

Abstracts

International Association of Gerontology and Geriatrics
21st World Congress of Gerontology and Geriatrics
July 23-27, 2017
San Francisco, California, USA

Abstracts are arranged numerically by session and in the order of presentation within each session.

SESSION 5 (SYMPOSIUM)

ENHANCING RECOGNITION OF GERIATRIC SYNDROMES BY PRIMARY CARE HEALTH PROFESSIONALS

Chair: J.E. Morley, *Saint Louis University, St. Louis, Missouri*

Co-Chair: H. Arai, *National Center for Geriatrics and Gerontology, Nagoya, Japan*

B. Vellas, *CHU Toulouse, Toulouse, France*

There is a shortage of geriatricians around the world. In the USA the number of geriatricians has grown smaller. This is in the face of the increased aging of the baby boomer population. Many primary care health professionals have had limited training in geriatrics. There is increasing understanding that early recognition of the new geriatric “giants” – frailty, sarcopenia, anorexia of aging and cognitive dysfunction – can lead to a decrease in disability and hospitalization with appropriate management. This has led to the development of a number of brief comprehensive screening processes for geriatric conditions. Examples of these include the Easy Care in the United Kingdom which has been widely disseminated; the Kihon Checklist (KCL) in Japan; the Gerontopole screen tool in Toulouse, and the Rapid Geriatric Assessment that has been developed as part of the Medicare Wellness Visit in Missouri. Professor Arai will discuss experience with the Kihon Checklist which is used by the Japanese Long-Term Care Insurance system. He will focus on how this index can be used to classify person into robust, frail and prefrail and its predictive value. He will also provide evidence of an exercise intervention for improving outcomes. Professor Vellas will explain the short Gerontopole screening questionnaire used by family practitioners as a tool to find persons in need of a referral to geriatricians. He will report on the outcomes of 1,108 older patients (mean age 82.5) that were screened by their family physicians. The necessary interventions in this group included medical conditions with a new intervention (32%), nutritional intervention (62%), physical activity intervention (57%) and a social intervention (26%). Professor Morley will describe the RGA consisting of 4 rapid screens – the FRAIL for frailty, SARC-F for sarcopenia, SNAQ for anorexia of aging and Rapid Cognitive Screen for MCI and dementia. These tests have been validated in from 2 to 5 continents and are available in up to 30 languages. Over 2,000 persons have undergone the test. Results show that both screening and case finding produce similar deficits. A computer assisted screening and management program has been developed and in addition handouts for lifestyle

intervention are available. These examples suggest that high quality geriatric screening can be carried out by primary care health professionals with positive outcomes.

RAPID GERIATRIC ASSESSMENT

J.E. Morley, *Saint Louis University, St. Louis, Missouri*

The Rapid Geriatric Assessment (RGA) is a tool developed to quickly identify four geriatric syndromes viz frailty, sarcopenia, anorexia of aging and cognitive dysfunction as well as to enquire if the person has advanced directives. It was developed to be used in conjunction with the Annual Medicare Wellness Visit. It takes less than 4 minutes to administer.

The components of the RGA are the FRAIL for frailty, SARC-F for sarcopenia, SNAQ for anorexia of aging and the Rapid Cognitive Screen which is derived from the St. Louis University Mental Status Examination. All the screening tools have been validated in multiple continents and are available in up to 30 languages.

We have ongoing educational interventions in rural counties, inner city clinics and academic centers. To date over 2,000 persons have been evaluated either as case finding in physicians’ offices or screening in the community. Preliminary results show the prevalence of frailty to be 23%; sarcopenia 32.8%; Anorexia 34.7%, MCI 19.3% and dementia 23.9%. In a group of diabetics both the SARC-F and FRAIL were highly predictive of new disability and hospitalization.

In addition to the screening tool we have developed a computerized assessment and management program for physicians’ offices. This program specifically provides a diagnostic plan for each component of the FRAIL, and diagnostic and management programs for the other syndromes. This approach is well accepted by primary care physicians.

We believe that this is a simple intervention secondary prevention program that will enhance the health of older persons.

FAMILY PHYSICIAN SCREENING FOR GERIATRIC SYNDROMES

B. Vellas, *CHU Toulouse, Toulouse, France*

The GFST (Gerontopole Frailty Screening Tool) has been developed to help health care professional to target older adults at risk for frailty. The GFST does not aim to measure frailty, but only to detect those at risk to be frail, to refer them to a frailty clinic for more precise assessment of frailty, and to look after the cause of frailty to propose targeted interventions.

The GFST includes few questions: is your patient living alone, had involuntary weight loss in the past 3 months, fatigability, mobility difficulty, memory complaints, slow

gait speed (see fig 1)? After that, most importantly the GFST asks in your own clinical opinion, do you feel that your patient is frail and at risk for further disabilities? If the health professional feels it, the subject must be referred to a frailty or geriatric clinic for further assessment. It was found that 95% of the subjects referred to the Gerontopole frailty clinic (n=1108) using the GFST were frail or pre-frail.

THE KIHON CHECKLIST: IS IT A RELIABLE ASSESSMENT OF FRAILTY?

H. Arai, *National Center for Geriatrics and Gerontology, Obu, Japan*

The Japanese Long-term Care Insurance (LTCI) system classifies older adults as vulnerable, dependent or independent. According to the LTCI system's criteria, vulnerable older adults are community-dwelling people who are at high risk of becoming dependent in the near future, as identified through a health check-up questionnaire, the Kihon Checklist (KCL). This checklist is comprehensive for assessing physical, social, and mental functions of seniors' lives. Therefore, it is conceivable for us to use it for screening frailty in a clinical setting as well as in the community. Based on the total KCL scores we could classify older adults into 3 groups, robust, pre-frail and frail, with a significant predictive ability for adverse health outcomes, such as an incidence of dependency or mortality, in a population-based longitudinal observational study. We also found that higher KCL scores were associated with higher incidence of adverse health outcomes such as incident disability and mortality in older diabetic patients. Thus the KCL also can be easily administered by healthcare professionals and used to evaluate the effectiveness of interventions.

SESSION 10 (SYMPOSIUM)

DESIGN, RESULTS, AND IMPLEMENTATION OF A WHOLE PERSON INTERVENTION FOR LATE LIFE CARE

Chair: P. Bingham, *Allina Health, Minneapolis, Minnesota*
 Discussant: S. Schroeder, *University of California, San Francisco, California*

In the next decade and a half, communities in the US will care for the same number of individuals over the age of 65 as they have over the past combined nine decades. Seven in ten of these individuals will live with a progressive serious illness that will last not weeks but months to years. While traditional palliative care services provided through inpatient settings and community-based models have demonstrated positive impacts on symptom management and experiences of care, there exists a woefully small number of palliative trained providers to enable sufficient support for the growing population. The need for innovative, upstream palliative care models that can be deployed wide scale and sustainably is critical. A large healthcare delivery system in the upper Midwest has developed an innovative model—LifeCourse—to support patients facing advanced serious illness and their key friends and families. The model is being evaluated in partnership with 900 intervention and usual care patients and their key friends and family (total n=1,800). In an effort to close the widening gap between the production of positive research results from new interventions and

ultimate systematic implementation of those interventions, the community-based care system testing this approach has moved to rapid deployment of the model across its primary and specialty care service areas. This symposium will offer an overview of the development of the LifeCourse model, the components of the model, the results to date from the research trial, and lessons from the rapid deployment of LifeCourse across the healthcare system.

CREATING A WHOLE PERSON INTERVENTION FOR PATIENTS WITH SERIOUS ILLNESS AND THEIR CAREGIVERS

E.W. Anderson¹, S. Schellinger¹, K. White², M. Frazer¹, K. Radel¹, D. Elumba¹, J. Roberts¹, J. Blomberg¹, 1. *Allina Health, Minneapolis, Minnesota*, 2. *University of Minnesota, Minneapolis, Minnesota*

This presentation describes the LifeCourse intervention and the human-centered research approach used to create it. Meetings were conducted with 183 patients, caregivers, and care professionals who experienced and/or worked with serious illness to systematically gather perspectives on optimal care delivery for persons diagnosed with serious illness. Participant feedback was shaped into care components that attend to how illness is lived, the care relationship is experienced, and care is delivered. Care components guided creation of protocols for a trained lay healthcare worker who meets with patients and caregivers in their home, earlier in the patient's illness trajectory, to holistically understand the patient's experience and goals for living well, and to enhance supportive relationships in one's family, community, and health care teams. Drawing upon the experiences of those who have lived and worked with serious illness may yield an approach that more fully supports patients and caregivers so they can live well.

UTILIZATION, QUALITY OF LIFE, AND CARE EXPERIENCE OF PATIENTS IN LIFE COURSE

H. Britt¹, N. Shippee², T.P. Shippee², P. Mobley¹, K. Fernstrom¹, A. Jones¹, J. Taghon¹, C.L. Cain³, 1. *Allina Health, Minneapolis, Minnesota*, 2. *University of Minnesota, Minneapolis, Minnesota*, 3. *University of California, Los Angeles, California*

Based upon current data from 450 intervention and 448 comparison patients, we find a 25% reduction in inpatient days (p=0.003) and a 57% reduction in number of ICU stays (p=0.004) for intervention compared to usual care patients. Of deceased patients, 49% of those in the intervention group enrolled in hospice compared to 42% of usual care patients; median length of stay in hospice for intervention patients was 23 days, compared to 15.5 for usual care patients (p=0.05). Examination of quality of life (QOL) of patients enrolled in LifeCourse (using the FACIT-Pal) reveals consistently more positive QOL for intervention patients than comparison patients, especially in the emotional, functional and palliative domains and among patients with lower starting QOL values. An experience survey designed specifically for the longitudinal nature of LifeCourse reveals consistently more positive experience, both overall and across many experience domains, for intervention compared to usual care patients.

LIFE COURSE BEYOND RESEARCH: LEARNING THROUGH IMPLEMENTATION AND EVALUATION

P. Bingham, V. Anugwom, S. Curran, A. Hunt, M. Hutchison, S. Nelson, L. Sutter, A. Betzner, *Allina Health, Minneapolis, Minnesota*

Strong research results and supportive funding propelled leadership of a healthcare system to implement LifeCourse across multiple clinics and collaborating community sites. LifeCourse relies upon lay healthcare workers, called care guides. The implementing primary and specialty care clinics hired care guides to provide whole person care for clinic patients living with serious illness. During implementation, clinic leaders were solicited to be part of a team which met over several weeks to help prepare the clinics, hire the care guides, and champion LifeCourse. The program materials were adapted from the research intervention to support the specific patient population and clinic processes. In addition to following a detailed implementation strategy, an evaluation plan was created to measure the effectiveness and provide feedback on the process and outcomes. The presentation will describe the implementation and evaluation framework for systematic deployment and will summarize the successes and challenges of integrating research into practice.

SESSION 15 (PAPER)

FACTORS AND DECISION-MAKING AFFECTING POST-ACUTE CARE AND READMISSIONS

CARE TRANSITIONS: AN INTEGRATED MODEL OF CARE FOR ELDERLY PATIENTS AT HIGH RISK FOR READMISSIONS

U. Ohuabunwa^{1,2}, E. Johnson², J. Turner², Q. Jordan², S. Cruel², 1. *Emory University, Atlanta, Georgia*, 2. *Grady Hospital, Atlanta, Georgia*

The peri-discharge period constitutes a critical time for older adults. Several successful care transitions models entail the use of advanced practice nurses, often cost prohibitive. The role of non medical personnel such as community health workers (CHWs) in improving transitions of care has not been widely studied. We sought to determine the effectiveness of a care transitions model utilizing CHWs in reducing readmissions and emergency room visits (ERVs).

A patient care model evaluation was done using a pre and post intervention design with follow-up at 3, 6, 9 and 12 months. Eligible patients were at high risk for readmission or with up to 4 emergency room visits in 1 month. They participated in the model designed to provide the patients with self management skills, and the support of a CHW who assisted in coordination of their care and followed the patient for a period of 1 year post discharge, achieved through pre-discharge interdisciplinary team meetings, regular home visits, weekly phone contact, accompaniment to PCP appointments, support with transportation, and medications, self management education aimed at promoting independence and good health behaviors at the time of discharge from the program.

Main Outcome Measures were readmissions, ERVs, increased primary care utilization.

Of 126 patients enrolled in the study, 117 patients participated actively, 65% males; 35% females. There was a

reduction in ERVs in 83.9% of patients, reduction in readmissions in 76.6% of patients, increased primary care utilization with established PCPs in up to 86.6% of patients. There was also a 65% reduction in healthcare cost.

Use of non healthcare personnel such as community health workers during transitions of care may be helpful in reducing healthcare utilization and probably costs.

IMPLEMENTING AN ACUTE CARE FOR THE ELDERLY SERVICE IN AN URBAN SAFETY NET HOSPITAL

U. Ohuabunwa¹, J. Turner², K. Shah², J. Alexander², R. Walton Mouw², J. Brandi², S. Everett², 1. *Emory University, Atlanta, Georgia*, 2. *Grady Hospital, Atlanta, Georgia*

Background: Older adults who are hospitalized are prone to multiple hazards such as falls, delirium, pressure ulcers, malnutrition, hospital-acquired infections and functional decline resulting in institutionalization, and readmission to the hospital after discharge. Geriatric-focused models of inpatient care offer effective ways to transform inpatient care for older adults and have been shown to improve outcomes. The role of these models of care in urban safety net hospitals has not been reported. We sought to determine the effectiveness of an Acute Care for the Elderly Service at our safety net hospital established 9mos ago.

Project Setting is a 953 Bed academically affiliated safety net hospital.

Participants were older adults 75yrs and older or patients 65 years and older identified to have 1 or more geriatric syndromes.

All patients who met criteria were admitted to the ACE Service run by an interdisciplinary team constituting of a Geriatrician, Nurse Practitioner, Pharmacist, Dietitian, Case Management/ Social Work, Nursing Staff, Rehab personnel including PT, OT, ST, Team members reviewed the patients and made recommendations regarding the patient's care. The focus of the service was to manage the following aspects of patient care – cognition, mood, functional status, nutrition, medication safety, skin care, transitions of care, A team of volunteers from our Senior Services Division also focused on involving patients in individual and congregate functional and cognitive activities to help preserve cognition and functional status. Community Health Workers provided support regarding the patients transition to other care settings with their providing support and care coordination immediately pre-discharge and in the discharge care setting for a period of 6 months post discharge for patients meeting criteria.

Initial data show a significant improvement in delirium and cognition scores as measured by the Nudesc and Six Item screen scores, on admission compared to discharge. There was a drop in the Nudesc Scores by 14.9% at discharge compared to admission scores. There was also significant improvement in mobility scores for patients pre ACE intervention and post intervention., though there was some decline in the Katz and Lawton functional scores, There was also a positive response by the primary hospital teams in reducing the number of beers medications that the patient was taking.

An ACE service with its care processes is a useful mechanism to improve cognition, mobility and medication safety in hospitalized older adults in a safety net hospital

IMPROVING DECISION-MAKING AND OUTCOMES IN TRANSITIONS TO POST-ACUTE CARE FACILITIES

R.E. Burke¹, E. Whitfield², C. Levy², E. Hess², 1. *Research and Hospital Medicine Sections, Denver VA Medical Center, Denver, Colorado*, 2. *Denver VA Center of Innovation, Denver, Colorado*

The number of older adults discharged to post-acute care (PAC) facilities after hospitalization is increasing rapidly, but their clinical course is uncertain. We sought to identify prognostic factors linked to outcomes of older adults discharged to PAC using a retrospective analysis of the 2003–2009 Medicare Current Beneficiary Survey (MCBS), a nationally-representative survey of Medicare recipients matched with claims data. Community-dwelling adults age 65 and older who were hospitalized and discharged to a PAC facility were included. The primary outcome was a composite of events representing failure to return to the community, including death, readmission to the hospital, or remaining in a PAC facility 100 days post-hospital discharge. Of 1416 eligible patients, 510 (35.9%) did not return to the community. In multivariable analysis, the most important factors included the presence of dyspnea (OR 1.46; 95% CI 1.09–1.96), cognitive impairment (1.12; 1.02–1.24), use of antipsychotics (1.10; 1.04–1.17), number of physician visits in the PAC facility (1.09; 1.03–1.14), index hospital length of stay (1.02 per day; 1.01–1.03), PAC facility length of stay (0.99 per day; 0.98–0.99), and better functional status (0.80; 0.75–0.85). The c-statistic was 0.694. More than one-third of older adults discharged to PAC facilities are readmitted, die, or remain in the PAC facility 100 days post-discharge. Several factors that influence these outcomes may be modifiable. Their predictive value is similar to most readmission prediction models, which have been successfully used to target interventions to high-risk groups. These findings may serve as a starting point for better informing decision-making and improving outcomes.

GERIATRIC CO-MANAGEMENT FOR CARDIOLOGY PATIENTS IN THE HOSPITAL (G-COACH): DEVELOPMENT AND FEASIBILITY

M. Deschodt^{1,2,3}, B. Van Grootven¹, K. Milisen^{1,3}, J. Flamaing^{3,1}, 1. *KU Leuven, Leuven, Belgium*, 2. *University of Basel, Basel, Switzerland*, 3. *University Hospitals Leuven, Leuven, Belgium*

The need to explore innovative care models that are able to sustain or improve healthcare outcomes for older hospitalized adults is urging. G-COACH is a multi-phase mixed methods research project that aims to test the efficacy of a geriatric-cardio co-management model of care. Geriatric co-management is characterized by collaboration and shared decision-making between the interdisciplinary geriatric team and treating physician. The G-COACH project incorporates: 1) a systematic literature review; 2) a two-round international Delphi study to determine quality indicators; 3) model development based on local stakeholder involvement and 4) a pre-post intervention study to test the efficacy of a geriatric co-management intervention.

The systematic review and meta-analysis including 12 prospective experimental studies showed that geriatric co-management reduced overall length of stay (MD, -1.88 [95% CI, -2.44 - -1.33]) and resulted in a trend towards reduced in-hospital mortality (OR, 0.72 [95% CI, 0.50 - 1.03]). There

was no effect on the number of patients discharged home, post-discharge mortality and readmission rate. The Delphi study resulted in 8 structure, 7 process and 16 outcome indicators that 28 international experts found feasible and appropriate to evaluate geriatric co-management programs. Based on the information from the review and Delphi-study, a theoretical geriatric co-management intervention was designed. This theoretical model was adapted into a practical co-management program based on participant observation, focus groups, interviews and an observational pilot and feasibility study including 80 patients. Finally, the practical co-management program will be evaluated in a large pre-post intervention study including 170 participants in each cohort.

LATE MOBILIZATION IN ELDERLY SURGICAL PATIENTS PREDICTS READMISSION OR DEATH AFTER DISCHARGE

J.L. Pederson¹, R.S. Padwal^{2,3}, L. Warkentin¹, J. Holroyd-Leduc⁴, A. Wagg⁵, R.G. Khadaroo^{1,6}, 1. *Department of Surgery, Faculty of Medicine & Dentistry, University of Alberta, Edmonton, Alberta, Canada*, 2. *Division of General Internal Medicine, Faculty of Medicine & Dentistry, University of Alberta, Edmonton, Alberta, Canada*, 3. *Alberta Diabetes Institute, Edmonton, Alberta, Canada*, 4. *Faculty of Medicine, University of Calgary, Calgary, Alberta, Canada*, 5. *Capital Health Chair of Healthy Ageing, Department of Medicine, University of Alberta, Edmonton, Alberta, Canada*, 6. *Division of Critical Care Medicine, Faculty of Medicine & Dentistry, University of Alberta, Edmonton, Alberta, Canada*

Acute surgical services are increasingly treating seniors with complex care needs who are at high risk for hospital readmission and functional decline. Yet, the prognostic importance of early post-operative mobilization remains unclear. We investigated whether time to post-operative mobilization among older surgical patients predicts readmission or death. Mobilization after emergency abdominal surgery in a prospective cohort of patients aged ≥ 65 years requiring help pre-operatively with < 3 activities of daily living were followed after discharge from 2 Canadian tertiary-care hospitals. Late mobilization was defined as ≥ 36 hours following surgery. The primary outcome was 30-day all-cause readmission or death. Patients (N=306) had a mean age of 76 ± 7.7 years, 55% were women, 41% were vulnerable-to-moderately frail. Gallstones (23%), intestinal obstruction (21%), or hernia (17%) were the most common reasons for admission. Twenty-four percent were mobilized ≥ 36 hours after surgery. Late mobilized patients were more often readmitted or died within 30-days [19 (26%) vs 22 (10%), $p < 0.001$] and within 6-months [38 (51%) vs 64 (28%), $p < 0.001$], compared to early mobilized patients. Late mobilization remained associated with increased risk of readmission or death within 30-days [adjusted odds ratio (aOR) 2.50, 95%CI 1.16–5.40, $p = 0.02$] and at 6-months (aOR 1.85, 95%CI 0.99–3.5, $p = 0.055$) in multivariable logistic regression adjusting for age, sex, comorbidities, total medications, hemoglobin, and frailty. Late mobilization is common in elderly patients following emergency abdominal surgery and identifies heightened risk of readmission or death after discharge. Interventions targeted at early mobilization may decrease risk for adverse events in this vulnerable population.

SESSION 20 (PAPER)

UNDERSTANDING AND TREATING MEMORY LOSS AND DEMENTIA

COGNITIVE DECLINE AND ITS DETERMINANTS IN DIVERSE ETHNO-REGIONAL GROUPS: THE COSMIC COLLABORATION

P. Sachdev, 1. *Centre for Healthy Brain Ageing, School of Psychiatry, University of New South Wales, Sydney, New South Wales, Australia*, 2. *Neuropsychiatric Institute, Prince of Wales Hospital, Randwick, New South Wales, Australia*

The Cohort Studies of Memory in an International Consortium (COSMIC) (*BMC Neurol.* 2013 Nov 6;13:165) is a consortium of population-based longitudinal studies of ageing and dementia, which currently comprises 27 studies with >50,000 participants. The main objectives of COSMIC are to harmonise shared, non-identifiable data from cohort studies in older individuals (60+ years), and perform joint or mega-analyses using combined, harmonised data sets. An earlier project applied uniform criteria to the prevalence of MCI in 11 studies, and estimate the prevalence to be 6.7% (range 3.2 to 10.8%), in contrast to the published estimates of 5.0% to 36.7% (*PLOS One.* 2015 Nov 5;10(11):e0142388). The current study examined rates of cognitive decline in 14 studies from 12 countries. It showed that cognitive function declined significantly with age for nearly every study and neuropsychological test, with processing speed exhibiting the greatest median decline (0.77 IQ points per year). No consistent relationships between test type and rate of decline were observed, however. The effects of sex and apolipoprotein E gene (*APOE*) were inconsistent in different studies. Each extra year of education conveyed enhanced scores for every test in every study. Language tests received the largest benefit (0.80–2.75 IQ points). The effects of other putative risk factors are currently being analysed and will be presented. COSMIC represents a truly international collaboration to establish the epidemiology of age-related cognitive decline and dementia.

THE CINGULATE CORTEX OF OLDER ADULTS WITH EXCELLENT MEMORY CAPACITY

F.V. Lin¹, P. Ren¹, M. Mapstone², T. Baran¹, 1. *University of Rochester Medical Center, Rochester, New York*, 2. *University of California-Irvine, Irvine, California*

Memory deterioration is the earliest and most devastating cognitive deficit in normal aging and Alzheimer's disease. Some older adults, known as "Supernormals", maintain excellent memory. This study examined relationships between cerebral amyloid deposition and functional connectivity (FC) within the cingulate cortex (CC) and between CC and other regions involved in memory maintenance between Supernormals, healthy controls, and those at risk for Alzheimer's disease (amnestic mild cognitive impairment). Supernormals had significantly stronger FC between anterior CC and R-hippocampus, middle CC (MCC) and L-superior temporal gyrus, and posterior CC and R-precuneus, while weaker FC between MCC and R-middle frontal gyrus and MCC and R-thalamus than other groups. These FC were significantly related to memory and global cognition in

all participants. Amyloid deposition did not differ among groups. Relationships between global cognition and FC were stronger among amyloid positive participants. Relationships between memory and FC remained regardless of amyloid level. This revealed how CC-related neural function participates in cognitive maintenance in the presence of amyloid deposition, potentially explaining excellent cognitive function among Supernormals.

MILD COGNITIVE IMPAIRMENT DETECTION BY SIMULTANEOUS USE OF SCALES: A NEURAL COMPUTING SOLUTION

C. Surez-Araujo¹, P. García Báez⁵, A. Prochazka⁸, N. Rodríguez Espinosa^{7,6}, C. Fernández Viadero³, 1. *Instituto Universitario de Ciencias y Tecnologías Cibernéticas, Universidad de Las Palmas de Gran Canaria, Las Palmas de Gran Canaria, Las Palmas, Spain*, 3. *Unidad de Atención a la Dependencia de Santander, Gobierno de Cantabria, Santander, Santander, Spain*, 5. *Departamento de Ingeniería Informática y de Sistemas, Universidad de La Laguna, La Laguna, Spain*, 6. *Unidad de Neurología, Conducta y Memoria, La Laguna, Spain*, 7. *Hospital Nuestra Señora de la Candelaria, Sta. Cruz de Tenerife, Spain*, 8. *University of Chemistry and Technology, Prague, Czech Republic*

At present there is an increase in the elderly population and more persons with cognitive troubles, where dementia is a socio-sanitary challenge. Mild cognitive impairment (MCI) may be a prodromal state of Alzheimer's disease and other dementias. It is considered an optimal target for diagnosis, likely to be highly prevalent in the future, worldwide.

MCI diagnosis is principally based in cognitive and daily living functional activities assessment. However, in clinical settings, essentially primary care setting, MCI is challenging because of time, consulting restrictions and even difficulties understanding cognitive test cut-off points, mainly when diagnosis depends on two or more scales, and it is underdiagnosed.

An intelligent system to assist in MCI diagnosis, based on hybrid neural architectures, the counter-propagation network (CPN), with a wrapper approach, has been designed. The dataset includes scores of three commonly used scales, MMSE, GDS and FAQ, along with years of education and age, relative to 203 normal control subjects and 128 subjects who revealed a MCI, from ADNI database.

The efficiency of the proposed CPN-based system, with MMSE, FAQ and age, was evaluated using several performance measurements and the clinical utility index (CUI). Its diagnostic performance was compared with a geriatrician, a neurologist and two family physicians. Our proposal achieved the highest score amongst all, AUC: 95,11%, Accuracy: 86,84%, Sensitivity: 90%, Specificity: 84,78%, CUI: 0,715. These results were also better than optimum cut-off over each one of the tests.

Neural computing methods may be useful tools in clinical settings even when employing brief screening tests.

BIDDING THE MEDICAL MODEL "GOODBYE!" NEW WAYS OF THINKING ABOUT DEMENTIA

A.J. Astell^{2,1,3}, A.M. Hernandez², 1. *School of Health and Related Research, University of Sheffield, Whitby*,

Ontario, Canada, 2. Ontario Shores Centre for Mental Health Sciences, Whitby, Ontario, Canada, 3. University of Toronto, Toronto, Ontario, Canada

Although dementia is a medical diagnosis, there are currently no disease-modifying therapies and health services have little to offer people who receive a dementia diagnosis. However, the Medical Model exerts a powerful grip on thinking about dementia, limiting the exploration of other models and approaches that may be of benefit. This opportunistic study explored the ease at which alternate models from other areas of health and disability could be explained to and understood by a range of health professionals. Data were captured from 40 staff in a psychiatric hospital during an interactive Grand Rounds session. A true case scenario was used with phased presentation of four different theoretical models: Medical Model, Recovery, Self-Management and Rights-Based. The session concluded with a video of the individual describing his life after adopting technology. Understanding was assessed through written answers regarding benefits and limitations of each approach to the case scenario and a final question asking which approach best explained his experience. The results suggested that conveying conceptual alternatives to the Medical Model is possible in a simple and accessible way. The written answers conveyed understanding of the three alternate models and their application to the case scenario. Fewer than 10% of respondents proposed that the Medical Model best explained the experience of the participant “loving every minute” of his life. This suggests the time has come to explore alternate models and lessons learnt from other fields to enable people to live well with dementia.

INTERVENTIONS FOR THE TREATMENT OF BEHAVIOURAL AND PSYCHOLOGICAL SYMPTOMS OF DEMENTIA: AN OVERVIEW

S. Harrison^{1,2}, S. Dyer^{1,2}, K. Laver^{1,2}, C. Whitehead^{1,2}, M. Crotty^{1,2}, 1. NHMRC Cognitive Decline Partnership Centre, Sydney University, Sydney, New South Wales, Australia, 2. Department of Rehabilitation, Aged and Extended Care, Flinders University, Adelaide, South Australia, Australia

Behavioural and psychological symptoms of dementia (BPSD) are common amongst people with dementia and can have a large impact on public health by potentially reducing quality of life, increasing caregiver impact and increasing costs associated with dementia care. The objective of this study was to synthesise the findings of systematic reviews of randomised controlled trials of interventions for the treatment of BPSD (PROSPERO CRD42016039477). A systematic search of The Cochrane Database of Systematic Reviews, DARE, Medline, EMBASE and PsycINFO retrieved 3467 citations. Systematic reviews of randomised controlled trials of interventions aimed at treating BPSD in patients with dementia of any type including Alzheimer’s disease or Alzheimer’s disease only were included. The most comprehensive and up-to-date reviews for acetylcholinesterase inhibitors, antipsychotics, antidepressants, benzodiazepines, mood stabilisers, melatonin, caregiver interventions, exercise, music therapy, cognitive stimulation and psychological interventions were included. For the majority of the interventions, included reviews were of moderate to high quality according to the AMSTAR checklist and the evidence was of low to moderate

quality as rated using GRADE criteria. Reported effect sizes for atypical antipsychotics on global BPSD measures were very small (SMD 0.17, 95%CI 0.08 to 0.25; moderate quality evidence). Cognitive enhancers also had very small effects; reviews reported non-significant trends in favour of donepezil or memantine (4 and 2 studies, respectively) and a small but significant effect for galantamine based on high quality evidence from two studies. Effect sizes have been compared across interventions and interpreted in light of the severity of dementia in study populations.

SESSION 25 (SYMPOSIUM)

PROMOTING HEALTHY AGING IN DIVERSE OLDER COMMUNITIES THROUGH ACADEMIC-COMMUNITY RESEARCH

Chair: N.M. Giunta, *Hunter College, New York, New York*
Discussant: D. Gardner, *Hunter College, New York, New York*

As global aging brings increased diversity in race/ethnicity, language and culture, ability, sexual orientation, gender identity, and access to economic and other resources, supporting the health and well-being of older adults and their communities is complicated by cultural and geographic diversity, and growing structural inequities. Community-based scholarship plays an essential role in understanding and addressing the needs that emerge from disparities and intersectionalities that shape the lives of older adults in multicultural communities. This symposium highlights innovative research and describes the challenges and rewards of academic-community relations that build knowledge and promote healthy aging through community-based inquiry. First, we present a study exploring long-term and advanced care planning among multicultural members of an urban LGBTQ senior center. Second, preliminary findings are shared from a community-based initiative to address knowledge and service-utilization gaps regarding Alzheimer’s disease among urban Latino elders. Third, we describe a university-community collaboration using social network analysis to improve provider knowledge and support for caregivers of individuals with dementia. Fourth, results are shared from a study of intergenerational transmission of cultural identity among older Pacific Islanders in Hawai’i. Finally, we present an ethnographic study of academic-community relationships in a rural U.S. college town, and perceptions of multiple stakeholders who influence the aging experience in their community. Through a variety of methods, these studies share a commitment to community-based research that aims to support collaboration, empower communities, and ultimately transform practice and policy to better meet the diverse needs of urban and rural older adults around the globe.

LONG-TERM CARE PLANNING AND THE CHANGING LANDSCAPE OF LGBTQ AGING

J. McGovern¹, D. Gardner^{2,3}, 1. *Lehman College, City University of New York, New York, New York*, 2. *Silberman School of Social Work, Hunter College, City University of New York, New York, New York*, 3. *Brookdale Center for Healthy Aging, New York, New York*

Older LGBTQ adults are twice as likely to grow old without a spouse or adult child and more often act as caregivers

for family members or friends than their non-LGBTQ peers. These distinct caregiving experiences may contribute to health and quality-of-life disparities for aging LGBTQ adults, including increased rates of isolation, depression, chronic illness, and shortened life expectancy. Findings are presented from a qualitative study examining long-term care and end-of-life planning among members of an LGBTQ senior center in the Bronx, New York. Focus groups and in-depth interviews with the primarily African American, Afro-Caribbean, and Latino participants explored plans and concerns regarding their future and advanced care needs. Findings suggest considerable resilience; participants recognized their future care needs and preferences, and described an increased sense of personal agency and greater acceptance about aging and end-of-life. We discuss implications for more inclusive and strengths-based practice, policy, and research with LGBTQ elders.

COMMUNITY-BASED PARTICIPATORY METHODS IDENTIFY NEEDS AND SOLUTIONS: LATINOS AND ALZHEIMER'S DISEASE

C.R. Gelman¹, R. Glushefski², 1. *Silberman School of Social Work at Hunter College, City University of New York, New York, New York*, 2. *Brookdale Center for Healthy Aging, New York, New York*

In the U.S. there will be over 1 million Latinos with Alzheimer's disease and related dementias (ADRD) by 2050. While Latinos are at greater risk for ADRD than non-Hispanic whites, they are less likely to access diagnostic and intervention services. Through an academic-community partnership, a needs assessment identified ADRD as a critical area of concern and an academic-community coalition was formed to design, implement, and evaluate an intervention that trains "natural helpers" (e.g., clerks, hair dressers) to be able to detect symptoms of ADRD, provide culturally competent information, and facilitate referral to a single bilingual, bicultural community-based organization for further intervention. Timely detection of ADRD can result in slower progression of dementia and an improved quality of life for persons with ADRD and their families. We describe the collaborative process of this community-academic partnership and discuss implications internationally, drawing comparisons with projects using natural helpers in various Latin American countries.

USING NETWORK ANALYSIS TO EXAMINE DEMENTIA CARE REFERRALS

C. Morano¹, A. Savage¹, C. Rees², 1. *Silberman School of Social Work at Hunter College, City University of New York, New York, New York*, 2. *State University of New York – Albany, Center for Human Services Research, Albany, New York*

Social network analysis (SNA) has been employed extensively to understand the size, density, centralization, fragmentation of health care and social care. Network theory and analysis has guided research in topics as diverse as primary care practices, teamwork and inter-professional practice, translational research, and to examine structural relationships and influence in networks. This paper describes a collaborative process with two universities and a community-based provider in designing the PSS Network Analyses

pilot study to examine the network structures used by dementia care consultants in a community-based program. Findings suggest a hierarchy of factors, including but not limited to length of waiting lists, distance to the caregiver, and race/ethnicity of the provider that influenced the selection of referrals to a variety of dementia related providers. This session concludes with a discussion of potential uses of SNA to support the concrete physical, emotional and financial needs of dementia caregivers.

INTERGENERATIONAL CULTURAL TRANSMISSION AND COMMUNITY IDENTITY AMONG PACIFIC ISLANDERS

H. Vakalahi², N.M. Giunta¹, 1. *Silberman School of Social Work at Hunter College, City University of New York, New York, New York*, 2. *Morgan State University, Baltimore, Maryland*

Transmission of cultural values, beliefs, and traditions from one generation to another rely on multiple mechanisms within a variety of social and environmental contexts. Intergenerational transmission of culture has been conceptualized among Pacific Island communities as relationships and connections across multiple systems from micro to macro to metaphysical. This phenomenological study set in a small community in Hawai'i included in-depth individual interviews conducted with 36 Elders in their homes. Community consultants collaborated with researchers throughout the study to maintain trust and rapport with participants. Qualitative analysis using principles of grounded theory resulted in preliminary findings that suggest community rituals serve as an important conduit for intergenerational transmission of values, traditions, beliefs, and historical knowledge. Culture is a primary underpinning of community life; therefore, the community context is essential for understanding macro and micro social work practice, particularly with indigenous communities. Implications for practice and research will be discussed.

A NEW NEIGHBORHOOD EVERY FALL: AGING IN PLACE IN A SMALL COLLEGE TOWN

K.H. Powell, *Frostburg State University, Frostburg, Maryland*

Older adults who live in neighborhoods adjacent to academic institutions have unique experiences that make them vulnerable to marginalization and displacement. As these neighborhoods become increasingly dominated by students and other university stakeholders, older adults find themselves in the minority in a neighborhood where they have lived for many years. Often these neighborhoods are attractive to universities, city governments, and private companies for their development potential, which can result in gentrification. Results of a year-long ethnographic study of a neighborhood adjacent to a medium-sized public university are presented to shed light on relationships between members of the following five stakeholder groups with vested interests in the neighborhood: older adult year-round residents, students who live off-campus, property owners/managers who serve as landlords, and public university or community officials. The study highlights challenges and opportunities for academic-community relations to support aging in place. Implications for practice and research will be discussed.

SESSION 30 (PAPER)

NUTRITIONAL ISSUES IN OLDER ADULTS

FAT MASS PREDICTS SURVIVAL IN MEN BUT NOT WOMEN IN THE BALTIMORE LONGITUDINAL STUDY OF AGING

N. Chiles Shaffer, S.A. Studenski, *National Institutes of Health, Baltimore, Maryland*

Age and body mass index (BMI) are known risk factors for mortality. It is important to distinguish the makeup of one's body composition, specifically the amount of lean and fat mass, from BMI and understand the contribution of body composition to mortality risk. We examined whether baseline lean mass and fat mass predict survival in the Baltimore Longitudinal Study of Aging, a study of normative aging. Cox proportional hazards were modeled in 632 men and 684 women (ages 20–95 years old) with DXA data. In the analytic sample, women were younger than men (mean age 59.8 vs. 63.7, p -value <0.001). Follow-up ranged from 2 to 25 years (mean: 13 years), and over the follow-up period 133 men and 91 women died. Baseline appendicular lean mass (ALM) (kg) and fat mass (kg) were used to predict survival, additionally adjusting for age and BMI (quadratic). In men, greater fat mass reduces mortality after accounting for age, ALM, and BMI. In women, neither fat mass nor lean mass were associated with mortality risk. In women, body composition does not add to the survival effect of BMI, while in men both lean and fat mass add to the survival effect of BMI. Further research is needed to fully understand the impact of lean and fat mass on survival in men and women, particularly assessing change in body composition over time.

PLASMA KLOTHO, ADIPOSITY, AND INSULIN RESISTANCE IN OLDER ADULTS: FINDINGS FROM THE INCHIANTI STUDY

M. Shardell¹, R. Kalyani², R.D. Semba², S. Bandinelli³, R. Varadhan², L. Ferrucci¹, 1. *National Institute on Aging, Baltimore, Maryland*, 2. *Johns Hopkins Medical Institutions, Baltimore, Maryland*, 3. *LHTC, Local Health Unit Tuscany Centre, Firenze, Italy*

Klotho is a recently discovered hormone with demonstrated anti-aging properties in animal studies. In older humans, evidence has linked plasma klotho with longevity. Insulin signaling is associated with longevity in animals and in humans, mediated in part by the accumulation of fat mass common in aging. Whether klotho is part of this longevity pathway is unknown. We hypothesize that plasma klotho is associated with insulin resistance and this association depends on by obesity status.

Plasma klotho was measured in 832 participants aged ≥ 55 years in InCHIANTI, a prospective cohort study comprising Italian adults. Insulin resistance was operationalized using the homeostasis model for insulin resistance (HOMA-IR). Body size was categorized using World Health Organization body mass index (BMI) categories (<25 [under- or normal weight; $n=303$], 25 – 29.9 [overweight; $n=393$], ≥ 30 [obese; $n=136$] kg/m^2). Stratified inverse probability weighted linear regression modeled the association while handling missing data.

Mean (SD) klotho concentrations (pg/mL) were 718.9 (434.6) for under/normal weight, 687.8 (237.1) for

overweight, and 680.6 (210.6) for obese participants. After adjustment for biomarkers, comorbidities, demographics, and lifestyle; each logarithm higher klotho (pg/mL) was associated with 0.69 higher units of HOMA-IR (95% confidence interval [CI] 0.19–1.20; p -value=0.007) in overweight participants. We found little evidence for association in participants with $\text{BMI}<25 \text{ kg}/\text{m}^2$ (beta=0.20; 95% CI -0.20–0.61; p -value=0.32) or obese participants (beta=-0.11; 95% CI -1.16–0.94; p -value=0.84).

Plasma klotho was positively associated with insulin resistance in overweight older adults, but not associated in other BMI categories. Further studies are needed to explore the relationship of these paradoxical findings to longevity.

NUTRITIONAL STATUS AND MORTALITY IN 5 YEARS IN BRAZILIAN ELDERLY: SURVIVAL ANALYSIS

L.P. Corona¹, Y. Duarte², M. Lebrão², 1. *Faculty of Applied Sciences, University of Campinas, Limeira, Sao Paulo, Brazil*, 2. *University of São Paulo, Sao Paulo, Sao Paulo, Brazil*

This study aimed to assess the impact of nutritional status on survival time in Brazilian elderly living in five years follow-up. Elderly ($n=1,256$) from the third wave of SABE Study (Health, Well-being, and Aging) conducted in 2010, were followed for 5 years, when they were contacted for the fourth wave. Survival functions were estimated according to nutritional status in four groups: 1) without nutritional alteration; 2) anemia only; 3) hypoalbuminemia only; 4) anemia and hypoalbuminemia (Anemia= hemoglobin $<12\text{g}/\text{dL}$ for women and $<13\text{g}/\text{dL}$ for men, and hypoalbuminemia= serum albumin $<3.5\text{g}/\text{dL}$). Body Mass Index (BMI) was also included. Hazard ratios (HR) were calculated, following the Cox proportional hazards model, controlling for baseline covariates. All analyses considered sample weights and were performed using the Stata@14. After the 5-year period, 12.3% of the elderly died and 8.2% were lost to follow-up. Those who died had lower hemoglobin and albumin concentrations (13.4g/dL and 3.7g/dL) compared to survivors (14.3d/dL and 3.9g/dL; $p<0.001$). Crude death rate was 27.6/1000 person-years for elderly in group 1, 124.3 in group 2, 116.0 in group 3 and 222.8 in group 4 ($p<0.001$). In final models, group 2 and 3 showed similar effect (HR=2.53, $p=0.002$; 2.32, $p=0.001$; respectively) and group 4 had a twofold risk (HR=4.48; $p<0.001$). BMI did not alter results, and lost significance when in the same model as biomarkers. Thus, anemia and hypoalbuminemia have additive effect on mortality risk in 5 years, independently from BMI. Because they are common and cost-effective biomarkers, they should be part of the geriatric evaluation in clinical practice.

PROTEIN INTAKE AND INCIDENT SARCOPENIA IN OLDER ADULTS: THE HEALTH ABC STUDY

D.K. Houston¹, J.A. Tooze¹, M. Visser², F.A. Tylavsky³, S. Rubin⁴, A. Newman⁵, T.B. Harris⁶, S.B. Kritchevsky¹, 1. *Wake Forest School of Medicine, Winston Salem, North Carolina*, 2. *Vrije Universiteit, Amsterdam, Netherlands*, 3. *University of Tennessee Health Science Center, Memphis, Tennessee*, 4. *University of California, San Francisco, California*, 5. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 6. *National Institute on Aging, Bethesda, Maryland*

Low protein intake has been hypothesized to contribute to sarcopenia, the age-related loss of muscle mass, strength, and performance. We examined the association between protein intake and incident sarcopenia in community-dwelling, older adults in the Health ABC study ($n=2,101$; mean age 74.5 yrs, 53% female, 37% black). Protein intake was calculated using an interviewer-administered food frequency questionnaire and categorized into tertiles (<0.7 , $0.7-1.0$, and ≥ 1.0 g protein/kg actual body weight and <0.76 , $0.76-1.06$, and ≥ 1.06 g protein/kg adjusted body weight). Sarcopenia was defined as low appendicular lean mass adjusted for BMI (<0.789 in men, <0.512 in women) and low grip strength (<30 kg in men, <20 kg in women) or slow gait speed (<1.0 m/sec). The association between protein intake and incident sarcopenia over 4 years of follow-up was examined using proportional hazard regression models adjusted for demographics, behavioral characteristics, height, total energy intake, and chronic conditions. Mean (SD) protein intake was 0.90 (0.36) g/kg actual body weight. The cumulative incidence of sarcopenia over 4 years of follow-up was 18.5%. Individuals in the lower two protein tertiles based on actual body weight were at greater risk of sarcopenia over 4 years of follow-up (HR (95% CI): 3.25 (2.04–5.18) and 1.78 (1.22–2.60), respectively) compared to those in the upper protein tertile. When adjusted body weight was used, only those in the lowest protein tertile were at greater risk of sarcopenia (HR (95% CI): 1.62 (1.02–2.57) and 1.17 (0.80–1.70)). Dietary protein should be studied further as a modifiable risk factor for sarcopenia.

DEVELOPING A CLINICAL DIAGNOSTIC TOOL FOR THE IDENTIFICATION OF OLDER ADULTS WITH HYPOVITAMINOSIS D

C. Annweiler¹, G. Duval¹, A. Brangier¹, P. Paré¹, O. Beauchet², A. Kabeshova¹, B. Fantino¹, 1. *Geriatric Medicine, Angers University Hospital, Angers, France*, 2. *McGill University, Montreal, Quebec, Canada*

Background: Hypovitaminosis D is highly prevalent among older adults and associated with adverse health events. To rationalize vitamin D assays and save health costs, our objectives were to develop and test a clinical diagnostic tool for the identification of older community-dwellers with hypovitaminosis D.

Methods: 1924 community-dwelling volunteers ≥ 65 years without vitamin D supplements were recruited in this cross-sectional study. A set of clinical variables (age, gender, living alone, individual deprivation, body mass index, undernutrition, polymorbidity, number of drugs used daily, psychoactive drugs, bisphosphonates, strontium, calcium supplements, falls, fear of falling, vertebral fractures, Timed Up&Go test, walking aids, lower-limb proprioception, handgrip strength, visual acuity, wearing glasses, cognitive disorders, sad mood) was recorded from standardized questionnaires and medical examination at the time of serum 25-hydroxyvitamin D (25OHD) measurement. Hypovitaminosis D was defined as serum 25OHD ≤ 75 nmol/L, ≤ 50 nmol/L or ≤ 25 nmol/L. The whole sample was separated into training and testing subsets to design, validate and test an artificial neural network (multilayer perceptron, MLP).

Results: 1729 participants (89.9%) had 25OHD ≤ 75 nmol/L, 1288 (66.9%) had 25OHD ≤ 50 nmol/L, and 525 (27.2%) had

25OHD ≤ 25 nmol/L. MLP using 16 clinical variables was able to diagnose hypovitaminosis D ≤ 75 nmol/L with accuracy=96.3%, area under curve (AUC)=0.938, and $\kappa=79.3$ indicating almost perfect agreement. It was also able to diagnose hypovitaminosis D ≤ 50 nmol/L with accuracy=81.5, AUC=0.867 and $\kappa=57.8$ (moderate agreement); and hypovitaminosis D ≤ 25 nmol/L with accuracy=82.5, AUC=0.835 and $\kappa=55.0$ (moderate agreement).

Conclusions: We developed an algorithm able to identify, from 16 clinical variables, older community-dwellers with hypovitaminosis D. Such inexpensive tool should help clinicians in decisions to supplement their patients without resorting to blood tests.

SESSION 35 (SYMPOSIUM)

INNOVATION IN HEALTH CARE DELIVERY FOR ADULTS AGING WITH DISABILITIES

Chair: J. Caldwell, *National Council on Aging*

Co-Chair: M. Campbell, *Grapeview, Washington*

The Center for Medicare and Medicaid Services (CMS) Innovation Center (CMMI) has contracted with NORC at the University of Chicago to evaluate 23 Health Care Innovation Award (HCIA) programs, using a multi-year mixed-methods evaluation comprising several domains: Medicare and Medicaid claims experience, multiple site visits, focus groups, and in-depth interviews with patients, physicians, program staff, and front line workers. After the second year of the evaluation, we observe evidence of reduced health care utilization and improved quality of life for one-fourth of the programs, with supportive qualitative information seen in focus groups, such as improved communication with physicians, enhanced access to non-medical services, and the establishment of a single point of contact, thereby reducing the need for acute services. This symposium summarizes key evaluation findings on five topics central to health care delivery: expanded medical homes for individuals with intellectual or developmental disabilities, care coordination for Medicaid beneficiaries, chronic disease self-management for individuals aging with disability, end-of-life care, and training for direct care workers. The panel suggests that policy makers hoping to implement innovative care coordination services for high-risk populations should consider the upfront investment necessary to establish a medical home, careful retraining of clinicians, and the return-on-investment that may be possible through reductions in hospitalizations and emergency department use.

AGING WITH A PHYSICAL DISABILITY IN MEDICAID MANAGED CARE

T. Heller, R. Owen, A. Bowers, H. Gibbons, *Department of Disability and Human Development, University of Illinois at Chicago, Chicago, Illinois*

Medicaid expansion brings the opportunity to serve new patients through innovation programs. Using data from a mixed-methods CMMI evaluation, we explore cost and quality of care outcomes for five programs. Several awardees achieved statistically significant reductions in total cost of care and significant reductions in hospitalizations, relative to respective comparison groups. In addition, three of these

awardees delivered targeted services to Medicaid beneficiaries at the highest risk, while improving quality on indicators such as primary care use and potentially avoidable hospitalizations. Innovation programs achieved these outcomes by helping patients who use unnecessary emergency department visits establish relationships with primary care practitioners, investing substantially in building patient trust through community outreach, peer support, home visits, and providing social service support for housing, food, and transportation.

INNOVATION FOR INDIVIDUALS AGING WITH LIFELONG DISABILITY

S.A. Ruiz¹, M.M. Putnam², J. Caldwell³, 1. *Health Care, NORC at the University of Chicago, Bethesda, Maryland*, 2. *Simmons College, Boston, Massachusetts*, 3. *National Council on Aging, Arlington, Virginia*

Medical advancements have extended the life of individuals with long-term disability into later life, also known as aging with disability. The paucity of evidence-based programs demonstrating effectiveness represents a gap for this unique group. This study analyzes quasi-experimental mixed-methods evaluation data on two programs in California (N=211) and Minnesota (N=124) funded under CMMI's Health Care Innovation Award (HCIA) program, including Medicare and Medicaid claims data on over 800 patients, administrative comparison groups, survey data, site visits, and focus groups with patients and caregivers. All programs show evidence of improved quality of care and some support for reduced utilization. In addition to self-management education and motivational interviewing, mechanisms driving these favorable findings include enhanced access, supportive care, and avoidance of acute exacerbations of chronic conditions. Individuals aging with disability are not traditional consumers and often require careful tailoring and adaptations of existing programs.

INNOVATION IN CARE COORDINATION FOR INTELLECTUAL OR DEVELOPMENTAL DISABILITIES

S.A. Ruiz¹, J. Caldwell², 1. *Health Care, NORC at the University of Chicago, Bethesda, Maryland*, 2. *National Council on Aging, Arlington, Virginia*

A significant gap remains between existing evidence-based care coordination techniques in medical homes for the general population and those that have been successfully translated for people with intellectual and developmental disabilities (ID/DD). Two programs funded by CMMI have dedicated resources to the translation of existing evidence-based practices for the ID/DD population in community or clinical settings. Across New York, New Jersey, and Rhode Island, these programs have served over 2,200 individuals and demonstrated improved quality of care and limited evidence of reduced health care claims utilization. A greater-than-expected investment was needed to retrain clinicians and other staff to understand the unique needs of people with ID/DD and cater approaches based on person-centered planning. Establishing a medical home faced several barriers, such as administrative delays due to changes in State Medicaid offices and issues regarding health plan reimbursement. Additionally, community-based organizations often encountered difficulties in targeting their services to a population with the appropriate risk level for a successful intervention.

SESSION 40 (SYMPOSIUM)

LONG-LIVED ANIMAL MODELS AND HEALTH-SPAN EXTENSION IN STUDIES OF AGING

Chair: N.R. Barzilai, *Albert Einstein College of Medicine, New York*

Co-Chair: V. Gorbunova, *Rochester University, Rochester, New York*

Discussant: D. Sinclair, *Harvard Medical School, Boston, Massachusetts*

A dramatic advance in the field of aging occurred when animal models were targeted by genetic, environmental or by drugs and their life span has been extended. Some drugs are approved for use in human conditions but not for aging. The NIA has created an intervention testing program (ITP) where drugs that may target specific mechanisms for aging can be used and life span is determined in 3 centers for both sexes. The challenge that has not been addressed adequately before, is how we make sure that life span extension is coupled with health-span. A longer or even similar period of diseases is not really a good alternative for targeting aging. For example, while different species of nematodes may have extended life- but not health-span several human centenarians group have extended health-span coupled with contraction of morbidities. In this symposium we would like leading gerontologists in the biology of aging to discuss their experience and address the following points:

Is longevity in long-lived sub-species in nature live also healthier?

How do we study health-span in pre clinical setting of animal models?

Is there health-span exchange i.e. protection from one disease but propensity for another (rapamycin and diabetes as an example)?

Which other animal models can be useful to confirm effects that are relevant to humans.

Animals in nature (Gorbunova, V), genetic manipulations (Cohen, H), testing drugs in rodents (Sinclair, D and Strong R; including rapamycin, acarbose, metformin, resveratrol and supplement of NAD) will be subject for discussion.

THE NIA INTERVENTIONS TESTING PROGRAM: AN UPDATE

R. Strong¹, D. Harrison², N. Nadon³, R.A. Miller⁴, 1. *Texas Health Sciences Center, San Antonio, Texas*, 2. *Jackson Lab, Bar harbor, Maine*, 3. *NIH/NIA, Bethesda, Maryland*, 4. *University of Michigan, Detroit, Michigan*

The NIA Interventions Testing Program is a preclinical, multi-site translational research program to evaluate agents hypothesized to extend mouse lifespan by retarding aging or postponing late life diseases. Interventions proposed by scientists from the research community are initially tested, in parallel, at three sites (Jackson Laboratories, University of Michigan and the University of Texas Health Science Center at San Antonio) in male and female genetically heterogeneous UM-HET3 mice using identical, standardized protocols. The use of genetically heterogeneous mice greatly reduces the possibility that the results are only valid for a single strain. Fifty-three lifespan experiments, involving 30 test agents, were initiated in the first 11 years of the ITP. Significant effects on longevity, in one or both sexes, have been published

for 6 of the tested agents. These agents are proving useful as new tools to probe the aging process and for identifying new therapeutic targets for clinical intervention.

LONGEVITY MECHANISMS IN LONG-LIVED MAMMALS

V. Gorbunova, A. Seluanov, *University of Rochester, Rochester, New York*

Animals have evolved a dramatic diversity of aging rates. Even within mammals, lifespans differ over 50-fold from four years in a mouse to 211 years in a bowhead whale. This natural diversity of lifespan can be exploited to understand the mechanisms of longevity. With modern technological advances now available, it became possible to undertake comparative study of aging at molecular level. Our goal is to identify mechanisms that allow such exceptionally long-lived animals to live long and healthy lives and then use these mechanisms to benefit human health. I will discuss our recent progress in the studies of tumor suppressor mechanisms, and DNA repair in short and long-lived rodent species.

IMPROVING HEALTHSPAN BY MANIPULATING SIRT6 LEVELS: HOW DOES IT WORK?

H. Cohen, *Bar-Ilan University, Tel Aviv, Israel*

Mice over expressing the NAD⁺ dependent deacylases SIRT6 (MOSES mice) have extended lifespan along with significant improvement of their healthspan. In comparison to their wild-type (WT) littermates, old MOSES mice showed amelioration of a variety of age-related disorders, including: improved glucose tolerance, younger hormonal profile, reduced age-related adipose inflammation and increased physical activity. To explore the mechanisms underlying SIRT6 positive effects, series of complementary metabolomics, transcriptomics and proteomics analyses were performed. Together, these analyses demonstrate that SIRT6 overexpression mimics key features of the metabolic profile of dietary restriction (DR) a well-known treatment that extends healthy lifespan in multiple organisms. Like DR, SIRT6 overexpression reduces IGF-1 levels and signaling and induces liver and muscle AMPK activity. In addition, it reprograms liver metabolism, particularly, the induction of fatty acid beta-oxidation, thus providing the required energy when nutrients are limited. These findings will promote the development of drugs against age related diseases.

NAD PRECURSORS AS INTERVENTIONS FOR AGE-RELATED DISEASES AND EXTENDING HUMAN HEALTHSPAN

D. Sinclair, 1. *Harvard Medical School, Boston, Massachusetts*, 2. *Harvard Glenn Center, Boston, Massachusetts*

From yeast to mammals, nicotinamide adenine dinucleotide (NAD⁺) is a critical cofactor for redox reactions and for the activity of sirtuins. Levels of NAD⁺ decline with age. Interventions that boost NAD⁺ levels increase *C. elegans* lifespan and restore mitochondrial function in aging mice, in each case is dependent upon the sirtuins. Interventions that increase NAD⁺ availability, such as NAD⁺ precursors

and CD38 inhibitors induce profound changes in aging mice including reversal of aspects of aging. Thus agents that restore youthful NAD⁺ levels may be next generation interventions to improve human healthspan.

SESSION 45 (SYMPOSIUM)

BIOLOGICAL MARKERS IN FAMILY RESEARCH

Chair: L. Bangerter, *Mayo Clinic, Pennsylvania*

Co-Chair: S. Zarit, *Penn State University*

This symposium will examine the use of biological markers as an important component of family research. The papers presented in this symposium highlight the utility of biological markers as a mechanism by which to enhance our understanding of a variety of family experiences and relational ties including family stressors, parent-child interactions, everyday family support, and family caregiving. *Cichy* will discuss the association between daily family stressors and naturally occurring cortisol levels; this discussion will emphasize racial differences in these associations. *Birditt* will examine daily interactions that middle-aged adults have with their aging parents and adult children. This presentation will focus on how daily interactions with generations above and below have implications for daily negative affect and cortisol. *Bangerter* will focus specifically on the relationships between middle-aged children and aging parents and discuss the biopsychosocial implications of giving support to parents with health problems and limitation in activities of daily living. *Liu* will conclude with a discussion of biological implications of family caregiving through an examination of three biomarkers: salivary cortisol, Dehydroepiandrosterone Sulfate, and alpha amylase. Each presentation applies biological markers to understand distinctive family experiences and ties which are fundamental to individual and family functioning.

RACIAL DIFFERENCES IN ASSOCIATIONS BETWEEN FAMILY NETWORK STRESSORS AND SALIVARY CORTISOL

K.E. Cichy¹, R.S. Stawski², 1. *Human Development and Family Studies, Kent State University, Kent, Ohio*, 2. *Oregon State University, Corvallis, Oregon*

Research reveals emotional costs of African Americans' family ties, however, few studies consider the physiological toll of stressors involving family. We address this gap by examining racial differences in associations between daily family stressors and naturally occurring cortisol levels. During daily diary interviews, African American and European American respondents from the National Study of Daily Experiences (NSDE II, N = 1, 931) reported on daily network stressors (i.e., other family members' stressors) and provided salivary cortisol samples four times throughout the day on 4 of the 8 interview days. The interaction between individual differences in network stressor frequency and race significantly predicted cortisol area under the curve (AUC; $p < .01$). Even after covarying for negative affect, symptoms, and family support provision, African Americans who report more network stressors exhibited a lower AUC (i.e., less cortisol output), whereas European Americans exhibited no association. Implications for health disparities will be discussed.

DAILY INTERACTIONS WITH AGING PARENTS AND ADULT CHILDREN: IMPLICATIONS FOR WELL-BEING AND CORTISOL

K. Birditt¹, J. Manalel¹, K. Kim², S. Zarit³, K.L. Fingerman⁴,
1. *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*, 2. *University of Massachusetts Boston, Boston, Massachusetts*, 3. *Pennsylvania State University, State College, Pennsylvania*, 4. *University of Texas at Austin, Austin, Texas*

Midlife individuals report greater investment in their children than in their parents. Little is known about daily experiences in these ties, and the psychological and biological systems that may underlie these associations. The present study examined daily experiences with aging parents and adult children and implications of those experiences for daily negative affect and cortisol. Participants were middle-aged adults ($N = 156$; 56% women) from the *Family Exchange Study Wave 2* who completed a 7-day daily diary study and 4 days of saliva collection which was assayed for cortisol. Individuals reported more contact but fewer negative experiences with adult children than with parents. Nevertheless, contact and negative experiences with adult children were more consistently associated with negative affect and daily cortisol patterns than interactions with parents. Findings are consistent with the intra-individual stake hypothesis which suggests that individuals are more invested in relationships with their children than their parents.

SUPPORT TO AGING PARENTS: IMPLICATIONS FOR MIDDLE-AGED CHILDREN'S DIURNAL CORTISOL AND DAILY MOOD

L. Bangerter¹, Y. Liu², S. Zarit², K. Birditt³, K.L. Fingerman⁴,
1. *Mayo Clinic Robert D. and Patricia E. Kern Center for the Science of Health Care Delivery, Rochester, Minnesota*, 2. *Penn State University, State College, Pennsylvania*, 3. *University of Michigan, Ann Arbor, Michigan*, 4. *The University of Texas at Austin, Austin, Texas*

This study examines whether giving support to parents has implications for middle-aged children's diurnal cortisol and daily mood. During 4 consecutive days, 148 middle-aged adults (mean age = 55) reported support they gave to their parents and provided saliva 4 times a day. Multilevel models estimated within-person differences in positive and negative affect (PA/NA), cortisol awakening response (CAR) and area under the curve (AUC-G) as a function of giving same-day and previous-day support. We examined whether these associations are exacerbated when a parent has health problems or activities of daily living (ADL) needs. When participants gave support to parents with ADL needs, they had higher next-day AUC-G, higher same-day PA and lower next-day NA. Giving support to parents with health problems was associated with higher next-day NA. A biopsychosocial approach shows that giving support to aging parents is an ambiguous experience with differential implications for biological stress and daily mood.

LINKING DAILY HPA AND SNS ACTIVITY TO FAMILY CAREGIVERS' FUNCTIONAL HEALTH OVER TIME

Y. Liu¹, S. Zarit¹, M. Rovine², D. Almeida¹, 1. *Center for Healthy Aging, The Pennsylvania State University, State*

College, Pennsylvania, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*

The study examined the extent of association between stress biomarkers among 153 family caregivers of individuals with dementia (IWDs) and caregivers' changes in functional health over time. Caregivers who initially participated in a study of the effects of ADS services on three biomarkers, salivary cortisol, DHEA-S and alpha amylase (sAA), were followed for a one-year period. Two factors, caregiving transitions and ADS use, which might moderate the effects of biomarkers on functional health were considered. Among caregivers who experienced a transition, and who used less than average ADS days per week, lower daily cortisol and sAA total outputs were associated with increasing functional limitations. Caregivers who experienced a transition but used greater than average ADS days per week did not show such patterns of association. This study is among the first to explore associations between daily biomarkers and long-term health among family caregivers of IWDs.

SESSION 50 (SYMPOSIUM)

CHALLENGING ATTITUDES TO AGEING AND AGEISM

Chair: A. Kydd, *Edinburgh Napier University, Edinburgh, Lothian, United Kingdom*

Discussant: L. Ayalon, *Bar Ilan University, Ramat Gan, Israel*

The developed world has an increasing number of people who are classed as the 'old', with the largest increase being those aged over eighty-five years. Population ageing is a worldwide phenomenon. The "oldest old" (people aged 85 or older) constitutes eight per cent of the world's 65-and-over population. On a global level, the 85-and-over population is projected to more than triple between 2010 and 2050 (National Institutes of Health, 2011:8). In many countries, the oldest old are the fastest growing age group in the total population (United Nations, 2014; National Institutes of Health, 2011). These people are more likely to have multimorbidities and have less functional capacity to compensate physically for an acute episode of injury or ill health. Projections indicate that there will be considerable differences in the age composition of the EU-27 population during the period 2015 to 2050 (Eurostat, 2015). The most pronounced changes being the share of working-age and old-age groups in the population (Sobczak, 2014:18), meaning that there are a growing number of potentially dependent people coupled with a shrinking working-age population (Eurostat, 2015). It is imperative for all societies to address negative attitudes towards older people as there remains a high prevalence of ageism in societies globally. The detrimental effects of negative attitudes and ageism are substantial. In this symposium negative attitudes and ageism are discussed at discourse level; amongst older people; with caregivers; amongst professionals and with housing providers covering work from Ireland, Scotland, America, Malta and Spain.

AGEISM IN THE THIRD AGE

A. Kydd¹, A. Fleming², 1. *School of Nursing Midwifery and Social Care, Edinburgh Napier University, Edinburgh,*

Lothian, United Kingdom, 2. Independent Researcher, Hamilton, Lanarkshire, United Kingdom

The global increase in the numbers of older people show a dramatic increase in the numbers of people over 85 years. This means that the definition of 'older people' spans sixty years. The advent of the 'third' and 'fourth' age has served to provide a distinction between the old and the oldest-old. This paper presents a literature review exploring ageism by those in their third age not wanting to be seen as a member of the fourth age. This is a form of ageism -it involves stereotypical perceptions of the oldest old. Such attitudes disenfranchise the oldest old and can prove detrimental to those transitioning into the fourth age. They may choose to refuse assistance that might put them into the fourth age category, but might help them maintain their engagement and independence into their older age. After attending this session, participants will gain understanding of ageism amongst the old.

ATTITUDES TOWARD AGING AMONG THE GERIATRIC HEALTH CARE TEAM: DON'T FORGET THE CAREGIVER

M.F. Wyman^{1,2}, S. Shiovitz-Ezra³, O. Parag³, *1. Psychiatry, University of Wisconsin, Madison, Wisconsin, 2. WS Middleton Memorial VA Hospital, Madison, Wisconsin, 3. Hebrew University, Jerusalem, Israel*

Previous research examining attitudes toward the elderly among healthcare providers has established that negative stereotypes and negative views of older adults are common. However, few studies have assessed attitudes in an essential member of the geriatric health care team, the family caregiver. We present an overview of past research examining attitudes toward aging in health care, and discuss original findings from a sample of caregivers of White and African-American older women living in the community. Using the AGED Inventory (Knox et al., 1995), we examined predictors of negative or positive evaluations of the "typical" older woman. Associations with both caregiver and care recipient characteristics were observed. More negative ratings were related to increased caregiver burden and more care recipient depression, though care recipient medical burden was not related to caregiver attitudes. African-American caregivers rated older women more positively on some dimensions. Implications for addressing ageism in the healthcare team and for caregiver education are discussed.

PROFESSIONAL AGEISM-DOES IT EXIST?

S.C. Buttigieg, *1. University of Malta, Msida, Malta, 2. University of Birmingham, Birmingham, United Kingdom, 3. Aston University, Birmingham, United Kingdom*

Ageism has complex social roots and broad consequences. It includes a span of intolerant knowledge, values, attitudes and behaviours towards older adults. Two contexts that are intensely accessed by older people are healthcare and long-term care. Nevertheless, there is scant literature on the older people's real needs for care, seemingly a reflection of actual practice and ageist attitudes. One questions whether or not these contexts, as well as the transition between them, are serving the older people well. Indeed, professional ageism is the label used to describe the service providers' attitudes towards older adults, namely specific patient management

biases that are often based on negative misconceptions. This paper presents the findings of a narrative literature review that explores professional ageism in healthcare and long-term care, emerging from medical, geriatrics and gerontology journals. After attending this session, participants will understand the concept of professional ageism as identified in the literature.

AGEISM IN HOUSING: CHALLENGES FOR AGEING IN PLACE. THE CASE OF THE CITY OF TARRAGONA (SPAIN)

B. Deusdad, *Rovira i Virgili University, Tarragona, Spain*

Ageism as a practice associated with housing has not been analysed either by ageism analyses or housing studies, even though it is one of the causes, which prevents ageing-in-place. At the same time, most of the studies agree that older adults prefer to remain at home as long as they can. However, accessibility in dwellings and neighbourhoods is lacking in Western societies, not to mention in developing countries. Moreover, there is not enough housing supply currently to provide the possibility of moving in adapted apartments at an old age. This is clearly also the situation with those users of little or no resources.

Even though an Integral Urban Plan was implemented in Tarragona, most buildings still have accessibility difficulties for older people (no lifts, barriers outside and inside the dwellings), which has consequences for older people trying to maintain an active social life which in turn reinforces an attitude of ageism (forced isolation and loneliness). The city fails to provide care-adapted housing to those in need. Needless to say, there are long waiting lists so as to have access to public care-homes. A *false deinstitutionalization* based on family care and support is taking place with far more severe consequences for older people's ageing-in-place in the future.

DOES DISCOURSE MATTER IN AGEISM?

A. Phelan, *School of Nursing, Midwifery & Health System, University College Dublin, Dublin, Dublin, Ireland*

This presentation examines how ageism is explicitly and implicitly expressed in common discursive activities in everyday life. Using two methods of discourse analysis, Foucauldian discourse analysis and discursive psychology, the paper demonstrates how ageism is produced and reproduced through prevailing macro and micro discourses. Findings indicate that ageism is tacitly interwoven within commonplace narratives through domains such as cognitive, functional and financial dependency and such narratives serve to perpetuate and consolidate both a professional and social marginalization of older people. The paper concludes with the observation that discourse does indeed matter in the context of how we discursively construct older people, which inevitably impacts on how we relate to them and deliver services to them. After attending this session, participants will be able to understand the ways ageism is interwoven in commonplace, taken for granted narratives. In addition, participants will identify how ageist discourse impacts on practice in everyday life.

SESSION 55 (SYMPOSIUM)

DESIGN OF TECHNOLOGIES TO SUPPORT SUCCESSFUL AGING WITH DISABILITY

Chair: W.A. Rogers, *Georgia Institute of Technology*

Millions of people, worldwide, are aging with long-term impairments such as mobility, vision, and hearing impairments. They may have lifelong experience dealing with these limitations but the normative aging process brings additional motor, sensory, and cognitive changes that may lead to disabling conditions. Technology has great potential to support the needs of these individuals but we need targeted design solutions and a multi-pronged approach: (1) Success will depend on understanding user needs for everyday task challenges, in general, as well as for specific tasks such as medication adherence. These are the research topics of the presentations by Gonzalez et al. and Fain et al. (2) We need to test potential design solutions. Sanford et al. will detail a mobile application to support outdoor route planning by people aging with ambulatory disabilities who have comorbid vision loss. Gandy et al. will describe a cognitive game that overcomes barriers of access and provides compelling experiences that motivate and engage older players. (3) Long-term success will come from ensuring that designers consider the unique needs of older adults aging with impairments. Rebola et al. will describe a unique design competition targeted to students, worldwide, intended to inspire talented designers to develop innovative technology-enabled design solutions for the aging population, especially considering the varied abilities and limitations of older adults. These projects are part of the RERC on Technologies to Support Successful Aging with Disability (www.techsage.gatech.edu). This symposium links well with the meeting theme of global aging and health: bridging science, policy, and practice.

AGING CONCERNS, CHALLENGES, AND EVERYDAY SOLUTION STRATEGIES (ACCESS) OF INDIVIDUALS WITH IMPAIRMENTS

E.T. Gonzalez¹, T.L. Mitzner¹, J.L. Singleton¹, W.A. Rogers²,
1. *Georgia Institute of Technology, Atlanta, Georgia*, 2.
University of Illinois at Urbana-Champaign, Champaign, Illinois

Many individuals with long-term impairments use assistive technologies to enable them to participate in everyday activities. As their capabilities change with age, it is crucial to determine if their support needs are still being met, and if not, how to adapt or integrate technology supports. The Aging Concerns, Challenges, and Everyday Solution Strategies (ACCESS) Study provides a comprehensive user needs assessment for older adults with long-term vision, hearing, and mobility impairments. ACCESS is a two-part study comprised of questionnaires (e.g., demographics, health, functional limitations) and an in-depth interview assessing challenges with a range of daily activities and current strategies for overcoming them. Participants are between the ages of 60–79 in each target population (blind/low vision, Deaf/hard of hearing, mobility impaired). Data will provide insights into unmet needs among older adults with long-term sensory and mobility impairments and will provide guidance for the design of supportive technologies for this understudied population.

MEDICATION ADHERENCE FACILITATORS AND BARRIERS FOR OLDER ADULTS WITH DISABILITIES

W.B. Fain, S. Farmer, S. Owens, C. Fausset, A. Foster,
Georgia Tech Research Institute, Georgia Institute of Technology, Waco, Georgia

Medication regimens for older adults with chronic illnesses can be complex and difficult to manage. Approximately 50% of the general population does not adhere to prescribed medication schedules (Lee & Taylor, 2006). Various factors, including medication regimen complexity, cost, and poor patient health literacy interact in complex ways to produce barriers to adherence. Little is known about the medication adherence strategies of people with disabilities aging into secondary disabilities. This study uses an ethnographic approach to identifying facilitators and barriers to medication adherence in a population of 26 older participants with primary visual, hearing, or mobility disabilities. Many technologies designed to facilitate adherence are not viable for this population as they face a set of unique challenges compared to non-impaired older adults. By understanding how and why some patients are successful in managing their own medications, interventions can be developed to support those who are not.

APPLICATION FOR LOCATIONAL INTELLIGENCE AND GEOSPATIAL NAVIGATION (ALIGN)

J.A. Sanford, S. Guhathakurta, S. Melgen, G. Zhang,
S. Mahajan, *Georgia Tech, Atlanta, Georgia*

For people aging with long term ambulatory disabilities, the onset of age-related comorbid functional losses can severely restrict community mobility. The purpose of this project is to develop and evaluate the feasibility of a mobile application (ALIGN) based on static (e.g., sidewalk condition, street networks, land uses) and dynamic (e.g., traffic volumes, weather, and light quality) environmental factors to inform outdoor route planning by people aging with ambulatory disabilities who have comorbid vision loss. Twenty individuals with mobility and vision loss completed initial usability and utility testing with a beta version that limited the number of factors. Based on feedback from the laboratory usability testing, the user interface was refined, including increasing font size, adding a voice command button and a tutorial. Although real world testing demonstrated the utility of the application, results suggested that effectiveness could be increased with more precise and consistent verbal directions and real time information.

DESIGNING “SERIOUS” GAMES FOR OLDER ADULTS: A COGNITIVE TRAINING CASE STUDY

M. Gandy, L.M. Levy, R. Solomon, A. Lambeth, D. Byrd,
Interactive Media Technology Center, Georgia Tech, Atlanta, Georgia

The rising ubiquity of technology in people’s homes and across the world allows researchers to carefully craft game-based interventions for older adults that address serious needs such as physical rehabilitation, social connectedness, and education/training. Cognitive games, and other beneficial interventions, can be pushed, updated, and delivered to existing technology (computers, phones, tablets, smart TVs) overcoming barriers of access and providing compelling experiences that motivate and engage the older players.

However, these interventions must be built upon a foundation of scientific understanding regarding what types of activities will yield the desired “serious” outcomes. While game theming and interfaces must be designed to be accessible, approachable, and compelling for the target audience. Lastly validation of these interventions must be demonstrated via formal user studies. In this paper we present a case study of a multi-year project focused on designing, implementing, deploying, and testing a universally designed cognitive training game.

DEVELOPING A COMPETITION TO ADVANCE TECHNOLOGY DESIGN FOR THE AGING WITH DISABILITY POPULATION

C.B. Rebola, *Rhode Island School of Design, Providence, Rhode Island*

Design and technology can have a significant impact on the aging with disability population, empowering these individuals to sustain independence, maintain health, engage safely in basic activities at home/community, and fully participate in society. Yet, there is a need to increase knowledge, practice about, and availability of effective universally-designed technologies. A competition can be an effective way to tap into a rich, diverse and collective design intelligence to address these issues. The TechSAGE Design Competition 2016 was launched to inspire talented designers to develop innovative technology-enabled design solutions. As part of the competition, judging criteria were framed to guide contestants in the design of technologies. The judging was based on the criteria of promoting independence, integration, implementation, inspiration, and progression, as part of a framework through universal design. This presentation discusses results from the competition by analyzing the entries and judging towards presenting refined criteria for future competitions.

SESSION 60 (SYMPOSIUM)

THE HEALTHY AGING PROGRAM AT THE U.S. CDC: PROMISE AND PROGRESS IN PUBLIC HEALTH

Chair: L.C. McGuire, *Centers for Disease Control and Prevention, Georgia*

Co-Chair: V.J. Edwards, *Centers for Disease Control and Prevention*

With the graying of the U.S. population, there has been an increased recognition in public health to promote healthy aging and address major problems afflicting older Americans. The Centers for Disease Control and Prevention (CDC) has established the Healthy Aging Program (HAP) to serve as the focal point for cross-cutting public health action. Housed in the CDC’s National Center for Chronic Disease Prevention and Health Promotion (NCCDPHP), Program staff work with a variety of partners to increase the reach of their programs and broaden dissemination of their efforts.

For over 10 years the HAP has used the Healthy Brain Initiative as its guide for prioritizing activities. Based upon the public health model, this document enumerates a variety of activities designed to increase awareness of and support for cognitive health. Although this is a new area for public

health, great strides have been made in infusing cognitive health into public health programs.

This symposium will report on the activities of CDC’s HAP. Dr. McGuire will give an introduction to the Healthy Brain Initiative and explain how it serves as a guide for the CDC and state public health agencies. Dr. Taylor will discuss the new data portal for information about aging, and its potential to become a resource for researchers and policy makers. Dr. Edwards will describe surveillance efforts via modules administered via the Behavioral Risk Factor Surveillance Survey (BRFSS). Finally, Ms. French of the Alzheimer’s Association will present examples of CDC’s partnership activities and their impact on the community.

CDC’S HEALTHY BRAIN INITIATIVE: COGNITIVE AGING AND AD/RD FROM A PUBLIC HEALTH APPROACH

L.C. McGuire, *Centers for Disease Control and Prevention, Atlanta, Georgia*

The Center for Disease Control and Prevention’s (CDC) Healthy Aging Program leads the Healthy Brain Initiative to broaden understanding of and support for healthy cognitive aging as a central part of public health practice. The Initiative creates and supports partnerships, collects and reports data, increases awareness of cognitive aging, and promotes adoption of 35 action items detailed in *The Healthy Brain Initiative: The Public Health Road Map for State and National Partnerships, 2013–2018* (<http://www.cdc.gov/aging/pdf/2013-healthy-brain-initiative.pdf>). Because dementia, including Alzheimer’s disease, doesn’t have a cure, identifying and reducing modifiable risk factors is the best approach. The public health community should embrace cognitive aging as a priority, invest in its promotion, and move scientific discoveries to public health practice. This presentation will focus on public health’s role with respect to cognitive health through CDC’s Healthy Brain Initiative and current CDC activities.

AGING-RELATED SURVEILLANCE ACTIVITIES AT THE CDC

V.J. Edwards, L.C. McGuire, C.A. Taylor, *Centers for Disease Control and Prevention, Atlanta, Georgia*

One priority action in “The Healthy Brain Initiative: The Public Health Road Map for State and National Partnerships, 2013–2018” is surveillance of cognitive health issues. CDC’s Healthy Aging Program (HAP) has developed and promulgated the use of two modules, on subjective cognitive decline and caregiving, in the Behavioral Risk Factor Surveillance System (BRFSS). The BRFSS is the world’s largest ongoing telephone health-related survey, collecting data in 50 states and three U.S. territories. The HAP enlisted the help of subject matter experts and used cognitive testing to refine and improve these modules.

State-level data from the modules have been used to inform state Alzheimer’s plan development and implementation, and to create awareness and education about cognitive decline and caregiving through webinars, proclamations, and media events. These data can further the understanding of the public health burden, inform public health policy and strategies, and monitor quality of life for all Americans.

DATA AT YOUR FINGERTIPS: THE CDC HEALTHY AGING DATA PORTAL

C.A. Taylor, L.C. McGuire, *Centers for Disease Control and Prevention, Atlanta, Georgia*

Public health surveillance data are important as they can inform policymakers and health professionals on the current status of conditions, behaviors, and risk factors in a population. The Centers for Disease Control and Prevention National Center for Chronic Disease Prevention and Health Promotion has developed the Healthy Aging Data Portal. This free, publicly accessible online resource provides access to a range of national, regional, and state data on the health of older adults. Users can examine data on indicators such as nutrition and physical activity, screenings and vaccinations, tobacco and alcohol use, and mental and cognitive health.

Portal users may view data by geographic area or indicator, stratify by demographic variables, export data tables, print reports, and create customized maps and charts. The Portal enables policymakers and public health professionals to examine data on the health of older adults in order to enhance awareness and action in public health programming.

COLLABORATION BETWEEN THE ALZHEIMER'S ASSOCIATION AND THE CDC'S HEALTHY AGING PROGRAM

M.E. French, *Alzheimer's Association, Washington, District of Columbia*

The Alzheimer's Association has an ongoing, constructive partnership with CDC's Healthy Aging Program. This presentation highlights two products of this partnership -- state fact sheets and national reports based on the Subjective Cognitive Decline and Caregiving BRFSS modules, and, along with Emory University, the development of an undergraduate curriculum to prepare a competent public health workforce for the growing problem of Alzheimer's disease and other dementias.

BRFSS data can inform population-based responses to dementia. Alzheimer's Association state chapters disseminate state-specific data to local stakeholders and use BRFSS data to promote policy development/change. However, training future health professionals to understand the impact of this growing problem has not received a great deal of attention. To prepare a competent public health workforce, the Alzheimer's Association, CDC, and Emory University developed an undergraduate curriculum entitled, "A Public Health Approach to Alzheimer's and Other Dementias." Results of these joint efforts will be presented.

SESSION 65 (PAPER)

EDUCATION, RACE/ETHNICITY, AND COGNITION

COGNITIVE INEQUALITIES IN LATER LIFE: CROSS-COUNTRY DIFFERENCES IN THE EDUCATION-COGNITION GRADIENT

A. Leist, *PEARL Institute for Research on Socio-Economic Inequality, University of Luxembourg, Esch-sur-Alzette, Luxembourg*

Later-life cognitive function is intrinsically linked to amount and quality of education received in childhood and

adolescence, supposedly by education increasing cognitive reserve. However early cognitive skills also determine how much schooling is received. Current methods cannot disentangle education and cognition. I propose a method to standardize education and comparatively analyze the education-cognition gradient in order to assess if *cross-country differences in later cognitive function reflect earlier educational inequalities*.

Methods: 16,941 respondents to the Survey of Health, Ageing and Retirement in Europe providing at least two measurements (waves 1 to 5) from 16 countries, aged 50–59 were included. Cognitive function was an average of immediate, delayed recall and executive function. Education was standardized by logit-rank transformation, providing information on educational rank. Mixed (random-effects) models were run with covariates and education as fixed effect, random intercept and slope. Empirical Bayes predictors were estimated to investigate the education-cognition gradient.

Results: Cognitive levels were above average in most continental, northern European and some post-communist countries (Slovenia, Estonia), and below average in southern European, Poland, and Israel. Education-cognition gradients were above average in France and post-communist countries (Poland, Slovenia, Czechia), reflecting better average fit of cognitive levels with amount of schooling received. In contrast, continental European countries showed below-average gradients, i.e. higher cognitive inequalities.

Discussion: With this method, the link between education and cognition can be examined more closely. Findings reflect country differences in educational inequalities, i.e. accessibility to higher education independent of socioeconomic status, at the time when this middle-aged cohort was schooled.

EDUCATIONAL DIFFERENTIALS ON LIFE EXPECTANCY WITH AND WITHOUT COGNITIVE IMPAIRMENT IN BRAZIL

F. Andrade¹, M. Lebrao², Y. Duarte², 1. *Kinesiology and Community Health, University of Illinois--Urbana-Champaign, Champaign, Illinois*, 2. *Universidade de Sao Paulo, Sao Paulo, Brazil*

Low educational levels have been linked to cognitive impairment in late life, however the impact of education on cognitive impairment free life expectancy (CIFLE) has not been previously estimated in Brazil. The aim of the present study is to investigate the differences in life expectancy with and without cognitive impairment by educational levels and gender in Brazil. The sample was drawn from the three waves (2000, 2006 and 2010) Health, Well-Being, and Aging Study (SABE) collected in Sao Paulo, Brazil. Participants for whom the Mini-Mental State Examination was available were included (n=2,101). Interpolation of Markov Chains method was used to estimate CIFLE and years spent with cognitive impairment (CILE) by education and gender. CIFLE at age 60 was 12.7 years among men with no education and 16.0 among their educated counterparts. On the other hand, CILE was higher among men with no education than those with education (3.2 and 1.6 years, respectively). Among 60-year old women without education, CIFLE reached 16.0 years, but it was considerably higher among educated women (20.1 years). CILE reached 4.4 years among women

aged 60 with no education, versus 2.4 years women their educated counterparts. Older adults with no education live shorter lives and more years with cognitive impairment than those with education. Older women in Sao Paulo live longer lives, but they live a greater number of years with cognitive impairment.

RACIAL AND ETHNIC DIFFERENCES IN COGNITIVE IMPAIRMENT-FREE LIFE EXPECTANCY IN THE UNITED STATES

M.A. Garcia¹, B. Downer², C. Chiu³, J. Saenz⁴, S. Rote⁵, R. Wong⁶, 1. *University of Texas Medical Branch, Sealy Center on Aging, Galveston, Texas*, 2. *Division of Rehabilitation Sciences, University of Texas Medical Branch, Galveston, Texas*, 3. *Institute of European and American Studies, Academia Sinica, Nankang, Taiwan*, 4. *University of Southern California, Davis School of Gerontology, Los Angeles, California*, 5. *University of Louisville, Kent School of Social Work, Louisville, Kentucky*, 6. *University of Texas Medical Branch, Department of Preventive Medicine and Community Health, Galveston, Texas*

Background: Cognitive impairment and dementia are major health issues confronting older adults. In 2002, approximately 13.9% of people in the United States aged 71 and older had dementia, and 22.2% had cognitive impairment without dementia. Previous research suggests that older African Americans and Hispanics are more likely than older whites to suffer from cognitive impairment and dementia. Despite growing interests in racial/ethnic disparities in cognitive health, less is known about racial/ethnic differences in life expectancy with and without cognitive impairment/dementia.

Methods: This study employs data from 8 waves of the Health and Retirement Survey (1998–2012) to estimate racial/ethnic differences in the transitional probabilities among four states: cognitively normal, cognitively impaired/no dementia, dementia, and death among 32 271 Non-Hispanic Whites, African Americans, U.S.-Hispanics, and Foreign-born Hispanics adults 50 years and older. Sullivan-based multistate life tables are used to estimate life expectancies with and without cognitive impairment and dementia in later life.

Results: Results show that older African Americans and Hispanics spend a larger fraction of their remaining years with cognitive impairment and dementia relative to older whites regardless of gender. Foreign-born Hispanic women and African American males are particularly disadvantaged in the proportion of years spent after age 50 with cognitive impairment and/or dementia.

Conclusions: This issue merits special attention in the development of community-based long-term care programs to appropriately target the specific needs of different minority and immigrant elderly who are entering into their last decades of life.

EXAMINING CHANGES IN COGNITIVE IMPAIRMENT SYMPTOMS AMONG OLDER U.S. BLACK AND WHITE ADULTS

D. Byrd, *Community Health Sciences, UCLA Fielding School of Public Health, Los Angeles, California*

Individuals with increasing cognitive impairment are at risk of developing Alzheimer's or other dementias. Blacks are approximately 2–3 times more likely than whites to have cognitive impairment and these disparities worsen over time. This study examines black-white disparities in cognitive impairment scores among aging adults enrolled in all 5 waves of the Americans' Changing Lives Study (N = 3,617). Cognitive impairment was assessed at each wave using a 5-item Short Portable Mental Status Questionnaire. Multilevel analyses with age as the level-1 variable and other variables at the person-level were conducted. A significant interaction between age-squared and race was found (chi-squared = 6.19, p = .045), indicating that blacks cognitive impairment scores at each wave was significantly higher than whites in the presence of model covariates. Study findings demonstrate clear racial differences in the trajectory of cognitive impairment symptoms over time; whereby, cognitive impairment is more prevalent in later life among blacks.

EXERCISE AND COGNITIVE FUNCTION IN OLDER HISPANIC/LATINO ADULTS: RESULTS FROM THE "¡CAMINEMOS!" STUDY

L. Piedra¹, F. Andrade¹, R. Hernandez¹, S. Boughton¹, L. Trejo³, C.A. Sarkisian², 1. *Social Work, University of Illinois at Urbana-Champaign, Urbana, Illinois*, 2. *David Geffen School of Medicine at UCLA, Los Angeles, California*, 3. *City of Los Angeles Department of Aging, Los Angeles, California*

For this study, we examined the prospective effect of an evidenced-based exercise intervention (¡Caminemos!) on cognitive function among older Hispanic/Latino adults and the potential synergistic effects (if any) of an attribution retraining intervention given to a random sample to counter negative ascriptions of the aging process. We used baseline and follow-up (1- and 2- year) data collected from Hispanics/Latinos ≥60 years (N=571) who participated in ¡Caminemos! across 27 senior centers. All participants were randomly assigned to either: a) treatment group – a 1-hour attribution retraining session + 1-hour exercise class, or b) control group – health education + 1-hour exercise class. Mixed-effects linear regression was used to determine the effects of the exercise class and the attribution retraining component on longitudinal changes in cognitive functioning, as measured by the Modified Mini-Mental State (3MS) Examination. After we adjusted our model for age, sex, education, income and medical comorbidities, participants in both intervention arms displayed higher cognitive functioning scores at the 1-year (b=1.76, p=0.001) and 2-year (b=1.37, p=0.013) follow-up when compared to original baseline scores. However, we found no significant difference in cognitive function between the treatment versus control conditions (b=0.41, p=0.582), nor were any differences found across groups over time. The results indicate that the exercise intervention improved cognitive function in older Hispanics/Latinos, regardless of the supplemental age-related attribution retraining. These findings suggest that limited access to exercise programs may present a greater obstacle in forestalling cognitive decline in older Hispanics/Latinos than the negative beliefs they might hold about the aging process.

SESSION 70 (SYMPOSIUM)

HEALTH AND MENTAL HEALTH ISSUES OF OLDER ADULTHOOD: EVIDENCE BASED TREATMENTS

Chair: N. Kropf, *Georgia State University, Atlanta, Georgia*
Co-Chair: S. Cummings, *University of Tennessee*

Although the population of older adults is experiencing higher levels of health and well-being than previously, there is also the probability that health and social changes will accompany advancing years. Treatment approaches that effectively address health and mental health issues are necessary with the aging of the Baby Boomer generation. Increased aging is not limited to the U.S.; it is a global issue that is reshaping family life and social policy throughout the world.

This symposium will present three evidence based treatment approaches that are effective in addressing challenges of aging. *Psychoeducational and support interventions* are used to help older adults with adjustments to new conditions, create and enhance network bonds, and provide information for skill development. *Problem solving therapy* is a psychological intervention that teaches people to cope with stress of 'here-and-now' problems to reduce negative health and mental health outcomes. Effective problem solving skills are thought to mitigate the probability of experiencing negative health and mental health outcomes when confronted with difficult and challenging events. *Motivational Interviewing* is an approach to counseling that focuses on helping clients resolve ambivalence in an effort to work toward and effect behavioral change. This approach is frequently used to help overcome addictions and develop new ways to function, as in situations where health challenges require different behaviors. For each approach, theories of change, treatment approaches, and application to a case will be presented.

PROBLEM-SOLVING THERAPY FOR OLDER ADULTS

S. Cummings, *University of Tennessee, Knoxville, Tennessee*

Problem solving therapy (PST) is an effective intervention for treating older adults who struggle with stress related health and mental health issues (D'Zurilla & Nezu, 1999; Nezu, Nezu & D'Zurilla 2013). Clients are trained to overcome major obstacles that inhibit effective coping and heighten stress by means of problem identification, generation of solutions, solution implementation, and post-implementation evaluation. Effective problem solving involves the ability to adaptively develop and match helpful solutions to life problems while taking into account internal and external factors that impact the problem (Nezu, 2013). Research documents the effectiveness of PST for use with older adults experiencing a variety of issues ranging depression, anxiety and mild cognitive impairment to cancer, arthritis and post-stroke functioning (Kirkham, Seitz, & Choi, 2015). PST treatment principles and strategies will be presented and the research base reviewed. A case study will highlight the PST treatment approach with older adults.

MOTIVATIONAL INTERVIEWING: AN EVIDENCE-BASED TREATMENT FOR OLDER ADULTS

L. Cooper, *Meharry Medical College, Nashville, Tennessee*

Motivational Interviewing (MI) is a brief client-centered intervention focused on the resolution of ambivalence to

enable patient behavior change. Changes in health behaviors such as drinking, smoking, exercise and diet are often prescribed by physicians for older adults to help improve physical health, combat medical conditions and foster enhanced mood (Rollnick, Miller & Butler, 2008). Lack of compliance, however, is common due to a conflict within the patient regarding the pros and cons of change (Cooper, 2012). MI focuses on helping patients explore and resolve ambivalence by drawing out their intrinsic motivation to and capacity for change (Rosengren, 2009). A growing body of research indicates the efficacy of MI for improving health behaviors and decreasing depression and anxiety among older adults. The research based will be reviewed. MI principles, skills and techniques will be discussed and demonstrated via a case study.

PSYCHOEDUCATIONAL AND SOCIAL SUPPORT INTERVENTIONS WITH OLDER ADULTS

N. Kropf, *Georgia State University, Atlanta, Georgia*

During later life, a number of changes occur that impact health and well-being. Regardless of the reason or whether they are normative or non-normative, the older adult experiencing these changes often needs to modify behaviors, learn new skills, or deal with the psychosocial consequences. Additionally, family members and care providers are also impacted by these changing conditions, which have significance for their own functioning. Two approaches that are used in these circumstances are psychoeducation and social support interventions. While differences and in structure and context exist, the underlying theoretical perspectives of these approaches are comparable with goals and outcomes of enhanced coping, increased competence, and decreased stress. These two treatment approaches will be overviewed, including the methods of practice. Case content of an older woman who is newly diagnosed with a chronic illness will be presented to highlight application of practice principles.

SESSION 75 (SYMPOSIUM)

DEALING WITH TRUNCATION BY DEATH IN LONGITUDINAL ANALYSES OF GERONTOLOGIC OUTCOMES

Chair: T.E. Murphy, *Yale University School of Medicine, Hamden, Connecticut*

Co-Chair: L.C. Barry, *University of Connecticut Center on Aging, Farmington, Connecticut*

Discussant: P.H. Van Ness, *Yale University*

In longitudinal studies of older persons, mortality among participants is common and may bias the associations of primary interest between explanatory variables and non-death outcomes. Appropriate handling of truncation by death in applied gerontologic research depends on factors that include the study objective and the richness of the data resources. We first present simple scenarios illustrating the effect of differing imputational assumptions on associations with several post-discharge functional outcomes from older persons surviving the ICU. This first presentation also emphasizes the need to creatively choose ways of clearly demonstrating how the death of participants influences associations. We proceed

to examine two cases wherein the associations between an explanatory variable and longitudinal outcome are evaluated with both joint and separate modeling. The first examines the association between diagnosis of dementia and count of medications and the second that between the causal effect of vitamin D on count of depressive symptoms. The second example of joint modeling posits the use of g-computation of model parameters to obtain causal effects. Lastly we discuss two-stage multiple imputation and demonstrate some approaches for dealing with the incomplete data, from both attrition and mortality, in longitudinal studies of cognitive outcomes.

ASSOCIATIONS WITH POST-DISCHARGE FUNCTION OF OLDER ICU SURVIVORS: SENSITIVITY TO DEATH

T.E. Murphy^{1,2}, M. Pisani^{1,2}, L. Ferrante^{1,2}, T.M. Gill^{1,2}, 1. *Yale School of Medicine, New Haven, Connecticut*, 2. *Yale Program on Aging, New Haven, Connecticut*

In the Precipitating Events Project, 754 initially non-disabled persons of age 70 years and above have been followed on a monthly basis for over 15 years. Monthly telephone interviews solicit self-reported dependence in ADLs, IADLs, and certain mobility measures. Having recorded all deaths among participants, it allows a very focused examination of the interplay between monthly function and the occurrence of death. Supposing that decedents continued providing data after death, we illustrate how their deaths affect the primary associations of interest between explanatory variables and non-death outcomes over a range of imputational assumptions. We include the following examples on the monthly post-discharge function of survivors of an ICU admission: association between risk factors and time to functional recovery, association between pre-admission frailty and total count of disability among ADLs, IADLs, and mobility, and association between pre-admission frailty and incident discharge to a skilled nursing facility.

ASSOCIATIONS BETWEEN DEMENTIA STATUS AND POLYPHARMACY JOINTLY ACCOUNTING FOR DROPOUT AND DEATH

G. Agogo¹, D. Gnjidic², D. Moga³, H. Allore¹, 1. *Yale School of Medicine, New Haven, Connecticut*, 2. *University of Sydney, Sydney, New South Wales, Australia*, 3. *University of Kentucky, Lexington, Kentucky*

Dropout and deaths may bias associations between exposures and outcomes in longitudinal studies of older patients and may be accounted for by jointly modeling longitudinal outcome and death or dropout. As more seriously ill persons have both a higher likelihood of taking more medications and dying, we present methods to study the association between dementia diagnosis and change in the number of medication. Data from the US National Alzheimer Coordinating Center was used to match participants on year, sex, and age (n=5048; 2524 develop dementia, 2524 controls) who were ≥60 years and observed annually for 3 years (pre-diagnosis, diagnosis and post-diagnosis). One year post-diagnosis, 1532 (30%) participants had dropped out and 710 had died. We compare adjusted results from the joint model with separate models. We will demonstrate whether accounting for dropout and deaths alters the association between dementia and medication use.

COMBINING SHARED PARAMETER MODELS WITH STRUCTURAL MODELS TO OVERCOME DEATH BIAS IN AGING RESEARCH

M. Shardell, *National Institute on Aging, Baltimore, Maryland*

Bias from death is common in longitudinal studies of older adults. The problem is even more complex when researchers aim to estimate causal effects when time-dependent confounding is present. To address this problem, we propose fitting shared-parameter models for the study outcome and mortality. To obtain causal effects, we perform g-computation on model parameters. SAS PROC NL MIXED code enhances the method's usability. We illustrate the approach to study 25-hydroxyvitamin D [25(OH)D] and affect in observations occurring every three years from participants enrolled in the InCHIANTI study. Among 1,203 participants aged ≥ 60 years; 143, 298, and 435 participants died prior to first, second, and third follow-up visits, respectively. 25(OH)D < 20 ng/mL at all visits was associated with 2.61 worse mean affect, measured by Center for Epidemiologic Studies Depression Scale (95% Confidence Interval [CI] 0.97—4.26). In contrast, conventional linear mixed effects models with g-computation estimated a larger effect (2.94; 95% CI 1.34—4.54).

ANALYSIS OF LONGITUDINAL DATA OF OLDER ADULTS WITH ATTRITION AND MORTALITY

O. Harel, *University of Connecticut, Storrs, Connecticut*

Participant attrition and differential mortality within longitudinal studies pose serious problems for obtaining inferences about a population of aging individuals. Attrition and mortality are often highly related to aging-related outcomes. Inferences regarding aging-related changes are better defined as conditional on the probability of surviving and/or remaining in the study. Current state-of-the-art approaches rely on statistical assumptions of missing at random (MAR) where the probability of missing information is related to covariates and/or previously measured outcomes. However, death causes an individual to leave the population of interest whereas attrition from a study does not (though these are not unrelated processes). Recent statistical methods focus on deriving estimates of aging-related changes that are conditional on the mortality and attrition-related processes. We use two-stage multiple imputation and demonstrate some approaches for dealing with the incomplete data, attrition and mortality on cognitive outcomes in longitudinal studies of aging.

SESSION 80 (SYMPOSIUM)

GAIT REHABILITATION PROGRAMS AND AGING: NEW ADVANCES FROM THE CANADIAN GAIT CONSORTIUM

Chair: O. Beauchet, *McGill University, Montreal, Quebec, Canada*

Co-Chair: L. Bherer, *University of Montreal, Montréal, Quebec, Canada*

Discussant: J. Barden, *University of Regina, Regina, Saskatchewan, Canada*

This symposium will present recent advances in gait rehabilitation (GR) programs in older adults. Gait is the medical

term use to describe human bipedal locomotion. Gait impairment leads to unsafe gait and several adverse consequences such as falls.

GR is the act of restoring safe gait. It is a key component of preventive, symptomatic and curative interventions of gait impairment. Physical activity and exercises are the main component of GR. Several trials have suggested that physical exercises also protect against cognitive decline. But the question of the best outcome to determine the GR effects remains to determine.

Recent advances in the understanding of mechanisms of age-related gait impairment, like interaction between gait and cognition or the key role of vitamin D deficiency, raise the development of innovative and creative GR programs not only based on physical activity. An improvement of physical performance and fall reduction have been reported with vitamin D supplementation. It has also been reported that motor imagery, defined as mentally simulating a given action without actual execution, combined with physical exercises resulted in a more significant improvement of motor performance than physical exercises alone. New GR programs based on merging mental tasks, physical exercises and vitamin D supplementation are developed. In addition, new technology like software on electronic devices playing the role of virtual coach or corresponding to interactive video games has now been used to promote physical activity and change exercise behavior.

OUTCOME FOR GAIT REHABILITATION PROGRAM: BIDIRECTIONAL ASSOCIATION BETWEEN GAIT SPEED AND COGNITION

J. Best, *University of British Columbia, Vancouver, British Columbia, Canada*

Few cohort studies examined longitudinal associations between age-related changes in cognition and physical performance. Over 9-year period 2876 participants, who were initially well-functioning community-dwelling older adults (aged 70–79 years at baseline; 52% female; 39% black), were followed. Usual gait speed, Digit Symbol Substitution Test (DSST) and Mini-Modified Mental State examination (3MS) scores were assessed years 0, 4, and 9. Early decline between years 0–4 in gait speed predicted later decline between years 4–9 in performance on the 3MS ($P=.004$) and on the DSST ($P<.001$). The associations between early decline in cognition and later decline in gait speed were weaker and were non-significant after correcting for multiple comparisons ($P=.019$ for 3MS and $P=.051$ for DSST). The results indicate declining gait speed as a precursor to declining cognitive functioning, and suggest a weaker reciprocal process among older adults confirming that improvement of gait speed if a good outcome for gait rehabilitation program.

HYPOVITAMINOSIS D, VITAMIN D SUPPLEMENTATION, AND CHANGES IN GAIT: WHAT HAVE WE LEARNED?

O. Beauchet, *Medicine, McGill University, Montreal, Quebec, Canada*

Gait disorders are caused by physiological system impairments that depend in part on vitamin D-related metabolic processes. The association between hypovitaminosis D and gait instability may be explained by adverse effects on the

neuromuscular system as well as on central nervous systems, and in particular by impairment of the highest levels of gait control. However, the association between hypovitaminosis D and gait instability still needs to be investigated. Indeed, observational studies show mixed results, as some studies reported a significant association between low serum 25OHD concentration and poor muscle performance, while other not. Like observation studies, intervention studies have demonstrated discordant results. Some clinical trials found a significant vitamin D-related improvement in physical performance, while others failed to show any effect of supplementation. The results suggest that vitamin D supplementation alone is not sufficient to improve gait performance, and thus should be combined with physical or mental exercises.

DUAL-TASK TRAINING PROGRAM FOR OLDER ADULTS: BLENDING GAIT, VISUOMOTOR AND COGNITIVE TRAINING

T. Szturm, *University of Manitoba, Winnipeg, Manitoba, Canada*

Gait and cognitive impairments, which are common with ageing often coexist, causing a reduction in the levels of physical and mental activity and are prognostic of future adverse health events and falls. Multi-task training that simultaneously addresses both mobility and cognition benefit healthy ageing are important to consider in gait rehabilitation. An exploratory Randomized Control Trial was conducted to describe the feasibility and acceptability of a dual-task treadmill walking programs delivered in the community, and to obtain preliminary data on the effectiveness of the Multi-task training intervention. Twenty-four community-dwelling older participants aged 70–85 and with history of falls were recruited. Outcome included measures of gait under single and dual task conditions. Dual task conditions included computerized visuomotor and visuospatial cognitive activities. Results demonstrated the feasibility of the dual-task treadmill training programs in the community, and the system's ability to improve dual task gait and visuospatial cognitive functions.

SMARTPHONE ACCELEROMETRY FOR GAIT VARIABILITY ASSESSMENT AND REHABILITATION IN OLDER ADULTS

J. Barden, *University of Regina, Regina, Saskatchewan, Canada*

This session will focus on the use of body-fixed sensors (particularly accelerometers) to assess gait variability in older adults. An overview of different gait variability measures and processing methods will be provided (e.g., gait symmetry, stride regularity, fractal structure) including information on the relationship of these measures to diminished gait capacity and fall risk in older adults with and without physical impairments. This session will also present information on the advantages to be gained from using Smartphone technology for the purpose of gait variability assessment and monitoring in and out of the clinic. The potential application of using Smartphone technology as a clinical tool to assess various aspects of gait control and stability for the purpose of evaluating physical activity intervention (i.e., gait rehabilitation programs) will also be discussed.

COGNITIVE TRAINING, PHYSICAL EXERCISE, AND COMBINED INTERVENTION TO IMPROVE GAIT IN OLDER ADULTS

L. Bherer, *Concordia University, Montreal, Quebec, Canada*

A great amount of research in the past decades was oriented towards finding effective ways to enhance cognitive functioning and mobility in older adults. Physical exercise and cognitive training have shown great benefits for cognitive functioning, gait and posture in the older adults population. More recently researchers have investigated the potential synergetic effect of more than one approach for preventing cognitive decline. This talk will present recent findings from cognitive training and exercise intervention on cognitive and gait outcomes. Results from a combined intervention trial will also be presented and discussed in the context of expected synergetic effect of exercise and cognitive intervention to improve gait in older adults.

SESSION 85 (SYMPOSIUM)

PAIN AND RELATED SITUATIONS SURROUNDING OLDER ADULTS: AN INTERNATIONAL PERSPECTIVE

Chair: M. Tse, *The Hong Kong Polytechnic University, Hong Kong*

Co-Chair: A. Budnick, *Charité - Universitätsmedizin Berlin, Berlin, Berlin, Germany*

Discussant: B.S. Husebø, *University of Bergen, Bergen, Hordaland, Norway*

Chronic pain is common among ageing population. Fifty per cent of older people in the community and up to 80% of nursing home residents experience chronic pain. Chronic pain significantly impairs both physical and psychological well-being. Pain has never been adequately managed. Due to concerns about the side-effects of continuous analgesic use, only 20% of older adults take pain-relief medications. Individuals who suffer from pain is more likely to develop a sense of loneliness, fear, anger, depression and anxiety, which may lead to more severe mental health problems, if not addressed properly and in time. Indeed, unrelieved pain impact on individual and the society, which further increase the burden of medical and social services.

The Gate Control Theory describes pain in sensory, affective and cognitive dimensions; of which pain modulation can be achieved according to these dimensions. Brain region involved in pain perception, the anterior cingulate cortex, is less activated with social attachment, which in turn is associated with more pain, and vice versa. Therefore, creative, innovative and the use of social capital are important features in pain management.

The symposium will present innovative approaches in managing pain among older adults in China, Germany, Norway and Japan, including the use of peer volunteers to lead pain management program for older adults; the use of play activities in managing pain for dementia older adults, and an interdisciplinary approach aiming to reduce pain among nursing home residents.

THE USE OF PEERS IN LEADING PAIN MANAGEMENT PROGRAM FOR NURSING HOME RESIDENTS WITH CHRONIC PAIN

M. Tse, *School of Nursing, The Hong Kong Polytechnic University, Hong Kong*
IAGG 2017 World Congress

To examine the feasibility of a peer-led pain management program among nursing home residents. A quasi-experimental study in two nursing homes (with 50 nursing home residents) joined the study. Experimental group (n=32) was given a 12-week group-based peer-led pain management program. Education in pain and demonstrations of non-pharmacological pain management strategies were provided led by twelve trained peers. Control group (n=18) received pain management program each week over 12 weeks from the research team.

A significant reduction in pain intensity, activities of daily living, increased in happiness level for the experimental group ($p < 0.001$), while loneliness level dropped significantly for experimental group ($p < 0.001$) and not the control group. Peer volunteers showed a significant increase in self-rated pain management knowledge and self-efficacy in volunteering. Peer-led pain management program was feasible and has potential at relieving the chronic pain and enhancing the physical and psychological health of nursing home residents.

INTERDISCIPLINARY PAIN MANAGEMENT IN GERMAN NURSING HOMES—FINDINGS FROM A CRCT

A. Budnick¹, R. Kreutz², D. Draeger¹, 1. *Charité - Universitätsmedizin Berlin, Institute of Medical Sociology and Rehabilitation Science, Berlin, Germany*, 2. *Charité - Universitätsmedizin Berlin, Institute of Clinical Pharmacology and Toxicology, Berlin, Germany*

Pain management for nursing home residents (NHR) is important and needs more than a mono-disciplinary perspective. At least one in two German NHR suffer from pain. The extent of non-pharmacological therapies (NPT) used for pain management in NHR is rather low. Moreover, pharmacological pain management is often inappropriate. Scientists from six disciplines developed an intervention aiming to improve pain management skills in nursing staff and physicians. We performed a cluster-randomized controlled trial in twelve nursing homes. Pain management was analyzed before (T0, n=239) and after the intervention (T1, n=206; T2, n=177) in NHR aged ≥ 65 years. At baseline, 82.6% of NHR (mean age 82.9 ± 8.1 years) were affected by pain. At follow-up, the intervention resulted in an increase in prescribed NPT and a decrease ($p=0.03$) in the proportion of NHR without pain medication. The observed benefits of and methodological challenges in this interdisciplinary trial will be critically discussed.

THE RESPONSE OF AGITATED BEHAVIOR TO PAIN MANAGEMENT IN PERSONS WITH DEMENTIA. RCT TRIAL

B.S. Husebø¹, C. Ballard², J. Cohen-Mansfield³, D. Aarsland², 1. *Global Public Health and Primary Care, University of Bergen, Bergen, Hordaland, Norway*, 2. *Kings College, London, United Kingdom*, 3. *University of Tel-Aviv, Tel-Aviv, Israel*

Behavioral disturbances and pain are common in nursing home (NH) patients with dementia. Reduction of agitation by pain treatment was demonstrated. It is, however, unclear which specific agitated behaviors respond to analgesics. 352 patients with advanced dementia and behavioral disturbances were included from 60 clusters of 18 Norwegian NHs. According to a pre-defined scheme for 8 weeks,

intervention groups received individual pain treatment with acetaminophen, morphine, buprenorphine patch, and/or pregabalin. Control groups received usual care. We used linear random intercept mixed model in two-way repeated measure with adjustment for heteroscedasticity. Assessed by Cohen-Mansfield Agitation Inventory (CMAI), verbally agitated behaviors (factor 3), such as complaining, negativism, and/or cursing or verbal aggression, showed largest significant difference ($p < 0.001$), followed by physically non-aggressive behaviors (Factor 2) ($p = 0.008$), and aggressive behaviour (Factor 1) ($p = 0.037$) after 8 weeks. Especially, restlessness and pacing were sensible to analgesics, and should lead to assessment and treatment of pain.

IMPROVING FUTURE INTERDISCIPLINARY PAIN MANAGEMENT FOR OLDER ADULTS FROM STUDENTS' PERSPECTIVE

Y. Kodama^{1,4}, H. Fukahori¹, N. Yamamoto-Mitani², A. Ishii³, M. Tse³, 1. *Graduate School of Health Care Science, Tokyo Medical and Dental University, Tokyo, Japan*, 2. *School of Integrated Health Sciences, Faculty of Medicine, Tokyo University, Tokyo, Japan*, 3. *School of Nursing, The Hong Kong Polytechnic University, Kowloon, Hong Kong*, 4. *School of Nursing and Rehabilitation Sciences, Showa University, Yokohama, Japan*

Pain management for older adults should be provided through both pharmacological and non-pharmacological interdisciplinary methods. Healthcare students' perspectives regarding pain management might influence the quality of future care they provide to older adults. This study explored pain management strategies, knowledge, and education by surveying Japanese university students specializing in the healthcare sciences. We obtained 661 (44.4%) responses. The preferable strategy was a combination of pharmacological and non-pharmacological care (38.7%), particularly among nursing students (51.5%). A total of 563 (87.7%) students had not received pain management education during the past two years, and 404 (63.7%) desired more education. Pain medication knowledge was low to moderate; it was higher among medical students ($p < 0.05$). Poor pain management knowledge may affect the quality of care students provide to older adults after graduation. Support for older adults should be improved by further developing pain management education by considering the differences among disciplines.

EFFICACY OF PLAY ACTIVITY PROGRAM TO ALLEVIATE CHRONIC PAIN IN OLDER ADULTS WITH DEMENTIA

J.L. Lau, M. Tse, *The Hong Kong Polytechnic University, Kowloon, Hong Kong*

Dementia is known to be one of the leading causes of diminished quality of life in older adults. Pain is the leading contributor to disability in older adults with dementia. However, attention given to non pharmacological pain management of older adults with dementia is limited.

This study aims to investigate the efficacy of play activity program to relieve chronic pain among the older adults with dementia.

It is a pre and post interventional study. A total of 10 clients, included 5 males and 5 female joined the study. Their mean age was 79.1 and diagnosed mild (MMSE mean score

22.1) to moderate dementia (MMSE mean score 17). Mean pain score was 8.3 (moderate pain) as measured by Abbey pain scale. A play activity program was given 2 sessions per week for 3 weeks. Each session includes 25 minutes of physical exercises, 15 minutes of artworks and 5 minutes wrap up activities.

At the post-intervention assessment, the mean pain score of the dementia clients was decreased from 8.3 to 7.6. An improvement on the behavior, an increased socialization and eye contact between the dementia clients were observed. The program has promoted better health outcomes for dementia clients which will be discussed critically.

SESSION 90 (PAPER)

DETECTING AND MEASURING FRAILTY II

SIMPLE RESPIRATORY MEASUREMENTS FOR THE SCREENING OF FRAILTY IN LOW-MIDDLE INCOME COUNTRIES

E.O. Hoogendijk³, T. Flores Ruano⁴, P. Kowal², U. Perez-Zepeda⁵, E. Dent¹, 1. *School of Medicine, The University of Queensland, Woolloongabba, Queensland, Australia*, 2. *World Health Organisation, Geneva, Switzerland*, 3. *VU University Medical Center, Amsterdam, Netherlands*, 4. *Department of Geriatrics, Albacete University Hospital, Albacete, Spain*, 5. *Geriatric Epidemiology Research Department, Instituto Nacional de Geriatria, Mexico City, Mexico*

Frailty in older adults is characterised by a reduced capacity to cope with external stressors across multiple physiological systems. The respiratory system is particularly vulnerable to external stressors (respiratory infections, allergies, and smoking) and in turn, an individual's respiratory capacity may provide a simple means for the identification of frailty. This study assessed the ability of spirometry measurements to screen for frailty in the World Health Organisation (WHO)'s global Study of AGEing (SAGE). The SAGE database provided data on 42,487 people aged over 50 years across six low-middle income countries: China, Ghana, South Africa, India, Russia and Mexico (Wave 1: 2013 – 2015). Frailty was classified using Fried's frailty criteria. Spirometry measurements included Forced Expiratory Volume in 1 second (FEV1), Forced Vital Capacity (FVC), and FEV1/FVC. The ability of spirometry measurements to accurately identify frailty was determined by several efficacy measurements: area under receiver operator characteristic (ROC) curves (auROC), sensitivity and specificity, positive and negative predictive values (PPV and NPVs), and Youden Index (YI) score. We found that FEV1, FVC and an FEV1/FVC ratio $< 80\%$ all showed high discriminatory ability in accurately identifying frailty, independent of chronic respiratory conditions. Results from this study indicate that spirometry measurements can be used to screen for frailty in older adults residing in the community.

EVIDENCE FOR THE LATENT FACTOR STRUCTURE OF FRAILTY

L. Young, D. Sheets, B. Gali, S.W. MacDonald, *Nursing, University of Victoria, Victoria, British Columbia, Canada*

Despite increasing demand to support ‘aging in community’ for frail seniors, there is no gold standard frailty measure to guide frailty assessments by health professionals. Current frailty measures are not sensitive enough to support effective screening and thus negatively impact health professional decision-making during their care of seniors living in the community. The aim of this study is to investigate the latent structure of frailty to inform refinement of existing frailty measures for seniors living in the community to develop a robust measurement tool. Using data from Canadians ≥ 65 who were participants in the national Canadian Longitudinal Study on Aging (CLSA) (2012–2015), we assessed factors for the latent structure of three frailty scales (Rockwood’s Frailty Index, Fried’s Frailty Criteria and the Edmonton Frailty Scale). Using structural equation modelling we explored the relationship between frailty and factors across physical, psychological, social, and clinical domains. Structural equation models were developed to identify factors for the latent structure of frailty. Our models ($n=30,111$) highlight several key factors common among the three frailty scales including: age, sex, dementia, Activities of Daily Living (ADL), Instrumental ADLs (IADL), and cognition. Robust frailty assessments are key to effective health professional decision-making in support of ‘aging in community’ initiatives.

FRAILITY AND THE BLOOD PRESSURE RESPONSE TO THE STRESSOR OF HEMODIALYSIS AMONG OLDER PATIENTS

M. McAdams De Marco¹, H. Ying², I. Olorundare², A. Gross¹, Q. Xue¹, J.D. Walston², K.J. Bandeen-Roche¹, D. Segev², 1. *Johns Hopkins University School of Public Health, Baltimore, Maryland*, 2. *Johns Hopkins School of Medicine, Baltimore, Maryland*

Frailty is a multi-system dysregulation resulting in a vulnerability to stressors; yet evidence for this hypothesis is lacking. Hemodialysis represents a great stressor for older adults with ESRD. Sympathetic nervous system (SNS) activation is an essential compensatory mechanism for intradialytic blood pressure (iSBP/iDBP) maintenance. Frailty was measured on 163 older hemodialysis patients and pre- and post-dialysis BP measures were collected. We used adjusted linear and logistic regression to test for a difference in the pre- and post-dialysis change in SBP and DBP by frailty status. In a separate cohort, frailty was measured on 15 hemodialysis older patients who had 10 intradialytic BP measures and we used an adjusted linear growth curve model to test the association between frailty and iSBP as well as iDBP. Frail dialysis patients had a greater change in their SBP (-4mmHg; $p=0.24$) and DBP (-7mmHg; $p=0.001$) while on dialysis. In adjusted analyses, those who were frail had a 1.95-fold (95%CI:1.01–3.76; $p=0.047$) increased odds of a 15mmHg decline in SBP and 3.7-fold (95%CI:1.89–7.33; $p<0.001$) increased odds of a 5mmHG decline in DBP while on dialysis. For those who were frail, the rate of iSBP change was -2.93mmHG/30minutes ($p=0.05$) compared to -1.23mmHG/30minutes ($p=0.22$) for those who were nonfrail. Similar results were observed for iDBP (frail: -2.15mmHG/30minutes [$p=0.01$] vs. -0.68mmHG/30minutes [$p=0.21$]). Frailty represents a state of SNS dysregulation for patients in which adults undergoing the stressor of hemodialysis have a poor SBP and DBP response. This is the first

evidence of SNS dysregulation among frail patients with ESRD.

CIRCULATING BIOMARKERS PREDICT INCIDENT FRAILITY: THE IRISH LONGITUDINAL STUDY ON AGEING (TILDA)

A.M. O’Halloran¹, E.A. Laird¹, M. Healy², R. Moran³, J. Nolan³, S. Beatty³, A. Molloy¹, R. Kenny^{1,2}, 1. *Trinity College Dublin, Dublin, Ireland*, 2. *St. James’s Hospital, Dublin, Ireland*, 3. *Waterford Institute of Technology, Waterford, Ireland*

Blood biomarkers have been linked to phenotype frailty in several cross-sectional and fewer longitudinal studies. We examined whether blood biomarkers were associated with incident frailty at two years using three frailty instruments. Secondary data analyses were performed in adults aged 50+ years ($n=3,379$) from the Irish Longitudinal Study on Ageing (TILDA). Biomarkers of micronutrient status (vitamin B12, vitamin D, lutein and zeaxanthin), inflammatory stress (CRP), metabolic function (HbA1c, Total, HDL and LDL cholesterol) and renal function (creatinine and cystatin c) were measured at baseline. Pre-frailty and frailty were measured at baseline and two year follow-up using the Phenotype Frailty, Frailty Index and FRAIL Scale instruments. Logistic regressions computed associations between baseline biomarkers and combined incident prefrailty/frailty using the three frailty instruments at follow-up. Incident prefrailty/frailty was 21.1%, 15.6% and 13.8% for the Phenotype, Frailty Index and FRAIL Scale respectively. Lower vitamin D at baseline correlated with incident prefrailty/frailty for the phenotype (OR:0.99, $p<0.05$) and FRAIL Scale (OR:0.99, $p<0.05$) instruments. Higher CRP at baseline correlated with incident prefrailty/frailty for the phenotype (OR:1.01, $p<0.01$) and FRAIL Scale (OR:1.01, $p<0.05$) instruments. All analyses were adjusted for age, age², sex, education, smoking status, BMI, and the number of medications and supplements taken regularly. Only vitamin D and CRP were significantly associated with increased risk of transitioning into prefrailty/frailty over two years, for more than one frailty instrument. This highlights the importance of vitamin D sufficiency in this at risk group, and the importance of how we chose to measure frailty in older adults.

VALIDITY OF FRAILITY PHENOTYPE CRITERIA USING QUADRICEPS STRENGTH TO REPRESENT MUSCLE POWER

P. Assantachai, S. Intalapaporn, W. Muangpaisan, D. Pisarnsalakit, S. Udompunturak, *Preventive & Social Medicine, Faculty of Medicine Siriraj Hospital, Bangkok, Thailand*

Frailty detection among older people is needed to prevent subsequent disability or premature death. Although hand-grip strength is used in frailty phenotype criteria, some older people cannot perform the measurement. Since quadriceps strength has been proposed as an alternative indicator to represent muscle power in sarcopenia diagnosis. So, we have investigated the validity of frailty phenotype criteria using quadriceps strength.

During the first year of study, a total of 3,122 subjects aged 50 years old or more were recruited. The mean age was 64.8 ± 8.2 years. By using the modified criteria, 1490 cases

(47.7%), 1448 (46.4%) and 184 (5.9%) were robust group, pre-frail group and frail group, respectively. Among the frail group, 19.6% and 80.4% were men and women, respectively. With multiple logistic regression analysis, deformity (OR 1.96, 95%CI: 1.28–3.01), diabetes mellitus (OR 1.88, 95%CI:1.19–2.97), increasing age (OR 1.09, 95%CI:1.06–1.12), decreasing body weight (OR 0.94, 95%CI:0.91–0.97), increasing hip circumference (OR 1.05, 95%CI: 1.01–1.09), lower bone stiffness (OR 0.98, 95%CI:0.96–0.998), lower albumin (OR 0.46, 95%CI:0.22–0.95), longer 5-chair stand test (OR 1.05, 95%CI:1.02–1.07), poor ADL(OR 1.11, 95%CI:1.08–1.14) and poor quality of life (OR 0.93, 95%CI:0.91–0.95) were independent factors that determined frailty. When we measured the outcomes and characteristics of the frail group on the second year of follow-up, various adverse indicators and outcomes including death were found more frequent within frail group with statistical significance.

In conclusion, the frailty phenotype criteria using quadriceps strength was also an effective tool to identify those who were frail and not able to do handgrip strength measurement.

SESSION 95 (PAPER)

INTERNATIONAL PERSPECTIVES IN HOME CARE

HOSPITAL-AT-HOME INTEGRATED CARE PROGRAMME FOR DISABLING HEALTH CRISES IN CATALAN OLDER ADULTS

M.À. Mas^{1,2}, M. Inzitari^{1,3}, S. Sabaté⁴, R. Miralles^{1,5}, S.J. Santauegènia², 1. *Universitat Autònoma Barcelona, Barcelona, Catalonia, Spain*, 2. *Badalona Serveis Assistencials, Badalona, Catalonia, Spain*, 3. *Parc Sanitari Pere Virgili, Barcelona, Catalonia, Spain*, 4. *Fundació Puigvert, Barcelona, Catalonia, Spain*, 5. *Parc de Salut Mar, Barcelona, Catalonia, Spain*

In older patients with health crises, complex interventions are needed not only to provide acute treatments but also for post-acute care. In vulnerable patients, usual care includes acute hospitalisation and admission to geriatric rehabilitation units. Evidence supports hospital-at-home acute care but little is known about its use on acute disability. Based on a review of international experiences, we created a community resource as alternative to acute and post-acute inpatient care, for older patients living in the urban area of Barcelona.

We present data of a cohort of 244 hospital-at-home patients, comparing it with 605 matched inpatient care patients of a post-acute care unit. Clinical characteristics were similar between groups (home vs. inpatient, mean [95% IC] or %) including: age (83.8 [82.9–84.6] vs. 83 [82.4–83.6], $p=0.160$), Barthel Index at admission (41.5 [38.4–44.6] vs. 42.6 [40.7–44.5], $p=0.527$), delirium (16.8% vs. 13.4%, $p=0.197$), with differences in length of acute stay (6.1 [5.3–6.9] vs. 11.2 [10.5–11.9] days, $p < 0.001$). Main outcomes included: a. Health Crisis Resolution (patient at home at the end of intervention); b. Functional Resolution: Relative Functional Gain (functional gain/functional loss) $\geq 35\%$; c. Health Crisis Resolution with Functional Resolution. In the matched analysis, there were non significant differences in Health Crisis Resolution (home vs. inpatient) groups, OR [95% IC] 1.159, [0.777–1.729]. Hospital-at-home obtained

significant better outcomes on Functional Resolution (1.586 [1.067–2.358]) and Health Crisis Resolution with Functional Resolution (1.486 [1.029–2.147]), with shorter length of intervention (mean difference [95% IC], days) -5.813 [-9–849 to -1.778]. In conclusion, the new model obtained more efficient clinical outcomes.

DERIVATION OF FRAILTY INDEX FROM THE RAI—HOME CARE ADAPTED FOR SWITZERLAND

C. Ludwig¹, C. Busnel², 1. *School of Health Sciences - Geneva, Geneva, Geneva, Switzerland*, 2. *Genevese Institution for Homecare (imad), Carouge, Switzerland*

Since 2006, Swiss home care services have been advised to use RAI-HC adapted for Switzerland for defining individualized care plans. This instrument surveys a wide array of health domains that can be considered for the derivation an index of frailty (IF) according to the accumulation of deficit perspective. The data were collected in Geneva, Switzerland by the Genevese institution for homecare (imad) during the year 2015. Over this period, 3'839 individuals aged ≥ 65 years received the RAI-HC at admission. Among them 97.3% had no missing data and were considered for the analysis. The sample consisted in 3'736 individuals (67.8% females) aged 82.7 (± 7.7) years. The IF was derived from a set of 52 variables for which deficits were scored and computed according to the published guidelines (Searle et al. 2008). Results show that the IF is distributed normally, with a mean of .24 ($\pm .13$), an interquartile range of .16 and values of .04 at percentile 1 and .63 at percentile 99. Age effect was significant ($R^2=0.12$, $p < .001$), yet with a slope of .002 (95% CI of .001 to .002). The result supports the feasibility of deriving a frailty index from data collected with the Swiss RAI-HC and replicate previous findings using inter-RAI Home Care (Armstrong et al. 2010) and Acute Care (Hubbard et al. 2015) instruments. This procedure allows implementing a frailty estimation directly from the patients' assessment done in clinical routine, thus offering a frailty estimate without additional time of assessment.

THERAPEUTIC SELF-CARE IS AN ENABLING FACTOR THAT PROMOTES THE SAFETY OF OLDER ADULTS IN HOME CARE

W. Sun^{1,2}, 1. *Nursing, University of Toronto, Lindsay, Ontario, Canada*, 2. *University of Ontario Institute of Technology, Oshawa, Ontario, Canada*

The purpose of this mixed methods study was to examine the concept of therapeutic self-care in the context of home care safety, as well as its influence on the safety of older adults and their informal caregivers in home care.

The quantitative approach used a retrospective cohort design and utilized secondary databases for Ontario home care clients from the years 2012 to 2014. Logistic regression was used to examine the association between therapeutic self-care and adverse events. Qualitative interviews were conducted with the clients and their informal caregivers to generate themes about their perspectives of home care safety in relation to therapeutic self-care and informal caregiving.

Quantitative findings indicated that low therapeutic self-care ability was associated with an increase in the odds of clients experiencing: (1) unplanned hospital visits; (2) decline

in activities of daily living; (3) falls; (4) unintended weight loss, and (5) non-compliance with medication. Qualitative interviews revealed four over-arching themes: (1) Struggling through multiple aspects of safety challenges; (2) Managing therapeutic self-care by developing knowledge, competency and self-confidence; (3) Coping with informal caregiving through problem-solving, stress management and caregiver relief; (4) Seeking education, support and collaboration from home care.

This mixed methods study points to the importance of therapeutic self-care ability as an enabling factor in promoting the safety of older adults in home care. This knowledge is vital to the quality improvement in home care services that focuses on the enablement of therapeutic self-care to reduce the safety related risks and burden for home care recipients.

TEAM-MANAGED HOME-BASED PRIMARY CARE IN SINGAPORE: A CASE SERIES THAT DEMONSTRATES COST SAVING

W. Ng, K. Yea, F. Mok, Z.Z. Lim, *Tsao Foundation, Singapore, Singapore*

Home-based care is commonly perceived as costly and limited in reach. This paper investigates cost savings (or the lack of it) generated from a Singapore-based medical home-care called 'Hua Mei Mobile Clinic' (HMMC), which has been in operation since 1993. HMMC is an initiative from Tsao Foundation, a non-governmental organization that has a vision for assisting the elders 'to be a master of one's destiny and 'to have meaning in life even when one is near the end of it'. Elders recruited to HMMC are generally of advanced age, having multiple comorbidities and needing intensive health and social interventions. The core features of HMMC are: Primary Care Approach; Comprehensive Needs Assessment; Interdisciplinary Team care processes; Regular Team Communication; and 24/7 Access. **Method:** Pre- and post-HMMC enrolment health utilization data were studied for elders who fulfilled the following criteria: 1) enrolled to HMMC from 1st January 2013 to 31st December 2015 for six months or more; 2) health utilization data were accessible from HMMC electronic medical records. Pre- and post-enrolment data were then compared. **Results:** 62 elders were included in the study. There was a reduction in Emergency Department attendance by 62%; reduction in acute hospital admissions by 54%; as well as reduction in length of hospital stay 83%. **Conclusion:** HMMC had demonstrated cost savings in terms of the reduction in the use of tertiary health care resources. This study would be developed into a cost-benefit analysis to compare such cost saving with the cost of operating HMMC.

24-HOUR CARE: WORK AND SLEEP CONDITIONS AMONG FILIPINO LIVE-IN CAREGIVERS IN LOS ANGELES

J. Nazareno¹, K. Riley², S. Malish¹, 1. *Center for Gerontology, Brown University, Providence, Rhode Island*, 2. *University of California, Los Angeles, Los Angeles, California*

Live-in formal caregivers spend consecutive days in patients' homes, raising questions about their ability to secure adequate sleep while on duty. Few studies have examined

sleeping conditions and outcomes for this growing workforce. We collected weeklong sleep logs and interview data from 32 Filipino caregivers in Los Angeles who provide live-in services at least three consecutive days per week. We also utilized the Upworth Sleepiness Scale (ESS). Respondents recorded an average of 6.4 hours of sleep during workdays divided over 2.5 sleep periods. Caregivers reported significantly lower quality sleep while at work; more than 40% indicated excessive daytime sleepiness based on ESS scores. Female caregivers reported worse sleep outcomes than their male counterparts; some variations in sleep outcomes were also found by employment arrangements. Live-in caregivers experience frequent sleep interruptions at all hours of the day and night to attend to patients' needs. The resulting impacts on sleep quality pose risks for both work-related injury and errors in patient care.

SESSION 100 (PAPER)

FUNCTIONAL AND INTELLECTUAL DISABILITIES IN OLDER ADULTS

COHORT EFFECTS IN DISABILITY: IMPLICATIONS FOR MORE DISABILITY IN OLD AGE AND IN RECENT GENERATIONS?

E. Badley^{1,2}, M. Canizares², A. Perruccio^{1,2}, S. Hogg-Johnson^{1,3}, M. Gignac^{1,3}, 1. *University of Toronto - Dalla Lana School of Public Health, Toronto, Ontario, Canada*, 2. *Krembil Research Institute, Toronto, Ontario, Canada*, 3. *Institute for Work & Health, Toronto, Ontario, Canada*

The goal of this study was to determine a) if the age-trajectory (life course) of disability differs by birth cohort and b) whether any cohort differences are explained by changes in socio-economic status (SES), lifestyle factors, and the presence of chronic conditions. We used biannually collected data from the 1994–2010 Canadian Longitudinal National Population Health Survey: 10,330 participants born from 1925 to 1974 grouped in five 10-year birth cohorts. The outcome was reported disability (needing help with daily living activities or reporting long-term disability). We used multi-level logistic growth models to examine cohort effects in the age-trajectory of disability adjusting for sex, SES (education, income), lifestyle factors (BMI, physical activity, sedentary behavior, smoking status) and multimorbidity (2+ conditions up to 17). We found significant cohort differences in the age-trajectory of disability ($p < 0.0001$): when compared at the same age, each succeeding recent cohort had higher odds of disability than those in the earlier cohort. The age-trajectories were similar for men and women, although women had higher prevalence of disability. Low SES (education and/or income), being smoker, obesity, and multimorbidity were associated with increased odds of having disability. Though attenuated, cohort differences remained significant after accounting for differences in SES, lifestyle factors, and multimorbidity. The results suggest that more recent cohorts of Canadian adults are more likely to have disability and that they report disability earlier than previous generations. This finding has important implications for the organization and planning of healthcare and social services for the disabled population.

A CROSS-SECTIONAL STUDY EXAMINING IMPACT FACTORS OF DISABILITY AMONG THE ELDERLY IN DIFFERENT AREA

L. Luo, M. Yang, B. Dong, *Center of Gerontology and Geriatrics, West China hospital, Chengdu, Sichuan, China*

Introduction: Elderly with disability need more care due to the decline in physical function. As the most populous country of disability, the pressure what China faces is far greater than any country in the world. There are lack of the evidence of the impact factors of disability among the elderly and no guidebook help doctors how to prevent and intervene it. In this study, we aim to examine the difference of impact factors of disability among the Chinese elderly in rural and urban area.

Methods: Cross-sectional study. Establishing the database of disability among the elderly in rural and urban area. Analyze the difference of impact factors of disability among the elderly in rural and urban area.

Results: 1387 elderly were included, 751 were from rural area and the rest were from urban area. The impact factors disability among the elderly in rural area were: age, sexuality, scores of GDS, quality of sleep, chronic diseases, height, weight, smoking, educational level; The impact factors disability among the elderly in urban area were: age, scores of GDS, quality of sleep, physical exercise.

Conclusion: the impact factors of disability among the Chinese elderly in rural and urban area are very different. The doctors should use different methods to prevent and intervene it.

OLDER PEOPLE WITH INTELLECTUAL DISABILITY: AN 11-YEAR REGISTER STUDY OF HEALTHCARE USE PATTERNS

M. Sandberg, G. Ahlström, A. Axmon, J. Kristensson, *Department of Health Sciences, Lund University, Lund, Sweden*

The population of older people with intellectual disabilities (ID) is growing. People with ID are known to have more diseases and are believed to start aging earlier than the general population, but knowledge about their healthcare use is limited. This study aimed to explore somatic healthcare utilization patterns among people with ID in Sweden, compared to the general population 2002–2012. The sample consisted of people with ID, aged 55 years and older in 2012 (n=7936), and an equal-sized birth- and sex matched general population sample (n=7936). The sample was divided into 5-year intervals age groups. In- and outpatient data were collected from the Swedish National Patient Register. The result revealed that in younger age groups, the ID group had higher utilization compared with the general population sample, with higher risks for planned and unplanned in- and outpatient care, particularly for unplanned inpatient registrations. Decreasing patterns were seen with age; with lower risks in the ID group for the oldest age groups. This was most evident in planned in- and outpatient care. In those with at least one registration the ID group had, compared with the general population sample, fewer planned outpatient visits, and in the younger age groups longer unplanned length of stay. In conclusion this study shows that in younger people with ID utilize more healthcare than the general population, that utilization decreases with age and fewer people with ID use

healthcare in old age. The barriers for older people with ID to accessing planned healthcare need more investigation.

SESSION 105 (SYMPOSIUM)

BIOPSYCHOSOCIAL APPROACH TO INTERVENTION FOR COGNITIVE IMPAIRMENT IN WESTERNIZED CHINESE CULTURES

Chair: T. Liu, *The University of Hong Kong, Hong Kong*
Co-Chair: G. Wong, *The University of Hong Kong, Hong Kong, Hong Kong*

The effectiveness of biopsychosocial approach to dementia care and intervention is culturally sensitive. The bulk of these models have been developed in Western cultures; when applied to Asian countries, issues such as psychological processes, moral standards, and services delivery often determine their applicability. In this symposium, four papers are presented about applications of Western dementia care concepts in Hong Kong and Guangzhou, two Chinese cities sharing the same dialect with slightly different degrees of Westernization. **Wong et al** present a formative research on the cultural adaptation of cognitive stimulation therapy, an evidence-based non-pharmacological intervention originated from the UK, in the Hong Kong context. Issues such as more reserved and collective personality, attitudes towards authorities, and family roles are found to be important considerations in intervention design. **Wang et al** find different roles of self-efficacy in caregiver burden among Chinese adult children and spouses of people with dementia in Guangzhou and Hong Kong. The results are discussed in the context of family role and filial piety. While subjective memory complaint and depression are related to development of dementia, self-evaluative criterion and symptom attribution differ across culture and introduces variability in these parameters. **Liu et al** follow up 2,081 community-dwelling elders in Hong Kong, and find that depression but not subjective cognitive complaints predicted changes in cognition. The model of memory clinics has been adopted in Hong Kong, and **Chan** elaborated on the development and preliminary findings of a collaborative service among memory clinics, community-based dementia care services, and families.

CULTURAL ADAPTATION OF COGNITIVE STIMULATION THERAPY IN A CHINESE POPULATION: A FORMATIVE RESEARCH

G. Wong^{1,2,3}, O. Yek², A. Zhang¹, T. Lum^{1,2}, 1. *Department of Social Work and Social Administration, The University of Hong Kong, Hong Kong, Hong Kong*, 2. *Sau Po Centre on Ageing, The University of Hong Kong, Hong Kong, Hong Kong*, 3. *Department of Psychiatry, The University of Hong Kong, Hong Kong, Hong Kong*

Cognitive stimulation therapy (CST) has been recommended as an effective intervention for improving cognitive symptoms and quality of life in people with mild-to-moderate dementia. Evidence-based protocols originally developed in Western countries may not be directly applicable in Chinese population due to different cultural and societal factors. Following the formative method for adapting psychotherapy guidelines, we investigated the feasibility of applying CST in Hong Kong Chinese, and consolidated opinions of

stakeholders on necessary modifications for local adaptation. Focus groups and individual interviews were conducted in day care centres and nursing homes with CST group facilitators, CST group participants, family caregivers and formal caregivers before and after the intervention. Some key areas for modifications are related to the reserved personality, which require alternating the content of some activities (e.g., public expression of personal opinion), and possible role conflicts for family caregivers to continue delivering CST at home, which require alternating delivery format.

DIFFERENT ROLE OF SELF-EFFICACY IN THE EXPERIENCE OF BURDEN BETWEEN DIFFERENT CAREGIVERS

J. Wang^{1,2}, G. Wong^{2,3}, T. Lum^{2,3}, 1. *School of Nursing, The Chinese University of Hong Kong, Hong Kong, Hong Kong, Hong Kong*, 2. *Department of Social Work and Social Administration, The University of Hong Kong, Hong Kong, Hong Kong, Hong Kong*, 3. *Sau Po Centre on Ageing, The University of Hong Kong, Hong Kong, Hong Kong, Hong Kong*

Self-efficacy is an individual's assessment of his/her ability to successfully master a specific task. This study investigated the different mediating effect of three domains of self-efficacy between stressors and caregiving burden among adult child and spousal dementia caregivers. We interviewed 195 caregivers of people with dementia (123 adult children, and 72 spouses) recruited from memory clinics, community primary care and day care centers in two cities, mainland China. Series of multiple regressions were conducted to test the mediating effect. The results showed self-efficacy for controlling upsetting thoughts greatly mediate the effect of the stressors on caregivers' burden for both groups. Self-efficacy for responding to disruptive behaviors functioned as a mediator for adult children; whereas self-efficacy for obtaining respite functioned as a mediator for spouses. These results provided insight of mediating role of self-efficacy to inform different effective intervene methods for the two caregiver groups.

RELATIONSHIP BETWEEN SUBJECTIVE MEMORY COMPLAINT, DEPRESSION, AND COGNITION IN HONG KONG CHINESE

T. Liu¹, J. Xu¹, G. Wong^{1,2}, J. Tang¹, T. Lum^{1,2}, 1. *Sau Po Centre on Ageing, The University of Hong Kong, Hong Kong, Hong Kong, Hong Kong*, 2. *Department of Social Work and Social Administration, The University of Hong Kong, Hong Kong, Hong Kong, Hong Kong*

Subjective memory complaint (SMC) is common in older people and has been found to associate with depressive symptoms and future cognitive decline. However, the relationship between them is complex and still inconclusive. Understanding the respective extent SMC and depression explain and predict changes in cognitive function may provide insight. Our study followed 2,081 community-dwelling older persons aged 65 or above in Hong Kong for one year, and measured their SMC with a dichotomous question, depression with Geriatric Depression Scale (GDS), and cognition with Cantonese Montreal Cognitive Assessment (MoCA). Baseline SMC and GDS scores were moderately correlated ($r = .42, p < .001$), and they were associated with

poorer cognition after controlling for age, gender and education at baseline (R^2 change = .03, $p < .001$), and at follow-up (R^2 change = .03, $p < .001$). However, only depression was predictive of changes in cognition, not age, gender, education, or SMC.

TRIPARTITE COLLABORATION ON DEMENTIA CARE BETWEEN HOSPITAL, COMMUNITY, AND FAMILY

H. Chan^{1,2}, 1. *University Department of Medicine, The University of Hong Kong, Hong Kong, Hong Kong, Hong Kong*, 2. *Sau Po Centre on Ageing, The University of Hong Kong, Hong Kong, Hong Kong, Hong Kong*

Living with dementia is a great challenge to both patients and their caregivers due to the debilitating conditions that affect them progressively. In line with the Hong Kong Government's strategic direction on elderly services, an exploratory study was carried out to examine a tripartite collaboration model on dementia care among hospital-based memory clinic, community-based non-governmental organizations (NGOs), and families affected by dementia. Patients diagnosed with mild to moderate dementia and their caregivers were identified in memory clinics and referred to an empowerment program consisting of educational talks and workshops. They were later triaged to appropriate NGOs for cognitive training and social care. A designated Linked Person was responsible for care coordination. A feedback and support system was in place between the clinical teams and community partners. Attendance in the empowerment program and community care services was the main outcome measurement. Implications and findings of the care model will be discussed.

SESSION 110 (SYMPOSIUM)

BIOMARKERS OF HUMAN AGING

Chair: R.A. Kohanski, *National Institute on Aging, Division of Aging Bio, Bethesda, Maryland*

The Geroscience hypothesis states that slowing the rate of aging will delay the onset and/or reduce severity of aging-related diseases without necessarily altering life span, thus improving health at older ages. This is based on the observation that aging is a major risk factor for development of chronic diseases and degenerative conditions. The rate of aging can be understood as the losses of function coupled with the advent of chronic diseases with the passage of time. It is often represented as physiological or biological age versus chronological age or years. From this simple picture three questions emerge: What are the metrics used to measure physiological aging? Do these metrics – or biomarkers of aging – explain the “risk factor” aspect of aging that underlies the geroscience hypothesis? Do these biomarkers of aging account for the variation in health for each age group in a population?

QUANTIFICATION OF BIOLOGICAL AGING FOR TESTING GEROPROTECTIVE INTERVENTIONS

D. Belsky^{1,2}, 1. *Duke University School of Medicine, Durham, North Carolina*, 2. *Social Science Research Institute, Duke University, Durham, North Carolina*

Quantification of biological aging is contentious. Many methods are being put forward, but these have not been compared to one another in the same humans. We conducted comparative analysis of 7 measures of biological aging based on telomere length, epigenetic marks, and clinical biomarker algorithms in a 1972–3 birth cohort (N=1,037) followed prospectively through midlife, the Dunedin Study. We focused on a midlife cohort because this life course stage is little-studied in geroscience even though geroprotective interventions may be most effective if administered early, before disease processes become established. We evaluated correlations among biological ages estimated via different methods, tested within-person change over time, and compared predictions of healthspan-related characteristics (physical functioning, cognitive decline, subjective signs of aging). Results shed light on different strategies for uncovering markers of biological aging and highlight the utility of comparatively young cohorts for advancing geroscience research.

AGING AND HEALTH BIOMARKER DISCOVERY— TRANSLATIONAL INSIGHTS FROM NONHUMAN PRIMATES

R. Anderson^{1,2}, 1. *William S. Middleton Memorial Veterans Hospital, Madison, Wisconsin*, 2. *University of Washington School of Medicine and Public Health, Madison, Wisconsin*

An emerging paradigm in aging research identifies metabolic dysfunction as a root cause in the age-related increase in disease vulnerability. Several diseases of aging, including diabetes, cancer, and neurodegeneration, have an established metabolic component. Our studies in nonhuman primates have focused on links between metabolic status and disease vulnerability. Caloric restriction (CR) delays aging and the onset of age related disease in diverse species, including non-human primates. Our work demonstrates that CR animals are metabolically distinct from their control counterparts. Molecular profiling identifies CR responsive elements in the transcriptome, proteome, and metabolome that are highly enriched for metabolic pathways and in particular mitochondrial processes. These data show that improvements in health and survival are associated with changes in energy metabolism in nonhuman primates, a highly translational model for human aging. Metabolic biomarkers identified in these studies may be clinically relevant for the early identification of elevated disease risk in humans.

GROWTH DIFFERENTIATION FACTORS AND SENESCENCE-RELATED PROTEINS AS MODIFIERS OF AGING

N. LeBrasseur, *Mayo Clinic, Rochester, Minnesota*

Advances in geroscience include the identification of proteins that both accelerate and delay the emergence of aging-related phenotypes, at least in preclinical models. Translation of this work to humans is critical to determine whether these potential modifiers of aging associate with or predict important clinical outcomes and, ultimately, represent targets for novel and transformative therapeutic interventions to improve health among older people. Our laboratory has been particularly interested in 1) members of the transforming growth factor- β superfamily; growth differentiation factor 8 (GDF8, or myostatin), and GDF11, and 2) factors produced and secreted by senescent cells, collectively referred

to as the senescence-associated secretory phenotype (SASP). The objectives of this lecture are to provide the rationale for the selection of GDF8, GDF11, and SASP proteins as “geronic factors”, and to share findings from our recent studies that have examined their associations with aging-associated diseases and conditions.

GENERIC BIOMARKERS IN AGEING: TOOLS TO STUDY METABOLIC HEALTH AND RESPONSE TO INTERVENTIONS

E. Slagboom, *Leiden University Medical Centre, Leiden, Netherlands*

There is enormous diversity in health span with age, ranging from unhealthy 60- to vital 90-year-olds. This diversity is poorly understood and obscures the effect of interventions (rarely tested in elderly subjects). Underlying this diversity may be energy metabolism and immunity – understood as drivers of health in ageing. Biomarkers based on this knowledge could improve evidence-based medicine among the elderly, but will require coordinated efforts in longitudinal and intervention studies. Ageing-related changes in omics may have greater predictive power than traditional metrics of metabolic health (e.g. metabolites, glycosylations, transcripts, epigenetics and gut microbiome versus serum insulin, lipids, BP and BMI), especially in the fastest growing population of elderly humans. In our ongoing research on omics as biomarker in ageing, we witness signatures of early development in addition to age-related dys-differentiation, revealing both generic and disease-specific signatures. We will discuss the insights obtained from linking intervention and epidemiological studies.

SESSION 115 (SYMPOSIUM)

DYADIC ASSOCIATIONS IN LATER LIFE: EXPLORING THE INTERDEPENDENT NATURE OF HEALTH AND MARRIAGE

Chair: J.B. Yorgason, *Brigham Young University, Provo, Utah*

Discussant: C.A. Berg, *University of Utah*

Age-related changes in health often necessitate spousal caregiving among older married couples. Such caregiving can impact relationship functioning and satisfaction. Likewise, positive and negative marital interactions may also be linked with mental and physical health. Indeed, marriage provides the context for illness management and caregiving for health problems among later life couples. Although published literature points to these associations generally, advances in dyadic research continues to elaborate and provide nuanced details of how and when health and marriage are linked. This symposium advances understanding of interdependent associations between health and marriage, with five presentations using dyadic data. The first and second papers address links between illness and relationship satisfaction, with the first paper examining ADLs and IADLs among caregivers, and the latter addressing specific severe illnesses among a large Korean sample. The third and fourth papers explore spousal support during and in relation to diabetes treatment, using quantitative and qualitative approaches, respectively. The fifth paper uses a daily diary design to explore actor and partner reciprocal

lagged associations between health and marital interactions. The session discussant, Cyndi Berg, has expert knowledge of theory and research linking health and marriage in later life and during spousal caregiving. Together, the papers of this symposium present a unique dyadic examination of ways that health and marriage intersect for many older couples.

PHYSICAL AND COGNITIVE HEALTH RELATED TO MARITAL INTERACTIONS: A DAILY DIARY CROSS-LAG EXAMINATION

J.B. Yorgason¹, H. Choi², 1. *School of Family Life, Brigham Young University, Provo, Utah*, 2. *Sungkyunkwan University, Seoul, Korea (the Republic of)*

Marital processes have been linked with physical health. Physical health challenges, sometimes due to aging, have also been associated with marital outcomes. Literature has established interrelations between health and marriage, and that connections vary for husbands and wives. Studies examining reciprocal pathways between health and marriage have used panel data across years. The current study examined such pathways within a daily diary framework among couples across 14 days. Multivariate multilevel models were used to model cross-lag, actor/partner associations between daily physical and cognitive health and daily positive and negative marital events for 191 older couples. Findings suggest that daily health limitations are predictive of next-day higher positive marital events for husbands and fewer negative marital events for wives. Daily cognitive challenges in husbands were linked to fewer next-day negative marital events for wives. Also, daily negative marital events were linked to greater next-day cognitive challenges for both husbands and wives.

SPOUSES' HEALTH AND RELATIONSHIP SATISFACTION IN THE CAREGIVER HEALTH EFFECTS STUDY

J. Monin, *Yale University, New Haven, Connecticut*

Within spousal caregiving dyads, both partners' health and relationship satisfaction are inextricably linked. Drawing from interdependence theory, we tested the hypothesis that each spouse's health relates to their own and their partner's relationship satisfaction. Two hundred thirty three spousal dyads in the Caregiver Health Effects Study (CHES), ancillary to the Cardiovascular Health Study (CHS), reported relationship satisfaction at CHES baseline. Depressive symptoms, activities of daily living (ADLs), instrumental ADLs (IADLs), and self-reported health were obtained at the corresponding CHS wave. Using the Actor-Partner Interdependence Model we found that for both partners, greater depressive symptoms and lower self-reported health related to lower relationship satisfaction (actor effects). Caregivers' greater IADL needs were associated with lower relationship satisfaction (actor effect). When care recipients' depressive symptoms were high, caregivers had lower relationship satisfaction (partner effect). For both partners, having a spouse with greater ADL needs was associated with lower relationship satisfaction.

FOLLOWING YOUR LEAD: PATIENTS' DIET ADHERENCE, SPOUSE AWARENESS AND INVOLVEMENT IN MANAGING DIABETES

K.J. August¹, M.M. Franks², K.V. Westley¹, K.S. Rook³, M. Stephens⁴, 1. *Department of Psychology, Rutgers*

University, Camden, New Jersey, 2. *Purdue University, West Lafayette, Indiana*, 3. *University of California, Irvine, Irvine, California*, 4. *Kent State University, Kent, Ohio*

Spouses often are involved in the day-to-day management of chronic illnesses by supporting their partners' adherence to treatment recommendations (health-related social support), or regulating their partners' behaviors when adherence is irregular or absent (health-related social control). Although support and control have implications for both partners, little is known about what prompts spouses' daily involvement. Using daily diary data from 129 patients with type 2 diabetes, we found that on days when patients reported higher adherence to their diabetic diet, spouses were more aware of their partners being on track with their diet, which in turn, was related to more spousal support. On days when patients reported lower adherence, spouses were more aware of their partners being off track with their diet, which in turn, was related to more spousal control (both persuasion and pressure). Findings suggest that spouses may be appropriately calibrating their involvement in response to patients' adherence.

THE IMPACTS OF SPOUSES' HEALTH CONDITIONS ON DEPRESSIVE SYMPTOMS

J. Min¹, J.B. Yorgason², J. Fast¹, N.C. Keating³, 1. *University of Alberta, Edmonton, Alberta, Canada*, 2. *Brigham Young University, Provo, Utah*, 3. *Swansea University, Swansea, Wales, United Kingdom*

Spousal health decline can negatively affect one's mental health outcomes; however, less is known about how the quality of marital relationships and spousal caregiving moderates this association and how this association may be sensitive to the different chronic health conditions considered in this study. To address our research questions, we conducted multilevel analyses using 3487 couples age 45 + at baseline from the 4 waves of the Korean Longitudinal Study on Aging (KLoSA; 2006 -2012).

Results indicated that the husband's cancer and stroke were related to increased depressive symptoms among wives while these associations were not found among husbands. We also found a significant moderating effect of marital satisfaction and caregiving status. The findings suggest that considering gender, relationship quality and caregiving context within couples are important. Health care providers are encouraged to be aware of the possibility that couples are connected in both physical health and mental health.

HE SAID, SHE SAID: SUPPORTIVE INTERACTIONS AMONG MARRIED COUPLES DURING DIABETES APPOINTMENTS

A. Seidel², M. Marshall¹, M.M. Franks¹, S. Oates³, 1. *Human Development & Family Studies, Purdue University, West Lafayette, Indiana*, 2. *Pennsylvania State University, York, Pennsylvania*, 3. *IU Health, Indianapolis, Indiana*

Given that patients with diabetes who have supportive spouses follow treatment regimens better than patients who do not, we explored indications of spousal support, or lack thereof, during diabetes medical appointments. Data were collected from questionnaires and unscripted, audio-recorded conversations between diabetes patients, their spouses, and their physicians. We found a positive relation

between feelings of support and adhering to diabetes-related health behaviors (e.g. meal plans, testing blood sugars). Additionally, content analysis of conversations compared couples in which the patients reported high versus low levels of support. Healthcare conversations differed between the low support and high support couples in four key areas: spouse involvement in diet-related activities, spouse compliments or criticisms of patients diet-related behaviors, direct discussion about support, and frequency of spouse communication during the medical appointment. Implications may include training physicians to recognize spousal support that is available to patients with diabetes.

SESSION 120 (SYMPOSIUM)

HOW OLD DO YOU FEEL?: CURRENT DIRECTIONS IN SUBJECTIVE AGE RESEARCH

Chair: Y. Stephan, *University of Montpellier, Montpellier, France*

Co-Chair: A. Terracciano, *Florida State University, Tallahassee, Florida*

Discussant: T.M. Hess, *North Carolina State University, Raleigh, North Carolina*

Subjective age, i.e. how old or young individuals feel, is a growing area of research in Gerontology because of its links with important outcomes among older adults. Indeed, cross-sectional and longitudinal research has shown that, independent of chronological age, a younger subjective age is related to health-promoting behaviors, better physical and mental health, and better cognitive performance and slower cognitive decline over time. In addition, recent studies focusing on the determinants of subjective age revealed that the age individuals feel integrates a range of cues about aging, spanning from biological to social. This symposium brings together researchers from Europe and the United States to present new research on the determinants and implications of subjective age. First, David Weiss and Anna Reitz will examine whether variability in individuals' subjective age can be explained by essentialist beliefs about aging. Second, Matthew Hughes and Margie Lachman will test whether functional health and memory predict differential changes in subjective age. Third, Jennifer Bellingtier and Shevaun Neupert will report on the link between daily fluctuations in subjective age, affect, and daily Awareness of Age-Related Change. Fourth, Amit Shrira and colleagues will examine whether subjective age and nearness to death moderate emotional complexity among individuals with varying levels of posttraumatic symptoms. Finally, Yannick Stephan and colleagues will present new data on the association between subjective age and longevity from large national longitudinal cohorts followed for almost twenty years. As discussant, Thomas Hess will tie the relevance of these findings to theories of subjective aging.

IS AGE MORE THAN A NUMBER? ESSENTIALIST BELIEFS ABOUT AGING PREDICT HOW YOUNG OR OLD PEOPLE FEEL

D. Weiss¹, A. Reitz², 1. *Columbia University, New York, New York*, 2. *New York University, New York, New York*

Although aging comes with seemingly inevitable changes, there is a great variability in how young or old people feel.

However, little is known about the social-cognitive determinants of this subjective age bias, that is, the discrepancy between chronological age and felt age. Thus, we examined whether variability in individuals' subjective age can be explained by essentialist beliefs about aging. Specifically, we predicted that people who believe that aging is a fixed process, compared to those who think of it as malleable, should report a reduced subjective age bias. In line with predictions, findings demonstrate that people who endorse essentialist beliefs about aging perceived their age as static and unchangeable and reported a significantly smaller subjective age bias. This effect appeared to be even stronger with advancing age. The discussion focuses on social-cognitive and motivational mechanisms of subjective conceptions of aging and older adults' responses to aging-related challenges.

GETTING OLDER FASTER? CHANGES IN SUBJECTIVE AGE ARE TIED TO FUNCTIONAL HEALTH AND MEMORY

M. Hughes, M.E. Lachman, *Brandeis University, Waltham, Massachusetts*

There is interest in understanding what factors contribute to changes in subjective age. With longitudinal data collected in the Midlife in the United States (MIDUS) study, we examined changes in subjective age over 18 years. We assessed whether two domains that typically show aging-related declines, functional health and memory, would predict differential changes in subjective age, controlling for age, sex, and education. Whereas an average of 18 years had passed between the first and third waves, participants on average felt only 14.76 years older, although some felt they had aged more. Worse functioning with regard to health and memory predicted greater increases in subjective age. Additionally, those who reported that their health and memory, relative to their peers, had decreased also demonstrated greater increases in subjective age. This suggests that although most people feel that they are aging slower than they actually are, aging-related declines contribute to faster subjective aging.

DAILY AWARENESS OF AGE-RELATED CHANGE AND WELL-BEING IN OLDER ADULTS

J.A. Bellingtier, S.D. Neupert, *North Carolina State University, Raleigh, North Carolina*

Awareness of Age-Related Change (AARC) has emerged as a new dimension of subjective age associated with important well-being outcomes between-people (Brothers et al., 2015). Awareness of aging gains and losses may shift based on a day's experiences, but the implications of daily fluctuations have yet to be investigated. We measured AARC daily over 8 days in a sample of 116 adults ranging in age from 60 to 90. Findings indicate significant within-person variability in AARC. Controlling for age, gender, education, and between-person AARC, daily negative affect was significantly higher on days with a greater perception of AARC losses, whereas daily positive affect was higher on days with greater perceptions of AARC gains. Furthermore, daily AARC gains predicted younger daily felt ages and between-person differences in AARC losses predicted younger daily ideal ages. Findings suggest daily AARC plays an important role in the daily affect and subjective ages of older adults.

SUBJECTIVE AGING AND EMOTIONAL COMPLEXITY OF TRAUMATIZED OLDER ADULTS

A. Shrira¹, E. Bodner¹, Y. Hoffman¹, Y. Palgi², 1. *Bar-Ilan University, Ramat Gan, Israel*, 2. *University of Haifa, Haifa, Israel*

Subjective aging refers amongst other aspects to perceptions of one's age and nearness to death, and appears to be related to resilience. Subjective aging may be especially relevant for older adults coping with traumatic events. The present study examined whether subjective age and nearness to death moderate emotional complexity among individuals with varying levels of posttraumatic symptoms. We used data from two 14-day diary study samples (Sample 1: $N=188$, M age=57.8; Sample 2: $N=140$, M age=67.8). Subjective aging was measured at the between- and within-subject level in Sample 1 and 2, respectively. Emotional complexity was assessed by intraindividual correlations of positive affect and negative affect. In both samples, three-way interactions showed that feeling younger or further away from death was related to increased emotional complexity, especially among those high in posttraumatic symptoms. Findings suggest that favorable perceptions of aging are most relevant to regulating emotional experience of traumatized older adults.

SUBJECTIVE AGE AND LONGEVITY: EVIDENCE FROM THREE LONGITUDINAL SAMPLES

Y. Stephan¹, A. Sutin², A. Terracciano², 1. *UFRSTAPS, University of Montpellier, Montpellier, France*, 2. *Florida State University, Tallahassee, Florida*

The age individuals feel is related to health and well-being. In this study we examined the association between subjective age and mortality using three large longitudinal samples from the United States, the Health and Retirement Study, the National Health and Aging Trends Study and the Midlife in the United States Study (total $N=13455$). Controlling for demographic factors, an older subjective age was predictive of higher mortality risk across the three samples, over a follow-up of four to almost twenty years. Individuals who felt older had about twofold higher risk compared to those with a younger subjective age. The inclusion of depressive symptoms and disease burden partially accounted for these relationships. These findings provide further support to subjective age as a crucial biopsychosocial marker of aging.

SESSION 125 (SYMPOSIUM)

TIME USE AMONG OLDER ADULTS: DIFFERENTIALS AND IMPLICATIONS FOR WELL-BEING

Chair: D. Carr, *Rutgers University, New Brunswick, New Jersey*

Discussant: K. Latham-Mintus, *Indiana University-Purdue University--Indianapolis, Indianapolis, Indiana*

How do older adults spend their time, and what are the implications of daily time use for health and well-being? Drawing on daily diary data from the American Time Use Survey (ATUS) and Supplements on Disability and Use of Time to the Panel Study of Income Dynamics (PSID), these five papers document the correlates and consequences of older adults' time use, with particular attention to the ways that health, caregiving responsibilities and family relationships shape time use. Dukhovnov, Zagheni and Ryan explore

racial and ethnic differences in informal care transfers and the implications for older adults' emotional well-being. Kalenkoski examines how the unpaid caregiving responsibilities of older adults affect their well-being, paying particular attention to gender differences. Lam and Garcia assess whether elder caregivers report time constraints, and compare whether caregivers and non-caregivers vary in the time spent in personal care, social activities and sports, housework and employment. Shandra examines how the presence of a sensory, cognitive, physical, or multiple disability is associated with the likelihood and intensity of participation in six types of leisure activities (passive, exercise, organizational, hobbies, arts, and social), with particular attention to age variation therein. Flood and Genadek investigate the relationship between marital quality and duration and couples' shared time during later adulthood, with particular attention to active versus passive time use. The authors discuss the methodological and theoretical implications of their work, and show how daily diary data provides a unique window on older adults' daily lives and well-being.

ELDERCARE AND TIME CONSTRAINTS: DOES ACCESS OR UTILIZATION OF WORKPLACE LEAVE MATTER?

J. Lam¹, J. Garcia-Roman², 1. *University of Queensland, Indooroopilly, Queensland, Australia*, 2. *Minnesota Population Center, Minneapolis, Minnesota*

Population aging is requiring a re-examination of the role of eldercare. According to the U.S. Census Bureau, nearly one in five U.S. residents will be age 65 or older in 2030. Unpaid caregivers often experience what is called "caregiver strain," defined as psychological, emotional, and/or physical strain through the act of caregiving. This paper will draw on data from the 2011 American Time Use Survey (ATUS), to examine whether elder caregivers may report time constraints, as the act of providing care may take time away from other activities. It will compare whether caregivers and non-caregivers may vary in the amounts of time spent in personal care, social activities and sports, housework and employment. Further, it will investigate whether access and/or utilization of unpaid eldercare leave may modify this relationship, as it may allow worker-caregivers to engage, or perceive the possibility of engaging in various work and family responsibilities.

HOW DO THE ADULT CARE RESPONSIBILITIES OF OLDER AMERICANS AFFECT THEIR WELL-BEING?

C. Kalenkoski, *Texas Tech University, Lubbock, Texas*

This paper will use time-use and well-being data from the 2013 Disability and Use of Time Supplement to the Panel Study of Income Dynamics (DUST) to examine how the unpaid caregiving responsibilities of older adults affect their well-being, paying particular attention to gender differences. Early results using the 2009 DUST show that, controlling for pre-existing levels of reported life satisfaction, providing unpaid physical and medical care for others is associated with reduced levels of tiredness and pain compared to other activities by husbands. Wives do not experience any difference in tiredness or pain while engaging in this type of caregiving compared to other activities. In addition, these caregiving activities are not found to elicit any greater or

lesser amounts of calm, happiness, frustration, worry, or sadness than other activities by either husbands or wives. Other types of caregiving activities (by type of activity and type of recipient) will be examined.

MARITAL CHARACTERISTICS AND COUPLES' SHARED TIME DURING ADULTHOOD

S. Flood, K. Genadek, *Minnesota Population Center, Minneapolis, Minnesota*

This paper leverages unique data from the 2009 and 2013 Supplements on Disability and Use of Time to the Panel Study of Income Dynamics (PSID) to investigate the relationship between marital characteristics and couples' shared time during later adulthood. Previous research indicates that spousal interaction is a key dimension of marital quality. We extend previous research that has been primarily focused on time spent with a spouse for working-age adults and parents by considering couples' shared time during the stage of life after the career- and family-building years, specifically ages 50 and 79. By using the PSID, we make two key contributions to the literature. First, we analyze the quality of time with a spouse by differentiating between active and passive shared time. Second, we examine how marital quality and marital duration are associated with time with a spouse, which has been a major limitation of previous research in this area. Results show that the nature of time with a spouse – active versus passive – varies by levels of marital support and marital strain and that in the cross section, marital duration shows a u-shaped relationship with active shared time.

DISABILITY AND PATTERNS OF LEISURE PARTICIPATION ACROSS THE LIFE COURSE

C. Shandra, *State University of New York at Stony Brook, Stony Brook, New York*

I use nationally representative data from the Well-Being Module of the American Time Use Survey (N = 38,547) to examine: (1) how the presence of a sensory, cognitive, physical, or multiple disability associates with the likelihood and intensity of participation in six types of leisure activities (passive, exercise, organizational, hobbies, arts, and social), and (2) if these patterns vary by age. Overall, people with all types of disability are more likely to engage in passive forms—and less likely to engage in active forms—of leisure activity; however, many of these differences are mediated by health status. These associations persist, net of sociodemographic and health controls, for people with physical or multiple disabilities. Furthermore, greater differences in leisure time by disability status are observed with increasing age. Older adults with disabilities are more susceptible to disengaged leisure time, compared both to those without disability and to younger adults with disability.

SESSION 130 (SYMPOSIUM)

FACILITATING PURPOSE IN LATER LIFE

Chair: J. Nakamura, *Claremont Graduate University, Claremont, California*

Discussant: L.L. Carstensen, *Stanford University*

Across the life course, dedication to a social purpose is associated with both individual and collective well-being. Increasingly, later life is being recognized as a period when

adults may form a purpose goal meaningful to themselves and useful to others and dedicate their energies to pursuing it, for example, by leveraging accrued experience to create new ways of addressing social problems. Three papers will share empirical reports addressing how older adults in the U.S. form and pursue social purpose and the psychosocial and institutional means by which this can be facilitated, summarizing lessons learned from three mixed-methods research projects. A leader in the psychology of aging will provide a discussion. Anne Colby will present results of a study of purpose beyond-the-self and its correlates in adults over 50, based on a survey of a nationally representative sample (n=1,200) and over 100 interviews on the topic. Jeanne Nakamura will present a paper based on 50 in-depth interviews with individuals over 60 who have been honored for successful social innovation, charting the diverse pathways those individuals took to realize their purpose goals. Jim Emerman will discuss results of a survey of organizations helping older individuals find ways to live out their purpose goals, mapping programmatic resources available to this population and analyzing opportunities and gaps in services. Then, Laura Carstensen will provide an integrative discussion of the papers, informed by her extensive body of work. The session will conclude with discussion by the panel and audience of issues that have been raised.

NATIONAL STUDY OF PURPOSE BEYOND THE SELF IN OLDER ADULTS

A. Colby¹, M. Bundick², K. Remington¹, *1. Stanford University, Palo Alto, California, 2. Duquesne University, Pittsburgh, Pennsylvania*

This paper reports on the findings of a study of purpose beyond-the-self (bts) in U.S. adults aged 50–90. Purpose beyond-the-self is defined as active engagement toward goals that are meaningful to the self and contribute to the world beyond the self. The study includes a nationally representative survey of 1,200 respondents, with in-depth interviews of 107. Analyses to date indicate that about 30% of older adults exhibit purpose bts; that purpose is approximately equally prevalent across age, gender, education, income, and health status; and that people of color are more likely to be purposeful than are white respondents. Further analyses will report the significant positive relationships between purpose and other indicators of positive adaptation, including gratitude, prosocialness, generativity, and personal growth initiative. The nature, significance, and dynamics of purpose in later life will be explicated through interview-based case examples, describing highly purposeful individuals from a wide range of life situations.

PATHWAYS TO SOCIAL PURPOSE AND INNOVATION AFTER SIXTY

J. Nakamura, L. Graham, T. Chan, K. Procter, *Psychology, Claremont Graduate University, Claremont, California*

Much attention has been devoted to traditional forms of social contribution in later life such as volunteering. In contrast, little is known about social innovation – the creation of new ways to address persistent social problems. In particular, the pathways leading to social innovation in later life are largely uncharted. In an ongoing mixed-methods research project, we are examining the nature, antecedents,

and correlates of this form of social contribution in later life by studying nominees for the Purpose Prize, a U.S. award that recognizes successful social innovation by individuals over sixty. This presentation will draw on semi-structured interviews conducted with 50 Purpose Prize honorees. Based on systematic coding and analysis, we present the key building blocks of older adults' pathways to social innovation, and distill the features of the most common pathways while documenting the diversity of pathways taken. Implications for facilitating later-life expression of creative prosocial energies are discussed.

MAPPING RESOURCES FOR OLDER ADULTS SEEKING PURPOSE BEYOND THE SELF

J. Emerman, *Encore.org, San Francisco, California*

This paper will present findings from a survey of organizations serving the needs of individuals aged 50+ who identify one or more expressions of purpose beyond-the-self as a major life goal. We will discuss the types of services these programs offer, the range of populations and geographies served and some of the major opportunities and challenges these organizations face. Additionally, we will analyze where there are needs that the current configuration of organizations is not meeting and populations that are currently underserved. Finally, we will discuss opportunities for professionals and institutional sectors not currently engaged in this work to fill these unmet needs.

SESSION 135 (PAPER)

DEPRESSION: CORRELATES AND CONSEQUENCES

GAIT SPEED PREDICTS ENGAGEMENT IN PROBLEM SOLVING THERAPY IN OLDER ADULTS WITH DEPRESSION

S.T. Stahl, S.M. Albert, M. Dew, S. Anderson, M. Butters, A. Gildengers, J. Karp, C. Reynolds, *Psychiatry, University of Pittsburgh, Pittsburgh*

To determine the acceptability of clinical interventions for depression prevention, identifying clinical characteristics associated with its engagement is needed. The purpose of this study is to describe baseline correlates of engagement in Problem Solving Therapy (PST) in adults 60 and older who reported subthreshold depression and high disability burden. PST involved 6–8 sessions in which participants learn skills to solve self-selected problems that are contributing to stress and reduced quality of life. During PST, interventionists completed 3 rating scales that asked about patients' level of participation in problem solving activities, understanding of the process, and session homework effort in order to measure patients' engagement with PST. Using multivariate regression, we tested associations among demographics (age, sex, race, education), mental health (depression), physical health (medical illness, gait speed), and cognitive function as correlates of engagement in the PST intervention of our depression prevention trial (n=50). Faster gait speed was significantly associated with more effort and motivation during intervention sessions and greater understanding of PST concepts. Faster gait speed was also significantly associated with more effort in completing homework material, as rated by

interventionists. These findings suggest that healthier older adults may be more likely to engage in PST. These findings raise questions about whether therapists should consider gait speed when deciding to offer therapy like PST. Discussion will focus on the role of reporting intervention engagement in the clinical trial literature and whether an indicator of intervention engagement should serve a moderator or a mediator in trial outcome analyses.

THINKING, FEELING AND MOVING IN AGING: THE ROLE OF COGNITION AND DEPRESSION IN BALANCE CONTROL

F. Faria^{1,2,3}, S. Muir-Hunter¹, M. MonteroOdasso^{1,2,3}, 1. *Medicine, University of Western Ontario, London, Ontario, Canada*, 2. *Parkwood Institute, London, Ontario, Canada*, 3. *Lawson Health Research Institute, London, Ontario, Canada*

Emerging evidence shows that motor and balance control in older people is affected by cognitive status and by depressive symptoms. However, how static balance is affected by the presence of both, cognitive and depressive symptoms together, in the same individual is unknown. We hypothesize that balance control will differ in older individuals based on their cognitive status (MCI), presence of depressive symptoms, or both factors combined. Ninety six older participants (mean age =75 ±6) were stratified by cognitive and depressive status as follows: No cognitive or depressive symptoms (Controls, n=25; 71 years old), Cognitive but no depressive symptoms (MCI; n=36; 75 years old); Cognitive and with depressive symptoms (MCI_ds; n=19; 76 years old); and Cognitive with major depression (MCI_D; n=16; 74 years old). Balance (area of body sway) was assessed while standing during eyes open and eyes closed conditions using an electronic rigid platform (Berotec® Inc.). Balance under eyes open condition did not significantly differ across groups (Mixed RM-ANCOVA) after controlling for age, sex, cognitive performance, physical activity, previous falls, number of medications and antidepressants. Interestingly, participants having cognitive and depressive deficits (MCI_ds and MCI_D) showed a lack of "physiological" increase in balance sway in the challenging condition of eyes closed (p=0.003). Our findings suggest that combination of depressive and cognitive symptoms may reduce flexibility of balance control in older adults, placing them at higher risk of falls. Potential mechanism of these associations including the "hyper" cautious control through cognitive resources will be discussed.

URBANICITY OF RESIDENCE AND DEPRESSION AMONG OLDER ADULTS IN GHANA AND SOUTH AFRICA

D. Adjaye-Gbewonyo, G. Rebok, J.J. Gallo, A. Gross, S. Ahmed, C. Underwood, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

As the primary cause of disability worldwide, depression is a significant contributor to global morbidity and mortality and often disproportionately affects older adults. Several studies have demonstrated a link between urban residence and depression, but few studies have examined this association among older adult populations, and even fewer have studied it within an African context. Given that African societies are aging and urbanizing at rapid rates, this study

aimed to assess the relationship between urbanicity and depression using the Ghana and South Africa samples of the World Health Organization Study on Global AGEing and Adult Health (SAGE) wave 1 (2007–2008). Depression over the past 12 months was measured using self-reported treatment and depressive symptoms based on ICD-10 criteria in 4209 Ghanaian and 3149 South African adults 50 years and older residing in their current location for over one year. The 12-month prevalence of depression was 7.5% and 4.0% in Ghana and South Africa, respectively; and 41.1% and 65.5%, respectively, lived in urban areas. Comparing urban to rural residents, the unadjusted odds ratio (OR) for depression in South Africa was 1.46 (95% CI: 0.94–2.29), with an adjusted OR of 1.08 (95% CI: 0.66–1.76) in multivariable analysis. The unadjusted and adjusted ORs for Ghana were 0.92 (95% CI: 0.61–1.39) and 0.94 (95% CI: 0.60–1.47), respectively. Although these results do not support a significant difference in 12-month depression likelihood between urban and rural SAGE participants in Ghana or South Africa, they suggest that the direction of effects may differ in each setting.

DEPRESSION, CHRONIC DISEASE AND FUNCTIONAL LIMITS: A COMPARISON BETWEEN THE UNITED STATES AND INDIA

D. Eynon Black, J. Parajuli, J. Brown, *Miami University, Oxford, Ohio*

Depression is a substantial global health problem with implications for public health policy, planning of social programs and medical spending. Empirical evidence shows that chronic disease and functional limitation lead to depression among older adults. Few studies have attempted to understand the impact of functional limitations on the association between chronic disease and depression in low-income countries. Our study begins this investigation with a comparison study between India and the US. This study examines the effects of chronic disease conditions and functional limitations on depressive symptoms controlling for other measures including age, race, education and marital status. These associations are investigated with data from the 2012 wave of the Health and Retirement Study for the United States (HRS) and 2010 Longitudinal Aging Studies of India (LASI), harmonized for comparability. Preliminary findings suggest the association between chronic disease and depression is partially mediated by functional limitations in the United States. However, different results are present within the LASI dataset. The presence of chronic disease conditions does not predict depression, whereas there is a positive association between functional limitations and depressive symptoms ($p < .0001$) that does not alter the relationship between chronic conditions and depressive symptoms. We discuss the cultural and policy differences that are likely behind this observed difference and further discuss the implications of our findings for future research.

WHO'S SINGING THE BLUES? DEPRESSIVE SYMPTOMS AMONG OLDER ADULTS ACROSS THE CONTINUUM OF CARE

E. Neufeld¹, S. Freeman², L. Spirgiene⁴, U. Horwath³, 1. *Centre for Rural and Northern Health Research, Laurentian University, Sudbury, Ontario, Canada*, 2. *University*

of Northern British Columbia, Prince George, British Columbia, Canada, 3. *Hospital of Bonifratres, Cracow, Poland*, 4. *Lithuanian University of Health Sciences, Kaunas, Lithuania*

Late-life depression is a common mental health issue with a significant burden of illness on a global scale. This study investigated depressive symptoms among older adults across three health sectors in Ontario, Canada to inform a systems-level approach to late-life depression across the care continuum.

interRAI assessment data from the home care (HC), the palliative home care (PHC), and long term care (LTC) sectors were examined (2011–2014). Assessments on older adults aged 60 years+ in HC (N=116,533), PHC (N=19,678), and LTC (N=125,496) were examined. Depression symptoms were measured within each sector using the interRAI Depression Rating Scale (DRS) with a threshold of DRS>3 indicating probable depression. Change in depressive symptoms over time was examined, including predictors of the development of depression.

At baseline, DRS>3 scores were observed in 190.7 cases/1000 HC clients, 118.1 cases/1000 PHC clients, and 242.3 cases/1000 LTC residents. This increased to 206.4 cases/1000 HC clients, 133.2 cases/1000 PHC clients, and 286.5 cases/1000 LTC residents at follow-up. When looking at individual change over time, DRS scores remained the same for the majority of older adults across sectors. However, the proportion of individuals with a worsening of depression symptoms was highest in the LTC sector.

Changes in depressive symptoms are discussed by health sector in relation to demographic and clinical variables, including differences in the main drivers of depression symptoms. Results show that symptoms of depression are significant among older adults and require a multidisciplinary approach to assessment and care.

SESSION 140 (SYMPOSIUM)

ADAPTING A CARE VALUES/PREFERENCES INTERVENTION FOR PEOPLE WITH CHRONIC ILLNESS AND THEIR CARE PARTNER

Chair: D.W. Coon, *Arizona State University, Phoenix, Arizona*

Discussant: K. Maslow, *Gerontological Society of America, Washington, District of Columbia*

This symposium focuses on adapting SHARE (Support, Health, Activities, Resources & Education) into new formats and populations. Grounded in care values clarification/care preferences identification, SHARE is an individualized in-home intervention for people in the early-stage of Alzheimer's disease (AD) and their care partners, and has demonstrated feasibility, acceptability, and impact on key outcomes. Emphasis on early detection and treatment of life-limiting illnesses is growing, but without a corresponding emphasis on interventions that address the mental health/well-being of early-stage people (EPs) and their family care partners (CPs). SHARE, by identifying and intervening with a chronic life-limiting illness through EP-CP involvement in the early stages of an illness, creates advantages beyond early medical intervention alone. For example, EPs and CPs can be educated on the potential

impacts of the illness before crises occur and caregiver burden advances; EPs can be active decision-makers in their care by voicing their care values/preferences directly to CPs; and thus, EP-CP dyads can be coached on how to develop a plan that addresses the care, security, quality of life, and well-being of the EP while supporting the CP. The papers in this symposium provide an overview of SHARE with primarily non-Hispanic white dyads and its adaptation from a focus on AD to other chronic illnesses; a translation of SHARE into EPIC (Early-stage Partners in Care), a group-based format for AD dyads embedded into Alzheimer's Association Chapters; and additional insights into tailoring EPIC to meet the needs of Spanish-speaking Latinos in the US Southwest.

THE SHARE PROGRAM: FROM DEMENTIA CARE TO BROADER CHRONIC ILLNESS CARE

C.J. Whitlatch, S. Orsulic-Jeras, *Benjamin Rose Institute on Aging, Cleveland, Ohio*

Alzheimer's disease and other dementias are being diagnosed earlier in the disease progression thanks to advances in medical procedures and technologies. For the person receiving the diagnosis and their family carer, few programs exist which help care dyads plan for the future and discuss preferences for care. Likewise, for cognitively intact persons with chronic conditions, few programs exist which provide support as the care dyad works to create a manageable plan of care that addresses each person's concerns and fears. The SHARE Intervention, originally developed for early-stage dementia families, has shown positive outcomes for both members of the care dyad. This presentation first describes the development of the six-session SHARE intervention and its use in community settings. Next, discussion will focus on current efforts to adapt "SHARE for dementia" for use with families facing the challenges of chronic illnesses. Discussion will highlight revisions to program procedures, materials, recruitment, and evaluation.

EPIC (EARLY-STAGE PARTNERS IN CARE): TRANSLATING SHARE INTO A GROUP-BASED INTERVENTION

D.W. Coon, M. Todd, D. Kapp, *Arizona State University, Phoenix, Arizona*

This presentation focuses on the translation of SHARE into a group- and coach-call based intervention for people with early-stage dementia (EPs) and their care partners (CPs) that was delivered by Alzheimer's Association Chapter staff in urban and rural settings across Arizona. Sessions included activities for the entire group together, separate EP or CP groups, and one individualized session. EPIC provides skills-training, and care values clarification, planning, and support that honors the EPs' care values and future care preferences. EPIC participants reported significant changes in mood (e.g., depression and other negative affect) and quality of life indicators (e.g., quality of life, self-efficacy, care preparedness), as well as high levels of overall benefit; increased understanding of memory loss and its effects; increased confidence in dealing with memory problems, and that EPIC made their lives easier. One hundred percent (100%) of dyads reported that EPIC enhanced their ability to care for one another.

TAILORING EPIC, A GROUP-BASED SHARE INTERVENTION, TO MEET THE NEEDS OF SPANISH SPEAKERS

B.V. Carbajal, V. Rosas, D.W. Coon, *College of Nursing & Health Innovation, Arizona State University, Phoenix, Arizona*

This presentation provides insights on tailoring EPIC's outreach, assessment, and intervention activities for Spanish Speaking Latinos. EPIC (a group-based intervention protocol derived from SHARE) is designed to reduce stress and enhance well-being of people with early-stage dementia and their care partners. Steps in tailoring included: ongoing community advisory board feedback; conceptual translation of all project material; and incorporation of suggestions from six focus groups with 51 Latino family caregivers, professionals, and direct care staff. Participants regarded the project's revised care values and preferences as critically important for Latino families ("excellent visual aids"; "concepts are simple to understand and manage"; "very useful", "these activities would help to have a conversation and come to agreement"). Feedback also helped to expand Latino outreach efforts by choosing less threatening language to describe dementia, speaking at existing community health classes, conducting *Concerned about Changes in Your Memory?* forums, and using social media across the generations.

SESSION 145 (SYMPOSIUM)

MODELING THE OUTCOME AND COST IMPACTS OF INTERVENTIONS FOR DEMENTIA (MODEM)

Chair: M. Knapp, *London School of Economics and Political Science, London, United Kingdom*

Dementia has enormous impacts on health and quality of life for people with the illness, their families and other people who care for them. With population ageing the number of people with dementia will increase considerably over the coming decades, despite recent evidence that the prevalence and incidence of dementia has reduced in the last 20 years. A big challenge facing countries is how to provide high quality treatment and support to individuals with dementia in ways that are acceptable to them and at a cost considered by society to be affordable.

In this session we present results from the MODEM project which aims to generate new evidence and feed it into policy and practice to improve the lives of people with dementia and their carers. After an overview of MODEM describing the different components and scientific methods (Presentation 1), we describe the Dementia Evidence Toolkit developed from a systematic mapping of the literature on effective and (potentially) cost-effective interventions in dementia care (Presentation 2). MODEM will use both microsimulation and macrosimulation methods and in Presentation 3 we describe results from the microsimulation model MicSIMPOP on the amount of care estimated to be required over the period to 2040 conditional on socioeconomic factors, health behaviours, cognitive impairment and other comorbidities. The macrosimulation model (Presentation 4) integrates results from MicSIMPOP and the Dementia Evidence Toolkit overall to produce projections of future numbers of people with dementia and the cost impacts of making the evidence-based interventions more widely available.

THE MODEM PROJECT

M. Knapp¹, A. Comas-Herrera¹, R. Wittenberg¹, C. Jagger², MODEM Team¹, 1. *London School of Economics and Political Science, London, United Kingdom*, 2. *Newcastle University Institute for Ageing, Newcastle upon Tyne, United Kingdom*

MODEM is an ambitious project that is projecting how future costs, health and quality of life of people living with dementia and their family and other caregivers (carers) could be improved by wider availability of evidence-based interventions. It projects numbers, needs, costs and outcomes for people with dementia and carers over the period to 2040 under current care and support arrangements in England, and then projects what would happen if better treatments, better care services and better support for carers were made available to everyone who could benefit from them. Projections build on both microsimulation (individual-level) and macro-simulation (aggregate) models, a comprehensive review and synthesis of available evidence (as described in other presentations in this session) and the experiences of people with dementia and carers. Projections will feed into discussions of future policy, purchasing and provision. MODEM runs from 2014 to 2018.

MODEM DEMENTIA EVIDENCE TOOLKIT: WEB-BASED RESOURCE OF DEMENTIA CARE, TREATMENT, AND SUPPORT EVIDENCE

A. Comas-Herrera, D. McDaid, A. Park, B. Adelaja, D. Lombard, M. Knapp, MODEM Team, *London School of Economics and Political Science, London, United Kingdom*

The MODEM Dementia Evidence Toolkit is a public resource that gives access, via a website, to scientific evidence gathered as part of a systematic mapping of the literature on evaluations of interventions for treatment, care and support of people with dementia and carers. The Toolkit has two components: a bibliographic database and plain English evidence summaries on what works in dementia care. *The bibliographic database*: The searchable database comprises over 3,000 empirical journal articles and 700 systematic reviews, obtained by searching key bibliographic databases (Medline, Psychinfo, CINAHL, Social Care Online and IBSS) for articles published from 2009 to June 2015. The articles were screened and coded according to type of dementia, care setting, type of outcomes, type of intervention and country. *Evidence summaries*: The evidence summaries are produced using systematic methods. They aim to offer rigorous, yet accessible, digests of the evidence on effectiveness and cost-effectiveness of key dementia interventions.

MICSIMPOP: MODELING HOW LIFESTYLE FACTORS AND CHRONIC DISEASES AFFECT CARE NEEDS WITH DEMENTIA

C. Jagger¹, A. Kingston¹, H. Booth², MODEM Team³, 1. *Institute of Health and Society, Newcastle University, Newcastle upon Tyne, United Kingdom*, 2. *Australian National University, Canberra, Australian Capital Territory, Australia*, 3. *London School of Economics and Political Science, London, United Kingdom*

MicSIMPOP is a microsimulation model aiming to model the health and associated care needs of the English population to 2040 and the impact of interventions for risk factor reduction, disease prevention and treatment. Modelled on a

previous Australian microsimulation model DYNOPTASim, MicSIMPOP uses a discrete time approach with baseline data (and monthly transition probabilities) from three UK longitudinal studies: Understanding Society (ages 35+); the English Longitudinal Study of Ageing (ages 50+); and the Cognitive Function and Ageing Study II (ages 65+). Baseline characteristics generated on individuals include sociodemographic factors, lifestyle behaviours, a range of diseases including cognitive impairment, CHD, stroke, diabetes, and dependency/care needs measured by a time-based measure. This presentation will describe projections of dependency levels for people with different levels of cognitive impairment over the next 25 years as well as numbers with other comorbidity – of importance for appropriateness and effectiveness of interventions.

MACROSIMULATION MODEL: PROJECTIONS OF NUMBERS OF OLDER PEOPLE WITH DEMENTIA AND ASSOCIATED COSTS

R. Wittenberg, B. Hu, A. Comas-Herrera, MODEM Team, *London School of Economics and Political Science, London, United Kingdom*

The macrosimulation model will produce projections to 2040 of the future numbers of older people with dementia in England, associated expenditures on care and outcomes in terms of quality of life for them and their family or other unpaid carers. It will take as inputs the outputs of the microsimulation model and modelling of the impact of specific interventions. A key feature is that this model will differentiate between groups of people with dementia by severity of cognitive impairment and physical disability, and it will assign packages of care to people with dementia based on their needs related characteristics. It will use data from the MRC Cognitive Function and Ageing Study (CFAS), the English Longitudinal Study of Ageing (ELSA), official data from the Health and Social Care Information Centre, baseline data from various trials of interventions for people with dementia and new data collected as part of the MODEM study.

SESSION 150 (PAPER)

AGING-IN-PLACE/TRANSPORTATION

I'D RATHER STAY: DOCUMENTARY VIDEO AS A KNOWLEDGE MOBILIZATION TOOL FOR AGE-SUPPORTIVE NEIGHBORHOODS

C. Ottoni, J. Sims-Gould, H.A. McKay, *University of British Columbia, Vancouver, British Columbia, Canada*

We created "I'd Rather Stay," a 19-minute, evidence-informed documentary video, to engage community and government stakeholders around barriers and facilitators for age-supportive neighborhoods. We used the interaction model of knowledge translation to critically assess two dissemination stages; phase one (societal level): 14 forums with government, policy makers, and older adults, and 7 international film festivals with the general public (N= est. 800); phase two (individual level): screening and focus groups with 10–15 older adults in 6 different geographic locations (average age= 73). During phase one we analyzed video Director and researcher field notes, and post-screening discussion content.

In phase two we analyzed field notes, focus group transcriptions, and post-screening and 6-month follow-up surveys. In both phases, we found that documentary video effectively educated viewers and initiated discussion. Further, results from our extended data collection and analysis in phase two suggests that individuals were impacted along a scale: education, knowledge diffusion (sharing), and/or action to improve circumstances. We also offer insight on strategies to move research-evidence from discussion to implementation.

EVERYTHING IN MODERATION: INTERACTION EFFECTS AMONG GENDER, RACE, AND DRIVING REDUCTION/CESSATION

J. Vivoda¹, C.M. Connell², A. Schulz², J. Grengs², S. Heeringa², 1. *Sociology and Gerontology, Miami University, Oxford, Ohio*, 2. *University of Michigan, Ann Arbor, Michigan*

This research explored the moderating effect of the transportation environment on the relationships among gender, race, and driving reduction and cessation (DRC). We hypothesized that the higher likelihood of DRC among women and racial minorities may be partially explained by high congestion/roadway density. Models fully interacted by gender and race were also fit to explore whether the relationships among DRC and the other covariates were differentially affected by these demographics.

The transportation environment was operationalized using a measure of roadway density calculated from Geographic Information Systems data, and with congestion data from the Urban Mobility Scorecard. Seven waves of data from the Health and Retirement Study were combined with this environmental data, and discrete time survival analysis techniques were used in the analysis; driving reduction (DR) and driving cessation (DC) were analyzed as separate outcomes.

A significant interaction was observed between roadway density and gender in the model assessing DR (higher density only affected men), but not in the DC model. This was counter to our original hypothesis, and may be related to the decreased likelihood of men to change their driving habits overall. Interactions between the transportation environment and race were not statistically significant in the DR models, but were significant in the models assessing DC (White and Hispanic older adults had higher odds of DC given more congestion). The models fully interacted by gender and race also revealed several additional significant interactions among other covariates in the models and DRC, including relationship status, age, education, and household size.

THE CREATION OF AGE-FRIENDLY ENVIRONMENTS IS ESPECIALLY IMPORTANT TO FRAIL OLDER PEOPLE

H. van Dijk, A.P. Nieboer, J. Cramm, *Institution of Health Policy & Management, Erasmus University Rotterdam, Rotterdam, Zuid-Holland, Netherlands*

Worldwide efforts are being made to reduce reliance on expensive long-term care, resulting in a shift toward deinstitutionalisation and ageing in place. However, we lack insight into whether neighbourhoods are able to meet both frail and non-frail older people's environmental needs. Based on the WHO framework for age-friendly cities, this study aimed

to characterise the relationship between frailty and ageing in place, and to identify differences in neighbourhood characteristics supporting ageing in place missed by frail and non-frail older people. A concurrent nested mixed-methods approach was used. For quantitative evaluation, a sample of 945 independently living older adults residing in four districts of Rotterdam was asked to complete a questionnaire in 2013 [response rate, 62% ($n = 558$)]. In addition, 32 qualitative interviews were conducted with frail and non-frail older people. The results demonstrated that gender, age, and especially frailty were related to missed neighbourhood characteristics. Qualitative data showed that older people display awareness of their increasing frailty and often acknowledge that it increased their needs for neighbourhood characteristics enabling them to age in place. Thus, this study supported our expectation that the person-environment fit is not static. Expectations regarding neighbourhood characteristics seem to dissipate with advanced age and increasing frailty. Diversity in frailty level, gender, and age, but also the interrelatedness of age and frailty, should be accounted for in the identification of social and physical neighbourhood characteristics that community-dwelling older adults need to age in place.

DISCREPANCY OF SELF-ASSESSMENTS AND STANDARDIZED TESTS IN VISION/HEARING ABILITIES IN THE ELDERLY

G.G. Haanes¹, G. Eilertsen², 1. *Nursing, University of Faroe Islands, Tórshavn, Faroe Islands*, 2. *University College of South East Norway, Drammen, Norway*

Aim: To investigate whether answers provided by older home-care recipients to the question "Do you think your vision/hearing is good (0), not so good (1), poor (2), or very poor (3)?" can be used to identify those who have vision and hearing problems, and whether these elderly can provide a valid self-report of their vision and hearing.

Methods: Receiving operating characteristic (ROC) analysis was used to compare self-evaluations of vision and hearing with those yielded by a gold-standard test. The vision and hearing performances of 93 people, aged ≥ 80 years in the home-care setting were screened with a LogMAR chart and a portable pure-tone audiometer and a self-assessment screen.

Results: Comparisons of the findings using the cutoff point on the self-assessment scale with those of the gold-standard tests, yielded 40 false negatives for vision and 18 false negatives for hearing, indicating that a significant proportion of older people report their vision and hearing abilities as being good when standardized tests indicate that they are not.

Conclusion: Area under the ROC curve for self-assessment of vision was 69%, indicating the self-assessment question was a poor test. Area under the ROC curve for self-assessment of hearing was 73%, which may be considered a "fair" test. However, hearing self-evaluations are still insufficient for deciding who should be referred to a specialist for hearing examination.

HOME MODIFICATION PROGRAM CHALLENGES: BALANCING BEHAVIORS, PREFERENCES, NEEDS, AND COST

N. Brossoie, *Center for Gerontology, Virginia Polytechnic Institute & State University, Blacksburg, Virginia*

According to AARP, 90% of older adults in the United States want to remain living in their homes for as long as possible. Yet, housing data suggest that many homes may not be designed to accommodate the needs of older residents, and may need to be modified. In this study data collected from a rural home modification pilot program in Southwest Virginia was analyzed to identify the challenges faced in identifying, prioritizing, and initiating home modification projects. The means-based program served 24 homeowners aged 55+ living at or below 80% of the adjusted median income. A mixed-method approach was used to analyze survey and interview data. Analysis uncovered challenges to program management and sustainability. Residents often sought home modifications in lieu of making changes to their behaviors and preferences that caused problems (e.g., removing throw rugs to reduce falls). Residents frequently miscalculated the need for modifications, the scope of work needing to be done, and the prioritization of changes. Moreover, residents often perceived some upgrades to their homes as essential even though they would not personally utilize the changed space. Program leaders reported struggling with modifying homes in which the value of homes were less than the costs of modifications, and complying with the well-intended demands of non-custodial family members when they conflicted with resident wishes. Findings were used to develop a matrix to guide decision-making in future home modification programs that accounts for the competing demands of residents and their families, contractors, and program resources and sustainability.

SESSION 155 (SYMPOSIUM)

IMPROVING QUALITY AND ACCESS TO PALLIATIVE CARE IN THE UNITED STATES ACROSS CARE SETTINGS

Chair: S. Enguidanos, *University of Southern California, Los Angeles, California*

Co-Chair: N. Dudley, *University of California, San Francisco, Los Altos, California*

Innovative delivery models that provide access to quality palliative care programs across care settings are needed for an aging U.S. population living longer with advanced and serious illness. The 2015 Institute of Medicine report "Dying in America" highlighted the need for primary palliative care for diagnosis of advanced illness that includes basic symptom management, advanced care planning, and referral to specialty palliative care as symptoms progress. In addition, the National Consensus Project (2013) suggests palliative care be delivered according to patient/family values and beliefs. This symposium examines need identification and care provision in the context of advanced illness care for various populations of older adults and discusses the impact on policy and health care transformation. This symposium is composed of four distinct presentations: (1) a national description of older adults with advanced illness in primary care settings who may benefit from primary palliative care; (2) qualitative interviews with a Veteran patient sample with advanced illness and hospital staff regarding the role of religion and spirituality in care delivery; (3) findings from a feasibility study testing an intervention to provide primary palliative care to older adults during the transition

from hospital to home; and (4) lessons learned from a collaboration with a state-wide private insurance company to develop, test, and broadly implement a reimbursement model for the provision of home-based palliative care by primary care providers. These presentations represent efforts across the U.S. to improve access and quality of care in the context of life-limiting illness.

IDENTIFYING OLDER ADULTS IN U.S. PRIMARY CARE SETTINGS TO BENEFIT FROM PRIMARY PALLIATIVE CARE

N. Dudley, C.S. Ritchie, M.I. Wallhagen, B. Cooper, K. Patel, S. Chapman, *University of California, San Francisco, San Francisco, California*

Community-based palliative care is an important component of advanced illness management to address complex care needs of older adults living longer near end of life. There is an urgent need to provide primary palliative care in primary care settings by all clinicians that includes basic pain and symptom management, and discussions about advance care planning. However, a description of older adults in primary care settings with advanced illness and symptom burden who would benefit from primary palliative care is lacking. This study uses data from the National Ambulatory and National Hospital Ambulatory Medical Care Surveys from 2009–2011 to provide a national description of health care utilization of older adults with advanced illness and symptoms in primary care settings who may benefit from primary palliative care.

REGISTERED NURSES PROVIDING PRIMARY PALLIATIVE CARE DURING TRANSITION FROM HOSPITAL TO HOME

S. Izumi, B. Basin, J. McCalmont, M. Presley, J.G. Baggs, *Oregon Health and Science University, Portland, Oregon*

Although inclusion of palliative care throughout the illness trajectory is recommended, the majority of palliative care in the United States is still limited to hospital settings. There is no established program ensuring continuity of palliative care outside of hospitals. We conducted a feasibility study testing an intervention where registered nurses provided primary palliative care (PPC) to older adults with chronic illness during the transition from hospital to home. PPC delivered by nurses included symptom management, advance care planning, and communication with healthcare providers. Compared to 15 patients who received care from non-nurse health coaches, 15 patients who received PPC from nurses in addition to the coaching had fewer symptom-related re-hospitalizations, more conversations about advance care planning, and higher satisfaction with their care. Provision of PPC by nurses through the care transition showed potential as an effective and affordable intervention to ensure continuity of palliative care beyond the hospital setting.

SUSTAINING THE FUTURE OF PRIMARY PALLIATIVE CARE

S. Enguidanos, A.N. Rahman, *Leonard Davis School of Gerontology, University of Southern California, Los Angeles, California*

Despite significant strides in transforming end-of-life care, access to palliative care is limited and palliative care

programs and services remain precariously positioned in the U.S. health care system. Concrete, permanent funding mechanisms are needed to improve and sustain access to palliative care, particularly in primary care settings. This session presents learnings from a pilot study developed in collaboration with a state-wide private insurance company to develop, test, and broadly implement a reimbursement model for the provision of home-based palliative care by primary care providers. We will discuss developing relationships with insurers and present the core components of the care model, adaptations of the model for provision in primary care, and metrics that support widespread implementation across states. Finally, we will discuss the impact of this project on policy and its potential for health care transformation through expanded evidence and market pressures.

SESSION 160 (SYMPOSIUM)

AGE-FRIENDLY COMMUNITY CHANGE: ADVANCING GLOBAL RESEARCH, POLICY, AND PRACTICE

Chair: E.A. Greenfield, *Rutgers, The State University of New Jersey, New Brunswick, New Jersey*

Discussant: J. Barratt, *International Federation on Ageing, Toronto, Ontario, Canada*

The concept of age-friendliness, as well as strategic initiatives to make localities more age-friendly, has captured the attention of various stakeholders worldwide. Age-friendly champions include professional organizations, philanthropies, national governments, local officials, service providers, private citizens, and beyond. Academic research in this area has emerged arguably more slowly over the past 10 years. Accordingly, this symposium aims to serve as a catalyst for the engagement of additional gerontological research to accelerate systematic knowledge development on age-friendly community change processes—not only to enhance the efforts of local communities, but to benefit aging research more broadly. The first paper will introduce “age-friendly” as an emerging international field of research, policy, and practice and will identify opportunities for research to strengthen community change. The subsequent papers will provide examples of such possibilities. One paper will showcase efforts in Manchester, United Kingdom, demonstrating how empowering older adults as co-researchers can enhance the development and evaluation of age-friendly actions. Another paper will highlight work in Shanghai, China, focusing on the role of researchers during the exploratory phases for age-friendly community change through fieldwork and surveys with organizations that facilitate support for older adults. An additional paper will present research conducted in the north-eastern United States, demonstrating the utility of cross-site qualitative research for developing theories of change underlying age-friendly initiative processes. Jane Barratt—Secretary General of the International Federation on Ageing and a global leader in aging policy—will offer insights as discussant.

KNOWLEDGE DEVELOPMENT FOR AGE-FRIENDLY COMMUNITY INITIATIVES

A.J. Lehning¹, E.A. Greenfield², 1. *University of Maryland, Baltimore, Baltimore, Maryland*, 2. *Rutgers, The State University of New Jersey, New Brunswick, New Jersey*

This paper will provide an introduction to “age-friendly” as an emerging international field of research, policy, and practice. The presenters will provide a history of the age-friendly movement, including the World Health Organization’s initiative and how age-friendly efforts have emerged across diverse national contexts over the past decade. The presenters will then describe knowledge development concerning age-friendly community initiatives, noting that much of what has been written in this area has been published in the “gray” literature. While peer-reviewed publications on age-friendly efforts are growing in number, many remain descriptive or theoretical. Based on a review of the literature, this paper will identify opportunities for researchers to employ both qualitative and quantitative research methodologies to deepen systematic knowledge building concerning age-friendly community initiatives. The authors will describe how such knowledge development has the potential to strengthen age-friendly policies and practices, while also making meaningful advances to gerontological research more broadly.

PUBLIC GERONTOLOGY IN ACTION: CO-DEFINING GOALS OF AGE-FRIENDLY EFFORTS WITH OLDER CO-RESEARCHERS

T. Buffel, C. Phillipson, *The University of Manchester, Manchester, United Kingdom*

Age-friendly community initiatives have the potential to empower older people to advocate on their own behalf, yet there has been relatively little scholarly discourse on translating this principle into practice. This paper aims to address this gap by exploring older people as co-researchers in developing age-friendly communities in Manchester, UK. Through the application of a participatory methodology, older people were involved not only as the research target group, but also as experts and actors in the various stages of the research, including the planning, design, and realization of the project. The presentation will reflect on both challenges and opportunities concerning the involvement of older people as co-researchers, and will discuss the research approach as a tool for creating community networks on the one hand and empowerment of older people on the other. The presentation will also consider the implications of the findings for developing age-friendly communities in complex urban environments.

A CASE EXAMPLE OF RESEARCH TO PLAN AGE- FRIENDLY ACTION IN SHANGHAI, CHINA

L. Fang, J. Wang, W. Zhang, *Chinese Academy of Social Sciences, Beijing, China*

Shanghai, China, has been a member of the World Health Organization’s Global Network of Age-Friendly Cities since it was founded in 2006. Although the initiative has inspired government proclamations and some policy reforms over the years, much of the age-friendly action remains at the early stages of exploration. As part of continuing to develop plans for potentially new programs, we conducted fieldwork research and surveys with organizations that provide services to older adults in the greater Shanghai area. A central finding of our research is the availability of older adult mutual assistance programs in many parts of the region, although not all. Moreover, the programs that do exist are operating independently from the city’s age-friendly community initiative.

Additional research to understand why these programs have developed in particular locations is necessary to identify place-based leverage points for age-friendly actions, as well as place-based variation in the outcomes such initiatives.

A FRAMEWORK TO DESCRIBE THE EARLY PLANNING PHASE OF AGE-FRIENDLY COMMUNITY INITIATIVES

E.A. Greenfield, *Rutgers, The State University of New Jersey, New Brunswick, New Jersey*

This study employed a grounded theory approach to develop an empirically grounded framework of age-friendly community initiatives' (AFIC) objectives and resources in the early planning period. I conducted in-depth interviews with leaders of nine newly formed AFCIs in northern New Jersey (U.S.) at two points during the first six months of their projects. Results indicated three inter-related aims of the planning period: (a) building relationships, (b) harnessing data, and (c) raising the visibility of older adults and the AFIC. To achieve these objectives, leaders reported drawing on social and human capital within and among stakeholders, including the lead organization, consultants, organizational partners, municipal leaders, individual volunteers, funders, and web-based resources. The framework can be used to assess organizational and community readiness to begin an AFIC, target areas for resource development, and track AFCIs' early accomplishments. Findings also offer implications for research on the effectiveness and expansion of AFCIs.

SESSION 165 (SYMPOSIUM)

GLOBAL COUNCIL ON BRAIN HEALTH: ADVANCING INTERNATIONAL DIALOGUE TO PROMOTE WELL-BEING

Chair: S. Lock, *AARP, Washington, District of Columbia*

As people live longer, the need for clear, trustworthy information on brain and cognitive health is greater than ever. Launched in 2015, the Global Council on Brain Health is an independent collaborative of scientists, clinicians, scholars and policy experts convened by AARP to provide the foremost thinking on what people and professionals can do to maintain and improve brain health. The goal of the Council is to translate scientific research into actionable recommendations for the public that will help drive behavior change in individuals across communities and cultures. This symposium will feature leading researchers from the UK, US and Canada to highlight recommendations issued by the Council. It will showcase three consensus documents generated by the Council that are based on the latest research advancements. Particular emphasis will be placed on Council recommendations that are aimed at improving brain health in three areas: physical exercise, sleep and social engagement. In sum, this symposium brings together leaders at the forefront of this international effort to discuss the scientific and policy dimensions of brain health.

PHYSICAL ACTIVITY AND BRAIN HEALTH

T. Liu-Ambrose, *University of British Columbia, Vancouver, British Columbia, Canada*

The GCBH convened to examine research focused on the impact of physical activity on brain health. Eight issue specialists representing four continents arrived at consensus

statements to summarize the impact of physical activity on brain health: (1) Follow current public health recommendations of 150 minutes of weekly, moderate-intensity aerobic activity and two or more days a week of moderate-intensity, muscle-strengthening activities. In addition to purposeful exercise, lead a physically active lifestyle throughout the day. (2) Identify meaningful and enjoyable ways to increase and maintain physical activity. (3) Incorporate physical activity as a part of a healthy lifestyle to help reduce the risk of cognitive decline, and (4) When focusing on the impact of physical activity on brain health, stakeholders and policy makers should take into account the breadth of scientific evidence (i.e. animal studies, epidemiological studies, and randomized controlled trials) while recognizing the knowledge gaps.

SLEEP AND BRAIN HEALTH

K. Yaffe, *UCSF, San Francisco, California*

This talk will provide an overview of the consensus document on sleep and cognitive health. Recommendations issued by the Council addressed how sleep patterns change as individuals grown older. Sleep hygiene will also be discussed during this talk as a way of maintaining and improving cognitive health. Particular focus will be placed on the implementation of non-pharmacological methods as a way of improving sleep patterns. A full discussion of the recommendations relating to sleep duration, sleep timing, sleep quality, napping and sleep disorders as we age will be discussed.

SOCIAL ENGAGEMENT AND BRAIN HEALTH

L. Clare, *University of Exeter, Exeter, United Kingdom*

The relationship between social engagement and brain health will be the third topic examined by the GCBH. A broad range of contextual lifestyle factors will be considered in the consensus document and recommendations, including social engagement, social isolation, social networks, social support, living situation, marital status and loneliness. There are structural (e.g. family size), functional (e.g. level of support) and appraisal (e.g. attitudes, beliefs, mood) aspects involved in shaping each person's experience of social engagement or isolation. The relationship between stress, resilience and social engagement will also be discussed. Current evidence indicates a link between isolation and poor health outcomes and mortality; however, more research is needed to assess the impact of loneliness. Although it is widely accepted that supporting social connections is beneficial, there is as yet little robust evidence for the effectiveness of interventions addressing loneliness and isolation.

THE PUBLIC MESSAGING OF SCIENCE: WHAT THE EVIDENCE TELLS US ABOUT GETTING IT RIGHT

J. Goodwin¹, S. Lock², *1. University of Loughborough, Loughborough, United Kingdom, 2. AARP, Washington, District of Columbia*

Although it is often stated that the production of new knowledge is an intrinsically valuable objective, health science research is duty bound to show the public value of its work. However, a common criticism of empirical science is its failure of translation into society-useful outcomes. For example a common perception is that science is expert driven rather than society led, with little interaction between the two in the translation process. No more is this more important

than in brain health, in which the public understanding is parsimonious. Within this context we review the key elements of research-based societal change and will present new models of knowledge transfer and impact, including the WHO knowledge transfer model for ageing and health, its application in real life settings and the example of the Global Council for Brain Health whose remit is the presentation of reliable public messages derived from expert evidence.

SESSION 170 (SYMPOSIUM)

TECHNOLOGY-ENABLED SOLUTIONS FOR IMPROVING HEALTH OF ETHNICALLY DIVERSE OLDER AMERICANS

Chair: S. Levkoff, *University of South Carolina, Columbia, South Carolina*

Co-Chair: H. Chen, *Brigham Women's Hospital, Cambridge, Massachusetts*

Discussant: D.A. Lindeman, *University of California, Berkeley*

Over the past decade, substantial research has identified the role that health information technology (HIT) can play in enhancing health, through assisting with medication compliance, acquisition of information and skills for managing illness, and providing socio-emotional support to enhance retention of positive behavioral change. Despite the emergence of HIT and its evidence in supporting a variety of health outcomes, there has been less penetration of HIT in ethnic minority populations, where cultural values often play a role in mitigating access to HIT. This session provides an overview of four different studies, all of which are focused on developing culturally-competent HIT interventions for ethnic minority older adults with a range of health problems, including dementia, congestive heart failure, and HIV. The studies were all developed through focus groups with the at-risk populations, who identified needs, barriers, and facilitators to overcome barriers identified. In addition, iterative usability testing was conducted during the development of all HIT programs. Each presentation will focus on the unique contributions of the different theories (e.g., social learning, positive psychology, adult education/andragogy, behavioral economics, digital technology, cultural adaptation, and evidence-based care) that went into the development of the HIT program.

SUPPORTING MEDICATION ADHERENCE IN HIV+ OLDER AFRICAN AMERICANS

P. Weitzman¹, M. Pagan-Ortiz¹, J. Xing¹, X. Lu¹, S. Levkoff^{1,2}, 1. *Environment and Health Group, Cambridge, Massachusetts*, 2. *University of South Carolina, Columbia, South Carolina*

African Americans, who account for almost half of people living with an HIV diagnosis, are less likely than white HIV patients to receive antiretroviral therapy (ART), to be adherent to ART, and achieve viral suppression. Neurocognitive changes brought on by both HIV and aging processes, along with greater pill burden in older patients, make medication adherence especially challenging for older African Americans with HIV. This session will present results of a Phase I feasibility study that demonstrated the effectiveness

of a text-messaging program, which included pill reminders with motivational and health educational messages to support a positive outlook and healthy living, in increasing medication adherence among older African Americans with HIV. Qualitative data suggest: a sense of fatalism among newly-diagnosed patients places them at high risk for non-adherence; rapid decline in health post-diagnosis prompts non-adherent patients to become adherent; and, motivational messages are supportive in preventing intentional lapses (drug holidays).

MOBILE HEALTH FOR IMPROVING SELF-CARE FOR AFRICAN AMERICAN ELDERS WITH CONGESTIVE HEART FAILURE

H. Chen^{1,3}, S. Heiney², E. Shi³, S. Levkoff^{2,3}, 1. *Psychiatry, Brigham Women's Hospital, Cambridge, Massachusetts*, 2. *University of South Carolina, Columbia, South Carolina*, 3. *Environment and Health, Cambridge, Massachusetts*

African-Americans (AA) with congestive heart failure (CHF) are typically sicker, poorer, less educated, and have more co-morbid conditions than White older adults with CHF. Despite evidence of benefits of home tele-monitoring on mortality and hospitalizations, few care models have been designed specifically for African-Americans with CHF. This session reports on an intervention program conducted in South Carolina, where rates of hospitalization for CHF are among the highest in the country. The intervention was informed by qualitative research documenting specific needs for improving self-care and treatment compliance as identified by AA patients in a hospital-based Home Care Program. The low-cost intervention utilizes a mobile phone with a software application that: monitors CHF symptoms; improves self care by providing educational and motivational messages to reduce risks for CHF progression; and improves health care navigation by making it easy for patient to connect to health care providers.

USING WEBSITE AND VIDEO FOR SAFE SEX EDUCATION WITH OLDER DIVORCED WOMEN

P. Weitzman¹, M. Pagan-Ortiz¹, J. Xing¹, X. Lu¹, S. Levkoff^{1,2}, 1. *Environment and Health Group, Cambridge, Massachusetts*, 2. *University of South Carolina, Columbia, South Carolina*

HIV is on the rise among American women over age 50. The increase coincides with the rise in gray divorce. Few interventions promote safe sex practices among older divorced women. Access, stigma and privacy concerns make a web-based intervention ideal. This session presents the findings from a Phase I study utilizing a website based on positive psychology and social learning principles to promote wellbeing post-divorce in older divorced women. Safe sex education was embedded in the website, as well as videos of older divorced women talking about real-life experiences with dating and safe sex. Safe sex self-efficacy improved among all users. Perceived HIV risk scores of those who viewed the site with videos significantly improved. Qualitative data revealed strong acceptability and appeal of the videos. The text and graphics only web-based intervention proved effective at promoting HIV/STD prevention; the addition of videos increased both impact and appeal among users.

A SELF-DIRECTED LEARNING (SDL) SYSTEM FOR CHINESE DEMENTIA CAREGIVERS

N. An^{1,2}, H. Chen^{2,3}, J. Yang Sharir², S. Levkoff², 1. *Hefei University of Technology, Hefei, Anhui, China*, 2. *Environment and Health Group, Cambridge, Massachusetts*, 3. *Brigham and Women's Hospital, Boston, Massachusetts*

Ethnic Chinese dementia caregivers experience significant burden and reduced quality of life, and are not likely to seek skills training due to cultural barriers. To overcome barriers to help seeking, an online self-directed learning (SDL) intervention program to provide both caregiving and self-care skills was developed. The computer software to implement the SDL program has an “engagement design,” relying on theories of: adult education/andragogy; behavioral economics; digital technology; cultural adaptation; and evidence-based dementia care skills. The program, in Chinese language, uses brief videos, quizzes, progress tracking, and text message reminders to ensure continual and effective learning. Together with the educational website (www.loveandhelp.com) that provides knowledge information and an online community for increasing socio-emotional support for caregivers, the SDL program is part of the overall strategy of using health information technologies to enhance the overall caregiving capacity for dementia care.

SESSION 175 (SYMPOSIUM)

LONG-TERM CARE POLICY TRENDS IN CHINA, TAIWAN, JAPAN AND KOREA: IMPLICATIONS FOR AGING IN ASIA

Chair: Y.W. Glavin, *Case Western Reserve University/ Taipei Medical University, Mayfield Village, Ohio*

Co-Chair: F.K. Ejaz, *Benjamin Rose Institute on Aging, Ohio*

This Symposium compares LTC policy trends in China, Taiwan, Japan and Korea. Presentations include use of diverse methodologies ranging from analyses of national datasets (Japan and Taiwan), to reviews of public programs (China) and a literature review on the impact of public policies (Korea). Overall, two significant policy issues are covered: 1) Development of health, long term and community-based care; and 2) Impact on caregiving.

Dr. Sun will review China's policies of elderly income support (500 million participants), medical care insurance (95% covered), social services that support facility-based care and policy support for medical and care integration.

Dr. Wakui will examine service utilization and care patterns based on findings from the Comprehensive Survey of Living Conditions in Japan; and discuss policy and practice implications for balancing formal and informal care.

Dr. Nakashima will review Japan's Integrated Community Care, challenges associated with aging-in-place and ways of improving care coordination and promoting preventive care.

Dr. Chee will review the literature on the impact of Korea's Long-Term Care Insurance on older adults and their caregivers. A pilot qualitative study corroborates the research literature and found that people now support elder care through both public programs and traditional family caregiving.

Dr. Glavin will review data from the: 1) National LTC Study that describes Taiwan's disability population (2.89%)

and high public support (89%) for national LTC insurance; and 2) Integrated Health and LTC Study that stresses importance of unified assessment, coordinated financing, and integrated care and capitations.

Dr. Ejaz will serve as a moderator.

STATE POLICIES REGARDING THE CHINESE ELDERLY POPULATION

R. Sun, *Cleveland State University, Cleveland, Ohio*

China's policies to improve the well-being of the elderly are in three major dimensions. There are two major programs in the economic arena: 1) the establishment of old age support insurance in both cities and countryside. There are about 500 million participants and over 130 million elderly currently receiving monthly benefit. 2) The minimum living protection program, which is aimed to cover those in poverty or with low income. There are two parallel programs in medical care: 1) basic health care insurance, which covers 95% of the elderly in both urban and rural areas. 2) medical aid policy, which is aimed to help those in poverty or with low income, or childless, or in other special circumstances. For social services, the state and local governments are promoting to build more facilities, for-profit or non-profit, such as elderly housing, day care, assisted living, and nursing homes.

IMPACTS OF CHANGING FAMILIES ON PUBLIC LONG-TERM CARE INSURANCE PROGRAM IN JAPAN

T. Wakui¹, E.M. Agree², I. Kai³, 1. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 2. *Johns Hopkins University, Baltimore, Maryland*, 3. *The University of Tokyo, Tokyo, Japan*

Balancing formal and informal care system is a key to sustaining long-term care programs; however, the interrelated impacts between formal and informal care have been overlooked. In Japan, while women traditionally bear most of the caregiving roles in multigenerational households, trends toward delayed marriage and changes in family structure are leading to a greater variety in caregiving arrangements, such as son caregiving, multiple caregiving or unmarried-child caregiving. Analysis of the Comprehensive Survey of Living Conditions (CSLC: n=2248) national data suggested that patterns of services utilized differed by caregiver type. For example, son caregivers were more likely to use formal services in ADL care, compared to daughter and daughter-in-law caregivers. Findings have important implications for policy and practice and suggest that service utilization is linked to caregiver characteristics. Sustainability of the public long-term care program by balancing formal and informal care is discussed.

REVIEW OF JAPAN'S INTEGRATED COMMUNITY CARE, IMPACTS AND CHALLENGES IN SUPPORTING AGING IN PLACE

T. Nakashima^{1,2}, 1. *Rutgers University, Camden, New Jersey*, 2. *SUNY at Albany, Albany, New York*

The Japanese government implemented a long-term care insurance program called “Integrated Community Care System” to help older adults age in place. Municipal governments and Community General Support Centers are required to establish the Integrated Community Care System through

collaborations with long-term care services, healthcare, prevention programs, housing, and daily life support services.

Administrators, practitioners, researchers and policy makers are struggling with issues related to care coordination and increased efficiency in order to promote a higher quality of care for older adults. In this presentation, three important issues will be discussed to explain the challenges to supporting aging in place. These issues are: 1) how to combine medical and long-term care in the provision of home care, 2) how to enhance the functions of various community-based services, 3) how to promote preventive care and daily life support services involving the members of the community as volunteers.

THE CONCEPTION OF ELDER CARE IN THE CONTEXT OF LONG-TERM CARE POLICY IN KOREA

K. Chee¹, H. Lee², 1. *Sociology, Texas State University, San Marcos, Texas*, 2. *Catholic University of Daegu, Daegu, Korea (the Republic of)*

This study investigated how Korea's Long-Term Care Insurance Program implemented in 2008 has affected the ideas and experiences of elder care. According to the research literature, this program has helped reduce family caregivers' care burden and stress. In addition, elders were found to uphold traditional values of filial piety and preferred family care to institutional care, though family care was still more burdensome for caregivers. Qualitative data from our pilot study with seven adults (aged 23 to 61 years) corroborate these themes, but show that respondents emphasize independence for both young and old, and believe that family and society should be jointly responsible for elder care. We discuss our findings in light of their implications for research and practice. Future research could use the life course framework to examine cohort differences between perspectives of elders and their caregivers regarding what constitutes ideal elder care.

LONG-TERM CARE AND CARE INTEGRATION IN TAIWAN AND MAINLAND CHINA: OPPORTUNITIES AND DIRECTIONS

Y.W. Glavin¹, L. Hu², 1. *School of Medicine, Case Western Reserve University/ Taipei Medical U, Mayfield Village, Ohio*, 2. *School of Public Health Peking Union Medical College, Beijing, China*

National LTC Need Study (NLTCNS) conducted in 2009–2011 and 2015–2016, indicated Taiwan's disability rate in general population is 2.89%; in elderly population is 16.50%; the disabled population is estimated to raise from 740,000 in 2014 to 1,200,000 in 2031. After the implementation of National Health Insurance in 1995, Taiwan is in the process of developing the long term care system. NLTCNS indicated high public support for long term care insurance (87%), although new administration now considers a tax-based financing. Integrated Health and LTC Study (IHLTCS) was funded in 2015 to explore integration strategies and resources needed to support system integration. Presenters will discuss findings from both NLTCNS and IHLTCS to describe Taiwan's disability population, service utilization, issues causing fragmentation and stakeholder opinions. A proposal outlining focus areas to initiate care integrations and tools and external support required will be discussed.

SESSION 180 (SYMPOSIUM)

ADAPTATIONS OF EVIDENCE BASED TRANSITIONAL CARE MODELS IN THE U.S.

Chair: M.D. Naylor, *University of Pennsylvania School of Nursing*

M. Pauly, *Wharton School, University of Pennsylvania, Philadelphia, Pennsylvania*

Derived from rigorous study in well-designed clinical trials, evidence-based interventions (EBI) often are incorporated into health care practices, yet little is known about how they are adapted to local contexts. In this symposium, we will describe a mixed methods study of adaptations of the Transitional Care Model (TCM) funded by the Robert Wood Johnson Foundation. First, we will describe the TCM, a rigorously tested EBI proven to improve care, enhance outcomes and reduce costs among vulnerable chronically ill older adults. Then, we will discuss the rationale for the use of Stirman's "System of Classifying Modifications to Evidence-Based Programs" to explore the potential adaptations of EBIs, including those classified as contextual (e.g., external or internal system factors) or content (e.g., EBI components, frequency and mode of delivery) related. Using data from a national survey of expert practitioners based in diverse health and community-based organizations, we will then describe 344 programs who reported use of the TCM. The presentation will highlight common content adaptations and perceived contextual barriers and facilitators in implementation of EB transitional care interventions. Next, we will summarize findings from our qualitative analysis of interviews with expert practitioners based in 26 unique organizations that reported implementation of the TCM and describe both the nature of content and contextual adaptations of the TCM and the rationale for these adaptations. Practice, policy and research implications of findings related to adaptations of the TCM and other EBIs will be examined.

ADAPTATIONS OF EVIDENCE-BASED INTERVENTIONS: THE CASE OF THE TRANSITIONAL CARE MODEL

M.D. Naylor^{1,2}, K.B. Hirschman^{1,2}, M. Toles^{2,3}, E. Shaid^{1,2}, K. McCauley^{1,2}, M. Pauly⁴, 1. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*, 2. *NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania*, 3. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 4. *Wharton School, University of Pennsylvania, Philadelphia, Pennsylvania*

For over 20 years, multiple National Institute of Health funded randomized control trials and comparative effectiveness studies of the TCM have demonstrated enhanced patient experiences with care, improved health and reduced costs for older adults with multiple chronic conditions. Additionally, rigorous translational studies, supported by many foundations, have resulted similar quality and cost benefits for this vulnerable patient group. Similar to other EBIs, however, limited empirical data are available which describe how the TCM has been adapted in "real world" clinical practice. In this session, we will explore the rationale for rigorous examination of adaptations of the TCM and describing the aims of this study, the basis for using Stirman's "System of

Classifying Modifications to Evidence-Based Programs” and the reasoning behind the use of a mixed methods approach. We also will describe how findings contribute to the body of knowledge related to adaptations of EBIs.

PHASE I: A QUANTITATIVE EVALUATION OF ADAPTATIONS OF THE TRANSITIONAL CARE MODEL

K.B. Hirschman^{1,2}, M. Toles^{2,3}, O.F. Jarrin^{1,4}, E. Shaid^{1,2}, M. Pauly⁵, M.D. Naylor^{1,2}, 1. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*, 2. *NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania*, 3. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 4. *Rutgers, The State University of New Jersey, School of Nursing, Newark, New Jersey*, 5. *Wharton School, University of Pennsylvania, Philadelphia, Pennsylvania*

This session will summarize findings from a national survey designed to identify common adaptations of the TCM across diverse health and community-based settings. Targeted respondents were expert practitioners (i.e., clinicians or clinical leaders of transitional care programs). A web-based survey was conducted (September 2014 to January 2015). Of the 582 unique respondents who completed the survey, 344 reported use of the TCM alone or in combination with other EB transitional care models. The hospital-to-home design, a key TCM feature, was adapted by 60% of respondents. Two common adaptations of the TCM's nine core components related to staffing and care continuity. Specifically, 55% of respondents reported use of diverse clinicians vs. advanced practices nurses to deliver the TCM (contextual adaptation) and 52% of programs ended TCM services at hospital discharge (content adaptation). Practice and research implications of study findings will be explored.

PHASE II: QUALITATIVE ASSESSMENT OF ADAPTATIONS OF THE TRANSITIONAL CARE MODEL

M. Toles^{2,3}, K.B. Hirschman^{1,3}, E. Shaid¹, O.F. Jarrin^{1,4}, M. Pauly⁵, M.D. Naylor^{1,3}, 1. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*, 2. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 3. *NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania*, 4. *Rutgers, The State University of New Jersey, School of Nursing, Newark, New Jersey*, 5. *Wharton School, University of Pennsylvania, Philadelphia, Pennsylvania*

This session will describe findings from the study's qualitative phase designed to explore expert practitioners' perceptions of the rationale for adapting the TCM. Study investigators developed a questionnaire, interviewed 26 purposefully-selected TCM practitioners from the Phase I survey, conducted thematic analysis and described the characteristics and value of common contextual and content adaptations. Contextual adaptations were common. The TCM was commonly delivered by registered nurses and in a variety of settings (e.g., hospitals, integrated health systems, home care, etc.). Content adaptations also were common. Most often, visits were provided for higher-risk patients during hospital to home transitions but separate staff provided hospital and home services. Respondents offered diverse

goals for adapting the TCM including: expanding the reach of services, engaging patients, and collaborating with multiple clinicians. All respondents anticipated future TC program growth. Findings suggest the need to rigorously evaluate the effects of adaptations on health and cost outcomes.

SESSION 185 (SYMPOSIUM)

A NEW LENS ON QUALITATIVE METHODS IN AGING: CHALLENGES IN RECRUITING, ANALYZING, AND MIXED METHODS

Chair: C. Koren, *University of Haifa, Hod Hasharon, Israel*
Co-Chair: M. Roes, *German Center for Neurodegenerative Diseases (DZNE), Witten, Germany*
Discussant: A.J. Schwartz, *East Carolina University, Greenville, North Carolina*

This symposium addresses several challenges qualitative researchers from several countries encountered as they studied varied experiences of older adults in increasingly aging societies. Presenters have investigated interpersonal relationships within institutional settings (Washburn & Williams), the phenomenology of becoming an older person (Washburn & Williams), late-life re-partnering and its influences on intergenerational family relations (Koren), and health beliefs of older Latinos with cancer (Carrion & Nedjst-Haiem). Among the challenges the presenters have faced are addressing the ethical rights of special populations such as older persons living with dementia (Roes & Panke-Kochinke) and how best to approach older members of various ethnic backgrounds to participate in a research study (Carrion & Nedjst-Haiem).

Washburn and Williams will discuss how quantitative data in two mixed methods studies were used to better understand the intended meaning of participants' responses in semi-structured interviews. Recruitment issues are addressed in two presentations. Roes and Panke-Kochinke will explain how to identify the capacity to give consent and conducting an informed/ongoing (here and now) consent process whereas Carrion and Nedjst-Haiem will illustrate how to overcome recruitment barriers with older Latinos with cancer emphasizing how it promotes successful qualitative research by providing rich data. Koren will explain how to analyze data from a study with multi-generational families based on qualitative interviews conducted individually with each family member, discussing this approach in relation to qualitative dyadic analysis and qualitative methods in family research. As discussant, Schwartz will integrate, draw conclusions, and facilitate discussion on challenges using qualitative methods in research on aging.

QUALITATIVE DATA ANALYSIS OF THE MULTIGENERATIONAL FAMILY UNIT: THE CASE OF LATE-LIFE STEPFAMILIES

C. Koren, *University of Haifa, Hod Hasharon, Israel*

With life expectancy rising, families expanding to three, four, even five generations are becoming more common. Thus, new phenomena in aging and family studies are expected to develop requiring qualitative methodology. Along with the perspectives of the older generation those of the other

multigenerational family members will become increasingly important for understanding the meaning of aging.

The aim of this presentation is to illustrate how to conduct a qualitative study with multi-generational families. The emphasis is on the analysis of such units based on qualitative interviews conducted individually with each family member using data from a large qualitative study on the meaning of late-life repartnering from a family intergenerational perspective.

The study included 19 stepfamily-units (38 multigenerational family-units) a total of 107 participants (38 partners, 37 adult children, 32 young and adult grandchildren).

The method will be discussed in relation to qualitative dyadic analysis and qualitative methods in family research.

ADDRESSING RECRUITMENT CHALLENGES IN QUALITATIVE RESEARCH AMONG OLDER LATINOS WITH CANCER

I.V. Carrion¹, F.R. Nedjat-Haiem², 1. *Social Work, University of South Florida, Tampa, Florida*, 2. *New Mexico State University, Las Cruces, New Mexico*

This paper addresses the challenges and presents strategies that facilitate recruitment in qualitative research in a cancer care study with older Latinos. We analyzed factors that influence the recruitment process when conducting qualitative studies using a priori codes and constant comparison within a grounded theory framework.

Recruiting Latinos with cancer in a qualitative study entail understanding their beliefs and knowledge of research studies and the ability to articulate benefits of participating in research studies in the individual's language of preference. In order to ensure successful recruitment approaches, qualitative researchers must develop a research team that reflects the population which is being recruited as well as attend to gender ascribed health beliefs, transportation constraints, immigration issues and language barriers.

Overcoming recruitment barriers with older Latinos with cancer is vital in order to successfully conduct qualitative research studies. The findings will address the gaps in psycho-social care literature and inform evidence-based interventions.

MANAGING ONGOING CONSENT IN RESEARCH WITH PEOPLE LIVING WITH DEMENTIA

B. Panke-Kochinke^{1,3}, J. Serbser¹, J. Dreyer¹, M. Roes^{1,2}, 1. *German Center for Neurodegenerative Diseases (DZNE), Witten, Germany*, 2. *University of Witten/Herdecke, Witten, Germany*, 3. *University of Osnabrueck, Osnabrueck, Germany*

People living with dementia have the right to decide whether or not they want to participate in qualitative research and to give their informed/ongoing consent. How to create participation is also related to the question in what way(s) concepts of autonomy and self-determination are defined. However, as the symptoms of dementia progresses, the cognitive ability to give verbal consent diminishes and finally is lost, and therefore influencing the decision process. Although it seems ethically challenging to (not) let people with dementia participate in research, they must be protected against the risks of research participation. As a result, researchers have tended to seek the consent (assent) of the relatives of persons

with dementia that has progressed beyond the early stages. The aim of this presentation is to exemplify how to identify the capacity to give consent, and how concepts of autonomy and self-determination support an informed/ongoing consent process.

MIXED METHODS APPROACHES TO INCREASING OUR UNDERSTANDING OF THE LIVED EXPERIENCE OF OLDER ADULTS

A.M. Washburn, S. Williams, *National University, La Jolla, California*

This presentation will explain how quantitative data in two studies with a mixed methods design were used to better understand the intended meaning of participants' responses in semi-structured interviews. In the first study, 17 community-dwelling older adults answered questions about their experience of aging in place and completed several quantitative measures. Analysis of the interview transcripts employed a phenomenological-hermeneutic strategy; participants' responses to the quantitative measures were then used to inform further interpretations of their answers. In the second study, 40 nursing home residents answered questions about their interpersonal day-to-day social interactions and interpersonal relationships. A thematic analysis of their responses was followed by additional analyses using data from measures of social cognition, as well as nursing staff's ratings of their social behavior. In both studies, several widely-held assumptions about the nature of older adults' lived experience—for example, that loneliness and boredom are commonplace—are belied by the findings.

SESSION 190 (SYMPOSIUM)

ACCESS TO SERVICES AMONG VULNERABLE ELDERLY: ADDRESSING SOCIAL, ECONOMIC, AND ENVIRONMENTAL BARRIERS

Chair: M.B. Ryvicker, *Visiting Nurse Service of NY, New York, New York*

Co-Chair: K. Ornstein, *Mount Sinai Hospital, New York City, New York*

Discussant: C.M. Murtaugh, *Visiting Nurse Service of NY*

The ability of older adults to access and effectively navigate health and social services may depend on a myriad of factors. Physical disability and mobility issues, social support availability, home and neighborhood environments, access to transportation, and provider factors all form the landscape in which a person navigates and accesses services. This symposium will synthesize recent research that explores a range of social, economic, and environmental barriers to older adults' access to services, identifies unmet service needs that may be linked to these barriers, and examines different approaches to overcoming these barriers in vulnerable populations. The first paper examines the epidemiology of homebound status, focusing on socioeconomic factors, using data from the National Health and Aging Trends Study (NHATS), a nationally representative longitudinal survey of older adults in the United States. The second presentation uses the NHATS to examine demographic, clinical, and functional variations in types of transportation used to get to medical appointments. The third paper describes a pilot study of an in-home assessment tool to identify necessary

home improvements to overcome environmental barriers for homebound older adults. The fourth presentation describes a community-based initiative to identify neighborhood problems and barriers faced by older adults in accessing services. This collection of papers draws on multiple disciplines, including nursing, geriatrics, epidemiology, and the social sciences. The discussion will explore policy and practice implications of a multi-dimensional perspective on access and navigation barriers among vulnerable elders at high risk of unmet needs and poor health-related quality of life.

HOW DO ECONOMIC FACTORS DRIVE HOMEBOUND STATUS?

K. Ornstein, T. Soones, A. Siu, *Icahn School of Medicine at Mount Sinai, New York, New York*

There is a large and growing population of individuals with serious illness living in the community who are poor, homebound, and heavily reliant on caregiver support. Individuals of middle-income who do not qualify for Medicaid and lack the financial cushion of those with greater wealth may be especially vulnerable to becoming homebound. Using data from the National Health and Aging Trends Study, a nationally representative sample of Medicare beneficiaries, we prospectively examine the association between homebound status, caregiving and income. Among community-dwelling non-homebound individuals, those in the highest income brackets are least likely to become homebound or to be in nursing homes over 2 years of follow-up. This work demonstrates the role of economic factors on residence and quality of life and suggests that we need to expand policy initiatives to better serve those income groups most vulnerable to the costs related to living in the community with serious illness.

TRANSPORTATION TO MEDICAL APPOINTMENTS AMONG VULNERABLE ELDER

M.B. Ryvicker¹, K. Ornstein², *1. Visiting Nurse Service of New York, New York, New York, 2. Icahn School of Medicine at Mount Sinai, New York, New York*

Prior research on chronically ill elders has identified substantial subpopulations with unmet needs for outpatient care, even in urban areas fairly saturated with providers. This raises questions about barriers to effective healthcare navigation among vulnerable elders. We examined demographic, clinical, and functional variations in types of transportation used to get to medical appointments. Using data from the National Health and Aging Trends Study, we found that whites were more likely to drive themselves to the doctor (59%), compared to Blacks (42%) and Hispanics (35%). Nonwhites and those with lower education levels relied more heavily on rides from others, shuttles for seniors and public transit. Individuals who relied on rides or other forms of transit within the past year were 50% more likely to visit the ED in the subsequent year, controlling for selected characteristics. Further work is needed to expand transportation options for underserved elders to promote effective healthcare navigation.

A PILOT STUDY ASSESSING IN-HOME ACTIVITY PERFORMANCE AMONG VULNERABLE OLDER ADULTS IN NEW YORK CITY

D. Russell¹, S.L. Szanton², J.L. Feinberg¹, K.H. Bowles¹, *1. Visiting Nurse Service of New York, New York, New York,*

2. Johns Hopkins University School of Nursing, New York, New York

Decreased physical function is a common modifiable risk factor for nursing home admission and increases odds of hospital readmission by 320%. Nearly half of older adults leave the hospital with new difficulty completing activities of daily living, with many adults homebound. A challenging home environment can lead to further functional decline. This presentation will discuss findings from the In-Home Occupational Performance Evaluation (I-HOPE), a measure of in-home activity performance, to identify environmental barriers homebound patients face and identify needed home improvements. It will also include findings from interviews with building staff regarding facilitators and barriers to making needed home improvements. This work will enhance understanding of the functional and home modification needs among a population of vulnerable older adults. This pilot can serve as a catalyst for new models to mitigate environmental barriers and improve functional status for homebound patients, thus improving access to services.

A COMMUNITY-BASED INITIATIVE TO IDENTIFY AND ADDRESS BARRIERS IN OLDER ADULTS' ACCESS TO SERVICES

M. Oberlink, *Visiting Nurse Service of New York, New York, New York*

Older adults living in low-income communities often have difficulties accessing services in their own neighborhoods because: they lack knowledge about what services are available or the services simply don't exist; they lack reliable transportation to access the services or are unaware about transportation alternatives that might be available in their community; or they are fearful of leaving their homes in high-crime areas. The AdvantAge Initiative is a project that has conducted surveys and focus groups with thousands of older adults across the country asking them to identify neighborhood problems and barriers to navigating their communities and accessing services. Findings are communicated to stakeholders who use this information to plan strategies to remove barriers and make their communities more aging-friendly. We will discuss access and navigation barriers—such as misperceptions about services and inconveniently located services—and how communities have addressed these barriers.

SESSION 195 (SYMPOSIUM)

THE SAME OR DIFFERENT? UNDERSTANDING AGEING WELL AND THE TRANSNATIONAL MIGRANT LIFE COURSE

Chair: C. Victor, *Brunel University-London, United Kingdom*

Discussant: S. Torres, *Uppsala University, Uppsala, Sweden*

The 'healthy migrant' effect consistently demonstrates that those who migrate across international borders have lower rates of mortality and morbidity than the destination country, although we do not know if this holds for measures of wellbeing. Do older people with a transnational migratory life course demonstrate better wellbeing outcomes than their peers in their countries of origin

and destination and how do outcomes vary between different migratory pathways? We use 3 domains of wellbeing: loneliness, subjective health status/disability and life satisfaction/quality of life to explore the impact of a life course that involved transnational migration on 'ageing well'. Comparing migrant and non-migrant Turkish families Baykara-Krumme and Fokkema show that family cohesion is stronger in non-transnational migrant families. Klok and colleagues demonstrate how a sense of belonging to either ones 'own group' or the larger society in the country of settlement protects against loneliness but transnational belonging does not. Klokgieters explores whether factors of social participation, religious coping and motivation to migrate help maintain high levels of wellbeing in a context of migration stress among Turkish and Moroccan migrants. Victor and Burholt demonstrate heterogeneity across wellbeing outcomes according to migratory pathway. Those who left India demonstrate wellbeing outcomes comparable with their peers in both country of origin and destination whilst those from China fare worse than either. We conclude by synthesizing variations in 'ageing well' within and between those with migratory life courses, how these compare with peers in countries of destination and origin, and propose an agenda for further research.

THE IMPACT OF MIGRATION ON FAMILY SOLIDARITY TYPES

H. Baykara-Krumme¹, T. Fokkema², 1. *University Duisburg-Essen, Duisberg, Germany*, 2. *Netherlands Interdisciplinary Demographic Institute, The Hague, Netherlands*

This paper aims to expand knowledge on the effects of international migration on parent-adult child relationships. We develop a typology of families, include non-migrant families in the country of origin for comparison, and consider transnational families. Analyses are based on the Turkish 2000 Families Study, using information on adult non-co-resident children about their relationships with their parents. Latent class analysis shows four family solidarity types whose prevalence differ across the migrant groups. The proportion of the full-solidarity type is larger and that of the autonomous family type is smaller in first- and second-generation migrant families than in stayer families in Turkey. In transnational families there is less full solidarity and autonomous relationships are more common. All migrant groups display less advice-oriented and more material-oriented support relationships. These results indicate stronger family cohesion in non-transnational migrant families and few changes across migrant generations. Observed differences are not due to composition effects.

LONELINESS AND SENSE OF BELONGING AMONG OLDER TURKISH AND MOROCCAN MIGRANTS TO THE NETHERLANDS

J. Klok, T. Van Tilburg, B. Suanet, M. Huisman, *Vrije Universiteit Amsterdam, Amsterdam, Netherlands*

We examine how sense of belonging functions as a protective mechanism against loneliness. Drawing on Berry's work (1980) on acculturation strategies (i.e. integration, assimilation, separation and marginalization), we expect that more belonging contributes to less loneliness. We add a transnational belonging perspective and argue that this

could also function as a protection against loneliness, as it acknowledges the importance of place attachment. Using LASA data on older migrants aged 55–66, we distinguish Berry's acculturation strategies in our sample. Whether transnational belonging is a separate dimension of belonging, remains unclear. Regression analysis shows that the marginalized are lonelier than those with a stronger sense of belonging but that transnational belonging contributes to greater loneliness not less. We conclude that a transnational sense of belonging among older migrants needs to be explored further. We will do so qualitatively and try to expose the mechanisms through which a transnational belonging is lived.

RELIGIOUS COPING, SOCIAL PARTICIPATION, AND MOTIVATION TO MIGRATE AND THE WELL-BEING OF OLDER MIGRANTS

S. Klokgieters, T. Van Tilburg, D.J. Deeg, M. Huisman, *Vrije Universiteit Amsterdam, Amsterdam, Netherlands*

Stress resulting from the experience of migration is an important risk factor for a low level of wellbeing in older immigrants. Especially with regards to labour immigrants, studies show that they experience a number of stressors throughout their life course, including feelings of loss, and language barriers. However, not all immigrants experience these stresses in similar magnitude. Furthermore, some immigrants may possess resources that help them deal with the stresses associated with the experience of migration. This study examines the buffering resources that may help some immigrants overcome migration stress and maintain high levels of wellbeing while others succumb to these stressors. Data were collected from 255 Turkish and 199 Moroccan respondents in the context of the Longitudinal Aging Study Amsterdam. Linear regression analyses demonstrated that while migration stress is negatively associated with wellbeing, religious coping, motivations to migrate and active participation in organizations do not moderate this relationship.

AGEING WELL: A COMPARATIVE STUDY OF INDIAN AND CHINESE MIGRANTS TO ENGLAND AND WALES

C. Victor¹, V. Burholt², 1. *Brunel University-London, London, United Kingdom*, 2. *Swansea University, Swansea, United Kingdom*

Are older migrants from India and China to the UK ageing better than their peers in the host community or country of origin? We examine 3 dimensions of wellbeing: quality of life, loneliness and self-rated health using data from a survey of older people from minority communities and using the English Longitudinal Study of Ageing and the Indian and Chinese Longitudinal Studies of Ageing for comparison. Our sample of Indian (N=164) and Chinese (N=117) migrants did not present a consistent pattern in levels of wellbeing compared with their peers in their country of origin or majority community. Indian migrants reported loneliness prevalence of 10% in all 3 groups; life satisfaction and health rating were comparable with the majority community but higher than country of origin. Chinese migrants reported higher levels of loneliness and lower levels of self-rated health than their peers in either comparator group.

SESSION 200 (SYMPOSIUM)

IMPLEMENTING COMMUNITY-BASED FALLS PREVENTION RESEARCH INTO PRACTICE: INTERNATIONAL PERSPECTIVES

Chair: C. Meyer, *Royal District Nursing Service Institute, St Kilda, Victoria, Australia*

Co-Chair: K.D. Hill, *Curtin University, Perth, Western Australia, Australia*

Strong evidence exists for falls prevention interventions in community-dwelling older people; yet, the rate of falls, hospitalization rates and injury rates resulting from a fall across the globe are not declining. One in three community-dwelling older people experience a fall within a given year, with this rate increasing substantially for particular clinical groups such as people with dementia (60–80%). Adherence to falls prevention strategies is problematic, being cited as related to lack of personal relevance and appropriate advice; thus, uptake and participation in falls prevention activities is challenging. This symposium draws on international experts to highlight and discuss the issues facing falls prevention practitioners, particularly related to implementing falls prevention evidence into policy and practice.

AUSTRALIAN EXPERIENCES IN SUPPORTING FALLS PREVENTION POLICY TO PRACTICE THROUGH PARTNERSHIPS

K.D. Hill, *Curtin University, Perth, Western Australia, Australia*

This presentation will discuss two approaches in Australian states aiming to support improved falls prevention outcomes. The first approach involved a partnership between the Victorian State Government Department of Health, researchers and practitioners in falls prevention. This four year initiative involved (1) using State hospitalization to inform targeting of falls prevention initiatives, (2) surveying older people relating to preferences/intention/participation in falls prevention activities, (3) reviewing Government departments for gaps/overlap in falls prevention activities, and (4) development of sustainability guidelines to support falls prevention initiatives optimize longer term sustainability.

The second activity involved the development and implementation in Western Australia of a falls prevention Model of Care, providing a framework within the health and care system to support improved falls prevention activity uptake, coordination and outcomes. Broader implications of these approaches will be discussed.

LESSONS LEARNED FROM U.S. INJURY PREVENTION INITIATIVES: IMPLICATIONS FOR INTERNATIONAL EFFORTS

M.G. Ory¹, M. Smith¹, T.E. Shubert², 1. *University of Georgia, Athens, Georgia*, 2. *University of Northern Carolina, Chapel Hill, North Carolina*

As a national leader in falls prevention, the US Centers for Disease Control and Prevention has funded several state-wide initiatives to examine the impact of multi-level approaches to falls prevention for older adults. A 5-year evaluation conducted by Texas A&M and its partners at

the University of Georgia and University of North Carolina has tested the scalability and sustainability of group based community-based programs, home-based individualized programs, and clinical practice changes for increased screening and referral for those with falls risk. Findings from surveys and objective functional assessments demonstrate the success of interventions such as Stepping on and Tai-CHI as well as the American adaptation of Otago in terms of improvements in fall-related functional abilities and mobility. There has also been a growing appreciation of clinic-based approaches and the importance of enhancing linkages to community programs. This presentation will highlight lessons learned and implications for international efforts in falls prevention.

IMPLEMENTING FALLS PREVENTION IN MALAYSIA

M. Tan, *University of Malaya, Kuala Lumpur, Malaysia*

Only 8% of the Malaysian population is aged over 60 years, but this will increase to 15% of by 2025. Malaysia's healthcare system is, however, heavily burdened with ongoing infectious diseases and the rising epidemic of non-communicable diseases. Emerging age-related conditions has, therefore, been given little attention. The burden of falls is already taking its toll, with overcrowded hospitals and oversubscribed care home places. The public receive falls education through one-off articles or talk shows by the media and public awareness sessions organised by non-profit agencies. Regular group exercise programmes organized by non-governmental organizations and individuals are in existence. These are occasionally supported by local government grants. New private sector initiatives are now emerging for secondary falls prevention. Our recently completed randomized-controlled trial evaluating a hospital-based multifaceted intervention programme found that compliance to strength and balance exercises was high. Multi-agency working is now urgently required to address this emerging issue.

COMMUNITY-ENGAGED AND POLICY RELEVANT FALLS PREVENTION RESEARCH IN CANADA AND INDIA

S. Johnson, *University of Regina, Regina, Saskatchewan, Canada*

Falls among seniors are a global issue. While it has been estimated that 70% of the world's older adults are and will be in low and middle income countries (LMIC), most of the research in the area of falls emerge from high income countries (HIC). This presentation will highlight two examples from community-based falls research projects in Canada (intervention study) and in India (epidemiological study). The Canadian example will highlight an integrated partnership which enabled a falls prevention intervention to be embedded within the health system infrastructure to reach older home care clients. The Indian example will highlight the data gaps and an epidemiological study on functional capacity and falls in seniors. The implications of these two examples for the implementation of research into practice and policy, uptake among seniors, sustainability of intervention after the research phase, and scope for global engagement and partnership for translational research will be discussed.

ACTION RESEARCH TO UNDERSTAND FALLS PREVENTION FOR PEOPLE WITH DEMENTIA

C. Meyer^{1,2}, K.D. Hill³, S. Hill², B. Dow⁴, 1. *Royal District Nursing Service Institute, St Kilda, Victoria, Australia*, 2. *LaTrobe University, Bundoora, Victoria, Australia*, 3. *Curtin University, Perth, Western Australia, Australia*, 4. *National Ageing Research Institute, Parkville, Victoria, Australia*

The final presentation addresses a specific population group – people with dementia. In the Australian community care sector care managers and assessment officers are responsible for assessing the needs of older people and co-ordinating service referrals, including for falls prevention; while direct care workers are responsible for day to day personal/domestic care. Health professionals are a source of advice and guidance, yet feel their knowledge and skills may be inadequate. While having differing roles, these workers are all responsible for implementing falls prevention strategies. This paper examines knowledge of falls prevention for people with dementia; and of barriers and opportunities of translating this knowledge into practice. Action research sessions were utilized and thematic analysis undertaken. This study has implications for falls prevention in community-dwelling people with dementia, highlighting limited understanding of evidence-based strategies and broad health system constraints, but small incremental changes impact older people for preventing falls.

SESSION 205 (SYMPOSIUM)

INSIGHTS GAINED FROM THE DEVELOPMENT OF COMMUNITY PARAMEDICINE PROGRAMS IN CANADA

Chair: S. Sinha, *Mt Sinai Hospital, Toronto, Ontario, Canada*

Co-Chair: N. Foster, *Mt Sinai Hospital, Toronto, Ontario, Canada*

Older adults are the highest users of paramedical and ambulance services. These older adults typically struggle with polymorbidity, functional impairments, and social frailty. Most calls received by paramedics from older adults are neither time-sensitive nor immediately life-threatening. Paramedics are increasingly seeing older individuals in pre-crisis situations who need more support to help them age in place.

The need to work differently to meet the needs of older adults has given strength to the community paramedicine movement across Ontario. In 2014, Ontario's Ministry of Health invested \$6 million to support the development of 30 community paramedicine demonstration projects that allow paramedics to fill unique care gaps, and better integrate care for older patients.

Our proposed symposium will highlight insights gained from the community paramedicine demonstration projects through four talks: 1) "First-Year Outcomes of the MOHLTC Funded Community Paramedicine Demonstration Projects" by Dr. Samir Sinha, 2) "Establishing the Effectiveness of the Independence at Home Community Paramedicine Model", by Ms. Nicoda Foster, 3) "Lessons Learned from Renfrew County's Community Paramedic Response Unit Program" by Mr. Michael Nolan and 4) "Evaluating the Effectiveness

of Community Referrals by Emergency Medical Services" by Dr. Amol Verma.

The goal of our symposium is to enhance the awareness of attendees of community paramedicine, the diverse models of care it can represent and their ability to positively impact patients and providers and the health systems. The symposium will conclude with an interactive discussion exploring the facilitators and barriers to the implementation of effective community care models for the elderly.

FIRST-YEAR OUTCOMES OF THE MOHLTC-FUNDED COMMUNITY PARAMEDICINE DEMONSTRATION PROJECTS

S. Sinha^{1,3}, M. Nolan², N. Foster³, 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *County of Renfrew Paramedic Services, Toronto, Ontario, Canada*, 3. *Sinai Health System, Toronto, Ontario, Canada*

In 2014, Ontario's Ministry of Health and Long-Term Care (MOHLTC) invested \$6 million to support the development of 30 Community Paramedicine (CP) Demonstration Projects across the province. This investment supported the development of a variety of locally driven models that could allow paramedics to fill unique care gaps, and better integrate care for vulnerable patients in their communities. The 30 funded projects focused on activities related to conducting assessments and referrals, preventative home visits and Wellness Clinics. In the first 15 months, a total of 19,077 patients were enrolled across the 30 projects that engaged 1865 paramedics and 381 local primary, home and community care providers. Community paramedics completed 32,807 assessments and achieved a 14% overall decrease in the volume of 911 calls from patients enrolled more than six-months in a program. Therefore, community paramedicine activities have the potential to improve patient and system outcomes.

ESTABLISHING THE EFFECTIVENESS OF THE INDEPENDENCE AT HOME COMMUNITY PARAMEDICINE MODEL

S. Sinha^{1,2}, A. Thurston³, J. Klich³, N. Foster², 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *Sinai Health System, Toronto, Ontario, Canada*, 3. *Toronto Paramedic Services, Toronto, Ontario, Canada*

Older adults are the highest users of paramedical services. To improve care integration, the Independence at Home initiative (IAH) was launched to broaden the scope of practice of paramedics to provide proactive home visits for low-income older adults who were high-users of 911 services (i.e. ≥ 5 911 calls 6-months). During the first-year, 908 primary and follow-up visits were conducted with 588 patients where paramedics conducted holistic assessments to ascertain unmet health and social care needs. Outcomes for 111 clients enrolled over a 3-month period for whom 6-months pre and post follow-up data was available showed that pre enrolment this group made 301 911 calls (17% from 10 high-users) resulting in 246 (82%) ED visits. Six-months following the visit there were 154 911 calls (19% from six high-users) resulting in 103 (67%) ED visits. Overall, this program reduced 911 calls by 41% and ED transports by 42% six-months after enrolment.

LESSONS LEARNED FROM RENFREW COUNTY'S COMMUNITY PARAMEDIC RESPONSE UNIT PROGRAM

M. Nolan¹, S. Sinha^{2,3}, 1. *The County of Renfrew Paramedic Service, Pembroke, Ontario, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*, 3. *Sinai Health System, Toronto, Ontario, Canada*

The County of Renfrew Community Paramedic Response Unit (CPRU) program was designed to improve emergency response times, promote prevention activities and support older adults living in the community. Community Paramedics focus on preventative measures to support clients live independently. In 2015, 222 patients were enrolled in CPRU and received a total of 1186 home visits and 2874 assessments from community paramedics. An evaluation of the CPRU demonstrated following the first year of implementation demonstrated that all enrolled patients remained independent and were still living in their own home. Further, clients had a 35% decrease in hospital admissions one-year after being enrolled in the program. This same cohort experienced an 83% reduction in total hospital readmission rates 30, 60 and 90 days after receiving a visit from the paramedic.

EVALUATING THE EFFECTIVENESS OF COMMUNITY REFERRALS BY EMERGENCY MEDICAL SERVICES

A. Verma¹, J. Klich², A. Thurston², J. Scantlebury¹, A. Kiss³, G. Seddon⁴, S. Sinha^{1,5}, 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *Toronto Paramedic Services, Toronto, Ontario, Canada*, 3. *Institute of Clinical Evaluative Sciences, Toronto, Ontario, Canada*, 4. *Toronto Central Community Care Access Centre, Toronto, Ontario, Canada*, 5. *Sinai Health System, Toronto, Ontario, Canada*

Beginning in 2006, Toronto Emergency Medical Services (EMS) developed the Community Referrals by EMS (CREMS) program in which paramedics directly refer patients for home care and community support services such as meals on wheels. This retrospective cohort study assessed the utilization of home and community support services and EMS services among individuals who received CREMS referral in Toronto, Canada in 2011 and 2012. In all, 2,382 individuals received CREMS referral, with a mean age of 79.0 years (SD 13.6). In the 6 months after CREMS referral, there was an adjusted increase of 17.4 hours of support services per person (95% CI: 1.74, 33.09, $p=0.03$) and an adjusted reduction in calls to EMS by 0.19 fewer mean calls per person (95% CI -0.31, -0.06, $p=0.004$). The CREMS Program may represent a simple and effective way to address unmet needs for community-dwelling elders.

SESSION 210 (SYMPOSIUM)

FOOD INSECURITY IN MEXICAN OLDER ADULTS AND ITS IMPACT IN GERIATRIC CONDITIONS

Chair: R. Castrejn-Prez, *Instituto Nacional de Geriatria, Mexico, DF, Mexico*

Co-Chair: M.U. Perez-Zepeda, *Instituto Nacional de Geriatria, Mexico, DF, Mexico*

Discussant: M. Cesari, *Université de Toulouse III Paul Sabatier, Toulouse, France*

Aged population imposes new challenges for individuals, health systems and society as a whole. A reality that can

overtake Mexico and other countries with low and middle income is the simultaneous existence of additional blocks of priorities such as unequal social development, poverty, hunger, low levels of education, infectious diseases so that aging can be marginalized as a priority. Malnutrition and its both sides, undernutrition and obesity remains as a serious issue in several world regions. Food insecurity (FI) is understood as the access to sufficient, safe and nutritious food that meets the dietary needs and food preferences of people at all times, and under all conditions (physical, social and economic). FI may promote malnutrition which has been recognized as important for developing children, as well as to the health of older adults. It is known that undernutrition is a common problem of older adults. Mexico face the dilemma of a double burden of health-related problems, along with the continuously growing group of older adults there are still unresolved issues of poverty such as the availability of food for the population. Because of these, it is relevant to generate new information on how food insecurity may have a deleterious effect on aging. In this symposium, two common problems for the geriatric population will be covered in order to describe its association with food security: frailty and sarcopenia. Presented results could be used in order to design tailored programs to those older adults in risk for food insecurity.

FOOD INSECURITY AND FRAILTY: A SECONDARY ANALYSIS OF THE MEXICAN HEALTH AND NUTRITION SURVEY 2012

C. Garcia-Pena, M.U. Perez-Zepeda, *Geriatric Epidemiology Research, Instituto Nacional de Geriatria, Mexico, DF, Mexico*

Objectives: To determine the association between food insecurity and frailty in older adults of a middle-income country. **Methods:** Cross-sectional analysis of a representative nation-wide survey on health and nutrition. Descriptive analyses of food insecurity and frailty, and multivariate regressions were performed. **Results:** From a total of 7,108 60-year or older adults with a mean age of 70.7 a 54.7% were women. Food security categories were: 26.3% food security, 40.3% mild food insecurity, 20.5% moderate food insecurity and 12.9% severe food insecurity. Food insecurity categories were associated with frailty, being the severe category the highest coefficient of 0.465 (95% CI 0.387–0.542) after adjustment for confounding. **Conclusions:** Food insecurity may play a major role in aging by its association with frailty, which is in turn a condition that render the older adult in a higher risk to develop adverse outcomes.

FOOD INSECURITY AND ITS ASSOCIATION WITH SARCOPENIA ELEMENTS

M.U. Perez-Zepeda, *Geriatric Epidemiology Research, Instituto Nacional de Geriatria, Mexico, DF, Mexico*

Objectives: To describe the association between sarcopenia elements and food insecurity in a group of community-dwelling older adults. **Methods:** Cross-sectional analysis of 60-year or older community-dwelling adults from Mexico City. Food insecurity was measured by the ELCSA survey, and considered components of sarcopenia were: muscle mass, gait speed and handgrip strength. **Results:** From a total of 168 older adults with a mean of age of

76.7 (SD 10.1) and 76.8% were women, 22.9% had food insecurity. Appendicular muscle mass had a mean of 6.3kg (SD 1.08), gait speed of 0.87m/s (SD 0.27) and handgrip strength of 15.4 (SD 8.43). A multiple linear regression was performed for each of the variables of sarcopenia, adjusted for age, sex and comorbidity; only appendicular muscle mass had a marginal significance (-0.35 [95% CI -0.75 to 0.03], $p=0.078$). *Conclusions:* According to our data, there is a lack of association between sarcopenia and food insecurity.

SESSION 215 (PAPER)

ISSUES AFFECTING ACUTE HOSPITALIZATION OF OLDER ADULTS

THE IMPACT OF MULTIMORBIDITY, RACE, AND GENDER ON OUTCOMES AFTER ACUTE HOSPITALIZATION IN NHATS

O. Sheehan¹, H. Amjad¹, J. Huang¹, C. Boyd¹, J. Prvu Bettger², D.L. Roth¹, 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland*, 2. *Duke University, Durham, North Carolina*

Many disparities exist in access and quality of health-care among minority populations. The National Health and Aging Trends Study (NHATS) is a nationally representative and racially diverse sample of 8245 older Americans receiving federal Medicare health insurance. We linked the survey with administrative claims data to investigate potential disparities in outcomes (discharge destination, mortality and Emergency Department (ED) visits) after acute hospitalization. We also examined whether the impact of multimorbidity on outcomes differed by race or gender groups.

Of the 7609 community dwelling older adults in NHATS, 1842 were hospitalized at least once in the 2 years after baseline interview and 1584 had continuous fee for service Medicare insurance coverage. Over half of the population ($n=929$, 57.3%) had 4 or more chronic conditions. The presence of ≥ 4 chronic conditions was strongly associated with repeat hospitalizations (odd ratio (OR) 1.78; 95% confidence interval (CI) 1.48 - 2.14), ED visits (OR 1.84; CI 1.38 - 2.46) and mortality 1 year after hospitalization (OR 1.46; CI 1.06 - 2.01).

Race and gender effects were identified in outcomes including discharge destination with men less likely than women to be discharged to a Skilled Nursing Facility or rehabilitation hospital and Blacks and Hispanics more likely than Whites to receive skilled Home Health Care. The effect of multimorbidity, however, remained consistent across race and gender groups. NHATS provides a unique opportunity to study the complex relationship between multimorbidity, disparities and acute medical events and allows us to better understand where interventions should be targeted.

RE-ENGINEERING ON-DEMAND CARE IN SENIOR LIVING AND HOME HEALTH

K. Riddleberger, M. Prather, *DispatchHealth, Denver, Colorado*

In 2013, DispatchHealth was founded by clinical leaders who saw a need to decrease the number of lower acuity

emergency room and 911 visits. DispatchHealth is a Denver, CO based healthcare company that provides mobile, onsite medical assessment and treatment for patients with acute care needs. Our model provides a high tech, low cost care delivery option that extends the capabilities of the patient's care team. The vehicles are staffed by board-certified Emergency Medicine clinicians, equipped with advanced treatment capabilities, and connectivity to the health information exchange that allows for state-of-the art care in the convenience of the home, office or senior care facility. Our goal is to provide patients quality, convenient care in their time of need with the goal of breaking the cycle of acute care and returning that patient to their primary care provider.

DispatchHealth was created with the Triple Aim in mind. To date, we have saved over \$2 million dollars in acute care delivery costs. Our average cost for a visit is \$250 and the average cost for an emergency room visit is \$2400. We track the savings related to ER diversion for all of our patients. Patients that have bounced back to the ER within 30 days for the same complaint are removed from our savings calculation and therefore, negatively affect the overall savings number.

IDENTIFYING COMPLEX HIGH NEEDS PATIENT POPULATIONS FOR PERFORMANCE MEASUREMENT STRATIFICATION

M. Henry, D. Roman, D. Bardach, J. Puhek, B. Rehm, M. Barton, P. Lighter, *NCQA, Washington, District of Columbia*

Performance measurement targeting the needs of vulnerable patient populations, including older adults and adults with disabilities, requires a strategy for identifying patients with complex needs. Using cost and utilization as a proxy for complex needs, we evaluated a data set representing 2.4 million Medicare Advantage enrollees for the years 2012–2013. Using established value sets of ICD codes used in HEDIS® to define 17 common chronic conditions, we identified six conditions associated with the highest rates of emergency department use, in-patient admissions and readmissions, per patient cost, and physician visits. We also evaluated the relationship between these variables and number of chronic conditions. We found that psychotic disorders, substance abuse, pulmonary conditions (excluding asthma), heart failure, stroke, and major neuromuscular disease were associated with the highest cost and utilization. Patients with one or more of these conditions comprised 16% of the population. When compared to the rest of the population, these patients accounted for 3.5 times the ED visits, 7.2 times the in-patient admissions, and 3.9 times the cost. Results were similar for 17% of patients with three or more of the seventeen conditions considered. When compared to the rest of the population, these patients had 3.7 times the number of ED visits, 8.3 times the number of in-patient admissions, and 3.9 times the cost when compared to patients without one of the conditions. We concluded that the presence of high burden conditions or multiple chronic conditions can be used to identify a population of patients associated with high cost and utilization variables for the purposes of measurement.

EFFECTIVENESS OF AN INTERVENTIONAL PROGRAM TO REDUCE RE-ADMISSION RATES ACUTE CARE OF THE ELDERLY

M. Schapira, M.B. Outumuro, F. Giber, C. Pino, M. Mattiussi, G. Perman, M. Montero Odasso, L. Garfi, *Hospital Italiano de Buenos Aires, Buenos Aires, Argentina*

Care for older adults in hospitals requires to combine comprehensive and multidisciplinary approach to both, their health and social status. Acute diseases and inadequate management and complications in the period of transition from the hospital to the home, often causes the onset of disability or its aggravation. Transitional care model provides the possibility of continuity of care, to improve communication of the treating team with the patient and family and make more efficient plan of care implementation.

Objectives: To assess whether comprehensive, multidisciplinary intervention would reduce the re-hospitalization within 30 days, emergency consultations and mortality within 6 months.

Material and Methods: randomized single blinded controlled clinical trial. Two hundred forty participants were randomly allocated in two arms: usual care and intervention. Population: Older adults aged 75 years or more, which were discharged from one internal medicine ward.

The team is coordinated by a geriatrician who acts as case manager. The general functions of the multidisciplinary team are management protocols to reduce risk of falls, delirium and immobility, adequacy of treatment and care, family support, early discharge planning and joint monitoring post hospital discharge.

Results: The 30 days re-hospitalization rate was 35% in the control group and 18.3% in the intervention group ($p = 0.003$). Emergency consultations within 6 months were 60% in the control group and 43.3% in the intervention group ($p = 0.009$). Mortality rate decreased in the intervention group although was not statistical significant.

Conclusions: The co-management of elderly vulnerable patients in internal medicine with geriatricians, assisted by a multidisciplinary team proved to reduce hospitalizations and emergency visits during the 6 months follow up.

ARTIFICIAL INTELLIGENCE AND PREDICTION OF PROLONGED LENGTH OF HOSPITAL STAY AMONG OLDER ADULTS

C. Launay¹, H. Rivière³, G. Duval³, O. Beauchet², C. Annweiler³, 1. *CHUV Lausanne, Lausanne, Switzerland*, 2. *Mc Gill University, Montréal, Quebec, Canada*, 3. *CHU Angers, Angers, France*

Background. With the rapid growth of elderly patients visiting the Emergency Department (ED), it is expected that there will be even more hospitalisations following ED visits in the future. The aim of this study was to examine the age effect on the performance criteria of the 10-item brief geriatric assessment (BGA) for the prolonged length of hospital stay (LHS) using artificial neural networks (ANNs) analysis.

Methods: Based on an observational prospective cohort study, 1117 older patients (i.e., aged >65years) ED visitors hospitalized in acute care wards in a University Hospital (France) were recruited. The 10-items of BGA were recorded during the ED visit and prior to discharge to acute care

wards. The top third of LHS (i.e., >13 days) defined the prolonged LHS. Analysis was successively performed on participants categorized in 4 age groups: aged >70, >75, >80 and >85 years. Performance criteria of 10-item BGA for the prolonged LHS were sensitivity, specificity, positive predictive value [PPV], negative predictive value [NPV], likelihood ratios [LR], area under receiver operating characteristic curve [AUROC]). The ANNs analysis method was conducted using the modified multilayer perceptron (MLP).

Results. Values of criteria performance were high (sensitivity>89%, specificity>96%, PPV>87%, NPV>96%, LR+>22; LR-<0.1 and AUROC>93), regardless of the age group.

Conclusions. Age effect on the performance criteria of the 10-item BGA for the prediction of prolonged LHS using MLP was minimal with a good balance between criteria, suggesting that this tool may be used as a screening as well as a predictive tool for prolonged LHS.

SESSION 220 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: LONG-TERM OUTCOMES OF MILITARY SERVICE ON AGING: INTERNATIONAL PERSPECTIVES

Co-Chair: C.M. Aldwin, *Oregon State University, Corvallis, Oregon*

Discussant: R.A. Settersten, *Oregon State University*

Many studies of aging have been conducted on samples that include WWII and Korea-era veterans; thus, military service a “hidden variable” in aging research. The impact of service on later life development and aging is poorly understood, yet its effects are often broad and long-ranging, and can alter lives in positive as well as negative ways. This symposium considers the long-term effects of military service on health and well-being of veterans who served in the armed forces. Presenters are from several nations (Israel, Canada, Vietnam, Korea, and United States), and use a lifespan/life course perspective to examine the impact of service on later-life outcomes in veterans from various conflicts. Solomon and colleagues examine long-term effects of being a POW among Israeli veterans. Pedlar examines changes in Canadian veterans after service, and compares them to non-veterans. Korinek examines older Vietnamese war survivors, and the impact of wartime exposure on intergenerational relations. Kang and colleagues provide a lifespan examination of the long-term effects of combat exposure in Korean Vietnam War Veterans, while Lee and colleagues examine possible pathways for positive outcomes of combat exposure among US veterans from WWII and Korea. Dr. Settersten will be our discussant, focusing on common themes among studies, and the implications of military service for changing lives across countries.

PREMATURE AGING AMONG FORMER PRISONERS OF WAR: RESULTS OF A THREE DECADE LONGITUDINAL STUDY

Z. Solomon^{1,2}, S. Avidor^{1,2}, A. Ohry³, 1. *I-Core Research Center for Mass Trauma, Tel Aviv, Israel*, 2. *Tel Aviv University, School of Social Work, Tel Aviv, Israel*, 3. *Tel Aviv University, Sackler Faculty of Medicine, Tel Aviv, Israel*

Research suggests that trauma experienced at an earlier stage of life may be implicated in premature or accelerated

aging in later stages. Premature aging, in this respect, evinces in various domains, particularly in health impediments and mortality. The current study prospectively assessed the long term impact of war and war captivity on mortality, medical assessments of morbidity and self-rated health among Israeli combat veterans and former prisoners of war (POWs). Participants were evaluated at four points in time over three decades. Results revealed that war captivity was implicated in premature aging in all domains. Ex-POWs exhibited mortality rates four times higher than comparable veterans who were not held captive. Ex POWs' health outcomes were worse than those of controls when assessed both by medical professionals and via self-report measures. Differential post-traumatic stress disorder (PTSD) trajectories mediated the relationship between captivity and health. Theoretical and clinical implications will be discussed.

WELL-BEING IN THE LIFE AFTER SERVICE OF CANADIAN MILITARY VETERANS

D. Pedlar, *Veterans Affairs Canada, Charlottetown, Prince Edward Island, Canada*

This presentation reports on the well-being of Canadian military Veterans based on findings from three cycles (2010, 2013, 2016) of the large-scale population-based Life After Service program of research. A partnership between Veterans Affairs Canada, the Department of National Defense, and Statistics Canada, this national study uses cross sectional and longitudinal survey and data linkage methodologies to report on the well being of regular force and reserve Veterans across key domains of well-being (e.g., adjustment to civilian life, health, finances, employment, social integration). Compared to other Canadians, Veterans have higher levels of chronic mental and physical health conditions, much higher levels of functional impairment in the community and workplace, comparable levels of unemployment, higher levels of suicide, and are about half as likely to experience low income. Challenges facing Veterans in the transition to civilian life and links between military service and well being in later life will be discussed.

INTERGENERATIONAL RELATIONSHIPS IN FAMILIES INFLUENCED BY WAR: A STUDY OF VIETNAMESE WAR SURVIVORS

K. Korinek¹, B.P. Teerawichitchainan², 1. *Sociology, University of Utah, Salt Lake City, Utah*, 2. *School of Social Sciences, Singapore Management University, Singapore, Singapore*

Research conducted among U.S. veterans demonstrates that war exposure and PTSD can strain the very family relationships that lend support for post-conflict readjustment, but can also generate uniquely supportive service-based friendships. We need to better understand how military service and war exposure influence intergenerational relationships in less developed, post-conflict settings where war's violence has concentrated, and where family systems are central to old-age support. We contribute to scholarship on military service and older adult wellbeing by assessing structures and quality of family relationships among Vietnamese older adult war survivors, a population whose widely diverse war exposures has received scant scholarly attention. Our analyses of 405 older adults surveyed in the Vietnam Health and

Aging Study (2010), provide evidence to suggest that particularly stressful war exposures tend to visit lasting strain upon intergenerational relationships, especially in less-developed countries that have experienced war.

A LIFESPAN PERSPECTIVE ON COMBAT EXPOSURE AMONG KOREAN VIETNAM WAR VETERANS

S. Kang², H. Lee^{1,2}, S. Choun¹, C.M. Aldwin¹, A. Spiro^{3,4}, 1. *Oregon State University, Corvallis, Oregon*, 2. *Korea Military Academy, Seoul, Korea (the Republic of)*, 3. *Boston University Schools of Public Health and Medicine, Boston, Massachusetts*, 4. *VA Boston Health Care System, Boston, Massachusetts*

Although 320,000 South Korean army troops fought in the Vietnam War, few studies of Korean Vietnam War veterans exist. We used a lifespan developmental perspective to predict PTSD symptoms in later life among 450 male Korean Vietnam War veterans ($Mage = 66.98$, $SD = 3.04$). They completed mail surveys about prewar (prior stressors, childhood family environment), warzone (combat exposure, perceived control, unit cohesion, appraisals of military service), and postwar experiences (post-deployment stressors, social support, and PTSD symptoms). PTSD symptoms in later life were independently predicted by warzone (29.6%) and postwar factors (11.0%); some were protective (desirable appraisals and social support), but most were risk factors (combat exposure, unit cohesion, undesirable appraisals, and postdeployment stressors). While prewar variables accounted for 3.7% of the variance, they moderated the relationship between combat exposure and PTSD symptoms. The findings highlight the importance of a lifespan perspective on understanding the long-term impacts of combat exposure.

DOES COMBAT EXPOSURE HAVE POSITIVE LONG-TERM EFFECTS? FINDINGS FROM THE VA NORMATIVE AGING STUDY

H. Lee^{1,2}, S. Choun¹, C.M. Aldwin¹, A. Spiro^{3,4}, 1. *HDFS, Oregon State University, Corvallis, Oregon*, 2. *Korea Military Academy, Seoul, Korea (the Republic of)*, 3. *Boston University Schools of Public Health and Medicine, Boston, Massachusetts*, 4. *VA Boston Health Care System, Boston, Massachusetts*

While research has documented long-term negative effects of combat exposure, we focused on possible long-term positive effects via positive appraisals of military service. We also assessed the effects of optimism and education using 1,006 male veterans from the VA Normative Aging Study surveyed in 1990 and 1991 ($Mage = 62$, $SD = 7$, $range = 44-89$). We assessed their combat exposure, desirable appraisals of and unit cohesion during military service, dispositional optimism, and psychological well-being. Structural equation models showed that combat exposure had direct effects on positive appraisals of military service and unit cohesion, even controlling for optimism, but only indirect effects on psychological well-being through the positive appraisals. While optimism also predicted well-being in late life, it did not moderate the effect of combat experience on positive appraisals but did mediate the effects of education. Thus, combat exposure had only indirect effects on psychological well-being in later life.

SESSION 225 (PAPER)

HEALTH CARE ISSUES AND POLICY

COMORBIDITY, DISABILITY, AND FRAILTY PROFILES AS DETERMINANTS OF HOSPITALIZATION AMONG OLDER ADULTS

E. Belanger⁴, N. Sirven¹, C. Gomes², R. Guerra², J.M. Guralnik^{3,5}, 3. 1. *Université Paris Descartes, Paris, France*, 2. *Universidade Federal do Rio Grande do Norte Natal, Natal, Brazil*, 3. *University of Maryland School of Medicine, Baltimore, Maryland*, 4. *Brown University School of Public Health, Providence, Rhode Island*

Population aging increases the need to better understand the determinants of hospitalization in order to improve the quality of services. However, usual health measures often prove to be poorly predictive of hospitalization. The aim of this research is to determine whether physiological health measures designed for older adults, namely the Short Physical Performance Battery (SPPB) (Guralnik et al., 1994), frailty phenotypes (Fried et al., 2001), and profiles of functional decline (Lunney et al., 2003), are better predictors of hospital use. We use longitudinal data from the International Mobility in Aging Study (IMIAS), carried out between 2012 and 2014 in four countries (Canada, Brazil, Colombia, Albania) among individuals aged 65–74 at baseline (n=1724). Differences between health systems provide additional insights into the determinants of hospitalization. Health profiles from 2012, besides other confounders, are used to explain hospitalization in 2014. SPPB scores are computed using objective measures of gait speed, chair-stands, and balance. Frailty phenotype variables are created according to Fried's classification into robust, pre-frail, and frail. Four profiles of functional decline are created: (1) terminal illness – cancer and at least one ADL disability; (2) organ failure – heart or lung disease and at least 2 ADL disabilities, (3) low reserve – stroke or more than 2 ADL disabilities, and (4) other respondents. Sample attrition is corrected by means of a Heckman selection Probit model. Our results indicate that a score below 8 on SPPB, the pre-frailty phenotype, and a profile of organ failure are significantly associated with hospitalization. Cross-country differences are discussed.

OBSTACLES TO DISCHARGING ELDERLY HOSPITAL PATIENTS IN THAILAND

S. Wivatvanit, *Faculty of Nursing, Chulalongkorn University, Thailand, Bangkok, Pathumwan, Thailand*

In Thailand, the current increase of chronic illnesses from non-communicable diseases poses limitations for both the patient and caregiver for continuing care at home. This study investigated the obstacles to discharging elderly patients in general hospitals under the Ministry of Public Health in Thailand. A multi-stage sampling technique was employed to obtain a sample of 1,186 patients who were waiting to be discharged from the hospital. Data were based upon interviews with patients and family caregivers. Of the patients who were interviewed, a quarter of them had returned to the hospital due to inadequate care at home and the large majority (90%) were elderly patients. Descriptive analyses indicated that there were some key obstacles to discharge.

The most common obstacles included: 24.5 % of patients reported that they did not have family members who could provide the necessary care and 11.5 % lacked necessary assistive devices at home.

ADVANCE CARE PLANNING CONVERSATIONS BY MD OR NP/PA YIELD SIMILAR LIFE-SUSTAINING TREATMENT CHOICES

E. Chen¹, C.T. Pu², J. Ragland², J. Schwartz², M. Fairbanks², J.E. Mutchler¹, 1. *University of Massachusetts, Boston, Massachusetts*, 2. *Partners HealthCare, Boston, Massachusetts*

Recent changes in Medicare payment policy authorized reimbursement to clinicians for conducting advance care planning conversations with seriously ill individuals. This study examined whether end-of-life care preferences differed when advanced practice clinicians (nurse practitioners or physician assistants) vs. physicians conducted advance care planning conversations.

Medical Orders for Life-Sustaining Treatment (MOLST) and electronic health records data were collected from 600 patients at 3 hospitals in Eastern Massachusetts. Aggressive care was defined as a preference for *All Treatment* compared to a preference to *Limit Any Treatment* on the MOLST. Logistic regression analyses estimated the odds for aggressive treatment taking into account patient age, sex, race/ethnicity, severity of illness (Charlson Score), patient vs. proxy decision-maker, and palliative vs. non-palliative care clinician.

Nearly one-half (48%) of the patients were under the care of advanced practice clinicians. Proxy decision-makers signed 43% of the MOLST forms. Overall, 1:3 (36%) patients or proxy decision-makers chose All Treatment. Mean Charlson Score was 8 (SD=3). Mean patient age was 71 (SD=15); 49% were male; and 83% were non-Hispanic White. Patients were evenly divided between palliative and non-palliative care settings.

A highly significant model accounting for 42% of the variation in the outcome (pseudo R²=0.421; p<0.001) showed no difference in the odds for preferring aggressive life-sustaining treatments between patients under the care of advanced practice clinicians vs. physicians (OR=0.83; p=0.46).

These results are consistent with other studies showing no difference in clinical outcomes between patients under the care of advanced practice clinicians compared to physicians in intensive care settings.

PROXY DECISION-MAKERS CHOOSE LESS AGGRESSIVE END-OF-LIFE INTERVENTIONS THAN PATIENTS

E. Chen¹, C.T. Pu², J. Ragland², J. Schwartz², M. Fairbanks², J.E. Mutchler¹, 1. *University of Massachusetts, Boston, Massachusetts*, 2. *Partners HealthCare, Boston, Massachusetts*

Proxy decision-makers are needed for an estimated one-third of older Americans approaching death. Prior research used hypothetical illness scenarios to examine concordance between principals and their proxy decision-makers' treatment choices, and found high disagreement and a tendency for proxy decision-makers to err toward aggressive intervention.

This study used primary data collected from a severely ill patient population (N=593) at three hospitals in Massachusetts. Responses (from July 2012-January 2014) on the Physician (or Medical) Orders for Life-Sustaining Treatment (MOLST) were categorized into All Treatment (aggressive) vs. Limit Treatment (non-aggressive). Logistic regression analyses estimated the odds for aggressive treatment taking into consideration patient age, sex, race/ethnicity, severity of illness (Charlson Score), MD vs. Advanced Practice Clinician (MD vs. NP/PA), and palliative vs. non-palliative care clinicians.

Over one-third (36%) chose All Treatment. Proxy decision-makers signed 43% of the forms. Mean Charlson Score was 8 (SD=3). Mean age was 71 (SD=15); 49% were male; and 83% were non-Hispanic White. Palliative care clinicians administered 50% of the MOLSTs and 48% were signed by non-MDs.

A highly significant model (pseudo $R^2=0.421$; $p \leq 0.001$) revealed that proxy decision-makers were nearly 60% less likely to choose All Treatment compared to patient decision-makers (OR=0.43; $p \leq 0.001$).

This is the first known study to compare the aggressiveness of proxy vs. patient end-of-life care decisions using actual clinical choices rather than hypothetical scenarios. Hospital policy makers may wish to ensure that preferences for life-sustaining treatments are documented for patients who need proxy decision-makers to reduce the likelihood of administering unwanted treatment.

SENIOR HIGH COST HEALTHCARE USERS: HOW DO THEY DIFFER?

J. Lee^{1,3,2}, S. Muratov^{3,8}, J. Tarride⁸, M. Paterson⁶, T. Gomes^{7,6}, W. Khuu⁶, A. Holbrook^{4,3,5}, 1. *Division of Geriatric Medicine, McMaster University, Hamilton, Ontario, Canada*, 2. *Geriatric Education and Research in Aging Sciences (GERAS) Centre, Hamilton, Ontario, Canada*, 3. *Department of Clinical Epidemiology & Biostatistics, McMaster University, Hamilton, Ontario, Canada*, 4. *Division of Clinical Pharmacology, McMaster University, Hamilton, Ontario, Canada*, 5. *Centre for Evaluation of Medicines, Hamilton, Ontario, Canada*, 6. *Institute for Clinical Evaluative Sciences (ICES), Toronto, Ontario, Canada*, 7. *Li Ka Shing Knowledge Institute, St. Michael's Hospital, Toronto, Ontario, Canada*, 8. *Program for Assessment of Technologies and Health (PATH) Research Institute, St. Joseph's Healthcare Hamilton, Hamilton, Ontario, Canada*

High cost users (HCUs) are a small proportion of the population that use disproportionate healthcare resources. In 2011, 5% of the population in Ontario, Canada accounted for 65% (\$19.8 billion) of provincial health expenditures. Understanding HCU multi-morbidity and drug use is required to target interventions to improve clinical outcomes and contain healthcare costs. This study aimed to compare senior HCUs to non-HCUs based on demographics, co-morbidities, medication use, health service utilization, clinical outcomes and costs. We conducted a retrospective population-based matched cohort analysis of incident senior HCUs defined as Ontarians age ≥ 66 years in the top 5% of total healthcare costs in FY2013. Healthcare and prescription drug utilization data were obtained from health administrative

databases. The primary outcomes were annual total healthcare expenditures per patient, total drug costs per patient and drug-to-total healthcare expenditure ratio. Secondary outcomes were one-year mortality and hospitalization rate. Senior HCUs (n=176,604) accounted for \$4.9 billion in total healthcare expenditures and \$433 million in medication costs in FY2013. Compared to non-HCUs (n=529,812) on a per patient basis, HCUs incurred higher total healthcare costs (\$27,697 vs. \$2233) and higher medication costs (\$2453 vs. \$842). HCUs were characterized by greater polypharmacy (>5 medications, 87.7% vs. 47.6%) and multi-morbidity (median John Hopkins Expanded Diagnosis Clusters [EDCs], 14 vs. 10). HCUs had higher annual mortality (10.39% vs. 0.72%) and hospitalization rates (3.20 vs. 0.06 hospitalizations per 1000 person-years). Compared to non-HCUs, senior HCUs are frail, multi-morbid and vulnerable. The contribution of prescribing and medication utilization quality deserves further study.

SESSION 230 (SYMPOSIUM)

DOES ASPIRIN HAVE A ROLE IN FALLS, FRACTURES, AND FRAILTY?

Chair: G. Peeters, *Monash University, Melbourne, Victoria, Australia*

Co-Chair: A. Barker, *Monash University, Melbourne, Victoria, Australia*

Discussant: A. Newman, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Aspirin is among the most frequently prescribed and used drugs globally. Its use for the secondary prevention of cardiovascular events is well established, but there is increasing interest for its potential use for the prevention of ageing-related conditions. This symposium will provide an overview of the existing evidence regarding the effects of aspirin on inflammatory and bone remodeling pathways, the adverse effects of aspirin, and the findings of prior studies that have investigated aspirin use and fracture and frailty outcomes. The first presentation will discuss how aspirin may influence fracture risk via its effects on low-grade inflammation. The presented work is based on a comprehensive review of the literature including evidence from biomedical, clinical and epidemiological studies. The second presentation includes new data and builds on the first presentation by demonstrating the potential cost savings and improved quality of life if aspirin would be prescribed for the prevention of fractures. During the third presentation, original work will be presented demonstrating the positive and negative associations of antiplatelet agents (i.e. aspirin and/or clopidogrel) with risk of falls and cardiovascular events in older women with ischemic heart disease. In the fourth presentation, a theoretical overview will be given of how aspirin may affect frailty based on existing evidence. Finally, the findings will be summarized by the discussant, who will discuss the presented findings in terms of clinical implications and impact.

ASPIRIN FOR THE PREVENTION OF FRACTURES IN OLDER ADULTS—A REVIEW OF THE LITERATURE

A. Barker, G. Peeters, J. Talevski, A. Investigator Team, *School of Public Health and Preventive Medicine, Monash University, Melbourne, Victoria, Australia*

Despite several osteoporosis therapies being available, fractures remain a persistent source of pain, disability and healthcare utilization worldwide. In 2012, 140,822 low-trauma fractures occurred in Australia at a cost of \$2.75 billion. By 2022 the number of fractures is projected to increase 30%. The World Health Organization has identified fracture prevention as a public health priority. Aspirin—a widely available, simple and inexpensive drug—may provide a novel adjunct to current fracture prevention therapies. Aspirin is regularly taken by 19% of adults—mostly for preventing cardiovascular events. Cardiovascular benefits largely arise from anti-platelet effects. Anti-inflammatory effects may confer other benefits. Epidemiological studies suggest low-grade inflammation is associated with increased bone loss and fracture risk. Aspirin may effect fracture risk via anti-inflammatory pathways. This review summarizes existing evidence regarding inflammation and bone, anti-inflammatory and adverse effects of aspirin, findings of prior studies of aspirin and fracture outcomes and future research directions.

REDUCED FRACTURE RISK IN OLDER ADULTS TAKING LOW DOSE ASPIRIN: MODELING COSTS AND QUALITY OF LIFE

K. Sanders^{1,2}, J. Watts³, J. Abimanyi-Ochom³, A. Barker⁴,
1. Australian Catholic University, Melbourne, Victoria, Australia, 2. The University of Melbourne, Melbourne, Victoria, Australia, 3. Deakin University, Melbourne, Victoria, Australia, 4. Monash University, Melbourne, Victoria, Australia

Aspirin is generally associated with prevention of cardiovascular events. However, observational studies report associations between low grade inflammation, bone remodelling and fracture risk¹.

Modelled Australian data showed cost savings and improved quality of life associated with a 12% reduction in fracture risk in adults aged 70+ years taking 100mg aspirin daily. The model assumed uniform fracture risk reduction across gender and fracture sites, and included quality adjusted life years (QALYs) and costs specific to fracture site for age and gender.

The model predicts nine fractures per annum are averted per 1,000 older adults on daily low-dose aspirin. Fractures averted in women and men, respectively: hip 1.65, 0.92; vertebral 5.77, 2.12; wrist 4.10, 0.70; 'other' sites 8.26, 5.59. The predicted savings are AUD\$148,993 and 1.59 QALYs. Daily low-dose aspirin costs AUD\$10,000 - \$30,000/1,000 person-years.

If RCT findings confirm reduced fracture risk, daily aspirin may substantially reduce fracture burden in older adults.

¹Barker et al, 2015; ²Watts et al, 2013.

ANTI-PLATELET AGENT USE; FALL RISK VERSUS CARDIOVASCULAR RISK IN OLDER WOMEN

G. Peeters^{5,2,1}, S.E. Tett², S. Hollingworth², D. Gnjjidic³, S.N. Hilmer⁴, A.J. Dobson², R. Hubbard², 1. School of Public Health and Preventive Medicine, Monash University, Melbourne, Victoria, Australia, 2. The University of Queensland, Brisbane, Queensland, Australia, 3. University of Sydney, Sydney, New South Wales, Australia, 4. Royal North Shore Hospital, Sydney, New South Wales, Australia,

5. Global Brain Health Institute, University of California San Francisco | Trinity College Dublin, Dublin, Ireland

Patients with acute coronary syndrome are prescribed anti-platelet agents to prevent new cardiovascular events. Associations between anti-platelet agents and fall-related hospitalizations and cardiovascular events were examined in older women with ischemic heart disease (IHD). 2002–2011 surveys from the Australian Longitudinal Study on Women's Health linked with administrative hospital, pharmaceutical and death registry data were used. 885 women (82.7±2.7 years) had prior admission for IHD. There were 636 anti-platelet agent users (36.0% aspirins, 27.8% clopidogrel and 36.2% combination), 192 fall-related hospitalizations and 314 cardiovascular events including 82 deaths. Compared with non-users, users had higher risks of cardiovascular events (hazard ratio [HR]=1.32, 95% confidence interval [CI]=1.04–1.68) and cardiovascular deaths (HR=1.64, CI=1.00–2.68), but not falls (HR=1.17, CI=0.83–1.64). In the context of other recommended medications, anti-platelet agent use was not associated with fall risk, but was associated with an increased risk of cardiovascular events in older women with IHD.

EVIDENCE FOR THE POTENTIAL ROLE OF ASPIRIN IN THE PREVENTION OF FRAILTY

S. Ward¹, A. Newman², A.M. Murray^{3,4}, R. Woods¹, J. McNeil¹, 1. Monash University, Melbourne, Victoria, Australia, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, 3. Hennepin County Medical Center, Minneapolis, Minnesota, 4. University of Minnesota, Minneapolis, Minnesota

The interaction between aspirin and frailty is of interest, in particular because of growing use of aspirin by older populations. Aspirin may dampen systemic inflammation associated with frailty development, as well as reduce the incidence, and thus cumulative burden, of age-related diseases. Conversely frailty may increase the risk of aspirin-associated adverse events. The ASPREE primary prevention trial measures self-reported physical activity, and weight annually, and grip strength and 3 meter gait speed at baseline and even years post randomization to low dose aspirin or placebo. At baseline, average gait speed and grip strength were respectively 1.0±0.3m/s and 28.5±10.2kg in 65–74 age group (n=11163), 0.9±0.3m/s and 24.9±9.3kg in 75–84 age group (n=7219) and 0.8±0.3m/s and 21.0±8.4kg in the 85+ age group (n=732). These combined measures will facilitate an analysis of a differential effect of aspirin in frail participants, as well as measurement of the effects of aspirin on frailty outcomes.

SESSION 235 (SYMPOSIUM)

QUANTIFICATION AND ANALYSIS OF BIOLOGICAL AGING: GENETIC, GENOMIC, AND BIOMARKER GEROSCIENCE TOOLS

Chair: D.W. Belsky, Duke University School of Medicine, Durham, North Carolina

Discussant: T.T. Perls, Boston University Medical Campus, Boston, Massachusetts

Quantification of biological aging is a major frontier for translational geroscience. Aging is recognized as a leading

cause of disease and disability. It is hypothesized that intervention to slow the biological process of aging can simultaneously prevent/delay many different chronic diseases, extending healthspan. To develop such interventions methods are needed to quantify the biological process of aging in humans. The symposium participants use several promising approaches to quantify biological aging, including genetic, genomic, and physiologic-index-based methods. Key applications of these tools are in identifying novel therapeutic targets to slow aging and extend healthspan, and in measuring effectiveness of such therapies. With the aim of advancing those applications, our symposium focuses on (1) genetic research to identify molecular mechanisms of biological aging; and (2) linkages between biological aging measurements and age-related disease, with an eye toward intervention evaluation. The overarching goal of this year's symposium is to provide an update on several ongoing programs of biological aging research and to position research on biological aging within the broader field of geroscience. We view biological aging research as a bridge connecting clinical and basic-biology investigations of aging mechanisms with demographic/epidemiologic studies of aging populations. In sum, our symposium will integrate bioinformatic, clinical, and population research on biological aging and report on recent advances in the geroscience research agenda.

MOLECULAR SIGNATURES OF BIOLOGICAL AGING

P. Sebastiani, T.T. Perls, *Boston University, Boston, Massachusetts*

Many blood biomarkers correlate with physical function, anabolic response and healthy aging but their joint signature on aging phenotypes is unknown. We measured nineteen blood biomarkers that include some tests from total blood counts, lipid biomarkers, markers of inflammation and frailty in 4,704 participants of the Long Life Family Study (LLFS) and analyzed them using an agglomerative algorithm to group LLFS participants into clusters characterized by different biomarker signatures. The analysis identified 26 biomarker signatures that correlated with different aging phenotypes and predict morbidity and mortality. The predictive value of some of these signatures was replicated in the Framingham Heart Study. The analysis shows that various molecular signatures of circulating biomarkers exist and their significant association with morbidity and mortality suggest that these patterns represent different forms of biological aging. We will describe ongoing analyses that extend this work to include genetics and genomic data to better characterize the biological mechanisms underlying different signatures. A better understanding of the genetics underlying different signatures may identify targets for drug development.

AN OBJECTIVE MEASURE OF INDIVIDUAL HEALTH AND AGING FOR POPULATION SURVEYS

A. Cohen, *University of Sherbrooke, Sherbrooke, Quebec, Canada*

To perform effective surveillance of aging populations and forecast trends in morbidity and mortality, simple, objective measures of individual health states are needed. We used biological principles to develop and validate a robust, flexible biomarker-based health index for use in

population surveillance and economic analysis. Using 28 commonly available biomarkers in two datasets (WHAS and NHANES), we consider individuals as points in biomarker space and measure health as Mahalanobis distance to an "ideal state" of health, defined alternatively with population parameters or clinical thresholds. Surprisingly, population parameters outperform clinical thresholds, implying that clinical thresholds are imprecise and population means may provide a robust metric of healthy aging. Using the index, we show that low economic status is associated with accelerated biological aging in young (aged 20–40) and middle-aged (41–64), but not older adults (aged 65+) in our US datasets. We discuss implications for biological aging quantification in population surveillance.

EPIGENETIC AGE OF THE PRE-FRONTAL CORTEX AND ALZHEIMER'S DISEASE PATHOLOGY

M. Levine, *University of California, Los Angeles, Los Angeles, California*

Molecular biomarkers of brain aging are needed to advance understanding of age-related neurodegeneration. We developed a highly accurate epigenetic biomarker of tissue age, the "epigenetic clock" based on DNA methylation levels. Here, we examine association between epigenetic age and Alzheimer's disease (AD), cognitive decline, and AD-related neuropathology in 700 dorsolateral prefrontal cortex (DLPFC) samples from the Religious Order Study and Rush Memory and Aging Project. Results shows increased epigenetic age acceleration is associated with post-mortem AD diagnosis ($P=0.009$), increased neuropathology--neurotic plaques ($P=0.0002$), diffuse plaques ($P=.046$), Neurofibrillary tangles ($P=0.009$), and amyloid load ($P=0.002$)--and steeper declines in global cognitive functioning in the years leading up to their death ($P=0.004$). Results also suggest neuropathological markers mediate associations between epigenetic age and cognitive decline. Finally, genetic complex trait analysis (GCTA) revealed that epigenetic age acceleration, diffuse plaques ($r=0.24$), and working memory ($r=-0.35$) may share a common genetic profile.

GENETICS OF LATE ONSET ALZHEIMER'S DISEASE: CONNECTION WITH AGING, HEALTH, AND LONGEVITY TRAITS

A.I. Yashin, *Duke University, Durham, North Carolina*

Despite numerous studies confirming importance of genes in the origin of late onset Alzheimer's disease (AD), the details of genetic mechanisms remain elusive. Studying pleiotropic effects of genetic variants associated with AD on other health, and longevity related traits might clarify some fundamental aspects of this pathology and identify key connections with aging related changes. For this purpose we performed genome wide association studies of AD and other traits using case-control (LOADFS) data and longitudinal data (FHS and CHS). In the analyses of these data allowed us to detect pleiotropic associations of AD with other aging, health, and longevity related traits. The use of information on functional roles of detected genes (APOE, TOMM40, APOC1, PVRL2 among others) as well as on corresponding signaling and metabolic pathways provides us with important insights about possible causes of this health disorder.

SESSION 240 (SYMPOSIUM)

TRAUMA-INFORMED INTERVENTIONS FOR OLDER ADULTS WITH PTSD AND TRAUMA-RELATED PROBLEMS

Chair: A. Pless Kaiser, *VA Boston Healthcare System, Boston, Massachusetts*

Co-Chair: E.H. Davison, *VA Boston Healthcare System, Boston, Massachusetts*

Discussant: S. Thorp, *University of California, San Diego and, San Diego, California*

Older adults make up an increasing percentage of the world population, and a majority have been exposed to traumatic events during their lifetime. Posttraumatic stress disorder (PTSD) and other trauma-related problems influence the lives of many older adults, and there is limited research on interventions designed to decrease symptoms and improve functioning and quality of life among older adults who are impacted by trauma. The aim of this symposium is to present findings from several trauma-informed interventions for PTSD and trauma-related problems among older adults developed in various countries, as well as to discuss special considerations for interventions designed to treat older adults with symptoms related to earlier life trauma exposure. The first paper describes results from an RCT comparing the efficacy of Narrative Exposure Therapy with Present Centered Therapy for older adults with PTSD. The next paper presents findings from a study investigating an internet-based cognitive-behavioral writing intervention for older adults with PTSD related to WWII experiences. Third, we include a paper examining an intervention designed to promote successful processing and meaning-making among Veterans with later-adulthood trauma reengagement. Finally, we present epidemiological data on exposure to traumatic events, PTSD, and trauma-related disorders across several countries, present common reactions to trauma among older adults from a lifespan developmental perspective, and discuss implications for interventions designed for older adults. Together, these papers make important contributions to the research and provide strong support for interventions with older adults with trauma-related disorders, as well as provide recommendations for treatment with this special population.

NARRATIVE EXPOSURE THERAPY VS. PRESENT-CENTERED THERAPY WITH OLDER ADULTS: RESULTS FROM AN RCT

J. Lely¹, J. van den Bout², J.J. ter Heide^{1,3}, N. van der Aa^{1,3}, J.W. Knipscheer^{1,3,2}, R.J. Kleber^{3,2}, *1. Foundation Centrum '45, Arq Research Program, Diemen, Netherlands, 2. University Utrecht, Utrecht, Netherlands, 3. Arq Psychotrauma Expert Group, Diemen, Netherlands*

Older adults present a growing population in our society and in our mental health system. Among older adults, PTSD is a serious, but frequently hidden psychiatric disorder with various potential trajectories. Elderly patients may have been exposed to multiple traumatic events. Narrative Exposure Therapy (NET) was developed to address cumulative traumatic memories and aims at connecting them to context and meaning within an autobiographic narrative. Present Centered Therapy (PCT) targets current stressors with a solution-focused approach. In an RCT we investigated

the benefits of NET, compared to PCT, for older adults (>55 years, living independently) presenting with PTSD. Preliminary results showed that treatments and assessments were well-tolerated. Challenges were found in recruitment, treatment retention, and treatment interference by comorbid health problems. NET appears to be a safe and feasible outpatient treatment for older adults suffering from PTSD. PCT showed notable treatment effects as well, but NET demonstrated more sustained results.

RESULTS OF AN INTERNET-BASED COGNITIVE-BEHAVIORAL THERAPY FOR PTSD IN OLDER ADULTS

P. Kuwert³, M. Boettche¹, C. Knaevelsrud², *1. BZFO, Berlin, Germany, 2. Freie Universität, Berlin, Germany, 3. University Medicine Greifswald, Greifswald, Germany*

In an internet-based manualized cognitive-behavioral writing therapy, older adults ($M = 70.9$ years, $SD = 4.56$) with World War II-related PTSD were examined at four assessment points (pre, post, three- and six-months follow-up). Results revealed a significant decrease in PTSD severity scores (Cohen's $d = 0.43$) and significant improvements on secondary clinical outcomes of quality of life (Cohen's $d = 0.48$), self-efficacy (Cohen's $d = 0.38$), and posttraumatic growth (Cohen's $d = 0.33$) from pre- to posttreatment. All improvements were maintained at follow-ups. Participants reported high working alliance ($M = 6.09$, $SD = .87$, range 1–7). The findings provide promising insights into evidence-based age-specific treatment for PTSD. With regard to demographic change and taking into account the fact that early-lifetime war-associated traumatization has a disabling impact, it is a matter of urgency that clinical routine should effectively reach and address the needs of older adults.

LATER-ADULTHOOD TRAUMA REENGAGEMENT: FINDINGS FROM DISCUSSION GROUPS WITH OLDER COMBAT VETERANS

E.H. Davison^{1,2}, A. Pless Kaiser^{1,2}, J. Wachen^{1,2}, L. King^{1,2}, D. King^{1,2}, J. Moye^{1,3}, *1. National Center for PTSD, VA Boston Healthcare System, Boston, Massachusetts, 2. Boston University School of Medicine, Boston, Massachusetts, 3. Harvard Medical School, Boston, Massachusetts*

Later-adulthood trauma reengagement (LATR) is a phenomenon occurring among older Veterans who were exposed to stressful war-zone events in early adult years, functioned relatively successfully into adulthood, but begin to reminisce about combat-related experiences as they confront challenges of aging (e.g., retirement). LATR is conceptualized as a meaning-making process which may lead to growth or increased distress. The purpose of this study was to examine whether Veterans experiencing LATR benefited from a 10-week psychoeducational group presented from a lifespan developmental perspective. Thirteen older ($M = 68$) male combat Veterans completed discussion groups. Assessments of LATR, posttraumatic stress, positive appraisals of military experience, life satisfaction, resilience, and meaning-making were collected at baseline, post-group, and follow-up. Descriptive statistics revealed variability in individual responses on measures of distress, but that positive perceptions (e.g., positive appraisals) tended to

increase. Additionally, the intervention was well-received: retention was high and qualitative responses indicated high satisfaction.

TRAJECTORIES OF TRAUMA-RELATED DISORDERS ACROSS THE LIFE-SPAN: EVIDENCE AND CLINICAL IMPLICATIONS

M. Kaiser, H. Glaesmer, *Medical Psychology and Medical Sociology, Leipzig University, Leipzig, Germany*

Trauma-related disorders in younger people have gained extensive attention in research and clinical work. However, little knowledge exists about long-term consequences of traumatic experiences (TE) across the lifespan. TEs are associated with negative outcomes for mental and physical health. Processing of TEs may take different developmental paths. Symptoms may dissipate over time, become chronic, or be reactivated in association with physical aging and age-specific stressors (e.g. retirement). Collective, or generation-specific TEs may be related to unique reactions in old age. There are no longitudinal epidemiological studies on post-traumatic stress symptomatology in the German population. Therefore, no conclusion can be drawn about incidence or course of PTSD in the older adult German population. Nevertheless, research shows higher prevalence in trauma-related disorders in this group compared to younger adults, thus underlining the long-term impact of TEs in late life. Implications for therapeutic interventions for elderly patients with trauma-related disorders will be discussed.

SESSION 245 (SYMPOSIUM)

CROSS-NATIONAL EXPLORATION OF OLDER ADULTS' ALCOHOL USE

Chair: A.A. Moore, *University of California, San Diego, San Diego, California*

Co-Chair: A. Towers, *Massey University, Palmerston North, New Zealand*

Data on alcohol and older populations will be presented from multiple international studies. The presentations will address the epidemiology of alcohol consumption. Specifically data will be shared on cross national drinking patterns, life-course trajectories and risks of chronic disease, exiting the labor market and its impact on risk for problem drinking, binge drinking and angina in low and middle income countries, and demographic, socioeconomic and health factors associated with alcohol consumption.

CROSS-NATIONAL PATTERNS OF OLDER ADULTS DRINKING: RESULTS FROM AN INTERNATIONAL INVESTIGATION

A. Towers¹, N. Minicuci², I. Rocco², J. Sheridan³, P. Kowal⁴, D. Newcombe³, 1. *School of Public Health, Massey University, Palmerston North, New Zealand*, 2. *Consiglio Nazionale delle Ricerche, Padova, Italy*, 3. *University of Auckland, Auckland, New Zealand*, 4. *World Health Organization, Geneva, Switzerland*

Older adults are at significant risk of harm from alcohol use but there is no consensus as to the general patterns and prevalence of drinking in this population, nor how such trends might differ between countries. A collaboration of international researchers harmonised alcohol use data from

government-funded studies of ageing to investigate drinking patterns in older adults from nine countries around the world: United States, England, China, Ghana, India, Mexico, the Russian Federation, South Africa, and New Zealand. The results show substantial differences across countries in rates of abstinence, frequency of alcohol use, quantity consumed on a typical day, and rates of infrequent and frequent heavy drinking. Substantial gender differences in drinking patterns were evident both between and within countries. These findings suggest that drinking is common in older adult populations in most countries, that typical daily drinking amounts differ substantially between countries but that frequent heavy drinking is rare.

ALCOHOL CONSUMPTION OVER THE ADULT LIFE SPAN AND RISK OF CHRONIC DISEASE IN OLDER AGE

A. Britton¹, S. Bell^{1,2}, 1. *University College London, London, United Kingdom*, 2. *Cambridge University, Cambridge, United Kingdom*

Alcohol consumption changes over the life span. Analysis of longitudinal data, with repeat alcohol measures, is necessary to reveal changes within the same individuals as they age. Such data are scarce and few studies are able to capture multiple decades of the life course. Therefore we examined alcohol consumption trajectories (volume and frequency) using data from multiple cohorts that cover different and overlapping periods of the life course (combined sample size of over 60,000 men and women). We then explored the importance of taking a life course perspective by analyzing how different trajectories are associated with differing risk of developing several chronic diseases, such as coronary heart disease, stroke and cancer.

THE IMPACT OF FORCED EXIT FROM WORK ON PROBLEMATIC DRINKING IN OLDER EUROPEANS

M. Hyde¹, A. Towers², 1. *Centre for Innovative Ageing, Swansea University, Wales, United Kingdom*, 2. *Massey University, Palmerston, New Zealand*

Job loss is known to increase alcohol use in the general population. Yet few studies have examined how forced exit from work impacts on the drinking patterns of older adults. This is important as older adults can be at greater risk from alcohol-related harm. Using waves 4 and 5 of the Survey of Health, Ageing and Retirement in Europe we assessed the impact of forced exit on drinking patterns in people aged 50+ from 16 countries (N=15,774). Reason for exiting work did not differentially influence average drinking frequency and quantity. However unforced exit decreased the risk of binge drinking (OR 0.73: 95%CI 0.56-.95) whilst those who were forced out had an increased but non-significant risk of binge frequency compared to those still employed (OR 1.28: 95%CI 0.97-1.70). The results suggest that how one leaves the labour market impacts on the risk of problem drinking in later life.

BINGE DRINKING AND INCIDENT ANGINA PECTORIS AMONG OLDER ADULTS IN LOW-AND MIDDLE-INCOME COUNTRIES

P. Martinez¹, T. Clausen², 1. *Alcohol Research Group, Emeryville, California*, 2. *Norwegian Center for Addiction Research, University of Oslo, Oslo, Norway*

The association between binge drinking and angina pectoris (AP) among older adults remains controversial, and much of the evidence comes from developed countries. This study estimated the effect of binge drinking on incident AP among adults aged 50+ in four low and middle income (LAMI) countries. We used longitudinal data from WHO's Study of Global AGEing and Adult Health on 7,462 individuals from Ghana, India, Mexico, and Russia. We compared binge drinkers (5+ drinks/day for men, 4+ for women) to lifetime abstainers, former drinkers, and light drinkers. We fitted multivariate logistic regression models to estimate risk of incident AP at 5-year follow-up. Binge drinkers were more likely than lifetime abstainers (OR=2.07, p=0.04) and former drinkers (OR=2.50, p=0.02) to have incident AP, but not compared to light drinkers. Future research and prevention efforts should focus on the risk binge drinking poses for AP among older adults living in LAMI countries.

ALCOHOL CONSUMPTION IN OLDER ADULTS: RESULTS FROM SAGE, ELSA, HRS AND SHARE

N. Minicuci¹, N. Naidoo², S. Chatterji², P. Kowal^{3,4}, 1. National Research Council, Neuroscience Institute, Padova, Italy, 2. World Health Organization, SAGE, IER/HSI, Geneva, Switzerland, 3. World Health Organization, SAGE, Geneva, Switzerland, 4. Research Centre for Generational Health and Ageing, University of Newcastle, Newcastle, New South Wales, Australia

Two waves (2004 and 2010) of four longitudinal studies were included in an *ex-post* harmonization process of nine domains: socio-demographic and economic, health states, self-reported health and mental state, health examinations, physical and mental performance tests, risk factors, chronic conditions, social network, and subjective well-being. Drinking habits varied substantially across studies in older adults. Almost 90% of respondents in ELSA consumed alcohol, compared to 69% in SHARE, 55% in HRS and 34% in SAGE. Heavy drinkers were found to be highest in respondents from HRS and lowest in ELSA. Adjusting for gender and age, multivariable analyses examined the association between drinking profiles, abstainers versus not abstainers, and frequent heavy drinkers versus infrequent heavy drinkers, and other selected factors. Detailed results will be shown. Modifiable factors to address problem drinking in older adults need to be addressed by health systems.

SESSION 250 (SYMPOSIUM)

TAKING LEISURE SERIOUSLY: LEISURE-BASED INTERVENTIONS TO SUPPORT COGNITIVE HEALTH

Chair: S. Belleville, *Institut Universitaire de Geriatrie de Montreal, Montreal, Quebec, Canada*

Discussant: N. Anderson, *Rotman Research Institute, Baycrest, Toronto, Ontario, Canada*

Older adults are looking for ways to increase their cognition and prevent age-related cognitive decline. In this symposium, we will assess whether participation in cognitively stimulating leisure activities improves cognition in older adults. A large number of epidemiological studies have indeed shown that being engaged in such activities is associated with better cognitive health in older adults. Thus, interventions involving leisure activities might help to prevent cognitive

decline while at the same time being ecologically valid and easy to implement in the community. The symposium will present studies that have developed and tested leisure-based interventions meant to stimulate cognition in older adults. It will cover programs that rely on a variety of leisure activities, ranging from crafts, music and artistic production to technological learning and volunteering. Furthermore, the symposium will touch on major issues related to the use of leisure activities as a way to increase cognition. In addition to measuring the potential for these interventions to improve cognition, the symposium will address effects on well-being, the role of family members, the potential for web-based applications, the most effective intervention modalities and their effects on brain function.

EARLY-LIFE AND LATE-LIFE COGNITIVE LIFESTYLE AS A WAY TO PROMOTE COGNITIVE RESERVE IN OLDER ADULTS

S. Belleville, A. Cordière, G. Ducharme-Laliberté, B. Boller, *Research Center, Institut Universitaire de Geriatrie de Montreal, Montreal, Quebec, Canada*

The reserve hypothesis suggests that some individuals develop a form of resilience against the detrimental effects of brain damage. Inter-individual differences in reserve have been related to a range of differences in cognitive lifestyle. This presentation will examine the evidence suggesting that differences in early-life education and late-life engagement in mentally stimulating leisure activities determine differences in baseline cognition and age-related cognitive decline. It will also assess the effects of early-life education and mentally stimulating leisure activities in late life on critical brain parameters, including brain volume, cortical thickness, and task-related activation. Based on these findings, this talk will discuss the potential for leisure-based interventions and present evidence of the impact of those interventions on cognitive and brain function in healthy older adults. It will conclude by presenting ENGAGE, a currently held project developed to increase reserve with enriched leisure activities.

LESS IS MORE: COMPLEX VOLUNTEER JOBS AND MORE VOLUNTEERING ATTENUATE THE BENEFITS OF VOLUNTEERING

N. Anderson¹, M. Binns¹, E. Kröger², T. Damianakis³, L.M. Wagner⁴, D.R. Dawson¹, S. Bernstein¹, 1. Baycrest Health Science, Toronto, Ontario, Canada, 2. Laval University, Québec, Québec, Canada, 3. University of Windsor, Windsor, Ontario, Canada, 4. University of California, San Francisco, California

Research has identified higher cognitive functioning among seniors who held more cognitively or socially complex occupations. We tested the influence of occupational complexity and number of hours of volunteer work on cognitive, physical, and psychosocial benefits. A group of previously non-working and non-volunteering adults aged 56–86 were assessed prior to ($n = 169$), mid-way ($n = 97$), and after a year ($n = 75$) volunteering. Cognitive, physical, and psychosocial measures were related to demographic variables, time, and job characteristics with random-effects models. Younger and female participants had higher levels of cognition (verbal and visual episodic memory, working memory). Interestingly, cognitive improvement evident in the first six

months was attenuated among volunteers working more hours or in more socially or physically complex roles. No changes were found in physical or psychosocial functioning. Cognitive improvement was found among new post-retirement volunteers – greater if not volunteering too much or in overly challenging roles.

ENGAGEMENT IN MENTALLY CHALLENGING ACTIVITIES ENHANCES NEURAL EFFICIENCY

I. McDonough^{1,2}, S. Haber², G.N. Bischof³, D.C. Park²,
1. *The University of Alabama, Tuscaloosa, Alabama*, 2. *University of Texas at Dallas, Dallas, Texas*, 3. *University Hospital Cologne International, Cologne, Germany*

We tested how an intervention aimed to increase challenging leisure activities affected cognition and brain function. Thirty-nine participants engaged in 15 hours of activities per week over 14 weeks in either high-challenge activities (digital photography and quilting) or low-challenge activities (socializing or performing low-challenge cognitive tasks). Brain function was assessed using fMRI during a semantic classification task with two levels of demand pre and post intervention. The High-Challenge group, but not the Low-Challenge group, showed increased modulation of brain activity in regions associated with attention and semantic processing that stemmed from decreases in brain activity during the easy condition (neural efficiency). These effects were greater for those who spent more time committed to the program, who were older, and who gained most in cognition. Mentally challenging activities may be neuroprotective and an important element to maintaining a healthy brain into late adulthood.

LEVERAGING TECHNOLOGY TO PROMOTE ENGAGEMENT IN LEISURE ACTIVITIES IN SENIORS WITH COGNITIVE DECLINE

K. Murphy¹, A. Altschuler¹, G. Rowe¹, L. Hasher^{1,2},
M. Gordon¹, P. Spadafora³, L. Tsotsos³, A. Szczepura⁴,
1. *Baycrest Health Science, Toronto, Ontario, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*, 3. *Sheridan Centre for Elder Research, Oakville, Ontario, Canada*, 4. *Coventry University, Coventry, United Kingdom*

Leisure participation is associated with health benefits and withdrawal from leisure is a commonly associated outcome of cognitive decline. We investigated the feasibility of a web-based app 'ArtOnTheBrain' to promote involvement in enjoyable recreation in seniors with cognitive decline. ArtOnTheBrain employs artwork focused activities involving learning, solving puzzles, and socializing with storytelling and discussion. Iterative qualitative feedback interviews were undertaken to drive customizations of the app and establish user acceptability with two groups of 6 participants experiencing mild cognitive impairment, early dementia, and their family members. All participants became independent in navigating the app. Those experiencing cognitive decline commented it made them feel "smart" and their "opinion mattered". Family valued opportunity for enjoyable interactions outside those concerning daily responsibilities. Technology can be leveraged to support engagement with complex recreation to improve well-being with future investigated secondary outcomes examining benefits in social networks, life space, cognition, and health service utilization.

MUSIC PRACTICE AS A MEANS TO PROMOTE RESERVE AND COGNITIVE MAINTENANCE IN AGING

A. Moussard¹, C. Fouquet¹, L. Cuddy², S. Belleville¹,
K. Mahalingam³, N. Anderson³, 1. *Research Center, Institut Universitaire de Geriatrie de Montreal, Montreal, Quebec, Canada*, 2. *Queen's University, Kingston, Ontario, Canada*, 3. *Rotman Research Institute, Baycrest, Toronto, Ontario, Canada*

Music practice (playing music or singing) involves many interacting cognitive processes and brain areas. As a consequence, we can speculate that music practice could benefit non-musical activities. Many studies have indeed shown that music practice is associated with enhancement of different aspects of cognition and brain processing in younger adults. More recently, similar observations in older adult musicians, compared to non-musician controls, have suggested that being engaged in musical activities could contribute to the development of some form of cognitive or brain reserve, which may help cognitive and brain maintenance in aging. Moreover, a limited number of intervention studies have shown improved cognitive outcome after short-term music training in non-musician older adults. By presenting an overview of relevant literature and recently collected behavioural and brain data, this presentation aims to provide a better understanding of the effects of short- and long-term music training on older adults' cognition.

SESSION 255 (SYMPOSIUM)

INDIVIDUAL, EMPLOYER, AND JOB-RELATED INFLUENCES ON LATE WORK CAREERS OUTCOMES AND WORK ABILITY

Chair: D. Hochfellner, *New York University, Brooklyn, New York*

Co-Chair: I. Gutierrez, *RAND Corporation*

Discussant: G. Fisher, *Colorado State University*

Workforce trends indicate that many individuals are working until later ages, and that older people want to stay on the labor market even beyond retirement age. At the same time we also have evidence that older workers face barriers trying to pursue their late work careers. From the workers perspective job demands, work ability and motivations change. From a macro perspective technological change and occupational change make it harder for older workers to fulfill job requirements. In turn, employers can provide possibilities to bridge these gaps to enables longer work lives. This session seeks to address older workers careers from the individual, the establishment and macro perspective and discuss how factors such as job training, job motivations, occupational changes mitigate careers. What enables longer work lives by adapting the work environment to suit an aging workforce and what discourages longer careers by incentivizing for example earlier retirements. Dr. Gwenith Fisher will serve as the discussant for the session. In this role she will summarize and integrate the findings across the papers presented in the session and offer recommendations for future research. Dr. Fisher is an expert on aging workforce issues and has published more than 50 peer-reviewed papers and serves on four editorial boards of top psychology journals.

IN-COMPANY TRAINING FOR OLDER EMPLOYED WORKERS: RESULTS FROM A RANDOMIZED CONTROLLED TRIAL

G.J. van den Berg², C. Dauth¹, P. Homrighausen^{1,3}, G. Stephan^{1,4}, 1. *Institute for Employment Research, Nuremberg, Germany*, 2. *University of Bristol, Bristol, United Kingdom*, 3. *University of Mannheim, Mannheim, Germany*, 4. *University of Erlangen-Nuremberg, Nuremberg, Germany*

Even though older workers' labor market participation has increased, their labor market participation remains far below the employment ratios of other age groups. Investments in the human capital of older workers are important to increase and maintain their employability. Nevertheless, older workers' participation in in-company training is comparatively low. We examine governmental subsidized in-company training for older employed workers in Germany applying an experimental information treatment approach. We sent out information brochures on this program to randomly selected eligible workers to investigate to what extent knowledge about the program increases program participation and subsequently their employment probability, wages, and other job characteristics. For this purpose, we use individual register data with daily precision matched with survey data. Furthermore, we analyze to which extent the subsidy produces deadweight losses. The latter occurs if the subsidy induces firms to substitute unsubsidized for subsidized training.

TECHNOLOGICAL CHANGE AND EMPLOYMENT OF OLDER WORKERS

I. Gutierrez², D. Hochfellner¹, 1. *Center of Urban Science and Progress, New York University, Brooklyn, New York*, 2. *RAND Corporation, Santa Monica, California*

The effects of technological change on earnings have been studied widely, showing a bias in favor of skilled workers. Economic models suggest an age bias might also exist: technological change depreciates human capital if it is not paired with trainings, and evidence suggests older workers participate less in training activities. However, still little is known about the extent to which older workers are particularly affected by technological change. In this paper we use more than 10 years of panel information on German employers, including earnings and employment administrative data, and survey information on technological change (including the introduction of new production processes and technologies, innovation of products and reorganization of human resources), to investigate how technological change impact the flows of older workers into and out of employers, the share of older workers in the workforce, and the wage of older workers relative to their younger peers.

JOB CHARACTERISTICS, OCCUPATIONAL TRANSITIONS, AND RETIREMENT IN OLDER WORKERS

A. Sonnega, B. McFall, *University of Michigan, Ann Arbor, Michigan*

A range of sociodemographic and economic characteristics have been shown to predict both earlier and later retirement. Less is known about the role of occupations and

their characteristics on the work choices of older workers. Knowing more about the occupations that workers seem to stay in longer or leave earlier may point the way to policy interventions that are beneficial to both individuals and system finances. This project uses detailed occupational categories and work characteristics in the Health and Retirement Study (HRS) linked to information in the Occupational Information Network (O*NET) to examine compositional changes in occupations held by older workers over time; to provide some basic and interesting information about relationships between occupations and their characteristics and retirement outcomes; and to shed some light on which occupations and associated characteristics might encourage or discourage longer working lives.

WORKING AFTER RETIREMENT AND ITS RELATIONSHIP WITH LIFE SATISFACTION

E. Dingemans, K. Henkens, *Netherlands Interdisciplinary Demographic Institute, The Hague, Netherlands*

This research studies differences in life satisfaction between full retirees and working retirees (bridge employees) and argues that these differences may depend on variations in the income position of retirees. The hypothesis is that especially for those with low pension income, bridge employment is an important tool to supplement income in order to foresee in both material and psychological well-being. This hypothesis is tested using data from the Survey of Health, Aging and Retirement in Europe project (SHARE), waves 2, 4 and 5. The analytical sample consists of about 53000 retirees (aged 60–75) in 17 countries. The results show that life satisfaction differs between full retirees and bridge employees and across countries. Working retirees report higher levels of well-being compared with full retirees, also after controlling for the effects of traditional predictors of well-being such as income, partner status and health.

SESSION 260 (PAPER)

END-OF-LIFE PLANNING AND TRANSITIONS

END-OF-LIFE PLANNING AND DECISION-MAKING: THE IMPORTANCE OF FAMILY TIES

T.M. Cooney¹, A. Shapiro², C.E. Tate³, 1. *University of Colorado--Denver, Denver, Colorado*, 2. *California State University San Marcos, San Marcos, California*, 3. *ACCORDS, School of Medicine, University of Colorado, Anschutz Medical Campus, Aurora, Colorado*

The critical role offspring play in their parents' later lives is well established; while some assume caregiving responsibilities, others provide companionship, and emotional and instrumental support. Less is known about offspring's contributions to their parents' end-of-life (EOL) decision-making and to care choices during the dying process. We analyzed several waves of data from different modules of the U.S. Health and Retirement Study (HRS) to examine whether relationship quality with offspring predicts aging parents' engagement in EOL planning, and whether parents discuss EOL wishes with offspring, name a child as Durable Power of Attorney (DPA), or whether offspring act as decision-makers in care discussions near parents' end-of-life. We linked

2012 and 2014 HRS Exit Interview data—collected for deceased respondents, with their prior core data from 2008, 2010, or 2012, and self-administered questionnaire data, resulting in 1227 cases who identified as parents. Regression results revealed that parents' engagement in EOL planning was greater for unmarried respondents, and was not associated with relationship quality (i.e., supportiveness, strain, contact) with offspring. But, for parents who discussed EOL wishes, children were more likely to be involved in such discussions if the parent was unmarried, and the children were rated higher on supportiveness. Perceiving their children as supportive also predicted an increased likelihood of parents naming a child as DPA. Regarding cases where treatment decisions were required near the parents' time of death, children were more likely to assume a major decision-making role if their parent had earlier rated them as high on supportiveness.

HOW DOES EDUCATION AFFECT TRANSITIONS BETWEEN CARE SETTINGS IN OLDER ADULTS NEAR THE END OF LIFE?

S. Kelfve^{1,2}, J.W. Wastesson², S. Fors², K. Johnell², L. Morin²,
1. National Institute for the Study of Ageing and Later Life, Linköping University, Norrköping, Sweden, 2. Aging Research Center, Karolinska Institutet & Stockholm University, Stockholm, Sweden

High socioeconomic status (SES) is often associated with better resources to organize home care and avoid burdensome transitions between care settings near the end of life. However, high SES is also associated with better resources and greater desire to seek specialist care in the final stages of the disease. Using register data covering all individuals 65 years and older who died in Sweden in 2013 (n=75,722), we aimed to investigate the association between level of education and different transition patterns in the last month of life. Overall, 52% of community-dwelling individuals and 16% of nursing home residents died in hospital facilities. In the community, individuals with tertiary education were more likely to die in hospitals than individuals with only primary education (adjusted OR=1.22, 95% CI=1.15–1.30). No difference was found in the nursing home setting (p=0.115). Among community-dwellers, the association between education and in-hospital death was found for all population sub-groups (e.g. sex, age, number of comorbidities, cause of death). This association was however stronger for individuals who died from cancer compared with organ failure. In addition, older people with tertiary education had more planned hospital admissions and were more often hospitalized over the entire last 2 weeks of life. Our results suggest that education does affect end-of-life transitions (including in-hospital death), especially for old people in ordinary living.

LIFE, DEATH, AND LEGACY: IS TALKING ABOUT DEATH GOOD FOR YOUR HEALTH?

K. Stott, J.J. Benson, S. Kerr, A. Jones, A. Ermer, *Human Development and Family Science, University of Missouri, Columbia, Missouri*

Research has shown that many people are uncomfortable discussing end-of-life care and death. Popular opinion polls have supported these findings as many respondents rank death as their most avoided discussion topic. Findings

have indicated that many have not shared their end-of-life care preferences with even their closest family and friends. However, other research suggests discussions about death can be good for health and well-being. In order to understand this phenomenon better, we conducted a randomized controlled trial to test the efficacy of a death awareness workshop in promoting healthy behaviors and death anxiety.

Data from 89 participants in the Life, Death, and Legacy study were used to address our research focus. Implementing a Pretest-Posttest randomized experimental design, the control group completed an individual writing assignment about a fear-inducing topic (becoming quadriplegic). The treatment group attended a two-hour workshop that included discussion topics such as aging, mortality, and relationships. ANCOVA was used to compare group differences on a number of outcomes measuring health behaviors and anxiety about death. Significant differences were found between groups on post-test scores. The treatment group reported less fear of death, less aversion to the topic of death, and higher scores in healthy nutrition attitudes. These statistically significant differences were detected both within the treatment group and in comparison to the control group. In summary, our findings suggest talking about death can be helpful in terms of assuaging fear and anxiety about death. These findings have important implications for practice in hospice and palliative care settings.

PROVIDER PERSPECTIVES ON ADVANCE CARE PLANNING DOCUMENTATION IN THE ELECTRONIC HEALTH RECORD

E. Dillon¹, J. Chuang¹, A. Gupta², S. Tapper⁶, S. Lai³, P. Yu⁴, C.S. Ritchie⁵, M. Tai-Seale¹, 1. Palo Alto Medical Foundation Research Institute, Mountain View, California, 2. Stanford University, Palo Alto, California, 3. Palo Alto Medical Foundation, Palo Alto, California, 4. Hartford HealthCare, Hartford, Connecticut, 5. UCSF School of Medicine, San Francisco, California, 6. Palo Alto Medical Foundation, Santa Cruz, California

Advance care planning (ACP) is valued by patients and clinicians yet documenting ACP in an accessible manner is problematic. In order to understand how providers incorporate electronic health record (EHR) ACP documentation into clinical practice we interviewed providers in primary care and specialty departments about ACP practices (n=13), and analyzed EHR data on 358 primary care providers (PCPs) and 79 specialists at a large multispecialty group practice. Structured interviews were conducted with thirteen providers with high and low rates of ACP documentation in primary care, oncology, pulmonology, and cardiology departments. EHR problem list data on advance health care directives (AHCD) and physician orders for life-sustaining treatment (POLST) were used to calculate ACP documentation rates. Examining seriously ill patients ≥65 years with no pre-existing ACP documentation seen by providers during 2013–2014, 88.6% (AHCD) and 91.1% (POLST) out of 79 specialists had zero ACP documentations. Of 358 PCPs, 29.1% (AHCD) and 62.3% (POLST) had zero ACP documentations. Interviewed PCPs believed ACP documentation was beneficial and accessible, while specialists more often did not. Specialists expressed more confusion about documenting ACP, whereas PCPs reported standard clinic workflows.

Providers cited lack of interoperability between outpatient and inpatient EHR systems, uncertainty about who should document ACP, lack of a single well-known location for ACP in the EHR, and lack of time and compensation as concerns. Results suggest providers desire standardized workflows for ACP discussion and documentation. New Medicare reimbursement and increasing quality metrics for ACP are incentives for healthcare systems to address barriers to ACP documentation.

A LONGITUDINAL EDUCATIONAL APPROACH TO IMPROVING END-OF-LIFE CARE IN JAPANESE NURSING HOMES

S. Kobayashi¹, A. Kawakami³, Y. Seki², R. Rokkaku², 1. *Department of Nursing, School of Health Science, Tokyo University of Technology, Tokyo, Japan*, 2. *Dokkyo Medical University, Mibu-machi, Japan*, 3. *Tokyo University, Tokyo, Japan*

This study aimed to clarify the effect of a longitudinal educational approach for end-of-life care in nursing homes in Japan. Recently, nursing homes in the Japanese Long-term Insurance system have been required to perform new roles, including providing end-of-life care for residents. The situation brought anxieties to their staffs. Therefore, we conducted an educational approach for six nursing homes in Tokyo, Japan between June 2013 and March 2016. We established two kinds of participants. One group was 10 core members who participated in workshops about end-of-life care. The other group was general staff, who were affected by the core members on the job. The Job Content Questionnaire (JCQ) was used to measure job strain. The questionnaire determined the subjects, ages, gender, types of job, the experiences of end-of-life care, and scores for job strain. In order to promote more and better responses to our questionnaire, we decided not to assign linking identity numbers to the general staff. It obtained 215 (47.5%) responses from the general staffs at the initial research and the second time 245 (54.2%). There were no dropouts among the core members. Approval for this study was obtained through the Tokyo University of Technology Research Board in 2013. Before implementation of this educational approach, participants' average age was 40.28 years, 55.8% were female, average job tenure at current nursing home was 109 months. The score of work environment was significantly improved whereas the emotional demands, quantitative and qualitative job overload did not change.

SESSION 265 (SYMPOSIUM)

TRENDS IN LONGEVITY, HEALTH, AND FUNCTIONING AMONG VERY OLD PEOPLE—THE NORDIC CASE

Chair: M.K. Jylha, *University of Tampere, Tampere, Finland*
Co-Chair: S. Fors, *Aging Research Center*

The unprecedented decline in old age mortality and the consequent increase of very old people are rapidly changing the landscape of aging, and create new challenges for health and social care. In this symposium we take advantage of several representative population-based studies and exhaustive national registers to explore trends in longevity, health and functioning among very old people, as well as trends in

long-term care in the Nordic countries. Denmark, Finland, Iceland, Norway, and Sweden are high-income countries with largely shared egalitarian norms and traditions, and welfare states with universal health care. Since the 1990s, all the Nordic countries have experienced a rapid increase of the very old population and, simultaneously, major reforms in their elderly care. The first paper describes the demographic changes showing remarkable differences between the five countries. The second paper analyses the trends in functioning and health of very old people in Sweden and Finland. The third paper explores whether there are socioeconomic differences in health and functioning of very old people and how these differences have changed over time. The fourth paper analyses the impact of demographic changes and health trends on the use of health and long-term care, using Finland as an example.

THE AGING POPULATION IN FIVE NORTHERN EUROPEAN COUNTRIES: DEMOGRAPHIC CHANGES FROM 1990 TO 2014

T. Høj Jørgensen, C. Nilsson, *Section of Social Medicine, Department of Public Health, Faculty of Health and Medical Sciences, University of Copenhagen, Denmark, Copenhagen, Denmark*

The Northern European countries are known for their similarities, but also differences in longevity. However, demographic differences between the oldest old are less explored. We investigated demographic changes and difference between the oldest old in five Northern European countries from 1990–2014. Demographic information was collected from national statistical databases and the Human Mortality Database. The gender-ratios for 85+ and 90+ year old decreased from 1990–2014 in most of the countries. The proportion of 85+ and 90+ year old, life expectancy at age 85- and 90-years, and the proportion reaching 85- and 90-years increased from 1990–2014 for both genders in all the countries. Yet, there were great differences in the pace of these increases and there were still great differences between the countries in 2014. In conclusion, demographic markers of the oldest old have become more similar in the Nordic European countries, however there still remains remarkable difference between the countries.

CHANGE AND STABILITY: TRENDS IN HEALTH AND FUNCTION AMONG THE OLDEST OLD IN FINLAND AND SWEDEN

S. Fors¹, M.K. Jylha², 1. *Aging Research Center, Karolinska Institutet & Stockholm University, Stockholm, Sweden*, 2. *School of Health Sciences and Gerontology Research Center, University of Tampere, Tampere, Finland*

One of the key tasks of public health research, in the light of population ageing, is the tracking of trends in health and function among older adults. In this study, we have explored trends in health and physical function among the oldest old in Finland and Sweden during the period 1992 – 2014. The study is based on the SWEOLD survey from Sweden, and the Vitality 90+ survey from Tampere, Finland. The results show that, for most measures of health, the prevalence either increased or remained stable throughout the period. For ADL disabilities, on the other hand, there was some indications of a decrease in the prevalence over time in both in

Sweden whereas the prevalence remained stable in Finland. In sum, these results suggest that different health measures may follow different trends and, thus, underscore the importance of using multiple health indicators when monitoring health trends in the older population.

TRENDS IN HEALTH INEQUALITIES AMONG THE OLDEST OLD IN FINLAND AND SWEDEN

L. Enroth¹, S. Fors², 1. School of Health Sciences and Gerontology Research Center, University of Tampere, Tampere, Finland, 2. Aging Research Center, Karolinska Institutet & Stockholm University, Sweden, Stockholm, Sweden

Trends in socioeconomic health differences are largely unexplored for the oldest old. The study examines socioeconomic differences in functioning and health among the oldest old in two Nordic countries. The Vitality 90+ Study is a population based survey of the oldest old (90+) in Tampere, Finland, with comparative data from 2001, 2007 and 2014. The SWEOLD survey is a nationally representative survey of the oldest old (77+) in Sweden with comparable data from 1992, 2002 and 2011. Socioeconomic differences in mobility, activities of daily living and in self-rated health were estimated in cross-sectional setting in three waves and over time. The results suggested better functioning and health for the better off in both countries. The study suggests that despite the increasing survival and positive societal changes, the association between socioeconomic status and health is remarkably stable for the oldest old over the last decades.

LONGER LIVES MEAN HIGHER NEED FOR LONG-TERM CARE AT THE END-OF-LIFE

M. Aaltonen^{1,2}, L. Forma², J. Pulkki², J. Raitanen^{2,3}, P. Rissanen², M.K. Jylha², 1. Institute for Advanced Social Research, University of Tampere, Tampere, Finland, 2. Faculty of Social Sciences (Health Sciences) and Gerontology Research Center, University of Tampere, Tampere, Finland, 3. UKK-Institute for Health Promotion Research, Tampere, Finland

Death is increasingly postponed to a very old age. Both high age and closeness of death are major contributors to use of care. We used nationwide register based data to identify care profiles during the last two years of life among those who died at the age of 70 or older in Finland in 1998 (N=34,116) and 2013 (N=38,087). From 1998 to 2013, the number of those who died at very old age, with dementia, and with multi-morbidity, increased. Most people stayed at home until the last year of life, but nine in ten were in long-term care or in hospital during the last six months. In future, people may have more healthy years, but simultaneously the last years are lived with more severe disability. Postponed death will increase the need for use of long-term care, but also the need for home care in the last years of life.

SESSION 270 (SYMPOSIUM)

INFORMAL CAREGIVER CONTRIBUTIONS TO CARE DURING HEALTHCARE TRANSITIONS

Chair: B. Buurman, University of Amsterdam, Amsterdam, Netherlands

Co-Chair: J. Prvu Bettger, Duke University, Durham, North Carolina

Discussant: H. Buck, The Pennsylvania State University, University Park

A person's social network of family and friends is an important system of support for general health and well-being. When ill and hospitalized acutely, this network of family and friends can become a workforce of informal caregiving with varying degrees of involvement. Although the concept of informal caregiving is not new, the trend of leveraging caregivers as trained and informed participants of a healthcare team is increasing. Informal caregivers can play a key role in addressing the gaps in care continuity that exist globally when patients transition home from the hospital. In resource-limited regions, informal caregivers can be trained as lay health workers or care extenders. Even in developed nations, caregivers can be active contributors in supporting patients with post-discharge recommendations for therapy, self-care, and medication management.

This symposium will discuss three approaches to caregiver involvement in care with examples from ongoing research around the globe. First, we will present an academic-clinical-community collaborative model designed to educate and train caregivers to provide in-home support for older adults transitioning home from the hospital. Second, we will present the assessments used to assess caregiver capacity in a pragmatic trial and the electronic care plan used to facilitate an integrated care model. Third, we present the role of informal caregiving in low and middle income countries and the models of care being tested in different regions to address the lack of healthcare providers. The variation in activities caregivers are engaged with demonstrates great potential for mobilizing caregivers as a valuable healthcare resource.

CAREGIVER SUPPORT AFTER HOSPITAL DISCHARGE: THE DUKE ELDER FAMILY CAREGIVER TRAINING (DEFT) PROGRAM

C.C. Hendrix, 1. Duke University, Durham, North Carolina, 2. Durham Veterans Affairs Medical Center, Durham, North Carolina

The decline in functional reserves and comorbidities complicate the recovery of older adults following a hospital discharge. Consequently, the assistance of family and friends (caregivers) while convalescing at home is particularly needed. The Duke Elder Family Caregiver Training (DEFT) Center offers a model for an academic-medical-community partnership for integrated caregiver support after hospital discharge. Under the leadership of the Duke School of Nursing, caregivers referred by Duke Hospital providers receive education and training in home care from Duke learners in Nursing, Medicine, Physical Therapy programs. Video technology is used for real-time observation of skills and communication at home. The DEFT collaborates with community-based agencies for resources and activation of lay volunteers for instrumental support. The DEFT aims to increase caregiver preparation for home care reduce preventable health care utilization among patients, and increase competence among learners in interprofessional care and care transitions. Preliminary data will be discussed in the presentation.

CAREGIVER ROLE IN COMPREHENSIVE POST-ACUTE CARE STROKE SERVICES

B. Lutz¹, C. Bushnell², P. Duncan², S. Gesell², M. Boynton², A. Kucharska-Newton³, S. Jones³, J. Freburger⁴, 1. *University of North Carolina - Wilmington, Wilmington, North Carolina*, 2. *Wake Forest Baptists Medical Center, Winston-Salem, North Carolina*, 3. *University of North Carolina, Chapel Hill, Chapel Hill, North Carolina*, 4. *University of Pittsburgh, Pittsburgh, Pennsylvania*

Comprehensive Post-Acute Care Stroke Services (COMPASS) is an ongoing pragmatic cluster-randomized controlled trial comparing the effectiveness of a post-acute, transitional care intervention with usual care for stroke patients discharged from hospitals across North Carolina. The innovative intervention combines services from post-acute care coordinators and advanced practice providers with linkages to community-based services to enhance continuity and coordination of stroke post-acute care. The COMPASS intervention is unique in its focus on addressing post-discharge needs of both patients and family caregivers. Assessments of the patient's functional and social status and related post-acute care needs, and the caregiver's capacity for assisting the patient provide the basis for an individualized electronic care plan addressing specific needs; linking patients and caregivers to relevant community-based services (e.g. caregiver support, medication management) and follow-up care. Examples of the COMPASS assessments, and methods for real-time electronic care plan generation and immediate links to community resources will be discussed.

CAREGIVERS AS THE PRIMARY RESOURCE FOR POST-HOSPITAL CARE IN LOW-AND MIDDLE-INCOME COUNTRIES

J. Prvu Bettger, *Duke University, Durham, North Carolina*

Low and middle income countries face numerous challenges in providing efficient and appropriate care to patients after hospital discharge including lack of available community-based providers; healthcare professionals without expertise to address post-acute needs; inability to connect patients to available community-based services; poor provider-to-patient communication, education and training; and inadequate policies for health care access and community reintegration. The ATTEND trial in India and RECOVER trial in China are both completing enrollment in 2016 for studies of models that provide caregiver training in the hospital on key therapeutic areas for stroke patients to support continued therapy at home. ATTEND leverages physiotherapists as the trainers and RECOVER uses nurses. Hospitals in Eastern Africa unable to spare any in-hospital resources for training are adapting manuals and videos to use on the general wards for discharge teaching. Challenges to implementation and measurement and broader applicability of these models will be discussed.

SESSION 275 (SYMPOSIUM)

THE IMPACTS OF LESBIAN, GAY, BISEXUAL AND TRANS (LGBT) LIFE COURSES AND IDENTITIES IN LATER LIFE

Chair: K. Almack, *University of Nottingham, Nottingham, United Kingdom*

Co-Chair: G.M. Gutman, *Simon Fraser University, Vancouver, British Columbia, Canada*

Previous research has shown that older lesbian, gay, bisexual and transgender (LGBT) people have very diverse life courses. Some have lived outwardly conventional lives while others have lived more unconventional ones. It has also been shown that older LGBT people use (and do not use) sexual and gender identity labels very differently in different historical, cultural and geographical locations and at different stages of their lives. The papers in this symposium explore some of the impacts of these diverse life courses and identities in later life, in order to contribute to more nuanced and less homogenised ways of understanding LGBT older people's experiences and needs.

Fredriksen-Goldsen's paper is a systematic review and narrative analysis LGBT ageing studies spanning 25 years, showing the tension between individualized and interconnected identities for LGBT ageing. Kong's paper explores some of the ways in which the identities and lives of older gay men living in Hong Kong were affected by participation in a research project, demonstrating how this become a site for the construction of new collective identities. King's paper examines how the housing experiences, concerns and preferences of older LGBT people are intersected and complicated by questions of identity with significant implications for policy and practice. Meanwhile, Jones' paper compares the experiences of older people with bisexual relationship histories who do and do not identify as bisexual, in order to add to our understanding of the contextually specific way in which identities are used, and the effects this may have in later life.

RESEARCH ON LGBTQ AGING ACROSS THE LIFE COURSE: DECADE IN REVIEW

K.I. Fredriksen-Goldsen, *University of Washington, Seattle, Washington*

Given shifting demographics, the global population of LGBTQ (lesbian, gay, bisexual, transgender, queer) midlife and older adults is rapidly growing. Given increasing research on LGBTQ aging, this paper assesses the existing literature to identify key themes, trends and gaps in the knowledge base. Building upon a previous 25-year review, we use a narrative analysis across more than 60 studies published from 2005 to 2014. Key components of equity and life course theory (Fredriksen-Goldsen et al., 2014) are applied to examine structural, psychological, social, and other factors associated with aging and well-being in later life in these historically disadvantaged communities. The findings highlight the diversity in LGBTQ aging experiences, intersectional considerations in identity and development, and the ways in which lives are both individualized and interconnected across social relationships, communities, and social structures. Next steps for the future of LGBTQ research in later life are identified.

QUEERING PARTICIPATORY ACTION RESEARCH

T.S. Kong, *The University of Hong Kong, Hong Kong, Hong Kong*

This article examines the ways in which a research project transformed into participatory action research (PAR) with the outcome of setting up a self-help group for older (60+) gay men in Hong Kong. The self-help group offers two types

of service: community building and public education. The overall process witnessed a change in the level of participation by both the researcher and researched, as well as the social transformation of the participants and production of local knowledge on Chinese homosexuality. By bridging the gap between gay and lesbian/queer (GL/Q) studies and PAR, this research examines how the group's establishment has transformed individual identities into collective ones which reunites the gay community that queer research has tended to fragment. This article concludes with a critical reflection on the role and significance of the notion of 'community' in contemporary gay life.

A COMPARISON OF THE AGEING EXPERIENCES OF OLDER PEOPLE WHO DO AND DO NOT CLAIM BISEXUAL IDENTITIES

R.L. Jones¹, K. Almack², R. Scicluna³, 1. *School of Health, Wellbeing and Social Care, The Open University, Milton Keynes, United Kingdom*, 2. *University of Hertfordshire, Hatfield, United Kingdom*, 3. *University of Kent, Canterbury, United Kingdom*

Older bisexual people are widely acknowledged to constitute a particularly hard-to-reach group within LGBT+ ageing research. One reason for this lies in differences in the claimability of bisexual identities compared to lesbian and gay identities. This means that reliance on claimed sexual identities to recruit participants has significant analytic effects. The *Looking Both Ways* study therefore recruited a sample composed half of older people who did identify as bisexual and half of those who did not but acknowledged a history of relationships with more than one gender (n=12, ages 51–83, mean 64). Life history interviews enabled nuanced exploration of sexual and gender histories and imagined futures. Comparison between the two groups suggests ways in which life course events and historical cohort influence the claiming of particular sexual identities in earlier and later life, which then have implications for ageing futures.

IDENTITY MATTERS? THE HOUSING CONCERNS, EXPERIENCES, AND PREFERENCES OF OLDER LGBT PEOPLE IN THE UK

A.D. King, *Sociology, University of Surrey, Guildford, Surrey, United Kingdom*

Research has documented the unique experiences and characteristics of older LGBT adults. Yet in the UK there has been a gap in knowledge about older LGBT people and housing. This presentation outlines findings from the SAFE Housing Project, drawing on data from five focus groups with 28 older LGBT people age 50 plus, as well as an extensive online survey completed by 175 older LGBT people in two areas of England (Greater London and Shropshire). Results showed that housing concerns, preferences and experiences were strongly related to identity, in terms of gender, gender identity and sexuality, as well as geographical location and other social factors. Hence, the research challenges the view that housing for older LGBT people can be perceived of in terms of an individualistic choice and demonstrates why a more nuanced, identity-based understanding of older LGBT people's housing needs to be considered.

SESSION 280 (SYMPOSIUM)

LONG-TERM CARE: INTERNATIONAL IMPERATIVES, LOCAL RESPONSES

Chair: C. Roles, *Age International, London, United Kingdom*

The demographic changes taking place globally mean that long-term care is becoming a policy imperative in every region of the world. There are many challenges that policy-makers and practitioners have to confront: the determinants of demand; the cost of care; who is responsible for provision of care (the state, family or individual); the role of the private sector; and the agency and voice of older people themselves. Global frameworks such as the WHO's Global Action Plan on Ageing and Health and the Sustainable Development Goals help make visible how governments and civil society should respond to these challenges. The varying realities of wealthier countries, lower-income and middle-income countries requires different responses at national and local levels, but there are also commonalities that bridge these differences and allow us to learn from each other. This symposium will examine long-term care challenges across diverse international economic and social contexts and stimulate dialogue on how best to respond.

THE INTERNATIONAL POLICY CONTEXT FOR ACTION ON LONG-TERM CARE

J. Beard¹⁻³, 1. *World Health Organisation, Geneva, Switzerland*, 2. *University of Sydney, Sydney, New South Wales, Australia*, 3. *Southern Cross University, Sydney, New South Wales, Australia*

The World Health Organization has identified ageing as a priority issue and released the first *World report on ageing and health* in 2015. This was followed by the adoption in 2016 of the *Global strategy and action plan on ageing and health* by the World Health Assembly. The report and strategy provide a clear public health framework for action on ageing in 4 strategic areas: developing age-friendly environments; aligning health systems to older populations; building systems of long term care; and improving measurement, monitoring and research. These objectives are framed around a significant reconceptualization of *Healthy Ageing* that is relevant even for those older people who have experienced significant losses of capacity and who require on-going care and support. The *World report* makes clear that in the 21st Century, there is no country that can afford not to have a system that supports long-term care.

LONG-TERM CARE SYSTEMS AND THE IMPORTANCE OF BUILDING THE PAID AND UNPAID WORKFORCE

A. Pot, *World Health Organisation, Geneva, Switzerland*

Building a sustainable paid and unpaid workforce is essential for the development and improvement of long-term care systems worldwide, including care at home, in the community and in institutions. This paper will examine the challenges facing the establishment of long-term care systems, with special attention given to building a sustainable workforce. Questions to be addressed include: What is needed for caregivers like family members, volunteers, peers, migrants,

nursing assistants and others to provide care in the next decades in different parts of the world? How to share the burden of care? The consequences for policy-makers, researchers and service providers will also be discussed.

DEVELOPMENT OF COMPETENCIES IN THE CARE OF OLDER PERSONS: COMPARATIVE PERSPECTIVES

P. Conboy, *HelpAge International, London, United Kingdom*

More people are ageing and, as they age, their health and care needs become more complex. Many are living with more than one long-term condition and single disease approaches to care are failing to meet their needs. One of the keys to the effective care of older people is the assurance that those working for them – doctors, nurses, primary and community care workers, care attendants – have the right knowledge, training, skills and values to deliver the right type of care. In middle and low income countries, access to specialist geriatric care is limited and the challenge is to establish innovative models for the development of competencies in the care of older persons for a range of professional groups and sectors. This presentation will explore the issues and challenges of developing such models by sharing experiences from selected low and middle income countries.

GLOBAL CHALLENGES TO FAMILY CARE

K. Glaser, *Kings College London, London, United Kingdom*

Families are undergoing rapid transformations that are affecting intergenerational care and support around the Globe. While families have proved remarkably adaptable in the face of such change, the ability of families to provide care and support is at risk. Not only are care demands likely to increase given projected rises in complex multi-morbidities and challenging health conditions such as dementia, but social changes such as women's increasing engagement in paid work and migration are influencing care and support within families. Moreover, changes in family behaviour are not distributed uniformly across social groups. This has raised concerns that the need for family assistance among all generations of the already disadvantaged may increase, potentially exacerbating social disparities in intergenerational care and support. This paper will examine evidence on the extent of such disparities around the globe and their consequences for the health and wellbeing of older people and their families.

SESSION 285 (SYMPOSIUM)

THE EFFECT OF FAMILY CAREGIVING ON THE WELL-BEING OF OLDER ADULTS AS CAREGIVERS OR CARE RECIPIENTS

Chair: M. Kim, *Daegu University, Korea (the Republic of)*
Co-Chair: L. Park, *University of Wisconsin-Madison, Madison, Wisconsin, Afghanistan*

Depending on the situation, older adults can be caregivers or care recipients. Also depending on the situation the effect can positively or negatively affect the older adults' well-being. This session focuses on family caregiving on the well-being of older adults in Korean families. The purpose of this session is to highlight different caregiving styles involving older adults in Korea and in the U.S. Two studies from Korea

focus on the well-being of older adults as the caregiver. The first study explores the potential use of narrative therapy to alleviate caregiving burden stemming from stigma and feelings of guilt that older parents struggle with from having an adult child with developmental disabilities. The second study examines the well-being of grandparents helping raise their grandchildren as the nuclear family system changes with an increase in working mothers. The other two studies, using datasets from the US, focus on older adults as recipients of caregiving. The first study using the Wisconsin Longitudinal Study examines whether co-residence of an adult child has a positive or negative effect on the quality of life for their older parents. The second study using a national dataset on Medicare beneficiaries and their caregivers examines various caregiver and care recipient factors influencing the likelihood of older adults, who are vulnerable to chronic illness and dementia, to remain in the community and avoid nursing home placement. Implications of these studies on family caregiving suggest that the status of the older adult as caregiver or care recipient may have differing effects.

RE-AUTHORING THE NARRATIVES OF THE OLDER CAREGIVING MOTHERS

J. Ko¹, S. Lee², J. Park², 1. *Kyung Hee Cyber University, Seoul, Korea (the Republic of)*, 2. *Chung-Ang University, Seoul, Seoul, Korea (the Republic of)*

This presentation is to illustrate the potential use of narrative therapy (NT) for alleviating caregiving burdens of the older parents, whose adult children have developmental disabilities (DDs). Five sessions of group narrative therapy were conducted on participants. As sessions progressed, meanings of their children were changed into something that gives them reason to live; the unilateral nature of their relationship was later described as interdependent. Participants' identity as mothers shifted from an "imperfect" one to someone "striving to improve the situation." The authors pointed out that NT is an effective approach in the Korean cultural context for addressing the multiple hardships of the older mothers, including the image as a sinful daughter-in-law who gave birth to an imperfect child and the lonely journey as a caregiver during a time when resources for children with DDs and their families were limited in Korea. Creating alternative meanings allows them to experience empowerment in their lives.

THE EFFECT OF GRANDPARENTS' CAREGIVING OF GRANDCHILDREN ON WELL-BEING

M. Kim^{1,3}, L. Park², 1. *Daegu University, Daegu, Korea (the Republic of)*, 2. *University of Wisconsin-Madison, Madison, Wisconsin*, 3. *The Institute of Aging Society, Daegu University, Daegu, Korea (the Republic of)*

The changing nuclear family system has created serious child caring issues in Korea. In Korea, half of working mother's children were taken care of by their grandparents. This study used Pearlin et al.(1990)'s stress process model to analyze grandparent's well-being while caregiving grandchildren. The model consists of primary stressors, secondary stressors and coping resources. This study used the 5th and 5th addition wave of KReIS (Korean Retirement and Income Studies) which were collected in 2013 and 2014 respectively. The sample size of this study was 174 who took care of their

grandchildren. As a well-being measure, life satisfaction and subjective health were used. Hierarchical multiple regression was used for data analysis. Caregiving location had a significant effect on both life satisfaction and subjective health. The age of grandchildren had a negative significant effect on subjective health. Emotional and instrumental support affected life satisfaction, and coping affected subjective health.

IS IT BENEFICIAL OR DETRIMENTAL TO WELL-BEING?: CO-RESIDENCE WITH AN ADULT CHILD IN OLD AGE

E. Namkung, *University of Wisconsin-Madison, Madison, Wisconsin*

Increased life expectancy in parent generation and prolonged period of financial instability in child generation have made it more likely for aging parents to live with their adult children. However, little has been known about whether co-residing with an adult child has a positive or negative effect on parental well-being in old age. Using the Wisconsin Longitudinal study, this study examined (1) how co-residence affects well-being of aging parents aged 65 or older ($n=6,537$, $M_{age}=71$), and (2) whether the effects are moderated by limitations in Activities in Daily Living (ADL) and marital status of parents. Co-residence predicted greater depressive symptoms and poorer psychological well-being, and these deleterious effects of co-residence in later life were significant regardless of parents' marital status and ADL limitations. Given the strong effects of co-residence status on parental well-being, practitioners should assess whether or not this living situation is optimal for the well-being of the elders.

FACTORS THAT CONTRIBUTE TO REMAINING IN THE COMMUNITY AMONG OLDER ADULTS

H. Moon, S. Rote, *University of Louisville, Louisville, Kentucky*

The combination of a longer life expectancy and high rates of chronic illness and dementia will lead to a rise in the number of older adults in need of informal or formal care. The majority of older adults, however, prefer to age in place in their community. Using national data on Medicare beneficiaries and their caregivers, we investigated 772 caregiver (CG) and care recipients (CR) factors that influence the likelihood of remaining in the community and avoiding nursing home placement over a 3-year period. The only CG factor (higher CG's education) and CR factors race (being non-White), lower levels of ADL disability, dementia status (no probable or possible dementia), and CR's sense of community was a significant predictor of remaining in the community. Our findings highlight the need to enable CRs to maintain relationships with their neighbors or community members to avoid nursing home placement.

SESSION 290 (SYMPOSIUM)

CHANGE AGENTS: ASSESSING THE HEALTH TRANSITIONAL CARE NEEDS FOR VULNERABLE OLDER ADULTS

Chair: I.C. Williams, *University of Virginia, Charlottesville, Virginia*

Co-Chair: K.M. Rose, *University of Virginia School of Nursing*

Discussant: A. Perez, *University of Pennsylvania, Philadelphia, Pennsylvania*

Racial disparities in health care are well documented, and eliminating them is a national priority. Similarly, the unique needs of sexual and gender minorities are increasingly becoming a high priority. Among older adults, health care transitions, such as a discharge from hospital to home, are one of the most vulnerable times placing patients at risk for poor outcomes. As the proportion of ethnic/racial and sexual/gender minority older adult grows, it is increasingly important to design health care services and tailored interventions that are responsive to this population and their caregivers to ultimately avoid unnecessary re-hospitalizations and reduce poor health outcomes.

This Change AGent qualitative study represents an initial step in developing responsive transitional care services and was designed to identify strategies for navigating transitions in healthcare for ethnic, racial, sexual and gender minorities. This symposium will present findings and recommendations from focus groups, individual interviews, and discussion forum data collected through a Change AGent action community. Results from three papers will focus on (1) the state of the science for transitional care for older adults and the method of the Change AGent action community, (2) unique transitional care needs of older adult racial/ethnic minorities, and (3) the shortages of tailored transitional care services available for older sexual/gender minorities. Findings from these studies are central to understanding the gaps for practice, research, and education for transitional care among vulnerable older adults.

STATE OF SCIENCE: TRANSITIONAL CARE AMONG OLDER VULNERABLE ADULTS

K.M. Rose¹, K.B. Hirschman², A. Perez², R.A. Jablonski-Jaudon³, L. Eastham¹, J. Anderson¹, I.C. Williams¹,
1. *University of Virginia, Charlottesville, Virginia*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*, 3. *University of Alabama, Birmingham, Alabama*

Improving transitions of care among chronically ill older adults and their family caregivers, especially for our most vulnerable populations who have been historically stigmatized resulting in poorly managed transitions and likely poorer health outcomes and increased health care costs, is essential. The purpose of this paper is to describe the Change AGent funded project to better understand the state of the science in transitions of care for older adults and their family caregivers with a specific focus on our most vulnerable populations defined as racial/ethnic and sexual/gender minorities. We will describe the methods used for this project which include the assembly of groups of experts in both transitions and vulnerable populations to learn more about disparities. We will summarize the need for practice change and how transition of care services may help better meet the unique medical, emotional, and psychosocial needs of older adults from vulnerable and underserved populations.

EXPLORING TRANSITIONAL CARE CHALLENGES AMONG OLDER RACIAL/ETHNIC MINORITIES

I.C. Williams¹, A. Perez², L. Eastham¹, K.B. Hirschman², R.A. Jablonski-Jaudon³, J. Anderson⁴, K.M. Rose⁴, 1. *School of Nursing, University of Virginia, Charlottesville, Virginia*,

2. *University of Pennsylvania, Philadelphia, Pennsylvania*,
 3. *University of Alabama, Birmingham, Alabama*, 4.
University of Tennessee at Knoxville College of Nursing,
Knoxville, Tennessee

For minority older adults and their families, being stigmatized has historically resulted in poorly managed transitions and likely poorer health outcomes and increased health care costs. Vulnerable older adult patients and their families are possibly being missed or are not taking advantage of resources available because of their own sense of stigmatization and lack of trust of their health care providers. Our goal was to address these disparate gaps and explore established evidence-based transitional care models to identify the gaps and needs of racial/ethnic older adults and their family members. Results suggest that trust and communication between team members and families, empowerment of patients and families, and culturally tailored coaching will make transitions smoother. The context in which vulnerable families understand the model of care must be developed more effectively, ultimately saving money and improving quality of care. Recommendations for research, education, and practice based on analyses will be discussed.

TRANSITIONS IN CARE FOR SEXUAL AND GENDER MINORITIES: RECOMMENDATIONS FOR RESEARCH AND PRACTICE

J. Anderson¹, R.A. Jablonski-Jaudon², K.B. Hirschman³,
 A. Perez³, L. Eastham¹, I.C. Williams¹, K.M. Rose¹, 1.
School of Nursing, University of Virginia, Charlottesville,
Virginia, 2. *University of Alabama, Birmingham, Alabama*,
 3. *University of Pennsylvania, Philadelphia, Pennsylvania*

The estimated 2 million U.S. older adults who self-identify as members of the LGBTQ community will increase exponentially over the next several years to more than 4 million by 2030. A recent Institute of Medicine report stated that the existing evidence and knowledge regarding the health of LGBT individuals is lacking and requires further research. Consequently, there is a shortage of services that reflect knowledge and understanding on the well-being of LGBT older adults, particularly related to transitions in care. The purpose of this study was to foster discussion among health care professionals and health sciences research to understand the unique medical, emotional, and psychosocial needs of LGBTQ older adults in terms of transitions in care. Focus group and discussion forum data were collected and analyzed using content analysis. Recommendations for research, education, and practice based on the analysis will be discussed.

SESSION 295 (SYMPOSIUM)

INNOVATIVE USES OF TECHNOLOGY FOR TRANSPORTATION AND DRIVING NEEDS OF OLDER PERSONS

Chair: C.C. Quinn, *University of Maryland School of Medicine, Baltimore, Maryland*

The purpose of this symposium is to present how innovative technologies are enabling older persons maintain independence in transportation services and adapt vehicles for older drivers. Previous studies confirm the relationship

of transportation to socialization, loneliness, housing, and access to health care. While 20% of older adults do not drive, 78% of caregivers and friends transport older persons, and driving safety are major issues, focus on older adults has been limited. Using technology to improve the simplicity, efficiency and safety could have a major impact on the use of on demand transportation services and capabilities of older adult drivers.

In this symposium Dr. Charlene Quinn, will provide an overview of the translation of technology to transportation and driving capability of older persons.

Dan Trigub, will describe Lyft Company's curb to curb transportation for older adults, including driver training, impact on increasing access to health appointments, development of services for older persons without smart phones and Lyft's national and international health, housing and non-profit senior programs.

Victoria Kline will discuss on-demand transportation pilot and demonstration programs of the national Village to Village Network, including Sequoia Village, whose members help each other to age in place by providing access to support services and community activities.

Dr. David Eby, Transportation Institute Research of the University of Michigan will discuss advanced in-vehicle technologies, focusing on: use (how older drivers use technologies), perception (what they think about technologies), and outcomes (safety and/or comfort benefits of technologies).

LYFT: USING TECHNOLOGY TO CONNECT AGING PERSONS WITH TRANSPORTATION ON-DEMAND

D. Trigub, *Lyft, San Francisco, California*

Technology applications in the on-demand economy are a novel way to reach older persons. Annually, 3.6 million Americans miss or delay medical care because they lack appropriate transportation. Lyft has created a new mobility option for older adults and caregivers that help make transportation on-demand and accessible. Lyft operates in 200+ cities across the U.S. with over 400,000 drivers giving 3 million rides per week. Lyft and its international partners cover 51% of the world's population. Lyft has developed a platform called "Dispatch" which allows any third party including hospitals, home care providers, Medicaid transportation brokers and others to request rides on behalf of a senior. No smartphones required. A requester simply inputs the passenger's name and pickup and drop-off location, and a Lyft driver is matched instantly. Today there are over 25,000 rides being booked by Dispatch each week with 500,000+ rides completed in just the past few months.

OLDER DRIVERS AND ADVANCED IN-VEHICLE TECHNOLOGIES

D.W. Eby¹, L.J. Molnar², L. Zhang³, R. St. Louis²,
 N. Zanier², L.P. Kostyniuk², 1. *Transportation Research*
Institute, University of Michigan, Ann Arbor, Michigan, 2.
Transportation Research Institute, University of Michigan,
Ann Arbor, Michigan, 3. *Tsinghua University, Beijing, China*

Driving is a complex task that involves psychomotor, visual, and cognitive functional abilities. As people age they may experience declines in driving abilities as a result of age-related medical conditions and the medications used to treat these conditions. This study was a detailed synthesis of the

literature that addressed 16 advanced in-vehicle technologies. This synthesis focused on how older drivers use these technologies, what they think about them, and safety and/or comfort benefits of these technologies. This presentation will also report on training, education, and research needs in technology applications for driving.

VILLAGE TO VILLAGE NETWORKS: ACCESSING MOBILE TRANSPORTATION SERVICES TO HELP AGE IN PLACE

V. Kline, *Sequoia Village, San Carlos, California*

Village to Village Network (VtV) is a national peer to peer network to help establish and continuously improve management of their own villages whether in large metropolitan areas, rural towns or suburban settings. The mission of VtV is to enable communities to establish and effectively manage aging in community organizations initiated and inspired by volunteer members. Approximately 190 Villages are operating in the US, Australia and the Netherlands with 185 additional Villages in development. Villages in San Francisco and the Bay Peninsula, both members of VtV, have developed as backups to their existing core of volunteer drivers, an on-demand transportation services meeting a major need of older adults to age in place. This presentation provides use cases and older adult testimonials on use and impact of on-demand transportation services for Village members.

THE RESPECT SHOE INSOLE TO MONITOR FRAILTY PARAMETERS

A. Piau¹, Y. Charlon², E. Campo², F. Nourhashemi¹, B. Vellas¹, 1. *Gérontopôle, Toulouse University Hospital, Toulouse, France*, 2. *CNRS, LAAS, Toulouse, France*

Frailty detection and evaluation is not routinely done when older adults receive health care or social services. Standardized research measures of frailty are available. However, seamless follow-up of frailty parameters or access to information on adherence to lifestyle recommendations from evaluations may prevent or delay frailty. Our European consortium is evaluating a removable shoe insole to measure dynamic characteristics of gait (speed, distance). The insole transmits wireless data to be available for distance consultations by users (i.e., patients or physicians). The first phase of the study determined end user evaluation (technical, clinical, social, ergonomic, and economic), at the Blagnac smart house (n=10). The second evaluation phase involves 60 frail community-dwelling subjects, with 30 of them which will use the smart insoles for 3 months. Comprehensive assessments determined the feasibility, acceptability, interoperability, integration in a healthcare network, and clinical relevance of the technological device in comparison to usual care.

SESSION 300 (SYMPOSIUM)

MEDIA AND AGEISM

Chair: M. Wilinska, *Jönköping University, Jönköping, Sweden*

Co-Chair: S. Mosberg Iversen, *University of Southern Denmark, Odense, Denmark*

It is widely recognized that how we approach old age is conditioned upon culture. Media is undoubtedly the largest cultural arena in which societal images and attitudes towards

old age and older people are formed. The existing research usually discusses the process of underrepresentation and misrepresentation of old age and older people. However, media as an important part of everyday realities among older people are also about creation and active use of media and their content.

It is therefore pertinent to the study of ageism to not only understand how different types of online and offline media represent ageing and old age, but also how people of different ages access and use those media and what types of knowledge about media and old age dominate. The main objective of this symposium is to address these concerns by specifically focusing on a) the processes of knowledge production about media and via media with regards to old age, and b) the ways in which older people's use various types of online and offline media.

The symposium brings together ageing and media studies researchers from several European countries who are active in research promoting anti-ageist knowledge that reflects the growing diversity of people of different ages who are commonly referred to as 'old'.

MEDIA AND HEALTH INFORMATION LITERACY AMONG SENIOR CITIZENS IN ICELAND

Á. Pálsdóttir, *University of Iceland, Reykjavík, Iceland*

The paper explores various aspects of media and health literacy among senior citizens in Iceland by comparing two age groups, those who are 60 to 67 years old and those who are 68 years and older. Health literacy refers to the 'cognitive and social skills which determine the motivation and ability of individuals to gain access to, understand and use information in ways which promote and maintain good health.' It is closely related to a joint definition by UNESCO and of media and information literacy, which allows individuals to '... access, retrieve, understand, evaluate and use, create, as well as share information and media content in all formats...' The term media and health information literacy combines these two concepts. Thus, competency in media and health information literacy is important as a tool for lifelong learning, which provides people with better opportunities to fight age discrimination and make informed decisions.

AGE DISCRIMINATION IN BIG DATA ANALYSIS: THE CASE OF AGE-PREDICTIVE SYSTEMS

A. Rosales, M. Fernández-Ardèvol, *the Universitat Oberta de Catalunya, Barcelona, Spain*

Digital communication systems opened the door for tracking everyday activities. Terabytes of data created by real life users in their daily activities on digital devices. Big data are used among others, to understand human behavior and to model statically to predict human behavior.

However, big data analyses are limited by assumptions, values, and biases. Concretely, older people often constitute a minority group in digital media, both in terms of the number of users and in terms of activities. Also, tracked data often do not have demographic information, do not include older people, or do not make a generational analysis. Thus presumably, big data analysis provide conclusions and influence decisions without taking into account the nuances related to older people, their particular interests and habits leading to structural discrimination.

The paper analyzes this topic within the area of intelligent systems to predict the age of users in social network sites.

FIGHTING AGEISM: OLDER PEOPLE SELF-DEPRECATING HUMOR IN EVERYDAY ONLINE CONVERSATIONS

L. Ivan, I. Schiau, *National University of Political Studies and Public Administration, Bucharest, Romania*

By the means of netnographic techniques we investigate the use of humor in an online community of grandparents from Romania, departing from the distinction between self-deprecating humor and other -deprecatd humor (James & Olson, 2000). The two types of humor are described as commonly used regardless the cultural contexts, holding adaptive value in conversations. Our data support the idea found in the literature that self-deprecatd humor is used particularly on sexual conversational topics, also when we talk about older people's online conversations. Furthermore, we found that self-deprecatd humor is used by participants in approaching other "less comfortable" topics in connection to ageist discourse, for example the use of technology, the frailty and cognitive impairment. The findings suggest the idea that self-deprecatd humor could be seen as an adaptive way to fight ageist everyday practices.

SESSION 305 (SYMPOSIUM)

THE BENEFITS OF THE HUMANITIES AND ARTS FOR OLDER ADULTS

Chair: M. Ardel, *University of Florida, Gainesville, Florida*

This symposium draws on diverse research approaches across different disciplines to demonstrate the wide range of benefits of the humanities and arts for older adults.

Using data of 242 older wise and creative nominees and controls, the first presentation shows that emphatic concerns for others partially mediated the positive relations of wise and creative nominees on life satisfaction, indicating possible benefits of programs, which encourage growth in wisdom and/or creativity. The second presentation discusses the role of Vital Involvement (VI) in behavioral interventions that engage older adults in arts participation to foster health and psychosocial growth and help heal the multiple losses and deteriorations of old age. The third presentation analyzes the impact of arts participation on the quality of life of frail older adults by providing a systematic review of the international literature, interviews with older adults and family caregivers, and focus group discussions with health and art professionals, researchers, and policy makers. The fourth presentation draws on interview, focus group, and video data from four qualitative arts-based research projects to demonstrate the power of the arts in addressing relational and social justice issues and reducing the suffering experienced by persons with dementia. The final presentation explores the value of reading novels and short stories for older adults based on a meta-analysis of publications on literature and aging.

Overall, the presentations suggest that the humanities and arts should not be overlooked in models of aging well and might be particularly beneficial for older adults most marginalized in our communities.

WISDOM AND CREATIVITY AS TWO ROUTES TO SATISFACTION IN LATER LIFE: A PERSONAL TRAITS MODEL

W. Shi¹, M. Ardel¹, L. Orwoll², 1. *Sociology and Criminology & Law, University of Florida, Gainesville, Florida*, 2. *Ann Arbor, Michigan*

Wise and creative older people are considered exemplars of successful aging. Indeed, our study of 66 wisdom nominees, 84 nominated visual artists, and 92 controls between the ages of 53 and 92 ($M=71.3$, $SD=8.97$) showed that both wise and creative nominees reported higher life satisfaction than controls, particularly after controlling for subjective health, suggesting that wisdom and creativity are two routes to greater satisfaction in later life. There was no significant difference in stated life satisfaction between wise and creative older nominees. The positive relations of wise and creative nominees on life satisfaction was partially mediated by respondents' emphatic personality traits, assessed by items from the California Personality Inventory. It appears that both wisdom and creativity foster empathic concerns for others, which further contributes to life satisfaction in old age. Hence, older adults are likely to benefit from programs that encourage growth in wisdom and/or creativity.

VITAL INVOLVEMENT IN INTEGRATING HUMANITIES AND ARTS INTO OLDER ADULTHOOD

H.Q. Kivnick, *School of Social Work, University of Minnesota, St. Paul, Minnesota*

The arts and humanities contribute to knowledge through ways of knowing that transcend the verbal, linear, and measurable. This presentation discusses the role of the Vital Involvement (VI) construct in behavioral engagement of elders in H&A activities. Practitioners implement interventions that engage older adults in arts participation, and evaluate individual participation impact in terms of validated outcome variables. The VI construct contextualizes elder arts participation within lifelong psychosocial development. As VI is fundamental to earlier-life healthy development, and arts participation exemplifies the dynamic, reciprocal VI process, so arts participation can help to catalyze the ongoing development that underlies old age as a period of growth and possibility. Such ongoing growth and health promotion have been shown to be "healing" for multiple losses and deteriorations of old age, as well as health promoting for elders who still focus far more on "living a good life" than on "compensating for problems".

LIBERATING THE ARTS FROM THE THERAPY CULTURE IN DEMENTIA CARE

S.L. Dupuis¹, P. Kontos³, G. Mitchell², C. Jonas-Simpson², J. Gray⁴, 1. *Recreation and Leisure Studies, University of Waterloo, Waterloo, Ontario, Canada*, 2. *York University, Toronto, Ontario, Canada*, 3. *Toronto Rehabilitation Institute, Toronto, Ontario, Canada*, 4. *University of Toronto, Toronto, Ontario, Canada*

Influenced by biomedical/behavioural models, the arts within dementia care are valued primarily as therapy; arts-based interventions are provided as non-pharmacological means to improve functioning of "patients" and treat misunderstood "behaviours". Informed by theorizing within liberation arts and critical theory, this presentation aims to

liberate the arts in dementia care from the therapy culture and demonstrate the power of the arts to address broader relational and social justice issues connected to aging and elder care. We draw on interview, focus group, and video data from four qualitative research projects using theatre, visual arts, an arts-based learning academy, and elder clowning. Findings demonstrate how the arts: challenge dominant discourses and problematize oppressive policies and practices; ignite personal discovery, growth, and transformation; and nurture relational citizenship. The arts create transformative spaces for relational flourishing and prompt the social change needed to reduce the harm and suffering experienced by older adults living with dementia.

READING NOVELS AND SHORT STORIES: BENEFITS FOR OLDER ADULTS

P. Derkx, *University of Humanistic Studies, Utrecht, Netherlands*

Alain de Botton & John Armstrong argue in *Art as Therapy* (2013) that art has seven functions referred to as remembering, hope, sorrow, rebalancing, self-understanding, growth and appreciation. Rita Felski in her *Uses of Literature* (2008) analyzes the spectrum of reader responses to literature in terms of recognition, enchantment, knowledge and shock. Using these lenses and focusing on novels and short stories this paper will give the results of a meta-analysis of the scattered publications on literature and aging since the first conference on humanities and aging, which took place in Cleveland, Ohio in November 1975. The conclusion will present a carefully considered judgment on what the main value of reading novels and short stories can be for older adults

SESSION 310 (SYMPOSIUM)

SUPPORTING OPTIMAL AGING OF OLDER PERSONS WITH MULTIPLE CHRONIC CONDITIONS AND THEIR FAMILIES

Chair: M. Markle-Reid, *McMaster University, Ontario, Canada*

Co-Chair: J. Ploeg, *McMaster University*

Discussant: V. Boscart, *Conestoga College, Bright, Ontario, Canada*

The prevalence of multiple chronic conditions (MCC) among older persons is increasing worldwide and is associated with poor health status and high rates of healthcare utilization and associated costs. Current health and social services are not addressing the complex needs of this group or their family caregivers who are largely responsible for their care in the community. There is uncertainty in the literature on the effectiveness of interventions for individuals who have MCC. The purpose of this symposium is to describe four studies, funded by the Canadian Institutes of Health Research Signature Initiative on Community Based Primary Healthcare, that contribute to our understanding of future directions for interventions to support optimal aging of older persons with MCC and their families.

The first paper describes the results of a qualitative study of the experiences of managing MCC from the perspectives of 130 older adults with MCC, their caregivers and

healthcare providers. The second study examined the patterns of health services use and associated costs among older adults with MCC using multiple linked administrative databases. The results of these two studies informed the design of two intervention studies. The third paper describes the results of a pragmatic randomized controlled trial of an inter-professional community-based health promotion program to address the needs of older adults with MCC and Type 2 Diabetes Mellitus. The final paper describes the results of a pragmatic randomized controlled trial of an online intervention for family caregivers of older persons with MCC and dementia.

MANAGING MULTIPLE CHRONIC CONDITIONS: EXPERIENCES OF OLDER ADULTS, CAREGIVERS, AND CARE PROVIDERS

J. Ploeg¹, N. Matthew-Maich², K. Fraser³, S. Dufour¹, C.A. McAiney¹, S. Kaasalainen¹, M. Markle-Reid¹, R. Upshur⁴, 1. *McMaster University, Hamilton, Ontario, Canada*, 2. *Mohawk College, Hamilton, Ontario, Canada*, 3. *University of Alberta, Edmonton, Alberta, Canada*, 4. *University of Toronto, Toronto, Ontario, Canada*

The purpose of this study was to explore the experience of managing multiple chronic conditions (MCC) in the community from the perspectives of older adults with MCC, caregivers and healthcare providers. Semi-structured qualitative interviews (n=130) were conducted in two Canadian provinces with 41 community-living older adults (65 years and older) with 3 or more chronic conditions, 47 caregivers and 42 healthcare providers working in community settings. Participants described the experience of managing MCC as: (a) overwhelming, draining and complicated, (b) organizing pills and appointments, (c) being split into pieces, (d) doing what the doctor says, (e) relying on family and friends, and (f) having difficulty getting outside help. The experience of managing MCC was highly complex and significant gaps existed between the perceived needs of older adults and caregivers and the ability of health and social care systems to meet those needs. Study results informed the design of intervention studies.

MY TOOLS 4 CARE: AN ONLINE INTERVENTION SUPPORTING CAREGIVERS OF OLDER PERSONS WITH DEMENTIA

W. Duggleby¹, J. Ploeg², C.A. McAiney², S. Ghosh³, S. Peacock⁴, K. Fisher², 1. *University of Alberta, Edmonton, Ontario, Canada*, 2. *McMaster University, Hamilton, Ontario, Canada*, 3. *Faculty of Medicine and Dentistry University of Alberta, Edmonton, Alberta, Canada*, 4. *College of Nursing University of Saskatchewan, Saskatoon, Saskatchewan, Canada*

Based on Transition theory an online intervention was developed for family caregivers of older persons with dementia with multiple chronic conditions living at home (My Tools 4 Care). The purpose of the study was to evaluate the impact of My Tools 4 Care on caregiver self-efficacy, hope, and quality of life. A mixed methods pragmatic randomized control trial was conducted with 185 participants randomly assigned to a treatment or a control group. Study results indicate that participants perceived My Tools 4 Care helped them

to reflect on their caregiving journey, how far they've come, and what supports they have available to them. Participants appreciated that My Tools 4 Care provided information and education for the caregiver. Some participants also noted that My Tools 4 Care helped them to reflect on the importance of self-care.

ACHRU—COMMUNITY PARTNERSHIP PROGRAM FOR OLDER ADULTS WITH DIABETES AND MULTIMORBIDITY

M. Markle-Reid¹, J. Ploeg¹, K. Fraser², K. Fisher¹, N. Akhtar-Danesh¹, A. Bartholomew¹, A. Gafni¹, 1. *McMaster University, Hamilton, Ontario, Canada*, 2. *University of Alberta, Edmonton, Ontario, Canada*

In response to the complex needs of older adults with Type 2 Diabetes Mellitus and multimorbidity, an inter-professional community-based health promotion program was developed. A pragmatic randomized controlled trial study design was used to conduct the 6-month program comprised of in-home visits, monthly group sessions, and nurse-led coordination of care delivered by Registered Nurses, Dietitians, and fitness leaders from the YMCA or community centre. Compared with the usual care group (n=79), the intervention group (n=80) showed statistically significant and clinically important improvements in the mean SF-12 measured mental health (3.69, p=0.02, 95% CI: 0.60, 6.78), vitality (3.68, p=0.02, 95% CI: 0.57, 6.80) and general health scores (3.56, p=0.02, 95% CI: 0.65, 6.46). These benefits were achieved at no additional cost compared to usual primary care. The results support the effectiveness of the program in improving health related quality of life in older adults with Type 2 Diabetes in community settings.

SIMILARITIES IN SERVICE USE AND COMORBIDITY IN OLDER ADULTS WITH DEMENTIA, DIABETES, OR STROKE

L. Griffith¹, A. Grunier², K. Fisher¹, A. Gafni¹, C. Patterson¹, M. Markle-Reid¹, J. Ploeg¹, 1. *McMaster University, Hamilton, Ontario, Canada*, 2. *University of Alberta, Edmonton, Alberta, Canada*

This study describes the striking similarities seen across three studies examining health service use and associated costs among community-living older adults with comorbidity and one of dementia, diabetes, or stroke, using linked administrative databases from Ontario, Canada.

We identified 376,434 persons with diabetes, 95,399 with dementia, and 29,671 with stroke (2008). Comorbidity prevalence differed, with 75% of the stroke cohort having 3+ comorbidities, compared to 50% for dementia and 46% for diabetes. However, in all three, hypertension and arthritis were most common with a frequency over 75%. Overall utilization increased with comorbidity for the three index conditions. Although per-patient costs differed (highest for stroke, then dementia and diabetes), the relative pattern of costs over time was similar. In each cohort, total service costs increased with comorbidity, with acute care services increasing the most. Although intensity of comorbidity differed among the cohorts, we found similar relationships between comorbidity, utilization and costs.

SESSION 315 (SYMPOSIUM)

IMPORTANCE OF TRAJECTORY ANALYSIS FOR RESEARCH ON COGNITIVE DECLINE, DISABILITY, AND DEMENTIA

Chair: A. Singh-Manoux, *INSERM U1018, Paris, France*

Co-Chair: A. Elbaz, *INSERM U1018, Paris, France*

Populations across the world are becoming older, with the over-65 age group fast approaching one third of the population of rich countries. Prevention efforts to address this unprecedented societal challenge are hindered by lack of knowledge on the principal risk factors for age-related functional decline, disability, and dementia. Much of evidence comes from studies where risk factor levels are measured once, making it difficult to establish their importance for ageing outcomes such as cognitive decline, dementia, and disability. This symposium will present and discuss our research using longitudinal data from the British Whitehall II study and the French Three Cities Study. Specifically, we will show the impact of duration of exposure to atrial fibrillation on cognitive decline and risk of dementia; the importance of hormonal status on functional decline and disability; we will compare the importance of walking speed assessed once and decline in walking speed for dementia; the importance of adverse health behaviours for the risk of disability in two cohorts; and finally the importance of assessment of physical activity and BMI for dementia by modelling their trajectories over 28 years before dementia onset. The underlying theme of this symposium is the use of longitudinal data on risk factors and functional outcomes in identifying trajectories of risk factors for ageing outcomes.

ATRIAL FIBRILLATION AS A RISK FACTOR FOR COGNITIVE DECLINE AND DEMENTIA

A. Singh-Manoux, A. Fayosse, A. Dugravot, *INSERM U1018, Paris, France*

We assessed associations of AF with cognitive decline and dementia in adults followed between 45 and 85 years. A total of 737 incident AF and 323 incident dementia were identified. In analysis adjusted for sociodemographic covariates, AF was associated with an increased risk of dementia (hazard ratio=1.78; 95% CI: 1.28, 2.48). By age 60 years, participants with AF at age 50 and 55 years, compared to AF-free participants, had an excess decline in cognitive functioning corresponding to an age effect of 3.2 and 1.8 years. By age 85, participants with AF at ages 70, 75, and 80 years had an excess decline in cognitive function corresponding to an age effect of 7.0, 4.6, and 2.4 years, respectively. In adults aged 45–85 years AF is associated with accelerated cognitive decline and higher risk of dementia even at ages when AF incidence is low; overt stroke explained only part of the association.

LIFETIME ENDOGENOUS ESTROGEN EXPOSURE AND DECLINE OF GAIT SPEED IN ELDERLY WOMEN

M. Canonico, F. Artaud, A. Singh-Manoux, A. Elbaz, *INSERM U1018, Paris, France*

There is increasing evidence of a role of vascular risk factors and disease in decline of physical function. Lifetime estrogen exposure is associated with cardiovascular disease

among postmenopausal women. Whether reproductive history is related to motor decline remains poorly investigated. Analyses are based on elderly women from the Three-City Study followed over 10y. We examined the cross-sectional and longitudinal associations of age at menopause, oophorectomy, and parity with gait speed (GS, cm/s) and disability. One-year older age at menopause was associated with faster baseline GS (beta: 0.21; 95% CI: 0.01;0.42) and lower disability hazard over the follow-up (HR=0.98; 95%CI:0.97;0.99). Oophorectomy was associated with slower baseline GS (beta:-5.07; 95%CI:-9.07;-1.07). There was no association of parity with GS and disability. Higher endogenous estrogen exposure during reproductive life may be protective for motor function in the elderly. These results are consistent with the hypothesis of a cardiovascular component of motor function.

GAIT SPEED AND DECLINE IN GAIT SPEED AS PREDICTORS OF INCIDENT DEMENTIA

A. Elbaz¹, F. Artaud¹, A. Singh-Manoux¹, J. Dumurgier²,
1. INSERM 1018, Paris, France, 2. INSERM U942 and Memory Clinical Center, Saint Louis–Lariboisiere–Fernand Widal Hospital, Paris, France

Previous studies showed that baseline slow gait speed (GS) is associated with an increased risk of incident dementia. It is unknown what is the added value of measuring GS repeatedly in order to identify those at higher risk. We examined the relationship between baseline GS, change in GS, and the hazard of incident dementia in community-dwelling elderly people (N=3,663) dementia-free at baseline (mean age, 73.5y) and followed over 9y, from the prospective French Three-City study cohort. 296 participants developed dementia during the follow-up. Gait was slower up to 7 years prior to the clinical dementia onset. GS decline was more accelerated in those who later developed dementia. Independently of baseline gait speed, those who experienced a steeper decline over the follow-up had an increased dementia risk. Our findings highlight the benefit of using repeated measures in order to identify those with a steeper GS decline and higher dementia risk.

TRAJECTORIES OF UNHEALTHY BEHAVIORS IN MIDLIFE AND RISK OF DISABILITY AT OLDER AGES

F. Artaud¹, S. Sabia^{1,2}, A. Dugravot¹, M. Kivimaki², A. Singh-Manoux^{1,2}, A. Elbaz¹, 1. INSERM U1018, Paris, France, 2. Department of Epidemiology and Public Health, University College London, London, United Kingdom

Most evidence on the association between unhealthy behaviors and disability comes from studies in the elderly, where reverse causation and selection bias may distort associations. We examined associations of trajectories of four health behaviors (physical activity, diet, smoking, alcohol), starting in midlife and over 20y, with subsequent disability (range=54-84y) in the Whitehall II cohort study. Disability was assessed three times over 8y, and behavior trajectories were defined using group-based trajectory models. GEE models were used to examine their independent associations with disability. Of 6,825 participants, 19.2% were disabled at least once. Participants with persistent inactivity or declining physical activity, recent ex- or current-smokers, and persistent/recent abstainers or persistent heavy alcohol drinkers

had higher disability risk; fruit/vegetable consumption was not associated with disability. Disability risk increased with the number of unhealthy behaviors trajectories. Unhealthy behavior trajectories in midlife are associated with greater disability risk later in life.

RISK FACTORS TRAJECTORIES PRIOR TO DEMENTIA DIAGNOSIS: BMI AND PHYSICAL ACTIVITY

S. Sabia, A. Dugravot, A. Elbaz, A. Singh-Manoux, INSERM U1018, Paris, France

Dementia is preceded by a preclinical period that unfolds over several years, and affects various processes, including risk factors levels. Thus, the risk factor-dementia association drawn from studies based on older adults may be subject to reverse causation biases. We aim to present trajectories of two risk factors, physical activity and BMI, for which associations with dementia remain unclear, in the 28-year period preceding dementia diagnosis. We will present results from the Whitehall II study where risk factors were assessed up to 7 times over 28 years among 329 dementia cases, assessed via electronic health records, and 1974 controls. We will show that both BMI and physical activity trajectories are modified over the course of 28 years, particularly in the decade preceding dementia. Thus, when these risk factors are measured in the 10 years before diagnosis their associations with dementia are different to that when they are assessed in midlife.

SESSION 320 (PAPER)

PHYSIOLOGICAL FACTORS AND HEALTH OUTCOMES

HIV INFECTION AND OLDER ADULTS IN SOUTH AFRICA

I.L. Butler^{3,4}, W.B. McLeod^{1,2}, B.N. Tipping^{3,4}, S. Coetzer^{3,4},
1. Health Economics and Epidemiology Research Unit, Department of Internal Medicine, School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand., Johannesburg, Gauteng, South Africa, 2. Center for Global Health and Development, Boston University School of Public Health., Boston, Massachusetts, 3. Division of Geriatrics, Department of Internal Medicine, School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, Gauteng, South Africa, 4. Wits University Donald Gordon Medical Centre, Johannesburg, Gauteng, South Africa

The number of Human Immunodeficiency Virus (HIV) infected adults aged over 50 years in South Africa is increasing. There is limited knowledge about how this population differs from younger HIV positive adults and whether there are different treatment outcomes.

The study objective was to explore dissimilarities between younger and older HIV positive adults at initiation of Antiretroviral Therapy (ART) with regard to their baseline demographic, clinical and laboratory variables and then compare 12-month ART outcomes.

We did a retrospective record review of a large single site and included treatment-naïve HIV positive adult patients at initiation of ART. Patients aged 18–40 years (n=10726) were

compared to patients aged 50+ years (n=1635). Baseline variables and 12-month outcomes in the two groups were compared using log-binomial regression.

The older cohort had significant differences in baseline demographic, clinical and laboratory data compared to the younger cohort. These included: gender ratios, education and employment levels and BMI and CD4+ count categories. At 12-months of treatment a higher proportion were dead (PR 1.52, 95% CI 1.30–1.76), a lower proportion had a favourable treatment outcome namely viral load suppression and CD4+ increase of >100cells/m³ (PR 0.84, 95% CI 0.80–0.90) but there was no difference in treatment complications between the two groups (PR 1.01, 95% CI 0.96–1.07).

HIV positive South African adults aged over 50 years are a unique population. Despite better baseline clinical and laboratory variables, the 12-month outcomes were worse. Contrary to first world studies, there was no difference in treatment complications in our sample.

CALPAIN ACTIVITY MAINTAINS GOOD HEALTH OF CENTENARIAN T CELLS; SUMMARY OF THE CALPACENT PROJECT

J.M. Witkowski¹, A. Mikosik¹, E. Bryl¹, J. Foerster¹, T. Fülöp², C. Caruso³, 1. *Pathophysiology, Medical University of Gdansk, Gdansk, Poland*, 2. *University of Sherbrooke, Sherbrooke, Quebec, Canada*, 3. *University of Palermo, Palermo, Italy*

Causes of aging-associated deterioration of human immunity, and the reasons why the immune system of the oldest old individuals (centenarians) is relatively robust, remain moot. Intracellular proteolysis system of two proteases – μ - and m-calpain – and their inhibitor – calpastatin (the calpain-calpastatin system (CCS)) - is active in resting human peripheral blood T cells, participating in maintenance of their readiness to proliferate and secrete cytokines in response to stimulation. The amounts of the CCS proteins decrease in resting T lymphocytes of healthy elderly, only to return in the centenarians to those levels seen in the young individuals. We compared the calpain activities and the levels of transcription of the CCS genes in the resting and stimulated peripheral blood T lymphocyte populations of young, elderly and centenarians, and correlated these activities with the strength of proliferative and cytokine secretion responses to a polyclonal stimulation. Calpain activities significantly decrease in the resting T cells of the elderly compared to the young, and rise again in centenarian lymphocytes, in parallel to the relatively higher proliferative and secretory dynamics and CCS genes' transcription in the centenarian than in elderly T cells. Calpain activity seems to increase the levels of phosphorylation of chosen signal transduction molecules. Concluding, we propose that the CCS activity is essential for the maintenance of adequate level of the T cell responses, that its decrease in the elderly is one of the reasons for the immunosenescence, while its relative preservation may facilitate relative robustness of T cell responses in the centenarians.

PERIPHERAL FATIGUE DOES NOT INFLUENCE THE ONSET OF FATIGUE IN OLDER ADULTS

J. Yentes¹, A. Rosen¹, T. Grindstaff², Z. Starks^{1,3}, 1. *University of Nebraska Omaha, Omaha, Nebraska*, 2.

Creighton University, Omaha, Nebraska, 3. *A.T. Still University, Kirksville, Missouri*

Muscular fatigue is the decline in ability of a muscle group to produce force following a contraction. Although older adults are less susceptible to fatigue, they have decreased muscle mass, strength, and contractile ability. Peripheral fatigue is attributed to metabolic buildup, while central fatigue is linked to down-regulation of motor unit firing. Decreased oxygen in the tissue and brain is linked to peripheral and central fatigue, respectively. The purpose of this study was to evaluate the onset of fatigue in older adults and assess alterations in oxygenation within the soleus muscle and prefrontal cortex following a plantar-flexor fatigue protocol. Eleven participants (56.3 ± 7.6 years, 169.5 ± 6.5 cm, 75.3 ± 6.7 kg) were assessed before and after a fatigue protocol consisting of repeated maximal concentric contractions completed until <50% of isometric one-repetition maximum was reached. Peripheral fatigue was assessed via resting twitch (RT) and central fatigue was assessed via electromyography (rEMG) and percent of voluntary muscle activation (ITT). Soleus muscle oxygenation (StO₂) was recorded with an oximeter and central oxygenation (HbO) of the prefrontal cortex was measured via functional near infrared spectroscopy (fNIRS). Significant decreases were found for ITT (p<0.01), rEMG (p=0.03), StO₂ (p<0.01), and prefrontal cortex oxygenation (p=0.04). The results indicated that central fatigue was the primary contributor to the observed fatigue. Fewer type II muscle fibers in older adults would cause less metabolic buildup and less peripheral fatigue. A decrease in oxygenation in either the prefrontal cortex or muscular tissue may be related to the faster onset of fatigue in populations with disease.

CARDIAC TISSUE GLYCATION AND SKIN AUTOFLUORESCENCE IN CORONARY ARTERY DISEASE PATIENTS

A. Simm, K. Jacobs, A. Navarrete Santos, A. Wienke, H. Treede, B. Hofmann, *Clinic for Heart Surgery, Martin-Luther-University Halle-Wittenberg, Halle (Saale), Germany*

Aim: During ageing, advanced glycation end products (AGEs) accumulate in extracellular matrix proteins like collagen and contribute to a decline in organ function. As skin autofluorescence (sAF) can assess subcutaneous accumulation of fluorescent AGEs, this study aimed to investigate the relationship between AGE-modified cardiac tissue collagen and AGE related sAF in coronary artery bypass surgery patients.

Methods: Between January 2011 and January 2012, data from 72 consecutive male patients undergoing isolated CABG were prospectively recorded. Collagen fractions were isolated from the right atrial auricle of these patients by proteolysis and collagenase digestion. Collagen was quantified by hydroxyproline assay and AGEs by the AGE related intrinsic fluorescence. Skin autofluorescence was measured using an autofluorescence reader.

Results: The biochemical analysis showed that the insoluble cardiac collagen fraction contained the highest amounts of accumulated AGEs; the AGE related intrinsic fluorescence of this fraction increased with age (p=0.0001), blood glucose level (p=0.002), HbA1c level (p=0.01) and the skin autofluorescence (p=0.008).

Conclusion: This study confirmed for the first time a relationship between cardiac tissue glycation and the AGE related skin autofluorescence. In addition, cardiac tissue glycation was associated with age, blood glucose levels and long-term glucose values of the assessed CAD patients.

IMPACT OF TELEMEDICINE ON CARE IMPROVEMENT IN NURSING HOMES

N. Salles, A. Lafargue, M. Barateau, C. Caubet, M. Dupuy, A. Prigent, K. Libert, *University Hospital, Bordeaux, France*

Even if challenges of telemedicine are great in geriatrics, particularly in the monitoring of elderly patients with chronic diseases requiring repeated hospitalizations, literature data concerning the benefits of telemedicine remains poor.

The aim of this study was to describe the impact of teleconsultations on care improvement in nursing homes.

Methods: This study was based on teleconsultations organized by an expert team in the department of clinical gerontology, Bordeaux, France. After obtaining patient and general practitioner (GP) consent, the nursing home care team connected to a virtual room with the expert center. Following each teleconsultation, a report was written and sent via a secure messaging system to the GP.

Results: a total 312 teleconsultations were analyzed and concerned residents with a mean age of 85.2 ± 8.2 years; mean ADL (Katz) score: 2.1 ± 1.1 ; mean MMSE score: 15.7 ± 6.5 ; mean CIRS-G score: 14.4 ± 5.2 ; and mean drugs intake per day: 8.1 ± 3.5 . Reasons for teleconsultations were mainly behavioral problems related to dementia (25.3%); complex chronic ulcers (38.8%), psychiatric disorders (16.3%), and chronic spasticity (11.3%). Teleconsultations permitted the avoidance of specialized consultations in 62.2% of cases; programmed hospitalizations (9.3%), and emergency admission (2.5%). Teleconsultations permitted to avoid the renouncement of care for 81 (26%) nursing home residents. Ninety four (30.1%) therapeutic optimizations were realized and permitted to stop neuroleptic treatment in 36.2% of cases, anticholinergic treatment (23.4%), and psychotropic treatments (18.1%).

In conclusion, global geriatric assessment remains essential during teleconsultations and should permit to decrease return trips to the hospital for nursing home residents.

SESSION 325 (SYMPOSIUM)

GLOBAL TRENDS IN INTERPROFESSIONAL EDUCATION IN AGING AND HEALTH: PROGRAM DEVELOPMENT AND EVALUATION

Chair: P.G. Clark, *University of Rhode Island, Kingston, Rhode Island*

Discussant: M. Formosa, *International Institute on Ageing, Msida, Malta*

Major forces shaping the global development of the health care and social services workforce are: (1) the need for interprofessional education (IPE) and practice (IPP), and (2) the impacts of aging, chronic disease, and disability on healthcare systems. The WHO (2010) *Framework for Action on Interprofessional Education and Collaborative Practice* highlighted the growing importance of health care and social services students and professionals learning how to work together. The WHO (2015) *World Report on Ageing and*

Health called for international action to address the global implications of aging for health care. These two forces merge in the development of educational programs to train students and professionals to work together collaboratively to promote health in older adults. This symposium both (1) reviews the interprofessional health and aging program development and evaluation strategies used in different country contexts, and (2) assesses the factors and forces that have emerged in differing national and educational settings to shape the course of academic programs linked to practice contexts in aging and health. Papers include a discussion of programs developed and evaluated in the Nordic countries, the UK, and the US. Methods of program impact assessment of both interprofessional learning outcomes and knowledge and skills related to practice with older adults will be presented, and the analyses and interpretation of data will be reviewed and critically assessed. Implications for developing programmatic strategies and evaluations will be explored, and recommendations for how to respond to the dual WHO calls for action will be presented.

INTERPROFESSIONAL GERIATRICS EDUCATION IN DENMARK: CLINICAL SUPERVISOR PRACTICAL COMPETENCE PROFILE

T. Kramer^{1,2}, 1. *University of Copenhagen, Copenhagen, Denmark*, 2. *Aarhus University Hospital, Aarhus, Denmark*

InBetween was a pilot project to use the development of a patient pathway through the healthcare system to strengthen patient-centred, interprofessional collaboration skills for health professions students from medicine, nursing, physiotherapy, and occupational therapy. The program evaluation utilized ethnographic studies of interprofessional practice orientation in real learning contexts and investigated clinical supervisors' practical competence profile in geriatrics. The evaluation framework was "multi-site ethnography" involving a mixed methods approach, including participant observations, interviews, videos, audio logbooks, and documents. Major findings of the evaluation were: (1) interprofessional collaboration improves patient-centred practice, (2) clinical supervisors' profession sets the agenda for interprofessional conferences, and (3) professions' preconceptions seem to be maintained by clinical supervisors. Discussion will focus on the continued refinement and dissemination of this model program in both educational and practice settings. Forces supporting and opposing its implementation in the Danish context will be explored.

NORWEGIAN DEMENTIA EDUCATIONAL PROGRAM: DEVELOPING STAFF COMPETENCE IN PERSON-CENTRED DEMENTIA CARE

A. Rokstad^{1,2}, B. Døble¹, J. Stordalen¹, K. Krohne¹, K. Kristiansen¹, 1. *Norwegian National Advisory Unit on Ageing and Health, Tønsberg, Norway*, 2. *Molde University College, Molde, Norway*

The Dementia ABC Educational Program was initiated by the Norwegian Dementia Plan in 2015. It offered high quality, interprofessional, easily available training for care staff in all municipalities. Program evaluation assessed impact on participants' person-centred care competence and job satisfaction level. The program consisted of written booklets and interprofessional reflection groups and workshops.

A longitudinal evaluation followed 1,795 participants from 90 municipalities over a period of 24 months, with a 6-month follow-up after completion. The Person-Centred Care Assessment Tool (P-CAT) evaluated person-centeredness. A significant increase in the mean P-CAT sub-score of person-centred practice and the P-CAT total score was found at 12, 24, and 30 months compared to baseline. A significant increase in satisfaction with workload, personal and professional development, demands balanced with qualifications, and variation in job tasks was reported. Results indicate that the interprofessional, multicomponent training positively impacted the development of person-centred care practice and staff job satisfaction.

INTERPROFESSIONAL GERIATRICS EDUCATION: IMPLEMENTATION AND EVALUATION OF NOVEL SIMULATION DAY IN THE UK

T. McGowan¹, P. Ehilawa¹, A. Blundell¹, A. Gordon², J. Pattinson¹, N. Woodier¹, M. Fores¹, 1. *Nottingham University Hospitals NHS Trust, Nottingham, United Kingdom*, 2. *Royal Derby Hospital, Derby, United Kingdom*

Following the introduction of an Advanced Nurse Practitioner Programme in Geriatric Medicine at a large UK teaching hospital, a pilot regional interprofessional simulation day with medical registrars was designed and held four times over four months. The format included five scenarios involving simulated patients, covering topics on delirium, elder abuse, falls, end of life communication, and polypharmacy. Structured debriefs were held after each scenario with an interprofessional faculty. Ninety percent of the 39 participants would recommend the day to colleagues and stated it was pitched at an appropriate level. Following the day, participants scored 1.1 marks higher on a 10-point knowledge test ($P < 0.001$) and 2.5 points higher on the Readiness for Interprofessional Learning Scale ($P < 0.003$). Discussion will explore impact on clinical practice two months after the simulation and qualitative data from post-simulation focus groups reflecting on the interprofessional learning. Implications for interprofessional education in the UK will be discussed.

EVALUATING AN INTERPROFESSIONAL COURSE IN GERIATRICS TEAMWORK: IMPLICATIONS FOR THE U.S. CONTEXT

P.G. Clark¹, R. Filinson², 1. *Gerontology, University of Rhode Island, Kingston, Rhode Island*, 2. *Rhode Island College, Providence, Rhode Island*

Supported by a federal Health Resources and Services Administration (HRSA) grant, the University of Rhode Island offers a service-learning course on interprofessional teamwork in aging and health for health professions students. Novel adaptations of two validated questionnaires were used to evaluate the course's impacts on attitudes and skills relevant to interprofessional teamwork with older adults: (1) the Attitudes Toward Interdisciplinary Teams, ATIT, Scale and (2) the Team Skills Scale, TSS. Findings showed statistically significant improvement with regard to a positive orientation towards interprofessional teams on 10 of the 21 attitudinal items and on all 17 skills items. All 3 of the ATIT composite subscales showed an increase in support for the tenets of interprofessional training. Implications of this evaluative

methodology will be discussed. The unique educational and practice contexts of the US for developing and evaluating such academic courses will be explored, including the forces supporting and opposing such programs.

GRADUATE EDUCATION INITIATIVES FOR INTERDISCIPLINARY RESEARCH ON AGING AND HEALTH IN SWEDEN

S. Iwarsson, M. Haak, A. Fange, T. Svensson, M.H. Nilsson, G. Ahlström, C. Lofqvist, *Lund University, Lund, Sweden*

Sparked by the development of a Nordic Master's Program in Gerontology, and followed by the establishment of graduate schools integrated with national aging research centers in Sweden, a national Graduate School for Ageing and Health (SWEAH) was established. SWEAH is a partner of the International Summer School on Ageing (ISSA). Program evaluation results show that students appreciate the networking and interdisciplinary ambitions of these programs, but they also display challenges inherent in motivating students to get seriously involved in activities requiring that they leave their disciplinary comfort zones. Based on experiences and evaluation results gained from these programs over the years, we describe and problematize requirements for efficient capacity-building in a national and international context. Spin-off effects in terms of international engagement and collaboration in supervision teams and examination committees serve to strengthen the interdisciplinary competence and capacity for international collaboration of the management teams and teachers involved.

SESSION 330 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: DEVELOPING ACUTE CARE SERVICES FOR OLDER PEOPLE: GLOBAL PERSPECTIVES FOR THE NEXT DECADE

Chair: R.Y. Wong, *University of British Columbia, Vancouver, British Columbia, Canada*

The development of responsive and efficient acute care services for older people remains a high-priority focus around the world and into the next decade. This symposium showcases expertise from North America, Europe, Southeast Asia and Asia to review the latest evidence and experiences that improve the care for older people in hospitals globally, and provide an interactive opportunity for participants to share strategies from their local jurisdictions.

After attending this session, participants will be able to: (a) list the steps of developing a geriatric program that is aligned with innovations (such as personalized medicine and big data analytics) in the future hospital; (b) describe how quality improvement can drive better frailty care; (c) give examples of how to improve delirium care; and (d) identify the characteristics of effective post-acute care services.

The symposium speakers are recognized leaders in Geriatrics globally and locally, hence providing their global perspectives. All have solid track records of implementing system-based improvements on acute care services for older people.

At the symposium, we will present cutting-edge, evidence-informed findings and experiences that will influence acute care services in the next decade. We plan to tailor to participants' needs in identifying local improvement opportunities

and sharing with them lessons learned during knowledge-to-practice translation.

GERIATRIC PROGRAM DEVELOPMENT IN THE FUTURE HOSPITAL

R.Y. Wong, *Medicine, University of British Columbia, Vancouver, British Columbia, Canada*

The steps of developing a specialized geriatric program in the future hospital include initiating a high-level analysis, conducting an environmental scan, designing an operational plan, developing an inter-professional staffing model, implementing strategies to optimize service, and evaluating the program. During this process, the program logic model, service-patient matrix, and patient segmentation matrix can be helpful tools. An inter-professional model of geriatric service is critical for program sustainability. The strategies to optimize patient-centred care must be feasible and aligned with paradigm-shifting innovations, such as personalized medicine (with integrated genomics and microbiomes platform) and big data analytics (health informatics). The geriatric program that is developed must be nimble enough for broader adaptation and dissemination, both within the hospital and across the health system.

DEVELOPING ACUTE FRAILTY MODELS IN UK HEALTH SYSTEMS

D. Oliver, *Royal College of Physicians of London, London, United Kingdom*

Increasingly the core and system-critical business of acute care systems in the UK is older people with complex co-morbidities, dementia and frailty.

We are fortunate in having Geriatric Medicine as the largest General Internal Medical Speciality, with a strong presence at the urgent hospital front door in Emergency Departments, Acute Medical Units and Rapid Access Ambulatory Clinics and managing a large bed base in deeper wards.

Geriatricians increasingly work in interface roles across the acute and community boundary. And there is a growing focus on new models of care outside hospital such as integrated rapid response teams.

I will discuss the development of national quality improvement drives and key resources and clinical networks such as the Acute Frailty Network and Older People in Acute Care Programme (Scotland), the progress we have made in urgent and emergency care for frail older people and the very real challenges we still face.

ACUTE CARE INNOVATIONS IN DELIRIUM MANAGEMENT

W. Lim, *Tan Tock Seng Hospital, Singapore, Singapore*

Delirium is an acute decline in cognitive functioning that is a common, under-recognized, serious, and costly disorder that affects as much as 50% of hospitalized elderly. Increasingly used as an indicator of health-care quality for hospitalized elderly, delirium provides a target for system-wide process improvement to prevent downstream complications and costs.

Multi-component non-pharmacological risk factor approaches are the most effective strategy for delirium prevention. Pharmacological prevention or treatment has been largely disappointing, prompting the shift towards process,

staff and environmental approaches beyond the treatment of reversible patient factors.

Care innovations include the Hospital Elder Life Program (HELP), general medical units with best practice in delirium, and the Delirium Room. We will share our experience and related outcomes in setting up the Geriatric Monitoring Unit, a designated unit for systematic, specialized, and restraint-free management of acute delirium care. Challenges such as upscaling, demonstrating value, sustainability, and further research will be discussed.

INNOVATIONS IN TRANSITIONAL AND COMMUNITY CARE POST-ACUTE SERVICES

T. Chan, *Kwong Wah Hospital, Hong Kong, China*

An aging population has led to an increasing need of acute care for elderly people. A number of geriatrician-led transitional care services were established in Hong Kong over last 20 years to support elderly patients who were discharged from acute setting. Community Geriatric Assessment Teams provide post-discharge support and long term follow up to residents in old age homes. A validated risk assessment score, HARRPE, was developed to identify hospitalized elderly patients who were at risk of unplanned readmission in 28 days. At-risk patients will receive comprehensive assessment. Those with complex needs are provided with home visit by case-managers, domiciliary rehabilitation as well home support services from Non-Government Organizations (NGO). Multi-disciplinary rehabilitation is also provided at Geriatric Day Hospitals for elderly patients with various disabilities. Patient Support Call Center offers telephone follow up for discharged patients with high HARRPE score. Outcomes of patients were shown to be improved.

SESSION 335 (SYMPOSIUM)

NOVEL APPROACHES TO IMPROVING PRESCRIBING FOR VULNERABLE OLDER ADULTS

Chair: M. Steinman, *University of California, San Francisco School of Medicine, San Francisco, California*

Medication misadventures are common in older adults, and have a major impact on quality of life and mortality for this population. Unfortunately, existing efforts to improve prescribing quality have fallen short, and new approaches are needed. This symposium will address this critical gap by discussing several new strategies to conceptualize and improve prescribing quality in older adults. There will be four presentations of original research on these topics by experts from the United States, Italy and Israel. These will include three presentations on clinical trials of interventions to improve pharmaceutical care and medication safety in older adults, and one presentation on novel ways of conceptualizing the scope and impact of drug-drug interactions in older adults. Each of these presentations will include a traditional presentation of original research findings, plus a brief discussion about how the research fits into a larger understanding of how to conceptualize and improve pharmaceutical care quality in older adults. The last third of the symposium will consist of a moderated discussion with the presenters, including questions from the audience. The focus of this moderated discussion will be commonalities and lessons learned from research in the areas discussed, and how health systems and

clinicians can use these findings to improve pharmaceutical care for the older adults they serve.

REDUCING PSYCHOACTIVE MEDICATION USE IN OLDER ADULTS WITH DELIRIUM SUPERIMPOSED ON DEMENTIA

D.M. Fick¹, A.M. Kolanowski¹, L.C. Mion², J. McDowell¹, J. Waller³, 1. *Penn State University, University Park, Pennsylvania*, 2. *Vanderbilt University, Nashville, Tennessee*, 3. *Georgia Regents University, Augusta, Georgia*

Delirium is often misdiagnosed in dementia and mis-treated with medications that may be continued even after hospital discharge. This paper will present results from the Early Nurse Detection of Delirium Superimposed on Dementia (END-DSD) NIH funded cluster randomized trial. We hypothesized that subjects on the END-DSD units would receive fewer psychoactive medications compared to subjects on control units. Participants ($n = 391$; $M_{age} = 84$; 71% female; 95% Caucasian) were enrolled at the time of admission. The intervention group had significantly lower number of medications given PRN than the control group. The number of unique Beers medications given PRN was lower in the intervention group. And the number of PRN medications with an anticholinergic burden score of 3 was significantly lower. These drugs negatively impact older adults and should be avoided. Nurses play an integral role in decreasing the use of PRN and psychoactive medications in older adults.

IMPROVING MEDICATION SAFETY AND TRAINING FOR OLDER ADULTS WITH DEMENTIA

N. Brandt, *University of Maryland at Baltimore, Baltimore, Maryland*

The intent of this session is to highlight the work of an interprofessional team and tactics to improve medication safety for older adults and their caregivers. Interprofessional health care providers at the Baltimore Veterans Affairs Medical Clinic, namely medicine, pharmacy, nursing, neuropsychology & social work, have been actively involved in various clinical and educational initiatives. One of these initiatives is the "DEMO: Dementia Evaluation, Management and Outreach" program. This program aims to extend dementia evaluations to regional community-based outpatient clinics, which serve people in more rural regions, and to improve management and follow-up of these patients, including medication coordination and adherence monitoring. Additionally, the team has created and evaluated online interprofessional training focusing on medications and other needs of older adults with dementia, looking at knowledge, skills and attitudes. Results and resources will be shared with conference attendees that can be useful for their clinical care settings.

IMPACT OF A NURSE-BASED INTERVENTION ON MEDICATION OUTCOMES IN OLDER ADULTS: THE CC-MAP STUDY

E. Shadmi^{2,3}, M. Low³, R. Balicer^{3,4}, M. Steinman¹, 1. *Division of Geriatrics, Department of Medicine, University of California, San Francisco School of Medicine, San Francisco, California*, 2. *University of Haifa, Haifa, Israel*, 3. *Clalit Research Institute, Tel Aviv, Israel*, 4. *Ben Gurion University of the Negev, Beersheva, Israel*

Medication-related problems are common in older adults with multiple chronic conditions. Holistic, patient-centered approaches may be particularly well-suited to addressing the complex and disease-crossing nature of these problems. In this presentation, we will present results of a cluster-controlled clinical trial that evaluated the impact of a nurse-based primary care intervention on medication outcomes in 1,218 high-risk older Israeli adults. Our primary outcome was the number of changes to patients' medication regimens, a marker of attention to patient-centered prescribing. After 9 months of follow-up, intervention subjects had more changes to their medication regimen than control subjects (mean 4.04 vs. 3.62 medication changes; adjusted difference 0.55, $P=0.001$). Similarly, intervention subjects had more changes to their symptomatic medications (mean 1.38 vs. 1.26 changes, adjusted difference 0.20, $P=0.003$). We will discuss how our findings inform a broader understanding of the role of nurse-based interventions in improving pharmaceutical care for vulnerable older adults.

DRUG INTERACTIONS AND THE NEED FOR A COMPREHENSIVE APPROACH TO PRESCRIBING

G. Onder¹, D. Vetrano^{1,2}, 1. *Università Cattolica del Sacro Cuore, Rome, Italy*, 2. *Karolinska Institutet, Stockholm, Sweden*

One of the biggest challenges in preventing drug interactions in older adults is the substantial gap that exists between theory and clinical practice. Drugs have a network of effects that go well beyond a single specific drug target. Moreover, the spectrum of possible drug interactions goes well beyond the traditional drug-drug and drug-disease dyads, for example by impairing immune response and therefore decreasing the effectiveness of vaccination. In this presentation, original data on the possible interaction of statins and PPIs on the effect of influenza vaccination will be shown. Similarly, drugs can contribute to the onset of several geriatric syndromes or worsen cognitive status, but such interactions are rarely considered as factors limiting their use. This presentation will also include original data from nursing homes, home care, and acute care hospitals showing the relationship between drug interactions and geriatric syndromes and cognition.

SESSION 340 (SYMPOSIUM)

MIDLIFE VASCULAR FACTORS, LATE-LIFE HEARING LOSS AND FUNCTIONAL DECLINE: INSIGHTS FROM THE ARIC STUDY

Chair: J.A. Deal, *Johns Hopkins University, Baltimore, Maryland*

Discussant: K.J. Bandeen-Roche, *Johns Hopkins University*

Strategies for the prevention of late-life decline in cognitive and physical function are informed by methodologically-sound observational studies that can identify factors which influence health processes occurring over long periods of time. The Atherosclerosis Risk in Communities (ARIC) Study is an ongoing, prospective observational study of 15,792 men and women (27% African American) aged 45–64 at baseline (1987–1989) from four U.S. communities. Initially designed to investigate the epidemiology, causes and clinical consequences of atherosclerosis, ARIC is now in its 6th

round of data collection. With rich data on midlife vascular factors and markers, audiometric hearing assessment at Visit 6 (2016–17), over 20 years of cognitive testing, and extensive late-life testing of neurocognitive and physical function, ARIC is uniquely suited to evaluate the role of midlife vascular determinants and late-life hearing impairment on functional decline in older adults.

In this symposium, we will discuss solutions to methodological challenges of long-term observational follow-up of functional outcomes from mid- to late-life, including harmonization of different cognitive measures across study visits and informative attrition over time, and present recent results that contribute to our understanding of the relationship of midlife glucose peaks and cognitive decline in older age, mid- to late-life body mass index trajectories and gait speed in late-life, and midlife cardiovascular health with late-life frailty. We will also present observational results of the relationship between hearing impairment and cognitive function, and discuss the design of ACHIEVE, a best practices hearing intervention vs. successful aging randomized trial, nested within the ARIC study.

GLUCOSE PEAKS AND COGNITIVE DECLINE: ATHEROSCLEROSIS RISK IN COMMUNITIES (ARIC) STUDY

A. Rawlings¹, A. Sharrett¹, T.H. Mosley², S. Ballew¹, J.A. Deal¹, E. Selvin¹, 1. *Johns Hopkins University, Baltimore, Maryland*, 2. *University of Mississippi Medical Center, Jackson, Mississippi*

Diabetes and HbA1c are associated with cognitive decline, but the role of glucose peaks is unclear. We examined the association of glucose peaks in midlife, measured by 1,5-anhydroglucitol (1,5-AG) at baseline (1990–1992) and 20-year cognitive decline, in 12996 ARIC participants (mean age 57, 13% with diabetes). Cognition was assessed using three neuropsychological tests at three time points from 1990–2013 (summarized as Z-score). Low 1,5-AG (<10 µg/mL, indicating hyperglycemic peaks) was examined within clinical categories of HbA1c using adjusted mixed models. We found no association between glucose peaks and cognitive decline in persons without diabetes. In persons with diabetes and Hb1c < 7%, those with glucose peaks had 0.19 greater Z-score decline over 20-years compared to persons without peaks (p-value = 0.162). In persons with diabetes and HbA1c ≥ 7%, those with glucose peaks had 0.38 greater Z-score decline compared to persons without glucose peaks (p-value = <0.001). More research is needed to determine if targeting glucose peaks among persons with diabetes can reduce cognitive decline.

THE RELATIONSHIP OF MID-TO-LATE-LIFE BODY MASS INDEX TRAJECTORIES WITH LATE-LIFE GAIT SPEED

B. Windham¹, M.E. Griswold¹, W. Wang¹, A. Kucharska-Newton², L.A. Pompeii³, S.B. Kritchevsky⁴, T.H. Mosley¹, 1. *Medicine/Geriatrics, University of Mississippi Medical Center, Jackson, Mississippi*, 2. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 3. *University of Texas Health Science Center, Houston, Texas*, 4. *Wake Forest School of Medicine, Winston-Salem, North Carolina*

Prior studies suggest being overweight in late-life may protect against poor function. Relations of BMI trajectories over 26 years at five visits (1987–2013, baseline n=15,720, aged 45–64yrs; 55% women; 27% black) to late-life gait speed at the fifth visit (aged ≥65yrs, n=6,229) were examined using linear mixed models, adjusting for demographics and comorbidities. Late-life gait speed was 94.3, 89.6 and 82.1 cm/sec for participants with mid-life normal BMI (<25), overweight (25 ≤ BMI < 30) and obese (BMI ≥ 30) (p < 0.001). Late-life gait speed was 96.9, 88.8 and 81.3 cm/s for participants who maintained normal, overweight and obese BMI across 26 years (p < 0.01). A 1%/year BMI increase for a participant with a baseline BMI = 22.5 (final BMI 28.5) was associated with a 4.6 cm/s (95% CI: -7.0, -1.8) slower late-life gait speed than a participant who maintained a baseline BMI = 22.5. Maintaining a normal BMI in mid- and late-life may help preserve late-life mobility.

AMERICAN HEART ASSOCIATION'S LIFE'S SIMPLE 7 IN MIDLIFE AND FRAILITY IN LATE LIFE: THE ARIC STUDY

P. Palta¹, A. Kucharska-Newton¹, S. Lirette², J.L. Lund¹, A. Folsom³, R. Foraker⁴, K.J. Bandeen-Roche⁵, B. Windham², 1. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 2. *University of Mississippi Medical Center, Jackson, Mississippi*, 3. *University of Minnesota, Minneapolis, Minnesota*, 4. *The Ohio State University College of Public Health, Columbus, Ohio*, 5. *Johns Hopkins University, Baltimore, Maryland*

The etiology of frailty remains poorly understood, yet is not completely explained by comorbidity and disability. We tested the hypothesis that ideal cardiovascular health, as measured by AHA's Life's Simple 7 (LS7) in mid-life (1987–1989), is associated with a lower prevalence of frailty in late-life (2011–2013). The LS7 cardiovascular health score (0–14 points) is a summary of 7 health behaviors/factors scored as ideal (2 points), intermediate (1 point), or poor (0 points). Participants were classified as “frail”, “pre-frail” or “robust” using established criteria. Each 1-point higher LS7 score was associated with a 19% (95% CI: 16%, 22%) higher prevalence of being classified as robust versus pre-frail, and a 34% (95% CI: 27%, 41%) higher prevalence of being classified as robust versus frail in late-life. Among the LS7 components, ideal levels of body mass index, physical activity, blood pressure, and glucose in mid-life were most strongly associated with prevention of frailty in late-life.

HEARING LOSS AND COGNITIVE DECLINE—OBSERVATIONAL RESULTS AND EMBEDDING OF A RANDOMIZED TRIAL IN ARIC

F. Lin¹, J.A. Deal¹, T. Chisolm², N.W. Glynn⁴, S. Davis³, T.H. Mosley⁵, J. Coresh¹, 1. *Johns Hopkins University, Baltimore, Maryland*, 2. *University of South Florida, Tampa, Florida*, 3. *University of North Carolina, Chapel Hill, North Carolina*, 4. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 5. *University of Mississippi, Jackson, Mississippi*

Hearing loss (HL) is independently associated with accelerated cognitive decline and an increased risk of incident dementia. The Aging, Cognition, and Hearing Evaluation in Elders (ACHIEVE) randomized trial is being planned to

determine if hearing loss treatment versus a successful aging control intervention can reduce the risk of cognitive decline in older adults. This trial will be nested within ARIC, and a pilot study was recently completed that established trial feasibility and intervention efficacy. In this 6-month pilot study of 40 individuals aged 70–84 years, the hearing intervention demonstrated a clear efficacy signal on communication and social functioning (domains hypothesized to mediate downstream effects of HL on cognitive decline). Estimated changes in standardized (z-score) outcomes were qualitatively different by intervention assignment for all measures, including perceived handicap due to hearing loss (HHIE, $p < 0.0001$), loneliness, number of contacts ($p = 0.007$) and diversity of social network, and social, mental, and physical function.

APPLICATION OF LATENT VARIABLE METHODS TO THE STUDY OF COGNITIVE DECLINE WHEN TESTS CHANGE OVER TIME

A. Gross^{1,2}, S. Burgard³, S. Davis³, J.A. Deal^{1,2}, T.H. Mosley⁴, J. Coresh¹, A. Sharrett¹, 1. *Department of Epidemiology, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 2. *Johns Hopkins University Center on Aging and Health, Baltimore, Maryland*, 3. *Department of Biostatistics, UNC Gillings School of Global Public Health, Chapel Hill, North Carolina*, 4. *Department of Medicine, University of Mississippi Medical Center, Jackson, Mississippi*

We demonstrated the use of factor analysis to link differing cognitive batteries over ARIC-NCS visits to common metrics representing general and domain-specific cognition. We used 23 years of data from the Atherosclerosis Risk in Communities Study (ARIC-NCS) ($N = 14,252$). Using generalized estimating equations, we compared associations of diabetes with cognitive change using general and domain-specific factor scores vs. z-scores. Factor scores provided stronger associations with diabetes at the expense of greater variability around estimates (e.g., for executive functioning, -0.065 SD units/year, $SE = 0.015$, vs -0.057 SD units/year, $SE = 0.013$), suggesting factor scores more explicitly address error in measured traits. We calibrated general and domain-specific cognitive performance across study visits in which different but overlapping cognitive tests were administered at each visit. Factor analysis facilitates use of all available data when measures change over time. We further demonstrate how to estimate factor scores during real-time data collection to enable selection into further screening.

SESSION 345 (PAPER)

MULTI-MORBIDITY AND ENVIRONMENTAL FACTORS AFFECTING GAIT AND FUNCTION

MULTI-MORBIDITY PATTERNS AND DISABLEMENT SEVERITY AMONG MOBILITY LIMITED OLDER ADULTS

M.E. Jacob^{1,2,3}, P. Ni¹, E. Leritz^{2,3}, J. Driver^{2,3}, S.G. Leveille⁴, A.M. Jette¹, J.F. Bean^{2,3}, 1. *Health and Disability Research Institute, Boston University, Brookline, Massachusetts*, 2. *New England GRECC, VA Boston Healthcare System, Boston, Massachusetts*, 3. *Harvard Medical School, Boston,*

Massachusetts, 4. *University of Massachusetts Boston, Boston, Massachusetts*

Multi-morbidity contributes to functional decline among older adults. However, it is not evident whether specific patterns of multi-morbidity are associated with worse disablement outcomes. We analyzed baseline data from the Boston RISE study, a cohort of older primary care patients with mobility limitations, to examine the association between multi-morbidity patterns and neuromuscular impairments and function. Participants ($n = 425$) self-reported 13 major chronic conditions and underwent assessment of impairments (leg strength, leg velocity, trunk extensor endurance, leg range of motion, sensation) and function (400 m walk test, Short Physical Performance Battery (SPPB), Late Life Function and Disability Instrument (LLFDI)). We conducted Latent Class Analysis among the chronic conditions and examined impairments and functional status among different latent classes. LCA identified a high multi-morbidity group with high prevalence of cardiovascular, metabolic and musculoskeletal diseases (Class 1), a low multi-morbidity group (Class 2) and a musculoskeletal group with high prevalence of arthritis, back pain and osteoporosis, but few other conditions (Class 3). After adjusting for age and gender, Class 1 had significantly lower strength, range of motion, SPPB score, gait speed and LLFDI scores compared to Class 2. However, Class 3 demonstrated less range of motion impairment and similar SPPB, gait speed and LLFDI scores compared to Class 2 but similar pain levels to Class 1. Among mobility limited older adults, a sub group with predominantly musculoskeletal conditions did not have worse neuromuscular impairments or function than a healthier sub-group; the sub-group with co-occurring musculoskeletal conditions and other comorbidities had the worst impairments and function.

IS NEURAL CONTROL OF WALKING IMPORTANT BEYOND GAIT SPEED?

J.M. Van Swearingen, C. Smith, L. Coffman, S. Perera, J. Brach, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Gait speed is a robust index of walking and functioning, but may not represent neural control of walking. Integrating spatial and temporal aspects of gait, the walk ratio (WR, step length/step rate) is a measure of neural control and is associated with energy expenditure. We explored the WR in relation to mobility-related endurance (6-minute walk, 6MWD) and walking confidence (modified Gait Efficacy Scale) in older adult participants in a community-based trial ($n = 391$; mean age, 80.5 ± 7.7 years). Gait speed was 0.92 ± 0.21 m/s and WR 0.0048 ± 0.0008 m/steps/min. Adjusting for gait speed, a 0.001 m/steps/min difference in WR was associated with 15 meters in 6MWD and 2.5 points in confidence (both $p < 0.005$). A clear gradient of mobility-related performance across WR quartiles was observed within quartiles of gait speed. Those who walked within the narrow gait speed range of 0.77 – 0.90 m/s, 6MWD ranged 237–281 meters and confidence ranged 71.1–77.1 points across WR quartiles. Among those with gait speed > 1.04 m/s, 6MWD ranged 317–369 meters and confidence 75.8–84.1 points across WR quartiles. Good and poor neural control of walking are possible at both slower and faster gait speed, and is associated with endurance and confidence independent of gait speed. Neural control of walking is an important aspect of gait and should

be considered in assessment and intervention in community-dwelling elderly.

AGE-ASSOCIATED FACTORS CONTRIBUTING TO OBSTACLE NEGOTIATION ABILITIES: NOT ALL IS AS EXPECTED

S. Eyal^{2,4}, I. Kurz^{1,4}, A. Mirelman^{4,6}, I. Maidan⁴, N. Giladi^{5,6,3}, J.M. Hausdorff^{4,2,3}, 1. *Department of Physical Therapy, Faculty of Health Sciences, Ben-Gurion University of the Negev, Beer-Sheva, Israel*, 2. *Department of Physical Therapy, Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel*, 3. *Sagol School of Neuroscience, Tel Aviv University, Tel Aviv, Israel*, 4. *Center for the Study of Movement, Cognition, and Mobility, Tel Aviv Sourasky Medical Center, Tel Aviv, Israel*, 5. *Neurological Institute, Tel Aviv Sourasky Medical Center, Tel Aviv, Israel*, 6. *Department of Neurology, Tel Aviv University, Tel Aviv, Israel*

Tripping over an obstacle is one of the most common causes of falls among older adults. Using an innovative, computer controlled, obstacle course, we evaluated age-associated changes in the ability to negotiate obstacles and the role of obstacle parameters (e.g., expected vs. unexpected, height and available response time (ART), and subject characteristics (e.g., executive function, gait and balance). Twenty healthy older adults (77.7 ± 3.4 years; 50% women) and 20 healthy young adults (29.3 ± 3.8 years; 50% women) underwent cognitive, gait and balance testing before negotiating the computer controlled obstacle course. The primary outcome measure was the ability to successfully negotiate the obstacles (without touching); independent variables included the obstacle height and ART. As hypothesized, the success rate (SR) for all subjects was higher when the obstacle was expected (99.0 ± 2.8%; compared to unexpected 66.0 ± 20.2%; p < 0.001). With an obstacle height of 25mm and an ART of 225msec, SR was lower (p < 0.001) among older adults (50.0 ± 40.4%), as compared to young adults (100 ± 0.0%). For all subjects, the effect of unexpected obstacle height on SR was opposite to our hypothesis; surprisingly, SR was lower when the obstacle height was higher (p < 0.001). For young adults, SR was related to ART (p = 0.02), however, for the older adults, SR was not related to ART. Among the older adults, SR was correlated with stride length (r_s = 0.42, p = 0.039) and Trail Making Test B (r_s = -0.38, p = 0.055). These findings provide new insights into the ability of older adults to successfully negotiate obstacles and help to better understand the mechanisms that underlie this everyday skill.

LIFE-SPACE PREDICTS HEALTHCARE UTILIZATION IN COMMUNITY-DWELLING OLDER ADULTS

R.E. Kennedy¹, C. Williams¹, P. Sawyer¹, A. Lo³, K. Connelly², A. Nassel⁴, C. Brown¹, 1. *Gerontology, Geriatrics, and Palliative Care, The University of Alabama at Birmingham, Birmingham, Alabama*, 2. *Indiana University, Bloomington, Indiana*, 3. *Emergency Medicine, The University of Alabama at Birmingham, Birmingham, Alabama*, 4. *School of Public Health, The University of Alabama at Birmingham, Birmingham, Alabama*

The UAB Life-Space Assessment (LSA) is a validated patient-reported outcome to measure community mobility

and social participation. We have previously shown that LSA predicts adverse health outcomes including mortality, nursing home admission, and cognitive decline, but the role of life-space in healthcare utilization among older adults in general is not known. Participants (N=400) were drawn from the UAB Study of Aging II, a longitudinal study of community-dwelling adults age ≥75 identifying predictors of mobility decline. LSA scores at each monthly follow-up interview were used to predict emergency department (ED) visits and hospitalizations over the next 30 days using generalized estimating equations, adjusting for baseline age, race, gender, education, Charlson comorbidity score, physician visits in the last month, and living alone. Over 35-months of follow-up, 55.8% of participants reported at least one ED visit or hospitalization. In multivariable models, a 10-point lower life-space was associated with a 12% increase in healthcare utilization (p < .0001). Further investigation is warranted on the utility of life-space scores for predicting unnecessary healthcare utilization and identifying conditions that can be managed in a less intense setting.

FROM HEAD TO TOE, FREQUENCY OF COGNITIVE ACTIVITIES IS ASSOCIATED WITH SHORTER FOOT REACTION TIME

Y. Cai¹, S.G. Leveille^{1,2,3}, J.M. Hausdorff⁴, J.F. Bean^{3,5}, B. Manor^{3,6}, T. You¹, 1. *University of Massachusetts Boston, Boston, Massachusetts*, 2. *Beth Israel Deaconess Medical Center, Boston, Massachusetts*, 3. *Harvard Medical School, Boston, Massachusetts*, 4. *Tel Aviv University, Tel Aviv, Israel*, 5. *Veterans Administration Boston Health System, Boston, Massachusetts*, 6. *Hebrew SeniorLife, Boston, Massachusetts*

Cognitively stimulating activities can improve both cognitive and physical function. Foot reaction time, a test of neuromotor performance and a possible risk factor for falls in older adults, might be influenced by participation in cognitively stimulating activities. The aim of this cross-sectional study was to examine the association between cognitive leisure activities and foot reaction time. We studied 310 community-dwelling older adults aged 71 to 101 years (mean=84.0y), in the MOBILIZE Boston Study II. Simple foot reaction time (SRT) and choice foot reaction time (CRT) were measured as time to initiation of movement in response to an intermittent light stimulus, seated with feet placed on a gait mat (CIR Systems, Inc., Franklin, NJ). The Cognitive Activity Scale (CAS), assessed frequency of participation in 17 cognitive leisure activities. SRT and CRT ranged from 0.17 to 0.55ms (mean=0.25 ± 0.06ms), and 0.21 to 0.72ms (mean=0.32 ± 0.08ms), respectively. Average SRT and CRT were shorter according to higher CAS scores. In multivariable models adjusted for age, sex, race, education, mobility difficulty, peripheral arterial disease, and number of joint pain sites, CAS scores were associated with shorter SRT (p=0.02) and CRT (p=0.01). The association persisted but was weaker after further adjusting for gait speed (SRT, p=0.05; CRT, p=0.03). Adjustment for vision impairment did not alter the relationship between CAS and reaction time. These results show that participation in cognitively stimulating activities is associated with shorter foot reaction time. Further research is needed to determine whether participation in cognitive activities could reduce fall risk in older adults.

SESSION 350 (SYMPOSIUM)

BIOMARKERS AND LONGITUDINAL TRAJECTORIES OF STRESS AND NEUROCOGNITIVE DISORDERS

Chair: C.E. Gould, *VA Palo Alto Health Care System, California*

Discussant: R. O'Hara, *Stanford University School of Medicine, Stanford, California*

Longitudinal studies provide insight into the development and course of stressors, anxiety, and neurocognitive disorders across the lifespan. The presenters in this symposium will consider the effect of genetic risk factors, combined genetic and environmental influences, and environmental stressors on physical and cognitive health trajectories. Presenters will discuss data from four unique longitudinal studies conducted in three countries: Brazil, Sweden, and the United States. These longitudinal studies utilize self-report, neuropsychological and biological measures to characterize aging processes as the presenters will describe. The first presenter, Dr. Lee, will consider the differential impact of major life stressors compared with daily stressors on physical health in the VA Normative Aging study. Second, Dr. Castro Costa will discuss the impact of genomic ancestry on depressive symptoms in a population-based cohort. Third, Dr. Petkus will describe the trajectories of anxiety and cognitive performance across the lifespan and the extent to which genetic and environmental influences explain these associations. Finally, Dr. Hirst will consider specific genetic risk factors for declines in list recall, a very sensitive predictor of cognitive decline. Dr. Ruth O'Hara will serve as the discussant and will guide the audience in considering how these findings from the influential multinational longitudinal studies may inform the development and course for physical and neurocognitive problems in late life.

STRESS AND HEALTH IN LATER LIFE: A COMPARISON OF MAJOR LIFE EVENTS AND DAILY STRESSORS

L.O. Lee, A. Spiro, *Psychiatry, Boston University School of Medicine, Arlington, Massachusetts*

Major life events (LEs) and daily stressors (DSs) have been linked independently to morbidity and mortality. This study compared how LEs and DSs were related to 3 health outcomes: change in health conditions and BMI, and all-cause mortality. We used longitudinal and daily diary data from 173 older adults in the VA Normative Aging Study. Self-reported LEs and DSs were assessed in 2002–3, and health conditions in 2002–3 and 2004–5. BMI was measured in triennial examinations. Mortality information was available through 3/2014. Separate regression models were used for each outcome, adjusting for age, sex, smoking, and drinking. Those with more LEs, but not DSs, showed an increase in health conditions over time. In contrast, more DSs, but fewer LEs, were associated with increase in BMI. In Cox regression models, neither LEs nor DSs predicted all-cause mortality. Findings demonstrate that the effects of stress on health vary across outcome and stressor type.

GENOMIC ANCESTRY AND THE RISK OF DEPRESSIVE SYMPTOMS IN OLD ADULTS

E. Castro-Costa, *Centro de Pesquisas René Rachou (CPqRR), Belo Horizonte, Brazil*

Genomic ancestry is well-known moderator factor of several chronic health conditions in general population. However, there are few evidences about the impact of genomic ancestry on depressive symptoms, particularly, in older adults. The aim of this longitudinal analysis is to evaluate the relationship between genomic ancestry and depressive symptoms in older adults from population-based cohort. We found that highest proportion of African ancestry was associated with depressive symptoms after controlling for potential confounders.

LONGITUDINAL ASSOCIATION OF ANXIETY AND COGNITIVE PERFORMANCE: GENETIC AND ENVIRONMENTAL INFLUENCES

A. Petkus¹, C.A. Reynolds², M. Gatz¹, 1. *University of Southern California, Los Angeles, California*, 2. *University of California, Riverside, Riverside, California*

The extent to which genetic and environmental influences explain longitudinal associations between anxiety symptoms and worse cognitive performance in later life is unknown. This study sample included 778 twins from the Swedish Adoption/Twin Study of Aging who completed at least one of seven assessments of anxiety and cognition over a 26-year period. Multi-level random coefficients models were fit to examine average trajectories of anxiety and cognitive performance over age. Multivariate Cholesky-ACE models were fit to decompose the variance and covariance between the estimated age 65 score (intercept) and estimated age effects (linear and quadratic) of anxiety and each cognitive test. Higher estimated anxiety was associated with worse processing speed, nonverbal memory, and visuospatial ability at age 65. Overlap in genetic influences between anxiety and cognitive performance contributed to these associations. Shared environmental contributions on level of anxiety and linear age changes in processing speed tests were also found.

GENETIC VARIATIONS IN 5-HTTLPR GENE AFFECT MEMORY PERFORMANCE IN OLDER ADULTS: A LONGITUDINAL STUDY

R. Hirst¹, R. O'Hara², 1. *Palo Alto University, Palo Alto, California*, 2. *Stanford University School of Medicine, Stanford, California*

The SS allele of the 5-HTTLPR serotonin transporter gene has been linked with greater risk for anxiety, depression, and cognitive impairment, particularly in memory, in older adults. However, no longitudinal studies have examined this association. Community-dwelling older adults ($n = 157$; mean age = 71.45 years, $SD_{age} = 9.02$) completed baseline genetic, cognitive, and psychological testing as part of a longitudinal study at our laboratory, with repeat cognitive and psychological testing at 12-month and 24-month follow-up. Conditional growth modeling revealed that, after controlling for depression (BDI-2 score), SS allele carriers performed worse than LL and LS carriers at baseline on delayed verbal recall (Rey Auditory Verbal Learning Test). However, SS carriers' memory performance was stable over the two-year period, while LL and LS allele carriers experienced decline. At two years, recall performances of the three groups were indistinguishable. Findings suggest an interactive effect of genetic status on memory over time.

SESSION 355 (PAPER)

THE ROLE OF FITNESS TRAINING IN IMPROVING HEALTH OUTCOMES

THE PROBALANCE RANDOMIZED CONTROLLED TRIAL: FOCUS ON STRENGTH AND GAIT OF OLDER ADULTS

B.R. Gouveia^{1,2,3}, E.R. Gouveia^{2,5}, A. Ihle^{2,8}, H.G. Jardim⁶, M.M. Martins⁴, D.L. Freitas⁵, J.A. Maia⁷, M. Kliegel^{2,8}, 1. *Saint Joseph of Cluny Higher School of Nursing, Funchal, Portugal*, 2. *Center for the Interdisciplinary Study of Gerontology and Vulnerability - University of Geneva, Geneva, Switzerland*, 3. *Institute of Biomedical Sciences Abel Salazar, University of Porto, Porto, Portugal*, 4. *Higher School of Nursing of Porto, Porto, Portugal*, 5. *Department of Physical Education and Sports, University of Madeira, Funchal, Portugal*, 6. *Higher School of Health, University of Madeira, Funchal, Portugal*, 7. *CIFID, Faculty of Sport, University of Porto, Porto, Portugal*, 8. *Department of Psychology, University of Geneva, Geneva, Switzerland*

This study aimed to assess the effect of the ProBalance rehabilitation program on strength and gait of community-dwelling older adults with balance impairments, aged 65–85. In this single-blind randomized controlled trial, the intervention included gait, balance, functional training, strengthening and endurance, flexibility, and 3D training. It was delivered by one rehabilitation nurse on a group basis (90-min sessions, twice/ week, for 12 weeks). Controls maintained usual activities. Strength was assessed by chair stand and arm curl tests. Gait velocity, stride length, and cadence were derived from the 30-foot walk-test. Assessments were at 0 (pretest), 12 (posttest), and 24 weeks (follow-up). Statistical analysis included descriptive and t-test statistics and mixed-ANOVAs. Of 177 participants assessed, 52 were randomized (IG, n=27; CG, n=25).

No significant differences were seen in the CG across time. The IG showed significant improvements in strength at posttest, for the lower and upper body [2.42(1.70), p<0.001; 2.23(2.55), p<0.001, respectively]. At follow-up, a significant decrease was seen [-1.15(1.76), p=0.003; 1.73(1.97), p<0.001, respectively]. A mixed-ANOVA (physical activity and age as covariate) detected a large interaction effect for strength tests. For gait parameters, there were only significant increases in gait velocity and cadence at maximal speed, at posttest [0.21(0.20); p<0.001; 0.22(0.31); p=0.002, respectively], with a large effect size for group in velocity and large interaction effect in cadence. Increases in strength, gait velocity and cadence (at maximal speed) can be attributed to the intervention. At follow up, a detraining effect in strength reinforces the indication of to maintain specific intervention.

Registration: ACTRN12612000301864.

TRANSLATING RESEARCH INTO PRACTICE USING PATIENT-CENTRED VIDEOS: DEVELOPMENT AND ANALYSIS OF UPTAKE

L. Giangregorio^{1,2,3}, C. Ziebart¹, C. McArthur¹, A. Cheung^{2,4}, J. Laprade⁴, R. Jain⁵, L. Lee⁶, A. Papaioannou^{6,3}, 1. *Kinesiology, University of Waterloo, Waterloo, Ontario, Canada*, 2. *University Health Network, Toronto, Ontario, Canada*, 3. *Geriatric Education and*

Research in Aging Sciences Centre, Hamilton, Ontario, Canada, 4. *University of Toronto, Toronto, Ontario, Canada*, 5. *Osteoporosis Canada, Toronto, Ontario, Canada*, 6. *McMaster University, Hamilton, Ontario, Canada*

Purpose: We used patients input and behaviour change theory to design a video series on the Too Fit To Fracture physical activity recommendations. The aim of this work is to describe series development and report on uptake.

Methods: Focus groups and interviews were conducted with older adults across Ontario, with purposeful sampling by gender and urban/rural location. Two researchers coded data and identified emerging themes, categorized as representing capability, opportunity and motivation in accordance with the Behaviour Change Wheel. Themes informed a 13-part video series featuring patient stories, answers to common questions, and functions: modeling, persuasion, training, incentivisation, education and enablement. Videos featured cases of variable age and gender, and addressed noted barriers or patient questions. Media communications were the primary delivery method. Uptake over 7 months was estimated as views in total and by region.

Results: Since their release in November 2015, videos were shared by the Canadian Society for Exercise Physiology, Osteoporosis Canada, American Society for Bone and Mineral Research and the International Osteoporosis Foundation, and in traditional and social media. Videos were viewed 20,800 times in 86 countries. Audiences were primarily in Canada (16898 views, 81% of total) and the United States (2060 views, 10% of total) and other English-speaking countries (744 views, 4% of total). Average duration of views in English-speaking countries was 78% compared to 60% elsewhere. Within Canada, rural residents accounted for 22% of the viewership, slightly above the proportion of rural Canadians (19%). Nearly half of views were within the month of release when promotion was active. Another spike came after traditional media articles about the work of one of the authors and cited the videos.

Conclusions: Partnering with knowledge users to create patient-centred, theory-informed, educational tools and delivery strategies resulted in broad uptake.

EFFECTS OF TAI CHI ON MULTISITE PAIN AND PHYSICAL FUNCTION IN OLDER ADULTS

E. Ogawa¹, T. You¹, S. Thapa¹, Y. Cai¹, G. Yeh^{2,3}, P. Wayne³, L. Shi¹, S.G. Leveille¹, 1. *University of Massachusetts Boston, Boston, Massachusetts*, 2. *Beth Israel Deaconess Medical Center, Boston, Massachusetts*, 3. *Harvard Medical School, Boston, Massachusetts*

Chronic pain is associated with a decline in physical function and an increased risk of falls in older adults. This study examined the effects of Tai Chi on pain severity, pain interference and physical function in older adults with multisite pain. Fifty-four community-dwelling older adults with multisite pain who reported falling in the past year or currently used an assisted device were randomized into a light exercise program or a Tai Chi program offered twice a week for 12 weeks. Pain severity and pain interference were measured using subscales of the Brief Pain Inventory, and physical function was measured by the Short Physical Performance Battery (SPPB). Paired t-tests were used to assess changes

within each group, and independent t-tests were used to assess differences between groups. Twenty-three participants in the light exercise group and twenty-two participants in the Tai Chi group completed the study. There were significant improvements only in the Tai Chi group in pain severity score ($p=0.01$) and pain interference score ($p=0.04$); however, there were no significant group differences in changes of pain scores. There were no significant improvements in SPPB scores in either group. Therefore, pain severity and pain interference were improved after a 12-week Tai Chi intervention in older adults with multisite pain; however, no between-group differences were detected, likely due to a small sample size. A larger study with longer term is required to examine the effectiveness of Tai Chi on multisite pain and physical function in older adults. (Supported by NIH Grant R21 AG043883)

THE EFFECT OF KINECT-BASED TAI-CHI EXERGAMING PROGRAM ON OLDER ADULTS WITH MILD DEMENTIA

P. Lin^{1,2,3}, C. Hsieh¹, Y. Wei¹, Y. Hsu¹, Y. Huang¹, 1. *Department of Physical Therapy & Graduate Institute of Rehabilitation Science, College of Medicine, Chang Gung University, Taoyuan, Taiwan*, 2. *Healthy Aging Research Center, Chang Gung University, Taoyuan, Taiwan*, 3. *Dept of Internal & Geriatric Medicine, Chang Gung Memorial Hospital, Linkou Branch, Taoyuan, Taiwan*

Studies have shown Tai-Chi's beneficial effects, but evidence in those whom with cognitive impairment is limited. There are growing applications of the interactive game-Kinect in health promotion and rehabilitation to enhance motivation and participation of the clients.

The purpose of this study is to investigate the effect of a 6-month kinect-based tai-chi program on physical and cognitive function in mild demented older adults.

A convenient sample of older adults aged over 60 in day-care centers were recruited and clustered randomized (by center) to 6-month kinect-based tai chi exercise, 45 min/session, 2 times/week ($N=20$) or control groups ($N=20$). Cognitive function (Cognitive Abilities Screening Instrument (CASI)), physical fitness tests (grip strength, knee extension strength, 30 sec sit-to-stand, arm-curl test, timed up and go, 5-meter walking time, 6 minute walking distance(6-MWT), functional reach(FR), chair sit-and-reach, and reaction time), Geriatric Depression Scale and proxy reported quality of life, MPBC behavior measure and Zarit's caregiver burden scale (ZCBS) were measured at baseline and after intervention. Two-way (group \times time) repeated measure ANOVA was adapted for analysis.

There were no significant differences of basic characteristics between 2 groups. Significant interaction effects were found in FR, 6-MWT, MPBC and ZCBS. For CASI score, the interaction did not reach significance, but with the Tai-chi group revealed relative maintenance and the control significantly decline after 6 month.

A 6-month kinect-based tai chi exercise program is feasible, fun and effectiveness for the mild demented OAs in improving balance, endurance and behavior problems, reducing care burdens, and at least maintaining cognitive function.

SESSION 360 (SYMPOSIUM)

WE ARE NOW THEY: OLD GERONTOLOGISTS LIVING IN AGE-SEGREGATED HOUSING

Chair: M.S. Moss, *Arcadia University*

Co-Chair: H.Q. Kivnick, *University of Minnesota, St. Paul, Minnesota*

Discussant: T. Sodei, *Ochanomizu University, Tokyo, Japan*

This symposium uses personal narratives to explore the perspectives of four retired, long term gerontological researchers (ages 70+ - 90+) on their current lives in some form of senior housing community. Each presenter narrates particular elements of her/his experience of living in an age-segregated community – as each one mediates personal experience on the basis of lifelong professional research, theory, practice, and developing wisdom. Like most of “us” conference attendees, these presenters have all spent their careers studying and writing about diverse aspects of aging adults (“Them”). Now the presenters are also “Them.” Wyatt-Brown describes living in a CCRC, where residents must actively struggle against being invisible to staff. Campbell examines multiple aspects identity when living, suddenly, in CCRC in a wholly new city. Moss and Moss focus more explicitly on using particular gerontological theories to meet the challenges of living in a retirement community. Co-chair/discussant Kivnick suggests additional gerontological theories as relevant to these three sets of experience. She also identifies common themes and unique issues for potential study, and highlights contributions that these and other path breaking gerontologists can make to our field's understanding and society's optimal structuring of this part of the experience of later life. Discussant Sodei broadens the session by looking at the presentations and their issues through the lens of Japanese gerontological practice and policy.

LIFE IN A CCRC: ON NOT BEING INVISIBLE

A.M. Wyatt-Brown, *Program in Linguistics, University of Florida, Baltimore, Maryland*

In *Aging in the Right Place*, Stephen Golant (2015) argues that CCRC residents must be able to trust the managers to treat them empathically when residents need more advanced care. True, but empathy is also necessary other times. When managers at my CCRC forced out a beloved employee for unexplained reasons, I began to resent my loss of the autonomy that I had traded for long-term care. Managers must understand, as Atul Gawande learned, (*Being Mortal*, 2014), that they cannot provide a supportive environment unless they make residents feel understood and respected. Surprisingly, when some of the hiring mistakes were corrected, I found that a weight had been lifted. During the turmoil, I learned that I relied on the comfort of my residential friends. Unlike some people who make elders feel invisible (Angell, 2014), fellow residents understand our dilemma. Yet the staff in CCRCs should provide emotional support as well.

AGING OUT OF PLACE

R. Campbell, *Turner Geriatric, University of Michigan, Ann Arbor, Michigan*

In December 2015, after ten years in Tokyo, and 35 years before that in Ann Arbor, Michigan, my husband and I moved

to Piedmont Gardens, a CCRC in Oakland, California. As a geriatric social worker, I had mixed feelings about moving at age 77 to age segregated housing. Novels reinforced the negative aspects of assisted living (Schine, 2016) although an early study of retirement communities (Ross, 1977) found many beneficial aspects. But the aging in place assumptions about staying put (Scharlach, 2012) did not fit with my ideas on continuity and change. My discoveries so far: 1) Moving in as a couple facilitates adjustment; 2) My young grandchildren enjoy frequent visits; 3) Living with ninety year olds has deepened my understanding of aging; 4) Sharing my gerontological expertise is challenging; a low profile seems best; 5) The surprising sense of community with many unexpected connections

ADAPTATION TO LIVING IN A RETIREMENT COMMUNITY

M.S. Moss, S.Z. Moss, *Arcadia University, Glenside, Pennsylvania*

For over one year, we have been residents of a very well designed town house in a retirement community, that emphasizes independence over dependency. We are living the experience of old age, after studying it for decades. We are now “they.” Thoughts of increasing frailty and death are in the air. Our multiple challenges include: (1) maintaining and modifying our social roles and outside ties to allow continuity of our individual sense of personal identity (Atchley, 1971). (2) Recognizing personal and societal themes of ageism, (Calasanti, 2003), both inside and outside our retirement community; and (3) adapting to and resisting the structures of community living, to maximize our sense of residential comfort and residential mastery (Golant, 2015). We discuss how our gerontological perspectives are reflected in our experience of living in an age-segregated community.

SESSION 365 (SYMPOSIUM)

THE GENETICS OF HUMAN AGING: RESULTS FROM A WORLD-WIDE COLLABORATION

Chair: J. Murabito, *Boston University School of Medicine, Massachusetts*

Co-Chair: D. Melzer, *University of Exeter, Exeter, Devon, United Kingdom*

Most observational studies of human aging suffer from confounding, but establishing links between inherited genetic variation and human aging can provide robust insights. Genetic evidence can help identify both biological pathways and also help prove the importance of environmental and behavioral risks. In this symposium, we will present work from a near global collaboration across the Cohorts for Heart and Aging Research in Genomic Epidemiology (CHARGE) consortium, the European Longevity consortium, and the Chinese Longitudinal Healthy Longevity Study as well as data from the UK Biobank investigating large human samples and unique aging phenotypes to facilitate gene discovery and uncover insights into aging biology. Dr. Joris Deelen will present a 1000 Genome meta-analysis of a novel longevity phenotype defined using age, gender and country specific survival thresholds. Drs. Luke Pilling and Janice Atkins will present data from analyses of parental age at death in nearly 500,000 middle-aged offspring. Novel

variants including one in the DNA repair pathway were identified and follow-up analyses to explore mechanisms underlying human aging will be presented. Dr. Daniel Evans will present the Longevity Genomics project and website, a resource to develop translational strategies to promote longevity. The overall project approach is to use longevity associated variants identified from GWAS, gene expression studies and evidence from animal models to identify longevity genes. Mendelian Randomization approaches will be used to evaluate the impact of longevity genes on outcomes and as potential targets for therapeutics.

WORLDWIDE GENOME-WIDE ASSOCIATION STUDY OF LONGEVITY

J. Deelen², D. Evans³, P.E. Slagboom⁴, J. Murabito¹,
1. *Boston University School of Medicine, Boston, Massachusetts*, 2. *Max Planck Institute for the Biology of Ageing, Cologne, Germany*, 3. *California Pacific Medical Center Research Institute, San Francisco, California*, 4. *Leiden University Medical Center, Leiden, Netherlands*

Genome-wide association studies of survival to advanced ages (i.e. above 90 or 100 years) have thus far identified a limited number of longevity loci, i.e. TOMM40/APOE/APOC1, FOXO3A and chromosome 5q33.3. To comprehensively explore the genetic architecture of human longevity, we initiated the largest international GWAS meta-analysis of longevity to date, including studies from the U.S., Europe and China. Genotypes were imputed using the 1000 Genomes Phase 1 reference panel. We defined longevity using country, gender, and birth cohort specific survival percentile cut-off points, where cases were defined as individuals whose age was above the 90th survival percentile and controls as those whose age was below the 60th survival percentile at last censoring. We currently have included over 10,000 cases and 20,000 controls and we expect the study size to increase even further with additional collaborators. The results of the 1000 Genomes meta-analysis of longevity will be presented during the meeting.

GENETIC VARIANTS FOR AGING WELL SUGGEST POTENTIAL FOR INTERVENTION

L.C. Pilling, J. Atkins, D. Melzer, *University of Exeter Medical School, Exeter, United Kingdom*

The UK Biobank is a cohort of 500,000 European origin volunteers. In our preliminary analysis of participants aged 55–70 against parental age at death, we identified several novel variants including one in a DNA repair pathway. We also found strong associations with known genetic variant counts for many common conditions and traits, especially for smoking, high blood pressure and cholesterol levels, obesity linked variants and others. We will present results for all 500,000 European origin subjects plus an overview of results from similar studies of Asian, African and other groups. In addition to promising new mechanistic insights, the results underline the importance of preventable risk pathways in human aging.

CAN GENETICS CLARIFY THE RISK PARADOXES OF LATER LIFE?

J. Atkins, L.C. Pilling, D. Melzer, K. Bowman, *University of Exeter Medical School, Exeter, United Kingdom*

Observational studies of aging cohorts often produce paradoxical associations between known risk factors (such as obesity) and later life outcomes. These paradoxes may be due to confounding from mixing together fit and frail groups, and from the impact of sub-clinical pathology on behaviors and exposures. In this presentation we will explore the role of genetics in clarifying these paradoxes.

Associations between germline genetic variants and phenotypes can't be confounded by the usual behavioral and social factors. Therefore so-called Mendelian Randomization analyses provide robust evidence for causal influences and pathways involved in health outcomes. We will provide an overview of the accumulating evidence from genetics to support the role of key risk factors and clarify claimed paradoxes. We will also present our own analyses, for example showing that body mass index related genetic variation does not support a paradoxical protective effect of being overweight or obese in later life.

TRANSLATIONAL STRATEGIES TO PROMOTE HEALTHY AGING: LONGEVITY GENOMICS RESEARCH GROUP

D. Evans¹, K. Bhutani⁵, G.J. Tranah¹, T. Girke², N.J. Schork³, S. Melov⁴, S.R. Cummings¹, 1. *California Pacific Medical Center Research Institute, San Francisco, California*, 2. *University of California Riverside, Riverside, California*, 3. *J. Craig Venter Institute, La Jolla, California*, 4. *Buck Institute for Research on Aging, Novato, California*, 5. *University of California San Diego, San Diego, California*

The Longevity Genomics Research Project is designed to create a publicly-available research resource available through its website (www.longevitygenomics.org) to enable scientists to develop translational strategies to promote human longevity and healthy aging. Our resource will consist of software tools as R packages, curated datasets, and project results. We will identify Longevity-Associated Genes (LAGs) from Longevity-Associated Variants (LAVs), gene expression studies of aging, and evidence from model organisms. Mendelian Randomization using cohort studies with genetic data and longitudinal measures of aging-related traits will be used to evaluate the potential impact of modulating LAG's on longevity. Candidate Longevity-Associated Drugs (LADs) that target LAG activity are then identified. Using sets of genes whose expression changes with age, we will report associations between genetically predicted expression of these genes and human survival, followed by connectivity map analysis to identify compounds that could target the expression of these genes.

SESSION 370 (SYMPOSIUM)

MANIFESTATIONS OF WISDOM IN REAL-LIFE EXPERIENCES

Chair: N.M. Weststrate, *University of Toronto, Toronto, Ontario, Canada*

Discussant: C.M. Aldwin, *Oregon State University, Corvallis, Oregon*

In the last 30 years, the scientific study of wisdom has flourished. Significant advancements have been made in terms of the definition and measurement of wisdom. Less work, however, has examined how wisdom manifests in, and

develops from, real-life experiences. This is a noteworthy gap in the literature, given that wisdom is a highly contextual phenomenon that is intimately connected to real-life situations, such as the management of difficult life events.

This symposium examines wisdom in relation to real-life experiences using a diverse range of ecologically rich methodologies that draw on research from North America, Europe, and the Middle East. These studies define real-life experience in a variety of ways, ranging from relatively mundane daily hassles to momentous and life-changing events.

Using a daily-diary methodology, Beichler and Glück report on how wise and less wise individuals experience everyday hassles and uplifts, with a focus on individuals' emotional appraisals of these relatively common events. At the level of momentous life experiences, two presentations address the role of wisdom in positive and negative relationship experiences. Farjam, Asadi, and Abadi present on differences in wisdom across groups of divorced and non-divorced women. Auer-Spath and Glück report on the role of wisdom and wisdom-related resources (e.g., empathy), in shaping people's views of the "good marriage" and their relationship satisfaction. Finally, Weststrate, Ferrari, and Fournier present on event content and self-reflective processing in midlife adults' autobiographical memories of wisdom-fostering life experiences.

Carolyn Aldwin will discuss these presentations in relation to the broader science of wisdom and optimal development.

WISDOM AND EVERYDAY REGULATION OF HASSLES AND UPLIFTS

E.M. Beichler, *Department of Developmental Psychology, University of Klagenfurt, Klagenfurt, Kärnten, Austria*

Are wiser individuals happier than others, due to their superior emotion-regulation skills, or even less happy because of their awareness of the negative sides of life? Recent resilience research suggests that being able to savor the good things in life may be as important to living a good life as being able to manage the difficult things. This study investigates how wise and less wise individuals experience and deal with daily hassles and uplifts.

Using a daily-diary method, 52 participants recorded positive and negative experiences and their emotional reactions twice a day for one week. They completed several self-report and performance measures of wisdom in an earlier study. Wiser participants reported the same number of daily uplifts but fewer daily hassles and more low-arousal positive emotions than less wise participants. Thus, wiser individuals seem to be better able than others to savor daily uplifts and deal constructively with daily hassles.

WISDOM AND THE GOOD MARRIAGE

I. Auer-Spath, *Developmental Psychology, University of Klagenfurt, Klagenfurt, Austria, Austria*

The development of human beings takes place in close interaction with other people. Thus, it seems likely that relationships to others influence the development of wisdom. Especially in the context of long-term relationships and the life events that couples go through together, individuals' personal development may be closely linked to that of their partners.

As a first step toward investigating the role of relationships in the development of wisdom, this study analyzed

relationships between participants' levels of wisdom and their views of a good relationship. A sample of 120 participants were interviewed about their views of a good relationship. Wisdom, wisdom-relevant resources, and relationship satisfaction were assessed using self-report and performance measures.

The results showed significant relationships between aspects of wisdom, especially those related to empathy, and relationship satisfaction. In their accounts of a good relationship, wiser individuals were more likely to emphasize acceptance of the other person's individuality.

DO DIVORCED AND NON-DIVORCED FEMALES DIFFER IN WISDOM?

S. Asadi¹, E. Farjam¹, H. Zareei Mahmoudabadi¹, J. Glueck², 1. Yazd University, Yazd, Yazd, Iran (the Islamic Republic of), 2. Alpen-Adria University, Klagenfurt, Austria

According to the MORE Life Experience Model, the experience of challenging life events, such as divorce or illness, interacts with personal resources to support the development of wisdom. To investigate this empirically the current study examined general and personal wisdom in divorced and non-divorced Iranian females. Twenty divorced women were recruited using a targeted sampling method and 20 non-divorced women were selected randomly. Participants completed interview-based measures of the Berlin and Bremen Wisdom Paradigms (Staudinger, 1994; Mickler & Staudinger, 2008), which were transcribed and rated for the five wisdom-related criteria. Intragroup results revealed that divorced females scored higher in personal wisdom than general wisdom, but there was no significant difference in levels of personal and general wisdom among non-divorced females. Moreover, intergroup comparisons failed to detect a significant difference between the two groups for either measure of wisdom. We conclude that divorce may provide an opportunity for the development of personal wisdom, but not general wisdom, and that increases in personal wisdom after divorce may influence females ability to optimally manage their future lives.

WHAT THE FISHERWOMAN SAID TO THE BOY: NARRATIVE CHARACTERISTICS OF WISDOM-FOSTERING EVENT MEMORIES

N.M. Weststrate, M. Ferrari, M.A. Fournier, *Applied Psychology & Human Development, University of Toronto, Toronto, Ontario, Canada*

Despite the importance of wisdom to human flourishing, little is known about how it is cultivated in people. Laypersons and experts believe that wisdom develops through life experience, yet this assumption has lacked empirical scrutiny. To address this, 502 midlife adults provided a written autobiographical narrative about an event in their life where they felt they grew in wisdom. A team of trained raters scored these wisdom-fostering event memories for *narrative content* (event type, cultural normativity, fundamentality, average event valence), *structure* (narrative coherence), and *process* (meaning-making and personal growth). Participants completed self-report and performance measures of general and personal wisdom. In general, results suggest that negative, fundamental, and culturally non-normative life events are

especially important to wisdom development and that particular styles of self-reflection may be central to the active construction of wisdom from adversity. In terms of event types, mortality events (e.g., premature death) and relationship events (e.g., divorce) were most commonly reported as wisdom-fostering.

SESSION 375 (SYMPOSIUM)

SOCIAL EXCLUSION IN LATER LIFE: UNDERSTANDING THE INTERACTIVE NATURE OF EXCLUSION PATHWAYS

Chair: G. Windle, *IMSCaR, Bangor University, United Kingdom*

Social exclusion is a complex multidimensional process, which although not directly measurable is evident by the presence of associated indicators. The choice of indicators however can be problematic, often overlapping with variables considered drivers or outcomes of social exclusion, obscuring our understanding of the process and mechanisms through which it occurs. This symposium highlights the need to disentangle these pathways and move beyond descriptive accounts of social exclusion, presenting a new working framework that allows direct hypothesis testing of these between domain relationships. Whilst this working framework can be applied to any population we focus on older adults. Life events that can drive social exclusion such as bereavement and changes in health are more likely to occur in later life, and occur more frequently, increasing the risk of social exclusion for this population. Using both quantitative and qualitative methods this symposium will begin to explore some of these framework pathways, modelling the relationship between environmental press and ageing in place on social exclusion; and exploring the relationship between social exclusion and health as both an indicator of exclusion and, whilst controlling for prior health, as an outcome. Possible protective factors that moderate the impact of poor health on social exclusion, such as technology use, will also be examined, and older adult's experiences of using technology and the barriers they face will be discussed. Through detailed examination of the complex pathways through which social exclusion exists we gain a clearer understanding of this phenomenon, and identify possible target areas for intervention.

MEASURING SOCIAL EXCLUSION IN OLDER AGE: DEVELOPING A WORKING FRAMEWORK FOR HYPOTHESIS TESTING

C.A. MacLeod¹, A. Ross², A. Sacker², G. Netuveli^{2,3}, G. Windle¹, 1. *Dementia Services Development Centre Wales, Bangor University, Bangor, Gwynedd, United Kingdom*, 2. *University College London, London, United Kingdom*, 3. *University of East London, London, United Kingdom*

Social exclusion is widely acknowledged to be a dynamic, multidimensional process; however, each dimension has the potential to be a determinant, indicator, or outcome of social exclusion, making it difficult to disentangle the pathways through which social exclusion exists. We constructed a working framework of *individual* social exclusion from which to directly examine some of these relationships. To

enable hypothesis testing it is important to separate out determinants from indicators of exclusion and to this end we conceptualised social exclusion as reflecting the three domains of service provision and access; social relations and resources; and civic participation. Rooted in this new working framework we constructed later life social exclusion measures for use with Understanding Society - the United Kingdom Household Longitudinal Study. This new working framework and developed social exclusion measures provide a platform from which to explore the complex relationships between domains of social exclusion.

HEALTH AND SOCIAL EXCLUSION IN OLDER AGE: RESULTS FROM THE UK HOUSEHOLD LONGITUDINAL STUDY (UKHLS)

A. Sacker¹, A. Ross¹, C.A. MacLeod², G. Netuveli³, G. Windle², 1. *Epidemiology and Public Health, University College London, London, United Kingdom*, 2. *Bangor University, Bangor, United Kingdom*, 3. *University of East London, London, United Kingdom*

We investigated longitudinal associations between health and social exclusion with data from 4 waves of UKHLS. Adults ≥ 65 years in Wave 3 participating in Waves 1–4 with complete data (N = 4169) were used. We modeled the relationship between a social exclusion index (SEI) and prior health and the relationship between SEI and subsequent health, conditional on baseline health and control variables. Poor self-rated health (SRH), limiting long-standing illness (LLTI) and psychological distress predicted SEI (b = 1.04 95%CI 0.88, 1.22; 0.94 95%CI 0.73, 1.15; 0.79 95%CI 0.59, 0.98, respectively). Mobile phone, car and internet use moderated associations. Higher SEI was associated with poorer health outcomes (OR SRH 1.17 95%CI 1.11, 1.23; LLTI 1.07 95%CI 1.02, 1.12; distress 1.10 95%CI 1.04, 1.16). Internet and technology use protected older adults in poor health from social exclusion, suggesting age-friendly hardware and software design might have public health benefits.

THE ENVIRONMENTAL EFFECTS ON SOCIAL EXCLUSION IN OLDER AGES

G. Netuveli^{1,2,4}, A. Ross², C.A. MacLeod³, G. Windle³, A. Sacker², 1. *Institute for Health and Human Development, University of East London, London, United Kingdom*, 2. *University College London, London, United Kingdom*, 3. *Bangor University, Bangor, United Kingdom*, 4. *Imperial College London, London, United Kingdom*

The role of unsupportive environments as a barrier for active life style and social participation has been noted. We investigated the effects of environmental press and ageing in place, as indicators of environmental support, on social exclusion with data from 3 waves of UKHLS. Environmental press was operationalised with three characteristics: the neighbourhood: disruptions, problems and insecurities. Ageing in place was operationalised as the length of residence in the neighbourhood and whether the participant would stay in the same neighbourhood. Social exclusion was measured using a social exclusion index (SEI). Neighbourhood problems (0.657, 95%CI 0.279, 1.036) and disruptions (1.988, 95%CI 1.569, 2.407) increased social exclusion significantly while being a stayer reduced social exclusion significantly

(-0.502, 95% CI-0.664, -0.341). There were no differences between men and women in these results. Policies that will improve neighbourhood quality and make places age-friendly can reduce social exclusion.

USING TECHNOLOGY IN LATER LIFE: QUALITATIVE INSIGHTS INTO ACTUAL AND PERCEIVED BARRIERS

C.A. MacLeod¹, K. Canvin², A. Sacker², G. Netuveli^{2,3}, G. Windle¹, 1. *Dementia Services Development Centre Wales, Bangor University, Bangor, Gwynedd, United Kingdom*, 2. *University College London, London, United Kingdom*, 3. *University of East London, London, United Kingdom*

Poor health is known to predict social exclusion in later life, however this relationship is moderated by internet and technology use. People's approach to technology varies and older adults are known to engage less with technology and its associated applications than younger age groups. We conducted qualitative interviews with 40 participants aged 65 years and over, asking people about their access to services and use of technology. Focusing on information and communication technology (ICT), we found varying levels of engagement amongst this group and identified four categories of use: proficient, basic/learner, proxy and avoider. We explored people's experiences of ICT and revealed a number of actual and perceived barriers, including hardware, software and social factors that inhibit people from fully engaging with technology. Technology use has the potential to protect older adults in poor health from exclusion, but first people need to overcome barriers preventing them from engaging with technology.

SESSION 380 (SYMPOSIUM)

BEST PRACTICES OF FOUR GLOBAL INNOVATION CENTERS TO IMPROVE THE LIVES OF OLDER ADULTS

Chair: J.G. D'Ambrosio, *University of Louisville, Louisville, Kentucky*

Co-Chair: A. Faul, *Institute for Sustainable Health and Optimal Aging*

This symposium brings together innovation centers from Canada, Ireland, the US and China who will share best practices for improving the lives of older adults by advancing the development and translation of technology in both clinical and community based settings. The Schlegel-UW Research Institute for Aging, Waterloo, Canada has developed a Centre for learning, research and innovation in long-term care through research-informed practice change and innovation in workforce preparedness. Their campus includes a long term care center, a workforce teaching and research facility that houses living classrooms and research labs. The Ireland Smart Ageing Exchange (ISAX), Ireland has established an independent network of businesses, academic institutions, government agencies and NGOs collaborating to fast-track research, development and commercialization of solutions for the global smart ageing economy. The Thrive Center, Louisville, Kentucky is an innovation center that partners closely with the Institute for Sustainable Health & Optimal Aging, University of Louisville to promote life-long wellness in order to transform the quality of life and care for

the global aging population. It acts as a hub for older adults, academia and industry to experience and create innovative products, services and education that will promote sustainable health and optimal aging. The Genesis Innovation Center housed within the Qinhuangdao Taisheng GRS International Rehabilitation Center is a state-of-the-art facility designed to bring the best care to the people of China. Genesis has been designed for guests to interact with some of the newest technologies created to improve healthy living and maximize independence.

THE THRIVE CENTER, AN INNOVATION HUB DESIGNED TO CARE FOR THE GLOBAL AGING POPULATION

J.G. D'Ambrosio¹, A. Faul¹, S. Rose², J. Reinhart², 1. *School of Medicine, University of Louisville, Louisville, Kentucky*, 2. *The Thrive Center, Louisville, Kentucky*

The Thrive Center, Louisville, Kentucky is an innovation organization, with a mission to promote life-long wellness by transforming the quality of life and care for the global aging population. The Center is a hub for older adults, academia and industry to experience and create ground-breaking products, services and education that promotes sustainable health and optimal aging. The Center includes interactive exhibits and cutting edge state of the art technology and products that can be used in the older adult market to promote quality of life and care. The exhibits rotate between stakeholders in the market and are open to exploration by older adults and caregivers. The Thrive Center is also an educational and evidence based service facility for academia, industry and the community. The Center partners closely with the Institute for Sustainable Health & Optimal Aging at the University of Louisville, and is located within the university's innovation research campus.

ENHANCING LIFE AND CARE OF OLDER ADULTS THROUGH PARTNERSHIPS IN RESEARCH, EDUCATION AND PRACTICE.

M. Sharratt, J. D'Avernas, *Schlegel-UW Research Institute for Aging, Waterloo, Ontario, Canada*

The Schlegel-UW Research Institute for Aging (RIA), Waterloo, Canada, has a distributed network across Ontario of 16 continuum of care Villages housing over 3,000 residents. Emphasis is placed on learning, research, and innovation in long-term care and retirement through research-informed practice change and innovation in workforce preparedness. The newest Village is contiguous with a 30,000 sq.ft. research building (RIA) as part of a unique Centre of Excellence. The magic of this infrastructure is that it brings potential front-line workers in contact with university students, researchers, and labs, and provides an opportunity to mingle with the residents of the Village (Living Classroom). In response to the aging demographic and a resource-limited system, the RIA is a catalyst for the development and spread of innovation that enhances the quality of life and care for older adults.

ISAX BRINGING BUSINESSES, ACADEMIA, GOVERNMENT, AND NGOS TOGETHER TO ADDRESS AGING

A. Connolly, *ISAX, Arthurs Quay, Limerick, Ireland*

The Ireland Smart Ageing Exchange (ISAX), Ireland has established an independent network of businesses, academic institutions, government agencies and NGOs collaborating to fast-track research, development and commercialization of solutions for the global smart ageing economy. ISAX has developed Start Your Own Business programs for smart ageing and for 'mature' entrepreneurs aged 55+, developed a Smart Ageing Community (panel of 55+ age cohort interested in sharing their life experience to help design better products and services and is forging themed clusters among its members to pursue new business opportunities.

THE GENESIS INNOVATION CENTER ADDRESSING THE NEEDS OF CHINA'S OLDER ADULTS

S. Thomas, *The Genesis innovation Center, Qinhuangdao Taisheng, China*

The Genesis Innovation Center, China provides new technology interaction to improve healthy living and maximize independence, including smart-home technology, and global innovative products such as sensors, digital applications, virtual and augmented reality, mobile health platforms, artificial intelligence, and 3D printing. Participants experience innovative designs from prototype to products ready for purchase. The Center has a "startup in residence" program for entrepreneurs and collaborates with engineers, startups and investors to accelerate design development. It has fully integrated tech-enabled care delivery utilizing robotics to access world class clinicians and resources, virtual rehabilitation and motion trainer tools to create and monitor compliance, performance and clinical outcomes. The Center's high-tech devices and switches improve environmental access, increase independence, and assist with cognitive or mobility impairments. Remote controlled appliances, sleep monitors, video capture technology, smart design features with biometric monitoring and clinician or caregiver alerting mechanisms are all built into the design of the center.

SESSION 385 (SYMPOSIUM)

OLDER MEN LIVING ALONE: ROBERT RUBINSTEIN'S SINGULAR PATHS REVISITED

Chair: M. Leontowitsch, *Goethe-University Frankfurt am Main, Frankfurt am Main, Hessen, Germany*

Discussant: E.H. Thompson, *College of the Holy Cross, Broadview Heights, Ohio*

Due to demographic changes the number of men who live up to old age is steadily increasing and the gap in life expectancy between men and women is closing. Across a variety of circumstances (e.g. widowhood, divorce, singledom, living apart together) a growing number of men are living on their own in later life. However, this group has received relatively little attention. Some social and environmental gerontological as well as medical work have considered older men living alone to be an at risk group, with higher scores of deprivation, suicide and mental health problems compared to older women living alone. Social anthropologist Robert Rubinstein's important publication "Singular Paths" in 1986 provided a novel account of how and why some older men live on their own, which suggested that this group was more emotionally and socially stable than previously expected. In

light of significant changes to aging this symposium aims to look at how our knowledge of this group has evolved over the past 30 years. Presentations will provide accounts of men's lives from different geographical areas as well as social settings. They will look at how perceptions and performances of masculinities are shaped by widowhood and other life events that have led men to live on their own after the age of 60.

WIDOWERS AS REAL MEN: THE EVERYDAY LIVES OF WIDOWERS IN NEW BRUNSWICK, CANADA

D.K. van den Hoonaard, *Gerontology, St. Thomas University, Fredericton, New Brunswick, Canada*

This paper explores the everyday lives of older widowers who live in New Brunswick, a relatively rural province of Canada. It is based on an in-depth interview study, from a symbolic-interactionist perspective, with widowers over the age of 60 whose wives had died within the previous ten years. The thematic analysis showed that the widowers used impression management to present their everyday lives as masculine. They minimized their ability to carry out household work, emphasized their relationships with women, and focused on masculine leisure activities. Using quotations from the interview transcripts, the paper argues that losing two pillars of masculinity, work and being in a heterosexual couple relationship, was threatening to the widowers' sense of masculinity. They framed their everyday activities to remind the female interviewer that they were still real men.

OLDER MEN LIVING ALONE—INSIGHTS FROM A GERMAN PILOT STUDY

M. Leontowitsch¹, I. Fooker¹, F. Oswald¹, N. Kramer²,
1. *Faculty of Educational Sciences, Goethe-University Frankfurt am Main, Frankfurt am Main, Hessen, Germany*,
2. *Institute of Historical Studies, Goethe-University Frankfurt am Main, Hessen, Germany*

This paper explores the lives of older men living alone in Frankfurt/Main, a medium-sized German city. The data is based on in-depth interviews with men aged 60+ who lived on their own for a variety of reasons and structured interviews with stake holders in social care, adult education and international cultural programmes. The inductive thematic analysis of the interviews with the men links their life events that led them to live alone in later life with social and historical changes that accompanied those experiences. In doing so the paper will argue that the way men live alone in later life needs to be understood in the context of their biography. The analysis of the stake holder interviews shows that a deficit orientated view of older men living alone does not match the heterogeneity of the group and the potential risks and resources these men have accumulated over the life course.

DEPRESSION, MASCULINITY, AND LIVING ALONE IN A MILITARY RETIREMENT COMMUNITY

K. de Medeiros, *Miami University, Oxford, Ohio*

Everyday concepts of depression are often associated with feminine traits such as sadness and uncontrollable crying. Such gendered traits can consequently pose challenges to constructions of masculinity in older men. This paper draws upon interviews from a unique sample—eight older men who reside alone in a military-sponsored retirement community and explores how masculinity is performed and defended in

light of age- and person-based threats such as depression. Findings point to the importance of the lifelong identity as a military serviceman as an important site through which to negotiate, process, or deny change with age.

SESSION 390 (PAPER)

SOCIAL AND ECONOMIC DETERMINANTS OF ADULT HEALTH

CONCEPTUALIZING PATHWAYS BETWEEN NEIGHBORHOOD ENVIRONMENTS AND RISK OF CARDIOVASCULAR DISEASE

A.J. Lehning², C. Mair³, S. Waldstein³, E. Onukwugh², M.K. Evans¹, A. Zonderman¹, 1. *National Institute on Aging, Baltimore, Maryland*, 2. *University of Maryland, Baltimore, Baltimore, Maryland*, 3. *University of Maryland, Baltimore County, Baltimore, Maryland*

Using cardiovascular disease (CVD) risk as an example, this paper discusses conceptual and methodological developments to advance research about neighborhood effects on health across the life course. CVD is a leading cause of morbidity and mortality, and modifying the neighborhood physical and social environment is a promising strategy for reducing racial and income disparities in CVD risk. However, empirical evidence of the specific pathways through which environments influence CVD risk is limited because previous studies: 1) measure only a few neighborhood characteristics rather than multiple indicators, 2) assess cardiovascular health primarily through self-reported measures or mortality rather than clinical biomarkers of risk, 3) do not consider intermediary pathways, and 4) analyze predominantly white samples.

We present an adapted version of the Social Determinants of Health and Environmental Health Promotion model (Shultz & Northridge, 2004), which conceptualizes the multiple pathways through which neighborhood environments influence individual and population health. We illustrate the potential of this conceptual model for reducing cardiovascular health disparities by demonstrating an approach for combining data from multiple sources at multiple levels. Specifically, we link household- and neighborhood-level data from administrative sources to Healthy Aging in Neighborhoods of Diversity across the Life Span dataset (HANDLS), a 20-year epidemiological study examining health disparities among socioeconomically diverse African American and white adults in Baltimore City, USA. We discuss the implications of our conceptual model and analytic approach as a means of leveraging community data to inform the design of multilevel interventions to reduce cardiovascular health disparities in an urban adult population.

THE EFFECT OF NEIGHBORHOOD CONTEXT ON COGNITIVE FUNCTION IN INDIVIDUALS APPROACHING MIDLIFE

E. Munoz¹, R. Corley², S.J. Wadsworth², C.A. Reynolds¹, 1. *University of California, Riverside, Riverside, California*, 2. *University of Colorado Boulder, Boulder, Colorado*

The context in which individuals develop plays an important role in determining function in old age. We examined

the role of neighborhood context in cognitive function in a sample of adults approaching middle-age (30–45 years) taking part in the ongoing Colorado Adoption/Twin Study of Lifespan behavioral development and cognitive aging (CATSLife), a longitudinal follow-up of individuals from the Colorado Adoption Project and Longitudinal Twin Study. We conducted an initial analysis of the adoptive subset of participants who underwent cognitive assessments at age 30–35 ($n = 266$; mean age = 31.86 (SD = 1.28); 52% female) and completed a neighborhood demographics questionnaire in which they reported on the prevalence of problems in their neighborhoods (e.g., crime, transportation, corruption). Results from multilevel models to account for family clustering showed that those who reported greater neighborhood problems, performed more poorly on WAIS performance tasks (Cohen's $d = -.37$) compared to WAIS verbal tasks (Cohen's $d = -.19$). Across the whole cognitive battery, including the WAIS subtests and specific cognitive ability tasks, effect sizes were larger for episodic memory ($-.34$) and spatial/fluid tasks ($-.31$), than for verbal ($-.22$) or perceptual speed tasks ($-.07$). However, effect sizes ranged within and across domain from large to small (range = $-.78$ to $.15$; median = $-.21$). We will extend analyses to incorporate a larger sample size with additional waves and compare results to international samples from the UK, Netherlands, and Germany. These findings suggest that the demands of dealing with stressful neighborhood environments may diminish cognitive function in adulthood.

LOW MOOD AND 9-YEAR INCIDENCE OF DEMENTIA: THE ROLE OF MARITAL STATUS AND LIVING SITUATION

L. Sjöberg¹, L. Fratiglioni^{1,2}, H. Wang¹, 1. *Aging Research Center (ARC), Department of Neurobiology, Care Sciences and Society (NVS), Karolinska Institutet and Stockholm University, Stockholm, Sweden*, 2. *Stockholm Gerontology Research Center, Stockholm, Sweden*

This study aims to examine whether low mood was related to an increased risk of dementia (DSM-III-R), and whether marital status and living situation can modify this association. To examine this, the Kungsholmen Project was used where 1203 cognitively healthy community-dwellers aged 75+ years were followed for 9 years. Low mood at baseline was associated with an increased dementia risk over a 9-year period (HR: 1.36, 95% CI: 1.09–1.69). Stratified analyses by marital status revealed that the effect of low mood on the risk of dementia was only observed in individuals who were single (HR: 1.50, 95% CI: 1.18–1.90), but not in those who were married (HR: 0.83, 95% CI: 0.48–1.42). A similar pattern was observed in stratified analyses by living situation; individuals with low mood were at a higher risk of developing dementia only if they were living alone (HR: 1.49, 95% CI: 1.17–1.91), but not if living with someone (HR: 0.96, 95% CI: 0.59–1.57). These associations could not be explained by socio-demographics or health status of the participants, and remained unchanged after excluding those who developed dementia during the first 3-years of follow-up. Overall, dementia risk was elevated among older adults who have low mood, but the risk exists only in individuals who were single or living

alone. This study emphasizes the importance of social interaction when experiencing low mood. Thus, specific attention should be directed towards the health care of older adults who are experiencing low mood and are single or living alone.

DIFFERENT INDICATORS OF SOCIOECONOMIC POSITION AND THEIR RELATIVE IMPORTANCE AS DETERMINANTS OF HEALTH IN OLD AGE

A. Darin Mattsson¹, S. Fors¹, I.P. Kreholt^{1,2}, 1. *Aging Research Center (ARC), Karolinska Institutet & Stockholm University, Stockholm, Sweden*, 2. *School of Health Sciences, Aging Research Network-Jönköping (ARN-J), Jönköping University, Jönköping, Sweden*

Socioeconomic position is most commonly operationalised as education, social class, or income. Socioeconomic position can also be operationalised as occupational complexity. Studies of health inequalities in the general population show that the choice of indicators influences the results. However, less is known about the influence of indicator choice in older populations. We explored whether the strength of the association between socioeconomic position and health in old age (69–88) varied by the indicator of socioeconomic position used.

Data from two nationally representative Swedish surveys (LNU and SWEOLD) were combined, providing 20 years of follow-up. Average marginal effects were analysed to compare the association between the indicators of socioeconomic position (education, social class, occupational complexity and income) and two late-life outcomes: mobility limitations and psychological distress.

All indicators were associated with both outcomes in late-life; differences were small. Income was independently and most strongly associated with both outcomes and contributed the most to model fit. Social class contributed the least to both outcomes. The results indicated that occupational complexity was at least as strongly associated to health in old age as social class and education.

If the primary objective of including an indicator of socioeconomic position is to adjust the model for socioeconomic differences rather than to analyse these inequalities, income may be the preferable indicator, as it seems to capture the most variation in late life health. If, on the other hand, the primary objective of a study is to examine health inequalities, the choice of indicator should be theoretically guided.

EDUCATION AND DEMENTIA: PROTECTION ONLY AMONG THE YOUNG-OLD?

D. Seblova^{1,2}, A. Lager^{1,2,3}, 1. *Aging Research Center, Karolinska Institutet and Stockholm University, Stockholm, Sweden*, 2. *Karolinska Institutet: Department of Public Health Sciences, Stockholm, Sweden*, 3. *Centre for Epidemiology and Community Medicine, Stockholm County Council, Stockholm, Sweden*

Whether the association between education and dementia is causal remains unknown. Our study examines this association in Swedish register data as well as the effect of a natural experiment prolonging compulsory schooling from six to seven years. Individuals born from 1920 to 1937 ($n=1\ 373\ 936$) were followed up in the National

Inpatient Register from 1980 to 2011 for hospitalizations with dementia diagnosis (n=103 235). Educational measures (schooling type, highest degree achieved and years of education) were derived from a 1970 census. In a Cox model, one year of education was associated with 4% lower risk of hospitalization with dementia diagnosis among 60–78 years old (HR=0.96, 95% CI: 0.96–0.97), adjusting for cohort, sex and geographical area. The association was robust to changes in the operationalization of education. Further, a dose-response association was present across the whole spectrum of educational attainment. Among 79–92 years old, one year of education was associated only with 1% lower risk of dementia (HR=0.99, 95%-CI: 0.98–0.99), and that was driven mainly by a low risk among those with university education. The results from the natural experiment, which prolonged schooling at the lower end of the educational attainment spectrum, also indicate a protective effect, but again only among the 60–78 years old. In summary, we find preliminary support for a causal protective effect of education on dementia. However, it is possible that prolonging schooling at the lower end of the educational spectrum, from 6 to 7 years, may not buffer against neurodegenerative processes among the oldest old.

SESSION 395 (SYMPOSIUM)

STANFORD CENTER ON LONGEVITY PRESENTS: STARTING POINTS FOR REDESIGNING LONGER LIVES

Chair: T. Sims, *Stanford Center on Longevity*
Co-Chair: L.L. Carstensen, *Stanford University*

Improved longevity is among the most remarkable achievements in all of human history and one of our greatest challenges. The mission of the Stanford Center on Longevity (SCL) is to redesign long life employing science and technology to alleviate the potential challenges of longer lives and improve the well-being of people of all ages. To commemorate SCL's 10th year, we will feature seminal projects underway that focus on optimizing longevity using multi-disciplinary and multi-method approaches. In this symposium, we will present four projects addressing timely issues stemming from longer lives. Tamara Sims will provide an overview of the Sightlines Project which aims to capture how well Americans of all ages are doing financially, socially, and physically over historical time in an effort to identify critical, actionable areas to better prepare society for long lives. Marti DeLeima will discuss work on financial fraud and ways of identifying those most at risk for victimization. Iya Vargas will present research aimed at promoting volunteerism among older adults as a way to promote well-being and inter-generational contact. Finally, Mary Rosenberger will discuss how utilizing a 24-hour activity cycle can better leverage new wearable technologies to enhance health. Taken together, these studies are designed to foster dialogue and multi-disciplinary collaboration among typically disconnected worlds. In doing so, SCL aims to develop workable solutions to urgent issues confronting the world as the population ages.

THE SIGHTLINES PROJECT: TRACKING KEY INDICATORS OF LONGEVITY ACROSS GENERATIONS

T. Sims¹, L.L. Carstensen^{1,2}, T. Rando^{1,3}, A. Yotopoulos¹, M. Deevy¹, K. Smith¹, 1. *Stanford Center on Longevity, Stanford, California*, 2. *Stanford University Psychology Department, Stanford, California*, 3. *Stanford University School of Medicine, Stanford, California*

More Americans are living to 100 than ever before. Yet, we are ill-prepared to navigate long life. A flagship project of SCL, *Sightlines* investigates how well Americans are doing on three key indicators: financial security, social engagement and healthy living. We examined eight nationally representative, multi-year datasets surveying more than 1.2 million Americans. On average, financial security (e.g., home ownership, lack of debt) has decreased since 2000 for those under the age of 75. Social engagement (e.g., interactions with family/friends/communities) remained stable since 1995 for most age groups, except Baby Boomers who show significant decline. For Healthy Living, we observed some gains (e.g., physical activity) and some losses (e.g., increased sedentary behavior) since 2002. Many of these trends vary by socioeconomic status and ethnicity. These findings can shape policy, guide product development, and inform individual-level interventions to ensure independent, 100-year lives.

ESTIMATING THE IMPACT OF FRAUD IN THE UNITED STATES

M. DeLiema, M. Deevy, *Stanford Center on Longevity, Stanford, California*

Financial fraud poses a significant threat to the financial security of aging societies. Despite billions of dollars lost to fraud each year, the United States has yet to routinely administer a national survey to estimate the extent of the problem. In collaboration with fraud researchers and policymakers, we are developing a definitional framework and survey to measure rates of fraud in an online sample of 2,000 adults. Thirty-eight percent reported victimization by one or more types of fraud in the past year. Consumer products and services were the most common scams followed by investment fraud. Risk factors included younger age, chronic life stressors, and risky investment preferences. In 2017, the survey will be launched as a module with the National Crime Victimization Survey and administered to over 50,000 households. Data will help identify trends in fraud prevalence and inform where to allocate prevention resources to protect those most at risk.

INCREASING RETIREES' SOCIAL ENGAGEMENT THROUGH MEANINGFUL VOLUNTEERISM

M.E. Vargas¹, A. Yotopoulos¹, J.W. Rowe², 1. *Stanford Center on Longevity, Stanford, California*, 2. *Columbia University, New York, New York*

The SCL Santa Clara County Volunteer Project is a multi-phase effort aimed at improving the health of County retirees through volunteerism, as well as improving the health and well-being of the recipients of the volunteerism and ultimately reducing the cost of medical care to the county. Working closely with the leadership of Santa Clara County,

we first administered a survey to 4000 county workers and retirees. Using the information learned from the survey, we are now recruiting 250 retirees and near-retirees into volunteer roles in the community, initially as developmental screeners for young children ages 0 to 5, and are following them over a two year period. The final phase envisions a large-scale longitudinal study measuring physical and cognitive health outcomes, monitoring health care utilization, and examining expected reductions in health care costs among volunteers in a wide variety of County volunteer positions.

24 HOURS OF PHYSICAL ACTIVITY, SEDENTARY BEHAVIOR, AND SLEEP WITH WEARABLE DEVICES

M. Rosenberger, K. Smith, *Stanford Center on Longevity, Stanford, California*

Wearable devices can provide a detailed description of daily activities, giving researchers the capability to create a new model of healthy living by using an interdisciplinary approach to disease prevention. A combination of expertise from exercise science, sedentary behavior research and sleep studies is needed to understand the relationship of all human activity to disease and longevity. Optimizing a 24-hour activity cycle is likely to be a key part of utilizing this new technology for health research and interventions. Additionally, it creates a new avenue for studying how behavior affects aging and how to best optimize activity for longevity. This presentation will describe the 24-hour activity cycle, why it is important for health, where the data are being collected, and how researchers are currently using the data to answer public health questions. Important future research directions will be highlighted.

SESSION 400 (SYMPOSIUM)

TRANSLATING EVIDENCE-BASED DEMENTIA CARE FOR OLDER ADULTS AND FAMILIES INTO PRACTICE: COPE CT STUDY

Chair: R.H. Fortinsky, *University of Connecticut, Old Lyme, Connecticut*

Discussant: L.N. Gitlin, *School of Nursing, Johns Hopkins University, Baltimore, Maryland*

This symposium contributes new knowledge to current efforts to successfully translate evidence-based interventions into existing home and community-based service settings for older adults with dementia and their family caregivers. We report on several aspects of the ongoing COPE CT study, which incorporates and evaluates implementation of the evidence-based Care of Persons with Dementia in their Environments (COPE) intervention into Connecticut's Medicaid waiver and state-funded homecare program for older adults. In COPE, occupational therapists teach family caregivers problem solving skills for managing dementia-related symptoms and their own stress, and nurses assess persons with dementia for underlying medical conditions that may affect function and behavior. In the COPE CT randomized trial, COPE services are added or not added to existing homecare service plans for older adults with dementia and their family caregivers (dyads). In this symposium, Fortinsky will first explain the COPE CT translational study design and report findings to date regarding enrolled dyad characteristics and clinical findings from COPE

interventionists. Piersol will then explain the principles and components of COPE, and how its fidelity is monitored in the COPE CT study. Molony will then provide perspectives from care management organizations responsible for coordinating publicly-funded homecare services. Robison will then report focus group findings regarding home care program care managers' experiences incorporating COPE into daily practice. Pizzi will then report findings from economic impact analysis data. Discussant Gitlin will comment on study implications for efforts elsewhere translating evidence-based interventions for this growing target population into homecare practice and policies.

OVERVIEW OF COPE CT STUDY DESIGN AND SELECTED SAMPLE AND TREATMENT CHARACTERISTICS

R.H. Fortinsky, *UConn Center on Aging, University of Connecticut, Old Lyme, Connecticut*

The COPE CT study tests effectiveness of incorporating the Care of Persons with Dementia in their Environments intervention (COPE) into care plans of older adults with dementia (OAD) and their family caregivers (dyads) enrolled in Connecticut's Medicaid waiver and state-funded homecare program. In this presentation, we explain the study's translational design, report interim results, and discuss project potential for replication. Eligible dyads are randomly assigned either to COPE plus usual care services, or usual care services only. Outcomes include functional independence for OAD, and perceived well-being for caregivers. Recruitment goal=290 dyads. Among 127 dyads enrolled to date: 81% of OAD and 72% of caregivers are female; mean/s.d. ages=84.7/7.6 for OAD and 61.3/11.9 for caregivers; 20% Black; daughters are most common caregivers. Most dyads receiving COPE complete all sessions. Nurse assessment of OAD has revealed medical conditions warranting physician treatment. Replicability potential is high because all states offer similar homecare programs.

CARE OF PERSONS WITH DEMENTIA IN THEIR ENVIRONMENTS (COPE): PRINCIPLES, CHARACTERISTICS, AND FIDELITY

C.V. Piersol¹, L.N. Gitlin², 1. *Thomas Jefferson University, Philadelphia, Pennsylvania*, 2. *Johns Hopkins University, Baltimore, Maryland*

COPE seeks to support the capabilities of older adults with dementia (OADs) living at home by reducing environmental stressors and enhancing caregiver knowledge and skill. COPE-CT, a translational study, tests the effectiveness of incorporating the intervention into Connecticut's Medicaid waiver program. This presentation describes intervention principles and characteristics and fidelity approach. COPE is theory-driven and sensitive to cultural attributes, focuses on caregiver-identified problems, provides empirically derived strategies and resources, and is designed to be transportable to real-world practice. COPE is delivered by advanced practice nurses (APN) [two sessions] and occupational therapists (OT) [10 sessions] who communicate assessment findings and care emergencies to agency care managers, an important translational element. The fidelity plan initially involves intensive monitoring and measurement of delivery, receipt and enactment components using traditional scientific

methods and practical approaches. Future plans are to have fidelity measures built into care delivery with care managers providing oversight.

COPE CT FROM ORGANIZATIONAL AND PUBLIC POLICY PERSPECTIVES

S. Molony, *Quinnipiac University, Hamden, Connecticut*

Home and community-based services (HCBS) offer a lower-cost option than institutional long-term care, while supporting older adults in their preferred setting. Nearly 70 percent of people with dementia live at home (Alzheimer's Association, 2009) and almost one-quarter has Medicaid coverage (Kaiser Family Foundation, 2015). HCBS services vary from state to state and while many provide options for long-term services and supports (LTSS) such as personal care, case management, physical or occupational therapy, few of these services are designed to formally address the needs of family caregivers essential to successful community living for persons with dementia. The COPE intervention offers a unique constellation of supports to these families that can be integrated into existing LTSS care management models. This paper compares and contrasts "usual care" with the enhanced supports offered as part of the COPE intervention and identifies key points for successful implementation by care managers and HCBS policymakers.

CARE MANAGER PERSPECTIVES ON COPE INTERVENTION IMPLEMENTATION IN THE CT HOME CARE PROGRAM FOR ELDERS

J.T. Robison¹, R.H. Fortinsky¹, L.N. Gitlin², 1. *UConn Center on Aging, University of Connecticut, Old Lyme, Connecticut*, 2. *Johns Hopkins University, Baltimore, Maryland*

An important aspect of the COPE CT study translational design is understanding implementation processes to enable widespread adoption of COPE within the CT Home Care Program for Elders (CHCPE), and within Medicaid waiver and state-funded homecare programs elsewhere. We draw upon Normalization Process Theory (NPT) which posits specific criteria for judging implementation potential of an intervention, how practice settings may be affected by the intervention, and how the intervention can be modified to support its implementation. Focus groups designed in accordance with NPT are conducted annually in years 2–5 of the study period with CHCPE care managers and COPE interventionists. This presentation reports findings from the 6 care manager focus groups held during study years 2 and 3, with special emphasis on their experiences recruiting participants from their client caseloads, perceived COPE intervention benefits and challenges, and how well COPE services are integrated into their daily service coordination activities

COST ANALYSIS PLAN AND CAREGIVERS' WILLINGNESS TO PAY FOR COPE-CT: INTERIM FINDINGS

L. Pizzi², E. Jutkowitz⁴, K. Prioli², L.N. Gitlin³, R.H. Fortinsky¹, 1. *UConn Center on Aging, University of Connecticut, Old Lyme, Connecticut*, 2. *Thomas Jefferson University, Philadelphia, Pennsylvania*, 3. *Johns Hopkins University, Baltimore, Maryland*, 4. *University of Minnesota, Minneapolis, Minnesota*

To inform a net financial benefit analysis of COPE-CT from the Medicaid perspective, a variable map was developed which included relevant costs and willingness-to-pay (WTP) for the program. WTP for non-pharmacological behavioral programs is critical to translation because it

indicates the monetary value caregivers place on these services. 85 participating caregivers were read a brief description of COPE-CT at baseline and asked to estimate their per session WTP using a contingent valuation method. Results were grouped by WTP thresholds.

WTP/session ranged from \$0 to \$200. 21 CG (24.7%) were unwilling to pay for this program, 17(20%) willing to pay \$10–25/session, 21(24.7%) willing to pay \$50–75/session, 19(22.4%) willing to pay \$100–125/session, and 7(8.2%) willing to pay \$150–200/session. The variable map will also be presented as a tool to explain how we will create the specific direct and indirect cost measures that will be used in the economic analysis for the COPE-CT study.

SESSION 405 (SYMPOSIUM)

FRAILTY IN OLDER ADULTS: INNOVATIVE PERSPECTIVES ON EARLY DETECTION AND INTERVENTION

Chair: S. de Bruin, *National Institute for Public Health and the Environment, Netherlands*

Discussant: T. Kardol, *Vrije Universiteit Brussel, Brussel, Belgium*

A MULTIDIMENSIONAL APPROACH OF FRAILTY IN THE GENERAL POPULATION—THE DOETINCHEM COHORT STUDY

L. Rietman^{1,2}, S. van Oostrom¹, D. van der A¹, S. Picavet¹, M. Lette¹, M. Verschuren^{1,2}, S. de Bruin¹, A. Spijkerman¹, 1. *National Institute for Public Health and the Environment, Bilthoven, Netherlands*, 2. *Julius Center, Utrecht, Netherlands*

Accumulation of problems in physical, psychological, cognitive, or social functioning is characteristic for frail individuals. This study explored which sociodemographic and lifestyle factors, life events and health characteristics were associated with these four frailty domains. The study sample included 4019 men and women (aged 40–81 years) examined in 2008–2012 of the Doetinchem Cohort Study. About 17% of the population was frail at one or more domains, with limited overlap between the frailty domains. Being physically active was consistently associated with a lower risk of being frail on each of the four domains. Short or long sleep duration was associated with a higher risk of being physically, psychologically, and socially frail. In conclusion, considering multiple frailty domains is important because the majority of frail people were frail on one domain of frailty only. Lifestyle factors including physical activity, smoking and sleep duration were cross-sectionally associated with multiple domains of frailty.

AGING IN PLACE WITH FORMAL AND INFORMAL CARE: OLDER PEOPLE'S NEEDS AND PREFERENCES

M. Lette¹, A. Stoop², L. Lemmens², Y. Buist², C. Baan^{2,3}, S. de Bruin², 1. *VU University Medical Centre, Amsterdam*,

Netherlands, 2. National Institute for Public Health and the Environment, Bilthoven, Netherlands, 3. Tilburg University, Tilburg, Netherlands

Older people in the Netherlands are increasingly being stimulated to remain independent and live at home for as long as possible, with help from formal and informal caregivers. In-depth interviews were conducted with 36 older people and provided insight into what older people need with regard to health, wellbeing and aging in place. Mobility appears to be essential for remaining independent. Additional important preconditions for living independently at home were good cognitive health, appropriate housing conditions and practical help (e.g. housekeeping, maintenance, administration). With regard to wellbeing, feeling respected and having a sense purpose and autonomy were important, as well as having social relationships. Respondents indicated to be reluctant to ask for structural help from their informal network, and they also felt that problems related to wellbeing were primarily their own responsibility. These results may help caregivers when organizing preventive (in)formal care and support for older people.

IMPROVING EARLY DETECTION INITIATIVES: PERSPECTIVES OF PROFESSIONALS IN THE NETHERLANDS

L. Lemmens¹, Y. Buist¹, M. Lette^{1,2}, A. Stoop^{1,2}, C. Baan^{1,3}, S. de Bruin¹, 1. National Institute for Public Health and the Environment, Bilthoven, Netherlands, 2. VU University Medical Centre, Amsterdam, Netherlands, 3. University of Tilburg, Tilburg, Netherlands

Many initiatives are developed aiming to proactively identify health and social problems in (frail) older people. Early detection and proactive delivery of care and support could help older people to age in place and remain independent. Previous research shows that these initiatives do not always meet the needs and preferences of older people with regard to e.g. setting, timing and scope. In-depth interviews with nineteen professionals in preventive elderly care were conducted to identify areas of improvement in existing initiatives. Identified improvement areas included: 1. More tailored approach, 2. Better information for older people (and thereby raising awareness about anticipating on future needs), 3. More use of informal networks, 4. Better alignment of initiatives within the neighborhood, 5. More attention for groups that are difficult to reach. It is recommended to take these starting-points for improvement into account to better align early detection initiatives with older people's needs and preferences.

EARLY DETECTION OF FRAILTY IN COMMUNITY-DWELLING OLDER ADULTS BY PREVENTIVE HOME VISITS

B. Fret, D. Verté, L. De Donder, *Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium*

Timely detection of frailty and preventive home interventions can allow older people to age well at home. Research indicates that preventive home visits can have a preventive effect on frailty for a well-defined population. The current paper will test the effectiveness and experiences with a consecutive model of preventive home visits: step 1 visit by volunteers, step 2: visit by professionals. Quantitative and

qualitative data are collected during preventive home visits performed among 450 community-dwelling older adults living in three cities in Flanders, varying in urbanisation rate (Tienen, Gent and Knokke-Heist). Results point towards the possibilities and constraints of performing preventive home visits by volunteers and develop guidelines and profiles. Second, findings demonstrate the effectiveness of the preventive home visits in terms of “detected cases who are frail but lacked care and support”. Finally, preventive home visits can guide to the most appropriate interventions, taking into account the clients' preferences.

DETECTION AND PREVENTION OF FRAILTY: INCREASING EFFECTIVENESS USING EVIDENCE-BASED RISK PROFILES

E. Dierckx, A. Smetcoren, L. De Donder, S. Dury, *Vrije Universiteit Brussel, Brussels, Belgium*

This paper investigates risk profiles of frailty among older people, as these are essential for detecting individuals at risk for adverse outcomes and to undertake specific preventive actions. Frailty is not only a physical problem, but also refers to emotional, social, and environmental hazards. In a first phase, data from the Belgian Ageing Studies, a cross-sectional study among home-dwelling older people (N= 28,049) were analyzed using multivariate regression models. Findings indicated several sociodemographic and socioeconomic risk profiles for frailty (domains). In a second phase (January 2017), these risk profiles are validated in three municipalities in Belgium. Samples are drawn from the population registers based on the detected risk characteristics. Results will demonstrate the effectiveness and efficiency of using these risk profiles among 900 older people. In the discussion, this paper elaborates on practical implications to use these profiles in detection and prevention of frailty.

SESSION 410 (SYMPOSIUM)

EMPOWERMENT, EMOTIONAL LABOR, AND EVERYDAY ENCOUNTERS IN HOME CARE FOR PERSONS WITH DEMENTIA

Chair: K. Scales, *Duke University, Durham, North Carolina*

“Home care” encompasses a range of services designed to meet individuals' long-term care and support needs in their home setting, thereby promoting independence and delaying admission to institutional care. Addressing concerns about home-care quality is a priority across many care systems, including in England, as reflected in the recent release of the Quality Standard for Homecare for Older People (NICE, 2016). Little is known, however, about how “good” home care – that which is person-centered, well-coordinated, and consistently staffed – is understood and implemented in daily practice, particularly for those with dementia. Drawing from an innovative mixed-methods study undertaken in England in collaboration with a large international home-care provider, the purpose of this symposium is to advance understanding of the structure and content of daily in-home care for clients with mild to moderate dementia. The primary data sources are extensive fieldnotes from one year of participant observation and weekly diary entries maintained by 11 paid caregivers over eight weeks. The first paper will discuss the tensions between autonomy (or “empowerment”) and

support in the daily delivery of care. The second paper will describe the emotional labor undertaken by home-care staff, with attention to how their deployment of “tact” to maintain clients’ dignity highlights the inherent conflicts of the paid caregiving relationship. The final paper will draw from the caregiver diaries to discuss the everyday challenges of providing consistently “good” care within broader structural conditions. Implications for workforce development, quality improvement, and commissioning of home-care services will be discussed.

EMPOWERMENT IN HOME CARE FOR PERSONS WITH DEMENTIA: IMPLICATIONS FOR PERSON-CENTERED CARE

K. Scales¹, K. Pollock², C. Travers³, L. Perry-Young², S. Wilkinson², N. Manning⁴, J. Schneider², 1. *Center for the Study of Aging and Human Development, Duke University, Durham, North Carolina*, 2. *University of Nottingham, Nottingham, United Kingdom*, 3. *Loughborough University, Loughborough, United Kingdom*, 4. *King’s College London, London, United Kingdom*

A key element of person-centered care, which is a priority across long-term care systems, is the “empowerment” of direct-care workers – understood as the legitimated autonomy to adapt care around individuals’ needs and preferences, instead of completing tasks by rote and routine. The nature of empowerment in the particular context of home-care is not well-understood, however. This paper draws from ethnographic data collected as part of a mixed-methods study of “good” home care to describe how caregiver autonomy is enacted and experienced in daily care. We examine the close link between autonomy and isolation for these workers, which can curtail the knowledge exchange that supports person-centered care in other settings. We also examine the relational and structural limits of autonomy, highlighting organizational surveillance techniques as a particular example. The paper concludes with a discussion of the implications of these findings for efforts to empower direct-care staff to provide person-centered in-home care.

CLOSE ENCOUNTERS OF THE CARING KIND: EXAMINING EVERYDAY EXPERIENCES OF HOME CARE USING STAFF DIARIES

C. Travers², K. Pollock³, K. Scales¹, L. Perry-Young³, S. Wilkinson³, N. Manning⁴, J. Schneider³, 1. *Center for the Study of Aging and Human Development, Duke University, Durham, North Carolina*, 2. *Loughborough University, Loughborough, United Kingdom*, 3. *University of Nottingham, Nottingham, United Kingdom*, 4. *King’s College London, London, United Kingdom*

Written diaries are increasingly used to gather data in academic, educational and vocational settings. Diaries get us “up close” to people’s lived experiences, yielding rich data free from retrospective bias. As part of a mixed-methods study, 11 home caregivers for clients with dementia kept reflective diaries for eight weeks. This paper reports findings from the diaries relating to: *caregivers’ key skills*, including their efforts to preserve client’s dignity and agency and to mediate among clients, relatives, and the home-care organization; the *daily demands of the job*, including physical and

emotional stressors; the *challenges of the job*, from interpersonal to logistical tasks; and the *daily experiences of job-related satisfaction*, including the practices of self as a skilled and caring worker and the sense of being appreciated. These findings are discussed in relation to the caregivers’ representations of home-care clients in the diaries, which range from *idealization to candor*.

TACT AND DUPLICITY IN INTERPERSONAL RELATIONS BETWEEN PAID HOME CAREGIVERS AND THEIR CLIENTS

K. Pollock², K. Scales¹, C. Travers³, L. Perry-Young², S. Wilkinson², N. Manning⁴, J. Schneider², 1. *Center for the Study of Aging and Human Development, Duke University, Durham, North Carolina*, 2. *University of Nottingham, Nottingham, United Kingdom*, 3. *Loughborough University, Loughborough, United Kingdom*, 4. *King’s College London, London, United Kingdom*

This paper explores tensions arising from caregivers’ practices of skilled interpersonal work, specifically the exercise of tact to protect the dignity of clients. The threat to self-esteem from low-paid, low-status employment is buffered by satisfaction from close relationships with clients. Emotional labor required of caregivers in the course of routine work may be rewarded by emotional capital and enhanced self-worth. Caregivers exercise great skill in supporting personhood and agency, particularly to deflect and cover up mishaps of mental and physical incompetence. However, the requirement – or “feeling rule” – of tact to maintain the personal dignity of clients breaches norms of fair and transparent dealing between people in close interpersonal relationships. Tact may be a manifestation of professional skill but can also undermine the authenticity in relationships between client and caregiver that its exercise aims to instantiate, and underlines the ambiguous nature of a personal relationship underpinned by pay.

SESSION 415 (SYMPOSIUM)

INTEGRATED CARE FOR PEOPLE WITH COMPLEX CARE NEEDS: PAST, PRESENT, AND FUTURE

Chair: J.M. Wiener, *RTI International, Washington, District of Columbia*

Co-Chair: W.L. Anderson, *RTI International, Research Triangle Park, North Carolina*

Discussant: J. Chen Hansen, *American Geriatrics Society, New York, New York*

Integrated care systems have a primary goal of providing coordinated care using formal linkages of different types of providers to provide high quality care to populations with complex care needs. The symposium will open with a background analysis of the need for integrated care systems for people with complex care needs, including an overview of the benefits and challenges. The symposium will then present three research projects funded by the U.S. Department of Health and Human Services’ Office of the Assistant Secretary for Planning and Evaluation that examine the past results, present challenges and future opportunities for integrated care. The first paper analyzes the effect that Minnesota’s well-established integrated systems of care have had on

health care and long-term services and supports (LTSS) use among dually eligible individuals over age 65. The second paper examines several current integrated systems of care to determine how care coordination is operationalized and the challenges that remain when exchanging information across acute care and LTSS providers. The third paper will examine the opportunities and challenges for expanding the Program of All-Inclusive Care for the Elderly (PACE), a fully-integrated care system, to serve younger people with disabilities and the implications of these findings for the older populations currently served by PACE. The discussant will respond to the studies' findings and discuss the evolution of integrated care and the potential for these delivery systems to provide high quality care for populations with complex and unique needs.

WHERE'S THE REST OF ME? THE CASE FOR INTEGRATED CARE

J.M. Wiener, *RTI International, Washington, District of Columbia*

Older people with disabilities currently receive care in a fragmented and uncoordinated financing and service delivery system, both within and between the health and long-term care systems. Financing for acute care is largely the responsibility of Medicare and the federal government, while long-term services and supports (LTSS) is dominated by Medicaid and state governments. As a result, no organization is responsible for managing all aspects of care for a person. Indeed, under the current system, the financial incentives are to shift costs between Medicare and Medicaid, especially for users of LTSS, where Medicaid's financial role is large for LTSS and small for medical care and Medicare's financial role is small for LTSS and large for medical care. The fragmented financing and delivery system has negative consequences for older people, including high levels of hospitalization and potentially avoidable hospitalizations.

INTEGRATING CARE FOR DUAL MEDICARE-MEDICAID ELIGIBLE SENIORS: A NEW LOOK AT THE MINNESOTA MODEL

W.L. Anderson¹, S. Long², Z. Feng¹, 1. *RTI International, Research Triangle Park, North Carolina*, 2. *Urban Institute, Washington, District of Columbia*

With few incentives for program coordination, the 10 million Americans who are dually eligible for Medicare and Medicaid often receive fragmented and inefficient care. Using 2010–2012 Medicare and Medicaid fee-for-service claims, managed care encounters, and enrollment data, we assessed the impact of enrollment in the Minnesota Senior Health Option (MSHO)—a state-wide fully-integrated Medicare-Medicaid model and the first of its kind—on health care and long-term services and supports use among elderly dual eligibles, relative to similar enrollees in Minnesota Senior Care Plus (MSC+), a Medicaid-only managed care plan with Medicare fee for service. MSHO enrollees had 60 percent higher likelihood of community-based services use and 49 percent lower likelihood of hospital-based care than similar MSC+ enrollees. Adopting fully-integrated care models similar to MSHO in Minnesota may have merit for other States as they consider strategies to improve care delivery for dual eligibles under Medicare and Medicaid.

INFORMATION EXCHANGE IN INTEGRATED CARE MODELS

M. Knowles¹, S. Mitchell², E.G. Walsh³, M. Ignaczak⁴, L. Bercaw³, 1. *Aging, Disability, and Long-Term Care, RTI International, Durham, North Carolina*, 2. *Digital Health Policy and Standards, RTI International, Chicago, Illinois*, 3. *Aging, Disability, and Long-Term Care, RTI International, Waltham, Massachusetts*, 4. *Quality Measurement and Health Policy, RTI International, Washington, District of Columbia*

Integrated care models offer the organizational structure to support the coordination needed to provide high quality care to populations with long-term service and support (LTSS) needs. This study describes how care coordination is operationalized by examining the information exchange processes in several integrated care models. We conducted an environmental scan, convened a technical advisory group, interviewed subject matter experts, and conducted case studies of three integrated care systems. We determined that care coordination and information exchange remain high touch processes, and organizational trust and personal relationships between providers remain foundational to successful care coordination; existing electronic health records are inadequate for integrated care models because they do not capture all information needed to support those with LTSS needs; electronic exchange of information with LTSS providers generally does not occur; and interpretation differences of regulations that protect patient health information create barriers to exchanging information and providing coordinated care.

CHALLENGES AND OPPORTUNITIES TO EXPAND THE PACE INTEGRATED CARE MODEL TO NEW POPULATIONS

S. Karon, M. Knowles, E. Vreeland, R. Love, G. Chiri, *RTI International, Research Triangle Park, North Carolina*

The PACE program has a long history of successfully serving people age 55 and older who need nursing home level of care in the community. The program provides integrated medical and social services, coordinated through highly-structured interdisciplinary teams and primarily provided through adult day health centers. The PACE Innovation Act of 2015 allows expansion of this model to other populations. We present findings from a recent study of how the PACE model might serve younger people with physical, intellectual, developmental, or mental health disabilities. Challenges identified include the structure and function of the interdisciplinary teams, acceptability of day center-based services, organizational capacity to support populations with unique needs, and adequacy of payment risk adjustment methodologies. We will discuss implications of these findings for the older populations currently served by PACE, and identify ways in which the PACE model might evolve to meet changing views of service provision and coordination.

SESSION 420 (SYMPOSIUM)

INTERNATIONAL PERSPECTIVES ON DIVERSE ROLES FOR OLDER PEOPLE IN HIGHER EDUCATION

Chair: T. Scharf, *Newcastle University, United Kingdom*

In focusing on students between the ages of 18–24, traditional models of higher education (HE) typically overlook

issues arising from demographic change. However, trends towards lifelong learning in some countries have increased age diversity within university classrooms. Further, increasing acceptance of the importance of public involvement and engagement (PPI/E) has created new opportunities for older people to connect with teaching and research taking place in HE. This symposium will draw on key international examples to explore the increasingly diverse roles of older people in HE. Matthew Kaplan will describe the Intergenerational Leadership Institute, a certificate training program developed by Penn State University for older adults already engaged in volunteering but with an interest in getting more involved, at a leadership level, in developing or expanding intergenerational programs in their areas of interest. Alison Phinney will discuss working in partnership with older people to undertake applied nursing research projects. Thomas Scharf will explore learnings that arise from developing a new educational programme for older adults in Ireland, "Touchstone", aimed at promoting civic engagement in later life. Ellen Tullo will present insights arising from the involvement of older adults in the design, development and delivery of an interdisciplinary module for undergraduate students in the UK. By comparing and contrasting these examples, and the roles that older people may adopt, contributors will critically review benefits and challenges associated with involving older people in the life and work of HE institutions.

UNIVERSITY AS INTERGENERATIONAL LEARNING AND LEADERSHIP INCUBATOR

M. Kaplan, *The Pennsylvania State University, State College, Pennsylvania*

Public awareness and interest in intergenerational programs is strong, fueled in part by a growing literature that attests to wide-ranging benefits for program participants and their communities. Participants tend to derive richer life perspectives, enhance social support networks, and find new pathways to civic engagement and community service. However, even successful programs tend to have difficulty finding skilled staff members to assist with program planning, activity facilitation, and program evaluation. Penn State University's Intergenerational Leadership Institute (ILI) is a lifelong learning and civic engagement program for older adults as well as an incubator for new intergenerational program development. ILI participants gain skills in reaching out to age-diverse populations, facilitating communication and cooperation across generations, and building consensus and teamwork among partnering organizations. The ILI adopts a micro-level approach to community innovation and service, focusing on the utilization of local assets and skills to shape self-help strategies at the local level

INCLUDING OLDER PEOPLE IN RESEARCH TOWARD CHANGE

A. Phinney, J. Baumbusch, L. Hung, *University Of British Columbia, Vancouver, British Columbia, Canada*

Through our respective programs of research, we seek to improve long term residential care services, support meaningful activity for older people in community settings, and enhance the physical environment for older patients in acute care hospitals. What unites our work is a commitment to

using research as a vehicle for effecting positive change in the health and social care systems. This pragmatist leaning has led us as nurses to consider older people not as the focus of our research, but as our *partners* in research. We discuss three ways that older people have been involved in our work: as *informants*; as *advisors*; and as *co-researchers*. We provide examples from various projects to illustrate the challenges and benefits of older people being included through these kinds of partnering roles, and where we see potential to further develop this approach to applied nursing research.

DEVELOPING A CIVIC EDUCATION PROGRAMME FOR OLDER PEOPLE: LESSONS FROM IRELAND

T. Scharf¹, B. McDonald², A. Atkins³, *1. Newcastle University, Newcastle, United Kingdom, 2. National University of Ireland Galway, Galway, Ireland, 3. University College Dublin, Dublin, Ireland*

Touchstone is a civic engagement programme that aims to develop the skills and capacities of a diverse population of older people to engage in community and, potentially, age-friendly initiatives. This paper reviews the experience of developing Touchstone in Ireland as a short course with the potential to generate participant-directed projects. We highlight the value of collaboration between higher education and community partners, presenting insights from a mixed-methods evaluation of two Touchstone courses involving 50 people aged 50 and over. Drawing on pre- and post-course questionnaires, two focus groups, and a range of observational data, the paper highlights opportunities and challenges emerging from development of the Touchstone programme. The paper concludes with an assessment of the potential role for higher education in Ireland and other countries in embedding age-friendly initiatives, founded on meaningful active engagement of ageing adults, within local communities.

SESSION 425 (SYMPOSIUM)

TECHNOLOGY SUPPORTING PEOPLE WITH DEMENTIA

Chair: W. Moyle, *Griffith University, Brisbane, Queensland, Australia*

Co-Chair: L.P. de Witte, *Zuyd University of Applied Sciences, Heerlen, Netherlands*

New as well as existing technologies can help the person with dementia and family carers to reduce social isolation and behavioral and psychological symptoms of dementia (BPSD), and therefore help to make the disease more manageable. This symposium, presented by leaders in the field of technology and social robots aims to assist participants to recognise the benefits of technology use in dementia care. An introduction to new online platforms to support family and community dwelling older people will demonstrate the relationship between independence and technology, while an overview of three social and telepresence robot projects will demonstrate the importance of these technologies in reducing social isolation and BPSD. The three symposium presentations will be complemented by the introduction of a new measurement of engagement - an important concept when measuring the effect of technology and persons with dementia.

IMPROVING DEMENTIA CARE THROUGH SOCIAL AND TELEPRESENCE ROBOTS

W. Moyle¹, C. Jones¹, B. Sung², T. Dwan¹, J. Murfield¹,
1. *Menzies Health Institute QLD, Griffith University, Brisbane, Queensland, Australia*, 2. *Curtin University, Perth, Western Australia, Australia*

The complexity of dementia, and the differing care services, makes it difficult to establish best practices for managing behavioural and psychological symptoms of dementia (BPSD). Our team have been trialling robots in the community and a social robotic laboratory. This presentation will demonstrate what we have learnt to date about the impact of using the robots in dementia care. Findings related to improvements in engagement, socialisation and mood as well as the feasibility of using social and telepresence robots from three studies will be outlined: 1) A cluster-randomised controlled trial ($n=415$, people with dementia living in long-term care), with three treatment groups – a robotic animal (PARO), a non-robotic animal (Plush-Toy), and usual care (control); 2) A case study of five dyads (people with dementia and family) using telepresence robots in a 6-week intervention; and 3) family, people with dementia and health professionals acceptance of telepresence robots in a laboratory trial.

ONLINE PLATFORM TO SUPPORT THE NETWORK OF CAREGIVERS OF PEOPLE WITH DEMENTIA

E. van Rossum, R. Verwey, A. Boessen, L.P. de Witte,
S. Willard, *Zuyd University of Applied Sciences, Heerlen, Netherlands*

Care technology is used insufficiently to support persons with dementia, their family and professional caregivers. We integrated a range of eHealth services and applications into an online platform, with the aim to strengthen care and support networks of persons with dementia. The platform was developed in an iterative user centered way, based on an available platform. It consists of 'cubes' with information about dementia (care), video communication options, a calendar and care plan. A first version was tested during 10 weeks in the networks of four community-dwelling persons with dementia. Family caregivers reported that they were better informed and felt more in control. Care professionals reported improved communication and better understanding among themselves and with family caregivers. In the autumn of 2016 the platform will be tested in 40 patient networks over a 4 months period. We will report the results of this field test and discuss the next steps.

A COMMUNITY ICT PLATFORM TO SUPPORT COMMUNITY-DWELLING ELDERLY PEOPLE: FEASIBILITY AND IMPACT

S. Willard¹, E. van Rossum^{1,2}, M. Spreeuwenberg^{1,2}, L.P. de Witte^{1,3}, 1. *Zuyd University of Applied Sciences, Heerlen, Netherlands*, 2. *Maastricht University, Maastricht, Netherlands*, 3. *University of Sheffield, Sheffield, United Kingdom*

Older people prefer to stay independent and active in their own environment. Information and communication technology can support them in accomplishing these goals. This is challenging though, as many are not familiar with technology. We introduced a community ICT platform in

Heerlen, a city with a highly ageing population, in close collaboration with older persons and active citizens. By means of simple and clear apps, the platform offers a market place for mutual services, community information, access to professional services, and possibilities to set up new community activities. A process evaluation is conducted to study the use of and experiences with the platform. In addition, the platform's impact on independent functioning, social contacts and involvement in community activities is studied in 150 users over a 12 months period. We will report data over the first 4 months and discuss the role of such platforms in future care and support models.

ASSESSING THE USE OF TECHNOLOGY TO ENGAGE PEOPLE WITH DEMENTIA

C. Jones¹, B. Sung², W. Moyle¹, 1. *Menzies Health Institute QLD, Griffith University, Brisbane, Queensland, Australia*, 2. *Curtin University, Perth, Western Australia, Australia*

The study of engagement (i.e. social interaction/connection) in people with dementia can determine the effectiveness of using technology to promote meaningful activity and to improve quality of life. This paper presents the psychometric properties of a recently developed 10-item Engagement of a Person with Dementia Scale (EPWDS). Four raters each watched and completed the EPWDS for 132 videos of people with dementia using PARO, a social companion robot for ten minutes. Psychometric properties of the EPWDS were assessed for Principal Components analysis along with measures of construct validity (i.e. convergent validity), internal consistency, test-retest reliability and inter-rater reliability. The EPWDS is reliable and shows validity in assessing engagement when using technology in five dimensions: affective, visual, verbal, behavioural, and social engagement. Importantly, it can be used to demonstrate the benefits of using technology to improve quality of life in people with dementia.

SESSION 430 (SYMPOSIUM)

FINANCING SERVICES FOR OLDER ADULTS WITH DAILY LIVING NEEDS: U.S. VS. INTERNATIONAL REFORM EFFORTS

Chair: G.E. Alkema, *The SCAN Foundation, Long Beach, California*

Over half of all adults turning 65 in the United States will experience a high need (needing assistance with two or more activities of daily living or experiencing severe cognitive impairment) for long-term services and supports (LTSS) over their lifetime. Fifteen percent will experience high need for five or more years. However, the United States lacks an insurance system to protect older adults from the risks associated with this need. It relies, instead, on an unsustainable mix of out-of-pocket payments, unpaid family caregiving and financing from Medicaid, a welfare-based healthcare program for low-income individuals.

Over the past two years, several influential bipartisan groups have developed recommendations for shifting the financing of LTSS to an insurance-based system. In this symposium, long-term care financing leaders will 1) share insights from new economic modeling platform that supported policy recommendation development, 2) discuss the structure

and status of policy recommendations to date, and 3) compare these proposals with long-term care systems from other countries also preparing for a rapidly aging population.

LTSS RISKS AND COSTS IN THE U.S.: NEW RESEARCH INFORMS FINANCING SOLUTIONS

A. Tumlinson, *Anne Tumlinson Innovations, LLC, Washington, District of Columbia*

New economic modeling from the Washington, DC-based research organization, the Urban Institute, has changed the policy conversation about long-term supports and services (LTSS) financing reform in the U.S. The Urban Institute has developed a micro-simulation model of the lifetime risk of needing LTSS and the costs associated with this risk. In this presentation, Anne Tumlinson, project coordinator for the modeling work, will share the major findings and discuss their implications. These include average lifetime risk for needing a high level of LTSS and the average costs of this risk, by financing sources – out-of-pocket spending and Medicaid. This presentation will explain how these risks vary by gender and income, and how the averages mask an uneven distribution of risk. This presentation will then present results from simulations of new insurance programs; the winners and losers under a variety of approaches.

BUILDING A NEW LTSS FINANCING SYSTEM IN THE U.S.: BIPARTISAN LEADERS JOIN TOGETHER TO CRAFT SOLUTIONS

K.J. Hayes, *Bipartisan Policy Center, Washington, District of Columbia*

The Washington, DC-based Bipartisan Policy Center (BPC) has been working, over the past two years, to recommend reforms for financing Long-Term Services and Supports (LTSS) in the U.S. Their work, chaired by Former Senate Majority Leaders Tom Daschle and Bill Frist, Former Congressional Budget Office Director Alice Rivlin, and Former Governor and Department of Health and Human Services Secretary Tommy Thompson, considered a wide range of private and public sector options. This presentation will share BPC's final recommendations on the roles of private long-term care insurance markets and public insurance programs, as well as insights on BPC's decision-making process, and how the economic modeling influenced those decisions. This presentation will also discuss the challenges that U.S. policymakers face in reforming the current system and political feasibility of reform given these challenges.

NEW LTSS FINANCING REFORM OPTIONS IN THE U.S. AND HOW THESE RELATE TO INTERNATIONAL EXPERIENCES

H. Gleckman, *The Urban Institute, Washington, District of Columbia*

While the 2010 Affordable Care Act (ACA) extended healthcare coverage to most Americans, it did not improve the financing of long-term services and supports (LTSS). As a result, a group of influential non-government stakeholders and thought leaders formed the "Long-Term Care Financing Collaborative" to develop detailed recommendations for enhancing both finance and delivery of LTSS. In this presentation, Howard Gleckman, a senior fellow at the Urban Institute and one of the Collaborative's conveners,

will discuss its recommendations, including a universal catastrophic insurance program. This presentation will compare the Collaboratives' recommendations with LTSS financing systems in selected other countries, and explain how lessons from these countries are informing reform efforts in the U.S.

SESSION 435 (SYMPOSIUM)

SOCIAL ISOLATION AND LONELINESS: A PLACE-BASED PERSPECTIVE

Chair: R. Winterton, *La Trobe University, Wodonga, Victoria, Australia*

As the population ages, more older people across the world are living alone, such that social isolation and loneliness have emerged as a key policy and practice challenge, with important implications for the health and wellbeing of older people. Thus, governments at all levels as well as major non-profit organizations have implemented a range of health promotion interventions designed to address this intransigent problem. In recent years, for example, Age UK has developed the Campaign to End Loneliness, while the Australian Red Cross is currently running a campaign called Doing it Tough designed to reduce older people's feelings of loneliness and isolation.

However, whilst researchers, policy-makers and practitioners all recognise this area as a major concern, there is an important gap in understanding of how social isolation and loneliness are impacted by the environments in which older people live. Thus, presenters at this Symposium will address this issue from a number of place-based perspectives, both across and within national boundaries, as well as across the rural / urban divide. Rurality is a particular focus as many older people across the world live in geographically isolated communities.

By exploring how social isolation and loneliness may differ according to the places people live, this Symposium will challenge us to explore the design and implementation of more appropriate and effective social interventions.

DOES LONELINESS AMONG OLDER PEOPLE VARY WITH THE PLACE THEY LIVE?

C. Victor, J. Pikhartova, *Brunel University London, London, United Kingdom*

There are variations between different countries in reported levels of loneliness but less attention has been given to variations within countries. We use data from the English Longitudinal Study of Ageing (ELSA) to investigate if loneliness for older people varies between different areas (urban, rural, inner city and deprivation status). Areas are classified using standard measures of deprivation and type (urban, rural) and we use 2 loneliness measures: R-UCLA scale and a self-rating question.

4,765 individuals were present in both waves 2 and 6 (mean age 71.6 years (wave 6)). Loneliness prevalence was 18% in wave 2 and 20% in wave 6. Loneliness was higher for those living in deprived areas (ORs from 1.4 to 1.8) compared to those who were not although the relationship was attenuated when confounding factors were taken into account (OR 1.11; 95% CI 1.02–1.20). There was no relation between loneliness and type of area (urban/rural).

UNDERSTANDING LONELINESS IN AUSTRALIAN RURAL AGEING POPULATIONS: A MIXED METHODS APPROACH

S. Hodgkin, R. Winterton, J. Warburton, *John Richards Initiative, La Trobe University, Wodonga, Victoria, Australia*

Utilising data from six Australian rural regions, this mixed-methods study sought to understand both the predictors of loneliness, and how loneliness is constructed among diverse rural ageing populations. At stage one, cross sectional data was collected via a telephone survey (n=266), with measures relating to wellness, health, social capital, social ties and reciprocal support, and loneliness. This was followed by qualitative, semi structured interviews (n=60), which sought to expand on the quantitative findings. A standard multiple regression found that wellness, mental and physical health, support received and community characteristics predicted 38.5% of the variability seen in loneliness. Other variables, (age, gender, social and community participation) did not contribute to the amount of variability in loneliness scores. This presentation critically discusses these findings in the context of the qualitative data relating to loneliness, and highlights how rural older adults construct loneliness in relation to micro and macro environmental characteristics.

FEELINGS OF LONELINESS IN AN URBANIZED COUNTRY: DOES PLACE AND CIVIC ENGAGEMENT MATTER?

S. Dury, N. De Witte, D. Verté, L. De Donder, A. Smetcoren, S. Van Regenmortel, *Vrije Universiteit Brussel, Brussels, Belgium*

This paper explores the relationships between environmental features, civic engagement and feelings of loneliness. It raises the question of how neighborhoods and municipalities promote or hinder feelings of loneliness. Data for the research are derived from the Belgian Ageing Studies, a structured survey among community-dwelling older people (n= 28 094, in 83 municipalities). We conducted multivariate regression models which included environmental factors (degree of urbanization, neighborhood connectedness and satisfaction, quantity and quality of contact with neighbors) and civic engagement (personal leisure, civic participation, informal help, community leisure, and volunteer work) on feelings of loneliness (social and emotional loneliness). The results indicate that feeling connected to the neighborhood, having qualitative contact with neighbors, and doing volunteer work or participate in an association lowers feelings of social loneliness. The conclusion raises practical implications and formulates a number of policy recommendations to tackle feelings of loneliness in an aging society.

THE IMPACT OF RURALITY, DISADVANTAGE, AND POPULATION TURNOVER ON SOCIAL ISOLATION AND LONELINESS

V. Burholt, D. Morgan, *Swansea University, Swansea, United Kingdom*

This study draws on the CFAS Wales data to test a pathway from poor health to loneliness in later life. We hypothesize that poor health will increase the risk of social isolation, and that social isolation will mediate between health and loneliness. Further, we hypothesize that rural environments, disadvantage places and population turnover will amplify

exclusion from social resources. We conceptualize a mediation model and a moderated-mediation model. Nationally representative data on older people living in Wales are used to validate the hypothesized pathways. The results indicate that our hypotheses are partially supported. We demonstrate that there are distinct pathways from poor health to loneliness in different types of areas. The statistical models increase our understanding of the contribution that environment has in social isolation and the experience of loneliness. We suggest that it is insufficient to consider loneliness as an outcome of interactions between individual-level characteristics.

SESSION 440 (SYMPOSIUM)

CHALLENGES FOR CONTEMPORARY GRANDPARENTING: GENDER, WORK, IMMIGRATION AND DISABILITY

Chair: S. Moffatt, *Newcastle University, Newcastle upon Tyne, United Kingdom*

Co-Chair: H. Merrick, *Newcastle University, Newcastle upon Tyne, United Kingdom*

Discussant: M. Silverstein, *Syracuse University, Syracuse, New York*

Increased life expectancy offers the potential for grandchildren to establish much longer term relationships with their grandparents, yet contemporary patterns of marriage, separation, divorce, labour force participation and migration make the experience of being a grandparent more complex and diverse. It is widely accepted that grandparents play an important role practically, emotionally and financially, but that this varies across cultures, social and family norms and welfare states. Gender, retirement practices, policies to extend working life, socio-economic factors and migration patterns are key to a better understanding of grandparenting in the 21st century, yet much is poorly comprehended and inadequately theorised. This symposium will address some of these gaps and draw on European, North American and globally focused research. Paper 1 examines the impact of social policies to extend working lives on grandparenting in the UK from the perspective of both women and men. Paper 2 focuses on the extensive childcare provided by working grandmothers in the US and how this impacts on their own lifecourse. Paper 3 explores cultural expectations amongst immigrant grandmothers in the US, and the conflicts which can ensue when 'norms' contrast with their country of origin. The final paper considers the experiences of grandparenting in the context of childhood disability and the challenges this can present across three generations of the family as the grandparent ages. More broadly, this symposium enables debate about how intergenerational relations, social policies, migration, gender, agency and structure will lead to a better understanding of contemporary grandparenting.

GRANDPARENTS, CARE, GENDER, AND FLEXIBLE WORK IN THE UK

D. Lain¹, W. Loretto², *1. University of Brighton, Brighton, United Kingdom, 2. University of Edinburgh, Edinburgh, United Kingdom*

UK grandparents are an important source of childcare provision for working parents (Glaser et al, 2010). At the same

time, however, there are increasing pressures for older people to remain in work, creating a potential tension between working and caring. We therefore need a much better understanding of the experiences, preferences and perspectives of grandparents providing care and how their decisions interact with their domestic, work and retirement circumstances. The paper presents results from a project qualitatively interviewing 60 UK grandparents that regularly care for their grandchildren while their adult children are at work. The sample includes grandmothers and grandfathers, and is stratified to include working and non-working grandparents on high to low incomes. Key findings relate to the influences of work-related flexibility and part-time work on caring; the importance of resources in terms of exercising control; and the role of grandfathers in caring.

CULTURAL AND GENDERED EXPECTATIONS OF LATIN AMERICAN AND CARIBBEAN GRANDMOTHERS IN THE U.S.

Y. Abdul-Malak, *Syracuse University, Syracuse, New York*

As with any other groups in the U.S, immigrant grandmothers provide care for grandchildren when their adult children are in need of assistance and public programs do not provide adequate support. This paper focuses on the theoretical framework of carework outside of the Western context. It draws on in-depth interviews with 15 immigrant non-custodial grandmothers from Latin America and the Caribbean and examines how contrasting cultural and gendered expectations between the sending and receiving countries make grandmothering challenging. Disciplining grandchildren was one of the more salient issues that was raised through almost all the interviews. Immigrant grandmothers attempt to reconcile the forms of discipline from their home countries and what they perceive as the tolerance that is pervasive in Americans childrearing practices. The issue of disciplining their grandchildren engenders some type of emotional stress that might have some deleterious effects on grandmothers' health.

GRANDPARENTING DISABLED CHILDREN: EXPERIENCES FROM THE UK

S. Moffatt, M. Tse Laurence, L. Pennington, *Institute of Health and Society, Newcastle University, Newcastle upon Tyne, United Kingdom*

Grandparenting in the context of childhood disability, is an under-researched area, particularly in the UK. This qualitative study draws on in-depth interviews with nine grandparents (seven grandmothers) of children aged 3–19 years with a range of developmental disabilities. Grandparenting 'norms' were similar to grandparents of non-disabled children, namely to 'not interfere' and 'be there'. However, this was complemented by 'intensive' grandparenting, and grandparents simultaneously expressed positive and negative feelings and exercised considerable agency to achieve a balance in their relationships with their disabled and non-disabled grandchildren. Grandparents reflected on the impact of their own ageing and death in the context of the continued needs of their disabled grandchild, and worried for their adult children, denied a 'normal' life course. The ageing of the disabled grandchild and grandparents impacts on the type and intensity of grandparenting provided, with particular

implications for the care responsibilities of middle generation adult children.

SESSION 445 (SYMPOSIUM)

BUILDING INTERDISCIPLINARY RESEARCH CAPACITY: LESSONS FROM THE INTERNATIONAL SUMMER SCHOOLS ON AGING

Chair: G. Lamura, *INRCA - National Institute of Health and Science on Ageing, Ancona, Marche, Italy*

Co-Chair: A. Martin-Matthews, *University of British Columbia, Vancouver, British Columbia, Canada*

Discussant: A.C. Walker, *University of Sheffield*

The objective of this symposium is to consider the rationale, delivery and outcomes of an International Summer School on Ageing (ISSA) for doctoral students and post-doctoral fellows, held in 2012 (Italy), 2014 (Sweden) and 2016 (Canada). The creation of the ISSA is a direct response to the "Road Map for European Ageing Research" (Walker et al., 2011), produced by the European Commission's *FuturAGE* project. ISSA is unique in its interdisciplinary approach, international audience (of both participants and mentors), and focus on ageing-related contents as well as methodological and research development issues. We analyse the outcomes of three ISSA. Data are based on participants' assessments at the end of each and then six months post-ISSA (six data-sets totally). The perspectives of several ISSA alumni (among its 60 graduates) reflect different national and disciplinary (including clinical) contexts in appraising ISSA's short- and longer-term impacts. Findings underscore the value of role-modelling through interaction with established researchers and the development of international research networks, leading to active interdisciplinary collaborations. This symposium also contextualizes approaches to the future of interdisciplinary education on ageing, comparing ISSA with other national and international initiatives. The training of early career researchers remains often largely mono-disciplinary, thus challenging researchers' professional capacities to understand the holistic nature of the ageing process. ISSA underscores instead the value of additional interdisciplinary training within an international framework. The *FuturAGE* project leader, Alan Walker (UK), is discussant, and will highlight how initiatives like ISSA can play a strategic role in capacity building in ageing research.

BUILDING FUTURE COHORTS OF RESEARCHERS: RATIONALE AND AIMS OF AN INTERNATIONAL SUMMER SCHOOL ON AGEING

G. Lamura¹, A. Martin-Matthews², C. Chiatti¹, T. Svensson³,
1. *INRCA - National Institute of Health and Science on Ageing, Ancona, Marche, Italy*, 2. *University of British Columbia, Vancouver, British Columbia, Canada*, 3. *Lund University, Lund, Sweden*

Globally, increasing efforts are being undertaken to set up programmes aimed at enhancing size, interdisciplinarity, international focus and quality of new cohorts of researchers in ageing-related issues. Awareness of such developments, as well as of the wide-ranging priorities identified by the

FuturAGE “Road Map for European Ageing Research”, prompted a group of researchers from countries with quite different gerontological traditions (Canada, Italy and Sweden) to initiate an “International Summer School on Ageing” (ISSA). This presentation provides an introduction to the rationale and objectives of the ISSA, starting with an overview of existing models for building a community of age-focused researchers. Lessons from different training initiatives are also discussed, including the Summer Program in Aging organised by Canada’s Institute of Aging. Finally, ISSA’s design, implementation and evaluation structure will be illustrated, highlighting the solutions adopted to enhance the capacities of participants for collaborating across disciplines, sectors and geographical areas.

OVERVIEW OF THE MAIN CONTENTS AND OUTCOMES OF THE ISSA: EVALUATION AND FOLLOW-UP STRATEGIES

F. Barbabella^{1,2}, C. Chiatti¹, R. Papa¹, 1. *INRCA - National Institute of Health and Science on Ageing, Ancona, Marche, Italy*, 2. *Linnaeus University, Kalmar, Sweden*

This contribution aims at illustrating contents and outcomes of the first three editions of the ISSA, including its mid-term impact on the careers of early-stage researchers who attended it. A longitudinal assessment was conducted with all participants (N=60), both at post-event and 6-month follow-up for each ISSA. Assessment included a questionnaire with structured and semi-structured questions on the satisfaction and usefulness of each module, as well as on advantages from participating in the ISSA. Findings underline the high rating of professional and research skills development in training for publication and grant-crafting. Furthermore, ‘interaction with established researchers’ and ‘being part of a research network’ were perceived as main benefits after attendance. Some students reported that, after the event, they remained in contact for study or research purposes. Results suggest that ISSA represented an exceptional opportunity for capacity building and to establish connections between researchers with different disciplinary backgrounds.

FROM ISSA STUDENT TO ALUMNI: LEARNING OUTCOMES AND EXPERIENCES OF PARTICIPANTS

C. Nilsen², E. Tullo¹, S. Van Regenmortel³, 1. *Newcastle University, Newcastle upon Tyne, United Kingdom*, 2. *Ageing Research Center - Karolinska Institutet & Stockholm University, Stockholm, Sweden*, 3. *Vrije Universiteit, Brussels, Belgium*

This presentation will compare and contrast the personal perspectives of three students who each attended different iterations of the International Summer School of Ageing (ISSA): 2012, 2014 and 2016. We will outline the key learning outcomes we obtained *during* the summer school and what this meant for our career trajectories *after* the event. In particular, we will discuss why and how participation in the summer school increased our confidence as early career researchers, gave hands-on tips and tricks, and allowed us to establish an international professional network beyond our home institutions. We will describe examples of concrete academic outputs prompted by participation in ISSA such as international conference symposia and ongoing collaboration between ISSA students and faculty members.

THE FUTURE OF INTERDISCIPLINARY AND CROSS-NATIONAL GRADUATE EDUCATION ON AGING AND HEALTH

S. Iwarsson, *Department of Health Sciences, Faculty of Medicine and Centre for Ageing and Supportive Environments (CASE), Lund University, Lund, Sweden*

Building upon the experiences of establishing a graduate school integrated in a center for research on aging (CASE) and the national graduate school for aging and health (SWEAH) in Sweden, Lund University is a founding partner of ISSA. Nurtured by collective as well as personal experiences of graduate supervision and examination internationally, trends useful for future interdisciplinary and cross-national education endeavors will be presented and problematized. Evaluation results show that students are highly motivated for interdisciplinary research, but also that they find it challenging to integrate such perspectives in their thesis projects. Students as well as supervisors must engage in networking beyond their comfort zones, while balancing mono-disciplinary formal requirements and interdisciplinary ambitions. PhD student engagement in cross-national research introduces even further challenges, but is highly rewarding for those involved. Truly committed and open-minded senior researchers serving as role models constitute a prime requirement for the future of such developments.

SESSION 450 (SYMPOSIUM)

THE WORLDWIDE FACE OF ELDER ABUSE: COMMONALITIES AND DIFFERENCES AMONG SELECTED WHO REGIONS

Chair: P.B. Teaster, *Virginia Polytechnic Institute & State University, Blacksburg, Virginia*

Discussant: G. Antezberger, *Cleveland State University, Cleveland, Ohio*

Building upon the first international study, *The Worldview Environmental Scan on Elder Abuse*, this symposium presents findings from the second international study, *The Worldwide Face of Elder Abuse*. Specifically, the purpose of this study was to understand commonalities and differences among World Health Regions concerning how and why people abuse older adults. The aims of the study were to: (1) increase the number of survey respondents, both in terms of represented persons and countries, (2) expand the group of experts and expertise in the field of elder abuse through the formation or use of related national multidisciplinary teams, and (3) explore undisclosed areas of inquiry with respect to elder abuse as a global problem. Participants in this symposium will present the following information: background of the study, methodology of the study, characterizations of cases from Asia, Europe, North America, and South America. The symposium concludes with observations from the case studies from the four regions as well as study implications and next steps.

OVERVIEW AND MAJOR FINDINGS FROM THE WORLDWIDE FACE OF ELDER ABUSE STUDY

P.B. Teaster, R.H. Weaver, *Human Development, Virginia Polytechnic Institute & State University, Blacksburg, Virginia*

The first large-scale international study, the WorldView Environmental Scan on Elder Abuse, explored the nature

and response to elder abuse (53 individual countries, 6 WHO regions). Results indicated that the problem of elder abuse existed and that no single definition applied. In developing countries, poverty and lack of social support were leading causes of elder abuse in developing countries; in developed countries, living alone and lack of social support were leading causes. Building upon the Scan, the Worldwide Face of Elder Abuse is the second ever large-scale international study of elder abuse. This presentation summarizes the major findings from the study, in which exploitation by a family member is prevalent across the majority of cases, and concludes with implications of the findings and future directions for conducting future large-scale international studies.

THE FACE OF ELDER ABUSE IN ASIA

E. Yan, G. Fang, *The University of Hong Kong, Hong Kong, Hong Kong*

Asian population is aging at an unprecedentedly fast pace. By 2050, 24% of the population would age 60 or above (HelpAge International, 2013). This presentation outlines the current state of knowledge of elder abuse in Asia, with a particular emphasis on studies conducted in Chinese societies. The presenter highlights the changing cultural values and sociodemographic characteristics and their relevance to understanding elder abuse in Chinese populations. Efforts to prevent and intervene elder abuse in Chinese societies will also be discussed.

THE FACE OF ELDER ABUSE IN EUROPE

B. Penhale, *School of Health Sciences, University of East Anglia, Norwich, United Kingdom*

This paper will provide an overview of elder abuse, with a focus on UK and European perspectives. The issues and developments that have occurred will be briefly explored. Over the last decade there has been increasing recognition of abuse and neglect of older adults as a social problem. A number of European countries have been working in this area but are at different stages of development. Recognition of abuse remains problematic. Defining and identifying abuse remain difficult, perhaps even more when the abuse occurs within institutional settings. Techniques of intervention with victims of abuse and those who abuse are in comparatively early stages of development, although there has been progress with systems for health and care professionals. Responses to the problem of elder abuse from several European countries will be explored, although there will be a concentration on techniques of intervention from a UK perspective.

THE FACE OF ELDER ABUSE IN SOUTH AMERICA

L. Daichman, *ILC-Argentina, Buenos Aires, Argentina*

In South America, there is a growing understanding that providers of public and private services abuse the human rights of frail older people by failing to provide personal care, adequate treatment, and basic nutrition and hydration. Over the last 15 years, policymakers, health professionals, users, and carers in Argentina have collaborated to publicise the benefits of providing compassionate, humane, and empathic care to elders. A better understanding of human rights and a new International Convention for the Rights of Older Persons will improve all types of care and prevent

institutional neglect and abuse. National campaigns such as *La Cultura del Buen Trato* and training over 25,000 caregivers have concentrated on positive reinforcement and support to staff delivering care to older people. Highlighting the importance of human rights in the care of older people emphasises that dignified care is the responsibility of all staff as well as those who commission care.

ELDER ABUSE IN CANADA: A GROWING DILEMMA IN AN AGING SOCIETY

E. Podnieks, *University of Toronto, Toronto, Ontario, Canada*

According to Statistics Canada, eight million adults will be over the age of 65 by 2031, nearly 25 percent of the population. Increasingly, older adults report being victims of abuse, even though Canada has actively addressed the problem since the early 1980s (Podnieks, 1989). This presentation describes the most recent study to quantify the extent of elder abuse and neglect in Canada (McDonald, 2016). More than three quarters of a million Canadian elders suffered some form of abuse last year, more than double the 1998 finding. One reason could be a rise in financial abuse, the second most frequent form behind psychological abuse. The most important risk factor was depression, followed by having been abused in another stage of the life course. This presentation describes the study's guiding theoretical framework, methodology, and findings and draws conclusions and offers implications for future research and services for maltreated older adults in Canada.

SESSION 455 (SYMPOSIUM)

COMMUNITY FOR SUCCESSFUL AGEING (COMSA) @WHAMPOA: CREATING AN ECOSYSTEM FOR AGEING IN PLACE

Chair: S. Harding, *International Longevity Centre, Singapore, Singapore*

Discussant: H.J. Vrijhoef, *Saw Swee Hock School of Public Health, National University of Singapore, Singapore, Singapore*

"Ageing in Place" remains the Holy Grail for aged care planning despite advances made in healthcare, home technology, housing design and healthcare financing. It requires coordinated, multipronged efforts from policy, research and practice to re-engineer the ecosystem where people live, work, play and age. One such re-engineering project has been initiated by Tsao Foundation, a Singapore-based but regionally oriented non-governmental organisation, in 2013.

This symposium showcases Tsao Foundation's ground-up, community-wide demonstration project called the *Community for Successful Ageing* or "ComSA". The impetus for ComSA comes from the Foundation's mission to fulfil older persons' needs and aspirations for their continuing healthcare and personal growth. Situated in a relatively lower-income and higher elder concentration locality in Whampoa, ComSA created a unique ecosystem that responds to policy and market challenges in a non-welfare state. ComSA pulls together multiple components for successful ageing, which include: multidisciplinary health and social services, civic empowerment and participation and policymaking.

ComSA planners, implementers, providers and researchers will be speaking at the symposium. Talks will be followed by discussions with participants for the following topic areas:

1. An overview of ComSA – its theoretical framework and essential components
2. The development of a system of care in ComSA – from case finding, primary care, care management to service provider networking
3. The development and activation of the grassroots community – from self-care to self-development
4. An overview of research activities – measuring processes and outcomes

AN OVERVIEW OF COMSA—ITS THEORETICAL FRAMEWORK AND ESSENTIAL COMPONENTS

M. Tsao¹, W. Ng¹, K. Peh¹, S. Harding¹, Z.J. Hildon^{2,3}, Z.Z. Lim^{1,2}, H.J. Vrijhoef^{2,4,5}, 1. *Tsao Foundation, Singapore, Singapore*, 2. *Saw Swee Hock School of Public Health, National University of Singapore, Singapore, Singapore*, 3. *London School of Hygiene and Tropical Medicine, London, United Kingdom*, 4. *National University Health System, Singapore, Singapore*, 5. *Department of Patient & Care, Maastricht University Medical Center, Maastricht, Netherlands*

The ComSA (Community for Successful Ageing) @ Whampoa initiated by Tsao Foundation (Singapore) brings together multidisciplinary expertise for optimising opportunities in longevity and improving the quality of life of older persons in the interconnected areas of health, personal empowerment, social participation and wellbeing. This session gives an overview of various ComSA components and the theories underpinning ComSA.

THE DEVELOPMENT OF A SYSTEM OF CARE FOR THE AT-RISK ELDERS IN COMSA

W. Ng, K. Peh, H. Chua, F. Hon, E. Koh, P. Cheong, *Tsao Foundation, Singapore, Singapore*

ComSA @Whampoa has two major domains: the System of Care (SoC) and Community Development. The SoC domain aims to create a comprehensive and integrated delivery system for care of the at-risk elderly. This session describes the creation of the SoC through three key components: 1) the development of novel biopsychosocial risk screener that identifies vulnerable community-dwelling older adults; 2) the provision of stratified aged care service by a multidisciplinary care management team in partnership with age-friendly primary health care providers; and 3) the creation of a service provider network. SoC implementers will also share their journey in developing the program, feedback gathered from the clients and SoC's impacts on the overall ComSA ecosystem. A more in-depth discussion of the care management component is available in the fourth presentation of the symposium.

COMMUNITY DEVELOPMENT IN COMSA: FROM SELF-CARE TO SELF-DEVELOPMENT

M.B. Geronimo, E.S. Ahmad, J. Lee, S. Harding, *Tsao Foundation, Singapore, Singapore*

ComSA @Whampoa has two major domains: the System of Care and Community Development (CD). The CD domain addresses psycho-social needs of ageing. It aims to increase

older persons' sense of health and wellbeing by: addressing problems of alienation and apathy; improving sense of optimism and community pride; cultivating leadership and trust among community members. This session describes the creation of CD through three key components: 1) the development of an educational intervention to assist elders to develop positive attitudes and behaviours toward self-care and wellness; 2) the creation of platform for elders to address their biopsychosocial challenges and collectively find solutions; 3) the facilitation of longer-term, elder-initiated civic action groups in partnership with stakeholders from across all sectors and age groups. CD implementers will also share their journey in developing the program, feedback gathered from the clients and CD's impacts on the overall ComSA ecosystem.

CARE MANAGEMENT IN COMSA: SHIFTING FROM A HOSPITAL-CENTRED TO A PROACTIVE, COMMUNITY-BASED APPROACH

H. Chua, K. Peh, F. Hon, E. Koh, P. Cheong, W. Ng, *Tsao Foundation, Singapore, Singapore*

Background: Traditionally, case management (CM) in Singapore adopts a hospital-centric model: CM clients are identified only by the hospitals; and referred by the hospitals to community-based providers. ComSA-CM aims to reverse this process by proactively identify clients even before problems are developed or worsen. **Method:** Selected case studies from ComSA-CM will be presented to explore: methodology used for proactive detection of CM clients; how care is integrated with other service providers; major operational challenges; and potential outcomes achieved. **Results:** This new care model required big changes in care focus, CM approaches and relationship to the clients. Adjustments were required for roles, skillset and the pacing with the clients. Most well (but at-risk) clients would resist CM initially; hence required persistent effort to build relationship. The acceptance of CM was facilitated by a concurrent community activation project. **Conclusion:** Community-based CM is proactive in preventing deterioration in clients already at-risk for hospitalisation.

SESSION 460 (POSTER)

ACUTE CARE I

MAKING BETTER DECISIONS ABOUT POST-ACUTE CARE: KEY STAKEHOLDER PERSPECTIVES

R.E. Burke¹, E. Lawrence¹, A. Ladebue¹, R. Ayele¹, J. Reither¹, J. Jones², E. Cumbler³, R. Allyn⁴, 1. *Research and Hospital Medicine Sections, Denver VA Medical Center, Denver, Colorado*, 2. *University of Colorado College of Nursing, Aurora, Colorado*, 3. *University of Colorado School of Medicine, Aurora, Colorado*, 4. *Denver Health and Hospital Authority, Denver, Colorado*

The number of older adults discharged to post-acute care (PAC) facilities after hospitalization is increasing rapidly, but their clinical course is uncertain. We sought to understand how the decision to go to a PAC facility after hospitalization is made from the perspectives of hospital-based clinicians (physicians, nurses, therapists, social workers), patients, and

caregivers. We also wanted to understand the perspective of PAC-based clinicians, patients, and caregivers on the content and quality of this decision-making. We conducted 70 semi-structured interviews at three hospital-based units and two skilled nursing facilities with content focusing on the knowledge, attitudes, and beliefs of participants regarding PAC. We used a team-based approach to analysis with both inductive and deductive components informed by social constructivism, transitions of care principles, and systems engineering. Among hospital providers, decision-making is decentralized and implicit, without consensus on which patients should go to PAC or when they are ready to be discharged. There was strong tension between patient autonomy and provider paternalism, and little feedback to improve decision-making. Patients and caregivers identified several systems barriers, including insurance coverage and hospital length of stay, which affected their decision-making. PAC providers identified common transitional care deficits and highlighted the increasing acuity and complexity of patients admitted to PAC, while patients and caregivers expressed stress and uncertainty about payment and planning for a possible return home. Decision-making about PAC is highly variable but can have a profound impact on outcomes; understanding these perspectives and identifying best practices for shared decision-making may improve outcomes.

ANTITHROMBOTIC AGENTS INTAKE PRIOR TO INJURY DOES NOT AFFECT OUTCOME AFTER A TBI IN ELDERLY PATIENTS

J. Julien^{1,2}, G. Alsideiri⁵, J. Marcoux³, M. Feyz⁴, E. de Guise^{1,2,6}, 1. *Psychology, Montreal University, Laval, Quebec, Canada*, 2. *Centre de recherche interdisciplinaire en réadaptation du Montréal métropolitain, Montreal, Quebec, Canada*, 3. *Neurology and Neurosurgery Department, McGill University Health Centre, Montreal, Quebec, Canada*, 4. *Traumatic Brain Injury Program, McGill University Health Centre, Montreal, Quebec, Canada*, 5. *Montreal Neurological Institute & Hospital, McGill University, Montreal, Quebec, Canada*, 6. *Research Institute-McGill University Health Center, Montreal, Quebec, Canada*

Previous studies have shown that anticoagulation is associated with a higher risk of bleeding after traumatic brain injury (TBI) and a higher mortality rate. However, other studies have shown conflicting results on the outcome after a TBI in anticoagulated patients. The purpose of this study is to investigate the effect of risk factors including international normalized ratio (INR) as well as the Partial thromboplastin time (PTT) scores on outcome following TBI in the elderly population. Data were retrospectively collected on patients (n = 982) aged 65 and above who were admitted post TBI to the McGill University Health Centre-Montreal General Hospital from 2000 to 2011. Age, Injury Severity Score (ISS), Glasgow Coma Scale score (GCS), type of trauma (isolated TBI vs polytrauma including TBI), initial CT scan results according to the Marshall classification and the INR and PTT scores and prescriptions of antiplatelet or anticoagulant agents (AP/AC) were collected. We found that age is significantly associated with an increase in the rate of death (CSHR:1.08, 95%CI(1.06, 1.11) and in the rate of discharge to a long-term facility (CSHR:1.06, 95%CI (1.03,

1.09)). PTT values above 60 adversely affected outcome in patients not on AP/AC only, and INR values had no effect on outcome or CT findings. Age and injury severity rather than antithrombotic agent intake are associated with adverse acute outcome in hospitalized elderly TBI patients.

MORTALITY AND ASSOCIATED RISK FACTORS FOR OLDER ADULTS VISITING THE EMERGENCY DEPARTMENT

C. Garcia-Pena³, P. Tella¹, L. Robles², U. Perez¹, 1. *Geriatric Epidemiology Research, National Institute of Geriatrics, Mexico City, Distrito Federal, Mexico*, 2. *National Institute of Psychiatry Ramón de la Fuente Muñiz, Mexico City, Mexico City, Mexico*, 3. *Research Department, National Institute of Geriatrics, Mexico City, Mexico City, Mexico*

Context: The recent increase in population aging has implications in every level of health, including acute care in an emergency department context. In order to allocate care for those in the highest risk of mortality, factors associated with lower survival in older adults that assist to emergency departments are needed.

Design: Cohort study

Setting: Observation and emergency department of two General hospitals of the Metropolitan area of Mexico City.

Patients or other participants: adults over 60 years of age, of both sexes, beneficiaries of the Mexican Institute of Social Security and residents of the Metropolitan area of Mexico City who were admitted for observation to an emergency department of one of the two participating general hospitals

Main and secondary outcome measures: All-cause mortality from the time of hospital admission until a follow-up home visit after discharge was measured. Included risk factors were from different dominions: socio demographic, health-care related, health-related (mental and physical) and in-hospital care-related. Survival functions were estimated using Kaplan-Meier curves, and associated life tables were calculated. Hazard ratios were derived from Cox regression models in a multivariate analysis.

Results: From 1,406 older adults 59.17% were women (n=701). Independent mortality risk factors found were age, schooling, delayed emergency assistance, length of stay in the ED, ED with geriatric care trained residents, handgrip strength, cognitive status, worsening delirium, decline in functional status and frailty.

Conclusion: The health system must adapt to the multidisciplinary needs of the older adults, emergency departments may represent triggers for mortality.

IMPACT OF A GERIATRIC CO-MANAGEMENT PROGRAM FOR ELECTIVE JOINT REPLACEMENT

J.C. Defillo^{2,1}, J. Goncalves Monteiro^{1,3}, L.E. Rubin^{1,4}, J. Froehlich^{1,4}, K. Butterfield^{1,3}, L. McNicoll^{1,2,3}, 1. *Alpert Medical School of Brown University, Providence, Rhode Island*, 2. *University Medicine Foundation, Department of Internal Medicine, Division of Geriatrics and Palliative Medicine, Providence, Rhode Island*, 3. *Department of Medicine, Rhode Island Hospital, Providence, Rhode Island*, 4. *Department of Orthopaedic Surgery, Division of Adult Reconstruction, Providence, Rhode Island*

Introduction: Geriatric co-management models (GCM) within orthopedic surgery have emerged in the last decade,

especially with hip fractures. Our aim was to compare a GCM program for elective knee (TKA) and hip (THA) replacement with historical (HG) and concurrent control (CG) groups in regards primarily to length of stay (LOS) and secondarily to 30-day readmission rates (RaR), mortality, and home discharges. **Methods:** Retrospective cohort design, including patients aged 70 and above undergoing elective joint replacement in a community hospital, November 2011 to December 2013. Protocols for geriatric syndromes and post-operative complications were developed. Of 1167 patients, 33.8% were HC. After GCM implementation, 344/733 (44.5%) were GCM patients. Outcomes were analyzed using multivariate analysis. **Results:** Baseline characteristics were similar except for slightly lower ASA score ($p=0.06$) and fewer rates of TKA (31.8% [GCM] vs 33.1% [CG] and 35.0% [HG], $p<0.001$). GCM group had significantly lower mean LOS (3.6 vs. 4.2 [CG] and 4.0 [HG], $p<0.001$). Rehabilitation discharges (29.1% vs. 36.8% [CG] and 34.0% [HG], $p=0.97$), and RaR (21.8% vs. 40.0% [CG] and 38.2% [HG], $p=0.43$) trended lower in GCM, but did not achieve statistical significance. In-hospital deaths were low (3 [CG] and 0 [GCM]). **Conclusions:** A GCM program for elective joint replacement is effective in reducing length of stay. Thirty-day readmission rates were 45% lower. Discharges to rehabilitation were less common by up to 20%. The positive impact of GCM on elective arthroplasty, if disseminated widely, could improve care for this vulnerable group of older orthopedic patients.

ESTIMATION OF APPENDICULAR MUSCLE MASS IN HOSPITALIZED OLDER ADULTS USING BIOELECTRICAL IMPEDANCE

R.R. Deer, L. Akhverdiyeva, E. Volpi, *Sealy Center on Aging, University of Texas Medical Branch, Galveston, Texas*

Sarcopenia is now a billable ICD-10 geriatric condition characterized by low appendicular skeletal muscle mass (ASMM) and low function. There is an increasing need of portable, provider-friendly, cost-effective methods for the estimation of ASMM.

The purpose of this study was to develop and validate an ASMM prediction model using Bio Impedance Analysis and DXA as reference. To increase applicability of our method, we used a single frequency “foot-to-foot” BIA scale (Tanita BF-350) that determines weight and percent fat mass (FM). A whole body scan (DXA, GE Lunar) was used to precisely determine ASMM.

Subjects ($n=171$, ≥ 65 yrs.) were enrolled during an acute hospitalization at UTMB. Testing included: demographics (age, gender, race), body composition (DXA, BIA, anthropometric measures), physical function (gait speed, grip strength), independence questionnaires (ADL, IADL) and chart review (blood metabolic panels, admission history).

FM derived from DXA (FM_{DXA}) was positively correlated with that measured by BIA (FM_{BIA}) ($r=0.792$, $p<0.01$). A Bland-Altman plot showed that BIA underestimated FM by $3.44 \pm 5.49\%$ ($p<0.01$). Scatterplots for linearity were run on all testing variables. FM_{BIA} , grip strength, and BMI had linear relationships with $ASMM_{DXA}$. A stepwise multiple regression was used to derive the ASMM prediction model using the following statistically significant variables: gender, FM_{BIA} , grip strength and BMI.

Once validated with a larger sample, this equation could be used in a hospital setting to estimate ASMM using a simple, portable and cost-effective device. Those identified to have low ASMM could then undergo further functional testing for diagnosis and treatment for sarcopenia.

COMPARISONS BETWEEN PREVALENT AND INCIDENT DELIRIUM IN OLDER ADULTS: A PROSPECTIVE COHORT STUDY

T.J. Avelino-Silva, F. Campora, J.A. Esper Curiati, W. Jacob-Filho, *Division of Geriatrics, Department of Internal Medicine, University of Sao Paulo Medical School, Sao Paulo, SP, Brazil*

We sought to compare clinical characteristics and mortality associated with prevalent and incident delirium in hospitalized older adults. We conducted a prospective cohort study in a university hospital geriatric ward, from 2009–2014, in Sao Paulo, Brazil. We included hospitalizations of acutely ill patients aged ≥ 60 years who experienced delirium. Delirium was detected using CAM criteria and defined either as prevalent (diagnosed at admission) or incident (diagnosed throughout hospitalization). Patients were submitted to standardized comprehensive geriatric assessments at admission. Additional clinical data were documented upon death or discharge. We compared the association of each group with in-hospital mortality using Cox proportional hazards models. We included 535 hospitalizations with a mean age of 82 years. Overall, 62% were women, 43% had moderate/severe dementia, 32% died in the hospital. Delirium was detected at admission in 70% of the cases. Prevalent delirium happened in older patients (mean age 83 vs. 80 years; $p=0.001$), was more frequently associated with dementia (49 vs. 29%; $p<0.001$), and more commonly precipitated by infections (80 vs. 64%; $p<0.001$). Medications precipitated a greater proportion of incident delirium cases (14 vs. 6%; $p=0.025$). We did not observe differences in delirium severity according to Delirium Index scores ($p=0.45$). Mortality was similar (32% for prevalent, 31% for incident delirium) and the adjusted hazard ratio for in-hospital death for prevalent delirium did not differ from incident delirium ($HR=0.84$; 95% $CI=0.56-1.26$). Two in three cases of delirium in acutely ill older adults were diagnosed at admission. Though similar regarding severity and prognosis, prevalent and incident delirium had distinctive predisposing and precipitating factors, which might justify different management approaches.

THIRTY-DAY RE-HOSPITALIZATION PREVENTION: MULTIDISCIPLINARY REVIEW OF MEDICATION OMISSIONS AND ERRORS

L. Cummings Vaughn¹, H. Pautler², S. Birge¹, *1. Washington University in St. Louis, Saint Louis, Missouri, 2. Barnes Jewish Hospital, Saint Louis, Missouri*

Medication errors can contribute to re-hospitalization. Centers for Medicare and Medicaid Services has targeted discharge medications to reduce errors and 30-day re-hospitalization. To characterize discharge medications, a pharmacist and geriatrician reviewed medical records of patients over the age of 65. The aim was to identify recurring medication errors that could be targeted by discharge coordinators. Errors were identified in 97% of patients, of which 34%

were omissions and 66% inappropriate. Of the latter, 53% were considered potential contributors to re-hospitalization in 60 days. The most common inappropriate errors were loop diuretics (14%), antihypertensives (9%), and sliding scale short-acting insulin (6%). The most common omissions were failure to treat vitamin D (32%) and B12 deficiencies (32%) and iron deficiency anemia (18%).

In summary, medication errors at discharge are common and can increase the risk of re-hospitalization. These observations suggest that more effective strategies should be implemented to reduce discharge medication errors.

HOSPITAL-WIDE COMPREHENSIVE GERIATRIC ASSESSMENT (CGA) FOR OLDER PEOPLE: EMERGING MODELS OF CARE

P. McCue¹, A. McLeod², K. Phelps³, K. Nockels³, S. Conroy³, H. Roberts⁴, S. Kennedy⁵, S.G. Parker¹, 1. *Institute for Ageing, Newcastle University, Newcastle upon Tyne, United Kingdom*, 2. *Newcastle upon Tyne Hospitals, Newcastle upon Tyne, United Kingdom*, 3. *Leicester University, Leicester, UK, United Kingdom*, 4. *Southampton University, Southampton, United Kingdom*, 5. *Sheffield University, Sheffield, United Kingdom*

Recent years have seen increased use of acute hospitals by older people. The effectiveness of CGA for inpatients is well established, but delivery of hospital wide CGA is not extensively described. The UK National Institute for Health Research recently called for more research on the delivery of hospital wide CGA.

We performed an umbrella review of reviews of inpatient CGA [PROSPERO 2015:CRD42015019159] which identified evidence syntheses published between 2009 and 2015. We also reviewed research papers and abstracts published since the most recent included review (2013–2015). We searched the Cochrane Database of Systematic Reviews, Database of Abstracts of Reviews and Effects, MEDLINE and EMBASE, for recent trials (RCTs), evaluations and conference abstracts describing CGA for hospital inpatients over 65 years. We used content analysis to create an overview of recently reported trends in hospital wide CGA

We screened 715 publications and selected 12 reviews, 17 papers and 34 abstracts for review. The umbrella review identified that frailty is not widely examined as a target for, or a determinant of CGA outcome. Recent papers and abstracts describe team based interventions, adjustment of skill mix and the use of protocols. Settings included the ED, acute assessment, surgical and oncology units. We found no recent RCTs which evaluated the effectiveness of CGA in these acute inpatient settings. Specific care processes for delirium, risk screening, medications and daily ward / board rounds were described.

New CGA trials which stratify participants for frailty and evaluate effectiveness in new hospital wide settings and services are justified.

EFFECTS OF AMBIENT TEMPERATURE ON MORTALITY OF HOSPITALIZED OLDER ADULTS: A PROSPECTIVE COHORT STUDY

T.J. Avelino-Silva, F. Campora, J.A. Esper Curiati, W. Jacob-Filho, *Division of Geriatrics, Department of Internal Medicine, University of Sao Paulo Medical School, Sao Paulo, SP, Brazil*

Older adults are particularly susceptible to harm resulting from exposure to extreme temperatures, but this has not been fully explored in the context of geriatric care. We sought to determine if temperature extremes are associated with in-hospital mortality in acutely ill older adults. We included hospitalizations of acutely ill patients aged +60 years, admitted to the geriatric ward of a university hospital, from 2009–2015, in Sao Paulo, Brazil. Our primary outcome was time to in-hospital death and we used mean daily temperatures to assess the effect of temperature on mortality. Mean daily temperatures at the high 95th/90th percentiles were defined as extreme heat, and at the low 10th/5th percentiles as extreme cold. Covariates included month of the year, weather and air quality variables, and data from standardized comprehensive geriatric assessments. Multivariate analysis was performed using Cox proportional hazards models. We included 1,403 cases, with a mean age of 80 years. Overall, 61% were women, median Charlson Comorbidity Index was 3, and in-hospital mortality reached 19%. Temperature percentile cut-offs were: 15°C; 16°C; 25°C; 26°C. Mortality was highest in the 95th percentile group, reaching 27%. The adjusted hazard ratio for all-cause mortality in the ≥26°C group as compared to the 16.1–25°C group was 1.89 (95% CI=1.14–3.12; p=0.013). The associations between other mean daily temperature groups and mortality were not statistically significant. In conclusion, a mean daily temperature higher than 26°C was independently associated with increased in-hospital mortality. Public health and hospital administrators should take this effect into account when developing hospital facilities.

PRELIMINARY RESULT ON GERIATRIC-SURGERY ATTENTION IN COLORECTAL SURGERY: A RETROSPECTIVE COHORT STUDY

J. Llabata-Broseta^{1,2}, F.J. Tarazona-Santabalbina^{1,2}, Á. Belenguer-Varea^{1,2}, D. Álvarez-Martínez², C. Trescoli Serrano¹, D. Cuesta-Peredo^{1,2}, J. Avellana-Zaragoza², 1. *Geriatric Medicine, Hospital Universitario de la Ribera (Alzira, València, Spain)*, Alzira, València, Spain, 2. *Universidad Católica de Valencia. San Vicente Mártir, València, Spain*

Introduction: Population aging is generating an increase of hospital surgical activity in geriatric patients. Given the functional, cognitive, social and clinical profile of these patients, comprehensive geriatric assessment (CGA) is a useful tool to identify clinical and functional problems.

Objectives: To evaluate the possible improvement of hospital care from an interdisciplinary approach using CGA in elective surgery for colorectal neoplasia.

Methodology: A retrospective cohort study was designed in patients over 69 admitted for colorectal cancer surgery between 2007 and 2012. Exposed (Geriatric-Surgery Intervention Group=GSG) were defined as the patients treated with interdisciplinary attention and no exposed (Usual Care Group=UCG) were defined as the patients treated by surgeons during hospital admission.

Results: The sample was composed of 310 patients (203 in GSG and 107 in UCG). GSG presented a higher mean age 77.5 (SD 4.8) versus 75.3 (SD 4.8) years, p<0.001, and higher score in Charlson index (5.2 (SD 3.5) vs 4.2 (SD 3.4), p=0.013. During hospital admission there were no difference

in number of complications, hospital stay and in-hospital mortality. GSG presented a significant reduction in the odds ratio OR of in-hospital delirium 0.22 (95% CI 0.08 to 0.60; $p = 0.003$). Cox regression showed no significant difference in mortality between groups during 12 months follow-up period after hospital discharge (Hazard ratio 0.98, 95% CI 0.31 to 3.14 $p = 0.977$).

Conclusions: Although higher age and comorbidity, GSG patients reduced OR of delirium. Future clinical trials could demonstrate the effectiveness of interdisciplinary teams in geriatric patients with elective colorectal cancer surgery.

TRENDS IN GERIATRIC EMERGENCY MEDICINE FOR OLDER ADULT PATIENTS

J.G. Schumacher¹, J. Hirshon², T. Hogan³, P. Magidson², M. Chrisman⁴, 1. *University of Maryland, Baltimore County, Baltimore, Maryland*, 2. *University of Maryland, Baltimore, Baltimore, Maryland*, 3. *University of Chicago, Chicago, Illinois*, 4. *Winterpark Hospital, Winterpark, Florida*

Older adults have sought treatment in emergency departments (EDs) since their inception, however, increasing numbers of older adult ED patients present unique challenges to EDs. This research examines the emergence of dedicated U.S. geriatric emergency departments (GEDs) and related models of ED care between 2007–2015. Survey data was collected from N=53 U.S. hospitals out of a total of N=82 hospitals identified as promoting their geriatric emergency medical services. Analysis reveals substantial heterogeneity in the organization and provision of care. Annual openings of new GEDs reached N=15 in 2013 with fewer than half that number opening in any other year. Over 85% of setting used the term “senior” in their title in contrast to “geriatric”. Most GEDs did not allocate dedicated GED space (56%), however, the majority (>80%) made modifications to bedding, flooring, lighting, and clinical procedures in a portion of the ED. Respondents noted challenges in GED staffing, training & education, availability of validated screening tools, and sustained support of the hospital administration. Overall, the care of acutely ill older patients remains in flux. Current ED settings make specific modifications based on local needs and resources in the absence of strong incentives to adopt recently released national geriatric emergency department guidelines and principles (2014).

LONG-TERM PROGNOSIS OF UPPER GASTROINTESTINAL BLEEDING IN THE ELDERLY POPULATION

A. Negers², N. Carbonell², M. Verny¹, C. Thomas¹, J. Boddaert¹, D. Thabut¹, H. Vallet¹, 1. *Geriatric department, Pitie Salpetriere hospital, Paris, France*, 2. *Saint Antoine hospital, Paris, France*

Although upper gastrointestinal bleeding (UGIB) represents a frequent medical situation with a high in-hospital mortality rate in the elderly population, data concerning long term prognosis are lacking and are essential to improve their medical care.

In this prospective observational study, all patients who have undergone an upper gastrointestinal endoscopy for bleeding were included between June 2015 and May 2016. Comorbidities were evaluated with the Cumulative Illness

Rating Scale (CIRS), functional autonomy with Activities of Daily Living (ADL) and Instrumental Activities of Daily Living (IADL) scales, and frailty with Rockwood scale. Primary objective was the 6-months mortality. Secondary objective was the comparison between 6-months and pre-hospital functional autonomy.

Fifty seven patients (age 83 [79–87] years, 58% women) were included. The median CIRS score was 10 [8–15], with scores of 5.5 [4–6] ADL, 3 [1–4] IADL and 5 [5–6] Rockwood. Main clinical presentation and etiology were respectively represented by melena (n=41, 72%) and gastroduodenal ulcers (n=38; 67%). Fifty six percent of patients (n=32) presented at least one complication during hospitalization and intra-hospital mortality rate was 18% (n=10). At 6 months, 48% of patients were dead. Among the survivors, 92% returned home. There was no difference for functional autonomy between pre-hospitalization and 6-months evaluation (ADL score 5.5 [4.5–6] ($p=0.31$), IADL score 2 [1–4] ($p=0.73$), Rockwood score 5 [4–6] ($p=0.59$)).

In the elderly, UGIB are associated with a high 6-months mortality rate. However, functional autonomy is preserved in survivors.

EXERCISE, PROTEIN, AND ELECTRIC STIMULATION REDUCES ICU ASSOCIATED SARCOPENIA IN OLDER PATIENTS

A.C. Verceles^{1,2}, M.C. Serra¹, C. Wells¹, D. Davis¹, J. Sorokin^{1,2}, M.L. Terrin¹, G. Alon¹, A.P. Goldberg¹, 1. *University of Maryland School of Medicine, Baltimore, Maryland*, 2. *University of Maryland Claude D. Pepper Older Americans Independence Center, Baltimore, Maryland*

Background: Older, critically ill patients receiving mechanical ventilation (MV) are more susceptible to ICU-related sarcopenia due to undernutrition, preexisting comorbidities, and physical deconditioning. We developed an intervention (ExPrES) which incorporates mobility and strengthening exercise (Ex), high-protein supplementation (Pr) and neuromuscular electric stimulation (ES) for 14 days to prevent sarcopenia in older, ICU patients.

Methods: Pilot study comparing the effects of ExPrES on nutrition goals, muscle mass, and functional mobility compared to usual ICU care. Exercise was mobility-based, protein was supplemented to 1.6–1.75 g/kg/d actual body weight, and electric stimulation consisted of two 30-minute treatments/day.

Results: We studied 22 ICU patients receiving MV (9 ExPrES, 13 control; mean age 61 ± 4 yrs, BMI 30 ± 1 kg/m²). The ExPrES group received more dietician-recommended calories (89 vs. 56%) and protein (88 vs. 39%) compared to controls. Although both groups were initially in negative nitrogen balance, by day 4 the ExPrES group achieved positive balance while the control group remained negative. The ExPrES group experienced less leg muscle loss (day 0–7, -8 vs. -13%; day 0–14, -12 vs. -23%) compared to the control group. The ExPrES group improved their gait speed while the controls' speed decreased (+0.37 vs. -0.05 m/s).

Conclusion: These results suggest that a daily intervention combining mobility and strength-based rehabilitation, protein supplementation, and electric stimulation can achieve positive nitrogen balance and reduce muscle loss in older,

critically ill patients over 14 days. Furthermore, this intervention can potentially reduce the neuromyopathic, mobility and malnutrition-associated complications associated with a prolonged ICU stay.

SESSION 465 (POSTER)

ADVANCE CARE PLANNING AND END-OF-LIFE DECISIONS

RELIGIOSITY AND ADVANCE CARE PLANNING BY WHITE AND AFRICAN AMERICAN OLDER ADULTS

C. Koss, *University of Kansas, Lawrence, Kansas*

Well-documented racial disparities in advance care planning (ACP) raise concerns regarding end-of-life care received by African Americans (AA). Although no clear reasons for disparities have been identified, religiosity is one commonly proposed explanation. Health and Retirement Study data (N=6,861) were analyzed to examine how religious affiliation, behaviors, and beliefs were associated with written and verbal ACP and to determine if religiosity explained ACP disparities between older Whites and AAs. The odds of advance directive completion were twice as high for Whites after controlling for demographic and health-related covariates (OR=2.51). Similar results were shown for advance care discussion (OR=2.42). More frequent religious service attendance was associated with higher odds of advance directive completion (OR=1.12), and more frequent prayer was positively related to verbal ACP (OR=1.08). Importance of religion was negatively associated with advance directive completion (OR=.87). Compared to those with no religious affiliation, Catholics (OR=.68) and Protestants (OR=.73) were less likely to engage in advance care discussion. In intragroup analyses, religious service attendance was positively associated with advance directive completion for both Whites and AAs. Whites who were Catholic and AAs who were Protestant were less likely to discuss treatment preferences compared to those with no religious affiliation. For White participants only, importance of religion exhibited a negative relationship with written ACP, whereas more frequent prayer was associated with higher odds of both written and verbal ACP. Although religiosity did not explain race disparities, distinct aspects of religiosity influenced ACP both negatively and positively, and these effects varied by race.

EARLY UPTAKE OF NEW U.S. CENTER FOR MEDICARE AND MEDICAID SERVICES' ADVANCE CARE PLANNING PAYMENT

M. Tai-Seale¹, Y. Yang¹, E. Dillon¹, S. Tapper², S. Lai³, P. Yu⁴, H. Allore⁵, C.S. Ritchie⁶, 1. *Palo Alto Medical Foundation Research Institute, Mountain View, California*, 2. *Palo Alto Medical Foundation, Santa Cruz, California*, 3. *Palo Alto Medical Foundation, Palo Alto, California*, 4. *Hartford HealthCare, Hartford, Connecticut*, 5. *Yale School of Medicine, New Haven, Connecticut*, 6. *UCSF School of Medicine, San Francisco, California*

January 2016 began the Center for Medicare and Medicaid Services' reimbursement for advance care planning (ACP) conversations. Multiple stakeholders are interested in knowing the impact of this highly anticipated new

reimbursement option. We examined the number of ambulatory care providers billing for ACP conversation as of June 30, 2016, along with historical ACP documentation (including Advance Health Care Directives (AHCD) and Physician Orders for Life Sustaining Treatment (POLST)) in a large multi-specialty healthcare system with an integrated multidisciplinary community-based palliative care program. In six months, 69 of 1,200 providers billed for ACP conversations, suggesting a modest yet meaningful uptake of the new ACP payment. Retrospectively, among 3,444 patients ≥ 65 with serious illnesses and no pre-existing ACP documentation, only 14% (N=483) had ACP documented in a digitally extractable location in the electronic health records at the end of a two-year period (2013–2014). Among the 6% of the 3,444 seriously ill patients who received palliative care services, 65% had ACP documented. In contrast, only 11% of those without palliative care had ACP. Propensity score weighted regression analyses showed a strong and statistically significant relationship between receiving palliative care and AHCD (OR=14.2, 95%CI=5.1–39.6) and POLST (OR=175.8, 95%CI=24.9–1243.2). We conclude that paying for ACP is a meaningful first step, which has resulted in a modest and growing number of providers reimbursed for ACP conversations. Systemic efforts are essential to improve providers' competencies in and patients' readiness for ACP discussions. Palliative care services should be integrated into routine care for seriously ill patients.

FACILITATORS AND BARRIERS FOR ADVANCE CARE PLANNING AMONG ETHNIC MINORITIES: SYSTEMATIC REVIEW

M. Hong, E. Yi, K.J. Johnson, M.E. Adamek, *Indiana University, Indianapolis, Indiana*

Growing evidence suggests under-engagement in advance care planning (ACP) among ethnic minorities in the U.S. However, findings about factors affecting ACP among ethnic minorities are fragmented. The purpose of this study was to synthesize findings from prior research about ACP among ethnic minorities and identify facilitators and barriers toward it. Out of 633 studies identified through an extensive literature search, only 25 studies met our inclusion criteria such as primary evidence, study location (U.S.), publication year (since 2006), study purpose (ACP) and sample (ethnic minority adults or older adults). Four categories of facilitators and barriers were identified: Socio-demographic factors, health care experiences, cultural values, and spirituality. Socio-demographic factors such as education and financial resources showed inconsistent findings regarding their association with ACP engagement. However, health literacy (knowledge and awareness about ACP) and past experiences with ACP are a common facilitator for ACP across ethnic minority groups, whereas mistrust toward health care system was identified as a barrier only for Black Americans. Collectivistic/family-centered cultural values greatly influenced ACP engagement among Latinos and Asian Americans; however, spirituality/religion played an important role among Blacks. The results of this systematic review illuminate facilitators and barriers that can be utilized to promote ACP for ethnic minorities. Educational interventions can be an effective venue to facilitate ACP for ethnic minorities by improving awareness about ACP. In such interventions, health care professionals

may need to consider including family members or clergy to address culturally unique barriers toward ACP.

INTENTION TO DISCUSS ADVANCE CARE PLANNING AMONG KOREAN AMERICANS

M. Hong¹, B.L. Casado², S. Lee³, 1. *Indiana University, Indianapolis, Indiana*, 2. *Colorado State University, Fort Collins, Colorado*, 3. *San Jose State University, San Jose, California*

Despite a growing interest in end-of-life care, there is a dearth of research about advance care planning (ACP) among ethnic minorities. The purpose of this study was to examine intention of ACP among Korean Americans. Two specific objectives were: 1) to identify factors affecting intention of ACP and 2) test the Theory of Reasoned Action (TRA) in explaining intention of ACP. The TRA explains that subjective norms, attitudes toward behavior, and perceived behavioral control predict intentions and behaviors. Specifically, using a culturally expanded TRA model, direct effects of acculturation on attitudes, norms and perceived control; and direct effects of attitudes, norms, and perceived control on intention of ACP were hypothesized. Data was drawn from a cross-sectional survey with 226 Korean Americans. Multivariate regression analysis revealed that greater knowledge about Alzheimer's and more positive attitudes and stronger subjective norms were associated with greater intention of ACP. The initial path model of a culturally expanded TRA model yielded a poor model fit. However, a revised path model produced an excellent model fit. In the revised model, direct effects of perceived control on attitudes and norms, and direct effects of attitudes and norms on intention were found. Perceived control had only an indirect effect on intention through attitudes and norms. Reluctance to seek medical assistance often found in Korean Americans may explain the direct effect of perceived control on attitudes and norms regarding ACP. The finding of the revised model suggests the importance of culturally sensitive approach to promote ACP among this population.

WHAT ENCOURAGES JAPANESE ADULT CHILDREN TO INITIATE END-OF-LIFE DISCUSSION WITH AGING PARENTS?

C. Shimada, R. Hirayama, K. Nakazato, T. Wakui, *Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

Sharing one's wishes about end-of-life care with family members is critical for older adults to receive their preferred course of care until the final days of their lives. This is especially true in Japan, where families are required to serve as surrogate decision makers for older adults. It has been found, however, that Japanese older adults are hesitant to bring up end-of-life issues in family conversation, suggesting the need for their family members to initiate end-of-life discussion. In this study, using online survey data from 1,010 Japanese adult children with at least one living parent aged 65 or older, we explored factors that encourage these children to talk to their parents about end-of-life issues. In doing so, we focused on (a) children's perceptions of parents' personality (e.g., whether, in children's view, parents were confident in their idea), (b) children's attitudes toward parent care and end-of-life discussion (e.g., whether children anticipated that they

would assume the role of parent caregiver, whether children recognized the importance of such discussion), (c) parents' medical history, and (d) both children's and parents' sociodemographic characteristics. Results of logistic regression analysis indicated that children's attitudes rather than other factors explained whether they broached end-of-life issues to their parents. Our findings suggest that, in Japan, approaching to adult children's idea about parent care role and end-of-life discussion can prompt them to initiate such discussion with aging parents regardless of sociodemographic background as well as how they view their parents' personality.

THE ROLE OF PERSONALITY IN ADVANCE CARE PLANNING

K. Kittle, B. Gaines, K. Boerner, *University of Massachusetts Boston, Boston, Massachusetts*

The topic of end-of-life care planning has received a surge of attention in recent years. Previous research has identified several social factors as predictors of advance care planning (ACP). However, the association between personality factors and ACP is not well-established. The aim of this study was to explore the association between the Big Five personality dimensions and ACP. Data from the 2012 wave of the HRS were analyzed. In the HRS, ACP activity was assessed with a series of questions about participation in informal discussions and completion of a living will and/or durable power of attorney. The sample included community dwelling adults age 65 and older who provided complete data on indicators of ACP ($n=3,514$). Descriptive, bivariate and multinomial logistic regression analyses were conducted. Approximately 45% of respondents reported both informal and formal participation, 28% were non-planners, 15% participated in informal planning only and 12% completed formal plans only. Compared to non-planners, the full model showed that individuals scoring high on Neuroticism were less likely to engage in informal planning (RRR = 0.78, $p < .05$), while those who scored high on Openness were more likely to engage in informal planning (RRR = 1.41, $p < .01$). Individuals scoring high on extroversion (RRR = 1.23, $p < .05$) and Conscientious (RRR = 1.36, $p < .05$) were more likely to engage in both formal and informal ACP. These findings suggest that personality dimensions may need to be considered in the discussion of factors that may facilitate or hinder engagement in ACP.

END-OF-LIFE DECISION-MAKING AMONG AFRICAN AMERICANS WITH SERIOUS ILLNESS

E.R. Smith-Howell^{1,2}, S.H. Meghani^{1,2}, S. Hickman³, 1. *University of Pennsylvania, Philadelphia, Pennsylvania*, 2. *NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania*, 3. *Indiana University School of Nursing, Indianapolis, Indiana*

African Americans' (AA) tendency to choose life-prolonging treatments (LPT) over comfort-focused (CFC) care at end-of-life (EOL) is well documented, however there is limited research that describes AA experiences of EOL care decision-making. The study objective was to describe AA bereaved family members' experiences of EOL decision-making and their perceptions of the decision to continue or discontinue LPT at EOL. A conceptual framework informed by the literature and the Ottawa Decision Support Framework guided

this study. Purposive sampling was used to recruit fifteen AA bereaved family members of AAs who died 2–6 months prior to enrollment from the palliative care program in a safety-net hospital and a large metropolitan church in the Midwest. Decedent mean age 68.7 was years. Participants were selected based on their Decisional Conflict Scale scores. Data were collected by telephone, using a semi-structured interview guide, and analyzed using qualitative descriptive methods and content analysis. Qualitative themes related to AA family members' experiences in EOL decision-making included understanding, relationships with healthcare providers, and quality of communication. Additional qualitative themes were related to perceptions of the decision to continue LPT (e.g., a lack of understanding) or discontinue LPT (e.g., patient preferences). Religious values and cultural values did not emerge as major themes in relation to family members' EOL decision-making. This study contributes evidence that quality of communication with healthcare providers plays a critical role for AAs in EOL decision-making, and challenges the majority of the literature that suggests religious and cultural values play prominent roles in AA EOL decision-making.

END-OF-LIFE DECISIONS FOR PEOPLE WITH INTELLECTUAL DISABILITIES: PREHOSPITAL PROVIDERS' PERSPECTIVE

J. McGinley, D.P. Waldrop, *School of Social Work, University at Buffalo, Fairport, New York*

Individuals with intellectual disabilities (ID) represent 1% of the population. Older adults are the fastest growing segment of this population with projections for a doubling by 2030 and a tripling within the foreseeable future. The Institute of Medicine (2014) found that only 1% of this population engage in advance care planning (ACP). Prehospital providers (Paramedics and Emergency Medical Technicians) are often first responders when family or professional caregivers find a person with ID in medical crisis and their decisions about treatment or transport influence how and where the person will die.

The purpose of this two-phase, mixed methods study was to explore how frequently medical orders (MOs) inform decision making during end-of-life calls and prehospital providers' opinions about MOs in emergency care for people with ID. Phase one survey data (N=245) was collected to determine the frequency of different end-of-life calls; 62.7% of prehospital providers treated an individual with ID and a completed MO. Phase two in-depth interviews (N=50) explored how prehospital providers made end-of-life decisions. Utilizing a critical discourse analysis approach, three themes were identified as informing prehospital providers' opinions about MOs for this population: provider familiarity; organizational processes; sociocultural context of ID. Ethical challenges raised by providers, including decision making capacity, are elucidated.

Results suggest that end-of-life decision making among older adults with ID is multifaceted. Although MOs are being presented with increased frequency during emergency calls, multiple (individual, facility and systems) factors inform prehospital providers' opinions of these documents and subsequently may impact decision making at end-of-life.

ASSESSING READINESS IN A DYADIC CARE PLANNING INTERVENTION FOR EARLY DEMENTIA

S. Orsulic-Jeras, E. Shelton, C.J. Whitlatch, *Benjamin Rose Institute on Aging, Cleveland, Ohio*

Evidence supports designing proactive, dyadic interventions for use in the early stages leads to more effective decision making, and provides an opportunity to document and validate the person with dementia's (PWD's) care preferences. SHARE (Support, Health, Activities, Resources, and Education) a seven-session, counseling-based intervention aims to encourage and support care dyads to have important discussions about health care preferences that are often put off or avoided until the later stages of dementia. Although having these discussions early on are critical, many care dyads are not yet ready to have them. This paper will describe how SHARE Counselors are trained to assess care dyads' readiness using an adapted, 4-stage version of the Transtheoretical Model (TTM). SHARE Counselors rated readiness of each care partner at baseline, after 6 sessions (8 weeks from baseline), and again after a final booster session (20 weeks from baseline). Findings from readiness assessments administered to 128 early-stage dementia care dyads will be used to illustrate: 1) how care partners who were less "ready" at baseline responded to discussions about future care, 2) strategies used by SHARE Counselors to engage care partners even when each started off at a different level of readiness, 3) how initial readiness levels at baseline impacted whether or not dyad completed the full intervention protocol, and 4) whether or not readiness improved over time as a result of the intervention. Discussion will highlight why understanding PWD and caregiver (CG) readiness is critical when engaging in sensitive discussions on future care needs.

SESSION 470 (POSTER)

AGEISM AND AGE DISCRIMINATION

LOVE IN LATE LIFE: PERSISTENT AND PREVALENT

E. Kahana¹, B. Kahana², T. Bhatta¹, M. Slone¹, 1. *Sociology, Case Western Reserve University, Cleveland, Ohio*, 2. *Cleveland State University, Cleveland, Ohio*

Our study explores concepts reflecting broad definitions of love in old age. Research documents the value of prosocial behaviors and of altruistic attitudes for enhancing well-being among older adults. While romantic love is also said to persist in old age, scientific studies primarily focus on social supports and care-giving. Yet, hardly any scientific studies address the broader and less technical concept of love in relation to experiences of older adults. In this study we focus on self-reports by older adults about experiencing and giving love in their lives. In our panel study of older adults living independently in the community (N=340) we inquired to what extent respondents feel love towards others and to what extent they experience being loved by others. Based on interviews with community dwelling older adults (mean age=75), we found that the overwhelming majority (92.7%) report that they feel much or very much love for other people. Similarly the vast majority reported that they feel loved by others (88.3%). Women and married people were significantly more likely to report both loving others

and being loved. Based on the high prevalence of love in the lives of older adults and the enduring nature of love over time, our findings support the view that love is a cultural universal. With more and more people living to reach old-age, recognizing the almost universal potential of older adults for loving and being loved become important challenges to disavowing ageism and for maintaining a civil society.

AGEIST STEREOTYPES AND THE INTERGENERATIONAL REENGAGEMENT OF OLDER ADULTS

G.D. Rowles¹, M.A. Guest¹, T. Kruger², A.M. Schuster¹, K.A. Anderson³, K.A. Nikzad-Terhune⁴, V. Lawson¹, 1. *University of Kentucky, Lexington, Kentucky*, 2. *Indiana State University, Terre Haute, Indiana*, 3. *University of Montana, Missoula, Montana*, 4. *Northern Kentucky University, Highland Heights, Kentucky*

In many traditional societies across the world, aging is viewed positively and older adults are fully integrated into their community, holding positions of influence and respect. In contrast, gerontophobia and gerontological illiteracy in most developed societies reinforces ageism--prejudice and discrimination against older adults--that estranges generations. In this three year study we examine the perceptions and representations of aging and old age of 1,034 undergraduate students completing introductory courses at six universities across the United States. The study examined views and representations of aging and old age. Students were asked to provide an age at which they considered an individual to be old, to list words they associated with "old person" and "grandma/grandpa," and to draw a sketch representing "aging." Findings indicate that (1) students consider a person to be old in the United States at 65 years of age, (2) have a far more positive view of older adults they know personally (i.e. their grandparents) than older adults as a category; and (3) images of aging, as represented in hand drawn sketches, are predominantly negative; they focus on a relatively short period at the end of life and are pervaded by concern for time, physical decline, medical care, institutionalization, and death. The findings reinforce the need for renewed efforts in developed societies to combat age stereotyping and ageism through gerontological education in order to facilitate the intergenerational reengagement of older adults as lifelong contributors to community life and culture.

RACIAL DIFFERENCES IN ATTITUDES TOWARD AGING, AGING KNOWLEDGE, AND CONTACT

R.C. Intrieri, M.L. Kurth, *Psychology, Western Illinois University, Macomb, Illinois*

Ageism is defined as "the systematic stereotyping of and discrimination against older people, because they are old, just as racism and sexism have accomplished this with skin color and gender" (Butler, 1975). Ageism in the twenty-first century may be more compelling than ever because of the sheer number of Baby Boomers turning 65 daily. Current population estimates suggest that the percentage of older adults will grow to about 18% of the population by 2030 (Cohn & Taylor, 2010). It is believed that misconceptions about aging are developed and maintained due to misinformation about aging and lack of meaningful contact with older adults. Butler's acknowledgment of ageism as a systemic problem

has generated research attempting to develop an adequate way to measure ageism, knowledge about aging, and attitudes toward older people. This research examined differences in attitudes toward aging, knowledge of aging and contact frequency between non-Hispanic whites and African-American young adults. Participants were 96 African-American (Mean age 19.27, $SD=1.318$) and 175 Non-Hispanic Whites (Mean age 19.87, $SD=1.685$) that were part of a larger study. ANOVA revealed significant group differences on the Aging Semantic Differential-Instrumental factor ($F_{(1, 269)}=8.169$, $p=.005$) and on the Fraboni Scale-Anitlocution factor ($F_{(1, 269)}=13.117$, $p<.0001$). No significant differences emerged between groups on either the Facts on Aging Quiz-Revised or everyday contact with older adults. Results suggest that while Non-Hispanic Whites held more negative attitudes toward older adults and higher levels of ageism they also showed higher levels of knowledge and a lower frequency of elder contact.

PERSONAL BELIEFS AND REACTIONS TO AGE AND MEMORY THREAT IN EVERYDAY MATERIALS

C.M. Strickland-Hughes¹, R.L. West², 1. *Psychology, University of Florida, Gainesville, Florida*, 2. *University of Florida, Gainesville, Florida*

Older adults hold complex, yet predominantly negative, beliefs about aging. When experimenters emphasize negative stereotypes about aging, it can be a threat, affecting older adults' physical performance, self-perceptions of aging, and memory. Reactions to stereotyping may vary with the situation or the individual. This study examines the impact of stereotype exposure for the first time with common everyday materials and evaluates the impact of stereotype exposure on personal beliefs and memory. A priori personal beliefs (e.g., sense of control over memory) may promote resilience to stereotypes, and beliefs may change after stereotype exposure. Participants were 34 men and women (ages 50-75; $M=62$). Everyday stimuli were newspaper cartoons, "jumble" puzzles, and word searches. A stereotype group saw stimuli with embedded age (e.g., weak, inept) and memory (e.g., dementia, forgetting) stereotypes. A control group saw similar stimuli without stereotype words. We controlled stereotype exposure, level of negativity, number of words, and stimulus size. Two-thirds of the stereotype group later reported awareness of the stimulus characteristics ("aware" group). Multiple measures of beliefs and memory were examined before and after stimulus exposure. The control and stereotype groups were comparable on beliefs and memory before working with the familiar materials. After exposure, 1) the stereotype group had higher story recall scores, and 2) the aware group showed the lowest perceived memory threat and the highest general memory evaluation. These results show that those who noticed the stereotypes counteracted their influence. Focusing on how to train stereotype awareness and response would be useful in future research.

MINDFUL AGING: THE IMPACT OF TRAIT MINDFULNESS ON AGING STEREOTYPES

S. Mallya, V. Huang, A.J. Fiocco, *Psychology, Ryerson University, Toronto, Ontario, Canada*

With a growing aging population, it is important to understand factors that encourage or discourage healthy

aging processes as we get older. Previous research has shown that negative beliefs about aging (i.e., negative aging stereotypes) can negatively affect health behaviours, memory performance and physical function. Thus, discovering ways to decrease negative aging stereotypes may aid in promoting healthy aging. It is postulated that mindfulness may attenuate negative aging stereotypes, as mindfulness cultivates openness, curiosity, and non-judgment. In the present study, we assessed whether mindfulness was associated with fewer negative beliefs and opinions about aging. Participants ($N = 201$) aged 55+ completed the Five Facet Mindfulness Questionnaire (FFMQ) and the Expectations Regarding Aging Survey (ERA-38) as part of an online study examining the psychological correlates of health behaviour in middle-aged and older adults. Controlling for age, sex, education, and retirement status, multiple regression analyses show that enhanced trait mindfulness is significantly associated with more positive beliefs about aging and expectations regarding cognitive function, mental health, sleep, and appearance (all $ps < .05$). These data suggest that interventions aimed at changing attitudes and beliefs, such as mindfulness-based interventions, may reduce negative aging stereotypes and improve quality of life among older adults.

RESPECTED OR A BURDEN? GLOBAL ATTITUDES TOWARD OLDER PEOPLE USING THE WORLD VALUES SURVEY WAVE 6

P. Nash¹, M. Schneiders², A. Officer², A. Jotheeswaran², 1. Swansea University, Cardiff, United Kingdom, 2. World Health Organisation, Geneva, Switzerland

The world population over age 60 is expected to double from 2000–2050, with 80% of this cohort expected to live in low- and middle-income countries by the middle of the century. The extent to which individuals and societies are able to benefit from population ageing will largely depend on their perceptions of ageing and older people. Public discourse around population ageing is discouraging, depicting older people as burdensome for health, economies and public spending. These narratives exemplify everyday ageism, as statements are built on assumptions that ignore older people's value and potential. Stereotypes and attitudes, acquired across the lifecourse, do not simply abate when an individual reaches older age. Negative implicit ageist attitudes are held and internalised by older people themselves, resulting in physical, cognitive and wellbeing declines. Wave 6 of the World Values Survey sampled over 85,000 participants from 60 countries and included assessments on attitudes toward ageing. Our preliminary analyses reveal marked differences in older people's roles between countries and cultures, suggesting that socioeconomic development, income inequality, valuing youth-oriented culture and breakdown of family support structures affect levels of societal ageism. Further, there are significant differences between developed and developing countries, which reflect the economic aspirations of both societies and individuals and mirror the implicit and explicit reporting of ageism-related items. The internalisation of this ageism and its physical outcomes has implications for utilisation of scarce primary healthcare resources across nations, but can be mitigated through well-defined approaches to tackling both implicit and explicit ageism.

GENDERED AGEISM AND MICRO AGGRESSIONS IN THE WORKPLACE

P. Taylor^{1,2}, C. McLoughlin^{1,2}, 1. Federation University Australia, Melbourne, Victoria, Australia, 2. National Seniors Australia, Melbourne, Victoria, Australia

The intersection of gender and age discrimination has formed an important facet of research concerning barriers to prolonging working lives. With increasing public policy interest in integrating later retirement into successful ageing frameworks, research has sought to understand whether workplace age discrimination is experienced differently by men and women at later career stages. While simplistic additive or multiplicative effects of being an older woman on experiences of workplace discrimination have been posited, research has been inconclusive. While some studies report gendered ageism affecting older women others find that older men appear to struggle with what has been argued to likely be their first experiences of workplace discrimination as they pass beyond what have traditionally been the 'prime working years'. Attempting to overcome the common methodological error of measuring discrimination with leading, unsophisticated self-report items, this presentation draws on nationally representative data from a survey of 3000 Australians obtained using the 'everyday discrimination' approach to measuring workplace discrimination. Binary logistic regression was used to assess the probabilities of experiencing 12 workplace discrimination behaviors across age, gender and functional capacity while controlling for employment type and socioeconomic position. The results replicate some studies' findings of counter-intuitive patterns of workplace discrimination across gender and age group, with discrimination more frequently reported by younger men. It is argued that a more nuanced approach to considering the intersection of age and gender is required and that in considering policy approaches to supporting longer working lives the role of age discrimination should not be overstated.

THE INFLUENCE OF AGEISM ON LIFE SATISFACTION OF OLDER ADULTS

H. Kim¹, H. Kang², 1. Gerontology Center, Lawrence, University of Kansas, Lawrence, Kansas, 2. School of Social Welfare, University of Kansas, Lawrence, Kansas

Older adults experience discrimination in a number of different ways due to their age, and this has potential to negatively affect their psychological well-being. The purpose of this study was to investigate the relationship between age discrimination and life satisfaction among older adults, and how this may be eased by other, constructive experiences of aging, such as a positive outlook on aging and participation in volunteer work.

This study used Health and Retirement Study data (2012 wave), selecting 1,975 persons (58% female) who claimed to experience age discrimination in daily life. Scales measuring the extent of perceived discrimination (in six circumstances) and life satisfaction were used to test the main relationship. Mediating variables were measured by a scale of positive self-perceptions about aging and by the frequency of volunteer activities. Participants' age and gender were controlled.

Perceived discrimination was most frequent in people feeling treated with less courtesy and respect and feeling treated as if they are not smart. Higher levels of perceived

discrimination were associated with lower life satisfaction, even after controlling for age and gender. However, the direct relationship between perceived bias and decreased life satisfaction ($b = -.16$, $p < .05$) was significantly mediated by a positive outlook on aging ($b = .48$, $p < .05$) and by volunteer work experience ($b = .06$, $p < .05$). In conclusion, ageism has a negative effect to older adults' current life satisfaction. At the same time, if older adults participate in meaningful activities, or have a positive self-perception, these are potential resources for reducing negative experiences of aging.

AGE DIFFERENCES IN THE EFFECTS OF SELF-STIGMAS ON WELL-BEING

J. Bookwala, *Lafayette College, Easton, Pennsylvania*

The present study used two-wave data from a probability-based sample of adults in the US to examine the effects of self-stigmas on physical and emotional well-being. Data were drawn from 1,216 core participants of the National Survey for Midlife Development in the United States (T1 mean age = 48.8, 50.5% women). Using mixed linear effects models, 3 stigma groups (no stigma, single stigma, multiple stigmas) were compared across 3 age groups (20–39, 40–59, and 60+ at T1) and over time on the five indicators of well-being. Results revealed a significant stigma group \times age group interaction effect for positive and negative affect ($F[4,1204] = 5.63$, $p < .001$ and $F[4,1204] = 5.69$, $p < .001$, respectively), but not physical health. Post-hoc comparisons showed that for both positive and negative affect, older adults had significantly better emotional well-being in the single and multiple stigma groups than their younger and middle-aged peers; in the no-stigma group, younger adults scored lower than older adults on positive affect and higher on negative affect but these effects were small in magnitude. These results are consistent with Carstensen's theory of socioemotional selectivity, which states that with age, individuals are more strongly motivated to regulate their emotional well-being and, thus, to expend effort toward enhancing positive emotions and minimizing negative emotions. Thus, older adults may de-emphasize stigma-based experiences and show greater emotional resilience in the face of such experiences relative to younger and middle-aged individuals. It is important to note, however, that older adults' resilience did not transfer to the domain of physical health.

OLD AND UNEMPLOYABLE? HOW AGE-BASED STEREOTYPES AFFECT WILLINGNESS TO HIRE JOB CANDIDATES

H.J. Swift, D. Abrams, L. Cuthbert, *School of Psychology, University of Kent, Canterbury, United Kingdom*

Across the world people are required or want to work until an increasingly old age. But how might prospective employers view job applicants who have skills and qualities that they associate with older adults? This paper draws on social role theory, age stereotypes and research on hiring biases, and reports 3 experimental- online - studies using age-diverse North American participants. These studies reveal that a) positive older age stereotype characteristics are viewed less favorably as criteria for job hire, b) even when the job role is low status a younger stereotype profile tends to be preferred, and c) an older stereotype profile

is only considered hireable when the role is explicitly cast as subordinate to that of a candidate with a younger age profile. Implications for age-positive selection procedures and ways to reduce the impact of implicit age biases are discussed.

WHAT FACTORS ARE RELATED TO MEDICAL STUDENTS' AND DOCTORS' ATTITUDES TOWARD OLDER PATIENTS?

R. Samra¹, T. Cox³, A. Gordon⁴, S. Conroy³, M. Lucassen¹, A. Griffiths⁴, 1. *The Open University, Milton Keynes, United Kingdom*, 3. *Birkbeck University of London, London, United Kingdom*, 3. *University of Leicester, Leicester, United Kingdom*, 4. *University of Nottingham, Nottingham, United Kingdom*

Background: A large research base exists on the relationship between medical students' and doctors' attitudes towards older patients with a variety of demographic, educational/training, job/career factors. Studies report conflicting findings and little consensus on associated variables.

Methods: A systematic review on the worldwide English language literature. Ten databases were searched (including Medline, PsychInfo and Science Direct) from database inception to December 2015 using a systematic search strategy. Quality was assessed.

Results: The search identified 2336 articles; thirty-eight studies met the eligibility criteria. Very few variables demonstrated consistent relationships with attitudes. Students' year of medical school, doctors' years of practice or seniority, participants' age and ethnicity did not demonstrate a relationship with attitudes. Participants' level of intrinsic motivation and increased interest in working with older people were positively related with attitudes. The relationship with gender was mixed; of the 28 studies examining gender and attitudes, 18 found no significant relationship. However, the remaining ten studies concluded that females reported more positive attitudes towards older patients than males; no studies reported more positive attitudes in males. None of the 38 studies measured social desirability (e.g. impression management), despite other studies demonstrating that socially desirable responding correlates with attitudes towards older people in other participants (Cherry, Allen, Denver & Holland, 2015) and female medical students score higher on social desirability than males (Merrill, Lorimor, Thornby & Vallbona, 1998).

Conclusions: Attitudes towards older patients show a relationship with participants' motivation type, interest in gerontology work, and a relationship with gender which warrants further investigation.

AGEISM AND SATISFACTION IN LATER LIFE: RESULTS FROM THE HEALTH AND RETIREMENT STUDY

L. Huang¹, M. Zhu², 1. *School of Social Work, Grand Valley State University, Grand Rapids, Michigan*, 2. *East China University of Science and Technology, Shanghai, China*

Purpose: To investigate the prevalence of ageism and the relationships between ageism and satisfaction in later life in the United States.

Design: Cross-sectional analysis

Setting: The 2010 wave of the Health and Retirement Study, a national representative panel study of older Americans.

Participants: Analysis is based on 10,937 older Americans aged 65 and above.

Measures: "Ageism" is conceptualized with two measures: The Everyday Discrimination Scale, and one item question about whether or not discrimination experience was specially based on age. The satisfaction measure consists of "Aging Satisfaction" and "Satisfaction with Life in Domains."

Results: Preliminary data analyses indicate ageism is a pervasive aging experience in the United States. Chi-Square tests show statistical differences in the levels of aging satisfaction and life satisfaction between participants with or without everyday discrimination experience and age-based discrimination. T-tests suggest that participants who experienced everyday discrimination had significant differences in aging satisfaction and life satisfaction, and that age-based discrimination experience is correlated with significant differences in aging satisfaction. However, t-tests do not indicate that ageism experiences predict levels of aging satisfaction and life satisfaction.

Conclusion: In light of new understanding of discrimination and its negative impact on older adults' physical health, mental health, and subjective well being, this empirical study adds emerging evidence on ageism and satisfaction in later life in the United States. Despite its limitations, this proposed study has significant implications for cultural changes in public discourse and human services involving older adults in the United States and globally.

GRAY PANTHERS GROWL AT THE MEDIA, AND MAKE THEIR OWN

A. Ciafone, *Media & Cinema Studies, The University of Illinois at Urbana-Champaign, Urbana, Illinois*

Drawing on archival research and close readings of media texts, this paper will exam the confluence of two remarkable moments in the history of the representation of older women in the media in a decade otherwise known for its social and cultural conservatism. In the 1980s, armed with the concept of "ageism," coined in just 1969, and experience in the feminist and civil rights movements, the members of the Gray Panthers set out to intervene in the representation of older women in the media. Mobilizing through their Media Watch Committee, they monitored TV for examples of ageism, conducted media literacy campaigns, and produced conferences and even their own media content to combat stereotypes and construct an alternative vision of aging. Not unrelated, women of the same generation appeared on TV with more agency – namely in *The Golden Girls*, 227 and *Murder She Wrote* – leading the *LA Times* to ponder whether there was a representational shift on TV, even a "waning devotion to youth." But as an Annenberg study of the time suggested, this drop in the bucket "does not make a ripple" when you consider that the representation of people over 65 was only around one-fifth their actual proportion in the US population, and were "treated disrespectfully most of the time." These TV exceptions proved the rule, then, and make the gray women of the 1980s and their media interventions all the more important to study.

SESSION 475 (POSTER)

AGING IN MINORITY AND DIVERSE POPULATIONS

RACE/ETHNIC DISPARITIES IN EXPOSURE TO CHRONIC STRESSORS VARIES BY AGE AMONG OLDER ADULTS

L. Brown¹, U. Mitchell^{1,2}, J. Ailshire¹, 1. *USC Davis School of Gerontology, Los Angeles, California*, 2. *University of Illinois Chicago, Chicago, Illinois*

Chronic stress exposure is linked to worse mental and physical health and blacks tend to report more stress exposure than whites. The experience of chronic stressors may vary across the older adult life course, making it important to investigate age differences in the race disparity in chronic stress exposure among older adults. We examine age variation in race/ethnic differences in the number of reported chronic stressors in five key domains: health, financial, residential, employment, and relationship. Data come from 6,878 white, black, and Hispanic adults age 54+ from the psychosocial subsample of the 2006 Health and Retirement Study. Descriptive results show whites and Hispanics report a decline in exposure to financial, residential, employment, and relationship stress after age 70. Yet, blacks report an increase in residential stress and relatively smaller decline in financial, employment, and relationship stress after age 70. Reports of health related stress increases for all race/ethnic groups after age 70. Multivariate results show that blacks ($\beta=0.23$, $p<0.001$) and Hispanics ($\beta=0.13$, $p<0.01$) report more stressors than whites. But while fewer stressors are reported by adults 70+, compared to the young-old ($\beta=-0.18$, $p<0.001$), analysis of age interactions shows that blacks ages 70+ reported more stressors than their white counterparts ($\beta=0.14$, $p<0.05$). Importantly, total stress burden is similar among blacks and whites ages 54–69. Black-white differences were similar after adjustment for sociodemographic characteristics. Hispanic-white differences were attenuated after adjusting for SES. Thus, race/ethnic disparities in stress may reflect differential experiences of age-related declines in chronic stress exposure.

CHINESE COMPREHENSIVE HEALTH ASSESSMENT SCALE AND HEALTH STATUS OF THE COMMUNITY-DWELLING ELDERLY

J. Li¹, X. Li¹, R. Gao¹, K. Du², 1. *Nursing, Xi'an Jiaotong University, Xi'an, Shaanxi, China*, 2. *Xi'an Aerospace General Hospital, Xi'an, Shaanxi, China*

Purpose: To develop Chinese comprehensive health assessment scale (CCHAS) for community-dwelling elderly with chronic diseases and to examine its reliability and validity.

Method: The original CCHAS was developed using literature review and in-depth interviews, as well as Delphi method. 440 community dwelling elderly were selected to complete the scale and SF-36.

Results: The CCHAS contained 30 items, including: physical health, activities of daily living, mental health, social adaptation and general health. The total Cronbach's alpha coefficient of the scale was 0.81, and the split half reliability was 0.93. The total CVI of the scale was 0.87. Pearson correlation coefficient between the CCHAS scale and SF-36 was

0.83. 56.59% of the elderly has good health status, while 9.77% has poor.

Conclusion: The CCHAS has acceptable reliability and validity and is significantly correlated with SF-36. The results demonstrate that the scale can be applied to health evaluations in community-dwelling elderly in China.

DYNAMICS OF DISABILITY AND DEPENDENCY: EXAMINING THE HISPANIC PARADOX THROUGHOUT ADULT LIFE

S.B. Laditka, J.N. Laditka, *University of North Carolina at Charlotte, Charlotte, North Carolina*

Research often shows that Hispanics in the United States have lower adult mortality than non-Hispanic whites (hereafter whites). Much less is known about adult life course functioning among Hispanics. We studied functioning in activities of daily living (ADLs), distinguishing between disability (having difficulty but not having help) and dependency (having help), among Hispanic, African American, and white women and men, using data from the Health and Retirement Study (10 waves 1994–2012, ages 51+, $n=35,797, 152,822$ functional status and death transitions). Multinomial logistic Markov models estimated monthly probabilities of transitioning among ADL status levels and to death, adjusted for age, sex, education, and race/ethnicity. Using the probabilities we created large populations with microsimulation, measuring monthly disability status for each individual, age 51 through death. Women with high school education illustrate the primary results: Life expectancy was greater for Hispanics than African Americans or whites, respectively at age 70, for example, 88.1, 85.2, and 86.4. The population percentage having difficulty was higher for African Americans than for Hispanics or whites at ages 60–90 ($p<0.01$), respectively at age 70: 38.4%, 33.9%, and 34.9% (no significant differences between Hispanics and whites). The population percentage having help was higher for Hispanics and African Americans than for whites at ages 60–90 ($p<0.01$), respectively at age 70: 6.3%, 7.5%, and 4.6% (no significant differences between Hispanics and African Americans). Results were similar for men. At midlife and older ages Hispanics may have relatively high rates of disabilities that require help from another person despite having lower mortality.

UNCOVERING NEUROPROCESSING AND SELF-MANAGEMENT BEHAVIORS IN PREHYPERTENSIVE AFRICAN AMERICANS

K. Wright¹, L.M. Jones¹, D. Fresco², J.T. Wright¹, J.P. Freidman¹, A.I. Jack¹, M. Wallace¹, S.M. Moore¹, 1. *Case Western Reserve University, Copley, Ohio*, 2. *Kent State University, Kent, Ohio*

Aims: African Americans with prehypertension have a 35% greater risk of progressing to hypertension as compared to Caucasian Americans. In this pilot study, we investigated how two neural networks associated with task-oriented and emotional/motivational cognition relate to self-management behaviors in prehypertensive African Americans. **Methods.** Community dwelling African Americans who met eligibility criteria of prehypertension, a systolic BP 120–139 and diastolic BP 80–89 mmHg, were enrolled. Participants completed brain imaging and surveys on everyday discrimination, self-compassion, decentering, social support,

self-efficacy, self-regulation, and the Nutrient Data Systems Report. Data were examined using descriptive statistics and correlation analysis. **Results:** Twenty participants, women ($n=11$) and men ($n=9$) aged 26–76 ($M=51.9, SD=12.2$) were enrolled. Findings from our pilot study indicated that everyday discrimination was associated with activation in the ventromedial prefrontal cortex and task positive/default mode networks ($r=-.72, p=.05$; $r=-.70, p=.05$ respectively). Activation in the ventromedial prefrontal cortex was associated with social support ($r=.58, p=.06$). Self-compassion and decentering were not associated with neurocognitive processing. Although self-efficacy was not associated with neurocognitive processing, self-efficacy was associated with self-regulation ($r=.53, p=.03$) and decentering ($r=.64, p=.05$). **Conclusions:** Findings indicate that neurocognitive processing are associated with everyday discrimination and social support. As we continue to examine the role of neurocognitive processing, we will use these findings to guide future work with self-management interventions and the possible underlying neurobiological mechanisms.

ORAL HEALTH AND DENTAL CARE IN OLDER ASIAN AMERICANS

Y. Jang¹, H. Yoon¹, N.S. Park², D.A. Chiriboga², 1. *The University of Texas at Austin, Austin, Texas*, 2. *University of South Florida, Tampa, Florida*

Responding to the paucity of information on oral health and dental care in older Asian Americans, the present study examined the status and factors associated with dental health insurance, self-rated oral health, and use of preventive dental service. Data were driven from 533 older adult participants (aged 60 and older) in the 2015 Asian American Quality of Life Survey conducted in Central Texas. The criterion variables of interest were selected based on the Andersen's behavioral model of health services: enabling (dental health insurance), needs (self-rated oral health), and utilization (use of preventive dental service) variables. Using a sequential design, the predictive model of each outcome was built, and sociodemographic and immigration-related variables were used as common covariates. More than 60% of the sample had no dental insurance, 45% reported that their oral health was either fair or poor, and 44% had not had dental check-up in the past 12 months. A series of logistic regression analyses identified the factors posing a significant risk to oral health and dental care. For example, those who had limited English proficiency were three times more likely to lack dental health insurance (enabling) and to have a fair/poor rating of oral health (needs). The odds of not using preventive dental service (utilization) were six times higher among those with no dental insurance coverage (enabling). The overall findings demonstrate substantial inequality in oral health and dental care outcomes in older Asian Americans and suggest strategies to promote their access to dental services.

AGE DIFFERENCES IN THE REASONS OLDER IMMIGRANTS RETURN TO MEXICO

A. Vega, K.B. Hirschman, *University of Pennsylvania, Philadelphia, Pennsylvania*

Mexicans are the largest immigrant group in the U.S. and are aging rapidly. Data support that many return to Mexico due to economic factors such as employment. Few studies

have investigated if older immigrants return to Mexico for different reasons than younger immigrants. Using the Mexican Health and Aging Study (N=963), we examine whether Mexican immigrants in the U.S. who returned to Mexico at age 50 and older report different reasons for returning than those who returned at younger ages. Few immigrants (regardless of age) returned to Mexico for economic reasons. In multinomial logistic regression modeling, older immigrants were more likely to return to Mexico due to illness (OR=3.06, 95% CI=1.29, 7.27) and just as likely to return because they missed family (OR=0.76, 95% CI=0.43, 1.33). Older Mexican immigrants in the U.S. with limited access to health care and/or caregiver support may return to Mexico.

COMMUNITY OF VOICES CHOIR STUDY TO PROMOTE HEALTH IN DIVERSE OLDER ADULTS

J.K. Johnson, S. Gregorich, A.M. Napoles, J.D. Flatt, W.B. Max, D.L. Pounds, A. Paniagua, A.L. Stewart, *University of California, San Francisco, San Francisco, California*

BACKGROUND AND PURPOSE:

With the rise in the number of older adults, there is an urgent need to develop cost-effective interventions that can be easily adapted for adults from diverse racial/ethnic and socioeconomic backgrounds. The goal of this presentation is to describe the baseline and 6-month randomized results from the Community of Voices (Comunidad de Voces) study that is examining the effect of a 12-month community choir intervention on the health and well-being of diverse older adults.

METHODS:

This study used a cluster-randomized controlled design. Twelve San Francisco Administration-on-Aging (AoA) senior centers were randomized in matched pairs to either begin the choir immediately (intervention) or wait 6 months to begin (control). Participants attended weekly, 90-minute choir sessions focused on psychosocial, cognitive, and physical engagement and led by professional music directors. We collected primary and secondary outcomes at baseline and 6 months that focus on psychosocial, physical function, and cognition using the NIH Toolbox and legacy measures.

RESULTS:

A total of 819 individuals expressed interest in the study, and 390 participants (61%) enrolled in the study; 92% completed the 6-month assessment. The sample included 35% non-Latino White, 20% Black, 18% Latino, and 27% Asian/Pacific Islander; mean age was 71 years (range 60–93, SD=7); 76% were women. Twenty six percent rated their health as fair or poor. Results on the primary outcomes from the baseline and 6-month assessments will be discussed.

DISCUSSION:

Working collaboratively with AoA senior centers facilitated recruitment and retention. If efficacious and cost-effective, the intervention could serve as an easily translatable model for promoting optimal aging and reducing health disparities.

SOCIAL SUPPORT, STRESSFUL LIFE EVENTS AND LIFE SATISFACTION: MINORITY AND NON-MINORITY BABY BOOMERS

C.L. Barragan, *School of Social Work, Eastern Michigan University, Madison Heights, Michigan*

The first wave of the Baby Boomer cohort approached retirement age in 2010, officially entering older adulthood. But this generation is vastly different than other cohorts. They are more active, educated, and are living and working longer. Older adults ultimately feel their social networks are as important as their health (Farquhar, 1995). Social support acts as a buffer between stress and well-being (Chronister, Chou, & Liao, 2013) following stressful life events (SLEs) (Hsu, 2011). Those without meaningful social support are lonelier (Utz, Swenson, Caserta, Lund, & deVries, 2014) and have lower life satisfaction (Nilsson, Rana, & Kabir, 2006), highlighting the importance of social support. Minorities frequently use kin networks for support which can be a specific concern as these peer and family supports are also aging (Park et al., 2013). Because of systemic health and access disparities, minorities typically turn 65 having already experienced a greater number of significant SLEs when compared to non-minority aging adults. The meaning of social support on the relationship between SLEs and life satisfaction between minority and non-minority elders of the Baby Boomer generation is examined in this work. This research utilized the Health and Retirement Study (HRS) (2006 through 2012) to perform a one-way ANCOVA. The interaction was significant between SLEs and changes in social support ($F(5,3915)=7.87, p<.001, n2=.012$) with significant differences between Minority ($M=.046, SD=1.64$) and Non-minority ($M=.989, SD=2.16$) respondents and levels of SLE's. Cultural differences in regards to social support networks is also discussed.

DOES THE HISPANIC EPIDEMIOLOGICAL PARADOX EXTEND TO CHILDHOOD ADVERSITY AND LATER LIFE DISABILITY?

J.N. Laditka, S.B. Laditka, *University of North Carolina at Charlotte, Charlotte, North Carolina*

Evidence suggests adverse circumstances during childhood increase later life disability. Little research has examined whether this association affects Hispanic Americans, whose life course health dynamics often differ from other groups. We estimated this association for African American, Hispanic, and non-Hispanic white women and men for eight childhood circumstances: fair or poor health, poverty, father or mother with education less than grade 8, household moves or receipt of money from family due to financial difficulties, father with extended unemployment, or no father in the household, using data from the Health and Retirement Study (8 waves, 1998–2012, ages 51+, n=29,629, 136,704 functional status and death transitions). We used a 5-level index of childhood risk factors, none to 4 or more. Multinomial logistic Markov models estimated monthly probabilities of transitioning among having difficulty with activities of daily living (ADLs), having help with ADLs, and death, adjusted for age, gender, education, and race/ethnicity. We used the probabilities to conduct microsimulations, creating large populations with monthly functional status measures through death for each individual, and analyzed outcomes in those populations. Women age 70 with high school education illustrate results (all $p<0.001$): Comparing those with 4 or more adversities to those reporting none, for Hispanics the percentage of remaining life with ADL difficulty was 8.7% greater, and with ADL help 9.8% greater. Comparable

results were 7.5% and 9.1% for African Americans, 9.7% and 6.8% for whites. Childhood adversity was not associated with mortality. Childhood adversity increased later life disability similarly for African Americans, Hispanics, and whites.

OLDER IMMIGRANTS' CARDIOVASCULAR HEALTH: MEASURING RISK AND THE IMPACT OF SOCIAL DETERMINANTS

T. Sadarangani¹, M. Jared², 1. *New York University, New York, New York*, 2. *New York University Rory Meyers College of Nursing, New York, New York*

The population of immigrants who resettle in older and middle age, also known as late-life immigrants (LLI), is expected to grow threefold by 2050. The stressors of aging and resettlement predispose LLI to negative health outcomes, including the development of cardiovascular disease (CVD). Despite the passage of the Patient Protection and Affordable Care Act (PPACA), affordable health insurance remains out of reach for most newly arrived LLI. Simultaneously, increasing numbers of uninsured LLI are presenting to emergency departments with life-threatening complications of CVD, including myocardial infarction.

Little is known about the financial and clinical benefits of expanding access to health insurance for LLI. This study, a secondary analysis of data from the National Health and Nutrition Examination Survey (NHANES), (1) examined the association between health insurance coverage and CVD risk (using two separate dependent measures: Framingham Risk Score and the presence of Metabolic Syndrome) among older immigrants and (2) explored the role of health insurance in CVD relative to other socially determined access barriers within immigrants' social ecology using hierarchical block regression. Early results found foreign born middle-aged and older adults to be a heterogeneous group who are less likely to be insured than the native born. Moreover, uninsured older immigrants have worse CVD risk profiles than their insured counterparts. Health insurance is a critical barrier to health access within immigrants' complex social ecology. A cost-benefit analysis is needed to determine the most effective method of expanding insurance coverage to recently arrived LLI.

RELIGION AND DEPRESSION SEVERITY IN OLDER SEXUAL-MINORITY ADULTS

C. Escher, F. Ma, S. Spies-Upton, S. Paulraj, C. Cummings, L.M. Brown, T. Tormala, R.G. Gomez, *PhD Program in Clinical Psychology, Palo Alto University, Palo Alto, California*

Older sexual minorities belonging to a religious group may experience poorer psychological wellbeing, as they have historically been discriminated against by religious communities. However, some research suggests that LGBTQ individuals can benefit from religious support. This study examined the relations of outness to religious community and religious activity with depression in 102 lesbian, gay, and bisexual adults over the age of 55. As part of a larger study, participants completed the Religion and Spirituality Questionnaire and the Center for Epidemiological Studies Depression Scale. Of those who reported being religious or spiritual (n=87), outness to religious community was significantly correlated

with relying on religious teachings for problems, satisfaction with outness to religious community, relying on religious beliefs as a guide, and praying ($p < .05$). When examining sexual minority subgroups, correlations indicated that outness to religious community was related to greater involvement in their religion in bisexuals and lesbians, but not in gay men. As for wellbeing and religion, depression severity was negatively correlated to outness to religious community and praying in Lesbians. In Gay men, depression was negatively correlated with belief in god and praying. In contrast, in bisexuals, satisfaction with outness, belief in god, and praying were positively correlated with depression indicating that religion may have a detrimental effect on depression. These findings suggest that some aspects of religion may be beneficial to the wellbeing of older sexual minorities, but the benefits may vary across sexual minority groups.

MENTAL HEALTH SERVICE UTILIZATION AMONG AGING LATINO AND ASIAN AMERICANS: THE ROLE OF SOCIAL CAPITAL

J. Muruthi, D.C. Lewis, K.G. Emerson, *University of Georgia, Athens, Georgia*

This study examines how rates of mental health service utilization are impacted by both social capital (friend support, family support, and neighborhood cohesion) and immigration factors (English proficiency and length of residence in the United States (U.S.)). Immigrants to the U.S. often face unique challenges (such as discrimination, language barrier, housing and transportation problems, sparse community and individual resources, and limited access to health services), which place them at risk for deficits in health. Studies have shown that social capital and immigration factors independently have significant impacts on immigrants' health outcomes. We analyzed the mental health service use data on individuals aged 55 and older from the National Latino and Asian American Study. We found three primary themes associated with mental health service use: A significant variation in service utilization within and between the sample depending on their English proficiency and length of residence; All indicators of social capital impact the rates of service utilization but the patterns of associations vary; and that family support had both independent and direct effects on the rates of service use even after accounting for socioeconomic status (SES). This study highlights the significance of social capital, immigration factors and SES as determinants of general health and, more specifically, mental health among aging immigrants. Findings from this study not only add to the aging health and minority literature but they also point to the need for effective and culturally-appropriate mental health interventions.

IMPACT OF PHYSICAL-MENTAL COMORBIDITY ON SUBJECTIVE WELL-BEING AMONG DIVERSE ELDERS

S.Y. Wang, G. Kim, *University of Alabama, Tuscaloosa, Alabama*

Objectives: Older adults are more likely to be burdened by multiple health conditions, and physical-mental comorbidity adversely affects one's well-being. However, little is known about comorbidity as a determinant for subjective well-being (SWB). Thus, this study examined racial/ethnic variations in the relationship between types and severity

of physical-mental comorbidity and SWB among diverse elders.

Methods: Drawn from the National Health and Aging Trends Study in 2011, 8064 elders (White, Black, Hispanic, or Asian) aged 65 or older were included for analyses. Participants were grouped using sixteen common physical health conditions and two mental disorders to examine influences of comorbidity. Chi-square analyses were used to compare racially/ethnically diverse participants on demographic variables and types of comorbidity. Analyses of covariance (ANCOVAs) were used to assess the relationship between types and severity of comorbidity and SWB across four major racial/ethnic groups.

Results: Significant differences were found on background characteristics and types of comorbidity among racially/ethnically diverse elders. For main analysis results (ANCOVAs), Blacks and Hispanics reported higher SWB than Whites after controlling for covariates ($F_{(3, 6818)} = 7.26, p < .001$). Participants with physical-mental comorbidity reported lower SWB compared to healthy participants ($F_{(3, 6818)} = 38.16, p < .001$). As the severity of physical-mental comorbidity increased, SWB decreased ($F_{(2, 1337)} = 3.13, p < .05$).

Conclusion: This study provided detailed descriptions and comprehensive knowledge of the relationship between physical-mental comorbidity and SWB among diverse elders. Identifying racial/ethnic-specific correlates of comorbidities and SWB may help healthcare providers develop intervention programs for diverse elders.

THE HEALTH AND WELL-BEING OF LATE MIDDLE-AGED, RURAL-DWELLING HISPANIC ADULTS WITH ARTHRITIS

S. Schepens Niemic, C. Vigen, J. Blanchard, J. Martínez, M. Carlson, *University of Southern California, Chan Division of Occupational Science and Occupational Therapy, Los Angeles, California*

Hispanic older adults with arthritis are at high risk for arthritis-related limitations in daily activities. Moreover, rural residence is associated with risk for arthritis, poor health outcomes, and healthcare disparities. This study's purpose is to describe differences in the health and well-being of late middle-aged (50–64 years), rural-dwelling Hispanic adults with and without arthritis. We conducted a cross-sectional analysis of 40 Hispanic adults (mean age=57.6 years, SD=4.8) who were participating in a feasibility study of a lifestyle intervention delivered in a primary care system in rural California, USA. Participants reported on medical diagnoses, including arthritis of any type, and various health and well-being parameters. We analyzed a subset of the measurement battery that holistically represented health and wellness: satisfaction with social activities, physical activity engagement, sleep quality, and general well-being. All participants were Spanish-speaking and 90% were female. Those who reported arthritis ($n=19, 47.5\%$) showed significantly poorer social activity satisfaction ($p=0.05$), physical activity participation ($p=0.04$), and general well-being ($p=0.04$) compared to non-arthritic participants. Although not statistically significant, individuals with arthritis also reported poorer sleep quality. This small cross-sectional study showed that self-reported arthritis was highly prevalent in a sample of late middle-aged,

rural-living Hispanics. Similar to previous findings in elders, the presence of arthritis was associated with poor health and well-being in multiple domains. While a larger-scale study is necessary to confirm these preliminary findings, this study informs efforts to develop lifestyle interventions tailored to vulnerable, late mid-life Hispanic individuals with arthritis and who are residing in rural communities nationwide.

AFRICAN AMERICAN CUSTODIAL GRANDPARENTS: A NATIONAL PROFILE OF HEALTH CHARACTERISTICS AND BEHAVIORS

D.M. Whitley¹, E.R. Fuller-Thomson², *1. Georgia State University, Atlanta, Georgia, 2. University of Toronto, Toronto, Ontario, Canada*

The U. S. Census Bureau reports 1.3 million African American (AA) grandparents reside with their grandchildren; nearly half (47%) have full parenting responsibility for their grandchildren's care. Despite the expanding literature on this family group, more information is needed on "solo grandparents" who are raising their grandchildren on their own. Using the 2012 Behavior Risk Factor Surveillance System survey, we compare the prevalence of medical conditions and health behaviors of 169 AA solo grandparents raising grandchildren in comparison to 1,635 AA single parents. Compared to single parents, AA grandparents had a higher prevalence of several chronic health conditions, including arthritis (50.3% vs.17.5%), COPD (12.5% vs. 3.6%), diabetes (20.1% vs. 6.9%), and coronary heart disease (12.6% vs.2.3%). Although a majority of the grandparents were enrolled in a health plan (92.9%) and had a primary medical provider (89.9%), nearly 44% rated their health as *fair* or *poor*. Further, AA grandparents were more likely to have a diagnosis of depression in their lifetime, as compared to single parents (25.4% vs.16.8%). Although AA grandparents were less likely to be overweight (27.9% vs. 33.1%) or obese (36.4% vs.45.8%), they were more likely to be current smokers (35.3% vs. 21.0%). Logistic regression analyses suggested that age differences account for most of the reported variances in chronic conditions between the parenting groups. However, the data illustrate the serious health problems of AA solo grandparents. The impact of the findings on grandparents' parenting roles is discussed, as well as suggestions for promoting community-based support services.

THE HEALTH STATUS OF OLDER ISLAND PUERTO RICANS COMPARED TO U.S. WHITE AND LATINO OLDER ADULTS

C. Perez, J. Ailshire, *Gerontology, University of Southern California, Hialeah, Florida*

Discussions about Latino health in the U.S. often overlook one large population of U.S. Latinos – island Puerto Ricans. Puerto Rico is a U.S. territory and Puerto Ricans are natural-born citizens of the U.S. Puerto Rico is experiencing population aging, but little is known about the health status of aging island Puerto Ricans, and whether it resembles that of Latinos in the mainland U.S. Using data on adults ages 60 and older from the 2002 Puerto Rican Elderly: Health and Conditions Project (PREHCO) ($n=4,389$) and the 2002 Health and Retirement Study (HRS) (10,679 Whites and 1,160 Latinos), we examine differences in

chronic conditions, disability, and self-rated health by race/ethnicity and gender. Results from logistic regression models show that Puerto Ricans have healthier profiles compared to whites; they have reduced odds of heart disease, stroke, lung disease, cancer, any ADL limitations, and fair-to-poor self-rated health (all differences significant at $p < .05$). Island Puerto Ricans have health profiles similar to mainland U.S. Latinos. Further investigation reveals that among island Puerto Ricans, women have increased odds of hypertension, lung disease, any ADL limitations, and fair-to-poor self-rated health compared to men (all differences significant at $p < .05$). Our findings suggest older Puerto Rican women experience a health disadvantage that is consistent with the double-jeopardy hypothesis. Despite their relatively disadvantaged social and economic status, island Puerto Ricans report better health than whites and have similar health as mainland U.S. Latinos. However, the Puerto Rican health advantage is primarily found among men.

SOCIOHISTORICAL CHANGES IN THE EDUCATION SPECIFIC HEALTH DISPARITIES IN THE U.S.

T. Bhatta, J.A. Kelley-Moore, *Sociology, Case Western Reserve University, Cleveland, Ohio*

Many of prior studies have attempted to explain the widening of educational inequalities in health by focusing solely on cohort-specific trends associated with educational attainment, such as health behaviors and economic factors. Interestingly, this approach treats the distribution of education within a particular cohort as a static “starting place” for the question of subsequent health disparities. There have been fewer attempts to explore the substantial sociohistorical changes in *opportunity structures* in the past century, which have served to change who is selected into particular levels of education attainment. This study employs a novel counterfactual approach to accommodate early life selection processes that may simultaneously shape educational attainment and health. Synthesizing cumulative dis/advantage and fundamental cause of disease theory, this study draws from *Health and Retirement Survey* (1992–2012; $n=35,692$) to explore potential historical variation (as represented by birth cohorts) in the influence of education on functional limitations over the life course. Results from generalized linear mixed models suggest increase in the average positive influence of education on functional limitations across birth cohorts. However, the increase in the influence of education across three recent birth cohorts born between 1931 and 1953 was found to be statistically insignificant ($t=1.32$, $p=0.19$). We obtained mixed findings (i.e., slight increase or decrease over time) with regards to educational differences in average rates of change in functional limitations. This study extends existing body of knowledge by investigating the role of changing opportunity structures in modifying patterns of educational inequalities in health across historical periods.

THE MEANING OF AGING WELL AMONG IMMIGRANTS AND REFUGEES IN THE ST. LOUIS REGION

L. Willoughby¹, H. Matsuo¹, J. Hale-Gallardo², S. Goswami¹, 1. *Saint Louis University, St. Louis, Missouri*, 2. *VA Medical Center, Gainesville, Florida*

Despite rich literature on the meaning of “aging well” and related concepts, such as “successful” or “optimal” aging, the meaning of aging well to foreign-born immigrants in the U.S. is relatively understudied and not well understood. In this paper, we present findings on perceptions of aging well among immigrants with differing characteristics including ethnicity, age, gender, mode of entry to the U.S., and length of stay in the US. The paper is based upon a mixed methods study on successful aging conducted in St. Louis, Missouri with a middle-aged and older adult immigrant/refugee sample ($N=320$; Bosnian, Chinese, Vietnamese, Korean, Indian, and Latino/a). Participant responses to the question “What does aging well mean to you?” were qualitatively analyzed and several themes emerged related to health, functional independence, financial security, and family relations. This study contributes to a better understanding of the role of health, demographic and social factors in improving the reception of programs designed to promote healthful aging.

ETHNICITY AND SATISFACTION WITH SOCIAL CARE IN ENGLAND: MEASUREMENT, DETERMINANTS, AND OUTCOMES

R. Willis¹, P. Khambhaita², P. Pathak³, M. Evandrou¹, 1. *Centre for Research on Ageing, University of Southampton, Southampton, United Kingdom*, 2. *Pensions Policy Institute, London, United Kingdom*, 3. *Sociology, Social Policy and Criminology, University of Southampton, Southampton, United Kingdom*

Satisfaction with social care services is routinely measured with Likert scales, and surveys have consistently found that people from minority ethnic groups are less satisfied than white people in England. These surveys cannot explain the reasons for the differences found. Therefore, qualitative interviews ($n=121$) with South Asian and White British service users, family carers, and social care staff were carried out to explore reasons for high or low satisfaction. Thematic analysis focused on three areas: (i) the satisfaction measurement itself, (ii) reasons for satisfaction, and (iii) how staff coped with working across diversity. People who gave the same responses to the Likert scale actually had very different experiences, indicating both that the surveys do not capture the full story and also that individuals understand the scale differently. People with a clear understanding of the social care system were better able to work collaboratively with care staff to meet their needs, and thus had a higher satisfaction level. A clear understanding is facilitated by greater opportunities to become familiar with the social care system, and so first-generation migrants are disadvantaged compared to the British-born. Finally, social care staff who adopted a culturally reflexive working style, and were comfortable asking questions about cultural or religious difference, were more confident working with clients who differed from themselves. Recommendations are to include a qualitative component in satisfaction surveys, increase outreach communication about how social care services work, and to encourage staff to recognise and discuss diversity.

DIVERSE AGING EXPERIENCES OF EAST ASIAN IMMIGRANTS IN THE UNITED STATES: A LITERATURE REVIEW

J. Liang¹, H. Stohry², 1. *Gerontology, University of Louisiana at Monroe, Monroe, Louisiana*, 2. *Miami University, Oxford, Ohio*

Around 12 percent of the immigrant population are aged 65 and older, and Asians are the fastest-growing group among elders in the United States. In the gerontological literature, East Asians (Chinese, Japanese and Korean) are often portrayed as a homogeneous group due to their shared cultural heritage (e.g., filial piety as a morality and practice) and are often stereotyped as the model minority population. In fact, despite commonalities, there exists great diversity when it comes to aging experiences, as shaped by varying socio-cultural factors such as timing and duration of immigration, historical background of immigration (e.g. professional, political refugee, military marriage), English proficiency, cultural dissonance, and interracial/interethnic marriage, in addition to demographic characteristics (e.g., gender, education). For example, Japanese immigrants have the highest rate of marrying Caucasians and are the most assimilated group among all Asians, thus they may experience old age differently from their Chinese and Korean counterparts. Also, foreign born immigrant elders living with children raised in America face different challenges from those naturalized citizens' aging parents brought to live with their family in terms of cultural adaptation and intergenerational communication. Such later life diversity among East Asian immigrant population warrants attention, as their needs are often under-met. Therefore, a comprehensive literature review is critical in educating service providers for understanding the socio-cultural factors that contribute to the heterogeneity within the group of East Asian immigrant elders and thus delivering culturally congruent and competent services.

MENTAL HEALTH STATUS OF MIDDLE-AGED AND OLDER HMONG REFUGEES IN THE U.S.

M.S. Yang, J.E. Mutchler, *UMASS Boston, Boston, Massachusetts*

Mental health issues have previously been identified as a major public health problem for Southeast Asians, who are one of the most rapidly growing populations in the U.S. Yet heterogeneity exists within the Southeast Asian ethnic groups in terms of health, socioeconomic resources, and level of adaptation to the United States. For instance, health outcomes are less favorable for the Hmong and Cambodian groups compared to other Southeast Asians and most other ethnic groups in the U.S. Existing research on mental health status of older Hmong populations in the U.S. is virtually absent. We analyze primary data collected from California for Hmong persons 50 years old and older (N=56). Questions included a short form depression scale (Hopkins Symptom Checklist-10 items (HSCL-10)) and demographic questions. In terms of family characteristics, 34% are widowed, 46% are married, and 66% live in a household including 5 or more people. Less than 5% have completed high school, and 18% speak or read English average or well. For this sample in the past 7 days the experience with difficulty in falling asleep or staying asleep (M=2.91, SD=1.25) and feeling tense or keyed up (M=2.57, SD=1.32) were the most commonly

reported depression symptoms. The overall mean HSCL-10 score was 2.34 (SD=.79). The findings are discussed in terms of the unique migration and adjustment experiences characterizing this population. Findings from this study could provide a more complete view of their status.

SESSION 480 (POSTER)

AGING IN THE COMMUNITY

ONLINE TRAINING OF LICENSE OFFICE PROFESSIONALS TO SCREEN APPLICANTS FOR MEDICAL IMPAIRMENT

J. Stowe^{2,3}, P. Niewoehner^{1,3}, 1. *VA Medical Center, St. Louis, Missouri*, 2. *Mid-America Regional Council, Kansas City, Missouri*, 3. *Missouri Coalition for Roadway Safety, Jefferson City, Missouri*

In states with voluntary reporting of possibly medically impaired drivers, previous research shows fewer than expected reports from license office professionals. Medical conditions that potentially impair driving are fairly common among older licensed drivers. Therefore, a crucial opportunity exists in license offices for early identification of impaired drivers prior to involvement in a traffic crash or incident. This study explores the development, implementation, and evaluation of an online training for license office professionals to identify likely medical impairment among driver license renewal applicants. Following statewide roll-out to over 180 privatized license offices, 85.9% of users found the training helpful and relevant, and 96.8% rated the training as "Very Good" or "Excellent" among trainees who responded to a survey embedded within the training (N = 183). The challenges of an agency-wide training release precluded an experimental design, but volume of reports of potentially impaired drivers was used to gauge training efficacy. In the 12 months prior to the training's release, 24 reports were made; in the year following release, 20 reports were made. Although the training was applicable, useful, and highly rated by trainees, it did not immediately increase the volume of reports made. In five of the evaluated months after release of the training zero reports were made. External factors, such as the impact of the privatization of government agencies with critical public safety roles should be evaluated and reported. Stronger policies, training mechanisms, and structural changes in licensing authorities are likely needed to improve screening efforts.

AN ANALYSIS OF THE ACCEPTANCE AND ATTITUDE OF ELDERLY DRIVERS TO THE NEW LICENSING SYSTEM

C.E. Wu¹, Y. Lin³, C. Chen¹, P. Tseng², 1. *Transportation Science, National Taiwan Ocean University, Keelung, Taiwan*, 2. *Department of Traffic Science, Central Police University, Taoyuan, Taiwan*, 3. *Department of Transportation and Logistics Management, National Chiao Tung University, Hsinchu City, Taiwan*

Research shows that elderly drivers/riders are significantly over-represented in crash statistics and physical changes associated with ageing (such as vision, memory and reaction speed) can increase the risk of crash for elderly drivers. In

Taiwan, elderly people aged 65 or greater comprised more than 12.5% of the entire population, however, the elderly drivers accounted for 31.4% of traffic accident fatalities in the fiscal year 2015.

The Ministry of Transportation and Communications (MOTC) initiated a campaign to encourage elderly drivers voluntarily surrender their driver license few years ago. However, this campaign was not favorable by the elderly and the disproportionate traffic accident fatalities of elderly remains. Early this year (2016), MOTC enacts a new licensing system to mandate the elderly drivers aged 75 years and over must take a medical and cognitive assessment to retain their driving license every two years. This study applies the Technology Acceptance Model (TAM) to investigate the contributing factors that influence the elderly's perception, acceptance and attitude toward the new licensing system. A questionnaire consists of three sections is administrated to the participants, including the demographic profile, driving experience, self-assessed fitness to drive, attitude toward new licensing system, and subjective evaluation of public transportation. It shows that the majority of participants are not aware of this new regulations. The acceptance and attitude of the participants are highly affected by their medical condition.

WORK CONDITIONS AND WORK DESIGN WITHIN THE HEALTH AND CARING SECTOR: THE CASE OF OLDER WORKERS

S. Merkel, J. Hilbert, *Institute for Work and Technology, Gelsenkirchen, Germany*

Most EU member states have a strong focus on raising retirement ages and financially incentivising longer working life. Yet so far these policies have paid little attention to growing social inequalities which benefit those most able to work longer and disadvantage those unable to work longer. In analysing unequally distributed chances and risks of working longer on the one side and of implications for quality of life and well-being on the other, our study takes up a research perspective which so far in retirement research has been underdeveloped. Against the backdrop of demographic change, the social service sector is a fast-growing business sector with rising socio-political and employment-related significance – in particular considering health and care jobs. Working conditions – i.e. physical and psychological stress, organisation of work, task variety and discretion, employee involvement and participation, leadership/management strategies, use of assistive technologies etc. – are an essential variable influencing the workability of older people. Therefore, the aim of our study is to examine existing problems and challenges of working conditions within the social service sector in Germany. A particular focus is laid on workers touched by health or social inequalities. To help overcome inequalities with adequate ways of work design and with improved working conditions is often seen as an effective way to generate additional workforce for professional caring jobs. To better understand current challenges for older workers and also ways to deal with these challenges, we use qualitative methods (problem centered interviews with the members of staff and expert interviews with representatives of national organization).

EXPECTATION AND REALITY OF NEW SHRC MEMBER: THE RELATED WITH JOB MATCHING AND SATISFACTION

M. Nakamura^{1,2}, T. Ishibashi¹, H. Osada², 1. *The Dia Foundation for Research on Ageing Societies, Tokyo, Japan*, 2. *J. F. Oberlin University Graduate School of Gerontology, Tokyo, Japan*

Introduction: Japan has Silver Human Resource Centers (SHRCs) for elderly working to live a worthwhile life. SHRCs have many job categories for persons aged 60 or older. This study examined the relationship between job matching and satisfaction of SHRCs member.

Methods: We had two surveys on member satisfaction at 2012 and 2013. We use eight questions (<1>Health maintenance, <2>Get to ikigai, <3>Auxiliary of the household, <4>Exchange with friends, <5>Contribute to the local, <6>Use of knowledge, <7>Better relationship with family, <8>Extend the life). The subjects were 152 new members belonging to the SHRC of the suburban in Tokyo. They were divided into Higher and Lower groups by comparison of one year later. We analyzed it by logistic regression analysis, using job match or job mismatch as objective variable.

Results: The percentage of people that could not get to the desired job was 45.4% (man 50.9%, woman 31.8%). Next, the percentage of Lower group was <1>27.6%, <2>32.2%, <3>48.7%, <4>40.1%, <5>32.2%, <6>45.4%, <7>42.8%, <8>35.5%. However, change of these satisfactions and job matching were not related ($p > 0.05$).

Conclusions: Even the new SHRCs members could not get the job desired, they'd satisfaction is not lowered. For them, Itself be joining than the matching of the work is probably important. However, this subjects was higher evaluation of <1> and <2>. Therefore, there needs to be additional test also with different SHRCs.

TRAINING OLDER WORKERS IN SMALL AND MEDIUM-SIZED ENTERPRISES: RESULTS FROM GERMANY

L. Naegele, F. Frerichs, *Institute for Gerontology, University of Vechta, Vechta, Lower-Saxony, Germany*

Small and medium-sized enterprises (SMEs) represent 99% of all businesses in Europe. In Germany the second biggest sector - craft trade - alone accounts for more than one million enterprises, five million workers and an average company size between 5 and 20 employees. Due to structural changes (demographic ageing of workforces, skill shortages or the transition to a knowledge-based society) SMEs in the German craft sector need to pay closer attention to the competence development, especially of their older employees. Research has shown that training activities of SMEs usually follow a distinct pattern: the smaller a company is the fewer training opportunities are offered. However this research is often focused on formal training, neglecting non-formal work integrated training measurements. Using a mixed method approach, which combines quantitative and qualitative methods, this paper researches the importance of non-formal training measurements in the context of SMEs from a gerontological perspective. Based on survey data from the "In-K-Ha Project" (funded by the Federal Ministry of Education and Research (BMBF)), we find a similar training behaviour across smaller and bigger companies. In a second

step we conducted 16 qualitative company case studies in order to identify explanatory factors for the training behaviour found in the SMEs we analyzed. Amongst the owner's willingness to invest in training factors such as staff retention, order volume and a company's degree of (technical) innovation have shown to be influential regarding the prevalence of training opportunities for older workers.

POST RETIREMENT ADAPTATION OF ELDERLY IN KERALA, INDIA

J.J. Katttakayam, *University of Kerala, Trivandrum, Kerala, India*

India is growing old! The stark reality of the ageing scenario in India is that there are 77 million older persons in India today, and the number is going to grow to 177 million in another 25 years. Kerala, a relatively small Southern state in India, is experiencing the last stages of demographic transition that can be compared to the demographic trend in many aging European countries. Kerala has the highest percentage of elderly population (12.6 %), higher than the national average. Though life expectancy has been increasing steadily in Kerala for the last four decades, the retirement age of the state government employees remained at 55 years until 2011 when it was increased to 56 years. As retirement has become an essential life-stage in older adults, adapting well to retired lifestyle is crucial for long term life-satisfaction of the elderly. Kerala has four lakh pensioners and 12 lakh social security beneficiaries. Though some welfare measures have been taken for the aged persons, these measures are not fool proof. The present paper attempts to capture the dimensions and issues of post retirement adaptation of the elderly in Kerala. Quantitative data were collected from 300 retired elderly from the selected households. The problem is approached from the perspective of changes happening in their social position and relations within their family. The majority of the respondents held that they get the expected care from their spouses after retirement. Though this is a positive sign, the fact that around one tenth of them do not get the expected care invites attention to the emerging situation that the elderly in the state are likely to face more seriously in the coming days.

RETIREMENT INCOME SYSTEM: A COMPARISON BETWEEN CHILE AND THE U.S.

A.E. Diaz-Valdes Iriarte¹, S.A. Lopez Bohle², 1. *School of Social Work, Boston College, Allston, Massachusetts*, 2. *Universidad de Santiago de Chile, Santiago, Santiago, Chile*

For the last few decades, the world's retirement systems have been objects of analysis. For the past century, social security has played an important role in society—especially as populations get older, presenting new challenges to governments and their existing policies. Chile and the U.S have different systems with similar results when it comes to poverty prevention. However, the retirement system in the U.S, which is public, is facing sustainability problems, and the retirement system in Chile, which is private, is facing inequality problems. Therefore, the aim of this paper is to make a comparative analysis of the retirement income systems between Chile and the U.S.

Despite the accomplishments, new reforms are inevitable, and the cost of the transition of systems in Chile can

offer new elements to the debate in the U.S. In addition, the importance and confidence that people have in the system in the U.S and its redistributive component can show other elements for the debate in Chile.

SUSTAINING COMMUNITY-BASED HEALTH INITIATIVES FOR ADULTS AGING WITH INTELLECTUAL DISABILITIES

N. Spassiani¹, B.A. Meisner³, J. Hammel⁴, T. Heller², 1. *School of Education, Trinity College Dublin, Dublin 2, Ireland*, 2. *University of Illinois at Chicago, Chicago, Illinois*, 3. *Dalhousie University, Halifax, Nova Scotia, Canada*, 4. *University of Illinois at Chicago, Chicago, Illinois*

Community-based intellectual disabilities (ID) agencies provide services and supports to people aging with ID, offering these individuals opportunities to participate in their community and engage in health promoting behaviors. However, little is known about the factors involved with *sustaining* community-based health initiatives (CBHI) among ID agencies. The purpose of the current study was to explore the facilitators and barriers of sustaining CBHI for people aging with ID living in group homes managed by ID agencies. Two non-profit ID agencies participated in the study. Nineteen semi-structured interviews were conducted with directors, managers, and direct support staff. Interviews conducted with directors and regional managers provided a broader systemic perspective, whereas interviews with support staff provided a front line perspective of the factors that may be effecting CBHI sustainability within group home settings. Grounded theory methods, including constant comparison, were used for analysis. Findings show that although ID agencies understand the importance of health and community participation for their clients and support such initiatives, agencies lack policies, resources, and ID and health education to sustain CBHI for their clients aging with ID over time. It is important to gain a better understanding of the influencing factors involved in sustaining CBHI that are being implemented by these agencies to enable individuals with ID to experience the many positive physical, psychological, and social health outcomes as they age and to potentially decrease their risk of institutionalization due to poor health.

ASSESSING OUTCOMES FOR THE INTERGENERATIONAL ACTIVE AGING FOR L.I.F.E. PUBLIC HEALTH INITIATIVE

E. Roberts, M. Ruppert-Stroescu, A.J. Bishop, G. Clare, J. Hermann, K. Struckmeyer, M. Balasubramanian, M. Kang, *Design Housing and Merchandising, Oklahoma State University, Stillwater, Oklahoma*

Active aging involves staying engaged in life in a number of ways, including maintaining independence, physical and cognitive fitness, and social engagement across the lifespan. This investigation highlights the **Active Aging for L.I.F.E.** health initiative, an intergenerational pilot program developed and implemented in northeastern Oklahoma. The program framework focused on both the functional and social systems which are predictors of well-being in older adults, and the understanding that the trajectory of aging is impacted by healthy choices and behaviors throughout the life course.

Program participants included older adults age 65+ (n=23) and college students age 18–25 (n=20). Participants attended a four-part speaker series focused in the four domains of *longevity, independence, fitness, and engagement*, and completed a series of pre/post series surveys used to gauge changes in attitudes and behaviors toward aging. A series of paired samples t-tests were conducted to compare attitudinal responses before and after attending four events, with college-age students showing the most change in their perceptions of their role and place in the aging process. Statistically significant differences ($p < .05$) in responses between genders were also identified, with female participants showing strong agreement in statements such as “I look forward to growing older,” and “It is a privilege to grow old.” These findings highlight that emerging adults, particularly females, may adopt more positive views toward aging with such programming, building a general acceptance of expected age-associated changes. This is also significant as women normatively live longer than men and are vulnerable to negative age-associated changes.

THE AGE-FRIENDLY UNIVERSITY INITIATIVE: BRIDGING COMMUNITY AND ACADEMY

T. Kennedy¹, T. Corrigan², R. Mark^{2,3}, 1. *School of Social Work, Arizona State University, Phoenix, Arizona, 2. Dublin City University, Dublin, Ireland, 3. University of Strathclyde, Glasgow, Scotland, United Kingdom*

An age-friendly university movement is transforming traditional universities into centers of lifelong learning that support active, healthy aging and include older adults in the core elements of the university. Initiated by Dublin City University (DCU), Dublin, Ireland and expanded as a collaboration between DCU, Arizona State University, United States, and the University of Strathclyde, Scotland, this international initiative spawned an inaugural international conference in 2015. In May 2016, the Association for Gerontology in Higher Education (AGHE), an educational unit of the Gerontology Society of America, announced its endorsement of the ten age-friendly principles which provide a guiding framework for developing, distinguishing, and evaluating age-friendly programs and policies. This session will present the history of the age-friendly university initiative and international collaboration, present the ten principles of an age-friendly university, discuss the experiences and challenges of the founding universities in this growing movement, and present a model of sustainability for universities considering joining the age-friendly initiative.

AGE-FRIENDLY COMMUNITY FEATURES: CAREGIVERS' PERCEPTIONS

K. Black^{1,2}, A. Badana³, 1. *University of South Florida, Sarasota-Manatee, Sarasota, Florida, 2. The Patterson Foundation, Sarasota, Florida, 3. University of South Florida, Tampa, Florida*

As communities strive to create age-friendly accommodations to best meet the needs of a growing aging citizenry, the concomitant growth of caregivers provides additional layers of consideration for planning. Increasingly, persons providing care are managing their own aging and negotiating their community's infrastructure for both themselves as well as on behalf of their aged loved ones. These dual standpoints provide a unique perspective for an age-friendly environment.

This study reports on the findings from a global age-friendly community effort that examined the aspirations of persons age 50 and older on the importance of community features across three clustered domains of community life including: (1) built environment (i.e. outdoor spaces and public buildings, housing and transportation); (2) social environment (i.e. civic participation and employment, social participation, respect and social inclusion); and (3) community and health supports (i.e. community supports and health services and communication and information). The study surveyed caregivers (n = 216) and non-caregivers (n = 135) in a Southeastern United States community in which more than half of the residents are age 50 and older and one-third are age 65 and older. Focus group data (n = 9) was also analyzed to further illuminate the findings. Results indicate significant differences across multiple areas with the greatest magnitude of differences noted in the areas of housing and community supports, suggesting that caregivers are simultaneously preferring to enhance their own aging and more efficiently manage the needs of their care recipient. Age-friendly implications of the findings are discussed.

HOW HOUSING WITH SERVICES WORKS FOR LOW- INCOME OLDER ASIAN IMMIGRANTS

P.C. Carder, G. Luhr, J. Lee, *Institute on Aging, Portland State University, Portland, Oregon*

This paper describes a pre- post-evaluation of a housing with services intervention, including culturally relevant programs, in 10 publicly-subsidized apartment buildings in a U.S. city. Twenty-three percent of residents spoke a Southeast Asian language. Intervention goals were to increase residents' access to health and social services, decrease ER use and social isolation, and improve quality of life. Repeated measures analyses examined differences between Asian language and non-Asian language speakers. Asian language speakers were more socially isolated than non-Asian language speakers at both time points. Food insecurity decreased overall from T1 to T2, with no differences within or between groups. More non-Asian language speakers used the ER, were hospitalized, and called 911 than Asian language speakers. No difference were observed on self-rated health or quality of life over time, within or between language groups. Culturally relevant services can improve the lives of Asian immigrants, though inconsistently across health/social domains.

HOW LIFE EXPERIENCE INFLUENCES FEELINGS OF EMERGENCY PREPAREDNESS IN OLDER PEOPLE

V. Cornell, *School of Social Sciences, University of Adelaide, Adelaide, South Australia, Australia*

Anecdotally, older people are considered under-prepared for emergency events. However, they are rarely engaged directly, to understand their knowledge and experience of emergencies and their feelings regarding preparedness.

This presentation will discuss research that explored how the life experience of older people influences their preparedness for emergencies. In-depth interviews were held with eleven people aged over 70 years, to explore emergency events experienced; the meaning and understanding drawn from the events; and participants' beliefs about emergency preparedness.

Participants did not view emergency preparedness as a one-off activity, such as completing an emergency plan or checklist; or packing an emergency toolkit or 'go bag'. It is a *process* of experiencing a variety of events over a lifetime and learning to create a feeling of mental preparedness and the ability to cope. While they might not define themselves as 'being prepared', they certainly considered themselves to be resilient; they accept their limitations and feel confident they can cope.

These findings are critical in terms of how older people are engaged in preparedness planning; and have implications for developing well informed emergency management and aged care policy and practice. Older people are not vulnerable *per se*; rather they may have some specific needs, but also a wealth of positive attributes in terms of knowledge, experience and sense of community.

By understanding that 'being prepared' is less important than 'being resilient', policy-makers can establish how best to assist older people in the face of emergencies.

EFFECTS OF NATURAL DISASTER ON RURAL PEOPLE CHOICE OF OLD-AGED CARE MODEL—BASED ON BAOJI CASE

M. Guo, Y. Jin, H. Mi, *Zhejiang University, Hangzhou, China*

Chinese population is aging at an unprecedented speed, meanwhile China also suffers a lot from disasters. Those areas suffering most from natural disasters are often rural areas, facing even serious aging problem and population vulnerability.

The hypothesis of this study is that people's choice of old-aged care model, once underwent natural disasters, may change to seek a higher-level ability of withstanding disasters, which differs a lot from those choices from who haven't suffer loss from disaster.

This study use data collected by our research team through survey from Shanxi Baoji and the account of the data is 854. Old-aged care model is dependent variable (0= traditional home-based care, 1=non-traditional home-based care) and whether they have suffered property losses (0=No, 1=Yes) is independent variable. To analyze the relativeness between the two variables, and the dependent variable is two-valued variable, logit model is available.

According to the regression result, the possibility of people who suffering property losses in a disaster choose non-traditional home-based care is 414.32% higher than the one who haven't suffered. Specifically, the significance of the parameter is 2%. Preference of old-aged care model among people who have suffered property losses in natural disasters have apparently changed.

One of our implication is that once traditional home-based care way be chosen, it means that at least a kinship has to take care of him and sacrifice working time or even a better work opportunity, which is of less possibility would one who have suffered property losses in a disaster choose.

RATIONAL AND AFFORDABLE LTC FOR TOTALLY DISABLED ELDER

J. Song, H. Pi, *Chinese General Hospital, Beijing, China*

Background: China is experiencing a foreseeable pressure from an increasing aging population. The problem on the

cost control of long-term care for totally disabled elders is a principal contradiction which hinders the development of the long-term care in China. However, no previous study has explained what effects the rationality and affordability of long-term care for disabled elders can make.

Aim: This study explores whether a rational an affordable long-term care for totally disabled elders can enhance quality of life and reduce pulmonary infection and pressure ulcer and other complications.

Methods: 100 totally Chinese totally disabled elders were included and randomly divided into two groups. One group accepted a rational an affordable long-term care service through individual assessment while the other accepted the ordinary long-term care service. Additionally, we evaluated the differences between two groups after 6 months through the quality-of-life evaluation instrument and the incidence of the pulmonary infection and pressure ulcer.

Results: Compared to those who are entitled to an ordinary rational an affordable long-term care service, the life quality of elders accepting rational an affordable long-term care service is remarkably high ($P < 0.05$). However, the ratios of pulmonary infection and pressure ulcer in elders accepting rational an affordable long-term care service have a remarkably decreased ($P < 0.05$).

Conclusions: We demonstrate that the rationality and affordability of long-term care through individually controlling can help totally disabled elders get an increasing quality of life. Furthermore, pulmonary infection and pressure ulcer can exert a significantly attenuated influence on them.

SESSION 485 (POSTER)

ARTHRITIS

ATTACHMENT STYLE, PAIN, AND PSYCHOLOGICAL WELL-BEING IN OLDER ADULTS WITH KNEE OSTEOARTHRITIS

A.M. Ingram¹, B.S. Cox¹, D.M. Smith², P.A. Parmelee¹, 1. *The University of Alabama, Tuscaloosa, Alabama*, 2. *Stony Brook University, Stony Brook, New York*

BACKGROUND: Previous research has shown that adults with an insecure vs. a secure attachment style are more likely to have worse pain, rate their life satisfaction lower, and have more depressive and anxious symptoms. This study examined linkages of attachment style with pain and well-being in persons with knee osteoarthritis (KOA). **METHODS:** In-person interviews with 256 older adults (mean age = 64.3, SD = 9.26), with KOA assessed attachment style, knee pain, depression, anxiety, and life satisfaction. All data came from a larger study examining daily quality of life with KOA. **RESULTS:** Multiple regression analyses examined effects of pain and attachment style on depression, anxiety, and life satisfaction. We categorized attachment as secure (close or dependent) and insecure (anxious). Results indicated that both close and anxious attachment styles and knee pain significantly predicted anxiety, $p < .05$, $R^2 = .337$. However, dependent attachment had no significant effect. Lower life satisfaction was significantly predicted by dependent attachment and knee pain, but not close or anxious attachment, $p < .05$, $R^2 = .321$.

Both dependent and anxious attachment predicted depressive symptoms, $p < .001$, $R^2 = .511$. Furthermore, significant interactions of KOA pain and dependent attachment on depression $p < .01$, and life satisfaction, $p < .05$, reflected buffering effects of attachment on the relationship between pain and psychological well-being. **DISCUSSION:** The results provide support to the importance of attachment style on older adults' physical and mental health when dealing with chronic pain. Implications for research and treatment are discussed. (Supported by R01-AG041655, P. Parmelee & D. Smith, PIs).

RACIAL/ETHNIC DIFFERENCES IN TEMPERATURE-BASED TREATMENT FOR KNEE OSTEOARTHRITIS PAIN

C.M. Pierpaoli¹, B.S. Cox¹, D.M. Smith², P.A. Parmelee¹, 1. *The University of Alabama, Tuscaloosa, Alabama*, 2. *Stony Brook University, Stony Brook, New York*

Background: Racial/ethnic differences in experimental heat and cold pain sensitivity have been observed among adults with knee osteoarthritis (KOA). However, little is known about how these differences influence the use of temperature-based treatments (TBTs) for pain. This research therefore examined differential use of heat vs. cold to manage knee pain among African Americans (AAs) and non-Hispanic Whites (NHWs) with KOA. **Methods:** 228 older adults (mean age = 64.5, SD = 9.42) reported their use of various arthritis treatments as part of an ongoing study of everyday quality of life with osteoarthritis. Heat treatments were assessed quantitatively (yes/no). Additionally, numerical codes were assigned to open-ended, qualitative data according to use of hot, cold, combined, or other non-temperature related treatments. Chi-square tests were performed to examine the relationship between racial group and the application of heat, cold, or their combination. **Results:** African Americans were more likely to report using specific heat treatments than non-Hispanic Whites, $X^2(1) = 19.898$, $p < .001$. Reported use of cold, combined, or non-TBTs did not differ across groups. **Discussion:** Although previous findings indicate that AAs display lower heat pain threshold and tolerance than NHWs, these differences may not extend to modalities for managing OA pain. Implications for treatment are discussed. (Supported by R01-AG041655, P. Parmelee and D. Smith, PIs)

PATIENTS' EXPECTATION, QUALITY OF CARE TRANSITION, AND HEALTH OUTCOMES AMONG OLDER ADULTS UNDERGOING HIP AND KNEE ARTHROPLASTY

S. Aree-Ue, I. Roopsawang, *Ramathibodi School of Nursing, Mahidol University, Bangkok, Bangkok, Thailand*

Total joint arthroplasty is commonly surgical procedure that reduces chronic joint pain and improves function as well as quality of life among older adults with osteoarthritis. These patients may be discharged with a short hospital stay due to limited resources. Since patients' expectations is important issue resulting in improving the quality of the services and health outcomes, the present study aimed to examine the patients' expectation, quality of care transition, and functional outcomes among Thai older adults undergoing hip and knee arthroplasty.

Ninety-five samples who underwent hip or knee arthroplasty participated in this study. The measures included the Expectation Questionnaire, the Care Transition Measure, the Modified Barthel Activities of Daily Index, and the Complication Record Form. Data analysis was performed using descriptive, Pearson's correlation coefficient, and multiple regressions.

Improvements in daily activities, ability to climb up and down stairs, and daytime pain were the most important expectations. The participants perceived the overall moderate level of quality of care transition with the highest score on the dimension of "empowerment to assert preferences" following by "information transfer". The lowest score was found on "patient and caregiver preparation". Urinary tract infection was the most common complication. Expectations and quality of care transition showed a positive correlation to functional outcomes, and quality of care transition was the most powerful predictor of functional outcomes.

A better understanding of the association among expectations, quality of care transition, and outcomes may improve the process of care and outcomes among older adults undergoing hip and knee arthroplasty.

GLOBAL VS. MOMENTARY ARTHRITIS PAIN AND EMOTIONAL DISTRESS: EMOTIONAL INTELLIGENCE AS MODERATOR

P.A. Parmelee¹, B.S. Cox¹, M. Scicolone¹, A.M. Ingram¹, F.J. Keefe², D.M. Smith³, 1. *The University of Alabama, Tuscaloosa, Alabama*, 2. *Duke University, Durham, North Carolina*, 3. *Stony Brook University, Stony Brook, New York*

Osteoarthritis pain affects emotional well-being in terms both of momentary mood states and of global, long-term mental health. Though emotional awareness and regulation strategies are known to affect these dynamics, there have been few direct comparisons of momentary and long-term linkages of pain, distress, and emotional regulation. This research therefore examined short- and long-term associations among emotional dynamics, pain, and distress among 171 older adults with knee osteoarthritis (OA). Respondent interviews yielded self-report data on global pain, depressive symptoms, and trait-level emotional intelligence (EI; attention, clarity, and repair). Respondents then completed an experience sampling method (ESM) protocol comprising 4 calls/day for 7 days, tapping momentary pain and negative affect. In global (person-level) regression analyses, all three EI subscales predicted lower depression, controlling for global pain, demographics and general health. Mood clarity was the strongest predictor; it also moderated the pain-distress linkage, such that persons high in mood clarity showed a weakened association of pain with depression. Parallel multilevel models for ESM negative affect yielded significant Level 2 effects of mood clarity and repair, and both person-level and momentary pain. Here, mood repair (vs. clarity) buffered effects of momentary pain, such that persons with stronger mood regulation skills displayed a weaker association of pain with negative mood "in the moment." These findings suggest that awareness and regulation of one's emotions can be a powerful tool for coping with OA pain. However, dynamics appear to differ between immediate, momentary affect vs. long-term well-being. Implications for clinical intervention

are discussed. (Supported by R01-AG041655, P. Parmelee & D. Smith, PIs.)

SELF-EFFICACY FOR PAIN COMMUNICATION IN OSTEOARTHRITIS PATIENTS AND THEIR SPOUSES

A. Stanford, L.M. Martire, *Human Development and Family Studies, Penn State University, University Park, Pennsylvania*

Spouses' greater understanding of the pain experience of older patients has shown to be beneficial for both members of the dyad. However, spouses tend to over-estimate patients' pain, which may be explained by variations in self-efficacy for understanding pain (spouse) or communicating pain (patient). Although previous work suggests that patient and spouse self-efficacy for pain communication may benefit emotional well-being, to our knowledge, no work to date has examined how these constructs may influence the relational outcomes of married couples. The current study sought to examine how self-efficacy for understanding the pain of patients with knee osteoarthritis (OA) is related to marital satisfaction and depressive symptoms of both members of the dyad. This study involved OA patients and their spouses ($N = 152$ couples) and examined reports of self-efficacy for understanding the patient's pain (spouse) and the self-efficacy for having one's pain experience understood by his or her spouse (patient). Consistent with hypotheses, regression analyses showed that self-efficacy for pain communication significantly predicted higher marital satisfaction in both patients ($p < .001$) and their spouses ($p < .001$). Self-efficacy for pain communication did not significantly predict fewer depressive symptoms for patients ($p = .262$) or their spouses ($p = .138$). These findings highlight the critical role that understanding pain can have in a couple's relationship.

SESSION 490 (POSTER)

ATTITUDES ABOUT AGING

VIOLENCE AGAINST OLD FROM AGGRESSORS' PERSPECTIVE

V. Bohm¹, J. Doll², 1. *Psicologia, Universidade de Caxias do Sul, Caxias do Sul, Rio Grande do Sul, Brazil*, 2. *Universidade Federal do Rio Grande do Sul, Porto Alegre, Rio Grande do Sul, Brazil*

Violence against the elderly is a practice found throughout the history of civilization, however, with increasing longevity, is gaining greater visibility and concern of many countries. To this, authors like Foucault, Elias and Scotson and Faleiros gave theoretical support to the exploratory qualitative research was carried out by listening to stories of the attackers. Thus, the main objective of this research is to analyze the factors that led to violence against the elderly through the perspective of the perpetrators, in order to prepare a discussion that subsidizes educational interventions in the field of violence. To this end, it has specific objectives a) know the stories of the lives of elderly offenders; b) identify the possible triggers that triggered the aggression; c) understand the structural aspects that may have relationships with the practice of violence and d) provide elements for educational interventions in the field of violence. The results

analyzed from the content analysis) were organized into two broad categories, namely: multidimensionality of violence, subdivided into "Construction of family relationships", "Consumption of illicit drugs and alcohol" and "unemployment", and the second category, named "Social Mechanisms of Attention to Violence". The results point to the complexity of violence against old people, characterized as a multidimensional process of relationships, which is not possible to identify a single cause as generating the event.

THE VALUE OF EXPERIENCE IN INCREASING UNDERGRADUATES' CAREER INTEREST IN WORKING WITH OLDER ADULTS

H. Obhi, Y. Su, J.A. Margrett, S.L. Francis, Y. Lee, D. Crawford, W. Franke, *Iowa State University, Ames, Iowa*

A well-trained workforce is key to meeting the demands of an aging population that is expected to nearly triple by 2030 (CDC, 2015). Ageist stereotypes and lack of knowledge about the aging process among younger adults are two prominent hurdles to meeting these demands. Undergraduates may have more gerontology-related career interest if they have had more contact with older adults and aging course work (Kalisch, et al., 2013). Gerontology-focused career interests of 816 undergraduate students were assessed by employing logistic regression with three blocks of predictors: past experience, knowledge, and attitudes. Results suggest that females were 1.52 times more likely to have career interest in working with older adults compared to males ($p = .02$). Individuals who had course experiences (practicum/internships) with older adults were 2.34 times more likely to have career interest in working with this population than those who did not have such experience ($p < .001$). Undergraduate students who participated in classes which offered aging-related content were 1.29 times more likely to express interest in working with older adults ($p = .003$). These results suggest that interest in working with older adults is related to educational opportunities and knowledge about aging. Educational policies should reflect these findings to achieve the well-trained workforce needed to meet the need of the aging population.

LONG-TERM EFFECT OF ATTITUDE TOWARD OWN AGING ON COGNITIVE FUNCTIONING

J. Siebert, H. Wahl, *Heidelberg University, Heidelberg, Germany*

Attitude Toward Own Aging (ATOA) has been shown to affect a variety of important developmental outcomes in old age, including memory. We extend previous research by examining differential long-term effects of ATOA on a broader range of cognitive abilities in later life relying on data of the German "Interdisciplinary Longitudinal Study of Adult Development and Aging (ILSE)". Using the older birth cohort of ILSE followed for 12 years across three measurement points (1930–32; $n_1 = 489$, $n_2 = 438$, $n_3 = 408$), we first present findings addressing the relationship between ATOA and change in fluid vs. crystallized abilities based on overall and gender-specific latent change score models, while controlling for education and objective health. As expected, ATOA predicted change in fluid functioning—but not in crystallized performance—over 12 years. Gender-specific analyses revealed a stronger association between ATOA and decline in fluid abilities for men, even after controlling for

objective health and education. Further, with data collection of the fourth measurement occasion just recently completed, we are in a position to prolong the association between ATOA and cognitive trajectories up to a 20-year observational period. Preliminary analyses support that the pattern of findings also holds for this 20-year interval. Moreover, the role of behavioral and psychological pathways linking ATOA and cognitive aging are discussed. Overall, our results add to the understanding of long-term implications of ATOA for cognitive decline trajectories and show that negative ATOA is a risk factor for age-vulnerable cognitive abilities.

THE RELATIONAL NATURE OF CHILDREN'S PERCEPTIONS OF PARENTAL AGING: FINDINGS FROM A JAPANESE SAMPLE

K. Nakazato, R. Hirayama, T. Wakui, C. Shimada, *Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

Although gerontological research has directed close attention to the components of people's views on aging in general, relatively little is known about how people perceive the aging of their family members, such as parents, as well as psychosocial correlates of such perceptions. In this study, from a social constructionist perspective, which presumes that individuals' perceptions are shaped through interactions with others, we sought to identify whether and how Japanese adult children's perceptions of parental aging are linked with the nature of the ties that they have built with their parents. Specifically, we focused on how much adult children perceived their parents as "young" for their age, and examined the association between such perceptions and structural (e.g., geographical proximity, contact frequency) and functional (e.g., exchanges of different forms of support) aspects of the relationship with parents. Using online survey data from 1,010 Japanese adult children with at least one living parent aged 65 or older, we conducted regression analysis, which revealed that children were more likely to perceive their parents as "young" for their age when finding it easier to self-disclose to parents; when having received greater amounts of tangible aid from parents; and when having provided fewer amounts of such aid for parents. Note that these results were obtained while controlling for parents' age and age disparity between parents and children. Our findings suggest that functional rather than structural aspects of parent-child relationships matter for Japanese adult children's perceptions of parental aging.

KOREAN BABY BOOMER COUPLES' SELF-PERCEPTION OF AGING AND FUTURE TIME: EFFECTS OF FAMILY LIFE EVENTS

Y. Kim¹, K. Kim¹, K. Boerner¹, G. Han², *1. Gerontology, University of Massachusetts Boston, Boston, Massachusetts, 2. Seoul National University, Seoul, Korea (the Republic of)*

Korean Baby Boomers (born between 1955 and 1963) comprise the largest segment of the population approaching old age in Korea, and the majority (94%) are currently married or partnered. Since studies have examined self-perception of aging at the individual level, little is known about how couples share perspectives on aging and future time. Using 727 couples (individual $N = 1,454$) from the *Korean Baby Boomer Panel Study Wave 3*, we examined three aspects of aging perceptions: aging anxiety and two

types of future time perspective (i.e., limitation and opportunity). In particular, this study investigated the effects of own and spouse's negative events (e.g., health disruption, job loss, parent loss) on perceptions of aging and future time, using Actor-Partner Interdependence Models (APIM). Given that husbands and wives age together and share most of family events, we expected similarity in aging perceptions among spouses. Due to gendered roles, however, we expected differential effects of family events on aging perceptions between husbands and wives. In line with our hypotheses, we found that Korean Baby Boomer couples shared similar perceptions on aging and future time (Intraclass correlations ranged from .45 to .56). For both husbands and wives, own health disruption was associated with more limited sense of time, but health disruption of wife's parents was associated with more positive aging perception. Experience of child's health problem was associated with more negative aging perception for wives only. Findings demonstrated both shared and unique effects of family events on aging perceptions of Korean baby boomer couples.

AN AGING STATE OF MIND: THE ASSOCIATION BETWEEN AGE IDENTITY AND SELF-RATED MEMORY

A.E. Barrett, C. Gumber, R. Douglas, *Florida State University, Tallahassee, Florida*

Age identity is associated with a wide range of health indicators, with younger identities predicting better physical functioning and self-rated health, fewer depressive symptoms, and lower risk of mortality. Recent research also reveals that younger identities predict better performance on memory tests and less decline over time. However, research focuses on objective measures of memory, with limited attention given to self-rated memory. The strong association between age identity and other perceptions of health and functioning, such as self-rated health and physiological change, suggests that age identity also may influence self-rated memory. We examine this possibility using the first wave of the National Health and Aging Trends Study (2011). The results of regression analyses reveal that younger identities are associated with better immediate and delayed recall, a finding in line with prior research. However, results also indicate that younger identities are associated with better self-rated memory. In fact, this association is among the strongest observed among other predictors examined, including sociodemographics and physical health. We discuss several directions for future research, including a consideration of the bidirectional relationship between age identity and self-rated memory, the mechanisms underlying the association, and potential implications for health and behavior.

MEASURING INTERGENERATIONAL RELATIONSHIPS: CONTEXT RULES

S.E. Jarrott¹, R.H. Weaver², N. Bowen¹, *1. College of Social Work, The Ohio State University, Columbus, Ohio, 2. Virginia Tech, Columbus, Ohio*

Intergenerational contact contributes to a range of health outcomes, including greater social and psychological engagement and lower levels of depression. Contact measures are limited. Informed by Allport's contact theory, the Queen's University Scale (Knox, Gekoski, & Johnson, 1986) measures

contact with the general elder population and a familiar elder. We administered the survey to young adults (N=606) to identify factors of intergenerational contact that may optimize intervention programming and enhance health of young people as they age. Factor analyzing the general elder items, only a second-order factor model achieved an acceptable fit. Absence of a simple factor structure reflects challenges to measuring intergenerational contact with this scale. First, multiple dimensions must be measured to fully represent relationships; items consistently grouped along dimensions of developmental periods, context of the intergenerational contact, and nature of the exchange (e.g., cooperating with, assisting, or receiving help). Second, items comprising the Queen's scale reflect relevant constructs but are limited in interpretability because many items reflect multiple dimensions, resulting in items double- and triple-loading and necessitating the second-order factor structure. For example, an item about quality of contact with older adults when the child was 0–4 years old confounds dimensions of quality and developmental stage. To understand the impact of intergenerational contact, researchers must move away from 1- and 2-item global measures of contact. Careful construction of items needs to capture singular constructs. Next steps include development and testing of a scale that captures dimensions of context, developmental periods, and the nature of the contact.

INTER-GENERATIONAL COHESION AND ELDER INCLUSION: A CROSS-CULTURAL PERSPECTIVE ON ATTITUDES TO AGEING

N. Ginnivan^{1,2}, 1. *Australian National University, Canberra, Australian Capital Territory, Australia*, 2. *Centre of Excellence in Population Ageing, Sydney, New South Wales, Australia*, 3. *Yale Public School of Health, New Haven, Connecticut*

Expanding our perspectives of how we age is important because focusing on age as a category is not very helpful given that ageing is a continual process of events - biological, psychological and social. That is, what accompanies the biological reality of growth and then decline is the 'psycho-social reality' of managing transitions through the various stages of life. Different social landscapes exist from culture to culture which give rise to diverse social relationships between peers, family members and inter-generational ties. The present study used mixed methods to examine two different cultures - Australia and the Philippines - and different generations (young 20–35 and older 60–96 year olds). Focus groups were held in both countries to explore how congruent or incongruent perceptions of the ageing self are at different stages of the life course. A survey with older participants recruited from Australia and the Philippines (52–79 years of age) explored whether growing up within, or being influenced by a collectivist culture creates more of a psychological buffer towards the negative aspects of ageing than those who are more individualist in their cultural orientation. Evidence from both the qualitative and quantitative studies showed that being part of a collectivist culture where there is a higher degree of inter-generational contact, social cohesion and elder respect does provide a buffer; this supports previous literature and theories which speculate that the surrounding culture can have a significant impact on how we view ourselves as we age.

ANALYSIS OF THE SITUATION (NOT) TO GIVE UP ONE'S SEAT TO AN ELDERLY PERSON ON PUBLIC TRANSPORTATION

A.A. Smolkin^{1,2}, 1. *Department of humanities, Russian Academy of National Economy and Public Administration, Moscow, Russian Federation*, 2. *The Moscow School of Social and Economic Sciences, Moscow, Russian Federation*

Usually "to give up a seat to an elderly person" is understood by participants as a "display of respect" as opposed to following the rules for using public transportation. This research is based on interviews and materials from participant observation of passengers' behavior on public transportation in 2009–2015 in Russia.

Any person who suddenly appears to fall ill will be likely to be given a seat unconditionally. Nevertheless, a 60-year-old person not exhibiting signs of frailty or physical distress, is unlikely to be given a seat. The logic of giving up seats in practice is based not so much on the principle of "respect for the aging", but more on "compassion for the ailing elderly". Conflicts are generally based on different understandings of legitimate reasons for giving up a seat - the vigorous behavior of an elderly person might seem to belie any declaration of frailty. On the one hand, "giving up one's seat" is still a socially expected norm; on the other, the rule is regularly broken. There are two main strategies for breaking it:

1. "Feigning urgent business" - a strategy of pretending to be occupied with something important. This strategy can be short-term (a passenger plays for time) and a long-term (showing no intention of getting up).

2. "Inattention" - The seated passenger pretends to be not "really included" in the situation to avoid being accused of disrespect. Methods include looking out of the window; "falling asleep"; listening to music, and being distracted by a cell phone.

FEAR OF DEPENDENCY AS A PREDICTOR OF DEPRESSION IN OLDER ADULTS

C.E. Adams-Price, *Psychology, Mississippi State University, Mississippi State (Starkville), Mississippi*

There is evidence that older adults who subscribe to negative stereotypes of aging tend to have higher morbidity and mortality rates than similarly aged individuals who reject negative stereotypes of aging (Levy et al., 2002). This paper examines the stereotype that older adults are dependent on others. Baltes (1996) linked the dependency stereotype to feelings of incompetence or helplessness. Fear of looking dependent in others' eyes has made some older adults refuse to use helpful assistive devices that would actually increase their independence (Resnick et al., 2009). In addition, some older people stay home all the time because they do not want to look like they need help when they are out in public (Adams-Price & Morse, 2009). This paper introduces a new measure of fear of dependency. The fear of dependency scale was developed from a sample of 1424 adults across the US between ages of 45 and 99. In a separate sample of 91 older adults, regression analyses were conducted that indicated that fear of dependency was a strong predictor of depression, even after health, disability, and age were taken into account. In addition, fear of dependency correlated negatively with life satisfaction and generativity, and positively with the Fears subscale of the Personal Longevity scale (Adams-Price

et al., in press). The implications of Fear of Dependency for well-being in later life will be discussed.

UNDERGRADUATE MEDICAL STUDENTS' ATTITUDES TOWARDS OLDER ADULTS IN NEPAL

R. Gautam, *Nursing, University of Massachusetts Lowell, Lowell, Massachusetts*

Life expectancy and other measures of human developments have improved over the past few decades in Nepal resulting in aging of the population. Research on aging is limited in Nepal in spite of a continued growth of older adults population. The objective of the study was to explore the nursing and medical students' and attitude towards older adults and ageism in Nepal. One hundred eighty-four undergraduate nursing and medical students responded to a cross-sectional survey about aging in Nepal. Study protocol was approved by the Institutional Review Board of the University of Massachusetts Lowell. Demographic information (age, gender, level of education, frequency of interaction with older adults, interest in career in aging, currently live with an older adult) was collected. Attitude towards older adults was measured by Behavioral Attitudes Towards Aging Scale (BATAS) and Fraboni Scale of Ageism (FSA). Medical students attitudes towards older adults and ageism were moderate and it varied by students frequency of interaction with older adults and living arrangement. Psychometric properties of the scales are also discussed in relational to its use in a third-world country like Nepal. The study results indicate a need for developing scales that are culturally sensitive and appropriate in the Nepalese context. Also, it is recommended that nursing and medical schools incorporate courses on aging in Nepal and around the globe to debunk the myths of aging.

COMPARING AMERICAN AND CHINESE COLLEGE STUDENTS' ATTITUDES, ANXIETY, AND KNOWLEDGE ABOUT AGING

G.Q. Zhan, S.M. Pearcey, R. Radomski, D.R. Moodie, *Kennesaw State University, Kennesaw, Georgia*

The current study addresses a cross-cultural research question: how similar and different are Chinese and American young people in their attitudes toward aging, anxiety, and knowledge about aging? Seven hundred seventy-nine college students (434 Chinese, 345 American) filled out a questionnaire that included Kogan's attitudes toward old people scale, a modified aging anxiety scale, and Palmer's aging facts, as well as some background information. Cronbach's alphas indicate satisfactory internal consistency of all three scales for both groups. Results show that the American participants scored significantly higher on the attitudes toward aging scale than the Chinese participants, indicating they hold more positive aging attitudes. The Chinese participants on the other hand scored significantly higher than their American counterparts on the anxiety scale, indicating they are more anxious about aging. The two cultural groups did not differ significantly on the aging knowledge scale. We also found that for both groups, all three aspects examined in this study are significantly correlated. Specifically, aging attitudes is positively related to aging knowledge but negatively related to aging anxiety; and aging anxiety is also negatively related to aging knowledge. There are also gender differences

within and across the two groups. We hope these findings will contribute to literature on cross-cultural research of young people's views on aging and the elderly. We will discuss the effects of globalization regarding whether Chinese young people are able to hold onto a core traditional value "filial piety" that has been essential in preserving intergenerational families in Chinese history.

SEXY SENIORS AREN'T GEEZERS: REDRAWING THE BOUNDARIES OF OLD AGE

S. Giles, T.M. Calasanti, *Sociology, Virginia Tech, Salem, Virginia*

Using survey data from the American Perceptions of Aging in the 21st Century, this study explores how the intersection of age and gender influences perceptions of sexuality and old age. Age as a gendered performance informs both the questions in this paper as well as the interpretation of the data in terms of how masculinity and femininity are constructed in later life. This study, looking at 3048 men and women (N=3048) ages 18 – 99, examined how whether or not the belief that old people can be sexy influenced opinions of the age at which a person would be in order to be considered old, controlling for respondent's age and self reported age category. A multiple regression analysis found that age uniquely intersected with masculinity and perceptions of sexuality to draw boundaries between middle and old age. Significant results showed that men who thought that old people could be sexy tend to perceive old age as occurring chronologically older than men who did not think that old people could be sexy. Thus, men perceive old age as a status that may be staved off so long as a successful performance of youthful sexuality can be maintained.

WHEN ARE PEOPLE TOO OLD TO MARRY? NEVER, ACCORDING TO MOST AMERICANS

E. Wethington, R. Donoso, *Cornell University, Ithaca, New York*

The impact of increasing life expectancy on older adults' expectations for starting new sexual partnerships and marrying remains a relatively unexplored area in gerontology. In this study we examine the sociodemographic and attitudinal correlates of beliefs about the appropriateness of marrying at later ages, specifically whether Americans believe that women and men may become "too old" to marry. We use original data from the Cornell National Social Survey 2015, a national telephone survey of 1000 Americans (age range 18–96, M= 48.9; 50% female; 82% White, 13% Black, 11% Hispanic). Participants were asked "When does a (woman/man) become too old to marry?" Following research on ageism, predictor variables examined were participant age, education, income, sex, race/ethnicity, discrepancy between one's actual age v. "felt" age, physical fitness, marital status, household composition, religious attendance, social/political ideology, and beliefs about when "(woman/man) enter old age." **Findings:** 77% reported that they believe men and women never become too old to marry ($r=.91$), thus dichotomous outcomes and logistic regression were used. Older (OR= 1.02), female (OR=1.21), more educated (OR=1.16), white and more liberal participants (1.09) were significantly more likely to state that women were "never too old to marry." Reports of "when old age begins" significantly predicted "never too old

to marry” but not when age was controlled. Beliefs regarding men showed a consistent pattern. Data on participant health were not available in this dataset, which may be a limitation. These findings are interpreted using theories of ageism, beliefs about longevity, and other societal trends.

TIME PERSPECTIVE AND QUALITY OF LIFE IN INDIVIDUALS WITH MULTIPLE CHRONIC CONDITIONS

P. Gellert¹, J. Ziegelmann⁴, M. Steko¹, C. Ernsting¹, J. Wienert³, M. Kanzler², A. Kuhlmei¹, 1. *Institute of Medical Sociology, Charité Berlin, Berlin, Germany*, 2. *Pfizer Deutschland GmbH, Berlin, Germany*, 3. *University of Lübeck, Lübeck, Germany*, 4. *Freie Universitaet Berlin, Berlin, Germany*

To examine whether future time perspective (FTP) is associated with quality of life (QoL) in older adults and whether this relation varies as a function of the number of chronic conditions of a person, a longitudinal study (study 1; N=479) over six months and a population-based cross-sectional survey (study 2; N=1681) in German individuals over the age of 65 years were conducted. FTP, QoL and chronic conditions (i.e., cardiovascular diseases, cancer, respiratory diseases, and conditions of the musculoskeletal system, depression, diabetes, and hypertension) were assessed with questionnaires. Fixed-effects models (with correlated residual errors in the longitudinal study) with interaction terms between FTP and conditions were applied. FTP (study 1: $\beta=-.11$; study 2: $\beta=-.23$) and chronic conditions (study 1: $\beta=-.29$; study 2: $\beta=-.28$) were significantly related to QoL in both studies. Significant interactions occurred in both studies, where individuals with a lower number of chronic conditions had generally higher levels of QoL compared to individuals with a higher number of conditions; although generally showing lower levels of QoL, the later had a stronger and more positive FTP-QoL relation with higher levels of FTP being related with higher levels of QoL. The protective buffering value of having a more open-ended time perspective can be used to inform future interventions.

SESSION 495 (POSTER)

BIOLOGY OF AGING

PEROXIREDOXIN 2 DEFICIENCY AGGRAVATES AGING-ASSOCIATED INSULIN RESISTANCE IN MICE

S. Park^{1,2}, H. Cha^{1,2}, 1. *College of Medicine Yeungnam University, Daegu, Korea (the Republic of)*, 2. *Smart-aging Convergence Research Center Yeungnam University, Daegu, Korea (the Republic of)*

Aging is associated with increased insulin resistance and oxidative stress may play a role. Peroxiredoxin (Prx) comprises recently characterized antioxidant family but the association of Prx2 with insulin resistance is not determined yet. In this study we examined the role of Prx2 in aging associated insulin resistance in Prx2 knockout and wild-type littermate mice. Insulin sensitivity was measured using hyperinsulinemic-euglycemic clamp in young mice at 2-month and in old mice at 22-month old. Plasma glucose and insulin levels were not significantly different among the groups. Glucose

infusion rate to maintain euglycemia at ~6 mM was reduced in old groups of mice compared to respective young group of mice. Glucose infusion rate of Prx2 knockout old mice was significantly lower than that of wild-type old mice. Whole body glucose turnover and skeletal muscle glucose uptake were reduced in old mice compare to respective young mice in both wild-type and Prx2 knockout mice. Whole body glucose turnover and skeletal muscle glucose uptake were significantly lower in Prx2 knockout mice compare to wild-type mice in old group, while they were similar between two genotypes in young group. Insulin stimulated-hepatic glucose production tended to be lower in old mice but it was not significantly different among the groups. Oxidative stress was increased with aging in both genotypes and deficiency of Prx2 gene aggravates the oxidative stress in skeletal muscle. These results suggest that Prx2 prevents aging-associated insulin resistance in skeletal muscle.

ASSOCIATION OF THE PROTECTIVE FOXO3 LONGEVITY VARIANT WITH TELOMERE DYNAMICS DURING AGING

P. Davy¹, B. Willcox³, D. Willcox⁴, M. Shimabukuro⁵, R. Chen³, T. Donlon³, B. Morris², R. Allsopp¹, 1. *University of Hawaii, Honolulu, Hawaii*, 2. *University of Australia, Sydney, New South Wales, Australia*, 3. *Kuakini Medical Center, Honolulu, Hawaii*, 4. *Okinawa International University, Naha, Japan*, 5. *UMIN Center, Okinawa, Japan*

Telomere attrition in proliferative tissues is a hallmark feature of human aging. To date, identification of genetic influence on the rate of telomere attrition is poorly understood. The two genes with the most robust effect on human longevity are *FOXO3* and *APOE*. Notably, we discovered a genetic variant of the *FOXO3* gene that is strongly associated with human longevity. This observation has now been reproduced in independent studies of over a dozen different populations around the world. In the present study, we sought to assess the effect of the longevity associated variant of *FOXO3* (rs2802292 - G allele) as well as variants of *APOE* on telomerase activity and the rate of telomere attrition during aging. The preliminary results from a cohort of Okinawan Japanese (N=120) ranging in age from 25 – 90 years, indicates no substantial effect of the variants for either *FOXO3* or *APOE* on telomerase levels in peripheral blood leukocyte (PBL) samples. Analysis of the rate of telomere attrition during aging as a function of the different variants of *APOE* also revealed no significant effect. In contrast, carriers of 1 or 2 copies of the rare longevity-associated G allele of *FOXO3* showed markedly reduced rates of telomere loss in PBL during aging, as compared to carriers of the more common variant of *FOXO3* (TT). Interestingly, no loss of telomere length was observed as a function of age for G allele carriers. These results mark the first report on genetic influence on slowing the rate of telomere attrition in humans.

H3K36ME3 PROMOTES LONGEVITY BY SUPPRESSING AGE-ASSOCIATED INTRAGENIC CRYPTIC TRANSCRIPTION

W. Dang, *Huffington Center on Aging, Baylor College of Medicine, Houston, Texas*

Epigenetic effects are mediated by reversible DNA methylation, histone post-translational modifications, as well as changes

in nucleosome and chromatin conformation. These reversible alterations have been shown to involve in nearly all nuclear and cellular functions; their misregulation has been linked to aging and attributed to many age-related diseases. Through an unbiased lifespan screen in the budding yeast *S. cerevisiae* using a systematic histone mutant library, we identified that methylation of H3 lysine 36 (H3K36) promoted longevity. Eliminating this modification by either mutating H3K36 or deleting the methyltransferase Set2 shortened lifespan; whereas loss of the demethylase Rph1 extended lifespan. The levels of H3K36 trimethylation (H3K36me3) decreased as cells age, commensurate with a genome-wide increase in intragenic cryptic transcription in old cells. This is consistent with the function of H3K36me3 in suppressing such cryptic transcription mediated through deacetylation of histones in gene body by recruiting histone deacetylase complex RPD3S. Deleting components of RPD3S shortened lifespan, supporting this model. The increased levels of cryptic transcription were suppressed by *RPH1* deletion, suggesting that its longevity effect is mediated by improved genome-wide control of cryptic transcription. Furthermore, increases in intragenic cryptic transcription were also detected in aged *C. elegans* and mammalian cells. Knocking down the H3K36me3 demethylase JMJD-2 extended worm lifespan. Finally, decreased levels of H3K36me3 and increases in H3K4me1, H3K27ac, and RNA polymerase II were detected toward the 3'-ends of genes showing age-associated cryptic transcription in human mesenchymal stem cells.

ANALYSES OF LEUKOCYTE TELOMERE LENGTH IN THE BERLIN AGING STUDY II (BASE-II)

A. Meyer¹, D. Saßenroth², B. Salewsky¹, D. Spira¹, E. Steinhagen-Thiessen¹, K. Norman¹, I. Demuth¹, 1. Charite - Universitaetsmedizin Berlin, Berlin, Germany, 2. German Institute for Economic Research, Berlin, Germany

Physical activity and sports have repeatedly been reported to be associated with telomere length. While this association is well investigated in the cross-sectional setting, very few longitudinal data are available on this topic. We studied the association of different types of sports across different stages of life on relative leukocyte telomere length (rLTL, measured at one time point) in advanced age. 815 participants from the Berlin Aging Study II (BASE-II) aged over 61 years were included in the analysis. Similarly, we studied the association between lean mass and rLTL. Telomere length was measured by real time PCR, physical activity was determined retrospectively by questionnaire and lean mass was estimated by dual X-ray absorptiometry. An overview on rLTL analyses in BASE-II with a focus on its association with physical activity and muscle mass will be presented. The results will be discussed with respect to possible mechanisms linking rLTL and physical activity on the molecular level.

CELLULAR STRESS RESPONSE GENES IN ALZHEIMER'S DISEASE: INSIGHTS FROM GENOME-WIDE ASSOCIATION STUDIES

A.I. Yashin, I. Akushevich, F. Fang, M. Kovtun, D. Wu, K. Arbeev, A. Kulminski, S.V. Ukraintseva, Duke University, Durham, North Carolina

Recent molecular-biological studies provide compelling evidence that genes involved in cellular stress response play crucial roles in the late onset Alzheimer's disease (AD). These

genes, their properties, and possible mechanisms of their joint action that lead to AD are widely discussed in the literature. The genetics of AD is also investigated in the genome wide association studies (GWAS) using data from the case-control/longitudinal studies. Genes detected in these studies influence vulnerability of neurons to cellular stressors. Surprisingly, the results obtained in GWAS and in molecular-biological studies of AD rarely overlap, so the genetics of AD is not consistently described in the two types of studies. We hypothesized that such inconsistency in the research findings may be caused by heterogeneity in the AD-related genetic mechanisms of cellular stress response that reduces strength of genetic associations in traditional GWAS of this disorder. This means that if stress-related genes do influence AD they are likely to be found among those whose SNPs have low levels statistical significance. To test this hypothesis we performed GWAS of AD using Late Onset Alzheimer Disease Family Study data. We showed that substantial number of SNPs, linked to genes involved in cellular response to various stressors can be found in the results of GWAS with a nominal level of statistical significance. Together with traditional GWAS findings these results indicate that genetics of AD includes genes affecting vulnerability/resistance to AD-related cellular stresses as well as "stress response" (resilience) genes influencing cellular ability to repair damage and restore homeostasis.

CELLULAR SENESCENCE DRIVES FIBROTIC PULMONARY DISEASE

M. Schafer¹, T. White¹, K. Iijima¹, D. Mazula¹, J. Passos², J.L. Kirkland¹, H. Kita¹, N. LeBrasseur¹, 1. Mayo Clinic, Rochester, Minnesota, 2. Newcastle University, Newcastle upon Tyne, United Kingdom

Idiopathic pulmonary fibrosis (IPF) is a progressive, fatal disease characterized by interstitial remodeling, leading to severely compromised lung structure and function. Cellular senescence, a stress-induced state of replicative arrest, is causally implicated in numerous age-related diseases. Markers of senescence are detectable within parenchyma of chronologically aged and IPF lung tissue. Whether and how senescent cells mechanistically regulate IPF or if their removal may be an efficacious intervention strategy is unknown. Through examination of IPF tissue and transcriptome datasets, we discovered elevated abundance of senescence effectors and senescence associated secretory phenotype (SASP) factors, with select markers increasing concordantly with disease severity. Leveraging intratracheal administration of bleomycin to replicate aspects of IPF, we demonstrate that suicide gene-mediated ablation of p16Ink4a-expressing senescent cells in Ink-Attac mice improves pulmonary function, body composition, and physical performance. Senolytic DQ treatment replicates several benefits of transgenic clearance. Thus, our findings demonstrate for the first time that fibrotic pulmonary disease is mediated in part by senescent cells, which can be pharmacologically targeted to improve physical health and function.

ANALYSIS OF THE METABOLIC AND ANTIOXIDATIVE EFFECTS OF TAURINE

T. Chiba¹, Z. Wang¹, Y. Ohata¹, S. Serizawa¹, Y. Watanabe¹, S. Nishizono², 1. Waseda University, Tokorozawa, Japan, 2. Sojo University, Kumamoto, Japan

Calorie restriction (CR) extends lifespan and delays the onset of a number of age-related diseases in multiple laboratory organisms. These anti-aging effects of CR may be mediated by increased lipid metabolism and oxidative stress resistance. Taurine (2-aminoethylphosphonic acid) is an amino acid that has been suggested to function as a regulator of both osmosis and lipid metabolism, and as an antioxidant. In this study, we aimed to evaluate the potential of taurine as a CR mimetic using rats and mice. Sprague Dawley (SD) rats were fed a diet supplemented with 0% (control), 0.5%, 1.0%, 3.0% or 5.0% (w/w) taurine for 2 weeks. SD rats fed a 5% taurine diet displayed a significant reduction in white adipose tissue mass compared with rats fed control diet ($p < 0.05$). Plasma and liver cholesterol and triglycerides were also significantly decreased in taurine-fed rats compared with controls ($p < 0.05$). Liver gene expression analysis showed decreased mRNA expression of fatty acid synthase and increased mRNA expression of carnitine palmitoyl-transferase 1A, a key mediator of beta-oxidation ($p < 0.05$). Furthermore, C57BL/6 mice fed a 5% taurine diet for 16 weeks showed increased survival under the oxidative stress induced by injection of 3-nitropropionic acid versus mice fed control diet ($p < 0.05$). These results suggest that taurine might have CR-mimetic effects through modulation of lipid metabolism and induction of oxidative stress resistance.

MICRORNA PROFILES OF IN VITRO CELLULAR SENESENCE OF HUMAN OSTEOBLASTS

K. Wang^{1,2}, Y. Hsu³, P. Kuo⁴, M. Huang^{5,6}, 1. *Division of Geriatrics and Gerontology, Kaohsiung Medical University Hospital, Kaohsiung, Taiwan*, 2. *College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan*, 3. *Graduate Institute of Medicine, College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan*, 4. *Institute of Clinical Medicine, College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan*, 5. *Division of Chest Medicine, Department of Internal Medicine, Kaohsiung Medical University Hospital, Kaohsiung, Taiwan*, 6. *Lipid Science and Aging Research Center, Kaohsiung Medical University, Kaohsiung, Taiwan*

Introduction: Osteoporosis is characterized by loss of bone tissue while age is considered as the common risk factor. There is an impaired osteoblastic bone formation in comparison with osteoclastic bone resorption during aging. One of the possible cellular mechanisms of age-related bone loss is osteoblast senescence. MicroRNAs (miRNAs) regulate the expression of mRNA/protein targets and play an important part in cellular senescence. The purpose of this study was to investigate alternations in the miRNAs that are expressed in replicative senescence of human osteoblast cells.

Methods: Osteoblasts were grown in vitro and cultivated to the eighth generation cells. We then employed immunohistochemical techniques to identify the expression of senescence markers of senescence-associated β -galactosidase (SA- β -gal) activity. RNA isolation, small RNA library construction and deep sequencing were performed. The generated next-generation sequencing (NGS) data were analyzed using the miRSeq software package.

Results: In vitro aging model showed the positive cell number of SA- β -gal stained osteoblasts were enhanced in the eighth generation senescent cells. Morphological changes

of large, flat and multinucleated than earlier young cells (first generation cell as the control group) were observed. In the NGS profiles, 168 miRNAs demonstrated over 2-fold changes. For those read counts over 10 reads per million (RPM), 29 of these miRNAs (including 10 upregulated and 19 downregulated miRNAs) were detected in the senescent group.

Conclusions: We demonstrated differentially expressed miRNAs detected between senescent and young human osteoblast cells. Further studies to identify candidate miRNA-regulated genes regulating pathways of replicative senescence are required.

POSSIBLE LINK BETWEEN AGING AND MESENCHYMAL STEM CELL EXOSOMAL MIRNA

A. Leszczynska^{1,2}, L. Florea², T. Ashvetiya², P. Johnston², J. Green², J.D. Walston², G. Gerstenblith², C. Hwang², 1. *Regenerative Medicine Institute, Cedars-Sinai, Los Angeles, California*, 2. *Johns Hopkins University, Baltimore, Maryland*

Aging is a complex phenomenon with the number of contributing biological factors. Recently, important links have been reported between microRNAs (miRNA) and aging. miRNAs are short, non-coding RNAs that induce mRNA degradation or repression post-transcriptionally and thus affect a number of biological processes including stem cell maintenance, proliferation and metabolism. It is well established that for cell-cell and cell-tissue interaction, miRNAs are transported as cargo in exosomes. To identify specific differences between miRNA from young-adult (6 week C57BL/6 mice) and aged (78 week) mesenchymal stem cells (MSCs), we performed microarray analysis of exosomal miRNAs and found that a number of biologically relevant miRNAs were differentially expressed. miR-370 was overexpressed (4.49 fold) in exosomes from the older animals. miR-370 has been implicated in cholesterol homeostasis, fatty acid metabolism and lipogenesis. miR-214 was overexpressed (2.7 fold) in exosomes of old MSCs. miR-214 represses Wnt signaling which regulates adipogenesis. This may explain the possible shift of MSCs differentiation tendency from the osteoblast to the adipocyte lineage; such a shift is also reported in aging-related diseases.

In addition, we investigated the effect of aging on the function of exosomes. MSCs from young-adult and aged animals were exposed to hypoxic (2% oxygen) conditions and exosomes isolated. Under hypoxic conditions, tubule formation induced by exosomes from young-adult animals was greater than that from the older group ($p=1e^{-7}$). Thus, age-associated differences in miRNA expression may account, in part, for age associated differences in fatty acid metabolism, body composition, and the ability to respond to a hypoxic stress.

DNA DAMAGE RESPONSE IS ESSENTIAL FOR THE MAINTENANCE OF INTESTINAL HOMEOSTASIS WITH AGE

P. JoungSun, J. Pyo, H. Jeon, Y. Kim, M. Yoo, *Pusan National University, Busan, Korea (the Republic of)*

The stem cell genomic stability forms the basis for robust tissue homeostasis, particularly in high-turnover tissues. For the genomic stability, DNA damage response (DDR) is

essential. This study was focused on role of the MRN complex (Mre11, Rad50, and Nbs1), two major DDR-related factors, ataxia telangiectasia-mutated (ATM) and ATM- and RAD3-related (ATR) kinases, and two transducer, Chk1 and Chk2 in the maintenance of intestinal stem cells in the adult *Drosophila* midgut. We explored the role of DNA damage response-related factors, utilizing immunostaining with an anti-pS/TQ antibody as an indicator of ATM/ATR activation, γ -irradiation as a DNA damage inducer, and the UAS/GAL4 system for cell type-specific knockdown of DNA damage response-related factors, or both during adulthood. Here we show that DDR is activated in the intestinal stem cells and enterocytes by DNA damage. ISCs or ECs-specific knockdown of DDR factors caused ISC or EC cell death, and induced intestinal stem cell proliferation. The results showed that the pS/TQ signals got stronger with age and after oxidative stress. The pS/TQ signals were found to be more dependent on ATR rather than on ATM in ISCs/enteroblasts. Furthermore, an ISC/EB-specific knockdown of DNA damage response-related factors decreased the number of ISCs and oxidative stress-induced ISC proliferation. EC-specific knockdown of DNA damage response-related factors increased ISC proliferation and centrosome amplification. These results indicate that DNA damage response-related factor is essential for the maintenance of intestinal homeostasis with age.

THE GENETICS OF FRAILTY: SUMMARY OF THE RESULTS OF THE GENETICS WORK IN THE FRAILL PROJECT

K. Mekli¹, A. Marshall², B. Vanhoutte¹, G. Tampubolon¹, J. Nazroo¹, N. Pendleton¹, 1. *University of Manchester, Manchester, United Kingdom*, 2. *University of St Andrews, St Andrews, United Kingdom*

Frail Project (Frailty Resilience and Inequality in Later Life) is concerned with examining causal processes relating to frailty, examining social, psychological, metabolic and genetic processes. We present the results of the genetic work done so far: the results of the hypothesis-driven candidate gene association analysis, the hypothesis-free genome wide association analysis, and examine the proportion of phenotypic variance explained by the genome-wide genetic markers. We use the English Longitudinal Study of Ageing survey of individuals aged over 50 years and assess their frailty status using the two main methods, the Frailty Phenotype (Fried *et al.* 2001) and the Frailty Index (Searle *et al.* 2008). We chose 87 genes involved in cholesterol transport, cortisol metabolism and inflammation, analysed with linear regression against the Frailty Phenotype and the Frailty Index, using age and sex as covariates. Then we extend the analysis to 7000 individuals with 2.5 million genotyped variants, using the same phenotypic measures and covariates. Finally, for explained variance estimation we use a well-accepted genome-wide complex trait analysis (Yang *et al.* 2011). The candidate gene association results support that inflammatory pathways are implicated in frailty, whereas the genome-wide scan results reveal further pathways, such as the ones implicated in stress-response. The estimation of proportion of phenotypic variance explained by these common genetic variants will be available by the time of the presentation. Our results advance understanding of the genetic determinants of frailty and associated biological pathways.

IMPORTANCE OF AGE AND SEXUAL DIMORPHISM IN ADAPTIVE HOMEOSTATIC RESPONSES TO OXIDATIVE STRESS

K. Davies, *Leonard Davis School of Gerontology, the University of Southern California, Los Angeles, California*

Previously we reported transient expansion of the homeostatic range of oxidative stress resistance, involving induction of Proteasome and the Lon protease, by low, signaling, levels of hydrogen peroxide (H_2O_2) in young *Drosophila melanogaster* flies (3 days). We described this physiological plasticity as 'Adaptive Homeostasis' (Davies, K.J.A. Adaptive Homeostasis. *Molecular Aspects of Medicine*. 49: 1–7, 2016) to differentiate it from damage-repair pathways. Now exploring potential sex differences in adaptation, we find both the inducible synthesis of Proteasome and Lon, and the transient increase in oxidative stress resistance caused by H_2O_2 only occur in female flies, whereas males are unable to adapt at any level of H_2O_2 exposure. In contrast, males adapt to very low levels of the redox-cycling agents paraquat or 2,3-Dimethoxy-1,4-naphthoquinone (DMNQ), whereas young females do not adapt to these agents. Importantly, the adaptive response to H_2O_2 is lost in 60 day old female flies, and adaptation to paraquat and DMNQ is lost in 60 day old male flies (as is oxidative stress adaptability in older C57BL/6J mice and older *Caenorhabditis elegans* worms). This appears to be part of a broader abrogation of Adaptive Homeostasis that occurs with age. We next transformed young males into 'pseudo-females' through over-expression of the female-specific transformer splicing factor (TraF). Pseudo-females recapitulated the female-specific pattern of Proteasome and Lon induction and oxidative stress resistance with H_2O_2 exposure, and lost the ability to adapt to paraquat or DMNQ. These studies allow us to begin to dissect interactions between sexual dimorphism and Adaptive Homeostasis in aging.

USING POISSON-NORMAL MODEL TO ASSESS LINK BETWEEN MICRORNA COUNTS AND PHENOTYPES IN CLUSTERED DATA

T. Törmäkangas, 1. *Gerontology Research Center, University of Jyväskylä, Jyväskylä, Finland*, 2. *Qufu Normal University, Qufu, Jining, China*

Modeling epigenetic effects underlying the aging process requires data processing models that are fast and account for multiple hypothesis testing simultaneously. The array data collected from MicroRNA provide high-throughput data which need specialized statistical analysis strategies for drawing proper conclusions. The aim of this study was to investigate potential of Poisson-normal model on real data and to identify microRNA markers related to phenotype groups in clustered (twin) data. As a live data example, the method was applied to the outcome hormone replacement therapy (HRT).

The real data consisted of 241 microRNA target counts from 11 select monozygotic female twin pairs discordant for HRT-use and a control group of 10 young unrelated women of the SAWES study. The test groups included 11 HRT-users and 11 non-users and 8 controls. TMM-normalized read count data was considered Poisson-distributed with normal-distributed random effects accounting over-dispersion and familial dependency within twin pairs, and we

compared the average read counts across the three groups. False discovery rates computed to account for multiple testing. Simulations were conducted to investigate optimality of the model under two random effect distributions: normal and gamma.

HRT-users were found significantly different from users in 14 microRNAs. Users differed from the controls in 10 targets, and non-users differed from controls in 10 targets. Differences in hsa-miR-126-5p, hsa-miR-142-5p, hsa-miR484 and hsa-miR10b-5p were significant between all groups ($p < 0.001$).

Read counts differed in relation to HRT-use and age. Simulations confirmed that the Poisson-normal model provides a useful framework for analysis of clustered data.

AGE-RELATED CHANGES OF IRISIN LEVELS IN PLASMA AND CEREBROSPINAL FLUID OF HUMANS

Q. Ruan¹, L. Yang⁵, J. Ruan³, W. Gu², Y. Zhang⁴, Z. Bao^{1,4}, Z. Yu¹, 1. *Shanghai Institute of Geriatrics and Gerontology, Shanghai Key Laboratory of Clinical Geriatrics, Department of Geriatrics, Huadong Hospital, and Research Center of Aging and Medicine, Shanghai Medical College, Fudan University, Shanghai 200040, China., Shanghai, China*, 2. *Department of anesthesiology Huadong Hospital, Shanghai Medical College, Fudan University, Shanghai, China*, 3. *Tongji medical college, Huazhong University of Science & Technology, Wuhan, China*, 4. *Department of Gastroenterology, Huadong Hospital, Shanghai Medical College, Fudan University, Shanghai, China*, 5. *Department of anesthesiology Huadong Hospital, Shanghai Medical College, Fudan University, Shanghai, China*

Background: Irisin, exercise-inducible myokine, is proposed to interact with other tissues, such as fat and brain to regulate the balance of metabolism, increase energy expenditure, weight loss and neurogenesis. Here, we investigated age-related changes of Irisin levels in CSF, and relationship to paired plasma and adiposity.

Methods: Irisin levels were measure in paired plasma and cerebrospinal fluid (CSF) of 77 normal human subjects (18 females and 59 males, age from 17 to 82) by ELISA assays.

Results: Using multiple linear regression analysis, we found Irisin levels in CSF and plasma gradually increased from young to high-aged stage and the levels of males were higher than that of females. Irisin levels in CSF and plasma were associated with gender and age, but not BMI. CSF Irisin levels were not associated with plasma levels. The relationship between plasma levels and CSF:plasma ratio was a quadratic curve. 19.7% of CSF:plasma ratio variance can be accounted for by plasma levels. No significant relationship between CSF:plasma ratio and age. The lowest value of CSF:plasma ratio were found in the age stage of 50–65 years old.

Conclusions: The levels of Irisin in CSF and plasma were increased with the increase of age. Males have higher Irisin levels in CSF and plasma. There is a saturable mechanism that regulates CSF irisin transport.

EFFECTIVE INTEGRATION OF BIOLOGICAL RESEARCH IN MEDICAL EDUCATION AND POLICIES IN AGING.

S. Murakami¹, L.A. Bordisso², 1. *Touro University, Vallejo, Armed Forces Pacific*, 2. *Early-Stage Advisory Group/Alumnus, National Alzheimer's Association, Chicago, Illinois*

This paper is to explore a potential “feedback loop” from patients to biological research proposed with an early-stage Alzheimer’s patient previously (Murakami, S. and Halperin, SA. 2014 *Frontiers in Genetics of Aging*. *Front. Genet.* 5:269. doi: 10.3389/fgene.2014.00269). Medical education has been undergoing a major change towards a single accreditation system for graduate medical education, which merges two types of medical schools, allopathic medical schools (MD schools) and osteopathic medical schools (DO schools). When implemented in 2020, medical education will share common competencies. Of them, scientific competencies have a highest priority, though it has a large gap in incorporating biological evidence into education. Research focuses on establishing specific evidence and may miss a wide variety of implications seen in the human systems. For example, our conversation between a researcher and a patient have led us to re-highlight early signs of behavioral problems in the Alzheimer’s disease, which are otherwise considered as late phase problems. In addition, we expect routine communication with patients can provide beneficial discussion about medical education and policies that are otherwise not considered. This paper will seek for suggestions for better use of biological evidence for education and policies.

SESSION 500 (POSTER)

CAREGIVING I

CAREGIVING ASSISTANCE PROVIDED TO OLDER ADULTS WITH AND WITHOUT DEMENTIA AND DISABILITY

C. Riffin¹, P.H. Van Ness¹, J.L. Wolff², T.R. Fried^{1,3}, 1. *Yale University School of Medicine, New Haven, Connecticut*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 3. *Veterans Affairs Connecticut Healthcare System, West Haven, Connecticut*

Studies examining the relationship between informal caregiving and caregiver burden have largely focused on samples defined by disease or disability, and on the provision of disability-related assistance. This study characterizes a broad range of caregiving activities provided to a nationally-representative sample of community-dwelling older adults. Participants were the primary caregivers (N=1,342) of individuals enrolled in the 2011 National Health and Aging Trends Study (NHATS) who responded to the associated National Study of Caregiving (NSOC). We estimated the prevalence of and associations between the number of tasks within three domains of assistance (instrumental activities of daily living (IADL)-related, health management, health systems logistics) and caregiver burden among caregivers of four groups of older adults: those with dementia and disability (n=261), dementia but not disability (n=230), disability but not dementia (n=229), no dementia or disability (n=622).

Caregiver burden was a composite measure of caregivers' emotional, physical and financial difficulties (dichotomized into any vs. no burden). Within each group, caregivers provided assistance with at least one task across domains of IADL-related assistance (>98%), health systems logistics (>78%), and health management (>54%). Unadjusted analyses using the Mantel-Haenszel trend test showed a significant linear association ($p < .05$) between the number of tasks provided and a higher risk of burden across the four groups for all but one domain in one group. These findings underscore the need for future research that addresses the full scope of assistance provided by caregivers to a broad spectrum of older persons, and call for an expanded conceptualization of the caregiver role.

ETHNIC DIFFERENCES IN POSITIVE ASPECTS OF CAREGIVING IN DEMENTIA CAREGIVER DEPRESSION AND BURDEN

M. Gonzalez Catalan, F. Ma, M. Huddleson, A. Harley, S. Paulraj, L.M. Brown, T. Tormala, R.G. Gomez, *PhD Program in Clinical Psychology, Palo Alto University, Palo Alto, California*

Previous literature shows the relation between resources available for caregivers and the number of stressors with higher levels of caregiver burden and depression in caregivers, being mediated or moderated by ethnicity (e.g., Pearlin, Mullan, Semple, & Skamp; Skaff, 1990; Pinquart & Sörensen, 2005). Moreover, positive aspects of caregiving, such as learning new skills and getting more meaning to life are associated with better mental health outcomes in caregivers (Kramer, 1997; Lin, Fee, & Wu, 2012). The present study examined ethnic difference in the relationships between positive aspects of caregiving, and caregiver depression and burden. This study sample included 643 elderly caregivers of patients with Alzheimer's Disease, including 321 Caucasians, 101 Latinos, and 214 African Americans. Two-tailed Pearson correlations indicated that positive aspects of caregiving were negatively associated with depression severity for all 3 ethnic groups ($r = -.204$, $p = .041$ for Latinos; $r = -.233$, $p = .001$ for African Americans; $r = -.273$, $p < .001$ for Caucasians). However, the relationship between positive aspects and caregiver burden was less strong for Latinos ($r = -.262$, $p = .008$) compared with African Americans ($r = -.408$, $p < .001$) and Caucasians ($r = -.409$, $p < .001$). Additionally, fewer positive aspect items (e.g., feeling needed and feeling appreciated) were correlated with depression and burden in Latinos compared to the other two ethnic groups. These results suggest that mental health professionals working with caregivers of dementia should consider ethnic differences when including the positive aspects of caregiving as a way to reduce caregiver depression and burden that ethnic minorities may encounter.

THE ROLE OF RELIGION IN CAREGIVER BURDEN AND DEPRESSION FOR FAMILY CAREGIVERS OF DEMENTIA PATIENTS

S. Shin, M. Huddleson, L.M. Brown, T. Tormala, R.G. Gomez, *PhD Program in Clinical Psychology, Palo Alto University, Palo Alto, California*

Family members who care for people with dementia may develop both negative and positive coping strategies due to caregiver burden that can influence mood (Raggi et al.,

2015). This study examined ethnic differences in how religion as a coping strategy was related to caregiver burden and depression. From a larger study, 101 Latino, 214 African American, and 321 Caucasian caregivers were administered the Center for Epidemiological Studies Depression Scale, the Burden Interview, and Religiosity and Spiritual Coping Questionnaire. Multiple regressions found significant interactions between ethnicity and positive religious coping on caregiver depression and burden. Correlational analyses by ethnicity indicated that positive religious coping was related to lower caregiver burden and depression for Caucasians and African Americans, but not Latinos. In particular, African Americans who participated more in religious activities and used religion as positive coping reported less caregiver burden and depression. Furthermore, African Americans who used more negative religious coping endorsed more burden and depression. Similarly for Caucasians, the more they participated in religious activities and used religion to positively cope, the less depressed and burdened they felt. Negative religious coping also was related to greater depression in Caucasians. For Latinos, only religious negative coping was related to greater caregiver burden. These findings suggest that religion can have both positive and negative impacts on caregiver burden and depression, but these religious influences appear greater for Caucasians and African Americans, and less so for Latinos.

EFFECTS OF CHARACTERISTICS OF CARE RECIPIENT AND CAREGIVERS ON CAREGIVER BURDEN

S. Kaewma¹, J.K. Schneider¹, C. Geneus², S. Prakobchai¹,
1. *School of Nursing, Saint Louis University, Saint Louis, Missouri*, 2. *Tulane University, New Orleans, Louisiana*

Objective: Caregiver burden has been associated with poor outcome for care-recipients and caregivers. This study examines caregiver and care-recipient characteristics associated with caregivers' burden. The caregiver stress model was used in this study. **Methods:** The data from the 2015 National Alliance of Caregiver the United States were examined for this secondary data analysis. The sample sizes included 1,404 survey participants who were caregivers for older adults. Multivariate logistic regression was used to analyze caregiver and care-recipient characteristics predicting caregiver's burden. **Results:** The burden predictor was 60.3% among 846 caregivers. After adjusting for covariates, care recipients with short term physical condition, long term physical conditions, emotional or mental health problems, and currently care providing had .38(95% CI:.26-.57), .39(95% CI:.26-.60), 1.55(95% CI:1.00 - 2.41), and 2.50 (95% CI:1.77- 3.54) times higher odds of burden compared to those without the mentioned conditions, respectively. Caregivers who reported a primary caregiver, physical strain, and provide care 0-8 hours had 1.72(95% CI:1.24-2.38), 1.70(95% CI: 1.20-2.41), and 9.51(95% CI:7.24-12.48) times higher odds of burden compared to those who did not report the mention condition. **Discussion:** Findings suggest that recipients with short term-long term physical condition, emotional or mental health problems, and currently care providing contributed to greater caregiver burden. As the number of physical strain increased, burden increased. Alzheimer's and dementia people were found not to be associated with caregiver

burden. Future researchers might investigate factors such as care-recipients in difference of illness and caregivers' social support. Nurse practitioner should assess for these characteristics to intervene reducing caregivers' burden.

LIVING ARRANGEMENT AND TIME ASSISTANCE TO NON-CO-RESIDENT ELDERLY PARENTS IN CHINA

Y. Hou, A.L. Janus, *Sociology, University of Edinburgh, Edinburgh, United Kingdom*

Family eldercare provided by children in China is facing more and more challenges nowadays as an increasing proportion of adults and elderly parents are living independently. Using data from the 2013 China Health and Retirement Longitudinal Study, we firstly test the mediation effect of norms in predicting actual living arrangement. Next, we examine how time assistance to elderly parents living alone is related to children's geographic proximity, children's competing roles, type of relationship to parent, and several family characteristics including parent's severity of need and sibship size. We use generalized linear models with random effects to take into account the "nesting" of parents within children. Results confirm that effects of education and economic resource in predicting living arrangement are significantly mediated by norms. Parent's need, sib-ship size, geographic proximity and relationship type have significant effects on time assistance. The finding helps to understand the new patterns of eldercare in China as a consequence of arising neo-familism and individualization. Understanding such mechanism helps to impact China's future policy formulation, which should satisfy the needs of both individuals and elderly parents to better maintain the crucial role of family in eldercare provision.

E-HEALTH INTERVENTION FOR INTERGENERATIONAL CAREGIVERS OF CHRONICALLY ILL OLDER ADULTS

A.M. Steffen¹, J. Epstein^{1,2}, K. Arenella¹, *1. Department of Psychological Sciences, University of Missouri - Saint Louis, St. Louis, Missouri, 2. Missouri Institute of Mental Health, St. Louis, Missouri*

Family-clinician communication is important for chronic disease self-management and improves outcomes for older adults and their family caregivers. In this e-health program based on principles from Social Cognitive Theory, adults assisting a parent with medical appointments and medication management were randomly assigned to one of two internet-based education interventions: (I.) Written didactics and video clips from medical experts, or (II.) Multimedia vignettes depicting actors responding to common healthcare challenges. Participants (N=136) had access to these materials for one month and completed pre- and post-intervention assessments. Post-intervention hierarchical regression analyses showed an intervention effect after controlling for pre-intervention scores. Relative to the didactics comparison group, the vignettes intervention reduced perceptions of caregiving role overload (F change (1, 133) = 4.68, $p \leq .05$). The ethnicity X condition interaction was also significant, with African American caregivers showing stronger reductions in perceptions of role overload in the vignettes condition compared to other caregivers (F change (1, 132) = 4.88, $p \leq .05$). When elders were identified as more physically

unhealthy (> 15 days in the past month), caregivers in the vignettes condition reported improved communication with the relative's health provider. When in the didactics condition, caregivers of comparably ill relatives described post-intervention decreases in effective communication (F change (1, 129) = 3.64, $p \leq .05$). These data suggest that the intervention holds most promise for caregivers of physically ill/frail elders. In keeping with Social Cognitive Theory, exposure to vignettes showing others successfully overcoming caregiving difficulties led to improved outcomes compared to information presented in didactic formats.

INFORMAL CAREGIVING AND HEALTH: LONGITUDINAL FINDINGS FROM THE HEALTH, WORK, AND RETIREMENT STUDY

F. Alpass, A. Szabo, J. Allen, C. Stephens, *Massey University, Palmerston North, New Zealand*

The present longitudinal study investigated changes in the mental and physical health of older caregivers over a 6-year period. Differences between patterns of caregiving were also examined. Data were collected in 2008, 2010, 2012, and 2014 from a sample of older New Zealanders (N = 803, 54% female) aged between 56 and 72 as part of the Health, Work, and Retirement study. Of participants, n = 258 were caregivers and n = 545 never provided care. Females were more likely to be caregivers. Analyses indicated that mental health declined over time for both caregiver and non-caregiver groups with the decrease being substantially larger for caregivers. There was also a gender effect suggesting that male caregivers' mental health declined to a greater extent. Non-caregivers reported more doctor visits over time and hospital admission increased for both groups but this increase was larger for caregivers. Male caregivers were admitted to hospital more often than female caregivers. Analyses were conducted to differentiate among different patterns of caregiving over the 6 year period (continued caring, stopped caring, on-and-off caring). There was no difference between caregiving groups in terms of gender, age, smoking and drinking behaviour. However, on-and-off carers had poorer mental health than those who provided care continuously. In sum, caregivers experienced more mental health problems over time, visited their doctors less but were more likely to be admitted to hospital. Male caregivers were more vulnerable to health decline. Furthermore, transitioning in and out of the caregiver role had a negative impact on wellbeing.

BURDEN AMONG CAREGIVERS OF OLDER ADULTS WITHOUT DEMENTIA OR DISABILITY: WHO IS AT RISK?

C. Riffin¹, P.H. Van Ness¹, J.L. Wolff², T.R. Fried^{1,3}, *1. Yale University School of Medicine, New Haven, Connecticut, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. Veterans Affairs Connecticut Healthcare System, West Haven, Connecticut*

The empirical literature on caregiver burden has been dominated by a focus on dementia and disease-specific samples, and the risk associated with providing disability-related assistance. In this study, we analyzed data from 611 community-dwelling older adults without dementia or severe disability who participated in the 2011 National

Health and Aging Trends Study (NHATS) and their primary caregivers who responded to the linked National Study of Caregiving (NSOC). Multivariable logistic regression models examined the relationship between the number of health-related tasks caregivers provided within three domains (instrumental activities of daily living (IADL), health systems logistics, health management) and caregiver burden, a composite measure of caregivers' self-reported emotional, physical, and financial difficulties associated with providing care (dichotomized into any vs. no burden). After adjusting for older adults' and caregivers' sociodemographic and health characteristics, separate models for each domain demonstrated that providing assistance with a greater number of IADL-related tasks (adjusted odds ratio (aOR)=3.5; 95% CI, 1.8–6.4), health systems tasks (aOR=1.8; 95% CI, 1.1–3.0), and health management tasks (aOR=1.6; 95% CI, 0.9–2.7) was associated with a higher risk of burden. In the full model including all domains of assistance, only IADL-related assistance remained significantly associated with burden; caregivers who reported poor health (aOR=2.0; 95% CI, 1.0–3.6), anxiety (aOR=2.4; 95% CI, 1.1–5.3), and cared for an older adult with self-reported depression (aOR=1.8; 95% CI, 1.0–3.0) were more likely to experience burden. Findings suggest that burden is associated most strongly with IADL-related assistance and with the physical and psychological well-being of caregivers and older adults.

CAREGIVER WORKSHOPS MAKE A DIFFERENCE IN THE LIVES OF RURAL ARKANSAS FAMILIES

R. McAtee, S. White, L. Roy-Rasheed, *Geriatrics, University of Arkansas, Little Rock, Arkansas*

The challenges of family caregivers that reside in rural areas differ on many fronts than those who live in urban or microunban areas. Resources are scarcer and when available are harder to find and more difficult to access. Obtaining common services such as home health, home assistance, meals on wheels, or respite care can be difficult if not impossible in some of the most rural areas. Training is also harder to find and attending available caregiver education programs can be very difficult due to lack of transportation and alternative support systems.

The Schmieding Home Caregiver training program has trained over 1442 family caregivers since 2009 in 8 microunban and rural areas throughout Arkansas. In 2016, a phone survey study was completed with family caregivers who had attended a Schmieding caregiver workshop between 2009 and 2015. Family caregiver participants were first asked basic demographic questions about themselves and their care recipient. These questions were followed by open-ended yet focused questions on issues like length of time they were a caregiver, what skills and knowledge they had learned in the training that helped them the most, and what major challenges they faced as a caregiver. The participants were also asked about what factors were most important to them in their ability to keep their loved one in the home for as long as possible. Data was collected and a pragmatic process of thematic content analysis completed. Key findings and examples under each theme will be presented and linked to existing research.

A TYPOLOGY OF SPOUSE CAREGIVER QUALITY OF LIFE EXPERIENCES ACROSS NEURODEGENERATIVE DISEASE GROUPS

K. Roland, N.L. Chappell, *University of Victoria, Victoria, British Columbia, Canada*

There are few comparative studies of spousal caregiver experiences across neurodegenerative disease groups. This study used the Stress Process Model to (1) compare quality of life (QOL) experiences of Alzheimer's disease (AD), Parkinson's disease (PD) and PD dementia (PDD) caregivers; and (2) determine whether distinct care experiences are accounted for by disease diagnosis alone, or whether experiences are defined through a unique combination of symptom presentation, care demands, support across disease groups. Caregivers were recruited from community (PD=43, PDD=21) and a larger study examining Cholinesterase Inhibitor effectiveness (AD=43). Caregivers were English-speaking and provided 3+ hours of care per week for 1+ year to community-dwelling spouses. 105 questionnaires were completed on characteristics, symptoms, demands and supports. QOL experience of caregivers was measured as life satisfaction, burden, and depression. A hierarchical cluster analysis using Ward's method and squared Euclidean distances allocated every case to one cluster. Four caregiver experiences were revealed: Succeeding, Coping, Getting by with Support, and Struggling. Results demonstrated problem behaviours and expressive support had a greater influence on clustering of caregiver experiences than diagnosis. Life satisfaction was similar across groups, demonstrating that caregivers can be burdened without impacting how satisfied they feel about life.

This expands on knowledge of spouse caregiver QoL by revealing different types of experiences that go beyond disease diagnosis and take into consideration presenting stressors and available supports. Our findings have implications for community organizations that serve these diverse groups; notably, not all caregivers in the same group have the same needs for support.

PREDICTORS OF CARE-RELATED EMOTIONAL DISTRESS AMONG CAREGIVERS FOR INDIVIDUALS WITH DEMENTIA

A. Leggett¹, D. Maust^{1,2}, H. Kales^{1,2}, *1. Psychiatry, The University of Michigan, Ann Arbor, Michigan, 2. Department of Veterans Affairs, Ann Arbor, Michigan*

In the United States, 15 million adults serve as informal caregivers for a person with dementia (PWD). While caregiving has many rewards, reports of burden and mental health concerns are common. Pearlin's Stress Process Model posits both primary stressors relating to the PWD's impairment and secondary strains resulting from care predict health outcomes for caregivers. Using the National Study of Caregiving (NSOC), we examine contextual factors of the PWD and caregiver as well as caregiver health and intrapsychic strains as predictors of emotional distress related to the caregiving role. We also examine whether PWD level of functional impairment (categorized as low, moderate, or high) moderates the effect of other PWD and caregiver characteristics. Our sample included 1063 caregivers for 717 PWDs. The caregiving role was found to be very emotionally difficult by 17% of the sample. Two-level hierarchical linear models (caregivers

nested within PWDs) were run with PWD and caregiver level contextual factors, caregiver health and psychological well-being, and interactions entered consecutively. High PWD functional impairment, being female, higher education, more pain, sleep difficulty, and lower psychological well-being were associated with higher levels of care-related emotional distress. When testing for the moderating effects of PWD level of functional impairment, the association between providing routine (as opposed to as-needed) care and increased emotional difficulty was strongest for caregivers of PWD with moderate impairment. Caregivers with greater feelings of psychological well-being (control/adjustment) were less likely to report care-related distress, even controlling for PWD functional impairment and caregiver health.

BUILDING SOCIAL SUPPORT IN ADULT CHILD CAREGIVERS OF PERSONS WITH DEMENTIA: THE NYUCI-AC

J.E. Gaugler¹, M. Reese¹, M.S. Mittelman², 1. *Center on Aging, School of Nursing, University of Minnesota, Minneapolis, Minnesota*, 2. *New York University School of Medicine, New York, New York*

Psychosocial interventions for families of people with Alzheimer's disease or related dementias often focus on building coping skills, providing respite, or building social support to mitigate the potential negative effects of care provision. The NYU Caregiver Intervention (NYUCI), a multi-component psychosocial intervention that offers individual and family counseling, support groups, and ongoing consultation originally tested for spousal caregivers, was adapted for adult child dementia caregivers in Minnesota (NYUCI-AC). The current study examined whether the NYUCI-AC was effective in improving perceptions of social support among adult child caregivers of persons with dementia who received this intervention, a key clinical objective of this intervention. A single blind, randomized controlled study design was used, and 107 adult child caregivers participated up to a 3 years. Based on our prior analyses of NYUCI-AC outcomes, a series of individual growth curve models will suggest the complex effects of a multi-component intervention over time on various domains of social support. A documented mechanism of benefit of the NYUCI is its ability to build social support among spousal dementia caregivers; the present study is anticipated to demonstrate that the NYUCI-AC will exert similar effects, but also deviate in important ways from the parent NYUCI. Process evaluation data as well as a counselor case study will further document how the NYUCI-AC did or did not enhance social support among adult child caregivers of persons with dementia.

MEASURING BURDEN WORRY: DEVELOPMENT OF CARE RECEIVER BURDEN WORRY SCALE

R.V. Shippee-Rice, P. DiNapoli, S. Kelly, G. Harkless, D. Pelletier, S. Fox, *University of New Hampshire, Durham, New Hampshire*

The concept "Burden Worry" is described as anxiety or unease arising from feelings related to becoming a physical, emotional, spiritual or financial drain on a caregiver leading to altered or strained relationships and the potential for loss of ongoing care. Burden worry can contribute to caregiver burden by limiting care receiver-caregiver communication, shared decision making, and satisfying care engagement. By

measuring effects of burden worry on the dyadic relationship, interventions can be designed to maintain or enhance a positive care receiver-care giver dynamic to promote higher quality care, improved decision making, enhanced relationship satisfaction, and extended length of caregiving. Few tools measuring care receiver burden worry are available for research or clinical use. The Care Receiver Burden Worry Scale guided by Life Transition and Social Ecology theories was developed from interviews with older adults receiving care from adult children. The original 24-item scale focused on four dimensions emerging from the interviews. This was later reduced to 18 items ($\alpha = .87$) explaining 58.2% of the variance. Factor analysis led to three factors: burden worry, maintaining self, and minimizing feelings of burden. The purpose of this presentation is to describe the original study and item development, testing procedures with older care receivers, correlations with demographic data and activities of daily living, and discussion of potential benefits of tool to examine effects of care receiver burden worry on caregiver burden, care receiver-caregiver communication, and decision making processes related to care needs of older adult.

PLANNING FOR AGING IN THE MIDST OF ENDURING CAREGIVING FOR PARENTS OF ADULT CHILDREN WITH ASD

C. Marsack¹, A. Weisz², 1. *Eastern Michigan University, Ypsilanti, Michigan*, 2. *Wayne State University, Detroit, Michigan*

Despite the growing wave of children diagnosed with autism spectrum disorder (ASD) reaching adulthood, very little is known about adults with ASD and their parental caregivers. These adults with ASD often require some form of lifelong reliance, often necessitating parents to continue their caregiving duties for their adult children. For many older parents, their parental duties become an enduring role as they simultaneously undergo their own aging processes. To date, there is a lack of information regarding the needs of parental caregivers of adult children with ASD as they, too, age. This study is the follow up to a larger, quantitative study ($n = 320$) which seeks to examine the experiences of parents (50+) of adult children (18+) with ASD. Using semi-structured interviews, 51 interviews were conducted nationally to understand parent perspectives, including those surrounding service availability, utilization, and satisfaction. Interviews were transcribed and analyzed using grounded theory and line-by-line analysis. A major finding of the study uncovers serious deficits in availability, accessibility, accommodation, and affordability of services. For many of the parental caregivers, a lack of service options inhibited them in planning for future care of their adult child. This presentation includes recommendations for next steps to improve supports and service delivery for aging parents of adult children with ASD who must balance their own aging and potential care needs with the demands of caregiving obligations.

FORMAL OR INFORMAL? THE IMPACT OF INFORMAL CAREGIVING ON FORMAL HOME CARE

C. Wu², F. Huang¹, 1. *Institute for Advanced Research, Shanghai University of Finance and Economics, Shanghai, China*, 2. *School of Statistics and Management, Shanghai University of Finance and Economics, Shanghai, China*

As the rapid growth of aging populations in both developed and developing countries, public long-term care policies become increasingly important. Much of long-term care is provided informally. As needs expand and expenses rise, understanding the role of informal care in meeting this escalating demand becomes crucially important. To develop and refine long-term care policies, we investigate the substitutability of informal for formal care. We set up the theoretical framework according to the work of Van Houtven and Norton (2004, 2008). We use latest three waves of Chinese Longitudinal Healthy and Longevity Survey (CLHLS 2005, 2008 and 2011) to investigate the effects of family informal caregiving on the utilization and expenditure of the formal care. Using the classical Two-part Model, we find that informal care reduces formal home health care. The reductions are heterogeneous across the physical function level and lifetime. Therefore, public policies should encourage and support family caregivers, rather than replace or attenuate the role of informal care. Public long-term care must be provided when informal care is not available.

JOB SATISFACTION AND PSYCHOSOCIAL WORK CONDITIONS: GENERATIONAL DIFFERENCES AMONG HEALTHCARE WORKERS

J. Miller, E. Sabbath, *Boston College, Chestnut Hill, Massachusetts*

Previous research in the area of healthcare workers has demonstrated associations between job satisfaction and psychosocial conditions of work. Psychosocial conditions of work include co-worker/supervisor support, bullying, job flexibility, and job demands and control. There is a growing body of literature in the aging and work domain that points to the unique factors of the psychosocial work environment that are valued distinctly by different generations. Despite the strong foundations of these two bodies of literature, there is relatively less empirically-driven research about the ways in which job satisfaction is associated with psychosocial working conditions for different age groups. From this lack of information, the research question arises: Is job satisfaction driven by different psychosocial working conditions or work organizational factors depending on the worker's age?

All data have been collected and analyses are forthcoming. We will use data from a cross-sectional study of 1,596 patient care workers at two large East Coast hospitals. Linear regression models will examine associations between several psychosocial work characteristics (people-oriented culture, work flexibility, supervisor/co-worker support, workplace harassment, and job demands and control) and job satisfaction, and then we will test for statistical interaction between these work characteristics and worker age. We will then stratify analyses by age group to test whether the direction, magnitude, and significance of predictors of job satisfaction is different for younger, middle-aged, and older workers. Based on findings, participants will have a basis for understanding methods for optimizing job satisfaction and managing and retaining an age-diverse workforce.

SESSION 505 (POSTER)

CHRONIC CONDITIONS

OSTEOPOROSIS PREVENTIVE BEHAVIORS AND BONE MINERAL DENSITY AMONG OLDER WHITE AND ASIAN WOMEN

Y. Du, L. Zhao, Q. Xu, H. Deng, *Tulane University, New Orleans, Louisiana*

Background and Purpose: With the growing aging population, osteoporosis has become an increasing public health problem. White and Asian women are at greater risk of developing osteoporosis/low bone mineral density comparing to black women. This study is to explore: 1) differences of Osteoporosis Preventive Behaviors and 2) Bone Mineral Density (BMD) among non-Hispanic White and Asian Women Age 50 and over.

Methods: 2816 subjects from Louisiana Osteoporosis Study are included in this study. Bivariate analysis is used to examine differences of osteoporosis relevant behaviors and BMD. Multiple linear regressions are adopted to explore hip and spine BMD differences considering physiological and/or behavioral factors.

Results: White women have both higher hip and spine BMD than Asians. Meanwhile, whites are more likely to engaging in milk consumption, Vitamin/calcium supplements use, sun exposure, and smoking. No exercise difference is found between the two groups. Hip BMD difference disappears when controlling for either physiological or behavioral factors. While, spine BMD difference still exists after adjusting for either physiological or behavioral factors, but disappears when controlling for both.

Conclusions and Implications: Bone health disparity exists between white and Asian women, with different magnitude in different bone sites. Though physiological factors play an important role in BMD, engaging in healthy behaviors can largely decrease this disparity. More interventions to improve bone health are needed in Asians. In addition, the relevant contributions of physiological and behavioral factors to different bone sites needs to be further studied.

FACTORS RELATED TO THE RELATIONSHIP BETWEEN URINARY INCONTINENCE AND HOMEBOUNDNESS IN OLDER-ADULTS

L. Jorge, J. Rocha, B. Rauber, G. Guimaraes, B.B. Neves, A. Bos, *Catholic University of Rio Grande do Sul, Porto Alegre, RS, Brazil*

Psychosocial effect generated by urinary incontinence (UI) might be a contributing factor related to homeboundness. The aim of the study was to determine whether there was a significant association between the UI and homeboundness older-adult and what factors influenced this association. The aim of the study was to determine whether there was a significant relationship between homeboundness and the presence of UI in the elderly, and what factors could influence this correlation. The dependent variable was reporting leaving the home less than twice a week in the last 6 months and the independent variables were UI, sex, marital status, age, health perception, cognition, and number of morbidities. Of the participants, 51.8% were women and 3.7% had

UI. UI increased the risk of homeboundness in 2.66 times in the simple model and 1.9 after controlling for co-variables. Being man was a protective factor (confidence interval 0.66 to 0.86). Single older-adult, divorced in relation to married had the marital status as a protective factor ($p < 0.01$). Increasing age was an independent risk factor ($p < 0.01$). Poor and regular self-perception of health were also considered a risk factor ($p < 0.01$) when comparing with good status. The number of comorbidities showed no significant correlation. We conclude that older-adult with UI has greater risk of being restricted to home especially when female, older age, low perception of health. Having good cognition and living without a partner were protective factors.

SIGNS OF EXACERBATION DETECTED BY FAMILY CAREGIVERS OF DEMENTED ELDERLY WITH CHRONIC HEART FAILURE

S. Hara¹, M. Taguchi², 1. *Shimane University Faculty of Medicine, Izumo-shi, Japan*, 2. *Shimane Prefectural Central Hospital, Izumo-shi, Japan*

The purpose of the present study is to clarify the signs of exacerbation of heart failure detected by family caregivers of the demented elderly suffering from chronic heart failure. Semi-structured interviews were conducted with 10 family caregivers living with demented elderly persons suffering from chronic heart failure. The details of the interviews were analyzed in a qualitative and descriptive manner. Consequently, as the signs of exacerbation of heart failure detected by the family caregivers, the following three categories were extracted: presence of visible physical changes, having difficulty in speaking, dressing and moving, and appearance of physical disorder in the patient's own manner. Family caregivers living with patients who were having difficulty in recognizing and indicating their intentions could detect signs of exacerbation of heart failure. These signs were minor changes or subtle differences that only the family caregivers knowing the patients' daily speech habits and living conditions could notice. Taking a collaborative approach with family caregivers, we should confirm the patient-specific signs of exacerbation of heart failure detected by family caregivers. In this manner, we should provide appropriate support that prompts patients to visit a hospital and prevent aggravation of heart failure.

PHENOTYPIC CHARACTERISTICS AND RISK FACTORS ASSOCIATED WITH EXACERBATION-PRONE ASTHMA IN OLDER ADULTS

M.D. Opina^{1,2}, E.R. Bleecker^{2,3}, A.T. Hastie^{2,3}, H. Li^{2,3}, D.A. Meyers^{2,3}, W.C. Moore^{2,3}, 1. *Wake Forest School of Medicine, J Paul Sticht Center on Aging, Winston Salem, North Carolina*, 2. *Wake Forest School of Medicine, Center for Human Genomics, Winston Salem, North Carolina*, 3. *National Heart, Lung, and Blood Institute's Severe Asthma Research Program, Bethesda, Maryland*

Preventing asthma exacerbations is a goal of National Asthma Guidelines, but identification of at-risk individuals is difficult, especially in older asthmatics. We aimed to characterize exacerbation-prone asthma in older adults to identify characteristics and predictive biomarkers associated with high-risk phenotypes to facilitate precision medicine approaches. 70 non-smoking subjects ≥ 60 years old in

the Severe Asthma Research Program underwent characterization (comprehensive questionnaires, lung function with bronchodilator reversibility, atopy assessment, biomarker collection). Using patient-reported exacerbations two phenotypes were defined; Exacerbation Prone Asthma (EPA, ≥ 1 /past year) and Very Frequent Exacerbations (VFE, ≥ 3 /past year). Risk and biomarker associations were assessed with odds ratios (OR) using logistic regression. 44% of older asthmatics had EPA. Healthcare utilization and treatment with higher corticosteroid doses were more frequent in EPA compared to non-exacerbating subjects ($p < 0.02$). Female gender (OR=2.90), respiratory infections (OR=2.90), and post-bronchodilator FEV1 $< 65\%$ (OR=2.72) were associated with EPA ($p < 0.05$). In contrast, sinusitis (OR=5.42), treatment with long-acting beta-agonists (LABA, OR=5.37), and pre-bronchodilator FEV1 $< 68\%$ (OR=3.48) were associated with VFE ($p < 0.04$) compared to subjects with fewer exacerbations. While sputum eosinophils $\geq 3\%$ was associated with VFE (OR=6.19, $p = 0.027$), blood eosinophils and exhaled nitric oxide were not associated with either phenotype. In conclusion, the EPA phenotype was associated with less reversible airflow obstruction, greater steroid use and respiratory infections. Persistent airway eosinophilia was associated with the VFE phenotype suggesting a role for targeted therapy with anti-IL5 immunomodulators in these patients. The association of LABA treatment with the higher-risk VFE phenotype suggests a possible adverse outcome of this drug class in older asthmatics that requires further investigation.

ACCELERATED PHYSICAL AND COGNITIVE AGING IN A CHRONIC PAIN CONDITION VS. NORMAL AGING

L.A. Zettel-Watson^{1,3}, J. Tessler³, J. Kircher³, L. Islas³, J. Aquino⁴, K.L. Fisher⁵, F. Cortez², B.J. Cherry^{1,3}, 1. *Gerontology, California State University, Fullerton, California*, 2. *North Dakota State University, Fargo, North Dakota*, 3. *Psychology, California State University, Fullerton, California*, 4. *Health Science, California State University, Fullerton, California*, 5. *Kinesiology, California State University, Fullerton, California*

Chronic pain conditions affect more Americans than diabetes, cancer and heart disease combined. Individuals with chronic pain disorders such as Fibromyalgia (FM) often experience declines in both physical and cognitive functioning, but for aging individuals, whether declines are a result of the chronic condition or senescence is unclear. To tease apart the impact of age and chronic pain on physical and cognitive functioning, the multidisciplinary research team of the Fibromyalgia and Chronic Pain Center at California State University, Fullerton, conducted a longitudinal study across five data collection waves (every two years for 8 years). Participants included 222 men and women (82% female) aged 50–87 years ($M = 63.4$, $SD = 8.9$) with and without FM (56% FM). Participants completed several physical performance measures (e.g., Senior Fitness Test, Fullerton Advanced Balance scale, 30-ft walk) and cognitive tasks (e.g., Digit Span Forward and Backward, Stroop Color-Word test, Trails A and B, Digit Symbol Substitution Task). Controlling for age, a multilevel model indicated that having FM was a significant predictor of physical and cognitive decline across time. Those with FM showed poorer performance across

both physical and cognitive domains, but over time, the FM group also experienced significantly more accelerated rates of decline compared to their healthy counterparts. Findings suggest that chronic pain conditions like FM exacerbate declines in physical and cognitive performance beyond normative aging changes. Understanding issues related to aging with chronic pain may help reduce disability and medical costs, improve physical and cognitive performance, and enhance quality of life.

SARCOPENIA IN PERIPHERAL ARTERIAL DISEASE: PREVALENCE AND IMPACT ON FUNCTIONAL STATUS.

O. Addison^{1,2}, S.J. Prior^{1,2}, R. Kundi³, A.W. Gardner⁴, A.S. Ryan^{2,1}, 1. *University of Maryland, Baltimore, Baltimore, Maryland*, 2. *Department of Veterans Affairs and Veterans Affairs Medical Center Baltimore, Geriatric Research, Education and Clinical Center (GRECC), Baltimore, Maryland*, 3. *Department of Surgery, Division of Vascular Surgery, University of Maryland, Baltimore, MD, Baltimore, Maryland*, 4. *Reynolds Oklahoma Center on Aging, Donald W. Reynolds Department of Geriatric Medicine, University of Oklahoma Health Sciences Center (OUHSC), Oklahoma City, Oklahoma*

Peripheral arterial disease (PAD) results in ischemic related pathological changes in the affected muscles. To alleviate exertional leg symptoms, those with PAD decrease physical activity resulting in a vicious cycle of decreased activity and accelerated mobility decline. These changes may place individuals with PAD at greater risk for sarcopenia. Sarcopenia has a prevalence in other clinical populations of ~1–22% and increases the risk for disability. This study sought to 1) determine the prevalence of sarcopenia in males with PAD and 2) compare the functional status of individuals with PAD with and without sarcopenia. Sixty-three participants with PAD (38% African American, age: 70.1 ± 0.7 years, BMI: 28.1 ± 0.5 kg/m², ABI: 0.65 ± 0.01 X ± SEM) underwent DXA scans to assess appendicular lean mass (ALM), and performed a six-minute walk test to determine six-minute walk distance (6MWD) and a treadmill test to measure claudication onset time (COT) and peak walking time (PWT). Sarcopenia was defined as ALM/ht² of less than 7.4 kg/m². Independent t-tests were used to compare 6MWD, COT and PWT. Sarcopenia prevalence in our PAD cohort was 17%. Individuals with sarcopenia (N=11) had lower 6MWD (p<0.05; 345 ± 21 vs 392 ± 10 meters) and COT (p<0.05; 106 ± 10 vs 183 ± 19 seconds) compared to individuals without sarcopenia (N=52). There was no difference in PWT between the groups (p=0.4; 345 ± 21 vs 392 ± 10). Men with PAD demonstrate a prevalence of sarcopenia consistent with other clinical populations and those with sarcopenia and PAD demonstrate decreased function.

ASSOCIATION OF MIDLIFE HYPERTENSION WITH LATE-LIFE HEARING LOSS

N. Reed, J.A. Deal, F. Lin, A. Sharrett, *Johns Hopkins University, Baltimore, Maryland*

The contribution of hypertension to hearing impairment (HI) in older adults is poorly understood. Hypertension could plausibly contribute to impaired circulation in the

cochlea and thereby disrupt metabolic activity related to hearing. However, results from previous epidemiologic studies of the association of hypertension and hearing loss have been inconsistent, and the relative importance of midlife versus late-life hypertension is unknown.

We analyzed data from 248 men and women (45–64 years at baseline, 1987–1989) in the Atherosclerosis Risk in Communities (ARIC) Study to quantify the relationship of mid- and late-life hypertension with late-life HI. Blood pressure was measured over 5 visits that were interspersed from 1997–2013. Hypertension was defined as systolic blood pressure (SBP) ≥140 mmHg, diastolic blood pressure (DBP) ≥90 mmHg, or antihypertensive use. SBP and DBP were also modeled continuously. Hearing was assessed using pure tone audiometry in 2013. A better-hearing ear pure-tone average (PTA) in decibels hearing level (db HL) was calculated using thresholds from 0.5–4 kHz and modeled continuously. The difference in PTA associated with hypertension was estimated using multivariable linear regression.

47 participants (19%) had hypertension at Visit 1 (1987–89) compared to 183 (74%) at Visit 5 (2013). In analyses adjusted for demographic and clinical covariates, midlife SBP was associated with HI, but late-life SBP was not (difference in PTA per 10 mm Hg SBP measured at Visit 1 (1987–89): 1.43 dB HL (95% CI: 0.32, 2.53) vs. Visit 5 (2013): -0.43 dB HL (95% CI: -1.41, 0.55)).

Our results demonstrate that midlife, but not late-life, SBP was independently associated with poorer hearing.

SELF RATED HEALTH IS ASSOCIATED WITH SERUM GLUCOSE AMONG ELDERLY LIVING AT RURAL AREA IN GUINEA

Y. Kasahara¹, M. Hirosaki², Y. Ishimoto³, M. Nakatsuka⁴, M. Fujisawa⁴, K. Matsubayashi, 1. *Shonan University of Medical Science, Yokohama, Japan*, 2. *Fukushima Medical University, Fukushima, Japan*, 3. *Mie University, Tsu, Japan*, 4. *Kyoto University, Kyoto, Japan*

Aim: SRH is an important outcome measure along with mortality, morbidity, and clinical outcomes. To our knowledge, however, little is known about the association between SRH and comprehensive geriatric functions in Guinea. We examined the association between SRH and comprehensive geriatric functions in rural area in Guinea.

Methods: The study population consisted of 129 people aged 60 and older (men=42, women=87, mean age 68.59 ± 7.5) living in Bossou, Nzerekore prefecture, Guinea in 2009. They were screened by the self-reported questionnaire contain SRH, basic ADL, moods, life styles and medical conditions. Furthermore, medical doctor checked blood serum and hemoglobin simply. SRH was assessed with the following question, “How would you rate your current health status?” using a 100-mm visual analogue scale (worst=0 to best=100). Mood was assessed with the following question, “Do you often feel discourage yourself?” Using the median SRH score of 43, we defined participants with a SRH score >43 as the high SRH group and those with a score ≤43 as the low SRH group.

Result: Elderly people with low SRH had significantly higher glucose serum, lower scores for each ADL item, functional reach length and self-rated happiness compared to those with low SRH.

Conclusion: Our findings demonstrated that SRH is associated not only physical disabilities but also serum glucose among the community-dwelling elderly in Guinea.

This suggests that SRH reflects some unperceived medical conditions especially diabetes. Medical examinations are useful for detecting early unperceived medical conditions and prevention of disease.

HEARING AID ACCLIMATIZATION BY OLDER ADULTS; THE EFFECT OF NOISE REDUCTION ON LISTENING EFFORT

D. Wright^{1,2}, J. Gagné^{1,2}, 1. *School of Speech Pathology and Audiology, University of Montreal, Montreal, Quebec, Canada*, 2. *Centre de Recherche de l'Institut Universitaire de Montréal, Montreal, Quebec, Canada*

The objectives of this study is to investigate acclimatization of older adults (OA) listeners with hearing loss (HL) to hearing aids (HA) using listening effort measures with and without noise reduction algorithms (NRA). The dual-task paradigm was used to measure the effort to understand speech in noise. The primary task will be the Hearing In Noise Test (HINT). The HINT is an adaptive speech perception in noise test that identifies the Signal-to-Noise (SNR) necessary for a performance of 50%. The second task will be a tactile pattern-recognition task (TPRT) in which participants have to identify the three pulse combinations (i.e. short-short-short, short-short-long, etc.). There will be 8 testing sessions over a period of 16 months to measure the effect of acclimatization. The participants, aged between 60 and 75 years of age, will have a bilateral mild to moderately-severe sensorineural hearing loss. 30 participants will be new HA users (sub-divided in two groups; with NRA and without NRA) and the other 15 participants will be experienced hearing aid users who will be our control group. Cognitive skills, including working memory and the processing speed will be evaluated using the Reading Span Test (RST) and the Digit Symbol Substitution Test (DSST), respectively. Our hypotheses are that acclimatization as measured by listening effort will be significant for all new HA users and that it will be correlated with cognitive abilities. Moreover, we believe that the presence of NRA will extend the acclimatization period since it distorts the auditory signal.

ASSOCIATION OF CARDIOVASCULAR AND NEURO-PSYCHIATRIC MULTIMORBIDITY WITH MOBILITY AND DISABILITY

D. Vetrano^{1,2}, D. Rizzuto¹, A. Calderón-Larrañaga¹, G. Onder², A. Welmer¹, R. Bernabei², A. Marengoni^{1,3}, L. Fratiglioni¹, 1. *Aging Research Center - Karolinska Institutet, Stockholm, Sweden*, 2. *Dept. Geriatrics, Catholic University of Rome, Rome, Italy*, 3. *Department of Clinical and Experimental Sciences, University of Brescia, Brescia, Italy*

Cardiovascular (CV) and neuro-psychiatric (NP) diseases are highly prevalent in the elderly and frequently co-occur. Which is the impact of their combination on mobility limitation and disability is not known. We here assess the longitudinal association between CV and NP multimorbidity and mobility limitation and disability in older adults.

Population-based study involving 3353 60+ year-old participants from the Swedish National Study of Aging and Care

(SNAC-K). Multimorbidity was defined as the presence of 2+ diseases. We used linear mixed models to assess the impact of CV and NP multimorbidity on walking speed (m/s) and 6 activities of daily living (ADL), over a 9-year follow-up period. Trajectories of walking speed and ADL are provided.

In our sample, (mean age 75 years; 65% females), participants with one CV disease (-0.14 m/s; 95%CI -0.22 to -0.06) and those with CV multimorbidity (-0.12 m/s; 95%CI -0.22 to -0.01) presented the highest decrease in walking speed after 9 years, as compared with participants free from CV and NP diseases. Conversely, participants with NP multimorbidity, alone (-1.58 ADL; 95%CI -1.09 to -2.08) or in association with CV diseases (-1.70 ADL; 95%CI -1.15 to -2.24) presented the highest decrease in ADL after 9 years, as compared with participants free from CV and NP diseases.

Cardiovascular and neuro-psychiatric multimorbidity affect differently mobility and functional ability of older adults.

USE OF ANTI-GOUT AGENT AMONG CHRONIC KIDNEY DISEASE PATIENT WITH HYPERURICEMIA

H. Chou¹, C. Wen^{1,2}, H. Chiu¹, H. Huang¹, C. Kuo^{3,4}, C. Huang⁴, 1. *Clinical Research Outcome and Training Center, Big Data Center, China Medical University Hospital, Taichung, Taiwan*, 2. *Department of Family Medicine, National Taiwan University Hospital, Taipei, Taiwan*, 3. *Big Data Center, China Medical University Hospital, Taichung, Taiwan*, 4. *Kidney Institute, China Medical University Hospital, Taichung, Taiwan*

Background: Chronic kidney disease (CKD) and hyperuricemia are mutually aggravating conditions worldwide. Very little is known of the use of antigout agents among CKD patients with hyperuricemia.

Objectives: To describe the use of antigout agents and concomitant medication among CKD patients with hyperuricemia.

Methods: We conducted a retrospective study using the electronic medical records from an integrated CKD care program of a tertiary teaching hospital from January 2003 through December 2015. Patients who developed hyperuricemia (serum uric acid concentrations > 7mg/dL in men and > 6mg/dL in women) at baseline and within 3 years of enrollments and treated by allopurinol, febuxostat, benzbromarone, colchicine or sulfapyrazone were included in this study. We excluded patients who were <20 or >90 years of age or treated with multiple antigout agents on the index date defined by the first day of prescription.

Results: During the study period, we identified 1,460 patients prescribed antigout agents in the final analysis. The range of mean age at index date was 66.0–71.2 in the five antigout agent groups. Compared to other antigout drug groups, patients in the benzbromarone group tended to have a higher estimated glomerular filtration rate (P=0.001). Patients in the allopurinol group exhibited greater concomitant use of oral hypoglycemic agents (p=0.006), fibrate (p=0.008), angiotensin-converting enzyme inhibitors (p=0.001) and calcium channel blocker (p<0.001). Users of febuxostat were more likely to receive acetaminophen.

Conclusion: To further evaluate the role of antigout agents in predicting CKD progression, researchers need to consider these unbalance potential confounding factors.

CARDIOVASCULAR AND NEUROPSYCHIATRIC MULTIMORBIDITY AND 11-YEAR HOSPITALIZATION AND DEATH

D. Vetrano^{1,2}, D. Rizzuto¹, A. Calderón-Larrañaga¹, G. Onder², R. Bernabei², A. Marengoni^{1,3}, L. Fratiglioni¹, 1. *Aging Research Center - Karolinska Institutet, Stockholm, Sweden*, 2. *Dept. of Geriatrics, Catholic University of Rome, Roma, RM, Italy*, 3. *Department of Clinical and Experimental Sciences, University of Brescia, Brescia, Italy*

Cardiovascular (CV) and neuro-psychiatric (NP) diseases are the most prevalent chronic conditions in the elderly and frequently co-occur. Which is the prognostic value of their different combinations is not known. We aim to investigate the prognostic role, in terms of hospitalization and mortality, of CV and NP multimorbidity in older adults.

Population-based study involving 3353 60+ year-old participants from the Swedish National Study of Aging and Care (SNAC-K). Multimorbidity was defined as the presence of 2+ diseases. Hazard ratios (HRs) for 11 years overall survival and proportional sub-distribution hazard ratios (sHRs) were calculated for the first hospitalization and competing risk mortality according to different combinations of CV and NP diseases.

Among the study participants (mean age 75 years; 65% females), 70% experienced at least 1 hospitalization and 38% died during the follow-up time. Participants with CV multimorbidity (sHR 1.52 95% CI 1.27–1.82) had higher risk of hospitalization, which increased (sHR 1.64 95% CI 1.32–2.03) if they had also NP diseases, as compared with those without CV and NP diseases. Similarly, the highest mortality rate was detected among participants with mixed (CV+NP) multimorbidity (HR 2.21 95% CI 1.74–2.81). Consistent results were obtained when a composite outcome of hospitalization plus death was considered.

In conclusion, CV and mixed multimorbidity are associated with the highest risk of hospitalization and death in the elderly.

MEDICARE PART D—COST BURDEN OF INHALED DRUGS FOR CHRONIC OBSTRUCTIVE PULMONARY DISEASE

C. Tseng^{1,2}, J. Yazdany³, R. Dudley³, C. Dejong³, D. Kazi³, R. Chen², G. Lin³, 1. *Family Medicine and Community Health, University of Hawaii John A. Burns School of Medicine, Honolulu, Hawaii*, 2. *Pacific Health Research and Education Institute, Honolulu, Hawaii*, 3. *University of California, San Francisco, San Francisco, California*

Chronic Obstructive Pulmonary Disease (COPD) causes significant morbidity worldwide and affects 1 in 8 elderly persons in the U.S. Inhaled drugs are highly effective, but cost hundreds of dollars. Since high cost can lead to medication nonadherence, we studied out-of-pocket costs for COPD inhalers for the 39 million beneficiaries covered by Medicare Part D.

Cross-sectional analysis using the June 2015 Centers for Medicare and Medicaid Services Prescription Drug Plan Formulary and Pharmacy Network Files. We examined 2,652 Part D plans nationwide and their coverage for short acting beta agonists (SABA), short acting muscarinic antagonists (SAMA), combination SABA/SAMA, long-acting muscarinic antagonists (LAMA), long-acting beta agonists

(LABA), inhaled corticosteroids (ICS) and combination LABA/ICS.

Between 93% to 100% of plans covered at least one inhaler in each class but required patients to pay \$30 to \$105 per inhaler. Under a standard 2015 Part D plan, beneficiaries would pay \$494 to \$1197 annually to fill one inhaler per month. Patients with moderate to severe COPD needing two or three inhalers would average \$1622 to \$2811 yearly in cost-sharing. It will be critical to examine how such high cost-sharing impacts COPD treatment adherence and health outcomes. Policymakers need to consider whether Medicare Part D, which provides drug coverage to 70% of the elderly and disabled persons in the U.S, can still adequately protect elderly persons from financial burden in the face of rising drug prices.

DEVELOPMENT OF QUALITY INDICATORS FOR CONTINUITY AND COORDINATION OF CARE IN ELDERLY IN JAPAN

H. Masaki², N. Kawai¹, K. Matsumoto³, M.T. Musgrave², Y. Yamashita², K. Kobayashi², T. Ishikawa², K. Yokote², 1. *Osaka University, Osaka, Japan*, 2. *Chiba university, Chiba, Japan*, 3. *Kawasaki University of Medical Welfare, Kurashiki, Japan*

This study is a part of a larger study on development of quality indicators (QIs) for continuity and coordination of care in elders and establishing a system that embodies quality. The study aimed to develop QIs for continuity and coordination of care in elders in Japan.

The QIs were developed based on systematic literature reviews. First, we searched CINAHL (1982–2013) using keywords “elderly,” “quality,” “transition of care,” and “continuity of care.” We extracted care contents and make indicators as form of IF, THEN, and BECAUSE referred to QIs of ACOVE-3. Thereafter, we reviewed Japanese literatures to make indicators suited to Japanese care situations, such as insurance system, policy, and care guidelines. We assembled an expert panel (home-care doctor, pharmacists, home-visiting nurse, policymakers) that provided suggestions on making the QIs relevant with the current situation.

Consequently, 16 QIs in 9 categories were developed. These categories were (1) identification of the source of care, (2) guaranteeing elders and their family participation in consultation of care, (3) providing information for care transition, (4) communication for continuity of care, (5) sharing information for continuity of care, (6) continuity and proper use of medication, (7) utilizing means for assisting with language barriers, (8) acquiring fundamental knowledge of care providers, and (9) developing tools for sharing information.

The QIs thus developed not only ensured continuity of medical regime, but also assured the quality of care provided to elders helping them live life on their own terms despite of changes in their physical condition.

POOR SLEEP NEGATIVELY IMPACTS PAIN, MOOD AND QUALITY OF LIFE IN ADULTS WITH AND WITHOUT FIBROMYALGIA

B.J. Cherry^{1,2}, M. Ruiz¹, P. Langmesser², J. Trevitt², J. Aquino³, D. Rutledge⁴, L.A. Zettel-Watson^{1,2}, 1. *Gerontology, California State University, Fullerton, California*, 2. *Psychology, California State University,*

Fullerton, California, 3. Health Sciences, California State University, Fullerton, California, 4. School of Nursing, California State University, Fullerton, California

More than 100 million Americans suffer from chronic pain, with an estimated 50% also experiencing poor sleep quality. Fibromyalgia (FM) is a chronic pain condition characterized by widespread pain and fatigue, often accompanied by sleep, mood, and cognitive disturbances. Despite a great deal of evidence documenting the existence of sleep and fatigue issues in FM, few studies have attempted to link these symptoms with psychosocial outcomes, and even fewer include a healthy comparison group. The current investigation utilizes data from both FM and healthy control participants from a longitudinal study conducted by a multidisciplinary research team at the Fibromyalgia and Chronic Pain Center at California State University, Fullerton. Participants included 222 adults (82% female) aged 50–87 years ($M = 63.4$, $SD = 8.9$) with and without FM ($n = 122$ and 100 , respectively). Sleep variables included trouble falling asleep, staying asleep, and feeling rested. Outcome measures included pain, anxiety, depression, and quality of life. Hierarchical regression analyses controlling for age and gender revealed significant results ($p < .05$) for both sleep and FM status; poorer sleep and having FM were related to higher levels of pain, anxiety, and depression, as well as lower quality of life. For anxiety, FM status moderated the impact of sleep, where those with FM who also reported poorer sleep quality had significantly higher anxiety levels than their counterparts. Poor sleep quality appears to exacerbate the impact of FM across a variety of psychosocial outcomes; clinical implications and the possibility of symptom clusters are discussed.

REAL WORLD SAFETY AND EFFICACY OF SGLT-2 INHIBITORS IN ELDERLY TYPE 2 DIABETIC PATIENTS

C. Trescoli Serrano, C.J. Fajardo, J. Arazo, F.J. Tarazona-Santabalbina, *Geriatric Medicine, Hospital Universitario de la Ribera (Alzira, València, Spain), Alzira, València, Spain*

We would like to evaluate the real world experience in safety and efficacy of adding SGLT-2 inhibitors to Elderly DM2 patients with an inadequate glycemic control. Elderly patients are frailer, have been diabetics for longer, have more diabetic complications, comorbidities and polypharmacy and therefore might be more susceptible to the effect of SGLT-2 inhibitors.

We studied 67 elderly DM2 patients who had been treated with SGLT-2 inhibitors for more than 6 months in our Health Department during 2015. Safety data was collected on most frequent and harmful events in this frail group as recorded in the computerized Primary and Hospital Care Medical Records. Patients' data: mean age: 67 years, 39% women, mean period diabetes: 12,5 years. 79% had hypertension, 81% had Hypercholesterolemia, 51% had a BMI > 30 and, 33% had a previous cardiovascular event. Antidiabetic treatment: 36% on insulin, 75% on Metformin, 45% on sulphonilurea (SU), 37% on DPP-IV inhibitors, 12% on pioglitazone and 13% on GLP-1 analogues. Mean treatment period was 8 months

Results before and after SGLT-2 inhibitors treatment were: HbA1c. 8,48 (SD 1,1) vs 7,44 (SD 0.8) % ($p < 0,01$);

(37% achieved HbA1c < 7%) Weight: 91,0 (SD 18) vs 88,8 (SD 17) kg ($p < 0,01$); Systolic BP: 134 (SD 9) vs 131 (SD 8) mmHg ($P: 0,04$). There were no statistical significant changes in e-GFR, lipid profile, hematocrit, diastolic BP and heart rate. No severe hypoglycemia, falls, diabetic ketoacidosis, or fungal infections were recorded during this period. Only 3 patients were treated for urinary tract infections. Two patients had thiazide treatment withdrawal during summer period because of symptomatic hypotension. No new cardiovascular events during treatment period. Hypoglycemia records were associated to insulin and SU treatment.

SGLT-2 inhibitors are safe and effective in not well controlled elderly DM2 patients in a real world experience. Effect on systolic BP should be considered as antihypertensive treatment might need to be reviewed.

THE BURDEN OF CHRONIC SYMPTOMS ON DISABILITY AND QUALITY OF LIFE IN OLD AGE

Y. Henchoz, B. Santos-Eggimann, *University of Lausanne Hospital Centre (CHUV), Institute of Social and Preventive Medicine (IUMSP), Lausanne, Switzerland*

The impact of multiple diagnoses on disability and quality of life (QoL) is well documented in older people, but less is known about chronic symptoms – the submerged part of the iceberg. This study aimed to determine the prevalence of chronic symptoms in community-dwelling older people, their associations with disability in basic activities of daily living (BADL) and QoL, and their public health impact. Data were compiled from the Lc65+ cohort study and two additional, population-based, stratified random samples of community-dwelling older people ($N=5,300$). Participants were asked whether they were disturbed for more than 6 months by 14 chronic symptoms (joint pain, back pain, chest pain, dyspnea, persistent cough, swollen legs, memory gaps, difficulty concentrating, difficulty in making decisions, dizziness/vertigo, skin problems, stomach/intestine problems, urinary incontinence, and impaired sexual life). Only 17.1% of participants were not disturbed by any of these chronic symptoms. The weighted prevalence ranged from 3.1% (chest pain) to 47.7% (joint pain), with substantial gender differences. Similarly, chronic symptoms that were significantly associated with BADL disability or unfavorable QoL, adjusting for socio-demographic characteristics and the number of other chronic symptoms reported, varied between genders. The number of chronic symptoms was significantly associated with BADL disability and unfavorable QoL, with dose response relationships. For both outcomes, joint pain and back pain had the highest population attributable fractions. In conclusion, chronic symptoms are associated with BADL disability and unfavorable QoL, particularly when they accumulate. Due to their high public health impact, musculoskeletal chronic symptoms are good candidates for preventive interventions.

CARDIO-CEREBROVASCULAR COMPLICATIONS IN OLDER DIABETICS WITH ARTERIAL HYPERTENSION

G. Prada^{1,2}, R. Nacu^{1,2}, L. Lungu^{1,2}, A. Ilie³, I. Alexa³, A. Prada², A. Herghelegiu¹, 1. *Clinical department, National Institute of Gerontology and Geriatrics "Ana Aslan", Bucharest, Romania, 2. University of Medicine and*

Pharmacy “Carol Davila”, Bucharest, Romania, 3. “Gr.T. Popa” University of Medicine and Pharmacy, Iasi, Romania

Introduction: Both diabetes mellitus (DM) and hypertension (HTA) are often encountered in elderly and impact on quality of life and morbidity. Aim of the study was to compare cardio-cerebrovascular risk and complications in elderly and adults diagnosed with DM and HTA.

Material and method: We analyzed 2 randomly selected groups of adults (50–64 years) and elderly (>75 years) diagnosed with both DM and HTA, total 600 subjects, 150 men and 150 women in each group; 2/3 resided in urban areas. 37% adults had higher education and 63% elderly medium education.

Results: Longstanding DM combined with HTA was a significant factor for complications. Insulino-dependent DM was more prevalent in elderly and correlated with duration of disease. Almost half of elderly had high cardiovascular risk, while most adults had low risk. More elderly (58%) as compared to adults (43%) had over 10 complications and comorbidities concomitantly. Chronic kidney disease was significantly more prevalent in adults ($p<0.01$), possibly due to impact of this complication on survival. Adults had significantly lower prevalence of left ventricular hypertrophy ($p<0.001$) and heart conduction abnormalities ($p<0.01$). More elderly had chronic atrial fibrillation, and congestive heart failure was statistically significant more prevalent in elderly ($p<0.01$) who also had higher NYHA classes. Moreover, heart rhythm disorders were more prevalent in elderly ($p<0.01$). Neurocognitive disorders, stroke, peripheral arterial obstructive disease and neuropathy were more prevalent in elderly ($p<0.001$).

Conclusions: Chronological age has an important impact on cardiocerebro-vascular complications in diabetics with hypertension. This highlights the importance of early diagnosis and monitoring.

HOME HEALTH AIDES' ROLE IN PRESSURE ULCER PREVENTION AMONG THE ELDERLY AT HOME: A SCOPING REVIEW

M. Sultana, A. Zecevic, *Health and Rehabilitation Sciences, Western University, London, Ontario, Canada*

The purpose of this scoping literature review was to explore current knowledge about the role of home health aides (HHAs) in pressure ulcer prevention among the elderly receiving home care. HHAs are unregulated care providers that constitute 70% of the home care work force in Canada. They are part of the patient's circle of care but not members of the interdisciplinary pressure ulcer prevention team. The literature review was used to identify sources of evidence, map key concepts, and determine research gaps. Key search terms “home care services”, “pressure ulcers”, “home health aides”, and “aged” were used to search 11 databases. Eight sources were retrieved: one textbook chapter and seven peer-reviewed journal articles. All documents were charted and analyzed using a descriptive summary and qualitative content analysis. The results suggest that HHAs' role in pressure ulcer prevention at home is unclear. Five themes emerged from literature: need for training and education, nurse as an educator, interdisciplinary care approach, relationship between HHAs patient and family, and beliefs of HHAs

about their role. Potential for enhancing HHA roles were identified in: observing patient's health condition; coaching patients and family on positioning, ambulation, and nutrition; assisting health care providers; and reporting to the interdisciplinary team, patients and caregivers. In conclusion, the HHAs could play more important role in pressure ulcer prevention in home care. Further research is recommended to create interventions with increased engagement of HHAs and explore their efficacy.

THE RELATED FACTORS OF SUCCESSFUL CATHETER REMOVAL IN A CHINESE HOME CARE POPULATION

I. Liu¹, M. Wu², J. Fu², Y. Lin¹, C. Lin¹, R. Huang¹, 1. *Department of Family Medicine, E-DA Hospital, Kaohsiung City, Taiwan*, 2. *Home Care Unit, E-DA Hospital, Kaohsiung City, Taiwan*

In Taiwan, home visit and long term care for the disable have been implemented for decays. However, functional preservation and catheter removal rate are still far from satisfactory. The aim of our study is to clarify the independent factors associated with successful catheter removal and also the detrimental factors related to mortality of home care patient.

In this cross-sectional study, 514 home care subjects aged from 40–104 with mean age of 83 years old were enrolled at a home care unit of a southern Taiwan teaching hospital (January, 2011 to December, 2015), after excluding subjects diagnosed as terminal cancer and life span <6 months.

Data were analyzed using SPSS (version 17.0; SPSS, Chicago, IL). In multivariate analysis, caregiver education <6 years vs. education beyond college (OR:3.33, 95% CI:1.16–9.52) and ADL (OR: 1.07 95% CI:1.04–1.10) were positively associated with successful catheter removal after adjustment for other clinical variables. Cancer (OR: 0.30, 95% CI: 0.11–0.86) and underweight (OR:0.43, 95% CI: 0.20–0.95) had detrimental effects on catheter removal. There is an insignificant association between catheter removal and patient age, sex, number/type of catheters, diseases, caregiver (relatives/local caregiver/foreigner caregiver), etc. Age (OR: 1.05, 95% CI: 1.02–1.08), cancer (OR: 4.49, 95% CI: 1.98–10.17), cardiovascular disease (OR: 6.91, 95% CI: 1.46–32.64), foreign caregiver (OR: 2.99, 95% CI: 1.32–6.77) were independently associated with mortality, whereas ADL was inversely associated with mortality.

In conclusion, age, disease categories and foreign caregiver increased the risk of mortality in home care subjects. Caregiver education and functional status of the patient were important correlates of successful catheter removal.

IMPACT OF DIABETES ON THE PREVALENCE OF MALNUTRITION AND SARCOPENIA IN AGED HOSPITALIZED PATIENTS

F.R. Herrmann², D. Zekry², V. Lachat², R. Rizzoli¹, 1. *Division of Bone Diseases, Department of Internal Medicine Specialties, Geneva University Hospitals and University of Geneva, Geneva, Switzerland*, 2. *Division of Geriatrics, Internal Medicine, Rehabilitation and Geriatrics, Geneva University Hospitals and University of Geneva, Geneva, Switzerland*

The prevalence of diabetes is expected to rise sharply worldwide in the coming decades, due not only to obesity and sedentary lifestyles, but also to aging per se. Diabetes is associated with a higher incidence of decreased skeletal muscle mass (sarcopenia) and physical disabilities. Sarcopenia and physical disabilities may be due to the combined effects of reduced physical activity, inflammation, obesity and insulin resistance. Further, malnutrition may be frequent in very old diabetic patients, and contribute to the risk of sarcopenia and physical disabilities. At the same time it may paradoxically lead to a “false” improvement in insulin sensitivity and glycemic control, in a phenomenon of reverse causality.

Results were prospectively collected during a case-control study involving 580 consecutively hospitalized patients with a bioimpedance assessment. Age ranged from 70.2 to 101.8 years (84.8 ± 6.2), with 184/396 male/female.

The prevalence of malnutrition, assessed by the Mini Nutritional Assessment (MNA), was similar in diabetic (13.1%) and control patients (11.2%).

Sarcopenia, was previously defined by a Fat Free Mass Index $<15.1 \text{ kg/m}^2$ and 17.5 kg/m^2 in European women and men, respectively. Its prevalence in our cohort amounts to 57.2% in the 383 control versus 34.5% in the 197 diabetic patients ($p < 0.0001$). Diabetics were 2.7 years younger and counted more men, but even after adjusting for age and sex in a logistic regression model the odds ratio of sarcopenia remained unchanged at 0.41 (95% CI: 0.28 - 0.59).

COPD IN COSTA RICAN ELDER OLDER ADULTS AND ITS ASSOCIATION WITH SARCOPENIA

M.G. Borda¹, M.U. Perez-Zepeda², C. Cano¹, 1. *Instituto de envejecimiento, Pontificia Universidad Javeriana, Bogotá, Bogotá, Colombia*, 2. *Geriatric Epidemiology Research Department, Instituto Nacional De Geriatria, Mexico City, Mexico, Mexico DF, Mexico*

Background: Sarcopenia is associated with to multiples comorbidities, including moreover those with some degree of inflammation. Chronic inflammatory states generate hypercatabolism and replacement of lean muscle mass for adipose tissue, decreasing muscle strength, power and function leading to disability and dependence. Here we study COPD as an important chronic inflammatory disease Strong associations have been reported between COPD and sarcopenia. The aim of this study is to evaluate the associations of COPD and sarcopenia with clinical outcomes, pulmonary function and health status and mortality.

Methods: Data was taken of the CRELES- retirement cohort survey, a longitudinal study taken place in Costa Rica with a representative sample of 2820 elder adults born before 1945. Starting in 2010 with a second wave starting in 2012. The variable ‘presence of sarcopenia in patients with COPD’ was used to identify associations with independent variables (sociodemographic factors, self-rated health, comorbidities, functional status, cognitive status, pulmonary function, hospitalizations and mortality).

Results: From a total of 2,827 60-year or older adults, 9.83% ($n=278$) were categorized as sarcopenic. A total of 18.09% referred as having a lung disease, from which 24.82% had sarcopenia ($p=0.002$). When grouping with

sarcopenia and lung disease status, 74.24% did not had any of the conditions, 15.56% had just lung disease without sarcopenia, 7.67% had only sarcopenia without having lung disease and 2.53% had both conditions. The only group that had a higher risk of mortality was that having both conditions, with a hazard ratio of 1.81 (95% CI 1.27–2.58, $p=0.001$), after adjusting for age and sex.

Conclusions: Older adults with lung disease have a significant higher prevalence of sarcopenia and a higher risk of mortality, than either any of the conditions alone. Special care to older adults with lung disease is important in order to detect sarcopenia and emphasize on those interventions that could impact this condition along with the regular treatment of the lung disease.

This in turn could ameliorate prognosis of older adults with both conditions.

CARDIOVASCULAR AND NON-CARDIOVASCULAR MULTIPLE CHRONIC CONDITIONS AND OUTCOMES IN OLDER ADULTS

H. Sheriff¹, C. Arundel¹, M.R. Blackman¹, Q. Zeng^{1,4}, C.S. Ritchie², T.E. Edes³, R. Allman³, A. Ahmed¹, 1. *VA Medical Center, Washington, District of Columbia*, 2. *UCSF, SF, California*, 3. *Veterans Health Administration Geriatrics and Extended Care Services, Washington, District of Columbia*, 4. *GW University, Washington, District of Columbia*

Background: Multiple chronic conditions (MCC) are common in older adults and often underlie poor health and outcomes. 14% of Medicare beneficiaries with ≥ 6 MCCs account for 70% of readmissions. We examined impact of cardiovascular (CV) and non-CV MCCs on outcomes in community-dwelling older adults.

Methods: Of 5795 Cardiovascular Health Study (CHS) participants age ≥ 65 years, 375, 955, 1409, 1253, 858, 536, 245, 115, 35, 10 and 4 had 0 to 10 MCCs, respectively based on 8 CV and 7 non-CV MCCs. Multivariable Cox regression models were used to estimate HRs associated with any MCCs, CV MCCs, and non-CV MCCs, adjusting for 25 baseline characteristics.

Results: One-year hospitalization occurred in 7%, 11%, 14%, 17%, 21%, 30%, 31%, 40%, 46%, 50%, and 25% of those with 0 to 10 MCCs (HR associated with each MCC increase, 1.20; 95% 1.15–1.25). Respective rates for one-year mortality were 0.3%, 0.2%, 0.7%, 1.0%, 2.8%, 3.7%, 5.3%, 7.0%, 20.0%, 20.0%, and 25.0% (HR associated with each MCC increase, 1.41; 95% 1.25–1.59). HRs for one-year hospitalization and mortality associated with each CV MCC increase were 1.16 (95% 1.09–1.22) and 1.31 (95% 1.12–1.54), respectively. HR for one-year hospitalization and mortality associated with each non-CV MCC increase were 1.19 (95% 1.12–1.26) and 1.50 (95% 1.26–1.79), respectively.

Conclusion: Among community-dwelling older adults, number of MCCs had a significant independent association with both hospitalization and mortality. CV and non-CV MCCs generally had similar associations with hospitalization, though non-CV MCCs appeared to have stronger association with mortality.

SESSION 510 (POSTER)

COGNITION I

THE VALUE AND EXTENT OF ENGAGED LIFESTYLE ACTIVITY AND COGNITIVE PERFORMANCE IN LATER LIFE

B. Hayslip¹, R.J. Maiden², 1. *Psychology, University of North Texas, Murrells Inlet, South Carolina*, 2. *Alfred University, Alfred, New York*

The meaning assigned to as well as one's predisposition toward an engaged lifestyle in later life in concert with the extent of participation in such activities has yet to be explored as each relates to cognitive functioning. Seventy-seven community-residing older adults completed measures of crystallized and fluid ability, rated the extent of their participation in a variety of 84 everyday activities, rated each activity regarding the extent to which they found it mentally stimulating, and completed a 20-item measure of the extent to which they were predisposed to lead an engaged lifestyle. Lifestyle predisposition, lifestyle activity participation, and the stimulating quality of such participation were moderately related ($p < .05$). Lifestyle predisposition was weakly but reliably ($p < .01$) related to vocabulary and letter sets performance, while lifestyle enrichment related more strongly to letter sets and letter series ($p < .01$) performance. Rated lifestyle activity was also related, but more weakly to such performance ($ps < .02$) and was weakly related to abstruse analogies performance ($p < .02$). Regression analyses indicated that both attitudinal, activity-related, and enrichment predicted both letter series and letter sets performance most powerfully relative to abstruse and common analogies and vocabulary performance ($p > .05$). They also indicated that enrichment was more important in this respect than either predisposition or participation. These findings suggest that not only engaged lifestyle participation, but also the perceived enrichment value of such participation and one's lifestyle predisposition may predict cognitive (fluid ability) performance in later life.

THE EFFECTS OF CULTURE, LIFE DOMAIN, AND AGE-RELATED ATTITUDES ON SUBJECTIVE AGING

E. O'Brien, T.M. Hess, *North Carolina State University, Raleigh, North Carolina*

Cross-cultural differences in aging attitudes may lead to variability in how people feel about and experience their own aging in specific contexts. These differences could consequently result in variability in specific age-related behavioral and health outcomes associated with subjective aging (SA) experiences. We explored how SA varies across domains of functioning in three different cultures and factors, such as perceptions about the age of being old and the situation of older people in society, that explain might observed variability. American ($n = 573$), Hong Kong Chinese ($n = 495$), and German ($n = 827$) adults aged between 26 and 95 years ($M = 58.17$, $SD = 14.5$) in the Aging as Future Project completed a questionnaire designed to capture subjective perceptions of aging, including general attitudes and SA, in eight different domains of functioning (e.g., family, work, health). Factor analyses showed consistency in the domain-specificity

of SA across cultures, but differences in the amount of variance shared between domains. GLM-based tests indicated that country moderated the effect of age group on perceptions of older adults' situations, with Chinese young adults reporting more negative perceptions than same-aged Americans and Germans. Additionally, perceptions of the age of being old explained unique variance in SA within each domain and was found to diminish the effects associated with culture on SA in some domains but not others. Initial results suggest that context-specific differences in age-related attitudes can account for cross-cultural variability in felt age. Findings may have important implications for adaptive aging within cultures.

THE ROLE OF AGE, INTEREST, AND COGNITION ON MIND WANDERING DURING READING

R. Mathews, M. Shake, E. Massy, *Psychological Sciences, Western Kentucky University, Bowling Green, Kentucky*

Previous research has suggested that age differences in mind-wandering during reading may be partly explained by interest in the text; however, those studies relied on post-hoc ratings of interest. In the present study, the authors directly manipulated interest and examined how that influenced age differences in mindless reading. Participants included 26 younger adults ($Age=19.15$) and 27 older adults ($Age=68.43$) who completed a battery of cognitive tests, and also read two computerized texts for 30 minutes each. The texts were based on topics they had previously rated as the most boring and the most interesting on a survey of various book topics. While reading the texts, they were randomly probed (every 2–4 minutes) by the computer to report their current thoughts. Participants reported being on-task or off-task; if the latter, they chose from several types of off-task thought categories (e.g., daydreaming, hungry, worried, etc.). A main effect of Age showed that older adults ($M=0.31$, $SE=0.05$) mind-wandered less than younger adults ($M=0.57$, $SE=0.05$), $F(1,51)=16.32$, $p < 0.01$, $\eta_p^2=0.24$. There was also a main effect of Interest, which showed that texts rated as boring ($M=0.55$, $SE=0.04$) engendered greater mind wandering than texts rated as interesting ($M=0.33$, $SE=0.03$), $F(1,51)=27.55$, $p < 0.01$, $\eta_p^2=0.35$. The interaction between age and interest was not significant, $F(1,51)=0.20$, *ns*. Participants also reported more cases of daydreaming when the text was boring, $F(1,51)=4.10$, $p < 0.05$, $\eta_p^2=0.07$. These data suggest that age differences in mindless reading exist; however, topic interest seems to be much more influential on mind-wandering frequency.

REDUCED VARIABILITY DURING TIME ESTIMATION IN OLDER ADULTS THROUGH TRANSCRANIAL MAGNETIC STIMULATION

W. Ren^{1,2}, Z. Zhang², J. Ma², P. Liu², M. Wang³, 1. *Institute of Psychology, Chinese Academy of Sciences, Beijing, China*, 2. *College of Education, Hebei Normal University, Shijiazhuang, Hebei, China*, 3. *Key Laboratory of Brain Aging and Cognitive Neuroscience, Hebei Province, Shijiazhuang, China*

Accurate time estimation abilities are important to proper performance of many daily activities. Previous study suggested a significant correlation between ability to measure

time passing and ability to execute independent activities of daily living. The scalar timing theory proposes that the ability to perceive time is underlay by a biological internal clock. Normal aging is commonly associated with reductions in the speed and increased variability in the internal clock, as a result of impairments in attention and memory as well as other cognitive functions.

The repetitive transcranial magnetic stimulation (rTMS) is one of the commonly used brain stimulation methods, which could modulate memory and executive function of the older adults. Here we were interested in whether the rTMS could modulate the perception of time in older adults. We applied ten sessions of rTMS to the right dorsolateral prefrontal cortex (DLPFC) of the participants in a randomized, double-blind, placebo-controlled design study. An interval production task was conducted, which included three different intervals of 2, 5 and 8 seconds, respectively. The mean time estimates, absolute error values (ABS) and the coefficient of variance (CV) were measured before and after the rTMS or sham stimulation. Results showed that rTMS reduced the ABS and CV of longer intervals (5 and 8 seconds), however, it didn't modulate the estimation of 2 seconds, indicating that rTMS modulate the estimation of longer intervals through reducing the variability caused by aging. These findings suggested that rTMS is a promising technique to ameliorate cognitive aging.

BASELINE INTERLEUKIN-6 AND LONGITUDINAL PROCESSING SPEED CHANGE IN THE ELDERLY

M. Wynn^{1,2}, R. Saloner¹, J.H. Kramer¹, 1. *Neurology, University of California, San Francisco, Berkeley, California*, 2. *Washington University in St. Louis, St. Louis, Missouri*

Inflammation is suspected to play a role in neurodegeneration and is associated with worse memory and smaller medial temporal volumes in controls. Many of the studies, however, have been cross-sectional and little is known about longitudinal changes in cognition due to inflammation. Our objective was to determine if baseline levels of inflammation predicted a steeper slope of cognitive decline longitudinally. Participants were cognitively normal, community dwelling, older adults (mean age = 73.28) followed over multiple visits spanning 4 to 6 years. Participants underwent a fasting blood draw and had their plasma analyzed for interleukin-6 (IL-6) using the Mesoscale platform. At each timepoint, participants completed a series of computerized reaction time tests that yielded a single composite processing speed score. The IL-6 values were log transformed and slope values of the processing speed scores were calculated using linear mixed models. 199 participants were included in this analysis.

Higher baseline IL-6 levels predicted greater increases in processing speed slope ($p < .01$), while controlling for age and baseline processing speed. These findings suggest that higher levels of systemic inflammation are associated with increased rates of cognitive slowing over time in healthy older adults. These results highlight the importance of inflammation in cognitive aging and the need for further research to elucidate the exact relationship between markers of inflammation and cognitive decline.

ACTIVE MEMORY WORKS™: WEB-BASED MEMORY TRAINING FOR OLDER ADULTS

G.W. Rebok, J.M. Parisi, M. Tzuang, A.P. Spira, *Mental Health, The Johns Hopkins University, Baltimore, Maryland*

Mounting evidence suggests that cognitive training interventions can improve cognitive performance in older adults. This randomized pilot trial tested a new web-based intervention, ACTIVE Memory Works™ (AMW), an online version of the evidence-based ACTIVE (Advanced Cognitive Training for Independent and Vital Elderly) memory intervention. Participants were cognitively normal, community-dwelling older adults age 65 and older ($N = 211$, M age = 71.1, range 65–89 yrs) and were randomly assigned to one of three conditions: 1) AMW; 2) ACTIVE classroom-based training; or 3) wait-list control. Participants completed measures of memory, executive function, and speed of processing at baseline, immediately following training, and 6 months later. The AMW and ACTIVE training groups both showed pre-post test improvements on memory performance (AVLT immediate recall and Rivermead paragraph recall), and maintenance of training gains at 6 months, but Treatment Group X Time interactions fell short of significance (p 's = 0.16 and 0.53, respectively). Consistent with previous findings, training effects were target-specific and showed little transfer to non-trained executive (Word Fluency, Animal Naming, Word Series, Digit Span Backwards) and speed of processing (Digit Symbol Substitution Test) abilities (p 's > 0.05). Over 96% of participants in the two intervention groups were satisfied with the assignment, compared to 76% in the control condition. Results suggest that web-based training programs like ACTIVE Memory Works™ may be viable alternatives to traditional in-person, cognitive training programs. Online cognitive-training programs extend the public health reach of cognitive interventions, are cost efficient, and hold promise for improving cognitive abilities in community elderly.

THE EFFECTS OF AGING BELIEFS AND PERCEPTIONS OF EFFORT ON TASK ENGAGEMENT UNDER COGNITIVE FATIGUE

C. Growney, E. O'Brien, T.M. Hess, *North Carolina State University, Raleigh, North Carolina*

Normative, age-related declines in cognitive ability can increase the costs associated with task engagement, and thereby increase the importance of motivation to deploy cognitive resources (Hess, 2014). Additionally, beliefs about aging related to different domains of functioning may differentially influence perceptions about the costs associated with engagement, affecting effort expenditure. We examined the impact of age-related attitudes and perceptions of effort on engagement in a cognitively-demanding task. A sample of 153 older adults aged 64–81 completed a computerized memory scan task that was designed to induce fatigue by increasing in difficulty across four trial sets. During a fatigue phase which followed, they completed a five-minute letter comparison task. Participants rated their perceptions of task load and motivation to engage in the task, and completed a questionnaire about their aging-related beliefs. Systolic blood pressure responsivity (SBP-R) was also recorded continuously throughout the course of the study in order to obtain an index of effort expenditure.

GLM-based analyses examining performance revealed an age by SBP-R interaction. High responsivity predicted strong performance across all ages, but low responsivity was a better predictor of poor performance for old-old than young-young individuals. Additionally, endorsing beliefs that cognitive declines happen as a normal part of aging predicted better performance among those who perceived high levels of mental demand in the task, but predicted worse performance among those who perceived less demand. Preliminary results suggest that expectations regarding aging in combination with perceptions of task demand may affect motivations to engage in cognitively-demanding and potentially beneficial activities.

POSITIVE EMOTION BOOSTS MEMORY TRAINING EFFECTS: A RANDOMIZED CONTROLLED TRIAL

S. Yin¹, X. Zhu², J. Li², W. Ren², L. Huo², 1. *Hubei University, Wuhan, China*, 2. *Institute of Psychology, Chinese Academy of Sciences, Beijing, China*

Older adults with subjective memory complaints (SMC) have high risk of dementia. Although plasticity of aging brain is well-established, relatively little is known about the efficacy of memory training for elderly with SMC. Positive emotion is supposed to boost training effects. This randomized controlled trial examined (1) the effects of a memory training program for elderly with SMC and (2) whether a positive emotion promoting group counseling would facilitate training effects. A sample of 124 older adults with SMC were randomly assigned into three groups. The first group (G1, n=42) received 6-hour group counseling and then 4-week memory training. The second group (G2, n=38) completed 6-hour reading followed by 4-week memory training. The third group (G3, n=44) received 6-hour group counseling and 4-week health lectures. All three groups completed cognitive assessments at baseline, mid-test and post-intervention. G1 and G3 had resting-state functional magnetic resonance imaging scanning at mid-test and post-intervention. Compared with G3, G1 demonstrated decreased memory complaints and improved performance on both lab memory tests and everyday memory tasks after training. When compared with G2, group counseling enhanced positive emotion in G1, and positive emotion boosted cognitive benefits from training, leading to larger memory improvement in G1 (Cohen's $d=1.17$) than in G2 (Cohen's $d=0.63$). Moreover, the boost effects of emotion on training gains were correlated to amygdala-hippocampus connectivity. The results suggest that memory training could enhance memory function in elderly with SMC, and positive emotion may facilitate the effects of memory training.

DEVELOPING A HEALTH NUMERACY SCALE TO ASSESS MEDICAL DECISION MAKING AMONG OLDER ADULTS

J. Wang^{1,2}, Y. Chen², Y. Fu³, 1. *Psychology, University of Wisconsin-Stevens Point, Stevens Point, Wisconsin*, 2. *Bowling Green State University, Bowling Green, Ohio*, 3. *Indiana University of Pennsylvania, Indiana, Pennsylvania*

As physical health and cognitive capacities decline in late adulthood, older adults need to be able to make sound decisions regarding medical matters to maintain an acceptable level of well-being. As health information is often presented

numerically, the ability to work with such information (health numeracy) is extremely important in these decision making processes. Unfortunately, while general numeracy (i.e., basic mathematics abilities) has gained attention from aging and decision making researchers, the construct of health numeracy was rarely studied. This research aimed to develop a tool for measuring health numeracy in older adults, and then to investigate health numeracy's effectiveness in predicting medical decision making. In study one, a pool of 16 health numeracy items was developed and tested through an online older adult sample ($N=262$). By using a Rasch analysis, items with difficulty scores that were too high or too low were excluded, and 6 items remained. The refined numeracy scale was validated by comparing to general numeracy and medical decision making. Both convergent validity and predictive validity were satisfied. In study two, the refined scale was cross validated in a community sample of older adults ($N=108$). It was found that the health numeracy scale was a better tool over the general numeracy scale used in predicting medical decision making in older adults from the community sample. Overall, this study developed a practical way of measuring health numeracy, and provided evidence in the benefits of health numeracy over general numeracy in medical decision making research.

THE JOINT INFLUENCE OF STRESS AND HEALTH ON COGNITIVE FUNCTIONS AMONG U.S. CHINESE OLDER ADULTS

Y. Chen¹, J. Wang¹, R. Zhang¹, X. Dong², 1. *Psychology, Bowling Green State University, Perrysburg, Ohio*, 2. *Rush University, Chicago, Illinois*

The Stress Paradox suggests that stress could have either facilitating or impairing influence on cognitive functions, depending on context. Age is positively associated with stress and negatively associated with health and cognitive functions, while education is positively associated with cognitive functions. The present study aimed to examine: 1) the impacts of age and education on cognitive functions; and 2) the joint influence of stress and health on cognitive functions above and beyond the impacts of age and education. The Population Study of Chinese Elderly in Chicago (PINE) used culturally and linguistically appropriate methods to study cognitive functions of Chinese older adults. Preliminary studies found that U.S. Chinese older adults reported higher levels of stress and lower levels of health than the general American older adults. About 3,159 Chinese older adults participated in the present study (58.9% female, age range 60 to 105 years old). They rated their current health status and used the Chinese Perceived Stress Scale to rate their stress levels over the past two weeks. In addition, their cognitive functions (i.e., working memory, perceptual speed, and episodic memory) were assessed during the face-to-face interviews. Controlling for the impacts of age and education, hierarchical regression analyses revealed significant effects of stress and health on cognitive functions, respectively. However, the individual effects of stress and health were no longer significant after entering the interaction terms of stress and health. Results are discussed in lights of the joint influence of stress and health on cognitive functions among U.S. Chinese older adults.

ASSOCIATION BETWEEN IMPAIRED SWALLOWING AND COGNITION IN HEALTHY OLDER ADULTS

L.A. LaGorio², R. Shah¹, A. Buchman¹, S.E. Leurgans¹, D.A. Bennett¹, 1. *Rush Alzheimer's Disease Research Center, Chicago, Illinois*, 2. *Rush University Medical Center, Chicago, Illinois*

Impaired swallowing, termed dysphagia, is a common morbidity of neurologic and non-neurologic diseases, but can also affect up to 63% of older adults without known disease. Among patients with neurologic disease like stroke or dementia, dysphagia co-occurs with impaired cognition; but, in community-dwelling elderly without disease, the relationship between dysphagia and cognition is unknown. This cross-sectional study examined associations between dysphagia and cognition in community-dwelling elderly.

Participants were community-dwelling older adults enrolled in the Rush Memory and Aging Project (MAP), a longitudinal study of aging and dementia. MAP participants complete a comprehensive cognitive assessment battery; scores from 19 tests are consolidated into a composite Z-score. For this study, 88 MAP participants (mean age=83.62±6.86 years) without any disease known to result in dysphagia, underwent dysphagia screening using the Modified-Mann Assessment of Swallowing Ability (MMASA), a validated and objectively scored dysphagia screening tool. Scores ≤93 indicate dysphagia. Univariate and multivariate analyses (adjusted for age, sex, education) explored associations between swallowing, dysphagia, and cognition.

Mean MMASA score=95.43 (SD=3.76); mean cognitive Z-score=0.31 (SD=0.53). Swallowing was positively correlated with cognition ($r=0.40$, $p<.0001$). Adjusted for demographics, lower swallowing scores remained associated with lower cognitive scores ($R^2=0.30$, $\Delta R^2=0.16$, $B=0.042$, $SE=0.014$, $p<.0001$). Dichotomizing MMASA scores into "dysphagia/no dysphagia" revealed that participants with dysphagia [$n=21$ (24%)] had lower cognitive scores [$F(1,83)=5.59$, $p=.020$].

Dysphagia was associated with lower cognitive function in community-dwelling older adults without disease known to result in dysphagia. Age-related dysphagia and impaired cognition may follow similar pathophysiological processes or share common neurologic substrates.

RECEIPT OF FINANCIAL SUPPORT FROM ADULT CHILDREN AND COGNITIVE FUNCTION AMONG CHINESE OLDER ADULTS

P. Xu, J.A. Burr, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

Changes in China's cultural, economic, and family systems require further study of support options available for older Chinese adults. This study examined the relationship between receipt of financial support from adult children and older parents' cognitive function. Rural and urban differences were also investigated. Data were drawn from two waves of the Chinese Longitudinal Healthy Longevity Survey (2005–2008). The study sample was restricted to older parents who were alive at both waves and were 65–105 years old having at least one living adult child. Cognitive function

was measured by a modified version of the Mini-Mental State Examination, with scores equal to or less than 18 indicating cognitive impairment. Prevalence models results showed receiving financial support from adult children was associated with a lower likelihood of cognitive impairment. A similar result was found among rural older parents. Bivariate analyses of incidence models showed a negative association between receiving money from adult children and cognitive function. However, the relationship became insignificant when social demographic characteristics were controlled. Among rural older adults, those who received financial support from adult children had lower risk of becoming cognitively impaired than those who did not receive financial support. Being younger, married, having higher education, being economically independent, and having higher self-rated health were also associated with a lower risk of cognitive impairment. The findings indicated the examination of prevalence and incidence models yields different conclusions about the relationship between receiving support and cognitive health, especially when taking into consideration rural-urban contexts.

SOCIAL FRAILITY HAS NEGATIVE IMPACT ON COGNITIVE FUNCTION AMONG OLDER PEOPLE

K. Tsutsumimoto^{1,2}, T. Doi¹, H. Makizako¹, R. Hotta¹, S. Nakakubo¹, K. Makino¹, T. Suzuki^{4,3}, H. Shimada¹, 1. *Department of Preventive Gerontology, National Center for Geriatrics and Gerontology, Obu, Aichi, Japan*, 2. *Japan Society for the Promotion of Science, Chiyoda, Tokyo, Japan*, 3. *J.F. Oberlin University Graduate School, Machida, Tokyo, Japan*, 4. *National Center for Geriatrics and Gerontology, Obu, Japan*

Social frailty as well as physical frailty may increase risk of disability in older people. However, it is not clear whether social frailty is associated with cognitive function for older people. This study determined relationships between social frailty and cognitive functions using cross-sectional data. In the present study, 4,425 community-dwelling older people (mean age: 72, 49% male) were included. We operationalized social frailty using the following components: living alone, going out less frequently than last year, not visiting friends sometimes, not feeling helpful to friends or family, and not talking with someone daily. Participants who replied to none of these questions were non-frail; those replying to one question were pre-frail; those replying to two or more questions were frail. We used the National Center for Geriatrics and Gerontology-Functional Assessment Tool including tests of word list memory, attention, executive function, and processing speed. Participants with one or more scores at least 1.5 standard deviations below the age- and education-adjusted reference thresholds were defined as declining in cognitive function. The overall prevalence rates of social pre-frailty and social frailty were 25% and 11%, respectively. We found significant relationships between declines in cognitive function and social pre-frailty (odds ratio [OR] 1.28, 95% confidence interval [95% CI] 1.09–1.50) and social frailty (OR 1.55, 95% CI 1.25–1.93). Socially frail individuals had higher risks of cognitive decline than those without social frailty.

THE RELATIONSHIP BETWEEN COGNITIVE FUNCTIONING AND HEARING ABILITY IN OLDER ADULTS

J. Shen, P. Souza, *Communication Sciences and Disorders, Northwestern University, Niles, Illinois*

Built on the recent epidemiologic evidence of the association between hearing loss and cognitive impairment, the present study aimed to investigate the relationship between cognitive functioning and hearing ability in a group of healthy community-dwelling older adults with a wide range of ages and hearing status. Montreal Cognitive Assessment (MoCA), a cognitive screening test for detecting mild cognitive impairment (Nasreddine et al., 2005), was used to assess cognitive functioning. Hearing ability was measured by clinical audiometric and speech-in-noise testing. The study included eighty older participants with an age range of 56–89 years and hearing status ranging from near-normal hearing to moderate hearing loss. The results showed that older individual's MoCA score was strongly associated with hearing ability. Hearing (i.e., pure tone threshold) significantly predicted individual performance on MoCA, particularly for those test items that rely heavily on auditory input. Taken together, these findings highlight the intimate relationship between cognitive functioning and hearing ability, which should be recognized by the medical professionals in order to better serve the aging community (Work supported by NIH).

BMI, COGNITION, AND EXERCISE RELATIONSHIPS IN THE SEATTLE LONGITUDINAL STUDY

E. Emerick¹, J.A. Blaskewicz Boron², S.L. Willis³, K. Schaie³,
1. *Gerontology, Youngstown State University, Youngstown, Ohio*, 2. *University of Nebraska Omaha, Omaha, Nebraska*, 3. *University of Washington, Seattle, Washington*

According to body mass index (BMI) statistics, current data show that 34.9% of all adults in the U.S. are obese, with levels increasing in adults across income and education levels (Center for Disease Control; CDC, 2010). Prior literature on the relationship between BMI and cognition has revealed inconsistent findings, with some variation based upon ability investigated. Using a subsample of 759 middle-aged and older adult participants (mean age=60.91 years; SD=12.18; Range=40–93 years; 54.4% female; mean education level=15.80 years) from the 1998 and 2005 waves of the Seattle Longitudinal Study, BMI-cognition relationships were examined for six cognitive abilities. Participants were categorized by weight based on the CDC's BMI standards: normal weight (n=305), overweight (n=261), and obese (n=193). Participants were stratified by the amount of days exercised in the past week: 0–3 days (n=455) or 4–7 days (n=274). Repeated measures MANCOVAs were employed, controlling for gender and education. A significant two-way interaction of BMI and exercise groups ($F(5, 3529)=2.44, p=.032$) indicated that both normal weight and obese adults bolstered cognitive performance when exercising 4–7 days rather than 0–3 days; however, overweight adults performed worse when exercising 4–7 days compared to 0–3 days. Current findings indicate that past exercise amount may play a role in cognitive performance. Discussion will consider possible reasons for these cognitive differences between exercise and BMI groups in the current sample.

UNDERSTANDING COHORT DIFFERENCES IN COGNITIVE FUNCTIONING: EVIDENCE FROM THE MIDUS NATIONAL STUDY

S. Agrigoroaei¹, M. Hughes², M.E. Lachman², 1. *Université catholique de Louvain, Louvain-la-Neuve, Belgium*, 2. *Brandeis University, Waltham, Massachusetts*

There is evidence that more recent birth cohorts show better cognitive performance than earlier ones. Our goal was to use data from two representative samples in the MIDUS national study in order to examine possible sources of cohort differences for multiple cognitive tests on the BTACT (Brief Test of Adult Cognition by Telephone). Two samples of the same age range were tested, on average, 8 years apart. The first sample (N = 3,929; age range: 32 to 76, M = 54.38, SD = 11.02) was assessed between 2004 and 2006 (participants born between 1928 and 1974). Participants from the second sample (N = 2,512, age range 32 to 76, M = 54.48, SD = 12.71) were tested between 2010 and 2014 (born between 1934 and 1982). Consistent with past research, significant cohort differences were obtained using a time-lag design on the majority of the BTACT tests. In addition, our results revealed stronger cohort effects in older age groups. Older individuals from the more recent birth cohorts showed better cognitive performance than those of the same age from the earlier cohorts. On average, the more recent cohorts were also characterized by higher levels of education, better functional and self-rated health, and also by a greater frequency of physical and cognitive activity. We will consider the role of increases in health-promoting behaviors such as an active and engaged lifestyle in addressing the mechanisms involved in cohort shifts in cognitive performance.

LONG-TERM EFFECT OF SUBJECTIVE HEARING ASSESSMENT ON SELF-RATED MEMORY

S.J. Cutler¹, C. Brăgaru², 1. *Sociology, University of Vermont, Bridport, Vermont*, 2. *University of Bucharest, Bucharest, Romania*

Recent research demonstrates an association between hearing ability and dementia. Despite these findings, mechanisms underlying the relationship remain unclear. Here we examine one such mechanism: the effect of subjective hearing assessment on subjective memory functioning. Data for the study come from the University of Michigan's Health and Retirement Study. Rs include persons 60 and older at T_1 (in 1992) who remained in the study at T_{11} (2012) (total N = 1,136). Using latent growth curve modeling, we examine the effect of self-rated hearing on self-rated memory at baseline and the effect of rate of change in self-rated hearing on rate of change in self-rated memory controlling for age, gender, education, marital status, and subjective health. Principal findings include the following: (1) there are strong and significant relationships ($p<.001$) between self-rated hearing and self-rated memory and between their rates of change net of the control variables; (2) the R^2 s indicate that 44% of the variance in self-rated memory is explained by self-rated hearing and the controls and that 33% of the variance in the rate of change in self-reported memory is explained by the rate of change in self-rated hearing and the controls; and (3) goodness of fit tests (CFI and RMSEA) are satisfactory. That there is a clear linkage between subjective dimensions of hearing and memory and changes therein suggests

the value of pursuing this connection as one mechanism by which hearing problems might lead to dementia. Practical implications for areas such as providing informed consent are also considered.

SLEEP EARLIER IN LIFE AND LATE LIFE COGNITION: MULTICENTER POPULATION DATA FROM SWEDEN AND FINLAND

I.P. Kreholt^{1,2}, M. Kivipelto¹, I. Skoog³, L.M. Johansson³, J. Skoog³, L. Sjöberg¹, H. Wang¹, S. Sindi¹, 1. *Aging Research Center (ARC), Stockholm, Sweden*, 2. *Institute of Gerontology, Jönköping, Sweden*, 3. *Institute of Neuroscience and Physiology, Center for Health and Ageing AGECAP, Gothenburg, Sweden*

Sleep disturbances are associated with mental wellbeing and physical health. Few studies have examined the long-term associations between sleep and cognition. In this study we assess the associations between sleep disturbances and cognition using population-based data.

Using four population-based studies (three Swedish, one Finnish), we analyzed data on insomnia. The short-term follow-up analyses (9–11 years follow-up time) used all four studies (N=3058). Midlife mean ages in the four datasets were 70, 70, 70 and 83 years. The long follow-up analyses used a Swedish dataset and the Finnish dataset with 21 and 22 years follow-up respectively (N=2068). Mean age was 50 and 58 years. Cognition was assessed using the Mini-Mental State Examination (MMSE).

We performed ordinal logistic regressions for the associations between sleep and cognition. The following potential baseline confounders were adjusted for: Data material, follow-up time, baseline age, sex, years of education (linear), alcohol consumption (linear), presently smoking, physically active, cohabitation, cardiovascular conditions, hypnotics (yes/no), and hopelessness (for short follow-up).

Short follow-up results using all four datasets showed similar significant associations in all models; insomnia was associated with poor cognition (fully adjusted model (all above covariates), $\beta = -0.14$, $p = 0.013$). Long follow-up results using the Finnish dataset showed significant associations controlling for follow-up time, age, sex, and education ($\beta = -0.20$, $p = 0.040$; Fully adjusted, $\beta = -0.18$, $p = 0.076$). No significant associations were found in the Swedish datasets (fully adjusted $\beta = -0.06$, $p = 0.585$).

In conclusion, insomnia in late adulthood is associated with worse late-life cognition.

LONG-TERM CALORIC RESTRICTION PREVENTS AGE-RELATED LEARNING IMPAIRMENT VIA SUPPRESSION OF APOPTOSIS

L. Ma, R. Wang, Y. Li, *Xuan Wu Hospital, Capital Medical University, Beijing, China*

Caloric restriction (CR) is the most reliable intervention to extend lifespan and prevent age-related disorders in various species from yeast to rodents. However, the underlying mechanisms have not yet been clearly defined. Therefore, we aimed to identify the underlying mechanisms of long-term CR on age-related learning impairment in C57/BL mice. Thirty six-week-old male C57/BL mice were randomly divided into three groups: normal control group (NC group, $n = 10$), high energy group (HE group, $n = 10$), and CR group ($n = 10$).

After 10 months, the average escape latency was lower in the CR group compared with the NC group, and the average time taken to first cross the platform in the CR group was significantly shorter than the HE group. Both Bcl-2 protein and mRNA expression levels in the CR group were significantly higher than those of the NC group and HE group. The expression of Bax, Caspase-3 and PARP protein in the CR group was significantly lower than the NC group. Our findings demonstrate that long-term CR may prevent age-related learning impairments via suppressing apoptosis in mice.

SESSION 515 (POSTER)

COGNITIVE IMPAIRMENT, FRAILTY, AND END OF LIFE

TRANSLATING EVIDENCE-BASED DEMENTIA INTERVENTIONS TO THE COMMUNITY

E. Gould, S. Hughes, S. Shuman, B. Lyda-McDonald, K. Maslow, J.M. Wiener, *RTI International, Washington, District of Columbia*

Efforts to translate evidence-based dementia interventions into community practice aid in determining effective programs and services. Randomized clinical trials are important to identify efficacy of a treatment or intervention, but translation studies provide useful findings about its impact in the community. Translation studies provide valuable information about care practices that can be successfully delivered in the community and help identify needs for adjustment of the intervention to suit different groups of people. However, even with evidence supporting the benefits, only a small portion of published interventions developed become widely disseminated, implemented, and sustained in either clinic or community settings. Many factors should be considered when deciding whether a program or intervention is appropriate for a community such as congruence with respect to agency mission and organizational practices, staffing expertise needed for implementation, capacity to maintain fidelity, and a reliable source of funding to ensure sustainability. Most of the translation studies of dementia interventions have been funded by the Administration on Aging through the congressionally mandated Alzheimer's Disease Services and Supports Program (ADSSP) followed by the U.S. Department of Veterans Affairs (VA); and the Rosalynn Carter Institute for Caregiving in partnership with Johnson and Johnson. This presentation will provide a brief overview of barriers and considerations for community translation and focus primarily on the ADSSP grantee experience translating evidence-based dementia interventions to the local community.

A NATIONAL DEMENTIA REGISTER FOR IRELAND: THE RIGHT APPROACH TO MEETING OUR DEMENTIA DATA NEEDS?

L. Hopper, S. Hughes, T. Burke, K. Irving, *School of Nursing and Human Sciences, Dublin City University, Dublin 9, Ireland*

With dementia prevalence set to increase as our population ages, there is an urgent need to gather valid epidemiological data in Ireland that provides accurate and reliable estimates of current and future dementia prevalence and facilitates the

development of effective dementia health and social policy. This study examined the feasibility of developing a national dementia register for Ireland. A rapid review of national and international patient registry literature was undertaken to identify registry functions, underlying design and process models, best-practice guidelines for their development, and the legal, ethical, clinical, technology, and financial issues relevant to the creation of an Irish dementia registry. Following ethical approval, we also conducted two focus groups with people with dementia and twenty-one expert stakeholder interviews with clinicians, and representatives from research, health, and social care organisations in Ireland and the UK, existing Irish patient registries, and international dementia registries. Discussions followed an agreed structure, were audio-recorded, transcribed, and analysed using inductive content analysis. Common themes that emerged from the literature review and stakeholder discussions were: registry function; registry data; benefits and risks; governance; legislation; barriers and facilitators; lessons learned; best practice; and complexities within the Irish system. Given the government strategy of addressing research and information systems as part of the 2014 National Dementia Strategy, it is opportune to examine the best approach to improving dementia data recording in Ireland. These results provide an evidence-base on which to progress this debate.

WHAT CONSTITUTES STABILITY OF HOME-BASED CARE ARRANGEMENTS FOR PEOPLE WITH DEMENTIA? A META-STUDY

K. Köhler^{1,2}, M. von Kutzleben¹, I. Hochgraeber^{1,2}, J. Dreyer^{1,2}, B. Holle^{1,2}, 1. *German Center for Neurodegenerative Diseases (DZNE) Site Witten, Witten, Germany*, 2. *University of Witten/Herdecke, School of Nursing Science, Witten, Germany*

Worldwide, most people with dementia live at home. The stability of home-based care arrangements is discussed as a crucial factor in health care policy and dementia research. For informal carers maintaining stability is an ever-changing challenge throughout the caring trajectory. We will be presenting a currently conducted synthesis of quantitative and qualitative studies with the primary research question: What constitutes and influences stability of home-based care arrangements for people living with dementia? The methodology of meta-study will be used (synthesis of meta-data-analysis, meta-method, meta-theory). For details see PROSPERO registration number CRD42016041727. First results show that the dynamic nature of stability as a continuous process is a broadly overlooked phenomenon and there is a lack of studies with a trajectory perspective. The majority of quantitative studies focuses on risk factors for institutionalization, but fails to comprehend the dynamics behind it. Qualitative research aims at understanding informal caregiving as a social construction, but pays little attention to its direct impact on whether a care arrangement can be maintained or not. From this synthesis a lot can be learned about how the phenomenon of stability has been understood and approached in dementia research within the last decades. The final results will help to define research gaps that have been overlooked in the past and to develop research questions and study designs that will be able to meet the methodological and theoretical requirements of this complex phenomenon.

Finally, they will provide an empirical and theoretical basis to develop stability promoting interventions.

DESIGN A RESTROOM SUITABLE FOR THE SENIORS—DEVELOP THE DESIGN SPECIFICATIONS FOR TAIWAN'S RESTROOM

C. Chang, *Architecture and Building Research Institute, Ministry of the Interior, Taiwan, New Taipei City, Taiwan*

The present paper, through the comparison of restroom design specifications between the US and Japan as well as the review of decrees, case investigations and expert interviews, explored how to target on the restroom in buildings and home to conduct design in order to improve the seniors living security and satisfaction after Taiwan enters an aging society in the future. Research conclusions: 1. This study found that Japan restroom specification include wheelchair toilets, inner-toilet equipped with colostomy equipment and multi-functional toilets, while the United States adopts accessible toilet. Therefore, Taiwan shall be in response to the building types and their usages to design restrooms of simple type and multiple-function type, respectively. 2. In addition to personal use, the elderly restroom may involve in issues of the assistance provided by carer and the usage of men and women as well as the conflicts with wheelchair users. Therefore, it is suggested that the development of such design specifications should be conducted from several dimensions of gender equality, accessibility, safety and comfort etc. and take into account of space planning and toilet room design, including how to accommodate different needs for toilet room, accessible facilities, toilet subsidiary accessory contents, washbasin, guide signs, etc. In the future, Taiwan should consider the economic factor and public acceptance to adopt demonstration site for setting, and then incorporate it into legislation in order to cope with the coming aging society.

SOCIAL EXCLUSION, SOCIAL CAPITAL, AND LIFE SATISFACTION OF OLDER ADULTS WITH DISABILITY

I. Song, S. Won, Y. Song, *Daegu Cyber University, Gyeongsan, Korea (the Republic of)*

This study aims to address social exclusion on life satisfaction of older adults with disability. Also, it is to identify moderating effects of social capital. Authors conducted a secondary analysis using 4th waves of Korean Longitudinal Study of Ageing (KLoSA). The sample in this study was 438 older adults with disability. Income, work, health, living arrangement, and education were included as social exclusion factors. The dependent variable, life satisfaction, was measured through a question asking, "how are you satisfied with your life in general? (0–100)". Finally, interaction with neighbors, attending religious meeting, and social gathering with friends were included as moderators, social capital. Gender, age, marital status, and place of living were included as control variables. Multiple regression results showed that health, housing, and education were statistically significant to life satisfaction. Thus, those who reported health condition was poor, lived in a rented house, and had less than middle school degree were less satisfied with their life than their counterparts. Among social capital factors, interaction with neighbors and social gathering with friends were significant.

Testing moderating effects was significant only for housing and attending religious meeting. When moderating effects were included in the model, all the social exclusion factors were not significant. Based on the findings, authors discussed social work implications to enhance life satisfaction of older adults with disability through reorganizing social services programs and developing social policies.

THE ASSOCIATION BETWEEN PAST FALLS AND SELF-RATED BALANCE ON THE SETTING OF GOALS AMONG OLDER PEOPLE

J.S. Oliveira^{1,2}, C. Sherrington^{1,2}, A. Tiedemann^{1,2}, 1. *The George Institute for Global Health, Sydney, New South Wales, Australia*, 2. *The University of Sydney, Sydney, New South Wales, Australia*

Goal-setting may be used to facilitate health behaviour change. Balance-challenging exercise can prevent falls. We investigated the association between the types of physical activity (PA) goals selected and the fall history and self-rated balance of people aged 60+ years participating in a randomised controlled trial aimed at increasing PA and preventing falls. Participants nominated two PA goals at baseline, which were summarised into categories (fitness; muscle strength; balance; weight loss; or flexibility). Chi-square analysis compared the proportion of participants with poor/fair self-reported balance, and those with past falls who set balance-related goals compared with other types of goals. Participants were 130 people with mean age of 69 years (SD=6.4, 69% females). Forty-two participants (32%) rated their balance as poor/fair and 36 (28%) had fallen in the past year. Overall fitness was the most common PA goal (57%), followed by weight loss (14%). Thirty-seven people (28%) set balance-related goals which comprised a significantly higher proportion of participants with poor/fair self-reported balance compared to the proportion with good balance (n=22, 52% versus n=15, 17% respectively, p<0.001). The proportion of past fallers who nominated a balance-related goal (n=12, 33%) was similar to the proportion of non-fallers nominating a balance-related goal (n=25, 27%, p=0.45). These results show that participants who had poor/fair self-rated balance were more likely to nominate balance-related PA goals, however participants who had fallen in the past year were not more likely to set a balance-related PA goal than non-fallers.

FRAILITY IN OLDER ADULTS: COMPETENCE CARE, INNOVATIVE PERSPECTIVES IN ELDERLY CARE

T. Kardol, *Vrije Universiteit Brussel, Brussels, Belgium*

To access collectively funded institutional care the government has put the bar very high. For this reason residents of care institutions have a great need for support in caring. Because of their multiple disorders every day institutional practice shows that the residents often only be seen as people with disabilities and not as people with abilities, ambitions and important social networks. This is a persistent evil in institutional care in a lot of European countries. A short moving film, called 'See me', will be shown to demonstrate what this means for the frail older people who live in a care facility. In order to ensure that frail elderly people are seen as individuals with qualities and ambitions, or as 'ordinary people', who are seen, it must change in care facilities. Emphasis

should be placed on a dignified and meaningful life for frail older people in care facilities. To realize that seven pillars for competence care are developed, namely:

1. Strengthen the resilience
2. Pay attention to experiences of loss and focus on resistance
3. Encourage reciprocity
4. Focus on talent development
5. Enjoy today and look forward to tomorrow
6. Pay attention to the role of relatives
7. Pay attention to a dignified end of life

After two years working with this new care concept in two care facilities in The Netherlands living and working in the care institution has been given a different look. A short film will be shown to demonstrate how a care facility is transformed into a meeting place and live studio.

AID IN DYING: QUESTIONS AND CONCERNS OF PROVIDERS AND THE PUBLIC

C.L. Cain, S. McCleskey, *University of California, Los Angeles, Los Angeles, California*

Aid in dying (AID) is a practice whereby a person at the terminal stage of a serious illness may request a prescription meant to hasten death. AID is now legal in five states across the United States and many additional states will consider similar laws over the next year. While interest in aid in dying has grown, questions about how to best carry out the practice, how to support patients to make end-of-life decisions that are best for them, and how to ameliorate disparities in quality of life at end-of-life continue. This presentation will briefly summarize what we know about the practice of aid in dying, what laws in the U.S. entail, and concerns of providers and the general public. Using a new survey of physicians, we will show that providers are most concerned about carrying out their obligations in an ethical and safe way. This includes knowing the legal process, understanding options for providing end-of-life care, explaining medications used in aid in dying, and having support through the process. Some concerns vary by provider type. In addition, we use data from focus groups with community members to show that the general public is concerned about patients knowing all options, possible coercion, how practices fit with religious beliefs, and how aid in dying will affect their family members. We summarize findings related to improving AID implementation as well as enhancing end-of-life care generally.

ADHERENCE TO ADVANCE CARE PLAN IN AN END-OF-LIFE PROGRAM FOR ELDERLY FROM NURSING HOMES IN HONG KONG

K.D. Yuk^{1,2}, H. Ming Ma^{1,2}, K. Au¹, M. Leung¹, J. Ng¹, H. Cheng¹, S. Yin Yung¹, E. Hui^{1,2}, 1. *Community Geriatric Assessment Team, Prince of Wales Hospital, Shatin, Hong Kong, Hong Kong*, 2. *The Chinese University of Hong Kong, Hong Kong, Hong Kong*

Background: In Hong Kong, dying in nursing homes will trigger a Coroner's referral, and over 11,000 nursing home residents were sent to acute hospitals to die every year. End-of-life (EOL) care in Hong Kong developed rapidly in recent years. An EOL Program for nursing home residents was

established, aiming to promote advance care plan (ACP) discussions and facilitate care in place.

Objective: To evaluate the adherence to patients' ACP preferences, and where and how their death occurred.

Design: Retrospective clinical audit of data from clinical notes and electronic patient records for the period October 2015 to March 2016.

Results: 83 nursing home residents were enrolled into the program during this period, with a mean age 92.4 years (median=93) and 87.8% of which had dementia. Advance care plans were established in all residents, mostly with their next-of-kins. All (100%) indicated their preference of do-not-attempt CPR (DNACPR). 32.9% indicated their preference against the use of both naso-gastric tube (NGT) feeding and non-invasive positive pressure ventilators (NIPPV). 51 participants (61.4%) accepted using NGT as a mode of feeding. During the patient journeys, adherence to ACP regarding NGT and NIPPV use were both 98.8% respectively. There were 35 (42.2%) deaths within this 6-month period, and the average duration of care per death case was 120.7 days (median=125). 26 (74.3%) of these deaths occurred in an extended care hospital, in particular 15 (42.9%) participants died in designated EOL wards.

Conclusion: Participants of this EOL program had their ACP preferences honored and deaths occurred in place.

PREVALENCE OF ADVANCE CARE PLANNING AMONG ELDERLY HEART FAILURE

M. Shimonishi, M. Hisamune, M. Matsui, *National Defense Medical College, Tokorozawa, Saitama, Japan*

Purpose: Elderly heart failure (HF) patients are increasing, they have a significant symptom burden and palliative care needs including advance care planning (ACP). End-of-life discussion is needed to improve quality of life among elderly HF patients, little is known about factors related to promoting ACP and completion of advance directives (AD) in HF patients. This study examined completion rates of AD and predictors of ACP process in HF patients by conducting a systematic review.

Methods: We searched PubMed and CINAHL from 1992 to 21 June 2016 using keywords "congestive heart failure", "heart failure", "advance care planning", "advance directives", "completion", "factors", and "predictors". Abstracts of the search results were reviewed according to inclusion criteria which refer to completion rates of AD and factors related to ACP process.

Results: Fourteen articles were selected according to the criteria. Participants were 6 inpatients, 3 outpatients, 1 community-dwelling persons, 1 family, and 4 physicians or providers. Completion rates of AD were from 12.7% to 49%. Factors related to completion of AD were older age, gender, race, marital status, education, perceived health, informed about ADs, knowledge, discussed AD with family, and discussed AD with physician.

Conclusion: AD Completion rates were not high in HF patients. Few patients were not ready to talk about ACP in outpatients, therefore, patient and provider discussion before is important to promote ACP and completion of AD in elderly HF patients.

IMPLEMENTING A PROCESS OF RISK-STRATIFIED CARE COORDINATION FOR OLDER ADULTS IN PRIMARY CARE

J. Elliott¹, P.T. Stolee¹, G. Heckman¹, V. Boscart², L. Giangregorio¹, 1. *University of Waterloo, Waterloo, Ontario, Canada*, 2. *Conestoga College, Kitchener, Ontario, Canada*

Primary health care may be the best place within the health system to coordinate care for older persons, but at present is poorly equipped to do so. Recent reviews found that an effective primary care model for complex patients requires appropriate targeting, engagement of patients and caregivers, and coordination with other services. This project aimed to understand the perceptions and experiences of providers, patients and caregivers with implementation of processes to achieve these aims. The Chronic Care Model and a multi-level framework for implementation of health innovations guided this study. Data collection and analysis followed a developmental evaluation approach. Data were collected using observations, individual interviews, a risk-stratification tool and tracking forms. Six patients, two family caregivers, and 13 providers were purposefully sampled from three primary care settings (rural and urban). Following implementation of a risk screening tool and an online referral mechanism, 560 patients were screened for level of risk, with care coordinated based on level of need. Although the screening and referral process took additional time in a busy practice context, health care providers, patients and caregivers identified many benefits. These included early identification of service need, greater awareness of community services available, and improved relationships between patients and providers. A process of risk-stratified care coordination offers potential benefits for older patients, caregivers and providers. However, taking the time to have meaningful conversations with patients was a challenge, and organizational structures and funding models may need to be modified to support fuller implementation.

AWARENESS OF ORGANIZATIONAL CULTURE AMONG STAFF OF A NEW DEMENTIA-CARE SPECIALIZED HOSPITAL IN JAPAN

H. Kawamura¹, M.p. Kanai², S. Kobayashi¹, Y. Matsushita¹, S. Furuya³, M. Kajiyama³, 1. *Tokyo University of Technology, Tokyo, Japan*, 2. *Kanto Gakuin University, Yokohama, Japan*, 3. *Kawasaki Memorial Hospital, Kawasaki, Japan*

This study aims to identify differences in the awareness of the organizational culture among nurses and care workers at a newly established dementia-care specialized hospital. A self-rating questionnaire survey was administered to 150 nurses and care workers working at a dementia-care specialized hospital in August, 2014, three months after the opening of the hospital. A scale by Harrison & Stokes (1992) of 15 items was used to measure the organizational culture orientation with four answer options for levels of power, role, achievement, and support orientations. Of the 105 responses (70%) 75 (50%) were valid (nurses, 53.3%; care staff, 46.7%). The mean age of respondents was 40.4 ± 8.0 years. The existing organizational culture was ranked from achievement, support, role, to power orientations. The scores of the organizational index were 10.4 for nurses and 6.0 for care

workers, showing significant differences. For the preferred organizational culture, achievement orientation was highest in both groups. A newly established dementia-care specialized hospital showed a strong achievement oriented organizational culture with a common vision or purpose, suggesting that staff engages in duties with a strong sense of responsibility. The achievement orientation of the preferred culture was stronger than that of the existing culture. The results suggest that staff would act from a common view of duties, suggesting the importance to make organizational arrangement to maintain the orientation. The awareness of the power orientation among care workers was stronger than for nurses.

DIRECT AND INDIRECT EFFECTS OF SOCIAL ENGAGEMENT ON COGNITIVE IMPAIRMENT AMONG CHINESE OLDER ADULTS

Y. Fang^{1,2}, F. Mao^{1,2}, Z. Zhou^{1,2}, 1. *State Key Laboratory of Molecular Vaccinology and Molecular Diagnostics, Xiamen, China*, 2. *Key Laboratory of Health Technology Assessment of Fujian Province University, Xiamen, China*

Objective: To decompose the total effect of social engagement on cognitive impairment through psychological well-being and to explore gender differences.

Methods: A total of 6,998 older adults aged 65 and over were obtained from the latest two waves of Chinese Longitudinal Healthy Longevity Survey. Social engagement was constructed by marital status, living situation, availability of help, availability of confidant, and social participation. Cognitive impairment was defined as ≤ 18 of the Mini-Mental State Examination. Psychological well-being was measured by seven items concerning mood-related and personality-related concepts of affect. The total effect was decomposed into direct and indirect effect by using logistic regression based on the Karlson, Holm, and Breen (KHB) method.

Results: The prevalence of follow-up cognitive impairment among the whole population was 15.69%, with 10.19% and 20.93% among male and female sub-sample respectively. The majority of old men scored 4 in social engagement while a majority of old women score 3. Old men had a better average score of psychological well-being than old women (19.52 vs. 18.44). The mediating effect was 15.38%, with 13.07% and 21.43% in the whole sample, male and female sub-sample respectively. However, the mediation was only significant in male sub-sample.

Conclusions: Social engagement was associated with an increased risk of cognitive impairment in old men. Moreover, part of the effect was significantly mediated by psychological well-being among male older adults. It helps us to pour more attention to old men when interventions are proposed to improve their cognitive function and quality of life.

PROMOTING ADVANCE CARE PLANNING IN COPD

M. Hisamune, M. Shimonishi, M. Matsui, *National Defense Medical College, Tokorozawa, Saitama, Japan*

Purpose: Chronic Obstructive Pulmonary Disease (COPD) is one of the few causes of mortality and COPD patients are increasing especially aged 75 years and older in Japan. Advance care planning (ACP), which involves patients-provider communication about end-of-life care, is important for COPD patients to promote end-of-life discussion. This study

reviewed completion rates of advance directives (AD) and related factors to ACP discussion in COPD patients.

Methods: A systematic review was conducted searching of PubMed and CINAHL from 1992 to 30 June 2016. Keywords such as “Chronic Obstructive Pulmonary Disease (COPD)”, “advance care planning”, “advance directives”, “completion”, “factors”, and “predictors” were used to select the articles. Abstracts of the search results were reviewed according to inclusion criteria which described completion rates of AD and factors related to ACP process.

Results: Ten articles were included for the review regarding the study purpose. Qualitative research design was used 5 studies of 10. Completion rates of AD were from 17% to 61%. A study of outpatient palliative care program for COPD reported that documented advance care plan at the initial appointment 0% changed 61% at follow-up. A multicenter, prospective, longitudinal study showed preferences regarding CPR or MV changed in 38.3% of the patients during the follow-up period, and related factors were generic health status, mobility, symptoms of anxiety and depression.

Conclusion: AD Completion rates and factors related to ACP process were well-not examined in COPD. Professional support to COPD patients is important, therefore, respiratory practitioners must choose the right time to promote ACP discussion.

SESSION 520 (POSTER)

DEMENTIA AND ALZHEIMER'S DISEASE I

ETHNIC DIFFERENCES IN FORMAL AND SOCIAL SUPPORT AND QUALITY OF CARE ON MOOD IN PEOPLE WITH DEMENTIA

F. Ma, M. Gonzalez Catalan, S. Paulraj, L.M. Brown, T. Tormala, R.G. Gomez, *PhD Program in Clinical Psychology, Palo Alto University, Palo Alto, California*

Ethnic differences have been found in caregivers' level and type of formal and informal social support offered to people with dementia. Both types of social support influence the emotional wellbeing of people with dementia. This study examined the influence of ethnicity on the relationship between the depression severity of people with dementia and the factors of social support and quality of care. As part of a larger study, 101 Latino American, 214 African American, and 321 Caucasian older adults with dementia of the Alzheimer type (DAT) were evaluated using the Mini Mental Status Exam. Caregivers were administered the Center for Epidemiological Studies Depression Scale, the Revised Memory and Problem Behavior Checklist, the Quality of Care questionnaire, and questions pertaining to the frequency of Formal Care and Social Support. A multiple regression model revealed that after controlling for patients' mental status and caregiver depression, a composite variable that combined quality of care and social support significantly explained an additional 2% of the variance in this sample. When examining these factors by ethnic group, caregiver depression remained an important predictor of the person's depression severity. However, only quality of care significantly predicted depression for Latino older adults with dementia, whereas, only frequency of social support predicted depression in African

American older adults with dementia. For Caucasians, neither quality of care or social support significantly predicted depression. These findings suggest that mental health professionals should consider ethnic differences when considering the relationship of quality of care and social support on the level of depression in people with dementia.

A LONGITUDINAL STUDY OF COGNITIVE DECLINE AND ITS FACTORS AMONG OLDER KOREANS: LATENT MIXTURE MODEL

J. Min, *Social Work, San Diego State University, San Diego, California*

As Alzheimer's disease continues to place enormous burden on both the individuals and society, an identification of the patterns of cognitive change over time receives growing attention. This study identifies a mixture of heterogeneous trajectories of cognitive changes in the population-based longitudinal panel survey. Data came from a four-wave panel survey; Korean Longitudinal Study of Ageing (KLoSA) from 2006 to 2012. A sample of 2,445 is selected; 60 years of age or older who did not show cognitive impairment (i.e., MMSE-K greater than 24) in 2006. Cognitive function was assessed by MMSE-K. The latent growth mixture models (LGMM) were estimated in Mplus 7 to identify heterogeneous groups with cognitive change over time. Two distinct classes of patterns of change in cognitive functions show the best model fit. Class 1 (Stable group) represents 91.5% of the study sample, indicating relatively stable, yet somewhat downward trend over six years as noted by mean scores of MMSE-K (T1 = 26.9, T2 = 25.9, T3 = 24.9, T4 = 25.7). On the other hand, Class 2 (Rapid decline group; 8.5%) shows sharp decline from T1 to T3 (26.3, 20.2, 16.6) and stay around 16.7 at T4. A post-hoc analysis indicates that the rapid decline group were more likely to be female, have lower educational level, have more IADLs, and have lower participation with social activities. Disentangling two heterogeneous patterns of cognitive changes over time among older adults has significant implication for research, practice, and policy for older individuals with Alzheimer's disease and their family.

POTENTIALITIES OF MEMORY CAFÉS IN SUPPORTING PEOPLE WITH DEMENTIA AND THEIR CARERS

L. Arajo^{1,2}, M.J. Amante¹, C. Alvarez³, I. Sousa³, 1. ESEV, CI&DETS.IPV, *Viseu, Portugal*, 2. CINTESIS, UNIFAI, ICBAS, *Porto, Portugal*, 3. *Portuguese Alzheimer Portugal, Lisboa, Portugal*

Alzheimer/Memory Cafés recently emerged in several European countries and in North America as an initiative that involves people with dementia, their family/friend carers, and all others interested in dementia, focused in socialization with an educational component. The sessions occur monthly and include a presentation on a different topic alternately with a stimulation/recreation activity, as well as refreshments, in a very informal and café-like atmosphere. The present study gathers evidence from eleven *Cafés* groups developed across Portugal in order to present the impact of this type of intervention in supporting people with dementia and their family members/carers. During the last three years of program implementation, 177 persons with

dementia and 737 family members/carers, as well as 142 persons with memory problems and 272 persons interested on this topic have participated on the 226 *Cafés* sessions that were developed. Qualitative data was collected with a subgroup of family members (N= 50) regarding their opinion on the main benefits of attending sessions to themselves and their relatives with dementia. Main key themes from the analysis, such as dementia-friendly environments, where family can be together with their relatives, other caregivers and persons with dementia socializing in the community, and the potential of *Cafés* for reducing the stigma, obtaining information and discussing the disease openly with other persons (e.g., family, carers, professionals, volunteers) are presented and discussed as important potentialities of this type of support available to people with dementia and their carers.

WHAT DO WE NEED TO KNOW? A CONTENT ANALYSIS OF INTERNET-BASED DEMENTIA RESOURCES

L.M. Schneider, K. Johanson, L.F. Feliciano, *University of Colorado, Colorado Springs, Colorado Springs, Colorado*

With the rise and popularity of the Internet, information about virtually any topic is readily accessible to anyone with computer access and a basic understanding of navigating the Internet. Approximately 80 percent of Internet users have used the Internet to search for health-related information. However, not every website on the Internet is monitored or reviewed for accuracy, readability, or usability. While research has investigated the qualities and elements of health education websites, little research has focused specifically on dementia websites. Exploration in this area is critical, as millions of Americans are expected to experience dementia within the coming decades and may seek information predominantly online. In this study, a content analysis was conducted with dementia websites to investigate how the depth of information provided in each website is associated with website rank, reading level, navigability, website domain, and types of dementias mentioned. Websites were coded by two graduate students using a predetermined codebook; interrater reliability was calculated. Correlational analyses and a standard multiple regression analysis were conducted on the variables. Results revealed that many dementia websites present information at a reading level too difficult for the average American to comprehend. Furthermore, results demonstrated that websites that are clearly marked and well-organized tend to provide information about multiple types of dementia, which may allow consumers to glean deeper information about dementia and enhance their online learning experience. Future research should strive to investigate full websites rather than initial pages and the extent that each website discusses each type of dementia.

SPATIAL, TEMPORAL, AND VARIABILITY NORMS FROM THE GAITRITE SYSTEM PREDICT MILD COGNITIVE IMPAIRMENT

T.V. Lukyn¹, S. Hundza¹, C. DeCarlo¹, R.A. Dixon², S.W. MacDonald², 1. *University of Victoria, Victoria, British Columbia, Canada*, 2. *University of Alberta, Edmonton, British Columbia, Canada*

Mounting evidence indicates associations among temporal, spatial, and variability metrics of gait and clinical outcomes including fall risk, mild cognitive impairment (MCI), and movement disorders.

Data from the Victoria Longitudinal Study (VLS) for select cohorts and retest waves were employed as a cross-sectional reference sample of older adults with intact cognitive performance and no history of falls. Participants (n=213) were 70 to 85 years of age (M=77.00, SD=4.22), with 152 women and 61 men. Regression-norming techniques were employed in the PREVENT Study, a multifactorial investigation of dementia, to identify participants with MCI. PREVENT participants (Controls=23, MCI=11) were 72 to 83 years of age (M=77.45, SD=4.23) with 20 women and 14 men. Select gait metrics were gathered from both samples using a 16-foot GAITRite computerized walkway. Participants walked across the mat at a self-determined normal pace a total of 8 times comprising 2 conditions: a walk-only condition (4 passes at a normal pace) and walking under cognitive load (4 passes counting backwards).

The combination of velocity (under both conditions), single support time (walk-only) and Stride Time SD (walk-only) yielded a 90.6% MCI-classification accuracy (81.8% sensitivity; 95.2% specificity). Each SD increase in velocity under cognitive load was associated with a 25-fold decreased risk of MCI classification, while each SD increase in single support time was associated with a 17.75-fold increased risk. Findings provide strong preliminary evidence that regression-derived norms of specific GAITRite indicators can facilitate identification of MCI risk within an independent sample.

DCRC_ABC RESOURCES TO SUPPORT THE MANAGEMENT OF BEHAVIOURAL AND PSYCHOLOGICAL SYMPTOMS OF DEMENTIA

K. Burns, R. Jayasinha, H. Brodaty, *Dementia Collaborative Research Centre, University of New South Wales, Sydney, New South Wales, Australia*

In 2011 the Australian Government funded the Dementia Collaborative Research Centre-Assessment and Better Care (DCRC-ABC) to develop Behaviour Management, A Guide to Good Practice, Managing BPSD. We systematically reviewed academic and grey literature to examine the evidence for psychosocial, environmental and biological interventions for managing BPSD. Intervention studies were critically evaluated to determine the strength of the evidence. The document provides guidance for the Australian Government funded Dementia Behaviour Management Advisory Services (DBMAS). Additional considerations for Aboriginal and Torres Strait Islander peoples and those from Culturally and Linguistically Diverse (CALD) backgrounds were incorporated. Training packages support the implementation of the evidence and practice-based principles of the Guide.

DCRC-ABC subsequently developed summary versions; A Clinicians' Field Guide to Good Practice, Managing BPSD and A Guide for Family Carers, Dealing with Behaviours in People with Dementia for family carers. Electronic resources followed with the BPSD Guide App for clinicians and the Care4Dementia App for family carers and frontline staff. Evaluation of the BPSD Guide App demonstrates its capacity to support clinicians.

In collaboration with Northern Territory DBMAS, DCRC-ABC developed BPSD posters to assist clinicians supporting those living in remote Aboriginal communities. A national knowledge translation (KT) project with the Australian Government funded Dementia Training Study Centres supports the implementation and evaluation of DCRC resources based on the Guide. A project to develop and evaluate an eLearning resource highlighting additional considerations for those managing BPSD in lesbian, gay, bisexual, transgender and intersex (LGBTI) people is underway. (www.dementiaresearch.org.au/bpsdguide.html) APPS - search 'BPSD' 'Care4Dementia'

EFFECTIVENESS OF A COLLABORATIVE CONTINUUM OF CARE MODEL FOR PATIENTS AND FAMILIES WITH DEMENTIA

J.L. Clark, R. Ghatak, T. McManis, A.C. Billbrey, D. Gallagher-Thompson, *Aging Adult Services, Stanford Health Care, Stanford, California*

Patients, families, and providers struggle with the complexities of Alzheimer's disease and related dementias as families report poor understanding and poor support for care planning. A quality improvement model was established at Stanford Health Care in 2008 to follow patients and families through the continuum. The model has since been strengthened with collaborations from Stanford's Center for Memory Disorders and the Stanford NIH Alzheimer's Disease Research Center. This poster outlines the results of a survey from caregivers receiving transitional care coordination and home visits. Survey revealed effectiveness of the program. The importance of integration (rather than fragmentation) of services and providers was stressed, along with knowing there was a number to call for support through the continuum. Of the 50% of respondents who completed the surveys: nearly 100% of respondents felt that consultations, family meetings, referrals, guidance and support during transitions of care were 'Very Helpful'; that information on coping and understanding complex behavior was 'Very Helpful'; that the information provided improved the quality of life for the patient; that the caregiver understood the disease better; and that the program helped their family avoid future problems. Nearly 100% 'Strongly Agreed' that they felt comfortable requesting help from staff in the future and had an overall satisfaction with being "heard" as new problems arise. At a junction where a cure is still far away, all efforts to support families and improve quality of life are strongly welcomed by families, most of whom have little or no preparation for a caregiving role.

THE KINTUN PROGRAM IN CHILE: EFFECTS IN OLDER PERSONS WITH MILD TO MODERATE DEMENTIA

J.M. Aravena³, J. Gajardo², M. Budinich³, 2. *University of Chile, Santiago, Chile*, 3. *INTA University of Chile, Santiago, Chile*, 3. *Kintun Center, Santiago, Chile*

The Kintun Program is an innovating health intervention project launched in Chile in 2013. It aims to enhance participation of persons with dementia (PwD) in everyday activities, respite for the caregivers and improve home-based care. The program involves different components including day care center, home visits, training for caregivers, counseling

and community education. These actions are developed by a multidisciplinary team. This program represents a novel approach to dementia care in Chile as a country with policies and dementia care strategies still under development. To analyze the effect of the Program Kintun on the PwD, a quasi-experimental study was conducted during the implementation of the program, with repeated measures at baseline (T.0.) and after 10–14 weeks of intervention (T1) during September 2013 and June 2014. Data were collected using: ADCS-ADL (activities of daily living), MMSE (cognition), TUG (fall risk) and NPI-Q (neuro-psychiatric behaviors and distress). Data were analyzed with t-student considering $p < 0,05$ and 95% CI. Final sample included 35 PwD, mean age $77,3 \pm 8,14$, 54,3% (19) women. Dementia severity 51,4%(18) mild, 42,9%(15) moderate, and 5,7%(3) moderate-severe. Cognition, activities of daily living, and distress scores show no difference (MMSE: T.0= $13,7 \pm 5,51$ and T.1= $13,9 \pm 5,64$, dif=0.27, $p=0,713$; ADCS-ADL: T.0= $46,7 \pm 16,34$ and T.1= $48,7 \pm 17,46$, dif=2.0, $p=0,293$; NPI-Dis: T.0= $14,7 \pm 10,40$ and T.1= $12,9 \pm 11,49$, dif=1.85, $p=0,267$). Fall risk and neuro-psychiatric behaviors scores show improvement (TUG: T.0= $16,7 \pm 7,18$ and T.1= $12,68 \pm 3,18$, dif=4.05, $p < 0,001$; NPI-Q: T.0= $23,4 \pm 11,92$ and T.1= $18,5 \pm 11,51$, dif=3.92, $p < 0,45$). The Kintun Program shows positive effects on neuro-psychiatric behaviors, fall risk and maintain cognition and activities of daily living.

PROACTIVE DEMENTIA CARE: EARLY INTERVENTIONS WITH PERSONS WITH DEMENTIA AND THEIR CAREGIVERS

T.C. Andersen, M.K. Luptak, *Social Work, University of Utah, Salt Lake City, Utah*

Background: Psychosocial interventions addressing caregiver burden in moderate-to-severe neurocognitive disorders have been extensively studied and use an array of validated outcome measures. Technological advances in imaging and biomarker technology allow for earlier diagnosis; however, psychosocial interventions and related outcomes measures have not kept pace. Current knowledge gaps include research on psychosocial interventions for: 1) early stages of the disease; and 2) caregiver-care recipient dyads. This presentation reports findings from a pilot study addressing these gaps.

Methods: This study examined the effects of Proactive Dementia Care (PDC), an intervention for individuals with early-stage neurocognitive disorders, and their caregivers, conducted over a 3-year period at a University Cognitive Disorders Clinic in a metropolitan area in the Intermountain West. Eighty dyads (an individual diagnosed with a progressive dementia and a designated caregiver) were enrolled. Study subjects were randomized into either the PDC treatment arm or the Standard Dementia Specialist Care (SDSC) treatment-as-usual arm. The PDC intervention allowed clinicians to partner with care dyads at the time of diagnosis to develop a comprehensive set of planning steps and to support families in proactively completing these steps.

Results: Data from multiple outcome measures was collected at 4 time-points for this study: baseline (n=80), 4 months (n=58), 12 months (n=54), and 18 months (n=54). Analyses were run to identify differences between the intervention and the treatment as usual group. This presentation

will describe multiple outcome measures, report key findings, discuss lessons learned, and summarize next steps.

SEEING WHAT THEY SEE: COMPENSATING FOR CORTICAL VISUAL DYSFUNCTION IN ALZHEIMER'S DISEASE

M. Sullivan^{1,3}, E. Harding¹, K. Yong¹, A. Carton¹, R. Woodbridge², S. Crutch¹, K.J. Gilhooly², M.L. Gilhooly², *1. University College London (UCL), London, United Kingdom, 2. Brunel University London, London, London, United Kingdom, 3. Nipissing University, North Bay, Ontario, Canada*

This poster reports on a study of brainsight in Alzheimer's disease (AD), integrating findings from three preparatory studies lead by neuropsychologists, engineers and social scientists. The work relies on unique insights offered by those with Posterior Cortical Atrophy (PCA) – a rare dementia usually caused by AD, but characterised by early, progressive visual impairment in contrast to relatively spared memory and language function.

A total of 27 people with PCA and a comparative sample of 23 people with typical AD completed (i) a battery of cognitive tests assessing memory, language and visual function, (ii) tasks involving navigation and object finding within a simulated environment (PAMELA) and (iii) in-depth individual and dyadic interviews in the home.

Neuropsychological and PAMELA studies identified people with PCA had particular difficulty in recognising and locating objects presented among visual clutter. PAMELA studies provided suggestions on the optimal environmental conditions for people to navigate and locate objects.

The interviews concurred that perceptual problems in AD result in numerous physical challenges in daily life (e.g. dressing, reading) but the management of these difficulties was mediated by complexities within the social environment (e.g. identity maintenance).

We conclude that widely varying profiles of cortical visual dysfunction in AD can result in a range of challenges for individuals and families, and that the physical environment can be moderated in ways which support performance of everyday activities. This project highlights the need for interventions to bolster existing capital within the family system and acknowledge the changing nature of AD-related difficulties over time.

EQUINE GUIDED SUPPORT PROJECT:WORKSHOPS FOR PEOPLE LIVING WITH EARLY STAGE DEMENTIA AND CARE PARTNERS

N. Askari¹, A.C. Bilbrey¹, M. Blair Humber², P. Hertel³, N.A. Schier-Anzelmo³, J. Hartman¹, D. Gallagher-Thompson¹, *1. Stanford University, Palo Alto, California, 2. Palo Alto University, Palo Alto, California, 3. Connected Horse, Rocklin, California*

There are 35 million people living with dementia worldwide. This number is expected to triple by 2050. Family caregiving remains the most common form of care, although researchers from around the world find that stress significantly typifies this experience. Additionally, persons are diagnosed earlier in the process, so that living with early-stage dementia is becoming more of a global reality. Yet few specific services exist to meet the needs of this population and their

family caregivers. This project is an innovative approach that offers considerable promise for application beyond the San Francisco Bay area where it was conducted.

A guided tour of the equine facility, followed by two 5-hour workshops, focused on activities with horses, discussion groups and mindfulness practices led by trained staff. Activities with horses included observing herd behavior, grooming, leading them, and connecting with them over the fence - all were intended to teach non-verbal communication skills to both care partners and the person living with dementia (PWD). Reflection on these experiences was the discussion groups' goal.

Pre/post-test design used standardized measures of stress, burden, mood, and social support for both care partners and PWD. Eighteen completed assessment (n=26): 9 dyads of care partners and PWD. Quantitative and qualitative findings indicated significantly increased positive perception of social support; greater reciprocity, awareness, upliftedness and appreciation of one another in dyads. Trends for improved mood in both members of the dyad were also noted. Future plans include partnering with other sites, expanding program's positive outcomes on a larger scale.

ARE NEIGHBORHOODS ASSOCIATED WITH THE LIKELIHOOD OF DEMENTIA? A STUDY IN THE TOKYO METROPOLITAN AREA

H. Murayama^{1,2}, M. Sugiyama², H. Inagaki², C. Ura², F. Miyamae², A. Edahiro², T. Okamura², S. Awata², 1. *Institute of Gerontology, The University of Tokyo, Tokyo, Japan*, 2. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

Background: Although several risk factors associated with dementia have been investigated on individual levels, little is known regarding whether neighborhood factors affect dementia. This study explored the relationship between neighborhood-level variables and dementia among elderly people.

Methods: A cross-sectional questionnaire survey was conducted in 2015. The participants were all residents aged 65+, living in a ward in the Tokyo metropolitan area, which comprises 262 neighborhood areas (n=132,005). We measured demographics, socioeconomic status, health status, and social capital (SC), in addition to providing a self-administered dementia checklist. The checklist consisted of 10 items, and its validity and reliability have been confirmed. The cut-off point was 17/18, and a score of 18+ indicated being demented (Clinical Dementia Rating of 1+). SC comprised three indicators: social cohesion, social network, and social participation. Neighborhood-level variables included the aging rate and educational level (proportion of people graduating from junior high school; higher proportions indicated lower neighborhood educational level). Neighborhood SC was an aggregate of the individual scores of each SC indicator.

Results: The analysis included 75,358 questionnaires. A multilevel logistic regression analysis stratified by sex showed that higher neighborhood educational level was associated with less likelihood of dementia occurring in both sexes, after controlling for individual-level and other neighborhood-level covariates. Moreover, women living in

neighborhoods with larger social networks were less likely to be demented.

Conclusions: Higher educational levels and denser social networks at the neighborhood-level were associated with less likelihood of dementia in older Japanese. Our findings provide valuable evidence regarding contextual factors of dementia.

BEHAVIORAL IMPACT OF TAKING AN ONLINE DEMENTIA RISK ASSESSMENT

C.C. Merz, M. Wynn, B.D. Carpenter, *Psychological & Brain Sciences, Washington University in St. Louis, St. Louis, Missouri*

Preventive strategies for dementia may be most effective if started early, though their implementation is a challenge. This longitudinal study examined behavioral intentions and behavior change in 118 older adults (M age = 69 yrs) who used an online dementia risk assessment tool. Participants provided health information on the website and received a personalized report that described their risk of developing dementia and recommended actions. Before and immediately after using the tool, participants indicated their intention to make health promotion changes. Then, 30 days later, they indicated which actions they had taken. At baseline, 50% of participants intended to take at least one action, which rose to 62% after reviewing their personalized report. Significantly more people intended to change their alcohol intake, diet, exercise, speak with family about risk, see their primary care physician, and obtain information about dementia after reviewing their report. One month later, 64% of participants reported they had taken at least one action, though not always the people who intended to. Participants who received more urgent risk information were more likely to endorse behavioral intentions ($r = .25, p < .01$) and report having made changes ($r = .26, p < .01$). However, one month after using the tool, 37% of the sample had taken no actions. Results from this study suggest that using an online dementia risk assessment tool has an inconsistent impact on behavior change that might reduce the risk of dementia.

HOW THE MINDFULNESS CONCEPT COULD BENEFIT THE CAREGIVING OF OLDER ADULTS

I. Tournier, D. Ferring, *University of Luxembourg, Luxembourg, Luxembourg*

Publications about mindfulness are growing exponentially since 2000 and are dominated by two major theoretical frameworks. The first one, related to meditative practices, defines mindfulness as paying attention in a purposeful and non-judgmental manner to the present moment. The second, more related to information processing, defines mindfulness as the processes of actively making new distinctions about a situation and its environment by avoiding to rely on automatic categorizations. With respect to the interaction between the caregiver and the person receiving the care, mindfulness might exert both direct and indirect benefits on the psychosocial well-being of both. We introduce in our presentation an information-processing approach that elaborates and identifies the mechanisms of how mindfulness can directly improve the interaction quality between the cared-for person and the caregiver. The notions of the present moment and as well as non-judgmental attention are the essential factors in

this process. As factors that lead to such an attitude we propose an integrative heuristic model that takes into account characteristics of both the caregiver and cared-for person.

PAIN INTERFERENCE IN PERSONS WITH DEMENTIA: A BEGINNING EXPLORATION OF ITS ASSESSMENT

P. Block^{1,2}, L. Snow^{8,7}, A. Amspoker^{3,4}, B.N. Renn⁵, S. Pickens⁶, N.L. Wilson^{3,4}, M. Stanley^{3,4}, M. Kunik^{3,4}, 1. *The University of Alabama, Tuscaloosa, Alabama*, 2. *Tuscaloosa VA Medical Center, Tuscaloosa, Alabama*, 3. *Michael E. DeBakey VA Medical Center, Houston, Texas*, 4. *Baylor College of Medicine, Houston, Texas*, 5. *University of Washington School of Medicine, Seattle, Washington*, 6. *University of Texas Health Science Center at Houston, Houston, Texas*, 7. *Alabama Research Institute on Aging, The University of Alabama, Tuscaloosa, Alabama*, 8. *Department of Psychology, The University of Alabama, Tuscaloosa, Alabama*

There is strong evidence that pain is highly prevalent in persons with dementia (PWD), yet under detected and poorly treated. Pain interference, the degree to which pain interferes with a person's ability to function, is a key pain treatment outcome, yet little is known about how to assess pain interference in PWD. Accurate assessment of pain in PWD is challenging because dementia makes PWD progressively less able to accurately self-report; caregiver proxy reports are thus an important part of pain assessment for PWD. The present study examined discordance between PWD and proxy reports of pain interference in a sample of 203 community-dwelling veterans with pain and dementia and their caregivers. Results indicated only a moderate association between PWD and proxy report for pain interference, $r=.37$, $p<.0001$. In comparison, the PWD/proxy report association for pain intensity was somewhat higher, $r=.46$, $p<.0001$. Next, predictors of PWD/proxy discordance were explored using two multivariate regression models with (1) pain interference discordance as the dependent variable and (2) pain intensity discordance as the dependent variable. Burden, mutuality, and cognitive impairment were simultaneously entered as predictors in both models. There were no significant predictors of pain interference discordance, and mutuality emerged as the only unique significant predictor of pain intensity discordance ($\beta=-.20$, $p=.0092$). In summary, pain interference PWD/proxy discordance is considerable and not well characterized. Because the effects of pain treatment efforts cannot be fully understood without valid assessments of pain interference, it will be important for investigators to conduct additional research in this area.

INFORMATION AND COMMUNICATIONS TECHNOLOGY IN DEMENTIA CARE: ACCEPTANCE AMONG PROFESSIONAL CAREGIVERS

J. O'Sullivan¹, J. Nordheim¹, L. Jordan¹, B. Hesse², S. Möller², J. Antons², 1. *Charité-Universitätsmedizin Berlin, Institute of Medical Sociology, Berlin, Germany*, 2. *Technische Universität Berlin, Quality and Usability Lab, Berlin, Germany*

When it comes to dealing with symptoms associated with dementia, a number of studies have established the effectiveness of psychosocial interventions. However, in view of

limited financial and human resources, implementing effective interventions in daily practice can be a major challenge for care providers. Recently, there has been a growing interest in the use of Information and Communication Technologies (ICTs) for supporting psychosocial interventions in nursing home settings. ICTs are cost-effective and widely available, and using them could potentially ease the burden of dementia care delivery. Therefore, in order to assess acceptance and attitudes of professional caregivers regarding ICTs in dementia care, a sample of $N = 205$ professional caregivers ($M = 38,81$ yrs; 70% female) from 10 residential care facilities located in Berlin completed a standardized questionnaire (TA-EG) on factors associated with technology use and acceptance. Additionally, 11 semi-structured interviews were conducted. Results showed that older and female caregivers, respectively, reported less Competence ($z = -4.21$, $p < .01$ and $z = -4.44$, $p < .01$, resp.) and Enthusiasm ($z = -2.38$, $p < .05$ and $z = -4.01$, $p < .01$, resp.) regarding the use of technology in their work environment. Furthermore, qualitative content analysis of the interview transcripts revealed both factors promoting the use of ICTs in residential dementia care, and potential barriers. Important recommendations for the development of ICT-based interventions in dementia care will be reported and general implications for their design and successful adoption will be discussed.

GENTLE PERSUASIVE APPROACHES IN DEMENTIA CARE: BUILDING STAFF CONFIDENCE AND EFFICACY

J. Tabamo¹, L. Hung², D. Bohl¹, N. Hillier³, J. Martin³, 1. *Medicine Program, Vancouver Coastal Health Authority, Vancouver, British Columbia, Canada*, 2. *University of British Columbia, Vancouver, British Columbia, Canada*, 3. *Langara College School of Nursing, Vancouver, British Columbia, Canada*

Literature suggests that patients living with dementia in the hospital are complex to care for, and staff are under-prepared to meet their unique needs. This proportion is expected to significantly increase, creating an urgent call to action. The *Gentle Persuasive Approach* (GPA) in Dementia Care: Supporting Persons with Responsive Behaviours is an evidence-based Canadian curriculum that is designed to help provide person-centered care for patients living with dementia in residential care, and offers a potential solution for other areas of practice. This poster highlights the benefits and limitations of introducing GPA in acute medicine and mental health units at Vancouver General Hospital.

We used mixed methods to evaluate a GPA education program delivered through a 7.5-hour workshop for staff members from acute medicine and mental health units. After the GPA workshop, 112 staff completed the standardized GPA program evaluation survey. Using semi-structured open-ended questions, we interviewed 22 staff that completed the GPA education. Staff responses were thematically analysed.

Eighty five percent of staff that attended the GPA workshops had no previous formal dementia care education. All staff agreed that the GPA course would improve how they cared for people with dementia in the hospital. Results of the interviews revealed useful information for future facilitation of GPA implementation in the hospital setting.

Supporting the facilitators and addressing limitations around GPA implementation can further improve the confidence, efficacy and capacity for staff to successfully care for patients living with dementia in the hospital.

CAREGIVING ACTIVITIES OF FAMILY CARERS AFTER TRANSITION TO NURSING HOME: FINDINGS OF A SURVEY

L. Hartmann¹, A. Stephan¹, A. Renom Guiteras², G. Meyer¹,
1. *Institute for Health and Nursing Science, Martin Luther University Halle-Wittenberg, Halle (Saale), Germany*, 2. *Witten/Herdecke University, Witten, Germany*

The period after nursing home admission is particularly challenging. Family carers of people with dementia have to cope with their changed role in the new setting. To support them in maintaining their caring role, their contribution in the nursing home must be better understood.

This secondary analysis used German data from a prospective cohort study which was part of the European project RightTimePlaceCare (2010–2013). Personal interviews were performed using a standardized questionnaire focusing on frequency and lengths of visits during the past 14 days, and the frequency of 15 predetermined care activities during the past 30 days. Baseline interviews took place 1–3 months after admission (T0), and follow-up 3 months later (T1). Descriptive data analysis was conducted.

The answers of n=119 family carers, mainly children, were analyzed. On average, they visited their relative 6–7 times a fortnight, usually between 1–2 hours. Siting and talking (T0=77%/T1=69%) and taking the person with dementia for a walk (T0=62%/T1=59%) were mainly reported. Support in ADL was provided constantly by around 20% of the relatives. Activities like crafts and sports were mentioned only rarely (T0=0%/T1=3%). No significant change in the behavior of family caregivers was noted over the observation period. However, most activities were reported less often at T1. A few activities slightly increased, such as supporting the person with dementia in crafts, sports and music. The results provide a detailed picture of family carers activities, indicating that involvement in more active everyday activities in the nursing home could be increased.

RICE-FARMING CARE FOR PEOPLE WITH DEMENTIA; A NOVEL WAY OF SOCIAL PARTICIPATION FOR THE ELDERLY

C. Ura¹, T. Okamura^{1,2}, S. Yamazaki³, T. Ishiguro⁴, M. Miyazaki⁴, M. Ibe⁴, A. Kubota⁴, Y. Kawamuro⁴,
1. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 2. *University of Tokyo, Tokyo, Japan*, 3. *Bunkyo Gakuin University, Saitama, Japan*, 4. *Kawamuro Memorial Hospital, Niigata, Japan*

Background: Although the collaboration between care and agriculture has been seen in the European context, little has been reported about the effect of care farm for the people with dementia. Rice-farming has been embedded in Japanese cultural traditions. We propose the novel method of social participation for dementia which uses rice-farming in its program.

Aim: To conduct a pilot study that assesses the effect of rice-farming care on the QOL and social participation of the people living with dementia.

Methods: Eight elderly persons (7 men, 1 woman) have been included in the study. Their mean age was 68.3 ± 6.2 years. Their diagnoses were MCI (n=2) and Alzheimer's disease (n=3), and the others (n=3). Their mean of MMSE score was 22 ± 4.8 points (range 14–27). They participated in the rice-farming program with the experienced facilitators every week, followed by the problem-solving group work. We observed and evaluated their degree of independence and their interaction each other during the program. Questionnaire about QOL, social participation, and physical health was collected prior to the study.

Results: All of them are continuing the program at now, and attendance rate of 10 weeks was 92.5%. There was no unexpected events including injuries or rejection. All of them enjoyed the rice-farming subjectively and objectively, but those with less impaired ADL showed more participation to the program.

Discussion: Our study revealed that people living with dementia can enjoy rice-farming safely. Compared with traditional day-care services, they could participate in the program more spontaneously.

CONCERNS OF ALZHEIMER'S DISEASE IN OLDER CHINESE AMERICANS: THE ROLE OF ALZHEIMER'S LITERACY

F. Sun¹, X. Gao², Q. An³,
1. *Michigan State University, East Lansing, Michigan*, 2. *Huazhong University of Science and Technology, Wuhan, Hubei, China*, 3. *East China Normal University, Shanghai, Shanghai, China*

Purpose: This study aims to understand the concerns of Alzheimer's disease (AD) in a sample of Chinese American elders aged 55 or older living in senior housing facilities. Focus of this study is the role of Alzheimer's literacy (encompassing actual knowledge of AD and cultural beliefs of AD) in influencing elders' concerns of AD.

Methods: Survey was delivered to 207 Chinese American elders (Mage=75.3, SD=7.5) through face-to-face interviews. Participants were recruited from four subsidized senior housing facilities in Phoenix metropolitan areas. About two thirds were female, and 38.1% had less than high school education.

Results: Participants had moderate levels of concerns about AD; the younger age group (55 to 64) was more concerned about AD than the older age group (age 80 or above). Participants who had more actual knowledge of AD had higher levels of concerns of AD; and those who embraced more traditional Chinese beliefs of AD (e.g., AD determined by one's fate) reported higher levels of concerns of AD. Other significant risk factors included individuals' depressive symptoms and lack of inter-generational support.

Conclusion: Efforts should be made to address worries of Alzheimer's in Chinese American elders in subsidized housing facilities. Emphasis should not be limited to enhancing individuals' knowledge of AD. Special attention needs to be paid to reducing culturally biased perceptions of AD and addressing emotional disturbance that could arise in this group after they acquire information of AD, such as that AD is not curable at this point of time.

SESSION 525 (POSTER)**DEMENTIA I****ANTIPSYCHOTIC USE PATTERNS AMONG PATIENTS WITH DEMENTIA DURING TRANSITIONS FROM HOSPITALS TO SNFS**

A. Gilmore-Bykovskyi¹, K. Kennelty², 1. *University of Wisconsin-Madison, School of Nursing, Madison, Wisconsin*, 2. *University of Iowa, College of Pharmacy, Iowa City, Iowa*

Transitions from a hospitals-to-skilled nursing facilities (SNF) for patients with dementia (PwD) are fraught with challenges for patients, caregivers, and their providers. Research suggests that these transitions are further complicated by antipsychotic medications commonly used to manage dementia-related behavioral symptoms. Some SNF providers report being unwilling/unable to accept PwD requiring antipsychotics to manage behavioral symptoms and describe routinely receiving inaccurate/incomplete medication histories regarding antipsychotic utilization during hospitalization highlighting abrupt withdrawal of antipsychotics prior to discharge as a common problem. No research has examined patterns of antipsychotic usage among PwD during hospital-to-SNF transitions. This retrospective cohort study identified changes in antipsychotic medication administration during the last 48 hours of hospitalization as compared to antipsychotics ordered upon discharge. Patients with dementia and primary discharge diagnosis of stroke/hip fracture who were discharged from one of two hospitals to a SNF (N=343) between 2003–2008 were included in the analyses. Overall 21% of patients received an antipsychotic within the last 48 hours of discharge. Twenty-five percent of patients who received an antipsychotic within the last 48 hours of hospitalization had potentially abrupt discontinuation of antipsychotics on discharge. These rates varied by medication, with Haldol and Seroquel having the highest rates of potential abrupt discontinuation at 65% and 27% respectively. Future research should examine inter-setting communication regarding these medication histories as limited information about the level of medication interventions required to manage complex symptoms and related therapeutic benefit or adverse events may hinder the timely development of individualized care plans in the SNF setting.

KNOWLEDGE, BELIEFS, AND WILLINGNESS: INGREDIENTS TO PREVENT ALZHEIMER'S DISEASE

S. Kim¹, R. Isaacson², 1. *Australian National University, Canberra, Australian Capital Territory, Australia*, 2. *Weill Cornell Medical College, New York, New York*

Modifiable risk factors for Alzheimer's disease (AD) have been actively sought and identified in recent years. Despite this, it remains a challenge to encourage risk-reducing lifestyle and health behaviors in individuals at risk. The aim of this study was to investigate whether AD knowledge, beliefs, and willingness to reduce risk would be the key determinants of AD preventive behaviors. These data were drawn from Alzheimer's Universe (www.AlzU.org), an online course and educational program developed in the USA. One hundred and forty four people (mean age=61.1; SD=9.1) who completed

both baseline and follow-up (3 months after completion of the program) questionnaires were included in these analyses. Eighty three percent of participants were female, the majority (96.5%) were Caucasian and sixty eight percent had tertiary education. Linear regression suggested that changes in willingness ($\beta=.539$, $p<.01$), changes in perceived susceptibility ($\beta=-.565$, $p<.05$), baseline knowledge ($\beta=.030$, $p<.05$) and baseline perceived susceptibility ($\beta =1.159$, $p<.001$) were significantly related to an increase in AD preventive behaviors. These factors were adjusted for age, gender, education, ethnicity and smoking status. Further analysis demonstrated that change in knowledge was a significant moderator ($p<.05$) of the relationship between willingness at baseline and behavioral changes. This study suggests that an increase in knowledge and willingness is linked to increased AD preventive behaviors. Promoting effectiveness-proven educational programs such as Alzheimer's Universe may encourage additional AD preventive behaviors and therefore reduce the risk of developing AD.

"WORK IS LIKE A CONVEYOR BELT": FINDINGS FROM AN ETHNOGRAPHIC STUDY OF ACUTE TRAUMA WARDS

A. Varley¹, B. Penhale², T. Backhouse¹, N. Lambert², F. Poland², J. Cross², S.P. Hammond¹, C. Fox¹, 1. *Norwich Medical School, University of East Anglia, Norwich, United Kingdom*, 2. *School of Health Sciences, University of East Anglia, Norwich, Norwich, United Kingdom*

Older people and their families consistently place high value on hospital care which promotes personalised relationships between staff and patients; often termed Person-Centred Care (PCC). PCC features in care guidelines from across Europe, North America and the Asia-Pacific region, evidencing the value placed on approach emphasising 'personhood' enacted via PCC approaches.

PCC practices can often become displaced in hospital care settings, relying upon highly routinized and task driven care orientations which prioritise physical rather than psychological health needs. This paper reports on an ethnographic study undertaken as part of an international research programme exploring ways to better deliver care to people living with dementia who are admitted to secondary care with hip fracture.

Observations were undertaken by five academic and three trained 'lay' researchers in Emergency Departments and Trauma wards in three hospitals from across the United Kingdom, generating a data corpus of 144 hours of observations (48 observations, 3 hours per observation). Applying a thematic lens to fieldnotes collected from the differing spaces, practices that were 'socially malign' featured regularly alongside 'positive person work' (Kitwood, 1997). The paper will present examples and provide recommendations for the amplification of PCC opportunities that can to buffer the task driven emphasis of acute care environments. We conclude that, being task orientated and providing PPC are not mutually exclusive phenomena.

I'M STILL HERE: THE EXPERIENCE OF LIVING WITH EARLY ONSET DEMENTIA

M. Sakamoto^{1,2}, S.L. Moore², S. Johnson^{2,3}, 1. *Nursing, University of British Columbia, Vancouver, Manitoba*,

Canada, 2. Athabasca University, Vancouver, British Columbia, Canada, 3. University of Alberta, Edmonton, Alberta, Canada

Dementia is a growing social and health care concern in today's world. Although dementia is most often associated with the aging process, younger people can also be diagnosed with the disease. Early onset dementia (EOD) is dementia onset before the age of 65. Dementia's degenerative nature is particularly challenging for younger people, as the disease tends to occur during a phase of life occupied with and characterized by middle-age tasks. In effect, younger people with dementia are forced to navigate and live a health experience normally encountered later in life. This presentation will summarize a Master's of Nursing research study that examined the EOD experience from the point of view of four adults under the age of 65 living with dementia, in particular examining how these individuals perceived their own personhood. Using Interpretative Phenomenological Analysis (IPA) as the research method, as well as integrating an arts-based approach, this qualitative study revealed that the EOD experience can be incorporated into six themes: *A Personal Journey, Navigating the System, The Stigma of Dementia, Connecting to the World, A Story Worth Telling and I'm Still Here*. The participants' stories as presented via these six thematic threads show that despite the challenges of living with dementia, people with EOD can have a strong sense of personhood. Implications for practice and policy making, as well as recommendations for future dementia research will be discussed.

INCREASED CARDIOVASCULAR CAPACITY IS ASSOCIATED WITH CORTICAL THICKNESS IN OLDER ADULTS WITH VCI

L. ten Brinke, C. Hsu, T. Liu-Ambrose, *Physical Therapy, University of British Columbia, Vancouver, British Columbia, Canada*

Vascular Cognitive Impairment (VCI), also known as vascular dementia, is after Alzheimer's Disease (AD) the most common type of dementia worldwide. A common biomarker of AD is a decrease of cortical thickness. Hypertension and diabetes are common risk factors for cerebral small vessel disease, which contribute to the development of cognitive vascular impairment. Exercise is a promising strategy for altering the trajectory of dementia by altering brain structure and function. The aim of this study was to investigate the association between general cardiovascular capacity (Six-Minute Walk Test) and changes in cortical thickness in older adults with VCI. Seventy-one older adults aged 56–96 years with VCI were randomly assigned to either a 6-month trice-weekly aerobic training program, or a 6-month nutrition program (i.e., control). Participants performed a 3T MRI scan at baseline and trial completion to determine cortical thickness. Results showed that improved general cardiovascular capacity in the aerobic training group, measured by an increase in performance on the Six-Minute Walk Test, was correlated with a higher cortical thickness at six months ($r = 0.56, p = 0.045$). Thus, a 6-month aerobic training program might be a good strategy to prevent cortical thinning in older adults diagnosed with VCI.

MULTIVARIATE TRAJECTORIES OF COGNITIVE DECLINE IN OLD AGE: CLUSTERS AND RISK FACTORS

H. Amano, A. Kitamura, M. Nishi, Y. Taniguchi, S. Seino, Y. Yokoyama, Y. Fujiwara, S. Shinkai, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

This exploratory study aimed to identify clusters of decline trajectories in terms of longitudinal multi-domain measurements of cognitive function, which would be related to common or specific risk factors. We conducted annual health check-ups for aged residents in Kusatsu, Japan, in 2002–2014, which included the Mini-Mental State Examination (MMSE). This analysis utilized a part of the data composed of up to 10 observations for 887 participants who scored 25 or higher on the baseline MMSE. We applied the group-based multi-trajectory model to the repeated measurements of six sub scores of the MMSE to identify four typical trajectories, which were characterized by (1) intact cognitive function, (2) lower attention, (3) lower attention, early decline in recall and declining orientation, or (4) lower attention and declining recall, orientation, language and construction. The trajectories were taken by 49%, 39%, 7%, and 4% of the subjects, respectively. The logistic regression analyses revealed that membership in each of the latter three trajectory groups was associated with (2) older age, lower education, diabetes mellitus, hypertension, and high white blood cell counts; (3) older age, low ankle-brachial blood pressure index, diabetes mellitus, and low hemoglobin levels; or (4) lower education, history of stroke, low hemoglobin levels, high white blood cell counts, tooth loss, and hypertension. There appeared two different trajectories of steep cognitive decline, one of which was related to diabetes mellitus and atherosclerosis; the other, to hypertension, inflammation, and stroke. In addition, tooth loss may be relevant to the latter, and anemia, to both.

E-INTERACTION WITH CONSENSUS-BASED RESOURCES FOR DETECTION AND MANAGEMENT OF DEMENTIA IN PRIMARY CARE

N. Loskutova¹, E.M. Bullard¹, W.R. Venable¹, C. Smail¹, E. Vidoni², 1. *National Research Network, American Academy of Family Physicians, Leawood, Kansas, 2. University of Kansas Medical Center, Kansas City, Kansas*

Recognition of dementia in primary care remains challenging even as national attention to the issue has risen. Despite the clear ethical, safety, health, and financial planning benefits of addressing cognitive health early, identification of dementia in at risk patients mostly happens at a time of crisis, hospitalization, or late in the disease. The goal of this project was to bring together high performers in Primary Care and Gerontology to streamline the profuse dementia care resources into a coherent framework for stimulating best practices in recognition and management of cognitive impairment in primary care. Participants were identified using the DARTNet Practice Performance Registry to rank high performers in diagnosis of dementia (prevalence of ICD-9/10 codes). Ten practicing primary care physicians were recruited from geographically diverse locations across the United States. A mixed methods approach was applied to resource evaluation and focus group domain-based moderated discussion. The work of the panel produced

an adaptable algorithm and identified resources included in a web-based interactive toolkit readily accessible and disseminated to primary care clinicians through the American Academy of Family Physicians' website and other conference and meeting venues, free of charge. Evaluation and reach of the toolkit is measured by ongoing web-analytics (visits, repeat visits, pages viewed, time in toolkit, etc.) and user surveys. Analysis is underway to fully characterize the user value of the toolkit. Development and availability of the toolkit is creating a greater awareness and ability to detect cognitive impairment at an earlier stage in disease progression among primary care physicians.

EFFECTS OF AMYLOID ON CHANGES IN COGNITIVE AND PHYSICAL FUNCTION IN VASCULAR COGNITIVE IMPAIRMENT

E. Dao¹, J. Best¹, R.G. Hsiung¹, V. Sossi¹, C. Jacova², R. Tam¹, T. Liu-Ambrose¹, 1. *University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Pacific University, Forest Grove, Oregon*

Alzheimer's disease (AD) and subcortical ischemic vascular cognitive impairment (SIVCI) are the two most common causes of cognitive impairment and often patients present with mixed AD-SIVCI pathology. Currently, much of our knowledge on the effects of co-existing amyloid pathology in SIVCI are based on cross-sectional studies and little is known about their effects on changes in cognitive and physical function over time. Thus, the objective of this study was to assess the impact of amyloid pathology on global cognitive, executive functions, and physical function over a 12-month period in people with SIVCI. This was a planned secondary analysis of data acquired from a proof-of-concept randomized controlled trial of aerobic activity in people with SIVCI. A hierarchical multiple linear regression analysis was conducted to determine the unique contribution of amyloid pathology on cognitive/physical function after controlling for age, experimental group assignment, and baseline cognitive/physical performance. We found that amyloid pathology significantly predicted decreased performance in: 1) Attention (Stroop Test – adjusted R-square change of 32.0%, $p < 0.05$); 2) Set shifting (Trail Making Test – adjusted R-square change of 34.7%, $p < 0.05$); 3) Processing speed (Digit Symbol Substitution Test – adjusted R-square change of 35.0%, $p < 0.05$) and; 4) Falls risk (Physiological Profile Assessment – adjusted R-square change of 9.0%, $p < 0.05$). However, amyloid did not predict changes in global cognition or working memory ($p > 0.05$). Our study suggests that amyloid plaques might be a marker for future decline in cognitive and physical performance among older adults with a primary diagnosis of SIVCI.

HOSPITAL ADMISSIONS OF PERSONS WITH DEMENTIA: RESULTS OF THE EUROPEAN RIGHTTIMEPLACECARE PROJECT

G. Meyer¹, R. Schmitz¹, A. Renom², A. Stephan¹, 1. *Institute of Health and Nursing Sciences, Martin-Luther-University Halle-Wittenberg, Medical Faculty, Halle (Saale), Saxony-Anhalt, Germany*, 2. *Witten University, Witten, Germany*

Persons with dementia are at high risk of hospital admission. Although often unavoidable, the referral to an emergency department (ED) or admission to an acute hospital

represents an unfavorable discontinuity of care with threats to persons with dementia, e.g. nosocomial complications and deterioration of mobility and cognition. There may be different patterns of hospital admission in persons with dementia across Europe because of different health care services. We conducted a secondary analysis of data assessed through the Resource Utilization in Dementia within the European project RightTimePlaceCare (countries: DE, EE, ES, FI, FR, NL, SE, UK). The study population comprised 2014 persons with dementia living at home and being at risk of institutionalization ($n=1223$) or admitted to a nursing home during preceding 3 months ($n=791$). Mean age was 82.9 ± 6.5 years and mean MMSE 13.2 ± 6.8 ; 67% were women.

Out of 1719 persons with dementia assessed at three months follow-up, $n=194$ (11.4%) had experienced at least one admission to ED and/or hospital; 70% were living at home. Most often reasons of admission were medical diagnoses, pulmonary infections, and fractures. Differences between countries in terms of admission frequency, reasons and wards referred to were only small. Few characteristics were associated with an increased risk of hospital admission (setting home care, weight loss, decreased Katz Index).

Our results contribute to the body of knowledge about the frequency and reasons of hospital admission of people with dementia in different countries and settings and therefore to the foundation of intervention development aimed to decrease avoidable hospital admissions.

SAFETY AND EFFICIENCY OF ANTI-PARKINSON DRUGS FOR DLB/PDD PATIENTS

H. Kowa, F. Kanda, T. Toda, *Neurology, Kobe University, Kobe, Hyogo, Japan*

One of the characteristic features of DLB (Dementia with Lewy Body) is high sensitivity to medicine, including not only neuroleptic drugs but also anti-parkinson drugs. Once hallucinations or systematized delusions were induced, it is too difficult to control psychiatric disorders as well as parkinsonism. The aim of this study is to decide the best anti-parkinson drug(s) for the treatment of parkinsonism with DLB and PDD (Parkinson's disease with Dementia) patients.

28 patients diagnosed with DLB and 20 diagnosed with PDD were examined. Their histories of prescription medication and those of side effects were obtained retrospectively from medical records. [Results] Among 48 patients, 9 cases were not prescribed any anti-parkinson drugs at all. Another 21 cases had some side effects, such as temporary hallucinations, delusions or nausea. Antiparkinson medications causing frequent side effects included trihexyphenidyl (100%), amantazine (67%), istradefylline (63%), selegiline (50%) and dopamine agonists (33%). On the other hand, entacapone (10%), zonisamide (11%) and levodopa with carbidopa or benserazide (13%) seemed to be relatively safer for DLB/PDD patients. As to dopamine agonist, rotigotine (25%) showed lower rate of side effects than pramipexole (45%) and ropinirole (40%).

In conclusion, for the treatment of parkinsonism in cases of DLB/PDD, levodopa/carbidopa or benserazide is the first choice, however, if more anti-parkinson therapy is necessary, the second candidate is zonisamide and/or entacapone from the viewpoint of safety.

PSYCHO-EDUCATION FOR INFORMAL DEMENTIA CARE-GIVERS: IS REFRAMING THE MOST IMPORTANT STRATEGY?

S. Pihet, S. Kipfer, P. Vaucher, *School of Health Sciences Fribourg, Fribourg, Switzerland*

Persons with dementia are often reliant on care given to them by close relatives or friends. These informal care-givers play a key role in helping their loved ones remain living at home but they can experience a heavy burden, putting them at high risk for exhaustion and health challenges which often leads to early institutionalization of the person with dementia. Psycho-educative interventions are effective in improving quality of life for care-givers, they typically teach a range of coping techniques but we know little about how these strategies are implemented in daily life. Our aim was to evaluate a validated psycho-educative program for informal care-givers for persons with dementia (15 sessions focused on three coping strategies: reframing, problem-solving and support-seeking). We did a pre-post analysis using mixed-methods design. Eighteen of 24 care-givers completed the program (dropout 21%). Results showed a reduction in burden ($t=2.13$, $p=.025$, $d=0.41$) and psychological distress ($t=1.94$, $p=.035$, $d=0.54$) and an increase in self-efficacy ($t=-2.33$, $p=.016$, $d=0.47$). We used interactive software to record implementation strategies used by the care-givers over 15 weeks. They improved their identification of unhelpful thoughts ($\beta=0.10$, $p=.045$), tried more often to reframe them ($\beta=0.24$, $p=.005$), and became more successful at doing so ($\beta=0.24$, $p=.018$). In contrast, problem-solving and support-seeking remained stable. In post-intervention interviews care-givers consistently mentioned that reframing was a helpful strategy which may, in part, explain the quantitative findings. In conclusion, having informal care-givers conceive the challenges they face differently seemed to be a promising core component of an efficient psycho-educative program.

RESULTS OF A MODERATE-INTENSITY EXERCISE PROGRAM FOR IWDs: IMPLICATIONS AND FUTURE DIRECTIONS

N. Dawson¹, K.S. Judge², M. Gregory¹, *1. University of Central Florida, Orlando, Florida, 2. Cleveland State University, Cleveland, Ohio*

Individuals with dementia (IWDs) experience difficulties across cognitive and functional domains resulting in disability. Non-pharmacological interventions aimed at reducing disability are greatly needed. Exercise is a low-cost and easily implemented approach for addressing disability but has not received extensive investigation. The aim of the current study was to develop and evaluate a novel and innovative moderate-intensity functional strength and balance program for IWDs using a randomized-controlled intervention trial. The sample consisted of 23 IWDs with an average age of 76.63 years demonstrating mild to moderate cognitive impairment (MMSE: $x=20.83$). Data indicated a high level of acceptability and feasibility of the current intervention with 99.04% treatment adherence suggesting that IWDs can participate in a moderate-intensity exercise program. Efficacy was examined using multiple linear regression. Group assignment significantly predicted performance in key outcome measures. IWDs in the intervention group demonstrated improvements in lower-extremity strength ($B=5.92$,

$t=3.26$, $p=.004$), balance ($B=4.04$, $t=4.13$, $p=.001$), and fast gait speed ($B=.32$, $t=2.61$, $p=.02$). These findings highlight the role exercise can be used to address IWDs' disability. Clinical implications and future research directions will be discussed including: 1) translating findings to clinical practice; 2) extending the protocol to include modifications that would potentially impact cognitive domains and psychological well-being; and 3) inclusion of physiological biomarkers to understand the underlying mechanisms of exercise on IWDs.

OPEN LABEL TRIAL OF MAGNESIUM L-THREONATE IN PATIENTS WITH DEMENTIA

T.E. Wroolie¹, K. Watson¹, K. Chen², D. Balzafiore¹, E. Reiman², N. Rasgon¹, *1. Department of Psychiatry & Behavioral Sciences, Stanford University School of Medicine, Stanford, California, 2. Banner Alzheimer's Institute, Phoenix, Arizona*

In the United States, there are an estimated 5.2 million cases of Alzheimer's Disease (AD), with AD and other dementias affecting nearly 1 in 3 senior adults. With the mounting financial and emotional burden of patient care, finding safe and efficacious treatments is essential. Emerging research on the cognitive effects of Magnesium L-Threonate (MGT) suggests that supplementation may benefit individuals with AD. Although limited, existing animal and human clinical trial data regarding the neural and cognitive outcomes after MGT supplementation, a mechanistic explanation of MGT effects is beginning to emerge, including upregulation of NMDAR signaling pathways. The current open label trial explored the effects of MGT use in patients with mild to moderate dementia. Fifteen patients underwent 18F-FDG-PET imaging, cognitive testing, and blood draws at baseline and at 12 weeks of treatment in order to assess the acute effect of MGT supplementation on hippocampal and prefrontal cortex mediated cognitive abilities including executive function, attention, processing speed, verbal fluency and memory. Cognitive testing and blood draws were also performed after 8 weeks of MGT discontinuation. Findings showed a significant improvement in regional cerebral metabolism along with improvement in a global index of cognitive functioning in the total sample after 12 weeks of MGT treatment. Increased red blood cell magnesium levels were associated with improvements in overall cognition and executive functioning in some but not all patients. Larger placebo controlled clinical trials are warranted to evaluate MGT as an effective, easily accessible, and affordable treatment supplement for individuals with AD.

SCIENTIFIC EVIDENCE FOR POSITIVE EFFECTS OF FAIRY TALE TELLING FOR PEOPLE WITH DEMENTIA

I. Kollak¹, C. Luderer², D. Dierking⁴, *1. Health and Nursing Management, Alice Salomon University Berlin, Berlin, Germany, 2. Martin-Luther-Universität Halle-Wittenberg, Halle (Saale), Germany, 4. Katharinenhof am Dorfanger in Fredersdorf, Brandenburg, Germany*

The Tales+Dementia+Study accompanied the project "Once upon a time... FAIRY TALES AND DEMENTIA", initiated and conducted by the German Center for Fairy Tale Culture. The project, financed by the German Federal

Ministry of Family Affairs, offered regular events of fairy tale narrations twice a week in five nursing homes located across Germany in Berlin, Frankfurt/Main and near Hamburg. 62 nursing home residents with dementia took part in the project.

The major aim was to analyze and better understand the effects of fairy tale narrations on people with dementia and challenging behavior living in nursing homes. The leading questions was: Do fairy tale narrations as psychosocial intervention improve the participants' well-being?

Data were collected through video recordings of the participants and storytellers, short memos of the events, free observations of the participants in everyday situations, guideline interviews with health professionals and storytellers as well as through documentation analysis. The data was analyzed via video interaction and content analysis – always organized as group sessions.

The analysis of 20 hrs. of videos and 21 interviews proved that activity and social interaction were encouraged by fairy tale narrations and competences were (re)activated. Challenging behavior, especially agitation, fear and apathy, were significantly reduced. A well-being became apparent.

The study provides scientific evidence that structured and free fairy tale narrating addresses the needs of people with dementia, reduces their challenging behavior, activates resources and should be offered regularly to enhance the well-being.

MAIN REASONS FOR EMERGENCY DEPARTMENT AND HOSPITAL ADMISSION IN PATIENTS WITH COGNITIVE IMPAIRMENT

I. Fort, M. Ciudad Mas, B. Bodegas, S.J. Santauegènia, *Badalona Serveis Assistencials, Badalona, Barcelona, Spain*

Patients with cognitive impairment are frequent users of Emergency Department (ED) and acute hospital units.

The main objective of this study was to analyze main reasons that lead patients with cognitive impairment or dementia to an ED or acute hospital admission. A second objective was to determine whether there were differences in the frequency of visits depending on age and the existence and severity of cognitive impairment.

The cohort of the study included 459 people attended by the Diagnosis and Treatment of Cognitive Disorders Unit (DTDU) of Badalona Serveis Assistencials for the first time (from 2004 to 2008) and followed during 5 years.

There were 154 men and 305 women, with a mean age of 75.9 years. Initial diagnosis were Mild Cognitive Impairment (MCI) (35.1%), Alzheimer's Disease (22.4%), Vascular Dementia (13.7%), Non cognitive impairment (13.5%), Mixed Dementia (Vascular Dementia and Alzheimer Disease) (10.2%) and Other dementias (5.1%).

380 people were attended at ED (1742 total visits) with a mean of 4.6 visits per patient. Main reasons for visits were falls, injuries and joint pain (29.6%), respiratory disorders (10.5%), digestive disorders (9.4%), urinary infection (3.5%), dizziness (3.3%), behavioural symptoms (2.9%), and other reasons (40.8%). 248 people were admitted at least 1 time in the acute hospital with a mean of 1.2 admissions per patient. Main causes were surgical conditions (28%), respiratory diseases (17.6%), heart diseases (9.1%), injuries (7.1%) and other medical reasons (38.2%).

We found that age was related to higher frequency of ED admission. MCI was found associated with both ED and hospital admission.

EATING DYSFUNCTION ACCOMPANYING DETERIORATION OF AD ON THE BASIS OF FUNCTIONAL ASSESSMENT STAGING

A. Eda¹, H. Hirano¹, Y. Watanabe¹, Y. Ohara², K. Motokawa¹, M. Shirobe¹, J. Yasuda¹, S. Awata¹, 1. *Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Itabashiku, Tokyo, Japan*, 2. *Department of Oral Health Education, Graduate School of Medical and Dental Science, Tokyo Medical and Dental University, Tokyo, Japan*

Background: The eating dysfunction is caused by deterioration of dementia. It causes malnutrition, and raises a risk of frailty and mortality rate. However, its details are unrecognized. We examined the eating dysfunction and nutrition states in elderly people with Alzheimer's disease (AD) on the basis of Functional Assessment Staging (FAST).

Methods: Subjects included 146 elderly AD females (mean age: 86.7 ± 6.2 years) requiring care in Japan. They underwent vital function tests (Barthel index and self-feeding assessment), severity of AD (e.g., FAST), nutritional status (e.g., MNA®-SF) and a basic information survey. All data were classified by FAST and used to draw approximate curves. The protocol in the present study was designed according to the Declaration of Helsinki.

Results: Barthel index showed S-shaped curve ($y = 0.0729x^3 - 2.0573x^2 + 10.333x + 65.523$, $R^2 = 0.7505$). Self-feeding assessment showed the eating difficulty came to arise from the stage of their FAST6e, and a slow curve ($y = 0.0032x^3 - 0.0176x^2 + 0.1781x + 19.308$, $R^2 = 0.6051$). On the other hands, MNA®-SF showed very slow drop line ($y = 0.0016x^3 - 0.0568x^2 + 0.1909x + 11.329$, $R^2 = 0.4327$).

Conclusions: An aspect of each functional decline became clear by putting each approximate curve on top of one another. Eating dysfunction became much more pronounced severity of AD on the basis of FAST. It is necessary to offer predictive support for elderly patients with AD, after comprehending consideration of functional decline over time and the differences in the cause of dementia.

CLINICAL VIDEO TELEHEALTH (CVT) FOR DEMENTIA: RURAL PROVIDER AND VETERAN RECOMMENDATIONS

M.I. Rossi^{1,2}, M. Homer¹, C. Dolbee¹, S. Shaffer¹, L. Jost¹, N. Kovell¹, P. Bulgarelli¹, W. Musser¹, 1. *VA Pittsburgh Healthcare System, Pittsburgh, Pennsylvania*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*

Introduction: In rural areas, older patients with cognitive decline, have little access to geriatric providers to provide diagnosis, treatment and support as the disease progresses. The TeleDementia clinic, an interdisciplinary Clinical Video Telehealth (CVT) clinic addresses this need.

Methods: Types of recommendations made via CVT by the team of a geriatrician, geriatric psychiatrist, psychologist, and social worker were analyzed and compared to recommendations made to similar patients seen in-person.

Results: From 5/2013–9/2015, 341 patients with cognitive decline attended 724 TeleDementia clinic encounters and

referring rural providers received 1098 recommendations regarding specialized dementia care.

Common themes of recommendations included: referral to VA services $n=650(59.2\%)$, evaluation of sensory deficits $n=69(6.3\%)$, treatment/ monitoring of orthostatic hypotension $n=61(5.6\%)$, improving diabetic management $n=73(6.6\%)$, recommendations related to reversible causes of symptoms $n=144(13.1\%)$, Geri Psychiatry referral $n=73(6.6\%)$, gun safety, hunting, and driving $n=71(6.6\%)$. The majority of Veterans received recommendations related to adjusting medications. Fifty-one (15%) of Veteran also had documented polypharmacy. Themes of recommendations were related to specialists seen. Recommendations were similar to those in a face-to-face dementia clinic. Implementation of recommendations was initially low but improved when the geriatric team initiated consults, services, and follow-ups.

Conclusion: Recommendations made in TeleDEMENTIA clinic are common to clinical recommendations made by geriatric professionals when Veterans are seen face to face. What makes these recommendations notable is these Veterans may never have received any recommendations without access to dementia care by telehealth. Implementation of recommendations improved when the team initiated services.

AGING AND DIVERSE LGBT COMMUNITIES: BUILDING AWARENESS FOR COGNITIVE DECLINE AND CAREGIVING NEEDS

M.R. McBride¹, L. Eskenazi^{2,8}, M.C. Alcedo³, M. Tzuang^{1,4}, D. Tan^{1,5}, E. Yau⁶, M. Adelman^{3,7}, D. Gallagher-Thompson¹, 1. *Stanford University, Stanford, California*, 2. *Family Caregiver Alliance, San Francisco, California*, 3. *Openhouse-SF, San Francisco, California*, 4. *Johns Hopkins University, Baltimore, Maryland*, 5. *San Francisco Department of Public Health, San Francisco, California*, 6. *Alzheimer's Association, Northern CA and Northern NV Chapter, San Jose, California*, 7. *San Francisco Department of Aging and Adults Services, San Francisco, California*, 8. *National Center on Caregiving, San Francisco, California*

Health disparities exist in LGBT older adult communities, a high risk population for chronic health conditions. Cognitive decline from Alzheimer's disease and related disorders (ADRD) is an increasing concern in LGBT communities due to natural aging. A 2010 report estimated an increase from 3 million to 7 million LGBT elders by 2030. Access to care challenges for LGBT elders, caregivers and service providers include lack of knowledge, discriminatory services, stigma, socioeconomic barriers, etc. To build ADRD awareness, a partnership of seven community and academic organizations held a one-day, highly-interactive conference on priority topics from results of a pre-event community survey. Sessions included: diagnosis/treatment/side-effects; LGBT affirming assessment and resources; substance use/effects on LGBT elders; health equity; diverse communities' needs; caregiving and mental health. About half of 227 attendees were service providers (nurses, social workers, public health workers, therapists, psychologists, etc.); the remainder were from the LGBT community (caregivers, care-recipients, care-partners, families). Half of attendees were white and the remainder reflected the diversity of greater San Francisco region

(Asian, Black/African American, American Indian/Alaska Native/Native Hawaiian/Pacific Islander, Hispanic/Latino). Speakers' knowledge/expertise and interactive sessions were highly rated; post-conference evaluation respondents ($n=118$) intend to use information to improve: communication with LGBT/straight care-recipients, LGBT caregivers and/or providers (61%); management of care-recipients (59%); and educate LGBT caregivers and LGBT elder care-recipients (48%). Examples of attendees' information needs were: caregiver stress, coping with discrimination, end-of-life, cultural competency, transgender health, etc. This interactive community awareness model can be adapted for LGBT elders, care-providers and healthcare professionals in global communities.

SESSION 530 (POSTER)

DEPRESSION, ANXIETY, AND PERSONALITY I

SOCIAL SUPPORT RESOURCES AND DEPRESSIVE SYMPTOMS IN COMMUNITY-DWELLING KOREAN OLDER ADULTS

S. Lee, *Department of Nursing, University of Ulsan, Ulsan, Korea (the Republic of)*

Objective: Evidence has shown that social support may have beneficial effects on mental health in elderly population. The present study examined the association between social support resources measured by the Resource Generator and depressive symptoms among community-dwelling Korean older adults.

Method: A cross-sectional survey of 1000 randomly selected older people in Chuncheon city (a rural town in South Korea) was conducted in 2015. Self-reported measures included sociodemographic characteristics, health characteristics, social support resources, and depressive symptoms. Multiple linear models were applied for the analysis.

Results: After controlling for the effects of potential covariates, multiple linear models indicated that the higher level of social support resources from family was associated with fewer depressive symptoms, whereas the higher level of social support resources from friends or neighbors was significantly associated with greater depressive symptoms. The easy availability of medical and social facilities was associated with fewer depressive symptoms

Conclusion: Although we cannot exclude the possibility of reverse causation due to the cross-sectional design, this study adds to previous work on the potential utility of the Resource Generator for evaluating the relationship between social support resources and depressive symptoms. Service providers can develop strategies for decreasing depression by increasing social support resource from family members and promoting an easy availability of medical/social facilities.

WIDOWHOOD AND DEPRESSION TRAJECTORIES OF OLDER ADULTS IN THE HEALTH AND RETIREMENT STUDY

F. Zhao, G. Hong, D. Russell, *Iowa State University, Ames, Iowa*

This study examined the heterogeneity of depression trajectories before and after widowhood in later life and the

effects of socio-demographic variables on these depression trajectories. Respondents were 1664 widowed older adults aged over 50 from waves 1 to 11 of Health and Retirement Study (HRS). Depression of the respondents was measured by an abbreviated 8-item version of the Center for Epidemiological Studies—Depression Scale (HRS CES-D). The HRS CES-D score was used for selected respondents at four consecutive waves: pre-widowhood wave, widowhood wave, and two post-widowhood waves. Using latent class growth analysis, four groups were identified as the depression trajectories before and after widowhood. *Low Depression* group (68.0%) consists of respondents whose depression score remained low all the time, *Increasing Depression* group (14.5%) whose depression score was low at pre-widowhood wave but increased after widowhood, *Decreasing Depression* group (11.5%) whose high depression score at pre-widowhood wave decreased over time, and *High Depression* group (5.9%) whose depression score was chronically high. Multinomial logistic regression analysis was conducted and age, gender, race, education level, as well as household income at pre-widowhood wave were found significant in differentiating different trajectories. The study highlights the importance of focusing on trajectories of depression over time among widowed older adults and identifying factors that predict both the development of depression and decreases in depression over time.

EMOTION REGULATION AND DEPRESSION IN SENIORS: THE ROLE OF EXECUTIVE FUNCTIONS AND PERCEIVED STRESS

V. Huang, A.J. Fiocco, *Psychology, Ryerson University, Toronto, Ontario, Canada*

Depression is a mental health disorder that significantly impacts quality of life in older adults. Chronic perceived stress and emotion regulation (ER) are both associated with onset and maintenance of depression. Maladaptive ER has been linked to greater perceived stress levels and prolonged experience of depressed mood. It is suggested that the use of adaptive ER strategies requires different domains of executive functions (EF), which commonly decline with chronic stress and increase in age. Given that some ER strategies require greater cognitive resources, it is plausible that both perceived stress and EF may modify the relationship between ER and depression. The present study examined the role of EF and perceived stress in the relationship between ER and depression among community-dwelling older adults. Participants ($N = 70$) aged 60+ completed the Trail-Making Task B, the Cognitive Emotion Regulation Questionnaire, the Beck Depression Inventory-II, and Perceived Stress Scale-10 as part of a larger study. Controlling for age, sex, education, and perceived socioeconomic status, a significant indirect effect of maladaptive ER on depression through perceived stress was found (0.47, 95% CI [0.21, 0.84]). This mediation was moderated by levels of EF (Maladaptive ER \times EF: $\beta = .01$, $t = 2.20$, $p = .03$). This study is the first to elucidate the interrelationship between underlying mechanisms of depression and may help support the development of personalized programs that help maintain emotional well-being among older adults.

RELATIONS OF SEXUAL FUNCTIONING AND SATISFACTION ON DEPRESSION IN OLDER LESBIAN WOMEN AND GAY MEN

S. Spies-Upton, C. Escher, S. Paulraj, C. Cummings, L.M. Brown, T. Tormala, R.G. Gomez, *PhD Program in Clinical Psychology, Palo Alto University, Palo Alto, California*

Depression as well as dissatisfaction with sexual wellbeing is common in older lesbian women and gay men. This study explored the relationship of sexual functioning and satisfaction with depression severity in lesbians and gay men who were ages 55 years and older. As part of a larger study, 32 lesbian women and 44 gay men were given the Center for Epidemiological Studies Depression Scale, Changes in Sexual Functioning Questionnaire, and questions regarding sexual satisfaction and frequency of current sexual activity. In gay men, depression severity was significantly correlated with sexual functioning ($r = -.448$, $p = .015$) but not with general sexual satisfaction ($r = -.212$, $p = .287$). When examining specific items of sexual satisfaction, enjoyment, frequency, desire, and thoughts and pleasure of thoughts of sexual activity were significantly negatively correlated with depression severity. As for sexual functioning, only ability and frequency of ejaculation and pleasure in orgasm was negatively correlated with depression severity in gay men. In lesbian women, depression was not significantly correlated with sexual functioning or satisfaction or to specific items of sexual satisfaction and functioning. Results suggest that depression severity was negatively correlated with sexual satisfaction but less so with functioning in gay men. However, no significant relationships were found between sexual functioning and satisfaction with depression in lesbian women. These findings suggest that sexual satisfaction and functioning may play an important role in the emotional wellbeing of older gay men, but not in older lesbian women.

THE IMPACT OF CATARACT SURGERY ON DEPRESSION AMONG OLDER ADULTS: A PROPENSITY SCORE ANALYSIS

R. Wong, *Brown School of Social Work, Washington University in St. Louis, Saint Louis, Missouri*

Cataracts is an eye disorder that is the leading cause of vision loss in the United States. Although individuals with cataracts typically undergo cataract surgery, the impact of this treatment on depression remains inconclusive. The purpose of this study was to examine the impact of cataract surgery on depression among older adults through a propensity score analysis. Data was retrieved from the Health and Retirement Study (HRS), which surveys a nationally representative sample of older adults over age 50. The sample was restricted to individuals with cataracts, but have not previously undergone cataract surgery ($n = 182$) in 2010. Depression was measured by the seven-item Composite International Diagnostic Interview-Short Form (CIDI-SF) scale in 2012. Greedy matching and propensity score weighting were both conducted as a sensitivity analysis to estimate the effect of cataract surgery on depression. Through Poisson regression, both approaches were consistent in suggesting a statistically significant increase in depression scores following cataract surgery. Greedy matching indicated individuals who received cataract surgery were expected to have an incidence rate for

depression scores 4.81 times that of individuals without surgery ($p < .05$). Propensity score weighting indicated an average treatment effect (ATE) incidence rate ratio (IRR) of 2.65 ($p < .05$) and an average treatment effect for the treated (ATT) IRR of 3.00 ($p < .05$) for individuals with cataract surgery. Our findings support previous studies in suggesting cataract surgery may exacerbate depressive symptoms in older adults. Therefore, further research is needed to understand factors contributing to increased depression following cataract surgery and how this can be prevented.

THE RELATIONSHIP OF NEUROTICISM AND DEPRESSION AMONG OLDEST-OLD ADULTS

G.D. da Rosa¹, P. Martin², L.W. Poon³, 1. *Gerontology Institute, Georgia State University, Suwanee, Georgia*, 2. *Iowa State University, Ames, Iowa*, 3. *University of Georgia, Athens, Georgia*

The purpose of this study was to assess the association of six personality facets (Anxiety, Anger, Hostility, Depression, Self-Consciousness, Impulsiveness, and Vulnerability) of Neuroticism from the NEO PI-R with subscales of the Cornell Scale for Depression in Dementia (depression, mood, behavioral disturbance, ideation, physical signs, and cyclic functions). Participants included 234 centenarians and 72 octogenarians from the Georgia Centenarian Study. Several blocked hierarchical multiple regression analyses were computed separately with proxy reports of participants' Neuroticism levels as predictors of the Cornell scales. The results suggest that participants with higher scores on the Anxiety personality facet had higher scores on overall depression, mood related signs, and ideation disturbance. Higher score on angry hostility were associated with higher levels of mood-related signs and cyclic functions. Higher levels of the depression facet of Neuroticism were related to higher scores on overall depression, mood related signs, behavioral disturbance, physical signs of depression, cyclic functions, and ideation disturbance. Participants with higher scores on self-consciousness had lower scores on depression. Participants higher in vulnerability had higher score on mood-related signs of depression. Covariate results suggest that older participants had lower scores on mood related signs, and ideation disturbance. Women had higher scores on physical signs of depression compared to men. Participants who lived independently were more likely to report higher scores on depression, and lower scores on cyclic functions. High cognitive functioning participants had lower scores on depression, mood-related signs, and higher scores on ideation disturbance.

IS DEPRESSIVE SYMPTOMATOLOGY ASSOCIATED WITH POORER COGNITIVE PERFORMANCE AMONG OLDER ADULTS?

K. Condeelis, M.R. Crowther, K. Murry, D. Dragan, *The University of Alabama, Tuscaloosa, Alabama*

Previous literature has focused on both depressive symptomatology and cognitive performance among older adults in inpatient settings. However, there is a paucity of research examining the association between depressive symptomatology and cognitive performance among community-dwelling older adults. Therefore, the study objective was to examine depressive symptomatology and cognitive performance in

a nationally representative sample of community-dwelling older adults.

An archival data analysis was conducted using data from the Midlife in the United States-II Study, Projects 3 and 4. The sample consisted of 256 older adults ($M=71.84$, $SD=5.40$, $Range=65-84$). Depressive symptoms were assessed using the Center for Epidemiologic Studies Depression Scale. Cognitive performance was measured using the Brief Test of Adult Cognition by Telephone.

Multiple hierarchical regression was used to test the hypothesized model. The presence of depressive symptomatology significantly predicted poorer cognitive performance, $b=-.02$, $p < .001$ and explained a significant proportion of variance in cognitive performance, $R^2=0.12$, $F(4, 242)= 8.70$, $p < .001$. Findings suggest that depressive symptomatology is significantly associated with poorer cognitive performance in this sample of older adults.

For community dwelling older adults, the presence of depressive symptomatology may serve as a contributing factor of poorer cognitive performance. These findings suggest that depressive symptomatology is an important factor to consider within the context of cognitive performance among older adults. Future research should focus on providing intervention strategies for older adults with depressive symptomatology as a means to moderate its effects on cognitive performance among this segment of the population.

IMPLEMENTING EVIDENCE-BASED DEPRESSION CARE IN NURSING HOMES: A TREATMENT FIDELITY STUDY

S. Meeks¹, K. Shryock¹, K. Van Haitsma², 1. *University of Louisville, Louisville, Kentucky*, 2. *Pennsylvania State University, State College, Pennsylvania*

There is a gap between what we know about evidence-based depression care and what is available in nursing homes. Closing the gap will require understanding context-specific implementation issues specific to nursing homes. We present implementation fidelity data from the treatment arm of a randomized control trial of BE-ACTIV, a 10-week depression treatment designed for implementation in nursing homes. 40 patients in 15 nursing homes were treated by graduate student therapists. Audio-recorded sessions were rated by the therapists and their Ph.D. supervisor for adherence to treatment protocol and session quality. There was moderate agreement on adherence and quality that exceeded chance (mean ICC for adherence =.81 and session quality =.53). Average adherence to core program features ranged from 80-94%; mean quality was 5.6 (SD 0.61) out of 6 points. Patients completed an average of 7.05 sessions (SD 3.67) and 26 completed 10 sessions. The theoretical basis of BE-ACTIV is behavioral activation; the therapist and client increasingly planned new pleasant events across sessions 1-5, from a mean of 3.7 (SD 1.34) after the first session to about 6 activities a week across sessions 6-9, with a similar progression in percent activities completed, ending with about 80% completed. Number of sessions and number and percent of activities completed were significantly related to the likelihood of remission at post-treatment, and of maintaining improvement at 3-month follow-up. Results demonstrate the feasibility and fidelity of BE-ACTIV in diverse nursing homes

with diverse patients, and support the theoretical premise of the intervention.

THE EFFECTS OF RTMS ON PSYCHOMOTOR RETARDATION IN ELDERLY DEPRESSION

V. Thomas-Ollivier¹, E. Foyer^{1,2}, S. Bulteau², A. Sauvaget², T. Deschamps¹, 1. *Laboratory "Movement, Interactions, Performance" (E.A. 4334), University of Nantes, France, Nantes, France*, 2. *Department of "Addictology & Consultation-Liaison psychiatry", Nantes University Hospital, Nantes, France, Nantes, France*

Depression-related psychomotor retardation (PMR) is often misinterpreted as the age-related slowing, playing down the importance of depression in aging population. Thus we tested the PMR-related cognitive flexibility by assessing the verbal fluency performance in healthy older controls ($n = 18$; mean age: 61.7 ± 9.23 years) and in age-matched patients with major depressive disorder (MDD) ($n = 29$; mean age: 57.1 ± 12.4 years). We also examined the antidepressant effects of repetitive transcranial magnetic stimulation (rTMS) in eligible MDD patients ($n = 17$), evidenced by an expected verbal fluency improvement. Three scores were assessed for semantic and phonemic fluency tests: (1) total number of words generated excluding preservative and intrusive errors; (2) number of switches; and (3) mean cluster size. The results clearly showed that PMR in geriatric depression differed from the age related slowing. Significant differences between groups in cluster size ($p < 0.05$) and percent of preservative errors ($p < 0.04$) were found for the phonemic fluency performance. In addition to significant improvement of the depression level ($p < 0.001$) and the PMR score ($p < 0.001$) after the rTMS treatment, the results showed a nonsignificant trend toward an increasing verbal fluency performance. Overall, the present study confirms the negative influence of depression on verbal episodic memory performance, regardless of age. But the depression-related deficits in cognitive flexibility seem not to be associated with the PMR scores before and after the rTMS treatment, challenging the possible validation of verbal fluency performance as one of relevant hallmark of PMR.

THE ASSOCIATION BETWEEN PHYSICAL ACTIVITY AND DEPRESSION IN OLDER ADULTS WITH PARKINSON'S DISEASE

M. Ventura¹, J.K. Johnson¹, D.E. Barnes^{1,2}, 1. *University of California, San Francisco, San Francisco, California*, 2. *San Francisco VA Medical Center, San Francisco, California*

It is important to understand the associations between physical activity (PA) and mood in the early stages of Parkinson's disease (PD) progression. The purpose of this study was to explore the relationship between PA and depression in newly diagnosed, untreated individuals with PD. We analyzed data from the Parkinson Progression Markers Initiative and examined depression (Geriatric Depression Scale; GDS) in 260 de novo individuals with PD. Participants with a GDS score ≤ 5 were considered "not depressed" and those with a GDS score > 5 were considered "depressed." We also examined scores on the Montreal Cognitive Assessment and self-reported levels of PA (Physical Activity Scale for the Elderly). Physical activity including light, moderate and strenuous PA, were tallied to create summary scores for frequency

(days/week) and duration (hours/day). Thirty-four percent of study participants reported being depressed at baseline. Those who were depressed had fewer years of education (15 vs. 16 years, $p=0.02$) but did not differ significantly by age, sex or cognitive function compared to those with no depression. Study participants engaged in PA for an average of 1.3 ± 0.4 days/week for 2.2 ± 0.4 hours. There were no significant differences in PA levels between those who were depressed or not depressed. Depressive symptoms were high in this cohort of patients with newly diagnosed, untreated Parkinson's disease. However, we did not observe an association between physical activity and depressive symptoms cross-sectionally. Future studies should examine the longitudinal association between physical activity and depressive symptoms in this cohort.

THE INTERPLAY OF LIFE EVENTS, RELIGIOUS EXPRESSION, AND SOCIAL SUPPORT WITH DEPRESSION

A.M. Ogletree, R. Blieszner, L.P. Sands, *Human Development, Virginia Tech, Blacksburg, Virginia*

Based on Pearlin's stress process model, we examined relationships among religious expression/participation, social support, and depressive symptoms in adults who experienced significant life events (SLEs) within the past year. Data came from the ORANJ BOWL study and included 5,468 randomly-dialed New Jersey residents aged 50–74 in 2008. We explored which events were the strongest indicators of the SLE construct and most associated with higher CES-D scores. We hypothesized more depressive symptoms among individuals with more stressful events, less social support, and lower religious expression. Religiosity was measured using 6 items from the Multidimensional Measurement of Religiousness/Spirituality. The 10-item CES-D indexed depressive symptoms; life events were recorded on a 14-item Cochrane-Robertson Life Event Inventory; perceived social support was measured using 4 items. Structural equation modeling assessed construct factor loadings and hypothesized associations; fit indices revealed good model fit to the data ($\chi^2=3637.32$, $p=0.000$, $df=221$; RMSEA=0.053, NNFI=0.911, CFI=0.922, SRMR=0.047). The strongest indicators of SLE were three items reflecting relational family events. Maximum likelihood estimates partially supported the hypotheses: individuals with more stressful events, lower public religious expression, and less perceived social support reported significantly more depressive symptoms. However, individuals with more private religious expression also had more depressive symptoms. These findings reveal that private versus public religious expression may have different roles in coping with significant life events.

RELIGIOSITY AND DEPRESSIVE SYMPTOMS IN OLDER ADULTS COMPARED TO YOUNGER ADULTS: MODERATION BY AGE

M.A. Stearns, E.D. Lantz, D.K. Nadorff, *Mississippi State University, Starkville, Mississippi*

Overall, religious individuals are more likely to have a positive life view, and are less likely to suffer from depressive symptoms. Given the high prevalence of depressive symptoms among older adults, it is important to identify possible protective factors. Thus, the current study examines the

effect of age on the relation between religiosity and depressive symptoms.

The sample ($N = 316$) was recruited using MTURK. Measures included age, the Center for Epidemiological Studies Depression Scale (CESD), and the Stearns-McKinney Assessment of Religious Traits (SMART). A large variance of ages was sought and ranged from 19 to 67. As expected, we found that the older adults aged 50 and older ($M = 230.35$, $SD = 106.97$) were more religious than younger adults aged 18–30 ($M = 230.35$, $SD = 106.97$, $t(1,437) = -6.07$, $p < .001$). Additionally, younger adults ($M = 18.40$, $SD = 13.72$) reported more depressive symptoms than the older adults ($M = 9.43$, $SD = 10.45$, $t(1, 67.975) = 3.16$, $p = .002$).

Moderation analyses were conducted using SPSS' Process macro on the entire data set. The interaction between religiosity and age just missed significance in predicting depressive symptoms, $t(1, 315) = -1.74$, $p = .08$. There was not a significant relation of religiosity on depressive symptoms for those one or more standard deviations below the mean age ($t = 0.26$, $p = .80$), whereas there was a significant relation for those one standard deviation above the mean ($t = -2.40$, $p = .02$). Implications, future directions, and limitations are discussed.

PERSONALITY, BOREDOM, AND COMPENSATORY USE OF TV IN THE HEALTH AND RETIREMENT STUDY

P.A. Fox¹, S.T. Mejia², K.A. Hooker³, 1. *DePaul University, Chicago, Illinois*, 2. *University of Michigan, Ann Arbor, Michigan*, 3. *Oregon State University, Corvallis, Oregon*

In addition to being a sedentary activity with health and well-being correlates, TV watching is also one of the most commonly reported daily activities among older adults. Despite especially high variability in time spent watching TV in this age group, personality has not been well integrated into explanations of that variation, or the study of conditions under which TV watching may serve as a compensation strategy when other activities are not available (Van der Goot, 2015; Baltes & Baltes, 1990). We used 2012 Health and Retirement Study data ($N = 4,655$) to examine conscientiousness, neuroticism, perceived boredom yesterday, and hours spent watching TV yesterday to examine how personality shapes time spent on this activity and the importance of perception that one does not have other things to do. As expected, lower conscientiousness and higher neuroticism were associated with watching TV longer as well as lower experienced well-being during TV watching (Net positive affect while watching TV; $B_C = .54$, $B_N = -.42$, both $p < .001$; Smith et al., 2014, p. 63). However, high conscientiousness individuals watched less TV only if the day was low in boredom. For neuroticism but not conscientiousness, there was a significant indirect effect via boredom, and unexpectedly, the remaining association of neuroticism to TV time was negative ($B = -.17$, $p < .05$). This suggests that beyond the boredom-TV pathway, neuroticism may be associated with less TV watching. Results partially supported the connection of conscientiousness to selective TV watching, and neuroticism to compensatory use of TV.

MALADAPTIVE PERSONALITY AND SOCIAL ROLE IMPAIRMENT IN DEPRESSED OLDER ADULTS IN PRIMARY CARE

A. Romirowsky¹, R.A. Zweig^{1,2}, L. Glick¹, J. Sirey³, 1. *Yeshiva University, Bronx, New York*, 2. *Albert Einstein College of Medicine, Bronx, New York*, 3. *Weill Cornell Medicine, White Plains, New York*

Personality pathology is associated with impaired social functioning in adults, though further evidence is needed to examine the individual contributions of personality traits and processes to social functioning in depressed older adults. This study is a secondary analysis examining the relationship between maladaptive personality traits and processes and social role impairment in depressed older adults in primary care ($N=56$). Participants were 77% female and ranged in age between 55–89 ($M = 66.82$, $SD = 8.75$). Personality pathology was measured both by maladaptive traits (NEO-FFI) and processes (Inventory of Interpersonal Problems; IIP-15). Individual variable as well as combined predictive models of social role impairment were examined. Higher neuroticism ($\beta = 0.30$, $p < .05$), lower agreeableness ($\beta = -0.35$, $p < .001$) and higher IIP-15 ($\beta = 0.28$, $p < .01$) scores predicted greater impairment in social role functioning. Categorical analyses of these variables found significant differences in social role functioning between individuals with high and low levels of agreeableness ($p = .05$) and IIP-15 scores ($p < .01$). All moderation analyses were non-significant, but a combined predictive model of neuroticism and IIP-15 scores predicted unique variance in social role impairment ($R^2 = .71$). These findings highlight the importance of accounting for personality pathology, as measured by both traits and processes, in the assessment and treatment of older adults with depression. In addition, these findings lend support for continued research into both linear and non-linear relationships between personality pathology and domains of functional impairment in older adults.

PERSONALITY AND ALL-CAUSE MORTALITY: COMBINED ANALYSIS BETWEEN NEUROTICISM AND EXTRAVERSION

H. Iwasa¹, Y. Masui², Y. Gondo³, H. Inagaki², Y. Yoshida², 1. *Fukushima Medical University, Fukushima-shi, Japan*, 2. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 3. *Osaka University, Osaka, Japan*

Purpose: Although recent studies have confirmed a relationship solely between personality traits and mortality, combinations of personality have been not fully investigated. This study explored whether a combination of personality traits was related to all-cause mortality among the middle-aged and elderly.

Methods: A total sample of 1050 men and 1424 women aged 52 to 77 years were examined at the baseline. The Eysenck Personality Inventory was administered to assess neuroticism and extraversion. We created three categories approximating the three tertiles of each personality trait score. We also combined the two scores and created four groups: Gloomy (N+E-), Passionate (N+E+), Low-keyed (N-E-), and Resilient (N-E+).

Results: During the 7-year follow-up period, 187 persons (7.6%, 119 men and 68 women) died, and 261 people (10.5%, 112 men and 149 women) moved away from the target region.

Cox proportional hazards model, adjusted for gender, age, education, presence of psychiatric problems, and chronic diseases, showed that neuroticism (hazard ratio [HR]: 1.48, 95% confidence interval [CI]: 1.05–2.08, for the highest tertile) and extraversion (HR: 0.64, 95% CI: 0.44–0.93, for the highest tertile) were independently associated with mortality. The combined analysis showed that Gloomy (HR: 2.01, 95% CI: 1.30–2.29) and Passionate (HR: 1.57, 95% CI: 1.06–2.32) demonstrated a higher mortality risk and that Low-keyed did not have a significant mortality risk, compared to Resilient.

Conclusions: Our results suggest that individuals with high neuroticism and low extraversion are prone to shorter lives and that mortality risk is elevated when combining the two traits.

DYADIC ASSOCIATIONS OF CONSCIENTIOUSNESS FACETS AND HEALTH, HEALTH BEHAVIOR, AND WELLBEING OVER TIME

J. Lee, W. Chopik, *Michigan State University, East Lansing, Michigan*

Objectives: Previous research suggests that the personalities of an individual and her/his spouse can have large implications for health and well-being. However, much of this research has been cross-sectional and has focused on broad, global personality traits. Less is known about how the components of personality traits (i.e., facets) affect changes in health and well-being over time in older couples. The current study applied actor-partner interdependence models to examine how conscientiousness and its facets moderated changes in health, health behavior, and well-being in older couples over a four-year period.

Method: 3,271 older heterosexual couples ($N=6,542$ individuals; $Age=67.34$, $SD=8.59$) from the Health and Retirement Study filled out a personality questionnaire at baseline. Measures of health (self-rated health, chronic illnesses), health behavior (light, moderate, and vigorous exercise), and well-being (depression) were assessed three times over a four-year period. Actor-partner interdependence models accounted for the non-independence of spouses and tested how partner conscientiousness affected health, health behavior, and well-being over time.

Results: Actor conscientiousness, orderliness, and industriousness most reliably predicted better health, health behavior, and well-being. Partner conscientiousness predicted better self-rated health; partner orderliness and industriousness predicted better health and more positive health behavior. Many of these relationships persisted over the four-year study window.

Discussion: The current study is the only of its kind to examine the dyadic effects of personality facets on health and well-being longitudinally. Results from the current study highlight the benefits of modeling dyadic processes within older couples and how these processes affect health and well-being over time.

SUBJECTIVE WELL-BEING INDICATORS AS DEPRESSIVE SYMPTOMATOLOGY PROTECTORS ON OLDER MEXICANS

S. Covarrubias-Castillo, E. Arias-Merino, B. Corona-Figueroa, B. Ochoa-Sanchez, *Universidad de Guadalajara, Guadalajara, Mexico*

INTRODUCTION. Subjective well-being incorporates the psychological dimension of aging. It is positively associated to: being married, perceived good health, autonomy, physical activity, social support, emotional and visual health, as well as cognitive functioning; subjective well-being has been negatively associated to depression.

OBJECTIVE. To determine a possible association between subjective well-being indicators and depressive symptomatology in Mexican older adults.

METHODOLOGY. Analytical and transversal study, with 2400 older adults' data from Health, Well-being and Aging Poll (*Encuesta de Salud, Bienestar y Envejecimiento - SABE*) in the Mexican states of Colima and Jalisco. The dependent variable was depression, and subjective well-being indicators were: cohabitation satisfaction and religion, as well as health, memory, sight, hearing, nutrition and monetary income self-report. For the association tests, χ^2 tests at 0.05 were used. Multivariate analysis was used, with adjusted OR (CI=95%) and $p<0.05$. Disease and gender were included as control variables.

RESULTS. Age range was from 60 to 98 years, with a mean age of 70.91 ± 7.61 years. 62% ($n: 1,489$) were women. Absolute prevalence of depressive symptomatology was 23.8%. All analyzed subjective well-being indicators obtained significant results; on multivariate analysis adjusted for disease and gender, cohabitation satisfaction, good / regular memory, good / regular health, good hearing, good / regular income and female gender resulted as protective factors of subjective well-being against depressive symptoms.

CONCLUSIONS. Indicators of subjective well-being, in general, protect older adults from depressive symptomatology, some of them, even with a previously diagnosed disease.

UNDERSTANDING PATHWAYS AMONG SOCIAL CAPITAL, DEPRESSION, AND SUICIDAL IDEATION FOR KOREAN ELDERLY

J. Kim, S. Choi, Y. Song, S. Kweon, H. Bae, *Pusan National University, Busan, Korea (the Republic of)*

Unfortunately the suicide rate of older adults in South Korea has been ranked first among OECD countries for long periods of time. Previous studies have identified older people's socioeconomic status, physical health, mental health, and lack of social support are significantly associated with suicidal ideation. However, little research has been conducted to examine how older adults' social capital including social relationship can mitigate suicidal ideation mediated by depression. For data analysis, 3524 older adults from the Korean welfare panel study data were utilized. We used structural equation modeling to examine direct and indirect effects among social capital, depression, and suicidal ideation. Results showed that higher levels of social trust and satisfaction from family relations significantly predicted lower levels of suicidal ideation. In addition, indirect paths from social capital variables including social trust, reciprocity, and relationships to suicidal ideation were all significantly mediated by levels of depressive symptoms. The findings indicate that enhancing older people's social capital can reduce their suicidal ideation as well as depressive symptoms. Thus, we need to consider how to develop social capital through strengthening social trust, reciprocity, and supportive networks among older adults.

DEPRESSION AMONG OLDER PEOPLE IN SRI LANKA: WITH SPECIAL REFERENCE TO ETHNICITY

A. Khaltar¹, N.G.W. Priyadarshani², N.Y. Delpitiya², C. Jayasinghe², A. Jayasinghe², A. Arai¹, Y. Obayashi¹, H. Tamashiro¹, 1. *Hokkaido University Graduate School of Medicine, Sapporo, Hokkaido, Japan*, 2. *University of Peradeniya, Kandy, Sri Lanka*

Sri Lanka, a multi-ethnic country, has been confronting with an ageing population. There is a gap in health among different ethnicities especially in older population. This study was to ascertain if the factors associated with depression differ among ethnic groups in community-dwelling older people in Kandy, Sri Lanka. A cross-sectional survey was conducted in people aged 60 years or over living in selected communities. The participants were asked about ethnicity (Sinhalese, Tamils, and Muslims), sociodemographic characteristics, and depression status by face-to-face interviews with a structured questionnaire. Depression was measured by 15-item Geriatric Depression Scale and the total score of 6 and above was considered as depression. The chi-square test and multivariate logistic regression with two-way interaction terms between ethnicity and other factors were performed. Participants (n=778) consisted of 56.0% of Sinhalese, 21.9% Tamil, and 21.2% Muslim. Of the participants, the prevalence of depression was 31.8%. The proportions of depression were 27.3% in Sinhalese, 42.1% in Tamils, and 32.9% in Muslims. Multivariate logistic regression analysis showed that low economic status, low perceived social support and having more than two self-reported diseases were significantly associated with depression. These associations and thus the factors did not differ among ethnic groups. The findings from this study would help practitioners uncover the older people with high risk and intervene its development or exacerbation among them.

SESSION 535 (POSTER)

DISABILITIES I

DEPRESSIVE SYMPTOMS AS A PREDICTOR OF DISABILITY AFTER NEW MEDICAL DIAGNOSES IN OLDER ADULTS

C. Wu, E. Skidmore, J. Rodakowski, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Study: Older adults face negative life adversities, such as the onset of new medical diagnoses, which leads to disability and increased mortality risk. In this study, we aim to investigate whether depressive symptoms and cognitive function predict disability after controlling demographic and health-related factors in older adults with new medical diagnoses. **Methods:** We conducted a cross-sectional secondary data analysis of Survey of the Health and Retirement Study. Sample included 3100 older adults who self-reported for having new medical diagnoses within last two years. The hierarchical logistic regression analysis was used to examine the model fit of two blocks of variables: 1) demographic (age, gender, partnership, education level, race, ethnicity) and health-related (comorbidity, recent hospitalization) and 2) cognitive function and depressive symptoms. **Results:** Older adults have an average of 69.9 year-old (SD=10.4) with 58.8% female.

Older adults with disability were more likely to be female (OR = 1.86, $p < .001$), with lower education level (OR = 1.28, $p = .018$), having comorbidity (OR = 2.43, $p < .001$), and having recent hospitalization (OR = 1.70, $p < .001$). After controlling for demographic and health-related variables, depressive symptoms (OR=7.31, $p < .001$) and low cognitive function (OR=1.03, $p = .001$) were significant predictors of disability. **Conclusion:** Findings demonstrate that depressive symptoms and cognitive function are significantly associated with disability in older adults with new medical diagnosis. Depressive symptoms showed clinical meaningfulness by the high magnitude of effect size. **Significance:** Results will inform future investigations focused on interventions for older adults who are vulnerable to long-term disability to prevent by focusing on depressive symptoms.

PREDICTIVE VALUE OF DISABILITY FOR ALL-CAUSE MORTALITY IN THE ELDERLY

T. Peng, L. Wu, W. Chen, T. Kao, *Division of Geriatric Medicine, Department of Family and Community Medicine, Tri-Service General Hospital, National Defense Medical Center, Taipei, Taiwan*

Disability is regarded as a serious issue in elderly individuals that affects quality of life. This study aims to explore the relationship between disability and all-cause mortality in the National Health and Nutrition Examination Survey (NHANES 1999–2002). A total of 1,834 participants in the age range of 60–84 years were included. Five major domains of disability, including activities of daily living (ADL), general physical activities (GPA), instrumental activities of daily living (IADL), lower extremity mobility (LEM), and leisure and social activities (LSA) were acquired by self-reporting. We applied an extended-model approach with Cox (proportional hazards) regression analysis to investigate the relationship between different features of disability and all-cause mortality risk in the study population. During a mean follow-up of 5.7 years, 77 deaths occurred. An increased risk of all-cause mortality was identified in elderly individuals with disability after adjusting for potential confounders (hazard ratio [HR]: 2.23; 95% confidence interval [CI]: 1.29 to 3.85; $P = 0.004$). Participants with more than one domain of disability were associated with a higher risk of mortality ($P_{\text{trend}} = 0.047$). Adjusted HRs and 95% CIs for each domain of disability were as follows: 2.53 (1.49 to 4.31), 1.99 (0.93 to 4.29), 1.74 (0.72 to 4.16), 1.57 (0.76 to 3.27), and 1.52 (0.93 to 2.48) for LEM, LSA, ADL, IADL, and GPA, respectively. This study supports an increased association between disability and all-cause mortality in the US elderly population. Disability in LEM might be good predictor of high risk of all-cause mortality in the elderly subjects.

BODY MASS, COGNITIVE STATUS, AND FUNCTIONAL OUTCOMES IN OLDER MEN AND WOMEN

C.M. Germain¹, E. Vasquez², J.A. Batsis³, 1. *Psychiatry and Behavioral Sciences, Duke University, Durham, North Carolina*, 2. *University at Albany, Albany, New York*, 3. *Giesel School of Medicine at Dartmouth, Hanover, New Hampshire*

Background: Body mass and cognitive status are independently associated with physical and functional outcomes in older adults. However, accumulating evidence suggests that higher body mass may be protective during late life, in late life. Yet little is known regarding the impact of cognitive impairment at various levels of body mass in older adults.

Methods: We examined prevalence and odds of physical and IADL limitations by cognitive status (normal/impaired) and body mass category (normal, overweight, obese) in 4,033 older men and 5,563 women aged 60+ from 2006/2008 waves of Health and Retirement Study. Models were adjusted for age, race, education, physical activity level, comorbidity and smoking status. Individuals with TICS score ≥ 7 were classified as cognitively intact/normal (REF); TICS scores < 7 were classified as cognitively impaired. Physical limitation (PL) was determined using the HRS summary score; IADL limitation was defined as difficulty/inability with meals, chores, managing money. Models were adjusted for age, race, education, physical activity level, comorbidity and smoking status and weighted.

Results: Prevalence of PL in adults with cognitive impairment in men were 50.7%, 52.3% and 67.3% for normal, overweight and obese categories; for women, rates of PL were 61.8%, 71.9%, 81.8%. Among men, cognitive impairment was significantly associated with higher rates of physical impairment in normal OR 2.11 (1.07–4.21), overweight OR 2.17 (1.17–4.03) and obese OR 1.09 (0.59–2.01) weight categories. Among women, adults who were cognitively impaired was associated with physical limitations in normal OR 2.11 (1.07–4.21) and overweight categories OR 1.71 (1.0–2.91) but not obese OR 1.09 (0.59–2.01). Association between obesity and cognition on IADL limitations are also discussed.

Conclusion: Older adults with poor cognition are at increase odds of physical limitations independent of body mass. The impact of cognitive impairment in combination with obesity varies between men and women and merits further investigation.

METABOLIC SYNDROME AND DISABILITY IN CHINESE NONAGENARIANS AND CENTENARIANS

M. Yang, B. Dong, Q. Hao, *West China Hospital, Sichuan University, Chengdu, Sichuan, China*

Metabolic syndrome (MetS) increases with aging. Little is known about the relationship between MetS and disability in the elderly population, especially in the oldest old. We therefore conducted this study to investigate the possible association between MetS and disability in a population of Chinese nonagenarians and centenarians. Data were obtained from a face-to-face survey conducted in 870 Chinese adults aged 90 years or older. MetS was diagnosed according to the International Diabetes Federation criteria. Activities of daily living (ADL) and instrumental activities of daily living (IADL) disabilities were evaluated using the physical self-maintenance scale and the Lawton-Brody IADL scale, respectively. The subjects included in the current analyses were 500 women and 225 men (mean age: 93.8 ± 3.1 years). MetS was present 13.0% in women and 9.8% in men. In women, the prevalence of ADL and IADL disabilities was significantly higher in the MetS group compared with the non-MetS group (ADL: 43.1% vs. 30.6%, $p=0.044$; IADL:

73.8% vs. 59.8%, $p=0.030$). After adjusting for relevant confounders, the MetS group showed significantly increased odds ratios (ORs) for either ADL (1.8, 95% confidence interval [CI] 1.2–3.4) or IADL disability (2.1, 95% CI 1.3–4.7) compared with the non-MetS group. In men, similar results were found with respect to the prevalence of ADL or IADL disability and adjusted ORs between MetS and non-MetS groups, but these results were not statistically significant. In conclusion, in our study population, MetS appeared to be associated with an increased risk of either ADL or IADL disability, especially in women.

PLANNING HEALTH SERVICES FOR SENIORS: CAN WE USE PATIENTS' OWN PERCEPTION?

S. Figueiredo^{1,2}, A. Rosenzweig², J.A. Morais^{3,4}, N.E. Mayo^{5,1,4}, 1. *School of Physical and Occupational Therapy, McGill University, Montreal, Quebec, Canada*, 2. *Center for Outcomes Research and Evaluation, Research Institute, McGill University Health Centre, Montreal, Quebec, Canada*, 3. *Faculty of Medicine, McGill University, Montreal, Quebec, Canada*, 4. *Department of Geriatrics, McGill University Health Centre, Montreal, Quebec, Canada*, 5. *Division of Clinical Epidemiology, McGill University, Montreal, Quebec, Canada*

Across Canada, people over 75 years of age represent 16% of all hospital admissions. The admission rate per 100,000 seniors is 5 times higher for acute care and 22 times higher for complex continuing care than the rates for younger adults. After a hospital discharge, dealing with new disabilities can be difficult and even overwhelming. Understanding patients' needs in a timely manner may allow services to be allocated to those at highest risk for deterioration, thus, improving care while optimizing health care cost. Could patient's perceptions of how they are feeling be used as a marker of potential need for post-discharge services?

The aim of the study was to estimate whether self-reported health can be used as an indicator of service needs among seniors.

In this cross-sectional survey, age and sex-adjusted logistic regression was used to estimate the link between functional status indicators and fair or poor self-reported health. Results were reported as Odds Ratio (OR) and its 95% confidence interval (95%CI). Backward stepwise logistic regression was performed to identify the best predictive model of service needs. Positive predictive value (PPV), sensitivity and specificity were calculated to identify whether health perception could be used to identify people in need of physical rehabilitation services.

142 seniors agreed to answer the survey yielding a response rate of 73%. Among the respondents (mean age 79 ± 7 ; 60% women), 40% rated their health as fair or poor. Seniors perceiving their health as fair or poor had higher odds of reporting impairments, activity limitations, and participation restrictions (OR ranging from 2.37; 95%CI 1.03–5.45 to OR 12.22; 95%CI 2.68–55.78) in comparison to those perceiving their health as good or better. The most significant predictors of service needs were community ambulation, household tasks, fatigue, and pain with 92% sensitivity and a maximum adjusted R-squared of 0.65. Self-rated health used as single-item showed a positive predictive value (PPV) of 1, sensitivity of 52%, and specificity of 100%.

In conclusion, our results indicate that all seniors reporting fair or poor health have indicators of need for further rehabilitation services. This question may be an alternate way of querying about need as many older persons are afraid to report disability because of fear of further institutionalization.

INVESTIGATION ABOUT ASSOCIATED ILLNESS WITH DISABILITY IN COMMUNITY DWELLING OLDER POPULATION

E. Kiyoshige¹, M. Kabayama¹, K. Sugimoto¹, Y. Arai², T. Ishizaki³, Y. Gondo⁴, H. Rakugi¹, K. Kamide¹, 1. *Division of Health Sciences, Osaka University Graduate School of Medicine, Suita City, Japan*, 2. *Keio University, Tokyo, Japan*, 3. *Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan*, 4. *Osaka University Graduate School of Human Sciences, Osaka, Japan*

Background: Few studies have investigated associated illness with disability including life style related diseases in community-dwelling older population. Aim of this study is to clarify associated illness with disability among 80 years participants in the Japanese epidemiological cohort study focused on community dwelling older populations (Septuagenarians, Octogenarians and Nonagenarians Investigation with Centenarians:SONIC).

Methods: Study subjects were general population at age 80 (± 1) years ($n=965$) in SONIC study. Disability was defined as having the certification in Japanese long-term care insurance system (LTCI). This certification was evaluated considering cognitive and physical functions based on medical doctor's evaluation in addition situation of subjects' daily life and support system for subject.

Results: 77 out of participants (7.9%, male:female=25:52) were certified as disability in LTCI. Stroke (OR:8.38 for male, 8.11 for female) in both male and female and cardiovascular disease (4.03) only in male, osteoporosis and osteoarthritis (2.16, 2.45, respectively) and metabolic syndrome (2.43) only in female were significantly associated with disability in this study subjects. In addition, normal blood pressure ($<150/90$ mmHg) was also associated with disability only in male (OR:4.41).

Conclusions: Obtained results in present study is similar to Japanese national survey about associated illness in LTCI among age 80 in Japanese community dwelling population. Interestingly, there are significant positive associations between disability and metabolic syndrome only in female and normal blood pressure only in male in present study. Afterwards, these associations should be carefully investigated and clarified underlying mechanisms by analysis using longitudinal data in SONIC study.

AUTISM SPECTRUM DISORDERS AND THE HEALTHCARE EXPERIENCES OF AGING ADULTS

K. Kent^{1,2}, 1. *Health Services Administration, Xavier University, Cincinnati, Ohio*, 2. *Miami University of Ohio, Oxford, Ohio*

The purpose of this qualitative, descriptive study is to illuminate the experiences of adults diagnosed with Autism Spectrum Disorders (ASD) and their challenges and successes in receiving quality primary healthcare services. Through

semi-structured interviews with eleven adults diagnosed with ASD and/or their caregivers, this study explored their perspectives and impressions of their healthcare experiences. Specifically, this study evaluated the population of adults with ASD (age 30+) who are also diagnosed with intellectual disabilities (ID). This population is challenged by a triple jeopardy of age, intellectual disability and autism symptomology (social/behavioral/communication challenges). In addition to their ASD diagnosis, more than half of these adults have major physical and mental health co-morbidities that require regular medical attention. As a result, this population often experiences negative health outcomes and sub-optimal relationships with healthcare providers due to their communication deficits, behavioral impairments and other factors. Many of these medical and mental health conditions could be better managed, and perhaps even prevented, through more effective screening and prevention services provided by primary healthcare providers. Payment sources for health services also has a significant impact in access to care. Many healthcare providers are well prepared to serve this population, while some are not. Hence, sharing healthcare experiences is critical for preparing primary healthcare providers to best serve ASD adults. By understanding the current gaps in care and eliminating barriers, this will inform the design for future improvements in the healthcare delivery system for physicians, nurses, allied health professionals and healthcare administrators.

IS VISUAL IMPAIRMENT JUST ANOTHER COMORBID CONDITION?

B. Swenor, B. Munoz, S. West, *Ophthalmology, Johns Hopkins University, Baltimore, Maryland*

Baseline data from the Salisbury Eye Evaluation study, a population-based sample of 2,520 adults 65 years or older was used. Visual impairment was defined by visual acuity and visual field measures. Time to complete three mobility tasks was measured: walking up 7 steps, walking down 7 steps, and walking 4 meters. Mobility disability was classified as 1 standard deviation below the population mean for each task. The total number of comorbid conditions was determined using data on 16 conditions that affect mobility and categorized as 1, 2, 3, or 4+ conditions. Odds ratios (OR) and 95% confidence intervals (CI) were determined for each comorbidity strata adjusting for age, sex, and race. Among older adults with 1 condition, the visually impaired were more likely to be disabled on all three tasks than the non-visually impaired (OR_{walking up steps} = 3.6; 95% CI:1.3–10.4; OR_{walking down steps} = 6.2, 95% CI:2.2–17.6; OR_{walking 4 meters} = 4.3, 95% CI:1.4–13.2). The association between visual impairment status and disability walking up and down stairs was attenuated and no longer significant when comparing those with 2 conditions, but visually impaired were 3 times more likely to have disability walking 4 meters than the non-visually impaired (OR= 3.0, 95% CI:1.3–7.0). For those with 3 or 4+ comorbid conditions, the associations between vision status and mobility disability declined and was not statistically significant for any of the tasks. Results suggest that while visual impairment is an important factor contributing to mobility disability, as comorbid conditions accumulate this effect is diluted.

THE ENRGISE PILOT STUDY: SCREENING AND RECRUITMENT PRELIMINARY RESULTS

J.A. Cauley¹, T.M. Manini⁴, R.A. Fielding⁵, S.B. Kritchevsky², M.M. McDermott³, A. Newman¹, W.T. Ambrosius², M. Pahor⁴, 1. *University of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania*, 2. *Wake Forest School of Medicine, Winton-Salem, North Carolina*, 3. *Northwestern University, Chicago, Illinois*, 4. *University of Florida, Gainesville, Florida*, 5. *Tufts University, Boston, Massachusetts*

Growing evidence shows that low-grade chronic inflammation is an independent risk factor of disability and impaired mobility. However, it is unknown whether interventions that reduce inflammation improve mobility. The ENabling Reduction of low-Grade Inflammation in Seniors (ENRGISE) Pilot Study is a multicenter randomized clinical trial to test whether omega-3 fish oil (ω -3) or the angiotensin receptor blocker losartan (LO) alone or in combination can ameliorate walking speed and lower inflammation. A total of 300 men and women age ≥ 70 years with elevated IL-6 and mobility impairment, as measured by slow gait speed and self-reported mobility difficulty are being recruited at 5 academic clinical centers. Recruitment began April 2016 and is expected to last 12 months. Of the 1416 telephone screens completed, 308 (25%) subjects had no self-report difficulty walking or climbing stairs; 152 (21%) were ineligible for both the LO and ω -3 study arms. Overall, 889 (63%) were ineligible for the screening visit 1 (SV1). We have completed 305 SV1s. To be eligible, subjects have to have a 4m walk speed < 1 m/sec and > 0.44 m/sec; 82% have met this criteria and their blood was sent for IL-6 measurements. Of these, 82 (61%) had an elevated IL-6 (> 2.3 and < 10 pg/ml) at SV1; 78 (87%) had an elevated IL-6 at SV2. To date, we have randomized 32 individuals; mean (SD) IL-6 = 3.49 (1.53) pg/ml. We will present the final results of the screening and recruitment in ENRGISE. These results will inform the design of the main larger trial to prevent major mobility disability.

FEAR OF FALLING AND ASSOCIATED FACTORS IN COMMUNITY ELDERLY WITH CATARACTS

R.L. Menezes^{1,2}, L.P. Paz¹, L. de Andrade Cascalho¹, 1. *University of Brasilia, Brasilia, Federal District, Brazil*, 2. *Brazilian Society of Geriatrics and Gerontology, Rio de Janeiro, Brazil*

Objectives: To investigate prevalence of the fear of falling of elderly with cataracts living in the community and, the associated factors with high concern with falling occurrences. **Methods:** A cross-sectional, analytical and observational study. It was composed by 86 elderly diagnosed with bilateral cataracts. To quantify the fear of falling among elderly, the scale Falls Efficacy Scale-International-Brasil (FES-I-BRASIL) was used. Other variables were obtained through application of a structured questionnaire. **Results:** Between participants, 41.9% reported low concern of falling, while 58.1% reported high concern. From those last ones, 52% fell at least once on the past 12 months and, 30% of them are recurrent fallers. The activities “to walk in slippery surfaces”, “to walk in irregular surfaces” and, “to walk up and down the stairs” represented higher concern for elderly. **Conclusion:** Cataracts or any other visual issue predispose falls due to difficulty in overcoming obstacles present in the

environment. Fear of falling is especially associated with factors acquired after the first fall episode.

ASSOCIATION BETWEEN HISTORY OF FALLS AND SARCOPENIA IN ELDERLY FROM CURITIBA—PARANA, BRAZIL

N.B. Moreira^{1,2}, A.S. Wojciechowski¹, J. Melo Filho¹, A.R. Gomes¹, M.C. Silveira¹, A.L. Rodacki¹, P.C. Bento¹, 1. *Federal University of Paraná, Brazil, Parana, Brazil*, 2. *Dom Bosco College, Curitiba, Parana, Brazil*

Sarcopenia and falls has been denoted as a consistent indicator of frailty and mortality among the elderly. This study verified the association between history of falls and sarcopenia of elderly users of Public Health Units from Curitiba – Paraná, Brazil. This observational cross-sectional study assessed 815 elderly subjects (157 men; 70.9 ± 7.6 years-old and 658 women; 70.8 ± 7.0 years-old). Sarcopenia was diagnosed and classified according to the European Working Group on Sarcopenia in Older People (EWGSOP) recommendations: calf circumference (< 31 cm), 8m gait speed (< 0.8 m/s) and strength handgrip (< 20 kg and < 30 kg for women and men, respectively). The stages of sarcopenia were classified in pre-sarcopenia, sarcopenia and severe sarcopenia. The history of falls was obtained by questioning subjects the number of falls experienced in the last 12 months. The Ordinal Logistic Regression and Odds Ratio (OR) were used to determine the association between variables. The prevalence of sarcopenia was 3.1% (0.4%, $n=3$ for men and 2.7%, $n=22$ for women). Thirty-seven percent ($n=304$) reported at least one fall in the last 12 months, from which 20.9% experienced a single fall episode ($n=171$). There was an association between the number of falls and severe sarcopenia ($OR=2.45$, $p=0.001$, $95\%CI=0.99-3.90$), whereas the remaining stages showed no significant association between sarcopenia and history or number of falls ($p>0.05$). Elderly suffering from severe sarcopenia presented two and a half times more chances to fall. This association reveals the importance of intervention program to prevent sarcopenia in an attempt to reduce the number of falls among the elderly.

IMPACT OF AN ONLINE COGNITIVE TRAINING PROGRAM IN OLDER ADULTS AT RISK FOR FALLS

H.J. Thompson^{1,2}, G. Demiris¹, E. McGough¹, T. Eagen¹, 1. *University of Washington, Seattle, Washington*, 2. *Harborview Injury Prevention and Research Center, Seattle, Washington*

The primary cause of traumatic injuries in older adults is falls. For persons with cognitive impairment, fall risk is substantially higher primarily related to changes in executive function. There is a growing interest among older adults with regards to cognitive training (CT) for maintenance or improvement of cognitive function. It has been speculated that performing CT might reduce risk of fall in older adults as higher-level cognitive functions have been implicated as required to safely navigate one’s environment. The purpose of the current quasi-experimental study was to explore the effectiveness of an online CT intervention on gait speed and balance tests in older adults at high risk for falls ($N=24$). Subjects meeting criteria were enrolled in the study for 12 weeks and following baseline assessment, received 8 weeks (3 sessions/week) of an online CT program. The

intervention targeted specific tasks such as processing speed, divided attention, and task shifting. Mean age of participants was 83.6 (SD 8.4). 62.5% of participants were at least moderately comfortable with computers at baseline. There was a statistically significant improvement from baseline on the 90 second balance test, which was retained 4 weeks post-intervention ($p < 0.05$). Gait speed on the 10M walk remained unchanged from baseline during or 4 weeks following the intervention. This intervention is a promising strategy to improve balance and reduce risk of fall in older adults at high risk. Further study in a larger randomized, controlled trial is warranted.

ASSOCIATION OF TELOMERE LENGTH WITH FUNCTIONAL IMPAIRMENTS: DATA FROM NHANES 1999–2002

J.A. Batsis¹, R.T. Emeny¹, T.A. Mackenzie¹, E. Vasquez², C.M. Germain³, P. Rippberger⁴, S. Bartels¹, 1. *Medicine, Geisel School of Medicine at Dartmouth, Lebanon, New Hampshire*, 2. *SUNY Albany, Albany, New York*, 3. *Duke University, Durham, North Carolina*, 4. *University of New England College of Osteopathic Medicine, Biddeford, Maine*

Background: Telomere shortening is associated with chronic diseases yet its relationship with everyday functional impairments has not been well characterized. We sought to characterize the association of telomere length with physical limitations (PL) as well as basic and instrumental activities of daily living (ADL) in a non-institutionalized population of older adults.

Methods: The sample consisted of 2672 adults aged ≥ 60 years from the 1999–2002 National Health and Nutrition Examination Surveys. Data on physical limitations (PL), instrumental activities of daily living (ADL) and basic ADLs were abstracted. Telomere length relative to standard reference DNA (T/S ratio) was assessed using quantitative PCR. We created separate multivariate regression models to examine the association between telomere length and the presence/absence of limitations (PL, basic/instrumental ADL), adjusting for age, race, education, gender, smoking, co-morbidity, and physical activity.

Results: The majority of the sample was female (55.5%). Mean age was 70.9 ± 0.28 years. Prevalence of PL, basic ADLs and instrumental ADLs were 54.0, 43.3 and 27.5%. Mean telomere length (\pm SE) in those with as compared to those without limitations was: PL 0.90 ± 0.02 vs. 0.93 ± 0.02 , $p = 0.03$; basic ADL 0.90 ± 0.02 vs. 0.91 ± 0.02 , $p = 0.29$; and instrumental ADL 0.92 ± 0.02 vs. 0.89 ± 0.02 , $p = 0.02$. Multivariable modeling adjusting for all covariates demonstrated that the presence of impairments were not associated with telomere length ($\beta \pm$ standard error); for PL $\beta = -0.013 \pm 0.01$, $p = 0.29$, for basic ADL $\beta = 0.01 \pm 0.01$, $p = 0.37$, and for instrumental ADLs $\beta = -0.01 \pm 0.01$, $p = 0.31$.

Conclusions: Older individuals with PL and instrumental ADL had shorter TL but a significant association was not observed after adjustment for confounding factors. Our results suggest having such a deficit abrogates the benefits of longer telomere length in individuals with these impairments.

PREVALENCE OF FUNCTIONAL DISABILITY AND ASSOCIATED FACTORS IN OLD AGE: A POPULATION-BASED STUDY

J.S. Nascimento^{3,4}, V.G. Moreira^{3,5}, M. Pegorari², M. Mapelli², D. Tavares², R.A. Lourenço^{3,5}, 2. *Triângulo Mineiro Federal University, Uberaba, Brazil*, 3. *State University of Rio de Janeiro, Rio de Janeiro, Rio de Janeiro, Brazil*, 4. *Federal University of Rio de Janeiro, Rio de Janeiro, Brazil*, 5. *Pontifical Catholic University of Rio de Janeiro, Rio de Janeiro, Brazil*

The aim of the present study was to estimate the prevalence and associated factors of disability in older people. It was a cross-sectional, observational study, that assessed demographic characteristics, health habits, functional capacity, occurrence of falls and gait speed test in a sample composed by 482 community-dwelling individuals, 80 years old and older, living in the cities of Uberaba and Rio de Janeiro, Brazil. Basic (ADL) and Instrumental (IADL) Activities of Daily Living were the dependent variables in two multivariate logistic regression model. The prevalence of disability for ADL and IADL were 31.5% and 78.2%, respectively; 70.7% were female, 61.4% were widowers, and the average age was 85.36 ($SD \pm 5.05$). Negative health self-perception (OR = 2.09; CI 1.28 – 3.41); higher number of self-reported morbidities (OR = 1.43; CI 1.23 – 1.66); use of five or more drugs (OR = 1.62, CI 1.02 – 2.59); living accompanied (OR = 2.12; CI 1.18 – 3.79) and no individual income (OR = 2.41; CI 1.08 – 5.40) were associated with disability for ADL. For the IADL, negative health self-perception (OR = 2.68; CI 1.53 – 4.69); use of five or more drugs (OR = 2.01, CI 1.17 – 3.46); dissatisfaction with their economic status (OR = 3.21; CI 1.79 – 5.76); lack of education (OR = 5.06; CI 1.14 – 22.46) and the occurrence of falls in the past year (OR = 1.88; CI 1.09 – 3.22). The identification of risk factors in the elderly must be considered in the evaluation and development of care for maintaining and restoration of functional capacity.

STEPPING PERFORMANCE IN OLDER ADULTS: ASSOCIATION WITH THE ACE GENE INSERTION/ DELETION POLYMORPHISM

K. Shuler, J.F. Susic, S.A. Talley, A. Goldberg, *University of Michigan-Flint, Flint, Michigan*

Many factors are associated with stepping performance in older adults, including strength, balance and neuromuscular coordination. The association between genetic factors and stepping performance has not been well studied. Although the angiotensin-converting enzyme (ACE) gene insertion/deletion (I/D) polymorphism is associated with physical performance in older adults, the relationship between ACE genotypes and stepping performance is unclear. The purpose of this study was to examine the association of stepping performance with the ACE gene polymorphism in older adults. Forty community-dwelling adults (mean age 71.6 yrs) performed the 30-Rapid Step test and the Maximum Step Length test. DNA was extracted from saliva using commercially-available kits. The ACE I/D polymorphism was genotyped by 2 PCRs followed by visualization of PCR products on agarose gels. To avoid misidentifying I/D genotypes, an insertion-specific PCR was conducted on all DD samples. Differences in stepping among the genotypes was evaluated using Kruskal-Wallis ANOVA followed by Mann-Whitney U test. Statistical significance was set at $p < 0.05$. There were statistically significant differences in the 30-Rapid Step

test and the Maximum Step Length test among individuals with the 3 ACE genotypes. I/D genotype individuals stepped faster than I/I individuals, and farther than D/D individuals ($P < 0.05$). The ACE gene insertion/deletion polymorphism appears to be associated with deficits in stepping performance in older adults. As poor stepping performance increases risk for falls in older adults, specific ACE genotypes may be associated with increased risk for falls. Knowledge of an individual's ACE genotype may provide added information in evaluating risk for falls in older adults.

PROMOTING ADL INDEPENDENCE IN VULNERABLE ELDERLY: SIX-MONTH FOLLOW-UP OF A PILOT COMPARATIVE TRIAL

C. Liu^{1,3}, D. Clark^{2,3,4}, H. Xu^{2,3,6}, N.R. Keith^{2,3,5}, 1. *Indiana University School of Health and Rehabilitation Sciences, Indianapolis, Indiana*, 2. *Regenstrief Institute, Inc., Indianapolis, Indiana*, 3. *Indiana University Center for Aging Research, Indianapolis, Indiana*, 4. *Indiana University School of Medicine, Indianapolis, Indiana*, 5. *Indiana University School of Physical Education and Tourism Management, Indianapolis, Indiana*, 6. *Indiana University School of Public Health, Indianapolis, Indiana*

Muscle strength is essential but insufficient to reduce ADL disability in older adults. A parallel-group randomized controlled trial was conducted to compare whether adding functional and task-oriented training to resistance exercise would generate a greater improvement on ADL performance relative to resistance exercise alone. Fifty-two older adults who showed muscle weakness, lived a sedentary life style, and had ADL difficulty were recruited from local subsidized housing properties. They received 10 weeks of resistance exercise or the 3-Step Workout for Life, which included practicing functional movements and ADL tasks at home in addition to resistance exercise. The Box and Blocks test, Timed Up and Go, and Assessment of Motor and Process Skills were used to measure physical function and ADL performance. At six-month follow-up, all three outcomes in the 3-Step Workout for Life group were not different from the baseline while the resistance exercise only group showed a significant decline (mean change in the Box and Blocks = -4.05 , $p = 0.02$; mean change in the Timed Up and Go = 1.84 , $p = 0.01$; mean change in the Assessment of Motor and Process Skills = -0.25 , $p = 0.01$). More importantly, the 3-Step Workout for Life group showed a greater improvement in ADL performance when compared to the resistance exercise only group (group mean difference = 0.37 , $p < 0.01$). Adding functional, task-oriented training to resistance exercise may help retain physical function and delay the decline of ADL performance after six months of detraining in vulnerable older adults.

SESSION 540 (POSTER)

ECONOMICS OF AGING, RETIREMENT, PENSIONS, AND FINANCIAL HEALTH

EXPERIENCES OF RETIREMENT LIFE AMONG RETIREES UNDER PENSION SCHEMES COVERAGE IN KENYA

S.M. Mwangi, L. Maina, *Sociology, Kenyatta University, Nairobi, Nairobi, Kenya*

In Kenya, the number of retirees exiting the laborforce with terminal retirement benefits has been on the rise. Retirement benefits are paid in four different modes, as total lumpsum, or partial lumpsum, or monthly pension, or annuities. Although studies have been conducted to examine the income security related to these modes of payment, the experiences of the retirees receiving particularly total lumpsum benefits have not been systematically documented. Thus, the objectives of the study were: to explain the primary characteristics of the Kenyan retirees; document the experiences of retirees receiving total lumpsum benefits; and recommend ways of dealing with these experiences and challenges. A sample comprising of 978 persons aged 55 years and older were recruited from 9 regions of Kenya. Data was collected using a survey questionnaire and focus group discussions. Majority of them were males, rural residents and married and received pension benefits from among the four types of schemes in Kenya: National Social Security Fund, civil service pension, occupational schemes and voluntary pension schemes. Findings indicate that negative experiences (e.g., mismanaging pensions, business failure, and unplanned lending) outweighed positive experiences (e.g., starting and running successful business, building a house). The study recommends that: retirees be encouraged to annuitize their pension savings in case other sources of retirement income may fail; raise the minimum pension amount to dissuade pensioners from investing their retirement savings; conducting business skills training for those exiting the workforce prior to retirement; and encourage prior retirement planning to avoid income pitfalls in retirement.

HOMEOWNERSHIP, SOCIAL INSURANCE, AND OLD-AGE SECURITY IN THE UNITED STATES AND EUROPE

S. Mudrazija, B.A. Butrica, *Urban Institute, Washington, District of Columbia*

Government policies often encourage homeownership as an effective way of building assets and a de facto self-insurance mechanism for old-age security. In the wake of the Great Recession, however, the homeownership rate in the United States has been declining. It may not rebound to its pre-recession peak in the foreseeable future, and it could decline even further. This project compares the United States and 10 European countries to understand the role of homeownership in retirement security, vis-à-vis public and private pensions, and savings. Using panel data from the Health and Retirement Study and the Survey of Health, Ageing, and Retirement in Europe, it explores trends in homeownership among older adults in different countries, both before and following the Great Recession, and examines how the link between homeownership and old-age financial security differs across these countries. The results show that homeownership rate in the United States (64%) is lower than in Southern European countries, and similar or higher compared to Northern and continental European countries. However, older persons in Southern Europe are much less likely than older Americans to tap into housing equity to support their standard of living in retirement. Unlike the United States, European countries have generally not experienced a substantial change in homeownership rates during and following the recent recession, regardless of the difference in

the severity of the economic crisis across countries. A notable exception is population of lower socioeconomic status. The study concludes with a critical comparison of homeownership-related policies in the United States and Europe.

WOMEN'S BASIC FIRST PILLAR PENSIONS IN EUROPE: WHAT FACTORS IMPACT THE AMOUNT?

S. Bould^{1,2}, C. Krekula³, C. Gavray⁴, I. Crespi⁵, R. Eleta-De Filippis⁶, N. Nikolaev⁷, 1. *Gerontology Institute, University of Massachusetts Boston, Somerville, Massachusetts*, 2. *University of Delaware, Newark, Delaware*, 3. *Karlstad University, Karlstads, Sweden*, 4. *University of Liege, Liege, Belgium*, 5. *University of Macerata, Macerata, Italy*, 6. *University of Le Havre, Le Havre, France*, 7. *Alivia Technology, Woburn, Massachusetts*

In all 5 of the countries studied, Germany, Sweden, Belgium, France and Italy, women live longer than men and risk having a lower amount of basic pension. This research examines the variables of age, work experience, marital status, educational level, and number of children as predictors of pension amount for women. Unlike men, marital status has a significant impact on pensions; widows have a higher basic pension amount than married women; never married and divorced women do better than married women in Germany, France and Belgium.

This research uses the SHARE data from Wave 5 to establish the basic pension amount. This pension consists of the state managed retirement pension plus old age pensions. These sources provide the principal income for the majority of retirees in these countries as the wage and salary related private occupational pension has limited impact on post retirement income for this cohort. The sample consists of all women over 65 who do not receive any work related income and report a pension amount for the last year of more than 1000 euro.

Initial results indicate that level of education is a significant predictor of pension amount in all countries studied. The women's education is a factor independent of her work experience and probably reflects her marriage prospects. Years of work experience is a significant predictor of pension amount for all countries except Belgium while the number of children is significant only in Germany. Final results will compare equations for women with those for men.

GENDER IN NEO-LIBERAL RETIREMENT INCOME SYSTEMS: COMPARING THE U.S., UK, AND SINGAPORE

D.A. Street¹, D. Price^{2,3}, 1. *Department of Sociology, SUNY at Buffalo, Buffalo, New York*, 2. *The University of Manchester, Manchester, United Kingdom*, 3. *Manchester Institute for Collaborative Research on Ageing, Manchester, United Kingdom*

A substantial literature highlights how reliance on private sector sources for later life finances systematically disadvantages women. Critics of the neo-liberal policy turn argue that this is because public responsibilities have increasingly been privatized. We critically assess this claim in respect of pensions using a comparative analytic approach to document retirement income systems in the US, UK and Singapore, three liberal countries often regarded as among the vanguard for private arrangements for income. Our conclusions are

derived from critical analysis of national policies and secondary analysis of official statistics. We find that, contrary to prevailing assumptions, Singapore (often referred to as the world's most marketized country) has multiple inbuilt state protections that minimize both risks and gender gaps in later life provision for citizens, and has many of the characteristics of protective state systems. However, in Singapore, the most disadvantaged workers, often migrant women, are neither included in national accounts nor considered as potential recipients of income in later life, thus heavily skewing the results. Such low-paid workers are included in data for the other two countries. The US seems to occupy the middle ground among the three countries. Both US and UK rely heavily on a mixed economy of retirement income; however, the greater state support for public pensions in the US Social Security system leads to categorizing the UK as the country where older women, and older people in general, seem most at risk of poor outcomes in old age.

FINANCIAL LITERACY AND THE ECONOMIC EXPERIENCES OF OLDER ABORIGINAL ADULTS IN CANADA

L. McDonald, E. Relyea, R.M. Mirza, J. Hsieh, K. Mercer, B. MacDonald, C. Aliman, J. Fujioka, *Institute for Life Course and Aging, University of Toronto, Toronto, Ontario, Canada*

Lifelong socio-economic development disparity between Indigenous Peoples and the general population across Australia, New Zealand, the United States, and Canada is a significant risk factor for marginalization in later years (Brascoupé, Weatherdon, & Tremblay, 2013). A scoping review on international financial literacy programs conducted prior to this study indicated the need to address financial knowledge gaps in Indigenous populations, specifically focusing on financial literacy across the lifespan. The findings of this review informed this mixed methods research study, drawing on results from a consensus meeting (n=15), survey (n= 50), and focus group data (n=25) to better understand the financial realities of Canadian elderly Aboriginals who live on and off reserves. The results of the study indicate that the financial capabilities of older Aboriginals are not well understood and that tailored money management initiatives must consider the needs of Aboriginal older adults with lower income. Strategies to improve financial literacy are also complicated by the implications of status, tax-exemptions, gendered income disparities, and band laws. The knowledge gained from this study led to the development of financial literacy resources that address the following issues: navigating financial resources and benefits, saving and education for grandchildren, legal and tax issues, and band issues. The findings from this study are applicable beyond a Canadian context to demonstrate the complexity of financial issues faced by the growing elderly Indigenous communities, and the need for diverse international financial literacy programs to include cultural elements of knowledge translation, cultural relevancy and cultural safety.

GOAL-SETTING TYPOLOGIES EVIDENT AMONG COMMUNITY-DWELLING AUSTRALIAN RETIREES

D. Dudley, K. O'Loughlin, V. Loh, *The University of Sydney, Lidcombe, New South Wales, Australia*

While in many developed nations the transition to retirement is becoming more complex, retirement remains a key milestone in many people's lives. As the time spent in retirement increases, the quality of life of retirees is of growing importance for researchers and policy makers across multiple disciplines. Prior studies into the nature of personal goals in retirement focus on the types of goals retirees have and how these goals shape wellbeing. However, few studies have examined how retirees view goal-setting in a broader lifestyle context, the motivations underlying goal-setting, and how these might change across retirement and with age. This paper will examine these less well understood dynamics of goal-setting.

Data from a series of paired and individual in-depth qualitative interviews with 60 semi- and fully-retired community-dwelling Australians aged between 55 and 90 years, indicate that the process of setting goals and the kinds of goals that are important to retirees appear to shift over time and at different retirement stages. Three typologies are observed in terms of the motivations for goal setting and the endeavours pursued. The first group characterised by those in early retirement or semi-retirement described goals set to create structure, explore new experiences and develop skills. Mid-retirement is characterised by a typology centred on goals which maintain connection with friends, family, and engagement with the broader community often through volunteer work. A third profile, more typical of those in late retirement, is focussed on more practical and modest goals designed to deliver independence and survival.

RETIREMENT ADJUSTMENT-THE EARLY YEARS: A 3 COUNTRY QUALITATIVE COMPARISON

D. Smeaton, *Policy studies Institute, London, United Kingdom*

In a review of psychological perspectives on the changing experience of retirement, Schultz and Wang note (2011: 8) "*retirees actively shape their experiences in retirement. As active selves, retirees reflect on and evaluate their experiences [and] are able to modify their environment to shape their retirement experiences*". Such perspectives emphasise the salience of self-efficacy, agency and proactive behaviour in shaping retired life, but can produce an under socialised conception of the individual agent. In theorising retirement transitions and outcomes it is important to account also for the extent to which retired lifestyles and 'choices' are constrained or facilitated by broader opportunities, cultural context and social structure. Social position, labour markets, welfare and pension systems set the context in which retirement pathways unfold. Opportunities may also be more locally determined, with community hubs, associational activity and local facilities playing an important role in the promotion of social integration.

In order to explore the influence of social context and opportunity structures on the experience of 'retirement' this paper examines a sample of 135 older people aged 55+ interviewed over 3 years as they made the transition from work to retirement in Italy, USA and England – each characterised by distinct cultural orientations and welfare regimes. Using qualitative methods, the paper introduces the voices of these retirees to gain insights into: their retirement journeys; pleasures and disappointments; social roles and activities; and the

opportunities and obstacles encountered in pursuing aspirations. Implications of findings for concepts such as 'successful ageing' and 'active ageing' are highlighted.

WOMEN'S ATTITUDES AND EXPECTATIONS TOWARDS PENSION SAVING FOR RETIREMENT IN THE UK

L. Foster, M. Heneghan, *University of Sheffield, Sheffield, United Kingdom*

Gender differences in the accumulation of pension savings in the UK and beyond are well documented. Such work has concluded that while differing lifetime work profiles (and family history) explained much of the difference, other factors may also be significant. This work, funded by the Fawcett Society in association with Scottish Widows, explores some of these factors through the use of 30 semi-structured interviews and a focus group with women (aged 24–39) about their attitudes and motivations towards pension saving. It identified various themes. These include a lack of knowledge about pension provision, exacerbated by a shortage of relatable and understandable advice in assisting with pension decisions. There was also a tendency to sequence saving, first paying down any debts accumulated at university, and then saving for housing and children, before finally beginning to focus on retirement. The interviews also elucidated a number of observations around the impact of motherhood and childcare with many participants expecting to rely on the pension of their partner in retirement. Women also often alluded to male roles in their pension making decisions, in particular, their father as a key source of advice. Whilst often taking a lead role in other household financial decisions, many women expressed the superior knowledge of their male partners around pensions. These practices may make pension provision appear to be a masculine domain. Following a discussion of these themes this poster will explore potential policy mechanisms to enhance women's pension saving for retirement.

PREDICTING FINANCIAL DISTRESS IN NURSING HOMES: AN APPLICATION OF THE ALTMAN Z-SCORE MODEL

J. Lord, R. Weech-Maldonado, G. Davlyatov, *University of Alabama at Birmingham, Birmingham, Alabama*

From 2000 through 2013, there have been 1,223 nursing home closures. Nursing home closures have a negative impact on the displaced resident's health and the local community (i.e. lost jobs). There are multiple factors that attribute to a nursing home closure; however, financial performance plays a significant role.

The purpose of this paper is to examine the probability of nursing home failure via the Altman's Z-Score bankruptcy prediction model. The Altman Z-score model is a discriminant function derived from a multiple discriminant analysis (MDA). The MDA generates a weighted linear function of the financial ratios that "best" discriminates between the group of firms in financial distress and those not in financial distress. Financial ratios include income and balance sheet ratios to assess the organization's liquidity, profitability, efficiency and insolvency. This study will require the establishment and validation of new weight coefficients in order to properly predict if the organization is financially healthy or risky. This study

utilized facility level data from the Medicare Cost Reports from 2000 to 2013. The sample size will be approximately 15,600 facilities per year. Hospital-based skilled nursing facilities, government facilities and nursing homes that receive no Medicare will be excluded from the study.

The validated Altman's Z-score model for nursing homes can serve as a tool for policymakers to identify nursing homes under financial distress. This can facilitate interventions targeting nursing homes that are at risk of closure.

FROM THE CFO TO THE BEDSIDE: AN EXAMINATION OF NURSING HOME FINANCIAL DISTRESS ON QUALITY

J. Lord, R. Weech-Maldonado, G. Davlyatov, *University of Alabama at Birmingham, Birmingham, Alabama*

From 2000 through 2013, there have been 1,223 nursing home closures. Nursing home closures have been shown to have a negative impact on the displaced resident's health. Displaced nursing home residents often face significant detrimental health effects, such as, a decrease in social engagement and with activities of daily living. Nursing homes that typically close do so because of financial difficulties.

This paper will examine the quality of care delivered in nursing homes under financial distress. This study will use 2000–2013 data from the Medicare Cost Reports, the Online Survey Certification of Automated Records (OSCAR), Certification and Survey Provider Enhanced Reports (CASPER), Long-Term Care (LTC) Focus, and the Area Resource File. The sample size will be approximately 15,600 facilities per year. The dependent variables consist of quality variables that include RN, LPN, and CNA staffing ratios, residents with catheters, restraints, pressure ulcers, bowel incontinence, bladder incontinence, hospitalizations, re-hospitalizations, and facility quality of care deficiencies. The independent variable will consist of a dichotomous variable identifying where a nursing home is in financial distress as calculated by the validated Altman Z-score. Control variables include for-profit status, size, acuity index, and market competition (Herfindahl Index). Data are analyzed using fixed effects regression and lagged independent variables.

If financial distress is correlated with inferior resident quality care, this should illuminate some reasons for disparities in the delivery of care of long-term care. Understanding how organizational performance is correlated with resident care quality has the potential to provide insights on how to address and improve patient care delivery.

THE 2015 ELDER ECONOMIC SECURITY STANDARD INDEX: GEOGRAPHIC AND DEMOGRAPHIC ASPECTS

Y. Li¹, P. Xu¹, J.E. Mutchler¹, J. Lyu³, *1. Gerontology, UMass Boston, Boston, Massachusetts, 3. Institute of Aging, Hallym University, Chuncheon, Korea (the Republic of)*

The Elder Economic Security Standard Index (Index) offers a cost of living standard for independent, community-dwelling singles and couples aged 65 and older, calculated for every county in the United States. The Index includes local cost of housing, food, transportation, healthcare, and other expenses. Annual costs of living are calculated under three housing scenarios: homeowners with a mortgage, homeowners without a mortgage, and renters. Across these scenarios, the Index shows

that cost of living increased 1% - 7% for seniors from 2011 to 2015. National summaries indicate that for singles in good health, annual Index values range from \$19,872 to \$30,516; for couples, they range from \$30,288 to \$40,932. Single homeowners in good health and without a mortgage have the lowest cost, whereas couple homeowners in poor health and with a mortgage have the highest cost of living. We illustrate spatial variation in cost of living for older adults using maps and spatial analysis techniques. Further analysis highlights gaps between cost of living and the typical Social Security benefit; these gaps also differ substantially across geographic areas. Locations in which the cost of living for seniors has increased most markedly between 2011 and 2015 are identified. We also identify gender, race, and age segments within the older population that are most substantially impacted by spatial inequality in cost of living for older adults. Resources for adults who are older, female, or of a racial or ethnic minority group are more likely to fall below the Index value.

EXAMINING ORGANIZATIONAL AND MARKET FACTORS ASSOCIATED WITH NURSING HOME FINANCIAL DISTRESS

J. Lord, R. Weech-Maldonado, G. Davlyatov, *University of Alabama at Birmingham, Birmingham, Alabama*

From 2000 through 2013, there have been 1,223 nursing home closures. Nursing home closures have a negative effect on the health of the displaced resident as well as adverse societal implications (i.e. lost jobs and reduced access). This paper will focus on the market and organizational contextual factors associated with nursing homes that are under financial distress.

This study will use 2000–2014 data from the Medicare Cost Reports, the Online Survey Certification of Automated Records (OSCAR), Certification and Survey Provider Enhanced Reports (CASPER), Long-Term Care (LTC) Focus, and the Area Resource File. Organizational factors such as chain affiliation, for-profit status, staffing, occupancy rates, acuity index, payer-mix, age of facility, and other related organizational factors will be explored. The market forces like a county's level unemployment, per capita income, percent of minority population, education levels, community size (rural vs. metropolitan), managed care penetration, Medicaid reimbursements and level of competition will also be explored. The independent variable will consist of nursing homes in financial distress as calculated by the validated Altman Z-score. Using regression analysis with state and year fixed effects, the study will examine the impact of these factors on nursing home financial distress.

Unfortunately, nursing home closures do not impact all communities the same. Nursing home closures may disproportionately impact certain ethnic/socio-economic areas. The identification of market and organizational contextual factors that are predictors of financial distress can complement prediction models based on financial indicators, and further assist policymakers in targeting nursing homes at risk of closure.

BARRIERS AND FACILITATORS OF RETIREMENT SAVINGS FOR PRE-RETIRES IN THE UNITED STATES

L. Sullivan, *Brandeis University, Waltham, Massachusetts*

The retirement landscape is undergoing significant changes in the United States as employer benefits are increasingly

being scaled-back and public social insurance programs for older adults face growing financial costs. Much public policy dialogue today focuses on shifting more and more of the burden of preparing for retirement onto individuals. However, many households have limited retirement savings and six in ten older households (65+) receive the majority of income from Social Security benefits. In the current context, more knowledge is needed regarding the experiences of households as they save for retirement. This paper aims to enhance our understanding of the factors that aid or hinder individual savings for retirement. Using semi-structured interviews to collect qualitative data regarding the savings experiences of 16 pre-retirees (ages 50–65), the research explores the underlying dynamics of retirement savings for households approaching retirement. Findings reveal four substantial barriers to retirement savings including: 1.) insufficient financial knowledge; 2.) difficulties with intertemporal decision-making; 3.) low capacity to save; and 4.) economic shocks during the life course. The two key facilitators of secure retirement prospects were: 1.) inheritance; and 2.) defined-benefit pensions for those who had stable careers with a single employer. With traditional pensions on the decline and many families without family wealth, the savings barriers outweigh the facilitators for most families in the sample. The discussion highlights the limitations of policy proposals that rely primarily on individual savings solutions for upcoming cohorts of retirees and suggests the importance of bolstering public programs such as Social Security.

SESSION 545 (POSTER)

EXPERIENCES OF OLDER ADULTS AND CAREGIVERS

HOW DO ELDERLY PEOPLE IN NEED OF CARE EXPERIENCE TRANSITION TO A LONG-TERM CARE FACILITY?

K. Krug, C. Boldt, S. Strupeit, *Nursing Science, Munich University of Applied Sciences, Munich, Germany*

As the average length of stay of nursing home residents is decreasing, more elderly people are experiencing the transition to a nursing home. This is a critical life event for those affected. The purpose of this study was to examine how elderly people in need of care experience transition to a long term care facility. Fifteen elderly people in Bavaria, who recently moved to a long term care facility, were interviewed about their experiences during the process of admission. They were asked to speak about the problems they were facing and how they managed to adapt to their new living situation. The theoretical background of this study was based on the diathesis–stress-model and the action-theoretical-model about the transition to a nursing home. The nursing home residents were facing great changes in their lives. They had to leave their home, had to choose from among their properties those, which should be disposed of or earmark any properties, they may wish to bring with them.

The greatest problems were to find social contact among the other residents and how to deal with the nursing staff shortage and great losses among their new social setting.

It was concluded that nursing staff plays an important role for new nursing home residents, as they are the first

social contacts to make. Nurses should observe their behavior and support them when in need.

RESIDENTS' SATISFACTION WITH CROSS-CULTURAL CARE IN RESIDENTIAL CARE HOMES: A CROSS-SECTIONAL STUDY

L. Xiao¹, E. Willis¹, A. Harrington¹, D. Gillham¹, A. De Bellis¹, W. Morey², L. Jeffers³, *1. School of Nursing & Midwifery, Flinders University of Australia, Adelaide, South Australia, Australia, 2. Resthaven Inc. Australia, Adelaide, South Australia, Australia, 3. AnglicareSA Inc. Australia, Adelaide, South Australia, Australia*

Introduction: In Australia residents in aged care homes and staff who care for them come from diverse cultural and linguistic backgrounds. This characteristic of diversity challenges aged care service providers to provide high-quality care for residents.

Method: The aim of this study was to examine the level of satisfaction with cross-cultural care services from Australian-born and Overseas-born residents. A cross-sectional survey was used to collect data in four care homes. A residential cross-cultural care service questionnaire was used in the survey. Two open-ended questions were included to give residents to comment on their perceptions of cross-cultural interactions with staff.

Results: In total, 123 residents completed the survey with a return rate of 31.1%. The median age of residents was 87 years of age. The length of stay in the care home was 12 months. Overseas-born residents made up 28% of the participants in the survey and they were from 10 countries. There was no significant difference between the Australian-born group and the Overseas-born group in terms of satisfaction with a whole range of care services. There were three categories identified from residents' comments: (1) the need to improve cross-cultural communication with staff, (2) the need to meet dietary preference for residents, (3) needs-based training programs for staff to improve cross-cultural integrations.

Conclusion: Australian-born and the Overseas-born residents may experience similar challenges to adapt to a cross-cultural care environment. Regular staff training to address residents' expectations of care services is one way to foster high-quality cross-cultural care.

SUPPORTING PEOPLE WITH DEMENTIA AND FAMILY CARERS IN TRANSITION TO NURSING HOME: A SYSTEMATIC REVIEW

A. Stephan¹, C. Müller^{1,2}, G. Meyer¹, S. Lautenschläger³, *1. Institute for Health and Nursing Science, Martin Luther University Halle-Wittenberg, Halle (Saale), Germany, 2. University of Cooperative Education in Health Care and Welfare Saarland, Saarbrücken, Germany, 3. University of Applied Sciences, School of Social Sciences, Saarbrücken, Germany*

During the transition of people with dementia from home to nursing home, family carers often feel insufficiently prepared and burdened, and people with dementia often show behavioral and neuropsychiatric symptoms.

A systematic review was conducted according to the Cochrane Handbook for Intervention Reviews and the protocol registered in PROSPERO. Reporting follows the

PRISMA statement. MEDLINE, CENTRAL, PsycINFO, CINAHL, OTseeker, and PEDro, were searched, additionally Google Scholar and ALOIS. The Cochrane Risk of Bias tool was used for critical appraisal. The development and evaluation of interventions were appraised according to recommendations of the UK Medical Research Council on complex interventions. Findings were synthesized narratively.

The search yielded 1,278 records. Five studies were included, all performed in the US. The interventions identified were individual and family counseling via telephone or ad hoc, addressing solely the informal carers. Data on efficacy were inconsistent. Significant effects were found concerning less depressive symptoms, burden, feeling of guilt, emotional distress, overload, and influence on interactions with staff. Other outcomes, i.e. stress, adaptation to placement, role overload, role captivity, were not statistically significantly affected. The risk of bias across studies varied from moderate to low. Only two studies tested the feasibility of the intervention before full scale evaluation, none evaluated the implementation process.

We identified a small number of studies with heterogeneous outcomes; evidence regarding the effectiveness of psychosocial interventions is thus insufficient. Reporting on the feasibility and the implementation process of interventions should be guaranteed, since it is crucial to evaluate the transferability across care settings.

AFRICAN AMERICAN ADRD FAMILY CAREGIVER PERCEPTIONS OF CAREGIVING AND SELF-CARE

F. Cothran¹, O. Paun¹, L.L. Barnes², 1. *Rush University College Nursing, Chicago, Illinois*, 2. *Rush Alzheimer's Disease Center, Chicago, Illinois*

Over 5 million persons are affected by Alzheimer's disease or related dementia (ADRD), which is a growing public health issue, with 75% of family caregivers providing care in the community. There are considerable mental and physical health costs impacting ADRD family caregivers, with research aimed at testing interventions designed to improve health outcomes of ADRD family caregivers. However, African American ADRD family caregivers are underrepresented in ADRD family caregiving intervention research, where little is known about how they experience the caregiving process and manage their own mental and physical health as a result of the caregiving process. The purpose of this study was to examine African American ADRD family caregivers' perceptions of the caregiving experience and self-care practices during the process of caregiving. Twenty-four, 90-minute semi-structured individual interviews were conducted with African American ADRD family caregivers. Common themes will be presented, where findings will further inform the design and implementation of a culturally tailored intervention to meet specific needs and improve the health of African American ADRD family caregivers.

EXPERIENCE OF ONE'S AGING: AGING KNOWLEDGE AND ROLE MODELS' INFLUENCE

E. Salina, C. Salaün, P. Jamin, D.S. Jopp, *University of Lausanne, Institute of Psychology, Lausanne, Switzerland*

Social relations may impact both what we know about aging and how we evaluate our own aging process. Yet, these influences are empirically not well established or understood.

Aging knowledge contributes to how we evaluate perceived age-related changes (Moliner et al., 2008). Role models influence the way of leading our lives (Lockwood et al., 2005). The present study examines these factors regarding their links to aging satisfaction.

A total of 389 individuals, aged 17 to 99 years (M = 45.61; 57.6% females) indicated their aging knowledge sources (i.e., TV, press, formation, family, other social contacts) and reported which specific person they had in mind when thinking about aging and the valence of these role models.

Over half of the participants (53.7%) mentioned family as main source of aging knowledge, followed by TV (5.7%) and education (3.1%). The younger participants were, the more they indicated that TV was their most important source of aging knowledge (F=4.289; p<.05). Family members were mentioned most often as role models (71.5%), and most of them were positive (55%; negative models: 11.8%). Individuals with family role models also reported to have their primary aging knowledge from the family (ch²=23.38, p<.001). Having positive role models was associated with higher aging satisfaction. Having a positive family role model was marginally linked to higher aging satisfaction (p=.05).

Results suggest the importance of the family for our aging process. It is an open question how TV or education could be used to better inform individuals about actual aging researches.

PERSONALITY, HEALTH BEHAVIOR, AND MORTALITY IN THE VERY OLD

T. Hirata¹, Y. Arai¹, M. Takayama¹, Y. Osawa², Y. Abe¹, T. Iinuma³, M. Fukumoto³, M. Takayama⁴, 1. *Keio University School of Medicine, Tokyo, Japan*, 2. *National Institute of Health / National Institute on Aging, Baltimore, Maryland*, 3. *Nihon University School of Dentistry, Tokyo, Japan*, 4. *Keio University Science and Technology, Yokohama, Kanagawa, Japan*

Growing evidence suggests that personality trait is associated with longevity, however, the mechanistic link has not been fully elucidated. The aim of this study was to investigate the association between personality traits and longevity and to investigate mediating pathways of this link in the very old. In a cohort of 460 senior (200 men and 260 women) aged 85 years or older living in the community, personality traits were assessed with NEO five-factor inventory, which consists of conscientiousness, agreeableness, neuroticism, openness, and extraversion. Activity of daily living (ADL), Cognitive function (mini-mental state examination), wellbeing (WHO5), leisure time physical activity (time spent for walking and exercise per week), denture wearing during sleep at night, and body mass index were assessed at the baseline, and all-cause mortality was followed-up for 6 years. Extraversion and conscientiousness showed significant positive association with wellbeing and physical activity, while neuroticism was negatively associated with wellbeing and cognitive function. Agreeableness was associated with being woman and wellbeing. During the study period, 151 (32.8%) persons died. In a multivariate cox proportional hazard model adjusted for demographics and potential confounders, only neuroticism was significantly associated with all-cause mortality (hazard risk for the highest tertile, 1.63, 95% confident interval, 1.05–2.52, p=0.029). Our results suggest that extraversion

and conscientiousness were associated with wellbeing and health behavior; however, the two traits has limited impacts on mortality beyond 85 years. Neuroticism was significantly associated with mortality independently from wellbeing, cognition, and health behaviors.

SESSION 550 (POSTER)

FAMILY AND INTERGENERATIONAL RELATIONSHIPS I

PARENT-CHILD RELATIONSHIP AND FILIAL PIETY AFFECT PARENTAL HEALTH AND WELL-BEING

H. Hsu, *Asia University, Taichung, Taiwan, Taiwan*

Purpose: Filial piety and family-centered concepts were previously the core of Taiwanese culture. However, the meaning and effects of these traditional concepts may have changed with the dramatic social evolution in Taiwan. The purpose of this study is to examine the effects of social exchanges, filial piety and adult children's concept of family on the health and wellbeing of their parents. **Methods:** Panel data were obtained from the "Panel Study of Family Dynamics," years 2005 to 2011. The sample comprised parents and their adult children who participated in the survey from 2005 to 2011. In total, 208 people and 1,336 observations were included for analysis. Factor analysis and generalized linear modeling with repeated measurements were applied. **Results:** The parent-child relationship predicted self-rated health for both fathers and mothers and predicted the life satisfaction of mothers. Filial piety was positively related to the self-rated health of mothers but was negatively related to the self-rated health of fathers. Other dimensions of filial piety and family concepts were not significant. **Discussion:** The parent-child relationship probably matters more than filial piety in the health and wellbeing of Taiwanese middle-aged and young adults. Such reciprocal harmonious relationships need the investment of time and an empathic perspective of the other's needs from both parents and adult children. A new paradigm of filial piety or the parent-child relationship is evolving.

BETWEEN ADULT CHILDREN AND PARENTS: MULTIGENERATIONAL SUPPORT EXCHANGE AND WELL-BEING IN MIDLIFE

J. Lin, C. Huang, C. Yu, *National Taiwan Normal University, Taipei, Taiwan*

This study examined a typology of multigenerational support exchange of individuals in mid-life, their aging parents and adult children. The relationships between multigenerational support exchange and a mid-life individual's life satisfaction were explored. Using data from the 2011 Taiwan Social Change Survey (Institute of Sociology, Academia Sinica, Taiwan, 2011), the Family Module consists of an island-wide sample of 2,135 adults aged 18 years old and above who were randomly chosen using a multi-stage stratified sampling method and interviews. In this study, only subjects aged between 40 and 64, with at least one aging parent (aged 65 and above, G1) still alive and one adult child (aged 18 and above, G3) were analyzed. Four types were found for multigenerational support exchange: (a) Give support to aging parents, (b) Support up and down, (c) Supported by

adult child, and (d) Low exchange. Middle-aged adults, who gave support to their aging parents and adult children, the "Support up and down" type, were most unsatisfied with life. Cultural values reinforce the meaning and expectations of intergenerational support and shape the outcomes.

DEPRESSION IN CHILDREN RAISED BY THEIR GRANDPARENTS VS. FOSTER PARENTS: THE IMPACT OF PARENTING STYLE

D.K. Nadorff, *Psychology, Mississippi State University, Mississippi State, Mississippi*

Over 5.4 million children within the US are raised by their grandparents, and yet, little research has been done on the developmental, emotional, and behavioral outcomes of these children. Most studies have used a comparison group of children raised in typical family settings, which proves an unfair comparison group, as so many of these "custodial grandchildren" have been placed into their grandparents' care as a result of parental trauma. The purpose of the current study is compare the mental health of children raised by their grandparents with those raised by a foster parent.

Participants were 323 grandparents raising their grandchildren, and 105 foster parents, recruited via Qualtrics Panel Service. The mean age was 50.44 years. The sample was 83.9% female, 58.6% were married, 17% were racial minorities, and 52% were employed. Measures included Angold & Costello's Mood and Feelings Questionnaire, which assesses children's depressive symptoms, and Frick's Alabama Parenting Questionnaire, which assesses the amount of warmth, consistency in discipline, and the amount of supervision that caregivers apply while parenting their children.

Children raised by their grandparents had significantly lower levels of depressive symptoms than those raised by foster parents. Grandparents also reported significantly higher levels of consistent discipline practices and higher supervision of their grandchildren. Mediation analyses found that the relation between caregiver type and children's depressive symptoms was significantly mediated by both supervision level and consistency in discipline. These results suggest that caregivers' discipline and supervision are two appropriate targets for interventions on children's depressive symptoms.

INHERITED STEPGRANDPARENT-STEPGRANDCHILD RELATIONSHIPS

C. Sanner, L.H. Ganong, M. Coleman, *Human Development and Family Science, University of Missouri, Columbia, Missouri*

Stepgrandparent-stepgrandchild relationships have increased in number. Although researchers have suggested that multigenerational steprelationships may be important, little is known about the relational processes involved in the development of these ties. Further, researchers have seldom differentiated between stepgrandparents who are the spouse of a biological grandparent, and those who are the parents of a stepparent (i.e., *inherited stepgrandparents*). These individuals "inherit" stepgrandchildren when an adult child becomes a stepparent by marrying someone with children from a previous relationship, thereby gaining a son- or daughter-in-law in addition to stepgrandchildren through their child's remarriage. Inherited stepgrandparents are different from other stepgrandparents

in that they did nothing to acquire their new status, making the stepgrandparent-stepgrandchild relationship mutually involuntary. The purpose of this study was to explore the development of stepgrandchildren's relationships with inherited stepgrandparents. Interviews with 43 inherited stepgrandchildren (aged 19–35) revealed variation in quality, frequency, and type of interactions with stepgrandparents. Stepgrandchildren ranged from having met their stepgrandparents once or twice (being unable to even recall their names) to receiving daily after-school care from stepgrandparents or sharing weekly family meals. These intergenerational step-relationships were close when stepgrandchildren were young when the relationships began, when relationship quality between middle-generation stepparents and the stepgrandparents were positive, and when stepgrandchildren were receptive to stepgrandparents' affinity-building efforts. The quality of stepgrandchildren's relationships with their stepparents, how they perceived their inherited stepgrandparents (i.e., as kin or not kin), and logistical conditions (e.g., distance, contact frequency) also were relevant. We explore the implications of these relationships for older adults.

HISTORY OF MATERNAL CHILDHOOD MALTREATMENT AND LATER-LIFE SOLIDARITY WITH THE ABUSIVE MOTHER

J. Kong, *Pennsylvania State University Center for Healthy Aging, University Park, Pennsylvania*

Studies based on the life course perspective have identified several mechanisms by which childhood maltreatment has a long-term negative impact on the adult victim's psychological functioning. However, little is known about whether and how later-life solidarity with the abusive parent plays a role as a potential mechanism. Thus, this study aims to address this gap in the literature by examining the mediating effect of later-life intergenerational solidarity with the abusive parent in the association between maternal childhood maltreatment and psychological well-being/depressive symptoms.

Using the 2004–2005 data from the Wisconsin Longitudinal Study, this study employed a structural equation modeling approach to analyze a total of 1,371 adults aged 65 years old. Results showed that maternal childhood maltreatment was associated with lower associational, affectual, and consensual solidarities with aging mothers. In addition, a mediation analysis showed that the association between a history of maternal childhood maltreatment and psychological well-being of the adult children was significantly mediated by affectual solidarity with the aging mother.

The findings of this study suggest that practitioners may support adults with a history of childhood maltreatment by unangling unresolved issues with their abusive parent. Policy support should be in place to address the concerns of adults with a history of childhood maltreatment through systematic and societal efforts.

MARITAL QUALITY OF GRANDPARENTS CARING FOR GRANDCHILDREN

S. Wang, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

High quality of marital relations has protective effects on older adults' mental and physical well-being. However,

few studies examined how providing grandchild care affect grandparents' marital quality. This study distinguished three grandchild care types and examined their associations with grandparents' marital quality.

The sample consists of married grandparents aged 45 and over from the 2008, 2010 and 2012 waves of the Health and Retirement Study (N=6181, 52% females, mean age = 68). Grandparent caregivers were categorized as primary caregivers (living only with grandchildren), co-parenting caregivers (living with adult children and grandchildren), and babysitting caregivers (not living with grandchildren but providing care). Babysitting care hours over the past two years were differentiated as high (more than 500 hours), modest (200 to 500 hours), low (less than 200 hours), and none (reference group). Marital quality was measured by perceived closeness with spouse.

Primary caregivers reported significantly lower marital quality than grandparents providing no care. Among grandparents with high care hours (500+), grandmothers are less likely to report close marital relations than grandmothers providing no care, whereas there is no association for grandfathers. Higher marital quality is also associated with older couples' better health and fewer dependent children in the household.

Findings suggest that high intensity of grandchild care can undermine marital relations, especially from wives' perspective. Support groups may target primary grandparent caregivers and grandmothers who provide high levels of grandchild care to relieve their care burden. Family therapists may take grandchild care responsibilities into consideration when providing counsel to older couples.

AGING FILIPINO IMMIGRANTS' GENERATIVITY: COLLECTIVISTIC IDEOLOGY AND SOCIOEMOTIONAL DEVELOPMENT

D.A. Augustine¹, D.C. Lewis¹, K.L. Bower¹, S. Young², 1. *University of Georgia, Athens, Georgia*, 2. *Point Forward, Redwood City, California*

This poster presents findings from a qualitative study with transnational Filipino families. Researchers conducted individual and dyadic interviews with 14 Filipino immigrant elders residing in the United States (U.S.). Filipino collectivistic ideologies of interdependence and a focus on family led to reliance of Filipino immigrant elders on social supports in both in the Philippines and in the U. S. These transnational support systems eased stressors associated with immigration and settlement experiences. However, these ideologies, which support a lifestyle of close personal relationships, also spurred participants' development of guilt. Aging far from their homeland, participants cultivated a socioemotional ramification associated with their immigration to the U.S. while also maintaining transnational relationships with family and friends in the Philippines. Participants regretted absences from relatives' and friends' life events (marriages, birthdays, deaths). The avoidance of daily life struggles in the Philippines, while increasing their quality of life in the U.S., further exacerbated feelings of guilt. The combination of guilt and a collectivist ideology of altruism strongly influenced the generativity of participants as they reached mid-life. Preserving their immigration journeys and sacrifices, they strive to pass on knowledge and experiences to the next

generation by educating their children about their Filipino cultural heritage and establishing programs that simultaneously benefit the younger generation and friends and family remaining in the Philippines. This research adds valuable information for those studying the intersection of aging and migration. It provides insights for professionals whose aim is to support successful aging of immigrant elders.

CARING FOR GRANDCHILDREN AND GRANDPARENTS' PHYSICAL AND MENTAL HEALTH CHANGE

J. Yoo¹, A. Karraker², D. Russell¹, 1. *Iowa State University, Ames, Iowa*, 2. *National Institute on Aging, Bethesda, Maryland*

Grandparent caregiving for grandchildren is an important component of intergenerational relationships that may have consequences for grandparent health. Many Asian societies—including South Korea—are aging, and more grandparents are providing care for grandchildren. However, the impacts of caregiving for grandparents' health and well-being in South Korea are not well-known. Using the Korean Longitudinal Study of Aging (KLoSA), we examined how the transition to caring for grandchildren influenced a variety of outcomes related to the health and life satisfaction of grandparents. The participants of this study were 6,372 KLoSA grandparents who had one or more grandchildren from waves 1–4. Outcome variables included grandparents' self-reported health, Activities of Daily Living (ADL), and Instrumental ADL (IADL), as well as grandparents' reported health satisfaction, relationship satisfaction with children, and overall life-satisfaction. We used fixed effects regression analyses to estimate differences in health and life-satisfaction among grandparents who did and did not provide care to grandchildren over consecutive two waves. Our results demonstrate that the health impacts of caring for grandchildren are complex for grandparents. Compared with grandparents who do not care for grandchildren, grandparent caregivers have more difficulties with ADL and IADL. Self-reported health and health satisfaction of grandchild caregivers, however, are not significantly different from non-caregiver grandparents. Grandparent caregivers report greater satisfaction with their relationship with their children as well as with their overall quality of life compared to grandparents who do not care for grandchildren. Taken together, these findings suggest that grandchild care has costs and benefits for the well-being of grandparents.

LOOKING FOR LOVE: ONLINE PROFILE CONTENT OF OLDER AND YOUNGER GAY, LESBIAN, AND HETEROSEXUAL ADULTS

E. Davis, K.L. Fingerma, *University of Texas at Austin, Austin, Texas*

Research on romantic relationship formation has focused primarily on young, heterosexual adults. Of the limited research on dating in late life, even fewer studies address the dating motivations and preferences of older adults who identify as gay or lesbian. Nonetheless, adults of different ages and sexual orientations may have different motivations when seeking dating partners. These differences in motivation may be evident in their self-presentations on dating websites. Consistent with developmental theories, older adults

may be more likely to emphasize existing ties with family and friends, while younger adults may emphasize themselves and their achievements. Additionally, heterosexual adults may be more focused on topics related to traditional mate value, such as occupation, while individuals seeking same-sex partners may be more likely to discuss sexuality and less likely to emphasize family relationships. The current study sampled 400 profiles from a popular dating website. Themes in these profiles were identified using Linguistic Inquiry and Word Count (LIWC; Pennebaker, Booth & Francis, 2007). Regression analyses revealed that younger adults were more likely to mention the self, as evidenced by a greater proportion of first person singular pronouns (I, me) compared to older adults. However, older adults were not more likely to mention ties to friends and family. Further, heterosexual adults were not more likely to mention their occupations than gay or lesbian adults, but gay and lesbian adults were more likely to discuss sexuality in their profiles and less likely to mention family. Results are discussed in terms of evolutionary and developmental theories.

AN INTERNET-BASED, MULTIGENERATIONAL INTERVENTION TO ENHANCE KNOWLEDGE ABOUT CARE PREFERENCES

B.D. Carpenter, E. Kozlov, *Psychological & Brain Sciences, Washington University in St. Louis, St. Louis, Missouri*

Family members find it difficult to communicate about end-of-life care preferences. Yet accurate knowledge about care preferences can enhance a range of outcomes for both patients and family caregivers. In this study we developed and evaluated an Internet-based, multigenerational intervention used with 40 later-life families (130 individuals) to enhance knowledge about care preferences. Conducting this kind of applied research over the Internet presents a range of benefits but also challenges. In this presentation we review both, and share results from the completed intervention. Overall, there was a wide range of knowledge about family members' care preferences, with intraclass correlations suggesting poor to good knowledge. The intervention enhanced knowledge about care preferences in some families but not others, suggesting the value of tailoring communication tools to address unique features of families. This research provides an example of one methodology among the many different approaches likely needed to enhance communication in families.

FAMILIES ACROSS BORDERS: ELDERCARE IN MEXICAN-ORIGIN FAMILIES WITH CHILDREN IN THE U.S.

J.C. Sechrist, *Sociology, McMurry University, Abilene, Texas*

In the nascent body of transnational elder caregiving literature, the empirical data primarily come from studies in Australia and Europe and focus on caregiving at great physical distances. Much less is known about transnational eldercare in the Americas. This study utilizes data from 1,930 parents about their 11,159 non-resident children from the baseline survey of the Mexican Health and Aging Study to examine within-family social support and care Mexican parents receive from their adult children when at least one of those children reside in the United States. The findings indicate that of those parents receiving financial help from at

least one child, 80% of the parents report that the help is from a child residing in the U.S. On the other hand, only 12.4% of parents receiving household support receive that type of support from a child in the U.S. Of those adult children residing in the U.S., males are more likely to send remittances, but there is no gender differences in U.S. children who provide household support. Further, the larger the sibling network, the less likely U.S. children are to provide either financial or household support. This study indicates the primary contribution U.S. resident children make to their parents is monetary, yet there are many who are also attempting to contribute physically to the care of parents in Mexico. The within family dynamics of Mexican parents with children living in the United States warrants continued examination in order to better understand the support systems of these aging parents.

ADULT CHILDREN'S PERCEPTIONS OF UNWANTED ADVICE FROM AGING PARENTS

H. Wang¹, K. Kim¹, S. Zarit², K.L. Fingerma³, 1. *University of Massachusetts Boston, Boston, Massachusetts*, 2. *Pennsylvania State University, University Park, Pennsylvania*, 3. *University of Texas at Austin, Austin, Texas*

Parents and adult children often provide advice to one another in everyday interactions. However, few studies have examined how received advice is perceived (i.e., whether the advice was solicited or not). Unwanted advice can be a source of tensions in parent-child interactions, and may represent longstanding problems in dyadic relationships. Using data from *Family Exchange Study* (Wave 2), the current study examined how adult children's perceptions of unwanted advice from parents are associated with life situations and relationship characteristics. Adult children ($N = 381$, aged 45–65) reported how often they perceived unwanted advice from each parent ($N = 491$). Multilevel models revealed that adult children were more likely to perceive unwanted advice from aging parents when they suffer major life problems (e.g., divorce, major health problem, addiction). This association was also moderated by adult children's relationship quality with older parents. Thus, adult children suffering problems were less likely to perceive advice from parents as unwanted when they had better relationships with parents. Our findings will contribute to the literature by considering how received support is perceived in parent-child relationships, which can be critical in understanding the implications of intergenerational support for well-being.

ADULT CHILDREN'S JOB LOSS AND PARENT-CHILD RELATIONSHIP QUALITY: THE ROLE OF PARENTS' EVALUATIONS

D. Kim, M. Gilligan, *Iowa State University, Ames, Iowa*

The life course concept of linked-lives indicates that intergenerational relationships are shaped by the life events of individual family members. In this paper, we examined how adult children's job loss during the Great Recession impacted parent-adult child relationship quality. In particular, we focused on how employed parents experienced adult children's job loss. In addition, we examined the mediating role of parents' evaluation of themselves and their children

in the association between job loss and parent-child relationship quality.

This study draws on 396 parents (M age = 66.44, SD = 5.71) from the MIDUS wave3 (2013–2014). All of the parents were employed and reported on whether their children experienced job loss in the last year (M age = 41.34, SD = 8.26). To explore how the employment status of children affects the relationship quality between employed parents and their children, we performed linear regression analysis. We conducted mediation analysis to examine the role of parents' evaluation of themselves and their children.

Regression analysis demonstrated that the employment status of children had a negative effect on the quality of parent-child relationship (β = -.107, p < .05). Mediation analysis indicated that parents' positive evaluation of themselves and their negative evaluation of their children helped to explain the association between adult children's employment status and the quality of parent-child relationships.

These findings indicate that adult children's job loss influences the parent-adult child relationship quality. Further, parents' evaluation of themselves and their children mediates this association. Taken together, this research highlights the linked lives between parents and adult children.

GRANDPARENTS PERCEPTIONS OF THEIR ROLE AS SOCIALIZING AGENTS: A QUALITATIVE STUDY

C. Noriega¹, J. Lopez¹, R. Dominguez-Bilbao², C. Velasco¹, 1. *CEU San Pablo University, Madrid, Madrid, Spain*, 2. *Universidad Rey Juan Carlos, Madrid, Spain*

Although most research has focused on grandparents' intensive care engagement, the most common scenario is grandparents providing auxiliary care. Value transmission and caring are the two most important functions developed by grandparents, but grandparents' socializing role has not been studied extensively. Grounded theory method was used to explore how grandparents with grandchildren in primary school perceive their role as socializing agents. 6 focus-group discussions were developed to collect data. A total of 42 grandparents from Madrid participated in this study. The mean age was 71.42 years old, 55% of participants were women, and they were providing care daily (47.62%) or weekly (52.38%). Data were analyzed by three researchers using the constant comparative method. Four themes emerged from data: 1) participants stressed they were not responsible for their grandchildren's education, but recognized the importance of getting involved supporting their adult children's parental role, 2) they stated the need to transmit traditional values, combining warmth and involvement to help grandchildren internalize these values, which they perceived are in decline in current society, 3) participants perceived grandchildren helped them to feel active and useful, increased their life purpose and gave them a second chance to repair the mistakes made with their own children, and 4) some grandparents emphasized some difficulties, such as burden and role ambiguity. Policies recognizing grandparents' contribution to current families and that favor close intergenerational relationships are needed. It should be developed intervention programs that help grandparents to perform their role more successfully and to deal with possible family conflicts.

GRANDCHILD CARE, GENDER, AND FURTHER ROLE OCCUPATIONS: IMPLICATIONS FOR GRANDPARENTS' HEALTH

M. Ates^{1,3}, K. Mahne², M. Wetzel¹, 1. *Doctoral Programme GROW, University of Cologne, Cologne, Germany*, 2. *German Centre of Gerontology, Berlin, 12101, Germany*, 3. *Doctoral Programme GROW, Cologne, 50931, Germany*

Several studies report significant associations between grandchild care and grandparents' health. Auxiliary care is considered to have a positive influence on health outcomes. The relevant literature applies role enhancement theory to explain this link because multiple role occupation might buffer stress emerging from particular roles and promote relevant health resources like self-expression and social support.

Considering role enhancement, we hypothesize that grandmothers face stronger benefits from grandchild care than grandfathers do. We argue that due to gendered role expectations, women are challenged to manage multiple role occupations. The most recent wave of the German Aging Survey (DEAS) shows, that an increasing share of grandparents combine grandchild care and active employment. Especially more elderly women are integrating into labour market, while they are still responsible for domestic work or informal care. The current analysis will therefore apply three waves of the DEAS to illuminate the intersections between auxiliary grandchild care, gender and further role occupations.

Controlling for relevant covariates and health at baseline, preliminary analysis with linear regression models show: Grandparents who repeatedly care for their grandchildren within six years face significant better self-rated health ($\beta=0.16$, $p<0.05$) and physical functioning ($\beta=4.7$, $p<0.01$) than non-caregiving grandparents. Further analysis will test if grandchild care effects differ by gender and if expected differences are driven by multiple role occupation. Furthermore, longitudinal analysis will illuminate whether associations between grandchild care and health can be interpreted as a causal effect. The analysis will additionally apply a latent health measure combining several self-reported and observer-measured health information.

GENDER DIFFERENCES IN THE RELATIONSHIP BETWEEN MARITAL STATUS AND HEALTH-RISK BEHAVIOUR IN GERMANY

R. Hilz, *Gerontological Research on Well-Being (GROW), University of Cologne, Cologne, Germany*

Compared to investigations in America, only a few European studies examined gender differences in the effect of family circumstances on risky health behaviour by older people. In this context, this research deals with the question of whether a higher health-related risk behavior exists among unmarried men and women in Germany. On the one hand, empirical findings indicate a significant effectiveness of marriage as a protective effect. On the other hand, studies disprove this causal connection and emphasize selection effects. To analyse the protection effect of marriage on smoking habits and body weight, the cross-sectional study used two waves from the German Ageing Survey (DEAS). The results of the regression models show the highest probability for an active smoking behavior at divorced and separated living men and women compared to married people. By contrast, widowed

men and unmarried women have lower risk levels. Contrary to the protection approach, unmarried men recorded a lower likelihood of obesity in relation to the body mass index of married men. Accordingly, the assumptions of marriage protective effect on the smoking behavior of men and women could be confirmed. In particular, longitudinal studies are necessary for future studies to improve causality analysis and for the avoidance or control of selection mechanisms.

SESSION 555 (POSTER)

FRAILITY I

BENEFIT OF MANAGING FRAILITY IN DIFFERENT CLINICAL SETTINGS: RESULTS FROM THE FRAILCLINIC PROJECT

A. Pardo, M. Checa, J. Gonzalesturin, T. Guevara, J. Carnicero, S.S. Alamo, L. Rodríguez-Mañas, *Hospital Universitario de Getafe, Getafe, Madrid, Spain*

One of the aims of FRAILCLINIC is assessing the feasibility of programs designed to manage frail older patients attended in different in-hospital settings.

Participants were selected from Cardiology, Major Surgery, and Emergency Room Departments in hospitals in three different European countries. Results here shown come from 109 patients (57 in intervention group) from Spain. Patients were characterized as frail if they met the Fried's criteria or the FRAIL criteria. Patients randomized to intervention group received a full Geriatric Assessment and recommendations were made by a geriatrician to be implemented by the treating physician.

Mean age was 83.4 (SD 5.3) and 61% were female. 61% of all patients were classified as frail using both Fried's criteria and the Frail scale. Risk of delirium was identified in 30% of patients; polipharmacy in 87.5%, constipation in 38.6%, urinary incontinence in 43.8% and visual deprivation in 60%. There were no differences in any of the previous variables between control and intervention groups.

In Surgery, the recommendations were fully (100%) implemented by the treating physicians. This figure was lower in the Emergency Room (89.4%) and Cardiology (50%). Patients in the intervention branch tend to be discharged to their homes more often than those in the control group (97.4% vs 83.7%; $p<0.01$): 100% vs. 75% in Surgery, 100% vs. 78.7% in Cardiology and 95.6% vs. 89.4% in Emergency Room.

Geriatrician's recommendations show a different rate of acceptance by hospital setting, although they improve the outcome of frail older patients.

Supported by Grant 20131208, DG-SANTE. EU.

ASSOCIATION OF FRAILITY PHENOTYPE AND MISTREATMENT

S.D. Piña, J.M. García, J. Avila-Funes, *Geriatrics, Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán, Mexico City, Mexico City, Mexico*

The phenotype of frailty has been related with increased vulnerability for the development of health-related adverse outcomes that could lead to social consequences such as mistreatment. The association between these two geriatric

syndromes has not been widely studied. Therefore the objective of this cross-sectional study was to determine the association between frailty phenotype and mistreatment. 852 community-dwelling subjects aged 70 and older participating in the Mexican Study of Nutritional and Psychosocial Markers of Frailty were included. Mistreatment was defined as one positive answer in the validated Geriatric Mistreatment Scale and Frailty was defined according to the phenotype proposed by Fried et al. The association between frailty phenotype and mistreatment was determined as the main outcome to construct a multivariate logistic regression analysis. The final model was adjusted by age, sex, cognition, depression and disability. Mean age of participants was 77.71 years (SD=6.07) and 54.81% were women. Frailty phenotype and mistreatment prevalences were 13.85% and 19.95% respectively. The unadjusted results showed a positive association between these two phenomena [Odds Ratio (OR) =1.63; 95%CI 1.00 to 2.66, p=0.05]. However, there was no association in the final model (OR=0.86; 95%CI 0.47 to 1.57, p=0.63). The results showed that there is a positive association between frailty phenotype and mistreatment, nevertheless there are confounders such as depression and disability that seem more strongly associated with the latter. However, frailty cannot be excluded as a possible determinant of mistreatment in this population.

THE ASSOCIATION BETWEEN SARCOPENIA AND LUNG FUNCTION IN OLDER AUSTRALIANS

S.C. Yu^{1,2,3}, T. Nguyen², R. Adams⁴, R. Visvanathan^{1,2,3}, 1. National Health and Medical Council Centre of Research Excellence Trans-disciplinary Frailty Research To Achieve Health Aging, School of Medicine, Faculty of Health Science, University of Adelaide, Adelaide, South Australia, Australia, 2. Adelaide Geriatrics Training and Research with Aged Care (GTRAC) Centre, School of Medicine, Faculty of Health Science, University of Adelaide, Adelaide, South Australia, Australia, 3. Aged and Extended Care Services, The Queen Elizabeth Hospital, Central Adelaide Local Health Network, South Australia, Adelaide, South Australia, Australia, 4. Health Observatory, School of Medicine, Faculty of Health Science, University of Adelaide, Adelaide, South Australia, Australia

The relationship of sarcopenia and lung function is uncertain. The aim of the current study is to compare the relationship between sarcopenia using three different definitions for low appendicular skeletal muscle mass (ASM) in combination with low grip strength and lung function in older community dweller. Participants (≥65 years old) were from the North West Adelaide Health Study. Measurements included anthropometric measurements, spirometry and dual energy x-ray absorptiometry of body composition. Sarcopenia was defined as low muscle mass and low muscle strength (<30kg for men and <20kg for women). Low muscle mass was defined as either: a) ASM adjusted to height squared, b) ASM adjusted to height and fat mass; or c) ASM adjusted for body mass index (BMI). There were 470 (53.4% women) subjects. Forced expiratory volume (FEV₁[L]) and forced vital capacity (FVC[L]) were significantly correlated with grip strength and the three low ASM definition. The associations were adjusted for age, gender, smoking and physical activity. After adjustment, ASM adjusted to BMI (β-coefficient -0.33,

P<0.001 for FEV₁ and β-coefficient -0.50, P<0.001) and fat mass definition (β-coefficient -0.26, P=0.04 for FEV₁ and β-coefficient -0.31, P=0.05 for FVC) of sarcopenia remained an independent predictor of lower FEV₁ and FVC. No association between sarcopenia and FEV₁ (β-coefficient -0.05, P=0.52) and FVC (β-coefficient -0.01, P=0.90) when ASM adjusted to height definition was used. Association between sarcopenia and lung functions are noted with some but not all definitions of sarcopenia. As there is a relationship between fat mass and lung function, sarcopenia definitions that account for fat mass may be more relevant in clinical practice.

NUMBER OF MEDICATIONS INCREASES IN COMMUNITY DWELLING OLDER PEOPLE ACCORDING TO THE FRAILTY STATUS

S. Lin¹, I. Aprahamian¹, N.O. Cezar¹, S. Elmadjian², A. Siqueira¹, M. Brito¹, M.S. Yassuda¹, C.K. Suemoto¹, 1. Universidade de São Paulo, São Paulo, São Paulo, Brasil, São Paulo, Brazil, 2. Universidade Anhembi Morumbi, São Paulo, São Paulo, Brasil, São Paulo, Brazil

Polypharmacy is a concern in geriatric practice. This study evaluated if there is difference in pharmacological treatment in a community dwelling frail population. Observational transversal study in a geriatric outpatient facility of tertiary hospital. Patients evaluated from March till September of 2015 were included. Being unable to answer telephone call, FRAIL questionnaire, or having no medical records were excluded. Review of medical records provided: age, sex, schooling level, hypertension, diabetes, dyslipidemia, heart failure, ischemic heart disease, stroke, osteoporosis, depression, dementia, cancer, chronic obstructive pulmonary disease, asthma, Mini Mental, Geriatric Depression Scale, and body mass index. Laboratory included hemoglobin, creatinine, fasting glucose, glycosylated hemoglobin. Medication dispensing program provided medication in use. Data was collected admitting 12 months before the frailty assessment which used FRAIL questionnaire, (robust = 0, pre-frail = 1-2 and frail 3-5). Proxy or patient were interviewed by telephone call. Logistic regression with adjustment for age and sex was performed to evaluate difference in medication.

1185 elderly were elected, 374 were excluded, remaining 811 participants. Age was 81.6 (7.2) years, 72,9% female. 13,8% were robust, 48,5% pre-frail and 37,7% frail. Depression among frail elderly, was 13,4% in robust, 48,5% in pre-frail and 38,1% in frail, p<0,00001. The same occurred to dementia. The other comorbidities had high prevalence but not difference. Total number of medication in use was 8,3 (3,2), logistic regression compared frail elderly to robust showed difference. In the adjusted model, the coefficient was 2,2, p<0,0001, CI 95% 1,5-2,9. There was no difference comparing robust to pre-frail.

ASSOCIATION OF FRAILTY WITH VITAMIN D AND PROCOLLAGEN TYPE I N PROPEPTIDE IN ELDERLY WOMEN

V. Alekna¹, A. Mastaviciute¹, J. Kilaite¹, M. Tamulaitiene^{1,2}, 1. Faculty of Medicine of Vilnius University, Vilnius, Please select region, state or province, Lithuania, 2. National Osteoporosis Center, Vilnius, Lithuania

Objective: This study was aimed to investigate the association between frailty, vitamin D and procollagen type I N propeptide (P1NP) in elderly women.

Methods: Women over 60 years of age with no vitamin D supplementation were included. Frailty status was defined using Fried's criteria, and participants were classified as robust, prefrail and frail if they scored 0, 1–2, 3 points, respectively. Vitamin D and P1NP concentrations in serum were measured with Cobas E411. Multinomial logistic regression was used to determine the associations.

Results: Of 161 women included, 103 were robust, 30 prefrail and 28 frail, with mean age 69.4 ± 6.2 years, 70.8 ± 7.9 and 75.8 ± 6 years, respectively. Vitamin D level was lowest (13.29 ± 6.15 ng/ml) in frailty group and highest (17.57 ± 8.19 ng/ml) – in robust women. Unadjusted analysis in frailty versus robust group (reference category – robust) showed that higher levels of vitamin D were statistically significantly associated with being robust (OR: 0.91, 95% CI: 0.85; 0.97; $p=0.009$), prefrailty versus robust group showed that higher levels of P1NP were statistically significantly associated with being prefrail (OR: 1.01, 95% CI: 1.0; 1.03; $p=0.036$). After adjusting for the age, the association between frailty and vitamin D was not statistically significant. However, the association between prefrailty and P1NP was still statistically significant (OR: 1.02, 95% CI: 1.0; 1.03; $p=0.04$).

Conclusion: In elderly women, higher level of vitamin D is not related to being robust, and higher level of procollagen type I N propeptide is associated with prefrailty.

PREVALENCE OF SARCOPENIA AND ITS ASSOCIATED FACTORS: THE IMPACT OF DIFFERENT CUTOFF VALUES

V.G. Moreira^{1,2}, J.S. Nascimento^{1,2}, R.A. Lourenço^{1,2}, 1. *Internal Medicine, Universidade do estado do Rio de Janeiro, Rio de Janeiro, Rio de Janeiro, Brazil*, 2. *Pontifícia Universidade Católica do Rio de Janeiro, Rio de Janeiro, Rio de Janeiro, Brazil*

Aim: To estimate the prevalence of sarcopenia and its associated factors in community-dwelling elderly living in Rio de Janeiro, Brazil, and to discuss the impact of different handgrip strength and gait speed cutoff values on sarcopenia frequencies.

Method: The health habits, functional capacity, and anthropometric measures of 745 individuals 65 years old and older from the Frailty in Brazilian Older People study were analyzed. They were classified into four diagnostic strata: no sarcopenia; pre-sarcopenia; sarcopenia; severe sarcopenia. Univariate and multivariate regression analyses were performed. Handgrip strength and gait speed cutoff thresholds tailored to the sample population and those proposed through a consensus of experts by the European Working Group on Sarcopenia in Older People were used to compare sarcopenia prevalences.

Results: The average age was 76.6 years, 70.3% were female, and 61.9% were Caucasian. The sarcopenia prevalence was 10.7 and 18% using the sample-tailored and the European consensus cutoff values, respectively. Sarcopenia was associated with advanced age (OR: 37.2; 95% CI: 12.3–112.4), Caucasian race (OR: 1.81; 95% CI: 1.02–3.52), single marital status (OR: 6; 95% CI: 2.2–16.39), low income

(OR: 3.64; 95% CI: 2.58–8.39), and comorbidities (OR: 3.26; 95% CI: 1.28–8.3).

Conclusion: In this study, the estimated prevalence of sarcopenia was similar to those reported in most studies once tailored handgrip strength and gait speed values were adopted. A higher prevalence was observed when the cutoff values suggested by the European consensus were used. This indicates that sarcopenia frequencies must be estimated using population-specific reference values.”

RELATIONSHIP BETWEEN FRAILTY AND DIETARY VARIETY AMONG OLDER ADULTS

K. Motokawa, A. Edahiro, M. Shirobe, J. Yasuda, H. Hirano, S. Obuchi, H. Kawai, Y. Watanabe, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

Objectives: Frailty is an important precursor of the need for long-term care. This study aimed to find requirements for dietary support or intervention from basic data as well as nutritional status obtained from the frailty older adults. Therefore, we clarified the differences in body composition and nutritional status according to severity of frailty.

Methods: The present study was carried out in 2014, and consisted of 747 individuals over 65 years. The participants completed the Kihon checklist, which is widely used to assess frailty in Japan. The Kihon checklist was categorized into 3 groups: Robust (≤ 3 score), Pre-frailty (4–7 score), Frailty (≥ 8 score). Survey items included basic information (sex, age, serum albumin level), multi frequency bioelectrical impedance analysis (body composition), food frequency questionnaire (dietary variety), brief self-administered diet history questionnaire (nutritional intake), and grip strength, 10-m walk time (physical function). Ordered logistic regression analysis was used to examine the associations of dietary variety with frailty.

Results: According to the Kihon checklist, 11.6% of the study participants were considered as frailty. Frailty were independently associated with dietary variety score and serum albumin.

Conclusion: Dietary variety and serum albumin were significantly associated with frailty in community -dwelling older adults. The causal relationship should be examined in a prospective study.

FRAILTY TRANSITIONS AMONG OLDER ADULTS

H.R. Stocker^{1,2}, R. Peterson^{1,2}, N. Toosizadeh^{1,2}, C. Wendel^{1,2}, M. Fain^{1,2}, J.J. Mohler^{1,2}, 1. *Arizona Center on Aging, University of Arizona, Tucson, Arizona*, 2. *Division of Geriatrics, General Internal Medicine, and Palliative Medicine, University of Arizona, Tucson, Arizona*

Purpose: Frailty is a geriatric syndrome associated with increased risk of adverse health outcomes. To better understand the dynamic process of frailty, our objectives were to evaluate baseline and six-month follow-up frailty transitions and the components associated with these changes in the Arizona Frailty Cohort.

Methods: One hundred and nineteen community participants (≥ 65 years) had two home visits, six months apart. Fried Frailty Index was measured at baseline and six month visits. Transitions in Fried category and components (i.e. unintentional weight loss, self-reported exhaustion, grip strength, walking speed, and physical activity) driving these transitions were assessed.

Results: Six-month frailty progression was observed in 13 individuals (11%) with 8 (7%) transitioning from non-frail to pre-frail and 5 (4%) from pre-frail to frail. Twenty-eight individuals (24%) observed frailty regression with 17 (14%) transitioning from pre-frail to non-frail and 11 (9%) from frail to pre-frail. Decreased walking speed (38%) and low activity (80%) contributed to the transitions from non-frail to pre-frail and from pre-frail to frail, respectively. In the regression from pre-frail to non-frail increased walking speed (53%) was common, and in the regression from frail to pre-frail increased activity level (45%) and decreased self-reported exhaustion (73%) were common.

Conclusions: Change in walking speed was most common among the non-frail to/from pre-frail, whereas change in activity level was common in pre-frail to/from frail transitions. These results illustrate that 1) gait changes may occur earlier than other criteria in frailty progression, and 2) frailty is a dynamic state and should be measured regularly.

THE MULTIDIMENSIONAL INSTRUMENT TO ACCESS FRAILTY SYNDROME IN ELDERLY FROM PRIMARY CARE SETTING

C.H. Schwanke¹, Z.C. Lindôso², T. Resende¹, 1. *Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, RS, Brazil*, 2. *Universidade Federal de Pelotas, Pelotas, Brazil*

Introduction: Several authors have studied the frailty syndrome (FS) but few studies are focused on basic health care especially in Brazil. The aim of the study was to develop and validate a multidimensional instrument tracking FS in elderly patients in primary care.

Methods: A cross-sectional study enrolling 355 elderly participants of the Multidimensional Study of the Elderly in Porto Alegre from the Family Health Strategies (EMISUS). The clinical criteria for the phenotype of FS was the modified Fried (without physical activity; 0 points= no frail individuals/1 point= pre-frail/2 or more points= frail). For the development of the instrument were selected 10 dimensions (social, age, sensory, depressed mood, cognition, number of medications, ADL/IADL, balance, urinary incontinence and nutrition) categorized as present or not.

Results: Through multiple logistic regression (Forward Wald method), considering as the dependent variable the Fried phenotype (0= no frail and 1= pre-frail/frail) and as independent variables the 10 dimensions, we found as independent predictors variables the following dimensions: undernutrition (OR= 2,66), polypharmacy (OR=1,92), dependence (OR=4,58), urinary incontinence (OR=1,88) and imbalance (OR= 3,32). We created the multidimensional instrument tracking frailty syndrome (IMSIFI) and established the cut-off point 1 to discriminate no frail to pre-frail/frail individuals (sensitivity= 0,759 and specificity= 0,563). The area under the ROC curve was 0,713. The phenotype more common was no frail (44.5%) by Fried criteria and pre-frail/frail (72.9%) by IMSIFI. Both instruments (Fried and IMSIFI) were associated with functional capacity.

Conclusion: IMSIFI is a simple, objective, and quick instrument for the context of primary care.

A MULTIFACTORIAL INTERDISCIPLINARY INTERVENTION IN PRE-FRAIL OLDER PEOPLE: RANDOMISED TRIAL

I. Cameron¹, N. Fairhall¹, B. John², K. Lockwood¹, N. Monaghan¹, C. Sherrington¹, S. Lord³, S. Kurrle¹, 1. *University of Sydney, St Leonards, New South Wales, Australia*, 2. *Hornsby Ku-ring-gai Health Service, Hornsby, New South Wales, Australia*, 3. *University of New South Wales, Randwick, New South Wales, Australia*

The study aim was to determine whether an intervention could reduce pre frailty and improve mobility disability. We conducted a single centre, randomised, controlled trial among older people who were pre frail in Sydney, Australia. One group received an intervention targeting the identified characteristics of frailty, while the comparison group received the usual healthcare and support services. Outcomes were assessed by a rater masked to treatment allocation at 4 and 12 months after study entry. The primary outcomes were frailty criteria with reference to the Cardiovascular Health Study criteria, and mobility as assessed by the lower extremity continuous summary performance score (CSPS) calculated from the Short Physical Performance Battery. Secondary outcomes were also assessed. A total of 194 participants (84%) completed the study. Overall, 38% of participants were men and the mean (SD) age was 81.5 years (5.3). In the intention-to-treat analysis, the mean between group difference in frailty criteria was .062 at 12 months (95% CI -0.24 to 0.36, p=0.7). The change score on the CSPS favoured the intervention group at 4 months (0.11, 95% CI 0.004 to 0.215, p=0.042) but there was no between group difference at 12 months. There were no major differences between the groups with respect to secondary outcomes. This intervention trial for pre frail older people did not show a benefit on frailty of a multifactorial interdisciplinary intervention. The same intervention had positive effects in frail older people and the reasons for the difference are currently unclear. Trial registration: ACTRN12613000043730

FRAILTY AS PREDICTOR OF MORTALITY IN INSTITUTIONALIZED OLDER ADULTS.

M. Martinez Reig^{1,2}, A. Avedaño Cespedes^{1,2}, M. Mas Romero^{1,2}, E. Gomez Jimenez^{1,2}, L. Palazon Valcarcel^{1,2}, R. Ceres Martinez^{1,2}, P. Abizanda Soler^{1,2}, J. Olivercarbonell^{1,2}, 1. *Department of Geriatrics, University Hospital Albacete, Albacete, Spain*, 2. *UDM Geriatria, Albacete, Spain*

This longitudinal observational cohort study was conducted in two Spanish nursing homes. Of the 331 subjects who agreed to participate we obtained valid data of 295 subjects. Frailty was defined by the presence of three or more Fried criteria: unintentional weight loss, low energy, exhaustion, slowness, and low physical activity. Mortality during the follow-up period (2012–2015) was recorded. Demographic data, comorbidity assessed by the Charlson index and disability in basic activities of daily living using the Barthel index were recorded at baseline. All data were analyzed using the SPSS 15.0 program. The association between frailty and mortality was determined by Cox proportionalhazard analysis and logistic regression adjusted for age, sex, Barthel index, Charlson index, and body mass index (BMI). Mean age of the cohort was 83.9 (SD 6.8), with 213 women (65.1%). Mean

Barthel index was 54.1 (SD 36.7), BMI 27.5 (SD 5.3) and Charlson index 1.8 (SD 1.6). 218 (66.9%) were frail and 108 (33.1%) non-frail. At follow-up, 128 subjects died, most of whom (81.2%) were frail. Frailty was associated with higher mortality (OR 2.3; CI 95% 1.2–4.6) adjusted for all study covariables. The adjusted probability of survival using Cox proportional hazard analysis showed greater adjusted risk of mortality for frail subjects (HR 1.8; CI 95% 1.1–2.9) during the three years of follow-up. To conclude, frailty is related to three-year mortality in institutionalized older adults.

PREVALENCE AND CORRELATES OF FRAILTY IN COLOMBO DISTRICT, SRI LANKA

N. Samarutilake¹, D.N. Samaraweera², A. Lokubalasoorya³,
1. *Healthcare Quality and Safety, Ministry of Health, Sri Lanka, Colombo, Sri Lanka*, 2. *Base Hospital Pimbura, Sri Lanka, Colombo, Sri Lanka*, 3. *Family Health Bureau, Colombo, Sri Lanka*

Newly developed validated frailty assessment instrument (FAI) was used to assess the prevalence of frailty in Colombo district, Sri Lanka. Criteria to diagnose frailty were developed giving weights according to the magnitude of the eigenvalues of principal components in domains of FAI yielded from factor analysis. Cross sectional descriptive and analytical study was conducted among 1620 elders selected by multistage cluster sampling method. Prevalence of frailty in Colombo district was 14.9% (95%CI:13.2%- 16.6%). Prevalence rates of frailty were higher in males (17.7%, 95%CI:15.0% - 20.4%) and elders below the age of 75 years (11.3%, 95%CI: 9.4% - 13.2%) than females (12.4%, 95%CI: 10.2% - 14.6%) and elders aged 75 years or more (21.6%, 95%CI: 18.2% - 25.0%). Age, gender, marital status, education, past medical history, physical activities, nutrition, Body Mass Index (BMI), activities of daily living (ADL) and instrumental activities of daily living (IADL), memory, living index, environment index, economic status, depression, duration of non communicable diseases (NCDs), number of drugs using, social contacts, social support and consumption of medical facilities during the preceding six months are significantly associated with frailty status at 5% level. However, number of drugs using (OR=0.86, 95%CI:0.77–0.95), admissions to hospitals (OR=4.86, 95%CI:2.92–8.08), age (OR=1.06, 95%CI:1.0 –1.09), IADL (OR=1.13, 95%CI:1.09–1.18), unsatisfactory environment (OR = 3.46, 95%CI: 2.17–5.51) and economic dependency (OR=7.09, 95%CI:2.87–17.51) were significant correlates at 5% level in logistic regression models. Prevalence rates are relatively high and early interventions to prevent frailty are recommended.

PROVIDING SOCIAL SUPPORTS CAN REDUCE MORTALITY RISK AMONG PRE-FRAIL OLDER ADULTS IN TAIWAN

C. Liao^{1,2,3}, C. Yeh⁴, S. Lee⁵, M. Lee^{3,6}, 1. *Department of Family Medicine, Taichung Armed Forces General Hospital, Taichung, Taiwan*, 2. *National Defense Medical Center, Taipei, Taiwan*, 3. *Institute of Medicine, Chung Shan Medical University, Taichung, Taiwan*, 4. *School of Public Health, Chung Shan Medical University, Taichung, Taiwan*, 5. *School of Nursing, Chung Shan Medical University, Taichung, Taiwan*, 6. *Department of Family Medicine, Taichung Hospital, Taichung, Taiwan*

Objective: To determine the association of providing or receiving social support on mortality risk among the elderly with pre-frailty or frailty. **Method:** In this notional longitudinal study, data were retrieved from the Taiwan Longitudinal Study on Aging (TLISA) from 1996 to 2007. Data for 1492 males and 1177 females (total 2669) aged ≥ 67 years were collected. Participants were divided into three groups: no frail older adults, pre-frail older adults and frail older adults. These elderly received social supports, and they also actively provided social supports to others. The study was examined using Cox regression analysis to evaluate the association between providing or receiving social support on mortality of pre-frail or frail older adults after adjusting several covariates. **Results:** Results showed the average age of these participants was 73.8 (SD=5.5) years, and more than half of the participants were male (55.9%). The number and percentage of frail elderly, pre-frail elderly and frail elderly groups were 402(16.9%), 1501(63.1%) and 474(19.9%) respectively. Final results of the multivariate Cox regression analysis showed a significant association between providing social supports with lower mortality rates among the pre-frail older adults after adjusting several covariates. [hazard ratio (HR) = 0.886; 95% confidence interval (CI) = 0.814–0.964; $p = 0.005$]. **Conclusion:** Providing social support to others may prolong life expectancy of the pre-frail older adults.

INFLUENCE OF STATIN USE ON THE PHYSICAL FUNCTION AMONG COMMUNITY-DWELLING OLDER JAPANESE ADULTS

H. Kawai¹, K. Ihara², T. Kera¹, H. Yoshida¹, H. Hirano¹, Y. Fujiwara¹, S. Obuchi¹, 1. *Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Tokyo, Japan*, 2. *Department of Public Health, Toho University School of Medicine, Tokyo, Japan*

Statin-induced myopathy is one of the muscle-related side effects of statins. However, some positive effects such as improved walking speed in patients with cardiovascular diseases and reduced risk of frailty have been reported to be associated with statin use. The objective of this study was to examine the association between statin use and physical function among community-dwelling older Japanese adults.

The subjects were 1022 community-dwelling older adults aged 65–88 years, who participated in comprehensive health check-ups from 2013 to 2015. Statin use in the subjects was checked by copying data from their medicine notebooks. The differences in skeletal muscle index (SMI), grip strength, gait speed, timed up-and-go test (TUG), one-legged stance, knee extension torque, and low-density lipoprotein (LDL) cholesterol between statin users and non-users were analyzed by t-test. Multiple regression analyses were also conducted to examine the association of statin use with physical function.

Among the 381 men and 559 women whose medication could be checked from their medicine notebooks, 93 men (24.4%) and 154 women (27.5%) were statin recipients. Some physical functions declined significantly in statin recipients compared to those in non-recipients. LDL cholesterol levels reduced significantly in statin recipients. Multiple regression analysis with controlling for age and number of

medicines showed statin use is independent factor in decline of grip strength, gait speed, and one-legged stance.

It was suggested that statin use might be associated with physical function in community-dwelling older adults.

SARCOPENIA IN UKRAINIAN OLDER WOMEN

V. Povoroznyuk, N. Dzerovych, R. Povoroznyuk, D.F. Chebotarev Institute of Gerontology NAMS Ukraine, Kyiv, Ukraine

The aim of this study was to evaluate the frequency of sarcopenia in the healthy Ukrainian women.

Materials and methods: 390 healthy women aged 20–87 years (mean age – 57.50 ± 15.99 years) were examined. The lean and fat masses were measured by the DXA method (Prodigy, GEHC Lunar, Madison, WI, USA). Appendicular skeletal mass (ASM) was measured at all the four limbs with DXA. We've also calculated the appendicular skeletal mass index (ASMI) according to the formula: $ASM/height$ (kg/m^2). Low muscle mass values conform to the following definitions: European guidelines (ASMI $<5.5 kg/m^2$) (EWGSOP, 2010), less than 20% of sex-specific normal population and two SD below the mean of the young adult Ukrainian females (20–39 yrs). We also assessed handgrip strength and measured gait speed. The sarcopenia was determined using EWGSOP-suggested algorithm.

Results: The ASMI values corresponding to a cutoff of low muscle mass by the definitions used were as follows: $<5.5 kg/m^2$ (European guidelines), $<5.7 kg/m^2$ ($<20^{th}$ percentile of sex specific population), $<4.8 kg/m^2$ (two SD below the mean of young Ukrainian females aged 20–39 yrs). The frequency of low muscle mass in women aged 65 yrs and older based on the above three criteria was 12%, 16% and 1.7%, respectively. The frequency of sarcopenia increased with age: in women 50–59 yrs – 5.1%, 60–69 yrs – 3.7%, 70–79 yrs – 18.4%, 80–80 yrs – 30.8%. The mean frequency of sarcopenia in women aged 65 yrs and older was 21.3%.

Conclusion: The mean frequency of sarcopenia in Ukrainian older women was 21.3%.

TRANSITIONS IN FRAILTY STATES AMONG INSTITUTIONALIZED OLDER ADULTS IN A THREE-YEAR PERIOD

M. Martinez Reig^{1,2}, A. Avedaño Cespedes^{1,2}, M. Mas Romero^{1,2}, E. Gomez Jimenez^{1,2}, L. Palazon Valcarcel^{1,2}, R. Ceres Martinez^{1,2}, P. Abizanda Soler^{1,2}, J. Olivercarbonell^{1,2}, 1. Department of Geriatrics, University Hospital Albacete, Albacete, Spain, 2. UDM Geriatria, Albacete, Spain

Longitudinal cohort which included 326 institutionalized subjects aged 65 and over. Frailty was defined by the presence of three or more Fried criteria. Frailty state was recorded at baseline, after one year of follow-up and after three years of follow-up. Mean age of the cohort was 83.9 with 213 women (65.1%). At baseline, 218 subjects were frail (66.9%). Among these, 39 died after one year of follow-up and 23 subjects had missing data. 138 of the frail subjects remained frail after one year of follow-up with 74 remaining frail after three years and 2 subjects improving to non-frail. 18 of the frail subjects at baseline improve to non-frail after one year of follow-up with 7 of them worsening to frail at three-year analysis and 4 remaining non-frail. At baseline, 108 subjects

were non-frail (33.1%). Among these, 11 died after one year of follow-up and 15 had missing data. 57 of the non-frail subjects remained non-frail after one year of follow-up with 26 remaining non-frail after three years and 13 worsening to frail state. 25 of the non-frail subjects worsened to frail after one year with 10 of them remaining frail at three-year analysis and 7 improving to non-frail. To conclude, frailty is a dynamic state which changes over time. To determine frailty status in institutionalized older adults may help to implement prevention or intervention programs.

IMPORTANCE OF PROGRESSION BETWEEN FRAILTY LEVELS AMONG COMMUNITY-DWELLING ELDERLY

R. López-López¹, J. Millán-Calenti¹, L. Lorenzo-López¹, A. Buján¹, C. Diego-Diez¹, E. Pásaro², A. Maseda¹, 1. Gerontology Research Group, Instituto de Investigación Biomédica de A Coruña (INIBIC), Complejo Hospitalario Universitario de A Coruña (CHUAC), SERGAS, Universidade da Coruña., A Coruña, Spain, 2. DICOMOSA Group, Department of Psychology, Area of Psychobiology, Universidade da Coruña., A Coruña, Spain

Previous longitudinal studies have revealed a relationship between frailty and mortality in community-dwelling older adults. It is crucial to identify older adults who are at risk of pre-frailty since they have more than twice the risk of becoming frail compared with non-frail individuals. Moreover, evidence suggests that pre-frail elderly may respond better to intervention than frail subjects. However, the clinical characteristics of pre-frailty have been investigated to a lesser extent compared to frailty.

Our cross-sectional study evaluates the prevalence and clinical characteristics of pre-frailty in a community-dwelling representative sample of 749 older adults (aged ≥ 65) from Galicia (Spain). According to Fried criteria, 71.8% of the participants were pre-frail, mainly because of low grip strength (95.0%), 3.7% were frail, and 24.4% were non-frail. Pre-frailty prevalence was higher in females and in individuals aged 65 to 79, with no differences between geographical settings. At the same time, mortality significantly increased in frailty group.

The high prevalence of pre-frailty is a relevant finding because it can give insights into associated risk factors and it may help to prevent the onset of disabilities and dependence. If we do not act, the three-quarters of our population will progress to frailty in a short period of time. In this context, pre-frailty status could be used as a preventive marker being an optimal target for interventions.

SESSION 560 (POSTER)

GERIATRIC WORKFORCE I

REPRESENTING OLD AGE IN THE MEDIA AND POPULAR DISCOURSE

S. Pickard, University of Liverpool, Liverpool, United Kingdom

This paper looks at representations of old age in the media, policy and medicine and their role in shaping the role and meaning of old age more generally. Taking a historical

view, it traces the bifurcation of good and bad old age into today's distinction between biological versus chronological ageing reflecting in the youthfulness of the third age versus the senescence of the fourth. However, since 2008 in particular the chronological or calendar classification has been assuming priority in the UK in particular in discussions of austerity politics, intergenerational justice, and the decision to leave the EU, where we find a strong theme of blaming the 'old' as obstructive to the well-being and progress of younger generations (and by implication society as a whole). This development in the 'progressive' press in particular has been taking the form of substituting age war for class conflict as a foundational structure for social inequality. We look at the role medicine and science as well as counter images found in different socio-historical contexts and in the media might help with imagining a more positive role for old age and a more harmonious relationship between ages and stages more generally.

AGENCY THROUGH MEDIA IN THE EVERYDAY LIFE OF NURSING HOME RESIDENTS

C.E. Swane, *EGV Foundation (Social Inclusion of Older Adults), Copenhagen V, Denmark*

Old people in nursing homes embody the notion of the fourth age, as recipients of personal care, medicine, meals, and organised activities in an institutional setting. People in nursing homes are also part of a society in which media have become a regular feature of everyday life (Mark Deuze 2011, Stig Hjarvard 2016). Based on ethnographic fieldwork in three Danish nursing homes, this paper explores ill and frail old people's subjective interaction with media technologies and material objects – bracketing for a moment aspects of care practices (Swane 2017).

Empirical data were constructed through ethnographic fieldwork conducted in three Danish municipal nursing homes in winter 2014–15. The material has the form of notes from talks, observations, photos, voice and video recordings and transcribed qualitative interviews with totally 39 residents, primarily in their private residences.

Embodiment and agency are central analytical concepts for analysing residents' use of particular media artefacts when the body is in pain and loses functionality. With theories of domestication (Roger Silverstone 1994) and biographical situation (Alfred Schutz 1962), the paper reveals how media are meaningful and important for residents in making an institutional dwelling 'their home'. E.g. subscribing to a newspaper even with a very poor eyesight, by mainly reading headlines in order to remain oriented to the world around, as one of few autonomous routines of everyday life.

In conclusion, old people's interaction with media seems to bridge the gap between institutionalisation and a long life's preferences and participation in social and cultural worlds.

OLD AGE AND OLDER PEOPLE ON WEBSITES BELONGING TO GROUPS OF THE EXTREME RIGHT IN SWEDEN

M. Nilsson, *University of Gothenburg, Gothenburgh, Sweden*

Across Europe nationalism and the influence of extreme right groups is growing, and perhaps contrary to what many think, old age and ageing is everpresent in this process.

Traditionally the discourse of the extreme right, such as fascists and national socialists, have valorized youth, strength and violence as instruments for the rebirth of a degenerated society. In this traditional discourse of the extreme right old age and ageing, and the ageing of society, is seen as part of the degeneration of society. However, during the last decades alternative representations of old age and older people in the discourse of the extreme right have emerged. Older people are here seen as having built society; as citizens that have done their duty and therefore should be rewarded in the form of good care and a high standard of living. The aim of this paper is in relation to the above to provide an analysis of how older people and old age is represented in articles and discussions on websites belonging to groups of the extreme right in Sweden. A specific focus is devoted to the interplay between representations of old age age in general public discourse and that expressed by actors of the extreme right.

COMPARISON BETWEEN MEDIA REPORTS AND ACTUAL SITUATION ON PREPARATION FOR AGING AND DEATH IN JAPAN

Y. Kimura, *Yokohama National University, Yokohama, Kanagawa, Japan*

Backgrounds

With the aging of society there is need and also a trend of preparation for aging and death. In Japan, this trend is called SHU-KATSU coined by the media in 2009. Originally, most subjects of SHU-KATSU were about funeral and grave. Nowadays, SHU-KATSU is defined as activities in preparation for funeral, grave, inheritance, medical and nursing care, and any planning for aging and death. Stakeholders say that SHU-KATSU is not only deciding about the relevant things of death but find out what one wants to do in rest of life.

The purpose of this study is to clarify the current meaning of SHU-KATSU. In this study the main points covered by the media are compared to actual preparations of elderly people covered by researchers.

Methods

Articles by Asahi-Newspaper were analyzed the by following steps.

1) Articles including the keyword "SHU-KATSU" were selected from a database.

2) The articles were categorized and text mined by the context of keywords and relative to the number of characters.

Results

There are some differences between the content covered in the media and the intention of the elderly.

In the mass media, funeral and grave are still the main subjects. On the other hand, psychological subjects such as 'views of life and death' and 'spiritual or emotional side of life' are poor.

In contrast in previous studies, the elderly tend to hope for a simple funeral and grave. They also tend to hope for an opportunity to learn about death and the preparation for it.

THE TRENDS IN GLOBAL STANDARDIZATION OF TRADITIONAL MEDICINE: A REVIEW ON THE MEETINGS OF ISO/TC249

K. Ozaki¹, T. Namiki⁵, M. Kageyama^{2,3,6}, Y. Nakamura¹, H. Rakugi⁴, 1. *Department of Geriatric Medicine, Itami City Hospital, Itami, Japan*, 2. *Kageyama Clinic, Sakai,*

Japan, 3. Dept. of Obstetrics and Gynecology, Osaka City Univ. Graduate School of Medicine, Osaka, Japan, 4. Dept. of Geriatric and General Medicine, Osaka Univ. Graduate School of Medicine, Suita, Japan, 5. Dept. of Japanese-Oriental (Kampo) Medicine, Chiba Univ. Graduate School of Medicine, Chiba, Japan, 6. Dept. of Gynecology and Obstetrics, Kyoto Univ. Graduate School of Medicine, Kyoto, Japan

Background/Objectives: Recently, international standardization has become a priority in the healthcare business, as the need to reduce variance of patient care under rapid increase of social security costs because of the aging population. The pace of globalization in the field of traditional medicine has surged since the establishment of a new Technical Committee (TC) as “TC249 Traditional Chinese Medicine (provisional)” at the International Organization for Standardization (ISO) in 2009. The following paragraphs review the current situation of standardization of traditional Chinese medicine (TCM) at the general meetings of in ISO/TC249.

Methods: The ISO/TC249 standards and standard projects on the ISO website were searched, and new standard proposals' information was collected from the proceedings at the meetings of ISO/TC249.

Results: Six standards were published under the responsibility of ISO/TC249 (as of June 2016), such as (1) TCM-Ginseng seeds and seedlings-Part 1: Panax ginseng C.A.Meyer, (2) Sterile acupuncture needles for single use, (3) TCM-Determination of heavy metals in herbal medicines used in TCM, (4) TCMHerbal decoction apparatus, (5) TCM-General requirements of moxibustion devices, and (6) TCM-Coding system for Chinese medicines-Part 1:Coding rules for Chinese medicines. A rapid development of international standardization in TCM has been observed in ISO/TC249, although inadequacy in proposing a country's domestic standards as the international standards without respect for the rules of laws or existing standards has been pointed out. Agreement was achieved that discussion of education standardization for students on TCM is beyond the scope of TC249.

Conclusions: This paper has briefly described the present status of international efforts to standardize traditional medicine.

AGING AND INTERDISCIPLINARITY IN THE CLASSROOMS OF UNDERGRADUATE COURSES: AN EXPERIENCE REPORT

V. Bohm, V. Herédia, *Universidade de Caxias do Sul, Caxias do Sul, Rio Grande do Sul, Brazil*

Demands arising from the aging population require competent professionals in their areas of training, but also have interdisciplinary attitude. This paper aims to share successful interdisciplinary practice at graduation, which is presented through an experience report. In 2002, aware of the shortage of subjects on human aging in curricula, the University of Caxias do Sul / RS / Brazil began offering an elective entitled Longevity: Life and Society, who had five teachers involved. In these 15 years of experience, new arrangements were made to meet the perceived changes in society and advances in knowledge about aging. There are four teachers who currently teach, keeping the key feature:

interdisciplinarity, both faculty and students, it is offered to various areas of training. There are four central axes that structure the discipline: sociological, discussing active aging and institutions, including long-term care facilities and family; psychological, addressing major theories and aspects of subjectivity in age; biological, understanding the functioning and changes of the body during life, and the axis of public policies, bringing the subject as citizen rights and duties. The course ends with the integration of axes presented in a final seminar, where students take the articulation of contents having as guiding the life of an old man interviewed during the semester. The results of this practice are positive, as students report to understand the human aging expanded form, identify labor camps and realize the need for interdisciplinary performances in future interventions.

THE PILOT STUDY ON EFFECTS OF FORMAL CAREGIVER EDUCATIONAL TRAINING PROGRAM IN KOREA

Y. Park, S. Bae, *Kyungbok University, Pocheon-si, Gyeonggi-do, Korea (the Republic of)*

The purpose of this study was identify the effects of the educational training program of formal caregivers who personally take care of persons with dementia at present in Korea. The study is one-group pre-posttest pre-experimental design and 14 formal caregiver educational trainees participated. The formal caregiver trainees had educational training provided to pass the national licensing examination in Korea, and the training was progressed for four hours every day for eight weeks. To measure the effects of the educational training program for the formal giver, Inventory of Geriatric Nursing Self Efficacy (IGNSE), Dementia Attitude Scale (DAS), and the mock test scores are used. IGNSE, DAS, the mock test scores were measured before and after the formal caregiver educational training program. After the educational training program, it was not significant in IGNSE ($t=0.12$, $p=.904$), but Dementia Attitude Stability Scale ($t=.7.48$, $p<.001$) and Dementia Attitude Total Score Scale ($t=6.78$, $p<.001$) were significantly decreased. Also, in the mock tests for the national licensing completion, the theory test score ($t=-10.75$, $p<.001$) and the practice test score ($t=-10.36$, $p<.001$) were significantly increased. The formal caregiver educational training program is helpful for the national licensing examination. However, it affected negatively in self-efficacy and Dementia Attitude of the formal caregiver for personal care for persons with dementia. Therefore, it is required to improve the formal caregiver educational training program for increasing self-efficacy and dementia attitude of the formal caregivers who personally take care of persons with dementia.

EXPERIENCE REPORT FOR A PSYCHOGERIATRIC INTERVENTION BETWEEN BRAZILIANS ELDERLY PARTICIPANTS

F. Negreiros, L.F. Araujo, J. de Oliveira Santos, T. Vieira de Moraes, M. de Souza Vasconcelos, D. da Silva Sampaio, A. Aguiar Trevia Salgado, D. da Silva Azevedo, *Psychology, Federal University of Piaui, Parnaiba, Piaui, Brazil*

The increase in life expectancy has led to a higher number of elderly people in Brazil, and therefore, the search for senior centers has intensified. The profile of elderly people who attend these groups is associated with senescence and active aging. Thus, the objective of this study was to describe the socio-demographic profile of the members of a Brazilian group and to highlight their relevant characteristics. The sample consisted of 54 elderly people, predominantly female (83.3%) with a mean age of 67.98 (SD = 7.96). The data collection was conducted through individual interviews and/or group activities. As a result, it was possible to notice the predominance of low-income participants, but without vulnerabilities. The individuals reported effective improvement in their health conditions after they started regularly participating in senior centers. It was found that octogenarians had lower participation rates. However, this scenario is likely to change, due to the rising number of elderly people who are reaching this stage of life and seeking to join these groups. They are likely to become physically, psychologically and socially more active. In the long term, the expansion of these services is important, and universities that participate will have the opportunity to spread knowledge and reduce taboos among the general population.

GERONTOLOGY AS A CAREER: EVIDENCE FROM COGNITIVE IMPROVEMENT IN A COGNITIVE TRAINING GROUP

L. Pelegrini, F.G. Casemiro, S. Pavarini, L.C. Alves, P. Castro, A.C. Grato, M.R. Cominetti, *Federal University of Sao Carlos, Sao Carlos, Sao Paulo, Brazil*

Background: The population aging process is a worldwide phenomenon. Projections show that by 2030, there will be more seniors than children. Capable and skilled professionals are necessary in order to deal with such demographic transition. *Purpose:* to discuss gerontology and the gerontologist as an important career for both present and future. *Methods:* 10 older adults from an Open University for seniors were tested before and after a cognitive training intervention. Gerontologists did this intervention in 20 sessions, which happened once per week during one hour. A change detection task was used to evaluate the effects of the intervention. The test had 21 trials and was adapted to a tablet device. *Results:* 9 participants were female; the mean age was 71.5 years (± 8.3); the mean for years of education was 11.3 years (± 4.8). The average reaction time on the pre-intervention measure was 5.9 sec (± 3.35), and 3.67 sec (± 1.21) on post-intervention; the difference between pre and post-intervention was statistically significant ($t=2.666$; $p=0.026$). The mean of correct answers was 12.1 (± 1.9) and 11.8 (± 3.2) on pre and post-intervention assessments, respectively. There was no statistical difference between these results ($t=0.335$; $p=0.745$). *Conclusion:* This study suggests that the professional performance of gerontologists can unfold in improvements to the elderly public. Because of their interdisciplinary characteristic, gerontologists tend to be, and can be, accepted and employed in a wide variety of institutes/organizations.

READMISSION METRICS DO NOT CAPTURE ALL BURDENSOME HOSPITAL STAYS: INTRODUCING THE ARAIV MEASURE

R. Gardner^{1,2}, B. Morphis², R. Youssef², 1. *Alpert Medical School of Brown University, Providence, Rhode Island*, 2. *Healthcentric Advisors, Providence, Rhode Island*

Care transitions are a time of vulnerability for older adults; the readmission rate within 30 days of hospital admission is the metric most commonly used to assess quality of care coordination. In the US, hospitals' readmission rates are publicly reported and hospitals face penalties from Medicare for excess readmissions. Despite its prevalence as a care coordination measure, the readmission metric is limited in its ability to capture all return visits to the hospital. Hospital stays coded as observation status are not included in the readmission metric, either as an index hospital stay or as a readmission. The exclusion of observation stays may incentivize hospitals to preferentially select observation status for their patients to avoid readmission penalties and may prevent an accurate assessment of care coordination. This study sought to examine the impact of including observation stays in the readmission metric, recognizing that any stay in the hospital is disproportionately burdensome to older adults. Using FFS Medicare claims data for the New England region of the US, we calculated the standard readmission rate for all beneficiaries and compared it to a readmission rate that included observation stays. The latter measure was entitled the All Revisits after Any Index Visit (ARAIV) measure. Using the ARAIV measure demonstrated that differential use of observation status by hospitals likely impacts publicly reported readmission rates. Given these findings and the fact that patients receiving care under observation status are often clinically indistinguishable from those who are fully admitted, we recommend that readmission metrics include observation stays.

HEALTHY LIFE EXPECTANCIES OF THE OLDER ADULT POPULATION OF SINGAPORE

S. Kang⁵, Y. Saito², A. Chan^{3,4,5}, V. Yong², 2. *Nihon University, Tokyo, Japan*, 3. *Health Services and Systems Research, DukeNUS Medical School, Singapore, Singapore*, 4. *Centre of Ageing Research and Education, DukeNUS, Singapore, Singapore*, 5. *Singapore University of Social Sciences, Singapore, Singapore*, 5. *Department of Sociology, National University of Singapore, Singapore, Singapore*

The Singapore resident population aged 65 and older is living longer, but research has cautioned that gains in life expectancy are not always positive. In order to better understand this development, there is a need to disaggregate healthy and unhealthy life expectancies. Research by gender suggests that while females fare better compared to their males counterparts with regard to the prevalence of diseases and disease-free life expectancy; they are disadvantaged when compared with their male counterparts with regard to impairments and functional disabilities. With available data on selected chronic diseases, impairments and functional disabilities of the older adult population in Singapore, this study seeks to add to this body of discussion. It seeks to achieve three objectives: (1) to provide follow-up analyses on health expectancies by gender for both chronic diseases, impairments and functional disabilities; (2) understand how

existing healthcare policy for the older adult population provides support in light of research results and observations; and (3) suggesting additional policy initiatives that could further compliment or enhance these existing policy implements. This study utilizes the prevalence-based Sullivan method to calculate the lifetime free of disease and impairment for the older adult population surveyed. The datasets employed for this study are cross-sectional data obtained from the National Survey of Senior Citizen from 2005 and 2011.

SESSION 565 (POSTER)

GERONTOLOGY AND GERIATRICS EDUCATION I

GERIATRIC FELLOW PACE ROTATION: LEARNING ABOUT MANAGED CARE AND MEDICAL DIRECTORSHIP PRINCIPLES

T. Suh^{1,2,3}, P. Mullan¹, C. Vitale^{1,3}, 1. *Internal Medicine, University of Michigan, Ann Arbor, Michigan*, 2. *Huron Valley PACE, Ypsilanti, Michigan*, 3. *Ann Arbor VA Hospital, Ann Arbor, Michigan*

A clinical rotation was developed for University of Michigan geriatric fellows in partnership with Huron Valley PACE (Program for All-Inclusive Care of the Elderly). Given the rapid growth of PACE nationally and especially in the state of Michigan, it was felt that it was important for U-M geriatric fellows to have the opportunity to learn principles of managed care and medical directorship while still in training.

This PACE rotation allows geriatric fellows to participate in frail elder care in a variety of clinical settings including clinic, hospital, skilled nursing facility and home. Fellows have the opportunity to talk with all members of the PACE interdisciplinary team about their roles in the PACE model and attend various interdisciplinary team meetings. The PACE Medical Director introduces fellows to medical directorship principles through attendance at leadership meetings and one-on-one conversations as well as principles of managed care through attendance at managed care meetings and discussions and demonstrations of the authorization process.

At the end of the academic year, each fellow gives a talk during a Division conference about how frail community-dwelling older adults age in place in another country as compared to the U.S. PACE model. Results of retrospective pre-post surveys of fellows' perceived skills in assessing PACE eligibility, working in a capitated model and effectively leading an interdisciplinary team will be presented, capturing the learners' insight gained as the concept of aging in place is explored internationally.

FACULTY DEVELOPMENT IN ETHNOGERIATRICS

G. Yeo¹, N.N. Hikoyeda¹, M.R. McBride¹, M. Tzuang^{1,3}, M.R. Grudzen¹, K. Mehta^{1,2}, 1. *Stanford University, Stanford, California*, 2. *University of California, San Francisco, San Francisco, California*, 3. *Johns Hopkins University, Baltimore, Maryland*

Thirty-three faculty members in eight health care disciplines from fourteen U.S. states devoted 160 hours each in the

Stanford Geriatric Education Center Faculty Development Program in Ethnogeriatrics (FDPE) to expand their knowledge, skills, and attitudes in caring for elders from diverse ethnic populations and in teaching ethnogeriatrics. Each year from 2011 to 2015 eight to eleven faculty trainees completed the 160-hour program. The FDPE model consisted of:

1. Four days of intensive onsite training on-campus at Stanford University School of Medicine which included eight modules using didactic sessions, interactive workshops, resource sessions, and 25 assigned readings;

2. Online self-paced learning based on 15 learning modules and 22 recorded webinars on ethnogeriatric topics;

3. Eleven monthly two-hour group meetings by conference call with faculty and trainees in which trainees reported on and discussed assigned modules and webinars; and

4. Individual capstone projects in ethnogeriatrics supported by monthly mentoring sessions with assigned faculty members.

Onsite modules included: Exploring Health Literacy, Ethnogeriatrics, and Health Disparities; Aging and Culture; Health Literacy in Patient Centered Health Care; Creating Health Messages for Low Literacy Elders; Patient and Relationship Centered Communications; Working with Interpreters and Translators; Improving Ethnogeriatric Health Care; Strategies for Teaching Cultural Humility/Competence.

Significant improvement among the faculty trainees was found in all of the 29 self-rated pre/post and post-hoc-pre/post measures of the learning objectives. Capstone projects resulted in 18 new curriculum units in ethnogeriatric topics, 10 new clinical interventions with diverse elders, and 2 research projects in ethnogeriatrics.

A FOUNDATION AND COLLEGE COLLABORATION TO PREPARE PHD NURSE FACULTY: ACHIEVEMENTS AND CHALLENGES

L.E. Benefield^{1,2}, 1. *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*, 2. *Reynolds Center of Geriatric Nursing Excellence, Oklahoma City, Oklahoma*

A multi-year partnership between a private foundation and the University of Oklahoma Health Sciences Center College of Nursing achieved core objectives: new highly-qualified PhD nurse faculty with geriatric focus and commitment to academic careers, a highly customized yet replicable interdisciplinary mentorship model, development and dissemination of shared-use geriatric educational materials for faculty and providers, and pilot funding for interdisciplinary research aimed to support aging in place. Within a case study model, strategies for achieving success are presented within a timeline stressing seminal decisions that fostered success or imposed temporary barriers. In addition, the mentorship model engaging PhD students with national and international experts, community constituents and older persons during formative stages of research and professional role development is reviewed. Lessons learned in working with a foundation funding the project, and methods of applying dimensions of the model to enhance current or developing programs, whether resource rich or resource restricted, will be detailed.

DECISION-MAKING CAPACITY ASSESSMENT (DMCA) TRAINING FOR PHYSICIANS

L. Charles³, J. Parmar^{1,3}, B.M. Dobbs³, S. Brémault-Phillips², O. Babenko³, P. Tian³, 1. *Network of Excellence in Seniors' Health and Wellness, Covenant Health, Edmonton, Alberta, Canada*, 2. *Department of Occupational Therapy, University of Alberta, Edmonton, Alberta, Canada*, 3. *Department of Family Medicine, University of Alberta, Edmonton, Alberta, Canada*

Context: Many physicians do not feel prepared to do DMCA. Hence, we developed and administered an interactive DMCA Workshop to familiarize physicians with concepts of capacity, a protocol, documents, and case studies.

Objective: To determine the effect of the DMCA Workshop on physicians' confidence and comfort with decision-making capacity assessments.

Design: Pre-test-post-test design. We administered a questionnaire before and after the Workshop. The questionnaire asked participants to rate their agreement (4-point Likert-type scale) on 15 statements regarding awareness, confidence, and understanding of core concepts of capacity.

Participants: 137 physicians who attended workshops

Intervention: A 3-hour DMCA Workshop accredited by the College of Family Physicians Canada.

Outcome Measures: (1) Mean ratings on the questionnaire items; (2) Demographic data (age, sex, years of practice, prior DMCA training).

Analysis: Descriptive statistics (mean, SD); Sign Test to compare pre- and post-workshop ratings; ANOVA to determine differences in ratings across demographics.

Results: There were 137 participants with an average age of 46 years; 55% females; 64% with ≥ 6 years of medical practice; and 54% with no prior DMCA training. The post-workshop ratings were mostly Agrees and Strongly Agrees (Mean ratings: 3.09–4.27; Range: 1–4). The highest positive differences were seen for problem solving techniques, understanding a trigger, knowledge and skill-set in regards to capacity assessments, standardized approach, and awareness of legislative acts. Among the participants, those without prior DMCA training exhibited the largest change in pre-versus post-workshop ratings ($p < 0.05$).

Conclusion: This study has shown that a DMCA Workshop was effective in training Family Physicians.

DECISION-MAKING CAPACITY ASSESSMENT EDUCATION FOR PHYSICIANS: CURRENT STATE AND FUTURE DIRECTIONS

L. Charles¹, J. Parmar^{1,2}, S. Brémault-Phillips³, B.M. Dobbs¹, L. Sacrey⁵, B. Sluggert⁴, 1. *Department of Family Medicine, University of Alberta, Edmonton, Alberta, Canada*, 2. *Network of Excellence in Seniors' Health and Wellness, Covenant Health, Edmonton, Alberta, Canada*, 3. *Department of Occupational Therapy, University of Alberta, Edmonton, Alberta, Canada*, 4. *Faculty of Rehabilitation Medicine, University of Alberta, Edmonton, Alberta, Canada*, 5. *Faculty of Medicine and Dentistry, University of Alberta, Edmonton, Alberta, Canada*

Objective: To examine the training needs of family physicians (FPs) regarding Decision-Making Capacity Assessments (DMCAs) and ways in which training materials, based on a DMCA Model, might be adapted for use by FPs.

Setting: FPs practicing in a variety of settings: Primary Care, Day Programs, Home Living, Supportive/Assisted Living, Long-term Care, Restorative Care, Geriatric Clinic, and Geriatric inpatient/rehabilitation units in the Edmonton Zone, Alberta.

Participants: FPs who chose to attend a focus group on DMCA.

Methods: A scoping review of the literature to examine the current status of physician education regarding assessment of decision-making capacity (DMC), and a focus group and interviews with FPs to ascertain the educational needs of FPs in this area.

Main findings: Based on the scoping review of the literature, four main themes emerged: increasing saliency of DMCA due to an aging population, sub-optimal DMCA training for physicians, inconsistent approaches to DMCA, and tension between autonomy and protection.

The findings of the focus groups and interviews indicate that, while FPs working as independent practitioners or on inter-professional (IP) teams are motivated to engage in DMCA and utilize the DMCA Model for those assessments, several factors impede them from conducting DMCA. The most notable factors are a lack of education, isolation from IP teams, uneasiness around managing conflict with families, fear of liability, and concerns regarding remuneration.

Conclusion: This research project has helped to inform ways to better train and support FPs conducting DMCA.

BRIDGING GAPS: PRE-PROFESSIONAL HEALTH SCIENCE STUDENTS ENGAGING OLDER ADULTS IN PUBLIC HOUSING

M. Milidonis², S. Giuffre¹, V.O. Cox¹, A. Kuehn¹, 1. *Cleveland State University, Cleveland, Ohio*, 2. *Cleveland State University, Cleveland, Ohio*

Intergenerational and cross cultural communication is an important skill for pre-professional undergraduate health science students. The purpose of this study was to evaluate the effect of a reflective teaching/learning experience on knowledge of aging and empathy. Breytspraak Facts on Aging quiz and Kiersma-Chen Empathy Scale (KCES) were the outcome measures in this pilot study. Undergraduate pre-professional healthcare students were recruited with snowball sampling. Students interviewed a community dwelling older adult living in low-income senior housing. Phone interviews identified life and music preferences. Students completed a post-interview reflection, anticipated best teaching strategy and downloaded individualized music onto MP3 players before teaching older adults how to use MP3 players. Students took post tests and participated in a focus group. Six students were on average 20 years old; female and with 2.5 years college education. All participants have previously worked with older adults and identified having a close relationship with an older adult. Nonparametric test identify the KCES empathy scores changed ($p = .03$) with all students showing improvement in empathy. No improvement was found Facts on Aging Quiz. Similar themes emerged in the focus group session. These results identify the benefit of reflective experiential learning in changing student empathy for culturally diverse older adults. Student knowledge about aging did not change with this experiential learning.

AGING: RETHINKING WHAT AND HOW WE TEACH

S. Hirst, C. Seneviratne, C. Mannion, *University of Calgary, Calgary, Alberta, Canada*

Due to changing demographics, it is increasingly necessary for professional nurses to acquire competency in the care of older adults. The specialty of gerontological nursing is caught among health care directives, physician assisted suicide, the position of older adults in society, practice setting challenges (i.e., staffing requirements, workload, blend of staff skill levels), various interests in curricula revisions, and career development. The specialty developed relatively recently in practice and even more recently in education, and as such often lacks the structural and institutional support needed for it to flourish.

Described in this poster, through a descriptive case study, is a curriculum re-design initiative undertaken by a University's Faculty of Nursing (Alberta, Canada). The Faculty restructured its undergraduate nursing curriculum to integrate aging content and related clinical experiences throughout its four year program. It was cognizant of the mandate, through legislation, to educate a generalist nurse at the undergraduate level of nursing education. At the same time, it asked how do we best provide aging content to our undergraduate students?

The purpose of this case study is to further understanding of an integrative approach to facilitate learning opportunities for undergraduate nursing students. A description of the work done by the Faculty in moving the integration of aging content from the spark of an idea to reality is provided. The benefits for students are described through feedback from them and from faculty members. Recommendations for continued enhancement of the program, specific to aging content, are included.

PAL-S: A PILOT PROGRAM TO INTEGRATE GERIATRICS EDUCATION IN MEDICAL SCHOOL CURRICULUM

G. Gnanasekaran^{1,2}, E. Russell², *1. University Hospitals of Cleveland, Cleveland, Ohio, 2. Case Western Reserve University, Cleveland, Ohio*

Integrating geriatric skills earlier in medical school training is vital to prepare for the upcoming challenges of an aging population. PAL-S program (Patient Advocate Liaison-Student Program) will target first year and second year medical students, through an innovative approach of interprofessional education in acquiring geriatric skills. The program trains student volunteers as Patient Advocate Liaisons (PAL-S) who serve as liaisons for elderly patients through their hospital course. The students thereby effectively improve their confidence and communication skills in elderly patient care. The recruited students are trained in elderly care, using online geriatric module, small group sessions led by facilitators with geriatric expertise, and hands on clinical experience by interprofessional education. The program will improve communication skills and confidence level in understanding comprehensive care of older patients by effectively interacting and collaborating with interdisciplinary staff. A pilot program was conducted with eight medical students from Case Western Reserve University.

Pre- and post-program surveys were conducted using a subjective rating scale and analyzed utilizing a two-tailed, paired t-test at $P < .05$. The program was able to improve the learner's confidence in caring and communicating, with older patients. The PAL-S program improved confidence and communication skill sets in elderly patient care for 1st and 2nd year medical students. The program would lay foundation to integrate geriatrics within foundational studies block, longitudinal themes and core clinical components of the medical school curriculum

SARCOPENIA, TELOMERE LENGTH AND MORTALITY: NHANES 1999–2002

J.A. Batsis¹, T.A. Mackenzie¹, R.T. Emeny¹, P. Rippberger³, F. Lopez-Jimenez², S. Bartels¹, *1. Medicine, Geisel School of Medicine at Dartmouth, Lebanon, New Hampshire, 2. Mayo Clinic, Rochester, Minnesota, 3. University of New England College of Osteopathic Medicine, Biddeford, Maine*

Background: Sarcopenia is defined as the loss of muscle mass or function with aging and is associated with adverse outcomes. Telomere shortening is associated with chronic diseases yet its relationship with sarcopenia is unknown.

Methods: Adults ≥ 60 years from the 1999–2002 National Health and Nutrition Examination Surveys with body composition measures were identified. Appendicular lean mass (ALM) was defined as fat-free mass of all four limbs. Sarcopenia was defined using the two Foundation for the National Institute of Health definitions: reduced ALM (men < 19.75 ; females < 15.02 kg); or ALM divided by body mass index (BMI) (ASM: BMI < 0.789 ; < 0.512 , respectively). Telomere length relative to standard reference DNA (T/S ratio) was assessed using quantitative PCR. Weighted regression models predicted telomere length with sarcopenia (referent = no sarcopenia) after adjusting for covariates, including age. We tested a (telomere) \times (sarcopenia) interaction, ultimately stratifying by the presence/absence of sarcopenia using proportional hazard modeling (HR [95% CI]).

Results: We identified 2,672 subjects. Mean age was 70.9 years (55.5% female). Prevalence of ALM and ALM: BMI sarcopenia was 29.2 and 22.1%. No adjusted differences were observed in telomere length in those with/without sarcopenia (ALM: 0.90 vs. 0.92; $p = 0.74$, ALM: BMI 0.89 vs. 0.92; $p = 0.24$). Deaths were higher with sarcopenia (ALM: 46.4 vs. 33.4%; $p < 0.001$; ALM: BMI: 46.7 vs. 33.2%; $p < 0.001$). We observed a modest interaction between sarcopenia/telomere length using both definitions (ALM $p = 0.03$; ALM: BMI $p = 0.04$). In the presence of sarcopenia, telomere length was not associated with mortality (ALM definition: HR 1.11 [0.67, 1.82], $p = 0.68$; ALM: BMI: HR 0.97 [0.53, 1.77], $p = 0.91$). Telomere length was inversely associated with mortality in individuals without sarcopenia (ALM: HR 0.59 [0.40, 0.86], $p = 0.007$; ALM: BMI: HR 0.62 [0.42, 0.91]; $p = 0.01$).

Conclusions: In older adults, telomere length was no different based on sarcopenia status. However, sarcopenia negated the known protective relationship of telomere length with mortality after adjusting for age.

GERIATRIC EDUCATION FROM THE PERSPECTIVE OF TWO RESIDENCY PROGRAMS: PUERTO RICO EXPERIENCE

M.E. Bidot-San Antonio, *Medicine, Medical Sciences Campus, University of Puerto Rico, San Juan, Puerto Rico*

The health care needs and the continuous services demand by the elderly population in Puerto Rico require physicians possess clinical competences in geriatric. The research questions were: How two geriatric residency programs, below Family Medicine and Internal Medicine from the Medical Sciences Campus, University of Puerto Rico, have responded the geriatric education trends? and Which are the internal and external influences that have affected the residency programs according to the Academic Plan Model of Stark and Lattuca (1997)? The research was qualitative and a historical designed was applied. The methodologies to collect the information were documents review and an elite interview to 11 subjects represented by directors of both residency programs, faculty members and deans. It was found the trends in geriatric education, such as: progress in the physician's training, changes in education approaches and the accreditation process to residency programs, among others. The residency programs are well structured and the external influences are related to changes of social and economic factors. In conclusion, the programs have responded to the geriatric education trends in the following areas: education of the geriatricians, the accreditation of both programs, and training in geriatrics to other specialist in medicine, the use of diverse clinical settings to develop their clinical practice and in the integration of an interdisciplinary approach in their curricula. The internal influences have affected positively the residency programs. On the other hand, the external influences that affect negatively the geriatrics education were the lack of funds and the implementation of managed care.

TRAINING IMPROVED STUDENTS' COMFORT LEVEL AND COMPETENCY WITH VALUE AND PREFERENCE-BASED PRESCRIBING

H.Y. Cheng, E. Bradley, *University of Virginia, School of Medicine, Charlottesville, Virginia*

When clinicians treat older adults with age-related pharmacokinetics and pharmacodynamics, drug-drug, drug-disease interactions, polypharmacy, and comorbidity, they face great challenges with value and preference-based prescribing/deprescribing. It was unknown whether a structured training program could improve fourth year medical students' attitudes, comfort level and competency on value- and preference-based prescribing/deprescribing for older adults.

All 4th year medical students rotated through a two-week required geriatrics clerkship and attended two, 1.5 hour-workshops on value and preference-based prescribing/deprescribing. They were assigned to either the intervention (the author as a primary preceptor) or control group (other attending as a primary preceptor) alphabetically by their last names. Only the intervention group received structured teaching on medication review at the bedside and reported to the author. Attitude, comfort level and competency on value- and preference-based prescribing/deprescribing were assessed by five questions. The authors tested 1) improvement of fourth medical students' attitude, comfort level and competency on value- and preference-based prescribing/

de-prescribing for older adults; 2) whether such improvement is greater in the intervention group.

One hundred and forty seven students participated in the pilot curriculum. Fifty-nine were assigned to the intervention and 88 to the control group. At the end of geriatrics clerkship, all students significantly improved their comfort level and competency on value- and preference-based prescribing/deprescribing for older adults, but not attitude. There was no difference between intervention and control groups.

This curriculum for fourth year medical students can significantly improve students' comfort level and competency on value- and preference-based prescribing for older adults.

MEDBIQUITOUS CURRICULUM IN GERIATRICS CLERKSHIP: INSTRUCTIONAL AND ASSESSMENT METHODS AND RESOURCES

H.Y. Cheng, *University of Virginia, School of Medicine, Charlottesville, Virginia*

MedBiquitous curriculum inventory developed by AAMC is used to standardize instructional and assessment methods and resource types for all clerkship except geriatrics clerkship. University of Virginia is one of few medical schools in U.S. that has required geriatrics clerkship and started to apply MedBiquitous curriculum framework to geriatrics clerkship and to align this framework with 26 minimum geriatrics competencies (MGC) for fourth year medical students.

Forty eight learning objectives (LOs) and what to teach in geriatrics for fourth year medical students in geriatrics clerkship were aligned with 26 MGC (Academic Med 2009 and 2008 Institute of Medicine) and matched to keywords. LOs were achieved by a variety of instructional methods (learning activities) including case-based instruction/workshop, flipped classroom, clinical experience including geriatrics clinic, nursing home, palliative care service (inpatient, outpatient and community), inpatient geriatric unit, transitional care hospital, and acute rehabilitation hospital, geriatrics research presentation, self-study of online learning modules, standardized patients, and primary preceptorship. LOs were supported by multiple resources including: online geriatrics learning modules, watching DVD, EMR, printed materials (rotation pocket book), real patient, searchable electronic databases, and simulation center. LOs were assessed by a variety of methods including clinical documentation review of progress notes, online clinical performance rating evaluation and checklist, geriatrics shelf examine, final exam, standardized patient test, oral patient presentation, geriatrics research presentation, mid- and final rotation feedback.

The author feels MedBiquitous curriculum inventory is a great framework to develop and organize geriatrics clerkship and to align MGC for medical students.

A LONGITUDINAL GERIATRIC TRAINING CURRICULUM IN MEDICAL SCHOOL: THE GERI-TRACK

R. Puttagunta^{1,2}, G. Salmeron², A.M. Woods², A. Major², A.D. Garcia², G.E. Taffet², 1. *Geisinger Health Systems, Danville, Pennsylvania*, 2. *Baylor College of Medicine, Houston, Texas*

Though the role of aging in disease is detailed in medical education, the intricacies of managing a geriatric patient

is often a lost art. The Baylor College of Medicine (BCM) Section of Geriatrics sponsors a medical school geriatrics pathway, “Geri-Track.” In the 1st year, a monthly lecture series integrates geriatric topics with basic science curriculum. During the 2nd year, a semester-long, “GeriSkills Workshop” focuses on common clinical geriatric issues. The 3rd year, “GeriHomes/GeriLACE” yearlong clinical course incorporates weekly visits to patients’ homes with community resources. The track concludes with a month-long rotation in clinical geriatrics. We report the 10 year history and outcomes of the BCM Geriatrics track and its success as a longitudinal undergraduate medical education program. Feedback surveys from participants were compared over a 10 year period. In addition, graduates and participants of the track were asked to evaluate their Geri-Track experience and its influence on their medical career.

From 2003 to 2013, 29 medical students completed the Geri-Track, and 3 have completed a geriatric fellowship. Graduates represent 11 different specialties with the most common being internal medicine (31%), family medicine, neurology and anesthesiology (13.8% each). All students that participated in the clinical components of the track found it beneficial for their career. Participation per activity ranged from 10–64 students for lecture and 3–21 for clinical experiences.

A four year long specialized geriatrics track during medical school is an attractive option to increase student interest in geriatrics and has potential to increase geriatricians.

CREATION AND USE OF A NATIONAL, COMPETENCY BASED GERIATRICS EDUCATION CURRICULUM: WEBGEMS

A. Shah¹, K. Callahan³, C. Usiak², K. Sauvigne², R.M. Leipzig², N. Marshall², C. Howe⁴, 1. *Community Internal Medicine, Mayo Clinic, Phoenix, Arizona*, 2. *Mount Sinai, New York, New York*, 3. *Wake Forest, Winston-Salem, North Carolina*, 4. *University of Arizona, Tucson, Arizona*

In 2007 Association of American Medical Colleges (AAMC) and the John A. Hartford Foundation hosted a National Consensus Conference on Competencies in Geriatric Education, leading to the creation of a set of 26 minimum medical student geriatrics competencies. Teaching these competencies has proved to be challenging due to lack of sufficient geriatrics educators at all medical schools and time in the medical school curriculum.

To meet this challenge, in 2010, a group of educators came together to create the webGEMs curriculum (web-based Geriatrics Education Modules) and developed 25 peer-reviewed online case-based modules linked to the AAMC geriatrics competencies, available at POGOe.org. We have tracked use of the modules along with responses to voluntary end-of-module evaluations.

To date, more than 8,000 medical, nurse practitioner, and physician assistant students have completed over 30,000 total cases, spending an average of 33 minutes per case. 7827 case evaluations have been completed, with 71% of responses rating the cases as good to excellent overall, 88% saying the case taught the key issues that a student should need on the topic, and 79% rating the case as a valuable use of the student’s time. Faculty rate the webGEMs has a highly

effective and efficient way to impart geriatrics knowledge. In addition to distance/on-line learning, webGEMs have been successfully used for “flipped learning” teaching also.

Although a laborious process, the creation of a national, web-based, geriatrics education curriculum for can result in thousands of trainees being taught core geriatrics competencies with excellent student evaluations.

SESSION 570 (POSTER)

HEALTH AND SOCIAL SERVICES INTERVENTIONS

THE FORWARD BUNDLE—A NOVEL TOOL TO IMPROVE THE CARE OF PATIENTS FEEDING AT RISK

P.J. Somerville, A. Lang, S. Carrington, J. Birns, *Geriatrics, St. Thomas’s Hospital, London, England, London, United Kingdom*

Care of patients with a permanently unsafe swallow who are inappropriate for tube feeding is extremely challenging. Feeding with acknowledged risk may be an appropriate strategy but without clear decision making and communication patients may spend unnecessarily long ‘nil by mouth’ (NBM), they or their family may experience significant anxieties, advance care plans may not be made, and feeding plans may not be properly communicated to downstream care providers.

The FORWARD bundle (Feeding via the Oral Route With Acknowledged Risk of Deterioration) was developed according to the ‘Plan-Do-Study-Act’ model of iterative quality improvement. It systematised best practice in risk feeding in a flow chart, facilitating patient identification, decision-making, implementation of oral feeding and further management. Patients fed at risk were evaluated in sequential 6 month periods before and after introduction of FORWARD. The primary outcome measure was time NBM. Further data were collected on documentation of capacity, best interest discussions and discussions with relatives, and patient, relative and staff feedback.

Mean time NBM sustainably decreased after FORWARD was initiated (3.1 days (n=20) versus 1.5 days (n=17); 0.6 days (n=20); 0.3 days (n=20) (p<0.05). There was a sustained increase in documentation of capacity assessments (40% versus 94.1%; 90%; 95%), best interest discussions (85% versus 100%; 100%; 100%) and discussions with next of kin (45% versus 100%; 95%; 100%). Patient and carer feedback reported perceived improved quality of life associated with the decision for feeding with risk using FORWARD. Staff feedback highlighted increased confidence with feeding and improved communication, documentation and knowledge.

EFFECT OF HOUSE CALL PROGRAM ON MEDICARE COST IN HIGH-RISK OLDER ADULTS: RETROSPECTIVE COHORT STUDY

R. Rothbaum¹, L. Romanovsky¹, S. Gordon¹, T. Raia¹, A. Abrams¹, D. Kim^{1,2,3}, 1. *Beth Israel Deaconess Medical Center, Boston, Massachusetts*, 2. *Brigham and Women’s Hospital, Boston, Massachusetts*, 3. *Harvard Medical School, Boston, Massachusetts*

House call programs may save health care costs in high-risk patients. This retrospective cohort study aimed to evaluate the effect of a house call program on health care costs and utilization in Medicare beneficiaries who received care at Beth Israel Deaconess Medical Center, Boston, MA. In November 2012-June 2013, 548 beneficiaries who were at high risk for hospitalizations were contacted for a house call program; 307 who agreed received at least monthly home visits by nurse practitioners who collaborated with their physicians for disease management and care coordination. The remaining 241 beneficiaries received usual care without home visits or care coordination. The outcomes of interest were changes in the 12-month total Medicare part A and B cost and health care utilization before and after their contact date. Compared with the usual care group, the house call group was older (82 vs. 79 years) and had higher burden of chronic conditions. After propensity score matching, the average total Medicare cost per member per month increased by \$494 in the house call group (\$1875 to \$2369) vs. \$47 in the usual care group (\$1845 to \$1892) ($p=0.01$). The number of emergency room visits, hospitalizations, skilled nursing facility admissions did not differ between the groups; home health agency use per 100 person-months changed by 125 days in the house call group (313 to 438 days) vs. -48 days (309 to 261 days) ($p=0.01$). In conclusion, our house call program was associated with increased health care cost and home health agency use.

SOCIAL CAPITAL INTERVENTIONS TARGETING OLDER PEOPLE AND THEIR HEALTH IMPACT: A SYSTEMATIC REVIEW

L. Coll-Planas^{1,3}, F. Nyqvist², T. Puig^{3,4}, G. Urrútiá^{3,5}, R. Montserín^{3,6}, 1. *Fundació Salut i Entornament - UAB, Barcelona, Spain*, 2. *Åbo Akademi University. Faculty of Education and Welfare Studies, Social Policy, Vaasa, Finland*, 3. *Institute of Biomedical Research (IIB Sant Pau), Barcelona, Spain*, 4. *Servicio de Epidemiología Clínica y Salud Pública, Hospital de la Santa Creu i Sant Pau, Universitat Autònoma de Barcelona, Barcelona, Spain*, 5. *CIBER de Epidemiología y Salud Pública (CIBERESP), Madrid, Spain*, 6. *Equip d'Atenció Primària Sardenya, EAP Sardenya, Barcelona, Spain*

Observational studies show that social capital is a protective health factor. Therefore, we aim to assess the health impact of social capital interventions targeting older adults. We conducted a systematic review based on a logic model and assessed effectiveness using vote-counting and standardised decision rules. Studies were retrieved from Medline, Embase, CINAHL, PsycINFO, Cochrane Central Register of Controlled Trials and Web of Science from January 1980 up to July 2015. We included randomized controlled trials targeting participants over the age of 60 or with a mean age of over 65 and focused on social capital or its components (i.e., social network, social support, social participation or social engagement). The comparison group should not include any social capital component. We focused on health outcomes and assessed risk of bias. The review protocol was registered in PROSPERO (ref. CRD42014015362). We examined 17,341 abstracts and included a total of 73 papers reporting 36 randomized controlled trials. There was a big heterogeneity across studies and positive effects were reported in

different contexts, participants' characteristics and intervention designs and in a wide variety of patient-reported outcomes and objective measures. Nevertheless, according to outcomes reported in five or more trials, social capital interventions showed mixed effects on quality of life, well-being and self-perceived health and were generally ineffective on loneliness, mood and mortality. Our review supports the potential of social capital interventions to reach comprehensive health effects in older adults while highlighting the lack of quality and comparability between trials.

A PILOT TRIAL FOR COMMUNITY EMPOWERMENT THROUGH NURSE-LED COUNSELING CENTERS

D. Shin^{1,2}, S. Bae^{1,3}, Y. Choi^{1,3}, M. Kang⁴, 1. *Hallym University, Chuncheon, Korea (the Republic of)*, 2. *Research Institute of Nursing Science, Chuncheon, Kangwondo, Korea (the Republic of)*, 3. *Institute of Health Service Research, Chuncheon, Kangwondo, Korea (the Republic of)*, 4. *Ewha Womans University, Seoul, Korea (the Republic of)*

Nurse-led counseling centers (NLCCs) have been established in 'Gu', a town-sized urban district in South Korea. The purpose of the NLCCs was empowering residents, cultivating their leadership and mobilizing community resources to prevent chronic diseases and manage their health. Clubs and health-committees were organized to fulfill the purpose. We examined its feasibility guided by the ADEPT model's four determinants such as goals, obligations, resources and opportunities. Four focus-group interviews have been conducted in October to November 2013. Participants were sixteen nurses, eight club leaders who were senior residents (private sector), and fifteen health-committee members of Gu (public sector). Nurses, club leaders and health committee members represented different perspectives toward goals of the NLCCs. Further, participants defined their roles based on their goal perceptions. Due to lack of agreements on goals and obligations, nurses felt overwhelmed and exhausted with unexpected roles, while other two groups felt that they have been asked to do tasks that they were not responsible for. For the resources, participants reported that the Gu had enough to empower residents, but they felt that the resources needed to be distributed more efficiently. Among three opportunities, organizational and public opportunities increased while political one did not. The NLCCs posed potentials for empowering senior residents and communities. Establishing channels among nurses, private and public sectors was essential to increase sustainability of the NLCC.

LIFE STORY BOARDS, PERSON-CENTRED CARE, AND PATIENTS LIVING WITH DEMENTIA: A QUALITATIVE STUDY

S.P. Hammond, A. Ruseell, P. Fisher, *Norwich Medical School, University of East Anglia, Norwich, United Kingdom*

With disease modifying drugs remaining beyond the horizon, providing better care for people living with dementia remains high on the international agenda. Person-Centred Care (PCC) approaches emphasise the social context in which care is provided by one human being to another. One approach to enhance PCC is to use Life Story Work (LSW). This involves discussing, gathering, and recording

information that represents important aspects of the patient's lived history, current beliefs and preferences.

In the United Kingdom (UK) booklets such as 'This is me' encourage social care professionals to see the person living with dementia as an individual and deliver PCC tailored to the person's needs. Such booklets are one method to enact the principles of PCC. A less researched is to develop Life Story Boards (LSB). LSB are visually more accessible and impactful. This paper reports on a 3 year study exploring opportunities for a LSB intervention in a UK 24 bed specialist inpatient dementia care unit.

Utilising a participatory approach, this exploratory study trained seven clinical support workers to engage in the co-production of LSB with people living with dementia. Semi-structured interviews were undertaken pre and post-intervention implementation. From a thematic analysis, we will discuss; care workers experiences of LSB creation, how PCC was and/or was not experienced and how the context impacted upon the fidelity, dose and reach of the intervention. We will close by highlighting how LSB provides a route into embedding a more PCC culture and illustrates opportunities for transferability to wider international contexts.

THE GERI-BRIEFCASE—AN E-HEALTH INSTRUMENT WITH THE POTENTIAL OF AVOIDING ACUTE ADMISSION

K. Andersen-Ranberg^{1,2,3}, A. Fournaise², J. Nielsen^{2,3}, S. Jakobsen^{2,3}, 1. *Institute of Public Health, University of Southern Denmark, Odense, Denmark*, 2. *Region of Southern Denmark, Odense, Denmark*, 3. *Odense University Hospital, Odense, Denmark*

As advancing age is accompanied by increasing morbidity, the ageing populations ahead will be a challenge to future health care costs. One way to keep health care costs at bay is to reduce avoidable admission of older adults. In Denmark, all frail citizens may receive means-tested municipal home health care service. When a frail older person shows signs of failing health, the community nurse is the first to judge the situation. But older persons may have subtle symptoms, and the pathological picture may be blurred by comorbid conditions. It may thus be hard for the community nurse to decide whether an older person's failing health needs acute attendance by a physician or not. However, in-home objective clinical assessment by Point of Care (POC) testing followed by real-time upload of test results to a joint IT-platform, which can be accessed by the treating physician, may qualify decision-making. In consequence, this may lead to timely treatment and potentially avoidance of acute admission. We report the development and real-life testing of the "GERI-briefcase", a portable, handheld POC instrument connected to an interface which uploads collected data to a joint IT-platform. The IT-platform is accessible for both community nurses, primary and secondary care physicians. We show that the GERI-briefcase may be used by trained community nurses in the homes of older adults, and that it streamlines communication across the primary and secondary health care sectors. The effect on avoiding acute admissions is currently being investigated in Svendborg Municipality, Region of Southern Denmark.

EFFECT OF A PRIMARY CARE VIRTUAL WARD ON THE READMISSION RATES OF OLDER PATIENTS POST DISCHARGE

I. Vedel^{1,3}, G. Arsenaault-Lapierre¹, M. Ladores², H. Saad², N. Sourial^{1,3}, J. Gagnon³, V. D'Souza², B. Kremer², 1. *Lady Davis Institute, Jewish General Hospital, Montreal, Quebec, Canada*, 2. *Herzl Family Practice Center, Jewish General Hospital, Montreal, Quebec, Canada*, 3. *Department of Family Medicine, McGill University, Montreal, Quebec, Canada*

Transitional care programs to reduce readmissions have had mixed results. Interventions led by primary care physicians may have a better impact. Our objective is to evaluate the impact of a Family Medicine-based Virtual Ward (VW) intervention at the Jewish General Hospital in reducing the emergency room (ER) visits, readmissions and the length of stay of older patients.

Our study is quasi-experimental with a historical control group. All 42 patients who received the intervention between July 1st 2014 and June 30th 2015 were included. These patients were compared to all 68 consecutive historical controls discharged from the hospital one year prior. Inclusion criteria were: 65 years or older, having a family doctor at the clinic, a high risk of readmission (LACE score above 10) and being discharged to home/senior residence. The patients' charts were reviewed to determine rates of ER visits and readmissions at 30, 60, and 90 days after discharge and cumulative length of stay (LOS) for all readmissions within 90 days.

Clinically meaningful decreases in ER visits, readmission rates and LOS were observed in the VW group compared to the control group; however, these differences were not statistically significant. ER visits at 30, 60, and 90 days were decreased by 2%-17%. Readmissions were decreased by 22%-26%. LOS at 90 days was decreased by 35%. Replication in a larger sample is warranted to confirm these findings.

A PHOTOGRAPHY INTERVENTION FOR OLDER ADULTS

D.J. Yoder, *Gerontology Institute, Georgia State University, Douglasville, Georgia*

In the United States, there are 10,000 people turning 65 every day and we will soon have the largest percentage of our population over 65 that our country has ever known. This will provide many challenges for our medical community, caregiving networks and government programs. Keeping older adults healthy and able to function independently will reduce the strain on the community and allow us to target our resources where they can make the most impact. I propose an intervention that teaches digital photography, basic photo editing and computer skills to older adults to improve cognitive function, increase overall happiness and improve physical health. Research has shown that learning a new skill can improve brain function and cognitive reserve, enhancing social ties leads to increased levels of happiness, and physical activity improves both cognitive function and happiness levels. Photography incorporates all of these activities and can be modified to suit the interests and abilities of virtually anyone. I propose a test with a quota sample of 8-10 individuals including a balance of genders, races and ethnicities, sexual orientations, and income levels to understand the impact this project

could have on people of different statuses. At the conclusion of this intervention, people should be able to send email, share photos on social media and search the web for information. Teaching these skills can help keep them connected with family and friends and give them access to information and social networks that otherwise may not be available.

SESSION 575 (POSTER)

IMMUNOLOGY AND VACCINES

ANTIBODY RESPONSES TO 23-VALENT PNEUMOCOCCAL POLYSACCHARIDE VACCINE AFTER PRIMARY AND REVACCINATION

K. Kawakami¹, H. Kishino², S. Kanazu², N. Toshimizu², R. Yokokawa², K. Takahashi², M. Kohn³, L. Musey³, 1. *Nagasaki Kawatana Medical Center, Nagasaki, Japan*, 2. *MSD KK, Tokyo, Japan*, 3. *Merck and Co. Inc, Kenilworth, New Jersey*

Despite increasing risk for pneumococcal disease with advancing age, many countries recommend only a single dose of pneumococcal polysaccharide vaccine (PPSV23) for older adults. Concerns about the possibility of declining response to revaccination with age have hindered the adoption of a revaccination policy. We examined antibody responses by age after primary vaccination and revaccination in a cohort of adults aged 70–89 years.

We measured serotype-specific IgG geometric mean concentrations (IgG, 14 serotypes) and opsonophagocytic activity geometric mean titers (OPA, 6 serotypes) 4 weeks after vaccination in a community-based cohort vaccinated ≥ 5 years earlier (N=161) or never vaccinated (N=81) with PPSV23. Subjects were aggregated into 4 groups using 5-year age increments for analysis.

Across age groups IgG and OPA in the primary vaccination and revaccination groups were not significantly different. Within each age group and for all serotypes there were no significant differences between the primary and revaccination groups, with the exception of the group aged 70–74 for which IgG for serotypes 23F and 19A and OPA for serotype 6B were higher in the primary vaccination group than the revaccination group.

IgG and OPA after PPSV23 did not decline with age between 70 and 89 years. For all age groups, patients responded similarly to primary and revaccination. The generally comparable levels of IgG and OPA for the serotypes tested after primary vaccination and revaccination regardless of age supports the value of revaccination with PPSV23, even to older adults.

RESPONSES TO 23-VALENT PNEUMOCOCCAL POLYSACCHARIDE VACCINE IN ADULTS 70–79 WITH CHRONIC DISEASES

K. Kawakami², H. Kishino³, S. Kanazu³, N. Toshimizu³, R. Yokokawa³, K. Takahashi³, M. Kohn¹, L. Musey¹, 1. *Merck and Co. Inc, Kenilworth, New Jersey*, 2. *Nagasaki Kawatana Medical Center, Nagasaki, Japan*, 3. *MSD K.K., Tokyo, Japan*

Many countries recommend that adults with chronic disease be vaccinated with pneumococcal polysaccharide

vaccine (PPSV23) because of their increased risk for pneumococcal disease. To explore the immunogenicity of PPSV23 in these patients we examined antibody responses in adults age 70–89 with chronic disease after primary vaccination and revaccination compared to healthy adults in this same age group

We measured serotype-specific IgG geometric mean concentrations (GMC, 14 serotypes) and opsonophagocytic activity titers (OPA, 6 serotypes) 4 weeks after vaccination in a community-based cohort vaccinated ≥ 5 years earlier (N=161) or never vaccinated (N=81) with PPSV23.

For each serotype the GMC and OPA titers did not differ significantly between each of the groups with co-morbid conditions and the group without any of those conditions, with the exception of significantly higher GMC titers against serotype 7F in the revaccination groups with lung disease and heart disease, and serotype 3 in the revaccination group with heart disease. The GMC also were not significantly different between those with 0, 1 and 2–3 of these conditions.

GMC and OPA responses to PPSV23 vaccination and revaccination in older patients with heart disease, lung disease or diabetes mellitus were not significantly different from older patients without these conditions, even if they had more than one of these condition or if they had been previously vaccinated. These results support the recommendation to vaccinate these patients at increased risk with PPSV23.

THE NEED FOR BETTER VACCINES FOR OLDER ADULTS

W. Schaffner^{1,2}, S. Gravenstein³, 1. *National Foundation for Infectious Diseases, Bethesda, Maryland*, 2. *Vanderbilt University School of Medicine, Nashville, Tennessee*, 3. *Case Western Reserve University, Cleveland, Ohio*

Seasonal influenza (flu) and respiratory syncytial virus (RSV) are the two leading causes of medically significant respiratory tract illnesses in older adults in the United States. The viruses circulate alongside other winter respiratory viruses and are often indistinguishable from each other based on clinical presentation alone. Although the impact of influenza in older populations is well recognized among health-care professionals (HCPs) and the public health community, there is an under-appreciation of the impact of RSV, which is estimated to cause nearly as many annual deaths in US adults age 65 years and older as influenza A infections.

Standard influenza vaccines do not provide optimal protection for older patients due to age-related immune senescence. Newer influenza vaccines, designed to provide a stronger immune response in older adults, have become available in recent years. There is currently no licensed vaccine available to protect against RSV, but, several promising candidate RSV vaccines are on the horizon to protect populations at increased risk of serious RSV outcomes, including those age 65 years and older.

The National Foundation for Infectious Diseases (NFID) convened experts to address prevention and treatment of both influenza and RSV in older adults and is developing outcomes reports. In the coming months, NFID will be developing strategies, content, and tools to support optimal prevention strategies against influenza and public health and HCP communities that are better prepared to address RSV prevention when vaccines do become available in the US.

ZOSTER VACCINE LIVE: REVIEW OF POSTMARKETING SAFETY BY DECADE OF LIFE

E. Willis, M. Woodward, E. Brown, Z. Popmihajlov, *Merck & Co., Inc., Kenilworth, New Jersey*

Zoster Vaccine Live (ZVL) was approved in 2006 for the prevention of herpes zoster (HZ) and post herpetic neuralgia in individuals ≥ 50 years-of-age. To describe the safety profile of ZVL by decade of life, spontaneous postmarketing adverse event (AE) reports received for ZVL from 02-May-2006 to 01-Nov-2015 from healthcare providers (HCP) worldwide for patients age ≥ 50 were reviewed. A total of 11342 reports, containing 28188 AEs, were identified. The majority of the reports were from those 60–69 (48%) years followed by 70–79 (28%), 50–59 (14%); and ≥ 80 years (10%). Overall, injection site reaction (ISR) (n=6788; 24%) and herpes zoster (HZ) (n=2577; 9%) were the most frequently reported AEs. ISR was the leading AE in ages 50–79 and HZ in those ≥ 80 years. Median time to onset (TTO) from vaccination to AE for ISR was 2 days. In slightly over half of the reports of HZ, TTO was ≤ 14 days postvaccination. HZ was also the most frequently reported serious AE among all age groups. In the majority (75%), HZ was considered serious because the HCP reported the event to be either medically significant or disabling. Sixteen events (<1%) of disseminated HZ (DHZ) in ages 50–59 (n=1), 60–69 (n=5), 70–79 (n=6) and ≥ 80 years (n=4) were reported; 40% of the patients were reported to be immunosuppressed. The remaining AEs were reported similarly across the age groups. This review indicated that DHZ was reported very rarely and the most frequently reported AEs for ZVL were similar by decade of life.

EFFECTIVENESS OF LIVE ZOSTER VACCINE IN PREVENTING POSTHERPETIC NEURALGIA (PHN)

R. Baxter², J. Bartlett², B. Fireman², M. Marks¹, J. Hansen², L. Aukes², E. Bresnitz¹, P. Saddier¹, 1. *Pharmacoepidemiology, Merck and Co. Inc., North Wales, Pennsylvania*, 2. *Kaiser Permanente Vaccine Study Center, Oakland, California*

A single dose, live attenuated zoster vaccine, is licensed in >50 countries for the prevention of herpes zoster and PHN. Duration of protection is being evaluated in a long-term observational study. We previously reported that vaccine effectiveness (VE) to prevent zoster tended to decline over time and was on average 45–50% over 5 years in people ≥ 60 (60+) years. We present here the results of VE against PHN. The study is conducted in a large US healthcare plan as an open cohort that members enter unvaccinated when they become age-eligible for vaccination. PHN cases among vaccinated and unvaccinated zoster cases were identified as having a PHN-specific diagnosis code ≥ 90 days after first zoster diagnosis code. VE against PHN was estimated using Cox regression adjusting for sex, birth year, race/ethnicity, healthcare use, comorbidities and immunocompromise status. From 2007 to 2013, >300,000 subjects were vaccinated (coverage >40% in 60+) and ~42,000 zoster episodes occurred. VE against PHN was 83% (95% CI 73–90%) in the first year, decreased in the second year, and then remained relatively stable through year 5, with an overall VE of ~70% in all 60+ age groups (60–69, 70–79, and 80+ years at vaccination); among people vaccinated at 80+, VE was 71% (54–82%). Overall VE against PHN was ~70% in all 60+

age groups. VE against PHN and zoster in people vaccinated at 80+ was similar to younger 60+ groups, supporting vaccination of all eligible people, including the elderly who are at increased risk of zoster and PHN.

REFERENCE RANGES OF LYMPHOCYTE SUBSETS IN NON-FRAIL OLDER ADULTS

B. Laffon¹, M. Sánchez-Flores¹, D. Marcos-Pérez¹, A. Maseda², L. Lorenzo-López², J. Millán-Calenti², V. Valdíglesias¹, E. Pásaro¹, 1. *DICOMOSA Group, Department of Psychology, Area of Psychobiology, Universidade da Coruña, A Coruña, Spain*, 2. *Gerontology Research Group, Instituto de Investigación Biomédica de A Coruña (INIBIC), Complejo Hospitalario Universitario de A Coruña (CHUAC), SERGAS, Universidade da Coruña, A Coruña, Spain*

Aging is associated with progressive changes in several key physiological systems including the immune system, which is continuously remodeled over the life course, a process known as immunosenescence. Nevertheless, reference ranges currently used for immunological biomarkers do not specifically differentiate the older adults group. Thus, the aim of this study was to establish reference ranges for lymphocyte subsets in non-frail older individuals, and to determine the influence of certain physiological or lifestyle factors. Percentage of the lymphocyte subpopulations were analyzed in peripheral blood from 144 older subjects (aged 65–95) by flow cytometry, and reference ranges were calculated. The individual status as non-frail or pre-frail did not affect the immunological parameters, but a clear influence of age and gender was observed for some of them. Results obtained will serve as a basis to determine the usefulness of lymphocyte subsets as immunological biomarkers of frailty.

Funding: Xunta de Galicia (R2014/021).

DISPARITIES IN INFLUENZA IMMUNIZATION STATUS AMONG POST-ACUTE AND LONG-TERM CARE PATIENTS/RESIDENTS

C. Byrne, L.A. Palmer, D.H. Barch, N.M. Jarrett, A. Helburn, H. Neumann, L. Smith, *RTI International, Research Triangle Park, North Carolina*

Influenza is associated with morbidity and mortality in at-risk populations. Individuals admitted for post-acute or long-term care may be especially susceptible to adverse outcomes. The CDC recommends annual influenza vaccination for everyone over 6 months old unless medically contraindicated. The quality measure, Percent of Residents or Patients Assessed and Appropriately Given the Seasonal Influenza Vaccine, is intended to encourage nursing homes (NHs), inpatient rehabilitation facilities (IRFs), and long-term care hospitals (LTCHs) to address this important aspect of clinical care. We analyzed assessment data for these three settings for the 2014–15 IVS (n= 1,780,510 MDS 3.0; 251,403 IRF-PAI; 100,545 LTCH CARE Data Set). The majority of patients and residents were assessed and when appropriate, vaccinated (80% in NHs; 91% in IRFs; 73% in LTCHs); however, disparities by demographic markers were observed when examining rates of vaccine receipt and rates of vaccine refusals. Chi-square tests of independence found significant relationships between vaccination status and patient characteristics of sex, race, ethnicity, and age ($p < .01$ for

all categories). Men, whites, and older individuals were more likely to receive the vaccine and women, minorities, and younger individuals were more likely to decline in these settings. Multiple logistic regression analyses of immunization status showed that, even when adjusting for selected patient- and facility-level covariates, these disparities were still present. Our research found little change a decade after disparities in nursing home residents' vaccination status were first observed. Disparities in vaccination still need to be addressed, now for all three of these settings.

IMMUNE RISK PROFILE (IRP) AND MORBIDITY PHENOTYPE OF INDEPENDENT OLDEST OLD

M. Caldeira, M. Brunialti, R. Salomão, C. Mello Almada Filho, M. Cendoroglo, *Geriatric, Universidade Federal de Sao Paulo, Indaiatuba, Sao Paulo, Brazil*

Background: The Immune Risk Profile (IRP) is defined as inversion of lymphocytes T CD4 / CD8. IRP+ is present in 13–15% of the studies and is associated with functional limitations and mortality in elderly. **Methods:** We invited elderly aged 80 and over, community-dwelling, with good cognition, no acute diseases and with chronic diseases under control. We analyzed CD4 and CD8 lymphocytes and the morbidity phenotype considered was: Hypertension, Heart disease, Diabetes, Stroke, nonskin Cancer, skin Cancer, Osteoporosis, Thyroid disease, Parkinson's disease and Chronic Obstructive Pulmonary disease. We classified the oldest old according to the age of diagnoses in: survivors10 and delayers10 (at least one of 10 diseases before or after 80 years old respectively), escapers10 (none of 10 diseases), survivors3 and delayers3 (heart disease, stroke, nonskin cancer before or after 80 years old respectively) and escapers3 (none of 3 diseases). **Results:** There were no differences between the distribution of diseases in survivors10, delayers10 and escapers10 and also survivors3, delayers3 and escapers3 according to sex. The CD4/CD8 <1 was present in 9 % of subjects, with a mean age of 85,6 years. From 224 independent oldest old, 162 of survivors3 + delayers3 and 42 of escapers3 were PIR- ($p=0,0039$). **Conclusion:** PIR – was more frequent in independent oldest old besides the presence of diseases and maybe is a marker of independent longevity.

SESSION 580 (POSTER)

INVOLVEMENT IN THE COMMUNITY THROUGH VOLUNTEERING AND CIVIC ENGAGEMENT II

SOCIAL ACTIVATION OF SOCIALLY ISOLATED ELDERLY BY VOLUNTEERS

P. Bos, *University of Humanistic Studies Utrecht, Utrecht, Netherlands*

This paper is based on an evaluative ethnographic study among elderly persons in the city of Rotterdam in the Netherlands. Data are collected among 55+ citizens who are admitted to a social work-program because of their problematic social isolation and/or loneliness. The program offers each client a volunteer who visits the client on a weekly basis. In-depth interviews in combination with thick descriptions, collected through participant observations and focus groups offer insights from both perspectives (clients and volunteers).

The study reveals a wide array of expectations, hopes and frustrations. Several clients appeared 'unmatchable' because of heavy needs. Many volunteers experience mismatches and declining motivation. Volunteers balance distance versus proximity or intimacy, sustainable relationships versus temporality, practical assistance versus social support. The increasing number of unmatchable clients requires reconsiderations and readjustments in terms of screening and selection of volunteers and clients. The operational volunteer staff needs intensive coaching to adjust and improve skills and to uphold motivation.

OLDER CITIZENS' ENGAGEMENT IN AGE RESEARCH CONCEPTUAL AND PRACTICAL CONSIDERATIONS

R. O'Sullivan^{1,2}, B. Murtagh³, *1. Institute of Public Health in Ireland, Belfast, United Kingdom, 2. Ulster University, Belfast, Northern Ireland, United Kingdom, 3. Queen's University Belfast, Belfast, Northern Ireland, United Kingdom*

The research community are increasingly being encouraged (both financially and morally) to connect with the relevant players from government, the non-profit sector, business and especially older people themselves. However, we need to understand and debate to a much greater degree how older citizens' involvement in research can be appropriate, meaningful and beneficial. This mixed methods research combines a review of literature and practices on user involvement, an e-survey of practitioners in the age sector (n50) and 18 semi-structured interviews with researchers, government and non-profit sector representatives. The paper presents a review of the nature of user involvement in research and how this can be strengthened to improve the quality of work and the potential for stronger impact. This presentation sets out a review of the conceptual and practical basis of user involvement in research on issues and topics relevant to older adults; the types, levels and value of different methods of user involvement; the reasons why older people and their representative organisations get involved, the attitudes of researchers and practitioners to older citizens' involvement. The paper utilises Foucault's theory of power, provides a typology of researchers' perspectives on user involvement and concludes with a set of good practice guidelines for researchers wishing to maximize involvement.

BARRIERS TO OLDER PEOPLE'S PARTICIPATION IN SENIORS' INTEREST ORGANISATIONS: A CROSS-CULTURAL STUDY

R. Serrat¹, J. Warburton³, A. Petriwskyj², F. Villar¹, *1. Cognition, Development, and Educational Psychology, University of Barcelona, Barcelona, Barcelona, Spain, 2. The University of Queensland, Brisbane, Queensland, Australia, 3. La Trobe University, Wodonga, Victoria, Australia*

Older people's active political participation is a core component of the active ageing model, which recognizes seniors' right to have a say in decisions directly affecting their lives. This often occurs through seniors' interest organisations; however, research into older people's volunteering for political organizations is very limited. One important dimension on which evidence is missing is the understandings of those

in responsible roles about the challenges to recruitment and retention. This evidence is fundamental to understanding and developing practice among these volunteer leaders. Further, given the nature of this participation, socio-political context may be an important influence on their beliefs and practice.

This study explores the perceptions of older people in such responsible roles within seniors' interest organizations, across two different socio-political contexts, about their own barriers to continued volunteering, and the barriers they perceive for others to become involved. The sample comprised 52 participants from nine Australian and five Spanish seniors' interest organisations. A questionnaire including open-ended questions regarding perceived barriers to recruitment and retention in seniors' organisations was used for data collection.

Analysis of findings showed three key categories relating to practical and resource issues, beliefs and attitudes towards participation, and organizational and contextual issues. However, there were considerable differences between the volunteer leaders' perceptions of barriers to others' recruitment and their own retention. Moreover, similarities and differences across the two countries highlight the importance of considering the influence of diverse socio-political contexts. Implications for seniors' interest organizations and future research are discussed.

FACTORS RELATING TO SATISFACTION AND MOTIVATION OF DISTRICT WELFARE COMMISSIONERS IN JAPAN.

Y. Sugihara, *Tokyo Metropolitan University, Hachioji-shi, Tokyo, Japan*

Formal volunteering offers broad benefits to the community. Therefore, understanding the strategy for the recruitment and retention of volunteers has been considered as an important policy issue. In Japan, district welfare commissioners are important formal volunteers that deal with community care and support. However, there are few people that willingly undertake work as the commissioners. This study examined factors associated with the satisfaction and motivation to continue working of district welfare commissioners, with a focus on the roles of "psychosocial gains," "role strain," and "support from others". Questionnaires were sent by mail to district welfare commissioners (N=1,936) living in Tokyo in 2012 (response rate: 69.5%). The results from structural equation modeling showed that those having high psychosocial gains such as feelings of fulfillment about their activities had a high level of satisfaction and motivation to continue working, whereas those feeling role conflicts (e.g. "I am assigned meaningless work.") and role ambiguity (e.g. "I don't know what to do.") had a low level of satisfaction and motivation. Role overload was not significantly related to the level of satisfaction and motivation. Although support from municipal offices, community support centers and other sources did not have direct effects on satisfaction and motivation, consultation and information support from them had indirect effects mediated by an increase in psychosocial gains and a decrease in role conflicts and ambiguity. These results suggest the importance of managing psychosocial gains and role conflict/ambiguity and promoting backup support for the retention of district welfare commissioners.

ENGAGING OLDER ADULTS AND THEIR CAREGIVERS IN INNOVATION ECOSYSTEMS FOR HEALTH AND AGING

H. McNeil¹, J. McMurray², K. Byrne¹, K. Grindrod¹, A. McKinnon³, P.T. Stolee¹, 1. *School of Public Health and Health Systems, University of Waterloo, Waterloo, Ontario, Canada*, 2. *Wilfrid Laurier University, Waterloo, Ontario, Canada*, 3. *Arthritis Research Canada, Richmond, British Columbia, Canada*

Innovation for health and aging offers potential benefits for the well-being of older adults and their caregivers. Regional Innovation Ecosystems (RIEs), involving a "triple helix" of industry, government and academic stakeholders, have been proposed to support development and commercialization of innovations. We sought to understand how older adults and their caregivers contribute their perspectives to RIEs for health and aging, and whether their role could be enhanced through an evolution of the triple helix partnership. A three-phase integrated mixed-methods study, emphasizing stakeholder engagement was conducted. Phase one involved a scoping review on user engagement in RIEs. Building on this, phase two engaged older adults and their caregivers (n=15), and representatives from the triple helix (n=21) in individual and group interviews. Following Kane and Trochim's (2007) Concept Mapping methodology, phase three integrated themes into a framework of priorities. We found that there is currently little meaningful involvement of older adults and their caregivers in RIEs. Evolving the triple helix theoretical framework to accommodate the growing importance of meaningful engagement of older adults and their caregivers will require a recognition of the need for diversity of representation, consideration of barriers such as system constraints and traditional partnerships, and appreciation of multiple roles that older adults could play in health and aging innovation. This study identified directions and strategies for enhanced engagement in RIEs for health and aging. We are continuing to collaborate with project stakeholders to develop RIEs that can support the health and well-being of older adults and their caregivers.

BABY-BOOMERS' VOLUNTEERING IN NON-PROFIT ORGANIZATIONS OFFERING HOME SUPPORT

J. Castonguay^{1,2,3}, M. Beaulieu^{1,3,4}, A. Sévigny², 1. *Faculté des lettres et sciences humaines, Université de Sherbrooke, Lévis, Québec, Canada*, 2. *CIUSSS de la Capitale-Nationale – Centre d'excellence sur le vieillissement de Québec, Québec, Québec, Canada*, 3. *Centre de recherche sur le vieillissement du CIUSSS de l'Estrie – CHUS, Sherbrooke, Québec, Canada*, 4. *Chaire de recherche sur la maltraitance envers les personnes âgées, Sherbrooke, Québec, Canada*

Non-profit organizations, important actors in the field of home support, are facing challenges such as recruiting and retaining volunteers. In view of the ageing population, this situation is worrisome: these organizations essentially rely on volunteer action. The imminent wave of baby-boomers entering retirement may improve the situation. However, free time and volunteering are not synonymous.

This poster will report the findings of a study which sought: 1) to identify individual and organizational factors that facilitate and/or hinder baby-boomers' volunteering in non-profit organizations; 2) to better understand the

interactions between them; and 3) to create a model of baby-boomers' volunteering.

This descriptive and comprehensive study is based on qualitative methods and a contemporary Straussian grounded theory approach, and is guided by an integration of the Bronfenbrenner's ecosystemic approach and the volunteer process model. The theoretical sample consists of 34 participants: volunteers, non-volunteers and volunteer coordinators. Semi-structured interviews are conducted and supplemented by non-technical literature.

For each stage of the volunteering process (antecedents, experiences, consequences), individual factors (e.g.: knowledge, availability, capacities, motivations) and organizational factors (e.g.: mission, activities, organizational structure, support) represent barriers and/or facilitators according to their intervention context. Some factors play a key role at a specific moment, while others appear transverse to the volunteering process. However, individual and organizational factors do not act alone; they interact with interpersonal and social factors.

Despite the benefits associated to volunteering, it is important to remain critical concerning its promotion. Pernicious shifts may happen such as a normalization and an instrumentalization of volunteering.

ECONOMIC RESOURCES AND VOLUNTEERING IN LATER LIFE: DOES RACE MATTER?

Y. Chen¹, H. Shen², 1. *Washington University in St. Louis, St. Louis, Missouri*, 2. *University of Missouri-St. Louis, St. Louis, Missouri*

Many important factors predicting volunteering in old age have been identified. For instance, evidence suggests that older adults who are healthier are more likely to volunteer. However, the effects of economic resources on volunteering remain inconclusive. Guided by the cumulative disadvantage theory, the present study investigates (1) whether the associations between economic resources and volunteering differ by types of economic resources (income, net worth, financial assets, home and car ownership), and (2) whether such relationships vary by race. Using data from the 2010 Health and Retirement Study, 9,859 community-dwelling older adults who were 65+ and self-identified as non-Hispanic White or non-Hispanic Black/African-American were included. Two hierarchical multinomial logistic regression models (one for Whites and the other for Blacks), controlling for socio-demographics and health, were utilized to assess the relationships between different types of economic resources and volunteering: non-volunteering (reference), informal-volunteering only, formal-volunteering only, and both types. Results showed that different types of economic resources were associated with different types of volunteering that older people engaged in: income was not related to any types of volunteering; owning a car and greater financial assets increased the likelihood of both types of volunteering. For Whites, financial assets were positively associated with formal-volunteering only, but for Blacks, greater financial assets increased the likelihood of informal-volunteering only. Findings suggest the importance of looking at different types of assets in understanding volunteering for older adults. It is equally important to consider different types of economic

resources when encouraging volunteering among older white and black adults.

INTERGENERATIONAL RECIPROCITY: THE ROLE OF SPIRITUALITY AMONG AFRICAN AMERICAN FOSTER GRANDPARENTS

D. Ivey, N. Fields, *The University of Texas at Arlington, Arlington, Texas*

Volunteering in later life is considered a major category of productive aging. The Foster Grandparent Program (FGP) is one of three National Senior Service Corps programs that allows volunteers (age 55+) to stay active by serving children with special needs in their communities. Over forty percent of volunteers in the FGP are from African American (AA) backgrounds, however, little research has examined the unique cultural experiences of this population. Although research suggests that spirituality and/or resilience are integral to the culture of AA elders, there is a dearth of research exploring the role of faith among AA foster grandparents in FGPs. Guided by gero-transcendence and transpersonal theories, the purpose of this study was to qualitatively explore the role of spirituality and resilience among AA foster grandparents. A researcher with expertise in the cultural aspects of intergenerational caregiving conducted in-depth qualitative interviews with a sample of foster grandparents from African American backgrounds (N = 10). Using an inductive approach through a process of thematic analysis, four main themes suggest that foster grandparents experienced love, kindness, bonding, and a sense of purpose through the FGP. Findings suggest that spirituality played an important role for foster grandparents within the context of connecting personal faith to the volunteer experience. Participants also reported intergenerational reciprocity and an enhanced sense of purpose in their daily lives through the FGP volunteer experience. We recommend strategies for culturally tailoring FGPs to take into account the unique strengths of AA foster grandparents, in particular, faith and spirituality.

BENEFITS AND BARRIERS FOR CHINESE IMMIGRANT FOSTER GRANDPARENTS: A MIXED METHODS STUDY

L. Xu, V. Miller, N. Fields, *The University of Texas at Arlington, Arlington, Texas*

Objectives: The National Senior Service Corp Foster Grandparent Program (FGP) provides volunteer opportunities for older adults to work as 'grandparents' with children with special needs. Although research suggests that race and culture impact foster grandparent volunteering, there is little research related to the experiences of Chinese elders participating in FGP. In this study, the researchers utilized a community-based participatory approach to explore the benefits and barriers to volunteering as foster grandparents in American schools from the perspective of Chinese immigrant elders.

Methods: Mixed methods were used for this study. Focus groups and brief survey were conducted with Chinese foster grandparents (N=20) to qualitatively and quantitatively explore participants' experiences in the U.S. school system working with special needs children. Descriptive analysis and inductive content analysis was employed. Themes were

identified until consensus was reached among members of the research team.

Results: Overall, the majority of participants (96%) enjoyed participating in the FGP. Participants shared that volunteering in the FGP was a reciprocally beneficial intergenerational experience. Participants also suggested that participating in the FGP provided meaningful opportunities to help children, valuable cross-cultural learning opportunities related to traditions/practices in the United States as well as offered a positive social outlet and stress relief. Barriers to FGP participation included difficulties with the English language and cultural differences between Western and Eastern teaching styles/classroom expectations.

Conclusions: Participation in the FGP for Chinese immigrant elders is both beneficial and challenging. Recommendations for culturally tailored foster grandparent training are provided along with implications for future research.

LOW-INCOME ADULTS' MOTIVATION TO BECOME A SENIOR CORPS VOLUNTEER

A. Georges, H. Uppal, W. Fung, *JBS International, Inc., Burlingame, California*

The Corporation for National and Community Service Senior Corps program engages low-income adults in national service. Volunteers were surveyed prior to starting service as a Foster Grandparent or Senior Companion and after nine months of service. Participants ($N=1,125$) were females (89%), racially diverse (45% White, 42% African American, and 11% Hispanic), and ages 55–91. A latent class analysis, based on 11 items, found that while a typical volunteer was motivated by altruistic motives, some motives were more predominant than others and some volunteers had multiple motives. Specifically, five categories of volunteers were identified: Altruistic (15%), Personal Growth (9%), Idealistic (21%), Social Exchange (22%), and Externally Driven (34%). A multinomial logistic regression analysis found that unlike previous studies, gender and race were not significant predictors of motivation. Findings also showed that volunteers with bachelor's degree or higher education were more likely to be in groups motivated by a desire to improve the community, as well as a desire to grow personally and help an individual. Volunteers who are separated/divorced, widowed or live alone were more likely to be in the Altruistic group than the Social Exchange group; the former identified the desire to help someone, while the latter identified with all motivations presented. The findings suggest that recruitment messages based on idealistic and altruistic values may have wider appeal for adults older than 76 years and those who are separated, divorced or live alone; and messages based on self-oriented motives (e.g., learning, self-accomplishment) would appeal to the more educated volunteers.

INFLUENCE OF INTERGENERATIONAL PROGRAMS ON SOCIAL CAPITAL IN LOCAL COMMUNITY

Y. Fujiwara¹, Y. Murayama¹, M. Hasebe^{2,1}, J. Yamaguchi¹, M. Yasunaga¹, K. Nonaka¹, H. Murayama^{3,1}, 1. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 2. *Seigakuin University, Ageo, Japan*, 3. *University of Tokyo, Tokyo, Japan*

Background & purpose: We launched an intergenerational program named REPRINTS (Fujiwara et al., 2006), in which volunteers >60 years old read picture books to children in school setting of a local community. REPRINTS has demonstrated reciprocal effects on senior volunteers and children (Yasunaga et al., 2016). The aim of this study was to clarify the relationships between intergenerational programs and social capital among local residents.

Methods: We conducted a mail survey among randomly selected 2,500 residents in Tama ward of Kawasaki city, aged 20–84 years in 2015. Of these, 978 residents (461 males and 517 females) responded the survey.

Respondents were asked about social capital and were assessed by two items: (1) “Can people be trusted in their neighborhood?” (neighborhood trust), (2) “In most cases, would people try to take advantage of their neighborhood?” (neighborhood norm). Awareness of the REPRINTS was also assessed: “Do you know the intergenerational program REPRINTS program or its activities in this community?”

Results: Among the 24 residential area in this community, 13 intervention areas had at least a kindergarten, an elementary school or a junior high school where REPRINTS volunteers often visited.

Awareness of the REPRINTS was 13.8% among respondents.

For those in their 20's and 30's, individual levels of neighborhood trust and norms were significantly associated with awareness of the REPRINTS program ($p<.01$). For the sample of those in their 40's, 50's and 60's over, community-levels of neighborhood trust were significantly associated with duration of the programs in the areas ($p<.05$).

Conclusion: A spillover effect of the intergenerational program associated with neighborhood trust and neighborhood norm in a community but differs between generations.

LET THE SUNSET GLOW: PRACTICING QUASI-VOLUNTEERISM IN SHANGHAI'S AGING COMMUNITIES (1998–2016)

T. Pan, G. Shen, *The Institute of Anthropological and Ethnological Studies, Fudan University, Shanghai, Shanghai, China*

Based on field research conducted intermittently since the late 1990s, this paper examines the innovative strategies developed by staff members of the street office and its affiliated residents committees, NGOs, social entrepreneurs in order to generate and sustain quasi-voluntarism in ageing communities in Huangpu District, Shanghai. In the context of everyday community-building practices, “quasi-volunteering” refers to activities of giving that do not preclude volunteers from benefiting from their work (e.g. material rewards or satisfaction). Through probing the local grounding of “quasi-volunteering” and identifying the operational worth of embedded adaptive wisdom, this paper attempts to bring multiple voices of motivated social actors to bear on the local system of eldercare management in order to provide a necessary corrective to formal accounts based primarily on survey research and questionnaires. By way of incorporating ethnographic perspectives that gives centrality to individual efforts to endure, control, and manipulate their circumstances, this paper seeks a deeper understanding of the strengths and

limits of located-based volunteer activities in facilitating positive ageing and meeting the dire needs of the elderly.

SESSION 585 (POSTER)

NUTRITION AND DIET QUALITY 1

DIETARY PATTERNS AND ATHEROSCLEROSIS IN COMMUNITY-DWELLING OLDER MEN IN HONG KONG AND THE U.S.

J. Woo^{1,2,5}, R. Chan^{1,2}, J. Leung³, J. Shikany⁴, 1. *Department of Medicine and Therapeutics, The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 2. *Centre for Nutritional Studies, The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 3. *Jockey Club Centre for Osteoporosis Care and Control, The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 4. *Division of Preventive Medicine, University of Alabama at Birmingham, Birmingham, Alabama*, 5. *CUHK Jockey Club Institute of Ageing, The Chinese University of Hong Kong, Hong Kong, Hong Kong*

Dietary pattern analysis is an alternative approach investigating the association between diet and atherosclerosis. This study examined the association of dietary patterns with prevalent atherosclerosis in community-dwelling men older than 65 years. We used data from the Osteoporotic Fractures in Men (MrOS) Hong Kong (HK) cohort (N=1768) and MrOS US cohort (N=5006). Diet was assessed with country-specific food frequency questionnaire. Principal component analysis identified three *a posteriori* dietary patterns: “vegetables-fruits dominated”, “dim sum-meat-fish dominated”, and “fast foods dominated” in HK site and two patterns: “vegetables-fruits-fish-poultry dominated” and “fast foods-red meat dominated” in US site. Ankle-brachial index (ABI) was measured and a cut-off value of <0.9 was used to define prevalent atherosclerosis. Multiple logistic regression was used to assess the association between dietary patterns and ABI controlling for demographic, socio-demographic and lifestyle variables, and comorbidities. There were 5% and 6.2% MrOS HK and US men with ABI <0.9 respectively ($p=0.06$). In HK site, men in the highest quartile of “vegetables-fruits dominated” pattern score [age and BMI adjusted OR=0.50 (95% CI: 0.26–0.96), $ptrend=0.03$] showed lower likelihood of having an ABI <0.9 compared to men in the lowest quartile. In US site, men in the higher quartile of “vegetables-fruits-fish-poultry dominated” pattern score was associated with lower odds of having an ABI <0.9 [age and BMI adjusted OR=0.59 (95% CI: 0.42–0.83), $ptrend=0.005$]. The associations were attenuated and no longer statistically significant in the fully adjusted models. There was no statistically significant association between other pattern scores and ABI category in either cohort.

PROTEIN INTAKE OF BRAZILIAN ELDERLY FROM SÃO CAETANO: A QUANTITATIVE AND SEMI-QUANTITATIVE ANALYSIS

N. Gaspareto¹, A.N. Previdelli¹, S.M. Lima Ribeiro², R.C. de Aquino¹, 1. *Universidade São Judas Tadeu, São Paulo, SP, Brazil*, 2. *University of São Paulo, São Paulo, Brazil*

Protein intake in elderly is associated with prevention or risk of adverse outcomes, particularly sarcopenia. We aimed

to evaluate quantitatively and semi-quantitatively protein intake in community-dwelling elders from São Caetano do Sul, SP, Brazil. Data from a cross-sectional study with 295 elders over 60 years, users of health facilities and community centers for elderly. Sociodemographic, health, lifestyle and food intake data we collected. Multiple Source Method estimated habitual intake for energy, macro and micronutrients. Protein was evaluated as total intake, grams per kilogram of body weight (g/kg), food source and meal. Prevalence of nutrient inadequacy intake was estimated using the EAR method to define cut-off points. The survey found that most elderly was female (85.1%), over 70 years (53.6%) and up to four years of education (41.7%). Median protein intake was 67g (or 1.05 g/kg) and inadequacy prevalence was 8.5%. Ratio of animal to vegetable protein was 2:1. The frequency of elderly who consumed less than 25g of protein in the breakfast was 98%, in the dinner 67% and 33% at lunch. Being that, most protein was consumed during lunch (43.0%). Milk and bakery groups had the highest relative contribution for protein intake at breakfast and snack meals, and meat at lunch and dinner. Higher prevalence of inadequate micronutrient intake, except vitamin C and sodium, was found among elderly who consumed less protein (g/kg). In conclusion, protein intake should be monitored to ensure the quantity, quality and adequate distribution between meals for health promotion and prevention of fragility related sarcopenia.

HIGH INTAKE OF NON-MILK EXTRINSIC SUGARS IS ASSOCIATED WITH POOR NUTRIENT INTAKES IN OLDER PEOPLE

S. Jyvkorpi¹, K. Pitkälä¹, T.M. Puranen¹, T. Strandberg^{1,3,2}, M. Bjorkman¹, H. Soini¹, H. Kautiainen¹, M. Suominen¹, 1. *Department of General Practice and Primary Health Care, University of Helsinki, Helsinki, Finland*, 2. *Helsinki University Central Hospital, Helsinki, Finland*, 3. *University of Oulu, Oulu, Finland*

Introduction: High dietary sugar intake may compromise protein and micronutrient intakes in people with low energy intakes. Results on micronutrient dilution studies in older people have been few and conflicting. We examined nutritional status and nutrient intakes in connection to non-milk extrinsic sugars (NMES) intakes in older people representing broad spectrum of both healthy and vulnerable older populations.

Methods: Cross-sectional study combined five Finnish datasets with home-dwelling (n=526) and institutionalized (n=374) older people. Nutritional status was assessed using Mini Nutritional Assessment (MNA) and nutrient intakes retrieved from 1–3 day food records. The participants were divided into quartiles corresponding to proportions of energy received from NMES. Energy, nutrient and fiber intakes were classified according to the NMES quartiles and the participants were divided according to place of residence (home, institution).

Results: High NMES intake was associated with age, female sex, poor cognition, low MNA scores, immobility and institutionalization. 90% of the participants in the highest NMES quartile (Q₄) were institutionalized. In institutionalized participants low protein and micronutrient intakes were observed in both those with low energy intakes (Q₁)

and in those with high NMES intakes (Q_4). In home-dwelling older people there was a linear trend of declining nutrient intakes with increasing NMES intakes in protein and most micronutrients.

Conclusions: Institutionalized older people had diets high in NMES compared to home-dwelling older people. In institutionalized older people both low energy and high NMES intakes were associated with low protein and micronutrient intakes.

METABOLIC ABNORMALITIES IN BRAZILIAN OLDER ADULTS—SABE SURVEY

D. Dourado¹, M.N. Marucci², M. Roediger², 1. *Universidad del Desarrollo, Santiago, Chile*, 2. *Universidade de Sao Paulo, Sao Paulo, Brazil*

The aim of this study is to investigate the metabolic syndrome components in Brazilian older adults by gender and age groups. Cross-sectional study with data from the SABE (Health, Well-being and Aging) Survey: epidemiological, cohort based and home-dwelling. The population included elderly individuals (≥ 60 years old), both sexes, selected by probability sampling, interviewed in 2010, belonging to three cohorts A/2000 ($n = 630$), B/2006 ($n = 214$) and C / 2010 ($n = 311$). The variables were: gender, age, metabolic syndrome components (MSC), identified according to the criteria of the National Cholesterol Education Program-Adult Treatment Panel III: waist circumference (WC) >102 cm for men, and >88 cm for women; blood pressure (BP) ≥ 130 and/or ≥ 85 mmHg; triglycerides (TG) ≥ 150 mg/dL; high density lipoprotein cholesterol (HDL-c) <40 mg/dL for men, and <50 mg/dL for women; fasting glucose (FG) >100 mg/dL. Rao & Scott test and logistic regression for complex sample with 5% significance level were used. 1155 subjects were studied, being 60.7% women. The MS prevalence was 57.9%. The most common MSC was high BP (85.2%), without difference by sex and greater in >70 y. The risk of high WC and low HDL-c in women were OR=5.1 (IC95% 3.89 – 6.64) and OR=1.30 (IC95% 1.02 – 1.66), respectively. Considering the age, the risk to WC, FG, HDL and TG altered were higher in the youngest ones (60-65y). BP was the most common altered MSC. The women and the “new-Brazilian-older-adults” presented more metabolic abnormalities, what is a matter of concern to future public health policies.

PREVALENCE OF DYSPHAGIA ASSESSED BY THE EAT-10 AND ASPIRATION PNEUMONIA IN HOSPITALIZED OLDER ADULTS

M. Martinez Reig^{1,2}, A. Avedaño Cespedes^{1,2}, M. Mas Romero^{1,2}, L. Palazon Valcarcel^{1,2}, E. Gomez Jimenez^{1,2}, R. Ceres Martinez², J. Olivercarbonell^{1,2}, E. Cortes Zamora^{1,2}, 1. *Department of Geriatrics, University Hospital Albacete, Albacete, Spain*, 2. *UDM Geriatria, Albacete, Spain*

This longitudinal observational cohort study was conducted concurrently in two Spanish acute geriatric wards during a four month period. 280 subjects belong to hospital A and 281 to hospital B. The presence of dysphagia was assessed by the EAT-10. Previous diagnosis of dysphagia was recorded at baseline, as well as thickener use before, during the stay and at discharge. Furthermore, presence of aspiration pneumonia as cause of admission and mortality related

to aspiration pneumonia were registered. Mean age in center A was 85.9 years with 60.7% women. 27.7% of subjects had previous diagnosis of dysphagia with a prevalence of dysphagia of 42.1% determined by EAT-10. Mean age in center B was 87.2 years with 59.1% women. 10% of subjects had previous diagnosis of dysphagia with a prevalence of dysphagia of 59.1% determined by EAT-10. Thickener use in center A at admission was 15%, 30% during the stay and 11% at discharge as registered in the discharge report. Data of thickener use were not recorded at center B. In center A, aspiration pneumonia was the main cause of admission in 12.1% of subjects. During follow-up, 10.4% of subjects died with 50% of deaths related to aspiration pneumonia. In center B, aspiration pneumonia was the main cause of admission in 9.6% of subjects. During follow-up, 11% of subjects died with 41% of deaths related to aspiration pneumonia. Our results showed that dysphagia is often underdiagnosed. EAT-10 is an easy tool that should be implemented in the routine assessment of at-risk older adults.

THE ADVERSE IMPACT OF OBESITY FOR POST-ACUTE NURSING HOME RESIDENTS WITH HIP FRACTURE

C. Kosar, K. Thomas, V. Mor, *Brown University, Providence, Rhode Island*

Obesity is a growing problem among elder nursing home residents. The impact of obesity on strength and mobility may prolong disability and complicate the recovery process for residents seeking to improve their physical function. The purpose of the current study is to examine the impact of obesity on short-term outcomes for residents with hip fracture admitted to Medicare and Medicaid certified nursing facilities for post-acute care. Minimum Data Set assessments were used to identify 402,470 residents admitted between January, 2011 and December, 2014. Residents aged <65 and who were underweight (body mass index (BMI) <18.5) were excluded. Residents were classified as normal weight, or having mild, moderate, or severe obesity according to BMI cutoffs established by the World Health Organization. Using robust Poisson regression we calculated the risk for 30-day hospital readmission, discharge home, and functional improvement associated with each level of obesity relative to normal weight. Models were adjusted for adjusted for age, gender, comorbidity burden, and facility fixed effects. Sensitivity analyses were stratified by nursing facility quality, which was defined using a case-mix adjusted 5-star rating obtained from the Centers for Medicare and Medicaid services nursing home compare website. Mild, moderate and severe obesity all conferred high risk for readmission, and lowered the probability of discharge home and functional improvement ($p < 0.001$ for trend). Results were similar in quality-stratified analyses. These findings suggest that distinct care planning for residents with hip fracture and obesity may be essential to improve outcomes.

INFLUENCE OF PROTEIN INTAKE DURING WEIGHT LOSS ON INFLAMMATORY RESPONSE OF OBESE, FRAIL OLDER ADULTS

K.N. Porter Starr^{1,2}, H. Mulder¹, M.C. Orenduff¹, C.F. Pieper¹, K.M. Huffman^{1,2}, S.R. McDonald^{1,2}, C.W. Bales^{1,2}, 1. *Duke University Medical Center, Durham,*

North Carolina, 2. Durham VA Medical Center, Durham, North Carolina

Both aging and obesity increase levels of pro-inflammatory factors, contributing to muscle loss and a negative cycle of functional decline. While obesity reduction improves inflammation, the concomitant loss of muscle mass is a serious concern in older adults. Indications that increased protein intake preserves lean muscle during weight loss are promising, but studies of protein effects on inflammation during weight loss are few and their findings equivocal. Thus, we examined the influence of increased protein intake on inflammatory markers in a 6-month, randomized, controlled weight reduction study of obese (BMI ≥ 30 kg/m²), older (≥ 60 years) adults with physical frailty (Short Physical Performance Battery [SPPB] score 4–10), who were randomized to either a Control weight loss diet (0.8 g protein/kg/day; C-WL; $n=14$) or a higher protein (animal source, 2/3rds beef) diet (1.2 g protein/kg/day; HP-WL; $n=25$) in a 1:2 ratio. Reduced kcal intake in both arms and target protein intake in HP-WL were confirmed by 3-day records. Outcomes included function by SPPB and serum levels of 11 biomarkers of inflammatory status. In both arms, weight loss (~8%) was achieved and SPPB score improved, with a superior functional response in HP-WL ($P<0.05$). Several markers of inflammation improved, but only in the HP-WL group, for whom leptin ($P<0.001$), CRP ($P<0.01$), and ICAM-1 ($P<0.01$) were decreased and adiponectin increased ($P<0.01$); however, only adiponectin trended ($P<0.07$) towards a difference by group. Findings from this pilot study show beneficial inflammatory responses to HP-WL in obese, frail older adults; however, confirmation in a larger study is needed.

DIET QUALITY IS ASSOCIATED WITH HEALTH-RELATED QUALITY OF LIFE IN AFRICAN AMERICAN AND WHITE ADULTS

M. Grimes¹, M.F. Kuczmarski¹, M.K. Evans², A.B. Zonderman², 1. Behavioral Health and Nutrition, University of Delaware, Newark, Delaware, 2. NIA/NIH, Baltimore, Maryland

Health-related quality of life (HRQoL) is associated with mortality and morbidity in older adults. Diet quality has been shown to affect HRQoL measures; however, past research has focused on adherence to the Mediterranean diet, and few studies have examined aging populations. The purpose of this study was to compare HRQoL with the Healthy Eating Index (HEI)-2010, a diet quality measure based on compliance with US federal standards, in a racially and socioeconomically diverse urban sample. This analysis included 1176 of 3720 participants from the *Healthy Aging in Neighborhoods of Diversity across the Life Span* (HANDLS) study. Participants were 30–64 years old at baseline. Tertiles of baseline HEI-2010 were regressed against follow-up HRQoL (physical and mental component scores (0–100) of the Short Form 12 (SF-12)) with BMI, race (African American vs White), follow-up time (years), and socioeconomic status (SES) (< or >125% of 2004 US poverty guidelines) as covariates. The mean (\pm SE) HEI-2010 score was 43.1 ± 11.7 (out of 100), and mean mental and physical HRQoL (\pm SE) scores were 49.7 ± 11.7 and 40.6 ± 6.4 , respectively. Lower HEI scores ($p=0.002$, $\beta=1.294$), lower SES ($p<0.001$, $\beta=-4.646$), longer follow up time ($p=0.047$, $\beta=0.720$), and African American

race ($p<0.001$, $\beta=2.899$) were associated with poorer mental health. Lower HEI scores ($p=0.002$, $\beta=0.693$) and higher BMI ($p<0.001$, $\beta=-0.164$) were associated with poorer physical health. Findings corroborate past research on the Mediterranean diet, suggesting there are several eating patterns that may improve HRQoL.

COMPARISON OF WEB-BASED INTERVENTIONS FOR WEIGHT LOSS AND WEIGHT MAINTENANCE IN RURAL WOMEN

P.A. Hageman¹, C.H. Pullen¹, M. Hertzog¹, B. Pozehl¹, C. Eisenhauer¹, L.S. Boeckner², 1. University of Nebraska Medical Center, Omaha, Nebraska, 2. University of Nebraska-Lincoln, Lincoln, Nebraska

This community-based clinical trial compared 3 web-delivered interventions, web-based only (WO) with web-based supplemented by peer-led discussion (WD) or professional email counseling (WE), on achieving weight loss and weight maintenance among rural women, ages 40–69. Rural women ($n=301$, baseline BMI of 28–45 kg/m²) were randomized to WO, WD, or WE groups. All groups received access to the comprehensive website which included self-monitoring and interactive features for healthy eating and activity. The primary analysis focused on each of 3 phases separately [Phase 1 guided weight loss (baseline to 6 mo); Phase 2 guided weight loss and weight maintenance (7 to 18 mo); and Phase 3 self-directed weight maintenance (19–30 mo)]. Linear mixed models were used for analysis. Intervention groups did not differ from each other in mean change on body weight, with this finding consistent across all phases and for all pairwise comparisons. Across the groups, estimated mean weight loss after Phase 1 ranged 4.0 to 5.5 kg (4.2 to 6.2% of initial body weight). All groups had increases ($p < 0.05$) in weight after Phases 2 and 3, with average weight increases of 2 kg and 1 kg after Phases 2 and 3, respectively. The lack of group differences were potentially due to the robust nature of the web-site available to all groups. While weight loss was modest, the use of web-based interventions may be clinically relevant for reaching rural women on a public health level, as small weight reductions are linked with health benefits.

ASSOCIATION OF ADIPOSITY, TELOMERE LENGTH AND AGE: NHANES 1999–2002

J.A. Batsis¹, T.A. Mackenzie¹, E. Vasquez², C.M. Germain³, R.T. Emeny¹, P. Rippberger⁴, F. Lopez-Jimenez⁵, S. Bartels¹, 1. Medicine, Geisel School of Medicine at Dartmouth, Lebanon, New Hampshire, 2. SUNY Albany, Albany, New York, 3. Duke University, Durham, North Carolina, 4. University of New England College of Osteopathic Medicine, Biddeford, Maine, 5. Mayo Clinic, Rochester, Minnesota

Background: Telomere shortening is associated with age and risk of medical co-morbidity. We assessed the relationship between measures of adiposity with leukocyte telomere length and whether it is influenced by age.

Methods: Subjects with dual energy x-ray absorptiometry (DEXA) measures were identified using the National Health and Nutrition Examination Survey 1999–2002. Obesity was categorized using body fat (BF%: low/high; men $\geq 25\%$; females $\geq 35\%$), body mass index (BMI) categories, and waist circumference (WC) (low/high, men ≥ 102 cm; females ≥ 88 cm).

Telomere length relative to standard reference DNA (T/S ratio) was assessed using quantitative polymerase chain reaction. Weighted multivariable regression models evaluated the association of telomere length with adiposity, both continuously and categorically (low/normal BF%, low/high WC, BMI 18.5–24.9 kg/m²=referent), adjusted for age (where indicated), race, sex, education, smoking, co-morbidities, and physical activity. The interaction between age strata and adiposity was assessed and subsequent models stratified by age.

Results: We identified 7,827 subjects (4,056 female; 2,672 age ≥ 60 years). Mean age was 46.1 years. Overall telomere length was 1.05 ± 0.01 (SE) that differed by BF% (low/high: 1.12 ± 0.02 vs. 1.03 ± 0.02; p < 0.001), BMI (underweight 1.08 ± 0.03; normal 1.09 ± 0.02; overweight 1.04 ± 0.02; obese 1.03 ± 0.02; p < 0.001), and WC (low/high 1.09 ± 0.02 vs. 1.02 ± 0.02; p < 0.001). Adjusted estimates between telomere length and adiposity measures were: BF% ($\beta = 0.0033 \pm 0.0008$; p < 0.001), BMI ($\beta = -0.025 \pm 0.0008$; p = 0.005), and WC ($\beta = -0.0011 \pm 0.0004$; p = 0.007). All age x adiposity interactions were significant (p < 0.001). Model estimated mean difference (Age > 60–Age < 60) was: BF% (-0.14 ± 0.01; p < 0.001), BMI (-0.15 ± 0.001; p < 0.001), and WC (-0.0015 ± 0.0004; p < 0.001). No significant association was present between telomere length and adiposity over age ≥ 60.

Conclusions: A negative association between adiposity and telomere length was observed but age abrogates this relationship.

HANDGRIP STRENGTH ASSOCIATED WITH DIET QUALITY IN URBAN AFRICAN AMERICAN AND WHITE ADULTS IN THE U.S.

E.S. Shupe¹, M.F. Kuczmarski¹, M.K. Evans², A. Zonderman², 1. *University of Delaware, Newark, Delaware*, 2. *NIA/NIH, Baltimore, Maryland*

Muscle mass loss and progressive declines in strength, associated with loss of physical functioning, increase with age. Diet quality can affect muscle strength and performance. Handgrip strength is an indicator of total-body muscle strength and physical performance. This study investigated the association between diet quality and handgrip strength in 2140 African American and White adults examined in baseline *Healthy Aging in Neighborhoods of Diversity across the Life Span* study. Diet quality was measured by Mean Adequacy Ratio (MAR) of 17 micronutrients from two dietary recalls. Handgrip strength was assessed using the Jamar Hydraulic Hand Dynamometer. Mean MAR (\pm SE) scores were 73.93 ± 0.31 and mean handgrip strength was 34.68 ± 0.29. When compared across tertiles, handgrip strength was significantly associated with MAR; with each tertile of MAR, handgrip strength significantly improved; (1st tertile-32.2 ± 0.47, 2nd tertile-34.5 ± 0.50, 3rd tertile-36.8 ± 0.53). Multiple regression models were used to explore the cross-sectional relationship of MAR to handgrip strength, adjusting for potential confounders. Model one included the main effects (race, age, sex, and socioeconomic status (SES)), model two included main effects and MAR as a continuous variable. Model three included main effects, MAR and race x SES interaction. Being African American ($\beta = 2.1$; p < 0.001), younger ($\beta = -.30$; p < 0.001), male ($\beta = 16.49$; p < 0.001), and higher MAR scores ($\beta = .06$; p < 0.001) were associated with greater handgrip strength in Model 3. SES was significantly associated with handgrip strength in model 1; however, in model 3, SES

and race x SES interactions were not significant. Better diet quality is important in maintaining handgrip strength.

PHYSICAL PERFORMANCE INFLUENCED BY DIET QUALITY IN U.S. URBAN WHITE AND AFRICAN AMERICAN POPULATIONS

S. Reilly¹, M.F. Kuczmarski¹, M.K. Evans², A.B. Zonderman², 1. *Behavioral health and nutrition, University of Delaware, Newark, Delaware*, 2. *NIA/NIH, Baltimore, Maryland*

Repeated chair stands are recognized as a measure of lower body strength. Diet quality can effect both muscle strength and mass, as well as risk of developing sarcopenia. The primary objective of this study was to examine the association of physical performance with diet quality by exploring the relationship between number of completed chair stands and diet quality in urban White and African American adults examined in Wave 3 (2009–2013) of the *Healthy Aging in Neighborhoods of Diversity across the Life Span* (HANDLS) study. The HANDLS study is a prospective epidemiological study designed to examine the roles of race and socioeconomic status on health disparities. Baseline wave (2004–2009) examined 3720 people. Lower body strength was measured by the number of completed repeated chair stands (0–10) by 2019 participants. Diet quality was assessed by diet diversity serving (DDS) scores (0–40), calculated using two 24-hour dietary recalls. Cross-sectional linear regression was used to determine the relationship between number of completed repeated chair stands and DDS scores, adjusting for the following covariates: race, socioeconomic status (SES), age, and sex. The mean (\pm SE) DDS score was 16.6 ± 0.02, while the mean chair stands completed was 8.6 ± 0.07. Being African American ($\beta = 0.496$; p = 0.001), higher SES status ($\beta = 0.780$; p < 0.001), younger ($\beta = -0.064$; p < 0.001), and male ($\beta = 0.495$; p = 0.001), along with higher DDS scores ($\beta = 0.035$; p = 0.006) resulted in being able to complete more chair stands. These findings provide evidence of the importance of consuming a diet consisting of a wide variety of foods to maintain physical performance.

THE HEALTHY NORDIC DIET AMONG OLDER INDIVIDUALS PREDICTS INCIDENT DISABILITY IN A 10-YEAR FOLLOW-UP

M. Perälä¹, M. von Bonsdorff^{2,3}, M. Salonen^{1,2}, J.G. Eriksson^{1,2,4}, 1. *Department of Health, National Institute for Health and Welfare, Helsinki, Finland*, 2. *Folkhälsan Research Center, Helsinki, Finland*, 3. *Gerontology Research Center and Department of Health Sciences, University of Jyväskylä, Jyväskylä, Finland*, 4. *Department of General Practice and Primary Health Care, University of Helsinki, Helsinki, Finland*

We investigated whether adherence to the healthy Nordic diet among older individuals was associated with incident disability 10 years later. We studied 972 participants from the Helsinki Birth Cohort Study who were free of disability at baseline. At the mean age of 61 years the Nordic diet score (NDS) was calculated based on a validated food-frequency questionnaire that the participants filled in. Higher scores indicated better adherence to the healthy Nordic diet. At the mean age of 71 years, participants' incident disability was assessed using a self-reported questionnaire and was based

on two levels of disability: mobility difficulty (difficulty in walking 500 m) and self-care dependence (difficulty in dressing or bathing). Association between the NDS and incident disability was tested by logistic regression analysis. In total, 92 participants (9.5%) developed difficulty in walking 500 meters and 44 participants (4.5%) developed difficulty in dressing or bathing during 10-year follow-up. After adjusting for age, BMI, educational attainment, physical activity, smoking, and energy intake, the likelihood of having difficulties in walking 500 m were lower among those in the highest NDS fourth than among those in the lowest NDS fourth (OR 0.29, 95% CI 0.12, 0.67). In addition, the odds of having difficulties in dressing or bathing were lower among those in the highest NDS fourth than among those in the lowest NDS fourth (OR 0.35, 95% CI 0.12, 0.99). In conclusion, adherence to the healthy Nordic diet among older individuals predicted incident disability during a 10-year follow-up.

LATE BEDTIME AND EXPOSURE TO LIGHT AT NIGHT ARE ASSOCIATED WITH METABOLIC DISORDERS IN ELDERLY

O.A. Poliakov, Y. Gavalko, M. Romanenko, L. Sineok, D.F. Chebotarev State Institute of Gerontology, Kyiv, Ukraine

Last decade we observe a rising interest to circadian cycle influence on metabolic disorders and weight control. However, whether changes of sleep characteristics are associated with metabolic syndrome (MS) in the elderly remains unclear.

We selected 88 elderly (60–74 years) patients: 68 with MS and 20 without abdominal obesity and MS. MS was diagnosed according to IDF criteria (2005). Sleep characteristics (bedtime, sleep duration, awakening time, exposure to bright light) were studied by questioning. Data were compared with one-tailed t-test, correlations were calculated using Pearson coefficient.

Bedtime in the elderly significantly correlated with body mass index ($r=0,35$) and waist circumference ($r=0,34$). Sleep duration significantly correlated with body mass index ($r=0,32$). Elderly people with MS went to the bed later (23:35 vs 22:36, $p<0,05$) and awoke later in the morning (07:53 vs 07:00, $p<0,05$) than people without abdominal obesity and MS despite the same sleep duration. Moreover, elderly people with MS showed significantly higher prevalence of light at night exposure (71 % vs 25 %, $p<0,05$).

More late bedtime with stable sleep duration and exposure to light at night are associated with increased body mass and waist circumference, and, thus, may be the factors that contribute to metabolic disorders in elderly.

SESSION 590 (POSTER)

OLDER ADULT MOBILITY AND REHABILITATIVE CARE

FALL EVENTS AMONG OLDER, COMMUNITY-DWELLING MEN: AN EXAMINATION OF RISK AND PROTECTIVE FACTORS

E.J. Nicklett¹, R.J. Thorpe², 1. School of Social Work, University of Michigan, Ann Arbor, Michigan, 2. Johns Hopkins University, Baltimore, Maryland

Falls are a leading cause of nursing home admission and hospitalization among older adults; however, there is surprisingly little research that examines risk and protective factors for falls among community-dwelling older men. Our study is the first to investigate fall events among older men—and to examine racial and ethnic differences in fall risk among men—using a population-based sample.

We analyzed data from 4429 community-dwelling men from the Health and Retirement Study aged 65 and older. We used multinomial logistic regression analyses to examine risk and protective factors for single and recurrent (1 or more) self-reported fall profiles at baseline (2000) and longitudinally (2000–2010). We examined self-reported fall events by race/ethnicity (non-Hispanic white, African American, and Hispanic/Latino), controlling health and socio-demographic characteristics.

In baseline analyses, African American men were less likely than non-Hispanic white men to experience multiple fall events, compared to no falls (RRR: 0.63, $p=0.005$). Racial/ethnic differences in single or recurrent fall events were not statistically significant in longitudinal analyses. Fall risk did not differ between non-Hispanic white and Hispanic/Latino older men.

Consistent with other population-based studies, certain characteristics (e.g., older age, ADL limitations, greater depressive symptoms) were associated with a higher relative risk of single and/or recurrent fall events over follow-up.

This study identifies risk and protective factors of single and recurrent falls among older men, which can inform clinical practice and falls prevention programs for diverse community-residing older adult populations.

EXPERIENCES OF VIOLENCE ACROSS LIFE COURSE AND ITS ASSOCIATION WITH MOBILITY DISABILITY IN OLDER AGE

D.T. Guedes¹, A. Vafaei², B. Alvarado², J.M. Guralnik³, R.O. Guerra¹, 1. FACISA, UFRN, Joao Pessoa, Paraiba, Brazil, 2. Queens University, Kingston, Ontario, Canada, 3. University of Maryland, Baltimore, Maryland

Background: Life course exposure to violence may lead to disability in old age. We examined associations between life course violence and mobility disability in older participants of the International Mobility in Aging Study (IMIAS).

Methods: During the IMIAS 2012 baseline survey, men and women aged 65–74 years were recruited at five cities ($n=1995$): Kingston and Saint-Hyacinthe (Canada), Tirana (Albania), Manizales (Colombia), and Natal (Brazil). Mobility was assessed by the SPPB and by two questions on difficulty in walking and climbing stairs. Childhood physical abuse history and the HITS instrument were used to gather information on childhood exposure to violence and violence by intimate partners or family members. Multivariate logistic regression analysis models were constructed to explore associations between violence and mobility disability.

Results: Psychological violence either perpetrated by partner or family was more frequent than physical violence. Compared to men, women were more often victims of all types of violence. Experiences of childhood physical abuse and adult physical violence either by family or partner were related to mobility disability (adjusted for age, sex, childhood socioeconomic status, education and research site). Those

exposed to physical violence by a partner showed 40% to 63% greater odds of mobility disabilities. Those exposed to childhood physical abuse showed 43% to 69% greater odds of mobility disabilities. Gender was not an effect modifier for the relationships between any form of violence and mobility.

Conclusion: Our results provide evidence for the detrimental effects of life course exposure to violence on mobility in later life.

ALTERNATIVE COST MODELS FOR DELIVERING IN-HOME BALANCE IMPROVEMENT AND FALLS PREVENTION PROGRAMMING

L.W. Kaye¹, A. Adoff¹, J. Crittenden¹, D. Wihry¹, M.R. Gugliucci², 1. *UMaine Center on Aging, Bangor, Maine*, 2. *University of New England, Biddeford, Maine*

The risk of falling increases with age with one in three older adults experiencing a significant fall each year. Falls are the number one cause of fractures, hospital admissions for trauma, loss of independence, and injury deaths among older adults. Virtually all available falls prevention programs that focus on older adult weight training and balance improvement are exclusively group taught in congregate settings. An NIH/NIA-funded research study assessed the efficacy of a self-taught, in-home, balance improvement curriculum for individuals who do not wish to take advantage of centralized, group taught falls prevention programming. Three alternative cost models were arrived at for Area Agencies on Aging (AAA) wanting to implement the program in communities experiencing varying levels of resource scarcity. Based on two focus groups conducted with staff (N=23) at two northern New England AAAs, the alternative cost models offered are particularly sensitive to potential budgetary limitations in small towns and rural communities. Programmatic costs of the three models vary based on decisions as to the utilization levels of staff versus volunteers, the frequency of follow-up home visits as compared to calls to clients, the length and intensity of training, and the decision to utilize mobile technology for data collection and documentation. Rural AAAs and other older adult health promotion agencies in particular will benefit from implementation options that are sensitive to the cost, time, and physical challenges associated with both staff and clients travel in geographically isolated regions.

PIONEERING A MEDICATION SELF-ADMINISTRATION PROGRAM IN A TERTIARY HOSPITAL REHABILITATION WARD

C. Humphries, S. Al Hashemi, *Pharmacy, Mona Vale Hospital, Sydney, New South Wales, Australia*

Introduction: Assisting patients to regain independence in medication management is an integral part of rehabilitation pharmacist care. A structured self-administration of medication program (SAMP) is needed as an objective measure of patients' ability to self-manage medication and support patient-centred care.

Aim: To assess and improve rehabilitation patients' ability to self-manage medications using SAMP and provide further support for unsuccessful patients.

Method: An assessment tool was developed to identify eligible patients. SAMP consisted of four stages: (1) initial pharmacist counselling with use of medication list, (2) supervised self-administration, (3) independent self-administration and (4) patient-to-pharmacist teach-back assessment. A Drug

Regimen Unassisted Grading Scale (DRUGS) was used to assess patients' understanding of medication. A validated Medication Regimen Complexity Index (MRCI) was used to assess change in complexity of medication regimen.

Results: The program had a high success rate with 14 out of 20 participants successfully completing the SAMP. The mean age of participants was 74.4 years. The participants were self-administering a mean of 6.1 medications on admission and 10.4 on discharge, with a mean increase in MRCI of 45%. Successful SAMP participants demonstrated a mean change in DRUGS score from 90.6% to 98.4%. Seventy-eight percent of successful participants reported increased confidence. Two patients self-withdrew. Most importantly, SAMP identified 4 patients as unable to safely self-administer giving the pharmacist opportunity to arrange alternative medication management.

Conclusion: SAMP improved patients' understanding and ability to self-manage medications. Furthermore, it enabled objective assessment of patients' capacity to manage their medications aiding decision making for discharge planning.

PREVALENCE OF HEARING IMPAIRMENT AND ASSOCIATED FACTORS AMONG OLDER U.S. ADULTS

K. Forrest, N. Campbell, *Slippery Rock University, Slippery Rock, Pennsylvania*

Hearing impairment significantly impacts older people's communication and interaction with others, and their ability to understand and follow doctors' advice. This study evaluated the prevalence rate of hearing impairment and associated factors among older U.S. adults. Data from the 2013–2014 National Health and Nutrition Examination Survey (NHANES) were analyzed. Hearing impairment was assessed through self-reporting of serious hearing difficulties. To account for the complex multistage sample design in NHANES, SAS survey procedures were utilized to analyze the data. All analyses were based on the weighted data for a better representation of the U.S. population. The current analysis contained 1,264 individuals aged ≥65, representing 12.4% of the NHANES sample, with 44.3% males. Age distribution was 34.0%, 26.3%, 16.0%, and 23.8% for 65–69, 70–74, 75–79, and 80+, respectively. Race distribution was 80.0%, 8.6%, 7.2%, and 4.2% for White, Black, Hispanic, and Asian, respectively. The prevalence of hearing impairment was 16.5% overall, 20.1% for males, and 13.5% for females. This rate increased significantly with age (27.0% among age 80+). Hispanic and White older adults had a significantly higher prevalence of hearing impairment than Black and Asian older adults. Those who lived alone, had an annual income of \$35,000 or less, and had poor health status were more likely to experience hearing impairment (all p-values < .05). Approximately one in every six older adults suffers from serious hearing impairment. Besides aging and some demographic factors, older adults with lower socioeconomic status and poor health status had a significantly higher risk for the condition.

LIFE SATISFACTION AMONG OLDER KOREAN ADULTS WITH DISABILITIES: AN APPLICATION OF THE PACID MODEL

S. Cho, *Office for Policy Research Team 1, Korea Disabled People's Development Institute, Seoul, Korea (the Republic of)*

This study aimed to examine whether the Psychosocial Adaptation to Chronic Illness and Disability (PACID) model is a well-established framework for older Korean adults with disabilities and to investigate the associated factors of life satisfaction (LS) among them. A sample of 384 older Korean adults with disabilities obtained from the Korea Welfare Panel Study data (2014), a representative national survey funded and approved by Korean government, was used in this study. Structural equation modeling was employed to examine the dynamics among the antecedents (i.e., causes of disability, age and income at disability onset, gender), process factors (i.e., depression, self-esteem, disability severity, functional ability, course of disability condition, discrimination experiences, use of services, social support, education, income) and outcome (i.e., LS) based on the PACID model. The research model had good model fit, indicating that the PACID model was well applied to older Korean adults with disabilities. The findings showed that various factors had direct and indirect influences on LS. Depression, self-esteem, functional ability, discrimination experiences and income directly affected LS. Age at disability onset influenced LS through functional ability and discrimination experiences; income at disability onset affected LS through depression, self-esteem and income; causes of disability affected LS through income. Findings suggest that programs and services are required to improve the levels of depression, self-esteem and functional ability of older Korean adults with disabilities in order to enhance their positive feelings toward life. Findings also suggest policy makers should pay attention to ways to reduce their discrimination experiences and increase their income level for better LS among older Korean adults with disabilities.

THE EFFECTS OF HEALTH ON MULTIDIMENSIONAL DISABILITY AMONG OLDER ADULTS: AN APPLICATION OF THE ICF

S. Cho, *Office for Policy Research Team 1, Korea Disabled People's Development Institute, Seoul, Korea (the Republic of)*

This presentation will report on findings from a study conducted among 10,451 Korean older adults (65+) sampled through the *2014 Survey of Living Conditions and Welfare Needs of Korean Older Persons*. The study had three objectives. First, to investigate whether chronic illnesses influenced multidimensional disability among Korean older adults; secondly, to analyze whether service-related environmental factors affected the multidimensional disability and thirdly, to test whether the service-related environmental factors moderated the association between chronic illnesses and multidimensional disability. Using the ICF as a conceptual model, the data was analyzed using structural equation modeling. For the purpose of this study, the multidimensional disability was composed by the following three dimensions: psychological/emotional functions, activity capacity and participation frequency; and the service-related environmental factors were composed by the following two factors: accessibility and infrastructure. Key findings showed that the higher the number of chronic illnesses the higher the level of multidimensional disability. Better accessibility to welfare facilities had a positive effect on all three dimensions of disability, and better infrastructure proved to increase the level of activity

capacity, although it had no statistically significant association with participation frequency. Furthermore, the analysis showed that the better infrastructure the lower psychological and emotional functions among older adults. Infrastructure had a moderating effect on the association between chronic illnesses and multidimensional disability. Based on these findings, I argue that there is an urgent need to enhance older Koreans' health status. The findings furthermore suggest that an increase in the number of welfare facilities and accessibility to these facilities can play an essential role in reducing the level of multidimensional disability and alleviating the negative influence of chronic illnesses on multidimensional disability among Korean older adults.

SESSION 595 (POSTER)

PHYSICAL ACTIVITY AND EXERCISE I

PROMOTE: TAILORING PHYSICAL ACTIVITY INTERVENTIONS TO PROMOTE HEALTHY AGEING

I. Bragina¹, S. Lippke², C. Pischke³, J. Meyer⁴, S. Muellmann³, E. Rost², H. Zeeb³, C. Voelcker-Rehage¹, 1. *Human Movement Science and Health, TU Chemnitz, Chemnitz, Germany*, 2. *Jacobs University Bremen, Bremen, Germany*, 3. *Leibniz Institute for Prevention Research and Epidemiology, Bremen, Germany*, 4. *OFFIS - Institute for Information Technology, Oldenburg, Germany*

Physical activity (PA) and the reduction of sedentary behavior positively influence healthy aging. PA results in increases in aerobic capacity and strength and is associated with less age-related cognitive decline. Further, a pronounced sedentary behavior, i.e. prolonged periods of sitting or overall inactivity, increases mortality risk regardless of PA level [1]. The interaction between sedentary behavior, dedicated exercise and PA level, and their effects on physical and mental fitness has not yet been fully elucidated.

120 healthy older adults (OA) participated in a 10-week exercise intervention within the PROMOTE project on tailoring PA interventions to promote healthy ageing. The intervention was tailored to individuals' age, gender, and previous PA behavior. Participants were randomized into two intervention groups (IG) and a waiting-list control group. Both IGs received a web-based self-regulatory counseling aid, which aims to support the participants in reaching a sufficient PA level. IG differed in the way of PA monitoring: subjective self-report vs. subjective self-report and objective measure of PA using an off-the-shelf activity tracker. (Non-) activity behavior (assessed objectively via ActiGraph) as well as physical and mental fitness were assessed at baseline and post intervention. Multiple regression and moderation analyses will be performed to analyze the interaction of dedicated exercise, supportive-technology, PA level and sedentarism and their effect on physical and mental health.

We expect sedentary behavior to moderate the association between PA and physical/mental fitness. Results will contribute to optimized health promotion programs and recommendations for OA.

[1] Hagger-Johnson, et al. (2016). *American J Prev Med* 50(2), 154–160.

EFFECTS OF COMBINED EXERCISE ON INFLAMMATORY FACTORS IN OLDER WOMEN WITH SARCOPENIC OBESITY

J. Jang¹, H. Park³, J. Park², S. Lim⁴, Y. Kwon⁵, 1. *Institute of Convergence Bio-Health, Dong-A University, Busan, Korea (the Republic of)*, 2. *Institute of Taekwondo for Health and Culture, Dong-A University, Busan, Korea (the Republic of)*, 3. *Department of Health Care Science, Dong-A University, Busan, Korea (the Republic of)*, 4. *Research Foundation for Industry-Academy Cooperation, Dong-A University, Busan, Korea (the Republic of)*, 5. *Department of Taekwondo, Dong-A University, Busan, Korea (the Republic of)*

This study aimed to evaluate the effectiveness of a combined exercise program on physical performance related to the risk of falling and inflammatory factor in community-dwelling sarcopenic obese elderly women.

Twenty-four participants with Sarcopenic Obese elderly women (≥ 70 years) were randomly assigned to either the intervention ($n=12$) or control ($n=12$) group, and the intervention comprised an individually tailored combined exercise program. The combined exercise program included resistance and aerobic exercise for 12 weeks.

The ANOVA and deltas of change ($\Delta\%$) were used for data analysis. The level of significance was set at $p<0.05$. The effects of greater statistical significance on body composition related the variables “time”, “group” and the interaction between the two (time \times group) were observed for the percentage of body fat ($F = 42.750$, $p < .01$), upper lean mass ($F = 29.342$, $p < .01$) and lower lean mass ($F = 45.333$, $p < .01$), arm curl ($F = 38.918$, $p < .01$), functional reach ($F = 9.651$, $p < .05$), chair sit-and-down ($F = 57.894$, $p < .01$), preferred walking speed ($F = 16.154$, $p < .01$), open-eyes one-legged standing time ($F = 5.199$, $p < .05$) were significantly improved after the intervention. Moreover, the mean values of serum lipids (triglyceride, HDL cholesterol, HOMA-IR) and levels of high-sensitivity C-reactive protein, IL-1 β and TNF- α) were significantly improved in exercise group as compared in control group.

Combined exercise training is associated with reduced inflammatory activity such as hs-CRP, IL-1 β and TNF- α in this population, and improve the physical performance related to the risk of falling in this population.

PREVENTION OF REHOSPITALIZATION OF FRAIL GERIATRIC PATIENTS

P. Eccles, *Azusa Pacific University, Azusa, California*

A literature search was done to determine if rehospitalization of frail geriatric patients could be prevented with the use of specific personalized home exercise programs. Five relevant studies had an exercise group and a control group. Authors of two of the articles reported significant reductions of rehospitalizations due to exercise program implementation. The results in the other articles pointed to exercise significantly impacting physical activity, quality of life, frailty, and overall health status. These results strongly indicated implementation of exercise programs for frail older adults for decreased rehospitalizations. To strengthen future research in this area there is a need to standardize outcome measures to determine physical ability as well as the definition of frailty. Rehospitalization of frail older patients could be

prevented with utilization of prescribed exercise programs. Therapists must be proactive to obtain referrals for home health patients who may benefit from a personalized home exercise program.

LEG CYCLING TRAINING ON CARDIORESPIRATORY FITNESS, MUSCLE STRENGTH, AND WALKING SPEED IN OLDER ADULT

S. Lin², J. Lin¹, M. Hsu¹, 1. *Department of Physical Therapy, Kaohsiung Medical University, Kaohsiung, Taiwan*, 2. *Department of Physical Medicine and Rehabilitation, Kaohsiung Municipal Ta-Tung Hospital, Kaohsiung City, Taiwan*

Purposes: This study was to explore if cycling motion training could improve cardiorespiratory endurance, lower extremity muscle strength and walking speed in older and young adults. **Methods:** Twenty-three healthy older adults and twenty-three healthy young adults were recruited. A stationary cycling system was used to provide exercise training at moderate exercise intensity for 30 minutes/day, 5 days a week for a month. A cycling training session consisted of 15-minute forward cycling and 15-minute backward cycling, at the pedaling rate of 60 revolutions per minute. Six-Minute Walk Test, 10-Meter Walk Test and a dynamometer test were used to assess cardiorespiratory fitness, lower extremity muscle strength, and walking speed respectively, prior to the start of the training, at the termination of the training, and at one-month follow-up. A mixed-model ANOVA was used to analyze training effects on outcome measures, with Bonferroni post-hoc test. **Results:** The ANOVA results showed no significant group differences for the 6-Minute Walk test and the 10-M Walk Test, while significant group differences on lower extremity strength. For both groups, significant training effects on the 6-minute Walk Test, 10-Meter Walk Test, and lower extremity strength were found at post-training ($p<0.01$) and follow-up ($p<0.05$). **Conclusion:** The results suggested that the cycling training protocol used in this study can effectively improve cardiorespiratory endurance, lower extremity muscle strength, and walking speed in both older and young adults and appear to be a practical exercise.

SHORT PHYSICAL PERFORMANCE BATTERY DIFFERENCES BETWEEN PHYSICALLY ACTIVE AND SEDENTARY OLDER ADULTS

J. Rosa, M.M. Monteiro Bezerra, J.E. Uchida, S.M. Borges, *student, Universidade Santa Cecília, Santos, São Paulo, Brazil*

The aim of this study was to compare the performance in Short Physical Performance Battery (SPPB) between physically active and sedentary older adults. A cross-sectional study was conducted with 123 older adults (mean: $72,68 \pm 7,06$ years old), who were divided into two groups: physically active (Study Group – SG; $n=75$) and sedentary older adults (Control Group – CG; $n=48$). The SPPB evaluates lower limb performance using three tests: balance (SPPBb), gait speed (SPPBg) and lower limb force (SPPBf). The final score is the sum of the three tests, ranging from 0 to 12. Statistical analysis showed a significant difference (Mann-Whitney test: $p=0.004$) between the groups in relation to total SPPB scores (SG: $8,73 \pm 1,88$ and CG: $9,67 \pm 1,97$ points). In the SPPB subtests, the SPPBb was significantly

different ($p=0,018$) between the SG (3.77 ± 0.54) and the CG (3.48 ± 0.77). The SPPBf was significantly different (Mann-Whitney test: $p=0.017$) between the SG (SG: 2.25 ± 1.10) and the CG (CG: 1.76 ± 0.99 points). By analyzing the balance tests evaluated in the tandem position (heel of one foot directly in front of and touching the other foot) there was a significant difference (Mann-Whitney test: $p=0,020$) between groups (CG: 8.43 ± 2.99 and SG: 9.46 ± 2.05 seconds). No differences were noted in the feet side by side position and the semitandem position (heel of one foot along side the big toe of the other foot). In conclusion, older adults who were physically active had a better lower limb performance in the lower limb strength and balance tandem positions compared to older adults living a sedentary lifestyle.

LEAD LEG PREFERENCE OF THE 8-FOOT UP-AND-GO

M. Henderson, T. Bodman, C. Patrick, M. Smith, A. Kiser, S. Wickham, L. Boyd, M.D. Powers, *Kinesiology and Health Studies, University of Central Oklahoma, Edmond, Oklahoma*

The 8ft-up-and-go (UPGO) test is a commonly used tool for assessing agility and dynamic balance in older adults. The purpose of this study was to determine if lead leg impacts UPGO performance. Participants were 31 adults (males=7, females = 24) over the age of 65 years, with a mean age of 82.03 years ($SD = 6.93$). Volunteers completed three UPGO tests of two trials each with the fasted time recorded for each test. In the initial test, participants performed the UPGO with no instruction on lead leg. Researchers noted the lead leg chosen (called preferred leg). In subsequent tests, participants were instructed to use either the right or left leg as the lead in random order. Results indicate no difference in performance between the three tests ($p = .10$). In the initial test, twenty-four participants preferred the right leg, while seven preferred the left leg. Although non-significant ($p = .19$), participants who preferred the left leg had scores 0.74 seconds faster than those who preferred the right leg on the initial UPGO test. When grouped by preferred leg, participants who preferred the right leg performed significantly better when instructed to use the right leg than during their preferred leg test ($p = .03$) which could indicate a familiarization effect. Those who preferred the left leg did not see a similar improvement in subsequent tests perhaps due to the high initial performance or the small sample size. While some evidence indicates a difference in performance between lead legs, further study is needed to draw definitive conclusions.

PERSON-CENTERED WALKING TO MAINTAIN THE MOBILITY, ADL FUNCTION, AND QUALITY OF LIFE OF LTC RESIDENTS

C.H. Chu^{1,2}, M. Puts¹, M. Parry¹, D. Brooks², K. McGilton^{1,2}, 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *Toronto Rehabilitation Institute - UHN, Toronto, Ontario, Canada*

Aim: To determine the efficacy of a person-centered multifaceted walking intervention (MWI) to maintain the mobility, ADL function, and QOL of LTC residents with dementia.

Method: An interrupted time-series design was used. Measures of mobility (2-minute walk test[2MWT], Timed-Up-and-Go[TUG], gait speed), ADL function (Functional

Independence Measure[FIM]), and QOL (Alzheimer's Related Quality of Life Scale[ARQOL]) were collected before and after the 2-month pre-MWI phase, and at the middle and end of the 4-month MWI phase. The MWI consisted of a *one-to-one walking regime* and an *individualized communication care plan* tailored to the resident provided up to 4x/week for 4 months. RM-ANOVA was used to evaluate MWI efficacy.

Results: All eligible residents ($n=26$), PSW staff ($n=21$) and power of attorneys ($n=25$) enrolled in the study. During the pre-MWI phase, residents experienced a significant decline in mobility: TUG increased by 4.4% (mean difference= 4.15 sec., $P=0.01$), 2MWT decreased by 9.7% (mean difference= -5.78 m., $P=0.03$), gait speed decreased by 11.3% (mean difference= -0.05 m/sec, $P=0.022$), decline in ADL function (mean difference= -17.88, $P=0.03$), and a loss of QOL (mean difference= -1.84, $P=0.030$). During the MWI phase, the TUG improved by 32.1% (mean difference= -8.58, $P=0.000$), 2MWT improved by 51.2% (mean difference= 27.47, $P= 0.000$), gait speed improved by 55.1% (mean difference= 0.23, $P=0.000$), ADL function increased by 25% (mean difference= 15.60, $P=0.000$), and QOL increased by 7.8% (mean difference= 2.44, $P=0.063$).

Conclusion: Findings provide preliminary evidence for a future trial, and a greater understanding of the role of person-centered care in delivering PA in LTC.

SUBJECTIVE AND OBJECTIVE PHYSICAL ACTIVITY IN OLDER ADULTS WITH AND WITHOUT ALZHEIMER'S DISEASE

B. Rendzia, A. Breda, A. Bevan, A. Watts, *University of Kansas, Lawrence, Kansas*

Physical activity has many health benefits, even among older adults diagnosed with Alzheimer's disease (AD), yet relatively little research has characterized the typical daily activities of people with AD as compared to their non-impaired counterparts. Modern technology allows us to objectively measure the amount and intensity of physical activity, but other methods are still needed to link objective amount and intensity data to information about types of activities. Older adults rarely engage in structured exercise or sports. Thus, we evaluated the types of everyday activities in which older adults with and without AD engage and the objectively measured activity counts generated by those activities. In older adults with ($n=38$) and without ($n=47$) AD, we measured physical activity for one week, objectively using a thigh-worn postural monitor (ActivPal_{TM}), and subjectively using activity diaries. Activity counts were averaged over 30 minute intervals to match the diaries. Sedentary activities were the most common self-reported activity type (38.4% of all waking self-reported activity, mean 83.1 counts/min), followed by indoor chores (19.4%, 88.7 counts/min) and errands away from home (14.0%, 89.1 counts/min). During leisure walking, participants with AD had lower objective activity counts/min than those without AD [$F(1,55)=9.4$, $p<0.01$], suggesting they walk less vigorously. Objective activity counts were lower in participants with AD [$F(1,65)=5.7$, $p<0.05$] and women [$F(1,65)=9.4$, $p<0.01$] during outdoor chores, suggesting less vigorous engagement. Understanding differences by AD status and gender during common types of unstructured physical activities may help to design more

effective and targeted physical activity interventions to promote health.

PHYSICAL ACTIVITY, COGNITIVE DECLINE, PLATELET CHANGES IN ALZHEIMER'S DISEASE AND HEALTHY OLD ADULTS

N.V. Bento-Torres, J. Bento-Torres, A. Tomás, V. Costa, P. Correa, C. Costa, N. Jardim, C. Picanço-Diniz, *Universidade Federal do Pará, Belém, Pará, Brazil*

We investigated potential associations between platelet morphological changes, level of physical activity, and age-related cognitive decline by analyzing blood samples of volunteer healthy old elderly adults with different exercise functional capacities. We also compared the morphology of platelets from age-matched healthy adults and Alzheimer's disease (AD) patients. Physical activity was assessed by the International Physical Activity Questionnaire (IPAQ, long form), and functional exercise capacity was assessed by agility (8-foot up-and-go), lower body strength (chair stand), and aerobic capacity (6-minute walk) tests. Cognitive function was assessed by the Mini Mental State Examination (MMSE) and Cambridge Neuropsychological Automated Battery (CANTAB). Compared to sedentary healthy adults, active healthy adults had significantly better functional exercise capacity in all physical fitness tests, better performance in visual sustained attention and reaction time tests, smaller platelet volumes, and larger platelet distribution width. There were significant correlations between platelet morphological markers and neuropsychological performance on visual learning and memory, rapid visual processing, and visual sustained attention tests. Compared to healthy elderly adults matched by age and educational level, AD patients had lower MMSE scores, which were associated with larger platelet volumes. Physical exercise in the elderly is associated with less cognitive decline, which may be correlated with reduced platelet volumes. Mean platelet volume, which is usually disregarded in standard blood sample analyses, may be used in association with cognitive assessments to improve differentiation between normal and pathological aging

AEROBIC AND RESISTANCE TRAINING TO REDUCE CANCER-RELATED FATIGUE: EFFICACY IN ONCOGERIATRIC PATIENTS

A. Fontvieille^{1,2}, H. Parent-Roberge^{1,2}, M. Langlois^{3,4}, T. Fülöp^{2,3}, M. Pavic^{3,4}, E. Riesco^{1,2}, 1. *Faculty of Physical Activity Sciences, University of Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *Research Centre on Aging, CIUSSS de l'Estrie CHUS, Sherbrooke, Quebec, Canada*, 3. *Faculty of Medicine and Health Sciences, University of Sherbrooke, Sherbrooke, Quebec, Canada*, 4. *Research Center of the Centre Hospitalier Universitaire de Sherbrooke (CHUS), Sherbrooke, Quebec, Canada*

Despite the high prevalence of cancer in the elderly, there is no strong evidence regarding the efficacy of exercise training for reducing debilitating effect of cancer-related fatigue (CRF) and improving quality of life (QoL) in the oncogeriatric population. Hence, the objective of our study is to determine the impact of combined aerobic and resistance training on CRF and QoL in older adults undergoing cancer treatment. A total of 40 older adults (65–80 years) with an ongoing treatment for a curable cancer will be recruited

and randomised in two groups: 1) combined training (EX, n=20) and 2) control group (CON, n=20). All variables will be measured before and after 12 weeks of intervention: CRF (FACIT-Fatigue), QoL (*European Organization for Research and Treatment of Cancer Quality of Life Questionnaire*), physical capacity (Senior Fitness Test) and body composition (fat and lean body mass, DXA). Our preliminary results show that 12 weeks of mixed exercise training alleviated CRF (Δ_{EX} : -5 vs. Δ_{CON} : -15) and the deterioration of global QoL (Δ_{EX} : -16.7; Δ_{CON} : -41.7). Physical functioning remained stable (Δ_{EX} : 0 vs. Δ_{CON} : -20) and cognitive functioning improved (Δ_{EX} : 33.3 vs. Δ_{CON} : 0), both in EX group only. Finally, lean body mass (Δ_{EX} : +0.5 kg; Δ_{CON} : -3.0 kg) and physical capacity improved in EX while it declined in CON. To conclude, our preliminary results show that combined training is feasible and have a positive impact on CRF and physical capacity. Furthermore, our intervention mitigated the reduction of QoL in older adults undergoing cancer therapy.

THE EFFECTS OF PHYSICAL TRAINING CESSATION ON EXECUTIVE FUNCTIONS IN OLDER ADULTS

L. Rodrigues^{1,2,3}, T. Vrinceanu^{1,2,3}, N. Berryman^{2,4}, L. Bosquet^{2,5}, M. Kergoat², T. Vu^{2,6}, L. Bherer^{1,2,3}, 1. *Concordia University, Montreal, Quebec, Canada*, 2. *Centre de Recherche de l'Institut Universitaire de Gériatrie de Montréal, Montréal, Quebec, Canada*, 3. *PERFORM Centre, Montreal, Quebec, Canada*, 4. *Bishop's University, Sherbrooke, Quebec, Canada*, 5. *Université de Poitiers, Poitiers, France*, 6. *Université de Montréal, Montreal, Quebec, Canada*

Combined strength and aerobic (S+A) and gross motor skills programs (GMS) have shown promise in selectively improving executive functions (EF) of older adults. However, interruptions in training may occur resulting in losses of training-induced physiological benefits. So far, little is known about the effects of physical training cessation on EF.

Therefore, forty older adults (70.5 ± 5.51 years; 67.5% female) who had completed an 8-week S+A or GMS program followed by an 8-week training cessation period were included in this study. Performances in the Random Number Generation (RNG) test (inhibition and working memory) in a single task (ST) and a dual-task (DT, walking at 4 km.h⁻¹) were analyzed.

Two-way ANOVAs, with repeated measures for time (pre, post intervention and follow-up), revealed a significant time effect for inhibition scores. For example, Turning Point Index (TPI - occurrence of sequence changes from ascending to descending numbers) improved in ST for all time comparisons (pre to post intervention and post to follow-up) whereas TPI performances in DT improved from pre intervention to follow-up and from post intervention to follow up (p < 0.05). However, participants exhibited worse performances (p < 0.05) from pre intervention to follow-up (ST and DT) and from post intervention to follow-up (ST) for one working memory score (redundancy index).

Our study demonstrates training cessation can selectively impact EF. Interestingly, performances for inhibition in a single and a dual-task can be improved after a period of physical training cessation, regardless of the exercise intervention employed.

PROACTIVE REACH AND TELEHEALTH MONITORING (GEROFIT) ENHANCE RESISTANCE EXERCISE AT RURAL SETTINGS

W. Valencia Rodrigo^{1,2}, D. Botros^{1,3}, D. Pendlebury¹, H. Florez^{1,2}, C. Lee^{4,5}, K. Oursler^{6,8}, L.I. Katzel^{7,8}, M.C. Morey^{9,10}, 1. Miami VA Geriatrics Research, Education and Clinical Center (GRECC), Miami, Florida, 2. University of Miami School of Medicine Department of Public Health Sciences, Miami, Florida, 3. Jackson Memorial Hospital, Miami, Florida, 4. Greater LA VA Geriatrics Research, Education and Clinical Center (GRECC), Los Angeles, California, 5. UCLA David Geffen School of Medicine, Los Angeles, California, 6. Salem VA Geriatrics Research and Education, Salem, New York, 7. Baltimore VA Geriatrics Research, Education and Clinical Center (GRECC), Baltimore, Maryland, 8. University of Maryland School of Medicine - Department of Medicine, Baltimore, Maryland, 9. Durham VA Geriatrics Research, Education and Clinical Center (GRECC), Durham, North Carolina, 10. Duke University School of Medicine - Department of Medicine, Durham, North Carolina

Gerofit, a health promotion exercise program for older Veterans, is well-received and supported by Primary Care (PC). However, we observed low referral numbers relative to the thousands of older veterans, limitations in space, resources, and long driving distances for potential participants.

We developed Proactive Reach: 1) partnership with rural PC leadership and providers, 2) use electronic medical records (EMR) to identify individuals without any contraindication to Gerofit, and 3) telehealth assessment and counseling (physical activity, aerobic, resistance, flexibility, balance exercises), and mailed Gerofit instructions, National Institute of Aging Go4Life book, pedometers and resistance bands.

Then, we implemented Telehealth Monitoring (phone): response, use, adherence and progress.

We identified 302 older subjects, and successfully completed Proactive Reach in 236 (78%). At baseline: average age 69.6 ± 7.2 , body mass index $29.3 \pm 5.9 \text{ kg/m}^2$; 21% declined services, 60% admitted not doing any exercise, 38% reported aerobic exercise, and only 2% reported resistance exercise.

We contacted again 107 subjects for Telehealth Monitoring. Fifty-one (48%) did not respond or declined further participation, 22 (20%) reported not having received materials, 34 (32%) confirmed receipt and satisfaction with the program. Effective use: book (79%), pedometer (11%), resistance bands (53%). Barriers: book (6%), pedometer (0%), bands (6%), neither (58%), other (25%).

Overall, 58% reported improved physical activity, and 38% effectively incorporated resistance exercise.

Proactive reach using EMR effectively identifies and delivers exercise interventions in rural PC, enhances physical activity, and increases awareness and implementation of resistance exercise. Further studies on telehealth monitoring are warranted, including cost-effectiveness and use of new technologies.

SEX-DEPENDENT EFFECT OF EXERCISE ON BRAIN HEALTH IN OLDER ADULTS WITH VCI

C. Barha, E. Dao, J. Best, R.G. Hsiung, R. Tam, T. Liu-Ambrose, *Physical Therapy, University of British Columbia, Burnaby, British Columbia, Canada*

Aerobic training (AT) is a promising strategy for the promotion of brain health. However, a large amount of variation exists in its efficacy, and importantly, it is greatly underappreciated that biological sex may moderate the effect of aerobic training on cognition. Few studies have directly or comprehensively compared males and females to address the question of sex differences in the magnitude of AT efficacy. Therefore, we conducted a secondary analysis of data acquired from a 6-month single-blind randomized controlled trial of AT in older adults with mild subcortical vascular cognitive impairment (sVCI), a population at high risk of progression to dementia. Executive processes were measured at baseline and trial completion using: 1) Trail Making Test (TMT; set-shifting); 2) Digit Symbol Substitution Test (DSST; sustained attention); 3) Stroop-Color Word Test (selective attention & conflict resolution). Total WML load (mm^3) was quantified using a semi-automated analysis pipeline at baseline and 6-months. We found that AT significantly enhanced TMT performance in females compared with controls. Notably, AT was ineffective in males. Groups did not differ in DSST or Stroop performance. Our results underscore the need for future studies to consider biological sex as a key moderator of the positive effect of exercise on brain health.

SESSION 600 (POSTER)

REHABILITATIVE CARE

CHRONIC DYSFUNCTIONAL AND PAINFUL FOOT IN ELDERLY

S. Nica, R. Nartea, M. Clantau, *Rehabilitation Medicine, UMF "Carol Davila", Bucharest, Romania*

Introduction

Older people frequently develop impaired balance and functional ability [6]. One main cause of this affection is represented by the foot and ankle problems. This condition affects the quality of the life in elderly. One important role in the disability of this patient is played by the painful foot.

Material and method

In this study we want to demonstrate the relationship between the painful foot, the disability and the quality of life in older people. We selected 30 patients (17 women and 13 men), aged between 65- 80 years old, who suffered from severe foot pain associated with disability for the last 3 months or more. We observed the walking speed, the endurance and we correlated this with the analog visual scale. We modulated this with gender, race, age, IMC, comorbidities, smoking status and the number of other pain locations.

Results

We could observe that the incidence of foot pain is really high, and also is increasing in the last years. This symptom is directly proportional with the disability prevalence and also with the limitation of the activities of the daily living. Hallux deformities, calluses or corns, edema, hammer toes and pes planus are the main affections that cause this symptom. [1].

Conclusions

The two components of pain, the sensory and the emotional, influence each other and correlated with the reduced functional ability, the increased risks of falls and the reduced physical and mental (depression) aspects influence the quality of life for older persons. These aspects are very important ones especially when the treatment solution is in discuss.

THE TIMED UP AND GO TEST WITH ADDITIONAL MOTOR TASK FOR ASSESSING OLDER ADULTS WITH CHRONIC STROKE

S. Ng, P. Chan, J. Si Tou, M. Tse, *The Hong Kong Polytechnic University, Hung Hom, Hong Kong*

Many daily activities involve multiple motor functions which have to be performed simultaneously. For example, carrying objects while walking is frequently mentioned as risky activities for falls in people with stroke.

The Timed Up and Go test (TUG) is an objective measure for assessing functional mobility. A version of TUG with an accompanying manual task (TUG_{motor}) has been developed to investigate the effect of performing multiple motor tasks on functional mobility in older adults. Participant is required to stand up, walk 3 meters, turn, walk back and sit down while holding a glass of water in one hand. The time to complete the task was recorded.

Thirty-three chronic stroke survivors and 32 healthy controls participated in this cross-sectional study. In addition to the TUG_{motor} times, stroke-specific impairments including Fugl-Meyer Assessment for the Lower Extremities (FMA-LE) scores, paretic hip abductor and knee flexor muscle strength, Berg Balance Scale (BBS) scores; the Timed Up and Go Test (TUG) times were recorded.

The TUG_{motor} completion times demonstrated excellent intra-rater, inter-rater and test-retest reliabilities, with intra-class correlation coefficients ranging from 0.944 to 0.987. The TUG_{motor} times correlated significantly with stroke-specific impairments. The MDC of TUG_{motor} times was 3.5 seconds, and the TUG_{motor} cut-off time of 13.5 seconds could discriminate participants with stroke from healthy older adults.

The TUG_{motor} is a reliable and easy-to-administer clinical tool for assessing advanced functional mobility in older adults with chronic stroke.

A CITIZENS JURY TO INFORM POLICY ON REHABILITATION FOR PEOPLE IN RESIDENTIAL CARE WITH HIP FRACTURE

K. Laver^{1,2}, E. Gnanamanickam^{1,2}, J. Ratcliffe¹, W. Shulver^{1,2}, I. Cameron³, M. Agar², M. Crotty^{1,2}, 1. *Department of Rehabilitation, Aged and Extended Care, Flinders University, Adelaide, South Australia, Australia*, 2. *NHMRC Cognitive Decline Partnership Centre, Sydney, New South Wales, Australia*, 3. *University of Sydney, Sydney, New South Wales, Australia*

It has long been recognised that eliciting the views and preferences of members of the public can improve health care decision making. One way of engaging members of the public in decision making is via Citizens' Juries. Citizens' Juries bring together a small group of people (jurors) who represent members of the public and ask them to consider a particular aspect of health care that is often complex (a 'wicked'

problem). The aim of this jury was to consider (1) should there be an investment in physical rehabilitation services in residential care for older people following hip fracture? and (2) If so, what are some options for providing this service (considering funding, models of service delivery and equity)? A group of 13 jurors in Australia listened to presentations from expert witnesses including rehabilitation and palliative care specialists, a residential care provider, a health economist and three consumers. Following deliberation, all members of the jury agreed that there needs be a greater focus on promoting independence and rehabilitation in residential care and that upskilling of care staff is required. Twelve of the thirteen jurors agreed that in-reach rehabilitation services should be provided for this population with certain parameters. The remaining juror had reservations. The jurors felt that rehabilitation should not focus on physical recovery exclusively but should be flexible to meet the needs of the person; for some people this may include a greater focus on pain management or psychosocial rehabilitation. All jurors agreed that rehabilitation should take place in the residential care setting.

THE GERIATRIC DEPRESSION SCALE (GDS) IN GERIATRIC REHABILITATION

K. Hager^{1,2}, M. Brecht¹, O. Krause^{1,2}, 1. *Center for Medicine for the Elderly, Diakovere Henriettentstift, Hannover, Lower Saxony, Germany*, 2. *Medical School Hannover, Hannover, Germany*

Background: The geriatric depression scale (GDS) is a widely used test the mood of patients in German geriatric clinics.

Aim: It should be investigated whether a depressive mood on admission was associated with a reduced amelioration in independence in the course of geriatric rehabilitation.

Methods: In a retrospective study 1453 patients in the years 2006–2009 in the center for medicine in old age were investigated. Beside the GDS several assessment tests were included like the Functional Independence Measure (FIM), and the Mini Mental State Examination (MMSE).

Results: 1315 (90.5%) of the patients showed a GDS-Score of 5 points or lower and were, according to the test, not depressive. Only 138 (9.5%) had 6 points or more and had to be classified at least as slightly depressive. The mean age of those with a GDS of 0–5 points was 81.7±7.4 but 79.0±8,3 years for those with 6–15 points (p<0.001). There was no difference with the MMSE (24.6±4.8 versus 25.0±4.6 points, n.s.). The FIM on admission was 86.9±21.5 for those not classified as depressive versus 82.8±21.3 points for those with a GDS over 5 points (p<0.05). The FIM on discharge was 101.9±20.0 versus 96.4±20.5 points (p<0.05). The improvement in the independence in the FIM therefore not different in the two patient groups (15.0±12.7 vs. 13.6±12.8 points, n.s.).

Conclusion: Over 90% of the geriatric patients admitted to a clinic for geriatric rehabilitation were not in a depressive mood. A depressive mood was associated with a younger age as well as with a slightly lower FIM on admission and on discharge, but there was no significant difference for the improvement of the FIM. A depressive mood should therefore not be an obstacle for the admission to geriatric rehabilitation.

BEYOND THE ISOLATED SWALLOW: DYSPHAGIA IN THE CONTEXT OF PERFORMANCE DURING A MEAL

T. Hansen, *Metropolitan University College, Copenhagen, Denmark*

Dysphagia (difficulty in swallowing) makes the socially and culturally important meal situation problematic in elderly people, and may lead to decreased health, well-being and quality of life. Since eating, drinking and swallowing are complex and integrated neuromuscular processes, it is proposed that assessment of dysphagia should be based on a multi-stage process of ingestion: pre-oral (anticipatory), oral, pharyngeal, and esophageal. However, there is limited literature regarding the influences of the individual ingestion stages on the swallowing safety in dysphagic elders during a meal. As a part of a comprehensive needs assessment for developing and enhance dysphagia rehabilitation, this study aimed to provide insights into which specific ingestive skill impairments influences unsafe swallowing in elderly (65+) people with dysphagia. A cross-sectional study with 328 Danish elderly people (mean age: 77.7 ± 11.6 years) referred to occupational therapy for swallowing evaluation was carried out, and data on mealtime performance was collected using the McGill Ingestive Skills Assessment. Multiple logistic regression models showed that unsafe swallowing during a meal was significantly associated with: 1) inability to maintain a seating position, 2) inability to self-feed, impaired judgment and energy and 3) reduced labial seal, inability to bite and chew food items, piecemeal deglutition, inability to coordinate respiratory pattern during ingestion and inability to clear the airway in case of aspiration. Since impairments in all stages of ingestion tend to occur concurrently in elders with dysphagia, the goal of rehabilitation should not only address the swallowing impairment, but also eating as an activity of daily living.

GENDER IN GERIATRIC REHABILITATION—ARE THERE ANY DIFFERENCES?

K. Hager^{1,2}, M. Brecht¹, O. Krause^{1,2}, 1. *Center for Medicine for the Elderly, Diakovere Henriettenstift, Hannover, Lower Saxony, Germany*, 2. *Medical School Hannover, Hannover, Germany*

Background: Gender may have an influence on the results of geriatric therapy and rehabilitation. The aim of this study was to analyze the activities of daily living (ADL), evaluated by the Functional Independence Measure (FIM) on admission and on discharge made by women and men.

Patients and Methods: Data of 2496 patients with a wide variety of diseases from the years 2006–2009 were analyzed. The patients were treated in the Center for Medicine in the Elderly in Hannover (Germany), a clinic with both acute and rehabilitative geriatric care.

Results: 1802 (72.2%) of the patients were women and 695 (27.8%) men. The mean age of the patients was 81.6 ± 7.7 years (women: 82.5 ± 7.3; men: 79.2 ± 8.3). Cognition was not different between women and men (women: 23.6 ± 5.6; men 24.1 ± 5.3 points; n.s.).

The FIM on admission for women and men was alike (women: 84.0 ± 21.9; men: 83.3 ± 23.9 points, n.s.). The mean improvement of the FIM was 14.3 ± 13.4 points (women: 14.7 ± 13.2; men: 12.9 ± 13.6; n.s.). No differences were

found neither for the motor nor the cognitive FIM. No differences were found for the FIM items.

Conclusion: Although women were slightly older than men, there was no gender difference of the whole FIM or FIM domains on admission as well as on discharge. This was also true for functions where men might have an advantage like climbing stairs or where women might have more interest in like hygiene.

MEDICAL OUTCOME AND UTILIZATION FOR HIP FRACTURE PATIENTS WITH OR WITHOUT OUTPATIENT REHABILITATION

P. Lin¹, P. Pan³, T. Lan⁴, 1. *Kuang Tien General Hospital, Taichung, Taiwan*, 3. *National Yang-Ming University Hospital, I-Lan, Taiwan*, 4. *National Yang-Ming University, Taipei, Taiwan*

The National Health Insurance (NHI) in Taiwan has not yet covered the post-acute care and only provides outpatient rehabilitation after discharge for hip fracture. This provides an opportunity to examine whether outpatient rehabilitation also improves the outcomes and reduces the medical utilization. The purpose of this study was to compare the medical outcomes and utilization in hip fracture patients receiving or not receiving outpatient rehabilitation.

The data of this retrospective cohort study were from the NHI Research Database. Propensity score matching by gender, age, Charlson Comorbidity Index, and Adjusted Clinical Groups with the 1:4 matching ratio was employed. A total of 3585 patients aged 65 and over admitted for hip fracture between 2005 and 2012 were further divided into two groups, 717 receiving and 2868 not receiving outpatient physical therapy during the first three months after hospital discharge. Each hip fracture patient was followed for one year. The outcomes included death, emergency use, and re-hospitalization. Medical utilization included outpatient, emergency, and inpatient costs. Cox proportional hazards regression and generalized linear models were used.

Patients receiving outpatient rehabilitation demonstrated significantly lower mortality rate than those without rehabilitation (12.7 % vs. 16.7 %, $p < 0.05$). Rehabilitation group had statistically significant lower risk of death (HR=0.74, 95% CI=0.59–0.94). However, patients receiving rehabilitation were at higher risk of emergency (HR=1.15, 95% CI=1.02–1.30) and re-hospitalization (HR=1.37, 95% CI=1.22–1.55). Rehabilitation group also had higher medical utilization ($p < 0.05$).

Patients receiving outpatient rehabilitation have lower risk of death, but higher risk of emergency, re-hospitalization, and medical utilization.

RANDOMIZED CONTROLLED TRIAL OF OCCUPATIONAL THERAPY IN ELDERLY WITH MILD AND MODERATE DEMENTIA

P. Kumar¹, M. O'Connell¹, S.C. Tiwari², R.K. Tripathi², R. Kenny¹, A.B. Dey³, 1. *Trinity College Dublin, Dublin, Ireland*, 2. *KGMU, Lucknow, India*, 3. *AIIMS, New Delhi, India*

Non-pharmacological intervention has been reported to reduce the symptoms of dementia. However, the few studies to have examined the effects of occupational therapy, emphasize specific domains, such as physical, functional and

quality of life. This study aimed to investigate the effects of occupational therapy on multiple key functional domains in patients with mild to moderate dementia. An open label randomized control trial was conducted among patients attending 2 memory clinics in India. Of 319 attendees screened, 100 had dementia (DSM-IV criteria) and were randomized to a novel occupational therapy programme of 2 sessions per week including relaxation, physical and cognitive exercises, and personal and recreational activities or standard medical treatment (control). Participants were reassessed after 5 weeks. The mean age of participants was 69.4 years with 78% male, 18 participants were lost to follow-up. Experimental and control participants were matched for demographic factors and severity of dementia. Using an intention to treat analysis the intervention group showed improvement in the primary outcomes. Geriatric Depression Scale (14.8 ± 4.4 to 13.3 ± 4.1 ; 95% CI (0.9, 2.0), Bristol Activities of Daily Living scale (23.1 ± 6.1 to 17.5 ± 4.7 ; 95% CI (3.8, 7.2), Modified Physical Performance Test (17.0 ± 3.1 to 19.6 ± 3.7 ; 95% CI (3.8, 7.2). Significant improvements were also noted in MMSE, BEHAVE-AD and the physical, psychological and environmental domain of WHOQOL-BREF ($p < 0.01$). This novel occupational therapy programme can improve physical performance, functionality, mood, cognition, behavioural status, and quality of life in mild to moderate dementia patients at short-term. Future studies are required to assess long term effects

REDEFINING DINING PRACTICES IN CARE FACILITIES THROUGH COMMUNITY-BASED PARTICIPATORY RESEARCH

S. Shune¹, D. Linville², 1. *Communication Disorders and Sciences, University of Oregon, Eugene, Oregon*, 2. *Couples and Family Therapy, University of Oregon, Eugene, Oregon*

As related to eating, older adults, especially those with swallowing problems (dysphagia), experience increased risk of mortality and malnutrition, and a loss of socialization, autonomy, and identity. Given required dependencies and adaptations, these eating-related negative outcomes may be further magnified among nursing home residents. Thus, one goal of person-directed care in these facilities is to enhance the dining process by understanding how to best support dining-related quality of life while balancing safety/risks, resident preferences, and quality of care goals (e.g., quantity of intake, decreased dysphagia-related sequelae such as pneumonia). The purpose of this study was to conduct a needs assessment in skilled nursing facilities using community-based participatory research (CBPR) methods in order to understand the dining-related needs, goals, and barriers of various stakeholders. In-depth interviews were conducted with 21 individuals across seven groups: residents with dysphagia, nurses, nursing assistants, dietary staff, speech-language pathologists, occupational therapists/assistants, and residents' family members. Interviews and data analysis were guided by grounded theory and CBPR methodology. Multiple process/procedural-based themes emerged across groups including how communication, transparency and education promote positive dining experiences, while lack of routine normalization, food presentation, and environment contribute to negative experiences. Attitude/relational-based themes centered around the meanings of autonomy and

identity, the quality of staff-resident relationships, the level of staff investment, and the stigmas associated with altered eating. These findings suggest the importance of taking an interdisciplinary approach to dining and highlight potential relevant and malleable intervention targets toward the design of new dining program models.

ACTIVITY PATTERNS AND MOBILITY BARRIERS IN A REHABILITATION SETTING

A.M. Mudge^{1,3}, P. McRae¹, P. Bew², J. Ylarde², S. Smith³, 1. *Internal Medicine and Aged Care, Royal Brisbane and Women's Hospital, Brisbane, Queensland, Australia*, 2. *Brighton Health Campus, Brisbane, Queensland, Australia*, 3. *University of Queensland, Brisbane, Queensland, Australia*

Functional decline is common in older inpatients and often necessitates inpatient rehabilitation following resolution of an acute illness/injury to restore independence. Limited mobility has been identified as an important predictor of functional outcomes in older acute care inpatients, but few studies have examined mobility in inpatient rehabilitation settings. This prospective observational study conducted in a purpose-built urban rehabilitation facility in Brisbane Australia used mixed methods to identify current mobility levels and barriers and enablers to mobility. Mobility levels were measured using activity mapping across two wards (a rehabilitation ward $n=37$ and restorative care ward $n=42$). A trained observer cyclically observed all ward inpatients over an 8 hour period (8am-5pm). On average, patients spent about 8% of day time upright or mobile (standing, walking or actively wheeling), and spent less than one third of daytime out of their bedrooms. Barriers and enablers were identified by a validated staff survey ($n=84$: 52 nursing, 25 allied health professionals, 7 other) and semi-structured patient interviews ($n=30$). Staff agreed that mobilisation benefited patients, and had knowledge, skills and physical resources to mobilise patients. Staff barriers included insufficient nurse-patient ratios, uncertainty about workload implications, concern about risk of staff injuries, patient contraindications to mobilising, resistance from patients and lack of interest from families. Patients rated the importance of mobilising very highly, but reported little mobilising outside of therapy sessions. Patient-reported barriers included lack of nursing assistance, lack of family and visitors, and pain. Findings will inform quality improvement strategies to enhance mobility in rehabilitation inpatients.

REHABILITATION OUTCOMES OF THE OLDEST-OLD PATIENTS AFTER HIP FRACTURE SURGERY: A PROSPECTIVE STUDY

P. Mazzola^{1,2}, P. Floris^{1,3}, F. De Filippi³, 1. *School of Medicine and Surgery, University of Milano-Bicocca, Monza, MB, Italy*, 2. *NeuroMI - Milan Center for Neuroscience, Milano, MI, Italy*, 3. *Regional Hospital of Valtellina and Valchiavenna, Department of Medicine, Geriatric Rehabilitation and Sub-acute Care Unit, Sondrio, SO, Italy*

Hip fracture (HF) incidence is growing progressively with an age-related trend. In recent years, the average age of elderly patients admitted to acute care units and rehabilitation facilities has increased steadily, but research about

clinical and functional rehabilitation outcomes in this age group is still limited. In order to contribute to fill this gap, the aim of this study was to investigate the functional and clinical outcomes of the oldest-old HF patients in comparison with younger subjects.

We prospectively enrolled 328 patients (80.5% females, mean age 85.2 years) admitted to the Geriatric Rehabilitation Unit of Regional Hospital of Valtellina and Valchiavenna (Sondrio, Italy) in the period 2012–2015. We divided them according to age: Group 1 (age <85, N=152) and Group 2 (age ≥85, N=176). All subjects underwent a comprehensive assessment according to a well-established orthogeriatric protocol and were compared. Outcome measures included the Barthel Index (BI) at discharge, the occurrence of medical complications, and death during the 30-day rehabilitation period.

The groups had similar baseline characteristics, and showed a similar incidence of complications. The baseline BI score was higher in Group 1 than in Group 2, but the recovery in terms of mean BI gain was significant in both cases (+36.2, $p < 0.001$, and +24.8, $p < 0.001$, respectively).

If carefully managed, the *oldest-old* have a good potential of recovery after HF surgery. The dissemination of comprehensive orthogeriatric protocols should be promoted because it allows to optimize the individuals' rehabilitation course, and to invest resources in patients irrespectively from their chronological age.

COGNITION, NOT LENGTH OF STAY, PREDICTS REHABILITATIVE IMPROVEMENT IN TRANSITIONAL CARE

E. Fauth¹, J. Sullivan¹, S.Y. Schaefer², 1. *Utah State University, Logan, Utah*, 2. *Arizona State University, Tempe, Arizona*

Activities of daily living disability for older adults is likely an outcome of physical limitations, environmental constraints, cognitive impairment, and psychosocial factors. During medical rehabilitation, physical therapy emphasizes physical improvements, but does not systematically consider cognitive ability or mood as part of treatment. The current study assesses the extent to which cognitive and psychosocial status at admission (intake) predicts patients' physical therapy progression (walking improvement) in a transitional care facility. Environmental conditions were considered constant for all patients. In a sample of adults ($n=93$; 65.6% female) aged 38–98 ($M = 75.17$; $SD = 9.72$) receiving physical rehabilitation, we used data from the St. Louis University Mental Status (SLUMS) exam, Resident Mood Interview (PHQ-9 from the Minimum Data Set), and 2-Minute Walk Test (2MWT). Mean intake 2MWT = 106.76 feet ($SD = 95.44$), or 32.54 meters ($SD = 29.09$), suggesting significant physical impairment. Intake SLUMS scores indicated 38.7% Dementia, and 28% Mild Neurocognitive Disorder. Mean number of weeks in rehabilitation was 4.09 ($SD = 1.87$; range 2–12). Linear regression models indicated that cognitive ability at intake (SLUMS score $B = -.420$; $p < .01$) predicted improvement in walking ability (change in feet on the 2MWT from intake to discharge), even after accounting for gender ($B = -.318$; $p < .05$), age ($B = -.078$; $p = n.s.$) and number of weeks in rehabilitation ($B = 0.159$; $p = n.s.$). Model R -squared = 0.22, with mood excluded from the model due

to bivariate insignificance with 2MWT. Intake cognitive function may be a useful predictor of rehabilitation success, rather than length of stay.

UNMET MEDICAL AND REHABILITATION NEEDS IN COMMUNITY: LIVING OLDER ADULTS WITH STROKE IN MEXICO

A. Kumar¹, B. Downer², R. Wong², 1. *Department of Health Services, Policy & Practice, Center for Gerontology and Healthcare Research, Brown University, School of Public Health, Providence, Rhode Island*, 2. *University of Texas Medical Branch Galveston, Galveston, Texas*

Stroke patients often need intensive medical care and rehabilitation to regain functional independence to live independently in the community. However, stroke patients often times do not receive sufficient medical care and rehabilitation, especially in lower and middle-income countries such as Mexico. The aim of this study was to explore the health characteristics of Mexican older adults who have experienced a stroke and determine if this population is receiving sufficient care and rehabilitation. We examined 15,354 participants from the Mexican Health and Aging Study-2012 wave. A total of 365 participants reported having been told by a physician that he/she had experienced a stroke in the past two years. The mean age of participants with self-reported stroke was 69.9 years and 58% were residing in an urban area. The majority had falls (55%), fracture (12%), upper limb disability (69%), and lower limb disability (86%). Comorbid conditions including hypertension (72%), diabetes (37%), and obesity (25%) were highly prevalent. Nearly half of stroke patients reported limitation in daily activities (53%), vision impairment (48%), difficulty in speaking (38%), and difficulty in expressing him- or herself (35%) due to stroke. Approximately 53% of stroke patients reported having received stroke-related medical treatment and only 18% reported having received physical therapy. These results indicate stroke patients in Mexico often experience comorbid health conditions and patients may have unmet medical care and physical therapy needs. These unmet needs may ultimately lead to long-term disability, which increases the burden on the patients, their caregiver, and the health care system in Mexico.

DEVELOPMENT OF ASSESSMENT METHOD FOR PHYSICAL PERFORMANCE BY Z-SCORE IN OLDER PEOPLE

N. Kamide¹, Y. Inaba², Y. Shiba¹, H. Sato¹, 1. *School of Allied Health Sciences, Kitasato University, Sagami, Kanagawa, Japan*, 2. *School of Nursing and Rehabilitation Sciences, Showa University, Yokohama, Kanagawa, Japan*

We have previously reported development of the physical performance score by z-score (PPSz) for assessing instrumental activities of daily living (IADL) disability risk among older individuals. The aim of this study was to investigate the validity of PPSz for community-dwelling older individuals. A total of 117 participants aged 65 years or older were recruited from the community (mean age, 72.4 ± 6.4 years; 23 male). The following physical performance tests were measured for the PPSz: 5-m walking times at comfortable pace and at maximum effort; timed up-and-go test; 5-repetition chair stand test; and grip strength. Measurement values

from those tests were transformed into z-scores, and summed to calculate PPSz in the present study. Z-scores for each test were calculated according to methods described in a previous study (Kamide et al., in print). As an assessment of IADL, the subscale of the Tokyo Metropolitan Institute of Gerontology Index of Competence (TMIG-IC) was used. Statistical analysis after adjusting for age and sex showed that PPSz was significantly lower for individuals with IADL disability than for those without IADL disability. Furthermore, the receiver operating characteristic curve was used to assess the ability of PPSz to discriminate IADL disability risk. The area under curve was 0.81 (95% confidence interval, 0.68–0.94), with 91.2% sensitivity and 66.7% specificity. The PPSz developed in this study could thus detect the presence of IADL disability among community-dwelling older individuals and may be useful for assessing IADL disability risk in older people.

NEW CONCEPT FOR SUPPORTING THE ELDERLY HAVING GARBAGE TROUBLES

K. Noda¹, J. Sagara², R. Tanemura¹, T. Nagao¹, J. Hoshii¹, T. Uchida¹, O. Nakata¹, K. Sunagawa¹, 1. *Kobe University, Kobe, Hyogo, Japan*, 2. *Kobe Design University, Kobe, Hyogo, Japan*

Introduction: The garbage gathering system in Japan is complex. People have to separate their garbage according to several different categories, which is difficult for many elders. Many elders in Japan are having problems of separating their garbage. We have developed a new way for supporting the elders having garbage troubles.

Method: This new concept has three characteristics. The first is the technology done automatically, specially designed for the elders who are poor at using modern technologies. The second is to stimulate and urge the elders to be able to separate and throw the garbage by themselves without direct support from the others. The third is that we have chosen the bed ridden and person with disability who are able to use IT devices for supporting the elders. We have experimentally tried this new method of separating the garbage to support the elders having garbage troubles and recorded the results.

Result: The participants in our experiment were six elders and five persons with disability. The elders were able to solve their garbage problems and the persons with disability were able to feel self-efficacy.

Discussion: We were able to seek some possibilities for supporting the elders with garbage troubles through this new method. However, there are some points we have to reconsider.

Conclusion: We believe that these three characteristics of our new garbage separating method will help the elders with garbage problems and lead the persons with disability to have their fair occupational rights in the society.

FUNCTIONAL DETERIORATION IN A GERIATRIC UNIT—HOW OFTEN DOES THIS HAPPEN?

K. Hager^{1,2}, M. Brecht¹, O. Krause^{1,2}, 1. *Center for Medicine for the Elderly, Diakovere Henriettenstift, Hannover, Lower Saxony, Germany*, 2. *Medical School Hannover, Hannover, Germany*

Background: Most patients in a geriatric unit show an improvement of their functional abilities. But unfortunately this is not always true. Additionally due to changing financial

resources the treatment results may have deteriorated over the past years.

Methods: In the Center for Medicine in the Elderly in Hannover, an in-patient geriatric clinic in Germany 756 patients in 2004 and 2527 in the years 2008 to 2009 were analyzed. The measure for the activities of daily living (ADL) was the Functional Independence Measure (FIM). Moreover data from 1602 patients from 2014 were included, but here the Barthel-Index (BI) was used as ADL measure. Improvement resp. deterioration was defined as more or less than 0 points on the ADL scale between admission and discharge.

Results: As shown by the FIM 5.2–6.0% of the patients deteriorated, 3.0–6.2% remained unchanged and 88.9–90.9% improved. As judged by the BI 6.2% deteriorated, 12.6% remained unchanged and 81.2% improved.

Conclusion: Over ten years and with two instruments to measure activities of daily living, deterioration was only seen in about 5–6 % of the patients. About 95% remained unchanged or improved in their independence. In a usual care setting the percentage of elderly patients, who show declining ADL abilities may be much higher (e.g. Sager et al., 1996).

THE EFFECT OF EXPIRATORY MUSCLE STRENGTH TRAINING ON THE SWALLOWING FUNCTIONS OF THE ELDERLY

N. Ito^{1,2}, S. Watanabe², K. Morita³, K. Morita^{1,2}, Y. Okuyama¹, T. Takizawa¹, K. Suzuki¹, Y. Iida¹, 1. *Nihon Institute of Medical Science, Saitama, Japan*, 2. *Graduate School of Gerontology J. F. Oberlin University, Tokyo, Japan*, 3. *Mizuho-no-Sato Geriatric Health Services Facility, Saitama, Japan*

The Effect of Expiratory Muscle Strength Training/EMST is reported not only to strengthen the respiratory muscle, but also improve the ability to swallow, and activate superficial muscles of the suprahyoid muscle group. Effects on the improvement in aspiration have not been fully determined yet.

Objective: To determine the effects of EMST on the swallowing functions of the community elderly residents using day-care centers, based on the accumulative time spent for the thrice saliva-swallowing. To expect that EMST would improve respiratory function, phonation and the ability to swallow in the elderly.

Methods: 31 community elderly residents using day-care centers were asked to participate in the 4-week intervention program for the study. The Threshold Trainor was used to undergo 5-set, 5-times-per-day EMST trainings at 75% load of maximum expiratory pressure/MEP, for 4 weeks. The participants underwent home training independently, monitored their compliance with study protocols, and reported on the log sheet. Swallowing functions were evaluated by accumulative time for thrice saliva-swallowing; respiratory functions, by MEP, and maximum inspiratory pressure/MIP; while phonation functions, by maximum phonation time/MPT. Comparative analyses between baseline time and that after 4 weeks intervention were done using t-test.

Results: Accumulative time for thrice saliva-swallowing was significantly reduced from 26.40 at baseline to 18.58 seconds 4 weeks after the intervention. Effects of intervention were also significant in: MPT-9.79 at baseline, prolonged to 11.62 seconds after 4 weeks; MEP-22.47, to 26.86 cmH₂O; MIP-19.06 to 21.02 cmH₂O after 4 weeks.

Conclusion: The study findings suggest that EMST could improve the swallowing functions in the elderly patients. The repeated EMST training leads to the shortened time necessary for swallowing. This may be explained by the fact that the pathway for swallowing is partially shared with that of phonation. The prolonged expiration time seems to have led to the improved phonation.

COGNITIVE FUNCTION DURING REHABILITATION AFTER HIP FRACTURE

K. Shibasaki^{1,2}, S. Ogawa¹, K. Mizobuchi², T. Asahi², M. Akishita¹, 1. *The University of Tokyo, Tokyo, Japan*, 2. *Asahi Neurology and Rehabilitation Hospital, Chiba, Japan*

Aim; Both hip fracture and dementia are major reason for elderly to be with long-term care. Hip fracture has been reported to deteriorate cognitive function. However, we little experience deterioration of cognitive function after hip fracture during rehabilitation. The aim of this study is that whether rehabilitation could prevent elderly with hip fracture from deterioration of cognitive function.

Method; We analyzed elderly with hip fracture by using Japanese rehabilitation database. Inclusion criteria are aged 65 or older, evaluated physical and cognitive function before and after rehabilitation and elderly with hip fracture. Elderly who were suffered from psychological symptoms which effect on cognitive function was excluded. Physical function and cognitive function were evaluated by using functional independence measure (FIM) and mini-mental state examination (MMSE) respectively. The data were compared before and after physical and cognitive function by paired-t test. Moreover, we divided into 3 group according to cognitive function (MMSE ≥ 24 , $\leq 23 \leq$ MMSE ≥ 14 , $13 \leq$ MMSE) and same analysis was done.

Result: The number of subjects were 475. The mean age was 83.4 ± 7.4 . The length of hospital stay was 44.0 ± 27.4 days. FIM was significantly improved compared before with after rehabilitation. Positive correlation was shown between the length of hospital stay and MMSE gain (after MMSE – before MMSE). Similar result was seen in analysis which divided into three groups.

Conclusion: Although hip fracture has been reported that alter cognitive function in the elderly, cognitive functional deterioration was not seen during rehabilitation period.

BENEFITS OF PHYSICAL THERAPY MANAGEMENT OF SPINAL STENOSIS IN THE GERIATRIC POPULATION: A CASE REPORT

M. Schooley^{1,2}, G. Mandel^{1,2}, 1. *University of St. Augustine, Saint Augustine, Florida*, 2. *First Coast Rehabilitation, Saint Augustine, Florida*

Spinal Stenosis is a common diagnosis among the geriatric population and is often associated with significant pain, loss of function and high medical costs. The patient in this case was referred with a diagnosis of lumbar spinal stenosis. He was experiencing severe pain and functional deficits. Additionally, he was scheduled to receive steroid injections. The patient was examined and treated by two physical therapists in an outpatient orthopedic setting. Interventions included patient education for aquatic home exercise program, manual therapy, functional strengthening and spine stabilization. Following one month of physical

therapy, patient demonstrated a meaningful change in spine active range of motion, neural tension, functional strength, manual muscle testing and Revised Oswestry Low Back Pain Questionnaire. Patient's improvement allowed him to function at his desired level and avoid costly injections. The results of this case demonstrate that a patient with a diagnosis of spinal stenosis can achieve meaningful changes in short term outcomes and self-management of spinal stenosis with physical therapy and compliance with home program. The duration and cost of physical therapy over 9 visits was equal to or less than the cost of a single steroid injection. Many patients with similar diagnoses go without treatment or undergo expensive medical interventions without prior utilization of physical therapy services. The purpose of this case report is to highlight the benefits of physical therapy in the management of spinal stenosis.

PHYSICAL PERFORMANCE MEASURES IN COMPETITIVE SENIOR ARCHERS

B. Jordre, W. Schweinle, M. Johnson, A. OKief, I. Pohlman, *The University of South Dakota, Vermillion, South Dakota*

Older adults are showing greater participation in sports competition and have been found to demonstrate physical performance superior to their community-dwelling counterparts. However, very little is known about the impact of competitive archery on the physical health of older adults. Eighteen competitive archers over the age of 50 completed a short health and exercise history and participated in a physical screen of waist circumference, waist-to-hip ratio, BMI, grip strength, chair stands, balance, and gait speed. Outcomes were compared to the results of 1,628 senior athletes participating in the same health screen who engaged in athletic competition unrelated to archery. Archers reported spending a significantly greater amount of time in strength training ($F=3.89, p=.048$) than other senior athletes but reported slightly less time spent on cardiovascular training. They showed significantly higher rates of diabetes ($\chi^2=12.28, p<.001$) but a lower incidence of cancer ($\chi^2=5.18, p=.023$). No other differences in health or training history were seen. Archers demonstrated performance superior to other senior athletes on measures of grip strength ($F=10.59, p=.001$), usual gait speed ($F=9.44, p=.002$), fast gait speed ($F=10.46, p=.001$) and single leg balance on foam ($F=6.32, p=.01$). All other comparisons were non-significant. Senior archers unexpectedly excelled in physical performance measures already associated with longevity, health and fall prevention. These benefits may be related to the sport-specific tasks of pulling a bow, maintaining a steady stance and walking to retrieve arrows. Longitudinal analysis with larger numbers of senior archers should be conducted to confirm any health benefits associated with archery.

SESSION 605 (POSTER)

RESEARCH METHODS: QUALITATIVE AND QUANTITATIVE APPROACHES

SYSTEMATIC MEASUREMENT OF NON-RESPONSE IN TRIALS WITH NURSING HOME RESIDENTS

A. Budnick¹, R. Kreutz², D. Draeger¹, 1. *Charité - Universitätsmedizin Berlin, Institute of Medical Sociology and Rehabilitation Science, Berlin, Germany*, 2. *Charité*

- *Universitätsmedizin Berlin, Institute of Clinical Pharmacology and Toxicology, Berlin, Germany*

Non-response in trials can cause bias, potentially impairing the reliability and validity of research results. Few systematic analyses have examined the reasons for non-response in surveys of nursing home residents (NHR). However, standardized assessment of these reasons may guide efforts to obtain higher response rates in this target group. We performed a cluster-randomized controlled trial in NHR from twelve nursing homes who were ≥ 65 years of age and without moderate or severe cognitive impairment. The aim was to improve pain management, and analysis was performed before (T0, n=239) and after an intervention (T1, n=206; T2, n=177). We additionally recorded open-ended comments throughout the trial to investigate the reasons for unit non-response by questioning NHR, legal representatives, nursing staff, and/or trained interviewers. The non-response rate was 60.8% at baseline, with a 25.9% attrition rate from T0 to T2. We performed content analysis following the “step model of inductive category development,” using all open-ended comments (n=522) to develop a system of categories representing the reasons for non-response in nursing homes. Overall, we identified four major categories of refusal—general refusal, health reasons, accessibility, and excessive demands—which further comprised 17 subcategories. In view of the insufficient number of trials that include very old people, we will discuss options for increasing response rates in future studies. Notably, as NHR commonly have legal representatives (e.g. a lawyer) due to cognitive impairment, non-response is often based on “third-party decisions”. Accordingly, it is necessary to discuss ethical issues in non-response analyses with NHR.

CULTURAL CONSIDERATIONS IN FOCUS GROUP RESEARCH WITH AMERICAN INDIAN FAMILY CAREGIVERS

C.H. Hennessy¹, R. John², 1. *Bournemouth University, Plymouth, United Kingdom*, 2. *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

The use of focus groups in gerontology to capture information on experiences, perceptions and attitudes related to aging and older people has burgeoned over the past 20 years. While researchers have given attention to procedural issues in conducting focus groups, there has been little examination of the effects of cultural factors in the use of this method. This presentation analyzes experiences from focus groups conducted with American Indian tribes in the U.S. Southwest and Oklahoma as part of research on the long-term care needs of elders and their family caregivers. Focus groups were used to establish content validity of a caregiver burden scale for a survey of family caregivers, and to explore the experience of caregiving to frail elders within reservation and other rural settings. This method was selected as being culturally compatible for use with tribal groups that have a strong oral tradition including storytelling and “talking circles”, an indigenous process that involves active listening and the opportunity for all participants to contribute their views on subjects under discussion. Issues that emerged in conducting these focus groups including the influence of cultural orientation to confrontation, cultural role definition that affected who identified themselves as caregivers, the decorum

accorded to older focus group members, the latitude of community and tribal concerns, and the public idealization of elder care, are discussed in terms of their effects on the focus group process. The implications of these influences are considered from a cultural framework for focus groups and in recommendations for research practice.

EXPLORING ENGAGEMENT IN DEMENTIA: EMERGING THEORETICAL AND METHODOLOGICAL APPROACHES

S.E. Canning, 1. *University of British Columbia, Vancouver, British Columbia, Canada*, 2. *University of the Fraser Valley, Chilliwack, British Columbia, Canada*

Ensuring quality of life for residents in long-term care homes poses complex challenges, especially for individuals with advanced dementia who often spend long periods alone in passive activity. While arts-based and creative programming have been shown to provide opportunities for meaningful engagement, there is limited understanding of the experiences of the residents participating, especially those with advanced dementia. My doctoral research seeks to better understand the social and emotional engagement of older adults with advanced dementia living in care, drawing particular attention to their experiences of participating in an innovative inter-generational dance programme.

Given the challenges of including older adults with severe cognitive impairment as research participants, in this presentation I address the need for conceptual and methodological development aimed at identifying and refining research approaches that look beyond the confines of language and memory. The theoretical framing of this study examines opportunities to understand persons with dementia in terms of phenomenological concepts of embodiment, personhood, and meaningful engagement. These conceptual underpinnings in turn support a methodological framing that draws on visual ethnographic approaches designed to analyse experiences of people with advanced dementia through observing their interactions, gestures, movements, and expressions. Preliminary findings illustrate the potential of this approach utilizing *visual* data as a vehicle to *hear* the voices of people with advanced dementia who are no longer able to communicate and participate in usual ways. Emerging theoretical and methodological approaches that provide more nuanced understandings of the experience of dementia are critical - *because everyone is someone*.

CARE MANAGERS' PERCEPTIONS OF ACP BARRIERS AND BENEFITS: NUANCES FROM A MIXED METHODS ANALYSIS

J. Aultman¹, K. Baughman¹, R. Ludwick², J. Heffner², 1. *Family and Community Medicine, Northeast Ohio Medical University, Rootstown, Ohio*, 2. *Kent State University, Kent, Ohio*

Barriers and benefits of advance care planning (ACP) experienced by Area Agency on Aging (AAA) care managers (CMs) were analyzed from a mixed methods approach. This methodology is used to acquire a deeper understanding of perspectives and practices related to ACP, and to identify nuances between quantitative and qualitative data. A two-part study was conducted with CMs; 458 participated in a survey, and 62 also participated in one of 8 focus groups.

Results from both surveys and focus groups showed that CMs felt knowledgeable about ACP. CMs were generally comfortable (67%) and confident (67%) when discussing ACP, and qualitative data confirmed that comfort levels tended to rise with experience and personal history with consumers. While ACP was not always easy, and there were some who were uncomfortable due to cultural factors, CMs recognized that consumers were generally comfortable with dying and found value in ACP. While surveys indicated 78% disagreed that ACP takes too much time, qualitative data revealed a more moderate position: some reported time was a “big barrier,” and when others placed ACP as a priority, there was not enough time for other obligations. Finally, CMs recognized their important role in a team-based approach to ACP (64%), despite the fact that they wished physicians would take a more active role.

Mixed methods analysis helps unravel complex nuances of CMs perceptions about ACP. In this study, CMs reported their attitudes about ACP, which were confirmed through a rigorous grounded theory qualitative analysis of focus group discussions.

RACIAL DIFFERENCES IN MISCLASSIFICATION OF HEALTHY EATING BASED ON FFQ AND 24-HOUR DIETARY RECALLS

B. Olendzki¹, E. Procter-Gray¹, M. Magee², G. Youssef², K. Kane¹, W. Li¹, 1. *Preventive and Behavioral Medicine, University of Massachusetts Medical School, Worcester, Massachusetts*, 2. *MedStar Diabetes and Research Institutes, Washington, District of Columbia*

Accurate measurement of dietary intake is an important component in the assessment of racial disparities in healthy eating among older adults. We examined the agreement in alternative healthy eating indices (AHEI) based upon Women's Health Initiative food frequency questionnaire (FFQ) and 24-hour dietary recalls (24HR) by race among urban older women. In 2014 and 2015, 49 White and 44 Black women 65 years and older living in Washington, DC, were queried about diet using both FFQ and 24HR. The correlation coefficients (ρ) of 56 nutrient intake measures and agreements in AHEI based on FFQ and 24HR were compared by race. The median ρ was 0.50 for Whites and 0.21 for Blacks. For 48 measures, ρ was lower for Blacks. Whites had a strong correlation of >0.5 for 25 items, while Blacks had strong correlations for only 3 items. Based on FFQ, the mean (SD) of AHEI was 54.0 (10.3) for Whites and 45.9 (8.8) for Blacks ($p<0.001$). Based on 24HR, the mean (SD) was 43.9 (10.8) for Whites and 33.2 (9.6) for Blacks ($p<0.001$). Using 32 as the cutoff (40% of maximum AHEI score), diet quality of 50% of Blacks and 14% of Whites was classified as unhealthy based on 24HR versus 2.6% and 0% based on FFQ. These results suggest that the FFQ had limited ability to accurately assess nutrient intake and healthy eating among Blacks, and underestimated racial differences in healthy eating. Further improvement in FFQ is needed for assessing racial disparities in healthy eating among older adults.

DEVELOPMENT OF THE HELP-SEEKING PREFERENCE SCALE FOR ELDERLY

T. Takahashi¹, T. Koike², T. Ando³, 1. *Graduate School of Environment and Information Sciences, Yokohama*

National University, Yokohama, Japan, 2. *Kyushu Sangyo University, Fukuoka, Japan*, 3. *Yokohama National University, Yokohama, Japan*

The purpose of this study was to develop the Help-seeking Preference Scale for elderly and to investigate the factors correlated with help-seeking preference among the elderly. A self-administered questionnaire survey was conducted by mail (N=1680). A Questionnaire consisted of a draft of the Help-seeking Preference Scale for elderly (12 items), demographic variables, social variables, physical condition, and others. 602 responses (302 men and 300 women) were analyzed.

Factor analysis (maximum likelihood method and promax rotation) was conducted with the 12 items. The results indicated 2 factors consisting of 10 items: (1) ‘desire to receive supports,’ 6 items ($\alpha=.83$), and (2) ‘reluctance to receive supports,’ 4 items ($\alpha=.70$). The test-retest reliability and the criterion-related validity of two factors were enough to use. Multiple regression analysis indicated that the desire to receive support was positively correlated with financial difficulty and decline in physical performances. Also, the reluctance to receive support was correlated with the subjects’ financial difficulty, social variables (neighborhood association, participating groups etc.), and demographic variables (sex, spouse).

The result suggests that the Help-seeking Preference Scale was both reliable and valid. And the results of multiple regression analysis suggests that the subjects’ financial circumstance influences the attitude toward receiving support from others. Moreover, while the willingness to receive support was positively correlated with the decline in physical ability, the reluctance to receive support was positively correlated with weak social ties.

APPLYING QUALITATIVE METHODS TO “BIG DATA”: INVESTIGATING LATE-LIFE OF SUICIDE

B. Mezuk^{1,2}, V. Kalesnikava¹, 1. *Family Medicine & Population Health, Virginia Commonwealth University, Richmond, Virginia*, 2. *University of Michigan, Institute for Social Research, Ann Arbor, Michigan*

Efforts to prevent suicide in later life are hampered by a lack of empirically-informed theoretical models. Most empirical research relies either on population mortality statistics, which are representative of all suicides but lack context, or on “psychological autopsy” studies of decedents which include detailed information but rely on small, non-representative samples. We sought to overcome these limitations by applying an interdisciplinary framework and qualitative analytic approach to Restricted-Access data from the National Violent Death Reporting System, a US population-based suicide registry that includes narrative text descriptions of the circumstances surrounding each death. We used a data mining approach to analyze 28,200 qualitative narratives of suicide deaths among adults age 55 and older from 2003–2012. We identified textual themes using clustering analysis and modeled the relationships across themes using association analysis. Preliminary themes extracted included those related to health (e.g., chronic pain, cancer), means of self-harm (e.g., overdose, fall), recent events (e.g., death of a spouse, admitted to a long-term care facility) and psychiatric history. While qualitative analysis of “big data” addresses

many limitations of existing methods of investigating suicide, it presents new challenges for both quantitative and qualitative researchers. It presents a conceptual challenge to consider how the subjective nature of lived experience for decedents (especially when it is constructed by others as in these case narratives) obscures our understanding of the causes of self-harm in later life. It also presents an analytic challenge through the need to engage in machine learning methodologies to handle these large datasets.

REVIEW OF DATA VISUALIZATION PRACTICE IN GERONTOLOGY

H. Mathews², T. Yamashita¹, S.R. Kunkel², A.J. Bailer²,
1. *Sociology, University of Nevada, Las Vegas, Las Vegas, Nevada*, 2. *Miami University, Oxford, Ohio*

Data visualization is an effective strategy to achieve clear scientific data communications. Gerontology has produced a tremendous amount of cross-disciplinary data based on surveys, experiments, and qualitative methods. Types of data and analytical techniques have become more diverse than ever before. However, little is known about how gerontologists use data visualization to communicate their research. The purposes of this study are to document data visualization practice in the premier gerontology journal and to provide basic guidelines for more effective data communication. To capture historical trends, all data graphics published in 1984, 1994, 2004 and 2014 issues in *Journal of Gerontology Series B* (JGSS) were examined and classified into common types. Results showed that the numbers of articles with data graphics increased from 29 data graphics in 16 (out of a total of 63) articles in 1984 to 163 graphic elements in 67 (out of 109) articles in 2014 in JGSS. Interestingly, the most frequently used data graphics were fairly simplistic: dynamite plots --- a modified bar-chart that displays means and standard deviations --- (45% of articles with data graphics), line-graph (18%) and box-plot (9%). Based on the review of data graphics and current literature in data visualization, it is recommended that data graphics should be diversified and tailored for target audiences, better able to stand alone, and more informative than simple summary statistics. Finally, the advantages and disadvantages of commonly used data graphics for displaying data distributions are illustrated with data from different simulated distributions (e.g., normal, skewed, bimodal).

A MIXED METHODS STUDY OF HOW NURSING HOME RESIDENTS VIEW THEIR SOCIAL RELATIONSHIPS AND INTERACTIONS

A.M. Washburn, S. Williams, *National University, La Jolla, California*

As part of a larger study of social cognition and social functioning in nursing home residents ($N=40$) with and without cognitive impairment, participants responded to open-ended questions about their day-to-day interactions with staff and other residents, as well as their ongoing relationships with family and friends. Beginning with a content analysis of verbatim transcripts, themes were constructed inductively first within and then across participants' responses to the interview questions. Next, data from measures of social cognition and cognitive status, as well as nursing staff's ratings of their social behavior, were used in within-participant analyses to

identify possible cognitive and behavioral correlates of residents' self-assessments of interpersonal relationships and interactions. Finally, patterns of perceived change in the residents' social functioning were characterized in cross-participant comparisons of these combined individual qualitative and quantitative results.

Participants' social experiences appeared to be determined not only by long-established habits and preferences and length of time at the nursing home, but also by their cognitive status and social cognition competencies. A common theme though, regardless of cognitive status, was the importance of managing ongoing relationships and day-to-day interactions so as to reduce one's own stress as well as burden on others. For those with little or no cognitive impairment, maintaining a sense of self was also a priority, especially as they became frailer and as they witnessed cognitive decline in their peers. Examples will be given of how participants with moderate cognitive impairment but intact social cognition assess their relationships and interactions with others.

COMPARING DAILY DAIRY METHODOLOGIES: MTURK VS. TRADITIONAL APPROACHES

J.A. Bellingtier, S.D. Neupert, *North Carolina State University, Raleigh, North Carolina*

To our knowledge, only one study has used mTurk (Amazon's crowdsourcing platform) to collect daily dairy data and it excluded older adults. We compare benefits and challenges associated with conducting a 9-day daily dairy study of older adults on mTurk vs. traditional approaches (i.e., in-person recruitment with paper-and-pencil data collection). The speed of recruitment (hours in mTurk vs. weeks in traditional methods) was balanced by a higher rate of participant drop-off in the mTurk sample. Of 167 individuals in the mTurk sample who agreed to participate only 139 met study criterion; 116 continued to day 2, and only 71 made it to day 9 (43% retention vs. 78% in our traditional sample). In comparison to our traditional sample, mTurk participants were more likely to be white, younger, male, and not retired. Methodologically, collecting data via mTurk allowed for more precise timing of cognitive measures, as well as verification of survey completion timing. However, recruitment via mTurk meant we were unable to personally explain the process to participants. Although detailed procedures were sent to participants, mTurk participants generated more emailed questions than traditional participants. mTurk presented additional challenges specific to daily dairy designs as the mTurk system is best designed to accommodate one-time cross-sectional research. We present problems and solutions related to designing a daily dairy study of older adults compatible with mTurk, paying participants, recruiting participants, validating participants' ages, and managing mTurk fees. Overall, we present mTurk as a viable option for daily dairy collection with older adults.

INFORMATIVE METHODS TO WORK ON FOOD FREQUENCY QUESTIONNAIRES DATA

M. Colpo^{1,2}, V. Del Panta¹, G. Sini¹, B. Stefania¹, 1. *Laboratorio di Epidemiologia InCHIANTI, Azienda UsI Toscana Centro, Firenze, Italy*, 2. *University of Florence, Florence, Italy*

Purpose and methods: Interest on studying the relationship between food intake (FI) and diseases status is increasing. FI data are usually collected by food frequency questionnaires (FFQ) leading to a large number of variables to be considered in statistical models.

Two approaches have been adopted in order to deal with FI data: *a priori*, by taking into account of clinical expertise aimed to build scores like Mediterranean Diet Score for example, or *a posteriori*, by adopting classical statistical methods to shrink information in a few number of covariates such as factorial analysis or principal components analysis. Unfortunately *a posteriori* methods are not enough reliable depending on their poor power in explaining complex correlation structures.

We are going to propose the Differential Networks method to overcome both arisen problems, in order to identify differences in the correlation structure between different groups.

An application of this method was aimed to study the link between FI and the occurrence of depressive symptoms in the InCHIANTI Study. CES-D score assessed depressive symptoms while FI data were collected by the EPIC-FFQ. A set of confounders was taken into account by modeling residuals derived from multivariate regression.

Results: Data on 665 participants (age=72.6 ± 5.9, 334F) with MMSE ≥ 24 were considered. Preliminary results showed that not-depressed participants seemed characterized by a complex pattern while depressed participants showed an easier one leading to a more random behavior in FI.

Conclusion: Properly modelling of FI data could be crucial to increase informative power to determine the role of food in diseases.

THE NORWEGIAN LONGITUDINAL STUDY ON LIFE COURSE, AGEING, AND GENERATION (NORLAG)

M. Veenstra, K. Herlofson, T. Hansen, B. Slagvold, T. Hellevik, G. Kvamme Løset, P. Solem, M. Aartsen, *Oslo and Akershus University College, NOVA, Oslo, Norway*

The objectives of the Norwegian panel study on life course, ageing and generation (NorLAG) are to: explore conditions for active ageing and wellbeing in later life; examine how different social contexts respond to long lives and ageing populations; and provide knowledge needed for the development of sustainable policies and practices in the field.

NorLAG is framed in a life course perspective and builds on the assumptions that ageing and old age are embedded in life pathways, that pathways are interdependent, and that the shape of life reflects the historical context. The longitudinal design gives the opportunity to examine different life phases, as well as to explore ageing as a process. The study includes four main domains: 1. Work and retirement, 2. Family and intergenerational relationships, 3. Quality of life and mastery, 4. Health and care.

NorLAG includes survey data from three waves (2002–03; 2007–08 and 2016–17) and annual registry updates on income, social benefits and civil status. NorLAG1 comprises of 5,559 respondents aged 40+ yrs (67%). Of these, 3,774 also participated in the second wave. NorLAG2 includes persons aged 18–79 years (N=15,156) and was merged with

the international Generation and Gender Survey. NorLAG3 includes persons 50+ yrs who have responded to one of the previous waves (N=9,300).

NorLAG's strengths are the combination of longitudinal survey and register data, large samples, possibilities to analyze role change and life events over time, extensive data on close family members, and a rich set of validated psychological and sociological scales.

LEVERAGING LARGE DATA: ASSESSING SOCIAL PARTICIPATION IN THE HEALTH AND RETIREMENT STUDY

B.T. Howrey¹, C. Hand², *1. Family Medicine, University of Texas Medical Branch at Galveston, Galveston, Texas, 2. University of Western Ontario, London, Ontario, Canada*

Continued participation in social activities is associated with positive health outcomes and higher quality of life among community dwelling older adults. Large datasets have the potential to reveal useful information regarding social participation and the factors that impact it; however, most datasets measure social participation via individual items. We use data from the Health and Retirement Study (HRS) to assess whether the five items from the psychosocial questionnaire pertaining to social participation (volunteer with youth, charity work, education, social clubs, non-religious organizations) form a reliable, cohesive scale. The psychosocial questionnaire is administered to an alternating subsample in each wave of the HRS since 2008. We included respondents 65 and older who returned the psychosocial questionnaire in 2010 and 2012 with responses to the social participation items (n=4,317 and n=3,978). In order to test whether the social participation items formed a reliable and cohesive scale, we first used the data from the 2010 wave and performed exploratory factor analysis (EFA) of the social participation items. All five items loaded onto a single factor (i.e., Eigen value >1.0) and had borderline reliability (Cronbach's alpha=0.68). We then used the 2012 sample and performed a confirmatory factor analysis (CFA) on the five items using a structural equation model. The CFA showed reasonable fit (RMSEA = 0.04, CFI = 0.99). Results suggest that a scale derived from the social participation items in the HRS may be useful in characterizing general social participation levels and identifying factors that can promote social participation in older populations.

SESSION LB610 (POSTER)

LATE BREAKER POSTER SESSION 1

ASSOCIATIONS OF CHILDHOOD SOCIOECONOMIC POSITION WITH FRAILTY TRAJECTORIES AT OLDER AGE

B.W. van der Linden^{1,6}, B. Cheval¹, S. Sieber¹, I. Guessous^{2,3,4}, M. Kliegel^{1,6}, D. Courvoisier^{1,2}, S. Cullati^{1,5}, *1. Swiss NCCR "LIVES - Overcoming Vulnerability: Life Course Perspectives", Geneva, Switzerland, 2. Unit of Population Epidemiology, Department of Community Medicine, Primary Care and Emergency Medicine, University of Geneva, Geneva, Switzerland, 3. Department*

of Epidemiology, Emory University, Atlanta, Georgia, 4. Institute of Social and Preventive Medicine, Lausanne University Hospital, Lausanne, Switzerland, 5. Department of General Internal Medicine, Rehabilitation and Geriatrics, University of Geneva, Geneva, Switzerland, 6. Center for the Interdisciplinary Study of Gerontology and Vulnerability, University of Geneva, Geneva, Switzerland

Poor socioeconomic circumstances during childhood have been shown to be associated with negative health outcomes at older age. Frailty is an important outcome associated with ageing, but research on risk factors of frailty is lacking. We aimed to assess associations of childhood socioeconomic position (CSP) with frailty trajectories at older age. Data on well-being, health, socioeconomic situation, and retrospective life course from 17,916 individuals aged 50 years and over included in the longitudinal Survey of Health, Ageing, and Retirement in Europe study was used. Frailty, including pre-frailty, was operationalized as presenting either weakness, shrinking, exhaustion, slowness, or low activity. Confounder-adjusted multilevel logistic regression models were used to analyze associations of CSP with frailty trajectories. Results showed that disadvantaged CSP was associated with higher risk of (pre)frailty and that this association was mediated by education for both men and women (OR=1.45, $p<0.01$; OR=1.43, $p<0.01$, respectively). A lower level of education was associated with a lower risk of (pre)frailty (OR=0.97, $p<0.001$, both men and women). Also lower skill main occupation class was associated with an increased risk of (pre)frailty in both men and women (OR=1.20, $p<0.01$; OR=1.28, $p<0.001$, respectively). Moreover, health behaviors and demographics seemed to increase the risk of being (pre)frail. The findings suggest that CSP is associated with frailty trajectories at older age, which can be explained by adult socioeconomic position, in particular by education. The results can help in improving frailty trajectories by stimulating educational achievement and associated consequences across the life course.

INCIDENCE OF DEMENTIA IN PREDOMINANTLY MALE U.S. VETERAN CENTENARIANS

R. Kheirbek^{1,2,3}, A. Fokar¹, M. Balish^{1,2}, M. Llorente^{1,2}, 1. Washington DC VA Medical Center, Washington, District of Columbia, 2. Georgetown University, Washington, District of Columbia, 3. George Washington University Medical Center, Washington, District of Columbia

Background: Centenarians are the fastest growing age group globally, yet little is known about US Veteran centenarians' incidence of dementia and its impact on survival.

Methods and Results: retrospective longitudinal cohort study of elderly U.S. Veterans. Subjects are community-dwelling Veterans living in rural areas, born between 1904 and 1914 who survived to at least age 80. The study included 47936 octogenarians, 27176 nonagenarians, and 1378 centenarians. Kaplan-Meier method was used to estimate the cumulative incidence of dementia within age groups. Incidence rates were compared using log-rank test.

Cox proportional-hazards model used to estimate unadjusted hazard ratios. Veteran centenarians were 92.5% male, 85.9% white, 38.3% widowed, 90.5% served in World War II and 72.1% had no service related disability. Significant

differences in dementia incidence rate were observed. By age 89 years, the estimated risk for dementia was 0.21% in the centenarian group, 3.1% in the nonagenarian group and 9.1% in the octogenarian group. Whereas by age 99 years, the risk of dementia increased to 8.3% for the centenarian group and 20.4% for the nonagenarian group. The difference in incidence rate remained between the statistically significant across age group ($P = <.0001$). The Hazard Ratio for dementia incidence among octogenarians and nonagenarians compared with centenarians is 8.9 CI 95% (7.2- 10.8) and 2.7 CI 95% (2.3- 3.3), respectively.

Conclusion: While dementia is generally under-recognized in the elderly, the study found that being a centenarian remained significantly associated with a reduced risk of dementia compared to both octogenarians and nonagenarians.

THE RELATIONSHIP BETWEEN BABY-BOOMERS' CONSUMPTION PATTERN AND DEPRESSION AMONG KOREAN RETIREES

S. Hong¹, S. Park², 1. Dongguk University in Korea, Seoul, Korea (the Republic of), 2. Shingu College, Seoul, Korea (the Republic of)

The purpose of this study is to examine the characteristics of baby boomers' consumption patterns among retirees and the effect of their consumption patterns on depression.

This study used the 5th data of Korea Retirement and Income Study (KReIS) of Korea National Pension Research Institute. Of those who were born in Korea from 1955 to 1963, total 2,034 retirees were included in this study. The Latent Profile Analysis (LPA) structured the empirical patterns of consumption and then multiple regressions analyzed the relationship between consumption patterns and depression.

In general, retirees spent more on private households and health care expenses. Overall the five consumption patterns were classified: (1) Basic life-oriented type (26.9%), (2) Balanced consumption life style (29.3%), (3) Social life-oriented type (18.3%), (4) Leisure-oriented type (18.5%), and (5) Education-oriented type (7.0%). The level of retirees' depression was associated with higher dissatisfaction with leisure activities, higher education, having no spouse, lower subjective health, higher limitations in physical functions, having any diagnosed disability, having fewer children, and more negative self-perceived economic status. Regarding their consumption patterns, the education-oriented type showed significantly lower depression than the basic life-oriented type.

These results suggest meaningful implications for better understanding of the baby-boomers' economic burden and life styles. In light of a key generation of silver industry and market, gerontological research on baby-boomers should expand its scope towards more inclusive measures of consumption in later life.

BIG DATA FOR RESEARCH ON AGING

R. Rosen, D. Hochfellner, Center for Urban Science + Progress, New York University, Brooklyn, New York

The interdisciplinary field of aging research is poised to benefit from the confluence of new data sources, new types of researchers, and new security and storage technologies.

Electronic health records can be linked with novel built environment data, in order to reduce reliance on surveys for health surveillance and to facilitate new studies on environmental determinants of wellbeing. Computer scientists, social scientists, and biomedical scientists bring complementary analytic and contextual knowledge to the field. Advances in sensor technology, cloud storage services, and cryptography can ensure that real-time data is both usable and secure. This confluence can be best leveraged by a shared research infrastructure for trusted information on effective aging research and healthcare interventions. The Center for Urban Science and Progress at New York University (CUSP) has built such an infrastructure. Users can remotely access microdata and novel data on the built environment, collaborate across fields and organizations, and responsibly disseminate urban policy research results to data providers and their stakeholders. We report here how the technical design must be directly informed by user expectations and must incorporate a training program, in order to incentivize a diverse community of active researchers and data providers. We demonstrate that it is indeed possible to balance usability with data security. We will introduce conference attendees to new urban informatics data for the aging research community. Further, conference attendees will learn how a pilot Aging Research Data Facility can operate as a secure research infrastructure for researchers, computer scientists, and practitioners to develop and disseminate evidence-based best practices in gerontology.

FRAILTY PREVENTION IN AT-RISK OLDER ADULTS IN THE PRIMARY CARE AND COMMUNITY SETTING

A. Garm, *Fraser Health, Surrey, British Columbia, Canada*

Research demonstrates it is possible to prevent and/or delay frailty. Comprehensive geriatric assessment (CGA), patient directed chronic disease management planning and health coaching have been identified as effective frailty prevention interventions for older adults. The CARES (Community Action and Resources Empowering Seniors) Project combines all three interventions in a collaborative inter-disciplinary model that introduces the CGA and FI calculation capacity into primary care physicians' electronic medical record (EMR)

Methods: Seniors aged 65 to 85 with an estimated clinical frailty score between 3 and 5 receive personalized health coaching for up to six months from Self-Management BC at no charge in weekly telephone contacts. Before and post coaching, primary care physicians conduct a CGA, which is embedded in the electronic health record and able to calculate a Frailty Index (FI). The effect of the combined intervention on frailty is evaluated by comparing the baseline and follow-up FI-CGA scores and quality of life assessments.

Results: Pilot studies CGA-FI scores of the participants were statistically significantly (0.032) decreased post intervention, which is equivalent to 2 less health problems at follow up. Meanwhile, 59% of participants reported an increase in their health attitude and 67% reported an increase in exercise frequency.

Discussion: CARES involves physicians, health coaches and patients in the prevention of frailty. The electronic CGA, FI and free health coaching provide both a measurement and management strategy to address frailty in the primary care and community setting.

Conclusion: Preliminary results suggest CARES is effective in delaying frailty. CARES empowers seniors to engage in self-management of their health in partnership with their physician. Together they are able to track and address frailty development through the use of the electronic CGA and FI results. Fraser Health in British Columbia, Canada has adopted CARES as part of a senior care strategy. More research is pending.

HEALTH AND SELF-PERCEPTION OF HEALTH—DO WELFARE REGIME AND SOCIOECONOMIC STATUS HAVE GENDER EFFECT?

A. Paz¹, I. Doron¹, A. Tur-Sinai², 1. *Gerontology, Haifa University, Tel Aviv, Israel*, 2. *The Max Stern Yezreel Valley College, Yezreel Valley, Israel*

Health is measured by subjective or self-perceived health as well as by objective parameters as the number of chronic illnesses or physical limitations. There is a well-established relationship between socioeconomic status and health indicating that individuals with lower income are likely to be less healthy than those with high income. Factors such as education, material status, social position, and work situation shown to be important determinants also in the perception of health. The study applies a cross sectional and a longitudinal study based on SHARE (Survey of Health, Ageing and Retirement in Europe) in its first, second and fifth waves. The cross-sectional model is based on data from 16 European countries, divided to 5 different types of welfare regimes, of 132,845 responders (mean age 65.8 ± 10.5) 55.8% of whom are women, to investigate the influence of welfare regime and socioeconomic status on health and self-perceived health. A second longitudinal model explores changes over time between the first, second and the fifth wave (a period of about 10 years) in health parameters and self-perceived health in correlation to changes in sociodemographic and socioeconomic factors. The study found significant gender differences in self-perceived health and that welfare regimes have an effect both on health perception and on health indicators that in some regimes (e.g. the Mediterranean countries) differ for men and women. A better understanding of the differences in socioeconomic abilities of men and women on their health is needed for framing social policies in different countries and regimes.

THE ROLE OF COMMUNITY OBLIGATION IN DEPRESSION DIAGNOSIS

S. Songco², D. Liao², S.S. Merkin², L.A. Jennings¹, 1. *Reynolds Department of Geriatrics Medicine, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*, 2. *Division of Geriatrics, David Geffen School of Medicine at UCLA, Los Angeles, California*

By 2030, depression is projected to be the foremost contributor to global disease burden. In cross-sectional studies, religious involvement and volunteerism are protective against depression. Connectedness to the welfare of a community

(community obligation) may also have long-term protective effects on depression.

Participants included 1,928 adults ages 45–76 without depressive symptoms who participated in the 1995 Midlife in the US (MIDUS)I survey and 10 years later in MIDUSII. Using logistic regression, we determined the effect of self-rated contribution to others (5-point scale), altruism, civic obligation, and volunteerism at MIDUSI on depression at MIDUSII. We also examined the effect of change in contribution to others and change in volunteerism on depression.

Excellent self-rated contribution to others (vs. good) at MIDUSI and a decrease in contribution to others from MIDUSI to MIDUSII were associated with greater odds of depression at MIDUSII (OR2.37, 95%CI 1.23, 4.57 and OR2.27, 95%CI 1.43, 3.60, respectively), after adjusting for age, gender, marital status, employment, health insurance, socioeconomic status, social contacts, and chronic conditions. Altruism, civic obligation, volunteerism, and change in volunteerism were not associated with depression. Multiple conditions, female gender, and partner loss were predictive of depression, while employment at MIDUSII and older age were protective.

Excellent self-rated contribution and a decrease in contribution to others over 10 years were associated with depression; the paradoxical relationship between excellent self-rated contribution and depression was unexpected. No other components of community obligation were predictive of depression. Additional studies examining the longitudinal relationship between community obligation and depression are warranted.

TO WHAT EXTENT CAN A PURPOSE-BUILT RETIREMENT VILLAGE BE DESCRIBED AS AN AGE-FRIENDLY COMMUNITY?

J. Proctor, *Social Sciences, Keele University, Newcastle Under Lyme, United Kingdom*

Background: In 2003, a research team from Keele University completed a three-year Lottery-funded project examining health, identity and well-being amongst residents in the then newly built Berryhill Retirement Village. More than 10 years on, this unique follow-up study explores the ways in which the village has evolved and responded to residents' changing needs over time. An overarching aim was to investigate the extent to which Berryhill may be defined and experienced as an "age-friendly community".

Method: In Phase One of the current project, 25 in-depth interviews were carried out with long-term residents (including six who took part in the original study). In Phase Two, a survey questionnaire was distributed to the whole resident population (149). The survey explored age friendliness in more depth across each of the eight domains identified by the World Health Organisation (2007) as being: Built environment, Transport, Housing, Social participation, Respect and Social inclusion, Civic Participation and employment, Communication and Information, Community support and Health services.

Results: Residents predominantly reported positive experiences in terms of opportunities to increase social participation and to be enabled to maintain independence in each phase of the research. However, the losses experienced by some residents in terms of changes in health, bereavement,

and changing roles and responsibilities created barriers to activities and wider community engagement.

Conclusion: The findings demonstrate the benefits of a longitudinal research in highlighting the different challenges staff and residents face in dealing with change across time. The relationship between loss and wellbeing in a communal environment has implications for regular reviews of policy and practice.

SLOW PROCESSING SPEED PREDICTS FALLS IN OLDER ADULTS WITH A FALLS HISTORY: 1-YEAR PROSPECTIVE COHORT

J. Davis¹, J. Best¹, K. Khan¹, L. Dian¹, S. Lord², K. Delbaere², C. Hsu¹, T. Liu-Ambrose¹, 1. *University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Falls, Balance and Injury Research Centre, Sydney, New South Wales, Australia*

Background/Objective: Recent epidemiologic data suggest that deficits in processing speed predict future injurious falls. Our primary objective was to determine a parsimonious predictive model of future falls among older adults who experienced ≥ 1 fall in the past 12 months based on the following categories: counts of 1) total, 2) indoor, 3) outdoor or 4) non-injurious falls; 5) one mild or severe injury fall (yes versus no); 6) an injurious instead of a non-injurious fall; and 7) an outdoor instead of an indoor fall.

Design: 12-month prospective cohort study.

Setting: Vancouver Falls Prevention Clinic, Canada (www.fallsclinic.ca)

Participants: 288 community-dwelling older adults aged ≥ 70 years with a history of ≥ 1 fall resulting in medical attention in the previous 12 months.

Measurements: We employed principal component analysis (PCA) to reduce the baseline predictor variables to a smaller set of 5 factors (i.e., processing speed, working memory, emotional functioning, physical functioning and body composition/fall risk profile). These 5 factors were used as predictors in regression models predicting the incidence of falls over a 12-month prospective observation period.

Results: Among older adults with a falls history, processing speed was the most consistent predictor of future falls; poorer processing speed predicted a greater number of total, indoor, outdoor, and non-injurious falls, and a greater likelihood of experiencing at least one mild or severe injurious fall (all p values $< .01$).

Conclusion: Poorer performance on the processing speed factor, a trainable factor, was independently associated with the most costly type of falls – injurious falls.

THE IMPACT OF PEER MENTORING IN RESIDENTIAL CARE ON THOSE VISITED

K. Theurer¹, B. Mortenson¹, R.I. Stone², S. Brown⁴, M. Suto¹, V. Timonen³, 1. *University of British Columbia, Vancouver, British Columbia, Canada*, 2. *LeadingAge Center for Applied Research, Washington, District of Columbia*, 3. *Trinity College Dublin, Dublin, Leinster, Ireland*, 4. *Schlegel-UW Research Institute for Aging, Waterloo, Ontario, Canada*

Depression and loneliness are biopsychosocial determinants of health, which contribute to functional decline and mortality among older adults living in residential care.

Research in other settings indicates peer support may be effective at reducing depression and loneliness and enhancing social identity. Therefore, an innovative peer mentoring intervention was developed based on the social identity theory in which volunteers and residents (mentors) form a supportive team. Mentors meet weekly, receive education and then external volunteers pair up with resident volunteers to visit socially isolated residents (visitees). This pilot study was conducted to explore visitees' experiences with the intervention and perceived outcomes. Data were collected for 74 visitees in 10 homes in Ontario, Canada. The effectiveness of the program was assessed over a 6-month period using qualitative interviews and quantitative outcome measures including standardized measures of depressive symptoms and loneliness. Attendance at other programs was also monitored. During their interviews visitees described strong emotional connections with their peers, which contributed to feelings of empowerment and an interest in becoming mentors themselves. Visitees reported reduced symptoms of depression ($p = 0.02$) and loneliness ($p = 0.02$), and a 60% increase in the number of other monthly programs attended was observed ($p = \leq 0.01$). The findings of this pilot suggest that peer mentorship may be a promising means of reducing symptoms of depression and loneliness, which are extremely prevalent in these settings. These findings will inform revisions to the program that will be evaluated in future research examining the efficacy of this intervention.

SKILLED NURSING FACILITIES ADMISSIONS AND HOSPITAL READMISSIONS IN PATIENTS WITH HIP FRACTURES

A. Karmarkar, D. Adhikari, C. Li, K.J. Ottenbacher, A. Kumar, Y. Kuo, *University of Texas Medical Branch at Galveston, Galveston, Texas*

Compare risk of 30-day and 90-day hospital readmission associated with post-acute services between skilled nursing facilities (SNF) and inpatient rehabilitation facilities (IRF), for patients with hip fractures. Secondary analysis of Medicare claims data (2012–2014), linking inpatient claims, enrollment indicators, patient-level assessment data from SNF and IRF settings, and the provider of services files. We identified index stays for patients with hip fractures using medical severity diagnosis related groups and ICD-9 codes in acute hospitals, and who were discharged to SNF or IRF. We only selected cases age 66 or older and on Medicare fee-for-service who survive 90-day follow-up ($n=60,347$). Selection bias associated with post-acute discharge destinations was handled using propensity score as the inverse probability of treatment weights in the outcomes models, along with adjusting for unbalanced patient-level covariates (socio-demographic characteristics, condition severity, acute length of stay, intensive care unit use, previous admission status, Elixhauser comorbidity index, and Hierarchical Condition Category composite score), and hospital-level covariates (profit status, size, urban/rural, presence of IRF as a unit). Risk for 30-day readmission was significantly lower for those discharged to IRF 0.93 (95% CI=0.87–0.99) as compared with SNF. The likelihood of 90-day readmission was also significantly lower for IRF discharges 0.91 (95% CI=0.87–0.96) compared with SNF. The risk of 30-day and 90-day hospital readmission was significantly higher for

those discharged to SNF. With the proposed episode-based payment model for hip and femur fractures, it is important to determine and compare quality of post-acute services, for selection of effective and efficient discharge setting.

EFFECT OF DAY SERVICE USAGE FREQUENCY ON THE CONTINUATION DURATION OF HOME LIVING

Y. Miyahara¹, M. Niikura², Y. Shimoda³, Y. Kitayama⁴, K. Teranishi⁴, Y. Naruse⁵, 1. *Course of Nursing, Graduate School of Medicine and Pharmaceutical Sciences for Education, University of Toyama, Toyama, Japan*, 2. *Department of Nursing, Graduate School of Medicine and Pharmaceutical Sciences for Research, University of Toyama, Toyama, Japan*, 3. *Department of Nursing, Kinjo University, Hakusan, Japan*, 4. *Faculty of Nursing, Toyama College of Welfare Science, Imizu, Japan*, 5. *Faculty of Social Work, Toyama College of Welfare Science, Imizu, Japan*

Purpose: The purpose of this study was to clarify the relationship between day service usage frequency and the subsequent continuation duration of home living based on long-term care insurance certification information on elderly people who had received their start care need certification.

Methods: The subjects were 4,674 elderly people (1,646 men, 3,028 women) aged 65 years or older in X Region of Japan who had received an initial certification in the long-term care insurance system between 2000 and 2013. The continuation duration of home living was calculated as the number of months from the effective first date of certification in the examination taken at home until the home living end date or the observation end date. The relationship between day service usage frequency and continuation duration of home living was analyzed using the Cox proportional hazards model.

Results: Hazard ratios that showed a significant trend for continuation of home living in users of outpatient services compared with the non-use group were 1.33 (95% Confidence interval[CI]:1.14–1.54) in the twice weekly group aged 75–84 years and 1.17 (95% CI:0.99–1.39) in the twice weekly group aged 85–94 years.

Conclusion: The results suggest that use of day services up to two times a week is a factor in the continuation of home living. That trend was seen to be relatively higher with age, and was not seen in people who used these services three times a week or more.

FORESHADOWING ALZHEIMER'S: VARIABILITY AND COUPLING OF OLFACTION AND COGNITION

J. Knight, A.M. Piccinin, *University of Victoria, Victoria, British Columbia, Canada*

The earliest stage of Alzheimer's disease (AD) pathology begins in one of the main components of the olfactory pathway, the entorhinal cortex, making deficits in smell a potential prospective biomarker for the early detection of AD. A bivariate longitudinal coupling model was used to determine whether assessment-to-assessment variation in olfaction mirrors variation in cognition over time. The model included terms for age, sex, education, ApoE e4 allele, and autopsy diagnosed AD pathology.

Using a sub-sample of 573 individuals: the between-person variation in odour identification had a robust positive

association to episodic memory ($b = 0.129$, $SE = 0.0135$, $P < 001$; conditional R -squared = 0.86). Higher AD pathology was related to both lower episodic memory at baseline ($b = -0.236$, $SE = 0.0685$, $P < 001$), and faster declines in episodic memory ($b = -0.059$, $SE = 0.017$, $P < 001$). Additionally, more rapid declines in olfactory identification were robustly associated with more rapid declines in episodic memory scores ($b = 0.011$, $SE = 0.0039$, $P < 0.001$). The within-person coupling between olfaction and episodic memory was robust and positive ($b = 0.07$, $SE = 0.016$, $P < 001$), indicating that odour identification and episodic memory scores fluctuated together over time.

This research indicates that at a given occasion, individuals with higher olfactory scores also have higher episodic memory scores. This coupled relationship indicates that olfactory testing can be a useful tool for assessing cognitive decline and possibly an inexpensive screener for pathological brain changes.

INCIDENCE OF HEART FAILURE IN PREDOMINANTLY MALE U.S VETERAN CENTENARIANS

R. Kheirbek^{1,2,4}, A. Fokar^{1,4}, M. Llorente^{1,4}, R. Fletcher^{1,4}, H. Moore^{1,3,4}, 1. *Washington DC VA Medical Center, Washington, District of Columbia*, 2. *George Washington School of Medicine and Health Sciences, Washington, District of Columbia*, 3. *Uniformed Services University, Bethesda, MD, Washington, District of Columbia*, 4. *Georgetown University Medical School, Washington, District of Columbia*

Background: Male centenarians are generally under-represented in centenarian studies. The United States Veteran cohort has the largest known male centenarians of any nation. Here we study Veteran centenarians' incidence of Heart Failure and its impact on survival.

Methods and Results: retrospective longitudinal cohort study of elderly U.S. Veterans. Subjects are community-dwelling, born between 1910 and 1915, who survived to at least age 80. The study included 31,109 octogenarians, 52,419 nonagenarians, and 3,351 centenarians. Kaplan-Meier method was used to estimate the cumulative incidence of heart failure within age groups. Incidence rates were compared using log-rank test. Cox proportional-hazards model was used to estimate unadjusted hazard ratios. Veteran centenarians were 97.0% male, 88.0% white, and 31.8% widowed. 87.5% served in World War II, 63.9% had no service related disability. Significant differences in HF incidence rates were observed. By age 89, incidence of HF for octogenarians was 19.3%, v. 3.3% for nonagenarians and 0.4% for centenarians. By age 99 incidence of HF for nonagenarians increased to 15.8% and 3.3% for centenarians. Differences in incidence rate remained significant across age groups ($P = <.0001$). The Hazard Ratio for heart failure incidence among octogenarians and nonagenarians compared with centenarians is HR 36.54 CI 95% (29.90- 44.66) and 5.37 CI 95% (4.42- 6.52), respectively.

Conclusion: In a large cohort of predominantly male U.S. Veterans, compared with octogenarians and nonagenarians, centenarians had the lowest incidence of heart failure after age 80, demonstrating compression of morbidity and extension of health-span in this unique group of survivors.

USING TRANSCRANIAL DIRECT CURRENT STIMULATION TO REDUCE CHRONIC PAIN IN ELDERLY INDIVIDUALS

M. Harvey^{2,1}, M. Martel^{2,1}, F. Houde^{2,1}, I. Dagnet³, M. Séguin^{1,4}, G. Leonard^{2,1}, 1. *University of Sherbrooke - Faculté de Médecine et des Sciences de la Santé, Sherbrooke, Quebec, Canada*, 2. *Research Centre on Aging, Sherbrooke, Quebec, Canada*, 3. *Université Claude Bernard Lyon 1, Lyon, France*, 4. *Sherbrooke University Hospital Centre - Department of Neurosurgery, Sherbrooke, Quebec, Canada*

The prevalence of chronic pain drastically increases with age. The objective of this study was to determine if transcranial direct current stimulation (tDCS) could be a valid treatment option to relieve chronic musculoskeletal pain in elderly individuals. Twenty-four chronic pain patients were randomized to receive either anodal tDCS over the contralateral motor cortex (2 mA, 20 minutes; $n = 12$) or sham tDCS ($n = 12$) for 5 consecutive days. Pain logbooks were used to measure pain intensity on the days before, during and after treatment sessions, and the Margolis pain drawing and scoring system was used to assess the number of painful areas. Analysis of the pain logbooks revealed that real tDCS led to a reduction in pain ($p \leq 0.04$), while sham tDCS did not produce any change. Patients from the real tDCS group also reported a decrease in the number of painful areas, while the patients in the sham tDCS group reported no change. Every patient who received real tDCS reported an alleviation of pain. These results suggest that anodal tDCS applied over the motor cortex can decrease pain, and that this effect persists for several days following treatment. To our knowledge, this study is the first to investigate the analgesic effect of tDCS with a randomized, controlled trial in elderly individuals. The results can support the use of this technique in chronic pain patients aged 60 years and older. Future studies are necessary to determine whether these results can be replicated using a larger population.

THE MOLECULAR BIOLOGIC STUDY ABOUT THE CIRCADIAN RHYTHMIC CONTROL OF MICTURITION FUNCTION

K. Chung^{1,2}, S. Cho³, K. Kim^{1,2}, 1. *Gachon University, Incheon, Korea (the Republic of)*, 2. *Gil hospital, Incheon, Korea (the Republic of)*, 3. *Kyung Hee University, Seoul, Korea (the Republic of)*

Circadian rhythmic(CR) disruption shows adverse effects like fatigue, nocturia, sleep-disturbance, and mood disorder which are common in elderly. We investigate the relationship between CR and water metabolism(WM) and expression of circadian-clock-gene(CCG) in peripheral bladder and central-micturition-centers(CMC).

In 8-week-old male(C57BL/6J male; WT) and CCG knock-out mouse(per1-/-per2-/-; PDK), metabolic cage was used to know WM according to CR in 12:12 LD-photoperiodic(LD cycle) and constant-dark(DD cycle). To know CCG expression, activation of Per2 promotor was checked after harvesting the bladder of adult/neonate mouse. We checked the expression of CCG; Bmal1, Rev-erba by extraction of RNA after reverse transcription and the check the rhythmic expression of CCG in micturition related tissues (detrusor, sphincter and uroepithelium, MRT) in WT and PDK to know the existence of peripheral clock in bladder. To know CCG

expression in CMC, real-time-RT-PCR was used in every 3 hours for 24-hour in DD cycle in WT and PDK.

WM was increased in DD cycle of WT, however, this was disappeared in PDK. CR is not related with environment but related with endogenous CR. We observe the activation of Per2 promotor CR, and characteristic circadian expression pattern of CCG in MRT of WT, but not observed in PDK, which means bladder peripheral clock is well functioned. In spinal level, unlike PDK, CCG expression rhythm was observed in WT. But there was no rhythmicity in upper CMC.

Endogenous CR in WM exist. Bladder peripheral CCG exists in MRT. But in terms of CMC, we can find CCG expression only in lower CMC.

GLYCAEMIA BUT NOT THE METABOLIC SYNDROME IS ASSOCIATED WITH COGNITIVE DECLINE IN AGEING MEN

J. Tournoy¹, M. Overman¹, N. Pendleton², T. O'Neill^{2,3}, F. Wu², D. Vanderschueren¹, EMAS Study Group^{1,2}, 1. *University of Leuven, Leuven, Belgium*, 2. *University of Manchester, Manchester, United Kingdom*, 3. *Manchester Academic Health Science Centre, Manchester, United Kingdom*

Objectives: Previous research has indicated that components of the metabolic syndrome (MetS), such as hyperglycaemia and hypertension, are negatively associated with cognition. However, evidence that MetS itself is related to cognitive performance has been inconsistent. In this longitudinal study, we aimed to investigate whether MetS or its components affect cognitive decline in ageing men and whether any interaction with inflammation existed.

Design: Longitudinal study over a mean of 4.4 (SD ± 0.3) years.

Setting: Multi-centre European male Ageing Study (EMAS).

Participants: Men aged 40–79 years.

Measurements: Cognitive functioning was assessed using the Rey-Osterrieth Complex Figure (ROCF), the Camden Topographical Recognition Memory (CTRM) task, and the Digit Symbol Substitution Test (DSST). High-sensitivity C-reactive protein (hs-CRP) levels were measured using a chemiluminescent immunometric assay.

Results: Overall, 1,913 participants contributed data to the ROCF analyses and 1,965 subjects contributed to the CTRM and DSST analyses. In multiple regression models, the presence of baseline MetS was not associated with cognitive decline over time ($p > 0.05$). However, logistic ordinal regressions indicated that high glucose levels were related to a greater risk of decline on the ROCF Copy ($\beta = -0.42$, $p < 0.05$) and the DSST ($\beta = -0.39$, $p < 0.001$). There was neither a main effect of hs-CRP levels nor an interaction effect of hs-CRP and MetS at baseline on cognitive decline.

Conclusions: We found no evidence for a relationship between MetS or inflammation and cognitive decline in this sample of ageing men. However, glycaemia was negatively associated with visuo-constructional abilities and processing speed.

A SYSTEMATIC REVIEW OF CHANGE POINT STUDIES ON COGNITIVE AND NEUROLOGIC OUTCOMES PRECEDING DEMENTIA

R. Graham¹, J.E. Karr¹, G. Muniz², S.M. Hofer¹, 1. *University of Victoria, Victoria, British Columbia, Canada*, 2. *University of Edinburgh, Edinburgh, United Kingdom*

Older adults who ultimately develop dementia experience accelerated cognitive decline long before diagnosis. The current systematic review aimed to summarize the literature on preclinical change points (CPs) in relation to mild cognitive impairment (MCI) and dementia, identifying the order in which cognitive and neurological outcomes decline and factors that modify the onset of decline. Eligible studies included preclinical MCI/dementia CP models for cognitive/neurological outcomes from longitudinal cohorts free of early-onset dementia or concurrent neurological disorders associated with cognitive decline. The search protocol yielded 16 eligible studies describing 9 cohorts (1 pre-MCI, 8 pre-dementia). Only the MCI cohort involved neuroimaging and motor outcomes, identifying CPs for increased ventricular cerebrospinal fluid volume (CP=3.66 years before onset [95% CI: 0.75–5.58]) and white matter (WM) hyperintensities (10.58 years [5.15–Unknown]). Gait resulted in the earliest CP at 12.10 years (8.10–Unknown), while finger tapping declined after diagnosis. Across domains, cognitive abilities declined roughly 3–4 years prior to MCI. The earliest observed CP for dementia was perceptual speed (10.90 years [7.50–14.40]). Verbal memory was most commonly measured, with CPs ranging from 1.00–8.60 years pre-diagnosis. The latest cognitive ability to decline was reading ability (0.40 years [-0.10–0.11]). Greater education, female gender, and involvement in cognitively-stimulating activities significantly delayed CP onset. CPs preceding Alzheimer's disease occurred earlier than CPs preceding vascular dementia. The findings from this systematic review suggest that neurological and cognitive changes occur long before MCI/dementia diagnoses. Lifestyle, dementia type, and gender influence the onset of decline, but few studies evaluated CP moderators.

STATE QUALITY OF CARE LAWS AND NURSING HOME OUTCOMES IN THE UNITED STATES

W. Lin, *University of Illinois at Chicago, Chicago, Illinois*

Introduction: Low quality of care in nursing homes has presented long-standing policy challenges for consumers, researchers and policy-makers. However, the impact of regulation on quality has only recently been addressed and current studies focus on enforcement stringency. Although all nursing homes are subject to federal standards, some states have adopted additional regulations in different areas of care. Using this natural experiment, this study is the first to analyze the contents of quality of care state regulations, compare them to federal regulations, tease apart specific components and link them to a corresponding quality outcome.

Methods: State laws for all 50 states and D.C. were compiled using primary legal research methods and secondary sources. Next, quality of care laws were analyzed and linked quantitatively to quality indicators developed and publicly reported by CMS.

Results: Using data from 2011 and coding laws as dichotomous variables, adjusted regression results on outcome variables showed that compared to states that were only subject to federal standards, states that went above federal regulations had better outcomes such as less high-risk residents with pressure ulcers, less residents who self-report moderate

to severe pain and less residents experiencing one or more falls with major injury.

Discussion: There is some evidence to support that more stringent state regulations have a positive relationship with quality of care in nursing homes. This study is well positioned to inform policy-makers on existing regulations and whether and how regulation is associated with better quality in the nursing home setting.

ORGANIZATIONAL FACTORS OF RESIDENT WEIGHT LOSS IN GERMAN NURSING HOMES

J. Zimmermann¹, H. Pfaff^{1,2}, 1. Graduate School GROW, University of Cologne, Cologne, Germany, 2. Institute for Medical Sociology, Health Services Research, and Rehabilitation Science (IMVR) at the Faculty of Human Sciences and the Faculty of Medicine of the University of Cologne, Cologne, Germany

Background: Nursing care in Germany is faced with a radical change in quality report standards. Until now nursing home quality has been measured mostly on the basis of structural and care process criteria. By the year 2018, new quality indicators will be implemented by law that include measures of resident outcomes. The results of this doctoral project should contribute to scientific discourse on quality reporting standards for German nursing homes. Theoretical Orientation: Using Donabedian's structure-process-outcome framework (1988), we assumed that structural indicators of quality are associated with outcome indicators. Methods: The data for this study came from the internal quality management of the Caritas Association and form the "EQisA"-project, within which the indicators of nursing home outcomes were developed and validated. The sample consisted of 221 German nursing homes which included data of over 22 thousand residents. For the investigation of relationship between organizational characteristics and weight loss a logistic regression analysis was used. Findings: The analysis showed that resident-to-staff ratios and mortality rate were associated with weight loss of residents with low cognitive impairment. Conclusion: The findings indicated that resident weight loss is more probably to occur in facilities with lower staffing levels of registered nurses and additional care staff and in facilities with higher mortality rates. However, there are only a few studies in Germany that examine this kind of relationships. More research using a broader national sample of nursing facilities would be needed in this field.

SUPERVISORY LEADERS IN AGING: PRACTICE CHANGE TO STRENGTHEN SOCIAL SERVICE DELIVERY TO OLDER ADULTS

D. Kaplan^{1,2}, B.M. Silverstone², 1. Adelphi University, Garden City, New York, 2. Hartford/NASW Supervisory Leaders in Aging Program, Washington, District of Columbia

Social services for older adults are instrumental in addressing vulnerabilities associated with aging. Yet, practitioners report needing expanded geriatric knowledge and better supervision. This poster reports outcomes of the first full year of implementation of a social work supervisor continuing education program. The program provides advanced training that enhances gerontological knowledge as well as supervisory skills in teaching and leadership. Positive

outcomes from three pilot programs led to a 2015 expansion, funded by the John A. Hartford Foundation under the auspices of the National Association of Social Workers. Now called Supervisory Leaders in Aging, the program is being adopted and tested in four states (IL, FL, MD, and NY), with plans for subsequent national implementation. NASW anticipates training nearly 160 MSW supervisors between 2015 and 2017. These supervisors will, in turn, provide support to more than 1,200 direct practitioners, potentially enhancing the health and well-being of more than 100,000 older clients annually. Trainees self-rated frequency of supervisory practices during the prior month, related to workshop content, were measured with the Practice Inventory for Supervisors in Aging Services. This novel measure was administered prior to the first session and three months after the final session. Statistically significant findings demonstrate that 18 previously used best practices were maintained by participants and 12 underutilized best practices were adopted as a result of education received during workshops, with variability across training sites. The program is shown to enhance supervisory practice overall. Implications of this tested model for enhancing workforce capacity will be discussed.

PREVALENCE AND CORRELATES OF FRAILITY IN CHINESE OLDER ADULTS: CHINA HEALTH AND RETIREMENT STUDY

C. Wu¹, E. Smit¹, Q. Xue², M. Odden¹, 1. Oregon State University, Corvallis, Oregon, 2. Johns Hopkins University, Baltimore, Maryland

Frailty is an age-related medical syndrome of decreased resilience to stressors and is associated with numerous adverse outcomes. Although there is preponderance of literature on frailty in developed countries, limited investigations have been conducted in developing countries including China, which has the world's largest aging population. We examined the prevalence of frailty in China by socio-demographics and geographic region, and investigated health and functional correlates of frailty. Data are from the 2011 baseline survey of the China Health and Retirement Longitudinal Study on 5,301 adults aged ≥ 60 years (mean=67.9, SD=6.9). Frailty was assessed using 5 criteria: weakness, slowness, exhaustion, inactivity, and shrinking. We classified individuals with 0, 1-2, and 3-5 criteria as "robust," "prefrail," and "frail," respectively. The prevalence of frail and prefrail were 7.0% and 51.2%, respectively. Higher frailty prevalence was observed in persons who were older, women, and had lower education level. Frailty prevalence ranged from 3.3% in the Southeast to 9.1% in the Northwest, and was >1.5 times higher in rural vs. urban areas. Frail vs. nonfrail individuals had higher prevalence of chronic conditions including cardiovascular disease, lung disease, kidney disease, stomach disease, and arthritis. Frail persons also had higher prevalence of falls, depression, disability, and functional limitation. In summary, the frailty prevalence among Chinese elders was similar to that in Western populations and we found substantial socio-demographic and regional disparities in frailty prevalence. This standardized frailty assessment may be incorporated into geriatric practice in China to identify the most vulnerable elders to reduce morbidity and disability.

THE CONNECTION BETWEEN SOCIAL SUPPORT AND COGNITIVE FUNCTION AMONG ELDERS IN RURAL EAST CHINA

J. Liang, J. Xue, X. Tao, W. Weng, B. Cui, J. Wang, Y. Jiang, S. Chen, *Zhejiang University, Hangzhou, Zhejiang, China*

This study aims to investigate the cognitive function of elders who live in rural areas of East China and studied the relationship between different subtypes of social support and cognitive function.

Two hundred and twenty-two elders aged 60 years or more were randomly selected from 9 villages of Jiande County. The assessment package included: General Characteristics Questionnaire, PHQ-9 (9-item Patient Health Questionnaire), DSSI (Duke Social Support Index), and MMSE (Mini-mental State Examination). The analysis methods included descriptive statistics and logistic regression.

The final sample included 218 participants, and 57 of them may have potential cognitive problems. Results showed that the education level, residential arrangement, and daily activities frequency may have positive relationships with cognitive function ($p \leq 0.05$). Age, the depressive symptoms presence, and overall scores of social support were negatively associated with cognitive function ($p \leq 0.05$). In the logistic regression, the best fit model indicated that elders reported more perceived social support were more likely to maintain good cognitive function.

This study found the social support's positive effect on buffering the decline of cognitive function in elders of rural East China, especially perceived social support. The positive connection between perceived social support and cognitive function indicates the importance of social support intervention approach in rural China. Further study will explore the protective effect of perceived social support in other areas, such as Midwest China, and the methods to prevent the abnormal cognitive decline in the regards of psychosocial factors for promoting healthy aging in rural China.

NEW IMPLICATIONS FOR DIABETES EDUCATION: PHYSICAL ACTIVITY BARRIERS AMONG DIABETIC OLDER ADULTS

S. Chard¹, L. Girling¹, E. Roth¹, B. Harris-Wallace¹, L. Henderson¹, C.C. Quinn², J.K. Eckert¹, 1. *UMBC, Baltimore, Maryland*, 2. *School of Medicine, University of Maryland, Baltimore, Baltimore, Maryland*

An estimated 33% of U.S. adults ≥ 65 have type 2 diabetes (T2D). Physical activity is a key component of successful T2D self-management. Yet, only 25% of older adults with T2D meet American Diabetes Association physical activity guidelines. Newly available findings from a NIA-funded ethnographic study of T2D among African-American and non-Hispanic Whites ($n=83$) provide insights into participants' questions and concerns that impede their physical activity. Systematic, thematic analyses using Atlas.ti, reveal first, considerable confusion regarding the appropriateness of physical activity in the context of changing comorbidities. Second, concerns regarding insulin levels and fears about exercising alone undermine the perceived safety of physical activity. Finally, participants struggle to find specific types of physical activity that match their fitness level, lifestyle preferences, and economic constraints. Faced with these barriers, participants report not being physically active, even as they

acknowledge the importance of physical activity for their T2D control. These findings are of immediate relevance to diabetes education. Personalized, ongoing diabetes education that is tailored to address physical activity in the context of T2D and participants' comorbidities is critically needed. Furthermore, detailed information on the range of community physical activity opportunities, their accessibility, and safety for participants may play a critical role in increasing levels of physical activity among the diverse older adults with T2D.

ERRORLESS TRAINING CHANGES VISUOMOTOR CONTROL IN REACHING UNDER VISUAL DEFICIENCY AMONG OLD ADULTS

M. Fan, T. Wong, *School of Public Health, Li Ka Shing Faculty of Medicine, The University of Hong Kong, Hong Kong, China*

Aging problems influence older adults on motor learning and control, such as coordination difficulties. Errorless training, aiming to prevent the accumulation of explicit knowledge in movement execution, is regarded as a potential training method to obtain motor benefit through visuomotor adaptation. Twenty-two right-handed healthy older adults (Mean age = 70.07 years, SD = 2.37) with normal or corrected-to-normal vision participated in the study and were trained to do a reaching task in the scenarios of changing the target size that minimized or promoted movement errors (i.e., errorless or errorful groups, respectively). The simulated vision deficiency was conducted by blocking parts of visual feedback of the hand controlled mouse cursor. Gaze behaviors and motor performance data was recorded by the EyeLink (SR Research, Canada). Both errorless and errorful training groups improved participants' motor performance in reaching under simulated vision deficiency. However, only errorless training but not errorful training could decrease reaching movement time with improvement in reaching accuracy. Additionally, different training methods affected gaze behaviors differently. Errorless training group demonstrated a significant decrease in first fixation duration on the target ($p < .001$) while errorful and normal training groups increased the duration. Participants in the errorless training group conducted more tracking actions to enter or leave the target area ($p = .011$), implying that perceptive dependence might be transformed from vision to proprioception. Errorless training affects gaze behaviors and motor performance positively during simple reaching task in older adults and might change the visuomotor control in reaching under the limited visual information situation by inducing a decrease in the dependence on vision with compensation by the proprioception.

SPIRITUALITY AND INTRINSIC RELIGIOSITY: MODERATORS OF WISDOM AND PSYCHOLOGICAL WELL-BEING RELATION

N. Borhan, O. Bozo, *Psychology, Middle East Technical University, Ankara, Turkey*

General opinion suggests that wisdom, intrinsic religiosity, and spirituality are linked to favorable outcomes. Research done so far about this topic verify this belief. Yet, to the best of our knowledge, there is not any study investigating the potential effects of intrinsic religiosity and spiritual well-being on

the relation between wisdom and psychological well-being (PWB) among elderly. Hence, the present study proposes and tests this moderation model. Three-Dimensional Wisdom Scale (3D-WS), Religious Orientation Scale (ROS), Spiritual Well-being Subscale of Mental, Physical, Spiritual Well-being Scale (MPSW), and Psychological Well-being Scale (PWS) were administered to 165 Turkish elderly people whose age ranged from 65 to 88. Wisdom and spiritual well-being had significant positive correlations with each other and they seem to contribute to PWB. In addition, a significant moderating effect of spirituality on wisdom-PWB association was found. Yet, intrinsic religiosity was unrelated to wisdom and PWB, and it did not have a moderating role in this relation. Findings regarding spirituality and wisdom are consistent with the literature while findings about intrinsic religiosity are contrary to expectations. This study emphasizes that wisdom and spiritual well-being should be taken into consideration when dealing with elderly in mental health or health settings.

A PROFILE OF AFRICAN AMERICAN CAREGIVERS FOR FAMILY MEMBERS WITH MEMORY PROBLEMS IN THE DEEP SOUTH

O.J. Clay, D. Ejem, M.M. Waters, *The University of Alabama at Birmingham, Birmingham, Alabama*

Interventions formulated to help caregivers have generally not included enough African Americans (AAs) to determine if they are effective within this population. The current investigation provides information on AA caregiving issues and needs. Participants were recruited from the Birmingham, AL metro area and received a \$25 gift card for completing a telephone interview. Caregivers provided information on demographics, social support, problems encountered as caregivers, and interest in services if they were made available. Of the 29 caregivers enrolled, 21 were female (72%) and 8 male (28%). The average age of caregivers was 53.76 years (range = 22 – 77) and they reported caring for individuals with average scores on the AD8 Dementia Screening Scale of 7.3 out of 8 and 10.8 out of 18 on the Clinical Dementia Scale Sum of Boxes (above the cutoffs for probable dementia). Caregivers reported between 1 and 20 members in their social support networks and 14 (48%) caregivers were employed. Caregivers reported problems dealing with the family member not remembering who they were, taking care of the family member's financial affairs, and other comorbid conditions such as high blood pressure and diabetes. Additionally, 23 caregivers (79%) reported being interested in at least 1 of the services listed. These data will be utilized to provide initial evidence of if the New York University Caregiver Intervention, an efficacious counseling and support intervention, can be pilot tested as constructed to address issues of AA caregivers in the Deep South or if cultural modifications need to be made.

OBJECTIVE PHYSICAL ACTIVITY, SEDENTARY TIME, AND INCIDENT DISABILITY IN OLDER ADULTS

T. Chen¹, Y. Haeuchi¹, T. Honda^{1,2}, S. Chen^{1,4}, K. Narazaki³, S. Nagayoshi¹, S. Kuamagai¹, 1. *Kyushu University, Kasuga, Japan*, 2. *Research Fellow of the Japan Society for the Promotion of Science, Tokyo, Japan*, 3. *Fukuoka Institute*

of Technology, Fukuoka, Japan, 4. *Central South University, Changsha, China*

Substantial evidence shows that higher levels of moderate-to-vigorous physical activity (MVPA) are associated with lower risk of disability, and an emerging body of literature suggests a higher level of sedentary time (ST) is related to a higher risk of disability. However, most studies assessed MVPA and ST using questionnaires. This prospective study investigated the associations of accelerometer-assessed PA and ST with risk of disability among 1,603 participants from the prospective population-based Sasaguri Genkimon Study, who were aged ≥ 65 years and without disability at baseline in 2011. MVPA and ST were assessed by a tri-axial accelerometer in 2011. During follow-up, incidence of disability was defined as first certification for personal support or care by the national long-term care insurance system of Japan. Cox proportional hazards models were used to estimate adjusted hazard ratios (HR) and 95% confidence intervals (CI) for the onset of disability. Over a median follow-up of 3.8 years, incident disability was identified in 149 participants (9.2%). After adjusting for sex, age, education, living status, cognitive impairment, multi-morbidity, smoking and drinking status, higher level of MVPA was associated with lower risk of disability. After additional adjustment for ST, those in the two higher tertiles of MVPA showed lower risk of disability compared to the lowest tertile group, with adjusted HR (95% CI) of 0.51 (0.32–0.81) and 0.52 (0.30–0.91), respectively. No association was observed for ST. These data demonstrated clear benefits of MVPA for prevention of disability.

THE DIFFERENTIAL IMPACT OF SOCIAL PARTICIPATION AND SOCIAL SUPPORT ON PSYCHOLOGICAL WELL-BEING

N. Sharifian, D. Gruhn, *North Carolina State University, Raleigh, North Carolina*

Being socially involved is theorized to diminish age-related declines in cognitive and emotional functioning. However, different facets of being socially involved may differentially impact functioning in older adulthood. In the present study, we aimed to expand on it by investigating the impact of two distinct aspects of social engagement - social support and social participation - to assess their impact on change in psychological well-being in two samples from the three-wave Wisconsin Longitudinal Study spanning 19 years (1992–2011): the original high school graduate respondents and their siblings. The goal of the present study was to examine (a) age-related trajectory of psychological well-being (PWB) and (b) whether interindividual differences in social participation and social support influenced intraindividual change in psychological well-being. Using latent growth curve models, we found general declines in psychological well-being from middle to old adulthood. Social participation predicted the slope of psychological well-being, that is, individuals high in social participation demonstrated a less steep decline in psychological well-being across the three time points than individuals low in social participation. Social support, however, did not demonstrate a buffer effect on declines in psychological well-being. Developmental implications of the age-related trajectory of psychological well-being and the relationship with social participation are discussed.

THE HEALTHY AGING INSTRUMENT (HAI): DEVELOPMENT AND PSYCHOMETRIC EVALUATION

L. Thiamwong¹, W. Maneesriwongul², P. Malathum², S. Jitapunkul³, T. Vorapongsathorn², A.L. Stewart⁴, 1. *College of Nursing, University of Central Florida, Orlando, Florida*, 2. *Mahidol University, Bangkok, Thailand*, 3. *Chulalongkorn University, Bangkok, Thailand*, 4. *UCSF, San Francisco, California*

The purpose of this study was to develop, refine, and evaluate the psychometric properties of the Healthy Aging Instrument (HAI). The HAI is a multidimensional instrument that attempts to measure the process of healthy aging in a Thai context. Themes emerged from focus groups and in-depth interviews, which were used to develop an item pool. The HAI was reviewed for content format by five experts and for clarity and readability by 10 older adults. The content validity index among the experts was high. After the pretest, the HAI consisted of 46 items. To test construct validity and internal consistency, the HAI was completed by 403 older adults in Southern Thailand. Evaluation of construct validity through principal component factor analysis with varimax rotation and using factor loading greater than 0.40 yielded nine factors: 1) Being Self-Sufficient and Living Simply, 2) Managing Stress, 3) Having Social Relationships and Support, 4) Making Merit and Good Deeds, 5) Practicing Self-Care and Self-Awareness, 6) Staying Physically Active, 7) Staying Cognitively Active, 8) Having Social Participation, and 9) Accepting Aging, which explained 62% of the variance in the process of healthy aging. Cronbach's alpha for each of the subscales ranged from 0.69 to 0.80 with an overall alpha of 0.88. The HAI demonstrated adequate internal consistency reliability and showed evidence of content and construct validity. It requires less than 15 minutes on average to administer and had no item-level missing data rates.

GENDERED INTERGENERATIONAL SUPPORT AND FUNCTIONAL LIMITATIONS OVER TIME AMONG RURAL OLDER CHINESE

W. Mao¹, I. Chi², 1. *School of Social Work, University of Nevada, Reno, Reno, Nevada*, 2. *University of Southern California, Los Angeles, California*

Objectives: There is much unknown regarding how familial and cultural factors contribute to the relationship between social support and physical functioning over time in later life. This study examined the dynamic relationship between intergenerational support and functional limitations over time among rural-dwelling older Chinese adults, as informed by the gendered filial norms and expectations within the Chinese context.

Methods: Data came from a regional representative longitudinal study The Well-Being of Older People in Anhui Province in 2001, 2003, 2006, and 2009. There were 1,322 respondents aged 60 or older having at least one son and at least one daughter at baseline, 1,080 respondents in 2003, 834 respondents in 2006, and 631 respondents in 2009. Functional limitations were measured as the sum of 11 items reflecting difficulty in performing personal and instrumental activities of daily living on a 3-point scale. Gendered intergenerational support was measured by instrumental support and emotional support from caregivers including sons, daughters, daughters-in-law, and sons-in-law. Cross-lagged

panel analysis with maximum likelihood estimation was conducted.

Results: Good model fit was demonstrated ($\chi^2(457) = 1390.088$, $p < .001$; CFI = .900; RMSEA = .039; SRMR = .063). Receiving more instrumental support from sons was significantly correlated with more functional limitations at a later time, whereas receiving more instrumental support from daughters-in-law was significantly correlated with fewer functional limitations at a later time.

Conclusion: Caregiver support programs and policies should take into consideration of the gendered nature of intergenerational support and its relationship with physical functioning in later life.

LONGITUDINAL EFFECTS OF AN INTERGENERATIONAL MOBILE TECHNOLOGY PROGRAM ON OLDER DIABETES PATIENTS

K. Yu, S. Wu, I. Chi, H. Hsiao, P. Lee, *University of Southern California, Los Angeles, California*

Mobile technology and tablet computing devices are gaining its popularity among older adults but the potential to improve their health is underutilized. Given the overwhelming prevalence of chronic disease in this population, Intergenerational Mobile Technology Opportunities Program (IMTOP) tested using the technology for older adult diabetes self-care. In a wait-listed comparison trial, 237 adults aged 55 and above with Type 2 diabetes participated in eight weekly intervention sessions at a general hospital in Taiwan. The intervention incorporated Chronic Disease Self-Management Program (CDSMP) to empower participants with diabetes self-management knowledge and skills. Each participant was given a tablet installed with the IMTOP App that was designed to encourage diabetes patients to regularly record their blood glucose, blood pressure, and self-care activities. College students (N=111) were recruited as volunteers to support seniors learning technology. Patients were linked via a communication app to form a social support network. All participants completed the baseline assessment, 233 and 226 completed 4-month and 8-month follow-up, respectively. The longitudinal effects were evaluated using linear mixed-effects models including contrasts compared mean estimates at each follow-up to the baseline. The results indicate a stable over-time improvement in overall diabetes self-care ($p < .0001$). Specifically, patients reported more blood-glucose testing, foot-care, and risk reduction (all with $p < .0001$), specific diet ($p = .04$), and reduced the frequency of smoking ($p = .03$). Both the WHOQOL physical health ($p = .03$) and self-rated general health ($p = .001$) were enhanced. Moreover, financial barriers to healthcare ($p < .0001$) and depression ($p = .001$) decreased over follow-ups. The findings support the effectiveness of IMTOP intervention over time.

RELATIONSHIP BETWEEN HAND GRIP STRENGTH AND FUNCTIONAL class IN ELDERLY PATIENTS WITH HEART FAILURE

M. Cadena-Sanabria^{1,2,3}, C. Velandia-Carrillo^{1,3}, 1. *Santander, Universidad Autonoma de Bucaramanga, Floridablanca, Santander, Colombia*, 2. *Universidad Industrial de Santander, Bucaramanga, Santander, Colombia*, 3. *Clinica FOSCAL, Bucaramanga, Santander, Colombia*

Methods: We performed a cross-sectional analysis of the study population, which comprised 120 adults with chronic stable cardiac failure and an EF $\leq 50\%$. Participants were from urban and rural households attending the Geriatric out-patient unit of the FOSCAL Clinic, in Santander (Colombia), who were enrolled in the FORCE study. Anthropometric and physical measurements were taken and EF and HF assessed using echocardiogram. Peak handgrip strength (the highest value achieved from three trials in each hand) was measured using a Jamar dynamometer, and calf circumference assessed. We evaluated associations between hand grip strength and functional class by New York Heart Association (NYHA) classification using Wilcoxon's Rank Sum Test. Patients gave written informed consent to participate, and the study was approved by the ethics committee of the FOSCAL clinic.

Results: The median age of the patients was 64.5 years with an age range between 29–88 years. The percentages for stages of cardiac failure were for NYHA I of 35%, NYHA II of 44%, and for NYHA III / IV of 21%; Finding a force average of 32 kg, 26.3 kg, 20.9 kg respectively. Statistical significant differences in the analysis of variance of all groups according to the NYHA classification ($p < 0.0001$) were described.

Conclusions: Patients with heart failure have a gradual decrease in hand grip strength in different stages according to NYHA functional class. We propose the realization of dynamometry as a useful, easy and economical measure, with a potential impact to evaluate the progression of heart failure.

LONGITUDINAL PATTERNS OF CHANGE IN SENSE OF PURPOSE IN LIFE FOLLOWING STROKE ONSET

N. Lewis¹, H. Brazeau¹, P. Hill², 1. *Carleton University, Ottawa, Ontario, Canada*, 2. *Washington University in St. Louis, St. Louis, Missouri*

A considerable body of research has linked having a sense of purpose in life with positive health outcomes in later life. However, it is less clear how the onset of a major health condition may impact one's sense of purpose long-term. In particular, stroke represents the leading cause of acquired adult disability worldwide and is commonly associated with significant physical and psychological symptoms capable of impairing one's ability to pursue major life goals. Using data from the Health and Retirement Study, the present study explored changes in purpose scores in a total of 90 participants suffering from stroke between 2006 and 2010. Purpose, demographic, social, and personality characteristics were assessed prior to stroke onset in 2006, and again four and eight years later. Overall, participants exhibited mean-level decline in purpose in life following stroke, though there was significant variability in purpose change within the sample. Cluster analyses revealed 4 distinct patterns of purpose change across the eight years of the study, suggesting both adaptive and maladaptive change patterns in purpose following stroke. These findings mirror past work from the post-traumatic growth literature demonstrating similar patterns of adaptation following potentially traumatic life events. Discussion will focus on demographic and psychosocial factors distinguishing these groups including personality and close relationship support.

A LONGITUDINAL STUDY OF THE NAVIGATION PATTERNS OF DEMENTIA PATIENTS AND THEIR RELATIONSHIP TO MMSE

A. Kumar^{1,2}, C. Lau³, S. Chan⁴, M. Ma⁵, W. Kearns⁶, 1. *Joint NTU-UBC Research Centre of Excellence in Active Living for the Elderly, Singapore, Singapore*, 2. *IGS, Nanyang Technological University, Singapore, Singapore*, 3. *SCSE, Nanyang Technological University, Singapore, Singapore*, 4. *College of Professional and Continuing Education, Singapore, Singapore*, 5. *EEE, Nanyang Technological University, Singapore, Singapore*, 6. *University of South Florida, Tampa, Florida*

Studies of the navigational patterns of assisted living facility residents with dementia have resulted in many insights into the progression of dementia e.g. more tortuous navigation has been associated with declining mental capability. In this pilot investigation, we found minute changes in navigational features such as speed, path-efficiency, angle-turn and, ambulation-fraction were predictive of cognitive function. In this study, navigational data of 10 subjects living in an assisted living facility were collected daily over a period of one year using an Ultra-wideband real-time location system with an accuracy of 20cm at 1Hz using a method described by Kearns et al. (2012), and compared with their cognitive status as measured by the Mini Mental State Exam. Six subjects had received clinical diagnoses of dementia with MMSE scores averaging 13.33 (SD=7.6) while the four control subjects' MMSE averaged 18 (SD=9). We hypothesized that linear trends in the aforementioned features over a lengthy period might provide useful information concerning dementia's progression. We employed linear contrast analysis to identify increasing and decreasing trends in the features and evaluated the change using one-way ANOVA to compare the trends within the two diagnostic groups. Two patients evidenced significant linear trends in angle-turn and path-efficiency with the maximum variability captured by angle-turn (14.7% and 11.7%). Both subjects were later found to have very low MMSE value (6 and 9 respectively). In four other residents angle-turn consistently increased over the 1-year monitoring interval suggesting that their cognitive abilities may have correspondingly deteriorated over this interval.

DEVELOPING AND VALIDATING THE LIFESTYLE COGNITIVE DEVELOPMENT QUESTIONNAIRE

S. Leanos¹, J. Coons¹, G. Rebok², D. Ozer¹, R. Wu¹, 1. *University of California, Riverside, Riverside, California*, 2. *Johns Hopkins University, Baltimore, Maryland*

Prior research has suggested that intellectual engagement may have a positive impact on the aging brain. While intellectual engagement has been employed in different ways in previous cognitive interventions, it has not been clearly defined. This issue may be one reason why experimental studies testing the causal relationship between intellectual engagement and cognitive functioning have produced mixed results. Wu, Rebok, and Lin (in press) propose that six factors define optimal intellectual engagement: 1) open-minded input-driven learning, 2) individualized scaffolding, 3) growth mindset, 4) forgiving environment, 5) serious commitment to learning, and 6) learning multiple skills simultaneously. Currently, there are no extant measures that accurately assess levels

of intellectual engagement. The current study reports the development of a new measure of intellectual engagement, the Lifespan Cognitive Development Questionnaire, which includes six scales designed to measure different aspects of intellectual engagement. Across two studies, we found that the scale reliabilities ranged from $\alpha=.493$ (learning multiple skills simultaneously scale) to $\alpha=.744$ (forgiving environment scale). The results of an exploratory item factor analysis were not fully in accord with theoretical expectations. The questionnaire serves as an initial effort to assess intellectual engagement and future work will focus on developing additional items that better represent the theoretical factor structure.

MICROCIRCULATION, MUSCLE STRENGTH AND BODY COMPOSITION IN OLDER ADULTS WITH AND WITHOUT SARCOPENIA

K.G. Lopes, P. Farinatti, R.A. Lourenço, E. Bouskela, R.B. Oliveira, D. Bottino, *State University of Rio de Janeiro, Rio de Janeiro, Rio de Janeiro, Brazil*

The number of older people is rapidly growing worldwide. Sarcopenia is the age-related loss of muscle mass and function that evolves to adverse health outcomes such as disability and loss of independence. Purpose: to compare body composition, muscle strength and microvascular function in older adults with and without sarcopenia. Methods: thirty-eight eutrophic inactive elderly, aged 72 ± 6 years, weight 65 ± 10 kg, mini mental state examination 25 ± 4 points, were classified as sarcopenic ($n=12$) and no sarcopenic ($n=26$), assessed by dual energy x-ray absorptiometry (DXA). All volunteers underwent assessments of body composition (DXA), handgrip strength, vascular reactivity [venous occlusion plethysmography (VOP)] and microvascular evaluation [nailfold videocapillaroscopy (NVC)]. Independent samples Student t-tests were used to compare variables between groups and Spearman correlations to compare microcirculation to body composition and handgrip strength. Significance was set at $p<0.05$. Results: Handgrip strength, muscle mass, L2-L4 bone mineral density and femoral neck were higher in no sarcopenic group. Likewise, baseline forearm blood flow and capillary diameters were also higher in no sarcopenic group ($p<0.05$ for all comparisons). The results demonstrated reductions in muscle strength, bone mineral density and basal forearm blood flow in sarcopenia. Although no differences were found in vascular reactivity and functional capillary density between groups, there were positive Spearman correlation coefficients between vascular reactivity and Handgrip strength or appendicular skeletal muscle mass or lean muscle mass as 0.34, 0.35 and 0.39, respectively. Conclusion: Independently of having Sarcopenia or not, better muscle strength and increased muscle mass were found with increasing vascular reactivity.

SEVERE SOCIAL ISOLATION AMONG THE UNMARRIED LIVING ALONE: NATIONAL HEALTH & AGING TRENDS STUDY-NHATS

T.K. Cudjoe¹, C. Boyd¹, R.J. Thorpe², J.L. Wolff², D.L. Roth¹, *1. Division of Geriatric Medicine and Gerontology, Johns Hopkins University School of Medicine,*

Baltimore, Maryland, 2. Johns Hopkins University, Baltimore, Maryland

Background: Social Isolation is a complex issue that affects the mental and physical well-being of older adults. It is often characterized as the absence of social integration. We examined severe social isolation in community-dwelling adults older than 65 years in the United States.

Methods: This is a cross-sectional study of community dwelling participants in Round 1 of National Health & Aging Trends Study who were unmarried and living alone. Participants were characterized as having severe social isolation if they a) had 0 or 1 person to talk about important things in the last month, and b) responded that they did not participate in any of the following activities in the last month: visiting family or friends; attending religious services; participating in club, classes, or other organized activities; volunteering; and giving care to a person who could not care for themselves. Weighted multivariable logistic regression analyses were performed to identify demographic predictors of severe social isolation.

Results: Of the 2379 study participants, 105 (4.0%) were characterized as having severe social isolation. Weighted multivariable logistic regressions (predictors: age, race, gender, education, and income) found that male gender (7.5% vs 2.7%; OR= 3.44, 95% CI=2.12–5.57), Hispanic vs white race (10.7% vs 3.5%; OR= 2.8, 95% CI=1.22–6.23), and those with less than a high school education vs beyond high school (7.9% vs 2.10%, OR= 2.3, 95% CI=1.10–5.14) were significantly more likely to have severe social isolation.

Conclusion: Among unmarried older adults living alone, male, Hispanic, and lower education are associated with severe social isolation.

SEXUALITY OF MIDLIFE AND OLDER WOMEN: USES OF THEORY IN RESEARCH

S. Jen, *School of Social Work, University of Washington, Seattle, Washington*

Gerontology is described as rich in data, but poor in theory, a lack which weakens the link between research and applied social gerontology. Reviews of theory in social gerontology at large have been completed in the recent past. However, little work examines theory use pertaining to specific older adult populations or narrower aspects of their lives. This literature review examines how theory is used in literature on the sexuality of midlife and older women. The review includes 21 articles published in English between 2000–2016. Search criteria included theoretical and empirical articles that focused on the sexual lives of mid-life and older women (age 45+). Returned articles were reviewed for substantive theory or methodology and integration of theory. All articles described the dominant narrative of asexuality or sexual decline. However, each positioned their own work as a counter-narrative, representing various theoretical reactions. The majority were framed from a social constructionist or interpretivist orientation. Theories were also differentially integrated throughout articles. While theoretical work is inconsistently integrated into empirical research, its uses have implications for the development of an overall narrative shaped by a body of literature. In research examining

the sexuality of midlife and older women, substantive theories and methodologies react to the culturally dominant, but empirically unsupported narrative of sexual decline, supporting the role of health care and social service providers to acknowledge and affirm the diverse sexual narratives of older women and the ways that socially constructed notions impact sexual experiences in later life.

EXPLORING USERS' SATISFACTION GAP TO LONG-TERM CARE SERVICE STATIONS IN THE REMOTE AREA OF TAIWAN

L. Liu, Y. Lee, *National Cheng Kung University, Tainan, Taiwan, Taiwan*

Aims: To achieve the goals of "ageing in place" and the universal accessibility of long-term care (LTC), the "Project of Implementing LTC System in Remote Area" has been in operation since 2009 in Taiwan. The government contracts out the program and sets up LTC service stations in remote area to deliver LTC services. By using PZB model (Parasuraman, Zeithaml, Berry, 1988), the study aimed to examine the service gap from the customers' perspectives in order to synergize local resources and deliver appropriate services.

Material and Methods: By convenience sampling at least 10 users from each LTC service station, participants were 206 older adults used one kind or more of LTC services from 23 LTC service stations in remote area. Data was collected by interviews and analyzed by using Multilevel modeling method in SAS 9.4.

Results: Users were mostly women (58.3%), with the age of 65–74 years old (37.4%). The overall satisfactions mean score was 4.366. The results of hierarchical generalized linear models revealed that 1) Users who know the function of service stations and service stations which run by public health centers had higher scores of user's satisfaction; 2) users who had been to and know the function of service stations; also the care managers who had longer LTC working experience got the significant higher satisfaction scores in tangible services.

Conclusion: It is suggested that promoting recognition and accessibility and hire experienced care managers can be helpful to improve user's satisfaction of LTC service stations in remote area.

I CAN'T GET NO SATISFACTION: CHRONIC DISEASE AND SEXUAL SATISFACTION AMONG OLDER COUPLES

S. Shen, *Michigan State University, East Lansing, Michigan*

Chronic diseases are especially widespread among older adults, and they can have harmful effects on their sexuality. To examine how an individual's cumulative number of chronic diseases is linked to their sexual frequency and their sexual satisfaction, I draw upon partner-specific learning theory and utilize a gendered sexuality approach. Data from the second wave of the National Social Life, Health, and Aging Project (N=929 dyads) are analyzed using Actor-Partner Interdependence Models to reveal gendered findings. The results show that a husband with fewer chronic conditions has a higher sexual frequency which is in turn related to his own and his partner's sexual

satisfaction, such that having sex more frequently is associated with higher sexual satisfaction for both a husband and his wife. Further, a decrease in a husband's chronic disease burden is also linked to an increase in his wife's sexual frequency, which is thus positively related to her own sexual satisfaction. A wife's sexual frequency, however, is not related to her husband's sexual satisfaction, nor does her own chronic disease burden have any effect on her or her spouse's sexual frequency. The results speak to healthcare providers treating older patients who are concerned about how their health impacts their sexuality and to policy makers working to ensure that adults can have satisfying sex in later life.

LIFE COURSE STAGE AND SOCIAL SUPPORT FOR END-OF-LIFE CAREGIVERS

S. LaValley, *University at Buffalo, Buffalo, New York*

Caregivers of terminally ill patients are at risk for anxiety, depression, and social isolation. Social support from friends, family members, neighbors, and healthcare professionals can potentially prevent or mitigate caregiver strain. However, little is known about how social support experiences differ among caregivers at different life course stages. This study uses thematic analysis of data from in-depth interviews with 50 caregivers of patients enrolled in hospice services to compare experiences mobilizing social support among caregivers at two life course stages: midlife caregivers caring for parents and older adult caregivers caring for spouses/partners. Both groups experienced long-term relationships and close social network ties as facilitators of support. For older adult caregivers, physical proximity to sources of social support also facilitated support mobilization. Older adult caregivers identified barriers to accepting social support as including: a preference to autonomously adhere to personal habits and routines, a sense of obligation to fulfill their role as spouses, and a perception that potential sources of support had their own families or other patients to take care of. Midlife caregivers' barriers to accepting social support included domestic conflict arising from multiple, overlapping caregiving roles, and disagreements among multiple siblings providing care for one parent. Findings enhance the understanding of how caregivers' life course stage affects their mobilization of social support resources.

OSTEOSARCOPENIC OBESITY: FREQUENCY AND ITS RELATION WITH FRAILTY AND PHYSICAL PERFORMANCE

C. Szlejf, L. Parra-Rodríguez, O. Rosas-Carrasco, *National Institute of Geriatrics, Mexico City, Mexico*

Design: Cross-sectional analysis of a prospective cohort.

Setting: The FraDysMex study, a two-round evaluation of community-dwelling adults from two municipalities in Mexico City.

Participants: Participants were 543 men and women older than 50 years, living in the designated area in Mexico City.

Measurements: Body composition was measured with dual-energy X-ray absorptiometry and OSO was defined by the coexistence of sarcopenia, osteopenia or osteoporosis and obesity. Information regarding demographic characteristics, comorbidities, mental status, nutritional status, history

of falls, fractures and hospitalization was obtained from questionnaires. Objective measurements of muscle strength and function were grip strength using a hand dynamometer, 6-meter gait speed using a GAIT Rite instrumented walkway, and lower extremity functioning measured by the Short Physical Performance Battery (SPPB). Frailty was assessed using the Frailty Phenotype (Fried criteria) and the FRAIL scale.

Results: The frequency of OSO was 16.6% (n=87). Frailty and poor physical performance measured by the SPPB were independently associated to OSO. In a logistic regression model assessing frailty with the Frailty Phenotype the odds ratio (95% confidence interval) for frailty was 5.04 (2.57–9.88), and for poor physical performance it was 2.41 (1.34–4.36). In the model assessing frailty with the FRAIL scale it was 2.12 (1.10–4.11), and for poor physical performance it was 2.53 (1.42–4.51).

Conclusion: OSO is a frequent condition in middle-aged and older adults, and it is independently associated to frailty and poor physical performance.

OLDER ADULTS WITH ALZHEIMER'S DISEASE & OTHER DEMENTIA FIND THEIR VOICE THROUGH DIGITAL PHOTOGRAPHY

C. Takeda^{1,2}, S. Dimond², 1. *University of California, Berkeley School of Public Health, Berkeley, California*, 2. *The Plaza Assisted Living, Honolulu, Hawaii*

Older adults afflicted by Alzheimer's disease and other dementias can greatly benefit from therapeutic activities that are dignifying and that can provide both physical and mental stimulation. In an effort to integrate technology and art therapy to support individuals with memory loss, residents at various memory care communities in Hawaii were taught how to use digital cameras and guided through the "photo-voice" process. This well-documented process involves taking photographs and then using these photographs to explore the unique thoughts and perspectives of the photographers, which in this case are older adults living in communities specializing in dementia care. Against a common misconception that older adults with dementia cannot learn new skills, the participants in this program found great success evident by their beautiful photographs and vivid reflections, which included reminiscence. Photographs will soon be displayed in public exhibitions to feature the creativity and "voice" of the older adult photographers and challenge perceptions about dementia. Overall, this community program capitalized on current technologies to achieve its program goals—the participants found a therapeutic opportunity to express themselves and the general public increased their awareness about the talents and skills maintained by those with Alzheimer's disease and other dementias.

A COMMUNITY-BASED VIRTUAL REALITY PROGRAM IMPROVES PHYSICAL ACTIVITIES IN PARKINSON'S DISEASE

Y. Liao, *Department of Gerontological Health Care, National Taipei University of Nursing and Health Science, Taipei, Taiwan*

Background: Virtual reality (VR) systems are proved to increase motor performance in stroke and elderly. However, the effects have not been established in patients with

Parkinson's disease (PD). Purpose: To examine the effects of VR based training in improving muscle strength, sensory integration ability and walking abilities in patients with PD by a randomized controlled trial. Method: Thirty six participants with diagnosis of PD were randomly assigned to one of the three groups (n=12 for each group). Participants received VR-based Wii Fit exercise (VRWii group) or traditional exercise (TE group) for 45 minutes, followed by treadmill training for another 15 minutes for 12 sessions in 6 weeks. Participants in the control group received no structured exercise program but fall-prevention education. Outcomes included lower extremity muscle strength, sensory integration ability, walking velocity, stride length, and functional gait assessment (FGA). All outcomes were assessed at baseline, after training and at 1-month follow-up. Results: Both VRWii and TE groups showed more improvement in level walking velocity, stride length, FGA, muscle strength and vestibular system integration than control group after training and at 1-month follow-up. The VRWii training, but not the TE training, resulted in more improvement in visual system integration than the control. Conclusions: VRWii training is as beneficial as traditional exercise in improving walking abilities, sensory integration ability and muscle strength in patients with PD, and such improvements persisted at least for 1 month. The VRWii training is then suggested to be implemented in patients with PD.

SELF-REPORTED PHYSICAL FUNCTION AS A PREDICTOR OF HOSPITALIZATION IN THE LIFE STUDY

K. Callahan¹, L. Lovato², M.E. Miller², A.P. Marsh⁵, T.M. Gill³, J.M. Guralnik⁴, S.B. Kritchevsky¹, W. Rejeski⁵, 1. *Wake Forest University School of Medicine, Winston-Salem, North Carolina*, 2. *Wake Forest University Health Sciences, Winston-Salem, North Carolina*, 3. *Yale University School of Medicine, New Haven, Connecticut*, 4. *University of Maryland, Baltimore, Maryland*, 5. *Wake Forest University, Winston-Salem, North Carolina*

Background: For older adults, hospitalization confers functional loss, which in turn increases hospitalizations. Physical function screening may identify an at-risk population for early intervention. The Mobility Assessment Tool – short form (MAT-sf) is a brief, innovative, avatar-based self-report tool that predicts mobility disability. This study explored whether baseline MAT-sf score is associated with number of hospitalizations and time to first hospitalization.

Design: Post-hoc analysis of prospectively-gathered data from the Lifestyle Interventions and Independence for Elders (LIFE) Study, a randomized clinical trial of lifestyle interventions to preserve mobility in older adults, conducted in eight U.S. academic medical centers.

Participants: Among 1635 sedentary community-dwelling older adults enrolled in LIFE, 1574 completed baseline physical function screening including MAT-sf, with scores ranging from 30.2 (low function) to 69.8 (high function).

Measurements: Number of hospitalizations and time to first hospitalization, adjusted for age, gender, race, living alone, clinical site, and baseline comorbid conditions, # prescription medications, and cognition.

Results: Of the 1557 participants with hospitalization data, 726 (47%) experienced at least one hospitalization,

with the majority (78%) of these experiencing 1–2 hospitalizations. For every 10-point increase in MAT-sf defined mobility, there was a 16% decreased rate of all hospitalizations (adjusted rate ratio 0.84, 95% CI: 0.76 to 0.93, $p < 0.001$). Higher baseline MAT-sf scores were also associated with a decreased risk of first hospitalization (adjusted Hazard Ratio 0.83, 95% CI: 0.76 to 0.92, $p < 0.001$, per 10-point increase in MAT-sf).

Conclusion: MAT-sf may identify older adults at increased risk for hospitalizations, who may benefit from care coordination.

USING VIDEO REFLEXIVE GROUPS TO DEVELOP DEMENTIA PRACTICE

L. Hung, *University of British Columbia, Vancouver, British Columbia, Canada*

Hospital environments have been criticized as inadequate for meeting needs of patients with dementia. There is a need to explore innovative ways to involve frontline staff to make practical changes. Using videos to show compelling patient stories can be a powerful way for promoting frontline engagement in practice development. This poster reports the perspective of staff on using videos and reflexive groups to develop person-centred care in a medical unit. Methods consisted of video interviews with patients with dementia and 31 focus groups with a total of 50 staff, including nursing, physicians, and allied health. Five substantial themes emerged as important roles of the video reflexive groups in contributing to creating collective commitment and actions to improve dementia practice in the medical unit: (a) seeing through patients' eyes, (b) seeing normal strange, (c) seeing inside and between, (d) seeing with others inspires actions, and (e) seeing team support builds a safe culture for learning. The findings suggest that videos reflexive groups can be an effective strategy for mobilizing positive change in acute hospital wards. In this study, staff participants described visual methods brought a fresh and practical approach to practice development in acute care.

HEALTH AND WELL-BEING OF RETIREES: THE ROLES OF SOCIAL INTERACTION AND EXCHANGE RECIPROCITY

Y. Wang, *Boston College, Boston, Massachusetts*

Utilizing two psychosocial frameworks – the social relationships perspective and the exchange reciprocity theory, this study examines how social interaction and exchange reciprocity affects health and wellbeing of retirees, and whether the effects vary by gender.

Data from the 8th and 9th wave of the Health and Retirement Study (HRS) were analyzed to look into the health and retirement satisfaction of retirees. Logistic regression was used to examine social interaction (positive, and negative social support, self-perceived social hierarchy), exchange reciprocity and demographic information on retirement satisfaction. Heterogeneous choice model was used to examine social interaction, exchange reciprocity and demographic information on retirees' self-reported health. Gender interactions were tested.

Results indicate that positive social interaction and exchange reciprocity were positively related to retirement

satisfaction and self-reported health, while negative social interaction was negatively related to retirement satisfaction and self-reported health. Having the same level of positive social interaction, women have higher odds of reporting more retirement satisfaction. Having the same level of exchange reciprocity, men have higher odds of reporting more retirement satisfaction and better self-reported health.

Incorporating the psychosocial framework helped to understand multiple facets of predictors in affecting retirement wellbeing. It also helped to further our understanding of the gender heterogeneities in successful retirement. Clinical intervention and public policy aiming to target both genders in retirement will be discussed.

ITEMS FOR MEASURING PERSONNEL RETENTION IN INTENSIVE CARE HOME FOR THE ELDERLY

A. Ogata¹, K. Ogiso², S. Toida³, S. Yamashita⁴, M. Watanabe⁵, N. Aida⁶, 1. *Nogoya University Graduate School of Economics, Nagoya, Japan*, 2. *Gifu University Nursing Course, School of Medicine, Gifu, Japan*, 3. *Shubun University Faculty of Nursing, Ichinomiya, Japan*, 4. *Chubu Gakuin University Faculty of Human Well-being, Seki, Japan*, 5. *School of Health Sciences, Gifu University of Medical Science, Seki, Japan*, 6. *Institute of Health Science, Academic Assembly School of Medicine and Health Sciences, Shinshu University, Matsumoto, Japan*

There is no scale for measuring the retention of nursing and caregiving personnel at intensive care home for the elderly (facilities covered by public aid providing long-term care to the elderly), and the topic has therefore not been discussed. The objective of this research was to find out suitable proposed items for a scale to measure the personnel retention.

Using the Delphi method, 111 prospective items were converged as basic scale items by three rounds. An eight-member panel of experts was convened that consisted of nursing and caregiving researchers and personnel from facilities covered by public aid providing long-term care to the elderly.

The study was approved by the bioethics review committee of the Nagoya University Graduate School of Economics.

As a result, the 111 items were organized into two categories: working environment and personnel support. A total of 29 items, 15 in the working environment category and 14 in the personnel support category, were compiled as proposed scale items.

Because the research yielded basic scale items for measuring personnel retention, it was concluded that a scale for personnel retention can be established by examining reliability and validity with large-sample survey.

WHAT FEELINGS DO PEOPLE WANT TO FEEL WHEN FUTURE TIME IS LIMITED?

D. Jiang¹, H.H. Fung², T. Sims³, J.L. Tsai³, 1. *The Education University of Hong Kong, Hong Kong, Hong Kong*, 2. *Chinese University of Hong Kong, Hong Kong, Hong Kong*, 3. *Stanford University, Stanford, California*

Socioemotional selectivity theory suggests that people prioritize emotionally meaningful goals and are motivated to experience their desired emotion, when they perceive future time as more limited (e.g., at an advanced age). Then, what

affective states do people desire to feel when future time is limited? The present research examined the relationship between future time perspective and the affective states that people ideally want to feel (ideal affect) using a combination of survey, experience sampling, and experimental methods. Two hundred Ninety-nine Hong Kong Chinese aged 18 to 80 years ($M = 46.64$ years, $SD = 20.81$ years; 46% female) participated in the survey and 106 of them participated in the experience-sampling study. Across two methods, we found that people who perceived their future time as more limited valued low-arousal positive states (e.g., calm and peaceful) more than did people who perceived future time as more expanded. Such finding was robust in both trait (from the survey) and momentary (from the experience-sampling) ideal affect. Then, we conducted an experiment among 258 Hong Kong Chinese aged 18–80 years ($M = 43.31$ years, $SD = 20.66$ years; 57% female), in which participants were primed with either a limited future time perspective or an expanded future time perspective. We found that participants in the limited future time condition valued low arousal positive states more and high arousal positive states (e.g., excited and enthusiastic) less than did participants in the expanded future time condition. These findings broaden our understanding of emotional goals in limited (vs. expanded) future time perspective.

END-OF-LIFE DECISION MAKING FOR BLACK OLDER ADULTS WITH DEMENTIA

K. Moss², N. Deutsch¹, P. Hollen¹, K. Rose³, V. Rovnyak¹, I.C. Williams¹, 1. *University of Virginia, Charlottesville, Virginia*, 2. *Case Western Reserve University, Cleveland, Ohio*, 3. *University of Tennessee Knoxville, Knoxville, Tennessee*

Black older adults with dementia worldwide are at risk of facing the end of life without advance care plans, leaving family caregivers struggling to make life-altering, health-related decisions on their behalf. The purpose of this study was to examine surrogate end-of-life decision making for Black older adults with dementia, including understanding of end-of-life terminology, health-related quality of life, and self-efficacy for surrogate decision making. A mixed methods approach was used for cross-sectional data collected from Black caregivers of Black older adults with dementia ($N=65$) in the United States. A subset of caregivers ($n=18$) completed qualitative interviews. Data were analyzed using content and thematic analyses, and statistical analyses of health-related quality of life and self-efficacy. Most caregivers reported the existence of a formal end-of-life plan for their care recipient. The term ‘end of life’ was interpreted as either “healthcare received prior to death”, such as cardiopulmonary resuscitation, “funeral arrangements”, or both. Caregivers reported high levels of self-efficacy for themselves and high levels of health-related quality of life for their care recipients. However, neither measure was associated with the existence of a formal care recipient end-of-life plan. A relationship existed between the presence of formal end-of-life plans and care recipient’s age and number of comorbidities. Study findings support a foundation for effective communication focused on meaning patients and families attach to healthcare terminology. They provide a basis for education and empowerment of Blacks caring for older adults with

dementia internationally, and education of healthcare providers caring for them.

USE AND OPPORTUNITIES OF GEOGRAPHIC INFORMATION SYSTEMS IN HEALTH RESEARCH FOR OLDER ADULTS

Y. Park, D.Z. Bliss, *University of Minnesota, Minneapolis, Minnesota*

Geographic Information Systems (GIS) enable examination of complex interactions of the environment and health. GIS is a powerful tool for influencing health policy, surveillance of infections, and investigating risks for diseases. The purpose of this systematic review was to describe application of GIS in health research for older adults aged 60+ and identify opportunities for future GPS use. Pubmed, Compendex, and Geobase databases (years 2007–2017) were searched for studies using the terms “older adults” and “GIS”.

The search yielded 43 studies subsequently organized by topic, GIS methods/measures, and region. Study topics were in 5 areas: Influence of the built-neighborhood on health behaviors (e.g., walking, diet, socialization [$n=13$ studies], and on health status (self-rated health, mental health, frailty, disability [$n=8$]); impact of environmental hazards on health and disease risk [$n=7$]; and the measured activity space of older adults’ neighborhoods [$n=2$]. Epidemiological analyses focused on distribution of diseases/conditions (e.g., breast cancer, chronic conditions, respiratory problems [$n=8$ studies]) or healthcare facilities [$n=3$], and patterns of healthcare utilization [$n=3$].

GIS methods/measures were GIS-derived measures (e.g., distance, density [$n=13$ studies]), geospatial analysis [$n=16$], geocoded data [$n=6$], mapping [$n=5$], and global-positioning systems [$n=2$]. Geographic regions were mainly urban areas in US [$n=17$ studies], Europe [$n=10$], Asia/Pacific [$n=10$], and North and South America [$n=6$].

There are numerous other health problems of older adults (e.g., memory loss, heart disease, incontinence, infections) and factors promoting well-being (e.g., safety, social center locations) as well as issues of healthcare accessibility in rural areas that may benefit from insights derived from GIS.

MAKING THE MOST OF MEALTIMES: WHO IS PRESCRIBED MODIFIED TEXTURE FOODS IN CANADIAN LONG-TERM CARE

V. Vucea¹, H.H. Keller^{1,2}, J.M. Morrison¹, A.M. Duncan^{2,3}, L. Duizer^{2,3}, C. Steele^{4,5}, 1. *University of Waterloo, Waterloo, Ontario, Canada*, 2. *Schlegel-University of Waterloo, Research Institute for Aging, Waterloo, Ontario, Canada*, 3. *University of Guelph, Guelph, Ontario, Canada*, 4. *Toronto Rehabilitation Institute-University Health Network, Toronto, Ontario, Canada*, 5. *University of Toronto, Toronto, Ontario, Canada*

Research suggests modified texture foods (MTFs) are prevalent among older adults in long term care (LTC), but characteristics of residents prescribed MTFs are sparsely documented. Making the Most of Mealtimes (M3) is a cross-sectional multi-site study with data from 32 LTC homes in four Canadian provinces (AB, MB, NB, ON). This secondary data analysis applied standardized terminology to examine the current prevalence of prescribed MTF and resident characteristics associated with their prescription.

Resident characteristics were collected from health records and standardized procedures. Homes used 67 different terms to describe MTFs. Diets were re-categorized using the International Dysphagia Diet Standardization Initiative (IDDSI) Framework (pureed, minced, moist and soft/bite sized textures). Bivariate analyses were performed. MTFs were prescribed to 47% (n=298) of the M3 sample (n=639) and significantly differed across provinces ($p < 0.0001$). Resident characteristics significantly associated with MTFs included: longer length of admission; dysphagia and malnutrition risk; dementia diagnosis; fewer vitamins/mineral supplements; prescription of oral nutritional supplementation; lower body weight, body mass index, and calf circumference; greater need of physical assistance; poor oral health status; and more challenges with eating, activities of daily living and impaired cognition. The prevalence of prescribed MTFs was high and diverse across provinces in Canada and residents on MTFs were more vulnerable than residents on regular texture diets. These findings demonstrate the value of using standardized terminology to inform policy and help identify subgroups more likely to consume these diets. (Funded by Canadian Institutes of Health Research).

WORKING LIFE EXPECTANCY WITH AND WITHOUT DISABILITY AT AGE 55 IN THE NETHERLANDS, GERMANY AND USA

M. van der Noordt¹, T. Van Tilburg⁴, S. van der Pas¹, C. Tesch-Roemer³, C.F. Mendes de Leon², D.J. Deeg¹, 1. *VU University medical center, Amsterdam, Netherlands*, 2. *University of Michigan, Ann Arbor, Michigan*, 3. *German Centre of Gerontology (DZA), Berlin, Germany*, 4. *VU University, Amsterdam, Netherlands*

Due to population aging, many countries are reforming their policies by abolishing early retirement routes and raising statutory retirement ages. As health deteriorates with age, many older workers may experience that health limits their workability. The necessity to continue working may depend on the flexibility and generosity of a national pension system. Flexibility refers to early retirement opportunities and their entitlement conditions, and generosity to the post-retirement income as percentage of pre-retirement income. This study compares working life expectancies at age 55 (WLE55) with and without disability across countries differing in pension system. Three countries were selected with decreasing flexibility and generosity: Netherlands, Germany, and United States, using data from the Longitudinal Aging Study Amsterdam (LASA), German Aging Study (DEAS) and the Health and Retirement Study (HRS), respectively. Participants aged 55–65 years at baseline (2002) with a paid job were selected and followed up to 2012/2014 (n=385, n=273 and n=2335, respectively). Two health states were distinguished based on difficulty climbing stairs: with and without disability. WLEs were estimated using the MSM and ELECT packages in R. In the Netherlands, total WLE55 was 5.3 years of which 0.6 with disability. In Germany, total WLE55 was 4.6 years of which 1.1 with disability. In the US, total WLE55 was 7.4 years of which 2.4 with disability. Flexibility and generosity seem to affect the number of working years of older adults both in total and with disability. Governments should be aware that disabled workers need special attention regarding their work environment.

FRAGMENTATION OF PHYSICAL ACTIVITY IS STRONGLY ASSOCIATED WITH GAIT SPEED AND FATIGABILITY

P. Kuo¹, V. Zipunnikov¹, J. Di¹, A.A. Wanigatunga¹, E.M. Simonsick², S.A. Studenski², L. Ferrucci², J. Schrack¹, 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 2. *National Institute on Aging, Baltimore, Maryland*

Low daily physical activity has been linked to poor health and functional performance with aging. However, the health implications of the daily patterns/temporal accumulation of physical activity remain unknown. We created an activity fragmentation index (AFI) to account for the number and duration of daily active bouts using 7-day accelerometry data from the Baltimore Longitudinal Study of Aging (n = 734, mean age 67.8 ± 13.2 years, 50% female). Minute-epoch activity counts were dichotomized into active or sedentary states, and summarized according to the distribution of active bout durations. AFI was calculated as the reciprocal of the average duration of the active bouts. Total daily volume of physical activity was summarized using total log-transformed activity counts (TLAC). Using multiple linear regression models adjusted for age, sex, height, weight, TLAC, and disease conditions, AFI was negatively associated with gait speed ($\beta = -0.06$ m/s, $p < 0.004$), and positively associated with laboratory assessments of high fatigability ($p < 0.001$). TLAC was a significant predictor of gait speed and fatigability until AFI was added to the model, suggesting that the duration and number of active bouts throughout the day mediates the associations among TLAC, gait speed, and fatigability. Together, these results imply that accounting for fragmented daily physical activity may be more important than total volume of physical activity when assessing functional performance in older adults. Further research is needed to validate this measure and determine the longitudinal value of activity fragmentation in predicting adverse outcomes in older adults.

NURSING HOME RESIDENTS' NARRATIVES OF THEIR INTERPERSONAL RELATIONSHIPS

B. Kang¹, E.S. McConnell^{1,3}, K. Scales^{1,2}, Y. Song¹, M. Lepore⁴, K.N. Corazzini¹, 1. *Duke University School of Nursing, Durham, North Carolina*, 2. *Duke University Center for the Study of Aging and Human Development, Durham, North Carolina*, 3. *Durham Veterans Affairs Medical Center, Durham, North Carolina*, 4. *RTI International, Atlanta, Georgia*

The cultivation of interpersonal relationships is central to promoting quality of life in nursing homes (NHs), as it is through these relationships that residents, family members and staff come to be valued as unique persons and are empowered as partners in care (Owen & Meyer, 2012). Beyond the care provider-recipient relationship, little research has considered the broader network of relationships experienced by residents. This study aims to explore residents' perspectives regarding the meaning of their relationships with co-residents, families, and staff in NHs. We analyzed individual and group interviews with residents (N=12 sessions; N=12 participants) from two NHs in North Carolina, which were conducted as part of a larger study on person-directed care planning. Informed by narrative inquiry (Jovchelovitch

& Bauer, 2000), the analysis explored various interpersonal relationships and their context through each resident's narration, using a two-cycle coding approach (Saldaña, 2012). Three consistent themes emerged: (i) residents perceived interpersonal relationships as supporting their needs, including the need to feel connected, respected, and supported; (ii) when residents' needs were met through relationships, it led to positive outcomes perceived by residents, such as feeling significant and capable; and (iii) when residents' needs were not attained in particular relationships, it led to negative outcomes including feelings of being neglected, isolated, and helpless. The importance of the findings about interpersonal relationships is discussed in relation to appreciative inquiry (Cooperrider et al., 2003), a strengths-focused approach for helping NH residents, families, and staff co-create personally meaningful living and working environments.

POSTURAL STABILITY AND FALLS RISK IN THE ELDERLY IN BIODEX BALANCE SYSTEM: A RELIABILITY STUDY

P. Garcia¹, P.G. de Oliveira¹, J.F. da Silva¹, A.S. Abreu¹, L.P. Paz¹, L.L. Martini², 1. *Physical Therapy, University of Brasilia, Brasília, Distrito Federal, Brazil*, 2. *Secretary of State for Health of the Federal District, Brasília, Distrito Federal, Brazil*

Background: The Biodex Balance System (BBS) platform is an important tool for assessing postural stability and risk of falls in the elderly. The objective of this study was to evaluate the inter-rater and test-retest reliability of the postural stability measures and the agreement of the identification of the risk of falling of the elderly in BBS. **Methods:** methodological study approved by ethics committee (n=34 elderly). The elderly were assessed in the Falls Risk (FR) and Postural Stability (PS) protocols. The platform was unstable in the FR (level 6-2, three repetitions of 20s). The stability was evaluated with and without visual feedback and with closed eyes in the PS (level 4, a repetition of 20s for each visual condition, unstable and stable platform). The elderly were assessed in two days. On the first day two evaluators assessed for inter-rater reliability and concordance study. One of the examiners re-evaluated the elderly after nearly one week to study test-retest reliability and agreement. **Results:** The FR measurements of the two evaluators were significantly different. The inter-rater interclass correlation coefficient (ICC) ranged from 0.48 to 0.71: very good reliability with unstable surface and good to very good reliability with stable surface. The ICC test-retest ranged from 0.64 to 0.91, featuring very good to excellent reliability. Moderate test-retest agreement (Kappa=0.529, p=0.002) and poor inter-rater agreement (Kappa=0.368, p=0.013) were found. **Conclusions:** the measures of postural stability and risk of falls in the elderly in BBS are reliable. Familiarization with the instrument may have improved retest performance evaluations.

THE ASSOCIATION OF CHILDHOOD SOCIOECONOMIC DISADVANTAGE WITH COGNITIVE IMPAIRMENT IN OLDER JAPANESE

M. Sugiyama¹, H. Murayama^{2,1}, H. Inagaki¹, C. Ura¹, F. Miyamae¹, A. Edahiro¹, T. Okamura^{2,1}, S. Awata¹, 1. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 2. *The University of Tokyo, Tokyo, Japan*

Background: Early prevention strategies for cognitive decline have been proposed, but there is sparse evidence regarding whether socioeconomic disadvantages in childhood are related to cognitive decline in old age. This study examined the association between childhood socioeconomic status (SES) and cognitive impairment among older Japanese.

Methods: In 2015, a cross-sectional questionnaire survey was conducted for all residents aged 65+ in a ward of the Tokyo metropolitan area (n=132,005). Cognitive impairment was assessed with a self-administered dementia checklist. This consisted of 10 items (ranging 10–40), and its validity and reliability were confirmed. The cut-off point for indication of dementia was 17/18; a score of 18+ indicated cognitive impairment. Childhood SES was determined with a single item consisting of five categories (high, middle-high, middle, middle-low, and low). Because the proportion of responses in the “high” category was small, we combined the high and middle-high categories into a single category in the analysis. Covariates included demographics, adult SES, health behaviors, health conditions, and body height.

Results: A total of 75,358 questionnaires were received and analyzed (response rate: 57.1%). Logistic regression analysis showed that middle-low and low childhood SES were associated with cognitive impairment, compared to middle-high/high childhood SES (odds ratio [95% confidence interval]: 1.14 [1.00–1.30] for middle-low; 1.23 [1.06–1.43] for low), after adjusting for covariates.

Conclusions: Socioeconomic disadvantage in early life was associated with cognitive impairment in later life. This suggests the importance of upstream approaches in childhood to aid in prevention of cognitive decline.

STRUCTURAL STUDIES OF ATASE1 AND ATASE2: NOVEL TARGETS FOR ALZHEIMER'S DISEASE AND AGING

M.A. Farrugia¹, Y. Ding², M. Feig³, L. Puglielli¹, 1. *Medicine, University of Wisconsin-Madison, Madison, Wisconsin*, 2. *Eli Lilly, Indianapolis, Indiana*, 3. *Michigan State University, East Lansing, Michigan*

The endoplasmic reticulum (ER) acetylation machinery includes AT-1/SLC33A1, a membrane transporter that transfers acetyl-CoA from the cytosol into the ER lumen, and ATase1 and ATase2, two ER-based Nε-lysine acetyltransferases. Mutations, genetic duplications, and increased gene dosage affecting the ER-based acetylation machinery have been associated with a familial form of spastic paraplegia, developmental delay and premature death, autism spectrum disorder with intellectual disability and progeria-like features, and late-onset Alzheimer's disease (AD). Importantly, AT-1/SLC33A1 is upregulated in p44+/+ mice, a mouse model of progeria, and mice overexpressing AT-1/SLC33A1 display a progeria-like phenotype. Finally, genetic or biochemical inhibition of the ER acetylation machinery can rescue AD in the mouse. At the mechanistic level, the ER acetylation machinery has been linked to maintenance of protein homeostasis within the secretory pathway. As such, ATase1 and ATase2 are currently active targets for therapeutics. Here, we used structural biochemistry and site-directed mutagenesis approaches to identify essential features of the enzymes, including the acetyl-CoA and the peptidyl-lysine binding pockets. We also explored the likely binding orientations of 31 inhibitors

known to affect ATase activity in vitro. Computational docking of the compounds using AutodockVINA identified 9 inhibitors with strong (< -8 kcal/mol) binding and binding pockets which differ between ATase1 and ATase2 in both overall area and residues predicted to be involved in docking. Varied concentrations of these compounds were used to treat H4 neuroglioma cells to observe their effect on autophagy and using electron microscopy and Western blot analysis of known autophagic markers.

A DECISION SUPPORT APP FOR REGISTERED NURSES TO FACILITATE AGING IN PLACE OF PEOPLE WITH DEMENTIA

T. Thoma-Luerken², M.H. Bleijlevens², M.A. Lexis¹, J. Hamers², 1. *Zuyd University of Applied Sciences, Research Centre Technology in Care, Heerlen, Netherlands*, 2. *Maastricht University, School for Public Health and Primary Care (CAPHRI), Department of Health Services Research, Living Lab on Aging and Long-term Care, Maastricht, Netherlands*

Registered nurses (RNs) play an important role in detecting practical problems of persons with dementia and advising them on (technological) solutions to facilitate ‘aging in place’. Both are challenging tasks knowing that detecting problems of persons with dementia is very complex and that the availability of new (technological) aids is rapidly growing. Therefore, in co-creation with RNs a decision support app was developed to improve nurses’ decision-making and to increase their confidence. The present study aims to assess the usability of this app and to evaluate its potential to increase nurses’ confidence in problem assessment and advices on solutions. The usability was tested in three iterative rounds by the project team ($n=4$), technology experts ($n=6$) and district RNs ($n=9$) using heuristic evaluation, a think aloud approach and the Post Study System Usability Questionnaire. Subsequently, written cases have been analyzed with and without the app by RNs. The nurses’ level of confidence in problem assessment and advices on solutions has been assessed on 10-cm VAS-scales. The participants valued the app as very usable instrument. Tester feedback resulted in improvements regarding system responses and interface related problems. The study indicated that the app has the potential to increase nurses confidence in problem assessment (mean scores app-users 8.9 versus 7.1 non-users) and advices on solutions (mean scores app-users 9.5 versus 6.8 non-users). To conclude, a usable decision support app is available for clinical practice now. However, its effects should be evaluated in a large sample of RNs, which will be the next step.

COGNITIVE IMPAIRMENT IN KOREAN OLDER ADULTS WITH RHEUMATOID ARTHRITIS

S. Shin¹, J. Lee², B. Yoon², 1. *Inje University, Busan, Korea (the Republic of)*, 2. *Inje University Ilsan Paik Hospital, Busan, Korea (the Republic of)*

Purpose: This study explored the prevalence of cognitive impairment in Korean older adults with rheumatoid arthritis (RA) using a set of computerized neurocognitive tests and the factors that were significantly correlated with cognitive impairment.

Methods: Individuals with RA were recruited by their rheumatologists during follow-up visits at one university hospital. Cognitive function was assessed using a set of 6 computerized neurocognitive tests yielding 18 indices covering a range of cognitive domains. Subjects were classified as ‘impaired’ if they performed 1 SD below age-based population norms on each test. The total cognitive impairment score was calculated by summing the transformed scores. Pearson correlation coefficient analyses were conducted to identify the variables that might be significantly associated with cognitive impairment.

Results: Fifty four subjects with a mean (\pm SD) age of 63.6 (\pm 10.5) years were included in the final analyses. 85% were female and 87% were married. Mean total cognitive impairment score was 11.1 (\pm 4.1, range=2–18). 92% were classified as cognitively impaired on five or more test indices. The proportion of persons who were classified as cognitively impaired on each test were 37% in executive function, 67% in visuo-motor coordination, 72% in language memory, 85% in visuo-spatial memory, 85% in continuous attention, and 92% in selective attention. Education ($r=-.558$, $p<.001$), income ($r=-.491$, $p<.001$), CVD risk factors ($r=.445$, $p=.006$), and functional limitations ($r=-.322$, $p=.024$) were significantly correlated with total cognitive impairment score.

Conclusion: The burden of cognitive impairment in RA is significant. Future studies identifying specific etiological contributors to cognitive impairment are warranted.

ASSESSING FAMILY CARE CONFERENCES IN LONG-TERM CARE: LESSONS LEARNED FROM CONTENT ANALYSIS

P.M. Durepos^{1,2}, S. Kaasalainen¹, S. Tamara³, J. Ploeg¹, D. Parker⁵, K. Brazil⁴, A. Papaioannou^{1,2}, 1. *McMaster University, Hamilton, Ontario, Canada*, 2. *Hamilton Health Sciences Corporation, Hamilton, Ontario, Canada*, 3. *McGill University, Montreal, Quebec, Canada*, 4. *Queen’s University, Belfast, Ireland*, 5. *University of Technology Sydney, Sydney, Ontario, Canada*

End-of-life (EOL) communication in long-term care (LTC) is often inadequate and delayed, leaving residents dying with unknown preferences or goals of care. Poor communication with staff contributes to families feeling unprepared, distressed and unsatisfied negatively effecting bereavement. Family Care Conferences (FCC) aim to increase structured, systematic communication around goals and plans for EOL.

FCCs were implemented as part of the ‘Strengthening a Palliative Approach to Care’ (SPA-LTC) project in four LTC sites in Ontario, Canada. The purpose of this sub-study is to evaluate: a) content, b) processes, and c) interdisciplinary engagement using mixed methods. Twenty-four FCCs were held for residents with a Palliative Performance Scale of 40% (nearing death) considered appropriate by staff. Data was collected from FCC forms (i.e., Family Questionnaires, Conference Summaries) and electronic charts. Through directed-analysis, data was analyzed using the Canadian Hospice Palliative Care Association’s ‘Square of Care’ model which includes eight domains of care: Disease Management, Physical, Psychological, Social, Practical, Spiritual, EOL, and Loss/Bereavement.

Findings showed on average each FCC documented 66% of domains with physical and EOL care domains being used

the most, and content about loss/bereavement documented the least. Use of FCC hard copy forms had benefits over standard electronic charts including: higher proportion of goals, timely completion, category for end-of-life care and accessibility. FCCs were attended by an average of three disciplines prompting holistic content although Personal Support Workers (PSW) and physicians attended minimally. Implications to optimize FCCs include tailoring use of FCCs forms, prompting bereavement discussion, furthering engagement of PSWs and physicians.

GENETIC ASSOCIATION OF THE ABCC9 GENE WITH HIPPOCAMPAL SCLEROSIS OF AGING NEUROPATHOLOGY

Y. Katsumata¹, P.T. Nelson^{2,3}, S.R. Ellingson⁴, D.W. Fardo^{1,3},
1. *Department of Biostatistics, University of Kentucky, Lexington, Kentucky*, 2. *Department of Pathology, University of Kentucky, Lexington, Kentucky*, 3. *Sanders-Brown Center on Aging, University of Kentucky, Lexington, Kentucky*, 4. *Division of Biomedical Informatics, University of Kentucky, Lexington, Kentucky*

Hippocampal sclerosis of aging (HS-Aging) is a common neurodegenerative condition associated with dementia. To learn more about genetic risk of HS-Aging pathology, we tested gene-based associations of the ABCC9 gene, which was reported to be associated with HS-Aging pathology in previous studies. Genetic data were obtained from the Alzheimer's Disease Genetics Consortium (ADGC), linked to autopsy-derived neuropathological outcomes from the National Alzheimer's Coordinating Center (NACC). Of 3,730 subjects with both genotype and autopsy information available to us, those who died at age 60 years or older were included in this study. After applying inclusion/exclusion criteria and quality control filtering, data from 3,251 participants of European ancestry were used in the analyses. Of the 3,251 subjects included in the study, 271 (8.3%) were identified as a HS-Aging case. The ABCC9 gene was significantly associated with HS-Aging when assuming a recessive mode of inheritance. For sensitivity analysis, we confirmed the same results even in people aged 80 years or older at death. The significant gene-based association between ABCC9 and HS-Aging appeared to be driven by a region in which significant haplotype-based associations were found. We further tested the haplotypes as an expression quantitative trait locus (eQTL) using two different public-access brain gene expression databases. The HS-Aging pathology protective ABCC9 haplotype was associated with decreased ABCC9 expression, and the results were consistent in two independent datasets. The gain-of-function haplotype in the ABCC9 gene was protective for HS-Aging in older people.

A PERSON-CENTERED APPROACH TO PREDICTING THE USE OF MEDICAL CARE AND SOCIAL SERVICES IN OLDER ADULTS

G. Santoni¹, A. Calderón-Larrañaga^{1,4}, A. Marengoni^{2,1}, A. Wimo³, L. Fratiglioni^{1,5}, 1. *Aging Research Center (ARC), Karolinska Institutet, Stockholm, Sweden*, 2. *University of Brescia, Brescia, Italy*, 3. *Karolinska Institutet, Stockholm, Sweden*, 4. *Aragon Health Sciences Institute, Aragon, Spain*, 5. *Stockholm Gerontology Research Center, Stockholm, Sweden*

As health and health changes in older adults are characterized by great heterogeneity, their needs and demand for health care also vary widely. Thus, a more personalized characterization of the care needs of older people is required to inform policy makers and to provide stakeholders with more reliable healthcare management tools. The aim of this study was to determine whether the prediction of the use of medical care and social services is improved by looking at a multidimensional health index rather than at individual health indicators separately. The multidimensional Health Assessment Tool (HAT) comprehensively appraises health and functioning in community-dwelling older adults by integrating five clinical indicators: multimorbidity, physical function, cognitive status, basic-activities of daily living (ADL), and instrumental-ADL. We found that a better health status, hence higher values of HAT, was associated with a lower number of both current (same year of assessment) and future (within 3-years after assessment) hospital admissions, hospital days, and hours/month of formal and informal care, following a clear dose-response trend. The association was less straightforward with current/future number of specialist visits and future number of primary care visits. The ability to predict any of the six health outcomes was significantly greater for the HAT than for disability and/or multimorbidity alone, with the exception of specialist visits which showed higher correlation with multimorbidity. In conclusion, our multidimensional index optimally predicts use of medical and social care by considering not only the chronic diseases older people suffer from, but how these interact and impact on functioning.

IS THEORY UTILIZATION LESSENING? AN ANALYSIS OF THEORIES IN PSYCHOLOGICAL GERONTOLOGY RESEARCH

N. Cone², M. Heinz¹, 1. *Upper Iowa University, Fayette, Iowa*, 2. *Loras College, Dubuque, Iowa*

This study examined which theoretical frameworks and models were most prevalent in the Journal of Gerontology, Psychological Sciences through a content analysis of the articles published between years January 2012 to November 2016. Two hundred and seventy-three articles were examined and 152 articles included a theoretical or model framework. Although some researchers included a framework, not all researchers fully used a theory or model as a basis for their research. For example, some articles only briefly mentioned a theory in the discussion section of the paper. Of those 152 articles, 98 incorporated theory substantially, whereas 54 articles only mentioned theory briefly. With combined results, the most frequently cited or used theory was Socioemotional Selectivity theory ($n = 33$). This was followed by the Five-Factor Model (Big Five Personality; $n = 9$) and Selection, Optimization, and Compensation theory ($n = 7$). Interestingly, 162 of the articles did not specifically present a model or theoretical framework. This might signify a lack of current theories or models properly fitting or guiding the research. However, other factors may have impacted the results. Circumstances such as a large focus on biological research and/or a special addition specifically focused on widowhood. These initial findings give the gerontological community a critical look at how theory and models shape gerontological research and current/future directions

of examination. Further research and examination of theoretical and/or model framework usage amongst gerontology research will help determine the validity of these results.

METABOLIC CROSS-TALK BETWEEN ER, MITOCHONDRIA, AND NUCLEUS: POSSIBLE IMPACT IN AGING

I.A. Dieterich, Q. Yu, K. Overmyer, J. Coon, L. Li, L. Puglielli, *Neuroscience Training Program, University of Wisconsin, Madison, Madison, Wisconsin*

Nε-lysine acetylation in the lumen of the endoplasmic reticulum (ER) regulates quality control and proteostasis within the secretory pathway. Mechanistically, it has been established that the import of acetyl-CoA into the ER lumen by the membrane transporter AT-1/SLC33A1 is an essential biochemical component of the ER acetylation machinery. Homozygous mutations in AT-1 are associated with developmental delay and childhood death while heterozygous mutations are associated with a familial form of spastic paraplegia. Finally, gene duplications of AT-1/SLC33A1 have been identified in patients with autistic-like features, intellectual disability and dysmorphic features that are consistent with a diagnosis of segmental progeria. Neuron-specific overexpression of AT-1 in the mouse leads to an autistic-like phenotype while systemic overexpression leads to a progeria-like phenotype that mimics an accelerated form of aging. While dissecting the phenotype of these mice, we discovered the influx of acetyl-CoA into the ER causes epigenetic and mitochondria adaptation. In light of the strong relationship between mitochondria biology and TCA engagement with aging and several age-associated diseases, we decided to use a combination of proteomic and metabolomic approaches to dissect the biochemical and molecular mechanisms that mediate the metabolic and functional adaptation of the mitochondria in the above progeria-like animals. These studies were paralleled by ex vivo genetic approaches to identify novel key regulatory elements. The results show that ACLY, SLC13A5 and SLC25A1 are essential in maintaining acetyl-CoA flux within the cell and a functional cross-talk between the ER and the mitochondria.

CHILDHOOD DISADVANTAGE AND METABOLIC SYNDROME: AN EXAMINATION OF GENDER AND HEALTHY LIFESTYLES

C. Lee¹, V. Tsenkova¹, J. Boylan², C.D. Ryff¹, *1. University of Wisconsin-Madison, Madison, Wisconsin, 2. University of Colorado-Denver, Denver, Colorado*

Objectives: We investigate (a) the extent to which healthy lifestyles (physical activity and diet) explain the association between childhood disadvantage and metabolic syndrome (MetS) in midlife, and (b) whether there are gender differences in the associations.

Methods: Data on 1,054 respondents came from the Biomarker Subsample of the Midlife in the U.S. Study. Childhood disadvantage was measured with four indicators: parental education, parental occupational prestige, financial level growing up, and welfare status. MetS is the total number of MetS symptoms defined by the National Cholesterol Education Program. Physically intense activities (> 500 metabolic equivalent minutes per week) were categorized into three domains: leisure, work, and chores. Food

consumption consists of two domains: healthy foods (fruits/vegetables, whole grains, fish, lean meat, non-meat protein) and unhealthy foods (sugary beverages, fast food, high-fat meat).

Results: After adjusting for life course confounding factors, individuals who were disadvantaged in childhood are less likely to participate in physically intense leisure activities with a stronger association for women after adjusting for adult SES. The association between childhood disadvantage and diet, however, appears stronger for men. Compared to advantaged men, those who were disadvantaged in childhood tend to consume more unhealthy food. In the association between childhood disadvantage and MetS, leisure activity is a significant mediator for women; unhealthy food consumption is a significant mediator for men.

Conclusions: Disadvantages in early life shape healthy lifestyles in adulthood. Life-course perspectives and gender-specific approaches are important for behavioral interventions to improve the cardiometabolic health of adults.

EFFECTS OF TAI CHI CHUAN ON IMMUNE AND INFLAMMATORY MAKERS OF ELDERS WITH AND WITHOUT DIABETES

K. Yang^{1,2}, W. Chang³, H. Chuang³, S. Yeh², *1. Mackay Memorial Hospital, Taipei, Taiwan, 2. Mackay Medical College, New Taipei City, Taiwan, 3. Kaohsiung Chang Gung Memorial Hospital, Kaohsiung, Taiwan, Taiwan*

Background: We have previously shown that moderate exercise of Tai Chi Chuan exercise could increase complement factor H with a decrease of factor B as a proteomic biomarker of Tai Chi Chuan exercise (Clin Chem. 2010;56:127–31.), and diabetic patients with different complications have varied proteomic markers (J Diabetes Metab Disord. 2016;15:24.). This study has further analyzed whether a 12-week program of Tai Chi Chuan exercise improves the inflammatory markers of type 2 diabetes mellitus (T2DM) patients in comparison to aged matched normal elders.

Methods: Plasma low abundance proteins were enriched by depletion of 14 high abundance proteins by an affinity removal system, and subjected to nanoflow liquid chromatography electrospray ionization (nano LC-ESI) mass spectrometry after a gel electrophoresis with in-gel digestion for 8 pairs of plasma from normal elders and T2DM. The plasma differential proteomes between normal adults (n=20) and diabetic patients (n= 24) before and after a 12-week Tai Chi Chuan exercise were validated by enzyme-linked immunosorbent assay (ELISA).

Results: A total of 826 proteins in plasma were consistently identified from 8 plasma samples of normal adults, and 817 were consistently identified in 8 plasma samples of T2DM patients. Using the MetaCore analysis, we found the low abundance proteins in plasma between normal adults and T2DM patients were significantly different in 5 functional pathways. We next selected the 6 proteins (DPP4, PIP, NGAL, L1CAM, THBS2, and GLP1) associated with metabolism or inflammation for validation by enzyme-linked immunosorbent assay. We found that PIP, THBS2, L1CAM and NGAL levels were significantly (p<0.013, Bonferroni correction adjust) higher in T2DM patients than in normal adults. Interestingly, Tai Chi Chuan exercise significantly (p=0.04)

increased DPP4 levels in normal elders but not in diabetic patients. The higher expression of PIP, THBS2, L1CAM and NGAL inflammatory markers in T2DM were not significantly reduced after Tai Chi Chuan exercise.

Conclusions: This study identified that Tai Chi Chuan exercise could increase DPP4 levels in normal elders, but did not significantly reduced inflammatory biomarkers in diabetic patients. Further studies to find another moderate exercise for improvement of inflammatory markers of T2DM patients are needed.

INTERNET-BASED INTERVENTIONS FOR CAREGIVERS OF ASSISTIVE TECHNOLOGY USERS: NEEDS AND PERCEPTIONS

D. Glinas Bronsard^{1,2}, B. Mortenson^{3,4}, S. Ahmed^{2,5}, C. Guay^{1,2}, C. Auger^{1,2}, 1. *Rehabilitation, Université de Montréal, Montréal, Quebec, Canada*, 2. *Center for Interdisciplinary Research in Rehabilitation of Greater Montreal (CRIR), Montreal, Quebec, Canada*, 3. *University of British-Columbia, Vancouver, British Columbia, Canada*, 4. *GF Strong Rehabilitation Center, Vancouver, British Columbia, Canada*, 5. *McGill University, Montreal, Quebec, Canada*

Providing home-based care to older adults using assistive technology (AT) (e.g. mobility aids, communication aids) can be challenging for family caregivers. MOvIT-PLUS™ is an Internet-based intervention aiming to offer remote monitoring, support and training to dyads of family caregivers and older adults using AT in their daily lives. Using an iterative user-centred design approach, 30 semi-structured interviews were conducted with end-users and key informants to i) identify end-user needs through discussion about past experiences with AT, and ii) explore end-users' perceptions of a mock-up of MOvIT-PLUS™. A modified content analysis approach was used to identify themes from a mix of emerging and expected concepts. Results indicate AT procurement is viewed as an ongoing cyclical process, with potential unmet needs at key moments before and after AT procurement. When expressing their preferences about the MOvIT-PLUS™ mock-up, end-users and key informants were generally supportive of automated monitoring calls and asynchronous training features, such as skill-based video bank. Moreover, end-users express their appreciation regarding professional-led counselling and training features such as videoconferences, but key informants had divergent opinions. These results are guiding the MOvIT-PLUS™ prototype design towards a graded support approach, starting with empowering end-users to resolve AT-related challenges and then adding professional support when needed. This study highlights that Internet-based interventions dedicated to family caregivers should consider concrete daily task challenges, ensure adequate follow-up and offer human support.

EDUCATIONAL LEADERS IN GERONTOLOGY: INTRODUCING COMPETENCY-BASED GERONTOLOGY EDUCATION IN KAZAKHSTAN

G. Yermakhanova^{1,2}, K. Absattarova^{1,2}, L. Waters¹, E.F. Ansello¹, 1. *Virginia Commonwealth University, Richmond, Virginia*, 2. *National Center for Health Development, Ministry of Health, Astana, Kazakhstan*

There are no courses in gerontology in Kazakhstan to train its medical students; however, this is about to change. Two Kazakh Scholars received 10-month internships at Virginia Commonwealth University. As part of their internship, they completed the 160-hour Faculty Development Program (FDP) by the Virginia Geriatric Education Center. The FDP is a case-themed, interprofessional curriculum grounded in evidence-based practices, with objective competencies reflecting the PHA; format is an in-person, monthly, interactive seminar series designed to increase knowledge and competency in interprofessional geriatrics and clinical care skills. To fulfill requirements of the FDP, participants complete a "curriculum project" inspired by FDP content. The Scholars designed a teaching intervention and evaluation plan to address the gap in gerontology education in Kazakhstan. Their project led to a 90-hour, two-credit course on the foundations of gerontology at Medical University that is about to be implemented. The Scholars incorporated the AGHE Gerontology Competencies for Undergraduate and Graduate Education as a framework for the curriculum. The primary objective is to introduce first-year medical students to the foundations of gerontology. Students will be paired with older adults to learn about the individual's experiences with health and the healthcare system. The curriculum reflects not only the traditional "bio-psycho-socio" template but also content and competencies on critical thinking, research, and problem solving. The overall goal is to establish an effective means of infusing geriatrics content into the medical school curriculum, while positively affecting mentors' and students' attitudes toward each other. Obstacles to implementation and successful processes are critically examined.

DEVELOPMENT OF A RAT CLINICAL FRAILTY INDEX

A.E. Kane, A. Yorke, C. Hancock Friesen, S.E. Howlett, S. O'Blenes, *Pharmacology, Dalhousie University, Halifax, Nova Scotia, Canada*

There has been a recent focus on the development of pre-clinical models of frailty in mice. A mouse clinical frailty index (FI) was developed based on the concept that frailty can be quantified as the accumulation of deficits in health, as originally shown in humans. Rats are a commonly used model for aging studies, so the current study aimed to develop a FI that measures the accumulation of clinically-evident health-related deficits in rats. Male Fischer 344 rats were aged from 6 to 9 months (n=12), and from 13 to 21 months (n=41). A FI comprised of 27 health-related deficits was developed from a review of the literature and consultation with a veterinarian. Deficits were scored 0 if absent, 0.5 if mild or 1 if severe. A FI score was determined for each rat every 3–4 months, and for the older group mortality was assessed up to 21 months. Mean FI scores significantly increased at each time point for the older rats (13 months, 0.06 ± 0.00 ; 17 months, 0.13 ± 0.01 ; 21 months 0.21 ± 0.01 ; $p < 0.0001$). The rate of deficit accumulation, and the maximum FI score (0.40) were similar to those observed in previous mouse and human FI studies. A high FI score measured at both 17 months ($p < 0.0001$) and 21 months of age ($p = 0.007$) was also associated with decreased probability of survival as assessed with Kaplan-Meier curves. The rat clinical FI has

significant value for use in aging and interventional studies, and will contribute to translational research in this field.

MULTIMORBIDITY PATTERNS PROVIDE ADDED PROGNOSTIC INFORMATION BEYOND FRAILTY STATUS IN OLDER ADULTS

Q. Nguyen¹, C. Wu⁴, M. Odden⁴, D. Kim^{2,3}, 1. *University of Montreal, Montreal, Quebec, Canada*, 2. *Brigham and Women's Hospital, Boston, Massachusetts*, 3. *Beth Israel Deaconess Medical Center, Boston, Massachusetts*, 4. *Oregon State University, Corvallis, Oregon*

Assessing frailty is useful in measuring heterogeneity of health status and predicting prognosis in older adults. However, individuals in a given frailty state have diverse multimorbidity patterns, some of which may portend poorer prognosis. This retrospective cohort study aimed to evaluate the impact of frailty and multimorbidity patterns on mortality in 7197 community-dwelling older adults in the National Health and Aging Trends Study 2011–2015. Individuals were assessed for the Fried frailty phenotype and 10 chronic conditions in 2011. Latent class analysis uncovered 5 multimorbidity patterns: minimal disease (n=1780), cardiovascular disease (CVD) (n=2087), non-CVD (n=1968), neuropsychiatric disease (n=641), and very sick (n=721). Robust individuals had minimal disease (41.4%), CVD (27.6%), or non-CVD (26.0%), whereas frail individuals had CVD (24.7%), non-CVD (21.9%), neuropsychiatric disease (22.7%), or very sick patterns (23.6%). During the 4-year period, the mortality risk was 6.6% for the robust (n=147/2213), 15.4% for the pre-frail (n=561/3647), and 37.7% for the frail (n=504/1337). Within each frailty state, the mortality varied substantially across the multimorbidity patterns, with minimal disease being the lowest and neuropsychiatric disease being the highest: 5.0–19.2% for the robust, 12.5–25.3% for the pre-frail, and 27.7–55.6% for the frail. Notably, compared with minimal disease, CVD was significantly associated with increased mortality only in robust and pre-frail individuals, not in frail individuals. Neuropsychiatric disease and very sick patterns were significantly associated with increased mortality only in pre-frail and frail individuals. These findings underscore the importance of considering clinically meaningful multimorbidity patterns in addition to frailty for better prognostication in older adults.

DESCRIPTIVE COMPARISONS BETWEEN PATIENTS WITH STROKE IN INPATIENT AND SKILLED NURSING REHABILITATION

I. Hong, A. Karmarkar, W. Chan, C. Andersen, Y. Kuo, K.J. Ottenbacher, J.S. Goodwin, T. Reistetter, *Division of Rehabilitation Sciences, University of Texas Medical Branch, Galveston, Texas*

Comparison of stroke rehabilitation outcomes across post-acute care (PAC) settings has been questioned because of the different patient and facility characteristics (i.e., functional status or stroke comorbidities) across PAC settings. Therefore, we explored differences in patient discharged to inpatient (IRF) and skilled nursing (SNF) rehabilitation following an ischemic or hemorrhagic stroke. We conducted a secondary analysis of data from the Centers for Medicare and Medicaid Services (CMS). The study included those

who sustained an ischemic or hemorrhagic stroke who were discharged to inpatient or skilled nursing rehabilitation from 2013 to 2014. Descriptive analyses were performed to explore patient and hospital differences in discharges to IRF and SNF. The final sample included 122,084 patients across 3,677 acute hospitals with 3,649 hospitals discharging individuals with an ischemic stroke compared to only 1,832 hospitals discharging patients with a hemorrhagic events. Across the sample, 88.6% of patients had ischemic event with 54.6% of patient being discharged to IRF. Patients 85 years and older were more likely to discharge to SNF. Similarly, there were greater numbers of comorbid conditions among those discharged to SNF. Comparison of self-care and mobility across settings suggest that IRF patients have higher functional abilities at admission to rehabilitation. This study suggests considerable differences in acute hospital discharge practices for ischemic and hemorrhagic stroke patients who receive IRF and SNF rehabilitation. Furthermore, these differences highlight the need for careful consideration and matching of patient and facility characteristics when comparing outcomes of care for post-acute care rehabilitation.

PSYCHOTROPIC MEDICATIONS AND QUALITY OF LIFE IN RESIDENTIAL AGED CARE FACILITIES

S. Harrison^{1,3}, C. Bradley^{1,3}, R. Milte^{1,3}, E. Liu^{1,3}, L. Kouladjian O'Donnell^{1,2}, S.N. Hilmer^{1,2}, M. Crotty^{1,3}, 1. *NHMRC Cognitive Decline Partnership Centre, Sydney, New South Wales, Australia*, 2. *University of Sydney, Sydney, New South Wales, Australia*, 3. *Flinders University, Adelaide, South Australia, Australia*

Recent clinical recommendations state that many psychotropic medications should be avoided wherever possible in people with cognitive impairment and dementia. Psychotropic medications have been associated with increased risk of falls, hospitalization, stroke and mortality in residents of aged care facilities. The objective of this study was to examine associations between psychotropic medications and quality of life in older adults living in residential care facilities. The population was from a cross-sectional study of 537 residents from 17 different residential aged care facilities in Australia, with a high prevalence of cognitive impairment and dementia. Overall, 70.8% (n=380) of the population had been prescribed/dispensed at least one psychotropic medication in the 100 days prior to recruitment. Participants residing in facilities which had adopted a person-centred, 'cottage model' of residential care had a lower prevalence of psychotropic medications (OR (95% CI): 0.26 (0.14, 0.52), p<0.001). An increased number of psychotropic medications were associated with poorer quality of life according to DEMQOL-Proxy-Utility scores (β (SE): -0.012 (0.006), p=0.03) and EQ-5D-5L scores (-0.026 (0.011), p=0.02) after adjustment for resident-level and facility-level characteristics. Analysis of the individual classes of psychotropic medications showed antipsychotics were associated with poorer DEMQOL-Proxy-Utility scores (-0.030 (0.013), p=0.03) and benzodiazepines were associated with poorer EQ-5D-5L scores (-0.062 (0.024), p=0.01). In conclusion, an increased number of psychotropic medications were associated with poorer quality of life. These medications have many adverse effects and the use of these medications should be re-examined when

investigating approaches to improve quality of life for older people in residential care.

POSTMENOPAUSAL SEXUAL ACTIVITY: OLDER MEN'S OPINIONS IN SOUTHWESTERN NIGERIA

O.C. Omobowale, *Community Medicine, University of Ibadan, Nigeria, Ibadan, Oyo State, Nigeria*

Postmenopausal sexual activity is considered a taboo in some Nigerian societies with existing information focused on the women, the men often neglected. This study assessed older men's perceptions of postmenopausal sexual activity.

A community based study was conducted among men who are 60 years and above in Southwestern Nigeria. Using a Focus Group discussion guide, opinions of community dwelling men on postmenopausal sexual activity and associated sociocultural beliefs were explored. Eight focus group discussions were conducted in all and data were analyzed thematically.

The mean age of the respondents was 64.0 ± 3.6 years. All the respondents were married and most of them had no formal education. The men listed the following socio-cultural beliefs associated with post-menopausal sexual activity: menopause makes a woman biologically manlike; sex after menopause is evil, causes swollen abdomen due to accumulated semen, makes one sick, indicates promiscuity and women are less sexually attractive after menopause. More than half of the respondents agreed with at least one of the socio-cultural beliefs. The majority were of the opinion that menopause marked cessation of sexual activity and many of the physical changes seen in old age including body weakness, urinary incontinence and loss of sight were ascribed to post-menopausal sexual activity. More than 70% of the discussants had stopped having sex and were of the opinion that post-menopausal sexual activity can cause "chronic abdominal pain for women", "semen contamination" and "weakness of manhood" for men (erectile dysfunction). "I would rather take another younger wife, than risk being impotent for life"

Sociocultural beliefs adversely affected postmenopausal sexual activity among these men, which has implications on the men seeking alternative sexual partners with the attendant problems of sexually transmitted infections /HIV. Educational interventions targeted at changing these erroneous beliefs should be developed and implemented.

YOUNG ADULTS' CONCERNS AND COPING STRATEGIES REGARDING INTERACTIONS WITH GRANDPARENTS WITH DEMENTIA

A.R. Ebert, A.M. Miron, A.E. Thompson, S.H. McFadden, *University of Wisconsin Oshkosh, Appleton, Wisconsin*

Concerns and coping strategies related to face-to-face interactions between young adults and their grandparents/great-grandparents with dementia were explored through the lens of a solidarity-versus-conflict conceptual framework. Participants indicated concerns about their inability to maintain the relational connection, not knowing what to say or how to behave, their lack of perspective-taking skills and emotion-regulation strategies, interacting with an ever-changing other, as well as concerns about other co-participants in the interaction. Participants' coping strategies were classified along two interaction dimensions: solidarity

(e.g., desire to maintain and improve the interaction with the grandparent by seeking the other's company, loving the other, and maintaining and celebrating the other's humanity/personhood) and conflict (e.g., dealing with self-focused concerns and the lack of skills and knowledge by engaging in substitute avenues for communication and using emotion-regulation strategies to reduce negative affect). Reducing grandchildren's self-focused interaction concerns could lead to more meaningful interactions in which focus is switched from the grandchild's concerns about their own interaction competence to concerns about the grandparent's wellbeing.

PREVENTING READMISSIONS AND INCIDENT DELIRIUM IN ELDERLY (PRIDE) PROGRAM

G. Gnanasekaran^{1,2}, S. Gravenstein^{1,2}, B. Idemoto¹, M. Singh^{1,2}, C. Liu², 1. *University Hospitals of Cleveland, Cleveland, Ohio*, 2. *Case Western Reserve University, Cleveland, Ohio*

Low cost intervention hospital based care models can reduce length of stay and decrease readmission rates of elderly patients, while improving patient care quality. Programs like Hospitalized Elder Life Program (HELP) and Coleman Care Transition Intervention© (CTI) have independently demonstrated better patient outcomes. Collectively, programs that improve outcomes do better with a comprehensive approach in primary prevention of delirium and providing safe transition of care. PRIDE (Preventing Readmissions and Incident Delirium in Elderly), a Quality Improvement (QI) initiative derives its program themes from the Hospitalized Elder Life Program (HELP) and Coleman Care Transition Intervention© to prevent delirium and provide safe care transitions for elderly hospitalized patients. An electronic dashboard identifies elderly patients admitted at a large academic hospital at risk for delirium and readmissions. Two fold interventions are then provided. Delirium Prevention: Trained volunteers cognitively and functionally engage patients in structured activities adapted from HELP. Improve Care Transitions: A Patient Centered Health record (PRIDE Journal) empowers patients with self- management tools to raise awareness on functional independence and medication self-management on discharge. Preliminary data shows improved outcome with reduced LOS (5.8 days vs 7.7 days, N=45), reduced readmission rates (9% vs 42 %, N= 45). 94% of patients endorsed improved self-management skills. The program also demonstrates better staff satisfaction in patient care. PRIDE program is able to demonstrate better quality of care for a hospitalized elderly patient and improve care transitions.

ESTABLISHING BIOLOGICAL PLAUSIBILITY FOR COGNITIVE FRAILTY: SYSTEMATIC REVIEW

L. Sargent^{1,2,3}, A. Starkweather⁴, S. Hobgood^{5,6}, H. Thompson⁷, M. Nalls², A. Singleton², E.J. Amella³, 1. *Virginia Commonwealth University School of Nursing, Richmond, Virginia*, 2. *NIH/NIA Division of Neuroscience, Bethesda, Maryland*, 3. *Medical University of South Carolina School of Nursing, Charleston, North Carolina*, 4. *University of Connecticut School of Nursing, Storrs, Connecticut*, 5. *Virginia Commonwealth University Hospital - VCU Health, Richmond, Virginia*, 6. *Virginia Commonwealth School of Medicine, Richmond, Virginia*,

7. NIH Library, Division of Library Services, Office of Research Services, National Institutes of Health, Bethesda, Maryland

On April 16th, 2013 the International Consensus Group (I.A.A./I.A.G.G) formally defined the novel phenotype cognitive frailty; a condition characterized by the co-occurrence of physical frailty and cognitive impairment. We hypothesize that there are biological factors to describe the interconnection between physical frailty and cognitive impairment. This systematic review focuses on identifying the shared measurable biological and genomic mechanisms for physical frailty and cognitive decline. Two independent reviewers assessed the eligibility of each report based on predefined inclusion criteria to ensure interrater reliability; a third reviewer resolved conflicting assessments. The review was conducted using PubMed, Embase, Scopus, Web of Science, LILACS, Gene Indexer, and GWAS Central. Findings resulted in 1232 abstracts for full review, 335 articles were included in the final review. Data extraction identified a correlation between 14 distinct inflammatory and protein markers with biomarker-related gene expression for cognitive frailty. Meaningful findings were identified in the relationship between key inflammatory (IL6, IL8, CRP, and Fibrinogen, TNF-alpha, and homocysteine) and clinical (gait, BMI, and anticholinergic medications) markers, and cognitive frailty. The abstract presents the first findings of the underlying biological characteristics for cognitive frailty providing evidence for converging pathophysiological pathways.

NATIVITY DIFFERENCES IN RECOVERY AND DETERIORATION IN LATE-LIFE DISABLEMENT

R. Wang, *Syracuse University, Syracuse, New York*

The current older adult population in the United States is not only one of the historically largest older adult populations, but one of the most racially and ethnically diverse, in part due to the growing number of aging immigrants. Despite sharing a racial or ethnic category, the lived experiences of immigrants may diverge from their native born counterparts. Moreover, with the greater prevalence of disability, it is critical to understand how older populations move through the disablement process. Using longitudinal panel data from the NHATS (2011) this research focuses on nativity differences in recovery and deterioration in late-life disablement between US-born and immigrant older adults living in the US. This research uses hazard models to provide a more nuanced picture of immigrant and non-immigrant old adult disablement, using a multi-stage measure of mobility and self-care disablement from NHATS. Results indicate that nativity differences in both recovery and deterioration in late-life disablement is mediated by early- and mid-life socioeconomic contexts. Additional models suggest that life course timing of migration shapes late-life disablement among immigrant older adults in the US. Developing greater knowledge on this process has implications on costs and possibilities for earlier interventions and the delay of more severe disability in later life for both US-born and immigrant older adults in the US.

SERUM SIRTUINS AS NOVEL PROTEIN MARKERS FOR FRAILITY

S. Dey, A. Singh, N. Rai, S. Shekhar, A.B. Dey, *Biophysics, All India Institute of Medical Sciences, New Delhi, New Delhi, India*

Frailty has emerged as a major health issue among older patients. The syndrome of frailty is a multi-organ dysfunction in sub-cellular level, affects older people and progresses irreversibly if not intervened at very early stage. Sirtuins (SIRT), a conserved family of NAD-dependent proteins, is one of the many mimics of calorie restriction which improves lifespan and health in experimental animals. In this cross sectional study, association of serum sirtuin concentration was assessed in frail and non-frail older subjects with an objective of examining it as a marker of frailty in old age. Serum SIRT1, SIRT2, SIRT3, SIRT4, SIRT5, SIRT6 and SIRT7 were estimated by real time label free Surface Plasmon Resonance (SPR) and Western Blot in 119 non-frail and 81 frail individuals, diagnosed by Fried's criteria. Serum SIRT level in Mean \pm SD; SIRT1 (non-frail-4.67 \pm 0.48ng/ μ l; frail-3.72 \pm 0.48ng/ μ l), SIRT2 (non-frail-15.18 \pm 2.94ng/ μ l;frail-14.19 \pm 2.66ng/ μ l), SIRT3 (non-frail-7.72 \pm 1.84ng/ μ l; frail-6.12 \pm 0.97ng/ μ l) SIRT5 (non-frail-8.71 \pm 3.48ng/ μ L; frail-7.25 \pm 3.13ng/ μ L), SIRT6 (non-frail-9.82 \pm 3.64ng/ μ L;frail-8.36 \pm 3.33ng/ μ L) and SIRT7 (non-frail-19.26 \pm 3ng/ μ L;frail-16.96 \pm 3.33ng/ μ L) levels were significantly lower among frail patients compared to the non frail. However, SIRT4 was not significantly different between the groups. In multivariable regression analysis, lower SIRT1 and SIRT3 level were significantly associated with frailty after adjusting age, gender, diabetes mellitus, hypertension, cognitive status (MMSE) and number of co-morbidities. For detecting the optimum diagnostic cut-off value a ROC analysis was carried out. The area under curve for SIRT1 was 0.9037 (cut-off-4.29ng/ μ l; sensitivity-81.48%; specificity-79.83%) and SIRT3 was 0.7988 (cutoff-6.61ng/ μ L; sensitivity-70.37%; specificity-70.59%). The present study shows that lower circulating SIRT1 and SIRT3 levels can be distinctive marker of frailty.

THE ASSOCIATION BETWEEN FILIAL DISCREPANCY AND DEPRESSIVE SYMPTOMS: FINDINGS FROM THE PINE STUDY

M. Li, X. Dong, Y. Hua, *Rush University Medical Center, Chicago, Illinois*

Background: The relationship between filial piety and depressive symptoms has been widely discussed, but limited research focused on the gap between filial expectations and filial receipt. This study aims to investigate the association between filial discrepancy and depressive symptoms. Methods: Data were derived from the Population Study of Chinese Elderly (PINE), a community-engaged, population-based epidemiological study of US Chinese older adults aged 60 and above in the Greater Chicago area. Depressive symptoms were measured by the Patient Health Questionnaire-9. Overall filial discrepancy was evaluated by filial receipt minus expectations. Levels of overall filial discrepancy divided older adults into four groups based on the medium value of filial expectations and receipt. Logistic regression analyses were performed. Results: Older adults with greater filial

receipt than expectations were more likely to have lower risk of depressive symptoms (OR, 0.95, (0.92–0.97)). The group with high expectations and low receipt has the highest risk of depressive symptoms among the four groups (OR, 1.51, (1.07–2.13)). Greater receipt than expectations in care (OR, 0.83, (0.76–0.92)), make happy (OR, 0.77, (0.69–0.86)), greet (OR, 0.88, (0.79–0.97)), obey (OR, 0.76, (0.68–0.86)) and financial support (OR, 0.80, (0.71–0.89)) was associated with lower risk of depressive symptoms. Conclusions: This study goes beyond previous research by examining the association between filial discrepancy domains and depressive symptoms. Cultural relevancy of health interventions is important in the context of Chinese communities. Health care professionals are suggested to be aware of the depressive symptoms of US Chinese older adults with high filial expectations and low receipt.

LONG-TERM EFFECTS OF PREDIABETES AND DIABETES ON COGNITIVE TRAJECTORIES IN A POPULATION-BASED COHORT

A. Marseglia, A.K. Dahl Aslan, L. Fratiglioni, N.L. Pedersen, W. Xu, *Karolinska Institutet, Stockholm, Sweden*

Diabetes has been linked to dementia risk, however, the cognitive trajectories in older adults with diabetes remain unclear. We aimed to investigate the effect of prediabetes and diabetes on cognitive trajectories among cognitively intact older adults in a long-term follow-up study.

Within the Swedish Adoption/Twin Study of Aging, 793 cognitively intact older adults aged ≥ 50 were identified at baseline and followed for up to 23 years. Cognitive domains (verbal, spatial/fluid, memory, speed) were assessed at baseline and up to seven follow-ups. Prediabetes was defined according to blood glucose levels in diabetes-free participants. Diabetes was ascertained based on self-report, hypoglycemic medication use and blood glucose levels. Data were analyzed with linear mixed-effect models adjusting for potential confounders.

At baseline, 68 participants (8.6%) had prediabetes and 45 (5.7%) had diabetes. Compared to diabetes-free individuals, people with diabetes had lower performance in spatial/fluid abilities (β -2.63; 95% CI -5.36, 0.05; $p = 0.058$), and an accelerated linear decline over time in verbal abilities (β -0.15; 95% CI -0.29, -0.01; $p = 0.041$). Prediabetes was associated with an accelerated decline in processing speed (β -0.01; 95% CI -0.02, -0.004; $p = 0.041$), but with a better maintenance of memory (β 0.23; 95% CI 0.05, 0.42; $p = 0.013$) over the follow-up.

Prediabetes may accelerate processing speed decline, and diabetes is associated with the verbal ability decline, suggesting that diabetes and even prediabetes affect especially the cognitive domains of fluid intelligence at the early stages of cognitive impairment.

UNDERSTANDING THE DETERMINANTS OF FLUID INTAKE IN LONG-TERM CARE

A.M. Namasivayam^{1,2}, J.M. Morrison³, N. Carrier⁴, C. Lengyel⁵, S. Slaughter⁶, C. Steele^{1,2}, H.H. Keller^{3,7},
1. *University of Toronto, Toronto, Ontario, Canada*,
2. *Toronto Rehabilitation Institute - University Health Network, Toronto, Ontario, Canada*, 3. *University of*

Waterloo, Waterloo, Ontario, Canada, 4. *University of Moncton, Moncton, New Brunswick, Canada*, 5. *University of Manitoba, Winnipeg, Ontario, Canada*, 6. *University of Alberta, Edmonton, Ontario, Canada*, 7. *Schlegel-UW Research Institute for Aging, Waterloo, Ontario, Canada*

Dehydration is estimated to be present in almost half of long term care (LTC) residents, and many residents do not consume the recommended levels of daily fluid intake (3700mL and 2700mL in men and women respectively) (Institute of Medicine of the National Academies, 2004). This likely has negative consequences for health, well-being and quality of life. The present study aims to understand the factors contributing to fluid intake of LTC residents. Data were collected from 622 LTC residents (31.7% male) from 32 LTC homes in Canada, aged 62–107 years (86.8 ± 7.8). Total fluid intake was estimated over three non-consecutive days (meals and snacks), considering estimated volume of beverages and water content of liquidized food. Average daily fluid intake ranged from 311–2390mL (1103.9 ± 378.7). Rigorous methods were used to collect resident and unit-level variables that captured potential risk factors for low fluid intake such as dementia status, activities of daily living, eating challenges, and mealtime experiences. Hierarchical regression analysis using backward elimination revealed that fluid intake was negatively associated with increased age, cognitive impairment, eating challenges and increased dining room staffing. Factors that were positively associated with intake were: being male, requiring more physical assistance, and more positive interactions between staff and residents at meals ($R^2 = 0.41$; $F_{88,533} = 4.20$, $p < 0.0001$). These results indicate that total fluid intake of LTC residents is insufficient. Variables identified to predict intake could help inform strategies and targeted interventions to improve fluid intake for residents of LTC. Funded by the Canadian Institutes of Health Research.

UNPLANNED AND EXTENDED NAPPING AMONG OLDER ADULTS: FREQUENCY, DURATION, AND PREDICTORS

N.E. Leland¹, D.J. Fogelberg², T. Mroz², M.V. Vitiello²,
1. *Occupational Science and Occupational Therapy, University of Southern California, Los Angeles, California*,
2. *University of Washington, Seattle, Washington*

Poor sleep is associated with negative health outcomes among older adults, yet little is known about napping in this population and research has not distinguished between planned and spontaneous naps, or duration. This study examines napping using a retrospective cohort of Medicare beneficiaries >65 years of age enrolled in year four of National Health and Aging Trends Study who reported regular napping ($n=1,016$). Regressions examined the relationships between sociodemographic and clinical characteristics and napping outcomes, specifically unplanned or extended (i.e., >60 minutes) naps. Survey weighting was used for all analyses.

Among Medicare beneficiaries who nap, 58.7% reported unplanned naps and 18.5% regularly take extended naps. Unplanned napping was associated with older age, non-white race, non-married status, poorer self-reported health, and shorter nighttime sleep duration. For example, individuals 75–84 years of age had 2.1 higher odds of unplanned

naps compared to those aged 65–74. Male sex, poorer self-reported health, and a greater number of chronic conditions were associated with higher odds of extended naps. Those with the worst self-reported health were 2.8 times more likely to take long naps than those reporting the best health. Pain and depression were not associated with either outcome.

We found that ~4.3 million older adults in the U.S. regularly nap without meaning to, and ~1.4 million individuals routinely took extended naps. Furthermore, different constellations of risk factors are associated with unplanned and extended napping. Research examining the impact of unplanned and extended napping is warranted to optimize sleep and other health outcomes.

MUTATIONS IN MITOCHONDRIAL ALH-6 RESULT IN EARLY REPRODUCTIVE SENEESCENCE

C. Yen, D. Lynn, S. Curran, *University of Southern California, Los Angeles, California*

Reproduction is essential to perpetuate life. Animals must utilize strategies in order to allocate the necessary resources for the energy-costly process of reproducing. Here, we show that *C. elegans* with mutation in *alh-6*, a conserved mitochondrial proline catabolism gene known to cause mitochondrial defects show a diet-independent decline in fertility. These animals have altered expression of metabolism and male-reproduction genes and display several sperm-specific defects. We identify that PRDH-1 is essential to confer these phenotypes and identify key metabolites and molecules that influence this premature reproductive senescence. Altogether, our data reveal new insights in reproductive aging and describes how important proper mitochondrial function is for reproductive capacity.

DANCE-MOVEMENT THERAPY LEADS TO A LOWER CORTISOL AWAKENING RESPONSE—A SIGN OF STRESS REDUCTION?

T. Vranceanu^{1,2,3}, A. Esmail^{1,2,3}, D. Predovan⁴, J. Pruessner⁵, L. Bherer^{2,3,6}, 1. *Concordia University, Montreal, Quebec, Canada*, 2. *Institut Universitaire de Gériatrie de Montréal, Montreal, Quebec, Canada*, 3. *Montreal Heart Institute, Montreal, Quebec, Canada*, 4. *Université du Québec à Montréal, Montreal, Quebec, Canada*, 5. *McGill University, Montreal, Quebec, Canada*, 6. *Faculty of Medicine, Université de Montréal, Montreal, Quebec, Canada*

Aging is associated with numerous chronic conditions that can be worsened by stress.

There are already some interventions that are targeting stress but no research to date has looked at the effects of Dance/Movement Therapy (DMT) on chronic stress (measured by the cortisol awakening response – CAR). To investigate this, 40 healthy adults over the age of 60 ($M=67.5$, $SD=5.3$) were randomised into three groups: waiting list (WL; $n=14$), DMT ($n=12$), and Cardiovascular Training (CT; $n=14$). The CT consisted of high intensity activity on a recumbent bicycle, while the DMT was comprised of exercises including coordination, body awareness, and socialisation. The two training groups were supervised by licensed instructors and met three times a week for three months. Before and after the training program all participants provided saliva samples on three days at 0, 30 and 60-minutes after awakening, and had their fitness level evaluated.

A group x time interaction was found ($F(2,35)=5.256$, $p=.01$, $\eta^2_{\text{partial}}=.231$), with the DMT group showing lower salivary cortisol values post-training, while the other two groups showed no change from baseline in their cortisol response to awakening. Physical assessments (VO₂max, and 10-meter walk) showed the greatest improvement in the CT group, moderate or no improvement in DMT, and no improvement in the WL. None of the changes of cardiovascular improvement were related to cortisol, suggesting that the change in cortisol seen in the DMT group is unrelated to fitness improvement. The results are further discussed in terms of psychological mechanisms that could explain the change in cortisol.

HOSPITALIZATION COSTS OF OLDER ADULTS WITH CO-DIAGNOSES OF ALZHEIMER'S DISEASE AND TYPE 2 DIABETES

N. Barragan^{1,2}, V. Shiao^{1,2}, T. Kuo^{1,2}, 1. *University of California, Los Angeles, Los Angeles, California*, 2. *Los Angeles County Department of Public Health, Los Angeles, California*

Along with other dementias, Alzheimer's disease (AD) costs in the U.S. were estimated to exceed \$235 billion in 2016. To date, there is a paucity of literature examining the costs of acute hospitalizations of patients with AD, especially when type 2 diabetes (T2DM) is present. In this study, we address this gap by comparing the costs of hospitalizations for patients aged 65 years and older who had AD, T2DM, or both. The present analysis draws from the Healthcare Cost and Utilization Project's National Inpatient Sample (NIS) data from the Agency for Healthcare Research and Quality. NIS represents all-payer, encounter-level hospital care data and is weighted to yield national estimates of hospital inpatient stays. The mean hospital stay costs were \$9,808 for patients with AD, \$12,966 for patients with T2DM, and \$10,511 for patients with both conditions. Even after controlling for critical factors that influence hospital stay costs (e.g., payer, length of stay, severity of disease, patient demographics, number of comorbid conditions, and number of procedures), regression analysis consistently indicated that while patients with both AD and T2DM incurred higher costs than patients who were diagnosed solely with AD, their costs did not exceed those with T2DM alone. Results from the present study have health policy implications and can inform hospitalization planning and practices for patients with AD.

COMMUNITY PRACTITIONER PERSPECTIVES ON HEALTHY AGING: A FOCUS GROUP STUDY

R. Dev, O. Zaslavsky, B.B. Cochrane, N.F. Woods, *Nursing, University of Washington, Seattle, Washington*

Perspectives of older adults only may not fully explain the phenomena of healthy aging. This project aimed to expand knowledge on healthy aging by exploring the perspectives of community-based professionals working directly with older adults. We purposively sampled community practitioners including nurses, social workers, and other health professionals ($n=12$), and conducted three in-depth focus group discussions of two hours each. Verbatim transcript data were analyzed using an inductive content analysis with consensual validation. Community practitioners suggested

various characteristics of healthy aging under person-specific, social, and spiritual components. Person-specific components included characteristics at the physiological, basic needs (nutrition, housing, medical), psycho-emotional and cognitive levels, whereas social components encompassed creating and contributing to the community. A spiritual component incorporated cultural aspects of elders. Practitioners viewed promotion of healthy aging as meeting the needs of older adults and making sure they have access to resources. They further emphasized, “resources is a broader term than just financial resources that includes personal resources, physical wellness, able to live independently and be socially connected.” Practitioners identified facilitators and barriers towards healthy aging in terms of care recipients and care providers. Two themes emerged about programs and activities: promoting fitness and promoting wellness. Although practitioners’ perspectives had some overlap with traditional research and medical views on healthy aging, the unique and holistic model derived provides a more refined foundation for supporting aging and addressing health disparities. Rapidly changing demographics and aging in the United States necessitate such culturally sensitive and empirically driven practices to promote healthy aging.

BLUNTED RESPONSE TO STRESS IN YOUNG IL-10TM/TM MICE: IMPLICATION FOR THE VULNERABILITY IN FRAILTY

N. Ge^{2,1}, H. Yang², R. Westbrook², R. Marx-Rattner², T. Burks², J. Langdon², P. Abadir², J.D. Walston², 1. *Center of Geriatric Medicine and Gerontology, West China Hospital, Sichuan University, Chengdu, Sichuan, China*, 2. *Department of Medicine Division of Geriatric Medicine and Gerontology, Johns Hopkins University, Baltimore, Maryland*

The hypothalamic pituitary adrenal axis (HPA axis) is a major neuroendocrine system for stress response and for regulating the immune system. Aged rats as well as older humans demonstrate progressive loss of control of the HPA axis, resulting in impaired diurnal rhythm and hypersecretion of glucocorticoids during times of stress. Higher levels and a blunted diurnal rhythm of cortisol have been observed in frail compared to more robust older adults. Understanding the factors underlying disturbed glucocorticoid secretion that precede age-related diseases and frailty are of considerable importance to prevent vulnerability and disability in late life. In order to study this system in vivo, we utilized a mouse model of chronic inflammation and as frailty and measured changes in plasma corticosterone and pro-inflammatory levels after acute cold stress. The plasma corticosterone level was determined 2 weeks before cold stimulation in 10 young (3 months), 10 old (21 months) C57BL/6J mice, and 10 young IL-10 tm/tm (3 months). 5 mice from each group were exposed to cold stress, the remainder served as controls and were not exposed to cold. The treatment groups were exposed to four degrees Celsius for 5 hours and the controls were kept in room temperature conditions at twenty five degrees Celsius. The results showed higher basal plasma corticosterone ($P<0.01$) and normal IL-6 and TNFR-1 levels in young IL-10tm/tm, compared to young and old C57BL/6J mice. However, there were unchanged corticosterone level and higher IL-6 and TNFR-1 levels ($P=0.04, 0.02$, respectively) in

young IL-10tm/tm mice after acute cold stress compared to young wild type mice. Lower GRα mRNA expression in hippocampus was also observed in control and treated young IL-10tm/tm ($P<0.01$), compared the age-matched wild type mice. These findings provide initial evidence for the hypothesis that HPA axis dysfunction is through whole life of frail subjects and even earlier than changes in immune system.

EFFICACY OF SKIN MOISTURIZER WITH ADVANCED CERAMIDE AND FILAGGRIN TECHNOLOGY IN CHINESE ELDERLY

A. Ikoma², Q. Gao¹, A. Lin⁴, L. Zang¹, I. Philp³, N. Wang¹, 1. *Pinetree Care Group, Beijing, China*, 2. *Nestle Skin Health, Tokyo, Japan*, 3. *Heart of England NHS Foundation Trust, Solihull, United Kingdom*, 4. *Galderma, Shanghai, China*

Chronic itch is a common health problem in the elderly, frequently associated with skin dryness. However, it is often the case that little attention is paid to skin care until scratching due to itch damages skin and leads to inflammatory lesions that need medical treatments. A pilot study was conducted in China to test the efficacy in the elderly of an easy-to-do skin care regimen with moisturizer that was developed using advanced ceramide and filaggrin technology. A total of 60 volunteers (26 males and 34 females, 72.6 +/- 8.7 years of age) with moderate dry skin and itch participated in the study and experienced a 2-week self-treatment with moisturizer and body wash. The change in skin dryness severity, itch severity, and quality of life (day- and night-time) was assessed 1 and 2 weeks after the initiation of treatment. As a result, all of skin dryness, itch, and quality of life rapidly improved at 1 week and further improved at 2 weeks with statistical significance compared to the baseline ($P<0.001$). The acceptability questionnaire completed by the participants at the end of the study showed their high satisfaction with the regimen. One case of contact dermatitis was reported and no other treatment-related adverse events occurred. In conclusion, this result provides evidence that the skin care regimen tested in this study is effective in the elderly, not only on skin dryness or itch but also on the quality of life, with a good tolerability and acceptability.

SESSION 615 (SYMPOSIUM)

THE EXPANDING ROLE OF U.S. EMERGENCY DEPARTMENTS IN THE CARE OF VULNERABLE OLDER ADULTS

Chair: A. Lo, *The University of Alabama at Birmingham, Birmingham, Alabama*

Discussant: K. Flood, *University of Alabama*

Adults 65 years and older account for 20 million emergency department (ED) visits annually, resulting in 20% of all ED visits and 36% of all hospitalizations despite representing only 13% of the U.S. population. The traditional U.S. ED model is ill-equipped to address the complex health care needs of older adults. The estimated 7,700 U.S. geriatricians are too few in numbers to absorb the care transitions of all older adults following their emergency care. Consequently, the responsibility of identifying individuals at higher risk for mobility impairment, functional decline, suicide risk and

elder abuse is often thrust upon emergency physicians. The nascent subspecialty of geriatric emergency medicine and recently developed care guidelines reflect the evolution of the ED's role in the U.S. This symposium discusses advances and challenges in current geriatric emergency care in terms of: (i) understanding how changes in function, mobility and social support increase utilization of emergency care; (ii) screening for suicide risk in older adults; (iii) identifying and assessing elder abuse, neglect and exploitation, and (iv) innovative ED-based short-stay units that provide comprehensive geriatric assessments at the time of ED visits. We offer insight into strategies of promoting care protocols despite the rigid metrics of U.S. fee-for-service emergency care or the absence of safety-net features found in socialized medical systems of other countries. Advances in geriatric emergency medicine in the U.S. are critical to addressing the unmet health care needs of older adults and signal an opportunity for collaborative, interdisciplinary, care initiatives involving all aging-related health professionals.

THE ROLE OF SOCIAL SUPPORT, FUNCTION, AND MOBILITY ON EMERGENCY CARE UTILIZATION BY U.S. OLDER ADULTS

A. Lo, R.E. Kennedy, C. Brown, *The University of Alabama at Birmingham, Birmingham, Alabama*

Population-based data on the impacts of social support, function and mobility on emergency department (ED) utilization among older adults are limited. We examined data on socio-demographics, social support, function (using Activities of Daily Living, ADL) and mobility (using life-space) from a population-based cohort of community-dwelling adults ≥ 65 years. ED utilization was determined via 6- and 12-month follow-up interviews. We used multi-variable logistic regression models. In the 12 months after baseline, 145 (15.5%) of 936 persons utilized an ED. Social support was not associated with ED utilization. ADL impairment and reduced life-space were associated with higher ED utilization, but their effects were stronger in individuals with social support (ADL Odds Ratio=2.11, $p=0.038$; life-space OR=1.27, $p=0.004$) than those without social support (ADL OR=1.63, $p=0.042$; life-space OR=1.15, $p=0.011$). Older adults seeking care in the ED should be screened for impairments in function and mobility, even if they have strong social support.

SCREENING FOR SUICIDAL THOUGHTS AND BEHAVIORS AMONG OLDER PATIENTS VISITING THE EMERGENCY DEPARTMENT

M. Betz¹, S.A. Arias², D.L. Segal³, I. Miller², C.A. Camargo⁵, E.D. Boudreaux⁴, 1. *Emergency Medicine, University of Colorado--Denver, Denver, Colorado*, 2. *Brown University, Providence, Rhode Island*, 3. *University of Colorado - Colorado Springs, Colorado Springs, Colorado*, 4. *University of Massachusetts Medical School, Worcester, Massachusetts*, 5. *Massachusetts General Hospital, Boston, Massachusetts*

Depression, suicide ideation (SI) and suicide attempts (SA) are common among older adults, representing serious public health problems. Individuals with multiple comorbidities and frequent contact with hospital-based emergency departments (ED) may have elevated – but unrecognized – risk. To

inform future interventions, we describe the prevalence of self-harm/SI/SA among older ED patients, including differences by age, sex, and race/ethnicity. We reviewed consecutive patient charts (2011–2014) at 8 EDs in 7 states, all with protocols to screen every patient for suicide risk. Among 142,534 patient visits, 23% were by patients aged ≥ 60 years. Documented screening for self-harm/SI/SA declined with age, from 81% in younger age groups to 68% among those aged ≥ 85 years. This decline may be due to age biases or to patient-level factors precluding screening (e.g., altered mentation). Our findings support the need for more detailed examination of the best methods for identifying – and treating – suicide risk among older adults.

PROVIDER PERSPECTIVES ON A MULTI-DISCIPLINARY EMERGENCY DEPARTMENT INTERVENTION FOR ELDER ABUSE

T. Rosen¹, M. Stern¹, M.R. Mulcare¹, T.J. McCarthy¹, V. LoFaso¹, E.M. Bloemen², R. Breckman¹, M.S. Lachs¹, 1. *Weill Cornell Medical College, New York, New York*, 2. *University of Colorado School of Medicine, Aurora, Colorado*

An emergency department (ED) visit provides an opportunity to identify elder abuse, but providers rarely recognize or report. We have begun designing a multi-disciplinary ED-based consultation service to improve identification, medical and forensic assessment, and treatment for potential victims. We qualitatively explored provider perspectives to inform intervention development. We conducted 16 semi-structured focus groups at a large, urban hospital with providers, including social workers, emergency physicians, geriatricians, and nurses. Focus groups were transcribed, and data was analyzed to identify themes. Providers believed an ED-based consultation service would be frequently utilized and would increase identification, improve care, and help ensure safety. Participants identified challenges including determining capacity for potential victims requesting discharge. They emphasized the value of coordinating with in-patient and out-patient medical and service providers. Providers suggested geriatric nurse practitioners may have ideal clinical and personal care training to contribute and highlighted the importance of social workers in care coordination.

INCORPORATION OF MULTIDISCIPLINARY GERIATRIC CARE INTO AN EMERGENCY DEPARTMENT OBSERVATION UNIT

L.T. Southerland, L. Kunduru, T.R. Gure, J. Caterino, M. Moseley, *Emergency Medicine, The Ohio State University, Westerville, Ohio*

Multidisciplinary geriatric assessment is difficult in the Emergency Department (ED) due to time limitations, patient volume, and specialized staffing needs. One solution is ED Observation Units which provide extended patient evaluations for up to 24 hours. Our ED implemented multidisciplinary geriatrician assessment including geriatric consultation, physical therapy assessment, and case management care coordination, available to any observation unit patients. We conducted a retrospective chart review of randomly selected adult observation unit patients ≥ 65 years old ($n=111$). Few were observed purely for geriatric assessment (7.2%, $n=8$),

but 25% (n=28) accessed at least one of the multidisciplinary assessments. The admission rate was 24% with average length of stay 15.5 hours. The admission rate for patients placed specifically for geriatric assessment was 62% (n=5/8). Multidisciplinary geriatric assessment is frequently utilized and feasible in an ED observation unit, but a higher admission rate should be anticipated in patients observed for this purpose only.

SESSION 620 (SYMPOSIUM)

SYSTOLIC BLOOD PRESSURE INTERVENTION TRIAL: FINDINGS THAT IMPACT OLDER HYPERTENSIVE PATIENTS

Chair: M.A. Supiano, *University of Utah, Utah*

Co-Chair: J. Williamson, *Wake Forest University*

Results from the Systolic Blood Pressure Intervention Trial (SPRINT) which compared usual (< 140 mm Hg) with intensive (< 120 mm Hg) SBP targets (ClinicalTrials.gov, NCT01206062) demonstrated that a lower SBP target may be safely recommended for many older patients. SPRINT included 2636 community living subjects aged 75 and older (28% of the entire study population) who were assessed for frailty status including usual gait speed, cognitive function, orthostatic hypotension, and adverse events including injurious falls. In the group of older subjects randomized to the intensive arm there was a 34% reduction in the primary composite CVD outcome and a 33% reduction in all-cause mortality at 3.14 years of follow-up when the trial ended early (numbers needed to treat 27 and 41 respectively). These results did not differ for the most frail subgroup nor for those with impaired gait speed. While some adverse events were higher in the intensive group, there was no difference observed in serious adverse events including injurious falls. This symposium will provide additional SPRINT results of relevance to older hypertensive patients including: 1) predictors of adherence and retention; 2) results for the impact of intensive versus standard treatment goals on incident heart failure with and without reduced ejection fraction, 3) arterial stiffness as a predictor of SPRINT outcomes, and 4) results for the impact of intensive versus standard treatment goals on transitions in frailty status.

BASELINE PREDICTORS OF RETENTION AND ADHERENCE IN THE SYSTOLIC BLOOD PRESSURE INTERVENTION TRIAL

M. Vitolins, J. Williamson, *Wake Forest University, Winston-Salem, North Carolina*

The internal validity and statistical power of a clinical trial depends on participant retention and good protocol adherence. Retention and adherence rates may be lower in older trial participants. We will report data from the Systolic Pressure Intervention trial (SPRINT) which involved 9361 hypertensive persons (2636 age 75+) who were assigned to a systolic blood-pressure target of less than 120mm Hg or a target of less than 140mm Hg. Retention and adherence rates by study arm after a median of 2.36 years of follow-up will identify baseline predictors of retention and adherence in SPRINT stratified by age and frailty status. Close

examination of predictors of adherence and retention will lead to new strategies for blood pressure management by identifying risk factors for non-adherence and study discontinuation. These results will aid clinicians in identifying older adults at increased risk for difficulty with adherence to blood pressure lowering therapy.

IMPACT OF INTENSIVE BLOOD PRESSURE CONTROL ON INCIDENCE AND TYPE OF HEART FAILURE IN THE ELDERLY

B. Upadhyay², J. Williamson¹, D. Kitzman¹, 1. *Wake Forest University, Advance, North Carolina*, 2. *Wake Forest University, Winston-Salem, North Carolina*

Population based studies show that the majority of persons in the community, particularly in the older age range, who develop heart failure (HF), have a preserved ejection fraction (HFpEF). The prevalence of HFpEF is rising, with morbidity, mortality, and healthcare costs now equal to HF with reduced ejection fraction (HFrEF). Multiple lines of evidence suggest that hypertension (HTN) may be even more closely linked to the development of HFpEF than HFrEF. Among patients with hypertension, lower blood pressure (BP) treatment goals could potentially have a differential impact on the development of HFpEF vs HFrEF. Thus, treating to lower BP goals in SPRINT could produce divergent responses, due to differences in both ischemic heart disease burden and in LV hypertrophic remodeling. We will present results from SPRINT characterizing the impact of intensive versus standard SPB therapy on middle aged and older patients with hypertension who develop incident HFpEF vs HFrEF.

ARTERIAL STIFFNESS AS A PREDICTOR OF OUTCOMES IN THE SYSTOLIC BLOOD PRESSURE INTERVENTION TRIAL

M.A. Supiano, *University of Utah, Salt Lake City, Utah*

Arterial stiffness is a major determinant of the age-related increase in systolic blood pressure (SBP) and is an independent predictor of cardiovascular events. The Systolic Blood Pressure Intervention Trial (SPRINT) affords a unique opportunity to determine if the difference in peripheral SBP that developed between the intensive treatment group (target SBP < 120 mm Hg) and the usual care group (target SBP < 140 mm Hg) – an average delta of 14.8 mm Hg – will be accompanied by significant differences in measures of vascular stiffness (aortic pulse wave velocity, PWV) and central (aortic) BP. In a subset of 648 SPRINT participants, PWV and pulse wave analysis measures were completed prior to randomization and annually throughout three years of follow-up. Results will be presented pertaining to the hypothesis that measures of vascular stiffness at year 3 will be predictive of the main SPRINT outcomes independent of the achieved peripheral SBP.

TRANSITIONS IN FRAILTY STATUS IN THE SYSTOLIC BLOOD PRESSURE INTERVENTION TRIAL

N. Pajewski¹, J. Williamson¹, M.A. Supiano², 1. *Wake Forest School of Medicine, Winston-Salem, North Carolina*, 2. *University of Utah, Salt Lake City, Utah*

SPRINT results indicate that treating to a systolic blood pressure <120mm Hg (intensive) confers benefits on

cardiovascular morbidity and mortality compared to a target of <140 mm Hg (standard). These benefits were apparent even among older (age 75 years or older) participants. While serious adverse events were not amplified overall in intensively treated participants, older patients may be more concerned about the impact of intensive treatment on frailty – an increased vulnerability to stressful events associated with aging – than with traditional adverse outcomes. Based on a model of deficit accumulation, we have previously developed a frailty index to characterize SPRINT participants at baseline incorporating information on self-ratings of health, depressive symptoms, lab measurements, cognitive and physical functioning, and comorbidity. To better inform future hypertension treatment strategies, we will present longitudinal results comparing the incidence and progression of frailty between the SPRINT treatment groups, and in the subgroup of older adults.

SESSION 625 (SYMPOSIUM)

SUPPORTING PROFESSIONALS TO DELIVER BETTER QUALITY END-OF-LIFE CARE IN DEMENTIA

Chair: J. van der Steen, *VU University Medical Centre, Amsterdam, Netherlands*

There is increasing policy focus on improving the quality end of life (EoL) care for older people and those living with non-cancer related long term illness. For people with dementia and their families the organisation and provision of care, towards and at the EOL, continues to be challenging with research revealing sub-optimal symptom control and a significant proportion dying in acute hospitals. Health care professionals can find EOLC in dementia difficult due to difficulties in prognostication and impaired communication and mental capacity in the dying person. The costs of dementia care, especially in the last year of life, are also considerable. With an ageing population potentially rapidly increasing such costs, it is crucial to explore more effective, integrated models of care and interventions which improve quality of care and facilitate preferred place of dying.

IMPROVING END-OF-LIFE CARE IN DEMENTIA: KEY AREAS FOR IMPROVEMENT

C. Bamford, M. Poole, R. Lee, E. McLellan, C. Exley, L. Robinson, *Institute of Health and Society & Newcastle University Institute for Ageing, Newcastle University, Newcastle, United Kingdom*

Relatively little is known about how good end of life care (EoLC) for people with dementia is supported or constrained in practice. As part of a five year research programme, we used qualitative methods to explore the delivery of EoLC from the perspectives of people with dementia, family carers, frontline staff and service managers. Integrative analysis highlighted seven key issues influencing the provision of EoLC spanning from early discussions to care after death.

These issues have informed the development of an evidence-based intervention comprising a Dementia Care Facilitator and newly developed resources to promote change. The resources include evidence-based scenarios illustrating common problems in EoLC, one of which will

be presented. Discussion points accompany the scenarios to engage staff and encourage the development of local strategies to improve practice. Together with other components of the intervention, the scenarios will be evaluated in a pilot trial in the UK.

DEVELOPMENT OF HEURISTICS TO GUIDE DECISION MAKING AT THE END OF LIFE FOR SOMEONE WITH DEMENTIA

N. Davies¹, K. Lamahewa¹, R. Mathew¹, J. Wilcock¹, J.T. Manthorpe², E.L. Sampson^{1,3}, S. Iliffe¹, *1. University College London, London, United Kingdom, 2. King's College London, London, United Kingdom, 3. North Middlesex University Hospital, London, United Kingdom*

The end of life for someone with dementia can present a series of challenges for practitioners. Challenges may be eased with the development of heuristics (rules-of-thumb). For example, FAST is used in stroke: Facial-weakness, Arm-weakness, Slurred-speech, Time to call 911. Through a co-design process we developed a toolkit of heuristics to aid practitioners making difficult decisions when caring for someone with dementia at the end of life. The heuristic toolkit consisted of four areas which were considered difficult decisions at the end of life; eating/swallowing difficulties, agitation/restlessness, reviewing treatment/interventions, and providing routine care. Each heuristic consists of a logic tree of rules. For example, eating/swallowing difficulties have two rules; ensure eating/swallowing difficulties do not come as a surprise and reflection about 'comfort-feeding' only or time-trialled artificial feeding. Teams appreciated the simplicity of the heuristics, allowing their use in educating less experienced colleagues and as an aid to conversations with families.

IMPLEMENTING AN END-OF-LIFE CARE PROGRAMME FOR NURSING HOME RESIDENTS WITH DEMENTIA: ROLE OF CONTEXT

K.J. Moore, B. Candy, S. Davis, J. Harrington, N. Kupeli, V. Vickerstaff, L. Jones, E.L. Sampson, *University College London, London, United Kingdom*

Nursing homes are a common place of death for people with dementia, however, quality of end-of-life care could be improved. We developed the Compassion Intervention to promote interdisciplinary care for residents with advanced dementia. We implemented a naturalistic study with an Interdisciplinary Care Leader working across two nursing homes in the UK. Based on reflections of the Interdisciplinary Care Leader and 48 interviews with healthcare professionals and care workers involved with the two homes, we examined how the intervention worked in practice. Contextual differences were identified between the two sites, with Care Home 2 having lower involvement with external healthcare services and less developed training procedures. Core components were implemented in both care homes but multidisciplinary meetings were only established in Care Home 1. The Intervention prompted efforts to improve advance care plans, pain management and person-centred care. Further testing of the Intervention's effectiveness in improving end-of-life care is recommended.

EFFECTS OF AUDIT AND FEEDBACK ON THE QUALITY OF CARE AND COMFORT IN DYING WITH DEMENTIA (FOLLOW-UP)

J. van der Steen^{1,2}, J. Boogaard³, M. van Soest-Poortvliet⁴, J. Anema³, A. Francke^{3,5}, W. Achterberg¹, H. de Vet³, 1. *Leiden University Medical Center, Leiden, Netherlands*, 2. *Radboud University Medical Center, Nijmegen, Netherlands*, 3. *VU University Medical Center, Amsterdam, Netherlands*, 4. *Netherlands Institute of Mental Health and Addiction, Utrecht, Netherlands*, 5. *Netherlands Institute of Health Services Research, Utrecht, Netherlands*

The Feedback on End-of-Life care in dementia (FOLLOW-up) project examined the effects of two audit and feedback strategies on quality (satisfaction) with care and comfort when dying with dementia in a 3-armed cluster randomized controlled trial. In 18 nursing homes, after death (January 2012-July 2014), a total of 668 families (response rate: 69%) rated the End-of-Life in Dementia (EOLD)-instruments. A generic audit and feedback strategy used group mean EOLD-scores and a patient-specific strategy used individual family reports of EOLD scores. Compared to no feedback, the generic strategy resulted in LOWER satisfaction in both adjusted and unadjusted analyses, while the patient-specific strategy increased comfort in unadjusted analyses only, due to a decrease in dying symptoms (one of four CAD subscales). We discuss possible explanations of disappointing effectiveness such as feedback with high mean baseline scores, and explanations based on an evaluation of the implementation processes. Trial number: NTR 3942.

SESSION 630 (PAPER)

FALL PREVENTION AND REDUCTION

THE STEPS TO AVOID FALLS IN THE ELDERLY (SAFE) STUDY

D. Matchar², P. Duncan⁵, C.T. Lien¹, M.E. Ong³, M. Lee⁴, R. Sim², K. Eom², 1. *Changi General Hospital, Singapore, Singapore*, 2. *Duke-NUS Graduate Medical School, Singapore, Singapore*, 3. *Singapore General Hospital, Singapore, Singapore*, 4. *St Andrew's Community Hospital, Singapore, Singapore*, 5. *Wake Forest School of Medicine, Winston Salem, North Carolina*

A multi-center, two arm, parallel group, randomized controlled trial: study participants were screened, assessed for risk factors and randomized (control or intervention) based on the SPPB score at baseline. High-risk participants (SPPB less or equal 6) were given a home-based exercise program up to 12 sessions (3 times per week) that specifically targets and modifies impairments that interfere with engaging in exercise in a group setting. When the high-risk participants attained SPPB > 6, they transitioned to a community-based group exercise program and continued until the end of active intervention phase. Low-to-moderate risk patients (SPPB > 6) were directly enrolled into an evidence-based one-hour group exercise program, which was offered up to 24 sessions with free transportation (2 times a week). The primary outcome measure was the number of fallers at the end of the nine-month study period. All analyses performed were on an intention-to-treat basis.

Between December 2012 and July 2014, 354 patients who were at least 65 years old and visited the Emergency Department for falls or fall-related injuries were recruited (177 participants in each group). At the end of the nine-month follow-up period, 37.9% of the control group and 30.5% of the intervention group fell at least once. The intervention program significantly reduced the number of fallers adjusting for critical comorbidities (odds ratio 0.33 [0.15 – 0.74], $p=0.004$). We also observed that the intervention group had a lower proportion of individuals with injurious falls and significantly less reduction in physical performance by SPPB. No adverse events were reported during the study period.

The SAFE study showed that screening, risk modification and intensive, consistent and progressive physical therapy can effectively reduce the number of fallers and injurious falls.

This study is registered with the U.S. Clinical Trials Registry, number NCT01713543 and was funded by Ministry of Health Singapore under its Health Services Research Competitive Research Grant (Grant Number: HSRG10MAY002).

SOCIAL DANCING TO REDUCE FALLS IN OLDER ADULTS—A CLUSTER RANDOMISED CONTROLLED TRIAL

D. Merom¹, E. Mathiew², E. Cerin², R.L. Morton⁵, K. Anstey⁷, C. Sherrington⁴, S. Lord⁶, R. Cumming³, 1. *School of Science and Health, Western Sydney University, Penrith, New South Wales, Australia*, 2. *Australia Catholic University, Nirth Sydney, Austria*, 3. *The University of Sydney, Sydney, New South Wales, Australia*, 4. *The George Institute for Global Health, University of Sydney, Sydney, New South Wales, Australia*, 5. *Clinical Trials Centre, The University of Sydney, Sydney, New South Wales, Australia*, 6. *NeuRA, University of New South Wales, Randwick, New South Wales, Australia*, 7. *The Australian National University, Canberra, Australian Capital Territory, Australia*

Small-scale trials have indicated that diverse dance styles can improve balance and gait of older adults, two of the strongest risk factors for falls in older people, but none of these studies has examined the effect of dance on falls. A cluster randomized controlled trial was undertaken in 23 self-care retirement villages around Sydney, Australia, involving 530 seniors (mean age 78 years, 85% women) without cognitive impairment. Intervention villages (12 clusters) were offered twice weekly one-hour social dancing class (folk or ballroom dancing) over 12 months (80 hours). The participants in the control villages (11 clusters) were advised to continue with their regular activities. Data on falls obtained from 522 (98%) participants and 424 (80%) attended the 12-month reassessment, which was lower among folk dance participants (71%) than ballroom dancing (82%) or control participants (82%, $P=0.04$). During the period 444 falls were recorded; there was no significant difference in fall rates between the control group (0.80 per person-year) and the dance group (1.03 per person-year). Using negative binomial regression the adjusted IRR was 1.19 (95% CI: 0.83–1.71). In post hoc sub-group analysis, the rate of falls was higher among dance participants with a history of multiple falls (IRR=2.02, 95% CI: 1.15–3.54, $p=0.22$ for

interaction) and in the folkdance intervention (IRR=1.68, 95% CI:1.03 -2.73). Social dancing did not prevent falls or its associated risk factors among villages' residents. Modified dance programmes that contain "training elements" to better approximate structured exercise programs, targeted at low and high-risk participants, warrant investigation.

DOES DEPRESCRIBING FALL-ASSOCIATED DRUGS REDUCE FALLS AND ITS COMPLICATIONS?: A SYSTEMATIC REVIEW

J. Lee^{2,4,6}, A. Negm^{1,2}, E. Wong⁵, A. Holbrook^{3,6,7}, 1. *McMaster University, Hamilton, Ontario, Canada*, 2. *Geriatric Education and Research in Aging Sciences (GERAS) Centre, Hamilton, Ontario, Canada*, 3. *Center for Evaluation of Medicines, Hamilton, Ontario, Canada*, 4. *Division of Geriatric Medicine, McMaster University, Hamilton, Ontario, Canada*, 5. *Department of Medicine, McMaster University, Hamilton, Ontario, Canada*, 6. *Department of Clinical Epidemiology & Biostatistics, McMaster University, Hamilton, Ontario, Canada*, 7. *Division of Clinical Pharmacology & Toxicology, McMaster University, Hamilton, Ontario, Canada*

Falls are the leading cause of injury and injury-related hospitalizations for seniors in Canada with annual health-care costs exceeding \$2 billion. Despite limited evidence of effectiveness, the withdrawal (discontinuation or dose reduction) of "fall-risk increasing drugs" (FRIDs) is typically part of falls prevention strategies and hospital accreditation initiatives. The study objectives were to determine the preventative efficacy of FRID withdrawal on falls and fall-related complications. An electronic search was conducted in MEDLINE, EMBASE, CENTRAL and CINAHL. A grey literature search included trial registries and conference abstracts. All randomized controlled trials in adults age ≥ 65 evaluating FRID withdrawal compared to usual care on falls rate or incidence, fall-related injuries, fractures or hospitalizations and/or adverse effects related to the intervention were included. Two reviewers independently screened eligible studies, abstracted data and assessed risk of bias. The GRADE criteria were used to rate overall confidence in effect estimates for outcomes. Five trials involving 1309 participants met eligibility criteria for inclusion. A FRID withdrawal strategy did not significantly change the rate of falls (RaR 0.98, 95% CI 0.63 to 1.51), number of fallers (RR 1.06, 95% CI 0.84 to 1.34) or rate of fall-related injuries (RaR 0.89, 95% CI 0.57 to 1.39) over a 6 to 12 month follow-up period. There is insufficient evidence that a FRID withdrawal strategy is effective for preventing falls. Based on very low quality evidence, it is uncertain whether FRID withdrawal leads to any appreciable clinically important benefit. Data evaluating the potential harms of FRID withdrawal is lacking.

EXERCISE TO PREVENT FALLS IN OLDER ADULTS: AN UPDATED SYSTEMATIC REVIEW AND META-ANALYSIS

C. Sherrington¹, Z. Michaleff^{1,2}, N. Fairhall¹, A. Tiedemann¹, J. Whitney³, R. Cumming¹, J. Close⁴, S. Lord⁴, 1. *University of Sydney, Sydney, New South Wales, Australia*, 2. *Keele University, Keele, United Kingdom*, 3. *King's College Hospital, London, United Kingdom*, 4.

University of New South Wales, Sydney, New South Wales, Australia

Previous meta-analyses have found exercise as a single intervention prevents falls in older people. This updated systematic review with random effects meta-analysis and meta-regression aimed to test whether this effect is still present when new trials are added and explore trial characteristics associated with greater fall prevention effects. One hundred comparisons from 89 randomised trials with 19,869 participants were available for meta-analysis. Overall, exercise reduced the rate of falls in community dwelling older people by 21% (pooled rate ratio 0.79, 95% CI 0.73 to 0.85, $p < 0.001$, I^2 47%, 67 comparisons) with greater effects seen from exercise programs that challenged balance and involved more than three hours per week of exercise. Together these variables explained 76% of the between-trial heterogeneity and in combination led to a 39% reduction in falls (IRR 0.61, 95% CI 0.53 to 0.72, $p < 0.001$). Exercise also had a fall prevention effect in community-dwelling people with Parkinson's disease (pooled rate ratio 0.47, 95% CI 0.30 to 0.73, $p = 0.001$, I^2 65%, 6 comparisons) or cognitive impairment (pooled rate ratio 0.55, 95% CI 0.37 to 0.83, $p = 0.004$, I^2 21%, 3 comparisons) but not in residential care settings or among stroke survivors, people with severe visual impairment or people recently discharged from hospital. Exercise as a single intervention can prevent falls in community dwelling older people, promising results are seen in people with Parkinson's disease or cognitive impairment but its impact in other clinical groups and aged care facility residents requires further investigation.

FALLS AND THE SOCIAL ISOLATION OF OLDER ADULTS IN THE NATIONAL HEALTH AND AGING TRENDS STUDY

J. Pohl, B.B. Cochrane, K.G. Schepp, N.F. Woods, *University of Washington School of Nursing, Seattle, Washington*

Falls among community-dwelling older adults can be life threatening. While an association between social isolation and falls has been described, the nature of that relationship is not well documented and could be important for fall prevention interventions. Study objectives were to describe the incidence of falls, prevalence of social isolation, and extent to which social isolation predicts falls in older adults. Secondary analysis of longitudinal data from the National Health and Aging Trends Study, involving a nationally representative sample of Medicare beneficiaries, included four rounds of annual interviews in participants' homes (round one $n = 7,609$). Social isolation was operationalized for the current analysis as a multiple-indicator, domain-inclusive construct based upon the Social Network Index. Falling during the previous year was self-reported. Incidence of falls ranged from 22.4–26.2% across the four rounds. Social isolation prevalence ranged from 19.8–21.9%. The probability of falling increased with each increase in social isolation construct score. Even after adjusting for age, gender, and education, social isolation significantly predicted falling (OR=1.08; CI=1.02–1.14). Adding self-reported general health, depression, and worry about falling to the model weakened the relationship between social isolation and falls (OR=1.02; CI=0.96–1.08). Adding the Short Physical Performance Battery, assistive mobility device use, and

activities of daily living to the model weakened the relationship further (OR=0.99; CI=0.94–1.04). Social isolation as a predictor of falls is partially explained by the strong relationship between social isolation and physical performance. Fall-prevention interventions targeting social isolation could have an important impact on physical performance and future falls.

SESSION 635 (PAPER)

CANCER-RELATED MORBIDITY AND MORTALITY ISSUES

A CLINICAL SCORE TO PREDICT THE EARLY DEATH AT 100 DAYS IN ELDERLY METASTATIC CANCERS

R. Boulahssass, S. Gonfrier, M. Sanchez, C. Rambaud, A. Gary, J. Turpin, I. Bereder, O. Guerin, *CHU de Nice UCOG PACA East, Nice, France*

Background: Trying to predict the very early death after a CGA is difficult in elderly metastatic cancers. Last year, we presented a clinical score to predict this risk in 815 elderly cancer patients (Boulahssass et al 9511 ASCO 2015). The aim of this new study is the next step by developing a score to estimate the risk of early death at 100 days in metastatic cancers (MC) in order to have the collective wisdom not to overtreat this population. 100 days is nearly 3 months, if patients are going to die within 3 months, it's maybe necessary to provide them best supportive care alone.

Methods: This is a multicentric and prospective cohort study approved by an ethics committee. At the baseline, a standardized CGA was performed (MMSE, MNA, Grip strength, ADL, IADL, CIRSg, Charlson, lee, PS, Gait speed, QLQc30, G8, Balducci), type and localization of metastases were collected. During the follow up of 100 days, events, treatments made and targeted geriatric interventions were collected. A multivariate logistic regression permits to select risk factors. The internal validation was performed by a bootstrap with randomized samples. Score points were assigned to each risk factors by using the β coefficient. The accuracy of the score was assessed with the mean c-statistic and the calibration with the Hosmer-Lemeshow goodness of fit test.

Results: In the cohort 312 patients had a MC with a median age of 82y. The independent predictors of death at 100 days in MC were: Age > 85y (OR 2,1 p=0,03), Metastatic localizations (ML): 2ML (OR 2,4 p=0,004), >2 ML (OR 6,3 p=0,001), MNA <17 (OR 8,7 p<0,0001) or $\leq 23,5$ and ≥ 17 (OR 5,4 p=0,002), Home confinement (OR 1,8 p=0,047), ADL <5,5 (OR 2,1 p=0,017), Cancers with global risk of early death at 100 days >30% (OR 2,05 p=0,016)

We assigned in the score: 3 points for: MNA $\leq 23,5$, ML >2 and 1 point for home confinement, ADL <5,5, ML=2, age >85y and types of cancers at risk >30%

The risk of death at 100 days in MC was 4 % for 0 to 2 pts, 18% for 3 to 4 pts, 33% for 5 pts and 44% for 6 pts and 83% for > 6 pts.

Conclusion: In daily practice, this score should help to avoid unnecessary treatment for patients with a high risk of death, especially for those with a score > 6.

COGNITIVE FUNCTION AND HORMONAL THERAPY ADHERENCE IN A COHORT OF OLDER SURVIVORS: CALGB 369901

S. Bluethmann⁴, C. Alfano², J. Clapp¹, L. Faul¹, G. Luta¹, J. Mandelblatt¹, 1. *Georgetown University, Washington, District of Columbia*, 2. *American Cancer Society, Washington, District of Columbia*, 4. *Pennsylvania State University, Hershey, Pennsylvania*

Background: Adjuvant hormonal therapy is the standard of care for estrogen-receptor-positive (ER+) breast cancer survivors, but up to half of survivors do not adhere to recommended treatment (5 years+). Adherence may be more complicated in women older than 65 years (the majority of survivors) due to adverse effects of hormonal therapy, such as cognitive impairment. However, the relationship between cognitive function and hormonal therapy adherence is poorly understood. The objective of this study is to examine the relationship of cognitive function and hormonal therapy adherence over 5 years in older breast cancer survivors.

Methods: A cohort of cognitively intact ER+, non-metastatic breast cancer survivors (65 years and older) that initiated hormonal therapy were recruited from 78 sites between 2004–2011 (n=909). Follow-up data were collected at 6 months and annually for up to 7 years. Cognitive function was self-reported using EORTC-QLC30. Group-based trajectory modeling determined groups based on the highest probability of membership and logistic regression was used to test associations with discontinuation of hormonal therapy before at least 5 years of prescribed medication use.

Results: The mean cognitive score for survivors at baseline was 93.2 points (SD=12.3). Most breast cancer survivors were in early to middle stages of disease (i.e., stage 1=47.4%, stage 2a=31.4% and stage 2b-3=21.3%). Approximately 30% of women reported early discontinuation of hormonal therapy. Many women (42%) had high cognitive function that remained stable over time; more (49.1%) showed a phase shift (i.e., slight decline) in cognitive function with time. Only 9.2% of survivors showed a pattern of accelerated cognitive decline over time. Survivors with accelerated decline were more likely than those who maintained high function to discontinue hormonal therapy (OR 1.49: 95% CI, 0.88–2.55, p=0.14), controlling for age, stage and prior use of chemotherapy. Additionally, survivors who exhibited a phase shift in cognitive function were significantly more likely than survivors who maintained high function to discontinue hormonal therapy (OR 1.40: 95% CI 1.03–1.91, p=0.03), also controlling for age, stage and prior use of chemotherapy.

Conclusions: Cognitive dysfunction is a relevant yet understudied side effect of hormonal therapy in older survivors and may affect the duration of medication adherence. Our preliminary results suggest that survivors with cognitive decline may play a role in early discontinuation of hormonal therapy in older survivors. This will be an important area for future research on temporality of these effects and has clinical implications for survivorship care.

THE NONAGENARIAN PATIENTS WITH CANCER IN THE UCOG PACA-EST COHORT

C. Rambaud¹, R. Boulahssass², S. Gonfrier³, M. Sanchez², D. Borchiellini⁴, M. Durand^{5,6}, G. Sacco¹, O. Guerin^{7,8}, 1.

Soins de suite et de réadaptation, Hôpital de Cimiez, CHU Nice, Université Nice Sophia Antipolis, Nice, France, 2. UCOG, Hôpital de Cimiez, CHU Nice, Université Nice Sophia Antipolis, Nice, France, 3. USLD, Hôpital de Cimiez, CHU Nice, Université Nice Sophia Antipolis, Nice, France, 4. Centre Antoine Lacassagne, NICE, Nice, France, 5. Service d'Urologie, d'Andrologie et de Transplantation, Hôpital Pasteur 2, CHU Nice, Université Nice-Sophia-Antipolis, Nice, France, 6. INSERM, U1189, ONCO-THAI, F-59037, Lille, France, 7. Hôpital de Cimiez, CHU Nice, Université Nice Sophia Antipolis, Nice, France, 8. Unité CNRS UMR6267/INSERM U998, Nice, France

Introduction: The number of nonagenarians people in the world is steadily growing. Decision making about those patients concerning cancer treatment is difficult due to the lack of recommendations. Comprehensive Geriatric Assessment (CGA) is a help for clinicians to take a decision concerning this treatment. UCOG PACA-Est Cohort is a large multicenter prospective cohort of geriatric patients with cancer. The aim of our study is to describe the population of patient age over 90 years old in the UCOG PACA-Est cohort. **Methods:** All patients included in the cohort have benefited from a standardized CGA before the treatment decision. The CGA included (not exhaustive): MMSE, ADL, IADL, gait speed, one-leg standing, Charlson comorbidity index (CCI). Characteristics of cancer, social and demographic data were also collected. During a 100-days follow up, the rate of death, and targeted CGA interventions were collected. **Results:** On the 860 patients of the cohort, there were 101 nonagenarians with a mean age of 92 years (SD 2y). There were 65% of women and 20% of the patients had a metastatic cancer. The nonagenarians were significantly ($p < 0,001$) more dependent for ALD (OR = 2,5 [1,6-3,9]) and IADL (OR= 3,2 [1,9-5,5]) than the rest of the cohort. They were more cognitively impaired (MMSE < 24, OR=2,1[1,4-3,3], $p < 0,001$). They had a slower walking speed (OR = 2 [1,3-3,1], $p = 0,003$). One-leg standing was often less feasible (OR = 5,4 [2,3-12,6], $p < 0,001$), and patients were more frequently confined at home (OR= 3 [2-4,6], $p < 0,001$). An increase in CCI was associated with the age > 90y (OR=4,3 [1,5-11,9], $p = 0,005$). After the CGA, the initial cancer treatment plan was modified for 32% of nonagenarians, versus 20% for the rest of the cohort (OR=1,89 [1,2-3], $p = 0,006$). The targeted geriatric interventions were not significantly different except for physiotherapy's and pain's care (OR= 1,5 [1-2,3], $p = 0,046$ and OR=2,2 [1,1-4,3], $p = 0,02$). The rate of death at 100-days follow up was more important for nonagenarians (OR= 1,8 [1,1-2,8], $p = 0,013$). **Conclusion:** The study suggests a high vulnerability for nonagenarians patients with cancer. In spite of the altered cognitive status and the loss of autonomy, the targeted geriatric interventions differ only for physiotherapy's care and pain's care. The study shows the influence of the geriatrician in the decision making of the oncologist. It also confirms the importance of a CGA in very old people.

COMPARISON OF OLDER PEOPLE WITH CANCER ACCORDING TO THE FRIED OR THE G8 CRITERIA

S.C. Gerard, S. Sourdet, S. Lozano, D. Brechemier, L. Balardy, Y. Rolland, *Gerontopole Toulouse University, Toulouse, France*

Background: Both the Fried criteria and the G8 have been proposed to screen for frailty in older patient with cancer. Frail older patients may benefit of a Comprehensive Geriatric Assessment (CGA). Our aim was to compare the characteristics of older patients with cancer according to the Fried or the G8 score.

Method: 70 years and older outpatient patients with solid tumors or hematologic tumors were included. The Fried's criteria, the G8 score, and a CGA including physical performances tests (Short Physical Performance Battery, SPPB) were performed.

Results: 286 patients (mean age 82.9 years ± 5.3), mainly with solid tumor (urologic, 28%, digestive, 20%, gynecological, 13%, at local stage, 83%) were included. 77.4 % of the cohort had G8 positive and 92.7% were classified frail or pre-frail with the Fried criteria (38 and 54.7% respectively). 69 patients with frailty or pre-frailty based on the Fried criteria (24% of the cohort) were not detected as frail by the G8. In this sub-group, CGA found poor physical performances (low SPPB, low gait speed). 70% and 60% had a gait speed below 1 and 0.8 m/s respectively) and 63% had a SPPB < 9/12.

Conclusions: Prevalence of frailty was higher using the Fried criteria compared to the G8. Patients undetected by the G8 as frail but detected by the Fried criteria had low gait speed and low SPPB score. Poor physical performances are relevant predictors of adverse event in older patient with cancer suggesting that the Fried criteria are more appropriated to screen for frailty.

CASE-CONTROL STUDIES OF VAGINAL AND VULVAR CANCERS AND GYNECOLOGICAL SCREENING: A SEER-MEDICARE ANALYSIS

E. Osterbur, *Health Sciences and Informatics, St. Louis University, St. Louis, Illinois*

This study was conducted to determine the association between Pap smear and pelvic examination screenings and the development of invasive vaginal and vulvar cancers in a Medicare population using a matched case-control design. Matched case-control data sets were constructed from the SEER-Medicare database that links the Surveillance Epidemiology and End Results (SEER) cancer registry data and Medicare enrollment and claims data of subjects who received care between the years 1991 and 1999 aged 65 years or older. The study identified vaginal (N=328) and vulvar (N=1,103) cancer cases. Controls were matched to vaginal (N=2,624) and vulvar (N=8,825) cancer cases representing up to eight matched controls for a single case. The association between screening tests (Pap smears and pelvic examinations) and invasive vaginal and vulvar cancers utilized a design matched on age and geographic location. The association between gynecologic screenings and the development of invasive disease was ascertained using conditional logistic regression analysis. The risk of regional and distant stages of invasive vaginal (OR 0.55, 95% CI 0.31-0.99) and vulvar (OR 0.70, 95% CI 0.42-1.00) cancers was reduced by Pap smear and pelvic examination screenings. This matched-case control design found evidence that Pap smear and pelvic examination screenings were beneficial for older women due to the decreased risk of regional and distant stages of invasive vaginal and vulvar cancers.

SESSION 640 (SYMPOSIUM)

MANAGEMENT ISSUES IN DELIRIUM

Chair: N. O'Regan, *Western University, London, Ontario, Canada*

Co-Chair: M. Dasgupta, *Western University, London, Ontario, Canada*

Delirium is extremely common, and leads to adverse outcomes. Delirium can be preventable, but is frequently missed. Much remains unknown about management of actively delirious individuals. In this symposium, we present the results of novel research from five centres, focusing on risk stratification, case identification and interventions for delirium. Our first abstract reports the prevalence of hypoactive delirium in older medical inpatients, the most underdetected and prognostically serious form. Our second abstract describes a brief two-step diagnostic approach which shows promise as a sensitive delirium identification method. Thirdly, we present a novel delirium risk stratification method for pre-operative cardiac surgery patients, using frailty assessment. Next, we report findings which indicate improvement in delirium symptoms with physical therapy. Finally we highlight the potential harm related to the oft-prescribed antibiotic treatment of asymptomatic bacteruria in delirious patients. This symposium will highlight new research, across a breadth of issues related to delirium.

FREQUENCY AND STABILITY OF MOTOR SUBTYPES IN OLDER MEDICAL INPATIENTS WITH DELIRIUM

N. O'Regan^{1,2,5}, D. Adamis³, D.W. Molloy², D. Meagher⁴, S. Timmons², 1. *Division of Geriatric Medicine, Department of Medicine, Western University, London, Ontario, Canada*, 2. *Centre for Gerontology and Rehabilitation, School of Medicine, University College Cork, Cork, Ireland*, 3. *Sligo Mental Health Services, Sligo, Ireland*, 4. *Department of Psychiatry, Graduate Entry Medical School, University of Limerick, Limerick, Ireland*, 5. *Lawson Health Research Institute, London, Ontario, Canada*

Hypoactive delirium is most commonly missed and yields the worst outcomes. Little is known about longitudinal course of motor subtypes, as most studies are cross-sectional in nature. We aimed to investigate the frequency and stability of motor subtypes in incident delirium in older medical inpatients. Medical inpatients of ≥ 70 years without prevalent delirium on admission underwent daily assessment for ≤ 7 days for incident delirium. Motor activity profile was established using the Delirium Motor Subtype Scale-4 (DMSS-4). Longitudinal subtypes were ascertained by examining the daily profiles of each delirious patient. In total, 1219 assessments were performed in 191 patients, 61 with incident delirium. Hypoactive subtype was most prevalent on any given delirium day ($n = 75/113$, 66.4%) and was the most common longitudinal subtype ($n = 38/61$, 62.3%). Hypoactive delirium is highly prevalent in older medical inpatients. Hence, delirium education programmes should focus on improving understanding and awareness of this subtle presentation amongst clinicians.

PILOT STUDY OF A DELIRIUM DETECTION PROTOCOL ADMINISTERED BY AIDES, PHYSICIANS, AND REGISTERED NURSES

D.M. Fick¹, S.K. Inouye³, C. McDermott¹, L. Ngo², J. Gallagher², J. McDowell¹, J.L. Penrod¹, E.R. Marcantonio^{2,3}, 1. *College of Nursing, The Pennsylvania State University, University Park, Pennsylvania*, 2. *Beth Israel Deaconess Medical Center, Boston, Massachusetts*, 3. *Harvard Medical School, Boston, Massachusetts*

Delirium is prevalent, costly, and morbid, yet underdetected by clinicians. We tested feasibility and acceptability of a 2-step delirium identification protocol. Step 1, a screener, consists of "What is the day of the week?" and "Months of the year backwards." If either/both items are incorrect, step 2, a 3-minute diagnostic assessment (3D-CAM) follows. Trained researchers enrolled 23 older hospitalized adults and identified 22% to be delirious after a reference standard assessment. Thereafter, physicians, and nurses, completed the 2-step protocol, while certified nursing assistants (CNAs) completed the screener only, all on the same patients. The screener took a median of 36 seconds to administer, with sensitivities: nurses-100%, CNA's-100%, physicians-80%. The 2-step protocol achieved sensitivities: nurses- 100%, physicians-80%, and specificities: nurses-89%, physicians-78%. Barriers and facilitators to implementation were also collected. We conclude that our screener and 2-step protocol can be feasibly implemented by clinicians, and is a promising approach to improve delirium identification.

IMPACT OF FRAILTY ON THE OCCURRENCE OF DELIRIUM IN THE POSTOPERATIVE CARDIAC SURGERY PATIENT

R.C. Aurora, *University of Manitoba, Winnipeg, Manitoba, Canada*

There is a lack of information on the interaction of frailty and the occurrence of delirium after cardiac surgery. Specifically, it is unclear if the addition of preoperative frailty screening to existing surgical perioperative risk models improves the prediction of postoperative delirium (PoD). In a prospective observational study, preoperative assessments of frailty (Modified Fried Criteria, the Short Physical Performance Battery and a 35-item Frailty Index) was performed in elective cardiac surgery patients. The primary outcome was PoD, assessed using the Confusion Assessment Method. Seventy-two (54.1%) of the 133 participants were deemed frail. After adjusting for the "traditional" preoperative risk score (EuroSCORE II), frail patients were at increased risk of PoD ([OR], 5.05, 95%CI, 1.58–16.13). The inclusion of a formal assessment of frailty significantly improved the discrimination of the EuroSCORE II in predicting PoD, pointing to opportunities for improved prevention and management.

INTERVENTIONS FOR ICU DELIRIUM—EFFECT OF PHYSICAL THERAPY ON ATTENTION IN CRITICALLY ILL PATIENTS

K. Neufeld, *Psychiatry and Behavioral Sciences, Johns Hopkins University School of Medicine, Baltimore, Maryland*

Delirium, or acute change in cognition and decreased attention, is a common neuropsychiatric syndrome in up to 80% of critically ill adults. It is associated with negative outcomes including increased mortality and morbidity. Multimodal nonpharmacological interventions including physical therapy are associated with decreasing delirium incidence and severity. This study examined the impact of routine physical therapy on performance of attention tasks in CAM-ICU defined delirious and non-delirious ($n=60$) critically ill patients. Patients in an intensive care unit were given an attention task, utilizing the Edinburgh Delirium Test Box, requiring the patient to count a series of flashing lights prior to, and up to 4 hours following clinically-prescribed physical therapy. Delirious patients had lower baseline performance and greater change in attention following physical therapy compared to non-delirious patients. The results are discussed in the larger context of early mobilization as an important non-pharmacologic prevention strategy for delirium.

TREATMENT OF ASYMPTOMATIC UTI IN OLDER DELIRIOUS MEDICAL INPATIENTS: A PROSPECTIVE COHORT STUDY

M. Dasgupta^{1,2}, C. Brymer¹, S. Elsayed¹, 1. *Western University, London, Ontario, Canada*, 2. *Lawson Health Research Institute, London, Ontario, Canada*

Despite clinical practice guidelines, asymptomatic bacteriuria in older people is commonly treated because of a change in mental status. We sought to determine how often asymptomatic urinary tract infection (UTI) is treated in older delirious individuals, and whether treatment is associated with functional recovery. Consecutive older medical in-patients were screened for delirium, and followed in hospital. Of 343 delirious in-patients, 237 (69%) had poor functional recovery (death, new institutionalization or decreased function at 3 months). Ninety four (27%) were treated for asymptomatic UTI, which was associated with poor recovery compared to those who were not (RR 1.30, 95% CI: 1.14–1.48 overall; RR 1.34). *Clostridium difficile* infection was significantly more common in the treated group ($n=7$, 7.5%) compared to the untreated group ($n=8$, 3.2%), OR 2.45, 95% CI: 0.86–6.96. Treatment of asymptomatic UTI in older delirious medical in-patients was common, and potentially harmful. Further research is needed to validate these findings.

SESSION 645 (SYMPOSIUM)

INNOVATIONS IN PALLIATIVE CARE COMPETENCY IN NURSING PRACTICE: ELNEC, AACN, AND COMMUNITY PARTNERSHIPS

Chair: C.R. Shillam, *University of Portland, Portland, Oregon*

Co-Chair: P. Mazanec, *Case Western Reserve University, Cleveland*

For 20 years, the American Association of Colleges of Nursing (AACN) has endorsed a set of standardized end-of-life (EOL) nursing care competencies. Since then, the demand for nursing competency in palliative care has risen to the forefront. The End-of-Life Nursing Education Consortium (ELNEC), an education initiative to improve palliative and

EOL care, has emerged as an international leader in ensuring all nurses attain competency. Using a train-the-trainer model, ELNEC provides nursing faculty, CE providers, staff development educators, and specialty nurses with training in palliative care to teach essential information in education and practice. Today, emphasis on palliative care across the illness trajectory from time of diagnosis through EOL, and across the lifespan, is required in all practice settings. In 2016, an expert panel of nursing faculty and leaders in palliative care revised the AACN EOL competencies to establish comprehensive palliative care competencies. The resulting AACN Palliative CARES document serves as a foundation to online teaching modules embedded in ELNEC curriculum. This symposium provides an overview of the AACN/ELNEC work, and how these modules are being used in a variety of ways to improve palliative care across settings. Presentations of this symposium will describe:

1. The AACN/ELNEC process of developing and advancing a new set of nursing care competencies in palliative care;
2. Creating and disseminating online modules to increase access to educational offerings;
3. Implementing the modules in an academic setting; and
4. Collaborating with community partners to incorporate community-created online learning modules into the ELNEC curriculum.

DEVELOPING AND ADVANCING NURSING CARE COMPETENCIES IN PALLIATIVE AND END-OF-LIFE CARE

B. Ferrell¹, P.J. Malloy², P. Mazanec³, 1. *City of Hope National Medical Center, Duarte, California*, 2. *American Association of Colleges of Nursing, Washington, District of Columbia*, 3. *Case Western Reserve University, Cleveland, Ohio*

In 2015, AACN and ELNEC convened a national panel of experts in nursing education, gerontology, and palliative care to revise the 1997 AACN *Peaceful Death* document and establish palliative and end-of-life nursing care competencies. The ELNEC train-the-trainer project to date has over 21,100 trainers training over 550,000 professionals in all 50 states and 88 countries. ELNEC has incorporated the newly-revised 17 palliative care competencies into 6 one-hour online modules available for implementation in nursing curriculum. To facilitate dissemination, the modules are available to all schools of nursing in four northwest states free of charge, and to all other schools across the country at a minimal cost, for one year. The use of these competencies, when embedded in the undergraduate curriculum, will empower future nurses to be leaders in advocating for access to quality palliative care and to compassionately promote and provide this essential care to older adults.

CREATING AND DISSEMINATING ONLINE MODULES TO ADVANCE COMPETENCIES IN PALLIATIVE AND END-OF-LIFE CARE

P. Mazanec², B. Ferrell³, P.J. Malloy¹, 1. *American Association of Colleges of Nursing, Washington, District of Columbia*, 2. *Case Western Reserve University, Cleveland, Ohio*, 3. *City of Hope National Medical Center, Duarte, California*

After AACN endorsed the Palliative CARES document, outlining 17 key competencies for palliative and end-of-life nursing care, ELNEC developed 6 one-hour online modules: 1) Introduction to Palliative Nursing; 2) Communication in Serious Illness; 3) Pain Assessment and Management; 4) Symptom Assessment and Management; 5) Loss, Grief, and Bereavement; and 6) Care of the Imminently Dying Patient. Modules can be used for online, face to face, or blended formats. They include limited text, with student interaction required in case studies, short videos, and examination questions. Faculty in nursing programs and continuing education control administration of modules in a variety of ways to meet learning needs of students and practicing nurses. This innovative curriculum increases access to palliative care education in nursing schools, meets palliative care competencies outlined in the AACN CARES document, and strengthens the palliative care workforce nationwide, providing greater access to palliative care for patients with serious illness.

IMPLEMENTATION OF ONLINE EDUCATION TO ADVANCE COMPETENCIES IN PALLIATIVE AND END-OF-LIFE CARE

M.A. Kozy¹, C.R. Shillam¹, A. Davis², M. Lippe³, 1. *School of Nursing, University of Portland, Portland, Oregon*, 2. *Washington State University, Vancouver College of Nursing, Spokane, Washington*, 3. *Capstone College of Nursing, The University of Alabama, Tuscaloosa, Alabama*

All schools of nursing in four northwest pilot states were invited to participate in the implementation of the six AACN/ELNEC Palliative CARES competency one-hour online modules. AACN/ELNEC leaders provided face-to-face one-day workshops to faculty in each of the four states. The workshop outlined the background on the development of the Palliative CARES competencies, the materials and format for the online modules, and strategies for implementation of the modules into existing nursing curricula. Attendees then participated in a brainstorming discussion to generate additional innovations in supporting faculty and students in use of the modules in both online and face to face formats. Schools agreeing to participate in the pilot dissemination phase of the modules incorporate the six modules into existing nursing courses, evaluate the learning outcomes of students in those courses, and provide feedback to AACN/ELNEC regarding the facilitators and barriers to implementation.

INNOVATIVE COMMUNITY COLLABORATIONS TO ADVANCE CULTURALLY SENSITIVE PALLIATIVE AND END-OF-LIFE CARE

C.R. Shillam¹, P. Mazanec², M. Dahlstrom³, S. Williams¹, 1. *School of Nursing, University of Portland, Portland, Oregon*, 2. *Case Western Reserve University, Cleveland, Ohio*, 3. *Familias en Accion, Portland, Oregon*

Continuing education and lifelong learning are essential to providing high-quality, safe nursing care to older adults. During development of AACN/ELNEC Palliative CARES online modules, an academic-practice partnership between the University of Portland and Familias en Accion resulted in evidence-based, culturally-sensitive palliative care online resources for continuing education purposes for health-care providers. Collaboration between the university and

AACN/ELNEC revealed a fit between Familias resources and needs for culturally-sensitive materials in the Palliative CARES online modules. Expanding the original purpose of these high-quality, community-developed online modules, the modules are now embedded into undergraduate nursing education and ELNEC train-the-trainer core and geriatrics curriculum. This partnership provides greater return on investment for funders, and expands the reach of the individual projects, ultimately reaching more nurses. Use of these online modules can streamline efforts to ensure older adults have access to goal-directed, high-quality health care across the continuum of disease trajectory and across the lifespan.

SESSION 650 (SYMPOSIUM)

CO-HOST AGHE: BEING AN AGE-FRIENDLY INSTITUTION OF HIGHER EDUCATION—PERSPECTIVES FROM GLOBAL PARTNERS

Co-Chair: K. Farah, *Lasell College, Newton, Massachusetts*
J.M. Montepare, *Lasell College, Newton, Massachusetts*
Discussant: N.M. Silverstein, *University of Massachusetts Boston*

The aim of this symposium is to illustrate the role higher education can play in responding to the challenges and opportunities associated with shifting demographics and the aging of populations being witnessed locally and globally. In this symposium we will describe the Age-Friendly University (AFU) initiative launched by Irish Taoiseach Enda Kenny and Dublin City University President Brian MacCraith that resulted in the development of the 10 AFU Principles. Now endorsed by international partners in Ireland, UK, US, Canada, and the Association for Gerontology in Higher Education (AGHE), the AFU Principles provide a valuable guiding framework that colleges and universities can use for distinguishing and evaluating age-friendly programs and policies, as well as identifying institutional gaps and opportunities for growth. Global partners will describe how their institutions are using the AFU principles and AGHE president will discuss needed efforts moving forward.

IMAGINING AND REALISING AN AGE-FRIENDLY UNIVERSITY

C. O'Kelly, *Dublin City University, Dublin, Ireland*

The number of people in Ireland aged over 65 is expected to double from 11% to 22% over the next twenty years. This cohort of the population has diverse educational needs which are currently inadequately provided for within higher education and the pressure to meet these needs will increase. In 2008 DCU engaged in a process which resulted in launching Ten Principles of an Age Friendly University. Our vision is to lead a global initiative to embrace the opportunities of an aging population by providing a place for older adults to learn, and where DCU will lead a centre of excellence (research, innovation, teaching, advocacy, engagement) with older adults, harnessing and developing areas of expertise. Opportunities to engage in authentic dialogue with older people also raise awareness within the traditional student cohort to embrace the longevity dividend and inform their own ageing process contributes to the transformational goals of DCU.

TEACHING AND LEARNING ON AN AGE-FRIENDLY INTERGENERATIONAL CAMPUS

J.M. Montepare, K. Farah, *RoseMary B. Fuss Center for Research on Aging and Intergenerational Studies, Lasell College, Newton, Massachusetts*

Lasell College, in Newton, Massachusetts, USA, has the distinction of being the first “age-friendly” intergenerational campus in the state with its recent endorsement of the 10 Age-Friendly University Principles developed by Dublin City University and global partners. Like age-friendly communities, age-friendly universities aim to enable older adults to participate in activities that promote positive and healthy aging. Moreover, age-friendly universities aim to promote greater age-diversity and inclusion across disciplines and departments and a breaking down of age-segregation in the classroom. Age-friendly universities also seek to support aging research by including older adults in research initiatives and by developing research agendas that are informed by the diverse educational needs of an aging society. In this presentation we describe how Lasell College has been working to meet these aims in its intergenerational teaching and learning collaboration with Lasell Village, a university-based independent living community, situated on the Lasell campus.

ENGAGING AN ENTIRE UNIVERSITY IN AGE-FRIENDLY UNIVERSITY PRINCIPLES

M.M. Porter, *University of Manitoba, Winnipeg, Manitoba, Canada*

The Centre on Aging at the University of Manitoba, as a research centre, has a 30+ year history of conducting and disseminating research on aging, as well as training students in research and aging. In May of 2016 the University of Manitoba officially endorsed the Age-Friendly University Principles, becoming the first University in Canada to do so. While the University of Manitoba is already actively engaged in all ten principles, this initiative brings the impetus to take a more concerted approach to enhance all of its activities. The presentation will outline what approach the University of Manitoba has taken to enhance its age-friendliness, including its reach across campus and to the broader community, and who the key individuals and departments have been in these efforts.

SESSION 655 (SYMPOSIUM)

ROLE OF MICROBES IN THE DEVELOPMENT OF ALZHEIMER'S DISEASE: STATE OF THE ART

Chair: A.E. Barron, *Stanford University, Stanford, California*

R. Itzhaki, *University of Manchester & University of Oxford, Manchester, United Kingdom*

Discussant: J. Miklossy, *Prevention Alzheimer International Foundation, International Alzheimer Research Center, Martigny, Switzerland*

Alzheimer disease (AD) is one of the most devastating diseases and aging is one of the most important risk factors. For many years huge efforts have been made to better understand the etiopathogenesis of AD. Also, many treatment trials have been performed. At present, we do not know what is the exact cause of AD nor how to treat it but we know

that neuroinflammation plays an important role, the latter occurring even some 20 years before the clinical appearance of the disease. For the last 25 years, infections have been suspected to play a role in the pathogenesis of AD, and recently, there has been much interesting progress on this aspect. This symposium, with prestigious speakers, would describe recent exciting advances in the field of AD. The main themes would be the general overview on the role of infections in the development of AD; the role of Spirochetes and Chlamydia pneumoniae in the development of AD; the role of amyloid beta (Ab) as an antimicrobial agent and the future for treatment and the interaction between other antimicrobial agents.

THE ROLE OF HERPES SIMPLEX VIRUS TYPE 1 (HSV1) IN ALZHEIMER'S DISEASE (AD)

R. Itzhaki, *University of Manchester and University of Oxford, Manchester, United Kingdom*

We discovered that HSV1 is present and active in a high proportion of elderly brains, and that in brain of carriers of the type 4 allele of the apolipoprotein E gene (APOE-e4), HSV1 confers a strong risk of AD. Significantly, we found also that APOE-e4 is a risk for cold sores. Subsequently, we showed that HSV1 infection of human neural cells in culture causes a striking increase in beta amyloid (Abeta) and AD-like-tau levels, and that Abeta deposits form in brains of HSV1-infected mice. Further, in AD brains, HSV1 DNA is located specifically within amyloid plaques. Antiviral agents reduce greatly Aβ and P-tau levels in HSV1-infected cells, suggesting that antiviral treatment might reduce the progression of AD. Epidemiological, genetic, immunological and virological studies by other groups support the causal link, HSV1-AD, as well as the proposal to treat AD with antiviral agents.

ALZHEIMER'S DISEASE, SPIROCHETES—A CAUSAL RELATIONSHIP

J. Miklossy, *Prevention Alzheimer International Foundation, International Alzheimer Research Center, Martigny-Combe, Switzerland*

Various spirochetes, in an analogous way to *Treponema pallidum*, are involved in the pathogenesis of several chronic disorders including Alzheimer's disease (AD). *Borrelia burgdorferi*, the causative agent of Lyme disease and various periodontal pathogen Treponemes (*T. denticola*, *T. pectinovorum*, *T. amylovorum*, *T. maltophilum*, *T. medium*, *T. socranskii*) persist in the brain and cause dementia and beta amyloid deposition. Spirochetes are able to reproduce *in vitro* and *in vivo* all the pathological and biological hallmarks defining AD. A strong statistically significant association between spirochetes and Alzheimer's disease fulfills Hill's criteria and confirm a causal relationship. Validation of these observations by historic and recent reports further confirm that senile plaques are made up by spirochetes and correspond to biofilms. That host pathogen interactions in chronic spirochetal infection are identical to those occurring in AD indicates that escaping host immune reactions, spirochetes sustain chronic infection and cause dementia and amyloid deposition and that Alzheimer's dementia might be prevented.

THINKING OUTSIDE THE BOX IN ALZHEIMER'S DISEASE: COULD INFECTION BE THE ANSWER

B. Balin, C. Hammond, C. Little, S. Hingley, D. Appelt,
Department of Bio-Medical Sciences, Philadelphia College of Osteopathic Medicine, Philadelphia, Pennsylvania

New concepts of infectious disease are evolving especially with the development of progressive chronic diseases that originally were not thought to be infectious. Infection is well-known to be associated with numerous neurological diseases. What has remained unclear, however, has been the role of infection in the development of chronic neurodegenerative diseases. In this regard, numerous studies over the past 25 years have investigated an association between various infectious agents and Alzheimer's disease (AD), the most prevalent condition accounting for dementia in the elderly. Of the pathogens being considered, Herpes Simplex Virus 1 (HSV-1), *Borrelia* species, and *Chlamydia pneumoniae* have garnered significant attention. Work from other laboratories on systemic infections has also led to further interest in the role that infection may play in the neurodegenerative process in older populations. Data from all of these investigations have led to a renewed interest in investigating the role(s) of pathogens in the etiology of sporadic late-onset AD.

AMYLOID BETA PEPTIDES AS ANTIMICROBIAL PEPTIDES: RELEVANCE FOR ALZHEIMER'S DISEASE?

B. Karine, G. Dupuis, E.H. Frost, T. Fülöp, *Medicine, Universite De Sherbrooke, Sherbrooke, Quebec, Canada*

Amyloid β ($A\beta$) peptides generated by the amyloidogenic pathway of amyloid precursor protein (APP) processing contribute significantly to neurological degeneration characteristic of Alzheimer's disease (AD). Their precise role, whether it be direct or the indirect target of an inflammatory response, has been a subject of considerable debate. Data published in the last 6 years by three different groups have added a new twist by revealing that $A\beta$ peptides could act as antimicrobial peptides (AMP). These observations are of significance with respect to the notion that pathogens may be important contributors to the development of AD, particularly in the case of Herpes simplex virus (HSV) infection which often resides in the same cerebral sites where AD arises. Our recent data support the interpretation that $A\beta$ peptides behave as AMP, with an emphasis on studies concerning HSV-1 and a putative molecular mechanism that suggests that interactions between $A\beta$ peptides and the HSV-1 lead to impairment of HSV-1 infectivity by preventing the virus from fusing with the plasma membrane.

EVIDENCE THAT THE HUMAN LL-37 MAY BE A BINDING PARTNER OF A β AND INHIBITOR OF FIBRIL ASSEMBLY

M. Chiari², E. De Lorenzi³, R. Colombo³, M. Cretich², L. Sola², P. Gagni², A.E. Barron¹, 1. *Stanford University, Department of Bioengineering, Stanford, California*, 2. *National Research Council of Italy, Institute of Chemistry of Molecular Recognition, Milan, Italy*, 3. *University of Pavia, Department of Drug Sciences, Pavia, Italy*

We are investigating the molecular biophysics of the early-stage etiology of sporadic Alzheimer's Disease (AD). What might cause initial accumulation of $A\beta$ peptide-rich fibrils and plaques in the AD brain? What is $A\beta$'s physiological

function? We focus on $A\beta$'s interactions with the human cathelicidin peptide, LL-37, an antibacterial and antiviral innate immune system effector and modulator ubiquitous in tissues, expressed by myriad cell types, yet unique in the proteome. We present experimental evidence and discuss a hypothesis that LL-37 is a binding partner of $A\beta_{1-42}$ can inhibit the formation of AD fibrils and plaques. We demonstrate binding between LL-37 and $A\beta_{1-42}$ by capillary electrophoresis, ELISA, Transmission Electron Microscopy (TEM), and circular dichroism (CD) spectroscopy. TEM shows that LL-37 inhibits the fibrillization of $A\beta_{1-42}$, especially the formation of long, straight fibrils characteristic of AD, while CD spectroscopy reveals that LL-37 binding prevents $A\beta_{1-42}$ from adopting β -type secondary structure.

SESSION 660 (SYMPOSIUM)

PERCEPTIONS, EXPECTATIONS, AND ATTITUDES ABOUT AGING: IMPLICATIONS AND OUTLOOK

Chair: J.E. Smith, *University of Michigan, Ann Arbor, Michigan*

Discussant: D.B. Whitman, *AARP*

Chronological age per se explains little: It does however carry information about social expectations, normative life events, biological processes, and individual beliefs and behavior. Negative stereotypes and attitudes about aging are prevalent but, as contemporary cohorts are living longer and healthier lives, the ways that people think about aging warrant a closer look. Speakers in this session consider sources and effects of attitudes and expectations about aging, and discuss implications of such self-related beliefs for the well-being of older adults. Hess and O'Brien use data from the Aging as Future Project to take a cross-cultural look at associations between subjective perceptions of one's own aging and beliefs about aging in different domains of everyday functioning. Giasson and Smith use data from the Health and Retirement Study to explore links between attitudes about one's own aging and time spent watching television. They examine associations with emotional well-being and discuss implications for daily lifestyle interventions. Andrews and colleagues report findings from the Baltimore Experience Corp Trial, a community-based volunteer intervention designed to promote generativity and wisdom. They examine the role of expectations regarding aging as a mediator of intervention-related improvements in cognitive function. Finally, Chopik and Kim present data from multiple longitudinal studies that collectively measure changes in expectations about the future from age 7 to 97. They discuss the shape and implications of lifespan trajectories in beliefs about the future. Whitman concludes with an integrative discussion of current efforts to reshape beliefs about aging at the level of individuals and society.

THE IMPACT OF BELIEFS ABOUT AGING ON PERCEPTIONS OF ONESELF ACROSS CULTURES AND BEHAVIORAL DOMAINS

T.M. Hess, *North Carolina State University, Raleigh, North Carolina*

Views regarding old age are important determinants of important physical and psychological outcomes, although

the causal underpinnings of these relationships are poorly understood. With an eye toward identifying potential underlying mechanisms, we used data from the Aging as Future project—which included 1891 adults ages 25 – 99 from China, Germany, and the United States—to examine relationships between subjective perceptions of one’s own aging and beliefs about aging in eight different domains of everyday functioning. Although some variation occurred across cultures and domains, more positive perceptions of one’s own aging process (e.g., younger subjective age, positive perceptions of self in old age) were generally associated with more positive perceptions of the aging process (e.g., greater control beliefs, lower beliefs in the age-determinancy of change). We discuss these findings in relation to current theories regarding subjective influences on the aging process.

AGING ATTITUDES AND TELEVISION WATCHING: IMPLICATIONS FOR WELL-BEING

H.L. Giasson¹, J.E. Smith^{1,2}, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *Institute for Social Research, Ann Arbor, Michigan*

Television can be an exciting escape, or a self-handicapping behavior adversely linked to health and well-being. We examine associations between individuals’ television watching and their attitudes toward their own aging using data from the Health and Retirement Study (N=5542). Analyses revealed that positive aging attitudes like “as I get older, things are better than I expected” were associated with fewer hours spent watching television, whereas negative attitudes like “the older I get, the more useless I feel” were associated with a greater number of hours spent watching television. Additionally, positive aging attitudes were associated with higher positive affect while watching TV. Negative aging attitudes were associated with lower positive affect and higher negative affect while watching TV. All analyses controlled for gender, race, age, education, work status, depressive symptoms, functional limitations, day of week, and trait positive and negative affect. We discuss possible cognitive, affective, and behavioral mechanisms.

EXPECTATIONS OF AGING AS A MEDIATOR OF COGNITIVE BENEFITS IN THE BALTIMORE EXPERIENCE CORPS TRIAL

R. Andrews^{1,2}, T.E. Seeman³, E. Tan⁴, G. Rebok^{1,2}, J. Menkin³, J.M. Parisi^{1,2}, T.L. Gruenewald⁵, M.C. Carlson^{1,2}, 1. *Johns Hopkins University, Baltimore, Maryland*, 2. *Center on Aging and Health, Baltimore, Maryland*, 3. *University of California Los Angeles, Los Angeles, California*, 4. *AARP, Baltimore, Maryland*, 5. *University of Southern California, Los Angeles, California*

Background: Having low age-expectations is a risk factor for worse cognitive and physical functions in older adults. Here, we asked whether a community-based volunteer program, designed to promote generativity and wisdom, improved cognition by increasing positive perceptions of aging.

Objective: In the Baltimore Experience Corps Trial (BECT), we examined whether changes in age-expectations mediated the effect of BECT participation on cognitive function over 2 years, and whether the mediation differed by sex and age.

Methods: Expectations Regarding Aging (ERA-12), Stroop interference, and RAVLT were collected at baseline and at two annual follow-ups. Mean age of the sample was 68.0 years, 85% were female and 92% were African American. We used mediation analysis to assess the mediating role of intervention-related changes in ERA on cognitive outcomes, controlling for key characteristics.

Conclusions: These results from a large-scale trial will inform whether community-based volunteering may impact cognitive function, in part, by improving age-expectations.

AGE-RELATED CHANGES IN EXPECTATIONS ABOUT THE FUTURE: IMPLICATIONS FOR HEALTH AND WELL-BEING

W. Chopik¹, E. Kim², 1. *Michigan State University, East Lansing, Michigan*, 2. *Harvard University, Boston, Massachusetts*

As individuals get older, they revise their thoughts and expectations about the future. Several theories in gerontology and developmental psychology make predictions about the ways in which perceptions about the future might change. However, little empirical data exists on changes in expectations about the future, particularly over large stretches of an individual’s life. The current study presents data from multiple longitudinal studies (the Institute for Human Development Studies, the National Survey of Midlife Development in the United States, and the Health and Retirement Study) that collectively measure changes in expectations about the future from age 7 to age 97. Results demonstrate increasingly positive evaluations about the future from early life until older adulthood, followed by more negative evaluations among the oldest old. Follow-up analyses examine correlations between future evaluations and changes in physical health. Implications for lifespan development and perceptions of aging during the second half of life are discussed.

SESSION 665 (SYMPOSIUM)

THE IMPORTANCE OF CONTROL BELIEFS FOR SUCCESSFUL AND HEALTHY AGING

Chair: J. Drewelies, *Humboldt University Berlin, Berlin, Berlin, Germany*

Co-Chair: D. Gerstorf, *Humboldt-Universität zu Berlin*

Discussant: H. Wahl, *Heidelberg University, Heidelberg, Germany*

Research has long acknowledged the dynamic nature of control beliefs across the lifespan and its important role in facilitating successful and healthy aging. This symposium brings together four papers that highlight how control beliefs do shape and are shaped by individual development in different contexts and phases of adult development. *Koffer* and colleagues examine how associations among daily stress processes and negative affect are related to both between- and within-person control beliefs across the adult lifespan. *Robinson and Lachman* examine if perceived control mediates the relationship between conscientiousness and daily physical activity. *Drewelies* and colleagues examine how internal and external control beliefs relate to a broad range of physical and cognitive functions of everyday using data from the Berlin Aging Study II. *Turiano* and colleagues investigate

how levels and changes in control beliefs predicted mortality risk using data from the MIDUS study. The discussion by *Wahl* integrates the four papers, highlights their theoretical and methodological contributions, and considers challenges and opportunities for inquiries on control beliefs.

DAILY CONTROL MODERATES STRESS REACTIVITY AND BECOMES INCREASINGLY IMPORTANT WITH AGE

R. Koffer¹, J. Drewelies², D. Gerstorff², D. Almeida¹, N. Ram^{1,3}, 1. *Pennsylvania State University, University Park, Pennsylvania*, 2. *Humboldt-Universität zu Berlin, Berlin, Germany*, 3. *German Institute for Economic Research (DIW), Berlin, Germany*

This study examines how associations among daily stress processes and negative affect are related to both between- and within-person control beliefs across the adult lifespan. Analyses included participants from the Intraindividual Study of Affect Health and Interpersonal Behavior, with $N=150$ adults aged 18–89 assessed over $T=63$ days. Multilevel models indicated that both lower levels of general control beliefs and days with lower daily control beliefs are associated with greater stressor reactivity. The association between stressor reactivity and daily control beliefs is particularly strong for those who experience generally higher levels of stressor exposure. Older adults appear to be more vulnerable to the association between daily control beliefs and stressor reactivity. We will discuss the theoretical importance of including multi-time-scale risk and resilience factors when examining the links between stress and well-being.

CONSCIENTIOUSNESS AND DAILY PHYSICAL ACTIVITY: PERCEIVED CONTROL AS A MEDIATOR

S. Robinson, M.E. Lachman, *Brandeis University, Waltham, Massachusetts*

Both conscientiousness and perceived control are positively related to health-promoting behaviors such as physical activity. The goal of the current study was to examine if perceived control mediated the relationship between conscientiousness and daily physical activity. For seven days, 145 adults, ages 22 to 94, recorded physical activity and sedentary time with an Actigraph GT3X+, and rated their perceived control over physical activity. Controlling for age, sex, and education, multilevel models revealed that on days with higher perceived control there were greater Kcals, METs, and time-spent in moderate to vigorous physical activity, and less sedentary time. Conscientiousness was related to greater daily perceived control over activity and negatively related to sedentary time; daily control beliefs mediated this relationship. The findings extend our understanding of the mechanisms linking conscientiousness, perceived control, and physical activity, and suggest that control beliefs and personality should both be considered when developing physical activity interventions.

EXTERNAL, NOT INTERNAL CONTROL RELATES TO PHYSICAL FITNESS AND COGNITIVE PERFORMANCE IN OLDER ADULTS

J. Drewelies¹, S. Duezel², I. Demuth³, E. Steinhagen-Thiessen³, U. Lindenberger^{2,4}, J. Heckhausen⁵, D. Gerstorff¹, 1. *Psychology, Humboldt University Berlin, Berlin, Berlin*,

Germany, 2. *Max Planck Institute for Human Development, Berlin, Berlin, Germany*, 3. *Charité – Universitätsmedizin Berlin, Berlin, Berlin, Germany*, 4. *Max Planck University College London Centre for Computational Psychiatry and Ageing Research, London, United Kingdom*, 5. *University of California, Irvine, California*

Lifespan research has shown that control beliefs are associated with key outcomes of successful aging. However, little is known about whether such associations exist when the focus is on performance-based indicators of everyday physical and cognitive. We test how control beliefs relate to physical and cognitive functioning and investigate age differences in the direction and size of such associations. We analyzed data from 1,090 older adults ($M_{\text{age}}=70.11$ years; $SD=3.9$; range 61–88; 51% women) who participated in the Berlin Aging Study-II using structural equation modeling. Results revealed that external control was related to physical health (lower grip strength) and cognitive performance-based indicators (poorer working memory) examined. Findings highlight the differential role of internal and external control beliefs for successful aging.

CONTROL BELIEFS AND LONGEVITY: ANALYSIS OF LEVEL AND CHANGE

N.A. Turiano, N.M. Silva, P.S. Mehta, S. Spears, *West Virginia University, Morgantown, West Virginia*

Control beliefs, representing an individual's perceived ability to meet the challenges of life, are associated with a host of positive developmental and health outcomes. However, less is known about how changes in control beliefs are related to health. Utilizing 20-year mortality data from a national sample of over 6,000 adults from the MIDUS study, we tested whether baseline levels of control beliefs, and 10-year change in control predicted mortality risk using Cox proportional hazards modeling. Net of age, sex, education, race, and marital status, results indicated that baseline control ($HR = 0.89$; $CI = 0.84 - 0.94$) as well as 10-year control change ($HR = 0.85$; $CI = 0.77 - 0.94$) predicted mortality risk. Individuals endorsing stronger control beliefs, as well as those who increased in control over the 10-year follow-up had substantially reduced hazards of dying. Findings underscore the dynamic shifts in psychological functioning are important for health and longevity.

SESSION 670 (SYMPOSIUM)

UNDERSTANDING LATER CAREERS: A COMPARATIVE ASSESSMENT

Chair: S. Vickerstaff, *University of Kent, Canterbury, Kent, United Kingdom*

Discussant: B. Beach, *International Longevity Centre - UK, London, United Kingdom*

In much research on older workers the emphasis has been on transitions to retirement and questions of what encourages people to stay in work. This symposium reorients the focus slightly to look at later careers or late life employment experiences. In the popular imagination later working life is now much more varied than it was in the past with opportunities to work flexibly, come in and out of paid employment or enjoy an 'encore career'. The contributions to this

symposium, which brings together a range of international research projects, have looked critically at these issues from different perspectives and with different methodological approaches.

Papers in the symposium cover later careers in the UK, the US and Switzerland. As a starting point a paper explores the way in which policies which impinge on later careers may have unintended consequences. Following this a project taking a life course perspective explores how certain accumulated disadvantages or advantages can limit the options that some older workers have. Two further papers utilise sequence analysis of longitudinal data sets to provide a detailed picture of the steps people are taking in their later working careers amplifying both the range of differences between people and the degree to which individuals are experiencing complex work endings. Finally combining longitudinal quantitative data with rich case study based qualitative data provides an opportunity to look in depth at the constraints on later life work changes and why people may find it difficult to change direction or downshift.

THE CONSEQUENCES OF ABOLISHING UK MANDATORY RETIREMENT AGES

D. Lain, *University of Brighton, Brighton, United Kingdom*

In 2011 mandatory retirement ages were abolished in the UK, constraining employers in their ability to retire off employees at fixed ages. Historically, UK employees have had few employment rights beyond age 65 and line managers often decided which workers could continue working (Vickerstaff, 2006). Thus far, there has been little research on the implementation and impact of this reform at an organisational level. This paper therefore presents findings from case study research in which workers, managers, trade unions and HR professionals were interviewed in four organisations. The findings show that the impact of these changes depended upon the organisational context. Furthermore, the reforms had a number of unintended consequences. This included one organisation ending a gradual retirement scheme, on the assumption that such schemes would now be legally indefensible. Policy-makers therefore need much greater awareness of the implementation of policies such as this at an organisational level.

THE IMPACT OF LIFE-COURSE PSYCHOLOGICAL HEALTH ON LABOUR FORCE PARTICIPATION AND EXIT IN LATER LIFE

C. Clark¹, M. Smuk¹, D. Lain², S. Stansfeld¹, M. van der Horst³, S. Vickerstaff³, 1. *Queen Mary University of London, London, United Kingdom*, 2. *University of Brighton, Brighton, United Kingdom*, 3. *University of Kent, Canterbury, United Kingdom*

Adulthood psychological ill-health has implications for receipt of disability pension but less is known about the impact on other types of labour force participation and exit, or about the role of childhood psychological ill-health. This study examined associations between labour force participation at 55 years and lifecourse psychological health using the 1958 British birth cohort data. Labour force participation was self-reported at 55 years. Psychological ill-health was reported at 7, 11, 16, 23, 33, 42 and 50 years. Childhood and adulthood psychological ill-health were both associated with

work place exit at 55y in terms of unemployment, permanent sickness and being a homemaker. The associations observed between childhood psychological health and labour force exit at 55y were largely independent of adulthood psychological ill-health and other adulthood factors. There were no gender differences. Childhood psychological ill-health may distally influence labour force participation and exit, having implications for the extending working lives agenda.

RETIREMENT SEQUENCES OF OLDER AMERICANS: MODERATELY DE-STANDARDIZED AND HIGHLY STRATIFIED ACROSS GENDER, CLASS, AND RACE

I. Madero-Cabib^{1,4}, E. Calvo^{3,4}, U.M. Staudinger³, 1. *Universidad de Chile, Santiago, Chile*, 3. *Columbia University, New York, New York*, 4. *Universidad Diego Portales, Santiago, Chile*

This study analyzes the de-standardization in older Americans' later-life careers. The focus is on the complexity in type, order, and timing of retirement sequences, as well as on their gender, class, and race stratification. Using sequence analysis on panel data including 7,881 individuals from the Health and Retirement Study (HRS), this study identifies six types of retirement sequences—early, complete, partial, late, ambiguous, and compact—that cannot be adequately summarized under the conventional model, where individuals completely retire from a full-time job. Stratified analyses suggest that retirement sequences for women, individuals with lower education, and Blacks are more heterogeneous and precarious than for men, highly educated individuals, and Whites, respectively. Additional results provide only partial support for reversible retirement sequences and changes in labor-force status happening at different ages. Overall, these findings suggest that retirement sequences in the United States are fairly de-standardized and strongly shaped by social stratification factors, but to some extent also irreversible and age-graded.

THE LIFE COURSE DETERMINANTS OF VULNERABILITY IN LATE CAREERS

I. Madero-Cabib^{1,2}, 1. *Universidad Diego Portales, Santiago, Chile*, 2. *Universidad de Chile, Santiago, Chile*

Late career is often seen as a more vulnerable life-stage in the labour market, in which workers may experience a deterioration in job quality. Using a life course perspective and longitudinal data, this article analyses the vulnerability associated with late career by focusing on four occupational dimensions: working-time, career continuity, retirement timing and income change. The research is carried out using data from Switzerland, a country where the age profile of the labour force is an increasing issue. The paper also adopts a cumulative disadvantage perspective to examine the impact of previous work and family life experiences on work life vulnerability at older age. Our data come from the Survey of Health, Ageing and Retirement in Europe (SHARELIFE). The paper uses cluster analysis, sequence analysis and ordered logistic regression. Results show that women with previous family responsibilities resulting in long-term unemployment or caring, often with health complications, are more likely to be vulnerable to deterioration in job quality in late career. This suggests that experiences in the last period of the working life may be just as gendered as earlier periods.

EXTENDING WORKING LIVES IN THE UK: WHY DON'T WE SEE MORE VARIATION?

M. van der Horst, S. Shepherd, S. Vickerstaff, *Social Policy, Sociology and Social Research, University of Kent, Canterbury, Kent, United Kingdom*

In a recent paper we showed that there is less variation in later life careers than one would expect based on the popularity of terms like 'phased retirement', 'bridge jobs', and 'un-retirement'. These concepts seemed more topical than typical, at least in the UK. In this paper we assess why this is the case by going more in depth quantitatively and investigating five qualitative case studies; Transport, Hospitality, Local Government, Manufacturing, and Mining. We will place special attention on what individuals say they want in later working life as well as investigate actual and perceived barriers. By combining strengths of quantitative and qualitative research we are in a unique position of being able to provide policy advice based on general patterns as well as a deeper understanding of why we see these patterns. We also provide employers with insight on what could extend older workers' labour force attachment.

SESSION 675 (SYMPOSIUM)

DISCRIMINATION AND HEALTH ACROSS THE LIFE COURSE

Chair: R.J. Thorpe, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Co-Chair: C. Hill, *NIH/NIA\OD\ODD\SPP*

Discussant: T. Lewis, *Emory University, Atlanta, Georgia*

There is a paucity of research that seeks to understand why race disparities in health across the life course remain elusive. One such explanation that has been garnering attention is discrimination. This symposium contains papers seeking to address the impact of discrimination on health or health disparities across the life course. First, Hargrove investigates the extent to which multiple dimensions of discrimination account for skin color disparities in hypertension among 976 African Americans adults in the Coronary Artery Risk Development in Young Adults Study. This author reports significant intragroup heterogeneity in the discrimination-health link. Second, Cobb and Thorpe examine the relationship between the frequency of everyday discrimination and pulse pressure among 7,181 Black, Latino, and White older adults who participated in the 2006/2008 Health and Retirement Study. These authors report that the frequency of perceived everyday discrimination may differentially affect pulse pressure of older Whites and Blacks. Third, Thomas examines the relationship between social class discrimination (SCD) and mental health among 627 Black adults in the Nashville Stress and Health Study. This author demonstrates that SCD impacts mental health across the life course. Finally, Byrd examines racial disparities in cognitive ability among 991 older black and white adults in waves 4 and 5 of the Americans' Changing Lives Study. There was no impact of discrimination on race disparities in cognitive ability over time. These presentations collectively bolster our knowledge of how discrimination impacts health and health disparities across the life course.

SKIN COLOR, DISCRIMINATION, AND HYPERTENSION AMONG AFRICAN AMERICAN ADULTS

T. Hargrove¹, E. Leslie², 1. *Sociology, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 2. *Vanderbilt University, Nashville, Tennessee*

Skin color is a significant source of stratification that shapes health among African Americans. While prior research provides evidence that discrimination experiences vary by skin color, the ways that discrimination influences the skin color-health relationship remain unclear. This study investigates the extent to which multiple dimensions of discrimination, including experience, frequency, and degree of stressfulness, account for skin color disparities in hypertension among African Americans adults age 43 to 55. Analyses of three types of discrimination (racial, gender, social class) in the Coronary Artery Risk Development in Young Adults Study (N=976) indicate that the health consequences of the experience of each type of discrimination, and the stressfulness of racial discrimination, vary by skin color in ways that disadvantage those of darker skin. This study demonstrates that there is significant intragroup heterogeneity in the discrimination-health link. Future research should unpack the differential health consequences of discrimination among multiply disadvantaged groups.

EVERYDAY DISCRIMINATION AND BLOOD PRESSURE IN OLDER WHITES, BLACKS, AND LATINOS

R.J. Cobb¹, R.J. Thorpe², 1. *University of Southern California, Los Angeles, California*, 2. *John Hopkins University, Baltimore, Maryland*

Despite ongoing interest in the link between everyday discrimination and cardiovascular health throughout the lifecourse, few studies have examined links between the frequency of everyday discrimination and pulse pressure among older adults. Data from the 2006/2008 Health and Retirement Study was used to examine whether pulse pressure varies by exposure to day to day discrimination. Multivariate linear regression models were conducted to test associations between frequency of perceived everyday discrimination and pulse pressure among Whites, Blacks, and Latinos. In models adjusted for age, sex, education, health behaviors, and blood pressure medication, recounting frequent everyday discrimination relative to individuals who reported no exposure to everyday discrimination had the highest pulse pressure scores. These results indicate that the frequency of perceived everyday discrimination may differentially affect pulse pressure of older Whites and Blacks. Future research is needed to determine whether this association persists over time.

SOCIAL CLASS DISCRIMINATION AND THE MENTAL HEALTH OF BLACK ADULTS

C.S. Thomas, *University of California, Los Angeles, Los Angeles, California*

Self-reported discrimination is a stressor linked to mental health among Blacks. Although past studies emphasize racial discrimination, mistreatment on the basis of other statuses (e.g. social class) may also influence health. This study examines the relationship between social class discrimination

(SCD) and mental health. Data are from 627 Black adults ages 18 to 69 in the Nashville Stress and Health Study. Outcomes assessed include depressive symptoms (CES-D) and psychological distress (0=low, 1=high). Two types of SCD are examined: major and day-to-day SCD (0=none, 1=SCD, 2=other discrimination). Logistic regression analyses indicate experiences of major (CES-D: OR=3.80, CI: 1.77–8.16; Distress: OR=3.01, CI: 1.02–9.26) and day-to-day (Distress: OR=3.14, CI: 1.02–9.76) SCD are associated with poor mental health, but these effects diminish in later life. Findings demonstrate the impact of SCD on Blacks' mental health across the life course. Future research is needed to understand the protective effect of age in this relationship.

DOES DISCRIMINATION PLAY A ROLE IN RACIAL DISPARITIES IN COGNITIVE ABILITY AMONG OLDER U.S. ADULTS?

D. Byrd, *Community Health Sciences, UCLA Fielding School of Public Health, Los Angeles, California*

Race and stress exposure are associated with cognitive ability among older adults. This study examines racial disparities in cognitive ability among aging black and white adults enrolled in waves 4 and 5 of the Americans' Changing Lives Study (N =991). Cognitive ability was assessed at both waves such that changes in cognitive impairment symptoms were examined longitudinally, controlling for cognitive status and risk factors that were measured at wave 4. Results show whereas there was no main effect of stressful life events or discrimination on cognitive ability, there was a significant race effect, $\beta = -.195, p = .013$. Inconsistent with predictions, there was no significant interaction between race and discrimination. Thus race, rather than social stressors, appears to influence cognitive ability among aging adults. In particular, blacks experience greater rates of cognitive impairment over time compared to whites. This finding highlights the importance of addressing racial disparities in cognition.

SESSION 680 (SYMPOSIUM)

INDIVIDUAL AGENCY IN WORK AND CAREER: ADAPTATION DURING ADULTHOOD AND OLD AGE

Chair: J. Heckhausen, *University of California-Irvine, California*

The increasingly globalized world economy has rendered careers and life-course trajectories of employment less predictable and more responsive to individuals' efforts. Individuals increasingly are expected to shape their job characteristics and to respond to challenges associated with aging-related constraints in work demands and job conditions. Presentations in this symposium address the way in which individuals play an active role in shaping their work activities and conditions, as well as how they respond to challenging conditions in their work life. Heckhausen and Shane present findings from MIDUS I, II, and III (age range: 20 to 93 years) on age trajectories of work-related engagement as a function of age and occupational characteristics. Zacher examines active job crafting in a sample of workers (age-range: 18 to 76 years) showing age-differential trends and effects of increasing structural and social resources as well as

challenging and hindering demands. Vogelsang, Olson, and Shultz investigate the social and personal influences on late life career change and their effects on emotional well being of older workers, showing a pervasive positive effect of investing extra financial resources as well as some benefits of family support and agency. Scheibe conducted daily surveys with workers from diverse backgrounds and discovered that older workers are better able to manage negative emotions associated with negative work events.

ACTIVE INVESTMENT INTO WORK ACROSS ADULTHOOD: AGE-GRADED AND OCCUPATIONAL INFLUENCES

J. Heckhausen¹, J. Shane², *1. University of California-Irvine, Irvine, California, 2. City University of New York, Brooklyn, NYC, New York City, New York*

How does the amount of thought and effort that individuals devote to work change across adulthood? Which individual and workplace characteristics modify this age trajectory? We examine these questions using the Midlife in the United States National Study of Health and Well Being (MIDUS I, II, and III) that spans 20 years with individuals ranging in age from 20 to 93 years. Participants reported a general decline in work-related engagement starting in midlife and dropping off progressively rapidly as they entered into and passed the typical age of retirement. However, individuals reported enhanced work-related engagement when working in a managerial or professional job, their workplace granted them greater autonomy, and they felt valued and respected. The positive association of greater autonomy with work-engagement was most pronounced through midlife, whereas during older age feelings of being valued and respected at work were associated with greater work engagement.

JOB CRAFTING ACROSS ADULTHOOD: IMPLICATIONS FOR FUTURE TIME PERSPECTIVE AND RETIREMENT INTENTIONS

H. Zacher, *University of Leipzig, Leipzig, Germany*

Job crafting involves workers actively changing the demands and resources of their job to increase the fit between their personal needs and the work environment. This study examines relationships between worker age and four dimensions of job crafting: increasing structural resources, increasing social resources, increasing challenging job demands, and decreasing hindering job demands. Moreover, interactive effects of age and job crafting dimensions on workers' occupational future time perspective and retirement intentions are investigated. Data came from 1,779 workers between 18 and 76 years. Results showed that age was positively related to increasing structural resources and negatively related to increasing social resources and decreasing hindering demands. Increasing structural resources was more beneficial among younger adults with regard to occupational future time perspective, whereas older workers benefited more from increasing challenging demands in terms of occupational future time perspective and lower retirement intentions. Implications for future research and practical interventions are discussed.

LATER LIFE CAREER CHANGES AND POSITIVE EMOTIONAL OUTCOMES: THE ROLES OF AGENCY AND SOCIAL RESOURCES

E. Vogelsang¹, K.S. Shultz¹, D. Olson², 1. *California State University-San Bernardino, San Bernardino, California*, 2. *University of La Verne, La Verne, California*

More individuals are attempting career changes in later life as an increasing number of older adults face precarious retirement prospects. Although many of these older job seekers eventually find new livelihoods, little is known about their emotional well-being subsequent to these changes. Using respondents from the 2014 *New Careers for Older Workers Study* who successfully navigated a career change after age 45 (n=337), we evaluate the contributions of demographic characteristics, agency, and resources when estimating three measures of career-oriented emotional well-being. We found that having financial resources during the career transition was associated with all three optimistic emotional outcomes; while family support and intentionality were also associated with more positive emotions. Conversely, prior job prestige and additional job training had no relationships with career-oriented well-being. These results suggest that later life career change, despite its challenges, often results in positive emotional outlooks—for those with the resources to support it.

SESSION 685 (SYMPOSIUM)

IMPROVING DEMENTIA CARE AND OUTCOMES ACROSS SETTINGS OF CARE

Chair: S. Zimmerman, *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Discussant: L.P. Gwyther, *Duke University, Durham, North Carolina*

The number of people with dementia residing in communities, assisted living, nursing homes, and other aged care homes across the globe is certain to increase. Despite great strides that have been made achieving better care and outcomes for people with dementia, gaps still exist – some of which are universal, and others of which are especially pressing in relation to specific settings of care. This symposium, sponsored by the Social Research, Policy, and Practice Section of the Gerontological Society of America, includes four evidence-based presentations of new programs and data to improve care and outcomes for persons with dementia; the work was conducted in the U.S. and Australia, and is broadly applicable. The first session describes an efficacious program to help family caregivers attend to medical signs and symptoms of their relative with dementia; the second addresses care in assisted living residences, focusing on potentially inappropriate antipsychotic use and other strategies to address behavioral symptoms of dementia; the third examines quality of life in relation to behavioral and psychological symptoms of dementia in nursing homes; and the fourth presents a goals of care intervention fostering focused communication and care planning in relation to individualized goals to prolong life, support function, or improve comfort in nursing homes. The discussant, Lisa Gwyther, is past president of the Gerontological Society of America and an international expert on dementia caregiving; she will discuss the global relevance of the findings for caregivers and care settings and how to improve dementia care moving into the future.

HELPING FAMILY CAREGIVERS ATTEND TO MEDICAL SIGNS AND SYMPTOMS OF RELATIVES WITH DEMENTIA

P.D. Sloane¹, S. Zimmerman¹, A.S. Beeber¹, L.P. Gwyther², B. Matchar², C. Lathren¹, K. Ward¹, 1. *University of North Carolina, Chapel Hill, North Carolina*, 2. *Duke University, Durham, North Carolina*

Few resources provide guidance to family caregivers when an individual with dementia has health-related symptoms and may need medical care. This session will present and discuss the design and outcomes of web-based resources and a book, both entitled *Alzheimer's Medical Advisor*, developed under a grant from the U.S. National Institutes of Health. To field test these resources, 193 caregivers (142 web version, 51 paper version) were enrolled and followed to learn incident health conditions, use of and attitudes regarding the resource, and change in caregivers outcomes (confidence, burden, anxiety, depression). Over six months, nearly 90% of participating caregivers reported having to address new or worsening organ-specific, nonspecific, and behavioral symptoms; pre-post data indicated significant ($p < .001$) improvement in caregiver confidence knowing about, deciding about, taking care of, and enacting behaviors, as well as reduction ($p < .05$) in caregiver role strain.

TREATING BEHAVIORAL SYMPTOMS OF DEMENTIA IN ASSISTED LIVING

S. Zimmerman¹, P.D. Sloane¹, S. Miller¹, D. Reed¹, J. Preisser¹, J.T. Hanlon², 1. *University of North Carolina, Chapel Hill, North Carolina*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*

Assisted living residences (ALRs) have become a notable site of care for persons with dementia in the U.S., as have similar settings across the globe. Concern has been raised, however, that ALR staff are not trained to address behavioral symptoms of dementia, and that antipsychotic medications are being used inappropriately to manage symptoms. This session will present data on non-pharmacologic and pharmacologic practices in the U.S., drawing on national estimates, data from 280 ALRs across seven states, and from 90 ALRs in one state. Illustrative statistics are that nationally, more than one-third of residents display behavioral symptoms, almost 60% of who are treated with a medication; that antipsychotic medications are more often prescribed in ALRs that have memory care units ($p < .05$); and that staff largely have the capacity to implement practices such as therapeutic touch or environmental modification, but rarely do so. Implications of findings across countries will be discussed.

UNPACKING THE INFLUENCE OF DEMENTIA-RELATED SYMPTOMS ON QUALITY OF LIFE OF NURSING HOME RESIDENTS

E.R. Beattie¹, E. Fielding¹, W. He¹, W. Moyle², 1. *Queensland University of Technology, Brisbane, Victoria, Australia*, 2. *Griffith University, Brisbane, Queensland, Australia*

The presence and severity of behavioral and psychological symptoms of dementia (BPSD) influence the everyday comfort of nursing home residents. Within a larger, nationally representative study of Australian nursing homes (n=53) conducted by the Aus-QoL group, this presentation examines the relationship between BPSD and quality of

life (QoL). Depression (Geriatric Depression Scale), agitation (Cohen-Mansfield Agitation Inventory) and wandering (revised Algate Wandering Scale) were rated by staff and used as indicators of a latent “BPSD” variable in relation to QoL (Quality of Life-Alzheimer’s Disease scale), with demographic and health characteristics as exogenous variables. The relationship between BPSD and staff-rated QoL was strong and negative ($n=216$, $\beta=-.71$). For resident-rated QoL, the relationship was significant but weaker ($n=150$, $\beta=-.16$). Notable among the correlates was the significant negative relationship of resident nutrition to all three BPSD indicators. These results support the need for early individual attention to ameliorate the impact of BPSD on QoL.

PROMOTING GOALS OF CARE TO IMPROVE DECISION MAKING IN NURSING HOMES

L. Hanson¹, S. Zimmerman¹, M. Song², F. Lin¹, C. Rosemond¹, T. Carey¹, S. Mitchell³, 1. *University of North Carolina, Chapel Hill, North Carolina*, 2. *Emory University, Atlanta, Georgia*, 3. *Harvard University, Boston, Massachusetts*

In the U.S., two-thirds of people with dementia die in nursing homes, meaning family members are positioned to inform care from admission through the end of life. Unfortunately, communication between family, staff, and medical providers about issues such as life-sustaining treatments is limited, often resulting in unwanted, aggressive treatments. This study of a Goals of Care decision aid aimed to facilitate goals-based communication and care planning related to prolonging life, supporting function, or improving comfort. It included viewing a decision aid and participating in a care plan meeting, and was tested in a cluster randomized trial with 302 family decision-makers in 22 nursing homes. Results found high fidelity (> 90% received the entire intervention), and family reported better quality of overall ($p<.05$) and end-of-life communication ($p<.02$); there was more palliative care content in treatment plans ($p<.02$), and significantly fewer hospital transfers. This intervention can easily be replicated in other countries.

SESSION 690 (SYMPOSIUM)

EFFECTS FROM LABOR MARKET PARTICIPATION ON FRAILTY AND SOCIAL EXCLUSION IN LATER LIFE?

Chair: N. De Witte, *Vrije Universiteit Brussel, Brussels, Belgium*

Numerous studies have shown that labor market participation affects living conditions during work life in many facets (e.g. financial and social). However, less is known how previous labor market participation affects life in retirement. In this symposium we discuss the effects of labor market participation on two later life conditions: social exclusion and frailty. To explore the underlying processes this symposium embraces a multi-method, multi-disciplinary and multinational approach.

Sofie Van Regenmortel starts with a qualitative study. By analyzing life story interviews in Belgium, she explores the influence of labor market participation on old-age social exclusion. Second, Michael Van der Elst presents a Belgian

quantitative cross-sectional study in which he examines the relationship between the timing of labor market exit and frailty and its different dimensions. Third, Martin Wetzel presents a study using German longitudinal data in which he investigates changes in perceived social exclusion at retirement depending on the last labor market status. Patricia Navarrete demonstrates the association of labor based employee benefits and frailty among Mexican older adults.

Since the symposium embraces different methods and an international approach, Nico De Witte will discuss the different findings and summarizes the different effects of former labor market participation on later life outcomes.

LABOR MARKET PARTICIPATION ACROSS THE LIFE COURSE: IS THERE A DOMINO EFFECT?

S. Van Regenmortel, A. Smetcoren, B. Fret, D. Lambotte, S. Dury, L. De Donder, *Vrije Universiteit Brussel, Brussels, Belgium*

Despite an increasing focus on the effects of the life course on inequalities in health and wellbeing, a life course approach has found little attention in social exclusion research. One major aspect of the life course, labor market participation, is often not included when examining old-age social exclusion. The current study examines qualitatively how labor market participation across the life course relates to dimensions of old-age social exclusion (e.g. material resources and participation). This study analyzes life story interviews from 44 Belgian older adults (60+). The interviews are based on McAdams’ life story scheme (2008). Results demonstrate that in older adult’s life stories, labor market is frequently mentioned and strongly associated with financial and material resources. Throughout the life course, labor market inclusion strongly influences dynamics in and out of exclusion. The study highlights the evidence for a domino effect from labor market participation on old-age social exclusion.

THE RELATION BETWEEN EARLY RETIREMENT AND THE ONSET OF FRAILTY IN BELGIAN OLDER ADULTS

M. Van der Elst¹, B. Schoenmakers¹, D. Verté², L. De Donder², N. De Witte^{2,3}, J. De Lepeleire¹, 1. *University of Leuven, Leuven, Belgium*, 2. *Free University Brussels, Brussels, Belgium*, 3. *University College Ghent, Ghent, Belgium*

Studies have shown that on average 11% of the older adults are frail. People with lower incomes are more likely to be frail. Research shows that early retirement leads to lower retirement income, but could also cause loss of social contacts, as the work environment is a source for social contact. The current study examines the relationship of retirement age and frailty in the later life and takes various dimensions (physical, social, psychological and environmental) of frailty into account. A cross-sectional method is used. The data are retrieved from the “Belgian Ageing Studies”, a large-scale survey ($N=30\ 984$) of community dwelling older people aged 60 and older. Frailty is operationalized by the Comprehensive Frailty Assessment Instrument (CFAI). Results are showing that retirement affects various dimensions of frailty differently. The discussion highlights the long-term effect of early retirement.

IN OR OUT OF SOCIETY? RETIREMENT AFFECTS PERCEIVED SOCIAL EXCLUSION IN GERMANY

M. Wetzel¹, K. Mahne², 1. *University of Cologne, Cologne, Germany*, 2. *German Centre of Gerontology, Berlin, Germany*

Previous studies have shown that perceived social exclusion (PSE) depends crucially on individual access to resources but also on the possessed social status. Employment status predicts both resources and status and thus unemployed show serious social disadvantages. We expect that the transition into retirement is associated with a loss in resources and status (increasing PSE) for those previously working while those previously not working profit due to a change in social status (decreasing PSE). Using longitudinal data from Germany, we estimated FE-panel regression models for 627 retirees. Those previously working report lower levels of PSE than those not working. Contrary to our expectations, retirement did not affect PSE for those previously working. However, for those not working previously, retirement decreased PSE. We hence assume that for those previously working retirement depicts a transition just from one valued status to another. For those not working, retirement indicates a reduction of stigmatization.

EMPLOYEE BENEFITS AND FRAILTY IN MEXICAN COMMUNITY-DWELLING OLDER ADULTS

A. Navarrete-Reyes¹, J. Avila-Funes^{1,2}, 1. *Instituto Nacional de Ciencias Médicas y Nutrición "Salvador Zubirán", Mexico City, Mexico*, 2. *Université Victor Segalen Bordeaux 2, Bordeaux, France*

Frailty has been associated with increased risk for adverse health-related outcomes. Several factors, including some financial and labor issues, have been linked to the development of such a phenotype.

This cross-sectional study of 927 community-dwelling older adults living in Mexico City aimed to identify the association between employee benefits (EB) and frailty status. Eight EB were reported while frailty was identified according to the phenotype proposed by Fried et al.

Frailty's prevalence was 14.1%. Participants reported the following EB: bonuses (12.3%), profit sharing (23.6%), pension (44.9%), health insurance (50.6%), food stamps (15.7%), housing credit (11.6%), life insurance (13.2%) and Christmas bonus (54.8%). Multinomial logistic regression analyses showed that EB were statistically associated with frailty (OR 0.85; 95% CI 0.74–0.98; P = 0.027).

The found associations and the underlying differences are important for preventing frailty in the elderly. Further research with longitudinal data is needed to examine the underlying mechanisms.

SESSION 695 (SYMPOSIUM)

MEDICARE AND MEDICAID INTEGRATION: RESULTS OF CALIFORNIA'S DUAL FINANCIAL ALIGNMENT DEMONSTRATION

Co-Chair: C.L. Graham, *University of California, Berkeley, Berkeley, California*

B. Hollister, *University of California, San Francisco, San Francisco, California*

Discussant: L. O'Shea, *NHS England, London, United Kingdom*

Over 9.6 million seniors and adults with disabilities in the United States (US) are dually eligible for Medicaid and Medicare. These beneficiaries (called "duals") have, on average the most complex care needs and account for a disproportionate share of spending in both programs. The Patient Protection and Affordable Care Act gave the Centers for Medicare and Medicaid Services (CMS) the authority to develop and test new models for integrating care for duals. California's dual alignment demonstration (the largest of the 12 state demonstrations) passively enrolled over 120,000 [ML1] dually eligible beneficiaries into Cal MediConnect (CMC) health plans, where Medicare and Medicaid services (including long-term services and supports -LTSS) were coordinated through a capitated managed care model. Enrollees received additional care coordination, transportation services, and expanded vision and dental benefits. Beneficiaries could opt out of the program and keep fee for service Medicare.

Using a participatory evaluation approach, researchers worked with diverse stakeholders including the state Medicaid agency, CMC health plans, disability advocates, provider groups and consumers to design an evaluation of the program. The evaluation sought to document health plan innovation and health system response to the demonstration, as well as beneficiaries' experiences with care. In this symposium, researchers will present results outlining the unique innovations and collaborations that resulted from the implementation of the program. Additionally, results of a representative telephone survey of 2,139 beneficiaries examining the demonstration's impact on access to care, continuity of care, and managed LTSS will be presented.

HEALTH PLAN INNOVATION IN CALIFORNIA'S DUAL ALIGNMENT DEMONSTRATION

B. Hollister², C.L. Graham¹, 1. *School of Public Health, University of California, Berkeley, Berkeley, California*, 2. *University of California, San Francisco, San Francisco, California*

The implementation of California's dual alignment demonstration resulted in a significant shift in practice for many stakeholders including: Managed Care Organizations (MCOs), providers, nursing homes, long term services and supports (LTSS) providers, and community based organizations that serve dually eligible beneficiaries. Evaluators conducted 36 key informant interviews with various stakeholders to document health system response and innovations resulting from program implementation. Findings reported will include: (1) health plan innovation and development of care coordination programs; (2) program impact on collaboration and coordination across agencies, (3) challenges, lessons learned, and recommendations for replication. Anecdotes and case studies are used to tell the story of, and lesson learned from, Cal MediConnect from various perspectives.

THE IMPACT OF CARE COORDINATION IN MEDICARE-MEDICAID INTEGRATION PROGRAMS

C.L. Graham¹, P. Liu², 1. *School of Public Health, University of California, Berkeley, Berkeley, California*, 2. *University of California, San Francisco, San Francisco, California*

This paper presents results of a cross-sectional telephone survey of 2,139 adult, dually eligible beneficiaries, including: 744 enrolled in CMC, 659 eligible beneficiaries who opted out, and 736 from non-demonstration counties in California. Results suggest that CMC care coordination is working well: those using care coordination were more likely to be satisfied with benefits and scored higher on measures of access to care than non-users. Of those who experienced disruptions in care after the transition, care coordination users were more likely to report those disruptions resolved than non-users. However, the only characteristic that predicted use of care coordination was use of behavioral health. Those in poor health and those with functional limitations, both characteristics that predict more disruptions in care, were not more likely to receive care coordination. Presenter will discuss the importance of risk stratification to ensure that it is being administered to those with the most complex care needs.

MANAGED LONG-TERM SERVICES AND SUPPORTS IN CALIFORNIA'S DUALS DEMONSTRATION

C.L. Graham^{1,2}, S. Kaye², 1. *School of Public Health, University of California, Berkeley, Berkeley, California*,
2. *University of California, San Francisco, San Francisco, California*

Beginning in 2014, California's duals demonstration enrolled over 120,000 dually eligible seniors and people with disabilities into managed care organization (MCO). 44% of these rely on LTSS, now coordinated by the MCO. Fourteen focus groups and a representative survey (N=1,306) with beneficiaries in the demonstration revealed that most beneficiaries are unaware that their LTSS is coordinated by the plan. LTSS users' satisfaction with the plan is lower than non-LTSS users. And their use of LTSS does not differ from a control group of LTSS users from non-demonstration counties. About half still have unmet need for personal assistance, and over a third have unmet needs for medical equipment and supplies. Less than half had been contacted by a care coordinator and only a third remembered getting an individualized care plan from the MCO. Challenges to fully integrating LTSS into MCOs for duals in California will be discussed by authors.

SESSION 700 (SYMPOSIUM)

A CROSS-CULTURAL COMPARISON OF APPROACHES TO ELDER MISTREATMENT RESEARCH AND INTERVENTIONS

Chair: R. Snyder, *The John A. Hartford Foundation, New York, New York*

Discussant: T. Fulmer, *The John A Hartford Foundation, New York*

Elder Mistreatment and Abuse is a growing concern as populations are ageing around the world. Leaders in both research and practice have contributed to a body of literature that provides evidence-based models for assessment and intervention. This symposium brings together world leaders who are the executives of the International Longevity Centers in their countries. Each will discuss the

approaches both in research and practice in their respective countries that represent of Argentina, Canada, Japan and the United Kingdom. The president of the International Network for the Prevention of Elder Abuse will open the symposium with an overview of the organization's mission in preventing elder abuse and raising public awareness. The president of the major foundation the focuses on improving care for older people in the United States, who is also a prominent researcher and practitioner in elder mistreatment, will serve as the discussant to summarize the overall impact of the current research and best practices provided by each of the presenters and to provide a review of how a philanthropic foundation can catalyze programs for elder mistreatment interventions. The panelists will engage in a robust discussion on best practices across cultures and will provide useful information on developing cultural competencies in addressing elder mistreatment in multi-cultural societies. This session will highlight the importance of understanding cultural sensitivity in designing research and developing programs in addressing elder abuse and mistreatment. This is a joint symposium of The John Hartford A. Foundation and the International Longevity Centre Global Alliance.

GLOBAL OVERVIEW OF ELDER ABUSE AND THE INTERNATIONAL ORGANIZATION THAT SEEKS TO PREVENT IT

S. Somers, *The International Network for the Prevention of Elder Abuse, New York, New York*

The International Network for the Prevention of Elder Abuse is a significant organization that raises the awareness of abusive and neglectful situations that cause harm to older people across the globe. This presentation will highlight the importance for country leaders to share best practices in research and practice that will not only help raise awareness throughout societies but will also work collaboratively in designing programs that will be evidence-based and culturally sensitive.

SOUTH AMERICA'S EXEMPLAR NATIONAL CAMPAIGN ON ELDERS' CRIME PREVENTION IN ARGENTINA

L. Daichman, *International Longevity Center-Argentina, Buenos Aires, Argentina*

A leading geriatrician and expert in elder abuse and former president of INPEA has spearheaded a public-private partnership to prevent crimes against older people. Together with other relevant NGOs, Dr. Daichman helped to develop a National Campaign on the Prevention of Elder Abuse and Respect for the Rights of Older Persons. This session will provide practical information on the feasibility of such partnerships as well as the preliminary results of the campaign's effectiveness in reducing criminal activities against Argentina's older citizens.

ADDRESSING ELDER ABUSE IN JAPAN, THE OLDEST COUNTRY IN ASIA

M. Osako, N. Tsukada, *International Longevity Center – Japan, Tokyo, Japan*

Despite the common perception that Japan with its traditional emphasis on filial piety would not need laws protecting older persons against abuse, in 2005 the country enacted The Law for Preventing the Abuse of Older People and Providing Assistance to Caregivers. The law addresses abusive and neglectful acts committed by caregivers in domestic and institutional settings. This paper will discuss trends in elder abuse in Japan since 2006 using annual surveys conducted by the Ministry of Health, Labour and Welfare. It will also explore possible reasons for certain key findings (such as the marked increase in violence in institutional settings) as well as promising features created by the law (e.g., establishment of municipal shelters for victims). The paper suggests (a) increasing counseling opportunities for abusers and (b) reducing caregivers' stress and workload as possible measures to reduce elderly abuse.

IN EUROPE THE UNITED KINGDOM'S UNIQUE CAPABILITY OF INFLUENCING POLICIES RELATED TO ELDER ABUSE

S. Greengross, *International Longevity Centre- United Kingdom, London, United Kingdom*

Baroness Greengross will speak of the United Kingdom's capability of influencing policies related to elder abuse. The key issues in the UK include financial abuse and, as the general incidence of dementia increases, how the impact on cognition and decision-making capability is adversely affecting the associated risk factors for abuse. In terms of improving legislative protection she will highlight the campaign to introduce a new aggravated offence of elder abuse designed to help remedy the failure of the current criminal justice system to adequately prosecute perpetrators of abuse. Baroness Greengross will also address the particular issues faced by minority communities. Additionally, she will discuss the dilemma that often abuse of older people goes unreported and sometimes can be 'passive', either because someone lacks the skills or external support necessary to adequately care for another person, or simply through unintentional neglect.

SESSION 705 (SYMPOSIUM)

GAINING A LONGITUDINAL UNDERSTANDING OF CULTURE CHANGE PRACTICE ADOPTION IN U.S. NURSING HOMES

Chair: S.C. Miller, *Brown University, Providence, Rhode Island*

Discussant: C.E. Bishop, *Brandeis University, Weston, Massachusetts*

Nursing home (NH) culture change strives to improve NH quality through deep systematic change. However, while studies suggest its implementation is associated with improved quality outcomes, empirical evidence of its value is inconclusive due to methodological challenges. To overcome many of these challenges, we designed a panel study using our nationally representative Time 1 (2009/10) survey data from U.S. NHs and newly collected Time 2 survey data from NHs that responded at Time 1. The Time 1 survey focused on the critical domains of *Environmental*

Practices (i.e., homelike environment), *Resident Care Practices* (i.e., resident-centered/directed care), and *Workplace Practices* (i.e., staff empowerment). The Time 2 survey was expanded to include additional items to enhance measurement of these three domains as well as to measure the additional domains of *NH Leadership* (i.e., modeling and enabling of culture change) and *Family and Community* (i.e., inclusion/involvement). In early 2016, the Time 2 survey was administered to 2,152 nursing home administrators (NHA). While follow-up is continuing, 834 (39%) NHAs have responded. In this symposium we present findings on the: 1) study's framework and survey design, including the cognitive-based interviewing performed to identify the NH leader to target at Time 2; 2) change in practice between 2009/10 and 2016; 3) practice in 2016 for the five measured domains; and 4) associations between domain scores and outcomes of interest. Study findings indicate significant improvement in domain scores between Times 1 and 2. Planned research will examine whether these improvements are associated with improvements in quality outcomes.

NURSING HOME CULTURE CHANGE: STUDY FRAMEWORK AND SURVEY INSTRUMENT DESIGN

S.C. Miller¹, D. Tyler², R. Shield¹, M. Lepore², R. Dahal¹, M. Clark³, 1. *Brown University, Providence, Rhode Island*, 2. *Research Triangle Institute (RTI), Washington, District of Columbia*, 3. *University of Massachusetts Medical School, Shrewsbury, Massachusetts*

While this study uses the commonly used term "culture change," it is the processes and structures promoting person-centered care (and their hypothesized outcomes) that we study. This measurement is guided by the Holistic Approach to Transformational Change (HATCh) model that depicts six interrelated domains needed for NHs to make care more individualized. The Time 2 survey measures five domains, with the sixth domain (Government and Regulations) derived from existing data sources. All time 1 survey items were included in the Time 2 survey. Additional "candidate" items came primarily from existing survey instruments, and are supported through validity testing. Items were refined through extensive cognitive-based testing and through guidance from an expert advisory committee representing provider and culture change organizations. We used an ecological conceptual framework to hypothesize the relationships among domains and how domain processes and structures are influenced by the context in which they are performed.

USING COGNITIVE TESTING TO IMPROVE A CULTURE CHANGE SURVEY

D. Tyler^{2,1}, C. Berridge^{3,1}, R. Shield¹, S.C. Miller¹, 1. *Brown University, Providence, Rhode Island*, 2. *RTI International, Waltham, Massachusetts*, 3. *University of Washington, Seattle, Washington*

The purpose of this study was to cognitively test questions for our nursing home (NH) culture change survey and determine which NH leader to target. Cognitive-based testing systematically tests survey questions to determine respondents' understanding of questions and

reveal thought processes involved in providing an answer to help increase validity and improve response rates. We conducted in-person interviews with 30 NH administrators (NHAs) and directors of nursing (DONs) in 15 NHs. Responses by NHAs and DONs were compared within facilities and across all facilities. Results showed that where the NHA and DON from the same facility provided different answers to the questions, the DON often provided a higher, more favorable response. Because data showed DONs tended to rate their facilities higher than did NHAs across survey domains, and given NHA responses appeared valid (based on interviews), we determined the survey should be administered to NHAs.

U.S. NURSING HOME CULTURE CHANGE: THEN AND NOW

J.C. Lima¹, M. Clark², M.L. Schwartz¹, C. Berridge¹, D. Tyler³, R. Shield¹, M. Lepore⁴, S.C. Miller¹, 1. *Brown University, Providence, Rhode Island*, 2. *University of Massachusetts Medical School, Shrewsbury, Massachusetts*, 3. *Research Triangle Institute, Waltham, Massachusetts*, 4. *Research Triangle Institute, Washington, District of Columbia*

We examined culture change practices within the same U.S. nursing homes (NHs) in 2009/10 and 2016. The proportion of NHs engaged in at least some culture change practices remained steady (87.2% vs. 87.7%). We calculated changes in scores across three domains using items measured at both time points (homelike physical environment, staff empowerment, and resident-centered/directed care). Cronbach alphas ranged from 0.40 to 0.65. For NHs with domain scores at both time points, more than half scored as high or higher at Time 2 on staff empowerment and resident care (58% and 70%, respectively) while only 37% scored as high or higher on physical environment (p values $<.01$). We recalculated domain scores at Time 2 using the expanded set of survey items. Scores correlated well with the original versions and Cronbach alphas improved (range 0.63 to 0.78). Compared to T1 measures, on average NHs improved across all three domains.

FAMILY AND COMMUNITY AND LEADERSHIP CULTURE CHANGE PRACTICES IN U.S. NURSING HOMES

M.L. Schwartz¹, C. Berridge³, J.C. Lima¹, D. Tyler², R. Shield¹, M. Lepore², S.C. Miller¹, 1. *Brown University, Providence, Rhode Island*, 2. *RTI International, Waltham, Massachusetts*, 3. *University of Washington, Seattle, Washington*

We used data from 834 U.S. nursing homes (NH) to understand culture change practice for the two domains added to our 2016 survey: family and community, and leadership. Domain scores reflect the average performance on nine and ten questions respectively, scored from 0 (rare) to 3 (almost always). Mean domain scores were 1.6 (sd = 0.46) for family and community and 1.40 (sd=0.32) for leadership. No differences in performance were observed by nursing home characteristics for either domain. Performance on both domains was correlated ($p<0.05$) with all other survey domains. We also assessed the relationship between leadership practices (by score quartiles) and the outcome of nursing

assistant retention above 50% (at 12 months), using multivariate logistic regression. After adjusting for NH characteristics, compared to NHs in the lowest quartile of leadership domain performance, NHs in the highest quartile had 2.04 (95% CI: 1.18–3.53) greater odds of experiencing retention above 50%.

STAFFING EMPOWERMENT PRACTICES IN NURSING HOMES WITH UNIONIZED NURSING ASSISTANTS

C. Berridge¹, M.L. Schwartz¹, D. Tyler², R. Shield¹, S.C. Miller¹, 1. *Brown University, Providence, Rhode Island*, 2. *Research Triangle Institute, Waltham, Massachusetts*

A key component of culture change is staffing empowerment supported by nursing home management. On the labor side, collective bargaining is one strategy to improve labor conditions; however, it is unknown if unionized facilities implement staff empowerment practices associated with culture change. In this paper, we examine changes in nursing assistant unionization in U.S. facilities, compare staff empowerment practices for unionized and non-unionized facilities, and model the relationship between empowerment practices, leadership practices, and union status. Using a 14-item composite measure to score facilities' empowerment practices, we find that unionized and non-unionized facilities do not differ significantly. Staff are more often cross-trained in unionized facilities and less likely to work with the same residents or receive rewards for extra training/education. After adjustment, we find that empowerment practices do not differ as a factor of union status ($b=.035$; 95% CI: $-.022, .092$), but are linearly associated with higher leadership scores.

SESSION 710 (SYMPOSIUM)

USING TECHNOLOGIES TO IMPROVE HEALTHCARE AND QUALITY OF LIFE IN THE VULNERABLE ELDERLY

Chair: G. Leonard, *Universite de Sherbrooke/ Research Center on Aging, Sherbrooke, Quebec, Canada*

Discussant: P. Boissy, *Universite de Sherbrooke/ Research Center on Aging, Sherbrooke, Quebec, Canada*

N. Lapierre, *University of Montreal, Montreal, Quebec, Canada*

Ageing is often associated to higher risk for many negative health related events. For example, it is well known that falls increase significantly with age and their consequences are often dramatic. Similarly, the changes observed in seniors, be them associated with normal aging or pathological processes, often generate important mobility impairments that can greatly affect quality of life. Finally, behavioral and psychological symptoms of dementia (BPSD) and chronic pain are serious health problems in aging populations that can negatively affect the wellbeing of patients and the work environment of the healthcare team. Early detection of falls and limitations in community mobility, as well as identification and management of BPSD and chronic pain in elderly individuals who have difficulty communicating because of dementia remain a challenge for healthcare providers. The current symposium will address these important issues and

will provide concrete examples on how technologies such as intelligent videomonitoring, mobile applications on smartphones and wearables sensors can be leveraged to provide outcome measures that can be used to identify elderly individuals who fall in their environment, have mobility limitations, exhibit disturbing BPSD or who suffer from chronic pain. More than simply detecting falls, mobility limitations, BPSD and pain, the proposed technologies offer healthcare professionals the possibility of assessing the underlying/contributing factors related to these negative health related events, in order to propose an approach of care that has a beneficial impact for the patient and can improve his quality of life.

BEHAVIORAL SYMPTOMS AND FALLS IN LONG-TERM CARE FACILITIES: PERCEPTIONS OF GERONTECHNOLOGY

A. Bourbonnais^{1,2}, J. Rousseau^{1,2}, J. Meunier¹, M. Gagnon³, M. Lalonde^{1,2}, N. Lapierre^{1,2}, D. Trudeau⁴, 1. *Université de Montréal, Montreal, Quebec, Canada*, 2. *Research Centre of the Institut Universitaire de Gériatrie de Montréal, Montreal, Quebec, Canada*, 3. *Université Laval, Quebec, Quebec, Canada*, 4. *Centre Intégré des Services de Santé et Services Sociaux du Centre-Sud-de-l'Île-de-Montréal, Montreal, Quebec, Canada*

Two of the most frequent problems in long-term care facilities (LTC) are behavioral symptoms and falls of older people living with Alzheimer's disease or associated disorders. Intelligent videomonitoring and mobile application are potential gerontechnologies to help manage these problems. However, evidence about the needs for technologies in LTC is scarce. The goal of this study was to explore the perceptions and needs of managers, formal and family caregivers in LTC regarding these technologies, as well as the conditions and ethical challenges that could influence their use. Individual interviews and a content analysis were conducted. Results show the relevance of these technologies in LTC and the characteristics that make them useful. Based on these results, technologies could be developed to improve the quality of clinical practice in LTC.

OLDER WOMEN'S PERCEPTION REGARDING A VIDEOMONITORING SYSTEM AT HOME

N. Lapierre^{1,2}, J. Meunier¹, J. Filiatrault^{1,2}, A. St-Arnaud³, M. Paquin^{1,2}, C. Duclos^{1,4}, C. Dumoulin^{1,2}, J. Rousseau^{1,2}, 1. *University of Montreal, Montreal, Quebec, Canada*, 2. *Centre de Recherche de l'Institut Universitaire de Gériatrie de Montréal, Montréal, Quebec, Canada*, 3. *CLSC Lucille-Teasdale, Montréal, Quebec, Canada*, 4. *Centre de Recherche Interdisciplinaire en Réadaptation, Institut de Réadaptation Gingras-Lindsay- de-Montréal, Montréal, Quebec, Canada*

Although ambient technologies are promising to Aging-in-place, few were studied at home. In a project aiming at monitoring night walks of older women at risk of falls, a videomonitoring system (VS) was implemented at home. The study aimed to explore their perception about the VS. Using a multiple case study design, the study included six women with the following characteristics: 1) ≥ 65 years old, 2) living alone, 3) ≥ 1 fall within the year, 4) waking up

nightly for going to the toilet. Their walks were recorded seven nights, on movement detection, for a time-window of their choice. Participants' perception was explored using pre- and post-videomonitoring-installation interviews. Data were qualitatively analysed. Participants, who feared to feel intruded, got used to the system and trusted it to protect privacy (eg. blurred images). Some technology features (eg. movement detection) eased their experience. Results support the use of ambient technologies at home.

QUANTIFICATION OF FREE-LIVING MOBILITY IN COMMUNITY LIVING OLDER ADULTS USING WEARABLE SENSORS

P. Boissy¹, M. Blamoutier², C. Duval², 1. *Université de Sherbrooke/ Research Center on Aging, Sherbrooke, Quebec, Canada*, 2. *Université du Québec à Montréal/ Institut Universitaire de Gériatrie de Montréal, Montréal, Quebec, Canada*

With the advent of miniaturized body worn sensing technology it is now possible to collect and store data on different aspects of mobility under free-living conditions for long period of time. 88 older adults living in the community in Montreal (Canada) wore for 12 days a data logging platform incorporating a GPS receiver with an 3D accelerometer. location, activity, travel and Geospatial distribution of mobility were extracted and compared across participants using ICF measures body structures and function (cognitive status, depressive symptoms, body composition, pain), personal (age, gender, education, revenue) and environmental (social participation, living situation, walking access to shop and services, access to a car). Results suggest that the proposed mobility outcomes are sensitive to the different domain of the ICF with environmental variables contributing significantly to variation in mobility of community dwelling older adults. On-going studies are looking at how aging and disease affect these mobility outcomes.

USING WEARABLE SENSORS TO IDENTIFY ELDERLY INDIVIDUALS WHO SUFFER FROM PAIN

G. Leonard¹, S. Laroche¹, É. Lagueux², P. Boissy¹, 1. *Rehabilitation, Université de Sherbrooke/ Research Center on Aging, Sherbrooke, Quebec, Canada*, 2. *Centre de recherche du CHUS, Sherbrooke, Quebec, Canada*

Chronic pain is a significant health problem in the elderly. The management of chronic pain in this population often remains a vexing challenge, notably for individuals who have difficulty communicating because of dementia. The aims of this study was to document, in these patients: (1) the feasibility of using a wearable platform incorporating multiple sensors (electrodermal activity blood volume pulse, acceleration, heart rate, and temperature) during everyday life activities to measure the activity of the autonomic nervous system; and (2) the utility of using such measures to identify patients who suffer from pain. Preliminary results indicate that wearable technologies are well tolerated by patients and provide useful information for the management of chronic pain. Clinical applications, as well as potential barriers and pitfalls will be discussed.

SESSION 715 (SYMPOSIUM)

CHRONIC DISEASE MANAGEMENT THROUGH A MASCULINITY LENS

Co-Chair: S. Solimeo, *Department of Veterans Affairs, Center for Comprehensive Access & Delivery Research and Evaluation (CADRE) Iowa City VA HCS, Iowa City, Iowa*

E.H. Thompson, *College of the Holy Cross, Broadview Heights, Ohio*

Discussant: T.M. Calasanti, *Virginia Tech, Blacksburg, Virginia*

Charmaz's 1994 seminal discussion of the identity dilemmas among chronically ill men underscored the importance of masculinity to how men manage and live with a chronic illness. Recognizing the diversity of masculinities across nations and communities, this symposium brings together scholars from different parts of the world to discuss how age and gender intersect to affect older men's chronic illness experiences. Gibson assesses the disruptions Parkinson's Disease brings to British men's expectations of a masculine, aging embodiment. Pietila and Ojala discuss Finnish older men's alliance on their aging bodies to help dilute how prostate cancer undermines body integrity and the men's sense of self as men. Drawing on a small sample of middle aged and older US men diagnosed with breast cancer, Thompson discusses the ways men with breast cancer confront the identity challenges of living with 'feminine' disease and its gendered treatment protocol. Solimeo and her colleagues draw on a large sample of older adults undergoing bone density testing for osteoporosis to assess the efficacy of how men manage their illness compared to women vets. Cumming and his colleagues review the bearing of geriatric syndromes and frailty on the independence among old Australian men as men. Calasanti's discussion will affirm the importance of not only how age and gender intersect to affect chronic disease experiences but also how masculinities differentially affect chronic disease management. People attending the symposium will better understand the value of using a gendered lens when studying disease management.

"I EXPECTED TO BE SLOW, BUT NOT THIS SLOW": PARKINSON'S DISEASE AND EMBODIMENT IN MEN'S AGEING

G. Gibson, *University of Stirling, Stirling, Scotland, United Kingdom*

Fifteen years since Thompson's (2007) call for the study of men's ageing, theorisation of masculinity and its embodiment as men age remain in their infancy. Despite offering opportunities to explore both men's bodily states and hegemonic notions of masculinity as men age, chronic illnesses have only rarely been studied using a lens of men's ageing. Using data from 30 narrative interviews with 15 men living with Parkinson's Disease, a progressive neurological disorder affecting movement and mobility, this presentation explores the disruptions chronic illness brings to a masculine, ageing embodiment. Drawing on Watson's (2000) male body schema, PD disrupts visceral, pragmatic and experiential dimensions of embodiment. In turn these also intersect with men's expectations of bodily ageing and the differing social concerns within men's lives as they age. Learning outcomes include promoting greater empirical engagement with

how gender and ageing intersect within men's experience of chronic illness.

WHEN BEING AN OLD MAN BECOMES AN ADVANTAGE: PROSTATE CANCER SURVIVORS' PERCEPTIONS OF MASCULINITY

I. Pietilä, H. Ojala, *University of Tampere, Tampere, Finland*

Both old age and prostate cancer have been thought to threaten men's masculine identities. Our qualitative analysis of interviews with 40 Finnish men with prostate cancer (50–70 years) shows that younger interviewees indeed expressed fears of losing their masculinity due to sexual dysfunctions caused by radical cancer treatments. However, the older interviewees often referred to their age as a factor, which made it easier for them to cope with such effects. Reaching a higher age set the interviewees free from masculine norms revolving around sexual prowess. They attached such norms to younger men's lives and underlined economic balance and stability in their families as bedrocks of an older man's good life. Old age thus became a positive resource for the men in coping with chronic illness and maintaining a masculine identity. The study highlights how cultural images of masculinity and ageing are intertwined in men's interpretations of chronic illness.

MEN WITH BREAST CANCER: MARGINALIZING OR THREATENING TO BEING A MAN?

E.H. Thompson, *1. Sociology & Anthropology, College of the Holy Cross, Broadview Heights, Ohio, 2. Case Western Reserve University, Cleveland, Ohio*

This research explores how men experience being a breast cancer patient in the US, and how their experiences are sanctioned by the nation's rendering of breast cancer as a woman's disease. Based on the sociological tradition of investigating the 'marginal man' who is destined to live in two, not merely different but antagonistic cultures, men's encounters with breast cancer's pink ribbon culture and hegemonic masculinity are ideal for better understanding how gender does affect men's chronic illness experience. Interviews with 17 men with breast cancer revealed that they are seen first by themselves as much as others in terms of their gender rather than their illness. Being diagnosed with and needing to be treated for breast cancer was unmistakably challenging. Distinct themes were deeply rooted throughout the men's narratives and conspicuous within nearly every interview: (1) *surviving personal marginalization*, (2) *embodiment of (their breast) cancer*, and (3) *gendered agency*.

GENDER AND OSTEOPOROSIS SELF-EFFICACY AMONG OLDER ADULTS PRESENTING FOR BONE DENSITY TESTING

S. Solimeo^{1,2}, T. Nguyen³, S. Edmonds^{2,4,5}, Y. Lou⁹, D.W. Roblin^{6,7}, K.G. Saag⁸, P. Cram^{10,11}, F.D. Wolinsky^{2,4,12}, *1. Department of Veterans Affairs, Center for Comprehensive Access & Delivery Research and Evaluation (CADRE), Iowa City VA Health Care System, Iowa City, Iowa, 2. Division of General Internal Medicine, Department of Internal Medicine, University of Iowa Carver College of Medicine, Iowa City, Iowa, 3. Department of Epidemiology, University of Iowa College of Public Health, Iowa City, Iowa, 4. University of Iowa College of Nursing, Iowa City, Iowa, 5. Department of Veterans Affairs, Iowa City VA HCS, Iowa City, Iowa, 6. Kaiser Permanente, Atlanta,*

IAGG 2017 World Congress

Georgia, 7. Department of Health Management and Policy School of Public Health, Georgia State University, Atlanta, Georgia, 8. Division of Clinical Immunology and Rheumatology, Department of Medicine, University of Alabama at Birmingham, Birmingham, Georgia, 9. Department of Biostatistics, University of Iowa College of Public Health, Iowa City, Iowa, 10. Department of Medicine, University of Toronto, Toronto, Ontario, Canada, 11. Division of General Internal Medicine, Mt. Sinai/UHN Hospitals, Toronto, Ontario, Canada, 12. Department of Health Management and Policy, University of Iowa College of Public Health, Iowa City, Iowa

A number of studies have shown gender differences in osteoporosis care such that men have lower rates of diagnosis, treatment, and poorer outcomes than women. In our analysis, we evaluated gender differences in self-reported confidence in one's ability to engage in bone health behaviors (i.e. consuming adequate dietary calcium and engaging in exercise), as measured by the Osteoporosis Self-Efficacy Scale (OSES). OSES was measured in 7,749 older adults presenting for bone densitometry at three U.S. medical centers. Overall, the calcium and exercise sub-scale scores are generally high and do not significantly differ by gender. OSES, however, has poor measurement model fit both overall and within gender groups, although the gender differences in the measurement model are minor, reflecting factorial invariance across genders. Given their generally high OSES sub-scale scores, greater attention to men's barriers to preventive care as an underlying factor in their poorer outcomes may be warranted.

EPIDEMIOLOGY OF FRAILTY AND GERIATRIC SYNDROMES IN OLDER AUSTRALIAN MEN

R. Cumming, N. Noguchi, V. Naganathan, F. Blyth, University of Sydney, Sydney, New South Wales, Australia

The geriatric syndromes (cognitive impairment, falls, incontinence and poor mobility) and frailty are major causes of loss of independence among older people. The aim of this paper is to describe the prevalence and incidence of these conditions among men participating in the Concord Health and Ageing in Men Project (CHAMP), an epidemiological cohort (panel) study of a representative sample of 1705 community-dwelling Australian men aged 70 years and over. At baseline, only 21% of men had one or more of the geriatric syndromes and only 10% were frail (based on Cardiovascular Health Study criteria). After five years, 59% of men were still alive and had not developed any of the geriatric syndromes. The geriatric syndromes and frailty only became common after age 85 years. These data support the concept of the "old old" (those aged 85 years and over) as a distinct group requiring specialised health and aged care services.

SESSION 720 (SYMPOSIUM)

GSA SRPP SECTION: DEFINITION, BUSINESS CASE, AND IMPLEMENTATION OF PERSON-CENTERED CARE

Chair: A. Coulourides Kogan, Keck School of Medicine of USC, Claremont, California

Co-Chair: L. Mosqueda, Keck School of Medicine of USC

Discussant: B. Chernof, The SCAN Foundation, Long Beach, California

Person-Centered Care (PCC) is considered the "gold standard" of health care and has recently been highlighted in policy and practice. Previously, PCC has been limited by a lack of single definition and confusing language (i.e. patient-centered care, person-directed care, etc.) resulting in inconsistent operationalization in health and social service settings serving older adults. Through a recent collaboration between the American Geriatrics Society and a research team at the University of Southern California and the Keck School of Medicine of USC, a single, expert-informed definition of PCC and eight essential elements has been developed for older adults with chronic conditions and functional impairment. This session will present the consensus definition, essential elements, and research that lead to developing these pieces: large systematic literature review, qualitative study of how PCC is operationalized in a sample of outpatient health care and social services organizations serving older adults, and expert-panel conference. The next phase of this project was to develop the business case for PCC upon the foundation set by establishing the definition and common language for PCC. This work will be presented along with an interactive return on investment (ROI) calculator that we developed to help organizations estimate their financial risks and benefits of implementing PCC. Finally, the clinical perspective of implementing PCC in a primary care geriatrician's practice will be presented. Discussing the challenges and benefits to providing PCC for older adults is important to shed light on the ideal vs. realistic provision of person-centered health care and social service support.

DEFINING PERSON-CENTERED CARE FOR OLDER ADULTS WITH CHRONIC CONDITIONS AND FUNCTIONAL IMPAIRMENT

A. Coulourides Kogan¹, K.H. Wilber², L. Mosqueda¹, 1. Family Medicine and Geriatrics, Keck School of Medicine of USC, Claremont, California, 2. University of Southern California, Leonard Davis School of Gerontology, Los Angeles, California

A single definition of person-centered care (PCC) is needed to provide clarity and a consistent point of reference for providing care, social services, conducting research, and developing policy for older adults with chronic conditions and functional impairment. Therefore, the purpose of this study was to develop the clinical case for PCC—rooted in research—resulting in a single, agreed-upon definition and essential elements for PCC. This presentation will discuss the quantitative (large, systematic literature review) and qualitative (study of outpatient health care and social service organizations serving older adults) research methods used to inform a single definition of PCC and essential elements, as well as the interdisciplinary expert-panel process that developed the final version of these items. The final definition and eight essential elements of PCC will be presented and discussed, highlighting a newly established foundation for future research, policy, and business analyses.

PERSON-CENTERED CARE: THE BUSINESS CASE

V. Tabbush, UCLA Anderson School of Management, Los Angeles, California

Evidence shows that person-centered care (PCC) can improve care and quality of life for patients; often resulting in fewer hospitalizations and ER visits, shorter hospital stays, and other service use reductions leading to lower expenditures. PCC is a recent health care priority (e.g. WHO, IOM, and ACA), and given payment reforms for providing care to older adults, creating a business case for PCC is imperative to inform policy and highlight incentives beyond patient-level outcomes for organizations to implement PCC. Therefore, the project was conceived to develop a business case for PCC and an interactive return-on-investment (ROI) calculator. These two products can equip and encourage organizations considering adopting or expanding PCC with the requisite tools, data, and motivation to systematically assess the business case in their own circumstances. They highlight the factors that affect the strength of the case, and shares encouraging evidence suggesting that PCC can be financially beneficial.

OPERATIONALIZING PERSON-CENTERED CARE IN PRIMARY CARE: A GERIATRICIAN'S PERSPECTIVE

L. Mosqueda, *Keck School of Medicine of USC, Alhambra, California*

Person-centered care (PCC) is a holistic approach to health care and social service provision that incorporates the person's values, preferences, and beliefs and holds them (and those close to them) at the center of all decision-making. This type of care represents an important departure from traditional health care that has been characterized as paternalistic, siloed, and marked by poor or a lack of communication between providers and care sites. With the newly established definition of PCC and essential elements, health care providers now have a clear point of reference from which to provide individualized PCC to their patients. However, systematic, environmental, and patient/family-level barriers and facilitators remain that may help or hinder the provision of PCC. The purpose of this presentation is to highlight the ideal vs. realistic practice of implementing PCC into a primary care setting serving older adults. Multiple case studies will be presented to support discussion.

SESSION 725 (SYMPOSIUM)

STANDARDISATION OF HEALTH OUTCOME MEASURES AND VALUE-BASED HEALTHCARE

Chair: J. Banerjee, *University Hospitals of Leicester NHS Trust, Leicester, United Kingdom*

The International Consortium for Health Outcomes Measurement (ICHOM) was founded in 2012 with the aim to propose consensus-based measurement tools and documentation for different conditions and populations. Variation in outcomes of healthcare is a global challenge and to date there are no comprehensive globally relevant outcome measures for older persons. Measuring and reporting meaningful outcomes matter because they are more likely to identify what is deficient in a care pathway across organisational boundaries and lead to better collaborative care provision. It also provides opportunities for different localities or organisations to compare variations in outcome and learn from each other. There is paucity of standardized clinical outcomes data beyond basic mortality and morbidity measures.

There is also a paucity of balancing measures with a systemic inability to measure unanticipated harm. The deficiency in outcome measurements that matter most to patients represents a global barrier to driving health care improvement and means providers have little information on which to judge the effectiveness of interventions. Where available, outcomes are not standardized and therefore hard to compare leading to a slow pace of change and inability to learn from others. More commonly there has been more emphasis placed on process measures with the assumption that changing processes improves outcomes for persons accessing healthcare.

ICHOM's Working Groups (WG) follow a structured consensus-driven modified Delphi technique to recommend a core battery of measures that reflect multiple outcomes that matter to patients. This international standard of health outcomes assessment has the potential to improve clinical decision-making, to enable better commissioning and service integration, to facilitate the exchange of scientific knowledge, and overall to enhance the care of patients internationally across different conditions. ICHOM has to date developed 19 standard sets and by 2017 at least 50% of the global disease burden (as defined by the WHO) will have been covered. A number of national registries and organisations across the world are already utilising ICHOM standard sets as their outcome measures.

DEFINING A STANDARD SET OF PATIENT-CENTERED OUTCOMES FOR PATIENTS WITH DEMENTIA

E. Reynish^{2,1}, A. Burns¹, C. Roberts¹, 1. *ICHOM Dementia Working Group, London, United Kingdom*, 2. *Stirling University, Stirling, United Kingdom*

Materials and methods: ICHOM convened an international, multi-disciplinary working group of patient representatives, psychiatrists, carer, social worker, specialist nurses, methodologists, psychologists, and registry experts to review existing data and practices. Using a modified Delphi method, the group developed a consensus Standard Set of outcomes that were felt to matter most to patients, along with case-mix variables for risk adjustment, that we recommend collecting for all dementia patients.

Results: The recommended Standard Set covers all types and stages of dementia. The outcomes include all-cause survival, cognition, neuropsychiatric behaviour, patient-reported domains of health-related quality of life and carer health-related quality of life. Baseline demographic, clinical, and condition information are included to improve interpretation of comparisons.

Conclusion: We defined a Standard Set of outcomes for people with dementia. The Set provides a universal rubric for outcome comparisons, with the ultimate goal of improving the value of care.

DEFINING A STANDARD SET OF PATIENT-CENTERED OUTCOMES FOR OLDER PERSONS

A. Akpan^{2,1}, J. Banerjee^{3,1}, C. Roberts¹, 1. *ICHOM Older Person Working Group, London, United Kingdom*, 2. *Aintree University Hospitals NHS Foundation Trust, Aintree, United Kingdom*, 3. *University Hospitals of Leicester NHS Trust, Leicester, United Kingdom*

Materials and methods: ICHOM convened an international, multi-disciplinary working group of patient representatives, geriatricians, acute physicians, carers, community specialists, specialist nurses, methodologists, psychologists, and registry experts to review existing data and practices. Using a modified Delphi method, the group developed a consensus Standard Set of outcomes that were felt to matter most to older persons, along with case-mix variables for risk adjustment, that we recommend collecting for older persons.

Results: The recommended Standard Set is aimed at covering on average, the last 10 years of life calculated by life expectancy at age 60. The outcomes include all-cause survival, falls, polypharmacy, patient-reported domains of health-related quality of life and carer burden. Baseline demographic, clinical, and comorbidity information are included to improve interpretation of comparisons.

Conclusion: We defined a Standard Set of outcomes for older persons. The Set provides a universal rubric for outcome comparisons, with the ultimate goal of improving the value of care.

THE IMPLEMENTATION OF ICHOM STANDARD SET OF OUTCOMES

J. Banerjee, A. Akpan, E. Reynish, C. Roberts, *ICHOM, London, United Kingdom*

The ICHOM Dementia Standard Set of outcomes is being piloted across a variety of provider settings and health economies, within 'Implementation Communities' in England and Scotland, supported by ICHOM. Dementia is a high priority issue for NHS England and the UK Government and current data metrics for dementia care tend to capture processes and costs, and do not measure whether they achieve the outcomes that matter most to those with dementia.

The Dementia Implementation Community will enable providers to capture the ICHOM Dementia Standard Set in a manner that is scalable nationally, and will ultimately include every patient with dementia who enters each participating health economy. The systematic measurement of Standard Sets of outcomes will enable global outcome comparisons, leading to improvements in the quality of care and the outcomes. The broader scope will aim to take the lessons learnt and extend this towards outcomes measurement for more patients internationally.

SESSION 730 (SYMPOSIUM)

IAGG INTERNATIONAL COUNCIL OF THE GERONTOLOGY STUDENT ORGANIZATION: COLLABORATIVE NETWORKS FOR EMERGING SCHOLARS: LOCAL, REGIONAL, AND INTERNATIONAL PERSPECTIVES

Chair: K.S. Hall, *Veterans Affairs/Duke University Medical Centers, Durham, North Carolina*

Co-Chair: C. Meyer, *Royal District Nursing Service Institute, St Kilda, Victoria, Australia*

There is growing interest in aging research internationally, yet many students and emerging scholars are uncertain of the process of establishing, building, and maintaining local, regional, and international connections. To address this need, the IAGG Council of Student Organizations (IAGG-CSO)

offers a symposium of several presentations and a structured discussion bringing a multidisciplinary and multicultural perspective to the topic of engaging in gerontological networks. Emerging scholars are pursuing, more than ever, professional networking opportunities spanning local, regional, and international borders. As access to quality information and communication technology increases across the globe, the field of Gerontology is approaching a new frontier, with emerging scholars looking to establish collaborative research networks unrestricted by geographical boundaries. This symposium explores the "why" and "how" of engaging locally and internationally. This symposium includes paper presentations reflecting an international perspective (IAGG-CSO Executive Committee members who are emerging scholars from Australia, Canada, and the United States); a regional perspective on the challenges of networking across vast distances where there may be few student organizations; and the local perspective by the Emerging Scholars Professional Organization of the United States, on the establishment and momentum of a successful student organization. To conclude the session, the audience will be engaged in an interactive discussion of how to foster engagement at a local, regional and international level.

THE MISSION OF IAGG-CSO TO FACILITATE NETWORKS AMONG STUDENT ORGANIZATIONS

C. Meyer, 1. *Royal District Nursing Service Institute, St. Kilda, Victoria, Australia*, 2. *Centre for Health Communication and Participation, La Trobe University, Bundoora, Victoria, Australia*

The IAGG-CSO is a standing committee of the IAGG, represented currently by three executive members from Australia, Canada and the United States. The IAGG-CSO works to support its members (student and emerging scholar sections within IAGG member sections, international gerontology/geriatric student and emerging scholar networks, and individuals working to create student sections) and foster participation and networking opportunities across the globe, particularly focused on the Regional and World Congresses. The IAGG-CSO is well placed to facilitate networking through regular newsletter contributions, commencement of a webinar series, development of a social media group (LinkedIn), and a vibrant student and emerging scholar program at the Regional and World Congresses. The symposium audience will be used to garner ideas regarding capacity building and local and international engagement for members, together with understanding how the IAGG-CSO can better meet the needs of members moving forward into the next 4 year cycle of IAGG secretariat.

MAKING MENTORING MEANINGFUL

S. Freeman, *University of Northern British Columbia, Prince George, British Columbia, Canada*

Mentorship plays an important role to support students and emerging scholars as they progress through their careers. Yet, it can be difficult to forge successful relationships as a mentee receiving guidance and support from established senior persons in one's field and as a mentor to other students and emerging scholars. This symposium will provide practical advice on how to start and sustain effective and mutually beneficial mentor and mentee relationships. We will

share examples of successes and failures experienced by mentors and mentees and share tips and strategies to support development and sustainability of positive relationships. We will address the role of mentorship in a virtual world and opportunities for international collaboration and networking. We will also share how the IAGG CSO is working to support students and emerging scholars to build these relationships through our experiences leading national organizations (Canadian Association on Gerontology and Australian Association of Gerontology).

THE CHALLENGES OF FORMING MEANINGFUL COLLABORATIVE NETWORKS ACROSS VAST DISTANCES

K.S. Hall¹, K. James², 1. *Medicine-Geriatrics, Veterans Affairs/Duke University Medical Centers, Durham, 2. University of Stellenbosch, Cape Town, South Africa*

The global community of students and early career scholars span many continents, often over vast geographic distances. Locating and connecting students and early career scholars is challenging and relies on excellent and consistent communication via various forms of media and technological advances. The speakers for this presentation will share their own insights and ideas, citing specific challenges and opportunities by region. This session will be structured to facilitate active discussion among the audience on the possibilities for forming and maintaining meaningful collaborative networks into the future.

THE ROLE OF INDIVIDUAL COUNTRY STUDENT SECTIONS AND THE IMPORTANCE OF NETWORKING

J. Hughes, *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Student sections within national gerontology and geriatrics societies offer a wealth of professional development and programmatic supports to students and emerging scholars in the region. However, the IAGG-CSO recognizes that many students are training in the absence of such networks, in regions that do not have active student sections. This session is meant to provide important resources for individual scholars who are interested in establishing a regional student section as well as tips for leveraging the resources of existing regional student sections. We will discuss the importance of establishing a regional student section and practical tools for initiating this process, using the GSA's Emerging Scholar and Professional Organization as a model. Best practices for expanding personal and professional networks and how to leverage student organizations to streamline and strengthen this process will also be discussed. Strategies for thriving and surviving the frenetic IAGG World Congress environment will be presented.

SESSION 735 (SYMPOSIUM)

EXPLAINING THE PHYSICAL AND PSYCHOLOGICAL IMPACTS OF HUMAN-ANIMAL INTERACTION ON OLDER ADULTS

Chair: N.R. Gee, *SUNY, Fredonia, Fredonia, New York*
Discussant: S. McCune, *Waltham Centre for Pet Nutrition*

Physical activity (PA) is a well-recognized indicator and determinant of health while sedentary behaviour (sitting or reclining) has been identified as an independent risk factor for poor health. Evidence indicates that while overall PA level decreases with age, older adults are also normally the most sedentary section of the population.

Dog ownership, and in particular dog walking as a feature of ownership, has been shown to be positively related to overall PA levels in a range of age groups (Christian, Westgarth, *et. al.*, 2013). Most of this evidence has been drawn from studies which used self-report PA measures.

The first presentation in this symposium reports the results from a study using an objective measure of PA in older adult Dog Owners (DOs) and Non-Dog Owners (NDOs). The presentation discusses the impact of physical activity on indicators of health and sets the stage for the following presentation.

The second presentation in this symposium discusses a biopsychosocial model, frequently used by researchers to explain the effects of Human-Animal Interaction (HAI), and presents results from the Pet Assisted Living (PAL) intervention on community dwelling older adults in the context of the model.

The biopsychosocial model provides a framework for understanding how multiple contributors can be related to chronic disease outcomes in older adults. Research in HAI has demonstrated that companion animals may directly influence physiological arousal by decreasing blood pressure and heart rate, reducing depression or anxiety and increasing social support. Each of which can affect the other realms within the biopsychosocial model and ultimately support health.

THE PET ASSISTED LIVING (PAL) INTERVENTION FOR ASSISTED LIVING RESIDENTS WITH COGNITIVE IMPAIRMENT

E. Friedmann², B. Galik², N.R. Gee^{1,3}, 1. *Psychology, SUNY, Fredonia, Fredonia, New York, 2. University of Maryland, Baltimore, Maryland, 3. WALTHAM, Waltham on the Wolds, United Kingdom*

Residents of 7 small assisted living facilities were randomized by facility to either reminiscing or Pet Assisted Living (PAL) intervention included a number of specific activities during each session designed to encourage maintenance of function in cognitively impaired residents' (N=19) health/function. Residents' participation in behaviors such as looking at, touching, brushing, talking to, walking with, and giving treats to the dog were noted for each of the 23-28 sessions/participant. Physical activity (PA) and depression were assessed monthly.

Physical activity increased and depressive symptoms decreased more with PAL than reminiscing intervention. Participation in looking at ($r=.550$), brushing ($r=.555$), and walking ($r=.492$) the dog predicted increases in PA and walking the dog predicted decreases in depression ($r=.521$) over the 12 week intervention (all $p's<.05$). Participants varied in their participation in each type of dog-related activity. Evidence supports that the PAL program helps preserve/enhance function of AL residents with cognitive impairment.

OLDER ADULT DOG OWNERS ARE MORE PHYSICALLY ACTIVE THAN THEIR NON-DOG-OWNING COUNTERPARTS

N.R. Gee^{1,2}, P. Dall³, S. Ellis⁴, B. Ellis⁵, M. Granat⁵, D. Mills⁴, 1. *Psychology, SUNY, Fredonia, Fredonia, New York*, 2. *WALTHAM, Waltham on the Wolds, United Kingdom*, 3. *Glasgow Caledonia University, Glasgow, United Kingdom*, 4. *University of Lincoln, Lincoln, United Kingdom*, 5. *University of Salford, Salford, United Kingdom*

The study examined the influence of dog ownership on physical activity (PA) in community dwelling older adults using a longitudinal design and an objective measure of PA (activPAL monitor).

Eighty six participants (aged 65–81 years) were matched on gender, age, and socio-economic status into dog owner (DO) and non-dog owner (NDO) pairs. Each participant wore a waterproofed activPAL activity monitor continuously for a week, three times over a year.

The results revealed that DOs walked significantly longer at a moderate cadence (31vs.11 min/day) and took more steps (9,700 vs.7,200 steps/day) than NDOs. DOs also sat for significantly less time overall (9.4 vs. 10.1 hours/day) than NDOs.

This study provides the first objective data demonstrating that older DOs walk more than NDOs and indicates that this walking was undertaken at a moderate cadence. On average DOs met recommended public health guidelines (30 min/day of moderate PA), but NDOs did not.

SESSION 740 (PAPER)

AGE-FRIENDLY INITIATIVES

USING EVIDENCE TO TRANSLATE NATIONAL POLICY INTO LOCAL ACTION

S. Shannon, *Department of Health, Dublin, Ireland*

The challenge of turning national policy into actions, implemented at a local level, is one faced by policy-makers world-wide. Ireland's national policy for promoting Positive Ageing explicitly acknowledges the role that the Age Friendly Cities and Counties (AFCC) programme plays in improving the lives of older people. Through a collaborative study jointly funded by national and local governments, the Healthy and Positive Ageing Initiative uses links established with the WHO's Age Friendly Cities Programme to translate knowledge into action.

Data from a random sample survey of people 55 and older in 20 AFCC programme areas during 2015/2016 (n=10,000) was disseminated to local AFCC alliances. Reflecting the priorities of the National Positive Ageing Strategy and the AFCC program, the survey covered areas such as deprivation and neighbourhood social capital, preferences for housing adaptation and local area walkability. Results link the social and built environment to the health and wellbeing of older people and identify barriers to participation and essential health and social services.

As the AFCC program expanded to 10 new local authority areas, results are used to develop a common understanding of age friendly priorities, to optimise and sustain political and social commitment and to identify areas for action in

new AFCC programs. The efficacy of the dissemination practices is explored through a qualitative study using thematic content analysis of the locally produced strategies and semi-structured interviews with the key stakeholders responsible for the implementation of strategies.

RECOGNIZING AGE-FRIENDLY BUSINESSES THROUGH CONSUMER AND COMMUNITY ENGAGEMENT

D.B. Bradley¹, J. Wassel², 1. *Center for Gerontology, Western Kentucky University, Bowling Green, Kentucky*, 2. *University of North Carolina Greensboro, Greensboro, North Carolina*

The World Health Organization (WHO) has established international guidelines for age-friendly communities that include the encouragement of active aging by optimizing opportunities for health, participation, and security in order to enhance people's quality of life as they age. According to the WHO, an age-friendly city adapts its structures and services to be accessible to, and inclusive of, older people with varying needs and capacities. As part of Bowling Green, Kentucky's participation in the WHO Age Friendly Cities and Communities Initiative, a baseline assessment identified addressing the role businesses play in promoting the longevity economy and economic inclusion for area elders. In this paper we review the rationale for age-friendly businesses and propose a detailed framework for incorporating elder consumer and community views. In collaboration with the Over Fifty Citizens Academy, a regularly meeting workgroup of elders committed to building an age friendly community in Bowling Green, we created a framework for recognizing age-friendly businesses. These community members developed an age friendly business values array which area businesses agreed to work towards. This Age-Friendly Bowling Green Business Checklist recognizes a business environment encompassing diversity, promoting optimal health, negating ageism/attitudes toward older adults, and valuing ongoing employee training on serving old adults. We conclude the paper by discussing challenges of project implementation and the role of consumer participation in the evaluation and monitoring of age-friendly certified practices in local businesses.

AGE-FRIENDLY COMMUNITY STRATEGIES: A RESEARCH-BASED APPROACH ADOPTED IN GUANGZHOU, CHINA

D.W. Lai², Q. Zhang³, J. Hewson⁴, C.A. Walsh⁴, H.L. Tong¹, 1. *MacEwan University, Edmonton, Alberta, Canada*, 2. *Hong Kong Polytechnic University, Hong Kong, China*, 3. *Guangdong Institute of Public Administration, Guangzhou, Guangdong, China*, 4. *University of Calgary, Calgary, Alberta, Canada*

Making communities more "age-friendly" has been an ongoing trend since the WHO launched its global Age-Friendly Cities project. However, research on how to assess and implement age-friendly communities in China is scarce even though China has the largest number of older adults in the world. The international research collaboration between the Faculty of Social Work, University of Calgary in Canada and Guangdong Institute of Public Administration in China aims to develop an age-friendly community strategy for Guangzhou, China using a multi-method, community-based

approach. We developed a quantitative baseline survey instrument using the WHO age-friendly framework, which was modified to be locally and culturally relevant. Trained interviewers administered the survey to adults 50 years of age and older in four distinct communities in Guangzhou ($N = 400$). Descriptive analysis was completed across items in 8 domains and comparisons were made across the four communities. Secondly, we used a series of 12 focus groups to share the preliminary findings with key stakeholders representing policy developers, service sectors and older adults in order to develop locally-relevant recommendations. This presentation will describe the findings related to the assessment of age-friendliness in Guangzhou, contribute to an increased understanding the cultural relevance of age-friendly communities, and identify strategies of developing age-friendly communities that are locally and culturally relevant.

A NEIGHBOURHOODS AND DEMENTIA STUDY: WHAT IS IMPORTANT TO PEOPLE WITH DEMENTIA VERSUS TRIAL OUTCOMES

S. Reilly¹, C. Opdebeek¹, H. Morbey¹, F. Ahmed¹, P. Williamson³, I. Leroi⁴, J. Keady², 1. *Division of Health Research, Lancaster University, Lancaster, Lancashire, United Kingdom*, 2. *School of Nursing, Midwifery and Social Work, University of Manchester, Manchester, United Kingdom*, 3. *Institute of Translational Medicine, University of Liverpool, Liverpool, United Kingdom*, 4. *Institute of Brain Behaviour and Mental Health, University of Manchester, Manchester, United Kingdom*

Many systematic reviews of effectiveness of non-pharmacological interventions for people with dementia have highlighted the variability in the outcomes assessed. This prevents comparisons of effectiveness across studies. This study, embedded in the Neighbourhoods and Dementia programme <http://www.neighbourhoodsanddementia.org/work-programme-summary/>, seeks to create a core outcome set for use within intervention studies aimed at people living with dementia. The 4-phase study design includes: qualitative interviews/focus groups and literature review; Delphi survey; systematic review; and stated preference survey. This presentation focuses on Phase 1, comparing outcomes identified through the qualitative work with those measured in previous and ongoing intervention trials. Thirty-five interviews and four focus groups were conducted with people with dementia, care partners, health/social care professionals, policy makers, service commissioners and research leaders. Outcome measures were also extracted from 129 international intervention trials. The qualitative data were analysed using a thematic framework to identify outcomes considered important to people with dementia. There were key differences in the emphasis of the outcomes in the literature compared to the qualitative data, indicating that many trials may not be measuring what is important to people with dementia. For example, activities were assessed in terms of frequency within previous studies; however, the meaningfulness of activities rather than the frequency were highlighted as important in the interviews. This core outcome set will help to ensure that the outcomes measured in evaluations of interventions are those that are considered the most

important to people living with dementia and will aide comparability and consistency in future studies.

SESSION 745 (SYMPOSIUM)

KEYNOTE: PALLIATIVE CARE IN THE MAINSTREAM—STEPPING UP TO THE PLATE: THE CASE FOR INTEGRATED GERIATRIC AND PALLIATIVE CARE STRATEGIES

Chair: D.E. Meier, *Icahn School of Medicine at Mount Sinai, New York, New York*

Discussant: L. Deliens, *VUB and Ghent University, Ghent, Belgium*

I. Higginson, *Kings College, London, United Kingdom*

This session will present the case for integrating geriatric and palliative care to deliver optimal care, improve quality and reduce costs. The speakers will outline palliative care issues common in elderly patients and integrative approaches that focus on quality of life, support for functional independence, and the patient's values and experiences. They will also identify the needs of policy makers, payers and health system leadership.

PALLIATIVE CARE IN THE MAINSTREAM: THE CASE FOR INTEGRATED GERIATRIC AND PALLIATIVE CARE STRATEGIES

D.E. Meier, *Geriatrics and Palliative Medicine, Icahn School of Medicine at Mount Sinai, New York, New York*

This session will present the case for integrating geriatric and palliative care to deliver optimal care, improve quality and reduce costs. The speakers will outline palliative care issues common in elderly patients and integrative approaches that focus on quality of life for both patient and family caregivers, support for functional independence, and the patient's values and experiences. The data on the needs and numbers of older persons with multiple chronic conditions and functional impairment as well as the outcomes of community-based integrative palliative care models on this group will be discussed.

PALLIATIVE CARE FOR ELDERLY (PACE) PEOPLE IN LONG-TERM CARE FACILITIES IN EUROPE

L. Deliens², D.E. Meier¹, 1. *Geriatrics and Palliative Medicine, Icahn School of Medicine at Mount Sinai, New York, New York*, 2. *VUB and Ghent University, Ghent, Belgium*

The main strategic scientific aims of comparing the Effectiveness of Palliative Care for Elderly (PACE) People in Long-Term Care Facilities in Europe are trifold. The PACE consortium consists of 8 research institutes, spanning 6 European countries, and 4 European organizations responsible for impact and dissemination. PACE has mapped palliative care systems in care or nursing homes in Europe; performed a large-scale representative study to examine quality of dying and palliative care in care or nursing homes in six European countries, including Poland, Finland, Netherlands, Italy, UK and Belgium; and is studying the impact of an innovative trial 'PACE Steps to Success' which aims to improve the quality of palliative care.

PALLIATIVE CARE NEEDS AMONG PERSONS WITH NON-CANCER CHRONIC ILLNESSES AND THEIR CARERS

I. Higginson², D.E. Meier¹, 1. *Geriatrics and Palliative Medicine, Icahn School of Medicine at Mount Sinai, New York, New York*, 2. *Kings College, London, United Kingdom*

Palliative care has traditionally been limited to persons predictably approaching death, especially those with cancer. The needs of the larger population of older persons with non cancer chronic illnesses and functional impairment in whom prognosis is unpredictable will be reviewed with special attention to caregiver role, symptom burden, and the mismatch of existing service delivery to the needs of this population.

SESSION 750 (SYMPOSIUM)

KEYNOTE: BEYOND RHETORIC—TAKING GLOBAL ACTION ON AGEING

Chair: N.C. Keating, *Global Social Initiative on Ageing, Seoul, Korea (the Republic of)*

Co-Chair: J. Beard, *World Health Organization*

Population ageing is now part of our global consciousness. Yet actions to address issues that arise from these demographic shifts have lagged behind. Among the many challenges/impediments to creating global action are: diverse patterns of ageing across countries and regions; different family, community and policy contexts that influence ageing experiences; and considerable inequities both between and within countries. The purpose of this session is to create an agenda and advocate for global action to improve quality of life of older populations.

The session has 3 main elements:

Contextualizing the agenda for global action.

Norah KEATING, will introduce the session, setting parameters around thinking and hence acting differently in response to population ageing.

John BEARD will provide an overview of global patterns of ageing, emphasizing how a global response requires understanding how these patterns are expressed in very different contexts around the world.

Delineating challenges from two developing countries.

Two prominent social gerontologists, Peng DU (China) and Isabella ABODERIN (Kenya), will each describe the 3 biggest challenges in population ageing in their country. Each will discuss which contexts (policy, community, family) should be the main focus for addressing these challenges; why this is the case; and what would be ideal outcomes.

3. *Establishing principles for action.* A substantial portion of the session will be a moderated discussion. The goal is to lead to strategies for action across countries- with local solutions for global issues. Session moderator is Norah KEATING.

CONTEXTUALIZING THE AGENDA FOR GLOBAL ACTION

N.C. Keating^{1,2,3}, J. Beard⁴, 1. *Swansea University, Swansea, United Kingdom*, 2. *North West University, Potchefstroom, South Africa*, 3. *University of Alberta, Edmonton,*

Alberta, Canada, 4. *World Health Organization, Geneva, Switzerland*

Population ageing has created an urgent need for societies to think strategically about what constitutes a good old age for its citizen--and to formulate actions toward achieving this goal. We present a template for global action that requires challenging cultural norms of old age as an inevitable period of decline; and fostering supportive environments to enable wellbeing. Keating sets parameters around thinking and acting differently: focusing on physical, social and policy environments and on the importance of creating congruence between resources of older persons and these environments. Beard presents global patterns of ageing, emphasizing that global responses require understanding how these patterns are expressed across world regions. He speaks to strategic objectives adopted by WHO and its country constituents to embrace a commitment to action on healthy ageing and to develop age-friendly environments to address the multiple and intersectoral influences that affect quality of life in older age.

CHALLENGES IN POPULATION AGING AND POLICY PRIORITIES IN CHINA

P. Du, *Institute of Gerontology, Renmin University of China, Beijing, Beijing, China*

China has 220 million older persons aged 60 and over, expected to increase to about 490 million by 2050. Despite the new population policy encouraging couples to have two children, the proportion of the older persons will double from 16.1% in 2015 to 34% by 2050. Thus the 3 biggest challenges in population ageing in China are: creating a universal social security system that narrows the gap between urban and rural areas; developing the social care system, including LTC insurance and services, to meet rising needs of care needs; and promoting intergenerational solidarity. The main focus for policy is the integration of efforts and resources; for community is the establishment of multi-functional service centers in age-friendly environments; for families is enhancing caring capacity. The ideal outcomes would balance family and social care, improve life quality of older persons and strengthen intergenerational solidarity.

IDENTIFYING PRIORITIES FOR ACTION ON AGEING IN SUB-SAHARAN AFRICA: LENSES AND LINES OF INQUIRY

I. Aboderin, 1. *African Population and Health Research Center, Nairobi, Kenya*, 2. *Centre for Research on Ageing, University of Southampton, Southampton, United Kingdom*

A point of departure for delineating the major challenges in population ageing in sub-Saharan African (SSA) countries such as Kenya, is to appreciate the recent expansion in of the national, regional and global policy and legal architecture that commits African countries to action on older populations. The comprehensive and multilayered nature of the responses required brings to the fore what may be viewed as a most urgent challenge of ageing for Africa: meaningful prioritisation. What action is most needed where? - within contexts of severe resource constraints and multiple other pressing agendas? This presentation delineates two principal lenses and lines of inquiry that SSA countries might pursue to pinpoint answers to this question, and highlights the two

chief associated challenges for research and debate on ageing in the region.

SESSION 755 (SYMPOSIUM)

KEYNOTE: HOW EARLY CAN WE DETECT COGNITIVE DISORDERS

Chair: R. Petersen, *Mayo Clinic, Rochester, Minnesota*

Cognitive changes in aging evolve gradually over the lifespan. Most individuals will experience very gradual changes in speed of processing, cognitive flexibility and recent memory. However, an increasing number of persons will develop cognitive impairment due to underlying degenerative diseases. We are learning about the development of subtle clinical and biomarker features of persons as they age. This symposium will focus on typical cognitive changes of aging and compare them to the early cognitive features of incipient diseases. Similarly, an emphasis has been placed on the role of subjective concern of persons as they age and the implication of these measures for the prediction of cognitive decline. Patient-reported outcomes are becoming an increasingly important aspect of characterizing cognitive aging. Finally, we are learning about the evolution of various imaging and fluid biomarkers of incipient diseases trying to detect patterns that will predict a subsequent cognitive decline. Profiles of the accumulation of amyloid, tau and vascular changes will be discussed in the setting of cognitive and subjective decline. The ultimate goal of this work is to detect patterns of impairment that may allow one to intervene with disease-modifying therapies when they become available.

BIOMARKERS OF AGING AND ALZHEIMER'S DISEASE

R. Petersen, *Mayo Clinic, Rochester, Minnesota*

Most individuals experience a cognitive decline as they age. Some of the cognitive decline is due to known pathologic entities occurring in the brain leading to degenerative diseases of aging, but others are less well explained. The Mayo Clinic Study of Aging (MCSA) is a population-based study of cognitive aging in the community. Approximately 3,000 participants are followed actively on an annual basis with extensive clinical and biomarker characterization. Biomarkers include imaging and biofluid serial markers. Our work has demonstrated that amyloid accumulates in the brain across the age spectrum. Tau distribution begins early in life and tends to spread outside the medial temporal lobe as amyloid accumulation increases. Vascular disease is a common feature of aging and contributes to the overall pathological burden. The combination of these markers leads to cognitive changes with aging, and the implication of these biomarkers for neurodegenerative diseases will be discussed.

THE ROLE OF SUBJECTIVE COGNITIVE CONCERN IN AGING

F. Jessen, *University of Cologne, Cologne, Germany*

Aging is associated with decline in cognitive performance. The majority of aging people experience this decline subjectively. In a subgroup this subjective experience of decline indicates the first manifestation of Alzheimer's disease (AD)

at a stage where the objective performance is still unimpaired. In the framework of very early detection of AD, subjective cognitive decline without objective impairment (SCD) has become a condition of great interest. Increasing data suggest that individuals with SCD, who have biomarker evidence of AD are at increased risk of progression to mild cognitive impairment (MCI) and dementia. Those with evidence of amyloid deposition and SCD are at greater risk of cognitive decline than those with amyloid deposition, but without SCD. Current research aims at identifying features of SCD, which are particularly associated with AD pathology. The presentation will give an overview on the developing topic of SCD in relation to AD.

SEPARATING THE EARLIEST PHASE OF ALZHEIMER'S DISEASE FROM AGE-RELATED COGNITIVE DECLINE

M. Albert, *Johns Hopkins University, Baltimore, Maryland*

Cognitive changes with age occur in the absence of disease. Several neurobiological mechanisms appear to underlie these age-related changes in cognition in optimally healthy individuals. There is, however, considerable recent evidence that a subset of individuals whose cognitive performance falls within the normal range have evidence of Alzheimer's disease (AD) pathology in their brain. This has led to the current emphasis on initiating treatment trials for AD as early as possible in the disease course. The challenge for the field is to identify those changes which are associated with cognitive aging versus those that are a harbinger of progressive cognitive decline related to disease. This presentation will give an overview of these issues, and provide data from ongoing research aimed at separating age-related cognitive decline from the earliest phases of AD.

SESSION 760 (SYMPOSIUM)

KEYNOTE: GENES, ENVIRONMENT, AND BEHAVIORS THAT PREDICT HEALTHY LONGEVITY

Chair: L. Ferrucci, *National Institute on Aging, Baltimore, Maryland*

Co-Chair: D. Kuh, *MRC Unit for Lifelong Health and Ageing at UCL*

S. Olshansky, *University of Illinois at Chicago, Chicago, Illinois*

Over the last few years research on factors that affect longevity and healthspan has made substantial progress. A picture is emerging where the match between the genetic background and the environmental challenges produces an array of possible responses that are meant to be adaptive but in some cases result in the emergence of diseases and accelerated aging. In this symposium, three speakers address factors that affect healthy longevity from complementary perspectives.

Luigi Ferrucci uses the paradigm of geroscience to propose that the biology of aging is at the root of both chronic disease and aging phenotypes. Different genetic, environmental and behavioral backgrounds promote specific physiological impairments that in young age are compensated but in old age are causative of and heterogeneous phenotypes.

Diana Kuh argues that a life course perspective will improve our understanding of human responses to environmental challenges with long-term impact on health span and longevity. Understanding how humans adapt to the environment during development affect how well they age and how long they live.

S Jay Olshansky discusses scientific theories about maximum life span. In the 20th century, life expectancy forecasters consistently underestimated duration of life because they assumed a biological limit to life. On the contrary more recent assumptions propose life expectancies exceeding 100 to 150 years.

BIOLOGICAL MECHANISMS UNDERLYING THE AGING PHENOTYPES

L. Ferrucci, *National Institute on Aging, Baltimore, Maryland*

Mechanisms of aging phenotypes such as the decline in muscle mass and strength are unknown. In the Baltimore Longitudinal Study of Aging (BLSA), adiposity was the strongest correlate of low muscle quality both cross-sectionally and longitudinally. Fat in muscle may cause problems to: 1) mitochondria oxidative phosphorylation; 2) energetic metabolism; 3) muscle fibers structural integrity. Mitochondrial muscle bioenergetics assessed by phosphorus MRS was associated with walking performance and such association was mediated by impaired strength. Participants with impaired mitochondria energetics had experienced larger weight gain over previous 20 years. Low muscle quality was associated with higher levels of circulating leucine, isoleucine, tryptophan, serotonin, and methionine. In MRI and EM analysis, the architecture of muscle fibers were distorted with fractures in the continuity of serial sarcomeres in older individuals. Increasing adiposity may lead to impaired mitochondrial function, reduced protein homeostasis, with negative consequence on muscle structure and function.

HUMAN RESPONSES TO ENVIRONMENTAL CHALLENGES: A LIFE COURSE APPROACH

D. Kuh, *MRC Unit for Lifelong Health and Ageing at UCL, London, United Kingdom*

The MRC National Survey of Health and Development (NSHD), the oldest of the British birth cohort studies, was 70 years old in 2016. Since the 1970s, the NSHD has provided evidence that environmental challenges early in life, and human responses to those challenges during development and growth, have long-term effects on adult health, aging and survival. Neural, metabolic, inflammatory and endocrine pathways have been suggested as the main mediators of biological embedding of childhood adversity, and as common mechanisms driving the rate of ageing and chance of survival; and epigenetic processes that underlie these mechanisms are being investigated. Key and recent evidence is presented from the NSHD and the other British birth cohorts, of the long shadow of childhood, and of these common underlying mechanisms. It is argued that a life course perspective enhances our understanding of aging, at the societal, individual, body system and cellular levels.

THE FUTURE OF PREDICTING HEALTHY LIFESPAN HAS ARRIVED

S. Olshansky, *University of Illinois at Chicago, Chicago, Illinois*

Estimating duration of life has been the purview of actuaries for nearly two centuries, but estimating how healthy people are likely to be when they reach older ages is a recent advance of epidemiology, public health, and the availability of requisite data. Yet, even these methods of measuring healthy life expectancy rely on survey data that, while the current gold standard, will be supplanted by a new source of longitudinal health data drawn from wearable sensors. We can now peer into the functioning of our bodies in ways never before thought possible, and discover how we are “driving our bodies” in much the same way we can already determine how well we drive our cars. Add to this the fact that genetic epidemiology is leading to a greater understanding of the inherited factors that influence duration and quality of life, and together with wearable sensors, a new technology has arrived that will revolutionize our concepts and methods of measuring and predicting healthy longevity. Here I will discuss this nascent health data economy and provide an example of what it will look like and how it is likely to function in the coming years.

SESSION 765 (POSTER)

ACUTE CARE II

FUNCTIONAL STATUS CHANGE AS A MORTALITY PROGNOSTIC FACTOR IN HOSPITALIZED ELDERLY: CASE-CONTROL STUDY

G. Fasce, F. Crispi, C. Muñoz, M. Zavala, C. Briceño, N. Castillo, N. Araya, *Geriatrics Section, Hospital Clínico de la Universidad de Chile, Santiago, Chile*

Background: Lower functionality has been associated to negative outcomes, such as worse quality of life and higher risk of mortality. Hospitalization is associated with a reduction of 50% of the previous functionality. On hospitalized elders, the impact of acute loss of basal functionality at discharge (delta functionality or DF) on mortality one year later hasn't been determined. Methods: A case-control study was developed. Case: Elders older than 60 years hospitalized between January 2013 and December 2014 in the Acute Geriatrics Unit of the University of Chile Clinical Hospital, deceased within 1 year of discharge. Control: Alive patients within 1 year of discharge. Exclusion criteria: Basal Barthel ≤ 15 . The functionality loss between basal and discharge Barthel was determined, identifying the cut-off point associated with a worst survival to one year, adjusted by other relevant variables. A p value < 0.05 was considered statistically significant. Results: 105 cases and 153 controls. The mean age was 81. Median Basal Barthel: 85. There were no differences among groups on age, basal or admission functionality, or frequency of geriatrics syndromes. A DF higher than 45% was associated with almost double mortality risk: OR: 1.7619 (CI:1.0394/2.9866; p= 0.0354). With a DF higher than 50%, the mortality risk becomes higher (OR: 1.8846 - CI:1.0680/3.3255; p=0.0287). Conclusions: A functionality

loss higher than 45% doubles the risk of death within 1 year of discharge. The risk becomes higher at higher DF. Therefore, interventions that preserve basal functionality should be promoted.

SURVEY OF AUSTRALIAN AND NEW ZEALAND PUBLIC ON CRITERIA TO TRIAGE PATIENTS IN AN INFLUENZA PANDEMIC

V. Naganathan^{1,2}, W. Cheung³, J. Myburgh⁴, 1. *Centre for Education and Research in Ageing, University of Sydney, Concord, New South Wales, Australia*, 2. *Ageing and Alzheimers Institute, Concord Hospital, Sydney, New South Wales, Australia*, 3. *Intensive Care Unit, Concord Hospital, Sydney, New South Wales, Australia*, 4. *Critical Care and Trauma Division, The George Institute for Global Health, Sydney, New South Wales, Australia*

To determine Australian and New Zealand (NZ) public's view on how intensive care (IC) beds should be allocated in a major influenza pandemic. Postal questionnaire was sent to 4000 registered voters randomly selected from the Australian and NZ Electoral rolls. Respondents chose from 6 methods to triage patients: use a "first in, first served" approach; allow a senior doctor to decide; use predetermined health department criteria; use random selection; use the patient's ability to pay; or use the societal importance of the patient to decide. Respondents' also rated the fairness of the six triage methods as well as 3 additional questions on the use of age, predicted mortality, and chronic comorbidity as selection criteria. The overall response rate was 15.1% in Australia and 27.0% in NZ. Australian respondents preferred that patients be triaged to the IC unit either by a senior doctor (43.2%) or by predetermined health department criteria (38.7%). NZ respondents preferred that triage by a senior doctor (45.9%). Respondents from both countries perceived triage by these two criteria to be fair, and the other 4 methods of triage to be unfair. A large proportion of respondents considered using a person's chance of survival to base triage decisions to be fair (80%) and the majority also considered treating younger people ahead of older people (66%) and on the basis of chronic comorbidity (60%) to be fair. In preparation for future pandemic planning there may be value in knowing the views of the public on how resources should be allocated.

PREVALENCE OF PIMS AMONG HOSPITALIZED ELDERLY PATIENTS BASED ON BEERS AND STOPP/START CRITERIA

T. Suansanae¹, W. Chivapricha², 1. *Pharmacy, Faculty of Pharmacy, Mahidol University, Ratcchathewi, Bangkok, Thailand*, 2. *Faculty of Pharmacy, Rangsit University, Muang Ake, Pathumthani, Thailand*

This was a cross-sectional study to determine prevalence of PIMS in hospitalized elderly patients. All patients who admitted at medical ward of Siriraj Hospital during May 2015 to February 2016 were recruited. All PIMS were identified at admission date by geriatric specialty pharmacist by using Beers 2012 and STOPP/START Version 2 criteria. Descriptive statistic were used throughout data analysis. A total of 187 patients were entered the study. Mean age was 74.4 years (SD \pm 8.70) and half of them were male (51.3%). The mean number of medications at admission is 8.24 (SD \pm 4.77) items/patient. Commonly admission reasons were

pneumonia, heart failure, NSTEMI, COPD with acute exacerbation and UGIB. At date of admission, 43.3% and 44.92% of patients had at least one Beer-listed PIMS and STOPP-listed PIMS, respectively. The most common Beers-listed PIMS were related to alpha-blockers, benzodiazepines and anticholinergics. While, the most common STOPP-listed PIMS were related to benzodiazepines, anticholinergics and PIMS induced ADEs in some specific condition such as dosage too high, drug interaction, and duplicate drug class. In conclusion, we found a high prevalence of PIMS among hospitalized elderly patients which could be detected by using either Beers or STOPP/START criteria.

RECOMMENDATIONS FOR THE MANAGEMENT OF OLDER PATIENTS VISITING EMERGENCY DEPARTMENT AND RISK OF DEATH

C. Launay¹, G. Duval², O. Beauchet³, C. Annweiler², 1. *CHUV, Lausanne, Switzerland*, 2. *CHU Angers, Angers, France*, 3. *Mc Gill University, Montréal, Quebec, Canada*

Objective: To examine the effects of geriatric and gerontological recommendations for the management of geriatric patients visiting an emergency department (ED) on risk of death in the first year following the ED visit.

Methods: A total of 131 geriatric patients who visited Angers University hospital ED were prospectively included in this pre-post quasi-experimental study. They were separated in three groups matched on age and gender: two intervention groups (11 patients with geriatric recommendations and 23 patients with gerontological recommendations) and one control group (97 patients without any recommendations). Intervention was provided upon the participant's ED admission. Incident mortality was collected via the administrative registry of Hospital before patients' discharge and via a systematic phone call 12 months after the ED visit. Age, gender, place of living, number of daily drugs taken, cognitive decline, and reason for ED admission were used as covariates.

Results: Multiple Cox regression model showed that gerontological recommendations were associated with a lower rate of mortality (adjusted Hazard Ratio [HR] = 0.12, P=0.038) but not geriatric recommendations (adjusted HR=9.94, P=0.905). Living at home was associated with a greater risk of death (adjusted HR=2.55 with P=0.020). Kaplan-Meier distributions of mortality confirmed that patients who received gerontological recommendations had a lower mortality rate compared to those who did not receive recommendations (P=0.005) and those who received geriatric recommendations (P=0.015).

Conclusions: Our findings show that gerontological but not geriatric recommendations were associated with a lower risk of mortality after an ED visit in geriatric patients.

FURTHER ENABLING CARE AT HOME HOSPITAL OUTREACH PROGRAM: OUTCOMES FOR OLDER PATIENTS' FAMILY CARERS

C. Toye^{3,2}, S. Slatyer^{3,2}, S. Aoun³, R. Moorin¹, R. Parsons⁴, M. Bronson⁶, R. Osseiran-Moisson³, K.D. Hill⁵, 1. *School of Public Health, Curtin University, Perth, Western Australia, Australia*, 2. *Centre for Nursing Research, Sir Charles Gairdner Hospital, Perth, Western Australia, Australia*, 3. *School of Nursing, Midwifery and Paramedicine, Curtin*

University, Perth, Western Australia, Australia, 4. School of Pharmacy, Curtin University, Perth, Western Australia, Australia, 5. School of Physiotherapy and Exercise Science, Curtin University, Perth, Western Australia, Australia, 6. Medical Division, Sir Charles Gairdner Hospital, Perth, Western Australia, Australia

When an older person who receives family care at home is discharged from hospital, an opportunity exists to identify and address the family carer's support needs. Home caregiving sustainability may then be supported. Health outcomes for care recipients may also be improved. This study tested the hypothesis that family carers' inclusion in the Furthering Enabling Care at Home program, immediately following care recipients' hospital discharges, would improve carers' self-reported preparedness for caregiving. The single-blind randomized controlled trial compared outcomes from usual discharge processes with those obtained when the new program was added. The program, costed during the study, was delivered by a nurse over the telephone. The nurse guided carers to seek any required clarification of discharge information and then implemented a systematic, carer-led, caregiving support needs assessment. Carers prioritized their needs and the nurse guided access to appropriate supports. Patients aged over seventy years, and their family carers, were recruited from the short-stay, medical assessment unit of a Western Australian public hospital. Data were obtained from sixty-two family carers in the intervention group and seventy-nine in the control group on three occasions: at the time of the care recipient's hospital discharge, and at approximately three and six weeks later. Compared to the control group, preparedness to care significantly improved in intervention group carers (moderate effect size). Small but statistically significant positive impacts from this low cost intervention were also observed in these carers' levels of strain and distress. The program's implementation in this and other similar settings merits consideration.

EFFECTS OF NURSING PATIENT EDUCATION ON QOL IN ELDERLY INPATIENTS: A SYSTEMATIC REVIEW

S. Strupeit, A. Buss, *Nursing Science, Munich University of Applied Sciences, Munich, Germany*

The aim of this study was to evaluate the effectiveness of nurse-delivered education interventions compared to usual care with regard to the quality of life in elders in the hospital.

A systematic review was performed to identify randomized controlled trials examining the effects of nurse-delivered educational interventions on the quality of life in elders in the hospital. The search was performed in December 2012 in the MEDLINE (via PubMed), EMBASE (via Ovid), and CINAHL (via EBSCO) databases and was limited with regard to publication time and language. The studies were appraised according to methodological quality, and p-values were extracted to determine the effectiveness of the interventions.

Four studies were included in the review. One study testing multicomponent interventions showed positive effects on quality of life. Two studies showed no effect, and one study showed a negative effect of the intervention on quality of

life. Methodological appraisal revealed single biases in most of the studies.

Because of methodological issues and heterogeneity between studies, this review could not provide evidence of the effectiveness of nurse-delivered education interventions in elders in the hospital for improving quality of life. Nurse-delivered education may be more effective as a part of multifactorial interventions. Further studies should examine interventions that focus on quality of life using validated measures.

HOSPITAL-WIDE COMPREHENSIVE GERIATRIC ASSESSMENT (CGA) FOR OLDER PEOPLE: A SURVEY OF UK HOSPITALS.

P. McCue¹, S.G. Parker¹, H. Roberts², S. Kennedy³, S. Conroy⁴, 1. *Newcastle University, Newcastle upon Tyne, United Kingdom*, 2. *Southampton University, Southampton, United Kingdom*, 3. *Sheffield University, Sheffield, United Kingdom*, 4. *Leicester University, Leicester, United Kingdom*

CGA is widely recommended for older hospital inpatients. The UK National Institute for Health Research (NIHR) recently called for more research on the delivery of hospital wide CGA.

We carried out a survey of acute hospitals in the UK with the assistance of the British Geriatrics Society, The Royal College of Physicians of London and the NIHR Ageing Clinical Research Network.

We asked hospitals to identify services which provided CGA: "A multidimensional, multidisciplinary process which identifies medical, social and functional needs, and the development of an integrated / co-ordinated care plan to meet those needs."

45 hospitals participated in the survey. All hospitals described the provision of CGA and returned descriptions of 82 services. The majority (78/82, 95%) of the services were led (60) or supported (18) by a consultant geriatrician. Teams were generally staffed by physiotherapists (81/82, 99%) and occupational therapists (80/82, 98%), with nurses (76/82, 93%) and health care assistants (73/82, 89%).

The majority (73/82, 89%) used clinical assessment processes (such as consultant or specialist nurse review) to identify appropriate patients, in preference to screening tools (36/82, 44%) or admission criteria (38/82, 46%). Most services (58/82, 71%) did not use standard methods for measuring frailty, with little consistency of choice of instruments among those who did.

Multidisciplinary team based CGA was available in all hospitals surveyed, generally led by geriatricians and staffed with therapists and nurses. These teams make extensive use of clinical assessment to select patients for their care. Relatively few measure or target frailty explicitly.

COMPREHENSIVE GERIATRIC ASSESSMENT PROCEDURE ONLINE, INCORPORATING INTERRAI ACUTE CARE ASSESSMENT

M. Martin-Khan², L.C. Gray¹, H. Edwards³, R. Wootton¹, P. Varghese⁴, K. Lim⁵, P. Darzins⁶, L. Dakin⁴, 1. *Centre for Research in Geriatric Medicine, The University of Queensland, Woolloongabba, Queensland, Australia*, 2. *The University of Queensland, Brisbane, Queensland, Australia*,

3. *Queensland University of Technology, Kelvin Grove, Queensland, Australia*, 4. *Queensland Health, Brisbane, Queensland, Australia*, 5. *University of Melbourne, Melbourne, Victoria, Australia*, 6. *Eastern Health, Box Hill, Victoria, Australia*

Nurse administered comprehensive geriatric assessment (CGA), based on the interRAI Acute Care assessment system, accessed online, enables geriatricians to review patients and provide input into care at a distance. This study was designed to determine whether geriatric triage decisions made using CGA performed “online” are less reliable than face-to-face decisions. This was a multi-site non-inferiority prospective cohort study. Patients referred for an acute care geriatric consultation were assessed sequentially by two specialist geriatricians. Patients allocated one face-to-face (FTF) assessment and an additional assessment (either FTF or online (OL)), creating two groups—paired FTF (FTF-FTF) or paired online face-to-face (OL-FTF). Case preparation was conducted by a trained nurse assessor using a web-enabled clinical decision support system. Geriatricians allocated to perform an ‘online’ assessment had access to this information only. Geriatricians allocated FTF reviewed this data, as well as the paper-based medical file and then consulted directly with the patient and attending staff. The primary decision was referral for permanent residential care. Overall percentage agreement (P_o) for the FTF-FTF group was 88% ($n=71/81$) (95% CI: 0.7847, 0.9392), with a Cohen’s kappa of 0.6432 (95% CI: 0.4411, 0.8452). Overall agreement for the OL – FTF group was 91% ($n=77/85$) (95% CI: 0.8229, 0.9585), with a Cohen’s kappa of 0.7291 (95% CI: 0.5529, 0.9053). The difference in agreement between the two groups was -3% (95% CI: -13%, 7%) indicating that was no difference. Geriatric assessment performed online using a nurse administered structured CGA system was no less reliable than conventional assessment for triage decisions.

FREEDOM OF MOVEMENT: A MULTILEVEL INTERVENTION TO REDUCE PHYSICAL RESTRAINTS USE IN ACUTE CARE

D. Zekry, A. Mendes, L. Mieiro, A. Maringue, P. Layat-Jacquier, F.R. Herrmann, G. Gold, *Internal Medicine, Rehabilitation and Geriatrics of Geneva University Hospitals, Geneva, Switzerland*

Physical restraints are frequently used in elderly care and justified to prevent falls, control disruptive behavior and allow interventions. Physical restraints do not bring benefit, being associated with poor outcomes like direct injuries, reduced mobility and mortality.

We have implemented an intervention multilevel program involving all the health care team of an acute care Alzheimer unit (SOMADEM) to reduce the use of physical restraints and to promote methods for achieving safety.

SOMADEM (SOMAtic and DEMentia) is an 18-bed unit in a geriatric hospital. Patients admitted in this unit have dementia and at the same time behavioral and psychological symptoms of dementia (BPSD) due to a concomitant acute somatic disease. The intervention model has a longitudinal design in 3 phases: education, specialized consultation and physical restraints alternatives. The educational part consists in a 4-hour training of all unit staff taught by a specialized interdisciplinary team. The content covers risk of falls,

management of disruptive behavior, legal issues regarding physical restraints prescription, alternatives to its use and discussion of clinical vignettes. A weekly specialized consultation by the same team proposes alternative ways.

Prevalence of physical restraints after the intervention program is the primary outcome; evaluation of types of physical restraints, falls and fall-related injuries, psychoactive drugs prescription, disruptive behavior, functional independence status and destination after discharge are secondary outcomes. Data during the 12 months after the start of intervention will be compared to a 15-month period before the intervention used as baseline. Encouraging results will be discussed.

POSITIVE BLOOD CULTURE IN ACUTE CARE HOSPITAL FOR MATURE PATIENTS IN JAPAN

Y. Kitagawa, *Department of Infection Control, National Center for Geriatrics and Gerontology, Obu, Japan*

Blood culture is one of the most important clinical examinations for infectious diseases. In this report, we review our blood culture test in recent a couple of years.

From April 2014 to June 2016, 4482 blood culture test were ordered in National Center for Geriatrics and Gerontology in Obu, Japan. In these cases, 611 tests were positive result (positive rate 13.6 %). The percentage for obtaining multiple blood culture sets was 76.6 % during study period.

There were 217 male and 144 female with age 80.4 years old. The cultured bacteria were *Escherichia coli* 68 cases (17.75 %), *S.aureus* 32 (8.36), *S. epidermidis* (MRS) 28 (7.31 %), *Klebsiella pneumoniae* 24 (6.27), *Escherichia coli* (ESBL) 22 (5.74), *S.aureus* (MRSA) 16 (4.18 %), β -*Streptococcus* (group-G) 11 (2.87 %), *Enterococcus faecalis* 9 (2.35 %), *Serratia marcescens* 8 (2.09), *Corynebacterium* spp. 8 (2.09), *St.pneumoniae* 6 (1.57), *St.agalactiae* (B) 6 (1.57 %), *S.epidermidis* 6 (1.57 %), *S. hominis* (MRS) 6 (1.57 %), *Prop.acnes* 6 (1.57 %), *E.aerogenes* 6 (1.57 %), *Proteus mirabilis* 5 (1.31 %), *Enterococcus faecium* 5 (1.31 %), *E.cloacae* 5 (1.31 %), *Bacillus* spp. 5 (1.31 %), *St.bovis* 4 (1.04 %), *S. parasanguinis* 4 (1.04 %), *S. hominis* 4 (1.04 %), *Corynebacterium striatum* 4 (1.04 %), *Bacillus cereus* 4 (1.04 %), *A.baumannii* 4 (1.04 %) and others 77 (20.1 %), respectively.

In our institute, reasonable blood culture test was performed as acute care hospital. However we try to obtain more multiple blood culture sets.

SEVERE HYPERTENSION ON ADMISSION AND ACUTE PNEUMONIA IN THE ELDERLY WITH ACUTE CEREBRAL HEMORRHAGE

M. Okuro, T. Okuno, T. Himeno, T. Morita, O. Iritani, H. Yano, K. Iwai, S. Morimoto, *Department of Geriatric Medicine, Kanazawa Medical University, Ishikawa Prefecture, Japan*

Objective: Cerebral hemorrhage is frequent condition in the elderly, and acute complications such as pneumonia increases the risk of mortality rate. However, there are few studies about the association with blood pressure on admission. We studied the association between the incidence of pneumonia and blood pressure on admission.

Methods: Elderly patients admitted to the Geriatric Emergency Ward of Kanazawa Medical University Hospital with a diagnosis of acute cerebral hemorrhage during 2002–2012 were recruited into the study. (59 men, 58 women, mean ages 80 ± 8 years, range 65–98 years). All patients underwent brain magnetic resonance imaging and magnetic resonance angiography on the first day of admission. The patients were divided into three groups according to the record of the highest mean SBP and/or DBP of two measurements every 2 h during the first 24 h after admission; 21 control patients with normotension to mild hypertension (SBP < 160 mmHg and DBP < 100 mmHg), 37 patients with moderate hypertension (SBP 160–179 mmHg and/or DBP 100–109 mmHg), 30 patients with severe hypertension (SBP 180–199 mmHg and/or DBP 110–119 mmHg), 29 with very severe hypertension (SBP \geq 200 mmHg and/or DBP \geq 120 mmHg). CT images were classified as 37 subcortical, 37 thalamus, 28 basal ganglia, 4 pons brainstem, 11 cerebellum and stratified analyses were performed. The definition of pneumonia includes clinical finding of rales, fever onset, purulent sputum, chest radiograph showing evidence of an infiltrate/consolidation/cavitation, necessity of medical treatment and antibiotic course.

Results: After admission, developed acute pneumonia occurred one out of 21 normotensive (4.8%), 7 out of 37 moderate hypertensive (18.9%), 6 out of 30 severe hypertensive (20.0%), 16 out of very severe hypertensive (55.2%). After adjustment by potential confounding factors such as age, sex, JSC, midline shift, hemorrhage volume, diabetes, white blood cell count, CRP, serum albumin, incidence of pneumonia was significantly associated with very severe hypertension comparing with other hypertension groups (OR: 4.89, 95% CI: 1.37–42.5, $p=0.014$).

Conclusion: We conclude that very severe hypertension on admission is a risk factor for acute pneumonia in elderly patients with acute cerebral hemorrhage.

EBV-POSITIVE DIFFUSE LARGE B-CELL LYMPHOMA OF THE ELDERLY: A DIFFERENTIAL DIAGNOSIS FOR SEPSIS.

R. Ortés Gómez¹, G. Lozano Pino¹, E. Villalba Lancho¹, G. Martín Núñez², 1. *Geriatric Unit, Virgen del Puerto Hospital, Plasencia, Cáceres, Spain*, 2. *Hematology Service, Plasencia, Cáceres, Spain*

Epstein-Barr virus (EBV)-positive diffuse large B-cell lymphoma (DLBCL) of the elderly is an uncommon aggressive lymphoma subtype arising in immunocompetent patients >50 years. Disease in elderly could have an atypical presentation and compromised functioning. We report a fatal case of EBV-positive DLBCL of the elderly in an 84-year-old man presenting as a respiratory sepsis and multiorgan failure.

Mr. E., an 84-year-old man, was admitted to hospital with a 3-days history of asthenia, functional decline, fever, unintelligible speech, and delusions. It was associated since two months ago with anorexia, weight loss, and an exertional dyspnea. Imaging demonstrated pulmonary infiltrate at right lower lobe. Mr. E. was transferred to Acute Geriatric Unit with diagnosis of pneumonia and delirium. Empirical treatment with antibiotics was started despite which we observed persistent fever, elevated bilirubin and cholestasis. CT-scan

showed pulmonary patched consolidation and retroperitoneal and mediastinal lymphadenopathy.

He developed renal and liver failure, and shock, and he was referred to Intensive Care Unit. Nevertheless he worsened with multiorgan failure, metabolic acidosis, and pancytopenia, and, accordingly, it was done bone marrow aspirate. He died sixteen days after his hospital admission. Bone marrow aspirate showed a neoplastic polymorphous lymphoid population composed of Reed-Sternberg (HSR)-like cells which expressed CD20, CD30, EBV/LMP and MUM-1 and the diagnosis of EBV-positive DLBCL of the elderly was made.

Disease in elderly could have an atypical presentation and compromised functioning. EBV-positive DLBCL is an uncommon aggressive lymphoma subtype and has a worse survival than would be expected in patients with EBV-negative DLBCL.

MOVE (MOBILIZATION OF VULNERABLE ELDERLY) AB INITIATIVE FOR INPATIENTS IN ALBERTA COMMUNITY HOSPITALS

J. Holroyd-Leduc¹, K. Osowy¹, J. Quirk², C. Harris², J.E. Moore², S.E. Straus^{2,3}, 1. *Medicine, University of Calgary, Calgary, Alberta, Canada*, 2. *Li Ka Shing Knowledge Institute, St. Michael's Hospital, Toronto, Ontario, Canada*, 3. *University of Toronto, Toronto, Ontario, Canada*

The objective of MOVE AB was to disseminate, implement and evaluate in community hospitals in Alberta, Canada an evidence based strategy that had been successful in promoting early mobilization in older patients admitted to academic hospitals in Ontario, Canada. Early mobilization strategies have been shown to improve both patient and system outcomes.

Four community-based hospitals in Alberta participated. The multi-disciplinary approach focused on three key messages: 1. encourage mobility three times a day, 2. progressive and scaled mobilization, and 3. mobility assessments should be implemented within 24 hours of admission.

MOVE AB was delivered in phases: Planning/pre-intervention, Intervention and Post-intervention. Key planning activities included a Readiness assessment and Barriers and Facilitators survey, which allowed for tailored interventions to each unit participating. Interventions included coaching, fairs, huddles, educational materials, e-modules as well as focusing on natural opportunities.

The primary outcome was the proportion of patients aged 65 and older who were mobilized during their hospital stay. Audits were conducted though all study phases, twice a week, 3 times a day.

Average mobilization rates increased over time (pre-intervention= 42.5%, intervention= 43.4%, post-intervention= 45.6%). Average mobility rates were highest during lunch (57.4%) and increased by 8% from pre-intervention to post-intervention. The majority of mobile activity consisted of sitting in a chair; sitting in bed with legs dangling or standing/walking in room independently. Additional analyses will include examining impact on length of stay and discharge location. However, we were able to successfully disseminate

the MOVE initiative from academic hospitals into smaller community hospitals.

EFFICACY OF DYSPHAGIA REHABILITATION AND NUTRITIONAL MANAGEMENT IN THE ACUTE CARE HOSPITAL

M. Yamori¹, H. Higashiyama², 1. *Prefectural University of Hiroshima, Mihara, Hiroshima Pref., Japan*, 2. *Onomichi municipal hospital, Onomichi, Hiroshima Pref., Japan*

We have experienced dysphagia rehabilitation by Speech-Language-Hearing Therapists (SLHTs) under nutritional management (nutrition support team, NST) which has been effective for patients' recovery especially in the acute stage. However, available information on the relation among recovery status, rehabilitation by SLHTs, and NST in the acute stage is limited. Hospitals where are not any or are only a few SLHTs, even in some urban areas of Japan still exist. Our aim of this study is to clarify the efficacy of dysphagia rehabilitation under nutritional management in an acute care hospital. The data of 750 patients admitted in a tertiary care hospital provided for this study. They were divided into four groups; SLHT group who were rehabilitated by SLHTs, both SLHT and NST (Abreast) group who were rehabilitated by SLHTs under NST, NST only (NST) group and Non-intervention (NI) group. The patients in SHLT and Abreast groups were older, more demented and with lower scores of FIM on average than the other two groups. 55.4% of SLHT group and 46.7% of Abreast group showed moderate to severe dysarthria. The percentage of tube fed patients was significantly higher in SLHT and Abreast group than others. However their inpatient periods and FIM score improvements did not show significant differences from others. The rate of their secession from tube feeding was significantly higher than others. We concluded that Dysphagia rehabilitation by SLHTs under nutritional management is effective for patients' recovery not only in convalescent stage but also in the acute stage.

DEVELOPMENT OF AN OUTPATIENT TRANSFUSION PROTOCOL TO REDUCE AVOIDABLE HOSPITALIZATIONS

Z.J. Palace, *Medicine, Hebrew Home at Riverdale, Bronx, New York*

Improving the quality of care to the elderly is a fundamental cornerstone of the practice of geriatric medicine. Reducing the frequency of avoidable hospitalizations is an area of particular focus. Inpatient hospitalizations in the elderly population are often also associated with the development of multiple complications, which, in turn, increase lengths-of-stay. These include hospital-acquired infections, development of new decubiti, physical declines resulting from prolonged immobility, and the untoward effects of acute adjustment reaction from an unfamiliar hospital environment. The development of well-designed interventions in the nursing home can significantly reduce the number of potentially avoidable hospitalizations in this population. "Development of an Outpatient Transfusion Protocol to Reduce Avoidable Hospitalizations" is a quality improvement initiative that was implemented at The Hebrew Home at Riverdale, a skilled nursing facility in Bronx, NY. The objective of this program was to develop a favorable

alternative to the hospitalization of postacute and long-term care patients requiring blood transfusion. In our experience, all patients being sent to the hospital for blood transfusion were being admitted as an inpatient, irrespective of the goals of care. This program is being successfully utilized for the patient who is evaluated for anemia at the skilled nursing facility and a clinical decision is made to order a blood transfusion without pursuing further workup. Through a clinical collaboration with a local hospital blood bank, a transfusion protocol was developed. The hospital physician coordinates the transfusion with the hospital's blood bank for the following day, to be done as an outpatient procedure.

SESSION 770 (POSTER)

AVENUES FOR AGING IN PLACE I

CHALLENGES IN ELDERLY NIGHT-TIME CARE: DIGNITY 24 HOURS A DAY IN SWEDISH ELDERLY HOME CARE SERVICES?

K.E. Andersson^{1,2}, M. Sjölund^{1,2}, 1. *Department of social work, Umeå University, Umeå, Sweden*, 2. *Department of social work, Umeå, Sweden*

The research study explores a large knowledge gap within Swedish elderly care – namely the challenges of within home care services at night. Despite that home care services is the most common support given to the elderly in Sweden. The few National and International studies that exist on night-time care, have focused on residential care facilities for the elderly. Therefore, focus here is on night-time care in their own homes, given by the night patrol – which we know very little about.

In the last decades, organizational transformation has taken place within elderly care towards increased rationalization and marketization. Along with demographical changes, this raises questions of dignified care, equal social rights and access to care. As the elderly are living longer and living in their own homes with severe disability and vulnerability, the pressure on home care services will increase – including at night. Dignity in care has been legislated in the Swedish Social Services Act, but is vaguely implemented, specifically at night.

Discussed are results of an interview survey with managers responsible for night-time home care services in 50 Swedish municipalities. How night-time care is organized varies depending on local governance, location and size of municipalities. This indicates challenges for equal access to care, depending on where you live. Care workers experience time pressure at night with many fragile elderly in need of care. How efforts to secure dignity and safety for older people varies over night is therefore important to reveal, not the least from a social equality perspective.

ACTIVITY ENGAGEMENT AMONG OLDER ADULTS LIVING IN THE COMMUNITY

S. Herbers, N.L. Morrow-Howell, C. Baum, B. Widener, Y. Wang, *Harvey A. Friedman Center for Aging, Washington University in St. Louis, Saint Louis, Missouri*

Activity is central to theories and frameworks regarding healthy aging. In this pilot study we sought to 1) understand

past and current activity engagement among older adults and 2) identify challenges and opportunities for re-engagement. We completed structured, in-person interviews with 110 older adults living in two community-based settings; 1) a low-income senior apartment community and 2) single-family homes or apartments located within the boundaries of a local NORC. Interviews included completion of the Activity Card Sort, a tool where past and present activity levels for 89 activities—classified as instrumental, low-demand leisure, high-demand leisure, or social—were reviewed. Interviews also included a series of questions that assessed reasons for reducing activities, facilitators to re-engaging in activities, and willingness to re-engage. Findings indicate that participants remained most engaged in instrumental (e.g., doctor visits, grocery shopping) and low-demand leisure (e.g., reading, using a computer) activities. There was no significant difference in current activity engagement across ages, however there was significant difference depending on where older adults lived. Participants living in senior apartments reported lower activity engagement for both instrumental and social activities. The most common barriers reported for activities were ‘no opportunity’ (83%), ‘no one to do it with’ (82%), and being ‘physically difficult’ (73%). The top activities residents would like to re-engage in were social or low-demand leisure. In terms of starting new activities, interest in high-demand leisure (e.g., yoga, biking) was high. These findings can help inform the development of interventions to engage older adults living in the community.

LONELINESS AS A MEDIATOR BETWEEN SOCIAL SUPPORT AND LIFE SATISFACTION AMONG SOLITARY OLDER ADULTS

X. Bai¹, S. Yang², C. Liu¹, M. Knapp³, 1. *The Hong Kong Polytechnic University, Hong Kong, China*, 2. *The Education University of Hong Kong, Hong Kong, China*, 3. *London School of Economics and Political Science, London, United Kingdom*

Despite the importance of optimal life satisfaction in later life, the varied pathways through different sources and directions of social support to older adults' life satisfaction remain unclear. Using a sample of a sample of 151 community-dwelling solitary Chinese older adults (65 and older) in Hong Kong, the present study used path analysis within the structural equation modelling (SEM) framework to examine the mediating effect of the sense of loneliness in the relationship between different sources and directions of social support and life satisfaction. Bootstrap approach was employed. Goodness-of-fit indices were obtained for the final model, with SRMR = 0.045, RMSEA = 0.039, and CFI = 0.987. The results showed that the sense of loneliness partially mediated the effect of family support (standardized $\beta_{\text{family-LS}}=0.213$; standardized $\beta_{\text{family-loneliness-LS}}=0.110$) on life satisfaction and fully mediated the effect of friends' support (standardized $\beta_{\text{friend-loneliness-LS}}=0.084$). It seemed that confidante relationships and formal sources of social support represented by community services did not affect solitary older adults' life satisfaction, but helping others can directly influence life satisfaction of solitary older adults (standardized $\beta_{\text{helping-LS}}=0.123$). The findings pointed out the importance of enhancing awareness among ageing service providers about the negative effect of insufficient social support on the sense

of loneliness and life satisfaction in older adults. Familial and friendship networks should be expanded for solitary older adults, and more volunteer programmes could be developed for them to join.

AGING IN PLACE WITH INTELLECTUAL DISABILITY: CARE TRANSITIONS AMONG OLDER TWO-GENERATION FAMILIES

C. Yueh-Ching¹, T. Kröger², W. Wang³, W. Lee⁴, 1. *Institute of Health & Welfare Policy, National Yang-Ming University, Taipei, Taiwan*, 2. *University of Jyväskylä, Jyväskylä, Finland*, 3. *Tzu Chi University, Hualien, Taiwan*, 4. *National Chi-Nan University, Nanto, Taiwan*

Little is known of transitions in care and housing of old two-generation families that include aging (≥ 40) adults with intellectual disability (ID) and their older (≥ 65) parents. This study employed the “housing pathways” theory in order to explore the experiences of these families of such transitions. All potential old two-generation families from two local authorities in Taiwan were recruited; 237 families completed our survey and 61 our in-depth interviews between May 2015 and July 2016. Different models and types of transitions in care and housing of these families were identified and found to be connected with changes in their care responsibilities and living arrangements. Old parents are concerned with transferring their care responsibility to others, often to their other children. The lifecycles and social/financial contexts of older parents and aging adults with ID, and those of the siblings of adults with ID, are linked together and need to be considered in the process of making moving decisions. Concerning the transitions in care and housing, kin relations, living geography and ethnic culture seem to be more important factors than social/health care needs/use of older parents and aging adults with ID. Aging in place was more popular than moving in old age among these families; hiring a migrant care worker strengthened families' choice of ageing in the old place. Care transitions, aging with disability and kin relations are linked together for these families and should be taken into account and addressed by aging, housing and disability policies.

TOBACCO CONSUMPTION AND INPATIENT HOSPITAL SERVICE USE AMONG AN OLDER ADULT POPULATION IN CHINA

A.C. Mui¹, Y. Zhang¹, H. Chen², N. Jiang¹, Y. Li³, 1. *Social Work, Columbia University, New York City, New York*, 2. *Washington University at St. Louis, St. Louis, Missouri*, 3. *Tsinghua University, Beijing, China*

This secondary research is based on the WAVE I (2010) of the WHO Study on Global AGEing and Adult Health (SAGE). Based on the Andersen-Newman Behavioral Model of Health Services Utilization, this study examined the role of tobacco use in predicting utilization of inpatient hospital service among older adult tobacco users (self-identified) in China ($n = 2,467$; age 55 or older). Tobacco consumption was assessed in terms of whether elders at the time of interview were using tobacco products (including cigarettes, cigars, pipes, chewing tobacco or snuff) daily. The mean age of the sample is 65.54 ($SD = 8.11$), with 91% male and 86% married. Results showed that 23% of the sample had received at least one overnight hospital stay in the last

12 months. Other things being equal, tobacco consumption was a significant need factor to inpatient hospital use. Data suggest that heavy smokers were more likely to use inpatient services. Among the predisposing factors, rural residency was associated with hospital use. Rural elders may prefer to stay in the hospital when needed because of the distance between villages and hospital facilities. In addition, the two enabling factors (having more financial resources and a higher level of social participation) were associated with increased likelihood of using hospital inpatient services. Consistent with the literature, having poor health status was a need factor associated with the increased likelihood of hospital service use. Tobacco use has been identified as a key preventable morbidity, and culturally meaningful tobacco cessation programs will be discussed.

LONG-TERM OUTCOMES OF HOME MODIFICATIONS FOR PERSONS AGING WITH A DISABILITY: A SURVEY

D. Pal, *March of Dimes Canada, Toronto, Ontario, Canada*

The Home and Vehicle Modification Program (HVMP) of the Ontario Ministry of Community and Social Services currently funds modifications to the homes and vehicles of eligible Ontarians to help them: continue living in their own homes, avoid job loss, and participate in their communities. (Ministry of Community and Social Services, 2015).

The program is administered by March of Dimes Canada, which in 2014 conducted a survey of consumers of the program to determine whether the homes whose modifications the program has subsidized are still occupied by the recipient of the subsidy, and to assess consumers' opinions of the effectiveness of the modifications of their homes.

495 consumers or their designates were surveyed by telephone, by mail, or online to evaluate the long-term benefits of home modifications funded under the program. They were sampled from consumers who had received funding between 2007 and 2010.

Results showed that 75% were still living in their modified home and the most frequent unexpected benefits were greater independence, improved personal care, improved mobility indoors, and improved quality of life. Median cost of modifications per day of use was less than \$8. In 2008 the cost for a long-term care home placement was approximately \$135 a day -- since 2013, the costs have increased to \$158.36 a day.

"WE TAKE CARE OF OUR ELDERLY ON OUR OWN": OBSERVATIONS ON AN AMIS COMMUNITY SENIOR CENTER IN TAIWAN

H. Cheng¹, S. Lo², S.Y. Chen³, 1. *Anthropology, National Taiwan University, Taipei, Taiwan*, 2. *National Taiwan University, Taipei, Taiwan*, 3. *National Chung-Cheng University, Taipei, Taiwan*

Faced with population aging in Taiwanese society, the government has promulgated the "Long-term Care Services Act" as the principal legal basis for developing a comprehensive long-term care system for improving the quality of life of the elderly. Resources, however, are distributed unevenly between urban and rural areas. To compensate for this, scholars have recently introduced the concept of

"Culture Care", and called on locals to build up their own care network through cultural knowledge that integrates interpersonal relationships and the social resource of the community. This study was conducted from January 23rd to 31st in 2016, under the course "Field Methods of Cultural Anthropology (with Practices)," with assistance of the professor in arranging research area and connecting informants. The study describes how the concept of culture care works in a Taiwanese indigenous community's senior center through participant observation and in-depth interviews. By understanding how the project was initiated, the organization of members, member interaction and local viewpoints on care of the elderly, it is found that clan-based caring boundaries, member interaction following the pattern of the Amis *finawlan* (age-set organization), curriculums focusing on member empowerment, and concerns of cultural heritage make the center not only a caring organization but also a social support network. In addition, the center enables every generation to take part in caring for the elderly and strengthens their social identity at the same time.

RURAL SYSTEMS CHANGE COLLABORATIONS TO IMPROVE COORDINATION OF SERVICES SUPPORTING AGING IN PLACE

D. Wihry¹, L.W. Kaye¹, J. Crittenden¹, M. Callaway², D. Walsh³, 1. *Center on Aging, University of Maine, Bangor, Maine*, 2. *Charlotte White Center, Dover-Foxcroft, Maine*, 3. *Eastern Area Agency on Aging, Bangor, Maine*

In rural and resource-poor regions, strategies to support aging-in-place focusing efforts on improving coordination of existing services represent a low cost strategy for improving older adult health and wellbeing. This poster presents findings from an ongoing evaluation of a multi-site systems change collaboration to improve service coordination in two rural US counties. Pilot interventions targeting community needs such as transportation or home-based services are paired with meetings of providers to improve service integration and build understanding of the spectrum of community resources available. Needs assessment findings indicate that among adults 65+ surveyed in the region (N=280), the most prevalent challenges for aging-in-place included getting household repairs (30%), understanding government benefits (21.5%), isolation (18.9%), falls (18.7%), and help with homemaking activities (18.2%). Among partners (N=15) involved in one of these collaborations, a limited history of cooperation in the community was rated as the most significant challenge to collaboration (Mean = 3.2) of the 20 factors measured by the Wilder Collaborative Factors Inventory. The project evaluation utilizes a mixed method approach to measure collaborative functioning through the Wilder instrument and uncovers systems changes through the Ripple Effects Mapping (REM) qualitative method. Early REM results indicate successes in increasing knowledge of the spectrum of services in the targeted regions among partners and supporting interactions between sectors that have normally not worked together. Findings also highlight the need for a dual approach educating consumers and providers about the range of available resources. Barriers to systems change will also be examined.

A LONGITUDINAL STUDY AT AN ELDER COHOUSING COMMUNITY: AFTER 10 YEARS, WHO LEFT AND WHO'S LEFT?

A.P. Glass, *Gerontology, University of North Carolina Wilmington, Wilmington, North Carolina*

Long common in Europe, the first senior cohousing communities opened in the USA in the last decade. These communities are run by the residents themselves and offer the potential for mutual peer support and a strong sense of community. A longitudinal mixed methods study has been conducted by annual data collection at one such community since it opened in 2006. One outcome explored is retention, which is important to sustainability and future-proofing. The cohousing community is comprised of both owned units and income-subsidized apartments, with 31 units in total. Of the original 39 first “charter” residents, 38 were white, 8 were male, and the mean age at move-in was 70.4 (range=63–84). Thirteen (33%) of these charter residents were still living in the community in 2016: 11 were females, all were white, with a mean age of 79.5 (range=73–94). Reasons why they have stayed included friends, the location, liking the community and the mutual support, and pride in their creation of a new model of housing for older adults. Six (15%) charter residents died locally. The remainder (projected mean age in 2016=79.7, range=73–88) moved due to health issues and the need for greater care, to be near family, because of the income-subsidized housing regulations, or because they found that living “in community” was not a good fit for them or was too much work. Lessons learned about sustainability and the value of cohousing for older adults will be shared and suggestions for similar housing models will be discussed.

DESIGNING AGE-INTEGRATED COMMUNITIES: LESSONS FROM A NATURALLY OCCURRING RETIREMENT COMMUNITY

D.A. Fitzsimmons¹, M. Klocek¹, S. Kuhn², 1. *Western University, London, Ontario, Canada*, 2. *University of Cambridge, Cambridge, United Kingdom*

Urban environments are an essential determinant of health and quality of life for older adults. Architecture cannot force people to participate in society, or create community cohesion; it does, however, have the potential to lay the foundation of social infrastructure necessary to encourage and support social relations. This in turn has the potential to influence behavior in a positive way. The purpose of this study was to learn from a highly successful naturally occurring retirement community (NORC) the different design characteristics of the built environment that make this such a desirable place to live. This study employed a hermeneutic phenomenological methodology to explore, describe and interpret the lived experiences of 12 independent, interdependent and dependent residents living in the Cherryhill NORC in London, Ontario, Canada. Participants identified the criteria that attracted them to this NORC initially and encouraged them to remain within the community. Participants also identified a number of elements within their apartment buildings, the transitional threshold areas, and external spaces that would further enhance their experience of living within this NORC. Issues included airflow, temperature control, exposure, balcony design, pet ownership, accessibility, community transportation, amenities and more.

Many design and planning guidelines for age-friendly communities describe elements that improve safety, mobility and access. This study revealed that ‘social opportunity’ spaces play a key role in the life of older individuals and provides further evidence of how seniors within this NORC leverage social capital to provide an invaluable support network for each other.

COMMUNITY-BASED SERVICES AND RESOURCES IN A RESIDENTIAL SETTING: LOCATION MATTERS

K.G. Emerson, T. Washington, M. Smith, A. Carswell, H.H. Ewen, *University of Georgia, Athens, Georgia*

One key component to facilitate an older adult’s ability to remain in the community is provision of formal services in their residence. However, service-accessible housing options are often limited to those with financial means, and many older adults remain in housing that is considered “service-poor.” The study examines the disparity of services availability by types of residence. Using cross-sectional data from Wave 2 of the Pathways to Life Quality dataset, we examined the sociodemographic characteristics, health status, and social support by residence for adults aged 50 and older. Data were categorized by elders living in their own home in the community (N=347), independent elders living in service-rich housing (Continuing Care Retirement Community residents; N=188) and elders living in service-poor housing (government subsidized housing; N=137). Data were analyzed across groups using ANOVA. The sample was a majority female, with an average age of 76 (range 50–101). Older adults living in the service poor residences had lower socioeconomic resources (lower education levels, less income; p-values<.000), worse health (higher functional limitations, more chronic conditions; p-values<.000), and less social resources (less social integration, less social support, lower marriage rates; p-values<.000) compared to those in service-rich residences or living in the community. These data suggest that elders living in service-poor areas are not only vulnerable due to lower service availability, but also have high social, economic, and health vulnerability. It is particularly important to identify groups that are most vulnerable in order to target interventions efficiently. Recommendations for policy and practice will be discussed.

PLACE ATTACHMENT AND PLACE IDENTITY AMONG OLDER ITALIAN MIGRANTS IN NEWCASTLE UPON TYNE

S. Palladino, *Newcastle University, Newcastle upon Tyne, United Kingdom*

This paper aims to gain a critical understanding of affective bonds established with and through places in later life, from the perspective of members of a migrant population. Whilst place attachment in older age has been investigated from a wide range of scholarly angles, the ways in which it might be experienced by people who are ageing away from their home countries is a neglected area of research. Older migrants’ processes of identification and belonging to specific places contributes significantly to active ageing and wellbeing in later life. In order to better understand this, I focus on how older Italian migrants in Newcastle upon Tyne, UK, interpret a sense of attachment and identification with significant places. This paper explores their experiences

of private and public places and the meanings they attribute to them. I build from ethnographic research on the ways in which private and public spheres are physical but also operate on social and symbolic levels (Wiles, 2011). Drawing on the social gerontology literature (Rowles 1978; 2003; Peace, 2005). I explore how individual make sense of the role of the home - and its embodied practices- plays in sustaining a sense of identity for themselves and others. This reflection offers a broader perspective on the migration status, of both appropriation and expropriation even many years after the process of migration (Basu and Coleman, 2008). Home, the experiences and meanings associated with it, need to be addressed as an expressive site to understand the perspective of a migrant population.

FACTORS INFLUENCING HUMAN-PET INTERACTION AMONG OLDER ADULTS

C. Hoffman¹, A. Glicksman¹, M.H. Kleban², K. Clark¹,
1. *Philadelphia Corporation for Aging, Philadelphia, Pennsylvania*, 2. *Abramson Center for Jewish Life, North Wales, Pennsylvania*

As more attention is paid to the role of pets in the lives of older adults, we need to better understand who is more likely to have a pet at home. Studies that recruit pet owners do not allow us to estimate either the proportion of older adults with a pet, identify the socio-demographic characteristics of persons more likely to own a pet, or whether different characteristics are more strongly associated with ownership of a particular type of pet. The 2012 Public Health Management Corporation's Household Health Survey asked a representative sample of older adults in Philadelphia and the four surrounding counties about pet ownership. Of the 3,042 persons age 60+ interviewed, almost 40% had a pet in their home. Our analyses compared persons 1) with no pet (n = 1,864) to 2) persons with a dog only (n = 406) and 3) persons with a cat only (n = 476). We found statistically significant differences in regard to sex, age, size of the household, income, renting or owning their home and whether the older adult had experienced depressive symptoms in the previous week. Interestingly there were no differences on measures of self-rated health, frequency of social interaction, or feelings regarding neighbors. Our findings suggest that research on the human-pet interaction in old age needs to consider several contextual issues (including the type of pet and the composition of the household) to better understand the impact of pet ownership on health and other outcomes for older adults.

FROM UNDERSTANDING OUR AGEING BODIES TO SAFETY IN AGEING IN PLACE

K. Lee³, Y. Lee¹, Y. Lee², S. Kwok², 1. *Hong Kong Design Institute, Hong Kong, Hong Kong*, 2. *Vocational Training Council, Hong Kong, Hong Kong*, 3. *Pro-Act Training and Development Centre, Hong Kong, Hong Kong*

This paper aims to discuss a cross-disciplinary collaborative project conducted by researchers from design and engineering. The project adopted the Action Research (AR) Methodology which intended to involve active senior citizens throughout the research process. The collaboration kick-started by the Ageing Bodies Study with the goal to develop the 1st Hong Kong ageing population profile including an ergonomic database animated by visual records of

people's everyday behaviors. This part was led by a group of design researchers working with design students to develop innovative ways to engage senior citizens. Through participating interactive activities, senior citizens were invited to co-investigate their bodies and lifestyle changes in the city. Additionally, ethnographic study including interviews at their homes was conducted to further inspect issues associated with independent living in their confined spaces in typical social housing projects in Hong Kong. Using the ergonomic and ethnographic results of the Ageing Bodies Study, engineering researcher took the led to develop a series of low-cost devices for confined bathroom to prevent accidents and improve safety at home. All the solutions were prototyped with local manufacturers and sent back to people's homes for testing and develop creative conversations on issues regarding their "Ageing In Place". This people-centered process documented a cohesion creation might form a good platform in rapid ageing society to bring both researchers, communities and developers together to address wicked problems of ageing for our future.

STATE OF COLLABORATION BETWEEN SELF-HELP AND PROFESSIONAL SERVICE NECESSARY FOR AGING IN COMMUNITY

M. Kinukawa, T. Inoue, T. Hashimoto, *Research Dept., Institution of Elderly Housing Sciences, Kyoto, Kita-ku, Japan*

Due to the necessity to cut down social security expenses in many aging societies,

frail older adults are directed to enhance self-help in their home-based lives. The development of self-help or mutual help has been also focused to substitute professional services. At the same time, difficulty to involve informal carers has been emerging due to the change in family relation, and the rapid increase of one-person households.

A new inclusive service to support home-based older adults has been launched in super-aged society, Tokyo. The users can select necessary services from a comprehensive care preparation consisted of meals, living assistance, nursing, condultation, social work, 24-hour regular home visitation, and as-needed visitation services. This initiative takes families and informal carers as effective environmental factors in supporting the users to involve their spontaneous participation in providing services.

Service records of 30 users of the service for one year were analyzed to capture the emergence of self-help. This study aimed to clarify how self-help could function and collaborate with professional supports.

Many of the users used the service under family supervision. Family living nearby modified and adjusted the service according to the changes of the users' needs especially on occasion of bad health condition, and also played an intermediate role between doctors/nurses and care professionals. Distant families or families with jobs received information from care staff. Based on the information, they advised the staff for future support.

The results indicate systemizing effective communication between self-help and care professionals needs to be considered in aging societies, and, in case raising self-help is difficult, professional staff needs to carry out thorough

information gathering, or an intermediate position between an older adult and care staff need to be prepared.

SESSION 775 (POSTER)

BIO-BEHAVIORAL RISK FACTORS OF HEALTH

USE, INTENTION TO USE, AND PERCEPTIONS OF RISK ACROSS TOBACCO PRODUCTS AMONG OLDER SMOKERS

J.K. Cataldo, J. Wang, K. Delucchi, C. Dankiewicz,
Physiological Nursing, UCSF, San Francisco, California

Recently there was an eight-fold increase for e-cigarette use among older smokers with nearly a 20-fold increase among former smokers. The purposes of this national survey study were to explore the perceptions of benefits and risks of tobacco product use among older current and former smokers. The sample (N=549) had a mean age of 56.9 (SD= 7.3) and included 92% current smokers, 56% females and 83% Non-Hispanic Caucasians. Dual use for e-cigarettes with cigarettes at 30 and 7-days was (24.3 and 16.6 %, respectively). When asked about the risk of harm on a 0–5 scale across products (cigarettes, cigars, e-cigarettes, and dip/chew), from least to greatest for self, others, and environment; cigarettes and cigars were seen as most harmful (4.3 and 4.1) and e-cigarettes as least harmful (2.5). For the risk of addiction across products, cigarettes had the highest mean score across three addiction measures: overall rating of addiction (4.6), ever tried to quit and couldn't (3.8), and felt addicted to the product (3.7). Among those who had never tried e-cigarettes, almost 12% said they were likely to try a flavored e-cigarette with nicotine for the first time in the next six months and among current smokers when asked about their next cessation attempt, over 50% thought they would try/use e-cigarettes. These findings suggest that older smokers perceive e-cigarettes as least harmful of all tobacco products and are increasingly using e-cigarettes to circumvent no smoking policies and for cessation attempts that are largely unsuccessful.

HEALTH AND RELIGIOUS CHANGE IN LATER LIFE

M. Silverstein², V.L. Bengtson¹, 1. *Roybal Institute on Aging, University of Southern California, Santa Barbara, California*, 2. *Syracuse University, Syracuse, New York*

Recent research has demonstrated a positive relationship between religion and health in later life. However, no research to date has examined how changes in religiosity, shifts upward or downward in spiritual or religious life, might have an impact on physical or emotional health. In this research we examine trajectories of later life religiosity and their relation to health in a mixed-methods longitudinal study based on the 45-year Longitudinal Study of Generations. The survey data were collected from some 400 individuals now 60–90 between 1971 and 2016. Qualitative data come from 100 interviews collected in 2016. Results indicate that most individuals who are religious report they have increased their religious or spiritual involvement since retiring; for those who are not religious a similar increase in spiritual and contemplative activities is reported. The quantitative data provide limited support for the linkage between increased religiosity and health or well-being.

REEXAMINING THE EFFECTS OF RESIDENTIAL MOBILITY ON WELL-BEING IN NULLPARENT WOMEN. FINDINGS FROM THE DUTCH NUN STUDY

E. Stitzinger, *VU University, Amsterdam, Netherlands*

In the 1980's The Nun Study by David Snowdon showed us new insights on the influence of ageing, lifestyle and Alzheimers. However, since then we have been struggling to find the significance of lifestyle versus biological factors and healthy ageing of the brain. In an effort to find new answers Dutch Nun Study included 200 Dutch Nuns living in Netherlands between 70 and 104 years of age and studied the relationship between biological factors, ageing and lifestyle. A better understanding of the interactions between genetics, individuality of functionality of neurons and lifestyle may change our view on the role and importance of cognitive functioning and help prevent cognitive decline in late life. Lifestyles of Contemplative, Active and Missionary Nuns were included. Findings are presented.

SOCIOECONOMIC ADVERSITY AND ALLOSTATIC LOAD: A TWIN ANALYSIS

J.K. Robinette¹, C. Beam¹, T.L. Gruenewald², 1. *Leonard Davis School of Gerontology, University of Southern California, Long Beach, California*, 2. *California State University, Long Beach, Long Beach, California*

Childhood socioeconomic status (SES) is related to health concurrently and into adulthood, and is associated with adulthood SES. Given these far-reaching relationships, some question whether adulthood SES associates with health beyond childhood SES. Biometric twin (ACE) models partition the predictor variables into additive genetic (A), shared environmental (C), and nonshared (unique) environmental (E) variance components. Researchers can control for latent genetic and shared environmental factors that may confound conclusions about the causal effects of adulthood SES on health. We used family data from the second wave of the national Midlife in the United States (MIDUS) Study (128 MZ pairs, 99 DZ pairs, 119 Sibling pairs) to examine this question. Health was assessed with a measure of multi-system physiological dysregulation posited to confer risk for the development of physical health problems. Adult SES was calculated with education, family-adjusted poverty to income ratio, current financial situation, enough money to meet needs, and difficulty paying bills. Results of ACE models suggested that male twins with lower adult SES had higher allostatic load, indicating greater physiological risk, than their co-twins with higher SES ($b = 0.19$), adjusting for genetic and shared environmental correlations between allostatic load and SES, and observed childhood SES, health status, and perceived support from family and friends. This relationship was not observed among female twins. These results add to a growing literature indicating that lower adult SES is associated with poorer multi-system physiological health, even after accounting for shared genetic and early environmental influences.

SOCIO-ECONOMIC DIFFERENCES IN THE SPEED OF HEART RATE RECOVERY FOLLOWING ORTHOSTATIC CHALLENGE

C. McCrory¹, P.V. Moore¹, L.F. Berkman², R. Kenny¹, 1. *Department of Medical Gerontology, Trinity College*

Dublin, Dublin, Ireland, 2. Harvard University, Boston, Massachusetts

Much recent work has focused on the prognostic value of heart rate recovery (HRR) as a risk factor for cardiovascular disease and cardiovascular mortality. This paper explores socio-economic variation in HRR following exposure to a potent physiological stressor. The sample involves a nationally representative cohort of 4475 community-dwelling older persons aged 50 years+ participating in the Irish Longitudinal Study on Ageing (TILDA). Participants completed an active stand (i.e. vertical stand from a supine position) as part of a clinic-based cardiovascular health assessment and heart rate and blood pressure responses to the stand were monitored over a two-minute time horizon using a finometer. Highest level of educational achievement served as our measure of socio-economic status. Mediation analysis was undertaken to explore the pathways through which social inequality comes to affect the speed of HRR using the extensive array of covariates available in the TILDA dataset. Participants with a primary level education were characterised by a significantly slower HRR following the stand compared with those with tertiary level education ($B = -1.16$ bpm, $CI_{95\%} = -1.78, -0.55$; $p < 0.001$). Mediation analysis revealed that lifetime smoking history accounted for a sizeable proportion (~50%) of the educational differential. Additional adjustment for other objectively measured markers of lifestyle measured during the clinic-visit rendered the educational differential non-significant.

INTENT TO AVOID FAT FOOD CONSUMPTION AND PERCEIVED STRESS IN MIDLIFE AND OLDER AFRICAN AMERICANS

E. Iheanacho-Dike¹, P.A. Ralston¹, I. Young-Clark¹, C.C. Coccia², 1. *Center on Better Health and Life for Underserved Populations, Florida State University, Tallahassee, Florida*, 2. *Florida International University, Miami, Florida*

Cardiovascular disease (CVD) is the leading cause of death for African Americans (AAs) in the USA, with diet and perceived stress identified as two key factors. Fat consumption has been identified as a key contributor to poor dietary health in AAs and stress may lead to increased fat consumption. However, few studies have examined the extent to which perceived stress and intent to avoid high fat consumption are related to fat consumption in mid-life and older AAs. Thus, the purpose of this study was to examine the relationship between intent to avoid high fat food consumption (intention to change fat behaviors, consistency of avoiding high fat foods), fat consumption (NCI Fat Screener) and perceived stress (Cohen's Perceived Stress Scale). Guided by the planned behavior and social cognitive theories, this study uses baseline data from a broader longitudinal church-based project to reduce CVD risk conducted with mid-life and older AAs ($n=221$) in six churches across a two county area of North Florida, USA. Age, gender, educational level and marital status were controlled in the analysis. Preliminary results showed perceived stress had an inverse relationship with consistency of avoiding high fat foods ($p < .01$). In addition, consistency of avoiding high fat foods was negatively related to general fat consumption ($p < .01$). Findings suggest participants with higher stress have less ability to consistently

avoid fat, and participants with higher ability to consistently avoid consuming high fat foods had lower reports of general fat consumption in their diets. Implications for practice will be discussed.

HEALTHFUL DIET PATTERNS ARE POSITIVELY ASSOCIATED WITH LEUKOCYTE TELOMERE LENGTH IN HEALTHY ADULTS

C. Leung, E. Epel, *Center for Health and Community, University of California, San Francisco, San Francisco, California*

Studies examining associations with healthful diet patterns and leukocyte telomere length (LTL) have been inconclusive. Using data from the 1999–2002 National Health and Nutrition Examination Surveys (NHANES), we examined four evidence-based measures of healthful dietary patterns in relation to LTL – the Healthy Eating Index-2010, the Alternate Healthy Eating Index-2010, Dietary Approaches to Stop Hypertension (DASH) Index, and the Alternate Mediterranean Diet Index. The NHANES study population included 4,758 US adults, aged 20 to 65 years, with no prior history of coronary heart disease, diabetes, stroke, or cancer. LTL was assayed from DNA specimens. Dietary patterns were estimated from 24-hour dietary recall data – for each pattern, a higher score signified better diet quality. Associations were examined using multivariate linear regression models, adjusting for sociodemographic characteristics, health behaviors, and total energy intake. Pearson correlation coefficients between the four dietary patterns ranged from 0.609 to 0.730. One-standard-deviation increases in the Healthy Eating Index-2010 ($B=0.015$, 95% CI 0.003, 0.028) and the DASH index ($B=0.016$, 95% CI 0.003, 0.029) were both associated with longer LTL. A marginally significant association was also observed with the Alternate Healthy Eating Index-2010 ($B=0.009$, 95% CI -0.000, 0.018). Further adjustment for body mass index and waist circumference did not alter these associations. The Alternate Mediterranean Diet Index was not associated with LTL ($B=0.002$, 95% CI -0.009, 0.013). In this nationally representative sample of US adults, several healthful diet patterns were associated with longer LTL. These results may provide insight on the complex associations between optimal nutrition and longevity.

HEALTH BEHAVIOR PROFILES OF KOREAN BABY BOOMERS: EFFECTS OF PERCEIVED HEALTH CONCERNS AND MASTERY

B. Kim¹, K. Kim¹, G. Han², 1. *University of Massachusetts Boston, Boston, Massachusetts*, 2. *Seoul National University, Seoul, Korea (the Republic of)*

Health behaviors including health-risk and preventive behaviors are closely linked to various health outcomes and longevity. This study aimed to identify distinct profiles of health behaviors among Korean Baby Boomers (born between 1955 and 1963) and examine factors (e.g., demographic characteristics, perceived health and illness, and mastery) distinguishing health behavior profiles. We analyzed a sample of 4,053 respondents from the *Korean Baby Boomer Panel Study* in 2014. Latent class analysis was applied to six health-risk (smoking, drinking) and preventive (exercise, health check-up, and supplement and herbal medicine intake) behaviors to classify profiles. We identified

five different combinations of health-risk and preventive behaviors: a) moderate risk and low preventive (34%), b) low risk and high preventive (22%), c) high risk and high preventive (16%), d) moderate risk and moderate preventive (14%), and e) high risk and low preventive (13%). Multinomial regression analyses for the pattern membership indicated that respondents who reported higher levels of health concerns were more likely to belong to the high risk and high preventive pattern, compared to the moderate risk and moderate preventive pattern. Also, respondents with a stronger sense of mastery were less likely to be in the low risk and high preventive pattern. Our findings suggest that different levels of health concerns and sense of mastery are reported by individuals who engaged in certain patterns of health behaviors among Korean Baby Boomers, which may highlight the potential importance of examining different types of health behaviors as patterns.

HEALTHY LIFESTYLE HABITS AND HEALTH-RELATED QUALITY OF LIFE AMONG OLDER ADULTS WITH DIABETES

W. Qin, A.L. Townsend, *Case Western Reserve University, Cleveland, Ohio*

Health-related quality of life (HRQOL) is impaired among people with diabetes. This study aims to examine the relationship between having at least one healthy lifestyle habit (no smoking, physical exercise, or both) and HRQOL among older adults with diabetes.

Adults age 65 or older with diabetes were selected from the 2014 Behavioral Risk Factor Surveillance System. HRQOL measures are general health (excellent, very good, or good = 1) and less than 14 days physical health not good, mental health not good, and impaired activity. Healthy lifestyle habits included not smoking and engaging in physical activity in past 30 days. Covariates were age, gender, race, education and body mass index. Binary logistic regression is employed to examine the relationship between having at least one healthy lifestyle habit and HRQOL.

In total 30,917 participants age 65 or older with diabetes were selected for this study. Just over half (56.2%) were female (n=17,373), 71.4% were non-smokers and 60.1% had physical exercise during past 30 days (n=18,578). Having at least one healthy lifestyle habit is associated with significantly better general health (odds ratio=2.78, $p<0.001$), less than 14 days physical health not good (odds ratio=2.68, $p<0.001$), less than 14 days mental health not good (odds ratio=2.11, $p<0.001$) and less than 14 days impaired activity (odds ratio = 2.95, $p<0.001$).

Overall, study findings imply that to help older adults with diabetes have better health and reduce impaired activities, prevention could encourage them not to smoke and to engage in more physical activity.

DRINK WISE AGE WELL: A UK-WIDE MULTILEVEL PROGRAMME TO REDUCE ALCOHOL-RELATED HARM IN OLDER ADULTS

S. Wadd¹, J. Breslin³, G. McDougall, L. Elliott⁴, I. Madoc-Jones⁵, A. Whittaker⁶, M. Donnelly⁷, 1. *University of Bedfordshire, Luton, Bedfordshire, United Kingdom*, 3. *Addaction, Glasgow, United Kingdom*, 4. *Glasgow Caledonian University, Glasgow, United Kingdom*, 5.

Glyndwr University, Wrexham, United Kingdom, 6. *Edinburgh Napier University, Edinburgh, United Kingdom*, 7. *Queen's University Belfast, Belfast, United Kingdom*

Alcohol use can have a detrimental impact on health, physical and mental functioning, social wellbeing and quality of life in older adults. The World Health Organisation has identified alcohol-related harm among older adults as an increasing concern. With funding from the National Lottery, a five-year multilevel programme to reduce alcohol-related harm in older adults (50+) is being implemented and evaluated across the UK. The programme, known as Drink Wise Age Well, is being delivered in five "demonstration areas" in England, Wales, Scotland and Northern Ireland. The programme is evidence-based and designed specifically for older adults. Activities include delivering community-level public awareness campaigns, providing a telephone helpline, a peer education project, a group resilience intervention, a programme of diversionary activities, alcohol training for professionals working in older adults' services and a range of age-appropriate interventions for those with existing alcohol problems. Importantly, the programme is also engaging with national and local policy makers to increase the profile of the issue and ensure that the needs of older adults are considered and highlighted in relevant strategy. Early findings suggest that the programme is reducing at-risk drinking, decreasing symptoms of depression and anxiety, increasing resilience, raising awareness of the issue, increasing professional capacity and improving positioning of the issue on the policy agenda. Multilevel programmes such as Drink Wise, Age Well could be key to reducing alcohol-related harm in ageing populations worldwide.

SIXTY AND SEXY: FACTORS INFLUENCING HIV RISK-TAKING BEHAVIORS AMONG OLDER AFRICAN-AMERICAN WOMEN

J.T. Richardson, M.A. Pyles, *Kinesiology and Health Sciences, Virginia Commonwealth University, Richmond, Virginia*

Despite myths and stereotypes, many older women are sexually active. Among older African American women, rates are increasing for newly-diagnosed HIV infection, for those living with HIV and for HIV/AIDS-related mortality. While African American women represent only 14% of the U.S. female population, they account for nearly two-thirds of all new HIV infections in women and for over half with AIDS. Although many health promotion/disease prevention (HP/DP) efforts are directed toward HIV risk-reduction for younger African-American women, less notice is directed toward their sexually active, older counterparts. Yet, the primary mode of transmission for both is high risk heterosexual exposure. Does a one-size-fits-all prevention approach work for all African American women? Or, is it necessary to customize interventions for older African-American women because of unique factors influencing their risky sexual behaviors? This inquiry explored whether early gender socialization and the establishment of gender norms and roles in a very different social era impact their current risk-taking sexual behaviors. Surveys and focus groups were used to elicit values, beliefs, attitudes, gender role expectations and knowledge in relationship to high risk sexual behaviors. The results highlighted the need to tailor HIV prevention interventions that

are socially- and culturally-relevant and appropriate for the priority population of older African American women. The resulting intervention design takes into account overcoming long-held gender roles/norms and positively impacts their knowledge, attitudes and behaviors that in turn empowers them to protect their health, practice healthy sexual behaviors and to improve their overall quality of life.

PROTECTIVE FACTORS IN VULNERABLE, RURAL OLDER ADULTS: LINKS WITH SALIVARY MARKERS OF INFLAMMATION

N.E. Schoenberg, R.L. Brown, A. Hansen, S. Bi, P. Keller, *Behavioral Science, University of Kentucky, Lexington, Kentucky*

Numerous social determinants-- individual, interpersonal, community, policy- converge to increase stress among older rural adults. This stress, which can manifest itself physically in potentially harmful inflammatory response, frequently erodes health and undermines social relations. Yet, over the life course, individuals tend to become more effective at identifying efficacious coping strategies. To improve our understanding of how this vulnerable population copes with stress, we conducted semi-structured and structured interviews with 21 rural residents, aged 65+ about physical and mental health, stress, and protective factors, including social support, religiosity, and exercise. Additionally, we collected saliva samples which were assayed for markers (pro-inflammatory molecules C reactive protein (CRP), tumor necrosis factor alpha (TNF α), and interleukin-6 (IL-6) of stress and inflammation. This sample was 65.6% female and comprised predominantly lower class families: 50% indicated they struggled to make ends meet and maintained numerous physical health problems: 53.1% reported at least one chronic disease, including heart disease, diabetes, high blood pressure, high blood cholesterol and etc. Of the three focal protective factors, only social support was significantly associated with lower levels of salivary inflammation markers. However, both exercise and religiosity demonstrated non-significant associations with inflammatory parameters that were in the predicted direction and may emerge as significant with additional participants. In addition, all three protective factors were significantly related to lower self-reported stress. Religiosity was most consistently associated with lower risk for health problems. Drawing on these protective strategies may be helpful for designing future interventions and policy for this and other vulnerable populations.

ASSOCIATIONS OF BIOBEHAVIORAL FACTORS AND SELF-RATED HEALTH IN BLACK MEN: NHANES 2009–2010

L.T. Lee¹, P. Bowen¹, G. McCaskill², O.J. Clay³, 1. *Acute, Chronic and Continuing Care, The University of Alabama at Birmingham, Birmingham, Alabama*, 2. *Birmingham/Atlanta Geriatric Research, Education, and Clinical Center, Birmingham, Alabama*, 3. *Department of Psychology, The University of Alabama at Birmingham, Birmingham, Alabama*

Background: Self-rated health is a strong predictor of health outcomes including mortality in the general population. Men with low self-rated health, living with diabetes or psychological distress have an increased risk of mortality

compared to women. Few studies have examined the relationship between physical activity and self-rated health within older African American men. The purpose of this study was to assess the relationships of diabetes, depression, and physical activity with self-rated health.

Methods: Investigators used 2009–2010 National Health and Nutrition Examination Survey data and participants were African American men age 45 years or older. They completed survey measures of demographic and socioeconomic factors, physical activity engagement, mental and physical health, and perceived health status. Covariate-adjusted multiple linear regression was used to assess whether diabetes, depressive symptoms, and physical activity were independently associated with self-rated health.

Results: The mean age of the analytic sample of 270 African American men was 60.17 \pm 9.36 years. Thirty percent (n=81) had poor or fair self-rated health and 27% had diabetes. Results revealed that fewer days of vigorous recreational activities, reporting high levels of depressive symptoms, and having diabetes were each individually associated with lower levels of self-rated health, p's < .05.

Conclusion: Findings from this investigation identified subsets of African American men who are at-risk for low levels of self-rated health. These results also suggest the potential importance of developing interventions that target diabetes and depression management as well as physical inactivity for this population in order to improve perceived health status.

SESSION 780 (POSTER)

CANCER AND AGING

A MULTI-MODAL INTERVENTION TO MANAGE PROSTATE CANCER SYMPTOMS

D.M. Kresevic^{1,2}, A. Zhang³, 1. *Louis Stokes Cleveland VA Medical Center, Cleveland, Ohio*, 2. *University Hospitals Of Cleveland, Cleveland, Ohio*, 3. *Case Western Reserve University, Cleveland, Ohio*

There are nearly 3 million prostate cancer survivors in the U.S., with many reporting urinary incontinence UI and decreased quality of life QOL. While post treatment recommendation include referral for Pelvic Floor Muscle PFM rehabilitation including Kegel exercises, timed voiding and medications it does not appear that this recommendation is consistently being done and evaluated. (ACS, 2015). In this study 279 eligible participants who consented were randomized to 1) a biofeedback and peer support group, (2) biofeedback group and individual phone calls and 3) usual care which included printed instructions. Biofeedback included a 60 minute session on pelvic exercises. Support groups and telephone groups included 6 biweekly sessions led by either a psychologist or nurse using a problem-solving approach to address urinary symptoms. Measures included: a urinary diary to track frequency of urine leakage, the University of California Prostate Cancer QOL Index, a visual analogue scale to measure severity of UI and SF-36V2 to measure overall physical well-being. Mean age was 64.8 years, 63.6% where white, 25.5% were high school graduates, 64.9% were married, 30.5% employed, 67.6% had stage II cancer, 56.1% were treated with surgery, 50% with radiation

therapy. The biofeedback plus support and plus telephone groups reported less symptom severity ($p \leq 0.001$) and fewer incontinence problems ($p \leq 0.01$) than the usual care group at 6 months. Study findings show that PFM exercise practice plus peer and individual problem solving support can significantly improve urinary continence and quality of life in patients following prostate cancer treatment.

PREDICTORS OF ADJUSTMENT TO AGING AMONG OLDER WOMEN IN BREAST CANCER REMISSION

S. Vonhumboldt, I. Leal, F. Carneiro, *Instituto Superior de Psicologia Aplicada (ISPA), Almada, Portugal*

Objectives: To build a structural model to explore the predictors of adjustment to aging (AtA) reported by older women in breast cancer remission.

Methods: 214 older women in breast cancer remission participated in this study. A questionnaire to determine socio-demographic (age, income, professional and marital status, education, household, living setting and self-reported spirituality), lifestyle and health-related characteristics (physical activity, leisure, perceived health, recent disease and medication), and measures to assess AtA, sense of coherence and subjective well-being, were employed. Structural equation modeling was used to explore a structural model of the self-reported AtA, encompassing all variables.

Results: Preliminary results indicated that self-reported spirituality ($\beta = .397$; $p < .001$), leisure ($\beta = .383$; $p < .001$), physical activity ($\beta = .267$; $p < .001$), perceived health ($\beta = .211$; $p < .001$), marital status ($\beta = .173$; $p < .001$), professional status ($\beta = .156$; $p = .009$), sense of coherence ($\beta = .138$; $p < .001$), and living setting ($\beta = .129$; $p = .007$), predicted AtA. The variables accounted for 79.2% of the variability of AtA.

Conclusion: Self-reported spirituality and leisure were the strongest predictors of AtA. Our preliminary findings suggest that health care interventions with older women in breast cancer remission still living in the community may benefit from clearly including predictors of AtA, as these are essential for promoting older women's aging well.

INCIDENCE OF AND RISK FACTORS FOR FALLS IN CANCER PATIENTS RECEIVING CHEMOTHERAPY

R. Yang, K. Mooney, *University of Utah, Salt Lake City, Utah*

Falls are complex in nature, causing physical injuries and emotional trauma. Certain medications, muscle weakness of lower extremity and sensory loss are reported as significant risk factors for falls in the elderly population. Frequently most of these risk factors can exist in cancer patients receiving chemotherapy. However, few studies have explored falls and fall risk factors in this population. In this secondary analysis of a longitudinal study, 85 patients with breast, ovarian, or lung cancer receiving chemotherapy at risk for falling were closely monitored using a novel automated telephone system (SymptomCare@Home). Fall events, defined as actual falls and near falls were ascertained during about three months of follow-ups. The mean of 1.05 falls ($SD=2.09$) with a 35.3% fall rate and a 16.7% injury rate were reported. Gender ($t(5)=1.31$, $p=.25$), ethnicity ($t(76)=-.08$, $p=.93$), and comorbidity ($t(69)=.86$, $p=.39$) were not associated with the

number of falls. Among fallers ($n=30$, 35.3%), about one-third had their shoes on, one-fourth fell in a dark area, and most fell onto a flat floor and inside the house. About 17% of patients had their medication regimens changed due to falls and fall related injuries. The main precipitating reason for the falls were faintness, the sudden loss of balance, and tripping, indicating falls were often unanticipated, leaving patients no time to avoid the fall. These findings suggested that the overall rate of falls in cancer patients is similar to that of the elderly population. However, due to the small sample size, risk factors for falls need further study.

DAILY FATIGUE AND COGNITION AMONG BREAST CANCER SURVIVORS

S. Eisel¹, S.B. Scott², B.J. Small¹, J.A. Mogle³, H. Jim⁴, P. Jacobsen⁴, 1. *University of South Florida, Tampa, Florida*, 2. *Stony Brook University, Stony Brook, New York*, 3. *Pennsylvania State University, State College, Pennsylvania*, 4. *Moffitt Cancer Center, Tampa, Florida*

According to the World Health Organization over the next 20 years new cases of cancer will increase by 70%. Because of increased cancer risk with age and improved survival rates, individuals over age 65 make up 2/3 of cancer survivors. Memory and attention difficulties (e.g., 'chemo-brain') and fatigue are common quality of life concerns for survivors but little is known regarding prevalence of these problems in daily life. Breast cancer survivors ($n=38$, age: 40–64), 6–36 months post-chemotherapy, were recruited from a cancer center in the United States. Neuropsychological tests were administered during a lab visit. Participants carried study smartphones for 14 days; five times daily the phones prompted them to complete brief surveys and to play brain games. Each night, participants reported on that day's memory problems. Survivors completed 91% of smartphone cognitive tasks and 92% of daily memory failure surveys. Multilevel models were conducted to determine if survivors report more daily fatigue on days when memory failures were reported. Results indicated that differences between people accounted for 69% of the variation in daily fatigue. Contrary to predictions, survivors did not report more fatigue on days when memory failures were reported. However, survivors who reported more memory failures across the two weeks also reported higher levels of daily fatigue. In sum, ecological cognitive assessments can inform which and when survivors are affected and which domains are impacted, essential information for developing interventions targeted to survivors most impacted by decreased quality of life and situations in which they are most at-risk.

MEANING-MAKING COPING STRATEGIES AMONG JAPANESE OLDER ADULTS WITH CANCER

X. Yi¹, F. Ahmadi², H. Kase¹, 1. *Health Sciences and Welfare, Waseda University, Tokorozawa, Saitama, Japan*, 2. *University of Gavle, Gavle, Sweden*

With the rapid expansion of aging population in Japan, the number of older adults with cancer has been increasing too. For example, a research conducted in 2008 shows that by the age of 70 years old, 20% of male and 16% of female are likely to be afflicted by cancer. And by the age of 80 years old, 39% of male and 26% of female are at risk. Besides

medical treatment, people with cancer tend to choose different methods to cope with their current situation. In recent years, some studies have drawn their attention on the role of religiosity and spirituality in coping strategies of disease. One significant problem is that many studies in this field have neglected non-religious populations.

This presentation will discuss the meaning-making coping strategies among older adults with cancer in Japan and what impact culture has on the coping methods they choose. The presentation will also draw attention on which meaning-making strategies are chosen by cancer patients in a non-religious country like Japan, and to discuss whether meaning-making coping methods can be used in the treatment of cancer.

PSYCHOSOCIAL FACTORS THAT INFLUENCE MOTIVATION TO SCREEN FOR CANCER AMONG ADULT BLACK MALES

D. Atakere, T.A. Baker, *Psychology, University of Kansas, Lawrence, Kansas*

There are significant disparities in morbidity and mortality rates among minority populations in general and among Black males in particular. Cancer, for example, is the 2nd leading cause of death among Black males. Yet, there exists prevalence of imminent and aggressive stage of diagnosis among this gendered population. An individual's motivation to screen for cancer is influenced by knowledge of cancer prevalence and perceived likelihood of being diagnosed. While the relationships between health and masculinity, identity, and attachment have been reported, much less is known as to how these factors influence the decision to screen for cancer. This study aimed to determine the influence identified health and social factors have on cancer screening among Black men. Participants were surveyed on questions assessing cancer knowledge, belief about cancer diagnoses, masculinity, self-esteem, attachment style, ethnic identity, and additional social and health characteristics. Results from the multivariate model showed that education, ethnic identity, masculinity, and attachment were significant indicators of cancer screening. Cancer screenings among Black men are contingent upon a myriad of psychological, social, and behavioral factors that are not exclusive, but rather coexisting determinants of health. Focusing exclusively on Black men enhances our understanding of this adult population, and data from this study holds promise in informing health messages that may reduce deleterious health behaviors and outcomes among this marginalized population, by underscoring factors that may impact the health needs of diverse race and gendered populations.

DYADIC INTERDEPENDENCE ON DEPRESSION TRAJECTORIES AMONG OLDER ADULTS WITH CANCER AND CAREGIVERS

H. Yoon, K. Choi, *Hallym University, Chuncheon, Gangwon-do, Korea (the Republic of)*

This study explores dyadic interdependence on depression for older adults with cancer and their family caregivers.

Cancer takes an emotional toll on patients and their family caregivers. Family caregivers' distress levels are similar to patients with cancer. Based on actor-partner interdependence model and caregiver stress process model, integrated stress

process model was developed as a research framework. Depression as a stress outcome was measured by Korean version CES-D. Stressors for older adults include functional status, physical symptoms and side effects. Stressor for family caregivers is caregiving burden. Older adults' functional status, physical symptoms and side effects were measured by EORTC-QLQ-C30. Stress moderators include optimism, spirituality, and family support for both older adults and their family caregivers.

A total of 180 older adult with cancer and family caregiver dyads who participated in two wave surveys in 2013 and 2015 are used for this study. Paired t-test, repeated ANCOVA, AMOS, and Mplus were used to analyze the data.

The level of depression of older adults with cancer and their family caregivers was not significantly different between wave 1(T1) and wave 2(T2). However, the level of depression of older adults with cancer who were cared by their adult children were significantly higher than their spouses. And family caregivers' level of depression was influenced by the period of caregiving. When the period of caregiving was under sixteen months, the level of depression of family caregivers was significantly increased at Time 2.

Results showed significant actor effects for the depression of older adults with cancer and their family caregivers from Time 1 to Time 2, and also significant partner effects for the depression leading from older adults with cancer (Time 1) to their family caregivers (Time 2). Spirituality, optimism, and family support were significant mediating factors reducing actor and partner effects between older adults with cancer and their family caregivers.

Results revealed that spirituality of both older adults with cancer and their family caregivers was important variable on depression. Research on spiritual effects of cancer on patients and caregivers show that there are positive effects of cancer on patients and their caregivers. For the most part, findings indicate that cancer can be a transformational experience. Patients and family members reconsider their priorities and reflect on what is important in their lives. Patients and family caregivers who are able to find more meaning in the illness report better quality of life.

AGE-RELATED DIFFERENCES IN HEALTH-RELATED QUALITY OF LIFE IN CANCER SURVIVORS

S.S. Vang¹, S. Kang², A.C. Mui¹, 1. *Columbia University, New York, New York*, 2. *SUNY Binghamton, New York, New York*

The purpose of this study is to examine age-related differences in health-related quality of life (HRQOL) between younger (age 18–65) and older cancer survivors (age 65+). Data used for this study were drawn from the 2014 Behavioral Risk Factor Surveillance System, a cross-sectional, state-based, annual random-digit-dialed telephone survey of non-institutionalized adults. All respondents who had completed the core questionnaire and cancer survivorship module were included (n=5,656).

Demographic data show that 60% of participants were females and 40% were males. Approximately 55% were married and 45% were separated, divorced, widowed, or never married. 49% reported having a high school degree or lower. T-tests indicate that older cancer survivors had poorer physical HRQOL than younger cancer survivors; however,

they were more likely to fare better mentally. Multiple regression results suggest that cancer survivors who exercised and were married had significantly better HRQOL. Survivors with greater co-morbidities and those who had not completed treatment reported worse HRQOL. Findings indicate that physical activity and social support could help improve survivors' HRQOL. Special attention should be paid to survivors who have co-existing conditions and those who have not completed treatment.

FLOURISHING DESPITE A CANCER DIAGNOSIS: FINDINGS FROM A NATIONALLY REPRESENTATIVE STUDY

E.R. Fuller-Thomson, K. West, *Social Work, University of Toronto, Toronto, Ontario, Canada*

This study investigated the association between cancer and complete mental health (CMH). CMH has three elements: 1) absence of mental illness, addictions and suicidal thoughts in the past year; 2) almost daily happiness or life satisfaction in the past month; 3) psychosocial well-being. Control variables included socio-demographics, health behaviours, current physical health and lifetime history of mental illness and childhood maltreatment. The nationally representative 2012 Canadian Community Health Survey-Mental Health was analyzed. This study used bivariate and logistic regression analyses to estimate the odds ratios of CMH among community dwellers aged 50 and older with current cancer ($n=438$), previous cancer ($n=1,174$) and no cancer history ($n=9,279$). Our analyses suggested that adults aged 50 and over with current cancer had a much lower prevalence of CMH (66.1%) than those with previous cancer (77.5%) and those with no cancer history (76.8%). After adjusting for 17 variables, the odds of CMH among those with current cancer remained substantially lower (OR=0.63; 95% CI=0.49–0.79) than those without cancer. Among those who had ever had cancer, the odds of CMH were higher for female, White, married, and older respondents, as well as those with higher socioeconomic status, and no history of childhood physical abuse, substance abuse, depression or anxiety disorder. These findings have a hopeful message for patients and clinicians. Two-thirds of current cancer patients have CMH. Former cancer patients are comparable to those without a cancer history, suggesting substantial resilience.

DECISIONAL CONFLICT AND PROSTATE CANCER SCREENING DECISIONS AMONG RURAL AFRICAN AMERICAN MEN

R.S. Allen¹, J. Oliver¹, M.K. Eichorst^{1,2}, L. Mieskowski¹, 1. *ARIA/Psychology, The University of Alabama, Tuscaloosa, Alabama*, 2. *Salem Veterans Affairs Medical Center, Salem, Virginia*

African American (AA) men have prostate cancer death rates (47.2) that are 137% higher than non-Hispanic whites (19.9). These numbers provide clear evidence that a significant prostate cancer disparity exists among AA men in the United States. Our study interviewed a sample of 33 AA men ($M_{age} = 54.61$, $SD = 8.30$, range = 40–71) from three southern, rural counties about their prostate cancer screening decisions and the conflict experienced in these decisions. Men were interviewed three times over the course of twelve

months (baseline, 6 mo, 12 mo). In addition to an overall score, the Decisional Conflict Scale (DCS) consists of 4 subscales: Informed (to assess how much is known), Values (to assess personal preferences), Support (to assess resources available), and Uncertainty (to assess clarity of choice). High numbers indicate greater conflict and low numbers indicate greater ease in making decisions. Men's report of overall decisional conflict decreased across 12 months, $F(2, 42)=8.983$, $p<.005$, with a significant difference between baseline ($M = 40.23$) and 12-months ($M = 20.91$). Moreover, this predicted how likely men were to report a desire to engage in preventive prostate cancer screening, $t(29) = 2.68$, $p = .013$. Specifically, greater perceived levels of support and stronger values predict greater intention to engage in prostate cancer screening across the course of one year. Rural AA men benefit from having social support, such as the presence of health care advocates (e.g., wives, mothers, siblings) to reduce decisional conflict and facilitate engagement in prostate cancer screening.

RELATIONSHIPS OF OLDER AFRICAN AMERICAN WOMEN AND FAMILY CAREGIVERS IN THE BREAST CANCER EXPERIENCE

E.L. Csikai¹, S.S. Martin², C. Broussard¹, 1. *The University of Alabama, Tuscaloosa, Alabama*, 2. *McGill University, Montreal, Quebec, Canada*

Within all human relationships, major life events, including diagnosis of a life-threatening illness, such as cancer, will be experienced differently by each member. African American women and family members in 'cancer dyads' may struggle with adjustment in new roles as "patient" and "caregiver" and also have multiple concerns about well-being as the combination of age and ethnicity puts older African American women at high risk for poor cancer outcomes. In this study, experiences with breast cancer diagnosis and treatment decision experiences within the context of relationships between older African American women and close family members/caregivers were explored.

Utilizing a qualitative phenomenological approach, in-depth, semi-structured, individual interviews were conducted with 15 older African American women (ages 46–67) who were diagnosed with and received treatment for breast cancer and one family member (husbands, daughters, sisters, and others) with whom they most closely shared the 'cancer experience'. Data were analyzed using dyadic analysis to identify meaning units and themes that both overlapped and contrasted; highlighting the relationship as affected by a common yet unique experience (Eisikovits & Koren, 2010). Overlapping themes included: fears/emotional reactions; family concerns; protection; and support. Contrasts included: trust/confidence in decisions; discovery and meaning of diagnosis; and future care.

Older women and family caregivers may have difficulty understanding each other's changing needs and that their relationship is affected differentially when confronted with life-altering serious illness. The mutual protection and support beliefs/behaviors developed within relationships during the cancer experience may be utilized to facilitate future medical decisions or health crises.

ETHNIC DISPARITIES IN CANCER INCIDENCE AND SURVIVAL AMONG THE OLDEST OLD IN THE UNITED STATES

J.L. Krok-Schoen^{3,2}, R.D. Baltic², J.L. Fisher¹, 1. *Arthur G. James Cancer Hospital and Richard J. Solove Research Institute, Columbus, Ohio*, 2. *Comprehensive Cancer Center, The Ohio State Univer, Columbus, Ohio*, 3. *School of Health and Rehabilitation Sciences, College of Medicine, The Ohio State University, Columbus, Ohio*

Two of the fastest growing segments of the U.S. population are the oldest old, people aged ≥ 85 years, and Hispanics. Currently, no studies have examined ethnic disparities in cancer incidence and survival in the ≥ 85 population. This study sought to examine potential ethnic disparities in cancer incidence and survival rates among the oldest old using data from the SEER Program. Cases diagnosed with one of the leading four cancer sites (lung and bronchus, colon and rectum, female breast, prostate) were reported to one of 18 SEER registries. Differences in cancer incidence were examined for cases aged ≥ 85 years and diagnosed 1992–2013. Five-year relative cancer survival probability was examined for Hispanic and non-Hispanic adults aged ≥ 85 years diagnosed 2006–2012. Results indicated that from 1992–2013, among those aged ≥ 85 years, non-Hispanics had higher incidence compared to Hispanics for colon and rectum, lung and bronchus, female breast, and prostate cancers. Five-year survival probability for cancers of all stages combined was higher for non-Hispanics than Hispanics in this age group. However, Hispanics had higher survival probability of colorectal cancer diagnosed at regional (67.2% vs. 60.5%) and distant (5.4% vs. 3.8%) stages than non-Hispanics, respectively. Hispanics also had higher survival probability of lung and bronchus cancer diagnosed at regional (15.9% vs. 12.7%) and distant (2.8% vs. 2.2%) stages than non-Hispanics, respectively. In summary, ethnic differences in cancer incidence and survival probability exist within the ≥ 85 population. Continued efforts are needed to understand and reduce ethnic disparities in cancer prevention and treatment among this population.

A MIXED METHODS APPROACH TO EXAMINING POSTTRAUMATIC GROWTH IN OLDER CANCER SURVIVORS

A.I. Hoogland, *Moffitt Cancer Center, Tampa, Florida*

A wealth of research has been conducted on cancer survivorship and posttraumatic growth (PTG; defined as positive change following the struggle associated with a trauma), but little research has investigated PTG in older samples. This lack of scholarship is surprising, considering cancer diagnoses are especially prevalent in older adults. To address this gap in our knowledgebase, a population-based random sample of older cancer survivors ($N = 56$) was recruited through the Kentucky Cancer Registry. Participants mailed in questionnaires that included several validated surveys, including the Posttraumatic Growth Inventory (PTGI). Overall, participants reported high levels of posttraumatic growth (PTG $Mean = 54.85$; $SD = 28.31$), which was positively associated with personal significance of the cancer diagnosis ($p = .04$). Normed PTGI Subscale scores were nuanced such that participants felt more appreciation of life, but a decreased sense of having new possibilities. Even among older adults, there

were age trends such that “older” older adults reported less PTG than “younger” older adults ($p = .002$), and were less personally impacted by a cancer diagnosis ($p < .001$). Qualitatively, a reliance on faith and a sense of acceptance emerged as themes, consistent with previous literature identifying a shift in perspective with age that allows for embracing changes in health status. It is feasible that older adults are better able to accept traumatic illnesses as a natural part of the life course, as has been seen in other studies on late-life illness.

SESSION 785 (POSTER)

CAREGIVING II

INFORMAL CAREGIVER BURDENS AND THE SUBSEQUENT COGNITIVE STATUS OF THE CARE RECIPIENT

D. Lloyd, M.P. Aranda, *School of Social Work, University of Southern California, Los Angeles, California*

Studying factors influencing caregiver burden implies that, in addition to the caregivers' quality of life, such burden may influence the health trajectory of care recipients. Five domains of caregiver burden are analyzed in relation to care recipients' change in cognitive status one year later using National Health and Aging Trends Study and linked National Study on Caregiving data. A sample of 703 care recipients whose baseline cognitive status is not probable dementia, and their primary informal caregivers, are included. Caregiver burden dimensions of social limitation, role overload, and psychological distress are associated with care recipients' transition to probable dementia, while positive mood and financial burden are not, in separate regression models with controls for care recipients' sex, age, race/ethnicity, marital status, education, self-rated health, and “possible dementia” status. When all five domains are included in the same model, social limitation is the sole net predictor of cognitive status change. Determinants of caregiver burden are examined as well. Simultaneous regression of all five burden measures on care recipient and caregiver characteristics reveals several factors. Notable predictors of specific caregiver burdens are recipients' relationship to the caregiver, their health, and caregivers' employment status, marital status, and gender. Caregiver commitment to a set schedule of caregiving is associated with social limitation, role overload, and psychological distress. Distress is greater among sons who are primary caregivers, compared with those who are the care recipients' spouse, while being married (but not the recipients' spouse), is protective. Additional findings will be reported, and their implications discussed.

PARTICIPATORY ARTS IN THE HOME TO SUPPORT WELLNESS IN DEMENTIA CAREGIVER AND CARE RECIPIENT DYADS

R. Poulos², D. Harkin¹, E.R. Beattie³, C. Cunningham^{1,4}, C. Poulos^{1,2}, 1. *HammondCare, Sydney, New South Wales, Australia*, 2. *University of New South Wales, Sydney, New South Wales, Australia*, 3. *Queensland University of Technology, Brisbane, Queensland, Australia*, 4. *University of Edinburgh, Edinburgh, Scotland, United Kingdom*

There is growing evidence that participatory art has a positive role in promoting the health and wellness of older people with a range of conditions, including people with dementia and caregivers. This pilot project trialled an eight week, two hours per week, participatory arts program (e.g. visual arts including mixed media, painting and clay) delivered in participants' homes by one of four professional artists (n = 6 caregiver and care recipient dyads). The evaluation employed mixed methods.

Caregiver interviews found that caregivers were overwhelmingly surprised by their own creative output and that of their care recipient. They indicated the program provided time away from the caring role, describing feeling 'relaxed' and 'less stressed'. The artists' visits provided an opportunity for caregivers to learn new skills, enjoy much-appreciated social interaction and reduce 'monotony'. Several caregivers learned novel ways of engaging with their care recipient from artist-care recipient interactions. Some dyads were able to use their creative output for inter-generational family engagement; and five dyads expressed an interest in pursuing art in some form post-program. Improvement in scores on the Warwick-Edinburgh Mental Well-being Scale and the Zarit Burden Interview were also found for some carers.

This pilot suggests that participatory arts delivered by professional artists in the home can equip family caregivers with new skills in shared creative activities that bring joy and emotional interaction and may counteract agitation and stasis. The model of program delivery can be readily scaled up and tested in a larger study.

"IF I GOTTA DO IT": EXAMINING COUPLES' CAREGIVING TRAJECTORIES FOLLOWING SPINAL CORD INJURY

A.A. Bender¹, E.O. Burgess², 1. *Emory University, Atlanta, Georgia*, 2. *Georgia State University, Atlanta, Georgia*

Sustaining a Spinal Cord Injury at any point in time is life altering – physically, emotionally, and financially – for all persons affected by the injury, but it can place unique challenges on younger married couples. This presentation uses data from individual interviews with 18 couples (ages 21–55) at three time points (96 interviews) following injury, as well as extensive observation in the rehabilitation setting. Using a combination of the life course perspective and cognitive sociology as guiding theoretical frameworks and grounded theory analysis, we examined how the health care institution influenced marital relationships during their rehabilitation stay and the subsequent transition home. We found staff and couples accepted and reinforced the dominant cultural narrative that women are natural caregivers, but larger social structures of class, gender, and the division of paid and unpaid labor work together to push some women into caregiving or prevent other women from engaging in caregiving. In contrast, male caregivers were excused from the expectations of caregiving and actively resisted taking on the caregiving role. Expanding on Aneshensel et al.'s (1995) caregiving career, we identified three main types of caregivers, each with their own path of caregiving – Naturalized, Constrained, and Resistant. Overall, the transition to injury is complex for patients and partners and this presentation highlights how the marital relationship is affected by a non-normative, unexpected transition. This research extends the

understanding of caregiving careers by emphasizing how gendered expectations are further modified by the rehabilitation context and additional structural factors such as work and family.

DOES CAREGIVING INFLUENCE MARITAL AND COHABITING UNION STABILITY IN MIDDLE AND LATER LIFE?

M.J. Penning, *Sociology, University of Victoria, Victoria, British Columbia, Canada*

Family and other informal caregivers provide the vast majority of long-term care to older adults as well as others with chronic illnesses and disabilities. Although they report some positive aspects of caregiving, in general, research suggests that caregiving is stressful and has negative implications for the health and well-being of caregivers. Yet, little is known regarding its impact on related outcomes such as union stability in middle and later life. To address this gap, we drew on retrospective data on union histories drawn from the 2007 Canadian General Social Survey for a national sample of adults aged 45 and older who were in a marital union or a cohabiting union a union at age 45 (n=17,194). Cox proportional hazard models revealed that being involved in caregiving activities was associated with a reduced likelihood of separation or divorce in middle and later life, particularly when the respondent was a primary caregiver and the care recipient was a current or former spouse/partner. However, this was primarily the case for men and those in marital unions. For women as well as those in cohabiting unions, caregiving activities (i.e., having been a caregiver before the age of 45, serving as a primary caregiver, and not receiving professional assistance) enhanced the risk of subsequent union dissolution. These findings suggest that caregiving both contributes to and undermines union stability. This, in turn, has important implications for theory, research, and the provision of support to informal caregivers.

DO FAMILY MEMBERS' MOST IMPORTANT CONCERNS ABOUT CAREGIVING VARY ACROSS THE CAREGIVING CAREER?

M.Y. Savundranayagam¹, S. Basque¹, A. Roberts², J.B. Orange¹, K. Johnson³, 1. *Western University, London, Ontario, Canada*, 2. *Northwestern University, Evanston, Illinois*, 3. *McCormick Dementia Services, London, Ontario, Canada*

Caregiver identity theory posits that family caregivers' relationship identity changes across the caregiving career. Family caregivers' initial relationship identity is one based on a familial dimension. As caregiving unfolds, however, their evolving roles help shape a new relationship identity involving the caregiver role. This study investigated whether family members' most important concerns about caregiving vary across the caregiving career and by kinship status. Participants included 10 adult-child and 18 spousal/partner caregivers to the persons with dementia. Participants identified their caregiving concerns prior to engaging in an enhanced dementia education and training program. Thematic analyses of their concerns yielded the following themes from most to least frequent: positive approaches to care, health status, vigilance, addressing dementia-related changes, safety, happiness of person with dementia, caregiver stress, and time for self and

others. Differences were found by relationship identity and by kinship status. With regard to positive approaches to care, adult-children viewed themselves primarily in terms of the familial role whereas spouses/partners viewed themselves primarily as caregivers. The same pattern was observed for health status. However, adult-children's health concerns focused on their relative with dementia's health whereas spouses/partners were concerned about their own health. Caregiver stress and addressing dementia-related changes were major concerns for spouses/partners whose relationship identity consisted primarily of the caregiver role. Happiness of the person with dementia, vigilance, and time for self and others did not vary across the caregiving career or by kinship. Findings reveal the differential needs of spouses/partners versus adult-children across the caregiving career.

A MULTI-COMPONENT CAREGIVER TRAINING PROGRAM FOR MANAGING BEHAVIORAL SYMPTOMS OF DEMENTIA

B. Karlin^{1,2,3}, D. Young⁴, K. Dash¹, M.K. Landon¹, 1. *Education Development Center, Waltham, Massachusetts*, 2. *Johns Hopkins University, Baltimore, Maryland*, 3. *Northeastern University, Boston, Massachusetts*, 4. *Seniorlink, Boston, Massachusetts*

Behavioral symptoms, including agitation, aggression, vocalization, and care refusal, are nearly universal among individuals with dementia. Despite the availability of effective psychosocial approaches for managing these behavioral symptoms, these approaches remain widely under-utilized among professional, and especially family, caregivers, due in large part to limited training in these approaches. This paper will examine the development, core components, and outcomes of an evidence-informed, competency-based training program in the prevention and management of behavioral symptoms of dementia among aging services providers and family caregivers within a system of home-based care and support. The Vital Outcomes Inspired by Caregiver Engagement (VOICE) Dementia Care Training Program was developed based on identification of state-of-the-art approaches to managing behaviors through expert review of the literature and structured needs assessment. Results from mixed-method evaluation design reveal significant improvements in knowledge, attitudes, and self-efficacy among training participants, with largest effect sizes ($d=1.8$) on domains of knowledge and self-efficacy to manage behaviors. In addition, the training of aging services staff and family caregivers led to significant increases in engagement, self-care, and personal development among many participants. Findings underscore the need and opportunity for training in improving the abilities and confidence of aging services providers and family caregivers in the nonpharmacological management of behavioral symptoms of dementia.

THE PARADOXICAL IMPACT OF COMPANIONSHIP ON THE BIOPSYCHOSOCIAL HEALTH OF OLDER AFRICAN AMERICAN MEN

J. Mitchell¹, T. Cadet², S. Burke³, E. Williams¹, D. Alvarez³, 1. *Social Work, University of Michigan-Ann Arbor, Ann Arbor, Michigan*, 2. *Simmons College, Boston, Massachusetts*, 3. *Florida International University, Miami, Florida*

Background: African Americans comprise 9% of the approximately 46 million U.S. adults age 65 and older. Two thirds of older African American (AA) men reside with spouses, relatives or other companions. This study investigated the assumption that living with or having frequent contact with companions most often confers health-related benefits for African American men. **Methods:** Utilizing a secondary data analysis of the National Alzheimer's Coordinating Center Uniform Data Set, this investigation examined the relationship between older African American men's physical health outcomes (diabetes, hypertension, cholesterol), mental health outcomes (depression, anxiety, sleep disturbances) and caregiver characteristics, including living arrangements and frequency of contact with the participants for 3,423 older AA men and their 1,161 companions at baseline. **Findings:** The mean age of both participants and companions was 74 years old and 90% of participants lived in a private residence. Logistic regression models indicated that the likelihood of high cholesterol was significant for participants when companions lived with participants (OR=1.38), called daily (OR=1.057) or visited daily (OR=1.059). Similar increased risk for anxiety was found when companions lived with (OR=1.66), called daily (OR=1.089), or visited daily (OR=1.079) with participants. Finally, participants experienced an increased likelihood of non-medical sleep disturbances when companions lived in (OR=1.67), called daily (1.105), or visited daily (1.078). All p-values were below .01. **Conclusions:** The frequency of contact with companions may be consequential for select health outcomes for older African American men, though the timing of contact (i.e. before any diagnosed illness or in response to it) requires further investigation.

INVESTIGATING THE RISK AND FUTURE NEEDS OF OLDER CARERS IN IRELAND AND ENGLAND: TILDA AND ELSA

C.A. McGarrigle¹, S. Leahy¹, R. Kenny^{1,2}, 1. *Trinity College Dublin, the University of Dublin, Dublin, Ireland*, 2. *Mercer's Institute for Successful Ageing, Dublin, Ireland*

Participation in leisure activities and supportive social ties have been associated with improved physical and mental health. These health effects work through a number of pathways, both behavioural and psychological, which can result in better health behaviours, and buffering of the harmful effects of stress. We investigate and compare the prevalence of informal caring by the older population in Ireland and England and investigate predictors of, and health outcomes associated with informal caring and determine whether these are moderated by social participation and support.

We examined measures of physical function (self-rated and objective (hand-grip strength)), mental health (CES-D, CASP-12), economic and social participation, associated with provision of informal care using multivariate models in the Irish Longitudinal Study on Ageing (TILDA) (wave 3, 2014), and the English Longitudinal Study on Ageing (ELSA) (wave 6, 2012–2013).

Provision of informal care was common and was associated with similar characteristics (younger age, female, more education, not employed). There were similar health outcomes for both countries. While there was no evidence of a difference in physical function, mental health differed:

quality of life increased with low intensity caring hours (<20), while depression increased with high intensity caregiving (50+ hours/week). These associations were attenuated by active social activities and positive social relationships.

Across two separate social care systems, the older population contribute substantially to the support and informal care of their family and friends. Overall, informal caring was associated with positive health outcomes, but this depended on accessibility to both social supports and formal care provision.

AUSTRALIAN LIVES ALTERED BY PARKINSON'S DISEASE: WORK, RETIREMENT, AND CARE

J. Brady, K. O'Loughlin, *Faculty of Health Sciences, University of Sydney, Cremorne, New South Wales, Australia*

People diagnosed with Parkinson's disease cannot be certain about when and in what way their motor and non-motor symptoms will progress through time and how efficacious their medication in managing symptoms will be on any given day. In this context people experience fluctuations in both disease and iatrogenic symptoms and, depending on the stage of illness, a person's body may be abled and disabled frequently with varying symptoms throughout the day. Changes in body function, age and stage of disease influence the type of care the person diagnosed will need in everyday life.

An Australian qualitative study has examined narratives from eighteen people living with Parkinson's disease (age >55; $n=9$ people diagnosed; $n=9$ partner-carers) who described how their lives have been changed by the onset of this chronic illness. The study is also informed by data collected from six focus groups ($n=31$). Participants identified a range of responses that clustered around the impact on them physically, emotionally, socially, and financially.

Findings show that people diagnosed and their partner-carer have to reconsider their life goals both individually and as a couple. A diagnosis often comes in the late stages of their career which can influence the transition to, and planning for retirement and, for the partner-carer, require them to manage paid work and spousal care.

This empirical study evidences and describes how people living with Parkinson's disease have very specific care needs, which influence their ability to remain in paid employment and capacity to remain financially independent.

MECHANISMS OF CHANGE IN A CAREPARTNER MOBILE HEALTH INTERVENTION FOR VETERANS WITH HEART FAILURE

R. Trivedi^{4,3}, S. Scott⁵, E. Bouldin², J.E. Aikens¹, J. Piette¹,
1. *University of Michigan, Ann Arbor, Michigan*, 2. *Appalachian State University, Boone, North Carolina*, 3. *Stanford University, Palo Alto, California*, 4. *VA Palo Alto Health Care System, Menlo Park, California*, 5. *Denver VA, Denver, Colorado*

Heart failure (HF) interventions have recognized that involving an informal caregiver in disease management can enhance outcomes. While patient-focused interventions appear to improve self-efficacy, the mechanisms that underlie dyadic interventions remain largely unexplored. We used data from a recently completed comparative effectiveness
