage to various tissues and organs of the body via direct and indirect immunological pathways. Our earlier research has suggested that cumulative damage resulting from exposure to multiple persistent pathogens may play a larger role in mortality than the contribution of any single pathogen. We hypothesized that leukocyte telomere shortening may be one pathway by which herpesvirus pathogen burden may synergistically influence longevity. This presentation will first describe the state of the literature on pathogen burden and survival. Next, we will present novel data linking multiple persistent herpesviruses to shorter telomere length using data from multiple large-scale studies. Our studies provide key insights on the role of multiple persistent infections and biological aging.

SESSION 4825 (SYMPOSIUM)

AWARENESS OF AGE-RELATED CHANGE: WHAT HAVE WE LEARNED SO FAR AND WHERE ARE WE GOING?

Chair: M.K. Diehl, *Colorado State University, Fort Collins, Colorado*

Co-Chair: H. Wahl, *Heidelberg University, Heidelberg, Baden-Wuerttemberg, Germany*

Discussant: M.E. Lachman, *Brandeis University*

In 2010, Diehl and Wahl introduced the construct of Awareness of Age-Related Change (AARC) into the social gerontology literature. The primary objective of this new concept was to theoretically and empirically enhance the area of subjective aging research and also to provide an integrative framework that could enrich this field of inquiry. According to Diehl and Wahl (2010), AARC refers to all those experiences that make a person aware that his or her behavior, level of performance, or ways of experiencing life have changed as a consequence of having grown older (i.e., increased chronological age). Since 2010, a body of theoretical and empirical work has emerged addressing several objectives. A first aim has been to clarify the theoretical status of the AARC construct vis-à-vis other subjective aging constructs. A second aim has focused on the psychometric assessment of AARC, and a third aim has focused on generating data to clarify the empirical status of AARC in comparison to other subjective aging constructs. In this symposium, we will provide an update and evaluation of what has been achieved so far. This critical review will also include a look forward and will

discuss areas and questions where AARC may be able to make constructive contributions in the future. In addition, we integrate most recent work with the intent to further differentiate the construct and expand its empirical scope.

SUBJECTIVE AGING RESEARCH AND THE CONSTRUCT OF AWARENESS OF AGE-RELATED CHANGE

M.K. Diehl¹, H. Wahl², 1. *Human Development & Family Studies, Colorado State University, Fort Collins, Colorado*, 2. *Heidelberg University, Heidelberg, Baden-Wuerttemberg, Germany*

How do adults perceive their own aging? And do these self-perceptions matter? Motivated by these questions, Diehl and Wahl (2010) proposed the construct of Awareness of Age-Related Change (AARC) as an extension of existing research on subjective aging. Our major goals with the AARC research program have been to deepen the understanding of individuals' self-perceptions and self-reflections on aging theoretically and empirically by linking adults' AARC with developmental outcomes, and by exploring the plasticity of AARC. We present the theoretical foundation of this fairly new construct and argue that AARC represents a key feature of the aging self. We describe AARC measurement approaches and provide evidence of the multi-dimensionality of the construct. We also review existing AARC-based studies and discuss the contributions that these studies have made, in particular, with regard to predicting developmental outcomes. New findings on AARC-related interventions will round out the presentation.

MEASURING AWARENESS OF AGE-RELATED CHANGE: DEVELOPMENT OF A MULTIDIMENSIONAL QUESTIONNAIRE

A. Brothers¹, M. Gabrian², H. Wahl², M.K. Diehl¹, 1. *Human Development and Family Studies, Colorado State University, Fort Collins, Colorado*, 2. *University of Heidelberg, Heidelberg, Germany*

We developed and evaluated a multidimensional questionnaire to assess the construct awareness of age-related change (AARC). An initial version of the questionnaire, developed from a large pool of items generated in focus groups and daily diaries, was tested with a cross-cultural sample of 819 adults from the U.S. and Germany, aged 40–95. Exploratory and confirmatory factor analyses yielded a two-factor structure, representing the awareness of positive and negative age-related changes, respectively named AARC-Gains and AARC-Losses. A shortened version of the questionnaire was then tested with a subsample of 425 returning participants 2 years later. The two-factor structure was confirmed. Evidence was found for item and scale reliability, as well as convergent, divergent, and predictive validity. The availability of a reliable and valid assessment tool for measuring AARC advances subjective aging research by capturing adults' positive and negative self-perceptions of aging.

ASSOCIATIONS AMONG AWARENESS OF AGE-RELATED CHANGE, DEPRESSIVE MOOD, AND THE ROLE OF SELF-REGULATION

A.J. Dutt, M. Gabrian, H. Wahl, *Heidelberg University, Heidelberg, Germany*

We examined associations among awareness of age-related change (AARC) and depressive mood based on two measurement occasions 2.5 years apart in a sample of 423 participants between 40 and 98 years of age at T1. In addition, modes of self-regulation, operationalized as tenacious goal pursuit (TGP) and flexible goal adjustment (FGA), was assessed at T2. AARC was cross-sectionally and longitudinally associated with self-regulation. Perceptions of loss-related aging experiences were negatively correlated with TGP and FGA, whereas the associations for perceptions of gain-related aging experiences were positive. These associations were significant even after controlling for subjective age. Perceived age-related gains and FGA interacted to predict depressive symptoms: When perceived gains were low and FGA was high, fewer depressive symptoms were reported. Perceived age-related losses predicted depressive symptoms independent from levels of self-regulatory attempts. These findings underscore the relevance of the dimensions of AARC in terms of self-regulation and developmental outcomes.

FUTURE TIME PERSPECTIVE AND AWARENESS OF AGE-RELATED CHANGE: TEMPORAL ORDER AND MUTUAL INFLUENCES

M. Gabrian¹, A. Brothers², H. Wahl¹, M.K. Diehl², 1. *Heidelberg University, Heidelberg, Germany*, 2. *Colorado State University, Fort Collins, Colorado*

Subjective perceptions of lifetime are inseparably tied to a personal past and future, which together motivate human action. This study examines how different subjective timeframes, i.e. Future Time Perspective (FTP) and Awareness of Age-Related Change (AARC), may interact to predict psychological well-being. Analyses were conducted within a structural equation modeling framework on a cross-national, 2.5-year longitudinal sample of 537 adults (40–98 years old). FTP mediated the longitudinal effect of AARC-Losses on well-being. Furthermore, AARC-Gains buffered the effect of FTP on well-being. Regarding the temporal order, findings suggest that age-related loss experiences sensitize individuals to perceive their future lifetime as more limited. Furthermore, perceived age-related gains represent a resource for psychological well-being, in particular when time is perceived as running out. We argue that it is important to consider mutual influences between subjective perceptions of lifetime and aging in order to better understand the mechanisms linking subjective aging to developmental outcomes.

AN ULTRA-SHORT SCALE ASSESSING AWARENESS OF AGE-RELATED CHANGE IN LARGE-SCALE SURVEYS

R. Kaspar¹, M. Gabrian², A. Brothers³, H. Wahl², M.K. Diehl³, 1. *Cologne Center for Ethics, Rights, Economics, and Social Sciences of Health, Cologne, Germany*, 2. *Department of Psychological Aging Research, Heidelberg University, Heidelberg, Germany*, 3. *Department of Human Development and Family Studies, Colorado State University, Fort Collins, Colorado*

Awareness of Age-Related Change (AARC) may play a key role in maintaining physical health and psychological well-being in later life. Thus, incorporating the concept of AARC into large-scale population-based surveys of well-being and health is relevant to gain a better understanding of its relevance. Hence, a brief measure that recognizes

the multi-dimensionality of the construct (i.e. gain-related vs. loss-related self-perceptions) is needed. Based on multi-dimensional item response (MIRT) analyses of AARC responses from a total of 819 community-residing individuals aged 40–89 from the United States and Germany, a 10-item scale is presented that offers a valid, reliable, and effective measurement of AARC gains and losses across this segment of the adult life span. This scale will be used for the first time in a representative population survey of adults aged 80 and older, the NRW80+ Study, conducted in the state of North Rhine-Westphalia in Germany.

SESSION 4830 (SYMPOSIUM)

MEANINGFUL AGING: NEW CONCEPTUAL AND EMPIRICAL INSIGHTS

Chair: P. Derkx, *University of Humanistic Studies, Geldermalsen, Netherlands*

Co-Chair: A. Machielse, *University of Humanistic Studies, Utrecht, Netherlands*

This symposium focuses on how ‘aging’ people experience their lives as existential and socially situated processes from the perspective of a meaningful life course. Meaning-in-life is a comprehensive construct that is broadly conceptualised (Baumeister & Vohs, 2005; Brandstätter et al., 2012; Derkx, 2013; Stillman, et al., 2009). In this symposium a meaningful life is understood as a life in which basic needs for meaning are fulfilled, such as purpose, moral worth, self-worth, competence, comprehensibility, connectedness and excitement. The presented papers show the results of philosophical and empirical research into meaning-making in the life of older adults.

Derkx conceptualises a humanistic meaning frame that acknowledges and promotes the autonomous and responsible role of individuals in shaping their existence meaningfully. Duyndam reflects on personal uniqueness as a key concept of meaningful aging. Machielse provides insights into the relationship between meaning-making and social connectedness, using data from a qualitative study on urban elderly. Bos explores the experiences of meaning-in-life in an anthropological study on elderly people, aging in a rural orthodox-protestant community in the Netherlands. Duppen focuses on the experience of frail older adults’ meaning-in-life and their connectedness with their social environment in Belgium.

HUMANISM AND MEANING IN LIFE

P. Derkx, *University of Humanistic Studies, Geldermalsen, Netherlands*

Starting from Baumeister’s theory (Baumeister & Vohs, 2005) a theory of a meaningful life has been developed involving seven needs for meaning: needs for purpose, moral worth, self-worth, competence, comprehensibility, connectedness and excitement (Derkx 2013). More than Baumeister’s theory this one strikes a balance between agency and communion. After outlining the theory the value and relevance of a meaning perspective for aging well will be shown. Issues that will be dealt with in this context are: (1) the difference between a happy life (= well-being) and a meaningful life, (2) continuity, disengagement and activity,

(3) the social construction and institutionalisation of a standard life course, (4) individualistic coherence (identity) and ‘lateral’ (relational) integration, (5) resilience as recovery, resistance and reconfiguration (transformation), (6) the role of religion and worldview in relation to suffering, and (7) views of death, finitude, afterlife and (vertical and horizontal) transcendence.

MEANING IN LIFE AND SOCIAL CONNECTEDNESS

A. Machielse, *University of Humanistic Studies, Utrecht, Netherlands*

This paper focuses on the relationship between meaning in life and social connectedness, the experience of belonging and relatedness between people. It is assumed that positive personal attachments contribute substantially to the capacity of making sense of one’s life. In turn, the experience of a meaningful life protects against the damaging effects of major life changes in various life domains, which tend to occur more often as people age. Our research provides valuable insight in ways older adults cope with losses, social impoverishment and disembeddedness, and how this influences their experience of a meaningful life. The data from a longitudinal study on 50 socially isolated older adults in the Netherlands are used to explore whether and how these elderly persons try to bring meaning into their lives and to what degree they succeed. The findings will centre upon the dimensions self-worth, competence and comprehensibility.

MEANING IN LIFE FOR FRAIL OLDER ADULTS: RESULTS FROM A QUALITATIVE STUDY

D. Duppen¹, L. De Donder¹, D. Verté¹, A. Machielse², D. Consortium¹, 1. *Vrije Universiteit Brussel, Brussel, Belgium*, 2. *Universiteit voor Humanistiek, Utrecht, Netherlands*

Frailty in later life is mostly associated with health decline and a greater risk in adverse events. Despite their situation, these frail older adults often manage to age in place and often play an active role in their family or community. This paper focuses on the experience of frail older adults’ meaning in life and their connectedness with their social environment. 121 semi-structured qualitative interviews of older adults in Belgium were analysed. 101 Respondents (aged 60 and over) were mildly or severely frail in the physical, social, psychological or environmental domain.

Findings indicate that, even severely frail older adults, experience a positive meaning in life. Key-dimensions of meaning in life were self- and moral worth, competence, purpose, connectedness, excitement and sense of coherence. The discussion highlights the various interpretations of the outcomes, while taking different frailty types and the social environment into account.

QUALITATIVE (ETHNOGRAPHIC) RESEARCH ON MEANING IN LIFE OF RURAL ELDERLY IN THE NETHERLANDS

P. Bos, *University of Humanistic Studies Utrecht, Utrecht, Netherlands*

This paper is an anthropological investigation and based upon in-depth interviews and thick descriptions (participant observations) collected among elderly persons in a rural orthodox protestant area (1600 citizens) in the Netherlands.

Data are collected from people who are 75 or older and who are ageing in a context where families traditionally live in inter-generational households (extended families). Our findings are centred upon dimensions such as purpose, moral worth, self-worth, competence, comprehensibility, connectedness and excitement. Hence, the paper explores meaning in life of people who are embedded in a family –, religious- and village-community.

SESSION 4835 (SYMPOSIUM)

WELL-BEING AS A PATHWAY TO REACHING THE EXTREMES OF HUMAN LIFESPAN

Chair: S.L. Andersen, *New England Centenarian Study, Boston, Massachusetts*

Co-Chair: D.S. Jopp, *University of Lausanne, Lausanne, Schweiz, Switzerland*

Discussant: M. Ardel, *University of Florida, Gainesville, Florida*

Genetics have been found to account for only a portion of the ability of long-lived individuals and their family members to remain in good health. Therefore other factors, such as psychosocial dimensions, may play a role in increased health spans and longevity. In particular, well-being has been associated with mental and physical health and social and environmental relationships. Higher well-being including lower stress levels and positive mood are associated with favorable biological processes, positive health outcomes, and reduced mortality. Therefore cohorts of long-lived individuals present a unique opportunity to study the association and interaction of well-being with longevity and other psychosocial variables.

This symposium addresses several facets of well-being among long-lived individuals. In the Fordham Centenarian Study meaning in life and will to live had more significant effects on well-being than health factors. Among centenarians from two Portuguese Centenarian Studies, spontaneous recollection of the past was common and generally positive, however, some centenarians avoid reminiscing due to negative effects of this behavior on their well-being. Better scores on indices of successful aging were found among elders from an area of Sardinia noted for exceptional longevity. Furthermore, it was determined that social desirability was an important factor affecting indices of successful aging in this unique cohort. The New England Centenarian Study found that centenarian offspring have higher levels of purpose in life than the general population indicating that well-being may be an important factor throughout the life course rather than just at the end of life for individuals predisposed to longevity.

MEANING IN LIFE AND WILL TO LIVE AS PREDICTORS OF WELL-BEING IN CENTENARIANS

D.S. Jopp, C. Meystre, C. Lampraki, *Institute of Psychology, University of Lausanne, Lausanne, Schweiz, Switzerland*

Existential factors such as meaning in life and will to live are assumed to be important factors for well-being in very old age, yet only few studies have examined these variables in centenarians to date. The present study investigates the effect of meaning in life and will to live in the context

of age-associated health restrictions (number of diseases, subjective health, health restrictions), using data from the Fordham Centenarian Study (N = 119, Mage = 99.25 years). Regression findings indicated that both meaning in life and will to live had strong direct effects on well-being, including life and aging satisfaction. Health factors were, in comparison, less important or non-significant. Significant mediation or moderation effects were not found. In sum, findings underscore the important role of existential factors in very advanced age and underscore the importance of addressing these factors to ensure high quality of life in very old age.

REMINISCENCE AND WELL-BEING IN CENTENARIANS

O. Ribeiro^{1,2,3}, R.A. Afonso⁴, J. Serrano Selva⁵, L. Teixeira¹, L. Arajo⁶, 1. *University of Porto - CINTESIS, Porto, Portugal*, 2. *ISSSP, Porto, Portugal*, 3. *University of Aveiro, Aveiro, Portugal*, 4. *University of Beira Interior - CINTESIS, Covilhã, Portugal*, 5. *Universidad Castilla-La Mancha, Albacete, Spain*, 6. *Higher School of Education, Viseu, Portugal*

Recollecting past experiences and events is expected to be spontaneous and frequent in old age, and is potentially related to a feeling of wellbeing and contentment. Few studies however have explored the emotions present in such an activity in centenarians. This quantitative study draws from the Portuguese Centenarian Study (PT100) and describes the frequency of spontaneous reminiscence activities, its elicited emotions, functions (e.g. ego-integrity), and associated psychosocial variables (valuation of life, satisfaction with life, depression, anxiety, loneliness) in a sample of 78 centenarians aged 100 to 108 years (M=101.0; SD=1.5). Results show that for most centenarians (n=43) thinking about the past is a regular and positive activity but significantly associated with feelings of loneliness; a subgroup of centenarians present an active avoidance of the activity, as it is embedded in negative and/or ambivalent feelings that influence current perceived wellbeing. These findings highlight the need for carefully planning reminiscence interventions in very advanced ages.

SARDINIAN ELDERS: SUCCESSFUL AGEING AND PSYCHOSOCIAL CORRELATES DESPITE RESPONSE BIAS

P. Hitchcott, M.C. Fastame, S. Desogus, R. Conti, M. Penna, *Department of Pedagogy, Psychology, Philosophy, University of Cagliari, Cagliari, Italy*

Extreme variance in the prevalence of successful ageing (SA) has been observed raising concern over the generalizability of findings. The study of populations characterized by SA is one solution to this problem. A total of 226 cognitively healthy community-dwelling participants aged 75–103, from the Blue Zone region of Sardinia were recruited and completed a range of indices of SA. Putative psychosocial correlates of SA were also assessed along with a measure of social desirability. After controlling significant social desirability bias, multiple indices of SA were found to be high relative to Italian cutoffs and differed between age groups and genders. A significant proportion of the variance in SA indices was explained by social desirability, perceived physical health,

gender, cognitive failures and gardening. Superior SA was evident in Sardinian elders. The data underscore a need to control social desirability bias when exploring the basis of SA.

PURPOSE IN LIFE AMONG CENTENARIAN OFFSPRING

S. Marone², L. Nussbaum³, P. Sebastiani³, T.T. Perls^{1,2}, S.L. Andersen^{1,2}, 1. *New England Centenarian Study, Boston, Massachusetts*, 2. *Boston University School of Medicine, Boston, Massachusetts*, 3. *Boston University School of Public Health, Boston, Massachusetts*

Purpose in life (PIL), a feeling of meaning and direction in life, is associated with favorable health outcomes including lower mortality and reduced risk of disease, disability, and cognitive impairment. Since centenarian offspring have been shown to have longer health spans we sought to examine whether they have higher PIL than the general population. We compared scores from the Ryff Scales of Psychological Well-Being in New England Centenarian Study offspring (N=296, mean age=81.6 years) with a Health and Retirement Study referent group (N=4916, mean age=70.4 years). Regression analyses adjusted for age, sex, education, and marital status indicated higher PIL scores ($p < .001$) among centenarian offspring than referents, although, this difference decreased with age. This indicates that PIL is associated with the ability to delay age-associated illnesses and functional decline. PIL and its association and interaction with other psychosocial variables and health behaviors should be further investigated in this cohort.

SESSION 4840 (SYMPOSIUM)

SOCIAL SUPPORT OF CHINESE OLD ADULTS—FINDINGS FROM THE CHINESE LONGITUDINAL AGEING SOCIAL SURVEY

Chair: W. Zhang, *Renmin University of China, Beijing, China*

Co-Chair: P. Du, *Institute of Gerontology, Renmin University of China, China*

The rapid modernization in China has changed the lives of its senior citizens more than ever before. In order to capture the current quality of life of the Chinese elderly, a baseline of Longitudinal Ageing Social Survey (CLASS) was conducted in 2014, covered 28 out of 31 Provincial areas of China (n=11,511). The survey collected information on health, mental health, intergenerational relations, and social care resources of the elderly aged 60+. CLASS provides detailed information on social support of older adults in China, which enables further analysis on its role in enhancing of the well-being of older persons. In this panel, five researchers from China and United States will introduce their findings using the baseline data from CLASS to address a different social and health issue namely: social isolation, social and intergenerational support, hospital service utilization of Chinese elderly.

The first paper explored intergenerational support from grandparents to grandchildren and its effect on the quality of life. The second paper also found supports from grandchildren to grandparents and proved the supports could be the substitution of ageing support from adult children. The third

study reported the hospital utilization patterns and found that social support as one of the significant predictors for hospital utilization. The fourth paper revealed types of social support and its determinants. The fifth study focused on the social network of the older adults in urban China, the prevalence of social isolation has been explored and compared between floating and non-floating older adults.

GRANDPARENTS RAISING GRANDCHILDREN IN CHINA AND ITS EFFECTS ON THE QUALITY OF LIFE OF OLDER PEOPLE

J. Sun, *Institute of Gerontology, Renmin University of China, Beijing, Beijing, China*

Based on the data of “China Longitudinal Aging Social Survey” in 2014, this study explores situation and characteristics of the Chinese elderly who taking care of their grandchildren as well as its effects on the quality of life of older people in the Chinese cultural context.

The results show that 34 percent of the Chinese elderly caring their grandchildren. The older groups with younger age, with spouse, higher educational attainments, better physical health and living in urban areas are more likely to care their grandchildren. The empirical results show that taking care of grandchildren do not improve the older grandparents’ economic benefits. However, the finding also supports that the care may enhance older grandparents’ positive psychological feelings and life satisfaction. This study indicates that the older people who provide care for grandchildren especially those live in the rural left-behind families and skipped-generation families should be supported and compensated.

GRANDCHILDREN AS SUPPORT AND CARE PROVIDERS TO OLDER ADULTS IN CHINA

M. Silverstein¹, L. Xu², 1. *Sociology, Syracuse University, Syracuse, New York*, 2. *University of Texas at Arlington, Arlington, Texas*

Increased life expectancy among older adults in China implies that grandparents increasingly survive long enough for their grandchildren to reach adulthood and take on elevated importance, even as smaller family size reduces the number of children and grandchildren available. This paper examined the family conditions under which grandchildren provide support and care to their grandparents. The data for our analysis derive from the 2014 wave of the Chinese Longitudinal Aging Social Survey, limited to 13.4% of respondents (n=1,551) who reported requiring personal assistance to perform daily activities. Logistic regression revealed that grandparents were more likely to receive care from grandchildren when they had no son available or had daughters who did not provide care. These findings support the compensatory or substitution role of grandchildren as sources of care for their grandparents. We conclude that grandchildren may take on elevated importance as smaller single-gender families become more common in China.

HOSPITAL UTILIZATION AMONG CHINESE OLDER ADULTS – PATTERNS AND PREDICTORS

I. Chi¹, H. Chen², R. Liu¹, 1. *School of Social Work, LA, California*, 2. *Department of Social Work, Fudan University, Shanghai, China*

China's population is aging rapidly and its healthcare cost has increased tremendously in recent years. It is critical to understand the hospital utilization pattern and the predictors of utilization among older Chinese adults. This study used a national sample aged 60 and older ($n=11,511$) who were the respondents from the China Longitudinal Aging Social Survey in 2014. About 25% of the respondents were hospitalized in the previous year. We applied the Anderson Model of Health Services Utilization, stepwise logistic regression models to identify the predictors of hospital utilization. The results showed level of literacy, social support, negative perception of aging, and rural residency significantly predicted hospital utilization. Separate models were run for rural and urban samples with significant differences in the utility of predicting hospitalization for age, social network, ADL and IADL disability. In addition, there are variations cross provinces in the hospitalization. Policy and practice implications are discussed accordingly.

PATTERNS OF SOCIAL SUPPORTS OF CHINESE ELDERLY AND ITS DETERMINANTS

J. Lu, L. Zhang, *Department of Sociology, Peking University, Beijing, China*

Early literature turn out that the patterns of social supports of the elderly in western nations are quite different from those of Chinese elderly, which indicates that more social supports for Chinese elderly depend mainly on their children and relatives. However, accompanied with process of the modernization and industrialization, the traditional patterns of social supports of Chinese elderly have changed. This study employed the CLASS data to identify the current patterns of social support and its determinants by using Logistic model. Our results show that factors such as schoolings, occupation before retirement, residence, social pension, etc., could affect the choice of social support of Chinese elderly, which urges both central and local governments to provide more social service and care for Chinese elderly in the rapid process of population ageing in China.

SOCIAL ISOLATION OF OLD PEOPLE IN URBAN CHINA

W. Zhang, R. Liu, *The Institute of Gerontology, Renmin University of China, Beijing, China*

With the development of urbanization in China since 1980's, a great number of floating people become elderly, and many of migrants brought their parents into urban communities, all above changes increasing the migration of the elderly. The migration changes the social environments of the elderly, increases the probability of social isolation. Employing the data of China Longitudinal Aging Social Survey (CLASS), this study described the situation of social isolation of the elderly in urban China, and identified differences between floating people and local citizens. A Logistic regression analysis has been conducted to reveal the determinants of social isolation, and a comparison between the non-floating elderly and floating elderly has been done. The results indicated that the living arrangement is the most important predictive factor for the family isolation, while the participation in social activities is

major determinant variable for the friend isolation of the older floating people.

SESSION 4845 (SYMPOSIUM)

MASCULINITY IN THE REALM OF CARE

Chair: S. Solimeo, *Department of Veterans Affairs, Center for Comprehensive Access & Delivery Research and Evaluation (CADRE) Iowa City VA HCS, Iowa City, Iowa*
Co-Chair: E.H. Thompson, *College of the Holy Cross, Broadview Heights, Ohio*

Discussant: L.W. Kaye, *University of Maine*

The canon that men should be self-reliant coupled with a feminization of self-care and the labor of caring for others diminishes many men's perceived capability to engage in preventive care as well as devalues the care work they do. The research discussed in this symposium explores the gendered nature of older men's care, for self or for others, and the consequences of such gendering for the men. The first three presentations engage the performance and meaning of self-care among men. Clark and Bennett discuss how older Canadian men actively draw upon masculinity scripts of physical competency and strength to resist negative perceptions of aging bodies. Leibing's study of older Canadian men who had embraced experimental stem cell treatment for their heart disease identifies how the men's cardiac recovery also embraced common masculinity scripts. Smith's interviews with US veterans incarcerated in maximum-security prison underscore the men's unmet health needs, and resistance to self-care in a macho culture thick with violence-enforced gender performances. The final presentation addresses the performance and meaning of men's care work for others. Seaman's work studies illustrate how men's caregiving labor is routinely erased, even in caregivers' own narratives of their labor. Finally, Kaye's discussion addresses how men's self-care and care work are obscured when later life masculinities are ignored, or when gender remains equated with the 1950's sex role model of separate spheres.

I DO LIKE THE WAY I LOOK: OLDER MEN'S PERCEPTIONS AND EXPERIENCES OF AGING AND BODY IMAGE

L.C. Hurd Clarke, R. Mahal, *The University of British Columbia, Vancouver, British Columbia, Canada*

This paper examines the body images of older Canadian men, focusing on their perceptions of and feelings about their changing, aging bodies. We draw upon data from in-depth interviews with 22 community-dwelling men, aged 65 to 89, who were diverse with respect to marital status, level of education, employment history, and household income. Our thematic analysis revealed three key ways that the men perceived and assessed their bodies. First, our participants were either pleased with their overall appearances or unconcerned about how their looks had altered over time. Second, the men emphasized the importance of bodily function over aesthetics as they highlighted their functional qualities (e.g. strength, independence, etc.) and physical activities (e.g. leisure pursuits). Finally, the men articulated concerns about future losses to their health and how such changes might undermine their independence. We consider our findings in

relation to the socio-cultural theorizing about gender, health, and body image.

SELF-CARE AND MASCULINITIES: ON CARDIAC DISEASE AND STEM CELL TREATMENT AMONG OLDER CANADIAN MEN

A. Leibing, *University of Montreal, Montreal, Quebec, Canada*

Cardiac diseases are responsible for a high number of premature deaths and disabilities, especially among older men. And although there exists now a “misery of choice” (Jones 2013) regarding the manifold kinds of interventions targeting heart diseases, about 50% of individuals die within 5 years after a severe cardiac incident. Stem cell treatments provide major hope for these patients, despite thin evidence for its effectiveness in humans. I present findings from interviews with older men who had undergone experimental stem cell treatment for severe heart disease as subjects in a randomized blind control trial. Men’s accounts demonstrated their major trust in the experimental stem cell procedure and they also revealed that cardiac recovery was tightly linked to common ideals of masculinity: The regeneration of the damaged organ meant the rebuilding of a masculine identity closely intertwined with physical activity and productivity.

INCARCERATED VETERANS: THE CARE OF A ‘MISSING IN ACTION’ POPULATION

R. Smith, *Muhlenberg College, Allentown, Pennsylvania*

The population of incarcerated American veterans--estimated at roughly 150,000--has unique health needs given the stressors presented from incarceration, any combat-related injuries (both physical and psychological), and experiences prior to contact with either the military or the criminal justice system itself. This paper explores the care and community shared by a group of older Vietnam-era veterans in Pennsylvania. Like other groups of veterans, these men are socialized to downplay their own health needs, despite being an especially vulnerable group given their extended periods of incarceration and their older ages. Based on participant observation and interview data from incarcerated veterans and formerly incarcerated veterans who advocate on their behalf, this paper explores the gendered carework done by veterans for other veterans.

CAREGIVING ACROSS THE GAP: MALE CAREGIVERS AND FEMALE CAREGIVING

A. Seaman, *University of Iowa, Iowa City, Iowa*

Growing scholarly attention to male caregivers has articulated the gendered nature of their labor and the burdens they experience. I build on this research by examining how male caregivers experience and reconcile the gap between the gender with which heterosexual, cisgendered men associate themselves and the female-gendering of caregiving labor. I draw upon 26 months of ethnographic research conducted in the Midwestern US with spousal caregivers of people living with early-onset dementia, using a case study approach to illustrate how people understand and give or deny the value of men’s caregiving. Particular attention is paid to the ways in which men’s caregiving labor is erased, notably in the caregivers’ own minds. As men make sense of their own caregiving experiences, they incorporate gendered understandings of

caregiving. Doing so renders certain, often intimate aspects of their own labor invisible and devalues the work they do acknowledge as less legitimate caregiving labor.

SESSION 4850 (SYMPOSIUM)

HEALTH TRAJECTORIES IN LATER LIFE IN JAPAN AND UNITED STATES

Chair: S. Shinkai, *Tokyo Metropolitan Institute of Gerontology, Itabashi, Tokyo, Japan*

Co-Chair: J. Liang, *University of Michigan*

Discussant: B.A. Shaw, *SUNY at Albany*

Although health inevitably declines with advancing age, the pattern of health changes varies from person to person. To analyze health changes in old age, the analysis of longitudinal data is essential. In this symposium, five speakers from Japan (Murayama H, Shinkai S, Taniguchi Y) and United States (Liang J and Botoseneanu A) will report findings on health trajectories by using longitudinal data from nationally representative cohorts of older adults (the National Survey of Japanese Elderly in Japan and the Health and Retirement Study in U.S.) as well as community-based studies (the Kusatsu Longitudinal Study on Aging and Health in Japan, KLSAH; Piedmont Dental Study in U.S., PDS). KLSAH is a longitudinal study, which entailed 2,000 community dwelling older adults assessed annually on functional health. PDS involved repeated observations of 810 dentate individuals aged 65 and over in North Carolina from 1988 to 1994. Using such data, each speaker will examine patterns of trajectories including cognitive function, oral health, and physical performance such as gait speed and muscle strength. They will also show the relative contribution of life-style related diseases such as cardiovascular disease and aging-related pathologies such as sarcopenia to different trajectory pattern of functional health. Finally, Shaw B (USA) will discuss how these findings contribute to a better understanding of health in later life and their implications for public health.

TRAJECTORIES OF BODY MASS INDEX AND THEIR ASSOCIATIONS WITH MORTALITY AMONG OLDER JAPANESE

H. Murayama¹, J. Liang², B.A. Shaw³, A. Botoseneanu², E. Kobayashi⁴, T. Fukaya⁴, S. Shinkai⁴, 1. *Institute of Gerontology, The University of Tokyo, Tokyo, Japan*, 2. *University of Michigan, Ann Arbor, Michigan*, 3. *University at Albany, State University of New York, Rensselaer, New York*, 4. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

This study examined the association between the trajectories of body mass index (BMI) and all-cause mortality in old age. Data came from the National Survey of the Japanese Elderly, which included 4,869 adults aged 60 and over, with up to seven repeated observations between 1987 and 2006. Four distinct BMI trajectories were identified: “low-normal weight, decreasing” (baseline BMI=18.7; 23.8% of sample), “mid-normal weight, decreasing” (baseline BMI=21.9; 44.6% of sample), “high-normal weight, decreasing” (baseline BMI=24.8; 26.5% of sample), and “overweight, stable” (baseline BMI=28.7; 5.2% of sample). Survival analysis showed that, relative to those with

mid-normal decreasing BMI, those with stable overweight trajectory had the lowest mortality, whereas those with low-normal, decreasing BMI had the highest mortality. In a sharp contrast with prior observations from Western populations, BMI changes primarily lie within the normal-weight range and virtually none are obese among older Japanese. The association between BMI trajectories and mortality varies according to the distribution of BMI within the population.

TRAJECTORY PATTERN OF MINI-MENTAL STATE EXAMINATION SCORE AND DEMENTIA IN KLSAH

S. Shinkai², Y. Taniguchi², H. Amano², H. Murayama¹, S. Seino², M. Nishi², Y. Yokoyama², A. Kitamura², 1. *Institute of Gerontology, The University of Tokyo, Tokyo, Japan*, 2. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

This study used repeated measures analysis to identify potential Mini-Mental State Examination (MMSE) score trajectory and determine whether MMSE trajectory was associated with incident dementia among community-dwelling older Japanese. 1,724 older residents in Kusatsu participated in annual geriatric health assessments during 2002–14. The total number of observations was 6,755 and the average number of follow-up was 3.9. A review of municipal database in the Japanese public long-term care insurance system revealed that 205 (11.9%) participants developed dementia until the end of 2014. As a result, we identified 3 distinct MMSE score trajectory patterns (high, middle, and low). Participants with middle (42.8%) and low (5.1%) MMSE trajectories showed multi-variate adjusted hazard ratios of 2.46 (95% CI, 1.64–3.68) and 10.73 (95% CI, 4.91–23.45), respectively, for incident dementia, as compared with those in the high (52.1%) trajectory group. Present data help us to construct the strategy for prevention of dementia in the community.

COURSES OF CHANGE IN PERIODONTAL DISEASE AMONG OLDER AMERICANS

J. Liang³, B. Wu¹, B.L. Plassman¹, J.M. Bennett³, C. Hybels¹, L. Landeman¹, J. Beck², 1. *Duke University, Durham, North Carolina*, 2. *University of North Carolina, Chapel Hill, North Carolina*, 3. *University of Michigan, Ann Arbor, Michigan*

This research depicted distinct courses of periodontal disease among older Americans and ascertained how these trajectories were associated with chronic diseases (i.e., hypertension, heart disease, stroke, diabetes, and cancer). Data came from the Piedmont Dental Study, which involved repeated observations of 810 dentate individuals aged 65 and over in North Carolina from 1988 to 1994. Attachment loss (AL) and pocket depth (PD) were clinically assessed. While group-based, semi-parametric mixture models (Proc Traj) were used for data analysis. Our data showed four distinct courses of change in periodontal disease over a five-year period. Whereas prior research has shown that oral health predicts heart disease and diabetes in old age, our findings suggest that these diseases may increase the risk for poor oral health as well.

TRAJECTORIES OF GRIP STRENGTH, CARDIOMETABOLIC RISK FACTORS, AND DISABILITY ON OLDER ADULTS

A. Botoseneanu², B.A. Shaw³, H. Murayama¹, J. Liang², 1. *Institute of Gerontology, The University of Tokyo, Tokyo, Japan*, 2. *University of Michigan, Ann Arbor, Michigan*, 3. *University at Albany, State University of New York, Rensselaer, New York*

Objective. To examine cardiometabolic risk factors as potential intervening mechanism in the association between trajectories of grip strength and functional disability in older adults.

Methods. Data came from ~3200 adults (≥65 years of age) from the HRS Study observed for up to 8 years. Hierarchical linear models assessed how changes in grip strength and cardiometabolic factors (HDL-cholesterol, HbA1c, C-reactive protein, and cystatin-C) are associated with a combined ADL/IADL index of functional disability. Analyses were performed stratified by gender.

Results. GS declined over 8 years following a linear trajectory. Decline in grip strength predicted an increase in the burden of functional disability in both men and women. Cardiometabolic factors (except cystatin-C) were associated with the rate of decline in grip strength and partially mediated the association with functional disability.

Implications. Cardiometabolic factors should be investigated as potential targets for reducing the burden of disability associated with muscle weakness in older adults.

PROSPECTIVE STUDY OF TRAJECTORIES OF PHYSICAL PERFORMANCE AND ALL-CAUSE MORTALITY

Y. Taniguchi², H. Murayama¹, S. Seino², M. Nishi², H. Amano², Y. Fujiwara², A. Kitamura², S. Shinkai², 1. *Institute of Gerontology, The University of Tokyo, Tokyo, Japan*, 2. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

This prospective study used repeated measures analysis to identify potential physical performance measures (PPM) trajectory patterns, and determine whether PPM trajectory patterns were associated with all-cause mortality in Kusatsu Longitudinal Study on Aging and Health. Among 1524 adults aged 65 years or older who participated in a baseline survey, 1048 adults (mean [SD] age, 71.6 [5.4] years; women, 57.0%) were followed-up at least once. The total number of observations was 4,747, and the average number of follow-up assessments was 4.5 during. The PPMs studied were hand-grip strength, usual gait speed, and one-leg standing time. We checked local registries to identify deaths from any cause; 89 (8.5%) participants died during follow-up. We identified 3 distinct trajectory patterns (high, middle, and low trajectory groups) for each PPM. After adjusting for important confounders, the trajectory groups for hand-grip strength and one-leg standing time were independent predictors of all-cause mortality.

SESSION 4855 (SYMPOSIUM)**CLINICAL PHARMACOLOGY TO GUIDE THERAPEUTICS IN FRAIL OLDER MEN AND WOMEN**

Chair: S.N. Hilmer, *The University of Sydney and Royal North Shore Hospital, St Leonards, New South Wales, Australia*

Co-Chair: D. Abernethy, *Johns Hopkins Medicine and FDA, Baltimore, Maryland*

Frail older people often receive multiple concurrent medicines, despite limited evidence of effectiveness and growing evidence of the harms of medicines in this population and in combination. This international symposium, led by the geriatric pharmacology subcommittee of the clinical division of the International Union of Basic and Clinical Pharmacology (IUPHAR), will showcase innovations in all phases of drug evaluation that can inform more effective and safe use of medicines by frail older people. IUPHAR is a non-government organization in official relations with the WHO with the mission of improved health through pharmacology education and research. In this symposium Prof Hilmer (Australia) will highlight novel pre-clinical models that can be used to evaluate relevant exposures for older people, such as polypharmacy and deprescribing, as well as relevant outcomes such as healthspan and frailty. Clinical evaluation of drugs in frail older people using new techniques, such as population pharmacokinetic modelling and pharmacogenomics, will be described by Prof Schwartz (USA). Prof Abernethy (USA) will describe regulatory issues such as the representativeness of clinical trial populations. Prof Le Couteur (Australia) and Prof Thuermann (Germany) will demonstrate novel approaches to pharmacovigilance in frail older people. All speakers will consider the effects of age, frailty and sex on clinical pharmacology and safe, effective therapeutics.

PHARMACOKINETICS AND PHARMACODYNAMICS OF FRAILTY AND POLYPHARMACY: PRECLINICAL INSIGHTS

S.N. Hilmer, *Medicine, The University of Sydney and Royal North Shore Hospital, St Leonards, New South Wales, Australia*

Pre-clinical studies form the foundation for pharmacology and therapeutics in humans. There have been recent calls for pre-clinical studies in aged animals and in both male and female animals to better reflect the older people who are commonly treated. There are opportunities to test effects of real life exposures in aged animals to inform therapeutics. For example, short term treatment with therapeutic doses of five commonly used medicines (polypharmacy) impairs physical function in aged but not young adult male mice. Objective models of important outcomes for older people, such as healthspan and frailty, have recently been developed. These are being measured as outcomes of treatments for disease or aging itself in pre-clinical studies, with differential effects observed by sex. The effect of frailty on pharmacokinetics, pharmacodynamics and toxicity of commonly used medicines (e.g. acetaminophen) is now being investigated in frail animals, to guide treatment of frail older people.

CLINICAL PHARMACOLOGY OF AGE, SEX AND FRAILTY: INSIGHTS FROM CLINICAL AND POPULATION STUDIES

J.B. Schwartz, *1. Medicine, University of California, San Francisco, San Francisco, California, 2. Jewish Home, San Francisco, San Francisco, California*

This presentation will discuss areas of agreement and disagreement, and identify gaps in knowledge of age, sex and frailty-related effects on drug clearance and responses. Agreement exists that renal clearance decreases with age, sex and possibly frailty, yet, there remains disagreement about the best way to estimate renal drug clearance to adjust medication doses in older people and in frail vs. non-frail. For oxidative CYP-mediated drug clearance, consistent decreases have been seen with aging in vitro and in vivo yet results from clinical populations do not detect consistent effects. Human data on age and frailty effects on transporters to guide dosing in clinical populations have yet to emerge. Evidence for a prominent role of polypharmacy in medication problems seen in clinical populations will be discussed as well as the altered pharmacodynamics reserve associated with older age and/or frailty that may underlie altered responses to medications.

REPRESENTATIVENESS OF CLINICAL TRIAL POPULATIONS: ARE THESE THE PATIENTS THAT GET TREATED?

D. Abernethy, *1. Office of Clinical Pharmacology, FDA, Annapolis, Maryland, 2. Johns Hopkins Univ. School of Medicine, Baltimore, Maryland*

Concern is frequently expressed that there is insufficient understanding of drug effects and side effects at the time of drug approval, as the patients in whom the drug will be used are not well represented in the drug registration package. A number of evaluations have indicated that this is so particularly for older patients with multimorbidity, as they are either underrepresented or excluded from drug registration trials. Regulatory authorities have tried to address this matter with a Guideline for inclusion of older patients in drug approval packages (US FDA), and an International Committee on Harmonization (ICH) question and answer document. A review of recent drug approvals in the United States of selected drugs that are likely to be prescribed to older patients with co-morbid illness, the characteristics of the patients studied, and how this compares to drug use in the community for drugs that are marketed for the same indication will be presented. Patient age will be compared by decade of age. This may provide an update of how pharmaceutical company sponsors of new drugs are responding to the regulatory guidelines and public concern.

PHARMACOVIGILANCE: ADVERSE EVENTS ASSOCIATED WITH PSYCHOTROPIC DRUG USE IN NURSING HOMES

P. Thuermann¹, S. Bergner², J. Stingl², *1. Clinical Pharmacology, University of Witten/Herdecke, Wuppertal, Germany, 2. Federal Institute for Drugs and Medical Devices, Bonn, Germany*

A high proportion of nursing home residents (NHR) receive - among many other drugs - psychotropics, particularly neuroleptics and sedatives. Clinical trials are usually conducted in younger populations. We aimed to analyze the

type and frequency of ADE occurring under psychotropic drug use in NHR and to compare them with ADE from spontaneous reports.

We conducted a prospective cohort study in 18 nursing homes in Germany, written informed consent was obtained from 888 NHR (74 % females, mean age 84 years). Research pharmacists collected data on drug prescriptions and ADE by chart review and interviews with NHR, nurses and physicians. Mean no. of drugs/day was 11 ± 4 , 69 % of NHR received psychotropics. During a 1-month observation period 18 % of NHR suffered an ADE, almost half of them related to use of psychotropics. Data obtained will be compared with SPCs and spontaneous reports from Germany.

SESSION 4860 (PAPER)

SOCIAL NETWORKS AND SOCIAL SUPPORT: CONTEXTUAL CONSIDERATIONS

SOCIAL CAPITAL AND HAPPINESS: AN INTERNATIONAL COMPARISON ACROSS THREE GENERATION GROUPS

Y. Wang, H. Weng, Y. Zhu, L. Lu, S. Huang, *National Cheng Kung University, Tainan City, TAINAN, Taiwan*

Happiness of the people is an important index of social development. This study focuses on the correlation between social capital and happiness and the comparison of international data. Three data sources are used. Samples are taken from the International Social Survey (ISSP) across 30 countries, providing a total of 49,504 people who are divided into three age groups: the young (20–34 years old), the middle-aged (35–64 years old), and the elderly (over 65 years old). This study uses hierarchical linear modeling to measure the cross-level effects of the happiness from different age groups (young, middle-aged, elderly) in 30 countries. The results find that of the 30 countries, there is a significant difference in the happiness level of the three age groups in 25 of these countries. The score of the elderly's happiness is shown to be the lowest out of the three age groups in 20 of the countries. The elderly's happiness is affected the most by country factors, about 14% in the three age groups. There is significant positive effect that factors in the national level have on the elderly's happiness. Social capital acts as a buffer against the adverse effects of urbanization and educational degree on the mental well-being of the elderly.

VARIATIONS IN RELATIONSHIPS ACCORDING TO PARTNER PERCEPTIONS: DATA FROM THE NSHAP PROJECT

J.J. Benson¹, T.S. Killian², *1. Human Development and Family Science, University of Missouri, Columbia, Missouri, 2. University of Arkansas, Fayetteville, Arkansas*

Previous research suggests that romantic relationships are intertwined with aging well. We used data from 2,013 persons who reported having a romantic partner or spouse in the first wave of the National Social Life, Health, and Aging Project (NSHAP) to examine how their perceptions of their relationships varied across relationship status, as well as a number of demographic variables and measures of health. The NSHAP interview included five indicators of

relationship perceptions: time spent, perceptions of openness, ability to rely on, demands made from, and criticism from one's partner. We used latent class analyses to examine unobserved heterogeneity in participants' responses on these items. Our model fit analyses suggested a three class model provided the best fit. Class one (15.9%) was characterized by moderate responses on time spent with, demands from, and criticism from partner, while scoring low on being open with their partners and high on relying on their partners. Class two (13.3%) was characterized by scoring relatively low on all perceptions except relying on partner. Class three (70.8%) was characterized by high scores on all perceptions. We next examined how probabilities of class membership were related to relationship status, demographics, and health. We found significant differences across race, age, sex, marital status, relationship length, and health. We did not find significant differences in class membership by cohabitation status. In summary, these analyses helped us identify variations in relationships using participants' perceptions of their relationships. We also found significant variations in relationship perceptions across several demographic variables and health.

SOCIAL SUPPORT AND EMERGENCE OF FUNCTIONAL IMPAIRMENT: SABE STUDY EVIDENCES

T. Brito⁶, D. Nunes², L.P. Corona³, T. Alexandre⁴, Y. Duarte¹, M. Lebrao¹, *1. University of São Paulo, São Paulo, Brazil, 2. Federal University of Tocantins, Palmas, Brazil, 3. UNICAMP, Campinas, Brazil, 4. UFSCar, São Carlos, Brazil, 6. Federal University of Alfenas, Minas Gerais, Brazil*

Aim: To verify the association between the characteristics of social networks of the elderly people and the emergence of functional impairment. **Method:** This is a longitudinal population-based study, which used the 2006 ($n = 1,413$) and 2010 ($n = 990$) cohorts of the Health, Well-Being, and Aging (SABE) Study. To characterize the social networks, the following variables were used: number of members in the network; living arrangements; sex and age of the members; coresidence with children or only elderly individuals; satisfaction with the relationships; and receiving and offering social support (financial, material, emotional, performing tasks inside and outside the home, providing companionship, and personal care). Logistic regression was used to analyze the data. All ethical guidelines were followed. **Results:** The social networks of the elderly people had an average of 8.15 members and consisted predominantly of family members aged between 15 and 59 years. Dependent elderly people received more material support, help in performing household tasks and those outside the home, and personal care, while the independent elderly people received more emotional support and companionship. Provision of social support ($OR = 0.32$, 95%CI 0.14 – 0.71) decreased the chances of developing dependency, independent of sociodemographic and health conditions. **Conclusion:** The strengthening of social networks in old age should be encouraged since confidence in informal care offered, mainly by families, may not be the best option for dealing with the growing demand for care that accompanies the aging of the population.

ACCULTURATION AND DEPRESSION AMONG OLD CHINESE IMMIGRANTS: SOCIAL SUPPORT AND NEGATIVE INTERACTIONS

L. Xu¹, F. Tang², L.W. Li³, X. Dong⁴, 1. *The University of Texas at Arlington, Arlington, Texas*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 3. *University of Michigan, Ann Arbor, Michigan*, 4. *Rush University Medical Center, Chicago, Illinois*

Immigration is a stressful experience. Social support from and negative interaction with relatives/friends play an important role in the health and well-being of immigrant older adults. This study examines the association between acculturation and depressive symptoms among old Chinese immigrants in the United States, and also investigates the roles of social support and negative interactions with relatives/friends in the association. We used data from the Population Study of Chinese Elderly (PINE), a population-based survey of community-dwelling Chinese older adults in the Greater Chicago area ($N = 3,158$). Depressive symptoms were measured by PHQ-9 and acculturation, social support and negative interactions with family/friends were all measured by standard scales. Negative binomial regression models were used to examine the relationships of acculturation and depressive symptoms. Results show that acculturation was associated with higher level of depressive symptoms ($IRR = 1.02$, $p < .01$) after controlling for age, gender, marital status, education, income, health, living arrangement, and years in the U.S. Negative interactions ($IRR = 0.99$, $p < .05$) had significant interaction effects with acculturation, whereas social support had direct effects, on depressive symptoms. The study findings suggest that older Chinese immigrants in the United States with low levels of acculturation are vulnerable to having depressive symptoms, and negative interactions with relatives/friends exacerbate the effect of acculturation on depressive symptoms. Community services to help older Chinese immigrants' acculturation and coping with negative interactions may be effective depression prevention in this population.

TACTILE INEQUALITY: NEIGHBOURHOOD SES AND THE FREQUENCY OF CARING TOUCH IN LATER LIFE

M. Schafer, L. Upenieks, *University of Toronto, Toronto, Ontario, Canada*

Touch is an important element of human social interaction. Scholars from a variety of disciplines increasingly recognize that supportive physical contact supports health and maximizes older people's sense of well-being. The investigation of touch, however, has yet to penetrate the field of neighborhood-effects research. Left unexamined, for instance, is whether contextual conditions are associated with patterns of person-to-person contact above and beyond person-level explanations. Drawing from ecological theories in the Chicago school tradition, the present study proposes that neighborhood socioeconomic disadvantage erodes local social ties and cohesion. We hypothesize that these dynamics should produce gaps in supportive touch activity between senior residents of advantaged and disadvantaged communities. Data come from Wave 1 (2005–2006) of the National Social Life, Health and Aging Project (NSHAP), a nationally-representative study of adults age 57–85 ($n=3,005$).

Neighborhoods were defined at the level of census tracts and NSHAP survey data were linked to records from the U.S. Census. Multivariate ordinal logistic regression analyses indicate that seniors living in neighborhoods characterized by low education, low income, high poverty, and high public assistance reported the lowest levels of supportive contact, net individual-level socioeconomic status, personal network size, health, and other covariates. At the same time, seniors who lived in predominantly Black neighborhoods were more likely to experience frequent touch, net other characteristics. Findings suggest a previously unrecognized form of environmental inequality experienced by older adults—tactile inequality—while also pointing to the importance of sub-cultural variation in touch related to racial/ethnic neighborhood composition.

SESSION 4865 (SYMPOSIUM)

INTERNET FRAUD AND SCAMS: A GROWING FORM ON ELDER FINANCIAL EXPLOITATION

Chair: M.A. Creedon, *A.T. Still University*
Co-Chair: G.M. Gutman, *Simon Fraser University, Vancouver, British Columbia, Canada*
Discussant: R.C. Long, *Wells Fargo Advisors, St Louis, Missouri*

The older adult population is increasing rapidly throughout the world. This surge in numbers is accompanied by a rapid increase in the use of the Internet as a communication tool by elders. This allows scam and fraud perpetrators to reach older adults with schemes for winning lotteries, requests for financial aid from “Nephews” on travel, and other strategies for accessing bank account information and other resources. While 1–10% of seniors in middle and high income countries are estimated to be victims of elder abuse, by definition (WHO/INPEA 2002) perpetrated by persons with whom they have a trust relationship, and financial abuse is among the most common types of elder abuse worldwide, financial exploitation by strangers such as occurs via the Internet is estimated to be far greater in terms of dollars lost. “According to the FBI, 80% of all scams in the USA target people between the ages of 55–85” says Richard Goralewicz, author of *The Little Black Book of Scams*. Similar patterns are seen in other developed countries. This symposium will provide information about current research related to Internet Fraud and Scams targeting seniors that is being conducted in the USA, Canada, the United Kingdom, and Ireland. It will also provide information about the strategies being undertaken by government agencies, major senior advocacy groups, financial organizations, and other bodies seeking to reduce the frequency of such incursions into the savings and resources of elders.

ENHANCING CYBER-SECURITY FOR OLDER ADULTS: RESEARCH AND STRATEGIES IN THE UK

L. Fenge, *NCPQSW, Bournemouth University, Bournemouth, United Kingdom*

A review will be given of current developments in the UK of the increasingly recognised risks posed by financial abuse/financial scamming. Recent legislation, including the Care Act (2014) will be considered in terms of agency responsibility to

protect vulnerable older adults at risk from financial scams. In particular there will be a focus on the implications for the financial industries such as retail banking and insurance, and how action in this area most vulnerable to financial scams. For example this may include an agreement that that organisations should only share information to other organisations via a clear opt in rather than opt out process to help avoid 'suckers lists', and that the banking sector should adopt a 24hour delay process on transactions above a defined threshold for those citizens who feel at risk of financial scamming. . Examples of research in the UK will be considered as well as the practical measures, in terms of partnerships and collaborations, which have been pursued to mitigate the prevalence and potential for financial abuse in the older population. These relationships include academic researchers working with Royal Mail, the police, social workers, trading standards organisations and others. Recommendations for interventions to reduce the prevalence and impact of financial abuse will be made.

NGO INVOLVEMENT IN ELDER FINANCIAL ABUSE RESEARCH AND PREVENTION: AN IRISH EXAMPLE

N. Feely, E. Timmins, *Age Action, Dublin, Ireland*

Age Action is one of Ireland's leading NGOs for older people. It has a long track record of research and campaigning to raise public awareness of elder abuse and improve early detection and prevention. In 2011 it published results of peer-led research into older people's understanding of elder abuse, which shed light on measures they believed could reduce abuse. The research involved older people in both the Republic of Ireland and Northern Ireland and was carried out in conjunction with the University of Ulster, Queen's University, Belfast, the South Eastern Health and Social Care Trust and the Social Policy and Ageing Research Centre. The focus of the symposium presentation will be on a current two-year project, funded by the Ulster Bank Community Impact Foundation, to raise awareness among older people and bank staff about financial elder abuse and how older people can protect themselves against online fraud and scams.

MASS MARKET FRAUD AND SCAMSTARGETING OLDER AMERICANS

R. Goldberg, *Dept of Justice Consumer Protection Branch, Washington, District of Columbia*

This presentation will review current U.S. Department of Justice Consumer Protection Branch (CPB) data on internet based financial abuse of older adults. The CPB has 40 attorneys focused on criminal and civil cases, many of them affecting older adults. Richard Goldberg, Director of CPB, will discuss the increasing complexity of fraud against elders over the past decade including more involvement of foreign nationals operating from other countries. He will review recent data from the FBI Internet Fraud Complaint Center, including data on five specific types of fraud and scams. He will present information on new trends including Tech Support Scams, IRS Scams, Jamaican Lottery Scams, Mass-mailing Frauds, and Unauthorized Withdrawals. Strategies that can assist elders to resist Internet frauds and scams will be presented.

ECONOMIC FRAUD AND MARKET PLACE ABUSES: HOW THE FTC PROTECTS AMERICA'S SENIORS

L. Griesman, *Federal Trade Commission, Washington, District of Columbia*

The U.S. Federal Trade Commission (FTC) is on the front line of protecting elders from a wide range of economic fraud and market place abuses. Bogus online health products, "grandparent" and IRS imposter scams, and investment frauds are just some of the areas where its enforcement and educational efforts touch interests of older consumers. Mindful that many seniors are online and tech savvy, the FTC reaches older consumers through traditional as well as electronic media, including its *Pass it On* educational campaign, which empowers elders to educate their peers. The FTC also works closely with international colleagues to protect consumers - old and young - from emerging threats in the marketplace.

PROTECTING OLDER CANADIANS AGAINST CYBER-CRIME AND SCAMS

G.M. Gutman, *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

Financial exploitation by persons in trust relationships and fraud and scams by strangers are among the commonest forms of elder maltreatment worldwide. A 2015 national prevalence study estimates 2.5% of community-dwelling Canadians age 55+ are financially abused. Rates of elder cyber-victimization are likely higher given that Canadians are the world's highest Internet users. This paper tracks interventions federal and provincial government agencies, NGOs and the financial industry in Canada have developed to address the problem. These include a recent financial industry example that offers online training to all staff and another that features bankers volunteering their time/expertise to offer seminars to groups of 10+ local seniors. Analysis focuses on changes over time in the content, format and method of delivery of awareness raising and preventive messaging and training, highlighting the trend towards enhancing consumer financial literacy in mainstream as well as among cultural minority seniors.

SESSION 4870 (SYMPOSIUM)

BUILDING THE POLICY RESPONSE TO DEMENTIA WORLDWIDE

Chair: A. Kalache, *International Longevity Centre Brazil, Rio de Janeiro, Brazil*

Co-Chair: S. Greengross, *International Longevity Centre UK, London, United Kingdom*

The number of people living with dementia worldwide is expected to triple by 2050 (from 47 million in 2015 to 132 million). Dementia is gaining high prominence as a global public health priority, as illustrated by the convening of the First WHO Ministerial Conference on Global Action Against Dementia in 2015. The personal, familial, social and economic consequences of dementia are prompting a range of actions across regions and cultures.

Sally Greengross, Co-President of the ILC Global Alliance, will give detail of the Global Parliamentary Action Group on Alzheimer's and Dementia, a key outcome initiative of the

2014 G7 Dementia Summit, and describe the progress toward achieving higher levels of global attention and collaboration. She will present a short summary of the issues facing UK legislators and describe the UK's first Dementia Research Institute, the Prime Minister's Challenge on Dementia 2020 and the outcomes of the National Dementia Strategy. She will also relate how the 2010 Equality Act and the 2014 Care Act conferred new rights on both patients and carers. Additionally, she will elucidate how the Care Quality Commission, the independent regulator of all health and social services in England, has shone a light into poor standards.

Following this Symposium keynote, there will be an overview of current policy responses and practices from the member countries of the Global Alliance of ILCs with a view to strengthen supranational and multi sectorial cooperation.

REGIONAL PERSPECTIVES: EUROPE AND ISRAEL

D. Halimi^{1,2}, S. Carmel^{3,4}, S. Greengross⁵, I. Holmerova^{6,7}, M. van der Waal^{8,9}, 1. *International Longevity Centre France, Paris, France*, 2. *Paris Descartes University, Paris, France*, 3. *International Longevity Centre Israel, Beer-Sheva, Israel*, 4. *Ben-Gurion University of the Negev, Beer, Israel*, 5. *International Longevity Centre UK, London, United Kingdom*, 6. *International Longevity Centre Czech Republic, Prague, Czech Republic*, 7. *Charles University Prague, Prague, Czech Republic*, 8. *International Longevity Centre Netherlands, Leiden, Netherlands*, 9. *Leyden Academy, Leiden, Netherlands*

International Longevity Centers (ILC-GA) are promoting healthy and active aging. Dementia is a severe and widespread health problem in Europe, with 6.4 Million patients. Two European health initiatives call to address the special needs of dementia patients, their families, and caregivers, while ensuring the sustainability of health and social security systems: The 2011 European Initiative which calls to see dementia a health priority and urges Member States to develop appropriate national plans, and the 2015 European Council's conclusions on « Supporting people living with dementia: improving care policies and practices ». The role of prevention, health promotion, risk reduction and early detection, as well as the promotion of the rights of dementia people, and intensification of research are clearly stated in these initiatives.

Relevant policies and interventions in France, the Netherlands, Czech Republic, UK and Israel will be reviewed.

ADDRESSING DEMENTIA IN NORTH AMERICA: CURRENT STATUS AND FUTURE DIRECTIONS

Linda Garcia², M. Gillis¹, 1. *International Longevity Centre Canada, Ottawa, Ontario, Canada*, 2. *University of Ottawa, Ottawa, Ontario, Canada*

Alzheimer's Disease and related dementias constitute a major and growing challenge to the wellbeing of individuals, families and society in the United States and Canada. The prevalence of dementia in the US is projected to almost triple from 5 million persons now to 14 million by mid-century. In Canada, the number of persons affected will nearly double from about 750,000 to 1.4 million. Actions underway in Canada in research, caregiver support and community intervention will be presented. Using the US National Dementia Plan as a model, it will be argued that a comprehensive and multi-sectorial approach is necessary that includes: public

awareness and community and workplace interventions; basic and applied research leading to better prevention, diagnosis, treatment and eventually, a cure; quality clinical care and support for affected individual and families.

DEMENTIA IN THE ASIA PACIFIC REGION

S. Harding^{1,2}, J. Byles^{3,4}, D. Peng⁵, J. Umranikar⁶, K. Mizuta⁷, 1. *International Longevity Centre Singapore, Singapore, Singapore*, 2. *Tsao Foundation, Singapore, Singapore*, 3. *International Longevity Centre Australia, Callaghan, New South Wales, Australia*, 4. *The University of Newcastle, Callaghan, New South Wales, Australia*, 5. *International Longevity Centre China, Beijing, China*, 6. *International Longevity Centre India, Pune, India*, 7. *International Longevity Centre Japan, Tokyo, Japan*

Asia Pacific region is now home to more than 17 million persons with dementia (PWD) (ADI, 2014). By the middle of this century, more than half of PWD will live within our midst. In terms of costs, the region is now spending US\$185 billion, with 70% of this amount being spent by the developed countries. For sure, this cost will continue to increase as the number of PWD increases. The need to push for the development of a national dementia action plan in every country within the region is never more urgent but this will require research into the health and care systems and a review of the overall health policy. The more developed and middle income countries within the region have been experimenting and piloting at the community level which could be developed further to become best practices that can be shared at the regional level.

REGIONAL PERSPECTIVES: LATIN AMERICA AND SOUTH AFRICA

L. Daichman², R. Pereyra³, J.R. Hoffman⁴, S. Kalula⁴, A. Kalache¹, 1. *International Longevity Centre Brazil, Rio de Janeiro, Brazil*, 2. *International Longevity Centre Argentina, Buenos Aires, Argentina*, 3. *International Longevity Centre Dominican Republic, Santo Domingo, Dominican Republic*, 4. *International Longevity Centre South Africa, Vanderbijlpark, South Africa*

The 60 plus population in Latin America and the Caribbean is projected to increase by 71% by 2030. The projection for Africa is 64%. Already underway, this is one of the fastest global ageing processes in human history. The number of individuals in these regions living with dementia will increase exponentially within the context of fast-moving social changes such as urbanization, greater female participation in the labor market, low fertility rates and an insufficiency of family care. This presentation will focus on examples of good practice on care and dementia prevention from Argentina, Brazil, the Dominican Republic and South Africa.

SESSION 4875 (SYMPOSIUM)

TOWARD A STRONG EVIDENCE BASE FOR CARER-FRIENDLY SYSTEMS IN THE EUROPEAN UNION

Chair: E.J. Hanson, *Linnaeus University, Kalmar, Sweden*
Co-Chair: S. Yghemonos, *Eurocarers, Brussels, Belgium*

Discussant: J.C. Tronto, *University of Minnesota, Twin Cities, Minneapolis, Minnesota*

80% of care across Europe is provided by the spouses, relatives and friends of older, sick or disabled people. There are over 100 million carers in Europe, probably an underestimate given the difficulty of (self-) recognition among carers. As population ageing generates growing demand for care, the intensity of caring roles is increasing. This symposium presents current policy and examples of research, highlighting gaps in knowledge. It is based on research priorities agreed by the Eurocarers Research Working Group to strengthen the evidence base for carer-friendly systems in Europe. An EU-wide NGO working for carers, Eurocarers has exceptional breadth of knowledge and comparative capacity.

The Symposium will start with an overview of the EU policy context concerning carers, care and caring and present Eurocarers' research priorities. Our second presentation will assess the impact and effectiveness of support for carers provided through public funding and NGOs, exploring which carers benefit from these approaches. The third presentation will focus on how new technologies support carers of older people, discussing the Eurocarers' hub 'InformCare', an outcome of the EU 'InnovAge' project. Our fourth speaker will focus on carer health and well-being, presenting conceptual findings derived from analysis of learning networks. The final presentation will debate methodological issues in conducting comparative research on informal care, inviting discussion of opportunities for wider, inter-continental, collaborative analysis.

The discussant will distil key themes from the presentations and reflect on future scope to recognise the roles/rights of carers and support their claims for quality of life.

RECOGNISING AND SUPPORTING THE ROLE OF INFORMAL CARERS ACROSS THE EUROPEAN UNION

S. Yghemonos, *Eurocarers, Brussels, Belgium*

Europe's increase in life expectancy and ageing demographics is generating a growing incidence of diseases and demand for care. In Europe, 80% of this care is provided by family, friends and neighbours. The contribution of these 'informal' carers constitutes a great resource and a pillar of the WHO approach towards people-centred care systems. Yet, their fundamental role is still not widely recognised across the European Union.

This presentation looks at the issues facing carers across the EU and highlights the entry points that exist in policy agendas to ensure carers' role is recognised, valued and supported.

The presentation outlines the potential and challenges of EU policy debates on:

- The inadequate provision and coverage of care systems
- The insufficient female labour participation
- The sustainability of care systems

The presentation concludes with the research priorities identified by Eurocarers in order to develop the evidence-base needed to help inform EU policy-making.

SUPPORT FOR CARERS IN EUROPE: WHAT WORKS WELL AND WHY?

S. Yeandle, *Sociological Studies, University of Sheffield, Sheffield, United Kingdom*

This presentation assesses evidence on support for family/friend carers of older and disabled people in Europe, drawing on the expertise of Eurocarers Research Working Group members and evaluation studies led by the author which were introduced with significant UK government funds in support of a 'national carers' strategy'. The presentation reviews the impact and effectiveness of publicly-funded and NGO-led initiatives developed in the past decade. These aimed to promote carers' health and wellbeing, address their social and financial exclusion, help them identify the skills they need, and acquire, in their caring roles, and obtain the help they need to combine their unpaid care with paid jobs or careers. The presentation includes discussion of the characteristics of carers who have, and have not, benefitted from this type of support, and explains the role of carers' advocacy organisations in campaigning for improvements and greater accessibility in carer support.

UNDERSTANDING CARER HEALTH AND WELL-BEING

E.J. Hanson^{1,2}, L. Magnusson^{1,2}, *1. Health and Caring Sciences, Linnaeus University, Kalmar, Sweden, 2. Swedish Family Care Competence Centre, Kalmar, Sweden*

Research has mainly focused on carer burden with scant attention being paid to concepts such as carer's satisfaction, resilience and wellbeing. This presentation explores the complex concept of carer's health and wellbeing, drawing on literature review findings, the expertise of Eurocarers Research Working Group members and an analysis of findings from learning networks involving carers. Emerging factors that appear to influence carer's health and wellbeing will be discussed. Namely, i) the degree of availability of appropriate support from both the formal sector and informal caring networks; ii) the role played by personal belief systems about the nature of caring, such as its level of perceived meaningfulness or not; iii) the nature of previous relationships with the cared-for member; iv) carers' personal repertoire of coping resources and strategies, and v) the level of intensity of caring. Finally, ways forward are considered, including routine health check-ups for carers and holistic carer assessment.

HOW NEW TECHNOLOGIES SUPPORT CARERS OF OLDER PEOPLE: THE EUROCARERS' INFORMCARE PLATFORM

G. Lamura¹, F. Barbabella^{2,1}, F. Andréasson³, H. Döhner⁴, E.J. Hanson², A. Poli⁵, B. Salzmann⁴, *1. Centre for Socio-Economic Research on Ageing, INRCA - National Institute of Health and Science on Ageing, Ancona, Marche, Italy, 2. Linnaeus University, Kalmar, Sweden, 3. Swedish Family Care Competence Centre, Kalmar, Sweden, 4. wir pflegen, Hamburg, Germany, 5. National Institute for the Study of Ageing and Later Life (NISAL), Norrköping, Sweden*

This presentation discusses how new technologies support family carers of older people with reference to the Eurocarers' hub 'InformCare', the web-platform of support services for carers of older people co-funded by the European Union within the INNOVAGE project. After highlighting the

status of technology-based services for carers in Europe, the main features of InformCare will be demonstrated. Tested in three European countries (Germany, Italy and Sweden), this tool provides a standardised, integrated, multilingual and culturally adapted set of on-line information and interactive services addressing carers' needs and preferences which are available for the first time in 27 Member States. The implementation followed a pilot test with 117 carers, showing improvements in carers' self-awareness and empowerment over a 3 month period. However, to ensure optimal benefit from InformCare, appropriate training and promotion campaigns are needed in order to overcome low digital literacy skills and lack of self-recognition characterising many carers.

METHODOLOGICAL ISSUES IN CONDUCTING COMPARATIVE RESEARCH ON INFORMAL CARE

V. Hlebec, *Faculty of Social Sciences, University of Ljubljana, Ljubljana, Slovenia*

Measuring and evaluating informal care in Europe remains a challenge despite a number of cross-national studies that at least partially address these issues. The last cross-national study that focused specifically on informal care in Europe – EUROFAMCARE is more than ten years old. Currently, only Ireland, England and Luxembourg have up-to-date national statistical sources designed to describe the provision of informal care. Thus, it remains unfeasible to precisely determine the number of informal carers in EU-28, measure their characteristics, and assess the extent and type of care they provide. This presentation will provide an overview of what is measured in a European cross-national context in terms of informal care and discuss the advantages and limitations of current cross-national studies. Further, opportunities for enhancing the usability of current cross-national surveys for purposes of measuring informal care in Europe will be proposed, concluding with an invitation to discuss opportunities for wider, inter-continental, collaborative research.

SESSION 4880 (SYMPOSIUM)

HOSPICE AND END-OF-LIFE CARE PRACTICES FOR RESIDENTS IN U.S. NURSING HOMES

Chair: D.J. Dobbs, *University of South Florida, Tampa, Florida*

Quality of end-of-life care should be a priority for older adults who reside in nursing homes (NHs) in the U.S., yet the results are mixed as to whether the majority of NHs achieve this objective. Gaps in care have been reported to exist in NHs related to pain management, and communication about health care decisions. Another issue is transitions near the end of life in and out of the NH. One common factor that has consistently been found to improve care at the end-of-life for NH residents is hospice use. This symposium will include papers that address hospice care for NH residents as well as other end-of-life care practices such as pain management and transitions to the emergency room for NH residents. The first paper highlights the lack of preparation for end-of-life care in NHs based on the perspective of emergency medical technicians and paramedics who responded to 911 emergency calls from NHs. The second paper examines the use of hospice services upon admission to

an NH in a national sample of community-based older adults. The third paper identifies the clinical characteristics and communication patterns associated with hospice care within the last six months of life in NH residents. The fourth paper examines the issue of pain management and identifies significant predictors of narcotic and non-narcotic analgesic use in NH decedents. The discussant will put the studies in context to the current state of hospice use, pain management and end-of-life care transitions for NH residents in the U.S.

PREDICTORS OF USE OF HOSPICE IN THE NURSING HOME

J.P. Reinhardt, *Research, The New Jewish Home, New York, New York*

The use of hospice in the nursing home has been growing which is important given its association with improved quality of care for patients at the end of life including symptom management, reduced hospitalization and higher family satisfaction. This study identified the clinical characteristics and communication patterns associated with hospice care within the last six months of life in nursing home residents. Data are from medical records of 300 nursing home decedents in a large healthcare system. Results showed that sixty-two percent of decedents were on hospice, and 92% of deaths occurred in the nursing home. Higher likelihood of hospice utilization in this setting was associated with dementia diagnosis, poorer cognitive function, weight loss, having a care goals discussion, and use of a greater number of medications. Findings emphasize the importance of hospice use in this setting.

HOSPICE AND PAIN MANAGEMENT IN THE NURSING HOME: PREDICTORS OF ANALGESIC USE

T.L. Marshall, J.P. Reinhardt, *Research, The New Jewish Home, New York, New York*

Undertreated pain in the nursing home is well documented. Residents may express pain verbally, or through disruptive behaviors and rejection of care if they cannot verbalize their pain. Improvement in identification and management of pain in the nursing home is needed. This study identified significant predictors of narcotic and non-narcotic analgesic use in nursing home decedents. Predictor variables included age, cognitive status, diagnoses, rejection of care, behavioral symptoms, pain rating, and receipt of hospice care in the nursing home. Outcome variables were medications for provide pain relief, narcotic and non-narcotic analgesics. Results showed greater use of non-narcotic analgesics was associated with younger age, poorer cognitive status, having arthritis, having cancer, rejection of care, and hospice use. Greater use of narcotic analgesics was associated with only two predictor variables, greater report of pain, and hospice use. Hospice use was the only variable associated with both narcotic and non-narcotic management of pain.

DYING IN PLACE? HOSPICE UTILIZATION AND CARE TRANSITIONS FROM THE COMMUNITY TO THE NURSING HOME

A. Holup, H. Meng, D.J. Dobbs, K. Hyer, *Aging Studies, University of South Florida, Tampa, Florida*

The use of hospice services upon admission to the nursing home (NH) raises questions about the potential for

residents admitted from home/assisted living communities to receive end-of-life care in the community and age-in-place until death. Because the Institute of Medicine recommends limiting transitions near the end-of-life, this study examined the use of hospice services on admission to a NH. Resident assessments from the Minimum Data Set were examined for NH residents admitted directly from home or an assisted living community. In 2008, a total of 139,262 NH residents were admitted from the community (representing approximately 10% of the total NH population). Seven percent of residents received hospice services on admission. Analyses suggests that older adults who were receiving hospice services in the community transitioned to the NH to receive end-of-life care. The capacity of hospice to maintain persons until the end of life in the community will be discussed.

EMERGENCY CALLS TO THE NURSING HOME AT LIFE'S END: PROVIDERS' PERSPECTIVES

D.P. Waldrop¹, J. McGinley¹, B. Clemency², 1. *University at Buffalo, Buffalo, New York*, 2. *Emergency Medicine Department, Erie County Medical Center, Buffalo, New York*

Nursing home (NH) residents account for over 2.2 million Emergency Department (ED) visits yearly; the majority are transported by Emergency Medical Services (EMS). The purpose of this study was to investigate how EMS providers respond to 911 calls when imminent death is from a chronic—non-acute condition. Surveys were conducted with 178 EMS providers and follow-up interviews with 43. Survey results indicated that 96% reported NH calls at least monthly - 48% on every shift; 58% report receiving at least monthly requests to transport an actively dying resident to an ED. Nearly half (46%) endorsed the need for interdisciplinary interventions between EMS, hospice, and NHs to address challenges. Interview themes illustrated contributing factors as: Limited staff training, experience; Dying-related fear, panic, distress; Staff shortages; and Organizational protocols promoting 911 calls. The findings illuminated the lack of comprehensive advance care planning for NH residents who are frail and approaching life's end.

SESSION 4885 (SYMPOSIUM)

REDEFINING THE GOALS OF AGE-FRIENDLY INTERVENTIONS

Chair: A. Glicksman, *Philadelphia Corporation for Aging, Haverford, Pennsylvania*

Co-Chair: L. Ring, *Philadelphia Corporation for Aging, Philadelphia, Pennsylvania*

Discussant: A.J. Lehning, *University of Maryland, Baltimore, Maryland*

Defining the goals of age-friendly interventions is a challenge to both policy and research. Interventions designed to make communities more age-friendly have targeted aspects of transportation, housing, food access, and strengthening social ties among others. Menec et. al. (2011) have suggested that the basic benefit of age-friendly communities is social connectivity, which is associated with these health outcomes. In 2015 a group of researchers came together to discuss and comment on Menec's framework. This group considered Menec's framework as it applies to age-friendly

efforts, research, and policy. This panel is a follow up to the original discussion. Each presentation represents next steps in considering the implications of the framework for the future of age-friendly efforts. DeLaTorre and Neal, who have been involved with age-friendly efforts for 10 years, compare Menec's framework to the work being done in Portland Oregon. They consider both similarities and differences in two approaches. Frochen and Pynoos Address housing policy and how housing fits into the age friendly framework. Ring, Glicksman, Kleban and Norstrand present a new methodological approach designed to support Menec's focus on an ecological framework by using two types of environmental measures – spatial and self-report, to better understand health outcomes. Finally, Lehning and Greenfield will respond by placing the three presentations into a larger policy perspective.

Verena Menec et. al. (2011). Conceptualizing Age-Friendly Communities. *Canadian Journal of Aging*, 479–493

ECOLOGICAL APPROACHES TO AN AGE-FRIENDLY PORTLAND

A. DeLaTorre, M.B. Neal, *Portland State University, Portland, Oregon*

Researchers at Portland State University's Institute on Aging (IOA) have been involved in age-friendly research in Portland, Oregon since the initial 2006–07 Age-friendly Cities project of the World Health Organization. Since the initial qualitative baseline assessment was completed and findings were shared locally and globally, an advisory council, coordinated IOA researchers, has continued to translate research into action. Many of the implications for research and policy detailed in Menec et al.'s framework – integrating ecological principles, interdisciplinary research and mixed methods, policy advocacy across domains – have been addressed by Portland's age-friendly initiative within the unique context of local stakeholders, policies, and practices. This presentation will highlight the similarities to the proposed age-friendly ecological model (e.g., research approaches, challenges with translating research to policy), the differences that seem to exist (e.g., an expansion of domains, rather than a contraction), and whether social connectivity is the common connector of age-friendly domains in Portland.

HOUSING FOR THE ELDERLY: ADDRESSING GAPS IN KNOWLEDGE THROUGH THE LENS OF AGE-FRIENDLY COMMUNITIES

S. Frochen, J. Pynoos, *University of Southern California, Los Angeles, California*

As our society ages, there is increasing concern about housing for older adults. Although the last decade has brought expanded research in this area, major gaps in knowledge remain in this field. This paper presents a literature review of the elderly housing research, examining the limitations in knowledge and categorizing the most salient research gaps identified in the literature. These include gaps that have been previously defined and persist since the inception of environmental gerontology as well as new research opportunities, namely, age-friendly communities. In our review, we found seven categories that characterize the gaps in knowledge in housing for older adults: age-friendliness; aging in place; conceptualization of home; falls; housing as it

relates to disability and health; person-environment fit; and housing programs and policy initiatives. Identification and review of these limitations provide a roadmap for investigation for researchers and areas to be strengthened for clinicians and policy makers.

THE ECOLOGICAL DIMENSION OF THE MENEK FRAMEWORK

L. Ring¹, A. Glicksman¹, M.H. Kleban², J. Norstrand³,
1. *Philadelphia Corporation for Aging, Philadelphia, Pennsylvania*, 2. *Polisher Research Institute, North Wales, Pennsylvania*, 3. *Independent Researcher, Newton, Massachusetts*

The Menec framework relies on a set of ecological principles that determine the level of social connectivity, including the person-environment fit. Environment can be measured either in terms of self-reported barriers or as geographical based measures of the physical and social environment. We used both types of measures to determine how they relate to one another and to key health outcomes. Building on our previous model that showed the association of self-reported environmental barriers to health outcomes, we added a measure of neighborhood distress that includes number of murders, vacant properties and corner stores. The distress measure was linked with each case at the Census Tract. Findings reveal an association of distressed neighborhood to health outcomes while the self-reported measures also remain significantly associated with these outcomes. We conclude that using multiple types of environmental measures can better describe the association between the individual and their environment.

SESSION 4890 (SYMPOSIUM)

THE CIRCLE OF CARE: IMPROVING CARE TRANSITIONS TO ENHANCE CARE QUALITY

Chair: S. Spohr, *JPS Health Network, Fort Worth, Texas*
Discussant: J. Idoine-Fries, *JPS Health Network, Fort Worth, Texas*

Successful care transitions, in which a patient shifts from one care setting to another, can have significant impacts on patient well-being and care quality. Previous research indicates that poor care coordination or inefficient care transitions can lead to unnecessary complications and preventable hospital readmissions resulting in significant amounts of wasteful spending. This symposium describes two 1115 Medicaid Waiver DSRIP (Delivery System Reform Incentive Payment) programs being implemented in two acute care settings in Texas. DSRIP programs have the capacity to transform healthcare processes and improve patient care through quality innovation. Both programs target the improvement of care transitions and care coordination for long-term care patients. Interdisciplinary teams work to build the linkages needed to support the patient and optimize transitions between acute care settings, post-acute care facilities, and an eventual return to home. Implementation of evidence-based strategies to reduce readmissions include tools from INTERACT and Project BOOST. Education in both the acute and post-acute environment is necessary to support the evolving and complex needs of this patient population. Care transitions strategies

including improved communication and information sharing via electronic medical record systems, integrated clinical support for transition management, and ongoing coordination of hospital services for patients in post-acute care settings have the capacity to improve patient care and satisfaction, reduce hospital readmissions and increase cost savings.

REDUCING READMISSION BY IMPROVING TRANSITIONS: PROCESS AND OUTCOMES

T.G. Michael, M. Raji, D. Villarreal, J. Torres, *University of Texas Medical Branch, Galveston, Texas*

Hospital readmission rates are well documented indicators of quality of care transition from hospital to skilled nursing facilities (SNF). We describe our DSRIP project whose goal is to develop and implement programs to improve transition and coordination of care from inpatient to SNFs and from SNF to home health, for patients aged 65 and older. The overall outcome is a reduction of 30-day re-hospitalizations. Processes implemented to improve these transitions include: (1) Evidence-based identification of seniors at highest risk of re-hospitalization based on chronic conditions, socioeconomic factors, and patient characteristics; (2) Program coordination and patient, staff and caregiver education led by Master-level Nurse practitioner; (3) Education of patient/caregiver dyads to increase their roles in managing their health; (4) Education addressing indications and early side-effects of medications, and (5) Development of "What to Expect" transitional care documents aimed at preparing patients/families as they transition to different healthcare settings. We used tools used developed by Project BOOST (Better Outcomes for Older adults through Safe Transitions) and Interact (Interventions to Reduce Acute Care Transfers), including the "8P's" score and the "Stop and Watch Early Warning Tool". Collaboration with stakeholders such as SNF administrators and home health agencies help to identify areas in transitions that require improvement. Preliminary data indicate a steady increase in patients' satisfaction score, timeliness of discharge information and a decline in re-hospitalizations to our Acute Care for Elders unit. Challenges (e.g. readmission from non-SNF sites) and opportunities identified during the implementation of the project will be discussed during the symposium.

EFFECTIVENESS OF A CARE TRANSITIONS PROGRAM TO REDUCE READMISSIONS AMONG SKILLED NURSING PATIENTS

S. Spohr^{1,2}, S. Mandapati^{1,2}, J. Sanchez¹, M. Barber¹,
J. Idoine-Fries¹, 1. *Long Term Care, JPS Health Network, Fort Worth, Texas*, 2. *University of North Texas Health Science Center, Fort Worth, Texas*

Effective care transition strategies are increasingly important as pay-for-performance programs continue to place strain on safety net hospitals to reduce readmissions and avoid penalties. In particular, patients transferring to skilled nursing facilities (SNF) are at increased risk of readmission due to disease status, comorbidities, and age. This project aimed to implement evidence-based care transition strategies between a safety net hospital and seven local SNF partners to reduce potentially avoidable readmissions. Historical patient data was abstracted from electronic medical records for 1,687 inpatient encounters discharging

to SNF in 2014–2015. All-cause 30-day readmission rates were compared among partner and non-partner SNFs at baseline and during the first year of implementation. Chi-square tests was used to compare the difference in readmission rates between groups. While the hospital is demonstrating an overall increase in readmissions, there was a significant reduction in all-cause 30-day readmissions among partner SNFs compared to non-partner SNFs ($\chi^2=8.9, p < 0.003$). There was a 4.1% decrease in readmissions among partner SNFs engaging in the care transitions program (2014–14.6%; 2015–10.5%), conversely, there was a 4.1% increase in readmissions from non-partner SNFs (2014–9.2%; 2015–13.3%). Evidence-based care transitions strategies between acute care providers and SNFs have the ability to reduce 30-day all-cause readmissions. The quality improvement efforts initiated with partner SNFs improved care transitions by supporting patient handoff from inpatient to SNF to home, providing feedback to hospital Case Management, and linking patients back into a medical home. Improved partnership and collaboration between hospitals and SNFs demonstrate benefits towards patient care and community health.

HOSPITAL AND SKILLED NURSING FACILITY PARTNERSHIPS REDUCE READMISSIONS AND HEALTHCARE SPENDING

S. Spohr^{1,2}, M. Barber¹, Y. Hardin¹, J. Idoine-Fries¹, 1. *Long Term Care, JPS Health Network, Fort Worth, Texas*, 2. *University of North Texas Health Science Center, Fort Worth, Texas*

Long-term care (LTC) facilities house over 1.5 million Americans each year. Quality incentive payment programs increase the need for improved care transitions between healthcare providers. An 1115 Medicaid Waiver DSRIP project targeted the development of care transitions partnerships between a safety net hospital and external LTC providers to transform healthcare processes and care across the continuum. A navigator service model was employed with seven partner LTC providers to improve patient access to the proper level of care while improving communication and care coordination for skilled nursing facility patients. LTC facilities underwent training and implementation activities of evidenced-based tools (INTERACT) for reducing readmissions to increase staff capacity and improve care outcomes. Historical encounter level patient data was collected to assess readmission rates and patient level predictors of 30-day readmissions. Average all-cause 30-day readmission rates declined 7% among the seven LTC partners compared to the pre-implementation year (Pre- 22%, Post- 15%). Compared to their pre-implementation rates, LTC partners prevented approximately 210 hospital readmissions in the first 15 months. The estimated average cost to the hospital per 30-day readmission is \$9,387, leading to a potential cost savings of \$2.0 million. Evidence-based strategies to improve care transitions implemented in LTC facilities has the ability to reduce 30-day readmissions for both acute and post-acute care providers. Improved partnership between hospitals and LTC providers allows for standardized communication and information sharing via Epic CareLink, integrated clinical support for transition management, development of a quality scorecard, and

ongoing coordination of hospital services for patients in LTC settings.

HOME VISITS FOR HOMEBOUND PATIENTS REDUCE HOSPITAL UTILIZATION

J. Idoine-Fries¹, S. Spohr^{1,2}, S. Mandapati^{1,2}, Y. Hardin¹, M. Barber¹, 1. *Long Term Care, JPS Health Network, Fort Worth, Texas*, 2. *University of North Texas Health Science Center, Fort Worth, Texas*

Nearly 4 million people in the US are considered to be homebound. Most homebound patients have chronic illnesses, multiple comorbidities, functional limitation, and cognitive impairment and do not have access to regular primary care. These conditions are manifested in high utilization of emergency department (ED) visits and inpatient (IP) admissions. Home visit programs have the ability to provide consistent primary care and divert patients from unnecessary ED and IP utilization. Historical patient data was abstracted from electronic medical records for 79 homebound patients receiving care in the home by a physician or nurse practitioner. Data were collected for the number of ED and IP visits in the three and six months pre- and post-enrollment in the home visit program. Wilcoxon Signed Rank test was used to determine the difference between pre and post ED and IP visits. Homebound patients enrolled in the home visit program completed an average of three visits in the home. Compared to the three months prior to enrollment in the home visit program, there was a 38% reduction ($p = 0.002$) in ED visits and 58% reduction ($p = 0.0001$) in IP admissions at three month follow-up. The reduction in ED and IP utilization was maintained at 6 month follow-up ($p < .05$). The home visit program provides needed access to healthcare among a vulnerable homebound population. Receiving primary care visits in the home demonstrates an effective way to prevent both ED and IP visits, thereby avoiding unnecessary hospital utilization, improving patient outcomes, and reducing healthcare costs.

SESSION 4895 (SYMPOSIUM)

IMPROVING MUSCLE, MIND AND MOBILITY THROUGH EXERCISE AND NUTRITION IN OLD AGE

Chair: R.M. Daly, *Deakin University, Melbourne, Victoria, Australia*

Co-Chair: G. Duque, *University of Melbourne, St. Albans, Victoria, Australia*

Mobility and cognitive deficits are prevalent as we age and may coexist in the same individual. Mobility decline is linked to osteoporosis and sarcopenia, which often coexist (hence the term ‘osteosarcopenia’) and collectively have been associated with a greater risk for incident disability, falls, fractures and frailty. Similarly, cognitive function also plays a central role. Indeed, it has been suggested that there is a bidirectional relationship between mobility and cognition: factors causing physical frailty or sarcopenia may contribute to impaired cognitive function and/or factors leading to cognitive impairment may also reduce physical function or contribute to muscle loss. However, many interventions to date have only targeted physical or cognitive function, and thus there is a need to identify strategies that can simultaneously improve both factors. Exercise is one strategy that can

concurrently have a positive effect on nearly all physical and cognitive functions, but not all forms are equally effective, with the benefits being modality and intensity-dependent, and reliant upon adequate nutrition. In addition, dual-task training that combines exercise with cognitive-motor tasks may provide some added benefits, but the available data is limited. This symposium aims to provide an overview of the current evidence related to the type and dose of exercise that may be most effective for preventing and managing sarco-osteoporosis, falls, fractures, frailty and cognition decline. Evidence-based nutritional approaches focusing on treatment with vitamin D in different dosages and the combination of exercise and nutrition to enhance physical and cognitive health and function will also be reviewed.

AN EXERCISE IN PRESCRIPTION FOR PREVENTING SARCO-OSTEOPOROSIS, FALLS AND FRACTURES

R.M. Daly, *Institute for Physical Activity and Nutrition, Deakin University, Melbourne, Victoria, Australia*

Exercise is the only strategy that can concurrently affect all fracture parameters (sarcopenia, fall risk, fall impact, bone strength), if it is appropriately prescribed. It is evident from the available literature that the effects of exercise are modality and intensity-dependent, and reliant upon adequate nutrition. Regular walking has little or no effect on preventing bone and muscle loss, and may increase falls and fracture risk. Multi-component interventions incorporating weight-bearing exercise and progressive resistance training (PRT) appear most effective for preserving bone health, with no apparent adverse effects of cartilage/joint health. Traditional slow speed PRT can improve muscle mass and strength in older adults and the frail elderly, which may be enhanced through the provision of additional dietary protein and vitamin D. However, PRT alone has mixed effects on balance and falls prevention. High-velocity PRT, which involves rapid muscle contractions, appears more effective at improving functional outcomes in older adults. Similarly, high-challenging balance training performed for at least 50 hours in total (eg. twice a week for 25 weeks) appears to be most effective for preventing falls. However, dual-task training, which combines exercise with challenging cognitive-motor tasks, has emerged as a novel approach to improve functional dual-task performance which is important as many older people fall whilst performing a secondary task. This presentation will review the latest evidence with regard to the optimal type and dose of exercise to prevent and manage osteo-sarcopenia, falls and fractures, and outline exercise-nutrient interactions that may optimize musculoskeletal health and function in the elderly.

INTEGRATING EXERCISE AND NUTRITION INTO AGED CARE TO REDUCE FRAILTY

G. Duque, *Australian Institute for Musculoskeletal Science (AIMSS), The University of Melbourne, Melbourne, Victoria, Australia*

Frailty is a common clinical syndrome in older persons that has been associated with an increased risk for poor health outcomes including falls, incident disability, hospitalization, and mortality. Physical inactivity, vitamin D deficiency and poor nutrition accelerate the progression of frailty. Despite strong consensus on the importance of identifying and treating frailty, therapeutic choices for frailty are limited. In this presentation

we will review the current state of knowledge about frailty and will analyze preventive measures and therapeutic interventions that can benefit both conditions simultaneously. We intend to go over the translational aspects of frailty research and highlight expected outcomes from different interventions for this condition. We will initially review the mechanisms contributing to frailty including metabolic and cell signalling changes. For example, we will analyze how changes in protein and amino acid intake as well as muscle wasting could be associated with frailty. Then, we will discuss evidence-based therapeutic interventions that pose promising opportunities for frailty focusing on nutritional interventions and physical activity. Finally we will translate this information into practical approaches that can improve care and decrease disability and poor outcomes in old frail individuals.

MULTIMODAL INTERVENTIONS TO PREVENT AND MANAGE COGNITIVE FRAILTY

M. Montero Odasso, 1. *Gait and Brain Laboratory, Parkwood Institute, Lawson Health Research Institute, London, Ontario, Canada*, 2. *Department of Epidemiology and Biostatistics, University of Western Ontario, London, Ontario, Canada*, 3. *Department of Medicine and Division of Geriatric Medicine, Schulich School of Medicine & Dentistry, University of Western Ontario, London, Ontario, Canada*

Exercise training is beneficial for cognition even in frail older adults and in those with low mobility. Animals and humans studies have demonstrated that aerobic exercise may have neuroprotective and neurorestorative effects. The rationale of combining aerobic and progressive resistance training as a multimodal exercise intervention is supported by research that has revealed potential beneficial effects on insulin-like growth factor-1, insulin sensitivity, and anti-inflammatory and brain-derived neurotrophic factor pathways, which are related to both sarcopenia and cognitive decline. Multimodal exercise interventions have shown positive effects on muscle/lean mass, cognition and brain volume. In addition, vitamin D deficiency has been linked to cognitive dysfunction, dementia and mobility decline. Besides its very well-known effects on muscle and bone physiology, vitamin D is considered a neurosteroid hormone which exhibits neuroprotective attributes through anti-oxidative mechanisms, neuronal calcium regulation, immunomodulation, enhanced nerve conduction and detoxification mechanisms. Compelling evidence from animal models and epidemiological studies supports a potential beneficial role for vitamin D on cognitive function. We will review the available evidence supporting that combining vitamin D supplementation with physical exercise will have a synergistic effect in improving or stabilizing cognitive function.

SESSION 4900 (SYMPOSIUM)

SOCIAL GERONTOLOGY WITHOUT BORDERS? NEW PERSPECTIVES FROM INTERNATIONAL RESEARCH

Chair: T. Scharf, *Newcastle University, United Kingdom*
Co-Chair: A. Lowenstein, *Max Stern Yezreel Valley College*
Discussant: N.C. Keating, *Global Social Initiative on Ageing, Seoul, Korea (the Republic of)*

As a field of study, social gerontology increasingly reaches across national borders, reflecting the need to understand key issues concerning the processes and outcomes of demographic ageing within a global context. This symposium addresses the growing trend towards cross-national research in social gerontology within the context of COST, the longest-running European framework supporting trans-national cooperation among researchers. A bottom-up networking program driven by the research community, COST Actions foster large-scale international research collaborations. In recent years, European researchers have secured support for four COST Actions relating to core topics of gerontological concern. Papers in this symposium present emerging ideas and insights from each of these Actions.

(1) Intergenerational Family Solidarity across Europe (INTERFASOL), involving researchers from 28 nations, responds to societies' need to develop mechanisms, programmes and policies that foster and nurture solidarity between the generations. (2) Reflecting evidence concerning the negative consequences of ageism at individual, familial, and societal levels, the Ageism COST Action engages collaborators from 34 nations in drawing on scientific knowledge to challenge the practice of ageism. (3) Gender and health impacts of policies extending working life in western countries (GENDEREWL) connects researchers from 32 nations in efforts to advance knowledge about the gendered impacts of extended working life on the health and economic well-being of older workers. (4) Responding to growing risks of social exclusion in later life, Reducing Old-Age Social Exclusion: Collaborations in Research and Policy (ROSEnet) engages researchers and policy-makers from 32 nations in deepening understandings of the complex nature of old-age exclusion.

INTEGENERATIONAL FAMILY SOLIDARITY ACROSS EUROPE (INTERFASOL)

M.I. Broese Van Groenou, *VU University, Amsterdam, Netherlands*

INTERFASOL aims to synchronize, integrate and improve European research in the field of intergenerational family solidarity (IFS), its benefits in key life domains (education, work, health and wellbeing) and the ways in which it can be strengthened across generations. Since 2014, researchers from 28 countries strive towards a) a meta-analytic overview of the relationship between IFS and key life domains, b) comparison of nationally funded research activities and evidence relating to IFS, c) development of a framework organizing best practices to facilitate IFS at micro, meso and macro level, and d) identifying key policy issues and stakeholders that are most effective in securing the benefits of IFS and developing strategies for effective knowledge dissemination. The paper will provide an overview of the main outcomes of the four working groups so far, and discusses methods and instruments that facilitate international collaboration in COST Actions.

AGEISM FROM A MULTI-NATIONAL, INTERDISCIPLINARY PERSPECTIVE

L. Ayalon¹, C. Tesch-Roemer², *1. Bar Ilan University, Tel Aviv, Israel, 2. German Centre of Gerontology, Berlin, Germany*

COST IS1402 on ageism aims to enhance scientific knowledge and attention to the topic of ageism by integrating the

different disciplines and schools of thought, by developing collaborations with public policy officials, non-academic professionals, civil society NGOs and older adults, by stimulating scientific and public interest, and by developing a new generation of researchers in the field. This COST Action aims to consolidate and harmonize existing measures and empirical evidence in the field in order to generate new directions and collaborations for research and practice. We have collaborated on an international book on ageism and a special section on ageism. We also have collaborated with policy makers both locally and internationally on bringing attention to issues concerning age and ageism. This presentation will provide a broad overview of some of our activities conducted in more than 34 countries by over 200 researchers and policy makers.

COST ACTION IS1409: GENDER AND HEALTH IMPACTS OF POLICIES EXTENDED WORKING LIFE IN WESTERN COUNTRIES

A. NiLeime, *NUI Galway, Galway, Ireland*

This paper discusses key findings arising from the scientific programme of COST Action IS1409, entitled Gender and Health Impacts of Policies Extended Working Life in Western Countries. The Action is an international network established to identify key issues related to extended working life from gender and health perspectives, to provide a comparative policy analysis across 32 countries and to identify data-bases and appropriate policy proposals. The issue of extending working life is a topical policy issue of pressing concern, given that populations are ageing, there is a concern about sustaining public pension costs and many people are living longer healthier lives. This paper interrogates the wisdom of adopting these typically undifferentiated policies from a gendered political economy of ageing perspective, drawing on findings from a cross-national review of policies in 16 countries (Phase 1 of the Action's policy review) focusing on workers in physically-demanding occupations and those with caring responsibilities.

OLD-AGE EXCLUSION: LONG-STANDING DISADVANTAGE AS A NEW GLOBAL CHALLENGE FOR GERONTOLOGY

K. Walsh, *Irish Centre for Social Gerontology, National University of Ireland, Galway, Galway, County Galway, Ireland*

While older adults are disproportionately affected by multiple forms of exclusion, research and policy concentrate on those of working age, those with low-income, and children. The lack of consensus in Europe as to older adult experiences during the economic crisis has marginalised concerns for old-age disadvantage even further. Social exclusion has emerged redefined from this period as a policy that almost explicitly does not consider later life. It is within this context that the ROSEnet (Reducing Old-Age Social Exclusion in Europe) COST Action aims to critically investigate the construction of life-course old age exclusion, refocusing scientific research on older adult disadvantage in Europe and beyond. This paper presents a conceptual framework derived from state-of-the-art international knowledge on old-age exclusion. The analysis will identify key mechanisms of exclusion in today's global context and explore the relative nature of old-age

exclusion as an empirical and conceptual challenge in cross-national ageing studies.

SESSION 4905 (SYMPOSIUM)

FARMING FOR HEALTH: LESSONS LEARNED FROM GREEN CARE FARMS FOR DEMENTIA CARE

Chair: S. de Bruin, *National Institute for Public Health and the Environment, Netherlands*

Co-Chair: H. Verbeek, *Maastricht University, Netherlands*

Discussant: J. Schols, *Maastricht University, Maastricht, Netherlands*

Over the last years, several innovations in dementia care have taken place, both for people with dementia using community-based services and those living in nursing homes. An example is the “green care farm (GCF)”, a farm that combines agricultural activities with care services for a variety of client groups, including people with dementia. The vast majority of GCFs provide adult day care services for people with dementia. New are GCFs providing 24-hour nursing care, as alternative for nursing homes. The number of GCFs is gradually increasing worldwide, with initiatives in Europe, Japan and the United States. Also the number of studies characterizing GCFs and their visitors, and evaluating their value for people with dementia and their family caregivers are increasing. This symposium provides insight into the experiences with green care farming so far, and the components that could also be implemented in other dementia care settings. The first presentation shows which components of Norwegian day care services at GCFs for other user groups are relevant for people with dementia. The second presentation focuses on experiences with transplanting the GCF model to the USA. During the third presentation the impact of 24-hour nursing care at GCFs as alternative for nursing homes for people with dementia is central. During the fourth presentation, lessons that other dementia care settings can learn from GCFs will be outlined.

KEY COMPONENTS OF FARM-BASED DAY CARE SERVICES FOR PEOPLE WITH DEMENTIA

I. Pedersen, G. Patil, *Department of Public Health Science, Norwegian University of Life Sciences, Aas, Norway*

Farm based day care services for people with dementia in Norway are aiming to provide meaningful activities and coping experiences. Nowadays, 43 care farms in Norway offer such adapted and quality based welfare services in collaboration with local health authorities. Studies have identified key components of Norwegian care farming services for other user groups to be; a social community, a structured everyday setting, a close relationship and support from the farmer, encouraging physical activity, offering a diversity of activities and work tasks, and the possibility to experience nature and having close contact with animals. Many of these components are also relevant for people with dementia, and will be beneficial for this target group. Findings from a qualitative study identifying relevant components of care farm services for this group will be showed during this presentation.

EXPERIENCES WITH GREEN CARE FARMING IN THE UNITED STATES

K.A. Anderson¹, M. Fischer², *1. School of Social Work, University of Montana, Missoula, Montana, 2. A Plus Health Care, Kalispell, Montana*

Despite decades of effective implementation in Europe, the Green Care Farm (GCF) model of care has only recently arrived in the United States (US). In the US, differences in health care approaches, funding systems, liability issues, and societal attitudes toward older adults and individuals with disabilities create substantial challenges to replicating the GCF model. In this session, we will explore the past, present, and future of the GCF model in the US. First, a program director from the Netherlands will discuss his past five years of experience in transplanting and growing the GCF model in Montana. Next, a researcher will provide findings from a qualitative study ($N = 19$) exploring the views and experiences of participants, family members, farmers, and administrators involved with the Montana GCF program. Finally, both presenters will explore the practice and policy implications associated with expanding the GCF model in the US.

THE PHYSICAL ENVIRONMENT OF GREEN CARE FARMS: A COMPARISON WITH EXISTING NURSING HOMES

B. de Boer, J. Hamers, S. Zwakhalen, H. Verbeek, *Maastricht University, CAPHRI Care and Public Health Institute, Department of Health Services Research, Maastricht, Netherlands*

Green care farms (GCFs) that provide 24-hour nursing care are developing. The environment of a GCF has unique characteristics such as the combination of care and agricultural activities, and the presence of gardens and animals. This study investigated the physical environment of 18 nursing home units, including 5 GCFs, 4 traditional nursing home wards, 6 small-scale living facilities on the terrain of a nursing home and 3 stand-alone small-scale living facilities. The OAZIS-Dementia was used, an observation tool indicating the potential of a care environment to have positive effects for people with dementia on 7 domains. GCFs scored higher than existing nursing homes on privacy and autonomy, sensory stimulation, view and nature, orientation and routing, and domesticity ($p < .05$). No differences were found on safety and facilities. GCFs allow residents to initiate activities and go outside whenever they want, which can be beneficial for their quality of life.

WHICH LESSONS CAN OTHER DEMENTIA CARE SETTINGS LEARN FROM GREEN CARE FARMS?

S. de Bruin¹, B. de Boer², Y. Buist¹, H. Verbeek², *1. National Institute for Public Health and the Environment, Bilthoven, Netherlands, 2. Maastricht University, Maastricht, Netherlands*

Earlier studies suggest that green care farms (GCFs) are a valuable addition to other dementia care services. We explored which lessons from GCFs could be implemented by regular long-term care institutions (RLTCIs) and which barriers and facilitators were expected. First, key lessons were identified by secondary data analysis addressing the following issues: 1. Aligning care with preferences and needs of people with dementia; 2. Making active use of stimulating

elements in the care environment and 3. Implementing a different care philosophy and vision. Second, semi-structured interviews (n=33) were conducted with professionals from RLTCIs and GCFs. Barriers and facilitators were identified at three interrelated levels; context (financial, organizational, social, professional), dementia care setting and client group. At GCFs, a holistic, integrated way of working was implemented in everyday care compared with a more task-oriented approach in regular care. These results may inspire care institutions to develop more person-centered dementia care environments.

SESSION 4910 (SYMPOSIUM)

SOCIAL AND ECONOMIC INEQUALITIES: THE MARGINALISATION OF OLDER PEOPLE

Chair: C. Waldegrave, *Family Centre Social Policy Research Unit, Lower Hutt, Wellington, New Zealand*

Co-Chair: C. Cunningham, *Massey University, Wellington, New Zealand*

This symposium will explore differing dimensions of social and economic inequalities and their impacts on the health and wellbeing of older citizens across differing countries and contexts. As the evidence concerning the impact of social relationships on morbidity and early death has grown in recent years, the challenge for researchers has been to understand its dimensions and the pathways that lead to positive rather than negative outcomes. Such research can be expected to have profound implications for positive health status and substantially reduced health and welfare budgets.

The four presentations by researchers from Canada, New Zealand, Ireland, England and Poland will provide research data that addresses gender dimensions, urban and rural differences, multi-dimensional measurement constructs, social relationships, health, wealth, neighbourhood characteristics, area deprivation, discrimination and abuse to identify obvious and hidden aspects of the ways in which older people are often marginalised in their communities. These multiple domains of investigation will produce findings that can inform better quality service provision for older people and enable smart evidence based policy interventions to be developed.

After attending this symposium, participants will have an informed understanding of the many forms of social and economic marginalisation and their negative impact on health and longevity. Additionally, participants will appreciate the multi-dimensional aspects of social and economic inequalities and ways to measure them. They will also be informed of risk and mitigating factors that will enhance the provision of services and evidence based policies that increase social inclusion for older citizens and reduce marginalisation.

SOCIAL AND ECONOMIC EXCLUSION IN LATER LIFE IN POLAND: A GENDER PERSPECTIVE

J. Perek-Bialas^{2,3}, M. Wilinska¹, 1. *Jönköping University, Jönköping, Sweden*, 2. *Jagiellonian University, Krakow, Poland*, 3. *Warsaw School of Economics, Warsaw, Poland*

Gender remains one of the primary structures that affects quality of life in old age. Recent research demonstrates a variety of ways in which age and gender may interact, not to mention their relations with other power structures. In

this paper, we comparatively examine men and women at different ages to observe the differential impact of age and gender on their lives and to identify spaces of exclusion in old age in Poland. We use data from the large scale national representative survey of the Social Diagnosis from the years 2000–2015 and intersect gender, age, socio-economic status, disability and education in our analysis. The results point at two particularly disadvantaged groups: older women and low-educated older men who also dominate various spaces of exclusion. We use these findings to problematize the understanding of exclusion in later life and to argue for an inter-sectional approach in ageing policies promoting social cohesion.

INDIVIDUAL AND AREA INFLUENCES ON THE DEVELOPMENT OF SOCIAL EXCLUSION AMONG URBAN ELDER

J. Prattley¹, T. Buffel¹, A. Marshall², J. Nazroo¹, 1. *MICRA Manchester Institute for Collaborative Research on Ageing, University of Manchester, Manchester, United Kingdom*, 2. *University of St Andrews, St Andrews, United Kingdom*

Social exclusion in later life is associated with decreased quality of life and poorer health outcomes. Reducing the number of people at risk of exclusion is a key theme in social policy but there is limited understanding of the relationship between neighbourhood characteristics, area deprivation and the level and development of social exclusion amongst older urban dwellers. Multilevel growth curve models for predicting exclusion are fitted to seven waves of data from the English Longitudinal Study of Ageing. Repeated observations of an individual's health, socioeconomic status and wealth are considered along with measures of neighbourhood and area deprivation. This multilevel structure has not previously been applied to studies of social exclusion in the United Kingdom and allows for the investigation of causal mechanisms linking area deprivation and exclusion. This research contributes new insight into the development and predictors of exclusion pathways across diverse groups of elders in urban environments.

THE DARKER DIMENSIONS OF SOCIAL INEQUALITIES: DISCRIMINATION AND ELDER ABUSE

C. Waldegrave, *Family Centre Social Policy Research Unit, Lower Hutt, Wellington, New Zealand*

Older people who are discriminated against or abused often experience it over and above other forms of marginalisation which renders them doubly vulnerable. This presentation will provide results from the New Zealand Longitudinal Study of Ageing (NZLSA). Amartya Sen's capabilities approach has formed the conceptual basis of the theoretical framework of this research programme (Sen, 1999). Two survey waves of a national random sample in excess of 3,000 older New Zealand citizens aged between 50 to 86 years have been carried out, which include a scale for discrimination and a screening scale for abuse alongside various questions and other scales on health, well-being and social connections. The results demonstrated statistically significant negative relationships between both discrimination and abuse on one hand, and health, well-being and social

connections on the other. The human rights and policy implications of these findings will be explored.

VOLUNTEERING, SOCIAL ISOLATION AND AGEING IN RURAL COMMUNITIES

M. Skinner¹, K. Walsh², T. Scharf³, C. Cunningham⁴,
1. *Trent Centre for Aging & Society, Trent University, Peterborough, Ontario, Canada*, 2. *Irish Centre for Social Gerontology, National University of Ireland, Galway, Ireland*, 3. *Institute of Health & Society, and Newcastle University Institute for Ageing, Newcastle University, Newcastle upon Tyne, United Kingdom*, 4. *Massey University, Wellington, New Zealand*

This paper examines how older rural adults connect to their rural communities via volunteering. The purpose is to extend current understandings of rural old-age exclusion as a complex, interdependent and place-embedded process involving interactions between older people and their place of residence. The paper conceptualizes the relationships between social exclusion and voluntarism as they relate to the lives of older rural people and then examines, empirically, the manifestation of these relationships in the context of rural ageing. Findings from an interview-based Irish case study of older adults and community stakeholders are interrogated with respect to multiple domains and mediators of age-related social exclusion, revealing the nuanced ways older people may be more or less included in or excluded from their communities based on their involvement in and capacity for voluntaristic activities. Implications for rural ageing policy and for addressing the broader problems of social isolation and loneliness are discussed.

SESSION 4915 (SYMPOSIUM)

BIG DATA—OPPORTUNITIES, CHALLENGES, AND PITFALLS

Chair: M. Gogol, *Lindenbrunn Hospital, Coppensbruegge, Germany*

Co-Chair: A. Simm, *Martin-Luther-University Halle-Wittenberg, Halle (Saale), Germany*

The progress in basic biological ageing research as well as its clinical applications has the potential for successful intervention. While ageing itself is the strongest risk factor for development of chronic diseases as well as chronic diseases accelerate ageing the growing knowledge may give the opportunity for earlier effective prevention and better treatment. This possibilities based on big data and new tools, e.g. precision medicine, computational biology, systems biology, and others, create new questions and inherited the risk for overdiagnosis and overtreatment as this new developments are not fully understood yet and effective strategies for preempting and prediction, prevention and countermeasures must be tested biologically and clinically. In general the upcoming possibilities to preempt, predict and prevent (or delay the occurrence) include the risk of overdiagnosis and overtreatment in a manifold way and must be outweighed against the risk and burden, individual and societal costs. On the other side the promise of precision medicine include also a more targeted therapy which may reduce overdiagnosis and overtreatment as well as underdiagnosis and undertreatment.

BIG DATA: FROM BIOMARKERS TO AN AGE SCORE

A. Simm, *Martin-Luther-University, Halle, Germany*

Many candidate biomarkers of human ageing have been proposed but in all cases their variability in cross-sectional studies is considerable, and therefore no single measurement has proven to serve a useful marker to determine, on its own, biological age. A plausible reason for this is the intrinsic multi-causal and multi-system nature of the ageing process. The recently completed MARK-AGE study was a large-scale integrated project supported by the European Commission. The major aim of this project was to conduct a population study comprising about 3200 subjects in order to identify a set of biomarkers of ageing which, as a combination of parameters with appropriate weighting, would measure biological age better than any marker in isolation. The strategy and use of hypothesis-free, data-intensive approaches to explore cellular proteins, miRNA, mRNA and plasma proteins as healthy ageing biomarkers, using ageing models and directly within samples from adults of different ages are described.

BIG HEALTH DATA COMBINED WITH SMALL HEALTH DATA—A FRAMEWORK FOR A PERSONAL HEALTH DATA BANK

M. Martin, *Universität Zürich, Zürich, Switzerland*

The existing data protection laws hinder the efficient use and combination of “big” (anonymized, clinic-owned) and “small” (non-anonymized, individually owned) health data. We suggest a framework to make the combination of big and small health data in an individualized health data bank possible and acceptable to patients, health care providers, politicians, and the public at large. Such an infrastructure is needed for the inclusion of real life health outcome measures for determining the effects of treatments.

Reimbursement of health-related costs in any health care system must be based on empirical evidence concerning safety, efficacy and cost-effectiveness of medical interventions. A limiting factor in evidence-based health care decision is that empirical evidence should apply to the individual patient. Large amounts of “Small health data” combined with Big Health Data offers new opportunities to optimize health care decisions by centering them around the individual patients’ needs. The combination of “big” with “small” data can provide systematic empirical evidence for patients and health care providers to inform treatment decisions. This requires a publicly controlled individualized health data bank (iHealthDB) that allows for the combination of big and small health data. This data bank should allow to upload individualized health data in different data formats (“small data”) and to combine these with anonymized personal data (“big data”).

Beyond the envisaged establishment of an individualized health data bank, the framework may also be applied for the setting up of a framework for electronic patient files. In addition, the goals of the project are in line with the WHO (2015) call for individualized evidence and care provision as well as the Swiss Federal Office of Public Health’s strategy “Health 2020” that emphasizes the importance of organizing health care around the needs of individuals.

ADVANCING PREDICTIVE AND PRECISION MEDICINE USING HUMAN NEURAL ORGANOID MODELS OF BRAIN DISEASES

R. Anand, *Ohio State University College of Medicine, Columbus, Ohio*

We have engineered neural organoids (containing the retina, cortex, midbrain, hindbrain, brain stem and spinal cord) from normal, Alzheimer's disease (APP gene duplication) and tuberous sclerosis (TSC2Arg1743Gln) patient skin cells. Whole genome transcriptomic results remarkably show comprehensive and accurate correlation of the dysregulated expression of hundreds of genes previously correlated with the clinical symptoms and/or pathologies of both of these diseases. For Alzheimer's disease these include genes for lipid homeostasis, inflammation, metal ion homeostasis, water homeostasis and longevity. For tuberous sclerosis these include genes for tumor formation, autism, blood pressure regulation, Zn⁺⁺ ion homeostasis, Pb⁺⁺ ion toxicity, round worm infections, and cholesterol metabolism among others. Our results suggest that synchronous dysregulation of the temporal coordination of these genes cause these diseases. These genes possibly define disease-specific functional architecture of the human genome.

CHALLENGES UNDERSTANDING AGING THROUGH BIOMARKERS ACROSS POPULATIONS: THE EXAMPLE OF CALCIUM

A. Cohen¹, V. Legault¹, T. Fulop¹, G. Fuellen², L.P. Fried³, L. Ferrucci⁴, 1. *University of Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *Rostock University, Rostock, Germany*, 3. *Columbia University, New York, New York*, 4. *US National Institute of Aging, Baltimore, Maryland*

Increasing availability of large clinical datasets including laboratory results raises the prospect of studying aging through these rich sources of biomarker data. However, substantial caution is warranted: most individual biomarkers fluctuate for many different reasons, and changes can have different interpretations in different contexts. This problem compounds with differences in population composition across data sets. Here, we illustrate this problem using the example of calcium. Using data from three cohort studies and sub-populations thereof, we show that calcium increases with age in some populations and decreases in others, and differs in its associations with mortality and frailty across populations. Different patterns emerge when considering calcium levels versus deviations from the normal values. Multivariate biomarker scores may partially mitigate these problems, but extreme caution is still warranted. More broadly, we should expect many findings about biomarkers and aging to be population-specific and should generalize only after empirical verification.

SESSION 4920 (SYMPOSIUM)

HEALTHY AGEING: FROM EPIDEMIOLOGY TO POLICY. CHALLENGES AND UPDATES FROM THE ATHLOS PROJECT

Chair: J. Bickenbach, *Swiss Paraplegic Research, Nottwil, Switzerland*

Co-Chair: M. Prina, *King's College London, United Kingdom*

Discussant: M. Huisman, *VU University Medical Center*

Although there is an overwhelming evidence of a rapidly increasing proportion of older people across the world, people age differently. The ATHLOS (Ageing Trajectories of Health: Longitudinal Opportunities and Synergies) project is a consortium of 15 partners across Europe who are working together to understand patterns of healthy ageing trajectories, and to seek the factors that determine those patterns. An in-depth understanding of how we age will give us insight into the individual and population interventions that can alter ageing pathways in ways that promote healthy ageing. The specific objectives of the project are to: 1-produce a harmonised dataset of over 18 international longitudinal studies of ageing; 2-identify patterns of healthy ageing trajectories and their determinants (including cohort effects); 3- determine and operationalise a more valid definition of 'older age' based on characteristics of people that change with age rather than chronology alone; 4- translate the findings, by means of knowledge translation methodologies and micro-simulation exercises, into evidence-informed policy recommendations. The five talks of this symposium will provide an insight into the work that we are carrying out, spanning from epidemiology to social science, from biostatistics to policy and knowledge translation. The first talk will set the scene and introduce the project, followed by more detailed and technical talks on the achievements and challenges we are facing during the analysis stages of the project. The final talk will specifically focus on the policy and knowledge translation phase of ATHLOS.

OVERVIEW OF THE ATHLOS PROJECT

B. Olaya^{1,2}, M. Bobak³, M. Prince⁴, J. Ayuso-Mateos^{7,2}, S. Scherbov^{6,2}, W. Sanderson^{6,8}, S. Chatterji⁵, J. Haro^{1,2}, 1. *Research, Teaching and Innovation Unit, Parc Sanitari Sant Joan de Déu, Sant Boi de Llobregat, Barcelona, Spain*, 2. *Centro de Investigación Biomédica en Red de Salud Mental (CIBERSAM), Madrid, Spain*, 3. *University College London, London, United Kingdom*, 4. *King's College London, London, United Kingdom*, 5. *World Health Organization, Geneva, Switzerland*, 6. *International Institute for Applied Systems Analysis (IIASA), Laxenburg, Austria*, 7. *Universidad Autónoma de Madrid, Madrid, Spain*, 8. *Stony Brook University, New York, New York*

ATHLOS aims to identify healthy ageing trajectories, the main determinants, the time when changes in trajectories are produced, and to propose timely interventions to optimise healthy ageing. Moreover, a new definition of 'old age' based on many characteristics rather than just chronological age will be used for calculating projections and guide policy recommendations. A harmonised dataset with over 341,000 individuals from existing longitudinal studies of ageing will be created, including information on physical and mental health, life styles, social environment, among others. A single metric of healthy ageing using Item Response Theory will be used. Trajectories will be defined with techniques such as Structural Equation Modelling or Growth Curve Mixture Modelling and cohort effects using Age Period Cohort. Interventions both at the clinical and population level will be designed based on our results. Finally, the impact of those interventions on healthy ageing will be assessed with micro-simulations.

A SYSTEMATIC REVIEW OF THE DETERMINANTS OF HEALTHY AGEING

C. Kralj, C. Daskalopoulou, M. Prince, M. Prina, *King's College London, London, United Kingdom*

Many papers have assessed which factors are associated with healthy ageing, yet this research area has not yet been summarised properly, partly due to the heterogeneity of the studies, and the scale of the task. During this talk, we will present findings from a systematic review of the determinants of healthy ageing (socio-demographic, biological, behavioural and psychological and social). We aimed to: 1-Identify the key determinants of healthy ageing; 2-Qualify and quantify the direction of associations; 3-Summarise research trends across the last decades; 4-Identify knowledge gaps. A review protocol was registered on Prospero before the start of the project (ID=CRD42016037935). Only longitudinal cohort studies were included. No language or time limits were used. The initial title & abstract screening included 92747 papers, whereas 2341 articles were retained for full text screening. Results will be presented, together with a discussion of the research and policy implications of this evidence synthesis.

DATA HARMONIZATION OF LONGITUDINAL STUDIES ON HEALTHY AGEING: THE ATHLOS PROJECT

A. Sanchez-Niubo¹, S. Tyrovolas¹, M. Moneta¹, M. Prina², D. Panagiotakos³, F. Caballero⁴, I. Fortier⁵, 1. *Sant Joan de Déu Research Foundation, Sant Boi de Llobregat, Barcelona, Spain*, 2. *King's College London, London, United Kingdom*, 3. *Harokopio University, Athens, Greece*, 4. *Universidad Autónoma Madrid, Madrid, Spain*, 5. *P3G Consortium, Montreal, Quebec, Canada*

Harmonizing datasets from existing research studies has many benefits: it increases sample size, improves the generalizability and comparability of results, and provides opportunities for collaborative research. However, this process is not always straightforward. Studies are usually very heterogeneous regarding study design, variables collected and follow-up time/number of waves. One of the aims of the ATHLOS project is to create of a harmonized dataset with over 341,000 individuals from 20 existing longitudinal studies of ageing using a rigorous process. This will include information on health status and functional limitations, lifestyles, social environment, among others. The harmonization framework is supported by Maelstrom-Research, an international research program who develops tools and platforms to ensure a systematic and rigorous harmonization activity. In order to explain this comprehensive process, during this symposium, we will present the challenges and successes of this phase of the project, together with a thorough explanation of the harmonization platform.

DEVELOPING A SINGLE METRIC OF HEALTH USING MODERN DATA ANALYTICAL METHODS

D. Panagiotakos², F. Caballero³, H. Arndt⁴, S. Chatterji⁵, G. Soulis², M. Prina¹, J. Haro⁶, 1. *King's College London, London, United Kingdom*, 2. *Harokopio University, Athens, Greece*, 3. *Universidad Autónoma de Madrid, Madrid, Spain*, 4. *Spring Techno, Bremen, Germany*, 5. *World Health Organization, Geneva, Switzerland*, 6. *Parc Sanitari Sant Joan De Deu, Barcelona, Spain*

One of the aims of the ATHLOS project is to develop a single metric of healthy ageing. Using as a paradigm the ELSA study – English Longitudinal Study on Aging (n= 11,906 participants, entry 1998–2001, last follow up 2011–12, 6 waves) - and applying the Item Response Theory (IRT) approach and multi-level Factor Analyses the metric of healthy aging was developed as a composite score of functioning measures. Exploratory Factor Analysis was conducted to detect the latent structure among items. After conducting the EFA and obtaining evidences for unidimensionality, a global health score was generated by means of IRT. Then, a Machine Learning (ML) approach was applied to explore patterns of healthy aging. Based on these modern analytical methods various socio-demographic and lifestyle behaviors revealed as determinants of healthy aging. Combining classical statistical approaches with machine learning methodologies, the derived pattern recognition is less biased and the conclusions more robust.

POLICY AND KNOWLEDGE TRANSLATION IN THE ATHLOS PROJECT

M. Bobak¹, J. Bickenbach², I. Gheno³, A. Zaidi⁷, S. Chatterji⁶, M. Prina⁵, J. Haro⁴, 1. *Epidemiology and Public Health, University College London, London, United Kingdom*, 2. *Swiss Paraplegic Foundation, Nottwil, Switzerland*, 3. *Age Platform Europe, Brussels, Belgium*, 4. *Parc Sanitari Sant Joan de Déu, Barcelona, Spain*, 5. *Kings College London, London, United Kingdom*, 6. *World Health Organization, Geneva, Switzerland*, 7. *University of Southampton, Southampton, United Kingdom*

An essential part of the ATHLOS project is the translation of the ATHLOS findings, integrated with outcomes of previous research, into prevention and intervention measures. This work stream includes: (i) alternative scenario analysis and microsimulations to examine the economic and social consequences of policy decisions and to identify population-level or clinical interventions to alter ageing trajectories; (ii) exploration with stakeholders of the implications of different approaches to healthy ageing; (iii) identification of major barriers for the optimal implementation of the ATHLOS recommendation; (iv) policy recommendations for health and social policies, clinical practice and prevention and address inequalities in ageing outcomes. To achieve these ambitious goals, this work package includes multi-disciplinary and multi-sectoral team working closely with stakeholders (including policy makers, healthcare services, clinicians, public institutions, international partnerships and organisations, social care services, and the general population) and focusing on strengthening the clinical practice, public health and health care systems.

SESSION 4925 (SYMPOSIUM)

BUNDLED PAYMENT—THE GOOD, THE BAD, AND THE ALARMING

Chair: U. Ohuabunwa, *Emory University*

Co-Chair: W. Horn

The Bundled Payments for Care Improvement (BPCI) initiative was introduced in 2013 under the Affordable Care Act and over 1,500 providers voluntarily participated including acute care hospitals, skilled nursing facilities, physician

group practices and home health agencies. Building on the success of the program, in April 2016 CMS implemented the Comprehensive Care for Joint Replacement (CJR) model which requires over 800 hospitals nationwide to be financially responsible for the quality and care of patients undergoing lower extremity joint replacements (LEJR). This symposium will explore the care of older adults with both LEJR and hip fractures and the role of geriatrics in providing integrated comprehensive care across the continuum. The care of complex geriatrics patients requires development of multidisciplinary partnerships between the geriatrics team and other clinicians such as surgical specialists, physiatrists and post-acute care providers including certified home health agencies (CHHA) and skilled nursing facilities (SNFs).

The target audience includes:

1. Physicians- internists and subspecialists
2. Nurses, social workers, physical therapists, geriatrics case managers
3. Trainees in all of these fields- students, residents and fellows.

COMPREHENSIVE CARE FOR JOINT REPLACEMENT PATIENTS: HISTORY AND NEW ACHIEVEMENTS

U. Ohuabunwa¹, E. Ng², 1. *Emory University, Atlanta, Georgia*, 2. *Montefiore, New York, New York*

Talk #1 Content Outline: Bundle Payment Model is a mechanism to accelerate the health care system's transition to alternative payment model and value-based care. Bundle payment aims to align incentives between payers and the various providers and suppliers to improve quality, outcomes and reduce costs. The importance of coordinated care across provider settings is a critical component of care transformation. The session will provide insights as to the experience in the Montefiore Health system in the implementation of the Bundled Payment program and lessons learned.

Talk #1 Speaker Expertise:

Eliza Ng, MD, MPH is a Senior Medical Director, Care Management Organization, Montefiore Health System, Adjunct Professor New York University School of Medicine

Dr Ng provides leadership in medical and population health management of the ACO and Value Based Care Programs. She provides management leadership in Montefiore's BPCI for joint and the Oncology Care Model Program, a CMS demonstration project in oncology bundle payment,

A GERIATRICIAN'S PERSPECTIVE ON CARING FOR BUNDLE PAYMENT JOINT REPLACEMENT PATIENTS

U. Ohuabunwa¹, W. Horn², 1. *Emory University, Atlanta, Georgia*, 2. *Montefiore, New York, New York*

Title Talk #2: From preoperative evaluation to discharge and transition of care – a geriatrician's perspective on caring for bundle payment joint replacement and hip fracture patients.

Talk #2 Content Outline: The talk will focus on educating clinicians from different specialties on the utility of creating an interdisciplinary team for better outcomes of elderly hip and knee replacement patients under the The Bundled Payments for Care Improvement initiative (BPCI); Preoperative evaluation for hip fracture patients using the ACS National Surgical Quality Improvement Program® (ACS NSQIP®);

Hip and knee replacement patients and their multidisciplinary care from hospital to 90 days postoperative.- prehospital academy, inpatient management and disease management system centered around the home; Team approach and residents education for Comprehensive Care for Joint Replacement (CJR) model patients

Talk #2 Speaker Expertise: Dr. Horn is the Director of Geriatrics Inpatient Service and Director of Geriatrics Hip Fracture Service at Montefiore Medical Center, a busy urban academic hospital in the Bronx. Dr. Horn organized and moderated a session on orthogeriatrics co-management during the AGS 2013 Annual Meeting ("Rally the Troops: Optimizing Teams for Care of Hospitalized Elders").

Her main interest is in developing and implementing models of care that involve different medical and surgical specialties for complex hospitalized elderly patients.

SNF CARE FOR BUNDLE PAYMENT PATIENTS

U. Ohuabunwa¹, L. Solberg², 1. *Emory University, Atlanta, Georgia*, 2. *University of Florida, Gainesville, Florida*

Talk #3 Content Outline:

Discuss the role of the short-term rehabilitation stay in a SNF for patients involved in the bundled payment model for joint replacements in Medicare. Explain the expectations and limitations this program sets for patients and providers. Discuss the role of the geriatrician in the co-management model in the hospital and in the role of the transition of care to the SNF. Present our model of care and the ability to replicate the process in practices of the audience.

Expertise of speaker in this topic:

Dr. Solberg is the Chief of the Division of Geriatric Medicine at the University of Florida College of Medicine. He has successfully implemented several hospital to SNF programs focused on the co-management of patients partnering with surgery and medicine services to benefit the older hospitalized patients. He has assisted in the design and implementation of local guidelines for the bundled payments program at the University Of Florida College Of Medicine. Dr. Solberg is an educator in geriatrics and inter-professional education. He is well published in clinical practice models, education research, and clinical education projects.

POST-ACUTE CARE IN CJR-THE CRITICAL ROLE OF THE CERTIFIED HOME HEALTH AGENCY (CHHA)

U. Ohuabunwa¹, A. Ehrlich², W. Rymarowicz², 1. *Emory University, Atlanta, Georgia*, 2. *Montefiore, New York, New York*

Talk #4 Content Outline

The speakers will outline the stages from design to implementation of a joint replacement program in a CHHA including collaboration with orthopedics, hospital leadership and discharge team; development of clinical pathways; staff education for RNs, PT, and HHA.

Montefiore Home Care has implemented an Elective Joint Replacement Program which cared for over 1,400 patients in 2015. Over 70 % of patients undergoing elective joint replacement are now discharged home compared with 30% before the program's initiation resulting in significant cost savings to the Montefiore network.

Speaker Expertise

Amy Ehrlich MD - Professor of Clinical Medicine, Medical Director Montefiore Home Care, Albert Einstein College of Medicine/Montefiore Medical Center

Wojciech Rymarowicz, MPT, Director of Rehabilitation, Montefiore Home Care.

The speakers have presented this topic at multiple national meetings.

SESSION 4930 (PAPER)

IDENTIFYING AND MANAGING DELIRIUM IN OLDER ADULTS 1

INCIDENCE, RISKS, AND OUTCOMES OF DELIRIUM AFTER TRANSCATHETER AND SURGICAL AORTIC VALVE REPLACEMENT

C. Kim^{1,2}, E.R. Marcantonio^{1,2}, L.A. Lipsitz^{1,2,3}, J.H. Lee², J. Popma^{1,2}, K. Khabbazi^{1,2}, J. Afilalo⁵, D. Kim^{4,1,2}, 1. *Harvard Medical School, Boston, Massachusetts*, 2. *Beth Israel Deaconess Medical Center, Boston, Massachusetts*, 3. *Hebrew SeniorLife, Roslindale, Massachusetts*, 4. *Brigham and Women's Hospital, Boston, Massachusetts*, 5. *Jewish General Hospital, Montreal, Quebec, Canada*

Transcatheter aortic valve replacement (TAVR) has emerged as a minimally invasive alternative treatment to surgical aortic valve replacement (SAVR) in high-risk patients. Postoperative delirium after SAVR is common; delirium rates after TAVR have not been established. We conducted a single-center prospective cohort study to determine the incidence and predictors of delirium in older patients undergoing TAVR (106) and SAVR (73). The Confusion Assessment Method was used daily to assess delirium. Relative to SAVR, TAVR patients were older (84 vs. 78 years), more likely to be frail (Fried phenotype) (82% vs. 36%), but had lower delirium incidence (26% vs. 51%). We identified the following preoperative delirium risk factors after TAVR: Mini-Mental State Examination score <27 (odds ratio [OR]: 6.0; 95% confidence interval [CI]: 1.3–28.5), history of atrial fibrillation (OR: 3.0; 95% CI: 1.1–8.0), and activities of daily living disability (OR: 2.7; 95% CI: 0.9–8.4). After SAVR, the only predictor was New York Heart Association class III-IV (OR: 7.5; 95% CI: 2.5–22.7). After adjustment, delirium was associated with perioperative complications after TAVR (OR: 4.7; 95% CI: 1.6–14.3), but not SAVR (OR: 1.8; 95% CI: 0.3–9.7). Coexisting delirium and complications were associated with prolonged length of stay in the intensive care unit and hospital, and discharge to an institution after both TAVR and SAVR. In conclusion, despite older age and greater frailty, delirium incidence was significantly lower in TAVR than SAVR patients. Risk factors of delirium were different after TAVR and SAVR, but delirium was associated with poor clinical outcomes in both populations.

THE SPECTRUM OF AROUSAL AND ATTENTION: CAPTURING DELIRIUM SUPERIMPOSED ON DEMENTIA

D. Davis¹, S. Richardson², W. Hasemann³, J. Cerejeira⁴, D. Meagher⁵, G. Bellelli⁶, A. Morandi⁷, 1. *MRC Unit for Lifelong Health and Ageing at UCL, London, United Kingdom*, 2. *Newcastle University, Newcastle, United*

Kingdom, 3. *Universitätsspital Basel, Basel, Switzerland*, 4. *Universitário de Coimbra, Coimbra, Portugal*, 5. *University of Limerick, Limerick, Ireland*, 6. *University of Milano-Bicocca, Milan, Italy*, 7. *Ancelle Hospital, Cremona, Italy*

Detecting delirium superimposed-on-dementia (DSD) is difficult because assessment relies on cognitive tests that may be abnormal in both conditions. We hypothesised that assessments focusing more on the arousal-attention spectrum, and less on general cognition, would provide better empirical data for DSD diagnosis.

We recruited patients aged ≥70y from five hospitals across Europe (excluding aphasia; severe hearing impairment). Delirium was diagnosed by physicians according to DSM-5 criteria including information from nurses, carers, and review of medical records. Dementia was ascertained by the Informant Questionnaire of Cognitive Decline in the Elderly (cut-off ≥3.5). Arousal was measured using the Observational Scale of Level of Arousal (OSLA), which assesses eye movement, eye opening, eye contact, posture, movement, and communication. Attention was measured by participants signalling each time an “A” was heard when “S-A-V-E-A-H-A-R-T” was read out.

The sample included 114 persons (mean age 82y (SD 7); 54% women). Dementia alone was present in 25% (n=28), delirium alone in 18% (n=21), DSD in 27% (n=31), neither in 30% (n=34). Arousal-attention were assessed in n=109 (96%). Using OSLA, 83% participants were correctly identified (sensitivity 85%, specificity 82%, AUROC 0.92). The attention task correctly classified 76% (sensitivity 90%, specificity 64%, AUROC 0.80). Combining scores correctly classified 91% (sensitivity 84%, specificity 92%, AUROC 0.94), remaining high in the subset with dementia (93% correctly classified, sensitivity 94%, specificity 92%, AUROC 0.98).

This combined arousal-attention assessment to detect DSD was brief yet with high diagnostic accuracy even in dementia. Such an approach could have major clinical utility for diagnosing DSD.

DELIRIUM MOTOR SUBTYPES AND ONE-YEAR MORTALITY AFTER HIP FRACTURE SURGERY

L. Carnevali¹, P. Mazzola^{1,2}, M. Corsi³, G. Bellelli^{1,2,3}, G. Annoni^{1,2,3}, 1. *School of Medicine and Surgery, University of Milano-Bicocca, Monza, MB, Italy*, 2. *NeuroMI - Milan Center for Neuroscience, Milano, MI, Italy*, 3. *San Gerardo Hospital ASST Monza, Acute Geriatrics Unit, Monza, MB, Italy*

Delirium is a common complication in elderly subjects hospitalized for hip fracture (HF). However, this geriatric syndrome is multifactorial and heterogeneous in terms of clinical presentation and outcomes. Different classifications have been proposed to describe delirium variants, but literature focusing on the prognostic impact of delirium motor subtypes in hip fracture patients is sparse and inconsistent.

A prospective observational cohort study with one-year follow-up was carried out in the Orthogeriatric Unit of a large university hospital in Italy from October 2011 to January 2015. Delirium was evaluated daily with the Confusion Assessment Method algorithm. Motor subtypes were identified according to Lipowski's classification, which takes into

account alterations of vigilance and behavior (hypoactive, hyperactive, mixed), and confirmed by clinical judgment.

Starting from 539 consecutively admitted patients, 424 were enrolled. Of them, 156 (36.8%) developed delirium. The prevalence of motor subtypes was 6.8% for hypoactive, 17.0% for hyperactive, and 13.2% for mixed subtype. One-year mortality was 15.5% in patients who did not experience delirium, and 41.4%, 20.3%, and 38.2% in the hypoactive, hyperactive, and mixed delirium subgroups, respectively. After adjusting for potential confounders in a Cox regression analysis, mortality was significantly higher among subjects experiencing the hypoactive subtype (Hazard Ratio 2.78, 95% Confidence Interval: 1.15–6.71).

In-hospital hypoactive delirium is significantly associated with higher one-year mortality in patients undergoing hip fracture surgery.

FRAILITY ASSESSMENT TO HELP PREDICT PATIENTS AT RISK OF ED-INDUCED DELIRIUM

M. Giroux^{1,2,3}, M. Émond^{1,2,3}, M. Sirois^{1,2,3}, V. Boucher^{1,2,3}, R. Daoust^{4,5}, E. Gouin⁶, M. Pelletier⁷, S. Berthelot^{1,3}, 1. *Readaptation, CHU de Québec, Québec, Quebec, Canada*, 2. *Centre d'excellence du Vieillissement de Québec, Québec, Quebec, Canada*, 3. *Université Laval, Québec, Quebec, Canada*, 4. *Université de Montréal, Québec, Quebec, Canada*, 5. *CIUSSS du Nord-de-Pile-de-Montreal, Québec, Quebec, Canada*, 6. *CIUSSS Mauricie-centre-du-Québec, Québec, Quebec, Canada*, 7. *CISSS de Lanaudière, Québec, Quebec, Canada*

Introduction: Delirium is a frequent complication among seniors in the emergency department (ED). This condition is often underdiagnosed by ED professionals even though it is associated with functional & cognitive decline, longer hospital length of stay, institutionalization and death. Frailty is increasingly recognized as an independent predictor of adverse events in seniors and screening for frailty in EDs is now recommended. The aim of this study was to assess if screening seniors for frailty in EDs could help identify those at risk of ED-induced delirium.

Method: This study is part of the ongoing multicenter prospective cohort *MIDI-INDEED* study. Patients were recruited after 8 hours in the ED exposure & followed up to 24h after ward admission. Frailty was assessed at ED admission using the Canadian Study of Health and Aging-Clinical Frailty Scale (CSHA-CFS) which classified seniors from robust (1/7) to severely frail (7/7). Seniors with CSHA-CFS $\geq 5/7$ were considered frail. Delirium was assessed using the CAM.

Results: 370 patients were recruited. Preliminary data show an incidence of ED-induced delirium of 10.0%. Average frailty score at baseline was 3.5. 72 patients were considered frail, while 289 were considered robust. Among the frail seniors, there were 48.4% (30–66) patients with ED-induced delirium vs 17.9% (13.7–22.0) in the non-frail ones ($p < 0.0001$).

Conclusion: Increased frailty appears to be associated with increased ED-induced delirium. Screening for frailty at emergency triage could help ED professionals identify seniors at higher risk of ED-induced delirium.

DISRUPTIONS, DISCONTINUITIES, AND DISPERSIONS: AN ETHNOGRAPHY OF DISJUNCTURES IN ORTHOPAEDIC WARDS

J. Cross, F. Poland, S.P. Hammond, T. Backhouse, A. Varley, B. Penhale, N. Lambert, C. Fox, *Norwich Medical School, University of East Anglia, Norwich, United Kingdom*

Enhanced Recovery Pathways (ERPs) have become viewed as evidence-based medicine being brought to bear. Events are sequential, aiming to maximise throughput, productivity and quality. It is notable that usual care is full of multiple types of disjunctures (disruptions, discontinuities and dispersions) for patients, carers as well as health and social care professionals. Patients featuring on the cognitive impairment continuum (living with dementia and/or delirium) can present particular disruptions to usual practice. As part of the Peri-operative Enhanced Recovery hip FracturE Care of paTiEnts with Dementia (PERFECTED) research programme, focused ethnographic observations were conducted to unpick the everyday lived experiences of how patients experiencing delirium and/or dementia impact on ERP orientated practices on Orthopaedic Trauma wards.

Observations of routine “public” care places and activities were conducted across the 24 hour cycle, over 4 weeks in 3 secondary care settings across the United Kingdom. The spaces were selected due to the presence of care delivery processes aiming to provide ‘enhanced recovery’ to PERFECTED’s target population. Consisting of 144 hours of fieldnotes, data identifies multiple types of disruptions and discontinuities for patients and staff, with patients living with dementia posing particular and specific disruptions to usual practice, conditioning and staff responses. We will discuss how such practice dilemmas are well-known but not well-captured in this setting in relation to their specific impact on clinical care. The paper will conclude by demonstrating the value of ethnographic observations in health science research and how ERP procedures can be situated in usual care practices.

SESSION 4935 (SYMPOSIUM)

AN INTERNATIONAL PERSPECTIVE ON IMPLEMENTING FRAILITY INTO CLINICAL PRACTICE

Chair: M. McAdams De Marco, *Johns Hopkins University School of Public Health, Baltimore, Maryland*

Discussant: J.E. Morley, *Saint Louis University, St. Louis, Missouri*

Frailty is a clinical state of increased vulnerability characterized by high risk of adverse healthcare outcomes when exposed to a stressor that is frequently observed in older adults. Although frailty is commonly recognized by clinicians across a range of diseases and medical conditions, it is most commonly utilized in clinical and biologic research rather than in routine clinical care. The slow progress in the implementation of frailty into clinical practice may in part stem from the lack of consensus around the definition of frailty and because of a proliferation of frailty screening tools. However, amongst clinicians, there is compelling need to identify and more appropriately treat frail and vulnerable older adults. This symposium will feature a group of international experts

who have helped to develop and propagate some of the major tools used in frailty research, including the frailty phenotype, the frailty index, and the Gerontopole frailty tool. These investigators will discuss attempts to date to integrate distinct tools into clinical practice for screening purposes, for risk assessment and for the prevention of adverse outcomes. They will also outline future plans for further implementation of these tools into primary care, hospital, and subspecialty practices with the goal of improving outcomes and quality of life for the most vulnerable subset of older adults.

THE USE OF PHYSICAL FRAILTY MEASUREMENT IN GENERAL AND SUBSPECIALTY CLINICAL PRACTICE

J.D. Walston, *Johns Hopkins School of Medicine, Baltimore, Maryland*

Physical frailty measurement, also known as the frailty phenotype or Fried Frailty assessment, uses an aggregate of measures of grip strength, walking speed, weight loss, fatigue and physical activity to determine frailty status. Frailty status has then been utilized in population studies in order to determine future risk of disability, falls, hospitalization, and mortality. In addition, it has been extensively utilized to identify chronic inflammation and altered stress response systems as probably biological basis of frailty. Results of these epidemiological studies have encouraged the increasing integration of physical frailty measurement into a wide variety of general and subspecialty clinical practices. These include 1) cardiovascular, oncological, and thyroid surgery, 2) anesthesia and pre-operative assessment, and 3) into general Geriatric practice. The speaker will provide a brief overview of the physical frailty assessment and provide examples of how it is presently being integrated into decision making processes in each of these specialties.

CLINICAL USE OF THE PHYSICAL FRAILTY PHENOTYPE IN OLDER TRANSPLANT RECIPIENTS

M. McAdams De Marco, *Johns Hopkins University School of Public Health, Baltimore, Maryland*

In the US, frailty prevalence is high in older end stage renal disease (ESRD) patients being evaluated for kidney transplantation (KT); among patients aged 65–74, 27.1% are frail and among patients aged ≥ 75 , 23.7% are frail. Older KT recipients are more than twice as likely to be frail, which increases their risk of longer length of stay, delayed graft function, early hospital readmission and post-KT mortality. At JHU and other US transplant centers, frailty is used as a valid and reliable ‘foot of the bed test’ and is included in the evaluation process to improve older KT candidate selection. These transplant centers can accept a marginal older candidate who are robust or in contrast, decide against transplanting a frail older candidates. Importantly, frailty mitigates the reliance on chronologic age for risk prediction in older adults and helps identify who would do well with KT despite their age.

USING A FRAILTY INDEX BASED ON DEFICIT ACCUMULATION

K. Rockwood, *Dalhousie University, Halifax, Nova Scotia, Canada*

Frailty as a state of increased risk can be operationalized by a frailty index. It is the proportion of age-related health

deficits present in an individual to the deficits counted. As it does not require special instrumentation, existing/routinely collected data can quantify frailty across clinical and population settings. Several electronic frailty indices have been devised, allowing risk to be graded on millions of people. The mean frailty index score varies by regional and national economic indicators, so it is also being used as a population health metric. Despite varying versions, the frailty index characteristically increases by ~4% annually across the adult lifespan, to a maximum value of 0.7. It is used in research to estimate personal biological age and more recently in pre-clinical models. From cellular to social inquiries the metrics of the frailty index can grade clinical risk and can facilitate the study of ageing, resilience and age-related illnesses.

CLINICAL APPLICATIONS OF THE CLINICAL FRAILTY SCALE AND THE PICTORIAL FIT-FRAIL SCALE

O. Theou, *Dalhousie University, Halifax, Nova Scotia, Canada*

Most health care professionals would agree on the importance of frailty assessment in clinical settings. Even so, there is no agreement on which frailty tool is feasible to implement in clinical settings and whether the same tool should be used across settings. In this presentation we will provide evidence about the clinical applications of the Clinical Frailty Scale and the Pictorial Fit-Frail scale. The Clinical Frailty Scale is based on the clinical evaluation of a patient’s status in the domains of mobility, energy, physical activity, and function and is now expanded to include nine levels from very fit to terminal ill. The Pictorial Fit-Frail scale recently developed to be simpler and easier to administer within clinical settings, measures levels of fitness to frailty using visual prompts.

IDENTIFICATION OF FRAILTY IN PRIMARY CARE: THE GÉRONTOPÔLE FRAILTY SCREENING TOOL

M. Cesari^{1,2}, A. Piau^{1,2}, B. Fougère^{1,2}, 1. *Université de Toulouse III Paul Sabatier, Toulouse, France*, 2. *Centre Hospitalier Universitaire de Toulouse, Toulouse, France*

In 2011, the Gérontopôle of the Centre Hospitalier Universitaire de Toulouse (Toulouse, France) developed a Frailty Clinic for providing multidisciplinary evaluation (and consequent personalized plan of intervention) to community-dwelling frail elders. An ad hoc screening instrument for frailty (the so-called Gérontopôle Frailty Screening Tool, GFST) was specifically conceived and proposed to the local general practitioners (GPs). The instrument was designed for 1) being formative for GPs in the identification of a usually underestimated clinical condition as frailty, 2) being easy to implement in the busy clinical routine, 3) largely relying on the subjective evaluation of the GP, and 4) supporting a multidimensional approach to frailty. Given the success of the initiative, the GFST (today available in nine different languages) and the Frailty Clinic model are today largely diffused in France.

SESSION 4940 (SYMPOSIUM)

NATIONAL ALZHEIMER'S PLANS AND INITIATIVES: LESSONS LEARNED FROM IMPLEMENTATION

Chair: H. Bergman, *McGill University*

Co-Chair: I. Vedel, *McGill University*

Alzheimer disease and related disorders have been recognized as a public health priority by WHO. Almost 20% of Baby-Boomers will suffer from Alzheimer's disease (AD) and related disorders during their lifetime. With the increasing number of older persons, Alzheimer's disease continues to be a major global public health issue. This will be even more imperative with the advent in the coming years of biomarkers and disease modifying medications.

Central to all these efforts is the objective to provide access to personalized, co-ordinated assessment and treatment services for people with AD and their caregivers.

Many jurisdictions across the world have developed initiatives to improve care of persons with dementia while some have actually adopted and implemented Alzheimer plans, with major efforts to develop and implement innovative collaborative care policies and models to improve early detection, access and care for patients and their caregivers. The French plan is focused on specialty care while plans in Canada and Israel as well as initiatives in the USA are anchored in primary medical care. The objectives of this symposium are to: 1) discuss the key characteristics of initiatives and policies implemented in Canada, USA, France and Israel; 2) present data on the impact of these initiatives, models of care and policies on the detection, diagnosis, treatment of dementia, continuity of care, quality of follow-up, coordination between primary care and specialty care, satisfaction; 3) examine policies implementation strategies and identify key factors for successful development and large scale implementation.

THE ISRAELI NATIONAL DEMENTIA PLAN: INCREASING AWARENESS AND MOBILIZING RESOURCES—A JOINT ENDEAVOR

I. Rasooly¹, J. Lemberger¹, J. Brodsky², M. Laron², S. Sternberg¹, A. Cohen¹, 1. *Ministry of Health, Jerusalem, Israel*, 2. *Myers-JDC-Brookdale Institute, Jerusalem, Israel*

In 2013, Israel developed a national strategic plan for dementia, based on an interdisciplinary and inter-organizational group of experts. The plan offers a holistic perspective and emphasizes collaboration among all relevant agencies. The Ministry of Health has set up an implementation committee that meets regularly.

Major accomplishments to date include:

- Increasing public and professional awareness of dementia.
- Promoting discourse among healthcare leaders to advance dementia policy and practice including prevention and timely diagnosis, provision of quality care, and end of life issues, with a focus on primary care.
- Increasing cooperation among governmental agencies and civil society, to encourage the development and implementation of services for people with dementia and their families.

A major challenge is to secure the needed financial and professional resources, and political support, to ensure sustainability of these accomplishments and future development for the years ahead.

CARING FOR OLDER ADULTS WITH DEMENTIA: A UNITED STATES PERSPECTIVE

C.M. Callahan^{1,2}, M. Boustani^{1,2}, H.C. Hendrie^{1,2}, 1. *Indiana University Center for Aging Research, Indianapolis, Indiana*, 2. *Regenstrief Institute, Inc, Indianapolis, Indiana*

In the United States, older adults with dementia receive health care through a distributed and fragmented system of providers. Families provide the majority of day-to-day care and primary care physicians remain the usual provider of health care. Only a small percentage of patients with dementia access specialty memory care practices. Clinical trial evidence demonstrates the capacity to redesign primary care for persons with dementia using the principles of collaborative care including: a focus on the patient-caregiver dyad; a tailored, team-based approach to care; and, an emphasis on non-pharmacologic approaches. However, persons with dementia account for only a small percentage of a typical primary care practice, rendering costly practice redesign impractical. We describe current efforts to reconsider the design and content of collaborative care models to improve scalability and reach to the large population of older adults and family caregivers who seek better options for care.

THE FRENCH ALZHEIMER'S PLANS

J. Ankri, *UVSQ-INSERM U1168, Paris, France*

France was one of the first countries to develop specific, funded, and well-structured plans for Alzheimer's disease. After two plans since 2000, the third one (2008–2012) resulted in actions from care to research, whilst respecting ethical considerations. It intended to improve the quality of care and to combine research efforts. An evaluation of this plan at the request of the French government was performed at the end of 2012, and led to a fourth plan expanded to neurodegenerative diseases. The French plans aim to offer a comprehensive response to the increase of the disease's prevalence. Faced with the challenges of the growing dementia population, every country has answered with their own methods and objectives, through the development of specific plans (like in France) or within their policies and programs for seniors as well as mental health. These differences may be linked to the different health and social systems.

THE QUEBEC ALZHEIMER'S PLAN: IMPACT ON DEMENTIA MANAGEMENT IN PRIMARY CARE CLINICS—CANADA

I. Vedel^{1,2}, N. Sourial^{1,2}, G. Arsenault-Lapierre², M. LeBerre², M. Hardouin², A. Bakry^{1,2}, H. Bergman¹, 1. *Department of Family Medicine, McGill University, Montreal, Quebec, Canada*, 2. *Lady Davis Institute, Jewish General Hospital, Montreal, Quebec, Canada*

The Alzheimer Plan, focusing on primary health care as the hub of networked care for patients with dementia, is being implemented in 40 selected Family Medicine Groups in Quebec, Canada. Our objectives were to: 1) assess the impact of the plan on detection, diagnosis, treatment and

quality of dementia care management, 2) describe the implementation strategies for successful large scale-up. We used a mixed methods design: a quantitative pre/post-Alzheimer Plan study and a qualitative implementation study. We conducted a chart review, survey, interviews and focus groups. The quality of dementia care management score increased significantly by 8%. Key elements for successful large-scale implementation were: leadership at all levels, existence of a champion family physician, ongoing training of clinicians, simple clinical tools, interdisciplinary care. Additional results are forthcoming. Further research across Canadian provinces is being conducted to identify the organizational and clinical characteristics associated with higher quality of care.

SESSION 4945 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: INTERNATIONAL EFFORTS TO ADDRESS POLYPHARMACY THROUGH POLICY AND HEALTH AUTHORITIES: IGRIMUP SYMPOSIUM 2

Chair: D. Garfinkel, *Homecare Hospice & Geriatric-Palliative Service, Israel Cancer Association & Wolfson Medical Center & Bat - Yam, Israel*

Co-Chair: M. Denking, *Bethesda Agaplesion Hospital, Ulm, Germany*

Discussant: M. Wehling, *Medical Faculty Mannheim Ruprecht-Karls-University Heidelberg*

In the first IGRIMUP symposium, we have concentrated on the wide variety of negative clinical outcomes of inappropriate medication use and polypharmacy (IMUP). There are also huge, negative economic consequences to individuals and societies. The second IGRIMUP symposium highlights the fact that in most countries, the extent of IMUP and its impact on the “geriatric boom burden”, are inappropriately appreciated and insufficiently addressed by decision-making authorities. Neither the academic health-related institutions nor governments or healthcare services seem to act forcefully enough to combat IMUP and reduce its negative impact on individuals and societies. Wise, knowledgeable, ethical medical doctors, pharmacists, nurses and other caregivers, are many times forced by the same health authorities to automatically implement clinical guidelines apparently representing good quality of care. However, these approaches may cause more harm than good in subpopulations of very old, those with comorbidity, dementia, frailty and limited life-expectancy (VOCODFLEX). Even patients with advanced cancer or non-cancer end of life situations, are prescribed “curative” and preventive medications many times until death. Professional healthcare gives mainly medical doctors and pharmacists are trying to invent and promote tools for improving screening, prevention and treatment of IMUP. However, unless the academy and policy-makers contribute much more, the caregiver’s chances to succeed in our fight against IMUP for the benefit of all of us, are slim.

WHAT POLICIES ARE IN USE ACROSS CANADA TO REDUCE INAPPROPRIATE MEDICATION USE IN OLDER ADULTS?

J. Shaw¹, C.A. Sadowski², J. Silvius^{3,4}, K. Chelak⁵, J.P. Turner⁶, C. Tannenbaum⁶, 1. *Institute for Health*

System Solutions and Virtual Care, Women’s College Hospital, Toronto, Ontario, Canada, 2. University of Alberta, Edmonton, Alberta, Canada, 3. Alberta Health Services, Calgary, Alberta, Canada, 4. University of Calgary, Calgary, Alberta, Canada, 5. Canadian Agency for Drugs and Technologies in Health, Ottawa, Ontario, Canada, 6. University de Montreal, Montreal, Quebec, Canada

Decision-making regarding the initiation and cessation of medications in older adults is primarily the responsibility of clinicians, however, this can be impacted by appropriate health policy. This study investigated policies across Canadian jurisdictions designed to discourage the use of inappropriate medications, and encourage deprescribing.

A nation-wide questionnaire containing 10 open-ended questions, were distributed to the Canadian Pharmaceutical Directors Forum through the Ministries of Health in 2015. Two reviewers categorized responses and analyzed themes.

Ten of 12 jurisdictions completed the questionnaires. Policies identified included de-listing specific medications, dose restriction, limited use/special authorization and incentives for reviewing medications or refusing to fill inappropriate prescriptions. 60% of jurisdictions coordinated collaboration across academic, health care, and policy sectors to provide additional services. Gaps noted included the potential for substitution of alternate harmful drug therapies. A range of strategies exist across Canada to reduce inappropriate medicines in older adults, with variable success.

EVIDENCE MAPS FOR DRUG THERAPY IN FRAIL OLDER ADULTS

M. Denking^{1,2}, D. Dallmeier^{1,2}, S. Brefka^{1,2}, S. Klöppel⁵, S. Voigt-Radloff⁵, C. Schönfeldt-Lecuona⁷, C. von Arnim^{6,2}, J. Bauer^{3,4}, 1. *Agaplesion Bethesda Clinic Ulm, Geriatric Medicine Ulm University, Ulm, Germany, 2. Geriatric Center Ulm/Alb-Donau, Ulm, Germany, 3. Department of Geriatric Medicine, Klinikum Oldenburg, Oldenburg, Germany, 4. Centre of geriatrics, University of Oldenburg, Oldenburg, Germany, 5. Centre for Geriatric Medicine and Gerontology, University Medical Center Freiburg, Freiburg i. Br., Germany, 6. Department of Neurology, Ulm University Hospital, Ulm, Germany, 7. Department of Psychiatry and Psychotherapy III, Ulm University, Ulm, Germany*

Evidence on the efficiency of pharmacotherapy is especially scarce for frail older adults, which are particularly exposed to extensive changes in the medication due to clinical needs. Adequate studies (RCTs and non-randomized trials) addressing this population are lacking, and observational studies frequently show heterogeneous results. One explanation for this heterogeneity could be differences in the conceptualization of frailty and its discriminative capacity across many different available assessments. In our project “Medication and QoL in Old Age” we developed evidence maps for highly prevalent diseases in frail older adults, starting with arterial hypertension and major depression. We set cut off points for the identification of frail persons using several frailty-, vulnerability-, and CGA-related scores used in trials. We aimed i) to gain a better understanding of the effect of pharmacotherapy across the identified frailty levels and II)

to build updated evidence maps for drug therapy based on operationalized criteria for frailty.

CONSENSUS VALIDATION OF THE FORTA (FIT FOR THE AGED) LIST IN SEVERAL COUNTRIES

M. Wehling, F. Pazan, *Medical Faculty Mannheim Ruprecht-Karls-University Heidelberg, Mannheim, Germany*

The drug treatment of the elderly is still in many cases inappropriate but health organizations/authorities in many countries fail to improve it. In order to adequately address this problem and to increase the appropriateness and quality of drug treatment in the elderly, our group has developed a clinical aid called the FORTA List. The FORTA List has recently been validated by experts from Germany and Austria in a Delphi consensus procedure. Moreover, we assessed FORTA's utility in a randomized prospective trial which showed that FORTA significantly ($p < 0.0001$) improves the quality of drug treatment. Based on our results, we conducted a consensus validation of country-specific FORTA Lists in several countries. In a preliminary analysis of the data from 6 participating countries each mean consensus coefficient was higher than 0.9. The results of this project will be used to develop country-specific FORTA Lists and a European FORTA List.

APPLICATION OF POTENTIALLY INAPPROPRIATE MEDICATION CRITERIA FROM NATIONAL HEALTH INSURANCE DATABASE

C. Chang^{4,1}, S. Yang^{5,6}, H. Lai⁷, H. Liu⁸, S. Hwang^{10,11}, D. Chan^{1,2,3}, 1. *Department of Geriatrics and Gerontology, National Taiwan University Hospital, Taipei, Taiwan*, 2. *Department of Internal Medicine, National Taiwan University Hospital, Taipei, Taiwan*, 3. *Superintendent Office, National Taiwan University Hospital Chu-Tung Branch, Hsinchu County, Taiwan*, 4. *Division of Internal Medicine, National Taiwan University Hospital Chu-Tung Branch, Hsinchu County, Taiwan*, 5. *College of Pharmacy, Kaohsiung Medical University, Kaohsiung, Taiwan*, 6. *Taipei City Psychiatry Center, Taipei City Hospital, Taipei, Taiwan*, 7. *Department of Family Medicine, National Taiwan University Hospital Hsin-Chu Branch, Hsinchu, Taiwan*, 9. *Department of Psychiatry, School of Medicine, Taipei Medical University, Taipei, Taiwan*, 10. *Department of Family Medicine, Taipei Veteran General Hospital, Taipei, Taiwan*, 11. *National Yang-Ming University, School of Medicine, Taipei, Taiwan*

National Health Insurance Research Database (NHIRD) is an important administrative database for investigation of drug utilization in Taiwan. Potentially inappropriate medication-Taiwan (PIM-Taiwan) criteria have been developed in 2012. We have applied the NHIRD to investigate the prevalence of PIMs, PIMs' associated factors, and leading PIMs among outpatient department (OPD) visitors, emergency department (ED) visitors, and older home healthcare service recipients (HHSRs), separately. The prevalence of having at least one PIM in 2009 was highest with 2012 Beers (86%; 60%), followed by PIM-Taiwan criteria (73%; 40%), then PRISCUS criteria (66%; 32%) among OPD and ED visitors, respectively. But, for HHSR, the prevalence of PRISCUS PIMs

was higher than those of PIM-Taiwan criteria. Polypharmacy was the major associated factors of PIMs regardless which set of criteria. By using PIM-Taiwan criteria, benzodiazepine for OPD visitors, psychotropic drugs and antihistamines for HHSRs, as well as antihistamines for ED visitors were the most prevalent PIMs.

CAN WE CHANGE THE POLICY OF PRESCRIBING COMMON MEDICATIONS UNTIL DEATH?

D. Garfinkel, *Homecare Hospice & Geriatric-Palliative Service, Israel Cancer Association & Wolfson Medical Center &, Bat - Yam, Israel*

"Preventive" medications for common diseases have proven efficacy in relatively healthy adults. Prescribing these to the very old, with co-morbidity, dementia, frailty and limited life-expectancy (VOCODFLEX) is harmful. We evaluated medications given to end-stage cancer patients (ESCP) upon admission to Homecare Hospice, Israel Cancer Association. 202 ESCP, average age 80, average Hospice stay until death 39 days. Average number of common medications 9.2, 63% consumed 6–12, 23% 12–22 drugs. 2 months before death, 22% were still on aspirin for "vascular problems prevention", 60% were prescribed at least one, 17% ≥ 3 Blood Pressure lowering drugs, 30% were still on statins "to lower serum cholesterol". Oncologists do not change medications prescribed by other experts and vice versa. ESCP continue to visit family physicians/experts who continue to prescribe based on "their guidelines"—unproven in this sub-population. "Defensive medicine guidelines" may be harming most vulnerable subpopulations. Who is responsible for stepping on the brakes?

SESSION 4950 (PAPER)

EPIDEMIOLOGICAL STUDIES: PHYSICAL FUNCTION AND LONGEVITY

FUNCTIONAL TRAJECTORIES IN THE ELDERLY: THE PAQUID COHORT, A 24-YEAR, POPULATION-BASED STUDY.

A. Edjolo, C. Proust-Lima, J. Dartigues, K. Pérès, *Univ. Bordeaux, Inserm, Bordeaux Population Health Research Center, UMR 1219, Bordeaux, France*

The aim was to describe the trajectories of dependency preceding death according to the continuum of dependency in the elderly.

A 2-parameter probit longitudinal Item Response Theory (IRT) model for graded responses combined with a latent class mixed model (LCMM) was performed on a sub-sample of 3 238 community dwellers aged 65 years and over at baseline (1988) from the Paquid prospective cohort on ageing. Dependency was estimated with a 11-item scale of basic and instrumental activities of daily living (ADL and IADL) collected at home every 2 to 3 years over 24 years. The IRT model described the continuum of dependency with early losses in IADL (shopping, transporting), last losses in ADL (eating and transferring), and an overlapping of IADL and ADL in the middle of the continuum; and the LCMM identified five heterogeneous 24-year trajectories adjusted

for age at death, education and sex. Two trajectories (24.2% of the sample) with an accelerated decline were associated with women (94.2% and 60.2%) and dementia (54.2% and 52.1%) with participants dying with ADL limitations in eating and toileting. Two other trajectories (69.5% of the sample) showed progressive decline with respectively 66.2% and 16.3% of men, few dementia (8.9% and 16.3%) and participants dying with limitations in handling finances and dressing. One trajectory showed an abrupt decline (6.2% of the sample) with 83.7% of men and few dementia (8.9%). The “mapping” of dependency process associated with longitudinal trajectories provide an in-depth understanding of the natural history of dependency in aging.

DETERMINANTS OF PEAK AND LOSS OF MUSCLE STRENGTH THROUGHOUT THE LIFECOURSE

C. Cooper^{1,2}, L. Westbury¹, H. Syddall¹, E. Dennison¹, C. Gale¹, 1. *University of Southampton, Southampton, United Kingdom*, 2. *University of Oxford, Oxford, United Kingdom*

Low grip strength in later life, a marker of sarcopenia, is an established risk factor for subsequent disability, morbidity and mortality. The principal determinants of low grip strength have been established as: older age; shorter stature; low physical activity; poor nutrition; socioeconomic disadvantage and comorbidity. Little is known about risk factors for accelerated loss of grip strength in later life. We investigated determinants of level and loss of grip strength using data from 1650 men and 2053 women (aged 50 to 89 years), who had grip strength measured at waves 2, 4 and 6 of the English Longitudinal Study of Ageing. Loss of grip strength was characterised using a residual multilevel-modelling approach and analysed for men and women combined in relation to participant characteristics. Older age, shorter stature, physical inactivity and comorbidity were associated with lower level, and accelerated loss, of grip strength ($p \leq 0.001$ for all associations). Lower levels of physical activity, household wealth ($p < 0.001$) and never having married ($p = 0.02$) were all associated with lower level of grip strength, but not with rate of loss. Our data suggest that peak muscle strength and the rate of involutional muscle weakness contribute in approximately equivalent proportion to the muscle strength of older people (75–89 years). Our results further suggest that each of these components may have different determinants during growth and older age. Further research is required to replicate our results and to inform development of interventions to promote maintenance and prevent loss of muscle strength in later life.

DISSIMILARITIES IN TRAJECTORIES OF PHYSICAL FUNCTION DECLINE IN OLDER ADULTS BY SEX

V. Del Panta, M. Colpo, E. Talluri, B. Stefania, *Local Health Unit Tuscany Centre, Florence, Italy*

Purpose: Aging is associated with decline of physical function with heterogeneous rates of decline across individuals. We aimed at identifying risk factors for accelerated decline of lower extremity performance over 9-year follow up in participants of the InCHIANTI study aged 65–75 years, with a Short Physical Performance Battery (SPPB) score >9 and non-disabled at baseline evaluation.

Methods: Time trajectories of SPPB were characterized by Latent Class Growth Curve, separately in men and women and categorized as fast and slow linear decline.

Predictors of SPPB decline were identified by logistic regression among demographic, physiological and biomarker variables. Fit of the model prediction was explored by ROC curve.

Results: 507 participants (246M, 261F both 70 ± 3.0 yrs of age) were included. Average baseline SPPB was 11.7 ± 0.6 for men and 11.2 ± 1.0 for women. Significant predictors of SPPB decline for males were none and low physical activity (OR=9.4 and OR=4.1), number of diseases (OR=1.4), hip flexion strength (OR=0.9) and total cholesterol (OR=0.98). Main predictors for women were different and included: age (OR=1.5), vitamin D <60 nmol/L (OR=3.0), C-reactive protein >5 µg/mL (OR=2.9) and hip flexion strength (OR=0.8). AUC values derived from ROC analyses were 81.9% for males and 85.6% for females.

Conclusion: Risk factors for differential rates of decline of physical function with age include both functional variables and blood biomarkers but are different between men and women. Of particular interest, C-reactive protein is a risk factor only in women confirming previous reports.

THE LINK BETWEEN EDUCATIONAL ATTAINMENT AND MORTALITY OVER TIME IN THE UNITED STATES

M. Rebeira, *University of Toronto, Toronto, Ontario, Canada*

This study shows the relationship between low, medium and high educational attainment and death rates based on adjusted risk ratios in the US adult population stratified by white and black, males and females over time (1986–2014).

Mortality relative risks, adjusted for marital status, smoking and alcohol were calculated using a generalized linear model from NHIS data for three time periods. Death rates based on these adjusted risks were apportioned for different educational groups based on educational prevalence data

The findings show that relative risk ratios for mortality which took into account age, smoking, alcohol and marital status resulted in lower risk ratios compared to unadjusted risk rates for all demographic groups in the study. The probability of death based on adjusted mortality risk ratios for white males decreased over time for all educational levels. The difference at aged 65 between lowest and highest educated increased over the past decade to return to rates closer to that in the late 1980s. The difference between low and high educated white males in 2000–2014 translate to a difference of a decade of life-expectancy. The probability of death based on adjusted risk ratios also decreased over this time period for black men, black women and white women. Compared to white men, all these groups showed an improvement in terms of reduction in death rates differences between 1992–1999 and 2000–2014. However, for all time periods, black males continue to have the largest differential in absolute percentage terms in probability of death compared to any other groups.

Conclusion

Lower-educated white males in the United States lose up to a decade in life-expectancy compared to high-educated white males.

DOES THE IMPACT OF BMI ON BACK PAIN CHANGE AS PEOPLE AGE? 37 YEARS OF FOLLOW-UP IN A BRITISH COHORT

S. Muthuri, R. Cooper, D. Kuh, *MRC Unit for Lifelong Health and Ageing at UCL, London, United Kingdom*

Back pain is one of the most prevalent conditions affecting older people and has a major impact on activity participation. Higher body mass index (BMI) is an important risk factor for back pain but there is little evidence on whether it becomes more or less important as people age. This study aimed to examine whether associations of BMI with back pain change with age and extend into later life using data from a nationally representative British birth cohort, the MRC National Survey of Health and Development. Back pain was self-reported at ages 31, 36, 43, 53, 60–64 and 68. Repeat measures of weight and height were used to calculate BMI at equivalent ages. Mixed-effects logistic regression models with random intercepts and slopes for age were fitted to test the associations of BMI with back pain across adulthood. The odds ratio (OR) for back pain increased per year increase in age ([OR=1.03 (95%CI 1.03 – 1.04)]. After adjusting for age and sex, higher BMI was associated with increased odds of back pain over the 37-year follow-up period [OR of back pain per 1kg/m² increase in BMI=1.06 (95%CI 1.05 – 1.08)]. There was no evidence that this association changed with age (agexBMI interaction, p=0.8). Associations were maintained when other risk factors for pain identified in this study (including childhood serious illness, height and occupation) were accounted for. These findings suggest that higher BMI across adult life is a persistent risk factor for back pain and remains an important target for intervention into old age.

SESSION 4955 (PAPER)

CULTURAL AND ORGANIZATIONAL FACTORS AFFECTING END-OF-LIFE CARE

DEATH OF A LOVED ONE FRAMES END OF LIFE DECISION MAKING IN AFRICAN AMERICAN PACE PARTICIPANTS

L. Gill², J. Sefcik¹, T.S. Waite¹, A. Booker¹, P.Z. Cacchione^{1,2}, *1. School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania, 2. Mercy LIFE West Philadelphia, Philadelphia, Pennsylvania*

Understanding the African American (AA) perspective around end of life (EOL) preferences, particularly place of death is a critical step in providing patient and family-centered care within a Program of All-inclusive Care of the Elderly (PACE). The purpose of this study was to better understand values and attitudes associated with EOL preferences. Focus groups (3) were held at one urban primarily AA (95%) PACE to investigate their EOL preferences. Twenty-one AA older adult participants were predominantly high school educated (71.4%), female (81.0%), and Christian (90.5%). Content analysis was used to identify the following themes: 1) Previous Experience with Death and 2) Spiritual Preparation and Celebration and one additional finding of “I Don’t Care.” In Previous Experience with Death, the participants reflected on the deaths of loved ones as they discussed some EOL situations likely to engender familial conflict and

burden. The AA older adults offered EOL planning strategies which they employed to avoid potential problematic EOL situations. Spiritual preparation and celebration included discussion on their relationship with God, being reunited with family after death and mapping out their funeral to celebrate their lives. Regarding the participants’ preference for place of death, it was equally divided between dying in the hospital where there are professionals trained to care for dying older adults and dying at home with family present. Implications include developing culturally sensitive educational materials to facilitate families having conversations around EOL preferences, in order to ensure wishes are honored and supported by both families and the PACE team.

30-DAY ALL-CAUSE READMISSION IN OLDER HEART FAILURE PATIENTS RECEIVING HOME VERSUS INPATIENT HOSPICE

H. Sheriff¹, C. Arundel¹, M.R. Blackman¹, H. Herrington⁵, W.S. Aronow³, R. Allman⁴, G. Fonarow², A. Ahmed¹, *1. VA Medical Center, Washington, District of Columbia, 2. UCLA, LA, California, 3. NYMC, Valhalla, New York, 4. Geriatrics and Extended Care Services, U.S. Department of Veterans Affairs, Washington, District of Columbia, 5. UAB, Birmingham, Alabama*

Background: Under Affordable Care Act hospitals may lose Medicare reimbursement for higher 30-day all-cause readmission, for which heart failure (HF) is leading cause, with ~25% HF patients being readmitted within 30 days of discharge. Hospice care may lower this risk. However, whether there is a difference between home hospice versus inpatient hospice remains unknown.

Methods: In Medicare-linked OPTIMIZE-HF, of 25345 hospitalized HF patients 479 (2%) received post-discharge hospice (201 inpatient and 278 home) care. Propensity scores for inpatient hospice care, estimated for each of 479 patients, were used to match 125 inpatient hospice with 125 home hospice patients who were balanced on 46 baseline characteristics. The 250 matched patients had a mean age of 83 years, a mean EF of 36%, 61% were women, and 4% African American.

Results: 30-day all-cause readmission occurred in 7% and 4% of matched inpatient hospice versus home hospice patients, respectively (HR, 2.73; 95% CI, 0.91–8.21). There was no difference in 6-month all-cause readmission (11% each). The risk of 30-day mortality was higher in the inpatient group, both at 30 days (87% vs. 82%; HR, 1.93; 95% CI, 1.39–2.67) and 6 months (93% vs. 87%; HR, 1.46; 95% CI, 1.11–1.91).

Conclusion: Among hospitalized older patients with HF, both inpatient hospice and home hospice care were associated with low rates of 30-day all-cause readmission, which was numerically lower in the home hospice group at 30 days, but not at 6 months. Home hospice patients had lower risk of all-cause mortality at both times.

BURDENSOME INTERVENTIONS AND ANTIBIOTIC USE AMONG END-OF-LIFE NURSING HOME RESIDENTS WITH DEMENTIA

N. Stall¹, H. Fischer², K. Fung², S. Bronskill^{2,3}, P. Austin^{2,3}, S. Mitchell^{4,5}, C. Bell^{2,3,6}, P. Rochon^{2,3,7}, *1. Division of Geriatric Medicine, University of Toronto, Toronto,*

Ontario, Canada, 2. Institute for Clinical Evaluative Sciences, Toronto, Ontario, Canada, 3. Institute of Health Policy, Management and Evaluation, University of Toronto, Toronto, Ontario, Canada, 4. Harvard Medical School, Boston, Massachusetts, 5. Institute for Aging Research, Hebrew SeniorLife, Boston, Massachusetts, 6. Division of General Internal Medicine, Mount Sinai Hospital, Toronto, Ontario, Canada, 7. Women's College Research Institute, Toronto, Ontario, Canada

Older nursing home residents with advanced dementia have limited life expectancies. These individuals often receive intensive medical care towards the end-of-life thereby incurring burdensome interventions and antimicrobials of questionable benefit. We aimed to describe the frequency, nature, and predictors of burdensome interventions and antimicrobials received by Ontario nursing home residents with advanced dementia during the last 30 days of life. A population-based retrospective cohort study was conducted using linked administrative records. Logistic regression was used to determine the patient and facility characteristics associated with receipt of burdensome interventions. We included 27,243 Ontario nursing home residents with advanced dementia who died between June 2010 and March 2015. The majority (71.1%) were women and the average age of death was 87.1 ± 7.2 years. Nearly half (46.8%) were dependent for their basic activities of daily living with 8.1% being totally bedbound. In the last 30 days of life, 21.8% were hospitalized, 8.9% visited an emergency department, and 9.8% received medical resuscitation. More than 1 in 3 (36.2%) were dispensed an antibiotic, and 86.6% of residents received a physical restraint. Male sex, fewer days in nursing home prior to death, and lower income were all independently associated with transfer to acute care and medical resuscitation, while palliative care consultation, bedbound status, and older age were negative predictors. We conclude that many older Ontario nursing home residents with advanced dementia receive burdensome interventions and antimicrobial agents at the end-of-life. The provision of care for these patients must align with their life expectancies and goals of care.

DOES EXPECTATION OF DEATH EXPLAIN RACIAL AND ETHNIC DISPARITIES IN THE LOCATION OF DEATH?

R. Romo^{1,2,3}, I.S. Cenzer^{2,1}, B. Williams^{2,1}, A.K. Smith^{2,1}, 1. San Francisco VA Medical Center, San Francisco, California, 2. University of California, San Francisco, San Francisco, California, 3. University of Virginia, Charlottesville, Virginia

Older black and Latino Americans are more likely than whites to die in the hospital. Minorities may seek more aggressive care at the end of life because they are less aware that they have a limited prognosis. We sought to determine if the expectation of death moderates or mediates racial/ethnic disparities in location of death. We examined after death interviews among next-of-kin for 5979 decedents over 65 who participated in the Health and Retirement Study and responded to the question: "Was the death expected?" 55% were women, 79% were white, 14% black, and 7% Latino. Death was expected for 59% of participants. We tested for an interaction between race/ethnicity and the expectation of

death on death in the hospital and used multivariate modeling to calculate unadjusted and adjusted relative risk of death in the hospital by race/ethnicity. Whites and Latinos were >15% less likely to die in the hospital when death was expected than when it was not; with no difference among blacks (interaction $p < 0.001$). Overall compared to whites, blacks and Latinos were more likely to die in hospital (blacks, $RR = 1.24$; Latinos, $RR = 1.90$, both $p < 0.001$). Adjusting for potential confounders attenuated the differences (blacks, $RR = 1.23$; Latinos, $RR = 1.14$, both $p < 0.001$), but further adjusting for the expectation of death did not (blacks: $RR = 1.21$, $p < 0.001$, Latinos: $RR = 1.13$, $p = 0.009$). These findings suggest that expectation of death has a stronger role on death in the hospital for whites and Latinos than black Americans, suggesting an important point for education and communication among black families.

SESSION 4960 (SYMPOSIUM)

SHEDDING LIGHT ON PATHOPHYSIOLOGY AND OUTCOMES OF POST-OPERATIVE DELIRIUM: NEW SAGES STUDY RESULTS

Chair: T. Trivison, Beth Israel Deaconess Medical Center, Boston, Massachusetts

Co-Chair: S.K. Inouye, Beth Israel Deaconess Medical Center

Discussant: S.A. Studenski, National Institute on Aging, Baltimore, Maryland

The Successful AGing after Elective Surgery (SAGES; P01AG031720) study is a unique longitudinal cohort examining the pathophysiology and long-term outcomes of delirium among older persons ($N = 566$; age 70+ years), followed for 3–6 years. The study features several strengths and innovations. It utilizes state-of-the-art measurement of the incidence, duration, and severity of delirium episodes. Its focus on elective surgeries permits 'true baseline' measures of key endpoints and covariables prior to surgery. Its repeated follow-up measurements at 1, 2, and every 6 months thereafter permit close examination of both acute and longer-term effects. Finally, its comprehensive data collection provides clinical and epidemiologic data, neuropsychological and functional measurements, brain imaging, and plasma biomarkers.

This symposium will present new results describing the SAGES cohort and procedures; the role of systemic inflammation in the pathophysiology of delirium; the influence of delirium on one-year functional recovery after surgery; the prediction of long-term cognitive decline following delirium; and the novel phenotype of "complicated" delirium, defined as a delirium event accompanied by longer-term cognitive decline over a 3-year follow-up period. Thus, this symposium will help to advance our scientific understanding and clinical management of the highly morbid and complex syndrome of delirium.

THE SAGES STUDY: DESCRIPTION OF COHORT AND DATA QUALITY

E.M. Schmitt¹, Y. Gou¹, T. Trivison^{2,3,1}, R.N. Jones^{1,4}, D. Alsup^{2,3}, T. Fong^{1,2,3}, E.R. Marcantonio^{1,3,2}, S.K. Inouye^{2,3,1}, 1. Hebrew SeniorLife, Boston, Massachusetts,

2. Beth Israel Deaconess Medical Center, Boston, Massachusetts, 3. Harvard Medical School, Boston, Massachusetts, 4. Warren Alpert Medical School of Brown University, Providence, Rhode Island

The Successful Aging after Elective Surgery (SAGES) study is the first NIA-funded Program Project focused on delirium. At pre-surgery baseline, SAGES participants (N=566) on average were 76.7 ± 5.2 years old, 58% female, 8% non-white, and without recognized dementia. Few reported dependencies in activities of daily living (8%) at baseline, but 30% had dependencies in instrumental activities of daily living. After orthopedic (81%), vascular (6%), or gastrointestinal (12%) surgery, 24% developed incident delirium. Study management and data quality procedures resulted in high rates of participant retention (95%) and near-complete data collection at 18-month follow-up (< 1% missingness on all major outcomes and covariables), substantially reducing bias from missing data. Interrater reliability was high with weighted kappas for delirium = 0.92 and for cognitive and functional outcomes > 0.94. We will provide a detailed description of the cohort and data quality procedures to provide the framework for this symposium.

THE ROLE OF INFLAMMATION IN POSTOPERATIVE DELIRIUM

E.R. Marcantonio^{1,3,2}, S. Vasunilashorn^{2,3,1}, S. Dillon², L. Ngo^{2,3}, R.N. Jones^{1,4}, S. Arnold^{5,3}, S.K. Inouye^{2,3,1}, T. Libermann^{2,3}, 1. Hebrew SeniorLife, Boston, Massachusetts, 2. Beth Israel Deaconess Medical Center, Boston, Massachusetts, 3. Harvard Medical School, Boston, Massachusetts, 4. Warren Alpert Medical School of Brown University, Providence, Rhode Island, 5. Massachusetts General Hospital, Boston, Massachusetts

To examine the role of inflammation in postoperative delirium pathophysiology, we used a longitudinal, nested case-control study within SAGES of 75 delirium cases and 75 matched controls. Plasma samples were collected preoperatively [PREOP], in the post-anesthesia care unit [PACU], and on postoperative day 2 [POD2]. We used the Luminex platform to examine 12 cytokines and the iTRAQ system to conduct unbiased mass spectrometry proteomics. Using Luminex, delirium cases had significantly higher interleukin (IL)-6 than controls on POD2 (median paired difference: 50.44 pg/ml, $p < .01$). Using iTRAQ, C-reactive protein (CRP) emerged as the top delirium-associated protein. ELISA confirmed that compared to controls, cases had significantly higher ($p < .05$) CRP levels at PREOP, PACU, and POD2 (median paired difference: 1.56, 2.53, 63.76 mg/L, respectively). Our findings provide the strongest evidence to date of the role of inflammation in delirium pathophysiology and provide the basis for developing better tools for risk stratification, prevention, and treatment.

DELIRIUM DELAYS FUNCTIONAL RECOVERY FOLLOWING ELECTIVE SURGERY

T.T. Hshieh^{1,2}, J. Saczynski^{2,5}, Y. Gou², E.R. Marcantonio^{2,3,4}, R.N. Jones^{2,6}, Z. Cooper¹, T. Trivison^{4,3,2}, S.K. Inouye^{4,3,2}, 1. Brigham and Women's Hospital, Boston, Massachusetts, 2. Hebrew SeniorLife, Boston, Massachusetts, 3. Harvard Medical School, Boston, Massachusetts, 4. Beth Israel

Deaconess Medical Center, Boston, Massachusetts, 5. Northeastern University, Boston, Massachusetts, 6. Warren Alpert Medical School of Brown University, Providence, Massachusetts

The role of delirium in recovery of physical function following elective surgery remains under-investigated. We analyzed data on 566 individuals in the SAGES cohort (age 70+ y) to the 18-month follow-up. Function was measured using the Activities of Daily Living and Instrumental Activities of Daily Living scales; the Physical Component Summary of the SF-12; and a composite index derived from these 3 elements. Mixed-effects regression models indicated that participants with delirium (24% of cohort) demonstrated less functional recovery than those without; at 1 month the covariate-adjusted mean difference on the functional composite was -1.5 (95% CI: -3.3, -0.2). At 18 months the difference was -1.8 (-3.2, -0.3), equivalent to the minimally clinically significant difference in prior studies. Thus, delirium is associated with a gap in functional recovery at 1 month that never resolves out to the 18-month follow-up, supporting the need for delirium prevention and extended rehabilitation to maximize recovery.

PREDICTION OF LONG-TERM COGNITIVE DECLINE FOLLOWING DELIRIUM IN OLDER ADULTS

E. Devore^{1,2}, T. Fong^{3,4,2}, E.R. Marcantonio^{3,2,4}, E.M. Schmitt³, S. Arnold^{2,5}, B. Dickerson^{5,2}, R.N. Jones^{3,6}, S.K. Inouye^{4,2,3}, 1. Brigham and Women's Hospital, Boston, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts, 3. Hebrew SeniorLife, Boston, Massachusetts, 4. Beth Israel Deaconess Medical Center, Boston, Massachusetts, 5. Massachusetts General Hospital, Boston, Massachusetts, 6. Warren Alpert Medical School of Brown University, Providence, Rhode Island

Postoperative delirium has been linked to long-term cognitive decline in older adults, but this area remains under-explored. We examined pre-surgical factors in risk groups (demographic, lifestyle, cognitive/physical/sensory/mental function, frailty, medical factors, biomarkers) associated with long-term cognitive decline among 134 SAGES participants who developed delirium. Using multivariable approaches, we identified explanatory factors that accounted for variability in rates of cognitive decline in an overall model incorporating factors across groups. Baseline General Cognitive Performance (GCP) score (composite score incorporating 9 neuropsychological tests) explained the most variation in cognitive decline (10.0%), and 6 factors—lower GCP, impaired IQCODE, living alone, slow walking, less exhaustion, and orthopedic surgery—combined to explain 25% of variation in cognitive decline. Thus, pre-surgical factors predict long-term cognitive decline following delirium, with the predictive value comparing favorably to prior studies. Such predictive models will be critical to target high risk older surgical patients for preventive and therapeutic approaches.

DELIRIUM ASSOCIATED WITH ACCELERATED COGNITIVE DECLINE: COMPLICATED DELIRIUM

R.N. Jones^{1,2}, D. Tommet^{1,2}, E.R. Marcantonio^{1,4,3}, T. Trivison^{3,4,1}, E.M. Schmitt¹, M. Shafi^{3,4}, A. Pascual-Leone^{3,4}, S.K. Inouye^{3,4,1}, 1. Hebrew SeniorLife, Boston, Massachusetts, 2. Warren Alpert Medical School of Brown University, Providence, Rhode Island, 3. Beth Israel

Deaconess Medical Center, Boston, Massachusetts, 4. Harvard Medical School, Boston, Massachusetts

Delirium is associated with accelerated long-term cognitive decline and risk for disability, dementia, and death. These two empirically-based but seemingly contradictory statements underscore that delirium is poorly understood and that broad descriptive categories such as DSM diagnostic labels -- originally intended for actuarial and service planning purposes -- contribute little to (and perhaps detract from) our understanding of a complex, heterogeneous, and potentially devastating geriatric syndrome. In this presentation, we review existing literature and report on new results from the Successful Aging after Elective Surgery (SAGES) cohort that support that delirium is both transient / reversible and associated with long-term decline, and provide new research results that highlight the differential symptom and clinical outcome profiles of persons with delirium complicated by accelerated long-term cognitive decline. We provide evidence to support the new conceptualization of "complicated" delirium. This new conceptual model holds important implications for research, prevention, and clinical management.

SESSION 4965 (SYMPOSIUM)

SOCIAL INNOVATIONS IN ACTIVE AND HEALTHY AGEING

Chair: A.C. Walker, *University of Sheffield*

This symposium reports and discusses the findings of an ambitious European project that developed and tested, as well as surveyed and catalogued, social innovations (SIs) aimed at improving the quality of life and well-being of older people. In particular INNOVAGE aimed to make a major contribution to the European goal of extending healthy life years (HLY). The project, which concluded in 2015, was based in seven countries. The four specific SIs that it developed and tested were in the fields of housing, carers, obesity and long-term care. It also created a unique database of 150 exemplars of SIs designed to improve later life well-being. The major objectives of this symposium are first, to report the outcomes of two of the four SIs developed by INNOVAGE (in the fields of housing and support for carers). In particular these papers will examine the major challenge of how to scale-up successful innovations and ensure their sustainability. Second, we focus on the concept of SI and how it was defined and classified in practice. Third the symposium will present the method developed to explore the potential impact of SIs on well-being. Symposium participants will take part in an evidence-based discussion about the meaning and applications of SI and examine its potential role in extending healthy life years. They will also hear about the pit-falls of SI development and scaling-up and take away detailed information on both specific initiatives and generalisable methods.

SOCIAL INNOVATIONS IN THEORY AND PRACTICE

A.C. Walker, *Sociological Studies, University of Sheffield, Sheffield, United Kingdom*

This paper will provide a brief overview of the INNOVAGE project, its objectives and methods. It will also outline the approach taken by the project to try to ensure

that its research outputs were relevant to key stakeholders in the ageing policy and practice fields. Then its main focus is, first, on the concept of social innovation. Acknowledging its ill-defined nature the paper pins it down to a precise usage in respect to ageing and shows how this can be applied in practice. Then, second, the paper discusses the method applied by InnoVage to try to bring a scientific assessment into a field that has very little by way of hard evidence. This approach entailed a global survey of SIs and a novel assessment and grading system. Finally some examples of the SI exemplars collected by the project are provided, with links to the project web portal on SIs for health and well-being.

ASSESSING THE ABILITY OF SOCIAL INNOVATIONS TO INCREASE HEALTHY LIFE YEARS

C. Jagger³, P. Wohland¹, A.C. Walker², D. Neary², 1. *The University of Hull / Hull York Medical School, Hull, United Kingdom*, 2. *The University of Sheffield, Sheffield, United Kingdom*, 3. *Newcastle University, Newcastle, United Kingdom*

The European Union has adopted Healthy Life Years (HLY), based on the Global Activity Limitation Indicator, as its preferred health expectancy for comparing countries and defining health targets. One such target is that of the European Innovation Partnership on Healthy and Active Ageing to increase HLY by 2 years between 2010 and 2020. We assessed the ability of the exemplar social innovations (SIs) identified on the database, to increase HLY. We searched for evaluations of the 157 exemplar SIs and categorised their outcome measures into a five point typology graded A (direct link to HLY) to E (no evaluation found). Only 2 SIs were graded A, and it was impossible to assess the impact on HLY for 90% (n=142) which were graded D or E. We also developed a 'HLY Modeller' in Microsoft Excel for users to explore the potential impact of a SI on population health (<http://www.innovage.group.shef.ac.uk/healthy-life-years.html>).

DESIGN, TEST AND IMPLEMENTATION OF A WEB PLATFORM FOR INFORMAL CAREGIVERS OF OLDER PEOPLE IN EUROPE

F. Barbabella^{2,1}, A. Poli^{2,3}, F. Andréasson^{1,4}, B. Salzmann⁵, A. Efthymiou^{6,7}, R. Papa², G. Lamura², 1. *Department of Health and Caring Sciences, Linnaeus University, Kalmar, Sweden*, 2. *National Institute of Health and Science on Ageing (INRCA), Ancona, Italy*, 3. *Linköping University, Norrköping, Sweden*, 4. *Swedish Family Care Competence Centre (NKA), Kalmar, Sweden*, 5. *wir pflegen e.V., Berlin, Germany*, 6. *Eurocarers, Brussels, Belgium*, 7. *Cyprus University of Technology, Limassol, Cyprus*

This contribution provides insights from one of the four social innovations of the INNOVAGE project, focused on the development of the InformCare web platform for supporting informal caregivers of older people in Europe. The platform included information resources on different topics (major diseases in older age, public care services and benefits, coping and reconciliation strategies etc.) and interactive services for professional and peer support (dedicated social network, forum, chat and videochat). The design phase was based on a consultation process involving almost 200 stakeholders and on user tests. The pilot phase was carried out as a mixed-methods study in Germany, Italy and Sweden,

which recruited totally 118 caregivers who could access the InformCare platform for 3 months. Positive findings led to its refinement and implementation in 27 European countries. Today, the platform is publicly accessible (www.eurocarers.org/informcare) in 32 versions and 23 languages, with over 2,500 web pages for informal caregivers.

APPROPRIATENESS OF A HOUSING ACCESSIBILITY APP: FINDINGS FROM THE EUROPEAN INNOVAGE PROJECT

O. Jonsson¹, B. Slaug¹, M. Haak¹, S. Tomsone², S.M. Schmidt¹, S. Iwarsson¹, 1. *Department of health science, Lund University, Lund, Sweden*, 2. *Riga Stradins University, Riga, Latvia*

This presentation focuses on the appropriateness of a social innovation in the form of a mobile application (app) intended to raise awareness about and support decision-making on housing accessibility. In total, 30 potential users in Sweden and Latvia, aged 65+ with various functional limitations, were engaged in iterative usability testing of two versions of the app. A think aloud protocol was used in one-to-one sessions between a moderator and each participant. To provide additional space for dialogue the individual sessions were followed up by user fora where the appropriateness, usability issues and possible refinements were discussed. Video recordings were analyzed. The findings provide knowledge and insights concerning an ICT solution for an unexplored target group with the potential for increased understanding applicable also in other design processes. To ascertain that the app is compatible with the goals and values of potential users, lessons learned from the analysis was applied.

SESSION 4970 (SYMPOSIUM)

VETERANS HEALTH ADMINISTRATION GERIATRICS AND EXTENDED CARE HOME AND COMMUNITY-BASED PROGRAMS

Chair: O. Intrator, *University of Rochester*

Co-Chair: K. Kelley, *Veterans Health Administration, Washington, District of Columbia*

Discussant: V. Mor, *Brown University, Providence, Rhode Island*

The Veterans Health Administration (VHA) provides care to about 7 million Veterans annually in 141 VA Medical Centers (VAMC) and over 900 clinics, nationally. VHA's Office of Geriatrics & Extended Care (GEC) "aspires to be integral to the solution for the unsustainable rise in healthcare costs in the United States". Its vision is to "empower Veterans and the Nation to rise above the challenges of aging, disability, or serious illness while honoring Veterans' preferences for health, independence and well-being by advancing expertise, programs and partnerships". By mid-2016 GEC services spanned a broad array of home and community based services (HCBS) including both medical and personal care programs. GEC programs care for over 400,000 Veterans of whom over 350,000 receive some community-based care and about 110,000 receive some care in nursing homes. Services are provided by VAMCs or purchased. Nationally, Veterans using GEC programs account for 6% of all VHA users but 30% of VHA's total expenditures. This symposium will highlight some of GEC's largest HCBS programs: Home Based

Primary Care (HBPC), Geriatric Patient Aligned Care Teams (GeriPACT) and small scale implementations of innovative home based programs such as caregiver support for Veterans with dementia, advanced care planning and shared decision making and others. The effectiveness of GEC investment in HCBS in reducing overall VA and taxpayers' costs of care will be presented. Discussion of GEC's national role as a model for providing extensive but cost containing care will round up the symposium.

PROMOTING GERIATRICS AND EXTENDED CARE (GEC) INNOVATIONS IN NON-INSTITUTIONAL CARE

K. Massey³, K. Shay^{3,5}, O. Intrator^{2,1}, S. Cai^{2,1}, R. Makineni⁴, R. Allman³, 1. *University of Rochester, Rochester, New York*, 2. *GECDAC Canandaigua VA Medical Center, Canandaigua, New York*, 3. *Veterans Health Administration, Washington, District of Columbia*, 4. *GECDAC Providence VA Medical Center, Providence, Rhode Island*, 5. *Brown University, Providence, Rhode Isl and*

GEC's innovative Non-Institutional Long Term Care program fosters additional patient centered services to increase Veteran choice, access, family and caregiver satisfaction, and improve quality and value of care. Between 2010 and 2015 GEC invested \$112m to support the implementation of 167 local programs selected competitively from among national submissions. As of the end of FY2015 92% of the programs were still sustained by their VA Medical Center (VAMC) resources and GEC began supporting implementation of successful programs through the establishment of mentoring partnerships. Challenging continued implementation is that VAMCs have limited budgets and competing priorities. To counter these challenges GEC established the GEC Data & Analyses Center to evaluate quality and cost of these programs, to provide an evidence base on which to advocate for continued VAMC support. GEC also provided training on development of business plans; and required letters of commitment from VAMCs to sustain programs after initial funding.

TARGETING FRAIL HIGH COST VETERANS IMPROVES IMPACT AND EFFICIENCY OF HOME BASED PRIMARY CARE (HBPC)

T.E. Edes¹, B. Kinosian^{6,2}, D. Davis¹, R. Makineni^{4,3}, C. Phibbs^{5,7}, D. Cooper¹, O. Intrator^{8,9}, 1. *Veterans Health Administration, Washington, District of Columbia*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*, 3. *Brown University, Providence, Rhode Island*, 4. *Providence VA Medical Center, Providence, Rhode Island*, 5. *GECDAC Palo Alto VA Medical Center, Palo Alto, California*, 6. *GECDAC Philadelphia VA Medical Center, Philadelphia, Pennsylvania*, 7. *Stanford University, Palo Alto, California*, 8. *GECDAC Canandaigua VA Medical Center, Canandaigua, New York*, 9. *University of Rochester, Rochester, New York*

HBPC has expanded to serve 53,000 veterans in 2015. HBPC provides interdisciplinary team (physician, nursing, pharmacy, dietary, therapy, psychology, social work) care at home for frail Veterans (24% annual mortality, average 5 diagnoses based self-care capacity limitations [JEN Frailty

index (JFI) mean 5.4]). Applying Independence at Home Qualifying (IAH-Q) criteria (hospitalization and post acute care in past 12 months, 2+ chronic conditions, JFI \geq 6) identified 304,000 Veterans in 2013. IAH-Q prevalence among HBPC Veterans varied between 32–46%, with annual costs per Veteran in HBPC with IAH-Q and non-IAH-Q \$79,000 and \$33,000, respectively. Comparing expected costs based on NOSOS scores (a VA modification of the Medicare HCC), calibrated to the IAH-Q population, HBPC observed costs were 12.5% lower (\$195M savings) in 2014, and 14% lower in 2015 (\$254M savings), or \$7,488/year lower per Veteran. Expanding HBPC to IAH-Q veterans leads to smarter spending, as well as better care.

EVALUATION OF THE COSTS FOR VETERANS RECEIVING CARE IN GERIATRIC MEDICAL HOMES (GERIPACT)

K. Shay³, C. Phibbs^{4,5}, O. Intrator^{2,1}, B. Kinosian^{6,7}, W. Scott⁴, S. Dally⁴, R. Allman³, 1. *University of Rochester, Rochester, New York*, 2. *GECDAC Canandaigua VA Medical Center, Canandaigua, New York*, 3. *Veterans Health Administration, Washington, District of Columbia*, 4. *GECDAC Palo Alto VA Medical Center, Palo Alto, California*, 5. *Stanford University, Palo Alto, California*, 6. *GECDAC Philadelphia VA Medical Center, Philadelphia, Pennsylvania*, 7. *University of Pennsylvania, Philadelphia, Pennsylvania*

VA Office of Geriatrics & Extended Care established Geriatric Patient-Aligned Care teams (GeriPACT) with team members (pharmacy, and social work) added to the panels, and panels 2/3 the size of most VA primary care teams, to better manage aged and frail Veterans. We evaluated GeriPACT effect on expenditures among Veterans with >2 diagnoses based self-care capacity limitations (JEN Frailty Index, JFI>2) cared for at 84 VA facilities. NOSOS, a refinement of Medicare's HCC model, was used to predict expenditures. Regressions estimated effect of GeriPACT on log expenditures, comparing GeriPACT Veterans to propensity score-matched Veterans receiving regular care. Management by GeriPACT was associated with significantly lower combined VA and Medicare expenditures: 14% less for JFI>2, 8% for JFI>5 and 13% for JFI 3–6. VA expenditures alone had associated savings of 12%, 6%, and 11%, respectively. GeriPACT reduces costs, especially when targeted at appropriate patients, e.g., those with JFI 3–6.

THE GIFT THAT KEEPS GIVING: VHA INVESTMENT IN HOME CARE PROGRAMS IMPROVES QUALITY, DECREASES COSTS

R. Allman³, O. Intrator^{2,1}, S. Dally^{4,6}, B. Kinosian⁵, C. Phibbs^{4,7}, R. Makineni^{8,9}, K. Shay³, 1. *University of Rochester, Rochester, New York*, 2. *GECDAC Canandaigua VA Medical Center, Canandaigua, New York*, 3. *Veterans Health Administration, Washington, District of Columbia*, 4. *GECDAC Palo Alto VA Medical Center, Palo Alto, California*, 5. *GECDAC Philadelphia VA Medical Center, Philadelphia, Pennsylvania*, 6. *University of Pennsylvania, Philadelphia, Pennsylvania*, 7. *Stanford University, Palo Alto, California*, 8. *GECDAC Providence VA Medical Center, Providence, Rhode Island*, 9. *Brown University, Providence, Rhode Island*

As around the world, the Veterans Health Administration's Office of Geriatrics & Extended Care has been developing and promoting non-institutional care (GEC NIC) in order to provide Veteran-aligned care, better access to services, care coordination and to balance quality and budget. Each of 141 medical centers has adopted GEC programs with penetrations among Veterans served of 2–16% rising from an average of 4% in 2008 to 6% in 2015. We found that a 1% point higher GEC NIC penetration reduced the risk of long-term institutionalization by 2% for a Veteran at no cost difference, among 80+ year old male Veterans with \geq 6 diagnoses-based self-care capacity limitations (JEN Frailty Index, JFI \geq 6, equivalent to 3 ADLs), adjusting for other Veteran characteristics. This result was maintained for JFI 3–5 and among similar cohorts of women Veterans. These promising results empower GEC as it strives to improve the care of frail Veterans.

SESSION 4975 (SYMPOSIUM)

LGBT OLDER ADULTS IN AUSTRALIA, BRAZIL, AND THE U.S.: RESEARCH, PRACTICE, AND NEW GROUND

Chair: M. Adams, *Services & Advocacy for GLBT Elders, New York, New York*

This symposium will spotlight emerging research, research gaps, and learnings from practice relative to the aging experiences of lesbian, gay, bisexual and transgender (LGBT) older adults. The symposium will focus on LGBT older adults in three countries: Australia, Brazil and the United States. Aging experiences and conditions among LGBT older adults in these three countries, along with differing states of research and practice, provide illustrative contrasts that highlight the need for further research and more responsive interventions.

For example, Australia and Brazil have made notable progress in reform of public policies and law to guarantee LGBT equity and inclusion. While substantial progress has not been made in either country on service and care interventions for this population, Australia has leveraged government policy to pioneer the establishment of LGBT cultural competency among practitioners. By contrast, the United States has lagged in reform of relevant public policies on aging, but practitioners in that country have pioneered innovative service and care interventions and are now exploring market-based strategies to build cultural competency among practitioners. Research on this population -- relatively new and undeveloped in all three countries -- is most advanced in the U.S., emerging in Australia, and virtually non-existent in Brazil.

LGBT OLDER ADULTS IN THE U.S.: RESEARCH AND PRACTICE

M. Adams, *Services & Advocacy for GLBT Elders, New York, New York*

Recent survey research conducted among a sample of 2,376 older adults in the U.S. indicates heightened levels of concern among lesbian, gay, bisexual and transgender (LGBT) older adults with regard to financial security, social isolation, inadequate support systems for aging, and negative repercussions from disclosure of LGBT identity. The research

data was weighted by gender, race, ethnicity, region and household income to align respondent data with U.S. population data.

This presentation will discuss this and other research on LGBT older adults in the U.S. and will explore the societal response to this population's barriers to healthy aging. Particular emphasis will be placed on innovative practices in service delivery and training of providers and practitioners, and recent efforts to leverage documented resiliencies among LGBT older adults. Attention will also focus on the relative lack of progress in responsive policy reform in the U.S. relative to other highly developed countries like Australia.

APPRAISALS OF ADVERSITY AND RESILIENCE IN LGBT ELDERS

B. deVries¹, R. Melendez¹, A. Siverskog², 1. *San Francisco State University, San Francisco, California*, 2. *National Institute for the Study of Ageing and Later Life, Linköping University, Linköping, Sweden*

Sexual and gender minority persons are often referred to as LGBT persons: but what does being LGBT mean to those whose lives are so defined? Open-ended responses to this self-concept question were content coded (inter-coder agreement, 87%) for 297 lesbians, 570 gay men, 318 bisexual and 265 transgender persons ages 45–64 from across the US. Three overarching themes emerged: (1) *pragmatics of identity* (e.g., “being gay is one facet of who I am”) mentioned in over 43% of responses; (2) a *life of stigma* (e.g., harassment and “hated for being me”) mentioned in almost 18% of responses; and (3) *positive marginality* (e.g., strength, resilience and “the freedom to be different”) mentioned in the majority of responses (over 53%). Transgender persons more strongly endorsed the latter two themes. These results reveal both the adversity and the strengths of LGBT boomers with implications for the aging of LGBT—and all—persons.

LGBTI ELDERS IN AUSTRALIA: EMERGING RESEARCH AND NATIONAL STRATEGY

S. Edmonds, *National LGBTI Health Alliance, Sydney, New South Wales, Australia*

Historically, Australian research on sexuality has tended to exclude older people from their samples. More specifically, until recently there has been minimal research focus on LGBTI elders and the issues that affect these distinct populations, including marginalization and discrimination against their genders, bodies, relationships, and/or sexuality. New research has documented discrimination against, and the invisibility of LGBTI elders within aged care, the specific health care needs of this population, and its impact on ageing and aged care policy and practice.

Australia's National LGBTI Ageing and Aged Care Strategy, coupled with legislative reforms, has resulted in significant change to this landscape. This presentation will highlight research learnings and focus on the positive outcomes that have been achieved for LGBTI elders in Australia through training, information and advocacy. The presentation will critically explore Australian attitudes toward LGBTI elders, inclusive professional practice and ageing issues specific to older LGBTI people.

THE PARADOX OF LONG LIVED EXPERIENCES OF LGBTI OLDER ADULTS IN BRAZIL

A. Kalache, 1. *International Longevity Centre Global Alliance (ILC-GA), Rio de Janeiro, Brazil*, 2. *New York Academy of Medicine, New York, New York*

In Brazil, studies on sexuality and LGBTI people are only now emerging; research related to aging in the LGBTI context is virtually non-existent. Early research on the LGBTI experience across the life spectrum indicates – despite progressive legislation and social attitudes – high levels of discrimination and bias-based violence such that mere LGBTI status impairs access to educational, economic and social resources.

This presentation will explore the juxtaposition of progressive legislation on LGBTI human rights and liberal social attitudes about sexuality against practitioners' observations of the lived experience of LGBTI older adults in Brazil, which is shaped both by the discrimination and marginalization endemic to the LGBTI population as a whole and by the intersection of LGBTI and aging experiences in the country. The presentation will highlight areas that require more research, and emerging innovative practices that suggest opportunities for progress in developing healthy aging experiences for the LGBTI older population.

SESSION 4980 (SYMPOSIUM)

KNOWLEDGE TRANSLATION: INTEGRATING AGING RESEARCH AND INNOVATION INTO POLICY AND PRACTICE

Chair: L. Battersby, *Simon Fraser University, Burnaby, British Columbia, Canada*

Co-Chair: M. Fang, *Simon Fraser University, Vancouver, British Columbia, Canada*

Discussant: K.M. Kobayashi, *University of Victoria, Victoria, British Columbia, Canada*

Knowledge translation (KT) is an iterative process for bridging research, policy and practice that can be integrated into research and development to support the relevance and application of research findings. KT includes the mobilization of experiential and scientific knowledge through to the commercialization and application of research innovations. Building KT into research projects is nascent in gerontology, yet articulation of a KT strategy for research impact beyond traditional end-of-grant dissemination is a funding requirement. Integrating KT effectively into research is a complex process that is often misapplied. This symposium will present four cross-disciplinary, Canadian projects that demonstrate critical elements for effective KT in aging research. Grigorovich et al. detail mechanisms of transdisciplinary working, essential for integrated KT, alongside the development and validation of an effectiveness scale used to support transdisciplinary working in research. Demonstrating the first step of any KT initiative, Canham et al. present methods and findings from an applied realist review that explored the current state of the digital divide for older adults. At the other end of the KT process, Fang et al. report on an evaluation of the impact of a knowledge mobilization initiative for aging and technology innovation. Finally, Battersby et al. present findings from an integrated KT project that collaboratively developed, validated, and disseminated national guidelines

for conducting mass interinstitutional relocations in long-term care. The symposium will conclude with a discussion led by a KT expert on the implications of using KT to bridge aging research and innovation with policy and practice.

THE TREAT SCALE: A REFLEXIVE TOOL FOR TRANSDISCIPLINARY WORKING IN AGING AND TECHNOLOGY RESEARCH

A. Grigorovich^{1,2,5}, M. Fang^{3,4,5}, J. Sixsmith^{6,5}, P. Kontos^{2,1,5}, 1. Dalla Lana School of Public Health, University of Toronto, Toronto, Ontario, Canada, 2. Toronto Rehabilitation Institute - University Health Network, Toronto, Ontario, Canada, 3. Simon Fraser University, Vancouver, British Columbia, Canada, 4. Heriot-Watt University, Edinburgh, United Kingdom, 5. AGE-WELL NCE, Toronto, Ontario, Canada, 6. University of Northampton, Northampton, United Kingdom

Adopting a transdisciplinary approach to the development of technologies to support older adults and their care partners is crucial to bridging research with policy and practice. Despite increased popularity of this approach, research evaluating transdisciplinary processes and outcomes remains limited due to an absence of evaluative tools. This presentation describes the development and validation of a new instrument: TREAT (Transdisciplinary Research Effectiveness in Aging and Technology) scale. Content areas were established through a scoping review resulting in four key themes: collaborative working practices, knowledge mobilization and exchange, integration and co-creation of knowledge, and action-oriented research. Subscale items were developed according to each theme. The overall structure, phrasing, and content validity of the TREAT were evaluated via consultation workshops with key stakeholders across Canada. Results suggest that the TREAT scale has significant potential for evaluating and improving transdisciplinary processes and outcomes for the field of aging and technology.

TRANSLATING RESEARCH BACK TO THE COMMUNITY: FINDINGS FROM A REALIST REVIEW

S.L. Canham¹, R. Wilson¹, L. Battersby¹, M. Fang³, J. Sixsmith⁴, A. Sixsmith³, 1. Gerontology Research Centre, Simon Fraser University, Vancouver, British Columbia, Canada, 3. STAR Institute, Simon Fraser University, Vancouver, British Columbia, Canada, 4. University of Dundee, Scotland, United Kingdom

This presentation will report on the process of conducting a realist synthesis review as part of a larger integrated knowledge translation (KT) project to assess gaps in information and communication technology (ICT) use among middle-aged and older adults. The realist review method is used to examine and understand causal mechanisms, exploring what works, for whom, in what circumstances, and why. To enhance this review, we applied an intersectional framework when synthesizing the evidence (i.e., peer-reviewed and grey literature) on access to and use of ICTs to better understand ways in which inequities exist. Review findings were shared with knowledge users at two World Café events, which enriched the realist review by validating some areas of the review, while also offering avenues for further refinement of the research. Such KT methods are integral to informing

and enhancing service and technology development for seniors and will be detailed in this presentation.

ENHANCING KNOWLEDGE MOBILIZATION AND COMMERCIAL OUTCOMES IN AGING AND TECHNOLOGY

M. Fang^{1,2,3}, L. Battersby^{1,2}, A. Grigorovich^{4,2,6}, J. Sixsmith^{5,2}, P. Kontos^{4,2,6}, L. Moreno^{4,2}, A. Mihailidis^{4,2}, A. Sixsmith^{1,2}, 1. STAR Institute, Simon Fraser University, Vancouver, British Columbia, Canada, 2. AGE-WELL NCE, Toronto, Ontario, Canada, 3. Heriot-Watt University, Edinburgh, United Kingdom, 4. University of Toronto, Toronto, Ontario, Canada, 5. University of Dundee, Dundee, United Kingdom, 6. Toronto Rehabilitation Institute – University Health Network, Toronto, Ontario, Canada

A globally aging population necessitates innovative approaches for the development of technologies to ensure older adults age well. Whilst scientists across disciplines address a wide-range of ‘aging complexities’ through research and innovation, without appropriate integration of commercialization mechanisms, such outputs may result in little or no impact. To implement commercialization effectively requires integration and synthesis of experiences and working practices of diverse intersectoral professional, academic, and community stakeholders. This presentation demonstrates how Innovation Workshops designed using the principles of transdisciplinarity facilitated the development of commercialization strategies to improve knowledge mobilization and commercial outcomes in aging and technology. We discuss key strategies of knowledge translation, such as effective commercialization, dissemination, and evaluation regarding communication and utilization of workshop materials and information. Results of the 3-month post-workshop survey, focus groups, reflexive summaries, and field notes highlight the importance and challenges of evaluating impact through implementation and evaluation of this knowledge mobilization initiative.

INTERINSTITUTIONAL RELOCATIONS: DEVELOPING GUIDELINES AND MOBILIZING KNOWLEDGE

L. Battersby¹, S.L. Canham¹, M. Fang¹, D. Krahn², A. Sixsmith¹, 1. Simon Fraser University, Burnaby, British Columbia, Canada, 2. Baptist Housing, Vancouver, British Columbia, Canada

Increasingly, long-term care (LTC) facilities need redevelopment due to the complexity of resident care needs and to meet higher standards of accommodation. Redevelopments require relocation of staff and residents en masse. While significant literature exists on the negative health and well-being outcomes of older adults’ relocation from their private homes into care homes, less research has focused on the relocation of staff and residents together from one LTC facility to another following construction of a replacement facility. This presentation will report on an integrated knowledge translation (KT) project that developed guidelines through active collaboration with a LTC provider, a synthesis review of the literature, deliberative dialogues with stakeholders across Canada, and comprehensive dissemination. Engaging knowledge users throughout the project contributed to the relevance and impact of the guidelines. Using this research

as a case example, the challenges and strategies for bridging research and practice through integrated KT will be discussed.

SESSION 4985 (SYMPOSIUM)

TAILORING ACTIVITIES FOR PERSONS WITH DEMENTIA TO MANAGE BEHAVIORS: INTERNATIONAL PERSPECTIVES

Chair: K.A. Marx, *Johns Hopkins School of Nursing*
Co-Chair: L.N. Gitlin, *School of Nursing, Johns Hopkins University, Baltimore, Maryland*

Almost 47 million people worldwide are living with dementia and this is expected to increase to around 75 million by 2030. Neuropsychiatric behaviors (NPS) such as agitation, aggression, depression and anxiety are almost universally experienced by persons with dementia. These behaviors have negative outcomes, including depression and reduced quality of life, for both the person with dementia and his/her caregiver. With the risk of medications to address these behaviors outweighing the benefits, non-pharmacologic interventions for managing NPS have been sought. One non-pharmacologic intervention that has shown promise is New Ways for Better Days: Tailoring Activities for Persons with Dementia and their Caregivers (TAP). TAP was developed in the United States and has been implemented in multiple countries. This symposium will present data from studies in several different countries that have examined TAP in their populations. Dr. Lindy Clemson will present pilot study data on adding TAP to the Australian health context. Dr. Jean Gajardo will then speak about developing a program in Chile, focusing on rural contexts. Dr. Katherine Marx will present the United States experience and data on caregiver readiness from a current Phase III Efficacy trial. Dr. Natalie Regier will then provide data from the Phase II proof of concept trial of TAP in the United States that suggest ways to tailor activities at different stages of the disease process. This symposium highlights the cross-cultural implementation challenges yet effectiveness of a non-pharmacologic intervention for managing behaviors in persons with dementia.

FACTORS INFLUENCING A CAREGIVER'S READINESS TO ENACT AN ACTIVITY INTERVENTION

K.A. Marx¹, L.N. Gitlin¹, K. Rose², 1. *Johns Hopkins School of Nursing, Baltimore, Maryland*, 2. *Widener University, Chester, Pennsylvania*

An intervention's success partly depends on how willing or ready participants are to make necessary behavioral changes. This study examines factors influencing caregiver level of readiness to participate in an activity intervention to reduce behaviors in persons with dementia upon study enrollment. Eighty-eight caregivers, primarily female (79.5%), average age 66.31 years (sd=11.7), caring for a family member with dementia [female (59.1%), average age 82.2 years (sd=7.7)] and managing an average of 6.7 (sd=3.1) behaviors were analyzed. The average readiness score at baseline was 57.1 (sd=6.7; 40–68) on a 13-item scale and was related to being female (.244, $p=.022$), greater burden (-.212, $p=.048$), having a close relationship (.391, $p>.001$), and more confidence in using activities (.288, $p=.007$). A stepwise regression

found that significant predictors of readiness were relationship closeness and gender $F(2,85)=12.372$, $p>.001$, with an adjusted $R^2 =.207$. Understanding a caregiver's readiness to change can influence how the intervention unfolds.

CHARACTERISTICS OF ACTIVITIES FOR PERSONS WITH DEMENTIA AT THE MILD, MODERATE, AND SEVERE STAGES

N. Regier^{1,2}, L.N. Gitlin^{1,2}, 1. *Johns Hopkins University School of Nursing, Baltimore, Maryland*, 2. *Johns Hopkins Center for Innovative Care in Aging, Baltimore, Maryland*

Most individuals with dementia develop significant behavioral problems, which present enormous challenges for caregivers. Given that there is no imminent cure in sight and pharmacotherapy is ineffective, it is critical to identify interventions that minimize behavioral disturbances, improve quality of life, and lessen caregiver burden. As activity-based interventions have shown great promise, we examined relationships of dementia disease stage (mild, moderate, severe) with types and characteristics of meaningful activities (cueing needs, help with initiation, recommended engagement time) provided in a home-based behavioral intervention trial. We found that type of activity, recommended cueing, and engagement time were significantly related to dementia stage. Findings provide guidance as to how to use and set up activities across the dementia trajectory and show that persons with even advanced dementia benefit from a wide range of meaningful activities with appropriate set-up. This study represents an important step towards developing guidelines for activities in dementia care.

THE USE OF TAP PRINCIPLES IN CHILE: HIGHLIGHTING CULTURAL AWARENESS

J. Gajardo¹, J.M. Aravena², 1. *University of Chile, Santiago, Chile*, 2. *Bernardo O'higgins University, Santiago, Chile*

Chile has a particular social and geographical distribution that challenges the design and implementation of health interventions: poverty, rurality, low levels of education and other situations demand a balance between evidence-based practices and enough flexibility to be adapted and become actual solutions. The Kintun Program is the first public center for the support of people with dementia and their carers in Chile and its theoretical foundation was developed with the mentoring of Dr. Laura Gitlin, modelling interventions according to the TAP principles. Three stories of behavioral symptoms in Chile, addressed from the TAP perspective, will be described in order to learn about the feasibility of this program in particular social and cultural contexts such as rurality, low education levels and caregiver's illiteracy. The stories highlight the relevance of cultural awareness and personal identity in the process of tailoring activities, showing benefits in the management of the symptoms

INTRODUCING TAP TO THE AUSTRALIAN HEALTH CONTEXT: A PILOT STUDY

L. Clemson¹, C. O'Connor¹, H. Brodaty^{2,3}, Y. Jeon¹, E. Mioshi⁴, L. Low¹, L.N. Gitlin⁵, 1. *The University of Sydney, Sydney, New South Wales, Australia*, 2. *University of New South Wales, Sydney, New South Wales, Australia*, 3. *Centre for Healthy Brain Ageing, Sydney, New South*

Wales, Australia, 4. University of East Anglia, Norwich, United Kingdom, 5. Johns Hopkins University, Baltimore, Maryland

Community dementia care in Australia is fragmented, with little access to tailored, systematic interventions. We conducted a pilot randomised trial of TAP in Sydney. Measures were collected at baseline and post intervention at 4 months with follow up at 8 months post randomisation. Outcomes included five domains of the Neuropsychiatric Inventory-Clinician rating (apathy, agitation, depression, sleep and irritability) and carer burden. Dyads (n=66) were recruited from various organisations, community groups and dementia services, with 54 remaining at 8 months. Diagnoses were Alzheimer's disease (n=36), frontotemporal dementia (n=20), other (n=10). Mean age was 73.4 years (range 50 to 92); 62% were men. Results show some positive trends though sample sizes limit significant results. There were small effect sizes for the total number of behaviours (cohen's d=0.25) and the level of burden experienced by the carer (cohen's d=0.39) and a moderate effect size for hours spent caring (cohen's d=0.55), favouring TAP participants.

SESSION 4990 (PAPER)

MOLECULAR UNDERPINNINGS OF THE AGING PROCESS

PROTEASOME AND LON AS EXAMPLES OF DECLINING ADAPTIVE HOMEOSTASIS IN AGING

K. Davies, *Leonard Davis School of Gerontology, the University of Southern California, Los Angeles, California*

The ability to transiently expand (or contract) the homeostatic range for protective mechanisms against various forms of stress has been termed 'Adaptive Homeostasis' (Davies, K.J.A. Adaptive Homeostasis. *Molecular Aspects of Medicine*. 49: 1-7, 2016). Examples include adaptations to heat stress, cold stress, exercise, oxidative stress, food deprivation, hypoxic or anoxic stress, chemical toxins, heavy metals, mechanical stress, salt, alcohol, osmolarity, and even emotional and psychological stresses. Important features of Adaptive Homeostasis include its mediation by discrete signal transduction pathways, as a result of small changes in signaling molecules/events, rather than in response to overt damage. We have previously demonstrated adaptive increases in oxidative stress resistance conferred by induction of the Proteasome and the mitochondrial Lon protease as prime examples of the plasticity of Adaptive Homeostasis in young C57BL/6J mice (3 months), young *Drosophila melanogaster* flies (3 days), and young *Caenorhabditis elegans* worms (3 days). Recent work, with older mice (18 months), flies (60 days), and worms (10 days), reveals abrogated inducibility of oxidative stress resistance by the very low (signaling) levels of hydrogen peroxide or paraquat that are extremely effective in their young counterparts. Under identical conditions we also find that the older animals lose the ability to induce both Proteasome and Lon. These are not simply threshold effects, since raising the levels of H₂O₂ or paraquat has no effect. Our studies indicate that vital signal transduction pathways such as Nrf2 may be inhibited or otherwise

opposed by rising levels of antagonists such as Bach1 and c-Myc during aging.

ACTIVATION OF TRANSPOSABLE ELEMENTS AS A MOLECULAR CAUSE OF AGING

S.L. Helfand, J. Wood, B.C. Jones, J. Taylor, *Molecular Biology, Cell Biology and Biochemistry, Brown University, Providence, Rhode Island*

Transposable Elements (TEs) are mobile genetic elements, highly enriched in heterochromatin, that constitute a large percentage of the DNA content of eukaryotic genomes. Aging in *Drosophila melanogaster* is characterized by loss of repressive heterochromatin structure and loss of silencing of reporter genes in constitutive heterochromatin regions. Using next-gen sequencing, we found that transcripts of many genes native to heterochromatic regions as well as TEs increased with age in fly heads and fat bodies. A dietary restriction regimen, known to extend lifespan, repressed the age-related increased expression of genes located in heterochromatin as well as TEs. We also observed a corresponding age-associated increase in TE transposition in fly fat body cells that was delayed by dietary restriction. Furthermore, we found that manipulating genes known to affect heterochromatin structure, including overexpression of *Sir2*, *Su(var)3-9*, and *Dicer-2*, as well as decreased expression of *Adar*, mitigated age-related increases in expression of TEs. Increasing expression of either *Su(var)3-9* or *Dicer-2* also led to an increase in lifespan. Mutation of *Dicer-2* led to an increase in DNA double strand breaks. Pharmacological inhibition of TE activity with 3TC resulted in both decreased transposition as well as increased lifespan in TE sensitized *Dicer-2* mutants. Together, these data support the retrotransposon theory of aging, which hypothesizes that epigenetically silenced TEs become deleteriously activated as cellular defense and surveillance mechanisms break down with age. Furthermore, interventions that maintain repressive heterochromatin and preserve TE silencing may prove key to preventing damage caused by TE activation and extending healthy lifespan.

IS ALZHEIMER'S DISEASE INFLUENCED BY INSULIN-LIKE GROWTH FACTORS? A MENDELIAN RANDOMIZATION STUDY

D. Williams, S. Hägg, I. Karlsson, N.L. Pedersen, *Karolinska Institutet, Stockholm, Sweden*

Alzheimer's disease (AD) development may be influenced by the actions of insulin-like growth factors (IGFs). Experimental evidence suggests that IGFI has strong neuroprotective effects. Epidemiological studies have reported associations of higher circulating IGFI and its binding protein, IGFBP3, with lower AD risk, yet some findings have been inconsistent. The aim of this study was to clarify whether IGFI variation may be causally related to AD risk. We conducted Mendelian Randomization analyses which tested whether AD risk differs between individuals grouped according to their genotypes of genetic variants that affect circulating IGFI and/or IGFBP3. First, we examined AD risk differences for seven IGF-related variants using published summary statistics from a genome-wide association study of AD risk (N= 17008 cases; 37154 controls). Second, we assessed whether any variant-AD associations were replicated in an independent sample of AD cases and controls

with genotype data, derived from the Swedish Twin Registry (N = 770 cases; 7224 controls). In the first sample, only one of the seven variants was associated with AD risk (P value = 0.02; all other $P \geq 0.41$). This variant is located in the gene *FOXO3*, implicated in human longevity. This result was replicated in the second sample. In a meta-analysis of both datasets, the odds ratio of AD per *FOXO3* risk allele was 1.04 (95% CI: 1.01, 1.07; $P=0.002$). These findings suggest that IGFI variation is not an important determinant of AD risk. *FOXO3* function may influence AD development via pathway(s) that are independent of IGFI signaling (i.e. pleiotropic actions).

DETERMINANTS OF DNA METHYLATION BASED AGE ACCELERATION IN YOUNG AND OLDER TWIN PAIRS

E. Sillanpaa^{2,5}, K. Ismail^{2,3}, T. Törmäkangas⁵, X. Wang⁴, J. Kaprio^{2,3}, O. Miina^{2,3}, 2. *Institute for Molecular Medicine (FIMM), Helsinki, Finland*, 3. *Department of Public Health, University of Helsinki, Helsinki, Finland*, 4. *George Prevention Institute, Department of Pediatrics, Medical College of Georgia, Augusta University, Augusta, Georgia*, 5. *Gerontology Research Center, Faculty of Sport and Health Sciences, University of Jyväskylä, Jyväskylä, Finland*

DNA methylation (DNAm) age, a novel marker of biological aging, has been shown to predict mortality and to be associated with physiological aging. However, the relative contribution of genetic and environmental factors to DNAm age over life span is not fully known. We estimated the magnitude of genetic and environmental factors in DNAm based age acceleration.

Age acceleration (residuals from a linear regression model of DNAm age on chronological age) in white blood cells was calculated from 450k BeadChip methylation data using an online calculator (<https://dnamage.genetics.ucla.edu>). The genetic and shared and non-shared environmental determinants of age acceleration were studied in young (20 to 25 year-old) and older (55 to 75 year-old) monozygotic (MZ, n=168 young, n=122 older) and dizygotic (DZ, n=121 young, n=42 older) twin pairs.

Correlation between DNAm age and chronological age was 0.97 ($p < 0.001$, n=1249 individuals).

Mean age acceleration was similar among young and older twin pairs, whether MZ or DZ. Intraclass correlation coefficients were 0.74 (95% CI 0.66, 0.80) for young MZ, 0.43 (0.27, 0.56) for young DZ, and 0.59 (0.46, 0.69) for older MZ and 0.17 (-0.13, 0.45) for older DZ twin pairs.

Quantitative genetic modeling revealed that genetic factors explained larger amount of the variation in DNAm age acceleration in young 74% (65, 82) compared to older twin pairs 53% (37, 65), while non-shared environmental factors were larger in older twin pairs (difference between age groups $p < 0.001$). The increasing discordance in age acceleration in older age is most likely explained by unique environmental factors.

TRENDS IN AGING FOR PEOPLE WITH DOWN SYNDROME: A 56-YEAR COHORT STUDY IN WESTERN AUSTRALIA

E. Glasson², R. Hussain¹, D. Dye³, A. Bittles^{4,5}, 1. *Research School of Population Health, Australian National*

University, Canberra, Australian Capital Territory, Australia, 2. *The University of Western Australia, Perth, Western Australia, Australia*, 3. *Curtin University, Perth, Western Australia, Australia*, 4. *Murdoch University, Perth, Western Australia, Australia*, 5. *Edith Cowan University, Perth, Western Australia, Australia*

In high income countries the life expectancy of people with Down syndrome (DS) rose significantly during the 20th century, from around nine years in 1949 to 57 years by 2000, equating to an increase of approximately 1 year of age per calendar year. This presentation quantifies survival patterns for people with DS using comprehensive population-based data collected over a 56-year period (1953–2009). All known persons diagnosed with DS were sourced from four complementary health and disability State-based databases (Disability Services, Death Registrations, Hospitalisations and Birth Defects Notifications) in Western Australia. Survival to 2010 was confirmed by the absence of a death registration between 1969 and 2010. Life expectancy was assessed using Kaplan Meier survival using the 1,948 cases born since 1953, which ensured that no death records were lost prior to the start of the earliest database. Deaths had occurred in 590 cases (25.3%). The results showed that survival rates started to decline between 55–60 years of age. Gender disparity was apparent, with females observed to have a slightly lower mean survival age than males throughout the lifespan. Although major improvements in the survival of children with DS are evident in recent decades, overall life expectancy appears to have plateaued with only minor increases in more recent years. The study findings suggest the possibility of a current natural upper survival limit for people with DS of around 60 years of age, and/or gaps in addressing health needs later in life through appropriate screening and early treatment.

SESSION 4995 (SYMPOSIUM)

INDIVIDUAL VIEWS ON AGING IN THE CONTEXT OF SOCIAL CHANGE AND CULTURAL DIFFERENCES

Chair: S. Wurm, *Friedrich-Alexander-University Erlangen-Nuernberg (FAU), Nuernberg, Germany*

Co-Chair: J.K. Wolff, *German Centre of Gerontology, Germany*

Discussant: U.M. Staudinger, *Columbia University, New York, New York*

Findings on the impressive impact of individual views of aging and old age (VoA) on health and longevity call for a better understanding of these views. Previous studies have examined VoA as well as preparation for age-related changes mainly on the individual level without broadening the perspective to contextual influences. In contrast and based on large-scale survey data, this symposium will look at how and why VoA are subject to social change, how they differ between different networks, countries and continents, and how this is able to affect preparation for age-related changes.

Wurm and colleagues will go into the social change of different VoA across 18 years based on four waves of representative, cross-sectional data from the German Ageing Survey (1996 to 2014). Using longitudinal data from the same survey in combination with district-level information, Wolff

et al. will examine whether changes in VoA depend on the pace of population aging on district level. Notthoff will look at the impact of the age structure of people's social network on VoA and will examine cultural differences in this impact, based on data of the European Social Survey. Kornadt and colleagues will address cultural differences in preparation for age-related changes based on survey data from the U.S., Hong Kong and Germany. Finally, the discussion of Prof. Staudinger (Columbia University, New York) will focus on the significance of survey data for research on VoA and its potential implications for policy and practice.

SOCIAL CHANGE OF VIEWS ON AGING OVER TWO DECADES: ARE THEY GETTING MORE POSITIVE?

S. Wurm¹, A. Beyer¹, J.K. Wolff², 1. *Friedrich-Alexander-University Erlangen-Nuremberg (FAU), Nuremberg, Germany*, 2. *German Centre of Gerontology, Berlin, Germany*

Previous studies have shown impressively the preponderance of negative views on aging (VoA), in particular in older adults. On the contrary, portrayals of older people in the media have become more positive and individuals born later are healthier in old age compared to those born earlier. Thus, VoA may have changed to the positive in Germany between 1996 and 2014. Overall, findings based on four waves of the German Ageing Survey (n = 20,715; 42–83 years) show that VoA became more positive during this period. Social change of VoA differed, however, by age: More positive changes were found for older adults compared to middle-aged adults; resulting in a convergence in the valence of their VoA. Moreover the findings showed varying strong changes for gain- vs. loss-related VoA during the 18-year period. Results are discussed beyond the background of chances and strains in different cohorts and age groups.

REGIONAL IMPACT OF DEMOGRAPHIC CHANGE ON CHANGES IN INDIVIDUAL VIEWS ON AGING

J.K. Wolff³, M. Wiest², S. Nowossadeck³, A. Beyer¹, S. Wurm¹, 1. *Friedrich-Alexander-University Erlangen-Nuremberg (FAU), Nuernberg, Germany*, 2. *Freie Universitaet Berlin, Berlin, Germany*, 3. *German Centre of Gerontology, Berlin, Germany*

Views on aging (VoA) are known as important resource for health in old age. Few studies have investigated contextual factors influencing VoA. Cross-cultural studies suggest: individuals in countries with rapid demographic change (DC) have more negative VoA. The contact hypothesis, however, postulates that individuals living in regional contexts with greater share of older adults have more positive VoA. The study investigates the effect of DC on changes in individual VoA over 12 years in adults (40+) comparing districts in Germany. Changes in VoA in three clusters of districts with different pace of DC are compared to districts with average DC. Results of three-level-growth-modeling show on average more negative VoA, but more positive change in VoA in rapid-aging/shrinking districts as compared to districts with average DC. The other clusters were similar to average DC. Results support the contact hypothesis and underline the importance of regional differences in the development of VoA.

FAMILIARITY BREEDS RESPECT: AGE STRUCTURE OF SOCIAL NETWORK INFLUENCES SUBJECTIVE VIEWS OF AGE

N. Notthoff, *Humboldt University Berlin, Berlin, Germany*

Although the proportion of older people in populations worldwide is growing, age stereotypes still appear to be pervasive. This contribution examines how the age structure of people's social network influences their perceptions of older and younger adults. We analyzed data from the European Social Survey (n = 56,544 participants aged 15 to 123 years (M = 47.54; SD = 18.50) from 29 countries. Having family and friends over age 70 and working with colleagues in that age group positively affected participants' perceptions of older adults, controlling for participants' own age. Likewise, those with a greater number of younger people in their social network reported more positive views of the younger age group. Cultural differences and possible underlying structural differences between countries will also be discussed.

PREPARATION FOR AGE-RELATED CHANGES CROSS-CULTURAL DIFFERENCES AND DETERMINANTS

A. Kornadt¹, P. Voss², K. Rothermund², 1. *Bielefeld University, Bielefeld, Germany*, 2. *Friedrich-Schiller-University Jena, Jena, Germany*

Preparation for age-related changes is a behavioral expression of aging-related beliefs with respect to what will change as one ages. It also includes representations of which age-related changes can be controlled or prevented by individual action and which are taken care of by others or society. Societal and cultural differences in age-related preparation were investigated in a sample of N=1895 individuals aged 26–95 years from Germany, the USA, and Hong Kong. Preparation was universally low in Hong Kong for all age groups, but increased linearly with age in the US. An asymptotic increase in preparation emerged in the German sample. We found pronounced country differences in preparation for those domains related to public provision (such as health care or retirement), especially between Germany and the US. Individual views on aging and perceptions of the role of older people in a society are investigated as possible mediating variables for country differences.

SESSION 5000 (SYMPOSIUM)

AGEING, THE DIGITAL AND EVERYDAY LIFE

Chair: W. Martin, *Brunel University London*

Co-Chair: B.L. Marshall, *Trent University, Peterborough, Ontario, Canada*

The 21st century has been characterised by a proliferation of digital devices, information technologies and mediated systems of communication within global and networked societies. Developments in digital technologies increasingly permeate everyday life and are interwoven with our identities, narratives, social relationships, social networks, lifestyles and societies. Digital technologies are, moreover, having profound influences within the lives of people in mid to later life.

The aim of this symposium is to critically explore perceptions, experiences and roles that digital devices, information technologies and mediated systems of communication may have in the lives of people as they grow older. The symposium

will further consider: (1) the opportunities and possibilities that people in mid to later life have to engage with and resist digital technologies in everyday life; and (2) how narratives surrounding engagement (or not) with digital technologies both challenge and reinforce ideas about ageing (and youth) in complex and, at times, contradictory ways.

The papers from this symposium are drawn from an international partnership funded by the *Social Sciences and Humanities Research Council of Canada* (SSHRC) entitled *Ageing, Communication, Technology (ACT): experiencing a digital world in later life*. ACT is a multi-methodological research project over 7 years (2014–2021) that brings together researchers and institutional and community partners to address the transformation of the experiences of ageing with the proliferation of new forms of mediated communications in networked societies. ACT is comprised of an interdisciplinary network of researchers, students, and community and institutional partners from around the world.

AGEING: A METHOD OF INQUIRY (TIME, TEMPORALITY AND MEDIA)

K. Sawchuk, *Concordia University, Montreal, Quebec, Canada*

In discussions with older adults on their engagements with cell/smart phones, mobile devices and computers (n 300+) the question of time is often part of the conversation implicitly or explicitly. The need for time management to minimize cost; the sense of a gap in generations who use different media; the desire to “hang on” to devices until they no longer function. These are but a few examples that illustrate how the connections between media and time, or perhaps more specifically the experience of temporality, emerged in conversations with Canadian mobile phone users 65 and over. Drawing on this interview data, this paper explores these connections. Further, I propose that the processes of ageing are one way for age studies researchers to gain insight into the experiences of media and temporality (Taylor, Jodie, 2010). In this respect, this paper is not ‘about’ ageing. Rather, ageing as a complex intersectional process of bio-social change, is explored as a “method of inquiry” to better understand time, temporality and changes in media practices.

VISUAL REPRESENTATIONS OF DIGITAL CONNECTIVITIES IN EVERYDAY LIFE

W. Martin¹, K. Pilcher², 1. *Brunel University London, Uxbridge, United Kingdom*, 2. *Aston University, Birmingham, United Kingdom*

This paper draws on data from *Photographing Everyday Life: Ageing, Lived Experiences, Time and Space* funded by the ESRC, UK. The research involved a diverse sample of 62 women and men aged 50 years and over who took photographs of their daily routines to create a weekly visual diary. The analysis highlighted: (1) the significance of digital connectivities and the ways in which people in mid-to-later life actively engage (and resist) technologies of communication in daily life; (2) the significance of embodied co-presence and the immediacy of shared space and/or time; and (3) how narratives surrounding engagement (or not) with digital technologies both challenge and reinforce ideas about ageing. Exploring the routines, meanings, and patterns that underpin everyday life has enabled us to make visible how people

build, maintain and experience their social connections, and the ways in which digital devices and information technologies are being incorporated within daily life.

OLDER PEOPLE WAYS TO COMMUNICATE IN FACEBOOK COMMUNITIES: A NETNOGRAPHIC APPROACH

L. Ivan, *National University of Political Studies and Public Administration, Bucharest, Romania*

Using a virtual ethnographic research (netnography) of a Facebook online community of older people from Romania, the current research describes members’ interactions, bonding and support on Facebook. Netnography is a form of ethnographic research adapted to include the Internet’s influence on contemporary social world. The ethnographic approach allowed us to observe how people use Facebook, analysing how often they post information or react to other members from the online community; who they communicate with using Facebook; what types of information they post or communicate about; how Facebook is implicated or not in family bonding and communication. The results indicate the importance of the online communities in understanding everyday practices of ICT use at older adults.

ACCUMULATIVE LEARNING PROCESSES: OLDER INDIVIDUALS APPROPRIATING SMARTWATCHES

M. Fernández-Ardèvol, A. Rosales, *IN3, Universitat Oberta de Catalunya - Open University of Catalonia, Castelldefels, Catalonia, Spain*

Pervasive digital technologies follow a fast innovation path. Thus, the appropriation of new digital devices follows an accumulative learning process. Adult individuals build up gradually their digital skills, mainly through informal learning processes, in response to everyday life particular goals.

Empirical information comes from a one-year research project. We delivered five smartwatches to analyze the processes of appropriation and domestication in the long term. Participants are members of a seniors’ learning club in Barcelona.

Key findings are in line with empirical evidence regarding informal learning processes associated with new digital technologies, which are valid for any age: (a) Peers are relevant sources of information, as knowledge is shared among those who have similar devices and similar interests. (b) The personal network is a source of knowledge sharing. Finally, (c) personal interests define what individuals (do not) want to learn.

“OUR FITBITS, OURSELVES?” WEARABLES, SELF-TRACKING AND AGING EMBODIMENT

B.L. Marshall, *Sociology, Trent University, Peterborough, Ontario, Canada*

As physical activity is considered key to the prevention of many age-related problems and inactivity becomes framed as irresponsible (“sitting is the new smoking”), the market for devices to measure, monitor, motivate and manage activity has expanded. Translating bodily movement into quantifiable outputs, these devices produce data which can be used, shared and/or displayed in different ways, and which are bound up with discourses of risk and the management of future health. While biomedical and exercise science research

focuses on how self-tracking devices can enhance behavioral interventions with older adults, I draw on interview data to explore the ways that data produced by self-tracking circulates through networks of technologies, relationships and expertise, and argue that more attention needs to be paid to the ways in which quantification is embedded in everyday social worlds.

SESSION 5005 (SYMPOSIUM)

A PRIMER ON THE WISCONSIN LONGITUDINAL STUDY: 60 YEARS OF SOCIAL DATA COMBINED WITH GENETIC DATA

Chair: P. Herd, *University of Wisconsin, Wisconsin*

Co-Chair Pam Herd, *University of Wisconsin-Madison, Madison, Wisconsin*

The Wisconsin Longitudinal Study is a panel study covering over sixty years, making it an excellent data source for researchers interested in linking early-life characteristics to later-life outcomes. The study is a sample of one in three Wisconsin high school graduates, and a selected sibling, from the class of 1957. WLS is unique among major social scientific resources for the length with which it has followed a large population-based cohort sample and the inclusion of siblings. The most recent round of data was collected between March of 2010 and December of 2012. The data cover nearly every aspect of the participants' lives from early life socioeconomic background, schooling, family and work to health, social participation, civic engagement, well-being, and cognition. The study also has a wealth of unique data including examples such as administrative IQ scores from high school, information collected from high school yearbooks that include measures of attractiveness, proxy measures for obesity, anthropometric and functioning, and complete lists of student activities for all respondents. Examples of administrative data include Medicare records, Social Security records, and resource data on primary and secondary schools attended by participants. At the cellular level, DNA data (to be released in the Fall of 2016) can be merged with fifty-five years of social data. This session will introduce the study to researchers who are not familiar with the data by providing an overview of the study as well as practical information on the structure of the data. Attendees will be provided with a USB containing documentation and the public data.

WHAT'S IN THE WLS? AN OVERVIEW OF SURVEY CONTENT ACROSS TIME

P. Herd, *University of Wisconsin, Madison, Wisconsin*

This presentation will provide an overview of the WLS data. Survey years include 1957, 1964, 1975, 1993, 2004, and 2011. The content of the WLS has changed to reflect the life course of participants: education inspired the initial data collection, familial and career outcomes focused data collection in midlife, and later rounds have shifted attention to respondent's health, cognitive status, psychological and other dimensions of wellbeing, non-work activities, and caregiving and social support. Some examples of non-survey derived measures include: parent earnings from state tax records (1957-60), high school IQ scores; characteristics of high

schools and colleges, employers, industries, and communities of residence; archival data on high school and elementary school resources; information on social participation, facial obesity, and attractiveness from yearbooks; matches to the National Death Index; Medicare claims data; and Social Security Earnings and Benefits.

GENETIC AND MICROBIOME DATA IN THE WISCONSIN LONGITUDINAL STUDY

C. Atwood, P. Herd, *University of Wisconsin, Madison, Wisconsin*

The WLS has GWAS data on 9400 participants. The inclusion of genetic data allows analyses linking genotypic, biomedical, psychosocial, and life course outcomes in novel ways. The WLS is a unique resource that is well suited for replication of findings from existing studies in a population-based sibling-design sample. More recently we piloted a study to collect stool samples in order to analyze participants' gut microbiome to study its relationship to human health. We are also doing ground-breaking research on the relationship between the gut microbiome and behavioral and social outcomes. One area of interest is examining how the unique mix of microbes in our gut may have much to do with why some diets work for some people but not for others. We expect that a healthy microbiome depends on our genes, diet, and our environment; all of which are measured within the WLS.

HOW TO ACCESS AND USE DATA FROM THE WISCONSIN LONGITUDINAL STUDY

C.L. Roan, *University of Wisconsin-Madison, Madison, Wisconsin*

With over 27,000 analysis variables covering more than 55 years of data, new users of the WLS data may find themselves overwhelmed when looking for the measures they need to answer their research questions. We will give detailed instructions on how to use the tools and reference materials developed by WLS staff. Attendees will learn how to search for analysis variables, where to find copies of the survey instruments online, and how to download the public data. We will also explain the organizational structure of the data, variable naming conventions, and offer recommendations on how to break the data into smaller pieces if your computing resources are limited. Participants in this symposium will also learn about the differences between publicly available data and the small subset of data available only by application. Finally we will explain how to apply to use the genetic data and other non-public data.

SESSION 5010 (PAPER)

LIFE-COURSE PERSPECTIVES ON DISADVANTAGE AND HEALTH

DOES CHILDHOOD MISFORTUNE INCREASE THE LIKELIHOOD OF MOBILITY LIMITATION IN LATER LIFE?

M. Williams, K.F. Ferraro, B. Kemp, *Purdue University, West Lafayette, Indiana*

Many studies in gerontology and epidemiology examine the influence of proximal risk factors on mobility limitations

in later life; however, recent research on the early origins of adult health shows the importance of considering distal risk factors, including those from childhood. This research uses data from the Health and Retirement study (2004) to examine whether childhood misfortune predicts developing a mobility limitation in later life. A series of logistic regression models were estimated to test whether six domains of childhood misfortune (socioeconomic status, infectious disease, chronic disease, impairments, risky adolescent behavior, and risky parental behavior) raised the risk of a mobility limitation, defined by reporting difficulty in performing at least one of five lower body mobility tasks, among persons 51 years or older. After adjusting for demographic factors and adult health behaviors, respondents who experienced misfortune in socioeconomic status, impairments, and two or more risky parental or adolescent behaviors in childhood were more likely to have a mobility limitation in mid-late adulthood, but these relationships were partially mediated by presence of chronic disease, pain, and depression. These findings reveal that experiencing childhood misfortune heightens the risk of chronic disease, which serves as an early catalyst of the disablement process.

CHILDHOOD SOCIOECONOMIC STATUS AND ADULT ISCHEMIC HEART DISEASE: A LIFE COURSE PATHWAY MODEL OF HEALTH

P. Morton¹, K.F. Ferraro², S. Mustillo³, 1. *Rice University, Houston, Texas*, 2. *Purdue University, West Lafayette, Indiana*, 3. *Notre Dame University, Notre Dame, Indiana*

There is a well-established relationship between childhood socioeconomic status (SES) and adult health, but how early-life conditions are able to influence health and aging in later-life is less clear. To elucidate this process, this study investigated how childhood SES influences ischemic heart disease (IHD)—a common disease among older adults—through multiple paths of adult health lifestyles, SES, and chronic inflammation. Guided by two interdisciplinary life course perspectives, this study hypothesized that socioeconomic disadvantage during childhood would lead to unhealthy lifestyles and lower SES in adulthood, which would lead to chronic inflammation that would subsequently raise the risk of IHD. Data came from six waves of the Health and Retirement Study between 2004 and 2014, comprising a sample of 11,697 U.S. men and women aged 51 and older. A series of Cox proportional hazards models examined the relationship between childhood SES and adult IHD. Statistical tests of mediation were conducted to determine whether adult health lifestyles, SES, and chronic inflammation mediated the relationship between childhood SES and adult IHD. Findings revealed that lower childhood SES raised IHD risk by directly impacting adult health lifestyles and SES, which subsequently led to higher levels of systemic inflammation, resulting in onset of IHD. These findings clarify how childhood SES impacts health among older adults. Using multiple mediating domains to assess the long-term effects of early-life conditions can enhance U.S. health policy in an effort to reduce the associated disease burden of childhood SES.

EXPLORING CUMULATIVE DISADVANTAGE, TELOMERE LENGTH, AND BREAST CANCER AMONG BLACK AND WHITE WOMEN

K. Latham-Mintus¹, T. Weathers², A. Irby-Shasanni², S.M. Bigatti², A. Storniolo², L. Robison², I. Telomere Laboratory², 1. *Department of Sociology, Indiana University-Purdue University--Indianapolis, Indianapolis, Indiana*, 2. *Indiana University-Purdue University Indianapolis, Indianapolis, Indiana*

Objectives: Cumulative disadvantage (CD) is a concept that recognizes the influence of social determinants on health over the lifecourse—emphasizing accumulated stressors as contributors to physiological damage. The shortening of telomeres has been found to have a direct relationship with increased cancer incidence and overall health. The purpose of this research is to develop a triangulated and biologically validated CD instrument to explore breast cancer disparities among Black and White women.

Methods: We recruited a purposeful sample of 15 White and 15 Black pre-menopausal women (ages 25–50 years) who had donated normal tissue to the Susan G. Komen Tissue Bank. Semi-structured qualitative interviews, designed to investigate participants' exposure to lifetime stressors, were conducted. Drawing from the qualitative interviews and previous research, a quantitative survey instrument was developed to capture the range of stressors experienced by our sample of women. All respondents completed the quantitative survey and their telomere length was assessed using DNA extracted from peripheral blood leukocytes.

Results: Qualitative and quantitative assessments of CD were consistent across childhood, adult, and lifetime stressors. Black respondents reported more childhood stressors ($t=-2.28$, $p=0.03$), adult stressors ($t=-1.87$, $p=0.07$), and lifetime stressors ($t=-2.17$, $p=0.04$); however, there were no significant differences in subjective assessments of the perceived impact of stress on health. There was some evidence of shortened telomere length among Black respondents with more CD.

Discussion: Preliminary analyses provide evidence of triangulation. Future research will further explore associations between CD and telomere length among a larger sample ($N=100$) of Black and White American women.

DOES FINANCIAL STRAIN DURING THE GREAT RECESSION COMPROMISE THE SOMATIC WELL-BEING OF OLDER ADULTS?

L.R. Wilkinson, *Sociology, Baylor University, Waco, Texas*

Studies to date provide growing evidence of the toll the Great Recession has taken on the lives of older adults. Drawing on a sample of older adults from the Health and Retirement Study ($N = 5,071$), this study poses two main research questions: Does financial strain increase acute physical symptoms among older adults? If so, does this relationship vary by age? There has been considerable debate on the extent to which the recession affected older adults, but so far research has failed to distinguish between two defining categories of older adults: under age 65 and aged 65 and older. There are marked differences between these two age groups that may shape their evaluations of financial strain, including access to resources. Guided by cumulative inequality theory, I anticipated that financial strain would

compromise somatic well-being for all adults following the Great Recession, but especially those under the age of 65 because of their more disadvantaged positions entering into the recession. For instance, adults under the age of 65 were more susceptible to unemployment and its reverberations, with many forced to delay retirement altogether. Findings from this study reveal that initial financial strain and change in financial strain between 2006 and 2010 independently contribute to increased acute physical symptoms among all adults, even after controlling for demographic and socioeconomic characteristics. Thus, despite their distinct social and economic circumstances, results from this study suggest that both groups were similarly affected by the Great Recession.

HOW EXPOSURE TO RECESSIONS AS A YOUNG ADULT IMPACTS SUBJECTIVE WELL-BEING IN LATER LIFE

B. Bartlett, *Duke University, Durham, North Carolina*

Numerous studies find that subjective well-being suffers during economic downturns, but are often limited to full-time workers and short-term effects. Combining research on subjective well-being and recessions with cultural demography and life course theory, this study expands on prior research by (1) exploring the effects of recessive periods beyond full-time workers, (2) examining long-term impacts of experience with recessions, and (3) determining whether exposure to recessive periods in young adulthood changes individuals' future outlook. In particular, this study focuses on exposure to a recession during young adulthood, a critical period for development. Using logistic models for the General Social Survey (GSS) repeated cross-sections (1994–2014) and logistic models adjusted for individual effects across three GSS panels of three years each (2006–2014), this study finds that exposure to a recession in young adulthood is associated with different levels of subjective well-being. This effect is different depending on the intensity of the recession: older adults who experienced a short recession in young adulthood have better well-being, while older adults who experienced a long-term recession in young adulthood have poorer subjective well-being. Finally, this study finds that these effects are partially mediated by future outlook (as measured by pessimism or optimism about children's future standard of living). These mechanisms are important given the dramatic decline in recessive periods throughout the 1980s, 1990s, and early 2000s, decreasing the proportion of the population exposed to short-term recessions, and thereby reducing the population capacity for positive subjective well-being.

SESSION 5015 (SYMPOSIUM)

NOVEL PARTNERSHIPS TO DEVELOP MEASURES OF QUALITY CARE FOR OLDER ADULTS: IMPROVING HOMEBOUND CARE

Chair: K. Ornstein, *Mount Sinai Hospital, New York City, New York*

This symposium will demonstrate the role of a unique, multi-stakeholder collaboration to improve care for homebound and other complex, older patients. The homebound are a vulnerable, high-risk population. Performance measurement of care for this population is insufficient, relative

to similar measurement in other care settings. Payers therefore have little basis on which to determine the quality of home-based medical care across providers while the spectrum of care needs for this population goes unrecognized. Interdisciplinary presenters represent varied healthcare perspectives, including practice, consumer advocacy, quality, research, and data science. The National Quality Forum (NQF) will describe the NQF Measure Incubator™, an innovative effort to facilitate efficient measure development and testing through collaboration and partnership. The Measure Incubator is addressing important gaps in quality measurement. Geriatricians from Johns Hopkins University and UCSF will describe existing definitions of the homebound, gaps in care, and needed quality assessments for these patients. Representatives from AARP will discuss the role of consumer organizations in measure development, particularly for frail populations. Finally, researchers and practitioners from UCSF and OptumLabs™ will highlight a collaboration to develop quality measures in an open science, “big data” environment. The team will present a data-driven example of using large data assets to develop quality measures for a high-risk target population. This symposium highlights the value of a collaborative model for measure development and care improvement for elderly homebound patients that leverages “big data”, and multiple stakeholder perspectives as core components.

INNOVATION IN MEASUREMENT: THE NQF MEASURE INCUBATOR™

H. Burstin, *National Quality Forum, Washington, District of Columbia*

Critical areas of health and healthcare for older Americans don't have enough or the right kinds of measures to drive improvement. With the rapid growth of long-term services and supports for the elderly and disabled, measures that reflect the quality of care provided in home and community-based services are needed. Measures that reflect the voice of patients and caretakers, including measures of function and shared decision-making must be developed. The NQF Measure Incubator™ is an innovative effort that facilitates efficient measure development and testing through collaboration to address important aspects of care for which quality measures are underdeveloped or nonexistent. NQF is exploring innovative and agile approaches to incubate and test measures more efficiently, such as early and continuous access to data. This innovative approach can help drive measurement where it's most needed during this period of rapid change in the care of older patients in their home and community.

MAKING THE HOMEBOUND VISIBLE: EPIDEMIOLOGY AND QUALITY MEASUREMENT

C.S. Ritchie², B.A. Leff¹, K.L. Harrison², 1. *Johns Hopkins University, School of Medicine, Baltimore, Maryland*, 2. *University of California, San Francisco, School of Medicine, San Francisco, California*

Recent nationally representative data suggest that between 2 and 6 million Americans are homebound. They are often unable to access office-based primary care and are among the most costly patients in the US health care system, because of a powerful combination of multiple chronic

conditions, functional impairment, frailty, and social stressors. Rendering the homebound visible to the health care system is critical to improving care delivery and health outcomes for this vulnerable population and population health efforts. Home-based primary care (HBPC) practices have developed effective approaches to address the clinical needs of this population. Appropriate metrics are lacking to measuring the quality of care delivered by HBPC to this frail population. This session will focus on 1) understanding the characteristics of the homebound population, and; 2) elucidating efforts to address gaps in quality measurement, including the development of quality measures, a national registry, and a learning collaborative for HBPC practices.

ALL IN IT TOGETHER: WHY DEVELOPMENT OF BETTER HEALTH CARE QUALITY MEASURES IS GOOD FOR CONSUMERS

L. Walker, *AARP Public Policy Institute, Washington, District of Columbia*

Health care in the United States is evolving. With this change, consumers and families are taking on greater responsibilities in managing their health care – sometimes voluntarily and sometimes involuntarily. For them to navigate effectively in this new environment they and their clinicians need information about the quality of care they receive, and that information has to be meaningful to their decision-making process. This is particularly so for people who are frail, functionally impaired, and have complex chronic conditions. The homebound are a subset of this group. Consumer and patient groups, including AARP, support the development of measures in critical gap areas, such as for patients who are homebound, who would benefit tremendously from the development of home-based quality of care measures. In addition to clinical measures, consumers would welcome development of measures in domains that capture patient and caregiver experience, care coordination, safety, and quality of life.

NO LONGER THE INVISIBLE HOMEBOUND: IDENTIFYING CANDIDATES FOR HOME-BASED MEDICAL CARE IN BIG DATA

K.L. Harrison^{1,4}, A. Altan², S.C. Dunning², C. Patterson², C.S. Ritchie¹, B.A. Leff³, 1. *University of California San Francisco, School of Medicine, San Francisco, California*, 2. *OptumLabs, Cambridge, Massachusetts*, 3. *Johns Hopkins University, School of Medicine, Baltimore, Maryland*, 4. *San Francisco VA Medical Center, San Francisco, California*

Homebound patients who could benefit from high-quality, cost-saving longitudinal home-based medical care cannot be identified easily by hospitals, health systems, or payers. Further, without a well-defined population denominator, assessments of care quality are inadequate. We addressed these gaps using the OptumLabs™ Data Warehouse, which includes more than 3 million commercial and Medicare 2014 enrollees age 65 and older. We identified two patient phenotypes who may benefit from home-based medical care: (1) patients with complex comorbid conditions already receiving home-based care (>2 in-home physician visits (N=30,251); and (2) patients receiving substantial acute care (>57% with >1 hospitalization, ER visit, or ambulance service) and low levels of ambulatory services (19.2% with <2 ambulatory

visits/year); (N=171,894). This project revealed a high-need patient population for whom home-based care may be beneficial and established a method for using administrative data to identify patients who are either homebound or would benefit from coordinated home-based services.

SESSION 5020 (SYMPOSIUM)

BEYOND PERFORMANCE MEASURES: NOVEL INFORMATION FROM ACCELEROMETRY FOR FUNCTION

Chair: T. Harris, *NIA/Intramural Research Program, Bethesda, Maryland*

Functional status has long been recognized as critical to health and independence of older persons. Self-reported and performance measures, which are quick and easy to administer, allow assessment of function and are widely used in community population studies and clinical trials. However, these measurements are limited in that they are taken at one point in time in home, clinical and laboratory settings, and thus may not be representative of a person's usual function over time. Accelerometry is an emerging technology that has gained popularity in recent years, which allows for continuous and objective assessment of daily physical activity and function over an extended period of time in the free-living environment. Although these device present new opportunities to understand functional mobility, the benefits may be limited by associated costs, methodological, and data processing challenges. This begs the question: Are the data generated from accelerometry worth the effort? In this symposium, presenters will highlight novel information derived from the accelerometers and compare with routinely available self-report or performance measures. Accelerometer types, body placement locations, processing challenges, and costs will be addressed

ACTIGRAPHY FEATURES FOR PREDICTING MOBILITY DISABILITY IN OLDER ADULTS

T.M. Manini¹, M. Kheirkhan¹, C. Tudor-Locke², N.W. Glynn³, J.M. Guralnik⁴, M. Pahor¹, S. Ranka¹, 1. *University of Florida, Gainesville, Florida*, 2. *University of Massachusetts-Amherst, Amherst, Massachusetts*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 4. *University of Maryland, Baltimore, Maryland*

Actigraphy has attracted much attention for assessing and documenting physical activity in the past decade. However, there is a lack of understanding whether these data can help in detecting and/or predicting mobility function, or more specifically, mobility impairment and major mobility disability (MMD). Men (N=357) and women (N=778) aged 70–89 years wore a tri-axial accelerometer (Actigraph GT3X) on the right hip during free-living conditions for 8.4 ± 3.0 days and 67 features were extracted from the accelerometer data. Sensitivity and specificity of identifying slow walkers was approximately 70% and 80%, respectively. The top five features, which were related to movement pace and amount (activity counts and steps), length in activity engagement (bout length), accumulation patterns of activity, and movement variability significantly improved the prediction of MMD beyond that found with common covariates (age,

walk speed, diseases). Actigraphy features from free-living conditions may be important for prediction of mobility phenotypes in older adults.

FRAGMENTATION OF DAILY PHYSICAL ACTIVITY: PREDICTION OF MORTALITY IN NHANES 2003–2006

J. Di, A. Leroux, J. Urbanek, A.P. Spira, J. Schrack, V. Zipunnikov, *Johns Hopkins School of Public Health, Baltimore, Maryland*

We review existing methods for quantifying fragmentation of accelerometry-measured physical activity and develop a unifying statistical framework that connects all methods by separately modeling switching between and duration of sedentary and active bouts. We analyzed the association of these metrics with mortality in National Health and Nutrition Examination Survey 2003–2006. We have identified that “Intradaily Variability” (1SD HR=1.32, 95%CI 1.18–1.48), “Active Bouts Fragmentation Index” (1SD HR=1.43, 95%CI 1.25–1.64), “Sedentary Bouts Gini Index” (1SD HR=1.15, 95%CI 1.06–1.25), and hazard rates of distribution function of durations of active and sedentary bouts (1SD HR=1.93, 1.40, 95% CI 1.59–2.34 and 1.23–1.59) independently predict mortality after adjusting for total sedentary time, total daily activity, age, sex, education, medical comorbidities, smoking status, alcohol consumption, and mobility limitations. Future studies should concentrate on developing metrics that jointly model the frequency of switching between the sedentary and active bouts as well as the bout durations.

PREDICTING VO2 MAX USING ACCELEROMETRY AND HEART RATE METRICS

J. Schrack¹, A. Leroux¹, J. Fleg², E.M. Simonsick³, V. Zipunnikov¹, S.A. Studenski³, L. Ferrucci³, 1. *Johns Hopkins School of Public Health, Baltimore, Maryland*, 2. *National Heart Lung and Blood Institute, Bethesda, Maryland*, 3. *National Institute on Aging, Baltimore, Maryland*

Traditional physical activity metrics include reported time spent in various levels of exertion, from sedentary to vigorous. Previous research has shown an association between time spent in moderate or vigorous activities and maximal aerobic capacity (VO2 max) in older adults, but the association between accelerometry derived activity metrics and VO2 max remains undefined. We modeled the association between VO2 max and objectively measured physical activity and heart rate in 411 BLSA participants (53% male, mean age 67, range 31–88), using percentages of heart rate reserve to define intensity of daily activities. Although the association between time spent in vigorous activities and VO2 max was significant, a continuous measure of total daily activity provided stronger results and a better model fit (accounting for 12% vs. 8% of unexplained variance), suggesting that total daily activity is a better predictor of VO2 max with aging, likely due to reduced intensity of daily activities.

SEDENTARY BEHAVIOR AND PHYSICAL ACTIVITY ARE ASSOCIATED WITH PHYSICAL FITNESS: THE MAASTRICHT STUDY

J. van der Velde¹, H.H. Savelberg¹, J. van der Berg¹, C. Stehouwer², P. Dagnelie¹, N. Schaper², A. Koster¹, 1. *Maastricht University, Maastricht, Netherlands*,

2. *Maastricht University Medical Center, Maastricht, Netherlands*

We examined the associations of sedentary behavior and high intensity physical activity (HPA) with physical fitness in 1,897 men and women aged 40–75 years from The Maastricht Study. Sedentary behavior and HPA (time/day) were measured continuously with the activPAL3 during 7 days. Physical fitness was expressed as 1) maximum power output ($W_{max} \text{ kg}^{-1}$) estimated from a sub-maximal cycle ergometer test and 2) covered distance (m) from fast-paced 6 minute walk test (6MWD). Mean (\pm SD) sedentary time was 9.3 ± 1.6 hours and median [25%–75%] time in HPA was 19.8[10.1–31.1] minutes. One hour less sedentary behavior was associated with a higher $W_{max} \text{ kg}^{-1}$ ($B = 0.022$) and longer 6MWD ($B = 2.455$) independent of HPA ($p < 0.05$). An additional 10 minutes of HPA was associated with higher $W_{max} \text{ kg}^{-1}$ ($B = 0.036$) and longer 6MWD ($B = 3.088$), independent of sedentary behavior ($p < 0.01$). HPA seems to be more important for physical fitness than sedentary behavior.

USING ACCELEROMETRY TO TRACK CLINICAL TRAJECTORIES: AORTIC VALVE REPLACEMENT AS AN EXAMPLE

T. Harris¹, P. Green², A. Eloyan³, V. Zipunnikov⁴, M. Maurer², M. Hung¹, C. Crainiceanu⁴, 1. *Laboratory of Epidemiology and Population Sciences, NIA/Intramural Research Program, Bethesda, Maryland*, 2. *Columbia University College of Medicine, New York, New York*, 3. *Brown University School of Public Health, Providence, Rhode Island*, 4. *Johns Hopkins School of Public Health, Baltimore, Maryland*

Accelerometry technology has been used to capture motion in studies of physical activity, where these instruments have been used to assess the total amount of activity and its intensity. Clinicians have begun to realize that these characteristics could provide information about underlying health status and the use of monitors to predict clinical outcomes has increased. This presentation will review current applications of accelerometers in clinical practice. Using data from a pilot study of 53 patients undergoing aortic valve replacement either through open heart surgery or through transcatheter valve replacement, we will show the pre-intervention accelerometry data. We will then compare post-intervention accelerometry data over time, illustrating where there are significant differences between the types of valve replacement and between the pre- and the post-intervention accelerometry data.

Accelerometry technology has been used to capture motion in studies of physical activity, where these instruments have been used to assess the total amount of activity and its intensity. Among other characteristics analyzed from the raw accelerometry signal include time spent sedentary, time in sleep, duration of bouts of motion, and time walking. Clinicians have begun to realize that these characteristics could provide information about underlying health status and the use of monitors to predict clinical outcomes has increased. This presentation will review current applications of accelerometers in clinical practice. Using data from a pilot study of 53 patients undergoing aortic valve replacement either through open heart surgery or through transcatheter valve replacement, we will show the pre-intervention

accelerometry data. We will then compare post-intervention accelerometry data over time, illustrating where there are significant differences between the types of valve replacement and between the pre- and the post-intervention accelerometry data.

SESSION 5025 (SYMPOSIUM)

UNDERSTANDING DIRECT AND INDIRECT CONTRIBUTORS TOWARD LONGEVITY OF THE OLDEST OLD

Chair: L.W. Poon, *University of Georgia*

Co-Chair: P. Martin, *Iowa State University, Iowa*

Discussant: D. Willcox, *Naha, Japan*

It is well known among centenarian research programs that both nature and nurture contribute to our understanding of longevity, morbidity, and functional capacity among the oldest old. Past research focused on the impact of specific biological, psychological, OR social main effects that contributed to longevity and functional capacities. Research directions have matured sufficiently that some ongoing research has begun to articulate both direct and indirect (or interactive) effects among bio-psycho-social predictors in order to advance the current state of research in longevity and functioning among oldest old survivors. This symposium is designed to showcase this future direction. The first paper will set the stage by briefly summarizing past accomplishments as well as needed directions for the next stage of research. Four papers will follow to provide examples of how direct, indirect, and interactive effects could further our understanding of mechanisms of longevity. The first paper will address the impact of past (distal) and current (proximal) experiences on healthy longevity. The second paper will address the interactions between genetics and personality; the third paper addresses the interaction between specific genes and morbidity that would enhance longevity. The last paper will examine and differentiate the impact of autonomy and competence that would contribute to life and aging satisfaction. A discussion will follow to summarize and integrate the papers on future longevity research.

A REVIEW OF CURRENT UNDERSTANDING AND FUTURE DIRECTIONS IN CENTENARIAN RESEARCH

L.W. Poon², P. Martin¹, 1. *Iowa State University, Ames, Iowa*, 2. *University of Georgia, Athens, Georgia*

This paper serves as an introduction to the symposium papers by reviewing past centenarian research around the world, primary research accomplishments, and thoughts on future directions to set the stage for the following symposium papers that focus on direct and indirect mechanisms toward longevity and functional capacities among the oldest old.

DISTAL AND PROXIMAL INFLUENCES ON HEALTHY LONGEVITY

P. Martin¹, L.W. Poon², 1. *Iowa State University, Ames, Iowa*, 2. *University of Georgia, Athens, Georgia*

There is wide consensus that healthy longevity is not determined by a single factor but by a variety of influences. Seldom, however, have distal and proximal factors been distinguished in the prediction of healthy longevity. The Georgia

Centenarian Study includes distal influences (e.g., family longevity, education, early life events, childhood socioeconomic status and childhood health) to assess the direct effect on well-being in very late life. In addition, proximal influences (e.g., personality, social support and health behaviors) and the mediation and moderation of proximal and distal influences were evaluated. Three hundred and eighty one centenarians from the Georgia Centenarian Study participated in this research and were tested on a wide range of longevity components. The results suggest that distal and proximal factors are important determinants of healthy longevity. We conclude that service providers and family members focus on proximal and distal variables when supporting oldest-old survivors.

NEED FOR AUTONOMY, COMPETENCE, AND RELATEDNESS IN CENTENARIANS

D.S. Jopp, C. Lampraki, C. Meystre, *Institute of Psychology, University of Lausanne, Lausanne, SCHWEIZ, Switzerland*

Psychosocial factors are important for longevity and well-being in very old age. In younger ages, fulfillment of basic needs such as autonomy, competence, and relatedness are widely discussed, using the framework of self-determination theory. As fulfillment of these needs is at risk in very advanced age, the present study investigated their direct and indirect effects in centenarians participating in the Fordham Centenarian Study (N = 119, Mage = 99.25). Findings indicate that a rather substantial number of centenarians felt that their needs were not well met. Regression findings showed that those who were able to maintain need fulfillment had higher life and aging satisfaction while considering education and health restrictions. Fulfilled autonomy need was strongly associated with life satisfaction, whereas fulfilled competence need was associated with aging satisfaction. Mediation effects were also found. In sum, findings suggest that feeling autonomous and competent remains essential for well-being in very old age.

PARADOXICAL ASSOCIATION BETWEEN LONGEVITY-RELATED PERSONALITY TRAITS AND MORTALITY IN CENTENARIANS

Y. Gondo¹, N. Hirose², Y. Masui³, H. Inagaki³, Y. Arai², 1. *Osaka University, Suita, Osaka, Japan*, 2. *Keio Medical School, Shinjyuku Ku, Tokyo, Japan*, 3. *Tokyo metropolitan institute of gerontology, Itabashi Ku, Tokyo, Japan*

Personality traits are the significant predictor of longevity. Among the big-five personality traits, researchers reported that having a lower score of neuroticism and a higher score of conscientiousness, extraversion and openness influence longevity due to their behavioral patterns. However, longevity associated gene (synaptojanin-2) showed association with agreeableness, although it is not reported to have any relationship with longevity. Such results raised a question whether observed associations between personalities and longevity might be the reflection of genetic influence on both biological robustness and personality traits rather than the consequence of causal effect of personality to behavioral regulation manners. We analyzed association between mortality and personality traits among centenarians. Conscientiousness showed a positive association with mortality after controlling participants' age, physical functions, cognitive functions and sex. The paradoxical result indicated that biological

traits explain more on longevity among centenarians rather than their behavioral patterns result from personalities.

SESSION 5030 (PAPER)

WORKFORCE AND ECONOMIC ISSUES

EMPLOYMENT SUPPORT SERVICE PROVISION FOR OLDER WORKERS: BOUNDARIES SHAPED THROUGH INDIVIDUALIZATION

D.L. Rudman¹, R.M. Aldrich², 1. *Occupational therapy, University of Western Ontario, London, Ontario, Canada*, 2. *Saint Louis University, St. Louis, Missouri*

Western economies increasingly promote extended formal labour force engagement across the lifespan. Older workers – persons aged 50 and older – are induced to continue working through policy changes such as increasing age thresholds for pension eligibility or financial penalties for early workforce exit. Such measures presume people's abilities to choose to continue working, but barriers to sustainable, secure employment disproportionately impact older workers. Front-line support service providers who assist out-of-work older workers must negotiate contemporary individualizing policies and discourses while recognizing their collective experience of difficulty within the labour market. In this presentation, we draw on data from a collaborative ethnographic study that uses governmentality, street-level bureaucracy, and critical occupational science as theoretical frames to understand long-term unemployment in Canada and the United States. Through a critical discourse analysis of qualitative interviews, participant observation field notes, and focus group interviews with 22 front-line service providers, we attend to how service providers negotiated conflicting discursive positions: despite positioning older workers as an 'at risk' group, service providers located barriers to employment in individual characteristics such as workers' attitudes, expectations, or skills. Moreover, service providers proposed activation-based, individualized strategies – such as crafting age-neutral resumes or enhancing computer literacy – as solutions to older workers' joblessness. As such, dominant discourses aligned with neoliberal individualizing and activating strategies set limits on attention to ageism and other systemic barriers collectively faced by aging workers within service provision practices, bounding how later life long-term unemployment is addressed and inadvertently contributing to precarity.

ACCOUNTABLE CARE ORGANIZATIONS AND POST-HOSPITAL CARE FOR OLDER ADULTS: COORDINATION AND COSTS

C.E. Bishop¹, J. Hefele^{2,1}, J. Perloff¹, R. Mechanic¹, 1. *Heller School for Social Policy & Mgt, Brandeis University, Weston, Massachusetts*, 2. *University of Massachusetts at Boston, Boston, Massachusetts*

Medicare accountable care organizations (ACOs), rewarded for containing Medicare costs for attributed beneficiaries, are seeking cost-savings in post-acute care (PAC). Intensified case management, focus on quality metrics, and improved transfers along the care continuum can improve

patient outcomes and experience for older adults using PAC while reducing Medicare costs. But narrowing provider networks and downward pressure on length of stay may decrease access to desired care for beneficiaries and constrain resources available for long-stay residents receiving care not covered by Medicare.

We report on case studies of PAC provider interactions with ACOs in three health market areas, revealing skilled nursing facility (SNF) and home health agency (HHA) response to cost-containment strategies. Some SNFs compete to attain and keep ACO preferred status while others question whether participation costs are compensated by increased referrals. Rounding in the SNF by ACO clinicians, while a potential source of conflict, brings timelier primary care to some SNF patients. Coordination strategies aim to improve transitions and reduce rehospitalization. HHAs are pressed to see patients more quickly after hospital or SNF discharge.

Analysis of Medicare claims data for beneficiaries in 18 health market areas over three years of ACO experience examines the impact of these interventions, comparing PAC discharge destination, concentration of discharges in preferred provider networks, length of stay, and 30-day rehospitalizations for ACO and fee-for-service Medicare beneficiaries. Aligning PAC providers with ACO goals is moving Medicare toward more coordinated and integrated care for beneficiaries and saving costs. However, implementation is still a work in progress.

SAVING LIVES OR SAVING MONEY? UNDERSTANDING THE DUAL NATURE OF PHYSICIAN PREFERENCES

A. Chen, D. Lakdawalla, *University of Southern California, Los Angeles, California*

A longstanding literature has highlighted the tension between the altruism of physicians and their desire for profit. This paper develops new implications for how these competing forces drive pricing and utilization in healthcare markets. Altruism dictates that providers reduce utilization in response to higher prices, but profit-maximization does the opposite. Rational physicians will behave more altruistically when treating poorer patients or those that face higher medical cost burdens, and when foregone profits are lower. These insights help explain the observed heterogeneity in pricing dynamics across different healthcare markets. We empirically test the implications of our model in the aging population by utilizing two exogenous shocks in Medicare price setting policies. Our results indicate that patient income, out-of-pocket costs, and profitability alone explain up to one-quarter of the variation in price elasticities. Finally, we demonstrate that uniform policy changes in reimbursement or patient cost-sharing among older adults may lead to unintended consequences.

LONG RUN ECONOMIC EFFECT OF TELEMONITORING ON THE ELDERLY WITH CHRONIC DISEASES

M. Tsuji, *Economics, Kobe International University, Kobe, Hyogo, Japan*

The rise of medical expenditures of the elderly due to chronic diseases such as heart failure, high blood pressure,

diabetics, and stroke becomes an important social and economic issue. One measure to cope with this is telemonitoring or telemedicine, which monitors biodata of the elderly staying at home including blood pressure, ECG, and blood sugar from remote medical institutions. Nurses monitor data and provide health advice. This study analyzes whether or how much telemonitoring can reduce users' medical expenditures and days of treatment in the long run. Using nine years data from 2002 to 2010 of Nishi-aizu Town, Fukushima Prefecture, Japan, the method of research is to compare the outcomes mentioned above between users of telemonitoring (treatment group) and non-users (control group) based on receipt of payment obtained from the National Health Insurance. The numbers of samples are 90 users and 118 non-users, respectively. Employing rigorous statistical methods, including the Instrumental Variable method, which deals with the endogeneity problem, this paper demonstrated that the treatment group has smaller medical expenditures by USD650 and fewer treatment days by 4.2 than non-users with respect to chronic diseases in the long run. In comparison with author's previous results based on five years data, this paper showed the longer they use, the larger the outcomes. To date, there is no study on examining the long-term economic effects of telemedicine, and thus the economic foundation for the sustainability of the telemedicine project is supported by this study.

SESSION 5035 (SYMPOSIUM)

IMPROVING THE EXPERIENCE OF DEMENTIA AND ENHANCING ACTIVE LIFE: EARLY FINDINGS FROM THE IDEAL COHORT

Chair: L. Clare, *University of Exeter, Exeter, United Kingdom*

Enabling people with dementia and carers to 'live well' with the condition is a key policy objective for most governments in the developed world. Living well with chronic illness or disability has been defined as 'the best achievable state of health that encompasses all dimensions of physical, mental and social wellbeing'. The IDEAL study aims to identify what helps people to live well or makes it difficult to live well in the context of having dementia or caring for a person with dementia, and to understand what 'living well' means from the perspective of people with dementia and carers. The study examines the way in which social capitals, assets and resources, the challenges posed by dementia, and the ways in which people adjust and cope affect well-being, life satisfaction and quality of life. Over a two-year period, we have recruited and interviewed 1500 people with early-stage dementia from across the UK, together with a carer wherever possible (carer n = 1352). All the participants will be followed up after 12 and 24 months. A smaller group is interviewed in more depth during each wave. In this symposium we present a profile of the IDEAL cohort followed by preliminary findings focused on (a) results of our systematic review of quantitative studies of variables associated with quality of life; (b) an analysis of levels of loneliness expressed by people with dementia and carers at the baseline interview; and (c) themes and methodological considerations arising from our initial round of qualitative interviews.

IMPROVING THE EXPERIENCE OF DEMENTIA AND ENHANCING ACTIVE LIFE (THE IDEAL STUDY): COHORT PROFILE

L. Clare¹, S. Nelis¹, Y. Wu¹, A. Martyr¹, M. Knapp², C. Henderson², R. Lamont¹, F. Matthews³, 1. *University of Exeter, Exeter, United Kingdom*, 2. *London School of Economics, London, United Kingdom*, 3. *Newcastle University, England, United Kingdom*

The IDEAL study population was recruited through a network of 29 National Health Service sites across England, Scotland and Wales. The baseline cohort (recruited August 2014 – June 2016) included 1500 community-dwelling individuals who had a clinical diagnosis of dementia and where possible their carers (N=1352). Of these participants, 43% were women, 11% had early onset dementia (aged<65), 75% reported two or more co-morbid health conditions, 17% lived alone, and 12% lived in more deprived areas. The percentages of specific dementia subtypes were: 56% for Alzheimer's disease 56%; vascular dementia 10%; mixed dementia 20%; fronto-temporal dementia 4%; Parkinson's disease dementia 3%; dementia with Lewy bodies 3%; other 5%. Among the 1352 carers, 82% were spouses/partners and 15% were adult children. Nearly 20% of participants with dementia lived alone. This large-scale cohort includes a diverse sample of people with dementia in terms of specific subtypes, demographics, living situation and carer relationship.

FACTORS ASSOCIATED WITH QUALITY OF LIFE IN DEMENTIA: A CORRELATIONAL META-ANALYSIS

A. Martyr¹, Y. Wu¹, R. Morris⁵, J. Hindle², J. Rusted³, J. Thom⁴, R. Clarke³, L. Clare¹, 1. *University of Exeter, Exeter, United Kingdom*, 2. *Bangor University, Bangor, United Kingdom*, 3. *University of Sussex, Brighton, United Kingdom*, 4. *University of New South Wales, Sydney, New South Wales, Australia*, 5. *Kings College Hospital, London, United Kingdom*

Quality of life (QoL) in dementia has been extensively investigated, but to date no comprehensive meta-analysis has synthesized evidence from quantitative studies to identify variables associated with QoL. In our systematic search we identified 306 articles that met inclusion criteria. There was sufficient data to analyse the association of 32 variables with self-rated and 36 with informant-rated QoL. Greater depression and more impaired basic activities of daily living were moderately associated with poorer self-rated and informant-rated QoL, although there was considerable heterogeneity. Carer depression and greater carer burden were also moderately associated with poorer informant-rated QoL. Basic demographic variables such as age, education, gender, and marital status explained only a very limited proportion of variance, with low levels of heterogeneity. Other associations were small or negligible. The finding that diverse variables make small contributions to QoL suggests there may be individual differences in what is important for QoL.

DUALITIES OF DEMENTIA ACCOUNTS: BIOGRAPHICAL RECONSTRUCTION AND NARRATIVE ECONOMIES

I.R. Jones², A. Hillman², C. Quinn¹, L. Clare¹, 1. *University of Exeter, Exeter, United Kingdom*, 2. *Cardiff University, Cardiff, United Kingdom*

Given the increasing success of campaigns to ensure the voice of people with dementia is represented, there are a growing number of people in the early stages of dementia being called upon to account for their experience, as a means of developing a collective illness identity. This paper draws on qualitative interviews with IDEAL pilot study participants who were members of a patient advocacy group and who represent the voices of patients and carers in research. We explore two connected themes: firstly, the ways in which people with dementia participate in identity construction, performing biographical reconstruction to make sense of their lives and preserve their sense of self; and secondly, as representatives of the patient voice, these interviews produce dementia illness narratives that are a source of material and symbolic value. The paper reflects on the dualities and tensions within these different narratives.

LETTING GO OF COHERENCE: THE CHALLENGES OF REPRESENTING DEMENTIA

A. Hillman², I.R. Jones², C. Quinn¹, L. Clare¹, 1. *University of Exeter, Exeter, United Kingdom*, 2. *Cardiff University, Cardiff, United Kingdom*

Drawing on IDEAL study in-depth interviews, this paper explores a sociological response to the 'turn to personhood' in qualitative research with people with dementia. Recognizing the voice of the person with dementia has led to important methodological developments to mitigate the practical difficulties of doing research with people for whom recalling events and reflecting on their meaning poses a challenge. This paper suggests that methods, including the qualitative interview, are imbued with a politics of selfhood in which individuals give coherence to experience and emotion. Such a politics jars with representations of dementia as a gradual decline in capacity, including a capacity to speak. The problem of representation in dementia research requires us to re-think method and methodology: firstly, to re-assess expectations of the research encounter; and secondly, to develop alternative interpretations of meaning which support difference in social and temporal frames, rather than seeking to eliminate them.

HOW LONELY AND ISOLATED ARE OLDER PEOPLE WITH DEMENTIA AND THEIR CARERS?

C. Victor¹, Y. Wu², R. Jones³, M. Kopelman⁴, N. Savitch⁵, J. Pickett⁶, S. Nelis², 1. *Brunel University, Uxbridge, United Kingdom*, 2. *University of Exeter, Exeter, United Kingdom*, 3. *RICE, Bath, United Kingdom*, 4. *Kings College London, London, United Kingdom*, 5. *Innovations in Dementia, London, United Kingdom*, 6. *Alzheimer's Society, London, United Kingdom*

Loneliness and/or isolation are key indicators of quality of life and living well. Using data from the IDEAL study we investigated the prevalence of loneliness and isolation for people with dementia and their carers. Loneliness was measured using the six-item de Jong Gierveld scale and isolation by the six-item Lubben social network measure. Preliminary data analysis reports a prevalence of loneliness for people with dementia of 7.8%, comparable with the 10% reported for the general population of older people aged 65+, and a prevalence of 31.8% for carers. Mean network sizes were 15 for people with dementia and 17 for carers, which are

comparable with the general population. People with dementia demonstrate levels of social engagement broadly comparable with rest of the population. Carers, whilst reporting network sizes similar to the general population, report very much higher levels of loneliness, highlighting the importance of relationship quality for living well.

SESSION 5040 (PAPER)

VOLUNTEERING/CIVIC ENGAGEMENT/SOCIAL INCLUSION

FACTORS ASSOCIATED WITH SOCIAL ACTIVITY PARTICIPATION AMONG MIDDLE-AGED AND OLDER CHINESE IN CHINA

A. Restorick Roberts^{1,2}, X. Pan³, Y. Lee⁴, 1. *Family Science & Social Work, Miami University, Oxford, Ohio*, 2. *Scripps Gerontology Center, Oxford, Ohio*, 3. *Texas State University, San Marcos, Texas*, 4. *University of Calgary, Calgary, Alberta, Canada*

Research from Western samples has linked participation in social, leisure, and other productive activities in later life with better physical and mental health. In China, social activity participation is an understudied, yet important topic. To measure and investigate social activity participation in China, ten items were included in the first wave (2011) of the nationally representative Chinese Health and Retirement Longitudinal Study (CHARLS). In this study, we aimed to (1) classify the dimensions of social activity among middle-aged and older Chinese adults through an exploratory factor analysis (EFA), and (2) identify the socio-demographic characteristics associated with each factor through a confirmatory factor analysis (CFA). Results from the EFA identified four dimensions of social activity, including informal volunteering (helping others without organizational affiliation), leisure (interacting with friends), formal volunteering and learning (charity work through an organization and lifelong learning), and technology use. The indices suggested that the hypothesized model fit the data adequately (1, $n=16,224$) =13.50, $p=.26$; RMSEA=.01; CFI=.99; TLI=.99; SRMR=.02. CFA findings showed that socio-demographic factors including age, education, marital status, and residential region were significantly associated with the informal volunteering factor, but not the other three factors. Respondents who were older ($\beta=.06$, $p < .01$), higher educated ($\beta=.04$, $p < .01$), married ($\beta =.14$, $p < .001$), and living in an urban region ($\beta =.13$, $p < .001$) were most likely to volunteer informally. In conclusion, this study establishes a framework for classifying dimensions of social activity participation that can be used in future research to explore cross-cultural comparisons.

EXPERIENCING CIVIL UNREST: ELDER VOICES ON FERGUSON

N.L. Morrow-Howell, C. Jackson, S. Herbers, *Washington University in St. Louis, St. Louis, Missouri*

Ferguson, Missouri, USA became the center of the nation's attention in August 2014, when an unarmed African American teenager was killed by a Caucasian police officer. Civic unrest continued for weeks. Images and voices in the news were largely of youth; the involvement of older adults was not evident. The aim of Elder Voices on Ferguson was to

hear how older adults experienced the social unrest and how they thought about improving their community. Ten focus groups were conducted with 73 participants. Focus group recordings were transcribed; and three coders completed a thematic analysis and member checking. Participants averaged 75 years of age, 73% were female, and 59% were African American with the remainder White. Eight themes were identified. Issues related to safety were most commonly discussed. Some focus group members participated in the protests but left before nightfall because they felt vulnerable. Concerns about going out after dark remain strong. Some felt intimidated to attend community meetings because of the angry nature of the discussion. There was recognition of on-going racism and long-standing problems in the community. Participants expressed concern and understanding toward the challenging situations faced by today's youth, including lack of opportunity in education and employment and lack of strong parental and community support. Participants reported a breakdown in intergenerational communications and expressed a desire for more exchange. Findings are being discussed with relevant organizations and public officials to increase the involvement of older adults in on-going community development efforts and to provide opportunities for intergenerational dialogue.

DOES VOLUNTEERING BUFFER HEALTH DURING THE RELOCATION PROCESS? A PROPENSITY SCORE ANALYSIS

E. Gonzales^{1,2}, Y. Wang³, H. Shen⁴, T.E. Perry⁵, 1. *School of Social Work, Boston University, Boston, Massachusetts*, 2. *Center for Innovation in Social Work and Health, Boston, Massachusetts*, 3. *Washington University in St. Louis, St. Louis, Missouri*, 4. *University of Missouri, St. Louis, St. Louis, Missouri*, 5. *Wayne State University, Detroit, Michigan*

Formal volunteering in later life has been shown to improve health. However, few studies have examined how volunteering can help to buffer health during life-transitions (e.g., relocating from one residence to another). Relocation in later life, at times, is unavoidable. Older adults may move by choice or due to changes in health, widowhood, financial circumstances, etc. Although health outcomes of relocation are mixed, we ask: can volunteering buffer one's health for those who relocate? We utilized 2008 and 2010 Health and Retirement Study and included individuals who were aged 50+, did not volunteer at baseline, and relocated between 2008 and 2010 (N=835). With volunteer engagement as the "treatment," propensity score weighting was performed step-by-step: 1) To estimate the propensity score, the Generalized Boosted Regression (GBR) model was run with a comprehensive set of covariates at the baseline (socio-demographic, health, social network, etc.); 2) Using the propensity score, two types of propensity score weights were calculated: the average treatment effect (ATE), and the treatment effect for the treated (ATT); and 3) To examine the effect of the "treatment," volunteering, on health outcomes in 2010, regression models were performed with ATE and ATT weights. Results suggested engaging in volunteering increased self-report health status; and reduced number of ADL and IADL difficulties. Volunteering did not influence depressive symptoms. Implications for policy and practices intersecting relocation

and volunteering will be discussed. Future research should examine the role of specific mechanisms of volunteering (e.g. social engagement, psychological motivations, neighborhood friendliness) and their impacts on health.

ENGAGING AGEING COMMUNITIES AS CO-CREATORS OF SOCIAL SERVICES AND SUPPORT

S. van der Pas, *University of Applied Sciences Leiden, Leiden, Netherlands*

As the welfare state retracts, the role of civil society increases. With rising cuts in welfare budgets, there is an increasing need for creative innovations by civil initiatives to cater for welfare and care arrangements. Older adults, social professionals and civil servants take on new roles that require specific capacities/practices of interaction. In this study we apply co-creation as a novel approach to enable older adults to gain ownership over their social and physical environment. Co-creation can be defined as a practice of interactions between older adults, professionals, students, researchers and community stakeholders who jointly define needs and choices as well as design and implement services and support. In a field lab on 'Living Independently for longer', with an elderly community co-operative in the Netherlands, we find that the co-creation approach, fostered empowerment, a more positive image of older adults, and led to the development of age-friendly services and support.

SESSION 5045 (SYMPOSIUM)

AGEING THE CARE OF OLDER ADULTS IN HOSPITALS THROUGH INNOVATIVE MODELS OF ACUTE CARE FOR ELDERLY

Chair: S. Sinha, *Mt Sinai Hospital, Toronto, Ontario, Canada*

Co-Chair: N. Foster, *Mt Sinai Hospital, Toronto, Ontario, Canada*

At Mount Sinai Hospital, in Toronto Canada, the Acute Care for Elders (ACE) Strategy was conceived as a multi-component intervention incorporating a series of evidence-informed but tailored inter-professional interventions (i.e., ISAR Screening, GEM, ACE Units, HELP, House Calls etc.) to improve the care of hospitalized older adults. Starting from fiscal year 2010/11 onwards, a number of evidence informed interventions were gradually implemented each year in a variety of individual patient settings while also looking to address the important issue of transitions especially between hospital and home. The ACE Strategy links these interventions to create a more seamless, integrated inter-professional and team-based delivery-model spanning the continuum of care

Our proposed symposium will explore outcomes related to the implementation of this innovative strategy through four talks: 1) "Establishing the Effectiveness of an Acute Care for Elders (ACE) Strategic Delivery Model" by Dr. Samir Sinha 2) "Measuring the Impact of the GEM Nursing Role in the Emergency Department Setting" by Ms. Nana Asomaning, 3) "Outcomes of a Quality Improvement Intervention to Reduce Unnecessary Urinary Catheter Utilization" by Dr. Richard Norman and 4) "Hospitalization

and Place-of-Death Among Homebound Older Adults in a Home-Based Primary Care Program” by Dr. Nathan Stall.

The goal of our symposium is to review this innovative strategy for supporting the acute care needs of the elderly. The symposium will conclude with an interactive discussion exploring the facilitators and barriers to the implementation of effective and integrated acute care models for the elderly.

ESTABLISHING THE EFFECTIVENESS OF AN ACUTE CARE FOR ELDERLY (ACE) STRATEGIC DELIVERY MODEL

S. Sinha^{1,2}, J. Bennett², J. Bon², T. Chalk², 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *Sinai Health System, Toronto, Ontario, Canada*

The Acute Care for Elders (ACE) Strategy recognizes the high-risk environment of the acute care hospital setting to all persons aged 65+. This population accounts for 42% of hospital admissions and 58% of overall hospital days in Ontario. We wanted to determine the effectiveness of a multi-component ACE Strategy to impact patient and system outcomes for older adults admitted to the general medicine wards from April 1, 2009 to March 31, 2014. A quasi-experimental time series analysis was conducted on the outcomes of 9,595 patient admissions. Results showed there was a 27.8% decrease in mean length of stay, 23.8% decline in the ALOS/ELOS ratio, and a 13.4% decline in readmissions with an 11% increase in the number of older patients being able to return home after discharge. This Strategy demonstrates the benefits from linking multiple evidence-informed models across the continuum of care in achieving patient and system outcomes.

MEASURING THE IMPACT OF THE GEM NURSING ROLE IN THE EMERGENCY DEPARTMENT SETTING

S. Sinha^{1,2}, N. Asomaning², 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *Sinai Health System, Toronto, Ontario, Canada*

With older adults increasingly becoming significant users of emergency department services, the creation of a Geriatric Emergency Management (GEM) Nursing Role has been one response to improve the overall delivery of care to older adults 65+ at higher risk of admission. In 2009, Mount Sinai Hospital established such a role and subsequently expanded it to a 7-day a week service with additional nurses. During the 2014/15 fiscal year we evaluated the impact of the care our GEM Nurses provided on ED Visitors 75+ whom they saw versus those who they didn't. In 2014/15 they saw a total of 1024 patients, 783 who were 75+. Patients seen were more likely to arrive by ambulance and be more medically complex. Through proactive screening and engagement with appropriate community supports, GEM nurses contributed to a total of 17 avoidable hospital admissions, 195 avoidable hospital days that led to \$189,000 saved for the hospital alone in a 12 month period.

OUTCOMES OF A QUALITY IMPROVEMENT INTERVENTION TO REDUCE UNNECESSARY URINARY CATHETER UTILIZATION

R. Norman¹, R. Ramsden², L. Ginty², S. Sinha^{1,2}, 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *Sinai Health System, Toronto, Ontario, Canada*

Urinary catheters are often placed unnecessarily, exposing patients to complications including urinary tract infections, falls, deconditioning, pressure ulcers and death. As older adults are at particular risk of these sequelae, we introduced a multi-modal intervention incorporating educational posters, small group teaching sessions, and changes to the hospital's computer physician order entry and nursing documentation systems to encourage evidence-based utilization of urinary catheters. A total of 24,499 patient admissions were included during the overall 41month study period. A quasi-experimental interrupted time series study was designed using segmented regression to assess outcome indicators. Across the services under study, mean catheter days per patient decreased by between 5.6 and 10.0 days ($p < 0.01$), while the absolute incidence of urinary catheterization almost halved across the same cohort ($p < 0.01$) following the intervention. The results from this study suggest that a relatively simple bundle of interventions can result in dramatic health outcome improvements.

HOSPITALIZATION AND PLACE-OF-DEATH AMONG HOMEBOUND OLDER ADULTS IN A HOME-BASED PRIMARY CARE PROGRAM

N. Stall¹, K. Salvi³, A.P. Costa², M. Nowaczynski^{4,1}, S. Sinha^{1,3}, 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *McMaster University, Toronto, Ontario, Canada*, 3. *Sinai Health System, Toronto, Ontario, Canada*, 4. *SPRINT Seniors Care, Toronto, Ontario, Canada*

Frail and homebound older adults are poorly served by existing primary care models. Home-based primary care (HBPC) can improve access-to-care and postpone adverse events. We completed a retrospective electronic chart review of a single-centre multidisciplinary HBPC program for homebound older adults. Patients with a preceding index acute care hospitalization who were subsequently active in the program for >30 days from October 2009 – April 2013 were enrolled. Hospital utilization one-year pre and post enrolment were compared. Patients active in the program for >90 days (n=94), had a 13.54 day (67.01%) annual reduction in days in hospital ($p < 0.005$) and 0.56 (52.51%) fewer hospital admissions per year ($p = 0.027$). Among patients active for 30 – 90 days (n=24), 16 expired (66.6%) with 8 deaths at home. HBPC as a post-discharge intervention for homebound older adults can significantly reduce future acute care hospital use and allow patients to die at home.

SESSION 5050 (SYMPOSIUM)

COMPARISON OF CENTENARIANS' CHARACTERISTICS AMONG 5 COUNTRIES, THE OLDEST OLD PROJECT (5-COOP)

Chair: F.R. Herrmann, *Geneva University Hospitals, THONEX, Geneva, Switzerland*

Co-Chair: D. Zekry, *Internal Medicine, Rehabilitation and Geriatrics of Geneva University Hospitals*

The number of centenarians is increasing dramatically in high income countries but at different rates due to differences in mortality among the oldest old. Changes in centenarians' functional health status remain controversial. The

5-COOP study, involving 5 countries (Denmark, Sweden, France, Switzerland, Japan), aims to

1. explore whether longevity (the rate of increase in the oldest old) is associated with cognitive and functional status of the survivors,

2. compare the living conditions and variations in health indicators, their level of functioning (mobility, cognition, activities of daily living), physical performance (chair stand and hand grip strength) and comorbidity among the five countries, and

3. analyze the associations between these different health indicators among the five countries.

Representative samples totaling 1253 subjects aged 100 years were surveyed using a common protocol including systematic and validated instruments. The selected countries are comparable regarding the level of wealth and development, access to education and medical resources, data quality and research facilities. They differ in regards to demographics, culture, social policy, and historical events during the past century. Conditions for conducting research surveys also differ in the five countries. This has led to unavoidable differences in sampling procedures, response rates and fieldwork that will be considered in the analyses as they may partly explain some of the variations and associations.

PATTERN OF SURVIVAL AND MORTALITY SELECTION IN THE FIVE COUNTRIES

J. Robine^{6,2}, F.R. Herrmann¹, B. Jeune³, M.G. Parker⁴, Y. Saito^{5,7}, 1. *Internal medicine, rehabilitation and geriatrics, Geneva University Hospitals, THONEX, Geneva, Switzerland*, 2. *Ecole Pratique des Hautes Etudes (EPHE), Paris, France*, 3. *Danish Aging Research Center, Institute of Public Health, University of Southern Denmark, Odense, Denmark*, 4. *Aging Research Center, Karolinska Institute, Stockholm, Sweden*, 5. *Nihon University Advanced Research Institute for the Sciences and Humanities, Tokyo, Japan*, 6. *Université de Montpellier, Montpellier, Inserm, U1198, Montpellier, France*, 7. *for the "Japanese 5-COOP team": Yasu Arai; Yasuyuki Gondo; Hirose Nobuyoshi; Yasu Arai; Donald Craig Willcox; Marina Kozono; Yukie Masui; Hiroki Inagaki, Various cities, Japan*

The aim is to describe the pattern of survival to old ages and the level of mortality selection for the centenarians in the five countries, using standard demographic indicators (i.e., life expectancy, mortality rates and probability to survive to specific ages) and more recently developed longevity indicators (i.e., modal age at death (M), mean deviation at M and centenarian rates). Under the current mortality conditions (years 2010–2012), 6% percent of the female newborn will become centenarian in Japan versus 4% in France and 2% in Denmark and in Sweden. The respective figures for male newborn are 1.4%, 1.1% and 0.6%. As expected the five low mortality selected countries for the 5-COOP study offer a variety of mortality selection for the surviving centenarian which will allow testing possible trade-off between longevity and functioning.

SAMPLING, RESPONSE MODES, AND INTERVIEWER BACKGROUND IN THE FIVE COUNTRIES

F.R. Herrmann¹, J. Robine^{2,3}, A. Skytthe⁴, B. Jeune⁴, Y. Saito^{5,6}, M.G. Parker⁷, 1. *Internal medicine, rehabilitation*

and geriatrics, Geneva University Hospitals, THONEX, Switzerland, 2. *Ecole Pratique des Hautes Etudes (EPHE), Paris, France*, 3. *Université de Montpellier, Inserm, U1198, Montpellier, France*, 4. *Danish Aging Research Center, Institute of Public Health, University of Southern, Odense, Denmark*, 5. *Nihon University Advanced Research Institute for the Sciences and Humanities, Tokyo, Japan*, 6. *for the "Japanese 5-COOP team": Yasu Arai; Yasuyuki Gondo; Hirose Nobuyoshi; Yasu Arai; Donald Craig Willcox; Marina Kozono; Yukie Masui; Hiroki Inagaki, Various cities, Japan*, 7. *Aging Research Center, Karolinska Institute, Stockholm, Sweden*

The aim is to describe response rates, response modes and interviewer background and to check for potential sampling bias among the five countries. Sampling rates were computed by country and sex. By describing the ways by which centenarian lists were obtained and how data were collected in the five countries comparability issues will be discussed. Sampling rates ranged from 30% in France to 86% in Sweden. In Sweden males were oversampled. Response mode consisted in direct interview for 28% of the sample (ranging from 5% in JP to 51% in DK), mixed interview involving both centenarian and a proxy for 39% (from 27% in FR to 48% in CH) and proxy interview for 32% (from 3% in DK to 57% in JP). Interviewer's background differed among countries. Participation rates, response modes and interviewer background should be taken into account when interpreting different health indicators and results will be adjusted accordingly.

LIVING CONDITIONS AND HEALTH CHARACTERISTICS AMONG CENTENARIANS IN THE FIVE COUNTRIES

Y. Gondo⁷, S. Fors⁴, B. Jeune⁵, K. Andersen-Ranberg³, D. Zekry⁶, J. Robine^{1,2}, 1. *Ecole Pratique des Hautes Etudes (EPHE), Paris, France*, 2. *Université de Montpellier, Inserm, U1198, Montpellier, France*, 3. *Dept. of Public Health, University of Southern Denmark, Odense, Denmark*, 4. *Aging Research Center, Karolinska institutet and Stockholm university, Stockholm, Sweden*, 5. *Danish Aging Research Center, Institute of Public Health, University of Southern Denmark, Odense, Denmark*, 6. *Internal medicine, rehabilitation and geriatrics, Geneva University Hospitals, THONEX, Switzerland*, 7. *Osaka University Graduate School of Human Sciences, Clinical Thanatology and Geriatric Behavioral Science, Suita, Osaka, Japan*

About half of the centenarians lived at home in each of the 5 countries except in Switzerland. In France and Japan about 40% lived in their own house and only about 10% lived in an apartment, whereas in Sweden it was the opposite. The proportion living in nursing homes was highest in Switzerland and lowest in Japan. Prevalence of different health indicators varied between countries, e.g., cardiovascular problems ranged from 7 (Japanese men) to 74 (Swiss men) %, inability to walk 500m from 46 (French men) to 87 (Japanese women) %. Associations between these health indicators varied between the five countries. However, no single indicator or association suffices to explore our research questions. Cross-country analyses will help us understand differences and associations between different health indicators and suggest possible effects of culture, policy and method.

COMORBIDITY, COGNITIVE, FUNCTIONAL, AND FRAILTY STATUS: SIMILARITIES OF THEIR LEVELS AND OVERLAPS

D. Zekry¹, Y. Gondo^{2,6}, M. Herr³, M.G. Parker⁴, F.R. Herrmann¹, K. Andersen-Ranberg⁵, 1. *Internal medicine, rehabilitation and geriatrics, Geneva University Hospitals, Geneva, Switzerland*, 2. *Osaka University Graduate School of Human Sciences, Clinical Thanatology and Geriatric Behavioral Science, Suita, Osaka, Japan*, 3. *INSERM UMR 1168, Université Versailles St Quentin en Yvelines, Versailles, France*, 4. *Aging Research Center, Karolinska Institute, Stockholm, Sweden*, 5. *Dept. of Public Health, University of Southern Denmark, Odense, Denmark*, 6. *for the "Japanese 5-COOP team": Yasu Arai; Yasuhiko Saito; Hirose Nobuyoshi; Yasu Arai; Donald Craig Willcox; Marina Kozono; Yukie Masui; Hiroki Inagaki, Various cities, Japan*

Globally, centenarians living in a nursing home were in a worst health status: 4 fold higher risk of dementia (OR=3.8), 3 to 5 fold worse functional mobility (walk, get out of bed or chair) and 2 fold more weakness assessed by grip strength. Sweden and Denmark had the significantly highest mean MMSE (24 ± 3.7 ; 23.8 ± 5.1); France and Switzerland the lowest (18.7 ± 6.2 ; 18.9 ± 8.0) ($p < 0.001$). In all the 5 countries, cerebro-cardiovascular diseases were the most prevalent comorbidities and they were equally prevalent independently from the living place: hypertension (from 28% in France to 55% in Japan), stroke (from 10% in France and Denmark to 19% in Sweden), and myocardial infarction (from 9% in Denmark to 56% in France).

Multivariate analysis of the associations between comorbidity, cognitive, functional and frailty status will be presented regarding similarities or differences among countries while taking into account survey participation.

SESSION 5055 (SYMPOSIUM)

IMPLEMENTATION OF BEST PRACTICES FOR OLDER ADULTS' TRANSITIONS FROM SKILLED NURSING FACILITY TO HOME

Chair: J. Carnahan, *Indiana University, Indianapolis*
Co-Chair: S. Baharlou, *Icahn School of Medicine at Mount Sinai, New York, New York*
Discussant: L. Lindquist, *Northwestern University, Chicago, Illinois*

Care transitions have become a target for reform efforts in the U.S., yet our current understanding of how to optimize care transitions remains incomplete. Most improvement efforts focus on the discharge process from hospital to home. In the U.S., many older, frail patients are discharged from hospital to a skilled nursing facility (SNF) for post-acute rehabilitation prior to returning home. The SNF to home transition is an equally important transition that has been largely neglected in the care transitions discussion. With this knowledge gap in mind, the Society for General Internal Medicine's Geriatrics Task Force assembled an expert team of physicians and a systems engineer. Clinical expertise encompassed primary care, nursing home, SNF, and the home care environment. Without adequate guidance on this important transition, not only do nursing facilities stand to lose, but

older adults will continue to circulate through the health-care cycle of hospital admissions and readmissions. The team developed a set of consensus Best Practices for transitioning patients from SNFs back to home, which was presented at three national meetings in 2016. This symposium will build upon this groundwork by presenting the "next steps" in the form of a framework for incorporating these Best Practices into routine medical practice.

Symposium presentations will address implementation with a multifaceted approach, including approaches to healthcare culture change, development of process maps, application of quality improvement techniques, and use of healthcare business models and health policy to operationalize health system improvement.

INTRODUCTION AND CONSENSUS BEST PRACTICES FOR SKILLED NURSING FACILITY TO HOME TRANSITIONS

J. Carnahan, *Indiana University, Indianapolis*

Community-dwelling patients treated in U.S. skilled nursing facilities (SNFs) after an acute hospitalization have a high incidence and prevalence of comorbidities and geriatric syndromes. These patients are also high risk for poor outcomes such as death and hospital readmission. This presentation will provide an introduction to the SNF model of care and to characteristics of this patient population, their epidemiology, and their healthcare outcomes and needs. Finally, the Best Practices will be briefly outlined to lay the groundwork for the following presentations, which will highlight practical steps to implementation.

CULTURE CHANGE TO IMPROVE CARE TRANSITIONS: A HUMAN FACTORS ENGINEERING APPROACH

A. Arbaje, *Johns Hopkins School of Medicine, Baltimore, Maryland*

Implementation of the Best Practices requires culture change to ensure sustainability. Older adults, family caregivers, and healthcare providers are all key stakeholders in the process of culture change. Individual-level factors and healthcare system-level factors can either impede or facilitate the culture change that is needed to successfully integrate these Best Practices into daily clinical routine. A systems approach known as Human Factors Engineering (HFE) evaluates the factors in a system that affect human performance. In this presentation, we will: (1) describe key principles of HFE as applied to improving care transitions; (2) use an HFE approach to identify barriers and facilitators to Best Practice implementation; and (3) discuss practical approaches for using HFE principles to strengthen individual health system efforts to implement the Best Practices and improve care transitions.

QUALITY IMPROVEMENT OPPORTUNITIES DURING IMPLEMENTATION OF BEST PRACTICES

S. Baharlou, *Mount Sinai School of Medicine, New York, New York*

Care transitions have been a major focus of quality improvement initiatives for almost two decades, yet little attention has been given to the transition from post-acute care, especially SNF care, to the community. Both post-acute

care and primary care practices benefit from employing quality improvement tactics in order to transform the health environment. In SNFs, the Best Practices can be integrated into both discharge planning and quality metrics. In primary care, billing, coding and monthly staff meetings can incorporate the Best Practices. This presentation will demonstrate how using a continuous quality improvement approach in both settings allows for ironing out the wrinkles in implementation, such as how to streamline communication between the silos of care.

HEALTH POLICY AND BUSINESS MODELS FOR BEST PRACTICES OPERATIONALIZATION

K. Steinberg, *California State University Institute for Palliative Care, San Marcos, California*

Payment models in the U.S. are evolving rapidly to embrace value-based reimbursement to individual clinicians and to healthcare institutions. This presentation will cover an overview of the changes, including readmission penalties and quality indicators impacting Five Star ratings through the Centers for Medicare and Medicaid Services (CMS), the U.S. agency that regulates and insures most impoverished and geriatric Americans. Additionally, alternative payment models (APMs) and other changing paradigms will be considered. The implications for SNFs from these policies will create multiple incentives to improve the transition process from the facility back to the community. These incentives will be discussed as they relate to individual clinicians and to institutions, as strategies to enhance implementation of the Best Practices.

HOW TO GET THERE FROM HERE: PROCESS MAPS FOR IMPLEMENTATION

L. Lindquist, *Northwestern Feinberg School of Medicine, Chicago, Illinois*

By charting the steps of implementation, process maps can both reveal the complexity of the application of the Best Practices as well as set the course for implementation. There are multiple nuances in implementing the Best Practices in part because diverse platforms exist for information transfers: paper SNF to paper primary care systems, paper SNF to electronic primary care systems, electronic SNF to paper primary care systems, and electronic SNF to electronic primary care systems, as well as a variety of hybrid systems. This presentation will present process maps for fluid application of the Best Practices in both the primary care and the nursing facility arenas.

SESSION 5060 (SYMPOSIUM)

INNOVATIVE CARE MODELS FOR OLDER ADULTS WITH COMPLEX MEDICAL, COGNITIVE, AND BEHAVIORAL CARE NEEDS

Chair: M.J. Karel, *Department of Veterans Affairs, Washington, District of Columbia*

Discussant: S.M. Ling, *Centers for Medicare and Medicaid Services, Baltimore, Maryland*

Caring for the older adult with multiple medical, neurocognitive, mental, and/or behavioral comorbidities is a challenge for health care systems. Most health care systems are not

organized to provide integrated, interdisciplinary, coordinated services necessary for safe and effective care of these patients. This symposium addresses the United States Veterans Health Administration's (VHA) efforts to address this need. The first paper summarizes recommendations of the interdisciplinary *Inpatient Care for Veterans with Complex Cognitive, Mental Health, and Medical Needs Task Force*, charged by VHA leadership to recommend evidence-based approaches to improve care for complex patients. The remaining four papers summarize implementation and evaluation of promising interdisciplinary care models. The Des Moines Community Living Center (CLC) Behavioral Recovery Outreach team is facilitating community discharges by supporting implementation of effective behavioral care plans with new care teams. In Boston, the Behavioral Rapid Response Team offers consultation to inpatient and CLC teams to intervene before behavioral concerns escalate into behavioral emergencies, reducing assault rates. In San Francisco, the Behavioral Education and Support Team works with acute medicine to develop behavioral care plans and facilitate more timely discharge of behaviorally complex patients. The VA Medical Foster Home Program provides care for Veterans who meet nursing home eligibility criteria with quantitative and qualitative data demonstrating positive outcomes for Veterans with mental health care needs. These local programs, and others, will serve as models as VHA moves forward in developing, evaluating, and disseminating best practices for the aging complex patient.

INPATIENT CARE FOR VETERANS WITH COMPLEX COGNITIVE, MENTAL HEALTH, AND MEDICAL NEEDS

M.J. Karel¹, J. Cortina¹, R. Allman¹, T.E. Edes¹, M. McGuire¹, S.G. Cooley¹, L. Vinson¹, I. Wiechers², 1. *Mental Health Services, Department of Veterans Affairs, Underhill, Vermont*, 2. *Office of Mental Health Operations, Department of Veterans Affairs, West Haven, Connecticut*

Increasing numbers of aging Veterans with complex and interacting medical, mental health, neurocognitive, and/or behavioral concerns are receiving care in Veterans Health Administration (VHA) facilities. VHA recognized that Veterans with complex care needs may not receive well-integrated care across inpatient care settings (medical/ surgical, mental health, skilled nursing, rehabilitation). A national, interdisciplinary VHA Task Force was established to recommend evidence-based strategies to achieve safe and effective care for this population. The Task Force noted a number of systemic challenges for caring for these patients, including silos of medical, mental health, or geriatric care; gaps in staff competencies; and inconsistent coordination of care across services and settings. Task Force recommendations focused on patient/family-centered models emphasizing care in place when possible, prevention, strengthening of interdisciplinary and integrated medical and mental health care, and attention to staff skills development. Plans for implementing recommendations and conducting systematic evaluation are underway.

THE BEHAVIORAL RECOVERY OUTREACH TEAM: CONTINUITY OF CARE FOR INDIVIDUALS WITH DEMENTIA

K. Matthews, S. Guenther, K. McVay, G. Brass, *VA Central Iowa Healthcare System, Des Moines, Iowa*

A significant subset of Veterans residing in VA Community Living Centers (CLCs) demonstrate challenging dementia-related behaviors that affect their quality of life, stress the caregiving staff, and interfere with successful placement in the community. The Behavioral Recovery Outreach (BRO) team was created at the VA Central Iowa Healthcare System to: (1) treat challenging dementia-related behaviors while Veterans reside in the CLC, and (2) ensure successful placements post-discharge. This team, comprised of a psychologist, nurse, social worker, and recreational therapist, facilitates successful placements by communicating effective behavior plans at discharge, providing on-site visits at 1, 3, 6, and 12 months post-discharge, and providing as-needed consultation. The team, working with 66 Veterans to date, has demonstrated 89% success in community placements. The BRO team implementation process and outcomes will be discussed.

THE BEHAVIORAL RAPID RESPONSE TEAM: EARLY INTERVENTION TO DECREASE ASSAULTS

K. Hinrichs, J. Pepple, S. Terry, J. Bradley, F. Festin, M. Preston, *VA Boston Healthcare System, Brockton, Massachusetts*

Increasing assaults and behavioral disturbances from patients led to creation of a workgroup with representatives from Nursing, Psychiatry, Psychology, and Administration to find patient-centered ways of decreasing assault rates. The Behavior Rapid Response Team (BRRT) was created to provide early intervention and behavioral consultation for patients showing escalating anger and potential for aggression before behavior requires an emergency response. BRRT is available 24/7 and is staffed by Nursing and Psychiatry. This program was rolled out in VA Mental Health and Community Living Center units and refined prior to roll-out in Acute Medical units. BRRT events and outcomes are documented and tracked. Assaults have decreased dramatically in CLC units - 63 assaults in 2013 down to 13 assaults in 2015 - and Nursing has reported increased confidence in their ability to manage behaviorally difficult patients. The BRRT consultation process and outcomes will be discussed.

THE BEHAVIORAL EDUCATION AND SUPPORT TEAM: INTEGRATED BEHAVIORAL CARE ON INPATIENT MEDICINE

D. Rasin-Waters, B. Kamholz, *San Francisco VA Health Care System, San Francisco, California*

The Behavioral Education and Support Team (BEST) was developed at the San Francisco Veterans Administration Medical Center to address complex patients on acute medical inpatient units and expand into preventive services upon discharge and follow up. BEST is an embedded behavioral health team: advance practice nurse, psychiatric nurse, psychologist, geriatric psychiatrist and occupational therapist. The program is distinguished from an emergency behavioral intervention team and psychiatric consultation-liaison services. Outcome metrics include decreasing length of hospital stay, behavioral altercations, readmissions, staff injuries and emergency behavioral interventions. Behavioral incidents in acute care have decreased due to BEST education of staff, dissemination of behavioral plans and increased collaboration with medical teams. The Joint Commission on Accreditation of Healthcare Organizations requested the program be written up as a best practice. BEST

program development, individual staff roles, collaboration, outcome data and individual case studies will be discussed.

MEDICAL FOSTER HOMES: PERSONALIZED LONG-TERM CARE FOR VETERANS WITH MENTAL HEALTH CARE NEEDS

L.M. Haverhals¹, C. Levy¹, C. Manheim¹, C. Gilman¹, T.E. Edes², *1. VA Eastern Colorado Healthcare System, Denver, Colorado, 2. Department of Veterans Affairs, Washington, District of Columbia*

The Veteran's Health Administration's (VHA) Medical Foster Home (MFH) program offers long-term care for Veterans who meet nursing home eligibility criteria in private homes with qualified caregivers. This mixed methods study analyzed interviews with 20 MFH caregivers across the U.S., regarding their experiences caring for Veterans with complex mental health (MH) needs. All MFH caregivers interviewed had extensive previous caregiving experience. While reporting challenges in caring for Veterans with MH needs, caregivers developed strategies to manage behaviors related to schizophrenia, dementia, and depression by collaborating with VHA's home-based primary care team, learning coping strategies for managing symptoms, and utilizing intercom systems. Caregivers viewed Veterans as family members and assisted with medication management; medication oversight was credited with decreasing the number of MH medications. Additionally, quantitative data comparing MFH to propensity-matched nursing home residents indicated that MFH residents had significantly lower rates of hospitalizations for anxiety and mood disorders.

SESSION 5065 (PAPER)

EDUCATING CLINICIANS AND CAREGIVERS ON DEMENTIA

EVALUATION OF SERVICE NAVIGATION AND NETWORKING FOR DEMENTIA CARE IN RURAL COMMUNITIES (SENDER) APP

I. Blackberry¹, J.C. Farmer², C. Morley⁵, A. Mahoney¹, D. Douglass⁴, T. Torabi¹, C. Wilding¹, D. Morgan³, *1. John Richards Initiative in rural ageing and aged care, La Trobe University, Wodonga, Victoria, Australia, 2. Swinburne University, Hawthorn, Victoria, Australia, 3. University of Saskatchewan, Saskatoon, Saskatchewan, Canada, 4. Heathcote Health, Heathcote, Victoria, Australia, 5. Rural Northwest Health, Warracknabeal, Victoria, Australia*

Identifying and locating appropriate services within a fragmented health systems can be challenging and frustrating due to lack of knowledge on local services (Gorska et al). Rural communities are particularly impacted over long distance travel to access services (Umstattd et al). A smartphone app has the potential to ease service navigation and connect dementia care givers and providers with each other. Using a co-design and co-production approach, we worked and evaluated the feasibility, acceptability and impact of a service navigation and networking app "SENDER", with 24 care givers and providers of people with dementia with smartphones in rural Victoria, Australia. We collated, mapped and uploaded data on local health, community and social services into the app. Through usage monitoring, focus groups, and a survey, we examined how often the SENDER app was

used, how it changed the care givers' knowledge of dementia services and support networks, how it affected their social connectedness to other dementia service users and providers, how its use affected care givers' burden, and how it affected service use. Feedback was also obtained to explore the app's ease of use. The networking function enabled rural dementia service providers and care givers to share information about transportation options to services, what the journey was like, and important amenities during travel and nearby the service. By involving care givers and providers in the app design and beta-testing, we add research knowledge about how to capitalise on revolutions in technology and best use technology to assist in rural dementia care.

ENHANCING UNDERGRADUATE HEALTHCARE EDUCATION IN DEMENTIA: EVALUATING THE TIME FOR DEMENTIA PROGRAMME

S. Banerjee, *Brighton and Sussex Medical School, Brighton, United Kingdom*

Traditional healthcare education, delivered through a series of time-limited clinical placements, often fails to deliver understanding of the experiences of older people with long term conditions. Longitudinal Integrated Clerkships and Senior Mentor Programmes allow students longer placements with continuity of contact and opportunities to learn about chronic illness and patient experience. We developed Time for Dementia (TFD) in an iterative partnership between the Alzheimer's Society, universities and the NHS. TFD was made a core part of the curriculum for all medical, nursing and paramedic students in two universities in south-east England. Students visit a person with dementia and their family in pairs for two hours every three months for two years. They follow a semi-structured interaction guide focussing on broad experience of illness and services by the person with dementia and their family, completing reflective appraisals. We conducted a mixed methods evaluation of TFD of process and its impact on student knowledge, understanding, attitudes and behaviours towards dementia using standardised quantitative instruments and qualitative interviews. The programme was delivered to all 348 eligible students using a network of 174 families. 310 (89%) of the students and 158 (91%) of the families contented to participate. Initial quantitative and qualitative analyses at 1 year suggest a positive impact on students in term of improvement in attitudes to and knowledge of dementia. This demonstrates feasibility and the preliminary data are positive. An assessment of the value of the programme will be provided by the longitudinal quantitative and qualitative data being collected.

ALZHEIMER'S DISEASE KNOWLEDGE AND HEALTH LITERACY IN RURAL RESIDENTS OF FLORIDA AND WEST VIRGINIA

L.K. Wiese, C.L. Williams, R.M. Tappen, D. Newman, *Florida Atlantic University, Boca Raton, Florida*

Rural residents face a higher burden of Alzheimer's disease (AD) related to healthcare access barriers. Studies of AD knowledge in rural residents are limited. The purpose of this study was to:

a) Describe and compare AD knowledge in rural, underserved, older adults in two settings (West Virginia and Florida)

b) Examine factors (e.g. age, sex, ethnicity, education, health literacy, caregiving experience) that may influence AD knowledge.

Participants were adult community residents at low-cost retail stores and senior centers in Glades County, Florida ($n = 200$) and Marion County, West Virginia ($n = 100$). The Basic Knowledge of Alzheimer's Disease scale (BKAD) was first piloted with 240 rural Fayette County, West Virginia Appalachian residents in 2013 with favorable results on reliability and validity testing using RASCH analysis.

Generalized linear mixed modeling revealed that AD knowledge varied between the West Virginia and Florida sites. BKAD total scores were significantly higher ($M = 15.8$; $SD = 2.9$) in Marion County, West Virginia, compared to the Glades, County Florida sample which included 29% African American and 10% Hispanic-American participants ($M = 12.75$; $SD = 3.37$). Health literacy negatively correlated with years in a rural area ($r = -.29$) and years of education ($r = -.47$) in Florida only. Correlations between BKAD knowledge and education were significant in both the West Virginia ($r = .33$) and Florida sites ($r = .59$). Our findings suggest that determining knowledge gaps is important in designing culturally relevant educational programs to increase awareness of cognitive risk and benefits of earlier screening.

CAN A TRAINING MODULE USING VIRTUAL REALITY HELP ADDRESS RESPONSIVE BEHAVIOURS?

L. Garcia^{1,2}, A. Robitaille¹, S. Bouchard³, N. Lesiuk⁴, R. Pinet¹, J. Constable⁵, L. McCleary⁶, K. Rabheru¹, 1. *University of Ottawa, Ottawa, Ontario, Canada*, 2. *Bruyère Research Institute, Ottawa, Ontario, Canada*, 3. *Université du Québec en Outaouais, Gatineau, Quebec, Canada*, 4. *Royal Ottawa Health Care Group, Ottawa, Ontario, Canada*, 5. *Alzheimer Society of Ottawa and Renfrew County, Ottawa, Ontario, Canada*, 6. *Brock University, St Catharines, Ontario, Canada*

Although there has been an increase in programs addressing responsive behaviours (RB) related to dementia, more is needed as caregivers still face difficulties in real-life situations. Virtual reality (VR) has been shown to give a more life-like feel to anxiety-provoking training situations by adding psychological realism and an element of stress to interventions. This project aimed to develop and evaluate a VR module that provides a realistic environment in which caregivers, staff and students in health-care fields can gain knowledge and skills on how best to respond to RBs. Existing training materials were surveyed and two RBs were identified for inclusion in the scene: perceived verbal and physical aggression, and perceived resistance to care. The VR scenario is based on three critical moments for interventions from the user in a dining room scene involving interactions with a resident and his granddaughter (both are virtual character models with motion capture of their body and facial expressions). The module is ready to be tested on pre-professional students, staff, professors, and informal carers to determine whether it may be a useful and usable addition to existing training tools in the future. The results of this consultation will be presented as well as a discussion of the relevance for developing a training tool for all those who come in regular contact with individuals with dementia.

EFFICACY OF AN INTENSIVE TRAINING COURSE FOR DEMENTIA CAREGIVERS

Z. Tan, L. Jennings, K. Ramirez, Y. Kofman, L. Ercoli, *Medicine/Geriatrics, University of California Los Angeles, David Geffen School of Medicine, Los Angeles, California*

Inadequate training and support can lead to higher levels of caregiver stress and burnout, and puts the individual with dementia at increased risk for adverse health outcomes (Schulz & Martire, 2004). To bridge this gap in dementia care, we launched an intensive, one-day training to improve caregiver competence and knowledge of caregiving.

One hundred and five caregivers (74% female; 68% >55 years; 60% White, non-Hispanic; 84% family) for community-dwelling adults with dementia attended an intensive one-day training ("bootcamp") led by health professionals (social worker, nurse, physician, physical therapist and neuropsychologist) in dementia care. We administered the Caregiver Competency Scale, Zarit Burden Interview, and a knowledge test of dementia caregiving pre and post attendance. Paired sample t-tests were conducted to compare scores on pre- and post- test measures.

We found that caregivers' perceived self-competence [$t(66) = 5.76, p < .001$] and self-reported knowledge of dementia caregiving techniques [$t(35) = 5.38, p < .001$] significantly improved after training. Caregivers for persons in moderate-severe stages of dementia reported higher levels of burden compared to caregivers for persons with mild dementia [$t(86) = 1.98, p = .05$]. White and male caregivers reported higher levels of burden compared to caregivers of other ethnicities or female caregivers [$t(86) = 2.26, p < .05$; $t(91) = 2.81, p < .01$].

An intensive one-day bootcamp improves caregiver competence and knowledge. Future work will assess the sustainability of the results over time and its effects on subgroups of caregivers who may be susceptible to higher levels of burden.

SESSION 5070 (SYMPOSIUM)

INSIGHTS INTO THE KEY ROLE OF PHYSICAL ACTIVITY AND EXERCISE ON SUCCESSFUL AGING IN OLDER ADULTS

Chair: N.W. Glynn, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Discussant: K.S. Hall, *Veterans Affairs/Duke University Medical Centers, Durham*

Consensus statements from the American College of Sports Medicine (ACSM)/American Heart Association and the World Health Organization promote regular physical activity during older adulthood as a means to gain substantial health-related benefits including reducing cardiovascular disease risk, preventing or mitigating functional limitation and fall risks, and serving as an effective therapy for several chronic diseases. Although physical activity cannot stop the aging process, the physiological effects of aging are known to be minimized by regular physical activity. What remains unclear is the best physical activity type (e.g., aerobic vs. resistance), intensity, treatment, and prescription for optimal health of older adults. The objective of this symposium, featuring researchers from the ACSM's Aging Interest Group & Strategic Health Initiative on Aging Committee, is to share

evidence-based knowledge and cutting-edge research on the role of physical activity/exercise in older adults on sarcopenia, psychosocial health, falls prevention, and fatigability. Dr. Hayes will examine the impact of resistance training and nutrition interventions for the treatment of sarcopenic obesity. Dr. Guggenheim will discuss the influence of resistance training on physiologic and psychosocial adaptations. Selection of ideal field-based assessments and designing exercise prescriptions for falls prevention programs will be shared by Dr. Thompson, and the relationship between vigorous physical activity and habitual walking on the reduction and/or preservation of fatigability will be explored by Dr. Simonsick. Together, these presentations will sharpen our understanding of the role of physical activity/exercise on successful aging in older adults.

EXERCISE AND NUTRITION INTERVENTIONS FOR THE TREATMENT OF SARCOPENIA: INFLUENCE OF OBESITY

A. Hayes^{1,2}, D. Scott^{3,2}, S. Dorgo⁴, 1. *Victoria University, Melbourne, Victoria, Australia*, 2. *Australian Institute for Musculoskeletal Science, Melbourne, Victoria, Australia*, 3. *Monash University, Melbourne, Victoria, Australia*, 4. *UTEP, El Paso, Texas*

Sarcopenia, the loss of muscle mass and function with aging, is gaining further clinical recognition with an ICD-10-CM code now in place. Obesity complicates sarcopenia, with diagnoses (based on muscle mass alone) often not seen in obese populations. Further, infiltration of fat into muscle - low muscle density as measured by computed tomography - is associated with low muscle strength. As such, exercise and nutrition interventions for sarcopenic obesity need to not only increase muscle mass and function, but also decrease fat mass and infiltration. Resistance training (RT) is a useful treatment for many chronic diseases, and sarcopenia is no different, with RT being shown to increase muscle mass and strength, improve body composition, as well as decrease risk of falls. While diet-induced weight loss is desirable, it can further exacerbate muscle loss, contributing to sarcopenia prevalence. Protein ingestion can help to maintain muscle mass, while promoting weight loss.

STRENGTH TRAINING FOR OLDER ADULTS: PSYCHOSOCIAL AND PHYSIOLOGICAL ADAPTATIONS

J. Guggenheimer, S. Olsen, D. Kurvers, N. Barron, *Nutrition & Exercise Science, St. Catherine University, St. Paul, Minnesota*

Resistance training (RT) has been shown to increase muscular strength and concurrently improve functional ability in older adults (OA). However, there is relatively little research available regarding the impact of RT on quality of life and psychosocial adaptations in OA. While there is myriad data available on the physiological adaptations to RT, there are comparably few studies focused on the psychological and social adaptations resulting from less traditional RT interventions. Therefore the aim of this review was to examine the impact of RT interventions on a variety of physiological and psychosocial outcome variables. As exercise prescription increasingly emphasizes multiple modalities, the

examination of corresponding outcome variables needs to be equally robust in order to reflect the increasingly diverse approaches to exercise prescription and the varied adaptations that accompany them.

FIELD-BASED ASSESSMENTS AND DESIGN OF EXERCISE PROGRAMS AIMED AT FALLS PREVENTION FOR OLDER ADULTS

C. Thompson, *University of San Francisco, San Francisco, California*

Almost one third of older adults over the age of 65 years fall annually. Many of these falls lead to debilitating injury and loss of independence. Fortunately, exercise has been shown to be an effective intervention to reduce falls risk and falls occurrence. Designing effective falls prevention exercise programs for older adults requires the integration of multiple domains of exercise including joint mobility, sensory stimulation, muscle strength and power, static balance, dynamic balance, and gait enhancement. In order to choose the correct combination and challenge of exercises to fit into these domains, it is essential to choose and perform assessments of function that are appropriate for older adults. This session will train participants to perform field-based assessments and design exercise programs using those data.

VIGOROUS ACTIVITY AND HABITUAL WALKING FOR PRESERVING LOW FATIGABILITY IN THE BLSA

E.M. Simonsick¹, A.R. Peterson³, J. Schrack², S.A. Studenski¹, L. Ferrucci¹, 1. *Intramural Research Program, National Institute of Aging, Baltimore, Maryland*, 2. *Johns Hopkins University, Baltimore, Maryland*, 3. *Philadelphia College of Osteopathic Medicine - Georgia Campus, Suwanee, Georgia*

Physical activity protects against functional decline; whether and what type of physical activity reduces and/or preserves fatigability is unknown. We evaluated the relationship between vigorous activity and habitual walking and the level and preservation of perceived fatigability (Borg rating of perceived exertion following 5 minutes of treadmill walking at .67m/s), in over 600 mobility-intact men (48%) and women aged 60–85 participating in the BLSA. In cross-sectional analyses adjusted for age, sex, race and body mass index, each 10 minute/week increment of vigorous activity was associated with lower fatigability ($\beta = -.02$, $p < .001$). Over an average 2.2 years accounting for initial fatigability and length of follow-up, each 10 minute/week increment of vigorous activity was associated with a lower increase in fatigability ($\beta = -.01$, $p = .027$). No associations were found for habitual walking. Findings indicate that preservation of low fatigability requires a high level of participation in effortful activity beyond that obtained in casual walking.

SESSION 5075 (SYMPOSIUM)

PERSON-CENTERED CARE PLANNING IN NURSING HOMES: AN INTERNATIONAL PERSPECTIVE ON THE USE OF NARRATIVE

Chair: K. Scales, *Duke University, Durham, North Carolina*
Co-Chair: K.N. Corazzini, *Duke University, Durham, North Carolina*

Discussant: J. Meyer, *City University London*

Person-centered care planning (PCCP) in nursing homes is based on a holistic perspective emphasizing residents' experiences and agency in all aspects of care (Phelan & McCormack, 2016). Increasingly recognized as a human right (Jönson & Harnett, 2015) and supported by policy in the United States (US) and European countries (Edvardsson et al., 2016), PCCP has been shown to improve outcomes and satisfaction with care (Ekman 2011). Central to PCCP is eliciting each individual's account of their illness or disability; these narratives (Kleinman 1988) are the means by which individuals make sense of their condition. Nursing home staff also develop narratives of residents' experiences; however, these narratives may not be person-centered. The purpose of this symposium is to advance our theoretical, methodological, and empirical foundation to elicit and integrate resident narratives for PCCP from an international perspective. The first study builds the theoretical case for considering narratives in care planning and outcomes. The second study uses data visualization to relate resident narratives in electronic health records to trajectories of care in the US. The third study draws upon resident-elicited narratives of pain in China. The fourth study, also from China, examines resident empowerment and staff respect for resident's individuality, which are foundational to eliciting person-centered narratives. Lastly, we present findings from an intervention study in Sweden, demonstrating effects of PCCP on quality of life and care. Findings across studies are discussed in terms of translational implications for PCCP, with attention to relevancy beyond the US and Western European context.

CONCEPTUALIZING THE ROLE OF NARRATIVES IN PERSON-CENTERED CARE

K. Scales¹, M. Lepore³, E.S. McConnell¹, R.A. Anderson², Y. Song¹, K.N. Corazzini¹, 1. *Center for the Study of Aging and Human Development, Duke University, Durham, North Carolina*, 2. *University of North Carolina-Chapel Hill, Durham, North Carolina*, 3. *RTI International, Washington, District of Columbia*

Person-centered care in nursing homes requires that care teams know each resident as an individual, with attention to their life history, current experiences of health and illness, and preferences for care. This personal knowledge can be understood as an evolving "narrative" – rather than a static, pre-given set of facts – which both reflects and determines patterns of action and interaction. This paper develops the concept of "person-centered narratives," defined as temporal, meaningful, and social discourses (Elliott, 2005) that are shared about individual nursing home residents among members of the care team, and considers their causal significance for care interventions and outcomes. We discuss person-centered narratives in terms of *content*, or the meaning and significance of different narrative elements; *form*, or the ways that narratives develop and change; and *performance*, or the social context of narratives (Mishler, 1995).

The extent to which narratives align or conflict within the care team is highlighted.

TRAJECTORIES OF PERSON-CENTERED CARE PLANNING IN NURSING HOME RESIDENTS: DATA VISUALIZATION

K.N. Corazzini¹, K. Scales¹, R.A. Anderson², Y. Song¹, B. Kang¹, E.S. McConnell¹, A. Vogelsmeier³, 1. *Center*

for the Study of Aging and Human Development, Duke University, Durham, North Carolina, 2. University of North Carolina-Chapel Hill, Chapel Hill, North Carolina, 3. University of Missouri, Columbia, Missouri

Measurement of person-centered assessment and care planning (PCACP) that bridges individualized narrative with outcomes indicators, is a critical methodological challenge to advancing PCACP (Harding, Wait, & Scrutton 2015). Simultaneously, we have made considerable advances in modeling person-level trajectories over time (Henly, Wyman & Findorff 2011). This study describes an approach to measuring PCACP in residents (N=15) diagnosed with congestive heart failure in one nursing facility. Data-intensive, person-level trajectories were constructed integrating electronic health records (EHR) data of nursing staff care collaboration and care management, with resident narratives of care plan goals over a 14-day time period. Data visualization techniques drawing upon Docherty (2015) allowed us to describe care patterns of better or worse functional trajectories co-occurring with care both congruent and incongruent with resident-centered care plan goals. We present findings in the context of how to integrate resident narrative with EHR data to advance measurement and inform practice.

OLDER RESIDENTS' QUALITY OF LIFE IN LONG-TERM CARE FACILITIES IN SHANGHAI, CHINA

J. Wang¹, J. Wang², Y. Cao², S. Jia², B. Wu¹, 1. Center for the Study of Aging and Human Development, Duke University, Durham, North Carolina, 2. Fudan University School of Nursing, Shanghai, China

Person-centered care (PCC) is new in long-term care(LTC) facilities in China. Older residents' individualized needs and sense of autonomy have long been overlooked in long-term care (LTC) facilities in China. Our study aimed to examine older residents' quality of life (QoL), and its relationship to their self-perceived quality of care received, and sense of empowerment in their own care. We conducted in-person interviews among 515 older adults from eight LTC facilities in Shanghai, China. Most participants reported their QOL, care received, and sense of empowerment as fair or poor. Controlling for residents' demographic characteristics, social support, and health status, care received and sense of empowerment were positively associated with their QoL. This study suggests that staff's understanding and respect of residents' individualized needs, and empowering residents are critical to improve their QoL. This study also provides empirical evidence for the importance of implementing person-centered care in Chinese LTC facilities.

PAIN REPORTING AND MANAGEMENT IN CHINESE LONG-TERM CARE FACILITIES: RESIDENT NARRATIVES

Y. Song¹, K. Scales^{1,3}, R.A. Anderson², B. Wu⁴, E.S. McConnell¹, A. Leung⁵, K.N. Corazzini^{1,3}, 1. School of Nursing, Duke University, Durham, North Carolina, 2. School of Nursing, University of North Carolina-Chapel Hill, Chapel Hill, North Carolina, 3. Center for the Study of Aging and Human Development, Duke University, Durham, North Carolina, 4. New York University Rory Meyers College of Nursing, New York, New York, 5. School

of Nursing, Hong Kong Polytechnic University, Hong Kong, Hong Kong

Pain is prevalent and has tremendous effects on residents' daily life, yet is under-recognized and undertreated in long-term care (LTC) facilities globally (Rice, Smith, & Blyth, 2015). In the context of rapid growth of LTC facilities in China, empirical knowledge of resident-level experiences with pain is limited and quality of care is concerning (Shum, Lou, He, Chen, & Wang, 2015). This study aimed to explore challenges with pain reporting and management from residents' perspectives, in order to inform person-centered care strategies to improve quality of pain care. We used semi-structured open-ended interviews with residents (N=5 in one facility). A two-cycle coding approach was adopted (Saldaña, 2012). Multiple challenges with pain reporting and management were described, including residents' perception that staff did not believe reported discomfort, considering pain as normal aging, or ignoring pain as a method of managing. Findings demonstrate the significance of resident narrative to advance care.

EFFECTS OF A PERSON-CENTERED CARE INTERVENTION ON RESIDENT QUALITY OF LIFE AND QUALITY OF CARE

H. Wijk^{2,3}, K.N. Corazzini¹, E. Alexiou³, I. Lindström², K. Swedberg², 1. Center for the Study of Aging and Human Development, Duke University, Durham, North Carolina, 2. University of Gothenburg Centre for Person-Centred Care (GPCC), Gothenburg, Sweden, 3. Sahlgrenska University Hospital, Gothenburg, Sweden

This prospective cohort study measured the effect of implementing a person-centered approach to assessment and care planning on quality of life and incontinence care at three residential care facilities for older persons (N=79) in Sweden. Based on the Gothenburg University Center for Person-Centered Care model (Ekman et al 2015), the 10 week behavioral intervention engaged all staff and management. Resident outcomes of quality of life and continence care were measured at base-line, immediately after, and post-six months; staff outcomes included strain. Resident narratives of needs, preferences and earlier habits were recorded in care plans; nursing notes throughout the intervention were examined in relation to these foundational narratives for congruence. Results indicated a significant increase in tailored, individualized assessments for continence care ($p<.05$), and a positive trend of gains in residents' quality of life. Staff reported decreased job strain ($p<.05$). Findings indicate important effects of PCC on resident and staff outcomes.

SESSION 5080 (SYMPOSIUM)

BREAKING NEW GROUND! TOWARD A RESEARCH AGENDA IN OLDER ADULT LEARNING FOR THE 21ST CENTURY

Chair: B.C. Findsen, University of Waikato, Hamilton, Waikato, New Zealand

Co-Chair: M. Formosa, International Institute on Ageing, Msida, Malta

One key development in the interface between educational gerontology and older adult learning is the unprecedented

exponential growth of the numbers of persons aged 60-plus participating in formal and non-formal learning contexts in addition to self-directed learning initiatives. Many surveys report that one out of every five older persons is engaged in some form of learning, some driven by employment-finding motives, others approaching learning as an end in itself. As a result, the subjects studied, locations of learning, and the emergent social and personal benefits are now increasingly diverse, complex and multifaceted. These factors point towards an urgent need to embed the field of late-life learning in rigorous academic scholarship. Unfortunately, this been slow to materialise as adult education and gerontology research are still appropriated by economic competitiveness and a 'caregiver lens' respectively, a state of affairs that has left out the subject of older adult learning out in the cold as far as legitimate scholarship is concerned. This symposium attempts to reverse such a trend by acting as a catalyst to showcase the pressing need for a holistic research agenda for older adult learning. This agenda re-thinks the notion of learning in a way that it reverberates with the psychosocial transitions experienced at the latter ends of the life course; is sensitive to the heterogeneity of older persons due to social class, gender, ethnic, and sexual differences; enhances our insight in the relationship between independent, self-organised, and online learning; as well as pushing the field beyond an Anglo-Western lens by studying differences in late-life learning in different regions, nations, and continents. In reaching out to such objectives, this symposium includes speakers from New Zealand, Australia, Malta, Hong Kong, and Italy, each of whom will put forward a series of goals and objectives for future research for late-life learning.

CONCEPTUAL ANALYSIS AND EMERGENT ISSUES IN LATER-LIFE LEARNING

B.C. Findsen, *Te Whiringa School of Educational Leadership & Policy, Faculty of Education, University of Waikato, Hamilton, Waikato, New Zealand*

The field of learning in later life (educational gerontology) has developed intermittently since the 1980s but is increasingly being taken seriously by selected governments who are cognisant of the "ageing time-bomb" of increasing numbers of older people in their societies and the challenges of how to adequately provide resources, including education, to heightened their quality of life. Historically, in the allocation of resources, later life education typically has received miniscule amounts and within some sectors aligned to social stratification, many older people miss out entirely. This presentation focuses on conceptual issues related to seniors' learning/education (especially related to lifelong learning) and issues which have emerged for older people and their societies. Illustrations of problematic concepts and emergent issues are derived principally from the context of Aotearoa New Zealand.

OLDER MEN LEARNING THROUGH RELIGIOUS AND POLITICAL AFFILIATIONS: CASE STUDIES FROM MALTA

M. Formosa, *University of Malta, Msida, Malta*

This article examines two case studies from Malta that focus on older men learning through informal avenues. The

first case study investigated the role of a community-based organisation – namely, a religious confraternity dedicated to 'Our Lady of Immaculate Conception' of the village of Mqabba – as an avenue for informal learning activities for older men. The second case study investigated the connection between affiliation in the Labour Party Veterans' branch of the Labour Party (Malta) and informal learning. The case studies were carried out by employing a qualitative-methodological framework whereby data was collected through semi-structured interviews. The intent was to reveal the perceived interests and expectations regarding what would be considered a satisfying lifestyle in the context of membership of older men in both organisations. Findings revealed the benefits that older men enjoy through participation in such organisations, including increased levels of independence, improved social participation, and positive effects on participants' self-esteem and personal confidence. Informants reported that membership also contributed to their mental and physical health and to increased activity. Many underlined how participation aided them in escaping boredom and keeping in touch with the outside world. Findings also highlighted that only a few informants were simultaneously involved in organisations and activities not related to their religious and political affiliations, which highlights the importance of both informal learning channels in helping older men lead successful and active lives.

KEY COMPETENCIES IN LATE-LIFE LEARNING: TOWARD A GERAGOGICAL CURRICULUM

B. Baschiera, *1. University Ca' Foscari of Venice, Venice, Italy, 2. University of Malta, Malta, Malta*

The European Commission stipulates a range of key competencies as the objectives for lifelong learning, competencies which are deemed necessary for personal development, social inclusion, active citizenship, as well as employment. Although it is stipulated that these competencies are relevant to all learners, many adult education specializing in older adult learning point to the ageist biases so prevalent in the Commission's vision. Taking into account such criticism, this paper reports the salient results of an education programme which endeavoured to (i) encourage the participation of persons aged 65 + in Life-long Learning through the development of their key competencies; (ii) strengthen older learners' levels of social inclusion; (iii) provide traineeships train adult and/or seniors training organizations, seniors associations and (educational) public bodies in the field of training for seniors; and (iv), design a relevant geragogical curriculum for learning competencies for older adults. Results indicated that older learners required a curriculum that improved their competencies in 'self-transformation' which included three dimensions: psychological (changes in understanding of the self), transcendental (revision of belief systems), and behavioural (changes in lifestyle). In practice, older learners declared that, as the result of this geragogical curriculum, they felt more capable to generate a fruitful relationship with others coming from different cultural backgrounds, travel abroad independently, be more aware of current affairs, and becoming closer to their grandchildren.

HONG KONG AND AUSTRALIAN SENIORS: VIEWS OF AGING AND LEARNING

G. Boulton-Lewis¹, M. Tam², L. Buys³, E. Chui⁴, 1. *Queensland University of Technology, Brisbane, Queensland, Australia*, 2. *The Education University of Hong Kong, Hong Kong, Hong Kong*, 3. *School of Design, QUT, Queensland, Queensland, Australia*, 4. *The University of Hong Kong, Hong Kong, Hong Kong*

Qualitative, semi-structured interviews, using open ended questions, were conducted with 40 older Australians and 39 seniors in Hong Kong who either had or had not engaged in organized learning in the last six months.

The samples were chosen using a purposive sampling strategy. In Australia participants were identified from 400 respondents to a Perceptions of Learning Survey distributed through seniors' organisations. In Hong Kong the respondents participated in the same survey and were invited to take part in follow up interviews.

Interviews were recorded, translated in Hong Kong, and transcribed,

Phenomenology was used to guide the interviews and analysis to explore the experiences and perspectives of these older people.

The biggest difference in views of aging was that 20% of the Hong Kong group as compared with 5% in Australia talked about aging in terms of decline. The views of learning also differed in both places. In Hong Kong 25% the main focus of learning was about health as compared with 5% of Australians.

The results and differences will be discussed in terms of life history in interaction with environment and values of culture and community. The implications will also be considered.

LEARNING FOR AND BY SENIOR ADULTS: AN ASIAN PERSPECTIVE

M. Tam, *The Education University of Hong Kong, Tai Po, Hong Kong*

Each culture has beliefs and ideas about the lifecycle including how people age and learning in later life. This presentation discusses the influence culture has on the view of ageing and older adults learning. It also attempts to elucidate what ageing and learning mean to people across different cultures.

With respect to learning, there is no shortage of research into the relationship between culture and learning. Yet much of it is confined to comparisons between Eastern and Western cultures. However, the East-West view of culture and learning has been criticized for being overly simplistic because cultures may overlap to result in both similarities and differences as people conceptualize and experience learning in different cultural contexts. With a focus on the Asian perspective, or more specifically, the Confucian philosophy of lifelong learning, this presentation discusses the cultural meaning of lifelong learning for older people in their cultural and social contexts.

SESSION 5085 (SYMPOSIUM)

RAISING AWARENESS ABOUT HEALTH EQUITY, PRODUCTIVE AGING, AND AT-RISK OLDER ADULTS

Chair: E. Gonzales, *Boston University, Boston, Massachusetts*

Co-Chair: R. Harootyan, *Senior Service America Inc, Silver Spring, Maryland*

Discussant: C. Matz-Costa, *Boston College*

This symposium integrates the phenomena of health equity and productive aging to help identify solutions that address disparities in health. We define health equity as social justice in health; measures of health disparities indicate the degree of inequity. Productive aging is defined as any activity that produces a good or services for society, whether paid for or not (e.g., employment, caregiving). How can social structures be revamped or expanded to promote greater productivity and health equity? How can policies and programs maximize positive outcomes for individuals and society?

Harootyan underscores the challenges in promoting computer literacy among offline older adults and presents multivariate survey results indicating how special computer training approaches not only improve older adults' instrumental skills but their mental health as well. Yulikova presents data on how a state's programs for disadvantaged unemployed seniors integrate many approaches to achieve productive engagement while also promoting self-health awareness/management. Lee et al. offer evidence that reducing financial hardship among racial minority family caregivers can improve the caregiver's health, regardless of differences in the care recipient's level of functional limitations. Gonzales et al. identify how cumulative inequality or unanticipated shocks disrupt the aging process and place unemployed older adults in tenuous circumstances leading to enrollment in SCSEP; yet, participants also reported resilience with high levels of individual, institutional, and environmental resources that promote their health.

Altogether, these quantitative and qualitative studies raise awareness of health inequities among at-risk older Americans and offer implications for policies and practices that can reduce health disparities.

EXPLORING HETEROGENEITY OF CO-OCCURRING RISKS AND RESOURCES AMONG AT-RISK OLDER ADULTS

E. Gonzales^{1,2}, R. Harootyan^{3,2}, K. Lee^{4,2}, 1. *School of Social Work, Boston University, Boston, Massachusetts*, 2. *Center for Innovation in Social Work and Health, Boston, Massachusetts*, 3. *Senior Service America, Inc., Silver Spring, Maryland*, 4. *Ohio State University, Columbus, Ohio*

This study explores the heterogeneity of co-occurring risks, barriers, resources, and preferences among at-risk older adults in the Senior Community Service Employment Program (SCSEP).

In-depth individual semi-structured interviews were conducted with 26 participants that explored risks, barriers, resources (individual, institutional, environmental), and workforce preferences. Interviews were audio-recorded and transcribed verbatim. Themes and variations across properties and dimensions were identified using constant comparison technique.

Two major themes emerged: cumulative disadvantages and highly disruptive shocks (health, economic or social) that led to SCSEP participation. While co-occurring risks and barriers were evident, many participants reported improved health during their SCSEP tenure. This study expands our understanding of SCSEP as having aspects of

community-based productive engagement that improve physical and mental health for at-risk older adults. Knowledge of co-occurring risks, barriers, resources and preferences suggests how Department of Labor performance measures can be enhanced to improve measurement of SCSEP participants' health and economic well-being.

PRODUCTIVE ENGAGEMENT IN COMPUTER TRAINING PROMOTES INSTRUMENTAL SKILLS AND MENTAL HEALTH OF SENIORS

R. Harootyan, 1. *Research, Senior Service America Inc, Silver Spring, Maryland*, 2. *Harootyan2, LLC, Vienna, Virginia*

People ages 65+ are least likely to use the Internet (59%) versus all adults age 18+ (87%). National surveys show that low-income/less educated seniors are much less likely to be online than more advantaged seniors. Only 19% of seniors without a HS diploma are Internet users, compared to 87% with a college degree. Reaching out to offline elders is especially challenging because of their high computer anxiety level and belief that the Internet is irrelevant.

Regressions and pair-wise analyses of 10,000 survey responses from older learners in the Digital Inclusion Initiative and from a program targeting low-income elders show that peer coaching in group settings effectively ($p < .05$) promotes 1) instrumental skills and 2) improved mental well-being (10-item pre/post morale scale). One significant predictor is the number of coaching sessions attended, suggesting that social engagement in a positive learning environment leads to both computer skill development and improved mental well-being.

UNDERSTANDING THE IMPACT OF RACIAL AND ETHNIC MINORITY FAMILY CAREGIVERS' ECONOMIC STRAIN ON HEALTH AND WELL-BEING

K. Lee¹, H. Dabelko-Schoeny¹, E. Gonzales², 1. *The Ohio State University, Columbus, Ohio*, 2. *Boston University, Boston, Massachusetts*

The purpose of this study is to investigate how care recipients' vulnerability and family caregivers' financial hardship mediate the relationship between informal care provided by non-white family caregivers and the caregiver's self-rated health.

Data from the 2013 Family Caregiver National Survey (Administration on Aging) were analyzed, using the PROCESS macro (Hayes, 2013) in SAS to conduct serial multiple mediator analysis. Results indicate that caregiving by non-white family caregivers negatively affected self-rated health serially through care recipients' ADL limitations and caregivers' financial hardship. Caregivers' financial hardship mediates the relationship between non-white family caregivers' caregiving and self-rated health. However, care recipients' ADL limitations did not mediate the relationship ($CI = -0.004$ to 0.020).

Funding for specific services that offset the high cost of providing care can assist economically disadvantaged family caregivers to continue to provide informal care. Policies and programs should focus on reducing financial hardship of racial minority family caregivers.

THE EFFECTIVENESS OF THE CHRONIC DISEASE SELF-MANAGEMENT PROGRAM AMONG AT-RISK OLDER ADULTS

O. Yulikova, *Massachusetts Executive Office of Elder Affairs, Arlington, Massachusetts*

The USDOL found that many unemployed low-income older adults in the Senior Community Service Employment Program (SCSEP) lack skills for managing chronic illnesses, which jeopardizes their employment prospects. 14% of SCSEP participants in Massachusetts leave the program for health/medical reasons. This study explored whether the evidence-based Chronic Disease Self-Management Program bolstered participants' ability to manage health conditions and could have wider policy implementation in workforce system.

Sixty SCSEP participants received CDSMP training during 2013. 100% completed the workshops. Thirty individuals completed post workshop survey. Descriptive analysis of pre/post questionnaires indicates that 83% of completers reported increased self-confidence in health management and will use the new tools; nineteen completers found the workshop useful in the job search process, thus improving their employment prospects.

A wider implementation of the SCSEP model through the American Job Centers can help job seekers with disabilities and multiple barriers to employment offer pathways out of poverty.

SESSION 5090 (SYMPOSIUM)

SITUATING WISDOM IN THE CONTEXT OF EVERYDAY LIFE: STATES, TRAITS, AND CHANGES OVER THE LIFESPAN

Chair: I. Grossmann, *University of Waterloo, Waterloo, Ontario, Canada*

Wisdom is an ancient concept, linked to good life, maturity, and sagacity. How does one develop this cherished quality? What are the situations and traits promoting wisdom in daily life? The present symposium brings world-class experts from four different countries (Austria, Canada, Finland, the US), who study these questions using a wide range of longitudinal, qualitative, diary, and experimental designs. A particular attention in this symposium is oriented to the question of interplay between wisdom-related states and traits. Jeste and colleagues will introduce the latest insights from the San Diego SAGE study, examining longitudinal shifts in wisdom and its relationship to mental health. Spännäri and colleagues will present new insights from the longitudinal CoPassion research project, examining the relationship between compassion and wisdom as a function of a compassion training. Glück and colleagues will use an autobiographic memory approach to examine professional wisdom. Their research indicates the profound role of organizational and situational constraints in constraining professionals' (teachers and managers) ability to act wisely. Finally, Grossmann will conclude the session by discussing various new advances from the Culture & Wisdom laboratory, with a particular attention to insights concerning situations, mindsets, and acts promoting wisdom in daily life. At the end, Grossmann will introduce a new, context-sensitive, efficient method for assessing wisdom

in daily life. The present symposium will shed light on exciting new directions in the rapidly growing field of wisdom research, drawing connections to various fields of gerontology, psychology, sociology, and psychiatry.

WISDOM ACROSS ADULT LIFESPAN: ASSOCIATIONS WITH POSITIVE TRAITS AND STATES

D. Jeste, A. Martin, B. Palmer, R. Daly, D. Glorioso, M. Thomas, *University of California, San Diego, San Diego, California*

We examined associations of cognitive, reflective, and affective dimensions of wisdom in a 2-year follow-up study of a community-based sample. Participants (51% male) were 1,441 adults aged 21 to 100 years ($M = 66$; $SD = 21$). Wisdom was assessed with 39-item 3-Dimensional Wisdom Scale. Cross-sectionally, correlations with age were small ($-.17$ for cognitive, and $-.05$ and $-.08$ for others). All 3 dimensions had medium size correlations ($r > .3$) with resilience, optimism, and personal mastery. The reflective dimension also had medium size correlations with happiness and life satisfaction, and inverse correlations with levels of perceived stress, anxiety, and depression. At 2-year follow-up, reliability change index scores indicated relatively little change in the reflective and affective scores, but a slight decline in the cognitive scores. These results suggest that wisdom is a relatively stable trait that is associated, especially its reflective dimension, with positive traits and states (e.g., resilience, happiness).

WISDOM AND COMPASSION: TOGETHER FOR BETTER (OR FOR WORSE)?

J. Spannari¹, M. Ardeli², A. Pessi¹, M. Paakkanen¹, 1. *University of Helsinki, Helsinki, Finland*, 2. *University of Florida, Gainesville, Florida*

Compassion and wisdom are two deeply human and social phenomena, rooted in our biology and in the evolution of social structures. But can they be taught and cultivated? This presentation examines qualitative and quantitative survey data from the Finnish CoPassion research project. The project included an intervention by training compassion & emotional skills, with a goal of enhancing compassion at the workplace. This talk discusses results of this intervention, focusing on shifts in compassion (measured via the Santa Clara Brief Compassion Scale), wisdom (measured via 3D-WS-12 scale), and participants' experiences of the effects of the intervention six months after it, as well as the interrelation between the constructs. This research will shed new light on the definitions and conceptualizations of wisdom in relation to compassion, but also on the ways these constructs evolve through brief interventions, speaking to malleability of trait-wisdom over time.

PROFESSIONAL WISDOM: WISDOM AND NON-WISDOM MEMORIES OF TEACHERS AND MANAGERS

J. Glueck, K. Leitner, A. Oberlojer, *Psychology, Alpen-Adria-Universitaet Klagenfurt, Klagenfurt, Austria*

Professional wisdom, the way people balance their own interests with those of their organization and the individuals they work with, has not often been investigated yet. We

believe that organizational and situational constraints can limit individuals' ability to act wisely. For a first test of this hypothesis, we investigated autobiographical memories of teachers and managers, two groups that are often viewed as in need of wisdom but differ markedly in control over their work, concerning professional situations in which they did and did not act wisely. A sample of 24 teachers and 15 high-ranking managers were interviewed about such situations, and responses were content-coded for wise and unwise behaviors and situational constraints. Results showed that unwise behaviors often involved ignoring divergent perspectives, overconfidence, and lack of empathy, and that situational factors predicting these differences including role pressures, limited time, and competition.

THE POWER OF THE SITUATION FOR UNVEILING INSIGHTS ABOUT DAILY WISDOM

I. Grossmann, *Psychology, University of Waterloo, Waterloo, Ontario, Canada*

Though wisdom is inherently context-dependent, only recently scholars began to empirically test the situational contingencies inhibiting or promoting wisdom in daily life. Grossmann reviews a range of recent diary studies and high-powered experiments concerning people's likelihood of engaging in wisdom-related cognitions (e.g., considerations of different perspectives, intellectual humility, dialectical thinking, integration/compromise). Results indicate that social contexts (e.g., being together with friends/work-colleagues) promote greater wisdom than non-social situations, self-focused contexts inhibit wisdom, and contexts promoting ego-decentered mindsets (e.g., generativity, self-distancing) sustain wisdom in self-focused situations. Within-person (state) differences in wisdom across situations also appear larger than between-person (trait) differences. At the end, Grossmann introduces a novel state-sensitive approach to measure wisdom-related characteristics across both state and trait-level, showcasing its utility in a large-scale study ($N = 2545$ U.S. Americans) of individual differences, social contexts, affordances promoting wisdom and downstream consequences in a cost-efficient fashion.

SESSION 5095 (SYMPOSIUM)

MEDICARE AND MEDICAID INTEGRATION IN THE UNITED STATES: CHALLENGES AND SOLUTIONS

Chair: C.L. Graham, *University of California, Berkeley, Berkeley, California*

Discussant: G.E. Alkema, *The SCAN Foundation, Long Beach, California*

Over 10 million seniors and adults with significant disabilities in the United States (US) are dually eligible for Medicaid and Medicare. They represent beneficiaries with the lowest incomes and, on average, the most complex care needs and the highest care utilization. For this reason, they account for a disproportionate share of spending in both programs. In Medicare FFS spending is more than twice as high for dual eligible beneficiaries compared with non-dual eligible beneficiaries. The frequently misaligned incentives in Medicare and Medicaid can cause much inefficiency, including duplication of care, poor coordination of care,

and higher rates of avoidable hospitalizations. In an effort to both integrate care and reduce costs, the Patient Protection and Affordable Care Act gave the Centers for Medicare and Medicaid Services (CMS) new authority to implement and test programs to align financing and administration of Medicaid and Medicare for dually eligible beneficiaries. In this symposium, researchers and policy experts will come together to discuss the issues around Medicare and Medicaid integration in the US as well as several models currently being tested. Experts from the Center for Health Care Strategies will give an overview on the challenges faced in integrating these two large programs and the various efforts being taken in the US. Researchers from University of California will present results from the evaluation of California's Dual Financial Alignment demonstration, in particular the innovation on the part of the health plans in implementing the program, and the perspectives of beneficiaries who participated in the program. Researchers from the Washington State Health Care Authority will present results from an evaluation of their health-home based, managed fee for service program in Washington state as well as insights from the state's experience working with beneficiaries and providers to transform care for this high-cost, high-need population.

STATE APPROACHES AND EARLY LESSONS FROM NEW MEDICARE-MEDICAID INTEGRATED CARE MODELS

A. Kruse, *Center for Health Care Strategies, Hamilton, New Jersey*

Since 2011, the US has seen significant investment in the development of integrated care programs that aim to better coordinate care and reduce Medicare and Medicaid program misalignments. The individuals navigating these separate state and federal programs regularly face: uncoordinated services; poor provider communication; and differing state and federal policies regarding reimbursement, beneficiary protections, covered benefits, and enrollment. As a result, care is often fragmented or episodic, resulting in poor health outcomes, cost-shifting, and avoidable spending. The Center for Health Care Strategies has convened states testing new integrated care models in collaborative learning projects from the initial design phase through to the current implementation and evaluation phase of these programs. This presentation will review the challenges faced in integrating care, the various integration models at play in the United States, and some key lessons from the development of dual eligible special needs plan and financial alignment demonstration based models.

RESULTS OF AN EVALUATION OF CALIFORNIA'S MEDICARE-MEDICAL INTEGRATION DEMONSTRATION

C.L. Graham^{1,2}, P. Liu², 1. *University of California, Berkeley, Berkeley, California*, 2. *University of California, San Francisco, San Francisco, California*

Beginning in 2014, California began enrolling seniors and people with disabilities who were dually eligible for Medicare and Medicaid into managed care health plans, called "Cal MediConnect" (CMC). Through these plans, all of their medical care and long-term services and supports were

integrated and coordinated through one payment system. Enrollees received additional care coordination and transportation benefits. Results of a randomized telephone survey, including 2,139 beneficiaries compares measures of access to care, coordination of care, continuity of care after transition, and overall satisfaction between those in the demonstration, those who opted out, and those in non-demonstration counties. Enrollees in CMC plans reported significantly improved coordination and access to care. Additionally, results of 39 key informant interviews with CMC health plan administrators and other stakeholders will demonstrate the overall health system response to the demonstration as well as innovations and lessons learned in the implementation of the program.

MEDICAID AND MEDICARE INTEGRATION: USING THE HEALTH HOME MODEL

A. Ericson, A. Lind, *Health Care Authority, Washington State, Olympia, Washington*

Among Medicaid clients, those who are also eligible for Medicare benefits are among the most complex and in need of multiple services. Historically, very few approaches to improved care management for Medicaid-Medicare clients were available to state Medicaid agencies. Under the Affordable Care Act, new paths were created to improve care delivery and client outcomes. In Washington, the Health Home model was chosen as a "Managed Fee-for-Service" demonstration under an agreement with the Centers for Medicare and Medicaid Services (CMS). This presentation will describe the planning and implementation of the demonstration, engagement trends since the start of the program in 2013, and early evaluation results, including the first in the nation shared savings to the state from CMS.

SESSION 5100 (SYMPOSIUM)

REDUCING OLD-AGE SOCIAL EXCLUSION: NEW DIRECTIONS IN MULTIDIMENSIONAL AND GLOBAL PERSPECTIVES

Chair: K. Walsh, *National University of Ireland, Galway, Galway, County Galway, Ireland*

Co-Chair: T. Scharf, *Newcastle University, Newcastle upon Tyne, United Kingdom*

The concept of social exclusion has considerable potential to explain and respond to disadvantage in later life globally. However, in the context of ageing populations the construct remains ambiguous, and questions about what, if anything, makes old-age exclusion unique as a form of disadvantage, and specific to ageing, still remain. Further, there is growing recognition that old-age exclusion is both multidimensional, impacting on a range of different areas of life, and relative, implicating the institutions, policies and values of particular global contexts. Old-age exclusion is thus likely to be a function of exclusionary mechanisms arising from: the ageing process itself; from different, but interconnected, life domains; and from the regional and country settings that older people are resident within. Compounded by scientific knowledge gaps, reducing old-age social exclusion therefore represents a significant global challenge. With current efforts lacking direction and impact and with consequences for individuals, families and social systems, old-age exclusion also

represents a substantial barrier to realising positive outcomes in global ageing and health. Drawing on work from a new innovative research and policy collaboration, involving 34 European and international countries (Reducing Old-Age Social Exclusion in Europe - ROSEnet), this session will focus on emerging and engrained forms of disadvantage. It will unpack cross-domain and cross-national ageing-related exclusionary mechanisms in the areas of economic, social, services, community and spatial, and civic rights exclusion. The session will present new empirical and conceptual directions with a view to charting new pathways to reducing old-age exclusion.

UNRAVELING ECONOMIC EXCLUSION IN LATER LIFE: FAMILIAR PATTERNS OR NEW TRENDS?

J. Ogg, *Research Unit on Ageing, Caisse nationale d'assurance vieillesse, Paris, France*

Population ageing and low economic growth pose challenges to reducing the number of people at risk of social exclusion. Fewer workers place pressures on public pensions systems and if not compensated by productivity gains, maintaining acceptable income levels in retirement is problematic. A well educated and skilled older workforce that delays retirement could increase productivity and remedy the structural difficulties of public pension systems. Consequently, European countries are addressing these challenges by increasing the length of the working life, delaying access to retirement pensions and promoting policy measures such as 'active ageing'. These measures are experienced differently by older workers, a major factor being educational and socio-economic differences. This paper explores the risk of economic inequalities in later life in the European context, with well-educated older workers ensuring their economic security into retirement and less-educated or unemployed older workers being exposed to exclusion.

A CONCEPTUALISATION OF EXCLUSION FROM SOCIAL RESOURCES: FROM GENES TO THE ENVIRONMENT

V. Burholt, *Centre for Innovative Ageing, Swansea University, Swansea, United Kingdom*

This presentation will build a science of exclusion from social resources drawing upon, extending and uniting multi-disciplinary research to develop a novel, comprehensive and dynamic conceptual model. The model will help researchers grapple with complex thinking, and see persistent problems in a new light providing breakthroughs in our understanding of the feedback loops between genetics, psycho-social, cultural and physical environments involved in the interrelationship between exclusion from social resources and loneliness. This presentation is framed within a critical human ecological framework which frees us from the constrained boundaries of traditional disciplinary perspectives. From the critical human ecology perspective the environment, the social interactions therein and the biological manifestation of the body are interconnected in an active process of mutual influence and change. It will propose a series of studies that could be used to refine and test the model through scientific exchange, experimentation and real world experiences.

SOCIAL EXCLUSION AND SERVICE USE IN OLDER AGE: RECENT EVIDENCE FROM THE EUROPEAN CONTEXT

G. Lamura¹, V. Draulans², F. Barbabella¹, V. Hlebec³, A. Siren⁴, R. Maskeliunas⁵, J. Barstad⁶, 1. INRCA, *National Institute of Health and Science on Ageing, Centre for Socio-Economic Research on Ageing, Ancona, Italy*, 2. KU LEUVEN (*University of Leuven*), *Leuven, Belgium*, 3. *University of Ljubljana - Faculty of Social Sciences, Ljubljana, Slovenia*, 4. *Danish National Centre for Social Research, Copenhagen, Denmark*, 5. *Kaunas University of Technology, Faculty of Informatics/Department of Multimedia Engineering, Kaunas, Lithuania*, 6. *Norwegian University College of Agriculture and Rural Development, Klepp St, Norway*

This contribution aims to provide an overview of main trends observed across European countries with regard to service use in older age in relation to social exclusion phenomena. Data will come from different sources, including preliminary findings from the EU-funded network ROSEnet. Previous research shows that the lack of services - such as for instance transportation, primary health and elder care services, or banking services - contributes to social exclusion in older age, especially in rural contexts. The access to web-based services represents an additional field in which new and old exclusion risks might accumulate, due to the increasing role played by digital skills in affecting the ability to remain independent and active in older age. Finally, the critical areas in which policy should focus on to address current and future challenges in this field will be identified, including issues such as the degree of urbanisation and gender differences.

AGE-RELATED MOBILITY ISSUES AND SOCIAL EXCLUSION OF OLDER ADULTS: OBJECTIVE AND SUBJECTIVE CRITERIA

I. Tournier, D. Ferring, *Université du Luxembourg, Luxembourg, Luxembourg*

An efficient mobility is essential to stay connected to community services and to participate in social interaction. However, mobility is impeded by age-related changes regarding perceptual, cognitive, and physical abilities that make older drivers and pedestrians overrepresented in road casualties. At the same time, self-awareness of these limitations frequently may lead to excessive fears (e.g., fear of falling) and self-imposed mobility reduction such as driving cessation that increases the risk of home confinement and social exclusion. This presentation offers an overview of these objective and subjective mobility limitations and their interaction. This is a necessary first step towards developing efficient actions aimed at improving both mobility and safety of older adults. Consequently, we explore in a second step how the socio-spatial environment can be adapted at different levels (e.g., social policy, road environment design) to become a more age-friendly space and as a consequence promote social inclusion in later life.

ACTIVE AGING POLICIES AND THE SOCIAL EXCLUSION LENS

S. Torres, *Uppsala University, Uppsala, Sweden*

The launching of the concept of successful aging in gerontological research, policy and practice gave way to a variety of policies on active, productive and healthy aging across

the world. These policies have been launched as universal one size fits all solutions to the challenges that population aging entail. At the core of these policies are, however, values that are often associated with highly industrialized societies which attribute great importance to independence, activity, future-orientation and the mastering of illness/ diseases in old age. This raises the question of these policies' appropriateness for populations that do not share these values and/ or whose life-course is not characterized by the continuity that the successful aging paradigm presupposes. This presentation will use research on older migrant populations across Europe to argue that the social position of privilege that these policies take for granted is exclusionary.

SESSION 5105 (SYMPOSIUM)

BLUE VERSUS GRAY: POTENTIAL HEALTH BENEFITS OF BLUEBERRIES FOR SUCCESSFUL AGING

Chair: D.K. Ingram, *Louisiana State University, Baton Rouge, Louisiana*

B. Shukitt-Hale, *USDA-HNRCA at Tufts University, Boston, Massachusetts*

Emerging evidence from both preclinical and clinical studies have generated evidence of the potential health benefits of consuming blueberries (BBs). This fruit contains among the highest levels of polyphenols identified that provide highly effective antioxidant protection in addition to activating a wide range of other stress signaling pathways directly impacting health. The challenge now is to identify mechanisms through which BBs mediate their health benefits. Based on a wide range of preclinical and clinical studies, D Ingram (LSU, USA) will chair this symposium to review progress in assessing the health effects of BBs to promote successful aging. A Rodriguez-Mateos (U. Duesseldorf, GERMANY) will review studies examining the cardiovascular effects of BBs. CM Williams (U Reading, UK) will examine the cognitive effects of BB consumption in children and adults. B Shukitt-Hale (USDA/Tufts U, USA) will present data examining the effects of BB on motor and cognitive performance and brain inflammation in older adults. Y Desjardins (Laval U, CANADA) will present findings highlighting effects of BB consumption on the microbiome and its impact upon various health parameters. D Ingram will conclude with a talk focused on the concept of "hormesis." Specifically, he will present data showing that berry fruits provide long-term protection against oxidative stress because they initially generate an essential mild oxidative stress.

EFFECTS OF BLUEBERRIES ON CARDIOVASCULAR FUNCTION

A. Rodriguez-Mateos, *King's College London, London, United Kingdom*

Recent epidemiological and human intervention studies suggest that berry consumption may have cardiovascular health benefits. Blueberries are rich sources of potential bioactive compounds such as polyphenols, fiber, minerals and vitamins. To date, few clinical trials have been conducted investigating the effect of blueberry consumption on clinically relevant biomarkers of cardiovascular disease (CVD) risk, showing that blueberry supplementation can decrease

blood pressure, improve endothelial function and decrease arterial stiffness in people at risk of CVD, such as pre-hypertensive, overweight, obese or people with metabolic syndrome. However, in the context of dietary recommendations and primary prevention of CVD it is also important to investigate the effects of polyphenol-rich foods on healthy people. We have conducted several clinical studies showing that blueberry consumption can improve endothelial function in healthy individuals and that these effects correlate with plasma blueberry polyphenol metabolites. The evidence available on the effects of blueberries on cardiovascular function and the role of polyphenols as mediators of those effects will be discussed.

EFFECTS OF ANTHOCYANIN-RICH BLUEBERRIES ON COGNITIVE FUNCTION IN HEALTHY YOUNGER AND OLDER ADULTS

C. Williams, G. Dodd, D. Lamport, J. Spencer, L. Butler, *School of Psychology & Clinical Language Sciences, University of Reading, Reading, United Kingdom*

Evidence from human studies demonstrates that consumption of various flavonoid subclasses are associated with cognitive benefits. We investigated the effects of an anthocyanin-rich blueberry beverage (BB), or matched placebo, on vascular and cognitive function in healthy younger and older adults. Stiffness index (SI), blood pressure (BP) and levels of brain-derived neurotrophic factor (BDNF) were recorded at baseline and one hour, whilst cognitive function was measured at baseline, 2 and 5 hours post-treatment. An MRI study was included to determine changes in cerebral blood flow (CBF). BB treatment produced better cognitive performance and higher circulating levels of BDNE. Correspondingly, increased CBF was observed in the precentral and middle frontal gyrus, as well as the angular gyrus, following BB. This suggests that acute BB treatment results in cognitive benefits mediated by an action on BDNF signalling pathways, in addition to vasodilatory properties and subsequent CBF increases.

EFFECTS OF BLUEBERRIES ON INFLAMMATION, MOTOR PERFORMANCE, AND COGNITIVE FUNCTION

B. Shukitt-Hale, M. Miller, N. Thangthaeng, D. Fisher, D. Bielinski, M. Kelly, T. Scott, *USDA-HNRCA at Tufts University, Boston, Massachusetts*

Motor and cognitive function decrease with age, to include deficits in balance, coordination, gait, processing speed, executive function, memory, and spatial learning. These functional declines may be caused by long term increases in and susceptibility to oxidative stress and inflammation. Research conducted in our laboratory, initially with aged animals but more recently with humans, has shown that consumption of blueberries, which are high in polyphenolics and have antioxidant and anti-inflammatory properties, can prevent and even reverse age-related neuronal deficits. Participants, aged 60–75 years, in a randomized, double-blind, placebo-controlled trial, consumed freeze-dried blueberry (24g/d, equivalent to 1cup blueberries) or placebo, and completed a battery of motor and cognitive tests at baseline, and following 45 and 90 days of intervention. Blueberry

supplementation improved some aspects of performance and berry serum metabolites were able to reduce inflammatory stress signals in a cell model. Therefore, dietary interventions with blueberries may be one strategy to forestall or even reverse age-related neuronal deficits.

BLUEBERRIES AND FRUIT POLYPHENOLS MODULATE THE GUT MICROBIOME AND MAY PREVENT AGE-RELATED DYSBIOSIS

Y. Desjardins, *Plant Science, Institute of Nutrition and Functional Foods, Laval University, Quebec, Quebec, Canada*

The incidence of chronic diseases is increasing during aging in association with low-grade inflammation in a syndrome called “inflammaging”. In the gut, inflammaging disturbs homeostasis and reduces epithelium tightness, the thickness of the mucus layer and weakens the immune barrier, leading to the diffusion of pro-inflammatory LPS. Aging people have an altered microbiota and a reduced barrier function. Recently, we have shown that obese mice fed with cranberry polyphenols had reduced intestinal inflammation and insulin resistance, while displaying a modulated gut microbiota. One specific bacteria, *Akkermansia muciniphila*, was identified and shown to stimulate mucus production and improve the barrier function. Our results suggest that the consumption of berry polyphenols maintains a well-balanced microbiota and improve intestinal and underlying metabolic functions. During this presentation, data on the loss of gut microbiota homeostasis during aging will be presented and discussed in light of the preventative role of berry polyphenols on chronic diseases.

SESSION 5110 (SYMPOSIUM)

IT COMES WITH THE TERRITORY: MECHANISMS UNDERLYING ENHANCED EMOTIONAL WELL-BEING IN OLDER ADULTHOOD

Chair: L. Eldesouky, *Washington University in St. Louis, Missouri*

Co-Chair: T. English, *Washington University in St. Louis*

Emotional well-being remains intact and in some ways improves in older adulthood. In this symposium, we highlight important mechanisms that underlie age-related changes in emotional well-being. The first presentation takes an experimental approach to examine age differences in the use of an emotion regulation strategy, situation selection, and its consequences for mood. The second presentation takes a daily diary approach to investigate how the link between age and daily emotional experience depends on emotion regulation strategy use. Taking a naturalistic approach, the third presentation examines age differences in the ability to affectively recover from daily stressors. Lastly, the fourth presentation takes a neurobiological approach to examine age-related changes in brain networks associated with cognitive function relative to those associated with emotional function. Taken together, these four presentations take a multi-faceted approach to demonstrate how and why emotional well-being is preserved in older adulthood.

AGING AND ATTENTION TO SELF-SELECTED EMOTIONAL CONTENT: A MOBILE EYE TRACKING INVESTIGATION

D.M. Isaacowitz, K.M. Livingstone, M.S. El-Nasr, *Northeastern University, Boston, Massachusetts*

Previous studies have found that older adults attend relatively more to positive and less to negative stimuli when presented with a single stream of affective input. In everyday life, however, attentional deployment is fundamentally and dynamically related to an earlier stage of emotion regulation: situation selection. We present 2 studies using mobile eye tracking to test for age differences in selections of emotional stimuli, and attention to selected choices. Younger, middle-aged, and older individuals were induced into either a negative (Study 1) or positive (Study 2) mood. Half were instructed to specifically try to regulate their mood state before having their selections, attention, and mood recorded. A database-oriented solution was implemented to analyze fixations to positive, negative, and neutral videos once selected. Findings suggested more similarities than differences among age groups in what material was selected, how participants attended to selected material, and how their choices and attention predicted mood.

AGE DIFFERENCES IN THE LINK BETWEEN DAILY EMOTION REGULATION STRATEGY USE AND WELL-BEING

L. Eldesouky, T. English, *Washington University in St. Louis, St. Louis, Missouri*

Researchers have posited that age differences in resource availability (e.g., cognitive control, physiological flexibility, knowledge and life experience) may impact emotion regulation strategy selection and effectiveness. Strategies that are more cognitively demanding and physiologically taxing may be less effective for managing emotional well-being among older adults than younger adults. In the presented daily diary study, 272 adults (aged 23–85 years) completed measures of emotion regulation strategy use and emotional experience for 9 consecutive days. As expected, detached reappraisal (a more cognitively demanding strategy) was less strongly linked to emotional well-being for older adults, and situation selection (a less cognitively demanding strategy) was more strongly linked to emotion well-being for older adults. However, age did not moderate the link between suppression (a more physiologically taxing strategy) and emotional well-being. These findings suggest that the consequences of emotion regulation may depend on both the strategy being used and the regulator’s age.

AGE AND LINGERING NEGATIVE AFFECT IN RESPONSE TO DAILY STRESSORS

K. Leger¹, S.T. Charles¹, D. Almeida², 1. *University of California, Irvine, Irvine, California*, 2. *Pennsylvania State University, State College, Pennsylvania*

One indicator of successful emotion regulation is the ability to affectively recover from a stressful event. According to the Theory of Strength and Vulnerability Integration (SAVI), older adults use strategies such as reappraisal to aid in affective recovery after a stressor has passed. The current study tests this theory by examining the extent to which older, middle age, and younger adults continue to experience lingering

negative affect in response to a stressor that occurred the day before. Participants ($N=1813$, Age 33–84) completed a series of daily interviews in Wave 2 of the National Study of Daily Experiences (NSDE II). Multi-level models indicated that the middle age group reported greater lingering negative affect the day after a stressor occurred than both the older and the younger adults ($b=.024$, $p=.02$). Results suggest that middle-aged adults, as opposed to younger and older adults, experience poorer affective recovery from daily stressful events.

RESTING-STATE NETWORKS ASSOCIATED WITH COGNITION BUT NOT WITH EMOTION SHOW AGE-RELATED DECLINE

K. Nashiro¹, M. Sakaki², M. Braskie³, M. Mather¹, 1. *University of Southern California, Los Angeles, California*, 2. *University of Reading, Reading, United Kingdom*, 3. *Imaging Genetics Center, Keck School of Medicine, University of Southern California, Los Angeles, California*

Correlations in activity across disparate brain regions during rest reveal functional networks in the brain. Although previous studies largely agree that there is age-related decline in cognitive networks (e.g., default mode network), how age affects other resting-state networks remains unclear. Here we used a dual regression approach to investigate age-related alterations in resting-state networks. The results revealed age-related disruptions in functional connectivity in all five identified cognitive networks, namely the default mode network, auditory discrimination, speech-related somatosensory, and right and left fronto-parietal networks, whereas such age effects were not observed in the three identified emotion networks. Furthermore, we observed age-related decline in functional connectivity in visual and motor/visuospatial networks. Our observation of age-related decline in all networks associated with cognitive function but not in those associated with emotional function supports the idea that normal aging is less associated with declines in emotional functioning than with declines in cognitive functioning.

SESSION 5115 (SYMPOSIUM)

VALUING ARTS INTEGRATION IN AGE-FRIENDLY COMMUNITIES

Chair: V.B. Lipscomb, *University of South Florida Sarasota-Manatee, Bradenton, Florida*

Discussant: D. O'Neill, *Trinity College, Dublin, Ireland*

Two foci of the 2015 Summit on Creativity and Aging in America were Age-Friendly Community Design and Lifelong Learning and Engagement in the Arts, which includes how the arts reflect and/or reshape contemporary cultural understanding of aging (Hanna et al. 2016). This symposium examines how integrating the arts into the age-friendly model can enhance quality of life for elders as well as combat community ageism. The first paper approaches arts integration on a national level, identifying how policies on aging impact the benefits of and need for arts in age-friendly communities. Surveys of age-friendly communities show the essential role that humanities and the arts play in creating an inclusive environment. The second paper addresses a collaboration between arts professionals and age-friendly community leaders. A theatrical production on aging arose from interviews with more than 100 residents of an age-friendly

community; analysis of audience talkbacks indicates that the program promoted respect and social inclusion, major issues addressed in age-friendly community design. The final presentation analyzes the process of a major collaborative arts-based research project, finding that participation in devising theatre enhances quality of life for older people. The discussant will draw on extensive experience with interdisciplinary arts-related approaches to aging research and policy. These presentations will offer insights into the creation and implementation of arts policies as key to the design of age-friendly communities.

AGE FRIENDLY COMMUNITIES' UTILIZATION OF THE HUMANITIES AND ARTS

G. Hanna, *National Center for Creative Aging, Washington, District of Columbia*

The humanities and the arts are being utilized in age-friendly communities internationally to break down isolation and to improve quality of life through social engagement and advances in community and home design. This paper will delineate effective practices that map and leverage assets in the humanities and the arts to bring resources to older people in their homes and community centers. Research will be presented from surveying participating age-friendly communities to illustrate current practices in the United States and other participating countries in this World Health Organization project. The survey results demonstrate the important role humanities and the arts play in the formation of age-friendly communities.

USING THEATRE TO REFLECT AND REVISE ATTITUDES TOWARD AGING IN AN AGE-FRIENDLY COMMUNITY

V.B. Lipscomb, K. Black, *Liberal Arts, University of South Florida Sarasota-Manatee, Bradenton, Florida*

This paper discusses the results of a documentary theatre program that was created to provoke public discourse about aging in an age-friendly community located in the Southeastern United States in which more than one-half of residents are age 50 or older. The professional theatre production resulted from more than 100 interviews with older community members. Post-performance talk-backs with the audience are analyzed to illustrate how the production facilitated insight and dialogue among its largely older audiences. Experience with the production suggests the potential to promote the subjective experience of aging as a positive appreciation of self and others. While differences in methodologies can affect the success of research-based theatre collaborations (Rossiter et al. 2008), this community-based effort is shown to enhance respect and social inclusion, a core domain of livability in the age-friendly community movement. Results point toward expanding arts involvement in age-friendly communities.

AGES AND STAGES: AN ARTS-BASED APPROACH TO ASSESSING THE VALUE OF THEATRE-MAKING IN LATER LIFE

M. Bernard¹, J. Rezzano², M. Rickett¹, 1. *Keele University, Keele, United Kingdom*, 2. *New Vic Theatre, Newcastle-under-Lyme, United Kingdom*

Funded by the UK's multi-research council New Dynamics of Ageing programme (2009–12), through follow-on funding from the Arts and Humanities Research Council (AHRC) (2012–13), and two AHRC “Cultural Value” project grants (2013–14), Ages and Stages is an ongoing collaboration between researchers at Keele University and practitioners at the New Vic Theatre, Newcastle-under-Lyme. Between 2013 and 2014, we supported the Ages & Stages Theatre Company to co-explore and co-research what their involvement had meant to them over the previous four years. The findings were used to shape three scripts/provocations entitled “Out of the Box,” performed at a concluding research symposium. Drawing on these projects, this paper focuses in particular on what we have learned through our methodologically innovative arts-based approach to the evaluation of participants' experiences. We discuss the value of theatre-making with older people; consider the role of participatory arts-based approaches; and highlight implications for future research in age-friendly communities.

SESSION 5120 (SYMPOSIUM)

MULTI-MODAL TRAINING TO IMPROVE COGNITION, MOBILITY, AND BRAIN FUNCTIONING IN OLDER ADULTS

Chair: K.Z. Li, *Concordia University*

A growing body of research argues for cross-over effects of training, such that exercise training leads to improved cognitive abilities and more efficient neural functioning (Bherer, Erickson, & Liu-Ambrose, 2013; Li, Yao, Cheng, et al., 2016). In parallel, computerized cognitive training has led to improved balance and mobility (Li, Roudaia, Lussier, et al., 2010). What underlies these cross-over effects may be the common cognitive functions and brain regions or networks that are jointly associated with cognitive and motor control. However, fewer studies have examined the potential synergistic effects of multi-modal training in the form of mixed cognitive and physical training schedules, virtual reality, computer gaming, or dual-task training (Basak, Boot, Voss, & Kramer, 2008; Mirelman, Maidan, Herman et al., 2011). This symposium presents recent work on this emerging topic, spanning a variety of approaches, such as gaming (Basak), virtual reality (Hasudorff), and combined exercise and cognitive training (Bherer, K. Li, C. Li). We will highlight a variety of outcomes measures including cognitive, motoric, and neural indices. We will discuss the influence of training format, task coherence, and trainee enjoyment and motivation on the magnitude of training-related gains. We will also discuss the specificity of training-related effects.

PLAYING FOR KEEPS: EFFECTS OF VIDEO GAME TRAINING ON NEURAL AND COGNITIVE PLASTICITY IN OLDER ADULTS

C. Basak¹, K. Nashiro², M. O'Connell¹, S. Qin¹, 1. *University of Texas at Dallas, Dallas, Texas*, 2. *University of Southern California, Los Angeles, California*

A major goal in aging research has been to examine ways to counteract age-related cognitive decline. The present study investigated whether 20-hour Real-time Strategy video game training (RTS), compared to active controls, could differentially improve cognition in older adults, both immediately and long-after training. Fifty-one healthy older adults ($n_{\text{RTS}}=24$, $n_{\text{Control}}=27$) were evaluated at before and after the training on an fMRI task-switching paradigm and on a comprehensive battery of cognitive tasks, with multiple tasks representing each cognitive construct. The RTS group improved significantly on episodic memory and working memory immediately after the training, compared to the controls. Changes in frontal activation in the task-switching paradigm in the RTS group were greater than the controls. Moreover, individual differences in game playing strategy (combat vs. wonders approaches) interacted with improvements in cognitive control. Our results suggest that RTS game playing can potentially improve executive control and working memory.

EFFECTS OF PHYSICAL EXERCISE, COGNITIVE TRAINING, AND COMBINED INTERVENTION ON EXECUTIVE FUNCTIONS

L. Bherer^{1,2}, M. Lussier^{2,3}, L. Desjardins^{2,3}, S. Fraser^{2,4}, K.Z. Li^{1,5}, N. Berryman², L. Bosquet^{6,2}, T. Vu^{2,7}, 1. *Dept. of Psychology and PERFORM Centre, Concordia University, Montreal, Quebec, Canada*, 2. *Centre de recherche de l'institut universitaire de Gériatrie de Montréal, Montreal, Quebec, Canada*, 3. *Department of Psychology, Université du Québec à Montréal, Montreal, Quebec, Canada*, 4. *Social Work, McGill University, Montreal, Quebec, Canada*, 5. *Centre for Research in Human Development, Concordia University, Montreal, Quebec, Canada*, 6. *Faculté des sciences du sport, Université de Poitiers, Poitiers, France*, 7. *Centre hospitalier de l'Université de Montréal, Montreal, Quebec, Canada*

Several studies have reported benefits of exercise interventions (see Bherer, Erickson & Liu-Ambrose, 2013 for review) and cognitive training (see Belleville & Bherer, 2012 for a review) on cognitive performance in older adults, but the effect of combining both interventions has rarely been studied. This talk will present findings from dual-task cognitive training, physical exercise intervention and combined fitness and cognitive trainings on neurocognitive and physical outcomes in older adults. Overall, results show improved performance in neuropsychological test of executive control (switching) after cognitive training, but no substantial added benefits of physical exercise training. In the computerized dual-task, results showed larger change in dual-mixed than in single-mixed trials, but only for the groups that completed the dual-task training. Results of our studies support the benefits of dual-task training on executive functions and dual task performance, and suggest equivalent effect of aerobic and stretching exercise on executive control and dual-task performance.

COGNITIVE TRAINING AND AEROBIC EXERCISE FOR COMMUNITY HEALTHY ELDERLY: A RANDOMIZED CONTROLLED TRIAL

C. Li, *Shanghai Key Laboratory of Psychotic Disorders, Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai, China*

Cognitive Training and aerobic exercise are two kinds of promising approaches against cognitive aging. The present study was designed to compare the training effect between cognitive training and aerobic exercise for community-dwelling, healthy older adults, and to explore the potential neurobiomarkers predicting behavioral gains from these interventions. A prospective, randomized, assessor-blinded, parallel-controlled trial was conducted. The results showed that cognitive training and aerobic exercise both can effectively improve cognitive function in community healthy elderly over time with good compliance and easy administration. Cognitive training and aerobic exercise have distinct training effects in different cognitive domains.

COMBINED EXERCISE AND COGNITIVE TRAINING: EFFECTS OF FORMAT AND MOTIVATION

K.Z. Li^{1,2,3}, L. Lai^{1,2,3}, H. Bruce^{1,2,3}, 1. *Dept. of Psychology, Concordia University, Montreal, Quebec, Canada*, 2. *PERFORM Centre, Concordia University, Montreal, Quebec, Canada*, 3. *Centre for Research in Human Development, Concordia University, Montreal, Quebec, Canada*

Recent evidence suggests that combined aerobic exercise and cognitive training is superior to single-modality training for improving cognition and mobility. However, we do not know whether multi-modal training is better delivered sequentially or simultaneously. The current study contrasted sequential and simultaneous protocols. Forty-one healthy older adults underwent simultaneous or sequential training, involving 12 sessions of computerized divided attention training and aerobic exercise. Comparisons of pre- and post-training measures revealed improvements on the trained cognitive task, a near transfer dual task, and measures of processing speed and verbal memory. Significant improvements were also observed on the Sit-To-Stand mobility measure, with greater gains in the sequential training group. A slight advantage overall was observed for the sequential group, however simultaneous training did not appear to detract from the impact of the intervention. The results will also be discussed in terms of motivation as a moderating factor in training efficacy.

TREADMILL TRAINING WITH VIRTUAL REALITY TO REDUCE FALLS AMONG OLDER ADULTS: RCT RESULTS

A. Mirelman^{1,4}, L. Rochester⁵, M. Olde Rikkert^{6,7}, B.R. Bloem^{6,7}, N. Giladi^{1,4,2}, A. Nieuwboer⁸, J.M. Hausdorff^{1,2,3}, 1. *Center for the study of Movement, Cognition and Mobility, Neurological Institute, Tel Aviv Sourasky Medical Center, Tel Aviv, Israel*, 2. *Sagol School of Neuroscience, Tel Aviv University, Tel Aviv, Israel*, 3. *Department of Physical Therapy, Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel*, 4. *Department of Neurology, Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel*, 5. *Institute of Neuroscience, Newcastle University, Newcastle, United Kingdom*, 6. *Department of Geriatric Medicine and Neurology, Radboud University Medical Center; Donders Institute for Brain, Cognition and Behavior, Nijmegen, Netherlands*, 7. *Radboud umc Alzheimer Centre, Donders Institute*

for Brain, Cognition and Behavior, Radboud University Medical Center, Nijmegen, Netherlands, 8. *Department of Rehabilitation Sciences, Katholieke Universiteit Leuven, Leuven, Belgium*

A randomized, controlled trial tested the hypothesis that a combined treadmill training with virtual reality (TT+VR) intervention would lead to fewer falls, compared to treadmill training alone (TT). 302 community-living older adults (age: 73.8 ± 6.7 yrs; 60.3% women) with a history of multiple falls and a range of motor and cognitive deficits were randomly assigned to six weeks of TT+VR or TT. The primary outcome was the falls incident rate (IR) during the 6 months post-training. Before training, the IR was similar in both training arms ($p=0.29$). Following training, the IR was 42% lower ($p=0.033$) in TT+VR, compared to TT (IRR:0.58; 95%CI:0.36–0.96). Post training, gait variability during obstacle negotiation, physical performance-based measures, and health-related QOL were significantly better in TT+VR post-training, compared to TT. An integrated, multi-modal approach targeting relevant motor and cognitive functions led to lower fall rates than treadmill training alone, with added benefits to mobility and QOL.

SESSION 5125 (SYMPOSIUM)

CONVOYS IN GLOBAL CONTEXT

Chair: T.C. Antonucci, *University of Michigan, Ann Arbor, Michigan*

Co-Chair: H.R. Fuller, *North Dakota State University, Fargo, North Dakota*

These four papers examine the role of social relations, conceptualized within the convoy model, on health and well-being. Drawing from samples around the world, specifically Japan, Lebanon, Mexico and the U.S., structural and qualitative aspects of social relations are shown to influence health while gender and socioeconomic status are shown to mediate the association. In Japan, Sugawara and Akiyama indicate that structural diversity can be beneficial even in societies that both instantiate and value homogeneity, especially when usual support sources, such as family, are not available. Abdulrahim, Ajrouch, and Antonucci demonstrate how higher education and being male reduce the likelihood of depressive symptoms while confiding has a positive and financial support has a negative effect on depressive symptoms in Lebanon. In Mexico, Fuller shows fewer structural differences in social relations, and that while positive quality relations have little effect, low negative quality relations mediate the SES-health link. Finally, Antonucci and Ajrouch report findings from the US indicating that the SES-health link is differentially mediated for women by both structure and quality of social relations. Women who have less contact with others are more depressed as are those with more negative quality social relations. In sum, the SES-Health link is ubiquitous while social relations, either structure or quality or both, and gender influence that link. The findings support the overall usefulness of the convoy model, by indicating that both individual and situational characteristics uniquely influence social relations and their effect on health.

DIVERSITY OF SOCIAL NETWORK AND WELL-BEING AMONG JAPANESE ELDERLY

I. Sugawara, H. Akiyama, *University of Tokyo, Tokyo, Tokyo, Japan*

In this study we examined the structural diversity/homogeneity of the social network of the older Japanese people and assessed how the network diversity was associated with the well-being of older adults. Data were obtained from the Second Social Relations and Health over the Life Course Study conducted in 2005 in Yokohama, Japan. The sample used in this study included participants aged 60 years and older ($n = 369$). Results showed an interaction effect of marital status. Specifically, it was observed that having a family-centered, homogeneous network had a positive association with subjective and mental well-being of married people. However, for single people, having a network of non-kin members, members belonging to different generations, and members with different educational status, was positively associated with well-being. These results suggested that even in a society where family plays a central role in people's life, having diverse social relations might be important for a better life, especially when support from family members is not available.

CONVOYS OF SOCIAL RELATIONS, GENDER AND THE EDUCATION-HEALTH LINK IN LEBANON

S. Abdulrahim¹, K. Ajrouch², T.C. Antonucci², 1. *Health Promotion and Community Health, American University of Beirut, Beirut, Lebanon*, 2. *University of Michigan, Ann Arbor, Michigan*

Our examination of the SES-health link focuses on depressive symptoms, a key indicator of well-being as people age. We test whether convoys of social relations influence the SES-health link differentially for men and women. The data are drawn from a regionally representative sample ($N=369$) of adults (aged 40–91) in greater-Beirut, Lebanon. A series of multiple regression analyses were performed. Results show that higher education levels and being male are associated with lower depressive symptoms. There were no main effects of network structure on depressive symptoms, but quality of relations matter. Higher levels of perceiving the ability to confide in others predicted lower levels of depressive symptoms, yet higher levels of perceived financial support predicted higher levels of depressive symptoms. These findings suggest quality of social relations and gender both exert influence on depressive symptoms above and beyond the effect of socioeconomic status.

QUALITY OF CHILD RELATIONSHIPS AS A MEDIATOR OF THE SES-HEALTH LINK AMONG MEXICAN PARENTS

H.R. Fuller, *Human Development and Family Science, North Dakota State University, Fargo, North Dakota*

Socioeconomic disparities in health are well-documented in the Mexican population; however, recent studies suggest that aspects of social support may help explain the link between poverty and health. Using data from the Survey of Social Relations and Well-being in Mexico, this study explores whether positive and negative qualities of child relationships mediate the effect of education level on depressive symptoms, stress, and self-rated health in Mexican parents

aged 40–93 ($N=499$). Lower education level correlated with poorer health and greater child negativity. Tests of mediation indicated that child positivity did not mediate the SES-health link, but child negativity did. For both men and women, child negativity mediated education level's link with depression and stress. For women only, child negativity mediated the link between education and self-rated health. Findings suggest that among Mexicans low negativity with children may help account for physical and psychological health. Implications and future directions will be discussed.

CONVOYS OF SOCIAL RELATIONS AND THE EDUCATION-HEALTH LINK: GENDER PATTERNS IN THE UNITED STATES

T.C. Antonucci, K.J. Ajrouch, *Life Course Development, University of Michigan, Ann Arbor, Michigan*

Our examination of the SES-health link focuses on depressive symptoms, a key indicator of well-being as people age. We test whether convoys of social relations influence the SES-health link differentially for men and women. The data are drawn from a regionally representative sample ($N=790$) of adults (aged 40–100) in the Detroit area, USA. A series of multiple regression analyses were performed. Results show that higher education levels are associated with lower depressive symptoms. There were no main effects of network structure or gender on depressive symptoms, but an interaction effect arose where women who had less frequent contact with their networks reported higher depressive symptoms than women who did not. Furthermore, quality of relations matter. Higher levels of negativity in social relations predicted higher levels of depressive symptoms. These findings suggest convoys of social relations exert influence on depressive symptoms above and beyond the effect of socioeconomic status.

SESSION 5130 (SYMPOSIUM)

STRENGTHENING INFORMAL SUPPORT RESOURCES FOR OLDER ADULT PATIENTS: THE JOHNS HOPKINS ROYBAL CENTER

Chair: D.L. Roth, *Johns Hopkins University, Baltimore, Maryland*

Discussant: J.E. Gaugler, *University of Minnesota*

The increased emphasis on home- and community-based care for older adults often assumes that family caregivers and other informal support persons are available and properly equipped to help deliver that care. However, greater attention is needed to develop evidence-based tools and evaluate programs that better involve family members and other support persons in the care of older adults. The Edward R. Roybal Center at Johns Hopkins University is dedicated to developing and testing innovative programs to meet this need. This symposium will feature innovative pilot projects that are funded by the Center and have designed and implemented promising interventions for older adults and their families. Older adult populations that are being addressed include those with significant cognitive impairment, end-stage renal disease (ESRD), hearing loss, and those with complex medication regimens who are receiving home health services. Qualitative findings will be presented that capture challenges

faced by patients and family members and have contributed to new tools and approaches. Individual presentations will describe 1) a pre-visit intervention to improve communication among primary care patients with cognitive impairment, their family members, and their health care providers; 2) a systematic approach that directly includes and involves family members in the home-based medication management of complex older adult patients; 3) an adaptation of an established environmental intervention to reduce social isolation and improve the mobility of older adults with ESRD; and 4) an affordable and accessible intervention for older adults with hearing loss that explicitly involves their family members or other communication partners.

INVOLVING FAMILY TO IMPROVE COMMUNICATION IN PRIMARY CARE FOR OLDER ADULTS WITH COGNITIVE IMPAIRMENT

J.L. Wolff¹, H. Amjad², C. Boyd², D. Echavarría¹, L.N. Gitlin³, D. Roter¹, K. Smith¹, J. Vick², 1. *Johns Hopkins University School of Public Health, Baltimore, Maryland*, 2. *Johns Hopkins University School of Medicine, Baltimore, Maryland*, 3. *Johns Hopkins University School of Nursing, Baltimore, Maryland*

Older adults with cognitive impairment face significant challenges when communicating with health care providers and navigating today's health care environment. Few interventions specifically capitalize on the fact that many older adults with cognitive impairment attend medical visits with a family companion. This presentation highlights modifications to an evidence-based, agenda-setting communication intervention that: (1) elicits and aligns patient and companion perspectives regarding patient health issues to discuss with the doctor and (2) stimulates discussion about the companion's role in the visit. A prior trial that excluded older adults with cognitive impairment found the intervention improved the patient-centeredness of visit communication. We will discuss refinements to the intervention based on qualitative findings from in-depth interviews with older adult-family companion dyads (n=20) and primary care providers (n=10). Preliminary results from a trial to test the communication intervention among older primary care patients with cognitive impairment and their companions will be presented.

PATIENT AND FAMILY PERSPECTIVES ON MEDICATION MANAGEMENT FOR OLDER ADULTS RECEIVING HOME HEALTH CARE

O. Sheehan¹, J. Gabbard², K.J. Carl³, J.L. Wolff⁴, H.H. Kharazmi⁴, B.A. Leff¹, C. Boyd¹, 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland*, 2. *Wake Forrest Baptist Health, Winston-Salem, North Carolina*, 3. *Johns Hopkins Home Care Group, Baltimore, Maryland*, 4. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Many family members of patients receiving skilled home health care are involved in the complex task of medication management. We conducted a qualitative study to explore the perspectives of 10 patients and their family members around medication management in skilled home health care. Inductive thematic analysis was used to code transcripts. Analysis revealed four themes: medication complexity, value of caregiver, communication and care coordination.

Medication complexity was the biggest issue. All patients described the value of their family member in medication management, including at times relying on family to assist with administration. Challenges included poor communication and a lack of coordinated care including difficulties resolving conflicting advice from providers. Medication regimens are challenging for older adults to navigate, with many roles and opportunities to engage families. This study informs a systematic approach to directly include and involve families in medication management of homebound older adults.

TAILORING A SUCCESSFUL PROGRAM TO A NEW POPULATION: FROM CAPABLE TO SOCIABLE

D.H. Crews², A. Delaney¹, J.L. Walker¹, L.N. Gitlin¹, R.J. Thorpe³, S.L. Szanton¹, 1. *Johns Hopkins University School of Nursing, Baltimore, Maryland*, 2. *Johns Hopkins University School of Medicine, Baltimore, Maryland*, 3. *Johns Hopkins University, Baltimore, Maryland*

Older adults with end-stage renal disease (ESRD) suffer from increased morbidity, life constraining fatigue, and decreased physical function compared to those without ESRD. Many also face housing and other environmental barriers that exacerbate functional limitations and thus require more energy to complete. Using Roybal pilot funds, we conducted focus groups among older adults with ESRD to inform an adaptation of an established intervention for older adults with functional limitations, CAPABLE. The results of 3 focus groups involving 7 people showed that participants felt socially isolated from their families, that the fatigue and time constraints of dialysis left it difficult to engage in social roles and that they would be interested in participating in a program which would provide participant-directed occupational therapy, and nursing visits with handyman repair/modification and assistive devices in order to improve physical and social function. Results from the resulting randomized control pilot trial will be presented.

DEVELOPMENT OF A COMMUNITY HEALTH WORKER PROGRAM TO ADDRESS HEARING LOSS

S. Mamo, C.L. Nieman, J. Suen, F. Lin, *Johns Hopkins University, Baltimore, Maryland*

Hearing loss is independently associated with social isolation, increased utilization of informal and community supports, functional decline, and incident dementia. Treating hearing loss could potentially mitigate these effects and enhance communication and social engagement, but hearing care remains unaffordable and inaccessible. The Hearing Equality through Accessible Research and Solutions (HEARS) project is a first-in-kind community-based intervention to provide affordable and accessible hearing care to older adults and their communication partners to improve well-being and social engagement. Through a community-engaged process, we have developed a curriculum to train community health workers to provide the HEARS intervention. Five community members who participated in the HEARS feasibility study participated in a series of focus groups and mini-training sessions to guide the development of a comprehensive, practice-based curriculum. We will present qualitative results and analyses that demonstrate the relationship between the themes discussed by the community members and the curriculum.

SESSION 5135 (PAPER)

AGING AND TECHNOLOGY: DIGITAL DIVIDE AND DIGITAL BENEFITS

DIGITAL DIVIDE: UNDERSTANDING DIFFERENCES IN ICT LITERACY IN THE CANADIAN CONTEXT

C. Kim, J. Fast, *University of Alberta, Edmonton, Alberta, Canada*

We know that inequality in access to the Internet is significantly related to socio-demographic inequalities, but we know far less about how other aspects of the “digital divide”, such as information and communication technology (ICT) literacy, are related to these same inequalities. The present study uses a sample of 21,189 Canadian respondents to the Program for the International Assessment of Adult Competencies (PIAAC) survey, to examine relationships between sociodemographic factors and ICT literacy and how those relationships differ by age. ICT literacy is measured as respondents’ scores on the PIAAC problem solving in technology-rich environments module. Results indicate that baby boomers scored significantly lower on the ICT literacy scale than younger counterparts. Results of multiple regression analyses are consistent with prior research on the digital divide indicating that social disparities in Canada in ICT literacy are related to gender, education, income, type of occupation, immigrant status, language spoken at home, and everyday experience with computers. When these relationships are examined across age groups, findings consistently indicate that being a man and having a skilled job or higher education are significantly and positively related to ICT literacy. However, older adults were found to be more disadvantaged in terms of ICT literacy by lower educational attainment than their younger counterparts while women aged 25+ are more disadvantaged than women under age 25 compared to their male counterparts. Overall, our findings show that the risk factors for lower levels of ICT literacy are similar to those for poorer access to the Internet.

ICT UTILIZATION PATTERNS: INCOME AND RACIAL DIFFERENCES IN OLD AGE

B. Kim¹, J. Jeon², C. Amorim³, K. Cox¹, M. Kimura¹, 1. *University of New Hampshire, Durham, New Hampshire*, 2. *Eastern Connecticut State University, Willimantic, Connecticut*, 3. *Institute of Professional Practice, Inc., Concord, New Hampshire*

Recent studies have shed light on the beneficial effects of information and communication technologies (ICT) on well-being in old age. This study identified ICT utilization patterns among older adults, and investigated the effects of income on ICT utilization patterns and how these associations differ across racial/ethnic groups.

We used the 2012 Health and Retirement Study, a nationally representative panel survey of individuals 51 years or older. Our sample was restricted to respondents over 65 years, who participated in a special survey about ICT utilization (N=863). ICT utilization patterns were identified with Latent Class Analysis based on the use of internet-based

communication, social network sites, smartphone, exercise equipment, health monitoring device, and online health information. Multinomial logit models were used to analyze the associations between income, race/ethnicity, and ICT utilization patterns.

Four ICT utilization patterns were identified including multifarious (7%), ecommerce-oriented (11%), fundamental (27%), and minimal users (55%). Low income and African American elders were more likely to be minimal users. Hispanic elders were more likely to be multifarious users or minimal users. ICT utilization patterns significantly varied depending on income levels among African American elders. High income African American elders were more likely to be multifarious or ecommerce-oriented users. Among Hispanics, ICT utilization patterns were not significantly different across income groups.

ICT utilization patterns differ across income and racial/ethnic groups. This study suggests that social services related to ICT for elders should target minority groups, particularly low income and African Americans who need additional attention and support.

EMBODIED CONVERSATIONAL AGENTS: TECHNOLOGIES TO SUPPORT OLDER ADULTS WITH MILD COGNITIVE IMPAIRMENT

G. Demiris¹, H. Thompson¹, A. Lazar², S. Lin¹, 1. *University of Washington, Seattle, Washington*, 2. *Northwestern University, Evanston, Illinois*

Various information technology applications with anthropomorphic or animal features (in order to generate likeness to a human or pet) have emerged, referred to as embodied conversational agents (ECAs), with the goal to engage older adults in conversations, with the ultimate goal to deliver health coaching, reminders, reminiscence therapy and address isolation and loneliness. We present findings from a longitudinal feasibility study assessing a digital companion system for ten older adults (average age 78.3 years) with mild cognitive impairment. The system was a tablet-based digital pet avatar that included features such as conversation ability, use of pictures and other media, and reminders. Participants used the system daily for 3 months and scored higher at the end of the study in cognition and social support scales (measured with the Montreal Cognitive Assessment and the MOS-Social support), with the largest benefit seen, as hypothesized, in the positive social interaction subscale. Participants scored lower in presence of depressive symptoms after study completion as assessed by the Patient Health Questionnaire PHQ-9. Interviews demonstrated that participants saw value in interacting with the system. Many appreciated the pet-like features and felt they developed attachment to it over time. Concerns included technical issues related to Internet connectivity and the repetitive nature of conversations. Our findings informed the creation of design recommendations for ECAs to support aging. We specifically focus on usability, responsiveness, ways to effectively engage clinicians and family members, as well as highlight ethical issues stemming from the use of ECAs by older adults with cognitive impairment.

TABLET-BASED TECHNOLOGY INTERVENTION TO IMPROVE OUTCOMES IN HOSPITALIZED OLDER ADULTS

S. Wexler, L. Drury, C. Pollak, *Pace University, New York, New York*

The purpose of this study was to examine the effect of an avatar virtual service animal on cognition, loneliness, depression, delirium, falls and restraint use in hospitalized older adults. The virtual pet speaks to the client, displays a full range of emotions and responds directly to client questions and touch. The study was conducted in a metropolitan teaching hospital. Participants on the intervention unit received the tablet based avatar virtual service animal for their entire hospital stay. Participants on the control unit received a daily visit from a nursing student. Measures (MOCA, 3 Item UCLA loneliness scale, GDS, and CAM) were administered upon study enrollment and prior to discharge. A total of 200 older adults hospitalized on two medical surgical units were enrolled, 100 who received the intervention and 100 controls. All patients were over the age of 65 (mean 80, range 65–96), English speaking, and admitted for a medical diagnosis. There was no significant difference in MOCA scores for participants on the intervention and control units at both study enrollment and study completion. On the intervention unit, there was a statistically significant difference in loneliness scores ($p < 0.001$), and depression scores ($p < 0.001$). There were no significant changes for all measures on the control unit. Fall rates, and hours of restraint use were statistically significantly lower on the intervention unit ($p < 0.001$). There were too few incidences of delirium on both units to allow for statistical modeling. Study findings support the use of this innovative technology for hospitalized older adults.

TABLET-BASED INTERVENTION FOR NURSING HOME RESIDENTS WITH DEMENTIA: A CLUSTER RCT

J. Nordheim¹, J. O'Sullivan¹, P. Gellert¹, S. Arndt², A. Kuhlmeier¹, J. Antons³, 1. *Charité-Universitätsmedizin Berlin, Institute of Medical Sociology, Berlin, Germany*, 2. *Norwegian University of Science and Technology, Trondheim, Norway*, 3. *Technische Universität Berlin, Quality and Usability Lab, Berlin, Germany*

Approximately 65% of nursing home residents suffer from Alzheimer's disease and related disorders (ADRD). Therefore, psychosocial interventions for dealing with ADRD related symptoms play an important role in residential care. Recent findings suggest that Information and Communication Technologies (ICTs) can be effective tools for supporting dementia care delivery. However, more systematic research is needed on specific benefits of ICTs in dementia care. In order to investigate effects of a tablet-computer-based intervention on Quality of Life and Behavioral Symptoms in nursing home residents with ADRD, a cluster-randomized controlled trial (cRCT) is currently underway in 10 nursing homes (N=200, MMSE<24, 5 experimental-, 5 control-group facilities) in Berlin. Over a period of 8 weeks, experimental group participants engage in 3 supervised 30-minute tablet sessions/week using adaptive tablet-applications targeting cognitive and functional abilities and supporting emotional self-regulation. Control group participants receive an equal amount of individual sessions without tablets. Dementia-related Quality of Life, Cognition and Behavioral Symptoms are assessed at baseline

and after intervention. Additionally, assessments of mood and behavior are conducted before and after each activation session in both groups. So far, n=29 participants (14 experimental group) have been included in the on-going cRCT. Preliminary results indicate a significant ($p < .01$) increase of the ratings for happiness (from 5.4 to 6.0), social behavior (from 5.1 to 5.6), and mood (5.0 to 5.5) in the experimental group. In the final analysis behavioral data (app parameter) will be also included.

SESSION 5140 (PAPER)

GERONTOLOGY AND GERIATRICS EDUCATION AND RESEARCH METHODS

AGING AND HEALTH AS A THEME IN LEARNING OUTCOME DESCRIPTORS IN NORWEGIAN BACHELOR PROGRAMS

K. Krohne, *Norwegian National Advisory Unit on Ageing and Health, Oslo, Norway*

Current policy guidelines specify that the capacity and quality of Norwegian health and social educational programs must be strengthened to meet the increasing proportion of elderly people's need for treatment, rehabilitation and residential care. This project highlights how themes associated with aging and health are visualized in learning outcome descriptors for bachelor programs in physiotherapy, occupational therapy, social work, nursing, and social education.

A text analytical approach was used in reviewing all learning outcome descriptors relevant to the selected bachelor programs. Direct and indirect references to aging and health related themes in learning outcome descriptors were registered on three levels: First level was the Norwegian National Framework Plan – one plan is designated for each of the five bachelor programs. Second level was the individual educational institution's Bachelor Program Plan. A total of 54 higher education institutions offering fulltime programs in physiotherapy, occupational therapy, social work, nursing, and social education were included at this level. Third level consisted of all these institutions' locally offered courses.

The strengthening of themes related to aging and health is not visible in the bachelor programs reviewed. Rather, results illustrate that such themes were under-communicated in broad and general learning outcome descriptors across levels. The extensive use of terms emphasizing a lifespan perspective in learning outcome descriptors contributed to conceal the programs' or courses' focus on aging and health. A better clarification of how age groups, such as the elderly, are weighted in when a lifespan perspective is used in learning outcomes descriptors is encouraged.

NEW WAYS TO REDEFINE OLD AGE

W. Sanderson^{3,1,2}, S. Scherbov^{1,2}, 1. *World Population Program, International Institute for Applied Systems Analysis, Laxenburg, Austria*, 2. *Wittgenstein Centre for Demography and Global Human Capital (IIASA, VID/ÖAW, WU), Vienna, Austria*, 3. *Stony Brook University, Stony Brook, New York*

Most studies of population aging focus on only one characteristic of people: their chronological age. For example, the Old Age Dependency Ratio categorizes people as "old"

at age 65, regardless of whether they were living 50 years ago or likely to be living 50 years in the future. But 65-year-olds today generally have higher remaining life expectancies and are healthier than their counterparts in previous generations. Age-specific characteristics vary over time and place. Focusing on only one aspect of the changes entailed in population aging but not on all the others provides a limited picture that is often not appropriate for scientific study or policy analysis.

The presentation will be devoted to new ways of measuring aging that more accurately represent the real world. It will be shown that once more adequate measures of aging are used past aging looks very different and in countries with high life expectancy almost no aging was observed. Future aging trends look much less gloomy when new indicators of aging are used compared to traditional approaches.

The recently developed characteristics approach for the study of population aging will be introduced and used in evaluating differences in aging across space and time. The main idea of the approach is the conversion of different characteristics that reflect people's physical, cognitive or health conditions to a single metric. The hallmark of the approach is the consistent use of changing characteristic schedules together with changing age structures, regardless of the exact way in which the two are combined.

REPRESENTATIONS OF PERSONS LIVING WITH DEMENTIA AND SEXUALITY IN THE NEWS

A. Grigorovich, 1. Dalla Lana School of Public Health, University of Toronto, Toronto, Ontario, Canada, 2. Toronto Rehabilitation Institute - UHN, Toronto, Ontario, Canada

News media are an important source of information about dementia, and can influence public attitudes towards persons living with this disease. The purpose of this research was to explore public understanding of sexuality and dementia by investigating how this issue was represented in English language online news media sources (e.g. articles, editorials) from North America and the UK published between 2014 and 2015. These publications were analyzed discursively by drawing on critical disability, sexuality and dementia scholarship to identify and interrogate dominant discourses within which sexuality and dementia are described and understood. The analysis demonstrates that representations are predominantly negative, consisting of descriptions of sexual violence or harassment committed by or against persons living with dementia. Examples included reports of spouses of persons with dementia charged with sexual assault, reports of sexual assaults committed by residents with dementia living in long-term care, and reports of men with dementia exhibiting "inappropriate sexual behaviors" in public. These representations very rarely featured the voices or perspectives of persons living with dementia, and reflect stereotypical and essentialist ideologies about the nature of dementia, gender norms, and socio-cultural anxieties about older and disabled sexualities. These findings demonstrate that media representations construct the sexuality of persons with dementia as revolting and dangerous, or the abject. In doing so, they contribute to the ongoing stigmatization of persons with dementia and the suppression of their sexual rights. There is thus a critical need for advancing alternative representations that

challenge stigmatization of the sexual lives of persons with dementia.

IS OUR CITY 'AGE-FRIENDLY'? BEING AGED AND POOR IN A SUPRA-CAPITALIST SOCIETY

Y. Kwok, Department of Applied Social Sciences, Hong Kong Polytechnic University, Hung Hom, Kowloon, Hong Kong

'Age Friendly City' initiated by World Health Organization (WHO) is now a buzzword in Hong Kong. The Policy Address by the Chief Executive 2016 promotes such concept. However, when the organic unity of the 'city' is 'undone, dismembered and dislocated' by capitalism (Lefebvre), it is difficult to make the urban environment 'friendly'. In Hong Kong, a supra-capitalist society where the Gini-coefficient for households surges to 0.537 (2011), and 1/3 of residents aged over 65 lives below the poverty line, it is almost impossible to rely on the 'Age Friendly City' guidelines, requiring only minor adjustments on government policy, to enable poorer elders to live a life with quality.

Using methods of ethnographic observation and in depth interview, our research has explored how older homeless people, ageing scavengers and illegal hawkers used the public space as a place for daily living, for earning their daily bread, for social participation and networking --- that means for life. Applying the theories of social gerontology, critical geography and urban poverty, our paper will discuss critically the spatiality of these poorer elders, their adaptation to the drastic living environment and tactics of resistance. Our qualitative methodological approach would not only offer an intense dialogue between the theories for interpretation and the empirical cases, it will also reveal the capitalist ideology embedded in the WHO Age Friendly City guidelines which excludes the older people of the grassroots class to lead their life in the public space.

SESSION 5145 (PAPER)

INTERGENERATIONAL ISSUES/FAMILY AND INTERGENERATIONAL RELATIONS

OCCUPATIONAL MOBILITY AMONG BROWN-COLLAR OCCUPATIONS AND THE IMPLICATIONS FOR AGING-RELATED ISSUES

G. Waterman^{1,2}, Z.D. Gassoumis², K.H. Wilber², F. Torres-Gil³, 1. National Council on Aging, Arlington, Virginia, 2. University of Southern California, Los Angeles, California, 3. University of California, Los Angeles, Los Angeles, California

As the number of Latinos in the United States continues to increase, aging-related issues within this group must be addressed. This paper examines occupational mobility among Latinos in brown-collar occupations, a crucial step toward long-term economic security. Previous literature has identified barriers to occupational mobility among Latinos: citizenship status, English language ability, educational attainment, and industry. Utilizing U.S. Census Bureau data, these barriers were examined to determine whether Latinos were able to transition out of brown-collar occupations over a ten-year period. Data were included for Baby Boomers

(Boomers) aged 25–40 in 1990 (using 1990 and 2000 decennial census data) and Generation X (GenXers) aged 25–40 in 2005 (using 2005 and 2015 American Community Survey/ACS data). Brown-collar occupations were defined based on occupations in which Latinos were over-represented in the 1980 decennial census (e.g., machine operators, farm workers). Latino Boomers decreased their brown-collar employment, from 18.8% in 1990 to 17.8% in 2000; by contrast, Latino GenXers only decreased from 19.6% in 2005 to 19.0% in 2015. Brown-collar incomes failed to keep up with non-Latino white workers, especially for Latino GenXers. Differences exist, however, by immigrant status. Based on the income stagnation of brown-collar employment, occupational mobility must be encouraged and supported among younger Boomers and GenXers in the U.S. Failure to do so will make worklife economic security more elusive and prospects for long-term retirement security grim. This economic insufficiency will have implications not only at the micro level, but also for social programs and federal, state, and local governmental budgets.

INTERGENERATIONAL LIVING ARRANGEMENTS OF OLDER THAI ADULTS AND THEIR PSYCHOLOGICAL WELL-BEING

S. Punpuing¹, B. Ingersoll-Dayton², K. Tangchonlatip¹, W. Huttaphet¹, 1. *Institute for Population and Social Research, Mahidol University, Salaya, Nakhonpathom, Thailand*, 2. *University of Michigan, Ann Arbor, Michigan*

Recent social and economic developments in Thailand have resulted in increasing migration from rural villages to urban centers. This trend has led to varying living arrangements for older people: skipped generation households, three generation households, older couple households, and older individuals living alone. The objective of this paper is to identify associations between the living arrangements of older adults and their psychological well-being. Data are based on a household study of 1,140 persons age 60 and over living in Kanchanaburi province, Thailand. Multiple regression analyses are employed. Results indicate that older couple households experience higher psychological well-being than those in three generation households. The effects of living arrangements disappear when controlling for demographics variables (e.g., age, gender, health, working status). Other significant predictors of well-being emerge: the amount of remittances from children, satisfaction with support from children and grandchildren, and satisfaction with support to children and grandchildren. Discussion of these findings will highlight some of the reasons for difficulties within intergenerational living arrangements. Also discussed will be the importance of social and cultural factors related to older people's psychological well-being. Implications for practice and policy to improve quality of life for aging individuals in Thailand will be provided.

MANAGEMENT OF CONFLICT BETWEEN GRANDPARENTS AND THEIR ADULT CHILDREN IN THAILAND

K. Tangchonlatip¹, B. Ingersoll-Dayton², S. Punpuing¹, 1. *Mahidol University, Salaya, Nakhon Pathom, Thailand*, 2. *University of Michigan, Ann Arbor, Michigan*

A common phenomena in rural Thailand is that adult children migrate to find work and leave their children behind in the care of their grandparents. The resulting living arrangement is referred to as a skipped generation household. This arrangement can benefit the intergenerational family but can also be associated with conflict. The present study explores how the members of skipped generation households manage the conflicts that occur. In-depth interviews were conducted with 48 grandparents in rural Thai skipped generation households. Using qualitative analysis, a variety of conflictual areas between grandparents and their adult children were identified. Conflictual areas included: the decisions made by migrant adult children; how to raise and discipline the grandchildren; and inconsistent remittances from the migrant children to the grandparents. Discussion will focus on the context of Thailand and the relationship between migration and conflict. Buddhist teachings play an important role in the way families react to conflict because children are taught to be accepting and to avoid arguments with their parents. Therefore, non-interference is a common strategy to avoid the escalation of conflict. Migration can result in family conflict but it can also be a strategy to avoid family conflict. That is, when conflict becomes intense, grandparents may encourage their adult children to migrate and offer to care for the grandchildren. Interventions that help families deal with stress and conflict will be discussed and adaptations to the cultural context of Thailand will be highlighted.

WORRIES OF THAI GRANDPARENTS IN SKIPPED GENERATION HOUSEHOLDS

B. Ingersoll-Dayton¹, S. Punpuing², K. Tangchonlatip², 1. *University of Michigan, ANN ARBOR, Michigan*, 2. *Mahidol University, Salaya, Nakhon Pathom, Thailand*

While skipped generation households occur throughout the world, the proportion of older people in Thailand who live in these families has been rapidly growing and is now as high as 15% in rural areas. In Thailand, most of these skipped generation households are the result of adult children who have migrated to find work and left their own children in the care of their grandparents. Previous research has focused on the migrants; however, much less is known about the grandparents who are left behind to provide childcare. This presentation focuses on in-depth interviews with 48 Thai grandparents living in skipped generation households. While many of the grandparents discuss the joys of providing care, they also acknowledge the worries associated with such care. Using interpretative phenomenological analysis, we examine these worries and develop a typology of concerns experienced by caregiving grandparents: worries about their grandchildren (i.e., their education and family relationships), worries about their adult migrant children (i.e., their work-related stress and marital relationships) and worries about themselves (i.e., their health and income). Perhaps overriding all these worries are the grandparents' concerns about the future. That is, what will happen to the grandchildren if their own health makes it impossible to provide care? Discussion of these findings focuses on programs and policies that could address the concerns expressed by grandparents and provide support to skipped generation households in Thailand.

SUBJECTIVE WELL-BEING OF CHINESE ELDERS WITH MIGRANT CHILDREN: THE ROLE OF FAMILY AND SOCIAL SUPPORT

M. Guo¹, J. Liu², L. Xu³, I. Chi⁴, W. Mao⁵, 1. *School of Social Work, The University of Iowa, Iowa City, Iowa*, 2. *Columbia University, School of Social Work, New York, New York*, 3. *University of Texas at Arlington, School of Social Work, Arlington, Texas*, 4. *University of Southern California, School of Social Work, Los Angeles, California*, 5. *University of Nevada at Reno, Reno, Nevada*

Objectives: Addressing the crucial intersection between aging and international migration, this study examined the ways in which family and social support could protect the psychological well-being of Chinese older adults in transnational families. **Methods.** Using a purposive sample of 292 Chinese older adults in Beijing who had at least one child moving abroad, multiple linear regressions were performed to predict depression (assessed by CES-D) and life satisfaction (assessed by Satisfaction with Life Scale), respectively, using indicators of family support (monetary, instrumental, and emotional support from children) and social support (number of friends the respondents had), while controlling for socio-demographic variables and physical health. Logistic regressions were further performed to predict the likelihood of worrying about lack of care using the same predictors. **Results.** Among the three types of family support, only emotional support from children was associated with lower depression and higher life satisfaction. Such findings remained the same when social support was added in the models, which was also associated with lower depression and higher life satisfaction. But having more friends, not having close relationships with children, was associated with a lower chance of worrying about lack of care in the future. Having more friends also buffered the negative influence of having poorer physical health or poorer relationships with children on older adults' life satisfaction. **Discussion.** Social support could be as important, if not more, as family support for older adults in transnational families. Future studies and programs shall look into the ways to strengthen this alternative support.

SESSION 5150 (SYMPOSIUM)

NEW DIRECTIONS FOR RESEARCH ON PERSONALITY TRAITS AND HEALTH IN OLDER ADULTHOOD

Chair: P. Hill, *Washington University in St. Louis, Missouri*

Consistently, research has demonstrated associations between dispositional traits and health outcomes, including mortality risk. One commonly reported mechanism is through health behavior, insofar that our personalities influence our tendencies to enact healthy lifestyles. However, a few critiques can be levied on the existing work. For instance, work is needed that provides greater specificity regarding the associations between personality and health behaviors, particularly with respect to how personality shapes one's perceptions of the risks and benefits involved. Furthermore, research is needed to link personality to more intermediary health outcomes that may help understand when and why traits are associated with mortality risks. Finally, researchers

typically have relied upon the Big Five trait taxonomy (extraversion, agreeableness, conscientiousness, neuroticism, and openness to experience), which may fail to provide a comprehensive picture of how personality influences healthy aging.

The current talks each address one or more of these concerns. First, Jackson and Weston provide a thorough examination of how personality traits influence older adults' likelihood to adhere to their medication, focusing on how traits may impact adherence for different reasons. Second, Sutin and Terracciano investigate the linkage between conscientiousness and arterial health, an important intermediary, physiological health outcome when considering mortality risk. Third, Condon and colleagues present an alternative approach to considering personality and health risks, which improves on the predictive value provided by "only" investigating the Big Five. Finally, Lewis and Hill similarly move beyond the Big Five by considering purposefulness as a predictor of disease onset.

CONSIDERING THE NUANCED ROLE OF PERSONALITY TRAITS ON NONADHERENCE

J.J. Jackson, S.J. Weston, P. Hill, *Washington University in St. Louis, St. Louis, Missouri*

Personality traits have been consistently associated with one's likelihood to adhere to medication, providing a process by which personality traits influence health outcomes. Unfortunately, past work has failed to comprehensively investigate when and why specific personality traits are associated with adherence. Using two samples from the Prescription Drug Study (N = 4808; a subset of the Health and Retirement Study), the current investigation examines the factors (costs, forgetfulness, side effects, health) that influence medication adherence across time, and their associations with Big Five personality traits. Multi-level models examined within-person fluctuations in medication adherence. Greater neuroticism predicted non-adherence when medications were perceived as costlier and less important for health. Lower conscientiousness predicted nonadherence when self-rated health was higher and when medications were perceived to be inexpensive and have more side effects. Findings are discussed with respect to the value of considering adherence as a multifaceted construct when associating it with personality.

PERSONALITY AND ARTERIAL HEALTH: CONSCIENTIOUSNESS PROMOTES BETTER CARDIOVASCULAR HEALTH

A. Sutin, A. Terracciano, *Florida State University, Tallahassee, Florida*

Conscientiousness is a consistent protective factor against morbidity and premature mortality: Individuals higher in the tendency to be organized and disciplined develop fewer diseases and live longer. These associations are hypothesized to be mediated through both behavioral and physiological mechanisms. Yet, more is known about the behavioral correlates of Conscientiousness than the physiological ones. In this study (N=5,614), we examined whether Conscientiousness was associated with carotid artery intima-media thickness, a measure of arterial wall thickness that is predictive of cardiovascular outcomes. Participants who scored higher in Conscientiousness had thinner (i.e., healthier) arterial walls ($p < .01$). Among the facets of Conscientiousness, the strongest

associations were with order, dutifulness, and self-discipline ($ps < .01$). These associations were independent of a range of behavioral and cardiovascular covariates. The results suggest that arterial health may be one mechanism through which Conscientiousness contributes to healthier aging.

PERSONALITY TRAITS (. . . BUT NOT THE BIG FIVE) PREDICT THE ONSET OF DISEASE

D.M. Condon¹, S.J. Weston², A. Khan¹, D.K. Mroczek¹, 1. *Northwestern University, Evanston, Illinois*, 2. *Washington University in St. Louis, St. Louis, Missouri*

The utility of personality measures as predictors of distal outcomes (e.g., mortality, longevity) is well-documented. Few have reported on more proximal outcomes; one prominent exception (Weston, Hill, & Jackson, 2014) considered personality predictors of chronic disease onset. We report here on efforts to (1) replicate their findings in a second cohort of participants from the Health and Retirement Study and (2) extend their analyses to evaluate the effects of socioeconomic factors. For 7 chronic diseases and the Big Five scales, the only significant measure in both samples when controlling for SES was Openness as a protective factor in the development of a heart condition. SES, by contrast, was a significant predictor in more than one-third of the models. We also demonstrate methods for empirically deriving outcome-specific scales with substantially improved predictive utility and advocate for broader use of these methods when prediction is more important than taxonomic description.

SENSE OF PURPOSE IN LIFE AND RISK FOR ONSET OF CHRONIC ILLNESSES

N. Lewis¹, P. Hill^{2,1}, 1. *Carleton University, Ottawa, Ontario, Canada*, 2. *Washington University in St. Louis, St. Louis, Missouri*

Chronic health conditions have become increasingly common in recent years and may prove to become an even greater problem given the aging population. Having a sense of purpose in life has been linked to a reduced risk for several chronic health conditions, though the mechanisms behind this relationship remain underexplored. The current study examined whether purpose in life predicts risk for development of seven common chronic ailments (arthritis, cancer, diabetes, high blood pressure, heart conditions, lung disease, and stroke) over an eight-year period using data from the Health and Retirement Study. Bootstrapping tests were used to examine the direct effect of purpose on onset of illnesses, as well as potential health behaviour mediators (physical activity, alcohol, smoking, and sleep quality). Sense of purpose in life was associated with onset for some but not all conditions. Results will be discussed in the context of implications for future research and practice.

SESSION 5155 (SYMPOSIUM)

INTERNATIONAL ADVANCES IN INTERPROFESSIONAL GERIATRIC MEDICINE EDUCATION

Chair: A. Blundell, *Nottingham University Hospitals NHS Trust, Nottingham, United Kingdom*

Co-Chair: R. Roller-Wirnsberger, *Medical University of Graz, Graz, Austria*

Discussant: A. Gordon, *University of Nottingham, Derby, Derbyshire, United Kingdom*

With our ageing population there is increased recognition of the needs of older adults with frailty within health systems. The UK's Health Service Journal reported in 2015 that older adults with frailty, dementia and multiple co-morbidities are now "core business" in all health and social care settings. Comprehensive Geriatric Assessment is an evidence-based model of care that delivers better outcomes for older adults with frailty and which mandates a multidimensional and interprofessional approach. All healthcare professionals require the core skills to deliver CGA to keep pace with the growing prevalence of frailty in all care sectors. This will require competencies in interprofessional working best attained through interprofessional learning. Further international emphasis on interprofessional working has been stressed by the World Health Organisation in their publication "Framework for Action on Interprofessional Education and Collaborative Practice".

This symposium presents recent advances in interprofessional geriatric medicine education in Europe including both policy and curriculum development in addition to novel approaches in interdisciplinary teaching. The subject areas cover both undergraduate and postgraduate arenas and include reference to patient and public partners and involvement of patients within educational programs.

DEVELOPMENT OF THE ROLE OF AN ADVANCED NURSE PRACTITIONER IN GERIATRIC MEDICINE IN THE UK

S. Goldberg², A. Blundell^{1,2}, J. Cooper¹, A. Gordon², T. Masud¹, R. Moorchild¹, 1. *Geriatric Medicine, Nottingham University Hospitals NHS Trust, Nottingham, United Kingdom*, 2. *University of Nottingham, Nottingham, United Kingdom*

Advanced Nurse Practitioners (ANP) are experienced nurses who undertake activities traditionally performed by medical staff. There are four pillars of advanced practice: advanced clinical skills, leadership/management, education and service development/research. ANPs are starting to specialise in the care of older people with frailty. The education of the ANPs in core geriatric topics has been core to the success of this project. Both the learning and service provision is interprofessional, allowing the ANPs and junior doctors to learn with and from each other, improving collaboration and care quality.

To ensure consistency in standards, we have developed a role description and ANP competencies through a Modified Delphi process. The development of the curriculum, the continuing professional development and the implementation of the integration of our ANPs into the medical ward teams will be presented. In addition we will share the results of an independent service evaluation that is currently taking place.

THE EUROPEAN INTERDISCIPLINARY COUNCIL ON AGING: A HUB FOR RESEARCH, EDUCATION, AND KNOWLEDGE

R. Roller-Wirnsberger, *Medical University of Graz, Graz, Austria*

Numerous policy initiatives across EU member states have been put in place in order to analyze and deal with the impact of this development e.g. on future concepts of welfare states, on health care demands, on respective access and

service delivery etc. Solution approaches developed so far confirm that all these impacts and consequences for ageing societies are intrinsically intertwined and the need for interdisciplinary approaches are undisputed. The core motivation of EICA is therefore to put an interdisciplinary focus on daily life related questions concerning *ageing, health and care* and to foster adequate education strategies and knowledge translation programs based upon research and research analyses, (Evidence based interdisciplinary Education) in Europe. The talk will outline the educational concept of EICA and how to foster an interdisciplinary knowledge translation towards various professional groups involved into the topic of aging and to foster knowledge transfer towards the general public and lay persons.

THE VALUE OF INTERPROFESSIONAL FEEDBACK AS PART OF A PRE-REGISTRATION MODULE IN GERIATRIC NURSING

A. Hutchinson¹, S. Tiplady¹, E. Tullo², 1. *Northumbria University, Newcastle, United Kingdom*, 2. *University of Newcastle, Newcastle, United Kingdom*

Pre-registration interprofessional education is often difficult to organise due to separation of healthcare disciplines by institution, culture and learning needs. One way to introduce an element of interprofessional learning to a single discipline - in this case nursing - is to bring together an interprofessional faculty team to offer students feedback from different perspectives. Pre-registration nursing students participated in a rotation of simulated scenarios relating to the care of an older patient, role-played by a service-user. Following each station, students received feedback from faculty members representing nursing, physiotherapy, social work and medicine, allowing them to question and reflect upon the key roles of each of the team members. Evaluation of this approach demonstrated that students and faculty members all benefited from the opportunity to rehearse interprofessional assessment in a variety of simulated scenarios, based on a shared aim of providing appropriate care for an older patient.

IMPLEMENTATION OF A NOVEL INTERPROFESSIONAL UNDERGRADUATE GERIATRIC MEDICINE SIMULATION SESSION

T. McGowan^{1,2}, A. Blundell¹, J. Mjojo¹, F. Moffatt², J. Pattinson¹, 1. *Geriatric Medicine, Nottingham University Hospitals NHS Trust, Nottingham, United Kingdom*, 2. *University of Nottingham, Nottingham, United Kingdom*

A multi-professional simulated teaching session was developed for nursing, physiotherapy and medical students training at a large UK teaching hospital to assess and manage older patients. Topics included comprehensive geriatric assessment, incontinence, delirium, elder abuse and a complex multi-disciplinary team meeting with a distressed carer. A multi-disciplinary faculty debriefed each scenario immediately, with eight simulation days per year.

73 fourth-year medical students, 18 nursing students and 5 physiotherapy students have participated since February 2016. Both perceived (measured using a Likert scale) and actual knowledge (multiple choice questions) increased significantly following the session. Students participating from July 2016 onwards will also complete the Readiness for

Interprofessional Learning Scale before and after the day, the results of which will also be presented. This suggests that inter-professional simulation can be used effectively to teach geriatrics, and both the implications and challenges of this will be discussed.

SESSION 5160 (SYMPOSIUM)

MEASURING PHYSICAL RESILIENCE IN OLDER ADULTS: TRAJECTORY, PHENOTYPE, AND AGE DISCREPANCY APPROACHES

Chair: C. Colon-Emeric, *Duke University, Durham, North Carolina*

Co-Chair: H. Whitson, *Duke University Medical Center & Durham VA*

Discussant: K.J. Bandeen-Roche, *Johns Hopkins University*

As the global population ages, identifying ways to optimize recovery following acute and chronic stressors will be important to public health. Understanding “physical resilience”, a characteristic at the whole person level which determines an individual’s ability to resist functional decline or recover physical health following a stressor, is therefore of intense interest. Physical resilience is thought to be constrained in part by underlying physiologic reserve across organ systems, and further influenced by factors such as genetics, the environment, and psychosocial factors including psychological resilience. Measuring physical resilience is a critical but challenging first step in identifying potential pathways for intervention.

This symposium will discuss three potential approaches to measuring physical resilience in older adults, with examples from ongoing research by an interprofessional group of investigators. First, we describe the use of functional trajectories to measure physical resilience, both at an individual patient level using perioperative activity monitors, and at a population level using administrative data. Second, we describe attempts to define a resilient phenotype with in-home video telehealth gait and balance assessment and using dual task stress testing. Finally, we describe an age discrepancy approach to measuring physical resilience by quantifying the difference between observed and predicted levels of readily available biomarkers based on chronological age. Once validated as predictors of functional outcomes following stressors in diverse populations, these measurements can be used in studies aimed at improving physical resilience and active life expectancy in older adults regardless of the underlying stressor.

CAN WE MEASURE RESILIENCE FROM ADMINISTRATIVE AND SECONDARY SOURCES OF DATA?

J. Prvu Bettger, *Duke University, Durham, North Carolina*

Administrative claims data aimed to measure health resource utilization is being used in the U.S. to examine patient outcomes of rehospitalization and mortality. While both are important markers of health decline, a third measure “home-time” (number of days alive and out of inpatient care) is emerging as a patient-centered outcome measure for an episode of care. In a national sample of 815 stroke patients treated at 88 hospitals, the Pearson correlation coefficient

between home-time within 12 months of an acute admission and functional independence was 0.713 (p -value <0.0001). The c-index of 1-year home-time predicting 12-month independence was 0.828. Home-time varied by both patient and healthcare characteristics in analyses of 156,887 stroke patients from 989 hospitals. In this presentation we demonstrate how examining consecutive days at home (rather than total) and integrating administrative data on service availability and use of assistive devices can provide more insight into resilience after an acute hospitalization.

USE OF PHYSICAL ACTIVITY TRACKERS TO MEASURE RESILIENCE PRE- AND POST-SURGERY AMONG OLDER ADULTS

K. Manning¹, D.L. McNeill¹, K. Caves², F. Tocci³, S. McDonald^{2,1}, M. Heflin^{2,1}, S. Lagoo-Deenadayalan^{2,1}, M.C. Morey^{1,2}, 1. GRECC, Durham VA Medical Center, Chapel Hill, North Carolina, 2. Duke University Medical Center, Durham, North Carolina, 3. Duke University, Durham, North Carolina

Resilience is often defined as the ability to bounce back or recover from a stressor. Using surgery as the stressor, we used Garmin Vivosmart® activity watches to measure trajectories (step counts) of older adults from the time of decision to undergo elective surgery through postop day 30. Participants were identified through the Durham VA Perioperative Optimization of Senior Health clinic (POSH), an innovative multidisciplinary preoperative clinic for older veterans (65+). Nine of 10 invited Veterans agreed to wear and use the device with a single training session. They also received weekly counseling calls to increase activity. Mean daily step counts were: 2256 at pre-op baseline, 5628 pre-op post-counseling, 2426 day of surgery or admission, 713 on day of discharge, 3022 during recovery, and 4501 at 30-day post-surgery visit. Use of physical activity trackers, collecting pre-stressor, stressor, and post-stressor measures is a promising method of assessing resilience in a vulnerable population.

RESILIENCE, RESERVE, AND PHYSICAL PERFORMANCE

S.A. Studenski, National Institute on Aging, Bethesda, Maryland

Resilience and reserve are related. Resilience can be conceived of as tolerance to challenge, while reserve represents excess capacity. Both can be assessed using performance measures that extend the ability to discriminate levels of health. Resilience can be assessed by challenge tests such as dual task protocols while reserve can be assessed by adding more difficult items to existing performance tests. Resilience and reserve testing are most appropriate for individuals who perform at or near the ceiling on a performance test, while such high level testing can result in missing data in persons with poor performance. Using data from the Baltimore Longitudinal Study of Aging, examples of the benefits and limitations of tests of resilience and reserve will be presented.

QUANTIFICATION OF BIOLOGICAL AGING FOR TESTING GEROPROTECTIVE INTERVENTIONS

D.W. Belsky, Duke University, Durham, North Carolina

Biological aging refers to the coordinated deterioration of integrity across multiple systems throughout the body that

occurs with advancing chronological age. Whereas chronological aging proceeds at the same rate for everyone, biological aging proceeds faster for some and more slowly for others, possibly explaining differences in disease-free lifespan, called “healthspan.” The geroscience hypothesis posits that interventions to slow biological aging can extend healthspan. Geroprotective interventions show promise in laboratory animals. To advance human translation, methods to quantify biological aging are needed. Proposed methods include algorithms applied to clinical biomarker and genomics data. Algorithms are trained by (1) comparing older persons to younger ones; (2) analyzing a benchmark sample against which deviations can be quantified; or (3) modeling change within individuals over time. Validation comes from prediction of function, frailty, disease, and mortality. We review several published algorithms and compare them in data from the Dunedin Study birth cohort (N=954).

SESSION 5165 (PAPER)

COGNITION IN OLDER ADULTS

COGNITION IN THE OLDEST OLD MāORI AND NON-MāORI: A PROSPECTIVE DIAGNOSTIC TEST ACCURACY STUDY

K. Zawaly¹, P.C. Wood², L. Tippett¹, S. Moyes¹, G. Cheung¹, A. Rolleston¹, N. Kerse¹, 1. The University of Auckland, Auckland, Auckland, New Zealand, 2. Memory Clinic, North Shore Hospital, Auckland, New Zealand

Objective: Cognitive decline is a rapidly evolving condition affecting a high portion of the ageing population. Our aim was to examine the diagnostic test accuracy of the Modified Mini-Mental State (3MS), diagnosing: mild cognitive impairment (MCI), cognitive impairment, or dementia. A clinical assessment following standard Memory Clinic criteria and a multidisciplinary discussion of each case was used as the reference standard.

Study design and setting: This study was a multisite sub-study from a large prospective cohort study (LiLACS-New Zealand [NZ]) of the oldest old indigenous people, Māori and also non-Māori to determine the predictors of successful advanced ageing. The 3MS and the reference standard were administered to 73 participants (n=32 Māori; n=41 non-Māori). This study adhered to Standards for Reporting of Diagnostic Accuracy Studies.

Main outcome measures: Diagnostic accuracy indicators used were: receiver-operating characteristics curves (ROC), area under the curves (AUC), sensitivity and specificity.

Results: Māori life expectancy and variation in health differs when compared to non-Māori and these rationales were used when the LiLACS-NZ cohort was constructed. Taking this into account the analyses were completed separately. To optimize the predictive validity of the 3MS ideal cut-offs were selected for Māori and non-Māori respectively: 1) MCI 90/100; 92/100, AUC, 0.75; 0.58, sensitivity 67%; 64%, specificity 75%; 67%; 2) cognitive impairment 85/100; 88/100, AUC, 0.84; 0.77, sensitivity 70%; 73%, specificity 87%; 83%; and 3) dementia 80/100; 84/100, AUC, 0.87; 0.90, sensitivity 83%; 83%, specificity 90%; 80%.

Conclusions: ROC analyses demonstrated predictive validity identifying cognitive impairment and dementia in Māori and non-Māori.

INSTRUMENTED TRAIL-MAKING TASK (ITMT) TO ASSESS DUAL-TASK AND COGNITIVE IMPAIRMENT IN ELDERLY

H. Zhou¹, M. Sabbagh², R. Wyman³, C. Liebsack³, M. Kunik¹, B. Najafi¹, 1. *Baylor College of Medicine, Houston, Texas*, 2. *Barrow Neurological Institute, Phoenix, Arizona*, 3. *Banner Sun Health Research Institute, Sun City, Arizona*

Current modalities to examine cognitive impairment are often unsuitable for busy clinics, subjective, or insensitive to evaluate dual-task cost, which is essential to isolate the cognitive control component of locomotion. In this study we an innovative instrumented trail making task (iTMT) based on wearable sensor and human-machine interface to evaluate motor-cognitive performance in older adults.

Thirty healthy age-matched control, Mild Cognitive Impairment (MCI), and Alzheimer's Disease (AD) subjects were recruited. Participants were asked to perform iTMT tests with different cognitive-challenge levels: iTMT_{fixed}, iTMT_{random}, and iTMT_{number-letter}. Conventional TMT A&B, Montreal Cognitive Assessment (MoCA), and dual-task cost (DTC) were used as references.

Between groups difference was more pronounced, when using iTMT_{number-letter} with average completion time of 26.3 ± 12.4s, 37.8 ± 14.1s, and 61.8 ± 34.1s, respectively, for healthy, MCI, and AD groups ($p = 0.006$). Pairwise comparison suggested strong effect sizes to separate between AD and healthy ($d=1.384$, $p=0.001$) and between MCI and AD ($d=0.920$, $p=0.029$). Significant correlation was observed when comparing iTMT_{number-letter} with MoCA ($r = -0.598$, $p = 0.001$), TMT A ($r = 0.519$, $p = 0.006$), TMT B ($r = 0.666$, $p < 0.001$), and DTC ($r=0.713$, $p<0.001$). Interestingly, no noticeable correlation was observed between DTC with MoCA or TMT.

This study demonstrated proof of concept of a simple, safe, and practical iTMT system with promising results to identify cognitive and dual-task ability impairment among older adults including those suffering from MCI and AD. Future studies are warranted to confirm these observations in larger samples and iTMT's ability to track cognitive decline over time.

EXECUTIVE FUNCTION AND LIFE-SPACE MOBILITY IN OLD AGE

T. Poranen-Clark², M. von Bonsdorff^{2,3}, M. Rantakokko², E. Portegijs², J. Eronen², J.G. Eriksson^{3,1,4}, T. Rantanen², A. Viljanen², 1. *University of Helsinki, Helsinki, Finland*, 2. *University of Jyväskylä, Jyväskylä, Finland*, 3. *Folkhälsan, Helsinki, Finland*, 4. *National Institute of Health and Welfare, Helsinki, Finland*

Mobility is important for maintaining independence and active participation in old age. Life-space mobility assessment incorporates the extent of mobility in terms of the distance from home, the frequency of mobility and the need of assistance for mobility. Executive function (EF) is one of the most important higher-order cognitive abilities that control

and guide goal-directed actions. The aim of the study was to examine the association between EF and life-space mobility.

A cross-sectional study of 174 community-dwelling persons aged 79 to 93 years living in Central Finland, who participated in the Life-Space Mobility and Active Aging study in 2016. EF was measured with the Trail Making Test (TMT) performance and coded into tertiles according to Delta TMT; TMT-B minus TMT-A (good; Delta-TMT ≤ 92s, intermediate; 93-161s and poor; ≥ 162s). Life-space mobility was assessed using the Life-Space Assessment (LSA, range 0–120) and dichotomized to restricted; LSA < 60 and unrestricted; LSA ≥ 60 life-space mobility. Adjustments were made for sex, age, years of education and diagnosed depression.

Mean age of the participants was 83 years and 57 % were women. 42 % of the participants had restricted life-space mobility. Logistic regression analysis revealed that people with good EF were less likely to have a restricted life-space mobility compared to those with poor EF (OR 0.394, 95 % CI 0.156–0.996) after adjustment for all covariates.

People with good executive function are less likely to have restricted life-space mobility in old age. Promoting executive function could possibly help maintain mobility and active participation in old age.

EFFECTS OF EXERCISE WITH INCREASED DIETARY PROTEIN ON COGNITION AND QUALITY OF LIFE IN OLDER ADULTS

M.B. Formica¹, J. Gianoudis¹, S. O'Connell¹, C. Milte¹, C. Nowson¹, K. Ellis², R.M. Daly¹, 1. *Deakin University, Melbourne, Victoria, Australia*, 2. *University of Melbourne, Melbourne, Victoria, Australia*

Progressive resistance training (PRT) and dietary protein are essential to optimize muscle health in the elderly, but both factors may also influence brain health/cognitive function via several pathways, including the regulation of various neurotrophic factors [brain-derived neurotrophic factor (BDNF)] and/or the modulation of systemic inflammation. The aim of this study was to investigate the effects of a multi-modal exercise program (aerobic+PRT) combined with a protein-enriched diet achieved through the consumption of lean red meat on cognitive function and health-related quality of life (HR-QoL). Community-dwelling men and women (n=154) aged 65+ years were randomised to a 24-week intervention consisting of PRT+lean red meat [2x110g raw weight to be consumed on each of the three training days (RT+Meat)] or PRT+pasta/rice (RT+CHO). Exercise compliance was no different between groups (~79%). Compliance with the meat and CHO was 87% and 91%, respectively. After 24-weeks both groups experienced a similar increase in global cognitive function (z-score change: RT+CHO +0.24 SD; RT+Meat +0.17 SD, both $P<0.001$). Psychomotor/attention composite scores decreased in the RT+CHO after 12-weeks (interaction, $P<0.001$), but there was no between group difference after 24-weeks. Working memory/learning composite scores increased in the RT+CHO compared to RT+Meat group after 12- and 24-weeks (net difference in z-scores, 0.24–0.27 SD, both $P<0.001$). Executive function, HR-QoL and serum levels of BDNF and inflammation (IL-6, -8, -10, TNF α) did not change in either group. In conclusion, these findings indicate that the provision of additional protein did not enhance

the effects of exercise on cognitive function in the community-dwelling elderly.

NOCTURNAL SALIVARY CORTISOL LEVELS AND COGNITIVE PERFORMANCE IN THE AGING POPULATION

M. Lima, S. Barreto, C. Cesar, W. Pedrosa, R. Santos, C. Lima, V. Passos, *Programme of Adult Health, Universidade Federal de Minas Gerais, Belo Horizonte, Minas Gerais, Brazil*

Introduction: Chronic stress, which causes hypercortisolism, has been associated with low cognitive performance. We hypothesize that this correlation persists in elderly individuals who do not have cognitive impairment and low education, even after considering social characteristics.

Objectives: To investigate the association between cognitive test performance and salivary cortisol levels among elderly with medium to high level of education.

Methods: Participated 196 Brazilian elderlies (60 years old or more), who had at least four years of schooling and did not have cognitive impairment according to Mini-Mental State Examination scores. The cognitive tests were the following: semantic and phonemic verbal fluency, Word List memory (learning, recall and recognition) from the *Consortium to Establish a Registry for Alzheimer's Disease*, and the Trail Making B test. Participants were instructed to collect salivary cortisol samples using a saliva device (Salivette®) at home at 11:00 p.m. two days before the evaluation. The following confounders were analyzed: socio-demographic characteristics, lifestyle habits, medications, comorbidities, common mental disorders, insomnia, and stressful life events.

Results: Participants were predominantly women (89.8%), with an average of 68.9 years of age and 12.2 years of schooling. A low recall test score was associated with high cortisol levels, older age, low monthly family income, dual-action antidepressant use, and common mental disorders. The ability to accomplish the Trail Making B test was directly associated with high cortisol levels, more years of schooling, and a high subjective social status in society score. It was also inversely associated with age.

Discussion: Association of high cortisol levels with a decrease in memory performance corroborate findings from most prospective studies of elderly without cognitive impairment and similar levels of schooling. The capacity to accomplish the Trail Making B Test was associated with high cortisol levels, possibly due to attention improvement of the elderly participants.

Conclusion: High cortisol levels increased the capacity to accomplish the executive function test, but it decreased the memory performance test.

SESSION 5170 (SYMPOSIUM)

CLINICAL DECISION SUPPORT: IMPROVING CARE, IMPROVING OUTCOMES

Chair: M. O'Connor, *Villanova University*

Discussant: K.H. Bowles, *University of Pennsylvania, Fort Washington, Pennsylvania*

Every day interprofessional health care teams evaluate patients' needs and make decisions regarding their care

often without empirically derived decision support tools to assist in making these common but important decisions. Chronically ill older adults often experience uncoordinated care transitions and are particularly vulnerable for poor outcomes. The purpose of clinical decision support is to provide evidenced-based and timely information to clinicians to inform decisions about health care and patient needs. Clinical decision support has the potential to lower costs, improve efficiency of care transitions and promote effectiveness of health care services. Clinical decision support is an understudied but emerging area of research and application is expected to become more common as evidence-based practice develops. This symposium highlights three cutting-edge and developing areas of clinical decision support including one application that suggests referral to post-acute care following an inpatient hospitalization and two applications in skilled home health.

Our first presentation reports on patient outcomes when the advice of a discharge referral decision support tool is compared to usual discharge planning practice. The second presentation reports the results of a qualitative study of how nurses decide the number and frequency of skilled home health visits. Next, a mixed methods study uncovers factors that are critical to consider when determining readiness for discharge from skilled home health. This symposium highlights the value of clinical decision support and its potential impact on outcomes of chronically ill older adults from hospital to home.

DECISION SUPPORT FOR POST-ACUTE CARE REFERRALS: DEVELOPMENT AND IMPLEMENTATION

K.H. Bowles^{1,2}, S. Ratcliffe¹, J. Holmes¹, M.D. Naylor¹, C. Whitehouse³, S. Keim³, 1. *University of Pennsylvania, Philadelphia, Pennsylvania*, 2. *Center for Home Care Policy & Research, Visiting Nurse Service of New York, New York, New York*, 3. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*

Decisions about who should be referred for post-acute care (PAC) are made by individual clinicians or teams for 14 million older adults per year, without national standards or guidelines. Using teams of multi-disciplinary experts we built a decision support (DS) tool that assists clinicians with these important decisions. The DS is based on two algorithms calculated from the characteristics of the patient during the hospital stay and provides a suggestion of refer or not, and which site of care is recommended. We will describe the development and testing of live DS in two hospitals. When the tool said to refer and patients did not get referred, readmission risk and ED use were 40% and 43% higher respectively, than those who did get referred. Use of DS can assure that high risk patients are identified and referred for PAC.

EXPLORING HOME HEALTH NURSE DECISION MAKING REGARDING VISIT PLAN DEVELOPMENT

E. Irani^{1,2}, K.B. Hirschman^{1,2}, P.Z. Cacchione¹, K.H. Bowles^{1,3}, 1. *University of Pennsylvania, Philadelphia, Pennsylvania*, 2. *NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania*, 3. *Center for Home Care Policy & Research, Visiting Nurse Service of New York, New York, New York*

Older adults are admitted to home health (HH) care from acute care settings with diverse needs, requiring different levels of care. However, it is unknown how nurses decide on visit patterns nor are there empirically derived clinical decision support tools to guide them. Using qualitative descriptive method, HH nurses' decision making about the number and frequency of nursing visits when developing a visit plan was explored. Semi-structured interviews with HH nurses (N=30) employed full-time by three agencies were analyzed. Through content analysis three approaches emerged: nurses followed a systematic approach to develop visit plans and based their decisions on a central team's recommendations, their professional evaluation, or their agency-specific guidelines. Factors considered included patient's clinical status, learning style, and support system. Findings are contributing to a decision support tool that guides HH nurses in developing appropriate visit plans to ensure an optimal transition of older adults from hospital to home.

DETERMINING READINESS FOR DISCHARGE FROM SKILLED HOME HEALTH SERVICES: A MIXED METHODS STUDY

M. O'Connor^{1,2}, H. Moriarty^{1,3,2}, A. Hanlon^{4,2}, E. Dowdell¹, K.H. Bowles^{4,5}, 1. *Villanova University, Villanova, Pennsylvania*, 2. *NewCourtland Center for Transitions in Health, Philadelphia, Pennsylvania*, 3. *Veterans Affairs Hospital, Philadelphia, Pennsylvania*, 4. *University of Pennsylvania, Philadelphia, Pennsylvania*, 5. *Center for Home Care Policy & Research, New York, New York*

Medicare relies upon an interprofessional team of home health (HH) clinicians to evaluate beneficiary needs and to decide to discharge from skilled HH or recertify patients for an additional 60-days. However, there are no national, empirically derived decision support tools to assist in making these important decisions and getting it wrong can result in adverse events after discharge. Two studies, one quantitative and one qualitative informed the research questions of what factors are associated with poor HH discharge outcomes and readiness for discharge. The quantitative OASIS data elements were found to not be helpful predictors for identifying which patients are likely to have adverse outcomes. However, the qualitative interview themes identified patient safety, independence and caregiver availability as critical for determining readiness for a safe discharge. These findings inform the development of an evidence-based discharge decision support tool to provide a standardized approach to determine readiness for discharge from HH.

SESSION 5175 (SYMPOSIUM)

FRAILTY PREVENTION, IDENTIFICATION AND MANAGEMENT: WHAT CAN RESEARCH ADD?

Co-Chair: B. Hanratty, *Newcastle University, Newcastle upon Tyne, United Kingdom*

K. Spilsbury, *University of Leeds, Leeds, United Kingdom*

Discussant: K. Rockwood, *Dalhousie University*

More and more people are living out their lives with frailty, as populations age. Frailty is associated with increased risk of a range of adverse outcomes, including admission to hospital or long-term care. Timely recognition of the level of frailty

and likely prognosis offer opportunities to make advance plans and discuss preferences for care. However, there are still gaps in the evidence base, particularly for clinicians in primary care. This symposium will highlight the contribution of different research methods to improving frailty care. A series of linked presentations will consider the relationship between disadvantage, frailty and mortality; the contribution of a novel frailty index in electronic health records to end of life care, older adults' priorities in clinical encounters about frailty, and the potential of a home based prevention service.

LIFE EXPECTANCY WITH FRAILTY: ARE THE EXTRA YEARS OF LIFE GAINED OVER THE LAST 20 YEARS FRAILTY FREE?

F. Matthews^{1,2}, A. Mousa¹, C. Brayne³, C. Jagger¹, 1. *Institute of Health and Society, Newcastle University, Newcastle upon Tyne, United Kingdom*, 2. *MRC Biostatistics Unit, Cambridge, United Kingdom*, 3. *University of Cambridge, Cambridge, United Kingdom*

Cross sectional investigations have shown the life expectancy with frailty has increased in across England, but some regions have done better than others. This investigation will look into whether the regional differences seen in life expectancy with frailty and severe frailty are related to deprivation, and whether location and deprivation is important. Using the longitudinal data from the MRC Cognitive Function and Ageing studies I and II with 7,500 individuals at baseline in each study, each with a two year follow-up and four year mortality information. Using discrete time Markov models to investigate longitudinal changes between states (robust, mildly frail, severely frail and death) with regard to age, sex, region and deprivation. The findings will show where inequality is increasing over time.

PRIMARY CARE FOR FRAIL OLDER ADULTS AT THE END OF LIFE: CAN A FRAILTY INDEX ENHANCE ROUTINE CARE?

B. Hanratty¹, D. Stow¹, A. Clegg², S. Iliffe⁴, S. Barclay³, L. Robinson¹, F. Matthews¹, C. Exley¹, 1. *Newcastle University, Newcastle upon Tyne, United Kingdom*, 2. *University of Leeds, Leeds, United Kingdom*, 3. *University of Cambridge, Cambridge, United Kingdom*, 4. *University College London, London, United Kingdom*

Recognising that a patient is nearing the end of life allows physicians to discuss prognosis and preferences for end of life care. Finding the right time to introduce palliative and terminal care for frail older patients can be a challenge. This study aims to determine whether an electronic frailty index (eFI) constructed from health care records can be used to identify palliative care needs in older patients nearing the end of life. Data from electronic health of 30,000 patients were analysed (15,000 patients age >75 who died between 2014 and 2015 matched by age and sex to 15,000 patients with no record of death). Monthly changes in frailty (eFI) over a one year period prior to death, key symptoms and diagnoses, medication, service utilization and mortality will be described. Latent growth models will be used to identify subgroups of patients where a defined change in frailty score predicts a need for palliative care. This study will illustrate the potential of automatically generated scores in electronic health records to inform end of life care for frail older adults.

MAKING THE MOST OF PRIMARY CARE CONSULTATIONS FOR OLDER ADULTS WITH FRAILITY: BALANCING PRIORITIES

K. Spilsbury¹, L. Schreuders¹, B. Hanratty², 1. *University of Leeds, Leeds, United Kingdom*, 2. *Newcastle University, Newcastle upon Tyne, United Kingdom*

Working with frail older adults is an increasingly important aspect of primary care based practice, but one where education and training have not kept pace with the need for a sensitive, skilled workforce. We will present findings of a rapid evidence synthesis and qualitative interview study to elicit the priorities of older people, their carers and health care professionals during primary care consultations. This work is informing the development of interventions and initiatives to improve the experiences and outcomes of contacts between primary care professionals and frail older people

DEVELOPMENT AND FEASIBILITY TESTING OF A HOME-BASED PREVENTION SERVICE FOR MILD FRAILITY

K. Kharicha¹, S. Iliffe¹, J.T. Manthorpe², C. Goodman³, B. Gardner^{2,1}, J. Wood¹, V. Drennan⁴, K. Walters¹, 1. *Centre for Ageing Population Studies, Department of Primary Care and Population Health, University College London, London, United Kingdom*, 2. *King's College London, London, United Kingdom*, 3. *University of Hertfordshire, Hertfordshire, United Kingdom*, 4. *Kingston University & St. George's University of London, London, United Kingdom*

Little is known about how to improve outcomes in mild frailty. We synthesised findings from three systematic reviews and qualitative work with 102 diverse participants (older people, caregivers, multi-disciplinary professionals) using a co-design process, to develop a new theory and evidence-based intervention promoting health and well-being for older people with mild frailty. The manualised intervention is individually tailored containing core components (physical activity, nutrition, social connections and mood), incorporating behavior change techniques and an assets-based approach.

We tested feasibility with 51 participants with mild frailty from four General Practices in England, randomised to intervention and usual-care. Baseline, 3 and 6 month assessments included measures of functioning, frailty, quality of life, mobility, well-being, psychological distress, cognition, falls, and service use.

Early findings suggest this new prevention service is feasible and acceptable. We will present an overview of the service, its evidence base, and findings on feasibility/acceptability and process evaluation.

SESSION 5180 (PAPER)

CARE OF OLDER ADULTS WITH DEMENTIA AND ALZHEIMER'S DISEASE: INTERNATIONAL DIFFERENCES

WHO WILL CARE FOR ME WHEN I HAVE END-STAGE DEMENTIA?

J.M. Teno¹, P. Gozalo², A. Trivedi², D. Meltzer³, V. Mor², 1. *Cambria Palliative Care Center of Excellence, University of*

Washington, Seattle, Washington, 2. *Center for Gerontology and Health Care Research, Providence, Rhode Island*, 3. *University of Chicago, Chicago, Illinois*

Over the past decade, physicians have increasingly focused their practice on hospitals, outpatient clinics, or nursing homes. For persons with advanced dementia, we document changes in the type of physicians caring for persons with advanced dementia and in continuity of care from the nursing home to the acute care hospital. Using 20% Part B Medicare claims between 2000 and 2010, we classified each physician caring for hospitalized dementia patients as either a hospitalist, primary care physician (PCP), or specialist. Additionally, we examined whether a physician saw the patient prior to or after the hospitalization. There were 248,287 hospitalizations of persons with advanced dementia with 4 or more ADLs impairments (avg. age 85, 31% male, 73% white). A hospitalist was the attending physician for the entire hospitalization (based on Goodwin's Part B billing proposed cutoff for being a hospitalist) increased from 10% to 18% while PCP decreased from 45% to 15%, with most hospitalizations for advance dementia involving a mixture of specialist, hospitalist, and PCP (61% of 2010 hospitalizations). When a hospitalist acted as the attending physician, there was an increase in the number of distinct hospitalists billing for that admission despite a declining length of stay. The proportion of hospitalizations in which a PCP saw the patient prior to the hospitalization decreased from 45% in 2000 to 32% in 2010. A similar trend was seen in the PCP seeing the patient post hospitalization (decrease 30% to 21%). Increasingly, hospitalized advanced dementia patients are cared for by hospitalists, with increased fragmentation of the hospitalist attending physician and declining continuity between the outpatient and inpatient settings.

DEATHS FROM RESIDENT-TO-RESIDENT AGGRESSION AMONG NURSING HOME RESIDENTS IN AUSTRALIA, 2000-2013

B. Murphy^{1,2}, J. Ibrahim^{1,2}, L. Bugeja^{1,2}, J. Pilgrim^{1,2}, 1. *Department of Forensic Medicine, Monash University, Southbank, Victoria, Australia*, 2. *Victorian Institute of Forensic Medicine, Southbank, Victoria, Australia*

Resident-to-resident aggression (RRA) among nursing home residents is a growing area of concern. This research aims to describe the frequency and nature of deaths from RRA in Australia, and examine associated individual, incident-level, organisational, and societal factors. Data on RRA deaths was obtained by reviewing the original coroner's (medical examiner) investigation file. The study identified 28 deaths resulting from RRA in Australia (2000-2013). The majority of residents involved in RRA incidents had a diagnosis of dementia (n=50, 89.3%), and a history of behavioural issues including aggression and wandering (n=43, 76.7%). The dyad typically involved male exhibitors (n=24, 85.7%), targeting either female (n=15, 53.6%) or male residents (n=13, 46.4%), who were younger (mean age difference of 6.1 years) and had resided in the nursing home for a shorter duration than targets of aggression (mean difference of 8.7 months). Incidents frequently occurred during the afternoon nursing shift (2pm-10pm) (n=14, 50.0%), in communal areas (n=17, 60.7%), and often involved a "push and fall" type assault (n=14, 50.0%). Incidents commonly

occurred in larger facilities (>60 residents) (n=18, 64.3%), offering both high and low care services (n=16, 57.1%). An inquest, or formal public hearing, into the death was held in one quarter of cases (n=7, 25.0%), and criminal charges were laid against exhibitors in only two cases (7.1%). This is the first national Australian study describing fatal cases of RRA and will assist to develop prevention policy. This study contributes new knowledge internationally as it examines incident-level and organisational factors in addition to individual factors.

PSYCHOLOGICAL WELL-BEING AMONG INFORMAL CAREGIVERS CARING FOR PERSONS WITH DEMENTIA LIVING AT HOME

C. Lethin⁶, A. Renom Guiteras¹, S. Zwakhalen⁷, M. Soto Martin², K. Saks³, A. Zabalegui⁴, C. Nilsson⁵, S. Karlsson⁶,
 1. *University of Witten/Herdecke, Witten, Germany*,
 2. *Alzheimers disease Research and Clinical Centre in Toulouse, Toulouse, France*,
 3. *Department of internal medicine, University of Tartu, Tartu, Estonia*,
 4. *Hospital Clínic de Barcelona, Barcelona, Spain*,
 5. *Clinical Memory Research Unit, Department of Clinical Sciences, Lund, Sweden*,
 6. *Lund University, Faculty of Medicine, Lund, Sweden*,
 7. *Department of Health Services Research, Maastricht University, Maastricht, Netherlands*

This study investigated informal caregivers' psychological well-being and predicted increase in psychological well-being, when caring for persons with dementia (PwDs) living at home, related to caregiver, PwD and formal care (FC) factors. This was a cohort study, at baseline and follow-up in eight European countries. Caregivers included (n=1,223) were caring for PwDs aged ≥ 65 years living at home, in risk of being institutionalized. Data was collected using standardized instruments. Logistic regression analysis of factors associated with caregiver psychological well-being at baseline and 3 months later was performed. Factors associated with presence of caregiver psychological well-being at baseline were positive experience of caregiving, low caregiver burden, high quality of life (QoL) for caregivers, male gender of PwD, high QoL of PwD and few neuropsychiatric symptoms for the PwD. At follow-up, caregivers with increased psychological well-being experienced quality of care (QoC) higher and were more often using dementia specific service. Predicting factors for caregivers' increased psychological well-being were less caregiver burden, positive experience of caregiving, less supervision of the PwD and higher caregiver QoL, if PwD were male, had higher QoL and less neuropsychiatric symptoms. Higher QoC predicted increased caregivers' psychological well-being. It can be concluded that informal caregiving for PwDs living at home is a complex task. Our study showed that caregivers' psychological well-being was associated with, among other things, less caregiver burden and higher QoL. Professionals should be aware of PwD neuropsychiatric symptoms that might affect caregivers' psychological well-being, and provide proper care and treatment for caregivers and PwDs.

CAN A REFORM OF PRIMARY CARE IMPROVE THE MANAGEMENT OF PATIENTS WITH DEMENTIA?

N. Sourial^{1,2}, G. Arsenault-Lapierre², H. Bergman¹, G. Maimon², M. LeBerge², L. Vaillancourt², I. Vedel^{1,2},

1. *Department of Family Medicine, McGill University, Montreal, Quebec, Canada*,
 2. *Lady Davis Institute, Jewish General Hospital, Montreal, Quebec, Canada*

The Quebec government has started implementing an Alzheimer Plan (AP) in 42 family medicine groups (FMGs) to improve the management of patients with dementia. We aimed to evaluate the change in the quality of dementia care management and the rate of cognitive testing and diagnosis after the implementation of this reform. Two independent sets of charts were extracted: one pre (2011–2013) and one post (2014–2015) implementation. We collected data from 13 FMGs in Quebec who have implemented the AP with a total of 945 randomly selected charts of patients 75+ with dementia or MCI and 1919 charts of patients 75+. The score on quality of dementia care management was based on 10 validated quality indicators including the evaluation of cognition, functional status, behaviour, weight, caregiver status, driving ability, medication and support services. We also looked at the proportion of patients 75+ with a cognitive test and with a diagnosis of dementia. The quality of dementia care increased from 44.1% to 52.0% ($p < 0.001$) after the AP. The proportion of patients 75+ with a cognitive test was 14.5% pre and 17.0% post AP; a diagnosis of dementia was present in 13.5% of charts pre and 14.5% post AP. These results provide an initial portrait of the impact of the AP in Quebec. The government plans to use these results to refine the Alzheimer Plan before province-wide dissemination.

AN AUTOMATED APPROACH TO IDENTIFYING PATIENTS WITH DEMENTIA USING ELECTRONIC MEDICAL RECORDS

L.A. Jennings¹, A. Hackbarth², N. Wenger³, Z. Tan⁴, D.B. Reuben⁴,
 1. *Reynolds Department of Geriatrics, Univeristy of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*,
 2. *UCLA Faculty Practice Group, Los Angeles, California*,
 3. *Divison of General Internal Medicine and Health Services Research, UCLA, Los Angeles, California*,
 4. *Division of Geriatrics, UCLA, Los Angeles, California*

To efficiently identify persons with dementia to serve as a comparison group for a dementia care management program, we created and validated an automated electronic health record (EHR) dementia identification method. We used 3 data elements in the UCLA EHR that would indicate the presence of dementia: 1) ICD-9 code for dementia, 2) documentation of dementia medication use (cholinesterase inhibitors, memantine), and 3) natural language processing (NLP) of clinical notes for evidence of dementia. We examined the positive predictive value (PPV) of combinations of these 3 elements to identify dementia compared to physician medical record review. Physicians reviewed 60 records stratified by age (40–64, 65–84, 85+). The 3-element model had a PPV of 87%, but PPV for the 2-element models that included medications were lower (27% and 47%). Thus, we dropped medications from the method and reviewed an additional 64 cases identified only by NLP+ICD9. The NLP+ICD9 approach was less accurate among 40–64 year-olds (PPV 48%); however, when this younger group was excluded, the PPV was high (93%). By applying the NLP+ICD9 approach to 989 patients with verified dementia in a dementia management program, we estimated its sensitivity to be 63%. In summary, using a

combination of ICD codes and NLP, we created a method to identify persons with dementia with a high PPV – especially among older patients – and reasonably high sensitivity. Advantages of an automated dementia identification system include readily identifying patients for care management programs, recruitment for research, or creation of observational cohorts and appropriate comparison groups.

SESSION 5185 (SYMPOSIUM)

DIABETES AND MUSCULOSKELETAL HEALTH IN OLD AGE

Chair: A. Koster, *Maastricht University, Netherlands*

Discussant: E.S. Strotmeyer, *University of Pittsburgh, Pittsburgh, Pennsylvania*

The prevalence of diabetes is rapidly increasing worldwide and its complications and comorbidities have an enormous impact on patients, health care systems and society. The objective of this symposium is to understand the association between diabetes and various factors that impact musculoskeletal health: physical activity, muscle strength, falls, bone quality, and osteoarthritis. Physical activity is important in the prevention and management of type 2 diabetes. Using data from The Maastricht Study, Dr. Koster will present the effects of replacing sedentary behavior with standing or stepping on type 2 diabetes. Dr. Tiainen will show the association between diabetes and muscle strength decline over 11 years of follow-up in the Finnish Health 2000 Survey. Diabetes has been associated with falls, fractures and other musculoskeletal health outcomes. Dr. Sagawa will present the fall injury risk for impaired fasting glucose and diabetes using data from the Health ABC Study. Decreased bone quality may contribute to the increased fracture risk in type 2 diabetes. Dr. de Waard will share results from The Maastricht Study on the association between diabetes and bone quality measures using high-resolution peripheral quantitative computed tomography. Finally, Dr. Schaap will present the relationship between type 2 diabetes and clinical knee osteoarthritis using data from the European Project on OsteoArthritis (EPOSA). Taken together, this symposium will provide insight into the broad health impact of diabetes on musculoskeletal function and outcomes in old age.

EFFECTS OF REPLACING SEDENTARY TIME WITH STANDING OR STEPPING ON TYPE 2 DIABETES

A. Koster, J. van der Berg, J. van der Velde, E.A. deWaard, H. Bosma, H.H. Savelberg, N. Schaper, C. Stehouwer, *Maastricht University, Maastricht, Netherlands*

We examined associations of theoretical reallocations of sedentary time to standing or stepping with cardio-metabolic risk factors and type 2 diabetes (T2D) in The Maastricht Study. Participants ($n=2,213$, 52% men, mean \pm SD age 60.0 ± 0.8 years), who were asked to wear an activPAL accelerometer for 8 days were included. Daily amounts sedentary, standing, and stepping time were calculated. An isotemporal substitution modelling approach was applied to examine replacement effects on waist circumference, body mass index (BMI), blood pressure, levels of cholesterol, triglycerides, glucose, and insulin, HbA1c, and T2D. Replacement of sedentary time (30 min/day) with stepping was associated with

a 1.42 cm ($B=-1.42$, (95%CI= $-1.78,-1.06$)) smaller waist circumference, a 0.48 kg/m² ($B=-0.48$ ($-0.62,-0.35$)) lower BMI, a lower odds for and T2D (0.79 (0.72,0.87)), and improved cholesterol, triglyceride and glucose levels. Replacing sedentary time with standing was associated with favourable outcomes in waist circumference, and cholesterol, triglyceride and insulin levels.

DIABETES AS A PREDICTOR OF MUSCLE STRENGTH DECLINE AMONG INDIVIDUALS AGE 55 AND OLDER

K. Tiainen¹, S. Stenholm^{1,2}, T. Strandberg^{3,4}, A. Jula⁵, S. Koskinen⁵, 1. *School of Health Sciences and Gerontology Research Center, University of Tampere, Tampere, Finland*, 2. *Department of Public Health, University of Turku, Turku, Finland*, 3. *Institute of Health Sciences/Geriatrics, University of Oulu and Unit of General Practice, Oulu University of Hospital, Oulu, Finland*, 4. *Department of Medicine, University of Helsinki, Helsinki, Finland*, 5. *Department of Health, National Institute for Health and Welfare, Helsinki, Finland*

The aim was to examine diabetes as a predictor of grip strength decline during an 11-years follow-up among individuals aged 55 and older.

This study is based on the representative population-based Health 2000 Survey and its follow-up in 2011. The study population consisted of 1257 individuals, aged 55–86 years at baseline. Baseline diabetes status was defined as increased level of fasting glucose (7.0 mmol/l or more) or use of diabetes medication. Grip strength was measured with a handheld dynamometer. Generalized Estimating Equation was used for statistical analysis.

During the 11-year follow-up, grip strength declined 68 Newtons (N) among non-diabetic and 98 N among diabetic men and the difference in change between groups was significant ($p=0.014$). Among women, grip strength declined 19 N in non-diabetic and 24 N in diabetic women ($p=0.644$).

In conclusion, diabetes is a strong predictor of muscle strength decline among older men but not among older women.

DIABETES, IMPAIRED FASTING GLUCOSE, AND FALL INJURY RISK IN OLDER ADULTS: THE HEALTH ABC STUDY

N. Sagawa¹, R. Boudreau¹, A. Vinik³, A. Schwartz⁴, T. Waters⁵, J.A. Cauley¹, T.B. Harris², E.S. Strotmeyer¹, 1. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *National Institute on Aging, Bethesda, Maryland*, 3. *Eastern Virginia Medical School, Norfolk, Virginia*, 4. *University of California, San Francisco, San Francisco, California*, 5. *University of Tennessee, Memphis, Tennessee*

Diabetes increases fall and fracture risk, but the association of impaired fasting glucose (IFG) with treated fall injuries is unknown. We assessed diabetes (diagnosed/treated and/or $FG \geq 126$ mg/dl) and IFG ($FG \geq 100$ mg/dl) in Cox Proportional Hazard models for fall injury from linked Medicare Fee-For-Service claims over 8.6 ± 3.3 years in Health ABC ($n=2363$, age 73.5 ± 2.8 years, 52% women, 38% black, 18% IFG, 17% diabetes). Fall injuries ($n=680$; 29%) were 76% fractures and 24% non-fracture fall injuries. After adjusting for demographic/lifestyle, medication and comorbidity factors, IFG had lower non-fracture fall injury risk vs. normal

glycemia (HR 0.59, 95%CI: 0.35–0.97). Diabetes had higher non-fracture fall injury risk vs. IFG (HR 2.06, 1.15–3.68), though no association existed vs. normal glycemia. No association existed for glycemic status and total fall injury or fracture risk. Non-fracture fall injury risk differs by glycemic status. Further investigation is necessary to understand the mechanism of IFG and fall injury risk.

BONE QUALITY MEASURED BY HR-PQCT IS NOT COMPROMISED IN TYPE 2 DIABETES—THE MAASTRICHT STUDY

E.A. de Waard^{1,8}, J.J. de Jong^{1,8}, H.H. Savelberg^{2,8}, T.A. van Geel^{3,4}, P.P. Geusens^{5,6,4}, A. Koster^{7,4}, J.P. van den Bergh^{5,9,8}, 1. Maastricht University, Department of Internal Medicine, Subdivision of Rheumatology, Maastricht, Netherlands, 2. Maastricht University, Department of Human Movement Science, Maastricht, Netherlands, 3. Maastricht University, Department of Family Medicine, Maastricht, Netherlands, 4. CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands, 5. Maastricht University Medical Centre, Department of Internal Medicine, Subdivision of Rheumatology, Maastricht, Netherlands, 6. University of Hasselt, Biomedical Research Institute, Hasselt, Belgium, 7. Maastricht University, Department of Social Medicine, Maastricht, Netherlands, 8. NUTRIM School for Nutrition and Translational Research in Metabolism, Maastricht University, Maastricht, Netherlands, 9. VieCuri Medical Center, Department of Internal Medicine, Subdivision of Endocrinology, Venlo, Netherlands

Patients with type 2 diabetes mellitus (T2DM) are thought to have an increased fracture risk. Decreased bone quality could contribute to this increased risk. In this cross-sectional study of 306 participants from The Maastricht Study, we compared volumetric bone mineral density (vBMD), micro-architecture and strength at the distal radius in participants with T2DM (N=60, median HbA1c 6.9%, median diabetes duration 8.8 years) and with normal glucose metabolism (NGM, N=246) using high-resolution peripheral quantitative computed tomography. Unadjusted analyses showed increased cortical porosity ($p<0.001$) and pore volume ($p<0.001$) in T2DM compared to NGM. However, after adjustment for age, sex and BMI, the associations between T2DM and cortical porosity and pore volume were no longer significant ($p>0.05$). vBMD, trabecular microarchitecture and bone strength were not significantly different between both groups in both unadjusted and adjusted analyses ($p>0.05$). Concluding, in this group of relatively well-treated T2DM participants bone quality may not be compromised.

THE ASSOCIATION BETWEEN DIABETES AND OSTEOARTHRITIS: THE ROLE OF WAIST CIRCUMFERENCE

L. Schaap¹, E. Timmermans², S. Zambon⁴, S. Maggi³, D.J. Deeg², 1. Health Sciences, VU University, Amsterdam, Netherlands, 2. VU University Medical Center, Amsterdam, Netherlands, 3. CNR Center on Aging, Padova, Italy, 4. Department of Medicine, University of Padova, Padova, Italy

Literature suggests that diabetes mellitus type 2 (DM2) and osteoarthritis (OA) often co-occur in old age. This comorbidity might be explained by the presence of metabolic

risk factors such as increased body weight. Logistic regression analyses using data from the European Project on Osteoarthritis (EPOSA) were performed to examine the association between self-reported DM2 and clinical knee OA in 2361 older men and women (mean age 73.9 years, SD 5.0). DM2 and OA were present in 13% and 18.3% of the study sample, respectively, and 3% had a combination of both diseases. After adjustment for demographics and lifestyle factors, persons with DM2 were 1.5 times more likely to have OA compared to persons without DM2 (OR 1.53 (95%CI 1.13 – 2.07)). However, after additional adjustment for waist circumference, the association was attenuated (OR 1.31 (95%CI 0.96 – 1.78)), suggesting that the association between DM2 and OA is dependent of waist circumference.

SESSION 5190 (SYMPOSIUM)

ADDRESSING THE INTERSECTIONALITY OF RACE, GENDER AND IMMIGRATION STATUS IN LONG-TERM CARE

Chair: N.R. Hooyman, University of Washington, Seattle, Washington

Discussant: S. Gupta, Caring across Generations, Washington, District of Columbia

To ensure quality culturally appropriate care for older adults and persons with disabilities within long term services and supports, it is essential to address the interconnections among the well-being of family caregivers, direct care workers and care recipients as well as the intersectionality of race, gender and immigration status. In many instances, low-income women of color, frequently immigrants, are providing care, but are unable to access affordable care themselves. The issues facing the direct care workforce and family caregivers require new approaches that legitimize the importance of care work and build on the interconnections between the need for care and a strong home care workforce. In designing community-based long-term care initiatives, policy expertise and grass roots organizing must be combined with a multi-sector, multigenerational and intersectional approach. This includes culture change, increased access to and choices for affordable quality care, more support for informal caregivers, and improved job quality of the direct care workforce. This symposium will address both national and state level policy initiatives that value the work of caregiving, expand access to home care options and ensure that solutions are inclusive and reduce inequities based on race, gender and immigration status. Presenters will highlight the accomplishments of Caring across Generations, a national coalition of more 200 organizations, PHI, Justice in Aging and the International Domestic Workers Federation as well as state-level initiatives to reduce disparities in care, improve long-term services and supports and advance public long-term care insurance that benefits both caregivers and those who receive care.

CULTURE AND SYSTEM CHANGE TO ENSURE JUSTICE FOR CAREGIVERS

S. Gupta, Jobs with Justice, District of Columbia, District of Columbia

Given the increasing number of older adult and persons with disabilities who require long-term services and

supports and the near universal desire to heal at home and in communities, demands are increasing on both informal family caregiving structures and the formal care workforce. Women, many of whom are caring for a child or grandchild and an aging or disabled relative, are most impacted by these demands. These demographic and social trends are putting immense strain on families and on existing social structures, and without real solutions will continue to widen the already existing disparities in wages, health outcomes, retirement security, and education that already negatively impact women. This paper will address the ways in which Caring Across Generations is leading national culture change, state-level policy initiatives, and grassroots organizing to shift the current long-term care system so that it works for all women as providers and recipients of care.

After attending this session, participants will:

Articulate the interconnections among the needs of family caregivers, direct care workers and care recipients, most of whom are women

Identify interconnections among national and state level culture and policy changes and grassroots organizing to ensure justice for all caregivers

INCREASING CARE INEQUITIES WITH AGE AMONG HISTORICALLY MARGINALIZED POPULATIONS

K. Prindiville, *Justice in Aging, Oakland, California*

Justice in Aging—formerly the National Senior Citizens Law Center—is a national nonprofit that fights senior poverty by securing access to health care and economic security for low-income older adults. Populations that have traditionally lacked legal protections—women, people of color, LGBT individuals, and people with limited English proficiency—are most at risk of aging in poverty and experiencing barriers to quality, person-centered health care and long-term services and supports. This paper will address obstacles faced by low-income older adults, especially women and people of color, and their family caregivers in accessing quality long-term care. It will also highlight systemic disparities—due to race, gender, and immigration status—within senior poverty that become amplified over a lifetime for both formal and informal caregivers and older adults and engender distinctive long-term care needs. It will conclude with strategies utilized by Justice in Aging to address such inequities.

After attending this session, participants will:

Articulate disparities that increase by age, race, gender and immigration status among informal and formal caregivers

Communicate effective national and state-level strategies to address such inequities and reduce poverty

THE NEED FOR A CULTURALLY COMPETENT WORKFORCE TO ADDRESS DIVERSITY AND INCLUSION

D. Wilson, *PHI National, District of Columbia, District of Columbia*

As more individuals of color are aging and need long-term services and supports, it is imperative that the home care workforce is trained to handle diseases specific to them. PHI, a national organization that aims to enhance the lives of people who need care by improving the lives of the workers who provide that care, offers disease-specific training for direct care workers so that they are equipped to give

culturally appropriate care. For instance, when working with African American elders who face high rates of hypertension and diabetes, direct care workers who have received training in those areas will be equipped to notice if an elder is having a diabetic or cardiac episode and call for interventions. This paper addresses PHI's state- and national-level strategies to ensure that home care workers have knowledge and skills to ensure the inclusion of and effective supportive care for an increasingly diverse older population.

After attending this session, participants will:

Identify the need for disease-specific training to ensure culturally appropriate home care

Communicate strategies utilized by PHI to prepare home care workers able to address diversity in an inclusive manner

DOMESTIC WORKERS AND LABOR PROTECTIONS GLOBALLY

A. Poo, *Domestic Workers Association, New York, New York*

Domestic workers worldwide are primarily women, increasingly migrants, and too often excluded from basic labor protections. However, due to increased labor organizing of this sector, domestic workers are succeeding in winning improved labor standards around the world, including passage of ILO Convention 189, which has been ratified by 22 countries as of July 2016. This presenter will describe the growing need for homecare worldwide and key recommendations from the international domestic workers' movement. The paper will address what domestic workers need to ensure care jobs are good jobs, provide specific policy recommendations with global implications, and share inspiring examples of domestic workers coming together with care recipients to achieve dignity for all.

After attending this session, participants will:

Understand the labor inequities faced by domestic workers worldwide

Identify policy and community organizing strategies that are advancing quality jobs for home care workers globally

SESSION 5200 (SYMPOSIUM)

HIGH QUALITY OF LIFE FOR ELDERLY CARE CENTER RESIDENTS: REALISTIC VISION AND TESTED CARE STRATEGIES

Discussant: J. Hamers, *Department of Health Services Research, CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*
R.A. Kane, *University of Minnesota, Minneapolis, Minnesota*

Individualized services, normal approaches to everyday life, and improved residential spaces in care homes in combination are meant to enable a good resident quality of life (QOL). This Symposium summarizes evidence-based ideas from 4 countries how to deliver high-quality physical care for frail nursing home residents without over-managing the residents' lives. Rosalie Kane and Lois Cutler discuss implementation of small-house nursing-homes in the United States, an intervention that simultaneously transforms physical settings, staff roles, and philosophy of care. Enhanced environments were crucial but insufficient; staff actions and organizational

policies were also crucial for the new environments to maximally benefit residents. Veronique Boscart presents research on the Neighborhood Team Development (NTD) model in care settings in Canada, where the goal is to provide excellent physical care within a team ethos where all staff mindfully apply techniques to preserve resident's autonomy and dignity and emphasize their QOL. Gørill Haugan highlights lessons about QOL from her study of care centers in Norway, including work on self-transcendence, sense of meaning, and spirituality for NH residents. Claire Goodman envisages realistic QOL for residents with substantial dementia, and actively-dying residents, including contributions of a caregiving workforce to resident QOL. Jan Hamers, whose Living Lab for Care of Older People in The Netherlands, has pioneered in how to create real homes in nursing homes, serves as discussant. We intend ample time for dialogue with panel and audience members on the essence of QOL in residential care for frail elders and how to achieve it.

RESIDENTS' BENEFITS FROM TRANSFORMED ENVIRONMENTS NOT AUTOMATIC: STUDY OF SMALL-HOUSE HOMES IN THE U.S.

R.A. Kane, *Health Policy and Management, SPH, University of Minnesota, Minneapolis, Minnesota*

In a national study, we identified the universe of small-house nursing homes (S-NHs) in the US, including trademarked Green House Nursing Homes (GH-NHs). We described implementation in 48 SH-NH models in which the unit of care are self-contained houses or apartments with under 16 residents; we site visited 10 S-NH projects for in-depth study. The model required simultaneous transformation of physical environments; all staff roles and reporting structure; and philosophy of care—the latter towards individualization and quality of life. In many instances, we observed resident-directed lifestyles that would have been impossible in traditional NHs. Transformed environments were essential but insufficient without supportive staff behavior and organizational policies. Implementation was an arduous process, and conscious effort was needed to avoid regression to institutional models. This presentation is illustrated by photographs, which we find an important adjunct to research, education, quality control, and advocacy.

CULTURE CHANGE IN CANADA: IMPLEMENTATION AND EVALUATION OF A NEIGHBOURHOOD TEAM DEVELOPMENT MODEL

V. Boscart, *Conestoga College Institute of Technology and Advanced Learning, Kitchener, Ontario, Canada*

The Neighbourhood Team Development (NTD) model was created to enhance resident-centeredness in nursing homes; Staff work in a framework of accountability and enhance resident-centeredness by using techniques to preserve resident's autonomy and dignity, and emphasize quality of life. This multifaceted study examined: the fidelity of the NTD model, process and contextual factors associated with implementation and outcomes, and effects of the NTD model on care experiences of residents, staff, family and organization. A repeated measure, mixed method design is underway with 72 Neighborhoods in 11 long-term-care Villages. This presentation discusses the NTD model and initial findings on quality of life measures, satisfaction surveys, interviews, staff engagement, observations, and organizational data.

Encouraging staff to work to their full scope of practice while providing better coordinated care is key to resident-centred care, as is seamless team functioning in which all team players work to their fullest capacity and residents come first.

MEANING OF QUALITY OF LIFE IN NURSING HOMES FOR PEOPLE WITH DEMENTIA AND PEOPLE WHO ARE DYING

C. Goodman, *University of Hertfordshire, Hertfordshire, United Kingdom*

The author has been part of a collaborative group working on quality of care for dementia in the United Kingdom and she has also conducted a "realist review" of effective health care for those living and dying in care homes. Her presentation will briefly touch on definitions for QOL in care settings, particularly for people with dementia or people who are actively dying. She will touch on how a caring and caregiving labor force might best be prepared and configured for enhancing the QOL of care center residents. She also considers the "uneasy alliance" of primary health providers and care home staff as they try to generate high quality proactive health care yet respect individuality and QOL.

SESSION 5205 (SYMPOSIUM)

HEARING LOSS INITIATIVES FROM THE NATIONAL ACADEMIES AND THE WHITE HOUSE—RECOMMENDATIONS AND PROGRESS

Chair: F. Lin, *Johns Hopkins University, Baltimore, Maryland*

Co-Chair: M.I. Wallhagen, *University of California, San Francisco*

Discussant: L.N. Gitlin, *School of Nursing, Johns Hopkins University, Baltimore, Maryland*

Two-thirds of adults 70 years or older have a clinically-significant hearing loss, but less than 20% of these individuals receive any form of treatment. Importantly, the potential functional consequences of age-related hearing loss for older adults are beginning to surface in epidemiologic studies demonstrating independent associations of hearing loss with cognitive functioning, dementia, and poorer physical functioning. However, for the vast majority of these adults, hearing health care (HHC) remains unaffordable and inaccessible. Recent national initiatives in the United States coming from the National Academies of Science, Engineering, and Medicine (NASEM) and from the White House President's Council of Advisors on Science and Technology (PCAST) are focused on increasing the accessibility of HHC and addressing hearing loss as a critical and neglected public health priority. This symposium will present the findings from the NASEM consensus study report and from the PCAST report to the President. Subsequent presentations will highlight early research studies that are addressing report recommendations through exploring innovative, accessible, and affordable models of HHC delivery for older adults.

NATIONAL INITIATIVES IN THE UNITED STATES ADDRESSING HEARING LOSS AS A PUBLIC HEALTH PRIORITY

F. Lin, *Johns Hopkins University, Baltimore, Maryland*

Growing recognition of the potential impact of hearing loss on older adults has spurred initiatives from the White House

President's Council of Advisors of Science and Technology (PCAST) and from the National Academies of Science, Engineering, and Medicine. The White House PCAST initiative on hearing loss followed the White House Conference on Aging in 2015 with a specific request to address hearing loss coming from the White House. This report was published in October 2015 and called for FDA regulatory changes to allow for greater innovation and affordability in hearing aids. In parallel, the National Academies initiated a consensus study in early 2015 after initially hosting a workshop on hearing loss and health aging in 2014. The final report from the National Academies was released in June 2016 and presents a set of recommendations spanning needed changes in regulation, policy, legislation, and clinical practice.

SOCIAL DESIGN AS A USER-CENTERED APPROACH TO INNOVATIVE INTERVENTION DEVELOPMENT: LESSONS FROM HEARS

C.L. Nieman^{1,2}, S. Mamo⁵, H. Han^{2,3}, L.N. Gitlin^{2,3}, S.L. Szanton^{2,3,6}, B. Slogeris⁴, M. Weikert⁴, F. Lin^{1,2,6}, 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland*, 2. *Center on Aging and Health, Baltimore, Maryland*, 3. *Johns Hopkins University School of Nursing, Baltimore, Maryland*, 4. *Maryland Institute College of Art Center for Social Design, Baltimore, Maryland*, 5. *University of Massachusetts Amherst School of Public Health and Health Sciences, Amherst, Massachusetts*, 6. *Johns Hopkins University Bloomberg School of Public Health, Baltimore, Maryland*

Effective behavioral interventions reflect the complexity and context of the communities with which they are tailored and the behaviors they seek to address. However, methodology that captures these complexities are limited, particularly for hearing care, where significant hearing care disparities persist despite its highly prevalent nature. Social design or design thinking is an innovative approach that places the user at the center, continually returning to the needs, preferences, goals, and experiences of the user and target community in an iterative process. We partnered with a team of social designers through a semester-long, graduate-level course to develop a user-centered approach to developing an affordable, accessible hearing care intervention through a process characterized by phases of 'ideation', 'inspiration', and 'implementation'. Our experience serves as an example of social design as a transdisciplinary approach to intervention development that may systematically and holistically address the multiple and complex barriers that characterize public health problems.

SAN ANTONIO HEARS: ADAPTING A RESEARCH PROTOCOL FOR HEARING LOSS AND DEMENTIA TO CLINICAL PRACTICE

B.B. Powers^{1,2}, S. Espinoza^{1,2}, V. Taylor¹, L. Arevalo^{1,2}, C.L. Nieman³, S. Mamo³, F. Lin³, 1. *Geriatric Research Education and Clinical Center, South Texas Veterans Health Care System, San Antonio, Texas*, 2. *The University of Texas Health Science Center at San Antonio, San Antonio, Texas*, 3. *Johns Hopkins University, Baltimore, Maryland*

The San Antonio HEARS Clinic is a clinical demonstration project in the San Antonio VA's Dementia Clinic. It adapts the dementia version of the Baltimore HEARS (Hearing Equality

through Accessible Research and Solutions) community-based hearing research protocol for patient-care. The VA is ideal for initial translation of this research as veterans have unrestricted access to audiology and hearing aids, but seek treatment at similar rates as community-based patients. The HEARS Clinic offers hearing screening to dementia clinic patients not wearing hearing aids, and patients who fail the screening are given the option of an audiology referral or participation in the San Antonio HEARS clinic. Those in the HEARS clinic receive a pocket-talker and undergo the dementia version of the HEARS intervention with their caregiver. The clinic monitors outcomes including the Cornell Scale for Depression in Dementia, MoCA, NPI, ADLs/IADLs, Zarit Caregiver Burden Interview, IOI-HA, and satisfaction surveys.

COMPARISON OF PSAPS AND HEARING AIDS: THE ROLE OF AFFORDABLE AND ACCESSIBLE DEVICES IN HEARING HEALTHCARE

N. Reed¹, P. Korczak², N. Polyak², F. Lin¹, 1. *Dept of Otolaryngology, Johns Hopkins University, Baltimore, Maryland*, 2. *Towson University, Towson, Maryland*

Personal sound amplification products (PSAPs) may represent a potentially affordable and accessible option in hearing health care.

15 adults (mean age = 71.2 years) with mild-to-moderate hearing loss completed sentence-based speech-in-noise testing under 7 conditions: unaided, aided with 1 advanced hearing aid (HA), aided with 4 different mid to high-performance PSAPs, and aided with 1 low-end PSAP. All devices were adjusted by an audiologist for best fitting possible. Device and sentence list order were randomized.

The absolute change in correct score percentage from unaided was compared across devices. Overall, mean score improvement with was within 15% of HA with 2 PSAPs and within 5% with 2 PSAPs. One PSAP was associated with a decline in score.

Our pilot results suggest that some PSAPs may be comparable to HAs in a controlled environment. These data support further investigation of PSAPs as potential introductory or transitory technologies in hearing rehabilitation.

SESSION 5210 (PAPER)

ELDER ABUSE, NEGLECT, AND EXPLOITATION

WHAT AMERICANS (NEED TO) KNOW ABOUT ELDER FINANCIAL EXPLOITATION

M. Howe¹, C. Jaress¹, K. Pudelek¹, A. Fontes¹, B. Dugoni¹, H. Breslau^{2,1}, 1. *Academic Research Centers, NORC at the University of Chicago, Chicago, Illinois*, 2. *University of Chicago, Chicago, Illinois*

Elder financial exploitation (EFE) is one of the most common types of elder mistreatment in the United States. Yet analyses of new, nationally representative, survey data (n = 1,042) suggest that many Americans (ages 18 and older) do not know how to detect, prevent, or intervene in EFE. To inform and improve upon elder financial exploitation (EFE) prevention and intervention efforts, we report findings on what Americans already know about EFE and how public assumptions about EFE vary within the population. With

support from NORC at the University of Chicago (NORC), nationally representative survey data were collected including information on to what extent Americans are aware of elder financial exploitation, its prevalence, its different forms, and resources available for intervening in or preventing it. Analyses also incorporate financial profile data for nearly half of respondents, including financial literacy measures. Data from 1,042 Americans, ages 18+, were collected using the AmeriSpeak Omnibus Survey (December 2015). Among other findings to be presented, analyses indicate that 41% of Americans know someone who has been a victim of theft of money or property, 37% know someone who has been a victim of scams, 27% know a victim of identity theft, and 22% know a victim of power of attorney abuse. Additionally, only 56% of Americans surveyed know whom to contact if they suspect EFE; of that 56%, only 31% would contact APS. We aim to use these data to provide: baseline measures of public perceptions of EFE, key correlates, and evidence-based prevention recommendations.

LISTENING TO STAKEHOLDERS TO BETTER MANAGE OLDER ADULT MISTREATMENT IN LONG-TERM CARE FACILITIES

M. Couture^{1,2}, S. Israel¹, M. Sasseville¹, 1. *Centre for Research and Expertise in Social Gerontology (CREGÉS), Integrated Health and Social Services University Network for West-Central Montreal, Côte St-Luc, Quebec, Canada*, 2. *Université de Sherbrooke, Sherbrooke, Quebec, Canada*

Many types of older adult mistreatment exist in long-term care (LTC) facilities: psychological, physical, sexual, financial, violation of rights, organisational, and ageism. Close to 20% of LTC establishments in the United States are “convicted” of older adult mistreatment each year. In Canada, the problem is also acknowledged by managers and administrators of these types of facilities. However, few studies have described the experience of diverse stakeholders regarding the management of older adult mistreatment situations within LTC facilities. As part of a project using a participative approach to develop and validate a policy template for LTC facilities, 105 key stakeholders (including administrators, managers, long-term care employees, residents/user committees, union representative, complaint commissioners, etc.) were surveyed about the perceived causes, the main difficulties encountered and priorities to address older adult mistreatment in their LTC establishment. The main issues identified were: 1) disparity between the ever-growing needs of residents and the lack of resources; 2) limited knowledge regarding older adult mistreatment and how to identify it properly; 3) a conspiracy of silence and a fear of reporting; 4) non-existent or unclear policies and procedures; as well as 4) no specific person mandated within the facility to respond to mistreatment situations administratively or clinically. Overall, the issues identified by the stakeholders could be addressed with additional training and the implementation of policies and procedures specifically adapted for LTC facilities.

INVESTMENT MINDSET AND BEHAVIORAL CHARACTERISTICS OF OLDER VICTIMS OF INVESTMENT FRAUD

M. DeLiema, *Center on Longevity, Stanford University, Palo Alto, California*

Background: Older adults lose billions of dollars to financial fraud each year, and investment scams are the most costly. The purpose of this study is to identify older adults’ specific attitudes towards risky investing, values about wealth accumulation, and experience of negative life events that may increase their risk of victimization.

Methods: Data are from an AARP telephone survey of 700 victims who were independently verified by the FBI and state securities regulators to have lost money to investment fraud. Scams included investments in precious metals, oil and gas exploration, commodities online trading, and multilevel marketing schemes. Victims were compared to a random sample from the general investor population, matched by age, race/ethnicity, and sex.

Findings: Compared to non-victims, we predicted that investment fraud victims would have more positive attitudes toward risky investment opportunities, would be more open to investment solicitations, and be more likely to have experienced negative life events prior to making the investment. We found that victimization is associated with ongoing housing, relationship, and financial trouble (OR=1.26, p=0.021). Victims differed from non-victims in their values toward wealth accumulation, greater interest in risky investment opportunities, and willingness to trust investment advice from friends and family.

Implications: This is the first study to investigate the attitudes, behaviors, and negative life experiences of confirmed victims of investment fraud and assess how they differ from non-victims. Victims demonstrated significantly poorer awareness of common investment fraud persuasion messages, suggesting that more education about investing safely is needed in the older population.

OPENING THE DOOR: A TRAINING PROMOTING ENGAGEMENT SKILLS IN ADULT PROTECTIVE SERVICES WORKERS

C.R. Gelman^{1,2}, A. Ghesquiere³, A. Halarewicz¹, G. Rogers³, 1. *Silberman School of Social Work, Hunter College, New York, New York*, 2. *Silberman Center of Excellence in Diverse Aging, New York, New York*, 3. *Brookdale Center for Healthy Aging, New York, New York*

The global population of older adults will reach 2 billion in 2050. WHO estimates that 1 in 10 elders experience abuse each month, but this is likely underestimated; research indicates for every known case, 24 go unreported. Reasons for under-detection include inadequate training and older adults’ reluctance to report abuse. Training adult protective services (APS) workers to interact with elders in a manner maximizing disclosure is imperative. Various theories support fostering strong worker-client relationships to enhance disclosure, facilitate appropriate interventions, and guide programs and policies.

An 8-hour training in relational engagement and assessment of older adults at risk for abuse was developed in response to and in extensive collaboration with NYC APS workers. The training, grounded in adult learning theory, includes case examples, role-plays, and self-reflection. Participants learn techniques for cultivating trust and eliciting information, learn to build relationships with alleged victims and abusers, and begin a person-centered, problem-solving process responsive to clients. Skills on use-of-self, self-awareness, and self-care are covered.

The training was piloted and evaluated with 3 groups of APS workers ($n=55$). We found statistically significant improvements in pre- and post-training items measuring self-efficacy and knowledge gain. Focus groups 6 weeks post-training revealed high satisfaction with training and self-reported application of specific skills learned, but continuing gaps and needs for training and support with elder abuse cases. We discuss national and international implications for APS training, practice, and policy, as well as future research directions to increase sustainability of the knowledge and skills acquired through this promising program.

EFFECT OF A WORKSHOP FOR HOMECARE PROVIDERS TO PROMOTE INTERPROFESSIONAL COLLABORATION IN JAPAN

M. Noguchi-Watanabe¹, K. Sakurai¹, Y. Matsumoto¹, S. Yoshie¹, T. Furuta², A. Matsukura³, S. Ayako⁴, N. Yamamoto-Mitani¹, 1. *University of Tokyo, Tokyo, Japan*, 2. *Furuta Clinic, Kashita-city, Japan*, 3. *Otakanomori Hospital, Kashiwa city, Japan*, 4. *Kashiwa city, Kashiwa city, Japan*

Homecare providers in the community work with various professionals. However, little is known about how interprofessional collaboration can be promoted.

The purpose of our study was to evaluate the effect of a community-based workshop to promote homecare provider interprofessional collaboration. Quasi-experimental design was used. Participants were homecare professionals (e.g., homecare nurses, care managers) recruited from each professional organization in a suburban city of Japan. The workshop lasted 2 hours, which included small-group discussions. Three groups were studied: two-workshop group, one-workshop group, and control group. Mail surveys were conducted twice; each study group answered an anonymous self-administrated questionnaire before, and 6 months after the first workshop. To assess interprofessional collaboration, a scale to measure face-to-face cooperation levels among homecare providers (Fukui, 2014) was used. Two-hundred seventeen participants were analyzed (two-workshop 59, one-workshop 86, and control group 72). Approximately 40 % were men. Mean age (45.9 ± 10.2 years) and profession type (physician 24, nurses 28, care-manager 72, others 94) differed between the groups. An analysis of covariance revealed after adjusting for age, number of training sessions, profession type, and pre-intervention score, “recognizing face and belief” and “getting a chance to meet” at month six improved in the two-workshop group ($p = 0.012$ and 0.095 , respectively) and one-workshop group ($p = 0.033$ and 0.020 , respectively), compared with the control-group. The two-workshop and one-workshop group were not significantly different at 6 months. This workshop might be effective for developing face-to-face relationships. Attending a single workshop may be enough to promote interprofessional collaboration.

SESSION 5215 (SYMPOSIUM)

BRIDGING INTERNATIONAL RESEARCH ON FEAR OF FALLING: NEW FINDINGS FOR PRACTICE AND POLICY

Chair: G. Zijlstra, *Maastricht University, Netherlands*

Co-Chair: K. Hauer, *AGAPLESION Bethanien Hospital, Geriatric Center at the University of Heidelberg, Heidelberg, Germany*

Discussant: H.W. Lach, *Saint Louis University, Missouri*

Fear of falling is common in different older populations, both in fallers and non-fallers. Previous studies have shown that fear of falling may lead to activity avoidance, and has a negative impact on balance, gait, mobility, social activity, mental health and independence. Internationally the research on fear of falling has taken a flight but researchers are still searching for a better understanding of fear of falling, factors that contribute to fear of falling and sustainable prevention strategies for the different older populations. Additionally linking the research findings to practice and new policy is challenging. This warrants connecting existing evidence, good practices and new international research findings, and searching for new opportunities to relate research, practice and policy. During this symposium five presenters from The Netherlands, Germany and Sweden will present their research on: 1) a successful approach to reduce fear of falling and its trajectory from development to nationwide implementation, 2) older adult's preferences regarding behavior change techniques in a fear of falling program, 3) measures for falls efficacy and fear of falling in hip fracture patients, 4) an overview of a series of studies on contributors to fear of falling in people with Parkinson's Disease, and 5) the effects of a physical activity intervention on fear of falling in nursing home residents. Professor Lach from the USA, our discussant, will reflect on the presented outcomes. The audience will be invited to interact with the presenters and discussant.

REDUCING FEAR OF FALLING: FROM DEVELOPMENT TO NATIONWIDE IMPLEMENTATION OF A SUCCESSFUL APPROACH

G. Kempen, G. Zijlstra, *Department of Health Services Research, CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands, Maastricht, Netherlands*

Concerns about falls are prevalent among older persons and have serious adverse consequences. Between 2002–2009 Maastricht University in The Netherlands developed and evaluated a Dutch version of A Matter of Balance (AMB-NL) to reduce concerns about falls. AMB-NL proved to be effective on a range of outcomes in an RCT and this cognitive-behavioral group program was nationwide implemented between 2009–2012. However, a process evaluation showed that around 40% of the target population did not complete the program. As a result a home-based version (AMB-Home) was developed and evaluated between 2013–2016. This latter study showed that – similar to AMB-NL – AMB-Home significantly reduces concerns about falls, activity avoidance and ADL-limitations. In addition, the number of indoor falls and the use of home and informal care were lower in the intervention group. Therefore, AMB-Home was also nationally implemented and eligible participants may now choose the format that suits their ability and preferences.

OLDER ADULTS' PREFERENCES REGARDING BEHAVIOUR CHANGE TECHNIQUES IN A FEAR OF FALLING PROGRAM

R. Vogel, M. Woiwod, G. Zijlstra, *Department of Health Services Research, CAPHRI Care And Public Health Research Institute, Maastricht University, Maastricht, Netherlands*

In an RCT a multicomponent group intervention showed to be feasible and effective (moderate effect size) in managing concerns about falls, also called fear of falling, in older adults. The program's effectiveness may be enhanced by tuning the program's behaviour change techniques (BCTs) to the preferences of participants; yet, their preferences are unknown. In this cross-sectional study older adults (N=25) rated the program's 27 BCTs in view of their feasibility and effectiveness during a structured, individual face-to-face interview. For both feasibility and effectiveness, the technique 'salience of consequences' was rated lowest and 'restructuring the physical environment' was rated the highest. The current study provided insight into the preferences for BCTs of potential users of the program. These preferences do not fully match with the preferences for BCTs by scientific experts, as studied previously; this is ground for further discussion and study.

FALLS EFFICACY AND FEAR OF FALLING IN HIP FRACTURE PATIENTS

K. Pfeiffer¹, K. Rapp¹, K. Kampe¹, J. Klenk^{1,2}, M. Hautzinger³, C. Becker¹, *1. Clinic of Geriatric Rehabilitation, Robert-Bosch Hospital, Stuttgart, Germany, 2. University of Ulm, Ulm, Germany, 3. University of Tübingen, Tübingen, Germany*

The question of how to assess fear of falling (FoF) and falls efficacy in hip fracture patients is still not clearly resolved. While the Fall Efficacy Scale International (FES-I) shows good reliability and structural validity in this population, it appears more related to functional performance than to more general anxiety symptoms (Visschedijk et al. 2015). Based on data of 124 community-dwelling elderly after hip or pelvic fracture (Mean age = 82.5 years; 76.6 % female) associations between different specific measures on FoF and falls efficacy (Short FES-I, Perceived Ability to Manage Falls, single item questions), functional ability, general anxiety symptoms, and additional measures that refer to emotion regulation (psychological flexibility, anxiety control) are presented and discussed. After attending this presentation, participants will have a better understanding of what they are measuring with different FoF measures in this high-fall risk population.

WALKING DIFFICULTY IS THE MAIN CONTRIBUTOR TO FEAR OF FALLING IN PEOPLE WITH PARKINSON'S DISEASE

M.H. Nilsson^{1,2}, S.B. Jonasson¹, B. Lindholm^{3,4}, P. Hagell⁵, S. Iwarsson¹, *1. Department of Health Sciences, Faculty of Medicine, Lund University, Lund, Sweden, 2. Memory Clinic, Skåne University Hospital, Malmö, Sweden, 3. Department of Clinical Sciences, Lund University, Malmö, Sweden, 4. Department of Neurology and Rehabilitation Medicine, Skåne University Hospital, Malmö, Sweden, 5. The PRO-CARE Group, School of Health and Society, Kristianstad University, Kristianstad, Sweden*

Fear of falling is more common and pronounced in people with Parkinson's disease than in controls. We conducted a series of studies that used multivariable regression analyses to identify explanatory factors of fear of falling in people with Parkinson's disease. Three independent samples were used. The first study (n=154) was a postal survey study that used well-established self-rating scales. The second study replicated the first one by using a clinical sample (n=104) and added unexplored motor aspects (e.g., gait speed, functional balance performance) as well as global cognition. The third clinical study (n=241) included independent variables that focused on personal (e.g. general self-efficacy) and environmental factors as well as Parkinson-related disabilities. In all three studies, walking difficulties was the strongest explanatory (60–68%) factor. The results imply that walking difficulties in daily life should be the primary target in order to reduce fear of falling in people with Parkinson's disease.

EFFECTS OF A PHYSICAL ACTIVITY INTERVENTION ON FEAR OF FALLING IN NURSING HOME RESIDENTS

K. Hauer¹, C. Jansen², M. Diegelmann², H. Wahl², *1. Bethanien-Krankenhaus/geriatrisches Zentrum, Heidelberg, Germany, 2. Heidelberg University, Heidelberg, Germany*

Study objective was to examine the effect of an intervention program on fear of falling, physical performance and life space in nursing home residents.

Frail, multi-morbid nursing homes residents (n=83, mean age: 82.6 ± 10.1, MMSE 19.5 ± 7.4) took part in a controlled intervention trial to promote physical activity. The intervention group (IG: n=56) took part in impairment-adjusted activity groups while the matching control group (CG, n=27) received usual care.

Residents with low baseline fall-related self-efficacy (FRSE) (documented by the Falls Efficacy Scale International) significantly increased life space (documented by a high-tech sensor network, S-net®) during intervention (p=.044, motor performances (Sit-to-stand, p=.031) and FRSE. Baseline FRSE and motor performances were significantly associated (SPPB: p=.022, gait speed: p=.012; TUG: p=.043).

An impairment adjusted activity program increased FRSE, motor performance and life space in multi-morbid nursing home residents with low FRSE, while FRSE and motor performances were highly associated.

SESSION 5220 (PAPER)

ESPO BIOLOGICAL SCIENCES SESSION: FUNCTIONAL CONSEQUENCES OF BIOLOGICAL AGING ON: GERIATRIC SYNDROMES, CHRONIC DISEASES AND CONDITIONS, AND IMMUNE RESPONSES

THE ASSOCIATION BETWEEN INFLAMMATORY BIOMARKERS AND FRAILTY SYNDROME AMONG CHINESE OLD PEOPLE

L. Su, B. Sun, Q. Hao, B. Dong, *The Center of Gerontology and Geriatrics, West China Medical School / West China Hospital, Sichuan University, Chengdu, Sichuan, China*

Chronic low-grade inflammation has been postulated to be one of the most important pathway in the development of frailty. The common reported inflammatory markers were interleukins-6, tumor necrosis factor- α , and C-reactive protein. However, the relationship between MCP and MIP with frailty syndrome is not well understood. Here, we investigated the associations between frailty and these inflammatory markers, using a community dwelling cohort from Southwest China, which is a part of the Comprehensive Geriatric Assessment and Health Care Service Study. Participants older than 60-year-old were included and grouped into frail, pre-frail, and non-frail groups according to the revised Fried frailty criteria. Serum levels of IL-10, MCP-1, MCP-3, MIP-1 α , MIP-1 β were measured using enzyme-linked immunosorbent assay. Total enrolled participants were 306, of which the frail were 15(4.9%), pre-frail 146(47.7%), and non-frail 145(47.4%). The mean age of the participants was 70.48 ± 6.6 years. The concentrations of MCP-1 and MIP-1 β were significantly different among frail, pre-frail, and non-frail groups (Mean for MCP-1 is 199.8 pg/ml, $p=0.003$ and Mean for MIP-1 β is 166.0 pg/ml, $p=0.004$). After adjusting for age, sex, body mass index, comorbid conditions and biochemical index, elevated serum levels of MCP-1 ($250.91 > \text{pg/ml}$) and MIP-1 β ($211.41 > \text{pg/ml}$) was positively associated with frail/pre-frail status (for MCP-1 $p=0.047$, OR=1.004, and for MIP-1 β $p=0.043$, OR= 1.005). No significant associations were found for IL-10, MCP-3, MIP-1 α level with frailty in this sample. We concluded that high serum levels of MCP-1 ($250.91 > \text{pg/ml}$) and MIP-1 β ($211.41 > \text{pg/ml}$) may be indicators of frailty syndrome in a sample of Chinese old people.

CEREBRAL HYPOPERFUSION DURING OVER-GROUND WALKING IS RELATED TO ARTERIAL STIFFNESS IN OLDER ADULTS

L. Fitzgibbon-Collins, I. Brar, G. Heckman, R. Hughson, *Schlegel-University of Waterloo Research Institute for Aging, Waterloo, Ontario, Canada*

Posture-related cerebral hypoperfusion is thought to contribute to a large proportion of falls in older adults (OA). Impaired vascular health, which might alter cerebrovascular hemodynamics, can increase the risk of cerebral hypoperfusion. The present study sought to examine posture-related reductions of cerebral tissue oxygenation ($t\text{SO}_2$) during a transition to walking and its association to indices of vascular stiffness. Twenty-three OA (87 ± 5 yrs) performed postural transitions from supine-to-walking over-ground with a walker. Near infrared spectroscopy measured $t\text{SO}_2$ at 3 time points: baseline, the lowest point upon walking (nadir) and between 40s to 60s during walking. Arterial stiffness was assessed from carotid pulse pressure (cPP) and compliance coefficient (cCC). K-cluster-analysis (clustering variables: $\Delta t\text{SO}_2$ and cPP) divided participants into good- and poor-cerebrovascular-regulation (CVR: $n=16$ and $n=7$, respectively). A one-way-ANOVA compared group difference with significance set to $p \leq 0.05$. $t\text{SO}_2$ at baseline, nadir and walking were significantly lower ($p < 0.001$) in the poor-CVR group versus the good-CVR group during the baseline $61 \pm 7\%$ vs. $67 \pm 5\%$, nadir $54 \pm 8\%$ vs. $65 \pm 5\%$, and walking $58 \pm 10\%$ vs. $66 \pm 5\%$. The poor-CVR group had stiffer carotid arteries compared to the good-CVR group as indicated by higher cPP

($71 \pm 16 \text{ mmHg}$ vs. $49 \pm 9 \text{ mmHg}$, $p < 0.001$) and lower cCC ($0.36 \pm 0.11 \text{ mm}^2/\text{Kpa}$ vs. $0.51 \pm 0.14 \text{ mm}^2/\text{Kpa}$, $p=0.027$). This is the first study to show differences in $t\text{SO}_2$ in OAs during a transition to walking. Importantly, this study reveals that OAs with poor-CVR have significantly stiffer vessels and lower cerebral oxygenation during rest, upon standing and during walking, which may be placing them at greater risk of a future fall.

RIGHT VENTRICULAR FUNCTIONAL DECLINE WITH AGING IN THE BABOON MODEL

A. Kuo¹, H.F. Huber², C. Li², P. Nathanielsz^{2,3}, G. Clarke^{1,3}, *1. University of Texas Health Science Center San Antonio, San Antonio, Texas, 2. University of Wyoming, Laramie, Wyoming, 3. Southwest National Primate Research Center, San Antonio, Texas*

As nonhuman primates, the baboons represent a unique model for translational studies on aging for extrapolation to humans. However, baseline right ventricle function with aging is not yet established in any primate species. Using cardiac MRI, we examined the key RV parameters in 28 male and female baboons at two age points. Cardiac MRI was performed to evaluate for RV systolic function to include steady-state free precession and tissue tagging sequences. Two groups of baboons were studied, young (YNG, $N=16$, 8M, 5.6yr) and elderly baboons (OLD, $N=12$, 6M, 16yr). Data analysis was performed with CMR42 Circle and Harmonic Phase Flow. Statistical analysis: student's t-test, linear regression, and Pearson correlation, significance $p < 0.05$. RV ejection fraction (EF) declined with aging (YNG $49 \pm 2\%$, OLD $39 \pm 3\%$, $p < 0.01$). RV EF correlated with previously reported values of left ventricular EF ($p < 0.05$) without any sex differences. RV stroke volume, end-systolic volume, and end-diastolic volume correlated with body surface area (BSA) ($p < 0.01$). After normalization, females demonstrated persistent lower stroke volume compared to males (M $25 \pm 1 \text{ mL/m}^2$, F $18 \pm 2 \text{ mL/m}^2$). Normalized RV stroke volume decreased in both sexes with age (YNG $27 \pm 2 \text{ mL/m}^2$, OLD $18 \pm 2 \text{ mL/m}^2$). Similar to previously reported human studies, sex difference is seen in RVSV/BSA but not RVEF. Greater age related decline is seen in the RVSV/BSA compared to humans. Additionally, age related decline in RV EF is seen, not previously reported in human studies.

CHRONIC EFFECTS OF PASSIVE MECHANICAL STRETCHING EXERCISE ON SOLEUS MUSCLE OF FEMALE AGED RATS

A.R. Gomes¹, A.S. Wojciechowski¹, A.F. Schewtschik², A.C. Loureiro², D.M. Santana², L.G. Capriglione², H. Martins, T.G. Zotz¹, *1. Department of Physical Education, Federal University of Parana, Curitiba, Parana, Brazil, 2. Pontifical Catholic University of Parana, Curitiba, Parana, Brazil, 3. Midwestern State University, Guarapuava, Brazil*

The loss of muscle mass related to ageing process, known as sarcopenia, occurs through a decrease of muscle fiber cross-sectional area (MFCSA). However, physical exercises can maintain and/or increase skeletal muscle mass. The aim of this study was to analyze the chronic effects of passive mechanical stretching exercise on soleus muscle of female aged rats. Fourteen aged female rats (28 months) divided

into two groups: Stretching (SG, $n=7$, 335 ± 39 g) and control (CG, $n=7$, 321 ± 32 g) were included. Rats were previously anesthetized and to stretch soleus muscle the left ankle was held mechanically in full dorsal flexion through an apparatus constituted by a load cell, to measure the force (N) to induce the muscle-tendon unit deformation. The stretching was performed on the left soleus muscle, 4 repetitions of 1 minute each with 30 seconds interval between each repetition through an apparatus, 3 times a week, for 3 weeks. After three sessions, left soleus muscles were removed, and the following analysis were performed: muscle weight with a scale and histological slides with transverse muscle section to measure MFCSA. The muscle weight was significantly higher in the SG when compared to CG (0.26 ± 0.3 mg *vs* 0.14 ± 0.03 mg, $p=0.003$, Kruskal-Wallis) and MFCSA of SG was significantly lower in the SG when compared to CG ($3919 \pm 1694 \mu\text{m}^2$ *vs* $4172 \pm 1446 \mu\text{m}^2$, $p=0.002$, Kruskal-Wallis). Despite increased muscle weight, the stretching protocol applied in aged muscle of female rats showed atrophy effect.

IMPAIRMENT OF MITOCHONDRIAL FUNCTION IN MURINE SEPSIS SURVIVORS

A.M. Steele, M.E. Starr, S. Patel, A. Rabchevsky, H. Saito, *Physiology, University of Kentucky, Lexington, Kentucky*

Sepsis, a life-threatening condition accompanied by profound systemic inflammation, is a serious problem among the aging population as both susceptibility and mortality increase dramatically with age. Among survivors, >70% report muscle weakness for years after hospital discharge. Published studies aimed at elucidating the underlying mechanism for this phenomenon have been limited to analysis during sepsis due to the lack of an appropriate model (*i.e.* models are too severe and cause early death or are too mild to induce long-term weakness). Despite this limitation, these studies have consistently observed mitochondrial dysfunction during sepsis. The objective of the current study was to determine if mitochondria remained dysfunctional weeks after recovery from severe sepsis. Experimental sepsis was induced in 16-month-old mice by cecal slurry injection in combination with ICU-like interventions (antibiotic and fluid resuscitation). Two weeks later, mice were euthanized and mitochondria from the tibialis anterior (TA; fast-twitch) and soleus (slow-twitch) muscles were isolated and subjected to respiration analysis using Seahorse Biosciences technology. The maximum ATP phosphorylation rate was significantly reduced in the TA of survivors however State IV was unchanged, suggestive of increased electron leakage. State V-driven-Complex I activity was also reduced. No significant changes were observed in the soleus-derived mitochondria, demonstrating that fast-twitch muscles are more susceptible to sepsis-induced damage. These data indicate that mitochondria remain dysfunctional long after recovery from sepsis and may be responsible for long-term sepsis-induced muscle weakness. Targeting mitochondria could be a potential therapeutic target for preventing or resolving long-term muscle dysfunction in sepsis survivors.

THE ROLE OF ANTI-CYTOMEGALOVIRUS CD8 TCELL RESPONSES IN ADIPOSE METABOLIC DYSREGULATION AND DIABETES

N. Contreras, M. Smithey, J. Nikolich-Zugich, *University of Arizona College of Medicine, Tucson, Arizona*

Cytomegalovirus (CMV) infection results in a lifelong and persistent infection that is characterized by stochastic bouts of replication. Furthermore, the primary and definitive location of viral replicative senescence has yet to be identified. As CMV has a broad tissue and cellular tropism the identification of a 'viral reservoir' has been difficult. The objective of this study was to investigate the potential involvement of adipose tissue in acute and chronic immune responses during CMV infection. Adipose tissue is a highly heterogeneous tissue containing the adipocytes and stromal vascular fraction (SVF). The SVF consists of numerous immune cells and specifically CD8a T cells, which are crucially important for the control of CMV infection. Inflammation within adipose tissue has been increasingly investigated in the context of obesity, but whether CMV infection adipose tissue and the downstream consequences of such an infection have not been reported. Here we demonstrate, using the mouse model of CMV infection (mCMV) that mCMV is capable of infecting the cellular constituents of adipose tissue and this results in a significant CD8a+ T cell response that is maintained in both the acute and lifelong infection, possibly leading to a decline in metabolic function. These results have far reaching implications for metabolic health, increase our knowledge of mCMV tropism, and identify a neglected reservoir for viral replication and persistence.

SESSION 5225 (SYMPOSIUM)

CAPABLE: FINDINGS, COST SAVINGS, AND SCALING FROM AN AGING-IN-PLACE DEMONSTRATION

Chair: S.L. Szanton, *Johns Hopkins University School of Nursing*

Discussant: J. Gajardo, *University of Chile, Chile*

As the global population of older adults continues to expand, it is ever more urgent to identify promising programs that decrease disability. The Community Aging in Place, Advancing Better Living for Elders (CAPABLE) program, funded by the Center for Medicare and Medicaid Innovation, is designed to reduce the health impact of impaired physical function among low-income older adults by addressing both individual capacity and the home environment. Using an inter-professional team composed of an occupational therapist, nurse, and handyman, CAPABLE helps older adults attain self-identified functional goals. With clinician input, participants develop action plans to achieve their goals. Home repairs, assistive devices, and home modifications support these goals. In this symposium, we present overall results, and cost savings from a Center for Medicare and Medicaid Innovation (CMMI) project of CAPABLE, plus scaling possibilities, and current scaling of the program to new cities. The 1st presenter will report results and multivariable models of the primary outcomes from the CMMI trial. The 2nd presenter discuss the association between home hazards and disability The 3rd presenter will report an economic analysis of cost savings to Medicaid from the CAPABLE program. The 4th presenter will report results

from testing CAPABLE in 3 cities in Michigan through a program called MI-CAPABLE. The 5th will present efforts by the AARP Foundation to scale CAPABLE through multiple channels and markets. The discussant will provide perspectives on barriers and opportunities to implement CAPABLE in diverse income settings and global health context.

CAPABLE IS ASSOCIATED WITH DECREASED DISABILITY IN LOW INCOME OLDER ADULTS IN BALTIMORE

S.L. Szanton^{1,2}, J.L. Wolff², L. Roberts¹, B.A. Leff², R.J. Thorpe², J.M. Guralnik³, L.N. Gitlin¹, 1. *Johns Hopkins University School of Nursing, Baltimore, Maryland*, 2. *Johns Hopkins University School of Public Health, Baltimore, Maryland*, 3. *University of Maryland Medical School, Baltimore, Maryland*

We present final results from the 281 CAPABLE participants in a CMMI project. Participants were low-income, cognitively intact, older adults with functional difficulty. They were 74.9 (SD=7.4) years old and predominantly African American (80%) women (83%). They had an average of 3.3 (SD 1.33) chronic conditions and reported difficulty in 3.9 (SD 2.04) out of 8 activities of daily living at baseline. Five months later, at the conclusion of the program, participants had difficulty with only 2.0 (SD 2.05) of 8 ADLs. 75% of the study participants reported difficulty with fewer ADLs at follow-up. In multivariate models, age, race, and depressive symptoms at baseline were not related to improvements. Depressive symptoms improved in 53% of the cohort. Home hazards decreased from an average of 3.3 hazards (SD=1.83) to 1.4 hazards (SD=1.14). Participants who had been hospitalized in the prior year benefited as much as their non-hospitalized counterparts ($p=0.14$).

THE INFLUENCE OF INTRA- AND EXTRA-INDIVIDUAL FACTORS ON THE ASSOCIATION BETWEEN FUNCTIONAL PERFORMANCE AND DISABILITY

S. Metzger¹, S.L. Szanton², M. Granbom^{2,3}, F. Tan⁴, L.N. Gitlin², G. Kempen¹, 1. *Department of Health Services Research, Care and Public Health Research Institute (Caphri), Maastricht University, Maastricht, Netherlands*, 2. *Department of Community and Public Health, School of Nursing, Johns Hopkins University, Baltimore, Maryland*, 3. *Active and Healthy Ageing Research Group, Faculty of Medicine, Lund University, Lund, Sweden*, 4. *Department of Methodology and Statistics, Care and Public Health Research Institute (Caphri), Maastricht University, Maastricht, Netherlands*

Disability is a serious health outcome in older adults, as it increases the risk for further functional decline, injuries and falls, institutionalization and even mortality. Disability reflects the gap between an individual's abilities and the environment in which that person functions. Consequently, in this study the moderating effects of environmental factors (i.e., home hazards) on the pathway from physical performance towards disability were studied using the baseline data of the CAPABLE study. Mean age of the sample ($n=300$) was 75.7 years and 88% was female. The average

score on the Short Physical Performance Battery were 4.9 (theoretical range 0–12, higher scores indicate better performance) and 4.0 and 5.9 for ADLs and IADLs, respectively (theoretical range 0–16, higher scores indicate more disability). Older adults had on average 8.8 home hazards. Preliminary analyses showed main effects of both home hazards and physical performance and some interaction effects on ADLs and IADLs.

COST SAVINGS FOR CAPABLE PROGRAM DRIVEN BY DECREASES IN HOSPITAL AND LONG-TERM CARE FOR PARTICIPANTS

S.L. Szanton¹, N.H. Alfonso², L. Roberts¹, D.H. Bishai², 1. *Johns Hopkins University School of Nursing, Baltimore, Maryland*, 2. *Johns Hopkins University, Baltimore, Maryland*

The direct cost for CAPABLE program participation, including visits, coordination, mileage, home repairs, modifications, and assistive devices, was \$2825 per participant. In a population of low income participants we used finite mixture model regression estimates in a Markov model to estimate monthly average expenditure and likelihood of high cost or low cost utilization for eight healthcare service categories. We found that Medicaid spending was \$833 less per month for the average CAPABLE participant, compared to a matched comparison group in the observation period (observations ranged from 6–24 months). While home health care utilization and primary care provider visits increased, the CAPABLE program was associated with decreased likelihood of hospital and long term care which drives overall lower spending in participants. The extent of the decrease could pay for program participation, as well as provide further savings for Medicaid.

IMPLEMENTING CAPABLE (COMMUNITY AGING IN PLACE FOR BETTER ELDERLY LIVING) AS MICAPABLE IN A WAIVER

S. Spoelstra¹, M. Kohler¹, J. Roth², A. Evelyn-Gustave², M. Schueller¹, S.L. Szanton², 1. *Grand Valley State University, Grand Rapids, Michigan*, 2. *Johns Hopkins University, Baltimore, Maryland*

Normalization Process Theory was used to adapt CAPABLE to MiCAPABLE for a Medicaid Waiver adding social workers (SWs) to address psychosocial needs, and modifying the electronic health record to monitor fidelity. The Home and Community Based Medicaid Waiver serves low-income, nursing home eligible adults in the community to delay institutionalization. Kotter Change model guided implementation of MiCAPABLE for 55 participants at 3 Waiver sites. Mean age was 66.8 years (standard deviation 11.64, range 42–96), 83.64% ($n=46$) female, and 71.15% ($n=37$) Caucasian, 25.00% ($n=13$) African American. Mean occupational therapist (4.26 [SD 1.65]), RN (3.13 [SD 1.12]), SW (1.79 [SD 1.53]) visits; 2.83 (SD 0.89) interdisciplinary coordination events. Enrollment/data collection is ongoing. Reductions in falls, depression, pain, institutionalization, and cost will be reported. We will also present lessons learned in adding a new component to an established model. Testing implementation of adapted interventions is recommended prior to scaling-up to improve sustainability.

MOVING FROM TRIAL TO MULTIPLE MARKETS: PLANNING WITH A NATIONAL FOUNDATION FOR IMPLEMENTATION

S.L. Szanton¹, D. Soliman², B.A. Leff¹, L.N. Gitlin¹, 1. *Johns Hopkins University School of Nursing, Baltimore, Maryland*, 2. *AARP Foundation, Washington, District of Columbia*

Many successful programs with vital evidence for improving aging do not get scaled beyond their initial trial. The AARP Foundation has a mission of improving life for low income older adults. Together, the AARP Foundation and the Principal Investigator of the CAPABLE program are using a multi-stage process to examine ways to scale CAPABLE through multiple potential channels. These channels include Accountable Care Organizations, Medicare Advantage plans, bundled payment in health insurance plans, homeowners insurance riders, and the self-pay market. The exploration process identified possible revenue streams, examination of each delivery aspect to make CAPABLE more scalable, as well as critical assumptions requiring testing. This process augmented more typical dissemination and implementation models by including a business development planning process. The multi-stage process will be presented along with the challenges and assumptions necessary to drive such a partnership.

SESSION 5230 (PAPER)

CHRONIC CONDITIONS IN OLDER ADULTS III

COMORBIDITY PATTERNS AND RISK FACTORS OF SEXUAL PROBLEMS IN LATE-LIFE: A LATENT CLASS ANALYSIS

C. Juang¹, B.G. Knight², 1. *University of Southern California, Los Angeles, California*, 2. *University of Southern Queensland, Darling Heights, Queensland, Australia*

Past studies on aging and sexuality examine sexual problems separately, but sexual problems rarely occur in isolation. The study identifies subgroups of midlife and older adults with similar comorbidity patterns of sexual problems empirically. The study also examines shared risks as a possible explanation for comorbidities between sexual problems. Participants (1431 men and 1687 women) were drawn from the Wave 2 dataset of the National, Social Life, Health, and Aging Project (NSHAP). Latent class analysis was conducted separately for men and women using 7 dichotomous self-report sexual problems to identify subgroups with similar patterns of co-occurring sexual problems. Multinomial regression was conducted to identify predictors of the subgroups. Four subgroups of men with different patterns of comorbidity were identified: unaffected group, moderately affected group, climaxing-erectile difficulties group, and multiple sexual problems group. Three subgroups of women were identified: unaffected group, desire-climaxing problems group, and multiple sexual problems group. Depression predicted the multiple sexual problems group for men and women. Men's patterns were predicted by older age and physical health indicators, whereas women's were predicted by education and ethnicity. In summary, our results indicate that shared risks contribute to comorbidities between sexual

problems. Mental health appears to play a larger factor in reporting multiple sexual problems than physical health. Our findings offers a nuanced view of comorbidity patterns of sexual problems and provides insight to clinical assessment and treatment of sexual problems in late-life.

INCREASED INCIDENCE OF MEDICALLY- ATTENDED NOROVIRUS AMONG OLDER ADULTS WITH CHRONIC DISEASE

M.A. Schmidt¹, K. Shioda², A.L. Naleway¹, C. Biggs³, A.J. Hall², 1. *Kaiser Permanente Center for Health Research, Portland, Oregon*, 2. *Centers for Disease Control and Prevention, Atlanta, Georgia*, 3. *Oregon State Public Health Laboratory, Hillsboro, Oregon*

Background

Norovirus exerts a significant burden of disease among the elderly, yet little is known about its relationship with underlying chronic disease. The goal of our work was to compare rates of norovirus-associated, medically-attended acute gastroenteritis (MAAGE) among elderly individuals with and without a previously-diagnosed, chronic condition.

Methods

We identified MAAGE episodes based on ICD-9 and chief complaint codes recorded during health care encounters among Kaiser Permanente Northwest members aged ≥ 60 years occurring from 4/1/2014-3/31/2015. We tested a sample of stool specimens from these individuals for norovirus. We defined the presence of a chronic condition as having at least one ICD-9 code associated with disease in one of eleven categories (i.e. diabetes, heart disease, kidney disease, cancer, etc.).

Results

We observed 6,238 MAAGE episodes among our study population of 117,185 (53.2 episodes per 1,000 individuals). Of these, 4,881 episodes (78%) occurred among those with at least one chronic condition. Despite similar norovirus positivity rates between those with (23/367, [6.3%]) and without (10/142, [7.0%]) a chronic condition ($p=0.74$), the incidence of norovirus-associated MAAGE was higher among those with a chronic condition (2.6 per 1,000; 95% confidence interval [CI] 1.6–3.9) than those without (0.8; CI 0.4–1.4).

Discussion

Our findings suggest an increased incidence of norovirus-associated MAAGE among those with a chronic condition. Additional research is necessary to compare norovirus-associated MAAGE among patients with different types of conditions, to determine whether having a chronic condition alters the clinical course and severity of acute norovirus-associated disease, and whether norovirus infection affects chronic disease outcomes.

SEX AND GENDER DIFFERENCES IN PAIN-RELATED DISABILITY AMONG PERSONS INITIATING CHRONIC OPIOID THERAPY

M. Thakral¹, K. Saunders¹, S. Shortreed^{1,2}, M. Von Korff¹, L. LeResche³, S. Thielke^{4,6}, D. Rosenberg¹, J. Turner^{4,5,7}, 1. *Kaiser Permanente Washington Health Research Institute, Seattle, Washington*, 2. *Department of Statistics, University of Washington, Seattle, Washington*, 3. *Department of Oral Medicine, University of Washington, Seattle,*

Washington, 4. Department of Psychiatry and Behavioral Sciences, University of Washington, Seattle, Washington, 5. Department of Rehabilitation Medicine, University of Washington, Seattle, Washington, 6. Geriatric Research, Education, and Clinical Center, Puget Sound Veterans Affairs Medical Center, Seattle, Washington, 7. Department of Anesthesiology and Pain Medicine, University of Washington, Seattle, Washington

Older women with chronic pain experience a higher prevalence of severe pain, widespread pain and pain-related disability than men, but little is known about whether sex/gender contributes to pain-related disability independent of differences in chronic pain. The purpose of this study was to determine whether sex/gender is associated with pain-related disability independent of differences in chronic pain, and to test for an age and sex/gender interaction among chronic opioid therapy (COT) patients. The Middle-Aged/Seniors Chronic Opioid Therapy (MASCOT) Study is a prospective longitudinal telephone survey of persons aged ≥ 45 years identified as initiating COT for chronic pain ($n=1262$). Baseline assessment included the Chronic Pain Risk Score, a combined measure of pain severity, widespread pain, depression, and days bothered by pain in the past 6 months. Disability was defined as moderate-to-severe pain-related disability ($> \text{Grade 3}$) using the Graded Chronic Pain Scale at 1 year. Women were more educated with more severe and widespread pain and more pain days than men. After controlling for covariates, women were more likely than men to have moderate-to-severe pain-related disability at 1 year (AOR 1.68, 95%CI 1.68, 1.33–2.14), which remained significant after controlling for Chronic Pain Risk Score (AOR 1.37, 95%CI 1.06–1.79). Age was no longer significant after controlling for Chronic Pain Risk Score and other covariates and there were no significant interactions between sex/gender and age. Further investigation is necessary to understand the biological/social factors that contribute to the differences in pain and pain-related disability among older men and women.

SESSION 5235 (SYMPOSIUM)

TRANS-DISCIPLINARY RESEARCH IN FRAILITY TO ACHIEVE HEALTHY AGEING

Chair: R. Visvanathan, University of Adelaide, Adelaide, South Australia, Australia

Co-Chair: O. Theou, Dalhousie University

The benefits of recognizing frailty and addressing the syndrome sooner rather than later range from a healthier older population to reduction in the demand on clinical health services, to a better quality of life for older people, that is more productive, enjoyable activity with more confidence. The National Health and Medical Research Council of Australia has funded a Centre of Research Excellence (CRE) for five years in the health services category to address the 'silent' public health issue of frailty. This 'global' CRE provides the platform for a diverse team of researchers to collaborate and engage with key stakeholders with the mission of developing and conducting innovative, high quality and trans-disciplinary frailty research with one goal in mind: to prevent and better manage frailty so that people can achieve 'Healthy Ageing'. This CRE brings together clinician researchers from

geriatric medicine, general practice, rehabilitation medicine, orthopaedics, pharmacy, nursing and allied health together with research experts in knowledge translation, economics, demography and geography. The four broad aims of this Frailty CRE are to: a) define the extent of frailty and inform health service policies; b) develop and test a new health economics model for frailty; c) test the implementation of a screening pathway to support early risk identification in general practice; and d) develop and test interventions to treat older people at risk for frailty in the community. As a direct result of our research, we hope to influence the development of innovative and translatable models of care.

FRAILITY IN THE NORTH WEST ADELAIDE HEALTH STUDY USING THE FRAILITY PHENOTYPE AND INDEX APPROACHES

M.Q. Thompson¹, O. Theou², S.C. Yu¹, K. Lange¹, R. Adams¹, R. Visvanathan¹, 1. University of Adelaide, Adelaide, South Australia, Australia, 2. Dalhousie University, Halifax, Nova Scotia, Canada

This study examined the prevalence of frailty in community-dwelling adults aged 65+ from the North West Adelaide Health Study ($n=945$, 74.7 ± 6.4 years, 56.1% females). Frailty was operationalized using the frailty phenotype and frailty index (FI) approaches. The mean FI was 0.23 ± 0.15 and the prevalence of frailty based on the phenotype was 20.6%, while 50.3% of the cohort was classified as pre-frail. Levels of frailty were higher in the oldest old (aged 75+ FI 0.26 ± 0.15 and 31.7% frail vs aged 65-75 0.20 ± 0.13 and 11.5%), in females (FI 0.25 ± 0.15 and 26.2% vs males 0.20 ± 0.14 and 13.5%), those with a lower income ($< \$20k$ p.a. FI 0.25 ± 0.15 and 24.5% vs $\$60k+$ p.a. 0.14 ± 0.10 and 5.9%), and a lower level of education (up to secondary level FI 0.23 ± 0.14 and 22.7% vs bachelor degree or higher 0.16 ± 0.14 and 6.7%). We are currently examining the ability of the both frailty tools to predict outcomes at four years.

THE IMPACT OF SARCOPENIA DEFINITIONS AND THE ASSOCIATION WITH LUNG FUNCTION IN OLDER AUSTRALIANS

S.C. Yu^{1,2,3}, T. Nguyen³, R. Adams⁴, R. Visvanathan^{1,2,3}, 1. National Health and Medical Council Centre of Research Excellence Trans-disciplinary Frailty Research To Achieve Health Aging and the Adelaide Geriatrics Training and Research with Aged Care (GTRAC) Centre, School of Medicine, Faculty of Health Sciences, University of Adelaide, South Australia, Adelaide, South Australia, Australia, 2. Aged & Extended Care Services, The Queen Elizabeth Hospital, Central Adelaide Local Health Network, South Australia, Adelaide, South Australia, Australia, 3. Adelaide Geriatrics Training and Research with Aged Care (G-TRAC) Centre, School of Medicine, Faculty of Health Science, University of Adelaide, Adelaide, SA 5000, Australia, Adelaide, South Australia, Australia, 4. Health Observatory, School of Medicine, Faculty of Health Sciences, University of Adelaide, South Australia, Adelaide, South Australia, Australia

The relationship between sarcopenia and lung function is uncertain. The aim of the current study is to compare the relationship between sarcopenia [using three different definitions for low appendicular skeletal muscle mass (ASM)

adjusted for either: a) height squared, b) height and fat mass; or c) body mass index (BMI)], in combination with low grip strength and lung function in 470 (53.4% women) community dwelling older people. Body composition was assessed using DXA and lung function assessed using spirometry. Forced expiratory volume (FEV₁) and forced vital capacity (FVC) were significantly correlated with grip strength and the three low ASM definitions. After adjustment for age, gender, smoking and physical activity, ASM adjusted to fat mass definitions of sarcopenia remained independent predictors of lower FEV₁ and FVC. Sarcopenia definitions that account for fat mass may therefore be more relevant in clinical practice.

AUSTRALIA'S FRAIL POPULATION—IMPLICATIONS OF PREVALENCE AND SPATIAL DISTRIBUTION

H. Barrie, *The University of Adelaide, Adelaide, South Australia, Australia*

In Australia and globally an unprecedented number of older people will be moving into a 'third age' over the coming decades. There are, however, common conditions associated with growing older that pose serious health risks; *frailty syndrome* is one of these conditions and a major threat to ageing well. The reported international prevalence of frailty is 4% for those aged 65–69 years, increasing to 16% in the 80–84 years age group. One in four older people aged 85 years and older are frail. Using national Australian Census data for 2011 and 2016 this presentation will examine the prevalence and spatial distribution of Australia's likely frail, older population. Spatial analysis of this older, frail population enables us to explore links to health services accessibility and the relationship between frailty and the built environment.

FRAILTY IN AUSTRALIAN RESIDENTIAL AGED CARE FACILITIES: RELATIONSHIP WITH ONE-YEAR OUTCOMES

O. Theou¹, J. Sluggert², J. Bell², E.C. Tan², T. Emery³, J.E. Morley⁵, K. Rockwood¹, R. Visvanathan⁴, 1. *Dalhousie University, Halifax, Nova Scotia, Canada*, 2. *Monash University, Melbourne, Victoria, Australia*, 3. *Resthaven Incorporated, Adelaide, South Australia, Australia*, 4. *University of Adelaide, Adelaide, South Australia, Australia*, 5. *Saint Louis University, Saint Louis, Missouri*

This study aimed to investigate the ability of the FRAIL-NH and Frailty Index to predict hospitalization and mortality in residential age care facilities over a 12-month follow up. A total of 383 residents (age 87.5 ± 6.2 years, 77.5% females) of six Australian facilities participated in the study. At baseline 35.9% of residents were classified as most frail based on the 7-item FRAIL-NH scale. Their median 66-item Frailty Index score was 0.33 (IQR 0.24–0.46). During the follow up period, 22.2% of residents died and 34.4% were hospitalized. Residents who died had higher FRAIL-NH (45.2% vs. 35.2% most frail) and Frailty Index [median (IQR) 0.41 (0.29–0.53) vs. 0.31 (0.23–0.42)] scores at baseline. Residents who were hospitalized had lower FRAIL-NH (25.2% vs. 41% most frail) and Frailty Index [median (IQR) 0.31 (0.24–0.41) vs. 0.35 (0.24–0.48)] scores at baseline. The FRAIL-NH scale and Frailty Index may help identify residents most vulnerable to hospitalization and mortality.

THE PERSPECTIVES OF OLDER PEOPLE AT-RISK OF FRAILTY ON BEING ADVISED ABOUT EXERCISE

A.D. Jadcak^{1,2,3}, J. Dollard^{2,3}, N. Mahajan¹, R. Visvanathan^{1,2,3}, 1. *Adelaide Geriatrics Training and Research with Aged Care (G-TRAC) Centre, School of Medicine, Faculty of Health Sciences, University of Adelaide, Adelaide, South Australia, Australia*, 2. *Aged and Extended Care Services, The Queen Elizabeth Hospital, Central Adelaide Local Health Network, Woodville South, South Australia, Australia*, 3. *National Health and Medical Research Council Centre of Research Excellence: Frailty Trans-Disciplinary Research to Achieve Healthy Ageing, University of Adelaide, Adelaide, South Australia, Australia*

Exercise prescription increases older peoples' participation in exercise. However, little is known about older peoples' perspectives on being advised about exercise. Semi-structured interviews were conducted with twelve older (mean age 83.42) participants at risk of frailty. Their attitudes towards exercise, the advice received, their access to relevant information and their perceptions of the general practitioner's (GP's) role in promoting exercise were explored using thematic analyses. The participants had mostly a positive attitude to exercise and indicated a preference for being advised firstly by their GP. The majority of participants reported minimal or no advice from their GPs. Participants also reported difficulties accessing advice on exercise and indicated that community councils and GP practices should promote exercise for older people more actively. This research has identified a gap in current practice and this should be viewed as an opportunity where change might lead to increased participation in exercise by older people.

SESSION 5240 (SYMPOSIUM)

FORMAL AND INFORMAL VOLUNTEERING IN LATER LIFE: TWO SIDES OF THE SAME COIN?

Chair: K.J. Ajrouch, *Eastern Michigan University*
Co-Chair: C. Tesch-Roemer, *German Centre of Gerontology (DZA)*

Formal volunteering comprises activities within an organizational context, while informal volunteering includes activities performed outside of an organizational context. In this symposium, we ask whether formal and informal volunteering compete with one another ("competition hypothesis") or if they are instead two sides of the same coin ("same coin hypothesis"). If the "competition hypothesis" holds true, there would be a negative correlation between formal and informal volunteering (individuals involved in formal volunteering would be less likely to provide informal neighborhood support). One of underlying causes for the "competition hypothesis" might be competing resources (e.g. finite time). If the "same coin" hypothesis holds true, there would be a positive correlation between formal and informal volunteering (an individual involved in formal volunteering is more likely to provide informal neighborhood support). One of the underlying causes for the "same coin hypothesis" might be overlapping motives (e.g. altruism). The relationship between formal and informal volunteering might differ across different societal groups and change with age. Restrictions in resources and entry barriers might lead

to competition between formal and informal volunteering in some groups (e.g. individuals with lower education). Across age groups there might also be differences in the relationship between formal and informal volunteering. As people grow older and individual resources dwindle, one might assume there is a positive correlation between formal and informal volunteering up to the third age, and a negative correlation in the fourth age. Participants in the symposium will report empirical findings from studies on volunteering.

ASPECTS OF THE COMPETITION BETWEEN INFORMAL AND FORMAL VOLUNTEERING AMONG OLDER PEOPLE

S. Pettigrew¹, M. Jongenelis¹, R. Newton², J. Warburton³, B. Jackson⁴, *1. Psychology, Curtin University, Perth, Western Australia, Australia, 2. Edith Cowan University, Perth, Western Australia, Australia, 3. La Trobe University, Wodonga, Victoria, Australia, 4. University of Western Australia, Perth, Western Australia, Australia*

The relationship between engagement in formal and informal volunteering activities is complex and likely to be bi-directional. Interview data collected from 242 non-volunteers in Western Australia were used to explore the barriers to participating in formal volunteering activities. Results indicate that the “competition hypothesis” applies to those providing informal volunteering services to family and friends; many felt too committed to also engage in formal volunteering. Three aspects of competition were evident: (1) temporal factors – primarily the time taken to perform informal volunteering duties; (2) logistical factors – the need to be flexible to accommodate short-notice requests for assistance from loved ones; and (3) psychological factors – the cognitive dissonance associated with cancelling their formal volunteering commitments which would inevitably clash with the informal commitments that were of markedly higher priority. This presentation will address these factors in the context of the “same coin” and “competition” hypotheses and suggest relevant potential recruitment strategies.

FORMAL AND INFORMAL VOLUNTEERING AMONG OLDER PEOPLE IN GERMANY – COMPLEMENT OR COMPETITION?

J. Simonson, *German Centre of Gerontology, Berlin, Germany*

Formal volunteering as well as informal volunteering (e.g. neighborly help) provide opportunities for social participation. In Germany, the rates of formal and informal volunteers among people aged 65 years and older are similar (34.0 percent and 31.8 percent). We investigate if these forms of participation compete against each other (people decide between them, e.g. due to limited time resources) or if they are positively associated (people combine them, e.g. due to an underlying motivation to help others). Based on the German Survey on Volunteering 2014 (n=28,960; individuals aged 65 years and older: n=7,271), we find a positive correlation between informal and formal volunteering among older people, supporting the hypothesis of association: those who volunteer formally are more likely to volunteer informally, and vice versa. Smaller participation rates in lower educated individuals for both forms indicate similar restrictions for

individuals with fewer resources to participate both in informal and formal volunteering.

PREDICTORS OF FORMAL AND INFORMAL VOLUNTEERING OVER TIME

T.C. Antonucci², K.J. Ajrouch¹, N.J. Webster², *1. Eastern Michigan University, Ypsilanti, Michigan, 2. University of Michigan, Ann Arbor, Michigan*

Volunteerism has increased dramatically over the last few decades. To better understand this trend, we examine the extent to which age, race, class and gender influence whether adults participate in formal and informal volunteering over time. Data come from the longitudinal Social Relations Study. We focus on individual's aged 40–70 interviewed in 2005 at Time 1 (N=574). Individuals reported a higher prevalence of formal volunteering at Time 1 compared to informal, yet 10 years later they were just as likely to engage in both types of volunteering. Moreover the proportion who volunteered both formally and informally was higher at Time 2. Multinomial logistic regression showed that age was the most powerful predictor of change in volunteering patterns. Older respondents were more likely to engage in formal volunteering at Time 2 compared to engaging in both formal and informal volunteering together. Findings are discussed within a life course/life span developmental framework.

INFORMAL VOLUNTEERING AMONG OLDER MIGRANTS – AN ALTERNATIVE ROUTE INTO SOCIAL PARTICIPATION?

C. Vogel, *German Centre of Gerontology, Berlin, Germany*

Volunteering enables individuals to participate in society, but opportunities are unequally distributed. Migrants living in Germany are less likely to volunteer in formal organisations – even more so in leadership positions – than German citizens who have been born in Germany. Does informal volunteering provide participation opportunities for those who are more likely to be excluded from formal volunteering such as older migrants? Based on the German Survey on Volunteering 2014 (n=28,690; migrants aged 50 and above n=1,810), we investigate how group differences in volunteering can be explained and how formal and informal volunteering correlates. Results indicate that migrants aged 50 and above are as likely to volunteer informally as older non-migrants (33% respective 34%) but less likely to volunteer formally (29% respective 42%). As older migrants who formally volunteer at the same time are more likely to volunteer informally, informal volunteering is rather an additional than an alternative route into social participation.

SESSION 5245 (SYMPOSIUM)

PATTERNS AND CONSEQUENCES OF PARENT-ADULT CHILD TIES IN DIVERSE CONTEXTS

Chair: J. Sutor, *Purdue University, West Lafayette, Indiana*

Co-Chair: M. Gilligan, *Iowa State University, Ames, Iowa*

In this symposium, we consider patterns and consequences of parent-adult child ties, using data collected from multiple nations and from Black and white families within the U.S. The first two papers shed light on the social factors that shape relationship quality, support and interaction

between parents and adult offspring. Deane and Zhou use NFSH data to explore parent-child contact and support in Black and white families, focusing on separating between- from within-family effects on these processes. Next, Deng, Thomese, and Silverstein use the Chinese Longitudinal Aging Social Survey to assign relationships to four relationship/family types distinguishing co-residence, exchange of support, and emotional closeness. The second set of papers examines the consequences of parent-child relations on well-being. Graham, Kim, Birditt, Zarit and Fingerma use data from the Family Exchanges Study to explore how middle-aged adults' provision of support to parents and grown children differentially affects cortisol levels depending on the contexts of the support. Next, Suito, Gilligan, Peng and Pillemer use panel data from the Within-Family Differences Study to compare the relative risk of single-time versus sustained perceptions of mothers' favoritism and disfavoritism on adult children's depressive symptoms in Black and white families. Finally, Kalmijn and Leopold use the Netherlands Kinship Panel Study to examine how parental death changes relationship quality, interaction, and support among adult siblings. Taken together, this diverse set of studies, using data from China, the Netherlands, and from Black and white families in the U.S., explores the complexity of patterns and consequences of later-life intergenerational ties.

EFFECTS OF WITHIN-FAMILY VARIABILITY ON PARENT-CHILD CONTACT AND SUPPORT

G. Deane¹, Y. Zhuo², 1. *University at Albany, Albany, New York*, 2. *St. John's University, Queens, New York*

We utilize an NSFH data extraction (from work by Spitze, Ward, & Deane 2006) of parent-child contact and support, and relevant parent- and (adult) child-covariates, which retains the family context (yielding clusters of adult siblings). We explore parent-child contact and support within the framework of the "between-within" (BW) method. Although this method was developed to reap the benefits of strong causal inference of a fixed effects (FE) estimator, while retaining cluster-level attributes that would normally be swept out by differencing or inclusion of a vector of fixed effects, our interest is explicitly in its ability to separate within- from between-cluster effects. We examine the heterogeneity of within-family differences and show how and why within-cluster effects are a conceptual and methodological match to the objective of modeling within-family differences on parent-child contact and support. NSFH oversampling of Black families allows exploration of race differences in these patterns.

INTERGENERATIONAL SOLIDARITY BETWEEN OLDER PARENTS AND ADULT CHILDREN IN CHINA

Y. Deng¹, F. Thomese², M. Silverstein³, L. Li¹, D. Pavlopoulos², 1. *Hunan University, Changsha City, China*, 2. *Free University Amsterdam, Amsterdam, Netherlands*, 3. *Syracuse University, Syracuse, New York*

Family change in China has been substantial over recent decades, with profound implications for how intergenerational relationships are maintained and managed in later life. In a nation where cultural norms of filial piety and strong son-preferences still govern behavior, concerns have been

expressed about the consequences of smaller family size and growth in single-gender families for intergenerational cohesion and support. This paper uses data concerning 32,737 intergenerational relationships reported by 11,511 older parents participating in the baseline (2014) Chinese Longitudinal Aging Social Survey. A multidimensional Latent Class typology of solidarity was used to assign relationships to four relationship/family types distinguishing co-residence, exchange of support, and emotional closeness. One-child families are geographically and emotionally closer, and sons and firstborns are either co-resident or have migrated. Urban and younger families are more cohesive, and tend toward downward intergenerational support. Implications are discussed in the context of contemporary family dynamics in China.

MIDLIFE ADULTS' SUPPORT TO PARENTS AND CHILDREN: IMPLICATIONS FOR DIURNAL CORTISOL RHYTHMS

J. Graham¹, M. Huo¹, K. Kim², K. Birditt³, S. Zarit⁴, K.L. Fingerma¹, 1. *University of Texas-Austin, Austin, Texas*, 2. *University of Massachusetts-Boston, Boston, Massachusetts*, 3. *University of Michigan, Ann Arbor, Michigan*, 4. *Pennsylvania State University, State College, Pennsylvania*

Middle-aged adults provide regular support to their aging parents and their grown children. Prior studies have shown that providing support may have negative or positive implications for well-being, but studies have not examined how providing support on a daily basis may influence physiology such as daily cortisol responses. Middle-aged adults ($N = 171$; $Age = 56.16$) from the *Family Exchange Study* participated in a diary study and provided 4 days of saliva collection sampled 4 times a day. Multilevel models revealed that providing support to parents was associated with flatter cortisol declines across the day. Additionally, adults providing support to children showed elevated cortisol awakening responses and steeper cortisol declines compared to adults who did not provide support to children. Thus, providing support in normative situations (e.g., to adult children) may be rewarding, but providing support in nonnormative or demanding contexts (e.g., to aging parents) may exert a physiological toll.

CONSEQUENCES OF ADULT CHILDREN'S PERCEPTIONS OF MATERNAL DIFFERENTIAL TREATMENT ACROSS TIME

J. Suito¹, M. Gilligan², S. Peng¹, J. Meyer¹, G. Con¹, K.A. Pillemer³, 1. *Sociology, Purdue University, West Lafayette, Indiana*, 2. *Iowa State University, Ames, Iowa*, 3. *Cornell University, Ithaca, New York*

Perceptions of mothers' favoritism and disfavoritism in adulthood are strong predictors of psychological well-being; however, it is not known whether perceptions that are sustained across time increase the risk for depressive symptoms beyond those found at a single point in time. In the present paper, we use data collected from 479 adult children nested within 219 later-life families as part of the first and second waves of the Within-Family Differences Study to explore the relative risk of single-time versus sustained perceptions

of mothers' differentiation. Preliminary findings reveal that adult children's perceptions of both favoritism and disfavoritism are relatively stable, consistent with findings based on mothers' own reports. Consistent with theories of cumulative stress, perceptions of sustained favoritism and disfavoritism were found to be stronger predictors of depressive symptoms than were perceptions at any single point. The effects are particularly strong for Black offspring who perceive sustained disfavoritism.

POSITIVE AND NEGATIVE EFFECTS OF PARENTAL DEATH ON ADULT SIBLING RELATIONSHIPS

M. Kalmijn, T. Leopold, *University of Amsterdam, Amsterdam, Netherlands*

How does the death of a parent affect the adult sibling relationship? Different theoretical perspectives suggest different outcomes. A solidarity perspective implies mostly positive effects on the sibling tie. In this perspective, the death of a parent is a major life event which increases the need for family support. A structural perspective implies mostly negative effects. In this perspective, the death of a parent implies the disappearance of a coordinating member in the family network, thereby gradually weakening the relationship between adult siblings. To test the perspectives, we analyze data from the *Netherlands Kinship Panel Study*, a large-scale survey that was collected over three waves between 2003 and 2010. The data allow us to examine changes in the sibling relationship before and after the death of the first and second parent. A range of characteristics of the sibling relationship can be used, including contact, support exchange, conflict, and quality.

SESSION 5250 (PAPER)

UTILIZING TECHNOLOGY IN THE CARE OF OLDER ADULTS

REGISTERED NURSES' USE OF COMPUTERIZED DECISION SUPPORT SYSTEMS IN DRUG MONITORING

R. Johansson-Pajala¹, K. Jorsäter Blomgren¹, L. Gustafsson¹, J. Fastbom², L. Martin¹, *1. School of Health, Care and Social Welfare, Mälardalen University, Eskilstuna, Sweden, 2. Karolinska Institutet, Stockholm, Sweden*

Registered nurses (RNs) working in long-term care settings have an important role in ensuring medication safety among older persons. There is an increasing focus on incorporating informatics, such as computerized decision support systems (CDSS) into RNs clinical practice. A qualitative interview study of 16 RNs aimed to identify and describe variation in RNs' perceptions of using a CDSS in drug monitoring. The CDSS provided information about e.g. inappropriate drugs and possible adverse drug reactions and was mainly used when performing medication reviews. The results showed that the RNs perceived the CDSS as supportive in terms of promoting standardized routines, team collaboration and giving possibilities for evidence-based clinical practice. However, there was a wish for increased collaboration and responsibility-taking from the physicians. Furthermore, in order to evaluate quality effects of medication reviews led

by RNs assisted with a CDSS, an exploratory study was performed. The study, performed in four nursing homes, had a cross-sectional follow-up design, three and six months after the introduction of the CDSS. The results demonstrated that the CDSS detected significantly more possible adverse drug reactions and drug-drug interactions, than the RNs suspected. However, RNs involvement in the performance of medication reviews, contributed with other valuable clinical information as untreated symptoms and lack of adherence. There was no significant improvement in the selected indicators of quality of drug use during the study period. Both studies suggest that a CDSS can support RNs in drug monitoring. Though, for the best results, a team-based approach should characterize the whole process.

TABLE-BASED CLINICAL FRAILTY SCALE—AGREEMENT BETWEEN ED PHYSICIANS, PATIENTS AND CAREGIVERS

J.S. Lee¹, J. Goldstein⁶, M.C. Tierney¹, M. Sirois², M. Chignell¹, M. Nolan³, K. Rockwood⁴, M. Émond⁵, *1. Medicine, Div of Emergency Medicine, University of Toronto, Toronto, Ontario, Canada, 2. CHU de Québec, Québec City, Québec, Canada, 3. County of Renfrew Paramedic Services, Renfrew Country, Ontario, Canada, 4. Dalhousie University, Halifax, Nova Scotia, Canada, 5. Université Laval, Québec City, Québec, Canada, 6. Nova Scotia Health Authority, Halifax, Nova Scotia, Canada*

Frailty predicts adverse health outcomes, and the Clinical Frailty Scale (CFS) has been validated internationally to predict adverse outcomes and mortality. Emergency Departments (ED) are challenged to assess frailty due to a lack of training and limited time. We studied the agreement between ED physicians and patient self-assessments using a tablet-based CFS that includes graphics and short descriptors for each of 9 frailty categories.

We conducted a prospective observational cohort study of people >65 years seen in the ED of 3 Canadian academic centers. We excluded patients who were critically ill, visually impaired, or unable to communicate in English or French. We compared agreement on the tablet-based CFS between 4 categories of assessors: Patients, ED physicians, trained research assistants and caregivers using the kappa statistic.

We enrolled 274/380 eligible patients who provided complete data (72.1%). Their average age was 75.8 years, and 48.9% were female. Their median MOCA score was 23/30 (IQR = 17 – 26) and their median OARS was 26/28 (IQR 22–28). Agreement between physicians and research assistants was good ($\kappa = 0.60$, 95% CI 0.50 – 0.70), as was physician-caregiver agreement and patient-caregiver agreement ($\kappa = 0.66$, 95% CI 0.40 – 0.93). Agreement between ED physicians and patients was only moderate ($\kappa = 0.47$, 95% CI 0.36 – 0.58). ED physicians more often rated patients as frail (40% vs 29%, $p < 0.001$).

There was less agreement between ED physicians and patient self-assessments for the CFS compared to physicians-research assistant agreement and care-giver patient assessments. Future research should validate whether patient or physician assessments have higher predictive validity of frailty.

ONLINE GROUP EXERCISES FOR OLDER ADULTS: RANDOMIZED CONTROLLED TRIALS TO STUDY ADHERENCE AND EFFECTS

F. Casati¹, M. Baez¹, S. Nikitina^{2,1}, 1. *University of Trento, Trento, Italy*, 2. *Tomsk Polytechnic University, Tomsk, Russian Federation*

Intervention programs to promote physical activity in older adults, either in group or home settings, have shown equivalent health outcomes but different results when considering adherence. Group-based interventions seem to achieve higher participation in the long-term. However, there are many factors that can make of group exercises a challenging setting for older adults. A major one, due to the heterogeneity of this particular population, is the difference in the level of skills. In this paper we report on the physical, psychological and social wellbeing as well as on the adherence outcomes of a technology-based intervention that enable online group exercises in older adults with different levels of skills.

A total of 122 older adults over 65 followed a personalized exercise program based on the OTAGO program for fall prevention, for a period of eight weeks. Participants could join online group exercises using a tablet-based application. Participants were assigned to study groups corresponding to technologies enabling different degrees of virtual group exercising and social interactions, and equipped with sensors detecting physical activity. Pre- and post-measurements were taken to analyze adherence, behavior change, and the physical, psychological and social wellbeing outcomes.

After the training program there were improvements in all groups in terms of physical outcomes, but the group with technology for virtual group exercising showed a significant and large positive difference in terms of adherence to the training program. In addition, this group showed a higher use of the process of behavior change, suggesting an effect of the persuasion strategies.

NEW COMMUNICATION TECHNOLOGIES FOR ENGAGING OLDER PATIENTS, FAMILIES, AND CAREGIVERS IN HEALTHCARE

L. McDonald¹, R. Burton¹, A. Lombardo¹, R.M. Mirza¹, V. Iafolla², C. Klinger¹, B. Hollister¹, 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *University of Alberta, Edmonton, Alberta, Canada*

New communication technologies—such as the Internet, social media applications, mobile and “smart” phones—can facilitate patients, families and caregivers’ access and use of health information and navigation through the healthcare system. This scoping review mapped the literature on new communication technologies to engage older adults, their caregivers, and families in the healthcare system. The review identified types of technologies, how they are used, outcomes, strengths, weaknesses, and challenges. Peer-reviewed and grey literature was searched for empirical studies published between January 2002 and December 2014. Three reviewers reviewed the abstracts for inclusion. Articles were included if they focused on older adults (55+ years of age) and involved a “new” communication technology that facilitated an engagement with the healthcare system. 69 articles were identified as appropriate for inclusion. Overall findings indicate that various new communication technologies (i.e. e-health records, email and smartphone apps) can be used to improve engagement with the healthcare

system, even amongst frail older adults. Users’ concerns with using new communication technologies included design, usability, and lack of experience. There is a gap in the literature concerning social media applications and how technology might influence and/or improve the caregiving experience. These findings suggest that training is an important component for introducing technology use in older patients, caregivers and families. While new communication technologies are a viable option for improving engagement with healthcare systems, older adults’ particular health needs must be considered for effective uptake and usage of these technologies.

SESSION 5255 (SYMPOSIUM)

RESOURCE CENTERS ON MINORITY AGING: STATE-OF-THE-ART RESEARCH

Chair: S.P. Wallace, *RCMAR National Coordinating Center @ UCLA, Los Angeles, California*

Health disparities between elders of color and non-Hispanic whites are well documented and their elimination continues to be a public health and policy priority. Promoting state of the art research in reducing these disparities is the goal of the the Resource Centers for Minority Aging Research (RCMAR) network, a NIH/NIA-funded program that provides mentoring and career support for junior faculty (RCMAR Scholars) engaged in minority aging research. This session highlights recent research from selected RCMAR Scholars that is pushing the field forward in identifying sources of disparities and interventions to reduce them.

PSYCHOPHYSIOLOGICAL WELL-BEING AMONG AGING AFRICAN AMERICANS: A LATENT CLASS ANALYSIS

C.S. Thomas¹, K. Whitfield², R.J. Thorpe³, 1. *University of California, Los Angeles, Los Angeles, California*, 2. *Wayne State University, Detroit, Michigan*, 3. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Psychopathology and chronic physical health conditions often co-occur among aging populations. Yet African Americans generally report more physical than mental health problems. This study examined social patterns in psychophysiological well-being among African Americans. Analyses were based on 697 individuals ages 22 to 92 in the Carolina African American Twin Study of Aging. Outcomes assessed include depressive symptoms (CES-D), life satisfaction, hypertension, and body mass index. Analyses identified three latent classes (Entropy²=0.65; AIC=136.12; Adjusted-BIC=176.43): (1) good physical/poor mental health (34%), (2) fair physical/good mental health (50%), and (3) poor physical/mental health (16%). Health status varied significantly by sociodemographic characteristics; younger African Americans had higher risk of poor mental/good physical health ($p<0.001$), while poor mental/physical health was associated with older age ($p<0.001$). Study findings demonstrate social patterns in psychophysiological well-being and suggest that the co-occurrence of physical/mental health problems are more prevalent in later life among African Americans.

BIOBEHAVIORAL FACTORS AND SELF-RATED HEALTH IN AFRICAN AMERICAN MEN: NHANES 2009–2010

L.T. Lee¹, P. Bowen¹, G. McCaskill^{2,3}, O.J. Clay^{4,1}, 1. *Acute, Chronic and Continuing Care, The University of Alabama at Birmingham, Birmingham, Alabama*, 2. *Birmingham/Atlanta Geriatric Research, Education, and Clinical Center, Birmingham, Alabama*, 3. *Birmingham VA Medical Center, Birmingham, Alabama*, 4. *Department of Psychology, Birmingham, Alabama*

Self-rated health is a predictor of health. Men with low self-rated health, and diabetes or psychological distress have an increased risk of mortality. This study assessed the relationships of diabetes, depressive symptoms, and physical activity with self-rated health.

Investigators used 2009 – 2010 NHANES data (survey measures of demographics, physical activity, mental and physical health, and perceived health) and participants were 45 years and older. Covariate-adjusted multiple linear regression was used to assess associations of self-rated health, diabetes, depressive symptoms, and physical activity.

Mean age (n=270) was 60.17 ± 9.36 years. Thirty percent (n=81) had low self-rated health and 27% had diabetes. Fewer days of vigorous recreational activities, reporting high levels of depressive symptoms, and diabetes were each associated with lower levels of self-rated health, p 's < .05.

Findings suggest the importance of interventions that target diabetes, depressive symptoms, and physical inactivity to improve self-rated health among this subset of men.

DIABETES EDUCATION AND INTERGENERATIONAL TECHNOLOGY TRANSFER

C. Senteio^{1,2}, D. Hershey², T. Campbell³, 1. *Library and Information Science, Rutgers University School of Communication and Information, New Brunswick, New Jersey*, 2. *Michigan State University, East Lansing, Michigan*, 3. *YOUR Center, Flint, Michigan*

We will describe how the implementation of an intergenerational diabetes and technology knowledge transfer program, developed from a proven intervention for HIV/AIDS, resulted in: 1) increased health literacy and self-efficacy for diabetes self-management (DSM), and 2) intergenerational technology knowledge transfer to support DSM. There are 2 groups of participants: 1) African Americans aged 65 or older diagnosed with type 2 diabetes and, 2) adolescents aged 18 – 25 connected to the diabetic participants via family or social-relationships. The 2 project sites were located in Flint and Detroit, Michigan.

We describe the current level of digital knowledge, technology readiness, and self-efficacy for African Americans aged 65 or older, and the impact adolescents have on African American elders' perceptions of relevance, knowledge, and self-efficacy concerning digital skills, access, and resources that can support DSM. We target a very important research problem, addressing health disparities by enhancing DSM skills via intergenerational technology transfer.

CULTIVATING LIFE IN A REVITALIZING CITY: GARDENS AND HEALTH AMONG OLDER AFRICAN AMERICANS IN DETROIT

J. Robbins-Ruszkowski, *Institute of Gerontology and Department of Anthropology, Wayne State University, Detroit, Michigan*

Gardening can promote physical, social, and emotional wellbeing for older adults in varied circumstances. Additionally, connections to place are important for wellbeing in later life, but can be threatened by transformations in the built environment. Several direct pathways from gardening to health may exist. Gardens can improve nutrition, bolster a sense of wellness, create and strengthen social connections, and transform urban landscapes. In contexts of urban structural inequality like Detroit, gardens have potential to transform bodies, persons, communities, cities, and broader polities. Indeed, gardening can be a medium for enacting self-efficacy and empowerment for African Americans. However, research has not yet focused on 1) the late-life-specific dimensions of urban gardening, or 2) how historical and political dimensions of place contribute to wellbeing in late life. In this presentation I will report on preliminary findings from an ethnographic pilot study of gardening among older African Americans in Detroit.

MEN LACKING A CAREGIVER HAVE GREATER RISK OF LONG-TERM NURSING HOME PLACEMENT AFTER STROKE

J. Blackburn¹, K. Albright², W.E. Haley⁵, V. Howard¹, D.L. Roth⁴, M.M. Safford³, M.L. Kilgore¹, 1. *The University of Alabama at Birmingham School of Public Health, Birmingham, Alabama*, 2. *Geriatric Research, Education and Clinical Center (GRECC) Birmingham VA Medical Center, Birmingham, Alabama*, 3. *Division of General Internal Medicine, Weill Cornell Medical College, New York, New York*, 4. *Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland*, 5. *University of South Florida School of Aging Studies, Tampa, Florida*

It remains unclear whether racial differences in caregiving predicts nursing home placement (NHP). Within the REasons for Geographic and Racial Disparities in Stroke (REGARDS) Study linked to Medicare claims, caregiver availability was measured by asking, "If you had a serious illness or became disabled, do you have someone who would be able to provide care for you on an on-going basis?" NHP was determined using a validated algorithm and risk estimated using adjusted Cox regression. Among 703 beneficiaries (43% black) with stroke from 2004–2012, NHP occurred for 16%. Lacking a caregiver affected 28% with NHP, resulting in a 1.7 hazard ratio (HR) (95% CI 1.1–2.6). Low-income and lacking caregivers had greater risk, HR 2.8 (95% CI 1.4–5.5). Blacks were twice as likely low income (38% vs 17%, $r = .28$, $p < .0001$). Caregivers and income are jointly important factors of NHP contributing to care disparities between blacks and whites.

SESSION 5260 (SYMPOSIUM)**COMMUNITY ENGAGED MODELS TO ENHANCE PHYSICAL AND SOCIAL DIMENSIONS OF HEALTH IN OLDER ADULTS**

Chair: K. Khan, *University of British Columbia, Vancouver, British Columbia, Canada*

In Canada, older adults will soon outnumber children, and there will be a greater increase in the proportion of adults over age 80 than any other age group. Maintaining one's mobility is considered the best guarantee of older adults being able to cope and remain in their homes and communities. There is clear evidence that neighbourhoods, communities and social networks where older adults live, directly affect their mobility and health.

In this panel presentation, we draw on our community based research across four interconnected programs of inquiry to 1: highlight the need to move beyond the 'instrumental/functional' understanding of mobility to explore what conveys meaning for older people, particularly in public urban environments; 2: describe the physical activity implications of a newly developed Greenway among older adults living in a highly walkable urban environment; 3: emphasize the importance of evaluating implementation of a physical activity intervention delivered at-scale across BC, and 4: describe the impact of a scaled-up physical activity intervention on dimensions of older adults' physical and social health. This session will be of particular interest to those who work with an aging population and social and urban planners who work across the age spectrum to design inclusive communities for people of all abilities. To animate our discussion we will use a series of short (2–3 minute) video vignettes (produced by our team) to foreground the voices and experiences of older adults.

"IT MAKES YOUR LIFE WORTHWHILE, IT GIVES YOU A PURPOSE IN LIVING": MEANINGFUL MOBILITY EXPERIENCES

T. Franke^{1,2}, J. Sims-Gould^{1,2}, M. Winters^{3,2}, H. Chaudhury³, H.A. McKay^{1,2}, 1. *University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Centre for Hip Health and Mobility, Vancouver, British Columbia, Canada*, 3. *Simon Fraser University, Vancouver, British Columbia, Canada*

In the ageing literature, mobility is often aligned most closely with physical movement while the relation between older adult's beliefs, attitudes, emotions and preferences and mobility are largely unexplored. To address this, we conducted a constructivist grounded theory study to explore what conveys meaning and motivation for older adults to engage in active forms of mobility. We conducted 24 qualitative in-depth interviews with 6 highly active, low-income community (urban) dwelling older adults across 4 years. Active forms of mobility were facilitated by participant's perceived benefit of physical movement, desire to establish control of the aging process and maintain independence, engagement in meaningful activities and affordability of transportation, social activities and daily needs (e.g. food). In conclusion, our study extends previous research to highlight

the crucial role that older adults' psychological and social dispositions play in facilitating active forms of mobility.

CHANGES IN PHYSICAL ACTIVITY AMONG OLDER ADULTS AFTER A NEW GREENWAY DEVELOPMENT IN VANCOUVER, BC

C. Pugh^{1,2}, J. Hirsch^{4,2}, C. Voss³, J. Sims-Gould^{3,2}, S. Lear¹, H.A. McKay^{3,2}, M. Winters^{1,2}, 1. *Simon Fraser University, Vancouver, British Columbia, Canada*, 2. *Centre for Hip Health and Mobility, Vancouver, British Columbia, Canada*, 3. *University of British Columbia, Vancouver, British Columbia, Canada*, 4. *University of North Carolina, Chapel Hill, North Carolina*

Supportive built environments that promote walking can increase physical activity (PA), yet little work leverages construction of new infrastructure to examine changes in PA. We acquired GPS and accelerometry data from older adult residents (≥ 60 years) of the Active Streets, Active People study ($n=121$). We measured average change between 2012 and 2014 in transportation-related PA, after the 2013 development of the Comox-Helmcken Greenway, a 2 km corridor in downtown Vancouver. Number of trips along the Greenway and a nearby street remained constant (10 trips/week on the Greenway; 9 trips/week on nearby street), yet the amount of PA declined both along the Greenway and the control street (-35 min/week). However, among those 70–74 years, overall PA increased. Declines may represent age-related decreases in PA or a lag between infrastructure and adaptive behaviour changes. Our analysis provides insight into the nuanced ways that a Greenway encourages Vancouver's oldest residents to maintain PA.

IMPLEMENTATION MATTERS: SCALE-UP OF AN OLDER ADULT PHYSICAL ACTIVITY MODEL

H.A. McKay^{1,2}, J. Sims-Gould^{1,2}, L. Nettlefold^{1,2}, C. Hoy^{1,2}, A. Bauman³, 1. *University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Centre for Hip Health and Mobility, Vancouver, British Columbia, Canada*, 3. *University of Sydney, Sydney, New South Wales, Australia*

To improve the health of populations, effective interventions from research settings must be implemented at scale. Further, physical activity reduces the risk of chronic disease and improves older adult health. Despite this, we know little about delivery of physical activity interventions at scale. Thus, with key partners we developed, implemented and assessed an evidence-based intervention (Choose to Move; CTM) that aimed to increase physical activity and social connectedness of low active older adults across BC.

We describe our conceptual framework for implementation and evaluation of CTM at scale and share findings from our mixed methods implementation evaluation, with a focus on delivery partners. At baseline for decision makers at delivery partner organizations (semi-structured interviews); funding, relationships and infrastructure were perceived as key facilitators to delivering CTM at scale. Choose to Move has potential to be delivered more broadly as a feasible, scalable model for community-wide physical activity among older adults.

IMPACT OF A PHYSICAL ACTIVITY INTERVENTION ON PHYSICAL AND SOCIAL DIMENSIONS OF OLDER ADULTS' HEALTH

L. Nettlefold^{1,2}, J. Sims-Gould^{1,2}, C. Hoy^{1,2}, A. Bauman³, H.A. McKay^{1,2}, 1. *University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Centre for Hip Health and Mobility, Vancouver, British Columbia, Canada*, 3. *University of Sydney, Sydney, New South Wales, Australia*

Despite the many benefits of physical activity (PA), 85% of older adults in Canada do not meet PA guidelines.

With community partners, we implemented a scalable, activity coach supported, evidence- and choice-based PA intervention (Choose to Move (CTM)) for low active (self-identified or <150 mins PA/wk) older adults (age>65 y). CTM supports the older adult priority within British Columbia's PA strategy.

We conducted a 3-month pre-post evaluation of cycle 1 delivery of CTM at scale across BC. We assessed PA and social connectedness (loneliness, social exclusion and interaction) by questionnaire. We found that participants (n=51) were significantly more active (mean +2.2±2.5 days/wk) following the intervention. Social exclusion (n=53) did not change; however, both loneliness and social interaction improved slightly. In conclusion, a choice-based model of PA designed for scalability and delivered at scale may be one strategy to enhance PA and social connectedness in previously low active older adults.

SESSION 5265 (PAPER)

DEMENTIA CARE AND CAREGIVERS

BARRIERS AND FACILITATORS IN PREPARING CAREGIVERS FOR THE DEATH OF AN ELDER WITH DEMENTIA

C.A. Hovland-Scafe¹, B.J. Kramer², 1. *Social Work, Cleveland State University, Cleveland, Ohio*, 2. *University of Wisconsin-Madison, Madison, Wisconsin*

For caregivers the dying process and the death of individuals with dementia is particularly difficult due to the uncertainty surrounding the process of dying and the timing of death. Due to the ambiguous nature and uncertain dying trajectory of dementia, it is likely that caregivers find themselves unprepared for the death, putting them at risk for increased symptoms of distress. This study sought to address the gaps that exist in our understanding of the barriers and facilitators of preparedness. Results reported here are from a qualitative study in which over a twelve month period, I conducted 30 in-depth, one-time qualitative interviews with bereaved caregivers of family members age sixty-five and older who died with a dementia-related diagnosis. In this study, three central themes were emphasized and identified: *barriers to preparedness; welcoming death; and facilitators of preparedness*. These findings highlight the importance for healthcare professionals to ensure that a person with dementia is as physically and emotionally comfortable as possible, and that the caregiver is supported and validated in their experience of the decline of the person with dementia. Furthermore, these results suggest that in preparing a caregiver for the death, it may be helpful for healthcare professionals to assess

caregivers' internal/external supports, include a faith-based support assessment, and ascertain their desire/ability to be self-directed in seeking out information and resources. The results of this study indicate a number of potential implications for the development, implementation, and testing of interventions for caregivers of persons with dementia at the end of life.

AGITATION, AGGRESSION, AND REJECTION OF CARE IN RESIDENTIAL CARE FACILITY RESIDENTS WITH DEMENTIA

S. Choi¹, C. Budhathoki¹, L. Volicer², L.N. Gitlin¹, 1. *Johns Hopkins University School of Nursing, Baltimore, Maryland*, 2. *University of South Florida, School of Aging Studies, Tampa, Florida*

Objectives: To estimate prevalence and co-occurrence of agitation, aggression, and rejection of care in persons with dementia (PwDs) in USA residential care facilities.

Methods: Cross-sectional analysis of the 2010 National Survey of Residential Care Facilities involving 3,434 residents with dementia. Behavioral symptoms data for past 30 days were obtained from interviews with staff. Presence of behaviors was based on the recorded value for behavioral items on the survey. PwDs exhibiting 'being excessively noisy' and/or 'moving aimlessly' were considered agitated. Those exhibiting 'destroying property', 'verbally threatening other persons', or 'being physically aggressive towards other persons' were considered aggressive. 'Refusing to take prescribed medicines' and/or 'refusing to bathe' was considered rejection of care.

Results: Of 3,434 PwDs, 55.2% (n=1,895) exhibited one of the three behaviors in previous month, with 40.3% exhibiting agitation, 21.7% aggression, and 35.9% rejection of care. Prevalence of aggression (1.7%, n=59) occurring alone was much lower than prevalence of agitation alone (12.8%, n=438) and rejection of care alone (10.8%, n=354). Among PwDs exhibiting any behavior, behaviors mostly co-occurred with 6.9% (n=131) exhibiting agitation and aggression, 17.3% (n=327) agitation and rejection of care, and 3.7% (n=70) aggression and rejection of care and 25.5% (n=483) exhibiting all three behaviors.

Conclusion: These are the first national estimates for agitation, aggression, and rejection of care in PwDs living in residential care facilities, indicating a high prevalence and co-occurrence. Identifying subgroups of co-occurring behaviors may facilitate developing effective treatment strategies for these behaviors as the context in which they occur may be different.

AN INTEGRATIVE MODEL PREDICTING HEALTH OUTCOMES OF FAMILY CAREGIVERS OF PERSONS WITH DEMENTIA

D. Yu, *The Chinese University of Hong Kong, Hong Kong, China*

Family caregiving for dementia is burdensome and challenging, and leads to poor caregivers' health. Research in this field has adopted the stress appraisal and coping process to explain the associated health impact. Little attention has been paid to how such process evolves synergistically with the intrapsychic, interpersonal and contextual factors in predicting caregiver's health. Integrating theories in

stress appraisal and coping, ecological system and human development, this study developed and tested an integrative model to precisely explain the caregivers' health in the context of dementia. A total of 400 family caregivers of PWD (mean age =58.2±12.9) were interviewed with validated questionnaires. Path analysis indicated that the effects of caregiving stressor, contextual (familism, social support) interpersonal (dyadic relationship) and intrapsychic factors (sense of coherence, neuroticism) on caregivers' health were mediated by stress appraisal and coping process. Caregivers who handled more dementia symptoms ($\beta=0.195$, $p<0.001$), with poorer dyadic ($\beta=0.326$, $p<0.001$) and social support ($\beta=-0.180$, $p<0.001$), and be more neurotic ($\beta=0.205$, $p<0.001$) perceived the caregiving situation as more burdensome, whereas those with better dyadic relationship ($\beta=-0.304$, $p<0.001$) perceived more caregiving gain. Caregivers with a stronger sense of coherence ($\beta=0.154$, $p<0.01$), and less strong belief on familism ($\beta=-0.171$, $p<0.001$) were more likely to use active coping. Active coping also mediated the effects of caregiving gain and burden, and had significantly positive direct effects on both physical ($\beta=0.285$, $p<0.001$) and mental health ($\beta=0.542$, $p<0.001$). based on the findings, various recommendations on service and theory development in the context of dementia caregiving were proposed.

WHY AREN'T PEOPLE WITH YOUNG ONSET DEMENTIA AND THEIR CAREGIVERS USING FORMAL SERVICES?

M. Cations¹, A. Withall¹, F. White², J. Trollor¹, C. Loy², P. Gonski¹, H. Brodaty¹, B. Draper¹, 1. UNSW Australia, Sydney, South Australia, Australia, 2. University of Sydney, Sydney, New South Wales, Australia

Despite reporting high levels of burden, people with young onset dementia (YOD) and their caregivers underuse formal services. Whether barriers to use are similar to those for older people are unknown. The aim of this mixed-methods study was to assess both patient/caregiver-related and service-specific/contextual barriers to service use in YOD, and establish recommendations for service design.

86 people with YOD and/or caregivers reported use of a list of services, and reasons for non-use. Quantitative data included dementia severity, functional impairment, behavioural and psychological symptoms of dementia (BPSD), caregiver burden and social network, and informal care use. Qualitative structured interview and focus group responses were pooled and analysed for themes.

Although at least one service was recommended to most participants (96.8%), 66.7% chose not to use one or more of these. Service non-use was related to social isolation and BPSD (both $p<0.05$), but not to age, sex, language, severity of impairment, functional disability, caregiver burden, or informal care. The reported barriers to service use were primarily YOD-specific, such as the service age limits or availability outside of working hours. Participants reported that services were inflexible and did not provide meaningful engagement. Being grouped with older clients had a negative psychological impact for many.

Barriers to service use in YOD are different to those most important to older people with dementia, and were often specifically related to age. Policy makers and service designers

must allow for flexible delivery aimed at meaningful engagement for people with YOD.

ACTIVITIES OF DAILY LIVING AND BEHAVIORAL AND PSYCHOLOGICAL SYMPTOMS OF DEMENTIA

A. Arai¹, T. Ozaki², Y. Katsumata³, 1. Dept. Health Care Policy, Hokkaido University Graduate School of Medicine, Sapporo, Hokkaido, Japan, 2. Hokkaido University School of Medicine, Sapporo, Hokkaido, Japan, 3. College of Public Health, University of Kentucky, Lexington, Kentucky

Behavioral and psychological symptoms of dementia (BPSD) are a well-known risk factor for an increased burden of care for staff in long-term care facilities and family caregivers. We conducted a cross-sectional survey of older residents with dementia or similar symptoms ($n=312$) in 2015 at 10 selected long-term care facilities in Hokkaido, Japan. Data were collected with a questionnaire completed by care staff. The questionnaire included a standardized scale to assess activities of daily living (ADL), cognitive function (CF), and BPSD. Our previous study demonstrated that an imbalance between ADL and CF was associated with BPSD among residents in long-term care facilities. In this study, we investigated the association between ADL and BPSD among facility residents by CF, based on high and low CF groups. The prevalence of BPSD was calculated as: 1) having any symptoms (AS); 2) having only behavioral symptoms (BS); 3) having only psychological symptoms (PS); and 4) having both behavioral and psychological symptoms (BPS). Of the 312 residents with dementia or similar symptoms, the prevalence of AS was 64%, BS was 21%, PS was 15%, and BPS was 29%. Among residents with high CF, functional decline in grooming was associated with having PS. In contrast, among those with low CF, maintenance of feeding was associated with having PS. Our findings suggest that it is important to support residents' ADL functioning as their CF changes, to help manage BPSD in long-term care facilities.

SESSION 5270 (SYMPOSIUM)

SUPPORTING AT-RISK OLDER PERSONS IN SWEDISH, JAPANESE, AND U.S. COMMUNITIES: SOCIAL TIES AND HEALTH

Chair: M.E. McCall, Samuel Merritt University, Oakland, California

In this symposium, a group of researchers from Japan, Sweden and the United States present work examining various types of social networks and informal care supports for various groups of at-risk seniors. These include: the relationship between social participation and longevity in very-old community-residing seniors in Japan; those with varying levels of cognitive impairments in Sweden who are at risk of nursing home admission, community-dwelling elders who live alone in Sweden but participate in neighborhood meeting places who are at risk for social isolation; and social support through community meeting places for older persons in south Louisiana since Hurricane Katrina. As all of these societies age, and within environments of shrinking economic resources, the role of informal supports for older persons at risk is a critical component of maintaining independence and dignity of persons in late life. This symposium takes a variety

of cultural and need settings and examines them through a common lens of social ties, utilizing the theory of social networks and social ties by Mark Granovetter. We introduce the concept of thin ties, and how informal but regular connections with others can prevent loneliness, provide meaning, and delay nursing home admissions. Results from both quantitative analyses (n=177 of cognitively impaired persons in Sweden; n=1,500+ in Japan) and qualitative (interview studies in Sweden and the United States) demonstrate the important impact of thin, but significant, social ties on both longevity and quality of life among older persons at risk.

THIN TIES AND SOCIAL CONTEXT: THE IMPORTANCE OF MEETING PLACES FOR OLDER PERSONS

C. Henning, *Jonkoping University, Jonkoping, Sweden*

Granovetter's theory of social ties discusses strong ties, weak ties, and absent ties. In a study in Tröllhattan, Sweden, the concept of thin ties was established. Through interviews and focus groups, the outcomes for older persons visiting a local meeting place included creating a structure for their everyday life, the opportunity for functional and rehabilitative activities, a sense of social cohesion and connectedness, and the significance of this in providing meaning for their lives. Additional data from visitors and volunteers, as well as observations of the meeting place and its participants, showed that while a person's home may be the source for thick ties, as these diminish in late life, the role of thin ties, which can be facilitated through the creation of meeting places in communities, could prevent social isolation and the associated decline in physical and mental health functioning that can result from loneliness and lack of connectedness.

MEETING PLACES AS A RESOURCE IN POST-TRAUMATIC CITIES: HURRICANE KATRINA'S AFTERMATH

K. Hedman, *Jonkoping University, Jonkoping, Sweden*

In this ongoing study, older residents in areas of southern Louisiana have been followed since 2005, when Hurricane Katrina hit the United States and devastated a massive number of communities. Interviews and program evaluations were conducted. For both people who left their homes and returned later or never returned, and those who did not leave their communities after the storm, meeting places and the establishment of various ties were found to be critical components of survival, and the ability to recover and process the traumatic events and their consequences. In the context

of models of emergency response management, the role of establishing meetings places and facilitating the development of social ties within a community are discussed.

SUPPORT FOR PERSONS WITH VARIED COGNITIVE FUNCTIONS: FORMAL AND INFORMAL TIES AND SUPPORT

C. Bökberg, *Lund University, Lund, Sweden*

Among persons with dementia at risk of nursing home admission and with various cognitive functions, structured interviews were conducted about functional capacities, amount of utilized formal and informal care and ties. Persons with dementia at risk of nursing home admission (n=177) were divided in two groups regarding cognitive function and compared across age, living circumstances and various levels of support need and mental status, as well as utilization of formal and informal support. Results showed that the group with more cognitive impairment was significantly younger, more often cohabitating, more dependent and had more neuropsychiatric symptoms. Regarding informal care and service, next of kin provided significantly more help and supervision regarding time and amount of days to the group more cognitive impaired. Improvements are desired to adapt formal care and service meeting increased needs in persons with dementia and reducing burden of next of kin

SOCIAL INTERACTION, SOCIAL TIES, AND LONGEVITY IN A COMMUNITY-DWELLING SAMPLE IN JAPAN

T. Anme, *Tsukuba University, Tsukuba, Japan*

Longitudinal studies of a village in Japan that has been followed for over 20 years provide data to analyze the relationship between various types of social interaction and participation and social ties, and longevity and functioning among older residents in a small fishing village (n=@5000) in Japan. Data have been collected every three years in this village for over 20 years. Interviews and assessments include physical and mental health conditions assessments, as well as data about level and types of social interaction and participation (from telephone contacts to participation in local community meetings). Data have shown over time that social interaction is positively related to longevity and life satisfaction. More recent analyses focus on various types of social activities and how those change as one ages. While the types of activities may change (e.g., due to physical limitations), the simple element of being connected, even through thin ties, remains important.
