This study considers the complexity of the relationship between health and social networks. Specifically, the analysis examines network size, composition and social support exchange in relation to self-rated health. The data are drawn from The German Ageing Survey (DEAS), which includes information about health and social networks (using a name generator) over a period of 18 years (1996–2014). In the first step, we estimate fixed-effects models to disentangle the influences of changes in social networks on health and vice versa. In the second step, we use a cross-panel design in order to analyze specific connections between different aspects of social networks and health over time. First results indicate significant effects of health on social networks and vice versa over time. In particular, the variable of social support shows a causal connection to health, after direct and indirect paths between health and social network are incorporated into the analytical model.

SOCIAL NETWORKS AND WORRY AMONG CHINESE OLDER ADULTS IN IMMIGRANT FAMILIES

I. Chi¹, L. Xu², 1. *School of Social Work, University of Southern California, Los Angeles, California*, 2. *University of Texas, Austin, Austin, Texas*

This study considered three groups of Chinese older adults in immigrant, transnational, and nonmigrant families. It investigated what they worry about and the relationship of their social networks to their degree of worry (N=786). Analysis of variance, chi-square tests and stepwise linear regression were conducted. Results showed that most participants worried about having no one to take care of them when their health needs increase. In general, older Chinese adults in immigrant families had the highest levels of worry. Emotional closeness with adult children was a significant correlate of worry for all respondents. The influence of having local friends on reducing worry was significantly stronger among those in immigrant families, as was the influence of children's filial piety. Practitioners and policy makers should

pay special attention to older adults in immigrant families, with a particular focus on promoting emotional closeness with adult children, friend networks, and children's filial piety.

SESSION 2075 (SYMPOSIUM)

AIR POLLUTION IN BRAIN AGING AND DEMENTIA

Chair: C.E. Finch, *University Southern California, Los Angeles, California*

Co-Chair: J. Chen, *University of Southern California, Los Angeles, California*

Discussant: G.M. Martin, *University of Washington*

Over 75% of older Americans are living in metropolitan areas, and this urban-dwelling aging population will continue to grow in the coming decades. Ambient air pollution, a ubiquitous exposure in urban environments, has emerged as a new environmental factor in brain aging and dementia. Over the last few years, accumulating epidemiologic and neurotoxicological data have shown the aging brain is vulnerable to neurotoxic effects of ambient air pollutants. For instance, elevated levels of fine particulate matter (PM_{2.5}: PM with aerodynamic diameters < 2.5 μm) are associated with several years of faster cognitive aging and loss of white matter volume. Rodent brain models with inhaled PM exposure suggest the neurodegenerative mechanisms may involve increased neuroinflammation and soluble amyloid, and attrition of glutamate receptors. Assembling four presentations with new findings, this symposium aims to better define the individual risk, heterogeneity, and pathobiological mechanisms linking ambient air pollutants with brain aging and dementia. Epidemiological studies show that both PM_{2.5} and O₃ exposures may increase the risk for dementia in older women (Chen). Epidemiologic studies also show that PM_{2.5}-associated adverse effects on aging brain may be strengthened in populations with APOE4 alleles (Chen) and in populations of low educational attainment (Ailshire). Rodent models with PM exposures from traffic emissions document the role of the lung-brain axis in microglial activation (Block) and illustrate ApoE4 interaction with exposure contributing to brain amyloid deposition (Cacciottolo). Together these findings show that environmental factors contribute to accelerated brain aging in synergy with the ApoE4 allele risk factor for Alzheimer disease.

NEUROTOXIC EFFECTS OF AMBIENT AIR POLLUTION ON BRAIN STRUCTURE AND DEMENTIA RISK IN OLDER WOMEN

J. Chen¹, X. Wang¹, R. Casanova², M.L. Serre³, W. Vizuete³, H.C. Chui¹, S. Resnick⁴, M. Espeland³, 1. *University of Southern California, Los Angeles, California*, 2. *Wake Forest School of Medicine, Winston-Salem, North Carolina*, 3. *Gillings School of Global Public Health, UNC, Chapel Hill, North Carolina*, 4. *National Institute on Aging, Baltimore, Maryland*

Ambient air pollution is a novel determinant of cognitive aging. Using a Bayesian Maximum Entropy method to estimate outdoor concentrations of PM_{2.5} (particulate matter < 2.5 μm; 1999–2010) and O₃ (1996–2010) for the prospective cohort (n=7479) from Women's Health Initiative Memory Study, we examined whether long-term exposures affect the

aging brain structure and dementia risk. Residing in places with high PM_{2.5} (>12 μg/m³) increased the relative risk (by 81–92%) for global cognitive decline and all-cause dementia, with greater adverse effects in APOE ε4/ε4. In both region-of-interest and voxel-based morphometry (VBM) analyses of brain MRI (n>1300), increased PM_{2.5} predicted smaller white matter volumes in multi-modal association regions (frontal; temporal). In VBM, PM_{2.5} exposure also predicted smaller volumes of prefrontal cortex, but not the hippocampal-amygdalar complex (HAC). Preliminary results suggested long-term O₃ exposure was associated with smaller grey matter (bilateral HACs/temporal poles; left entorhinal/perirhinal cortices) and increased the dementia risk in older women.

PM2.5 AIR POLLUTION, EDUCATIONAL ATTAINMENT, AND COGNITIVE FUNCTION AMONG OLDER U.S. ADULTS

J. Ailshire¹, A. Karraker², 1. *University of Southern California, Los Angeles, California*, 2. *University of Iowa, Ames, Iowa*

This study examines whether the association between air pollution and cognitive function among older adults differs by educational attainment. Data on 13,389 adults over age 50 are from the 2004 Health and Retirement Study and were linked to 2004 annual average concentrations of ambient fine particulate matter air pollution (PM_{2.5}). Multilevel linear regression models were used to examine the association of PM_{2.5} concentrations and individual-level education on cognitive function. Higher concentrations of PM_{2.5} were associated with lower scores on cognitive function, but the association was stronger among individuals with lower educational attainment. These findings were robust to the inclusion of a variety of individual demographic, socioeconomic, and health factors as well as neighborhood-level education and income. The findings suggest the cognitive harms of pollution exposure may be offset by educational attainment, and that older adults with low educational attainment may be particularly vulnerable to air pollution.

AIR POLLUTION, MICROGLIA, AND THE LUNG-BRAIN AXIS

M. Block, 1. *Indiana University School of Medicine, Indianapolis, Indiana*, 2. *Stark Neuroscience Research Institute, Indianapolis, Indiana*

Urban air pollution exposure has recently been linked to increased risk of several central nervous system (CNS) diseases and conditions, including cognitive decline and Alzheimer's disease (AD). The mechanisms mediating these effects are poorly understood. Recent findings indicate that the brain's innate immune cells, microglia, detect and respond to inhaled pollutants, where pulmonary damage may signal to the brain through circulating factors (The Lung-Brain Axis). Here, we will reveal the role of damage associated molecular patterns (DAMPs) in the microglial response to diesel exhaust particles, discuss the effects of these circulating factors in the 3x-TG murine AD model, and explore how aging may impact this process. These findings provide insight into the mechanisms underlying how air pollution may activate microglia and deleteriously impact central nervous system health.

NEURODEGENERATIVE EFFECT OF NANOSIZED URBAN AIRBORNE PARTICULATE MATERIAL (NPM)

M. Cacciottolo¹, T. Morgan¹, A. Saffari², C. Sioutas², J. Chen³, C.E. Finch¹, 1. *Leonard Davis School of Gerontology, University of Southern California, Los Angeles, California*, 2. *USC Viterbi School of Engineering, University of Southern California, Los Angeles, California*, 3. *University of Southern California, Los Angeles, California*

Particulate air pollutants are increasingly recognized for their neurotoxic impact in human populations and in experimental rodent studies, but the mechanisms involved and interaction with the *APOE* $\epsilon 4$ risk factor for Alzheimer disease (AD) remain unknown.

To evaluate the mechanism behind air pollutant neurotoxicity were examined female EFAD transgenic mice (*5xFAD*+/-/*human APOE* $\epsilon 3$ or $\epsilon 4$ +/+) with long-term exposure to nano-sized urban PM (nPM). nPM exposure increased cerebral β -amyloid, exacerbated by *APOE* $\epsilon 4$. Moreover, nPM exposure increased A β oligomers, caused selective atrophy of hippocampal CA1 neurites and decreased glutamate GluR1 subunit. nPM-induced CA1 atrophy was confirmed in wildtype female mice. Pro-amyloidogenic APP processing was also increased in neuroblastoma cells (N2a-APP/swe) with *in vitro* exposure to nPM, and correlates with alteration of lipid raft. We suggest that airborne PM exposure promotes pathological brain aging, with potentially greater impact in $\epsilon 4$ carriers throughout increased cerebral A β production and glutamatergic remodeling.

SESSION 2080 (PAPER)

GRANDPARENTING RISKS AND RESOURCES

LONG-TERM AND LATER-LIFE STEPGRANDPARENT-STEPGRANDCHILD RELATIONSHIPS

A. Chapman, Y. Kang, L.H. Ganong, M. Coleman, *Human Development and Family Science, University of Missouri, Columbia, Missouri*

Stepgrandchild-stepgrandparent relationships are increasingly common as a result of relatively high rates of divorce and remarriage and improved longevity. Positive intergenerational step-relationships can strengthen feelings of family solidarity and promote the social, emotional, and physical well-being of stepfamily members, yet little is known about how stepgrandchildren or stepgrandparents define and develop roles and relationships following remarriage. Guided by a developmental life course change perspective and grounded theory methods, we interviewed 41 stepgrandchildren about their relationships with 61 stepgrandparents. Some stepgrandchildren ($N = 24$) acquired stepgrandparents when they were adolescents or young adults (i.e., a biological grandparent remarried in later-life), while other stepgrandchildren ($N = 37$) acquired stepgrandparents before birth (i.e., a biological grandparent remarried when a parent of the stepgrandchild was young). Attention to variations in the ways in which stepgrandparents were acquired allowed for systematic examination of relational processes and contextual factors that affected stepgrandchild-stepgrandparent relationships in different family structures. Findings revealed that stepgrandchildren's closeness to stepgrandparents was

influenced by factors such as timing of life transitions (e.g., when in individuals' life courses intergenerational relationships began), stepgrandparents' roles in the life of the middle-generation parent and the quality of those relationships, whether or not the stepfamily defined the stepgrandparent as kin (e.g., through the use of claiming language), intergenerational contact frequency, stepgrandparents' affinity-building and how stepgrandchildren responded to stepgrandparents' efforts. Findings underscore the importance of attending to context when examining processes that affect intergenerational step-relationship development. Implications for researchers, practitioners, and educators are discussed.

INTENSITY OF CAREGIVING, WORKING, AND DEPRESSIVE SYMPTOMS AMONG GRANDPARENTS IN CHINA

Z. Cheng¹, X. Ye¹, I. Chi², 1. *Institute of Population Research, Peking University, Beijing, China*, 2. *USC Suzanne Dworak-Peck School of Social Work, Los Angeles, California*

This study investigated the association between intensity of caregiving and depressive symptoms among grandparents. And whether working could relieve grandparents' depressive symptoms as a moderator. Data came from the Chinese Health and Retirement Longitudinal Study (CHARLS, 2011–2012) baseline data, a nationally representative sample of those 45 and older. The analytic sample contained 5,430 grandparents with grandchildren aged under 16. The CESD-10 was used to measure depressive symptoms with a score from 10 to 40. We used Multiple Linear Regression. Most of grandparents spent high intensity of caregiving (≥ 48 weeks/year). After controlling demographic and socioeconomic variables, rural and urban grandparents co-residing with grandchildren tended to have more depressive symptoms, when providing care for their grandchildren. However, when not co-residing with grandchildren, both rural and urban grandparents had less depressive symptoms with spending high intensity of caregiving. Working acted as a supportive moderator on depressive symptoms among rural grandparents, but tended to be a stressful moderator on depressive symptoms among urban grandparents, when grandparents provided care of high intensity. Caregiving to grandchildren may benefit mental health of grandparents, which may be because in Chinese culture "Pleasure from grandchildren reduces loneliness". But not all caregiving appears positive; caregiving could burden grandparents.

CAREGIVER OPTIONS FOR FUTURE CARE PLANNING BY OLDER CUSTODIAL GRANDPARENTS RAISING ADOLESCENTS

T.L. Peterson, *Social Work, The University of Oklahoma, Norman, Oklahoma*

Grandparents raising grandchildren worry about what will happen to their grandchildren if they die. Yet, conversations with custodial grandparents about caregiver options remain largely understudied. This qualitative study describes issues related to caregiver options for future care planning with older grandparents raising adolescent grandchildren. This research applied a phenomenological approach involving in-depth, face-to-face interviews with twenty one grandparents ranging in age from 58 to 88 years. The grandparents identified as a

primary caregiver to a grandchild 12 or older and were residents of Oklahoma, Alabama, or Kentucky. A semi-structured interview guide contained a question asking “What is your thinking about caregiving arrangements for your grandchild in case you are no longer able to provide care? What actual steps, if any, have you taken to begin these caregiving arrangements in case you are no longer able to provide care?” Recruitment methods included word of mouth, newspaper advertisements, and distributing flyers to community agencies. Interviews were audiotaped and transcribed verbatim to identify themes. Older grandparents raising adolescent grandchildren described four issues related to caregiver options and future care planning: (1) behavioral health of the grandchild, (2) rationale for preferred caregiver choice, (3) nature/status of conversation with preferred caregiver, and (4) potential conflicts with grandchildren’s biological parents. These findings suggest older grandparents raising adolescent grandchildren face complex dynamics when considering caregiver options for future care planning. These older caregivers can benefit from research, practice, and policy to assist with the development of tailored interventions targeting future care planning.

DETERMINANTS OF GRANDPARENTS’ PSYCHOLOGICAL WELL-BEING: GENERATIVITY AND ADULT CHILDREN’S GRATITUDE

C. Noriega¹, J. Lopez¹, C. Velasco¹, W. Yolpant², 1. CEU San Pablo University, Madrid, Madrid, Spain, 2. Case Western Reserve University, Cleveland, Ohio

Grandparents have become an important source of support for current families. Two expressions of generativity are the care provided to grandchild/ren and the values transmitted. Little data have examined how intergenerational relationships affect to grandparents’ generativity and well-being. This study explored the relationship between grandparents’ psychological well-being, socializing values and styles, and adult children’s gratitude. Based on the Generativity Model of Chen (2009), we hypothesized that the influence on the grandparents’ well-being of the values they desire to transmit to their grandchild/ren (generative concerns) would be mediated by their socializing styles (generative acts), and adult children’s gratitude (perception of recipient’s attitude). Grandparents’ socializing styles would also influence their well-being mediated by their adult children’s gratitude. This study consisted of 300 grandparents from Madrid (Spain), with grandchild/ren aged 6–12 years old. Participants’ mean age was 71.55 (SD=7.32) and 56% were women. Excellent model fit was found using Path Analysis ($\chi^2=51.77$; $p=.26$; CFI=.98; TLI=.98; RMSEA=.02). Personal and relationship values predicted participants’ psychological well-being mediated by socializing styles (democratic and liberal styles) and adult children’s gratitude. A direct influence of the abilities and knowledge values on psychological well-being, which had not been hypothesized in the original model, was found. No significant associations between authoritarian style and well-being were found, once other variables were considered. These results highlight that grandparents’ engagement in generative acts positively affect their well-being, especially when adult children express gratitude for the help provided by grandparents. This suggests the need to promote intergenerational shared activities and positive family interactions.

RESOURCE DEPLETION OR MOBILIZATION? GRANDPARENTING AND ITS MENTAL HEALTH IMPLICATIONS IN TAIWAN

C. Peng, Senior Citizen Service Management, Minghsin University of Science and Technology, Hsin-Chu, Taiwan

As considerable studies have been done to investigate the effects of grandparenting on grandparents’ health, most of these studies were conducted in Western societies and have found mixed results. To fill these gaps, this study drew on longitudinal data from the Study of Health and Living Status of the Elderly in Taiwan to extend the knowledge of grandparenting to a cultural context that differs from the United States, where the majority of the research in this area has been conducted. Based on the stress and process theory, two contrasting models were built to test the effect of grandparenting on grandparents’ mental health. The resource depletion model hypothesized that grandparenting functions as a stressor that diminishes mental health, while the resource mobilization model specified that grandparenting mobilizes psychosocial resources that improve grandparents’ mental health. Structural equation modeling was utilized to perform the analysis. The results supported the resource mobilization model, which suggests a positive relationship between grandparenting and grandparents’ mental health. It further revealed that grandparenting provides a protective effect on grandparents’ mental health through increased social support, and multigenerational living arrangement also has positive effects on grandparents’ mental health among Taiwanese elderly. These findings suggest that cultural context and the expectations of the caregiving role may affect the health impact experienced by grandparents. This study suggests caution in assuming that findings in Western countries may be valid across societies, or that interventions based on these findings can be applicable in other countries.

SESSION 2085 (SYMPOSIUM)

SUCCESSES IN OLDER ADULT NUTRITION AND PHYSICAL ACTIVITY STUDIES: A USDA MULTISTATE RESEARCH PROJECT

Chair: D. Buys, Mississippi State University, Starkville, Mississippi

Co-Chair: J. Gilbride, New York University, New York, New York

Midlife and older adults represent the fastest growing segment of the US population; they have higher rates of obesity, chronic disease and disability than previous generations and current younger adults. Often preventable with effective nutrition and/or physical activity interventions, such efforts require collaboration between disciplines and institutions and across the levels of the socio-ecological model. This symposium highlights a multistate research project (MSRP) begun in 1989 in the northeastern United States through the United States Department of Agriculture’s MSRP mechanism. Working in partnership with the National Institute for Food and Agriculture, state agricultural experiment stations conduct and coordinate targeted investigations on high priority topics like nutrition and aging. This MSRP is a long-term collaboration among multidisciplinary scientists from private and state universities, including Land Grant Universities and

Cooperative Extension. The research, carried out in 5-year cycles, addresses specific goals for finding novel interventions and approaches to improve the nutritional health of older adults. For more than 20 years, multidisciplinary scientists have built on a legacy of prior research and a culture of collaboration by sharing resources and knowledge, jointly collecting qualitative and quantitative data to assess diet and health, testing tools in rural, suburban and urban settings, and expanding nutrition education and outreach. Some of these efforts are presented here, with projects addressing enablers of healthy eating among diverse older adults, measurement of sarcopenia in older women, factors influencing the nutritional risk and food intake of community-residing older adults, and telenutrition as an outlet for nutrition intervention among obese men.

RECOMMENDATIONS TO SUPPORT ENABLERS OF HEALTHY EATING IN OLDER ADULTS IN DIVERSE COMMUNITIES

N. Cohen¹, Q. Jiang¹, M. Ventura Marra², K. Woolf³, J. Gilbride³, S. Francis⁴, 1. *Department of Nutrition, University of Massachusetts Amherst, Amherst, Massachusetts*, 2. *West Virginia University, Morgantown, West Virginia*, 3. *New York University, New York, New York*, 4. *Iowa State University, Ames, Iowa*

Communities can provide an “age-friendly” environment to support healthy eating in older adults (OA) by addressing the highest priority approaches that promote key enablers of good nutrition. Using the Social Ecological Model, nutrition and aging professionals (n=30) from two rural (WV, IA) and two urban (MA, NY) city/county regions participated in focus group discussions to identify and prioritize enablers and behavioral settings essential for OA nutrition. Transcripts were recorded and analyzed for major themes using content analysis. The most important enablers were accessibility and cost, transportation and social support. Recommendations to improve enablers included nutrition education and outreach; modifying or expanding services and advocacy to improve accessibility and transportation; gearing program or food content and the built environment specifically to OA needs; addressing partnerships, policies, discounts and financial assistance to improve affordability; and fostering social support and empowerment. Community-based interventions targeting enablers can support older residents in achieving optimal nutritional health.

IDENTIFYING SARCOPENIA IN OLDER RHODE ISLAND WOMEN USING CURRENT DEFINITIONS

S.G. Slezak¹, M. Benson¹, E. Renna¹, K. Mahoney¹, D. Hatfield¹, F. Xu¹, I. Lofgren², M. Delmonico¹, 1. *Kinesiology, University of Rhode Island, Kingston, Rhode Island*, 2. *Nutrition and Food Sciences, University of Rhode Island, Kingston, Rhode Island*

Several working groups have established guidelines for the identification of sarcopenia (i.e. age related loss of lean mass) among older adults. However, more data need to be collected to determine sarcopenia prevalence among older populations using these guidelines. For this purpose a cross-sectional analysis was performed in a sample of older, community dwelling, female Rhode Island residents (n=93) aged 68.3 ± 7.0 years with a BMI of 29.6 ± 6.2 kg/m². Appendicular

lean mass was evaluated via DXA and bioelectrical impedance. Participants’ gait speed and grip strength were assessed. Using any definition there was sarcopenia prevalence of 17.2%, while criteria specific prevalences varied from 2.2%-12.9%. Sarcopenia classification variations between different guidelines are in line with other populations but indicate the variation in prevalence depending on guidelines used and lack of agreement between sarcopenia classification guidelines. These results warrant further evaluation with a larger cohort and among different sub-populations such as race and/or ethnic groups.

FACTORS INFLUENCING THE NUTRITIONAL RISK AND FOOD INTAKES OF COMMUNITY-RESIDING OLDER ADULTS

L. MacNab⁶, S.L. Francis³, I. Lofgren⁴, C. Violette¹, M. Shelley², M. Delmonico⁵, F. Xu⁵, 1. *Department of Nutrition, University of New Hampshire, Durham, New Hampshire*, 2. *Department of Statistics and Department of Political Science, Iowa State University, Ames, Iowa*, 3. *Department of Food Science and Human Nutrition, Iowa State University, Ames, Iowa*, 4. *Department of Nutrition, University of Rhode Island, Kingston, Rhode Island*, 5. *Department of Kinesiology, University of Rhode Island, Kingston, Rhode Island*, 6. *FoodMinds, Chicago, Illinois*

Understanding the nutritional status and food intakes of older adults is essential if this population is to remain independent. A multistate cross-sectional study evaluated the nutritional risk (NR) and food practices of 352 older adults attending various community-based health interventions. Most participants were white (77.6%) women (83.5%) between the ages of 60 to 70 years (42.9%). The majority were classified as “at possible NR” (53.7%) or “at NR” (26.4%). Participants had “low” lean protein, dairy and processed meat intake frequencies and “moderate” intake frequencies of whole fruit and juice, total and whole grains, vegetables and added fats, sugars and sweets. Factors influencing these food intakes include state, age and gender ($p \leq .05$). Results indicate that older adults choosing to participate in lifestyle interventions are at NR. Future needs-based nutrition education programs designed to reduce NR should target protein intakes while addressing the role of state, age, and gender on food intakes.

IMPROVING WEIGHT STATUS IN OBESE MIDDLE-AGED AND OLDER MEN THROUGH TELENUTRITION

M. Ventura Marra¹, M. Shotwell², K. Nelson³, J. Malone³, 1. *West Virginia University, Morgantown, West Virginia*, 2. *Vanderbilt University, Nashville, Tennessee*, 3. *West Virginia University Medicine, United Hospital Center, Bridgeport, West Virginia*

Obesity threatens the health, functionality, and quality of life of 34.5% of men in the United States with middle-aged men at highest risk. A randomized controlled trial piloted the effect of a 12-week telenutrition weight loss program compared to usual care on body weight in obese men, ages 40–70 with hypertension, diabetes or hyperlipidemia. Both groups (n=60) received educational materials; only the intervention group received individualized weekly support by a Registered Dietitian via telephone and videoconferencing.

In both groups, body weight was significantly reduced from baseline by 3.0% (95% CI: 1.5%, 4.0%; p-value: <0.001) at week 6, and by an additional 1.5% (95% CI: 0.8%, 2.2%; p-value: <0.001) at week 12. Body weight in the intervention group was further reduced by 1.9% (95% CI: 1.4%, 3.6%; p-value: 0.034) at week 12. Telenutrition can be effective for weight loss among men in health disparate areas like Appalachia.

SESSION 2090 (SYMPOSIUM)

THE UNSEEN CAREGIVER: SURVIVORSHIP, CREATIVITY, AND INNOVATION

Chair: K. Cloyes, *University of Utah, Salt Lake City, Utah*
Co-Chair: J. Eaton, *University of Utah, Salt Lake City, Utah*
Discussant: L. Ellington, *University of Utah, Salt Lake City, Utah*

Older adults will constitute 16% of the world's population by 2050. Meeting the care needs of scores of older adults with chronic health conditions will depend on the contributions of "informal" care provided by family caregivers and formal care provided by health aides and nursing assistants. Moreover, the vast majority of these caregivers are women whose labor represents billions of US dollars, even as they report struggling with financial and personal burdens.

This symposium examines the experiences and challenges of three groups of caregivers who, while collectively providing care and support to many older adults, report feeling "unseen", unacknowledged, and unsupported. Comparative analysis of their situation reveals both difficulties associated with their sense of "invisibility" and opportunities for enhancing support and empowerment. Jones describes the lack of social and medical discourse concerning family caregivers of cancer survivors, including gaps in understanding how they transition from chronic illness phase to survivorship and implications for support. Cloyes explores perceptions of creative caregiving and connections with long term care outcomes among nursing assistants, a group seldom included in research. Finally, Eaton presents findings on the use of ethnodrama to highlight the experiences of family caregivers, including its potential to promote public discussion of the caregiving experience and caregivers' social support. Ellington, an expert in communication between informal and professional caregivers, will facilitate discussion of how a broader and more inclusive view of caregiving, including innovative methods, will expand the science of caregiving.

ANALYSIS OF SURVIVORSHIP DISCOURSE IN RELATION TO CANCER CAREGIVERS

A. Kuglin Jones, *University of Utah, Salt Lake City, Utah*

Cancer is the second most prevalent condition that necessitates the assistance of nearly three million American family caregivers. Caregivers of adult cancer survivors are invisible partners in the survivorship journey created by a cancer diagnosis. A structure exists to describe the trajectory of survivorship and support for individuals with cancer but comparative research is lacking in revealing such a framework for caregivers. I conducted a critical literature review and a model

inclusive of 6 elements; language, identity, societal reaction, analogy/metaphor, meaning of health, and support, emerged allowing for survivorship discourse in relation to the cancer survivor. Analysis revealed a lack of linguistic or theoretical resources to describe the survivorship experience through the lens of the caregiver. No common social language exists to explain the caregiver experience. Without a common way to define, describe or explain the experience, identity is conflicted, health is ignored and support mechanisms absent.

NURSING ASSISTANTS AS AGENTS OF CREATIVE CAREGIVING IN LONG-TERM CARE

K. Cloyes, J. Eaton, L. Ellington, *College of Nursing, University of Utah, Salt Lake City, Utah*

Nursing assistants (NAs) provide most direct care for long term care (LTC) residents, greatly impacting resident wellbeing, yet are often seen as "unskilled" labor. Our study explores how arts-based caregiving techniques may improve resident quality of life and NA empowerment. We present content analysis of focus group data from NAs in two LTC facilities (n = 12). Initially, NAs related creativity to being "artistic," not to caregiving. Yet they then described engaging residents in creative activities (singing, dancing, storytelling) to build relationships and reduce challenging behavior. While most frequently linked with discerning and responding to resident needs, creativity was also foundational to time management, teamwork and navigating challenges. Many reported learning creative approaches by watching experienced NAs and that, while appreciated by family members, these skills are often unrecognized by professional staff. Developing NA-centered interventions to promote creative caregiving may enhance both person-centered LTC and NA empowerment, improving resident care.

COMMUNITY-BASED ACTION TO MAGNIFY THE FAMILY CAREGIVER EXPERIENCE THROUGH ETHNODRAMA

J. Eaton¹, N. Madsen², *1. College of Nursing, University of Utah, Salt Lake City, Utah, 2. Utah Caregiver Support Program, Salt Lake City, Utah*

The majority of long term care needs are placed upon family members who often have minimal support. In this study we collaborate with family caregivers to create an ethnodrama about their experience and evaluate the efficacy of professional performance to increase knowledge and motivate action. Twenty-two participants met over four months to discuss their life as caregivers. Discussions were analyzed in a two phase process and themes were developed into a script performed five times for 253 attendees. Evaluations (n=153) noted that 70.8% felt the performance represented their experience and 81% were motivated to take action. Caregivers expressed feeling valued and relief at the knowledge that they are not alone. While many related to the content, others assumed that action only applied to those providing care. Ethnodrama has the potential to humanize the complex reality of caregiving for family, professionals, and policy makers.

SESSION 2095 (PAPER)

HEALTH AND SOCIAL SERVICE INTERVENTIONS AND SOCIAL NETWORKS

SOCIAL INNOVATION IN AGEING, THE CHALLENGE OF SCALABILITY AND REPLICABILITY, NETWELL 10 YEARS ON

L. Carragher^{2,1}, R. Bond^{2,1}, 1. *Dundalk Institute of Technology, Dundalk, Ireland*, 2. *The Netwell Centre, Dundalk, Ireland*

Background: Evidence suggests that social innovation and ‘whole system’ approaches to facilitate greater levels of independence for older people are key to future sustainability of health and social care systems. However, little is known about how to make social interventions in the ageing field scalable and replicable. The aim of this program, introduced in Ireland in 2006 as a longitudinal collaborative experiment between the Health Service, Local Government and an academic partner, the Netwell Centre, was to develop, test and report on a range of service interventions for ageing.

Methods: A community-based participatory research approach was implemented to partner with older adults, health care practitioners, not-for-profit providers and communities.

Results: A total of 1,021 older adults continue to be supported at home through dedicated service brokerage to ensure access to the most appropriate services. Where service gaps are identified, these are filled through community and voluntary collaborations. 54 volunteers provide weekly home visits to the most vulnerable. 48 volunteers provide a daily telephone information service, making an average of 100 calls per day. 338 older men regularly participate in non-formal learning activities in Men’s Sheds. 124 older women attend weekly social groups. 20 families receive dementia support, including one-to-one communication and care-giving training. 240 older adults from community groups and nursing homes attend a social event every 6 weeks to grow and maintain social networks.

Conclusions: Ten years on, our evidence suggests that while many of the elements of a whole system approach can be replicated, this is dependent on community vitality and ensuring the 3rd sector is properly engaged with service delivery partners.

THE SOCIAL NETWORKS OF OLDER MIGRANTS IN LUXEMBOURG: STRUCTURE, SUPPORT, AND CHALLENGES TO OLD AGE

A. Ramos, *INSIDE, University of Luxembourg, Luxembourg City, Luxembourg*

Studies on social relations have shown the importance of categories such as class, gender, and health in the composition of the social networks of older people. Although ethnicity has been taken into account (Ajrouch, 2007, 2008), we still know very little about if and how migration influences the development of older migrants’ networks, and if and how it shapes the exchange of emotional and practical support. The present qualitative study sheds light on this question, by analysing the egocentric social support networks

(Kahn & Antonucci, 1980) of 35 individuals aged 65+, who migrated to Luxembourg in early adulthood, coming from Italy, Portugal, Germany, Belgium, and France. The results show that although older migrants have transnational and spread networks, their interpersonal interactions are mainly with co-nationals, with whom they share the same language and cultural background. The exchange of support is challenged by economic restrictions in interacting at distance, by the return of close friends after retirement, and by their low mobility when becoming very old and fragile. The study goes beyond the discussion on transnational care delivered by migrant family members (Baldassar & Merla, 2014), giving visibility to the support provided by non-kin, as neighbours and friends.

WHOSE CAREGIVER IS AT HIGH RISK? PREDICTING HELP WITH ACTIVITIES OF DAILY LIVING FROM CLAIMS DATA

H.B. Degenholtz, R. Schulz, T. Ding, *Health Policy and Management, University of Pittsburgh, Pittsburgh, Pennsylvania*

Unpaid caregivers make substantial contributions toward the well-being of family members with physical and cognitive disability. One estimate places the value of these contributions at \$470 billion annually in the US. Many caregivers are unprepared for the physical and emotional stress, potentially impacting their own health and psychological well-being. Caring for someone with higher levels of disability increases the risk. While there are proven programs and interventions to support caregivers, the healthcare system faces a problem: by its very nature, their work is not visible, and is not part of the medical record, making it nearly impossible to target them prospectively. We sought to develop a method for identifying caregivers that could be implemented by a health system or health insurer as part of an outreach effort. Using data from the 2011 Medicare Current Beneficiary Survey, we identified community dwelling people age 65 and older. We compared the predictive power of three models. Basic demographic characteristics alone correctly classified 67.2% of cases as having a helper that provides support with either basic or instrumental activities of daily living. Adding claims for durable medical equipment correctly classified 68.7% of cases and adding diagnostic information correctly classified 70.6%; positive predictive value 72.8%. A second series of models was estimated to predict ‘high risk’ caregiving (e.g., two or more activities of daily living). Using this approach, outbound telephone calls could be targeted to identify people who could benefit from supportive programs. Future research will validate this predictive model as a screening tool.

SOCIAL NETWORKS ASSOCIATED WITH COGNITIVE FUNCTION AMONG CHINESE ELDERLY: A ONE-YEAR FOLLOW-UP STUDY

Y. Cai, D. Cui, *Nursing, Wuhan University, Wuhan, Hubei, China*

This study aims to examine social networks of Chinese elders and explore their influences on cognitive function and the risk for elders having mild cognitive impairment (MCI). A longitudinal database of elderly Chinese from urban China during 2014–2015 was analyzed. A sample of 1295 elders

was investigated in 2014 and a total of 614 (47.4%) were followed up in 2015. Two types of regression models were used to explore influences of social networks on cognitive function status (a change in the MoCA score) and the risk for having MCI (MoCA score < 26) among these urban elders. The approximate age of this group was 74 years and they had on average one chronic disease. More than half (57%) were at-risk of having MCI. The most important component of their social networks was family (100%) with the majority having face-to-face contact (91.3%). More complex and stable social networks were statistically significant in association with better cognitive function status. The findings imply that developing various types of social ties at an earlier age is beneficial to maintaining cognitive function over time. This study suggests that social interventions and services can provide opportunities for Chinese elders to keep or rebuild connections with old friends, classmates, colleagues, relatives, and acquaintances, which may be more helpful in maintaining cognitive function.

FEE-FOR-SERVICE OR MANAGED CARE? INVESTIGATING DUAL ELIGIBLE CONSUMER PREFERENCES FOR HEALTH CARE

K.G. Kietzman¹, K. McBride¹, M. Moon², A. Bacigalupo², A. Benjamin¹, A. Reynoso¹, S.P. Wallace¹, A. Bacong¹, 1. *UCLA Center for Health Policy Research, Los Angeles, California*, 2. *Westside Center for Independent Living, Los Angeles, California*

The CHOICE study investigated the preferences and decision-making behaviors of dual eligible health care consumers (i.e., those eligible for both Medicare and Medi-Cal) in Los Angeles California. Between April 2014 and March 2015, eligible consumers were enrolled into a managed care demonstration program called Cal MediConnect unless they actively opted out. Cal MediConnect is designed to integrate the financing and delivery of Medicare and Medi-Cal benefits and provide vulnerable consumers with better coordinated care. Yet uptake and retention of Cal MediConnect has fallen far below expectations. We conducted 48 in-depth interviews with consumers who either “opted out” or were enrolled in a Cal MediConnect plan. Using constant comparison analysis, we identified a complex set of factors that influenced consumer decision-making including: relationships with and access to providers; anxiety and confusion about health care options; and perceptions of health care quality. While consumers acknowledged that extra benefits offered through Cal MediConnect were attractive, many were willing to forgo these advantages in order to retain an existing and trusted network of care. Many who “opted out” also preferred to direct their own care and generally disliked the restrictions they associated with managed care. Case studies illustrate how consumers evaluated the options available to them and highlight differences by age, race/ethnicity, and level of disability. Understanding how individuals make health care decisions will help inform strategies for effectively communicating with and responding to the preferences of a diverse group of dual eligible health consumers and practices that better support health-related consumer decision making.

SESSION 3000 (SYMPOSIUM)

DISRUPTING AGING: CHANGING PARADIGMS OF REACHING OLDER ADULTS IN UNDERSERVED COMMUNITIES

Chair: A. Chodos, *University of California, San Francisco, San Francisco, California*

Co-Chair: E. Tan, *AARP, Washington, District of Columbia*

Medical, social and mental health services for older adults are often poorly integrated in underserved communities. This leads to missed opportunities to support and improve the wellbeing of vulnerable older adults. This symposium will first engage the audience in understanding how cultural and psychological factors shape the experience of aging, and then it will explore how innovative programs incorporate this knowledge to address the needs of the most vulnerable older adults. This session is brought to you by AARP and the University of California, San Francisco's *Optimize Aging Collaborative*.

Specifically, this symposium will show how expectations of aging differ among minority older adults and how the impact of negative stereotypes of aging can lead to poor health, and then focus on programs that disrupt the current paradigm of aging. These include an example from Japan where the postal service, working with IBM and Apple, delivers iPads to millions of older adults who can then connect with services, their community and their families and the One City, One Strategy program in San Francisco that through successful collaborations reaches some of the most underserved older adults - such as those in minority communities, those living alone, and adults with dementia. The intended audience for this symposium is broad and includes healthcare providers, educators, city planners, and community-based services and agencies.

ETHNICITY DIFFERENCES IN EXPECTATIONS REGARDING AGING AMONG MINORITY SENIORS

J. Menkin¹, D. Araiza¹, C. Reyes¹, L. Trejo², S. Choi¹, P. Willis³, H. McCreath¹, C.A. Sarkisian¹, 1. *University of California, Los Angeles, Los Angeles, California*, 2. *City of Los Angeles, Los Angeles, California*, 3. *Watts Labor Community Action Committee, Los Angeles, California*

Although there are accumulating, international studies on expectations regarding aging, few have examined ethnicity differences in expectations within the United States (and have only compared Caucasian, African American, and Latino older adults). Asian societies are hypothesized to have higher esteem for older adults than western societies; however, the empirical literature is mixed. We examined differences in expectations regarding aging across 240 African American, Latino, Chinese, and Korean older adults in the Los Angeles area. Contrary to the typical East/West hypotheses, Chinese and Korean older adults had significantly lower expectations regarding aging than African American and Latino participants, even after controlling for other sociodemographic factors. Ethnicity accounted for more variance in expectations about social and emotional changes than in expectations about physical or cognitive function, indicating greater cultural differences in older adults' social roles than in their

expected physical and cognitive changes. Implications for interventions targeting aging expectations will be discussed.

INTERVENING TO REDUCE THE NEGATIVE IMPACT OF STEREOTYPE THREAT ON OLDER ADULTS' MEMORY PERFORMANCE

S. Barber, S. Ching Tan, J. Seliger, S. Niblett, *San Francisco State University, San Francisco, California*

Stereotype threat occurs when people know that poor performance on their part will confirm a negative, self-relevant, stereotype. In response to this people often underperform compared to their potential and inadvertently confirm the stereotype. This in turn has important clinical implications. In one study, stereotype threat more than doubled the number of older adults who fell below a clinical threshold for cognitive impairment on a brief cognitive status examination. The goal of the current research was to test whether affirming personal and cultural values would reduce stereotype threat in English and Chinese-speaking older adults. Although value affirmations are effective for younger adults, there was mixed support with older adults. This adds to other research showing that factors modulating stereotype threat effects in younger adults do not always hold when examining older adults. It also highlights the need to identify interventions that effectively eliminate stereotype threat effects specifically in older adults.

PROVIDING INTEGRATED DIGITAL SERVICES TO ISOLATED OLDER ADULTS—INTERNATIONAL RESEARCH AT IBM

N. Palmarini¹, L. Myers², *1. IBM, Cambridge, Massachusetts, 2. IBM, Orlando, Florida*

IBM Research, which developed an answering computer called Watson, is now being applied to Aging-in-Place support for isolated seniors in Japan and Italy, two countries that are leading the demographic transition of an aging world. Cognitive 'assistants' designed to understand and interact, along with aging-accessible mobile technologies are examples that will be presented in a case study from Bolzano, Italy where IBM is implementing an optimized aging in place solution to support caregivers to make informed decisions and enhance both quality of life and safety. In a second case study from Japan, IBM research will demonstrate how pioneering text analytics and accessibility technologies (such as natural language analysis and tracking) have been used to connect rural older adults to health services through Japan Post. We will report the results of the expansion of these large-scale demonstrations of how technology device-based services can preserve personal dignity and independence.

PARTNERING TO BETTER SERVE VULNERABLE OLDER ADULTS: THE OPTIMIZE AGING COLLABORATIVE

A. Chodos, A. Neumann, J. Rivera, J. Myers, R. Frazier, L. Walter, *University of California, San Francisco, San Francisco, California*

All U.S. communities are facing the demographic imperative of serving increasing social and medical needs of older adults. Despite this, there is poor integration of social and medical services, and most professionals working with older adults do not have formal training in key knowledge

areas related to the care of older adults. In San Francisco, we formed a partnership of public, private and academic groups engaged in aging services, called the *Optimize Aging Collaborative*, with the goal of training all professionals in the skills needed to be competent in responding to the needs of all older adults. We included a specific focus on particularly vulnerable older adults- those who live alone, who are lesbian, gay, bisexual or transgender, or who have dementia. We will demonstrate how our collaborative has increased knowledge and commitment to improve the well being of older adults and which elements of this partnership contribute to its success.

SESSION 3005 (SYMPOSIUM)

CREATING CARING COMMUNITIES: SOCIAL CAPITAL FORMATION AND AGING IN PLACE

Chair: A.E. Scharlach, *University of California, Berkeley, California*

Discussant: T. Scharf, *Newcastle University, United Kingdom*

Communities throughout the world are seeing the emergence of new types of consumer-driven support structures to promote aging in place, driven in part by global transformations in traditional family and societal supports. Of particular interest are grassroots community-based efforts that not only provide needed assistance, but also promote social connection, meaningful activity, civic engagement, and an increased sense of communal trust and solidarity. This symposium examines existing evidence regarding four of these initiatives: the Village model (US, Netherlands, Australia), Supportive Communities (Israel), Active Caring Communities (Belgium), and civil society voluntary care networks (Sweden). In the Village model, older community members create their own elder-led support organizations, assuming primary responsibility for operations, financing, and peer support. In Supportive Communities, a retired community member serves as a convener and key source of social and instrumental support, with administrative and financial assistance from the government. Active Caring Communities involve a neighborhood-organized model of care that supports frail older people to age in place in deteriorated neighborhoods. Finally, Swedish data examine the growth of peer and cross-generational informal assistance networks in the context of declining societal supports for older adults. Leading scholars will critically examine existing knowledge regarding each of these approaches, with particular attention to the ways in which they contribute to individual well-being, community social capital, and the ability to age in place.

FOSTERING SOCIAL CAPITAL THROUGH THE VILLAGE MODEL

A.E. Scharlach, C.L. Graham, *Social Welfare, University of California, Berkeley, California*

The Village model is an innovative approach to aging in place through social capital development, reflecting Villages' unique combination of community development, consumer direction, social engagement, civic engagement, and collective bargaining for services. This paper reports findings from a 3-year longitudinal study of 191 members of seven

US Villages regarding social impacts of Village membership. During their first 36 months as Village members, respondents experienced significant increases ($p < .05$) in the amount of interpersonal contact, group participation, ability to get help with routine tasks, ability to get places when needed, and feeling of belonging to a community. Earlier qualitative data revealed that the benefits of Village membership reported most frequently were the security of knowing that help was available when needed, social activities, and the sense of being part of a community. These findings are discussed regarding their relevance for social capital development in emerging models of community-based support.

AGING IN PLACE IN A SUPPORTIVE COMMUNITY

S.Y. Hantman¹, I. Hemel², 1. *Tel-Hai College, Tel Hai, Israel*, 2. *Upper Galilee Municipality, Upper Galilee, Israel*

This presentation describes the Supportive Community Program in a rural community in the north of Israel. The current demographic, social and economic changes the modern Kibbutz is undergoing in the last two decades created a renewed look at the services for the aged. One answer to these phenomena is the Supportive Community Program that underscores the role of the older adult as an equal partner in planning and creating a working community that will be accessible, suitable and flexible encouraging aging in place. This program, instigated by JDC - Eshel, is a package of services provided to older adults living in a designated geographic community. It reduces the need for the older adults to move out of their homes into institutional facilities as they age and their functional abilities decline, and allows them to remain at home in their communities by delivering the necessary services to them.

CARE CONVOYS WITHIN AN ACTIVE CARING COMMUNITY

D. Lambotte, L. De Donder, A. Smetcoren, T. Kardol, B. Team, *Vrije Universiteit Brussel, Brussels, Belgium*

This study aims to provide insights into the dynamic, diverse and multilayered characteristics of older persons' care networks. Longitudinal data used were gathered during three interview periods (2014, 2015, 2016) from the "Active Caring Community" project. The project is one of the six Care Living Labs in Belgium. 12 focus groups ($N = 98$) and 11 individual interviews with older people living in Antwerp and in 2 neighborhoods in Brussels are analyzed. Results indicate that care networks of older people are very diverse including a complex interplay between family, neighbors, social networks, semi-professionals and formal caregivers. Care networks are multidimensional whereby informal and formal caregivers differ in positioning according to the structure, function and adequacy of the provided care. Furthermore, turnover moments during the life course demonstrate the dynamic aspect of care convoys. Several policy recommendations to support care convoys within an Active Caring Community will be discussed.

CIVIC INVOLVEMENT AMONG CITIZENS AGE 75+ IN SWEDEN: PROFILES AND PATTERNS OF CHANGE

M. Jegermalm^{1,2}, E. Jeppsson-Grassman³, 1. *Social Sciences, Ersta Skondal UC, Huddinge, Huddinge, Sweden*, 2. *Dalarna University, Falun, Sweden*, 3. *Institute for the Study*

of Ageing and Later Life (NISAL) Linköping University, Department of Social and Welfare studies, Linköping, Sweden

The demographic trend with aging populations is a challenge for the welfare states, and old-old people are viewed as recipients of care and as a burden. In contrast to this view this paper discusses *volunteering in organizations* and *informal caregiving* among community-residing persons aged 75+ in Sweden. A country characterised as a 'Public-Nordic' welfare model, where one would expect civic involvement to be of less importance. The presentation will be based on a national statistical representative survey repeated five times in the period 1992–2014. The results challenge the view of seeing old-old people as mere recipients of services and care. Many people 75+ are actors in civil society – in fact they were the single age group where volunteering had increased the most over time. The findings challenge simplistic interpretations of the role of the welfare state - the public sector seemed to have an enabling function for civic involvement.

SESSION 3010 (SYMPOSIUM)

AGING AND MENTAL HEALTH: GLOBAL PERSPECTIVES

Chair: S. Cummings, *University of Tennessee*
Co-Chair: W. Li, *James Cook University, Townsville, Queensland, Australia*
Discussant: N. Kropf, *Georgia State University, Atlanta, Georgia*

Globally, the number of elders is growing at an unprecedented rate. As the older population continues its inexorable growth, so does the number of older adults with mental health disorders, such as Alzheimer's Disease, depression, anxiety, schizophrenia and substance abuse. The WHO estimates that 20% of older adults worldwide have neurological and psychological disorders (2015). The number of those with dementia is expected double to over 81 million by 2040. Late-life depressive disorders are also prevalent and are the leading cause of disability in older adults worldwide. Mental disorders lead to increased morbidity and mortality in older adults, and generate significant social and economic burdens in terms of increased strain on families and higher medical costs for societies. Mental health and well-being of older people across the globe are influenced by varying personal characteristics, cultural factors, familial constructs, and national policies and resources. This symposium will provide an understanding of issues related to ageing and mental health from a global perspective. Gerontological experts representing North American, Oceania, Europe, South Asia and East Asia will discuss the status of aging and mental health in their countries including prevalence, culture, caregiving, policies and services. With the continued global expansion of older populations, developing effective approaches to address geriatric mental health disorders is essential for the social and financial well-being of nations. The need for policies and aged care services to respond to the diversity in mental health issues for elders in socially, culturally, and geographically different settings will be discussed.

AGING AND MENTAL HEALTH: THE U.S. PERSPECTIVE

S. Cummings, S. Trecartin, *University of Tennessee, Knoxville, Tennessee*

By 2040 21% of those living in the U.S. will be 65 years of age and older. U.S. citizens come from different cultures and bring with them varying views of aging. However, the U.S. has long been a country with a primary focus on youth. Even though the U.S. population is rapidly becoming older, ageism persists. It is estimated that 20% of the older population experience mental health problems, including dementia, depression, anxiety and substance misuse. However, ageism and mental health stigma create barriers to adequate attention being focused on later-life mental health issues. National health insurance programs reimburse for mental health services for older adults, and recent federal policies have increased insurance compensation for mental health disorders. However, application of the federal policies vary by state, and service gaps still exist. Cultural and political factors impacting older adult mental health services will be considered.

MENTAL HEALTH IN LATER LIFE—AN AUSTRALASIAN EXPERIENCE

H. Park³, W. Li², 2. *James Cook University, Townsville, Queensland, Australia*, 3. *Western Sydney University, Sydney, New South Wales, Australia*

Both Australia and New Zealand are ageing societies where their populations are growing older and more diversified. As is the case in most developed nations, a significant proportion of older people experience mental health issues in their everyday lives in these nations. The prevalence of mental illness, ranging from depression to dementia, is significantly increasing among older adults across genders, cultures and ethnicities. Consequently, there is greater pressure on the health and social care system to meet the needs of older adults with mental health conditions, and such challenges will be constant in coming decades. This presentation provides an outline of ‘mental health in older adults’ in Australian and New Zealand contexts. It also discusses major issues associated with services and policies, alongside current programmes and practice models, in mental health care for older people in both societies. Cultural influences and caregiving realities are addressed for further discussion.

AGEING AND MENTAL HEALTH IN JAPAN, KOREA, AND INDIA

H. Kase, *School of Human Sciences, Waseda University, Tokorozawa, Saitama, Japan*

One of the most common features of ageing in Japan, Korea and India is the rapid expansion in the proportion of older adults. For example, the share of India’s population aged 60 and older is projected to climb from 8 % in 2010 to 19 % in 2050. This population ageing is likely to be associated with a further increase in the number of older adults with mental health problems in these countries. The prevalence of dementia is 8-10% of aged population in Japan, 8.1%-8.9% in Korea, and has been shown to vary from 0.84% to 6.7% in Indian studies. This presentation will discuss current issues and practices related to mental health in older adults in these three nations. The presentation will also

address the importance of community-based mental health service delivery systems to meet growing needs on long-term care and mental health services, and to reduce a financial burden on medical care.

SWITZERLAND: TOWARD AN INCREASING AWARENESS OF OLD PEOPLE’S MENTAL HEALTH

E. Galleguillos, *University of Lausanne, Lausanne, Switzerland*

In Switzerland, there is strong evidence of the significant human, social, and economical consequences of mental health problems. Although the country has one of the highest life expectancies in the world, with over 17% of the Swiss population being over 65, interest in mental health in later life is lacking. Moreover, despite a performing and expensive healthcare system, the federal structure and subsidiarity characterizing the Swiss political system tend to impede the implementation of coherent mental health policies. This presentation provides data regarding the prevalence of mental disorders affecting the elderly and current key policy debates.

BEYOND TRADITIONAL VALUES: MENTAL HEALTH IN LATER LIFE IN CHINA AND HONG KONG

A. Au¹, W. Li², 1. *Hong Kong Polytechnic University, Hong Kong, China*, Hong Kong, 2. *James Cook University, Townsville, Queensland, Australia*

According to the World Bank, China has the fastest aging population in human history. Strongly influenced by filial piety, there has been a culture of honoring an older person as a ‘treasure at home’ However due to various factors including rapid urbanization and associated policies, empty nest households are becoming more prevalent in Mainland China. In Hong Kong, traditional values are eroding, reinforced by a decline in the social status of older adults as a result of relatively low levels of education and lack of gainful employment. Moreover, social stigma and ‘face saving’ are prevalent in Chinese cultures. Mental illness is considered shameful. Negative stereotypes affect intervention models. This presentation examines the development of mental health services in China as well as the unique challenges faced by the different regions, including the paucity of community services in the Mainland and the sustainability of health/ community care in Hong Kong.

SESSION 3015 (SYMPOSIUM)

USING MOBILE APP AND INTERGENERATIONAL SUPPORT TO HELP OLDER ADULTS LEARN DIABETES SELF-MANAGEMENT

Chair: S. Wu, *University of Southern California, Los Angeles, California*

Discussant: H. Ya-Hui, *Taipei Tzu Chi Hospital, New Taipei City, Taiwan*

Diabetes is a prevalent chronic disease and a major medical disability worldwide. It affects 1 in 5 older people in Taiwan. Better self-management and greater social integration are effective means to contribute to active aging. Internet and mobile technology offer great potentials to improve diabetes self-management and social integration.

Older adults, however, are less likely to use such technology. This symposium will introduce the Intergenerational Mobile Technology Opportunities Program (IMTOP) designed to motivate and train older adults to use mobile technology for diabetes self-management. The IMTOP curriculum is based on the evidence-based Chronic Disease Self-Management Program (CDSMP) combined with tablet and Internet skill training, and delivered in 8 weekly sessions of 2-hour long small group classes. Two innovative components of IMTOP are: 1) using a graphic-based aging-friendly touchscreen diabetes self-management app to activate self-monitoring and behavior change; and 2) deploying college students as volunteer teaching assistants to provide intergenerational and technological support. To understand the program effects, a wait-list control trial with 350 people age 55 and older with diabetes was conducted in Taiwan in 2 hospital outpatient settings. College students were recruited from local universities to serve either as volunteers or as pure control (140 in each group). Five presentations in the symposium will discuss the IMTOP research design, the app development and usage, the obstacles and motivations of using the diabetes app, and the preliminary outcomes between the intervention and wait-list control groups, and qualitative analysis of the young volunteers' experiences in the program.

RESEARCH DESIGN OF THE INTERGENERATIONAL MOBILE TECHNOLOGY OPPORTUNITIES PROGRAM (IMTOP) IN TAIWAN

S. Wu, H. Hsiao, I. Chi, *School of Social Work, University of Southern California, Los Angeles, California*

The IMTOP study creatively integrates group-learning activities, the CDSMP, and skill training for using mobile tablet and a home-grown diabetes app for older adults, along with intergenerational support by college students. The 16-hour training curriculum teaches older adults to use a tablet device and an app to learn about the CDSMP and to help activate their monitoring and behavior change for diabetes self-management. The program was delivered through a small group class setting with 10 older adults and 4 college students serving as volunteer assistants to teach technology use. The quasi-experimental trial recruited 350 older diabetes patients from two outpatient clinics and 280 college students in Taiwan. The older adults were assigned to immediate intervention or 4-month wait-list control group and were followed up every 4 months for 3 times. The college students were assigned to intervention or control group and were assessed using mixed-methods evaluation up to 4 months.

DEVELOPMENT OF A DIABETES SELF-MANAGEMENT APP AND ANALYSIS OF USAGE PATTERNS AMONG OLDER PATIENTS

S. Wu, H. Hsiao, I. Chi, P. Lee, *School of Social Work, University of Southern California, Los Angeles, California*

This presentation will describe how an interdisciplinary team developed a diabetes self-management App specifically taking into account older adults' engagement with technology. The IMTOP Diabetes App used a graphic-based interface to help the older adults to record their biomarkers and health behaviors for self-management of type 2 diabetes. The data, presented in the forms of daily, weekly and long-term

charts, facilitates patient self-service visual analytics and their communication with healthcare providers. The evaluation framework for mobile health applications developed by Singh et al. was applied to evaluate the app development in terms of patient engagement, quality, and safety. Using quantitative data from app usage and follow up questionnaires, the research team plots the usage pattern and compares the perception of app usefulness between high and low intensity users. Preliminary data shows regular app users significantly reduced diabetes symptoms.

ANALYSIS OF OBSTACLES AND MOTIVATIONS FOUND UTILIZING A DIABETES HEALTH APP FOR OLDER PATIENTS

M. Li², A. Hagedorn¹, T. Yi Chuan¹, L. Pan², S. Wu¹, H. Hsiao¹, I. Chi¹, *1. School of Social Work, University of Southern California, Los Angeles, California, 2. Shih Chien University, Taipei, Taiwan*

Daily health behaviors for older adults managing diabetes can be improved using mobile applications (APPs). The Intergenerational Mobile Technology Opportunities Program (IMTOP) taught 350 older adults diabetes self-management principles and tested a new application. We conducted 4 qualitative focus groups with 52 participant's ages 55–75 who were either heavily or weakly engaged participants reporting their health behaviors via the APP. We use the Task-Technology Fit model to study APP adoption issues during an 8-week diabetes management course. The main findings of obstacles include: poor disease health management behavior before participation, lack of social network with other diabetic patients, lack of friendly environment or user-friendly device available, concern the app is too complicated, and lack of technical support. The most motivated App users reported: positive attitude about disease management, strong utilization of the APP, expectation the scientific evidence would benefit them, and willingness to engage in diet control and exercise behavior.

THE EFFECTS ON HEALTH AND WELL-BEING OF OLDER DIABETES PATIENTS USING IMTOP MOBILE APP IN TAIWAN

I. Chi, S. Wu, H. Hsiao, P. Lee, *School of Social Work, University of Southern California, Los Angeles, California*

This presentation aims to understand the effects of the IMTOP participation on the disease self-management, health outcomes and quality of life among older adults with type 2 diabetes. A total of 350 older adults (aged 55 and above) with Type 2 diabetes were recruited from 2 hospitals in Taiwan and assigned to the immediate intervention group (n=165) or 4-month waitlist control group (n=185). Patients were assessed at baseline and every 4 months for up to 12 months post intervention. Health status, diabetes symptoms and self-care, social engagements, patient empowerment, use of technology, depression, and quality of life were measured repeatedly. After participating in the intervention, the pre-post changes for the intervention group were significantly better than the waitlist group at 4-month in terms of physical health status, diabetes self-care, use of mobile technology, and overall quality of life. In addition, the intervention group was less depressed compared to its counterpart.

HOW YOUNG ADULTS CHANGED ATTITUDES TOWARD AGING AND HEALTH THROUGH IMTOP VOLUNTEERING EXPERIENCE

H. Hsiao, S. Wu, I. Chi, *School of Social Work, University of Southern California, Los Angeles, California*

Providing young adults opportunities to teach older adults mobile technology may have positive impact on their attitudes towards aging and health awareness. In this presentation, the experience of 140 IMTOP college student in Taiwan who served as IMTOP volunteers for 8 weeks was analyzed qualitatively using thematic coding by 2 researchers. The volunteers received preparatory training to learn about the concepts of aging and motivational interviewing. They then provided 16-hour services to teach older adults mobile technology skills related to learning about the CDSMP and the IMTOP app. From their self-reflections, young volunteers reported that the most important things they learned from this experiences were effective communication skills with older adults and health knowledge. The intergenerational interaction broke down their stereotypes about older adults and developed their empathy and patience with better understanding of difficulties and challenges older adults encounter when using technology products. Their health awareness was also enhanced.

SESSION 3020 (SYMPOSIUM)

WHAT PIAAC TELLS US ABOUT EDUCATION AND TRAINING, COMPETENCIES AMONG OLDER ADULTS, AND LABOR MARKET

Chair: J. Soroui, *American Institutes for Research, Washington, District of Columbia*

Co-Chair: P. Cummins, *Miami University, Oxford, Ohio*

Discussant: R. Harootyan, *Senior Service America Inc, Silver Spring, Maryland*

In March 2016, the National Center for Education Statistics of the U.S. Department of Education, released results from the Program for the International Assessment of Adult Competencies (PIAAC). The 2016 report is based on data collected in 2011–2012 and in 2013–2014. Together, the two rounds of PIAAC household data collection provide a nationally representative sample of 8,670 noninstitutionalized adults ages 16–74 in the U.S.

In addition to assessing key information-processing skills -- literacy, numeracy, and digital problem solving, participants also responded to an extensive background questionnaire on their educational attainment, employment, skill use at work and at home, as well as demographic questions, and questions related to health status and preventive health.

The PIAAC results indicate a strong relationship between age and performance in all three cognitive domains. In both literacy and numeracy domains, a smaller percentage of adults ages 45–74 performed at top proficiency levels than adults ages 25–34 and 35–44, and a larger percentage of adults ages 45–74 performed at the lowest proficiency levels compared to younger adults.

The first presentation will give an overview of PIAAC and key results for older adults. The second will use PIAAC data to examine relationships between skills and variables such as participation in formal and non-formal education and

training programs and employment, as well as labor force participation and income, for adults aged 45 to 65. The third presentation will examine associations between labor force participation, health status, and cognitive skills among adults aged 66 to 74.

SKILLS OF U.S. OLDER ADULTS: PROGRAM FOR THE INTERNATIONAL ASSESSMENT OF ADULT COMPETENCIES (PIAAC)

J. Soroui, *American Institutes for Research, Washington, District of Columbia*

This presentation is based on the results of the Program for the International Assessment of Adult Competencies (PIAAC) conducted in 2012 and 2014 in the U.S. and 33 countries. In the U.S. the study administered in 2012 and 2014 to a nationally representative sample of 8,670 adults ages 16–74. As a large-scale study, PIAAC is focused on measuring adults' key cognitive skills, including literacy, numeracy and digital problem solving, and the relationships between these skills and individuals' background and demographic characteristics. This session provides an overview of the study plus a comparison of results in the U.S. and other countries by demographic characteristics including age groups, with a focus on skills gaps between the younger and older populations in the U.S. and internationally. The PIAAC results indicate that the skills gap between the older and younger generation in the U.S. is smaller than other countries which may have significant policy implications.

ASSOCIATIONS BETWEEN EMPLOYMENT STATUS AND COMPETENCIES AMONG OLDER WORKERS IN THE UNITED STATES

T. Yamashita³, P. Cummins^{2,1}, A. Arbogast¹, 1. *Scripps Gerontology Center, Miami University, Oxford, Ohio*, 2. *Scripps Gerontology Center, Oxford, Ohio*, 3. *University of Nevada Las Vegas, Las Vegas, Nevada*

Over the past two decades, there have been substantial increases in labor force participation rates for ages 65 to 74: approximately 21% of males were in the labor force in 1994 and participation is expected to increase to 34% by 2024. Increases for older women over the same period were even greater (14% to 26%). It is critical to seek systematic strategies to promote employment security or to avoid unemployment among aging workers. This study analyzed the U.S. data from the Program for the International Assessment of Adult Competencies (PIAAC) to examine the association between labor force participation, health status and a series of competency indicators (i.e., literacy, numeracy skills) among adults aged 66 to 74 years old. Results showed that greater competencies were associated with higher chance of being employed. Additionally, older adults with better self-rated health had more proficient literacy and numeracy skills.

EDUCATIONAL PROGRAMS FOR OLDER ADULTS: OUTCOME ANALYSIS AND COUNTRY COMPARISONS USING PIAAC DATA

P. Cummins^{2,1}, S.R. Kunkel^{2,1}, 1. *Scripps Gerontology Center, Miami University, Oxford, Ohio*, 2. *Scripps Gerontology Center, Oxford, Ohio*

Continuous learning over the life course is necessary to effectively compete in a knowledge-based global economy.

Shifts in the age structure of the U.S. labor force combined with increased labor force participation among older adults add to the importance of gaining a better understanding of how adult education and training (AET) influences labor market outcomes for middle-aged and older workers. This study used U.S. data from the Program for the International Assessment of Adult Competencies (PIAAC) to examine the relationship between participation in AET programs and employment, labor force participation, and income for adults aged 45 to 65. Participation in an AET program significantly improved the log odds of both employment and labor force participation and significantly improved the log odds of moving up one income quintile. We also compared outcomes of AET participation in the U.S. with those in Germany, Japan, Sweden, and the U.K.

SESSION 3025 (SYMPOSIUM)

GSA DONALD P. KENT AWARD LECTURE AND ROBERT W. KLEEMEIER AWARD LECTURE

Chair: V. Mor, *Brown University, Providence, Rhode Island*
S. Olshansky, *University of Illinois at Chicago, Chicago, Illinois*

The Donald P. Kent Award Lecture will feature an address by the 2016 Kent Award recipient, S. Jay Olshansky, PhD of University of Illinois at Chicago. The Kent Award is given annually to a member of The Gerontological Society of America who best exemplifies the highest standards of professional leadership in gerontology through teaching, service, and interpretation of gerontology to the larger society.

The Robert W. Kleemeier Award Lecture will feature an address by the 2016 Kleemeier Award recipient, Vincent Mor, PhD of Brown University. The Kleemeier Award is given annually to a member of The Gerontological Society of America in recognition for outstanding research in the field of gerontology.

AGING SCIENCE HAS COME OF AGE

S. Olshansky, *University of Illinois at Chicago, Chicago, Illinois*

The seeds of aging science were planted thousands of years ago – but visible today is a fully blossomed tree that should bear fruit in our lifetime. The tree of aging science took root in the late 19th century; sprouted in the early 20th century; become full grown during the last 50 years; and now appears ready to yield benefits that could rival the most important discoveries in public health. Here I will tell the story of one branch of aging science that has led to the modern realization that our longer lives are a wonderful gift -- but it came with a Faustian trade. The longer we live, the more important biological aging becomes as a risk factor for fatal and disabling diseases. Continued life extension using the current medical model could yield an extended period of frailty and disability – A new paradigm of public health is now warranted.

FROM CLINICAL ASSESSMENTS TO POPULATION DATA: FROM VISION TO REALITY

V. Mor, 1. *Health Services, Policy & Practice, Brown University, Providence, Rhode Island*, 2. *Providence Veterans Administration Medical Center, Providence, Rhode Island*

Sidney Katz believed that structuring clinical assessments determines the quality of information and this was reflected in the 1987 Nursing Home Reform Act, which mandated all residents be comprehensively assessed using a standardized instrument. Over the last 30 years these assessments, now computerized and linked to Medicare and Medicaid claims, have transformed our knowledge of long term care populations, services and policies. Enlightened facilities stratify risk, target treatment and conduct quality improvement interventions. Researchers link assessment and utilization data, longitudinally tracking patients and create facility, county, state and year aggregates for public use. These data facilitate policy evaluation, pharmaco-epidemiology and comparative effectiveness studies. Most recently, pragmatic cluster randomized trials of quality innovations are undertaken, rivaling research being done by hospital systems. This lecture documents a career shaping this transformation of knowledge and practice, revealing the great opportunities that remain.

SESSION 3030 (SYMPOSIUM)

EXAMINING AGING AND SOCIAL INCLUSION THROUGH DIFFERENT LENSES

Chair: P. Marier, *Concordia University, Montreal, Quebec, Canada*

Co-organised by the Centre for Research and Expertise in Social Gerontology (CREGES) and the research team dedicated to the study of aging and social exclusion (VIES), this interdisciplinary symposium studies diverse groups of older adults (immigrants, lesbians, users of health and social services, and older women) and how they experience various forms of social inclusion and exclusion in their daily lives, be it by public authorities and the community in general. The contributions also analyse how social exclusion and inclusion affect older adults.

Dr. Marier provides an analysis of the concept of autonomy, how it is used in the health and social service sector, and how its use in evaluation tools can result in diverse forms of social exclusion with marginalized groups experiencing less access to services. Ms. Beauchamp presents results of a series of interviews with lesbian older adults on their experience with agism and heterosexism. Her findings reveal a lack of social recognition and visibility, but also a willingness on their part to play a more predominant societal role. Dr. Brotman studies the lived experiences of immigrant older adults and uncover the common structural stressors that affect their well-being. She will highlight the roles of the community and of government to support older immigrants and to ensure their social inclusion. Dr. Wallach discusses the effects of Western society's beauty norms on older women and how an aging female body can lead older women to experience social exclusion, not only by others but largely by self-social exclusion.

CHALLENGING AUTONOMY: A COMPARATIVE ANALYSIS AND A VIEW FROM CANADIAN OLDER ADULTS

P. Marier^{1,2}, A. Dubé³, D. Dickson^{1,2}, 1. *Concordia University, Montreal, Quebec, Canada*, 2. *Center for Research and Expertise in Social Gerontology, Montreal,*

Quebec, Canada, 3. Université de Montréal, Montreal, Quebec, Canada

This paper presents an in-depth analysis of the conceptualization of autonomy, as it pertains to older adults. The concept of autonomy plays a prominent role among health and social service professionals as it is used to measure physical and cognitive decline. However, the social gerontology literature has strongly criticized the lack of social considerations and the omnipresence of biomedical tools to address the needs of seniors. This reliance on biomedical tools can result in diverse forms of social exclusion with marginalized groups experiencing less access to services. Focus groups with older adults were conducted in their local retiree associations and in representative organizations. Preliminary findings reveal the extent to which older adults presented a different and more nuanced understanding of autonomy. Interviewees emphasized the lack of governmental support and, as a result, stress the importance of family, friends and even neighbors to ensure that aging in place is possible.

THE PERCEPTIONS OF AGING AMONG GAY AND LESBIAN OLDER ADULTS: SOCIAL EXCLUSION OR INCLUSION?

J. Beauchamp^{1,2}, L. Chamberland¹, H. Carbonneau³, 1. Université du Québec à Montréal (UQAM), Montreal, Quebec, Canada, 2. Center for Research and Expertise in Social Gerontology, Montreal, Quebec, Canada, 3. Université du Québec à Trois-Rivières (UQTR), Trois-Rivières, Quebec, Canada

Ageism and heterosexism as social exclusion processes can contribute to the social invisibility of gay and lesbian older adults. This contribution wishes to shed a light on the perceptions of aging and on the place of older gay and lesbian people in society, as perceived by gay and lesbian older adults. It is based on the results of semi-structured individual interviews conducted with 22 gay and lesbian older adults aged 60 and over. The participant's discourses reveal, among others, two elements: a lack of social recognition and visibility of gay and lesbian older adults in society as well as the willingness to assert themselves and take their place. The discussion will propose a reflection of the intersection between sexual orientation, age and generation to examine the dual process of social exclusion, due to ageism and heterosexism, and of social inclusion.

THE AGING FEMALE BODY, AGEIST BEAUTY NORMS, AND SOCIAL EXCLUSION: FROM INTERNALIZATION TO RESISTANCE

I. Wallach^{1,2}, L. Chamberland¹, J. Lavigne¹, J. Beauchamp^{1,2}, J. Duford¹, G. Miller¹, 1. Université du Québec à Montréal (UQAM), Montreal, Quebec, Canada, 2. Center for Research and Expertise in Social Gerontology, Montreal, Quebec, Canada

The preservation of youth is a main issue in Western societies resulting in the predominance of ageist beauty norms. Our research aims to determine whether these standards have negative effects on older women and lead them to experience social exclusion. Favouring a qualitative approach, this research is based on individual interviews with 20 women aged 64 to 83, lasting an average of 1h45, and analyzed using a thematic approach. The participant's discourses reveal the

internalization of beauty norms focussed on youth and the perceived pressure to attain these. Even though some women feel socially excluded by others due to an aging body, these ageist beauty norms mostly lead to experiences of self-social exclusion (choice of clothing, social activities that required a bare body, engagement in new intimate relationships). However, the results reveal that many are critical of these beauty standards, highlighting their agency against the exclusion of older female bodies.

EXPERIENCES OF IMMIGRANT OLDER ADULTS: STORIES OF DIVERSITY AND EXCLUSION

S. Brotman^{1,2}, I. Ferrer^{1,2}, S.D. Koehn³, M. Badger³, K. Sohng¹, A. Lang¹, K.N. Li³, S. Bukhari³, 1. McGill University, Montreal, Quebec, Canada, 2. Center for Research and Expertise in Social Gerontology, Montreal, Quebec, Canada, 3. Simon Fraser University, Burnaby, British Columbia, Canada

This paper presents the results of a narrative-photovoice project on the life stories of 18 older immigrants living in two Canadian provinces. The objective was to deepen our understanding of the diverse lived experiences of immigrant older adults (those who immigrated in later life and those who immigrated earlier and aged in Canada). Findings reveal factors impacting the immigrant aging experience, including language barriers, income (in)security, family and transnational relationships/obligations, work, retirement, health, social isolation, community engagement, and quality of life. Photographs provided visual documentation of significant places, objects, and people that embody the struggles and rewards of aging. Our study uncovers significant heterogeneity among immigrant older adults and common structural stressors that deserve attention from policy-makers and service providers. Results highlight the community sector as an outlet for engagement, information and social connection, and the role of government in funding services and programs to support older immigrant adults.

SESSION 3035 (SYMPOSIUM)

HEALTHCARE TRANSITIONS: CHALLENGES OF IMPLEMENTATION IN PATIENT-CENTERED RESEARCH

Chair: A.K. Hughes, Michigan State University, East Lansing, Michigan

Researchers from the MISTT (Michigan Stroke Transitions Trial) study will discuss the development and implementation of this patient-centered practical trial aimed at improving the transition from hospital to home for acute stroke survivors and their caregivers. Interventions in stroke rarely focus on the post-acute hospital phase and few have been patient-centered. This intervention is innovative in that it focusses on patient and caregiver psychosocial needs as well the typical physical ones. The three presentations in this symposium will provide an overview of patient-centered healthcare transition research which situates the MISTT project in the context of these two frameworks. In addition, an overview of the MISTT study development and implementation will be provided. Lastly, the challenges associated with implementation of patient-centered transition projects will

be discussed, as well as the specific challenges that this project is facing in the field. As is typical of much intervention research this team faced challenges with recruitment. The evaluation of and problem solving around those challenges will be described, as will the outcomes of changes to the recruitment process. This team also faced challenges associated with the incorporation of technology in the intervention. Lessons learned and suggestions for future research will be presented.

SETTING THE STAGE: HEALTH CARE TRANSITIONS AND PATIENT CENTERED RESEARCH

A.T. Woodward, *Michigan State University, East Lansing, Michigan*

The transition from hospital to home is a challenging period for older patients with comorbid illnesses and complex physical, psychological, and social needs. Many patients are slow to recover because of poor access to follow up care, education, and information. Caregivers report high levels of burden and stress. Rehospitalization rates for complex patients are high. While many existing transition-based intervention studies have been effective, most are not patient-centered. For example, they tend to be hospital-based despite patient and caregiver reports that they cannot fully absorb information in the hospital and do not yet know what help they will need. A patient-centered approach that engages patients and caregivers early in the process would suggest that a home-based transition intervention would be preferable. This presentation will provide an overview of patient-centered research, particularly within the context of health care transitions.

THE MISTT STUDY

A.K. Hughes, M. Reeves, M. Fritz, *School of Social Work, Michigan State University, East Lansing, Michigan*

Michigan Stroke Transitions Trial (MISTT) is a practical clinical trial that aims to improve patient and caregiver experiences of healthcare transitions after an acute stroke. Potential participants are recruited in the inpatient setting and randomized to one of three conditions- usual care, social work case management, or social work case management plus access to a curated website of stroke information and resources. The social work case management intervention was developed with input from patients and caregivers who mirrored our study population. Their input informed the four aspects of the intervention that we think characterize a “good transition”: support (emotional and practical); preparedness; addressing unmet needs; and stroke prevention. The MISTT trial is funded by PCORI (Patient Centered Outcomes Research Institute) and we expect to enroll 480 participants from four sites over the course of the trial. Our primary outcome measures are changes in levels of patient activation, caregiver strain, quality of life, and depression.

MISTT: IMPLEMENTATION CHALLENGES

P. Freddolino, *Michigan State University, East Lansing, Michigan*

Many randomized control trials (RCTs) encounter implementation challenges and MISTT has been no exception. The most salient challenges have come in two areas.

Recruitment issues have included lower census of stroke patients than expected in the providing hospitals; and some

differences in perspective by hospital staff on the nature of research and the purpose of this particular project by staff on whom the project depends to initiate recruitment.

Developing the technology tool – essentially a web portal – has been more complex than anticipated. While the content was based on what survivors and caregivers in our pilot phase indicated would be important, a usability evaluation indicated the need for major revisions in the organization and presentation of content. Also, there was less interest in using the web site than expected based on pilot participant interviews.

The presentation will report on how the team became aware of these challenges, the steps developed to address them, and the results of changes made.

SESSION 3040 (SYMPOSIUM)

ORAL HEALTH IN LATER LIFE: RESEARCH CHALLENGES, OPPORTUNITIES, AND INNOVATIONS

Chair: D. Carr, *Rutgers University, New Brunswick, New Jersey*

Discussant: G.S. O’Neill, *The Gerontological Society of America*

One of the most serious yet under-researched concerns among older adults is oral health. Mounting population-based research demonstrates stark socioeconomic, ethnic, and regional disparities in service utilization, edentulism, and untreated decay. Practitioners have identified poor quality oral health among long-term care residents, due in part to lack of training among staff and family caregivers. This panel brings together population health researchers and practitioners to identify the challenges in studying and treating oral health among older adults in the U.S. and Canada. Wu and Luo describe oral health disparities in the United States. Using National Health Interview Survey data, they also reveal vast heterogeneity in the dental health of Asian Americans, and delineate the role of language and cultural factors in explaining these disparities. Zwetchkenbaum and Carr provide an overview of large longitudinal data sets in the United States that are well-suited to studying oral health and its psychosocial correlates over the life course, and recommend future data collection initiatives. Yoon and Hoben describes gaps in research and assessment of the oral health concerns of long-term care residents, and present newly developed, valid assessment tools. They present plans for the development of an oral health think tank that will address research priorities identified by key stakeholders. Agha & Lyford describes the philosophies and practices of a holistic dental clinic in the United States, and documents the efficacy of this innovative care coordination model for enhancing late-life oral health. Panelists will propose new research and practice partnerships to further address late-life oral health concerns.

DISPARITIES IN ORAL HEALTH AND DENTAL CARE AMONG OLDER ADULTS IN THE U.S. AND ABROAD

B. Wu², H. Luo³, 2. *New York University, Rory Meyers College of Nursing and NYU Aging Incubator, New York, New York*, 3. *East Carolina University, Greenville, North Carolina*

Oral health disparity reflects some of the greatest challenges in the U.S. This presentation provides an overview

of oral health disparity in older adults across regions, race/ethnicity, socioeconomic status, and nations. Dental care and oral health are strongly correlated. This presentation also presents findings on dental care utilization among several Asian immigrant populations in the U.S. Using data from the 2013 and 2014 National Health Interview Surveys, this study examined acculturation and dental service use among 2,948 Asian immigrants in the U.S. Acculturation was measured by length of stay in the U.S., English language proficiency, and U.S. citizenship. This study found that dental service use varied across Asian immigrant groups. Controlling for socioeconomic status and health behaviors, longer length of stay was significantly associated with having a dental visit ($p < 0.05$). Compared with other adult population, older adults (age 65+) were more likely to seek dental visit.

PSYCHOSOCIAL INFLUENCES ON ORAL HEALTH AMONG OLDER ADULTS IN THE U.S.: DATA RESOURCES AND CHALLENGES

S. Zwetckhenbaum², D. Carr¹, 1. *Rutgers University, New Brunswick, New Jersey*, 2. *Rutgers School of Dental Medicine, Newark, New Jersey*

Disparities in oral health are well documented. Most studies use large cross-sectional health surveys, and document differentials in outcomes such as frequency of dentist visits, edentulism, and untreated tooth decay. However, important questions remain under-explored such as the impact of psychosocial factors shaping oral health treatment, prevention, and quality of life as individuals age. We provide an overview of large longitudinal data sets in the United States that are not widely used for studying oral health, yet have rich information on the family, psychological, and economic factors that enhance or impede oral health. We provide examples of the rich data available in studies like the Wisconsin Longitudinal Study (WLS) and Midlife in the United States (MIDUS), and recommend new data collection and analysis projects informed by the complementary knowledge and skills that social scientists and oral health practitioners bring to the study of later-life oral health.

A PROGRAM OF RESEARCH: IMPROVING ORAL HEALTH OF OLDER ADULTS LIVING IN LONG-TERM CARE

M.N. Yoon¹, M. Hoben², 1. *School of Dentistry, University of Alberta, Edmonton, Alberta, Canada*, 2. *Faculty of Nursing, University of Alberta, Edmonton, Alberta, Canada*

Oral health (OH) and OH care are neglected and sub-standard in long-term care. Poor OH not only compromises general health but also impacts overall quality of life. Despite existing OH care best practices, there are gaps in our ability to translate such evidence into care for frail people. This presentation will outline a program of research aimed at improving OH for older adults living in long-term care. Focus will be given to a) systematic reviews highlighting gaps in research; b) validation work on existing oral health instruments and the development of new psychometrically robust instruments; and c) an oral health think that identified targeted research interventions to address research priorities identified by key stakeholders.

AN INNOVATIVE MODEL OF INTEGRATED ORAL, HEALTH, AND WELLNESS CARE TO ADVANCE SUCCESSFUL AGING

Z. Agha¹, S. Lyford^{2,1}, 1. *Gary and Mary West Health Institute, La Jolla, California*, 2. *The Gary and Mary West Foundation, Solana Beach, California*

Poor oral health is a pervasive health issue for seniors and is associated with increased use of medical services, increased risk for chronic conditions and reduced quality of life. There is growing momentum for innovative holistic and integrated care delivery models to ensure comprehensive, human-centered, and sustainable healthcare that best addresses the needs of seniors. The Gary and Mary West Senior Dental Center, a unique community dental clinic in San Diego, opened in 2016 to provide high-quality oral healthcare coordinated with overall health and wellness services. This clinic integrates over 30 community nonprofits at the Gary and Mary West Senior Wellness Center to provide dental, health, housing services, nutritious meals and critical social and support services, together under one roof. Participants will discuss the development and implementation of the clinic, and will share initial research findings focused on improving health outcomes.

SESSION 3045 (SYMPOSIUM)

AN INTERNATIONAL PERSPECTIVE ON THE ENGAGEMENT OF OLDER ADULTS IN PHYSICAL AND DAILY ACTIVITIES

Chair: J. de Man-van Ginkel, *University Medical Center Utrecht, Utrecht, Netherlands*

Co-Chair: S. Metzethin, *Maastricht University, Maastricht, Netherlands*

Discussant: G. Meyer, *Universitat Witten/Herdecke*

Impaired mobility and functional decline are often the consequence of body changes due to normal ageing or disabling conditions such as a stroke. A need for acute or long-term care is often the consequence. However, professionals tend to focus on completion of care tasks rather than engaging older adults in daily and physical activities. Poor rehabilitation, further deconditioning and functional decline are common consequences of this inactivity. By contrast, professionals should encourage older adults to actively engage in physical and daily activities. These activities need to match with the capabilities and preferences of older adults as well as the care situation, setting and culture. This symposium addresses different studies, which are related to this topic. In the first presentation, an overview will be given of the most promising interventions for maintaining and restoring optimal physical functioning of patients who are in need for care.

The second presentation provides insight into the phenomenon physical activity in German hospitals according to nurses and patients. The third presenter from the US talks about the role of Function Focused Care regarding the prevention and management of sarcopenia. The fourth presenter from Denmark reports about the preliminary results of a randomized controlled trial evaluating a reablement service model. The last presentation will be about the 'Stay Active Home' program, which is recently developed and pilot-tested in the Netherlands.

ENHANCEMENT OF PHYSICAL FUNCTIONING IN THE DAILY NURSING CARE: A SYSTEMATIC REVIEW OF INTERVENTIONS

C. Verstraten¹, J. de Man-van Ginkel¹, S. Metzelthin², M. Schuurmans¹, 1. *Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, Utrecht, Netherlands*, 2. *Maastricht University, Maastricht, Netherlands*

Impaired physical functioning in daily activities are often the consequence of body changes due to normal ageing or disabling conditions. Therefore, nursing care should focus on maintaining and restoring physical functioning of their patients. Although nurses consider initiating and monitoring interventions to be parts of their role, little is known about the interventions they can use in their daily care.

A systematic review was conducted using the Cochrane method and the PRISMA-P guideline, focusing on interventions suitable for daily nursing care. The first search resulted in 2348 hits. Of the finally selected studies, the methodological quality of the studies, the level of evidence of the findings of these studies, and the effectiveness of the interventions will be presented. This will result in an overview of the most promising interventions for maintaining and restoring optimal physical functioning of patients who are in need for nursing care.

PHYSICAL ACTIVITY IN OLDER PATIENTS IN GERMAN HOSPITALS—A QUALITATIVE STUDY

I.T. Schneider, G. Ayerle, G. Meyer, *Martin Luther University Halle-Wittenberg, Halle/Saale, Germany*

Physical activation of older patients is mandatory to avoid loss of independence. A literature review suggests insufficient options for patients' mobility but potential for promotion of physical activity. In 2015/16 a qualitative study in two German hospitals was conducted aimed to describe mobility patterns during typical nursing situations. A phenomenological-hermeneutic approach was used to gain insight into the promotion of mobility in nursing and the meaning of mobility perceived by patients and nurses. Informed consent was obtained by nurses and patients. N= 37 interactions (bathing/dressing, transfer, eating) were observed using non-participating observations followed by focused interviews (nurses n=9, patients n=6). Data were analyzed in order to arrive at a thick description. Results indicate inflexible organizational structures and working processes, time constraints, nurse/patient attitudes, substitution of mobility by related activities carried out by nurses. The study is a first step towards a mobility enhancing nursing climate in hospitals for older patients.

PREVENTING SARCOPENIA: OPTIMIZING FUNCTION AND PHYSICAL ACTIVITY USING FUNCTION-FOCUSED CARE

B. Resnick, E. Galik, *University of Maryland School of Nursing, Ellicott City, Maryland*

Sarcopenia is the age-associated loss of skeletal muscle mass and function. The loss of skeletal muscle mass associated with sarcopenia results in a loss of strength, rate of force development and muscle power. Sarcopenia contributes to functional deficits in mobility and overall functional capacity. To overcome sarcopenia, behavior change that focuses on optimizing protein intake and increasing time spent in

function and physical activity are needed. We developed the Function Focused Care approach to help prevent and manage sarcopenia among older adults. Function Focused Care (FFC), involves teaching and motivating nurses, patients, and other members of the health care team to focus on and optimizing dietary intake and function and physical activity during all care interactions with patients. In this session, we provide the theoretical support for FFC and the successful ways in which to implement Function Focused Care in a variety of clinical settings to prevent and manage sarcopenia.

REABLEMENT IN DENMARK—BETTER HELP, BETTER QUALITY OF LIFE?

T. Rostgaard, L. Graff, *KORA - Danish Institute for Local and Regional Government Research, Copenhagen, Denmark*

Reablement in long-term care for older people is introduced by law in Denmark. Reablement provides a short-term, goal-oriented and multi-disciplinary intervention with the aim of strengthening functional ability in IADL and ADL in community-dwelling older adults. All municipalities must since January 2015 assess the potential for reablement and provide the necessary services. Only if the older person is believed not to have the potential for reablement, is traditional compensatory home help services given. Services are provided by multi-disciplinary teams of social care workers and physio- and occupational therapists, working close together with dieticians, nurses etc. This study presents preliminary results from the first RCT trial of reablement, reporting on changes in quality of life (ASCOT), health related quality of life (EQ-5D), loneliness (UCLA) and physical ability (Barthel) for 540 persons 65+. The study applies a control group design comparing results with persons of the same age receiving traditional compensatory home help.

DOING WITH... RATHER THAN DOING FOR... OLDER ADULTS: THE STAY ACTIVE AT HOME PROGRAM

S. Metzelthin¹, G. Zijlstra¹, J. de Man-van Ginkel², E. van Rossum^{3,1}, G. Kempen¹, 1. *Department of Health Services Research, CAPHRI Care and Public Health Research Institute, Maastricht University, Maastricht, Netherlands*, 2. *Nursing Science Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, Utrecht, Netherlands*, 3. *Research Centre for Community Care, Faculty of Health, Zuyd University of Applied Sciences, Heerlen, Netherlands*

In the Netherlands, 95% of older adults (≥65 years) are community-dwelling with 20% of them receiving homecare services. The 'Stay Active at Home' program focuses on doing self-care and domestic tasks *with* older adults rather than *for* them. The training program for professionals was pilot-tested using a mixed-methods design. Out of 33 professionals, who were invited to participate in the pilot, 20 attended the kick-off meeting of whom 18 agreed to participate in the study; 94% were female with an average age of 43.7 years. Face-to-face interviews showed that professionals particularly valued the practical examples to stimulate active engagement in daily and physical activities and the possibility to exchange experiences with their colleagues. Furthermore, the weekly newsletter with tips & tricks is perceived as useful to remain aware of the needed behavioral change. Overall, a

trend towards better scores for knowledge, self-efficacy and outcome expectation were found.

SESSION 3050 (PAPER)

POPULATION-BASED EPIDEMIOLOGICAL STUDIES

RACIAL DIFFERENCES IN MORTALITY RISK IN THE HEALTH, AGING, AND BODY COMPOSITION (HEALTH ABC) STUDY

M.M. Marron¹, D.G. Ives¹, D.C. Bauer², R. Boudreau¹, T. Harris³, S. Satterfield⁴, R.I. Shorr⁵, A. Newman¹, 1. *Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *Division of General Internal Medicine, University of California, San Francisco, California*, 3. *Laboratory of Epidemiology and Population Sciences, Intramural Research Program, National Institute on Aging, Bethesda, Maryland*, 4. *Department of Preventive Medicine, University of Tennessee Health Science Center, Memphis, Tennessee*, 5. *Veterans Affairs Medical Center, Gainesville, Florida*

U.S. blacks have a higher risk of death than whites. This varies by cause of death; stroke, kidney disease and some cancers are higher in blacks. We evaluated cause-specific mortality risk factors in Health ABC to determine whether specific risk factors are more important for these causes of death in blacks than whites. Potential risk factors included: demographics, smoking, body mass index, chronic disease, physical function, and cognition. Among N=3075 participants ages 70–79 (41.7% black), average follow-up was 11.9 years. Underlying cause of death was adjudicated by committee and categorized as: cardiovascular disease, stroke, cancer, dementia, pulmonary, infection, kidney, and other cause. Median survival (95% confidence interval) among black men, white men, black women, and white women was 10.6 (10.0, 11.5), 12.8 (12.4, 13.4), 13.4 (12.6, 14.6), and 15.3 (14.8, 16.2) years, respectively. Adjusting for age and sex, blacks had higher risks of dying from: any cause (hazard ratio=1.32 (1.21, 1.44)), kidney disease (HR=2.10 (1.17, 3.78)), cancer (HR=1.35 (1.13, 1.62)), and stroke (HR=1.32 (0.97, 1.75)). Higher all-cause mortality risk among blacks was attenuated by further adjustment for gait speed (black race adjusted HR=1.06 (0.95, 1.17)) or digit symbol substitution test (black race adjusted HR=1.01 (0.91, 1.12)), but minimally by prevalent diseases (black race adjusted HR=1.25 (1.13, 1.38)). Gait speed also attenuated higher risk of kidney and stroke deaths among blacks, but not cancer deaths. Factors contributing to poorer physical and cognitive function in similarly aged community-dwelling ambulatory black men and women could be targets to reduce disparity and excess mortality.

LOW LUNG FUNCTION IS A PREDICTOR OF MORTALITY ALSO ADJUSTED FOR SARCOPENIA.

D. Mellström¹, E. Waern¹, Å. Tivesten², C. Lewerin¹, C. Hongslo Vala¹, T. Cederholm³, M. Lorentzon¹, C. Ohlsson¹, 1. *Center for Bone and Arthritis Research (CBAR), Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden*, 2. *Wallenberg Laboratory for*

Cardiovascular and Metabolic Research, Institute of Medicine, University of Gothenburg, Gothenburg, Sweden, 3. *Department of Public Health and Caring Sciences/Clinical Nutrition and Metabolism, Uppsala University, Uppsala, Sweden*

Low lung function has been related to functional aging, chronic bronchitis and cardiovascular disease. However, low lung function has also been associated to muscle function and body size. The purpose of this study was to examine if low lung function is an independent predictor of 10 year mortality (379 died). We examined lung function with spirometry in 1010 men, age 69–80 years in the Gothenburg part of the Swedish MrOS-study. Both forced expiratory volume 1.0 (FEV1.0) and vital capacity (VC) decreased with age, and the age corrected HR for 10 year mortality per SD decrease in FEV1.0 was 1.39 (CI 1.25–1.54) and for VC 1.38 (CI 1.24–1.53). Bone mineral density (BMD) and body composition (including appendicular lean mass) was measured with Hologic 4500 A. Hand grip strength was measured with a Jamar dynamometer. FEV1.0 associated with hand grip strength ($r = 0.36$, $p < 0.001$). Sarcopenia was defined according to EuroWorkGroup in grip strength, gait speed and appendicular lean mass. A multivariate Cox model with mortality as dependent variable and age, sarcopenia-hand grip strength, gait speed, appendicular lean mass and lowest quintile of FEV1.0 revealed that only low FEV1.0 was a significant predictor HR 2.0 (CI 1.56–2.57). In a Cox model with 10 year mortality as dependent variable and with FEV1.0, hand grip strength, gait speed, hip BMD, height, BMI, diabetes, hypertension, cancer, stroke, COPD and myocardial infarction at baseline as covariates, HR per SD decrease in FEV1.0 was 1.24 (CI 1.08–1.42). We conclude that lung function is an independent predictor of all cause mortality in elderly men.

NOROVIRUS GASTROENTERITIS IS AN IMPORTANT CAUSE OF NOSOCOMIAL INFECTIONS IN GERMANY

F. Kowalzik¹, D. Zöller¹, H. Binder¹, R. Clemens², T. Verstraeten³, F. Zepp¹, 1. *University Medical Center of the Johannes Gutenberg University, Mainz, Germany*, 2. *GRID Europe Consult, Mainz, Germany*, 3. *P95 Pharmacovigilance and Epidemiology Services, Leuven, Belgium*

Noroviruses are the most important global cause of acute gastroenteritis (AGE). Testing for norovirus in patients hospitalized with AGE is incentivized in Germany because a positive diagnosis impacts reimbursement. We estimated the number of nosocomial infections overall and by age-group for norovirus gastroenteritis (NGE) using federal German databases. All hospitalizations in Germany are registered with the German Federal Statistics Office (DESTATIS). We extracted aggregate data for patients hospitalized with NGE (ICD-10 codes A08.1) as primary or non-primary diagnosis for the period 2007–2012. Cases with a non-primary diagnosis were assumed to be due to nosocomial infection.

During the six-year study period and based on our assumption, there were a total of 241,667 nosocomial NGE cases among hospitalized patients in Germany; an average of 40,278 cases per year studied (range 32,259–57,561). In any

study year the number of nosocomial NGE cases was 1.3 to 1.7-fold higher than the number of community acquired NGE hospitalizations. The average duration of hospitalization was 3.4 to 4.5-fold longer (17–18 days versus 4–5 days) when NGE was nosocomial compared to community-acquired. Adults of 85 years of age and older suffered the highest rate of nosocomial NGE (range 33.6 to 59.1/10,000 population).

We conclude that Noroviruses are an important cause of nosocomial infections among hospitalized patients in Germany. Assuming all non-primary coded NGE episodes to be nosocomial in nature may have lead to an overestimation.

DERIVATION AND VALIDATION OF A SCREENING TOOL FOR CHIKUNGUNYA VIRUS INFECTION IN THE ELDERLY

M. Drame^{1,2}, F. Najjoulah³, R. Cesaire³, J. Fanon³, L. Godaert³, 1. *Faculty of Medicine, EA 3797, University of Reims Champagne-Adenne, Reims, France*, 2. *University Hospitals of Reims, Reims, France*, 3. *Geriatry, University Hospital of Martinique, Fort-de-France cedex, Martinique*

The aim of the study was to derive a score for Chikungunya virus infection (CVI) screening in the elderly. Patients were 65+, and admitted to acute care units of Martinique University Hospitals for suspected Chikungunya virus infection (CVI). Reverse Transcription Polymerase Chain Reaction (RT-PCR) was used as gold standard testing. A point value was assigned to each independent factor according to the adjusted odds ratio of the final logistic regression model. Point values were rounded to the nearest integer and summed. The ROC curve was used to determine the best cut-off of the score that better identify confirmed positive CVI patients. Bootstrap analysis was used to evaluate the internal validity of the model and to estimate the C-statistic 95% confidence interval. In all, 687 patients were included. Mean age was 80±8, 51% were women, and 68% had positive RT-PCR. By multivariable logistic regression model, four variables were found to be independently associated with positive RT-PCR (fever: 3 points; arthralgia of the ankle: 2 points; lymphopenia: 6 points; absence of neutrophil leucocytosis: 10 points). Bootstrap methods showed good internal validity of the final model. The score ranged from 0 to 21, with an average of 14±6. The C-statistics was 0.86 (95% CI: 0.83–0.89). A score greater or equal 12 was considered as the best cut-off to identify positive RT-PCR patients (Sensitivity: 87%; 95% CI: 83%-90%; Specificity: 70%; 95% CI: 63%-76%). This score has good performances and good internal validation. It could be a helpful tool to screen elderly people with CVI.

PREDICTORS OF CRASHES AND MOVING VIOLATIONS IN A DIVERSE SAMPLE OF OLDER WOMEN: THE WHIMS STUDIES

R.A. Marottoli^{1,2}, E. Dugan³, S. Gaussoin⁴, M. Naughton⁴, S.R. Rapp⁴, B.M. Snively⁴, L. Vaughan⁴, 1. *Yale University, New Haven, Connecticut*, 2. *VA Connecticut Healthcare System, West Haven, Connecticut*, 3. *University of Massachusetts, Boston, Massachusetts*, 4. *Wake Forest School of Medicine, Winston-Salem, North Carolina*

The US population is aging and licensure rates are increasing among older drivers. The factors associated with crashes and moving violations among older women are not well characterized. Our aim was to determine the predictors of crashes

and moving violations among participants in the Women's Health Initiative (WHI) Memory Study-Epidemiology of Cognitive Health Outcomes (WHIMS-ECHO) and the WHI Memory Study of Young Women (WHIMS-Y), comprised of geographically diverse cohorts of older US women. Participants were enrolled in the WHI hormone therapy trial at ages 50–54 (WHIMS-Y) and 65–79 (WHIMS-ECHO). A telephone questionnaire assessing driving status, self-reported crashes, and moving violations in the previous year was administered to surviving WHIMS-ECHO and WHIMS-Y participants from September 2013 to June 2015. Given the age differences between participants in the two groups, we evaluated the cohorts separately: N=1029 respondents in WHIMS-Y (mean age 70.6±SD 1.7) and N=1716 in WHIMS-ECHO (86.0±3.4 years). Results showed that self-reported crashes were more common in the older WHIMS-ECHO cohort (105.32 v.80/1000 person-years), but moving violations more common in WHIMS-Y (35.56 v 9.2/1000 person years). Predictors of a combined measure of all adverse driving outcomes were: older age (p=0.03 WHIMS-Y, p<0.001 WHIMS-ECHO) and less social support in both cohorts (p=0.02, p=0.009), while lower cognitive scores predicted more events in WHIMS-ECHO (p= 0.004). Future analyses will further explore the predictors of adverse driving events and aim to identify interventions.

SESSION 3055 (SYMPOSIUM)

WHAT WORKS, WHAT DOESN'T, AND WHY: LEARNINGS FROM THE WORLD'S LARGEST HOSPITAL FALLS PREVENTION TRIAL

Chair: A.L. Barker, *Monash University, Melbourne, Victoria, Australia*

Co-Chair: J. van der Velde, *Academic Medical Center, Amsterdam, Netherlands*

Discussant: J. Treml, *Queen Elizabeth Hospital, Birmingham, United Kingdom*

Patient falls remain a common cause of harm in hospitals worldwide. Recent studies suggest harm is increasing despite investment in practice guidelines and implementation of prevention programs. This symposium presents key learnings from the 6-PACK project which will be compared to the learnings of prior studies. 6-PACK is a nurse-led falls prevention program reflective of Australian hospital accreditation standards and best practice guideline recommendations. The 6-PACK project incorporated a study of falls prevention beliefs, practice, safety climate and outcomes; a cluster RCT testing effectiveness of the 6-PACK, including economic and program evaluations; and an assessment of sustainability of practice and outcomes. It collected information from 540 staff and 50,150 patients from 24 wards across six Australian hospitals. This symposium includes four presentations. In the first, the 6-PACK RCT results will be presented including impacts on practice, falls and fall injuries; and implementation fidelity of the 6-PACK during the trial. The second reviews known barriers and enablers to the implementation of falls prevention programs and compares these to those experienced in the 6-PACK. The third presents findings of a cost of falls study conducted alongside the RCT. The final

presentation summarizes evidence relating to patient safety climate and falls, including measurement tools and climate in the wards participating in 6-PACK. The symposium will conclude by discussing novel solutions to hospital falls by the discussant, who will review the presented findings in terms of impact and clinical implications; and also compare to UK and European activities including NICE guidelines and FallSafe.

THE 6-PACK PROGRAM TO DECREASE FALL INJURIES IN HOSPITALS: THE WORLD'S LARGEST FALLS PREVENTION TRIAL

A.L. Barker¹, R.T. Morello¹, R. Wolfe¹, R. Lindley², J. Kamar³, The 6-PACK Investigator Team¹, 1. *Department of Epidemiology and Preventive Medicine, Monash University, Melbourne, Victoria, Australia*, 2. *University of Sydney, Sydney, New South Wales, Australia*, 3. *The Northern Hospital, Melbourne, Victoria, Australia*

The nurse-led 6-PACK falls prevention program includes a fall-risk tool and individualised use of 'falls alert' signs; supervising patients in the bathroom; ensuring walking aids are within reach; a toileting regime; low-low beds; and bed/chair alarms. This RCT evaluated the effect of the 6-PACK on falls and fall injuries in 24 acute wards from six Australian hospitals compared to usual care over 12-months. Positive changes in falls prevention practice occurred following the introduction of the 6-PACK. During the RCT, there were 46,245 patient admissions, 1831 falls and 613 fall injuries. The rate of falls (IRR=1.04, 95% CI, 0.78 to 1.37) and fall injuries (IRR=0.96, 95% CI, 0.72 to 1.27) were similar in intervention and control wards. The findings are in accordance with previous studies, which together provide increasing evidence of no effect for falls prevention interventions in acute wards. Novel solutions to the issue of in-hospital falls are required.

BARRIERS AND ENABLERS TO EFFECTIVE FALLS PREVENTION IN ACUTE HOSPITALS

D.R. Ayton¹, A.L. Barker¹, J. Talevski¹, R.T. Morello¹, C.A. Brand¹, K.D. Hill², The 6-PACK Investigator Team¹, 1. *Department of Epidemiology and Preventive Medicine, Monash University, Melbourne, Victoria, Australia*, 2. *Curtin University, Bentley, Western Australia, Australia*

Knowledge from hospital staff may assist us with implementing effective falls prevention programs. This study aimed to assess nurse and senior management perceptions of barriers and enablers of effective falls prevention in acute public hospitals to inform implementation of the 6 PACK program. Data was obtained via focus groups with nurses (n=12 with 96 nurses); interviews with senior hospital staff (n=24); and nurse surveys (n=420). Analysis was thematic and guided by the Theoretical Domains Framework and COM-B framework developed by Michie and colleagues. Barriers included a lack of time, skills, effective strategies and resources. Patient complexity, environmental factors and belief that falls were inevitable were also identified as barriers. Enablers included face-to-face education; leadership; and use of audit, reminders, feedback and benchmarking. These results inform that future implementation of falls prevention

programs should include promotion of executive and ward leadership; on-ward face-to-face education; and improved access to falls prevention resources.

FALLS NOT FALL INJURIES: THE REAL DRIVERS OF HOSPITAL COST-ANALYSES OF IN-HOSPITAL FALLS

R.T. Morello¹, A.L. Barker¹, J. Stoelwinder¹, T.P. Haines¹, M. Bohensky², J. Watts³, K.D. Hill⁴, The 6-PACK Investigator Team¹, 1. *Department of Epidemiology and Preventive Medicine, Monash University, Melbourne, Victoria, Australia*, 2. *University of Melbourne, Melbourne, Victoria, Australia*, 3. *Deakin University, Burwood, Victoria, Australia*, 4. *Curtin University, Bentley, Western Australia, Australia*

In-hospital falls are clearly associated with increased hospital costs. Given the lack of comprehensive and contemporary data on the cost of falls, this prospective cohort study – conducted alongside the 6-PACK trial – aimed to quantify the additional length of stay (LOS) and costs associated with falls in acute hospitals in Australia. We identified 1,330 falls and 418 fall injuries from 27,026 hospital admissions. Patients with an in-hospital fall had a mean increase in LOS of 8 days (P<0.001) compared with non-fallers, and incurred mean additional hospital costs of \$6669 (P<0.001). Patients with a fall-related injury had a mean increase in LOS of 4 days (P=0.001) compared with fallers without injury, and incurred mean additional hospital costs of \$4727 (P=0.080). Findings from this study provide contemporary costs associated with an in-hospital fall and associated injury. Programs need to target the prevention of all falls, not just the reduction of harm.

MEASURING SAFETY CLIMATE IN AUSTRALIAN HOSPITALS: POTENTIAL TO MAKE CHANGES AND IMPROVE SAFETY

S. Soh^{1,3}, A.L. Barker¹, R.T. Morello¹, C.A. Brand^{1,2}, 1. *Department of Epidemiology and Preventive Medicine, Monash University, Melbourne, Victoria, Australia*, 2. *Melbourne EpiCentre, The University of Melbourne, Melbourne, Victoria, Australia*, 3. *Department of Physiotherapy, Monash University, Melbourne, Victoria, Australia*

There is a growing body of evidence linking adverse events such as falls with poor patient safety climate. This study explored nurse perceptions of safety climate to guide the implementation of the 6-PACK falls prevention program. The Safety Attitudes Questionnaire (SAQ) was used to quantify safety climate. 420 nurses from 24 acute wards across 6 Australian hospitals responded to the questionnaire (response rate 59.8%). On average, 53.5% of nurses held positive attitudes towards job satisfaction followed by team-work climate (50.5%). There was variability in SAQ domain scores across hospitals as well as across wards within a hospital. Findings from this study provide an insight into possible targets for strategies to improve safety climate. Implications of the association between safety climate and falls will also help to tailor patient safety programs keeping in mind that wards may have their own safety 'sub-culture' distinct to the overall hospital culture.

SESSION 3060 (SYMPOSIUM)

GETTING PATIENTS UP: DESIGNING AND IMPLEMENTING GLOBAL INTERVENTIONS TO PROMOTE PATIENT AMBULATION

Chair: B. King, *University of Wisconsin Madison, Madison, Wisconsin*

Co-Chair: C. Brown, *The University of Alabama at Birmingham*

Discussant: C. Brown, *The University of Alabama at Birmingham*

Loss of independent ambulation in older adults during hospitalization is a worldwide phenomenon. Investigators from multiple countries have identified limited ambulation of older adults in the hospital setting to be independently associated with functional decline and loss of mobility at hospital discharge. Hospital settings are complex, thus engaging patients in ambulation is riddled with barriers that prevent hospital staff from walking patients. Therefore, designing and testing interventions to improve patient ambulation in the hospital setting will require innovative approaches. The aim of this symposium will be to highlight studies to improve patient ambulation conducted in four countries. Presenters will describe novel design approaches, study results and dissemination of a model of ambulation care.

The first presentation will discuss the impact of knowledge, attitudes and behaviors of multiple healthcare providers on whether or not patients are ambulated. The second presentation will describe the use of a human factors engineering model to design a multilevel intervention (MOVIN) and strategies to engage stakeholders in launching a complex design. The third presentation will describe the use of a simple strength-training program (STAND-Cph), initiated during the hospital stay and continued post discharge for 6-months. The fourth presentation will describe dissemination of a multilevel intervention study, MOVE ON, identifying components that impact sustainability. Loss of independent ambulation in hospitalized older adults is a global health concern. Due to the complexity of hospital systems and unique care needs of older adults, pioneering approaches to overcome barriers and create sustainable models of ambulation care are needed.

BARRIERS AND FACILITATORS TOWARD IN-HOSPITAL PATIENTS' MOBILITY: THE WALK-FOR STUDY

A. Zisberg¹, M. Agmon¹, E. Gil^{2,3}, D. Rand⁴, E. Azaiza⁵, M. Azriel⁵, 1. *The Cheryl Spencer Department of Nursing Faculty of Social Welfare and Health Science, University of Haifa, Israel, Haifa, Israel*, 2. *Internal Medicine and Geriatric Unit, Bnei-Zion Medical Center, Haifa, Israel, Haifa, Israel, Israel*, 3. *Faculty of Medicine, Technion, Israel, Haifa, Israel, Israel*, 4. *Department of Occupational Therapy, Sackler Faculty of Medicine, Tel-Aviv University, Israel, Tel-Aviv, Israel*, 5. *HaEmek Medical Center, Clalit Health Services, Afula, Israel, Afula, Israel*

Although mobility during hospitalization prevents functional decline, medical teams' knowledge, attitudes and behaviors may pose barriers toward its promotion. To describe these barriers and facilitators toward in-hospital mobility among physicians, nurses, physical-therapists (PT), and nurse assistants (NA) we conducted 10 in-depth interviews, and administered surveys among 90 medical team

members of two internal medical units in Israel. Mixed methods analyses reveal a complex, multi-faceted and paradoxical picture of organizational and personal factors: fear of falls overshadowed every positive attitude toward mobility. Nonetheless, PTs and NAs express the most positive attitudes toward mobility compared with physicians and nurses. Moreover, while family members were not considered as potential collaborators in mobility assistance, NAs demonstrated desire to learn and take more responsibilities toward patients' mobility. To conclude, identifying barriers and facilitators toward mobility may help in designing and adopting effective interventions to promote patients' mobility.

DESIGNING AND IMPLEMENTING MOBILIZING OLDER ADULT PATIENTS VIA A NURSE-DRIVEN INTERVENTION (MOVIN)

B. King, L. Steege, *School of Nursing, University of Wisconsin Madison, Madison, Wisconsin*

Up to 65% of older adults (aged 65 or older) experience functional decline or loss of independent ambulation during hospitalization. Limited ambulation during the hospital stay is an independent predictor of these adverse outcomes. Registered nurses (RNs) are responsible for promoting patient ambulation. But multiple system barriers prevent nurse-initiated patient ambulation. Systems Engineering Initiative for Patient Safety (SEIPS), a human factors engineering model, offers a critical understanding of how system components (people, tools and technology; physical environment; and organizational culture) impact nurse-initiated patient ambulation. This presentation will describe using human factors engineering for work system redesign, mapping our prior findings on barriers to patient ambulation onto SEIPS to create Mobilizing Older adult patients' Via a Nurse-driven intervention (MOVIN), and strategies to engage stakeholders in a multilevel intervention. Patient ambulation in hospitals is a complex process. A systems based approach to overcome barriers is necessary to improve patient ambulation.

SUSTAINABILITY AND SPREAD OF MOVE ON: A MOBILIZATION INITIATIVE TWO YEARS AFTER IMPLEMENTATION

B.A. Liu^{1,2}, J.E. Moore³, S. Khan³, W. Chan³, C. Harris³, S.E. Straus^{1,3}, 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *Regional Geriatric Program of Toronto, Toronto, Ontario, Canada*, 3. *Li Ka Shing Knowledge Institute, St. Michael's Hospital, Toronto, Ontario, Canada*

Mobilization of older patients in hospitals is a clinical care priority that can reduce functional decline, delirium and length of stay. The Mobilization of Vulnerable Elders in Ontario (MOVE ON) initiative promoted 3 core messages: Mobilization should occur at least 3 times daily, mobilization should be progressive and scaled, assessment should take place within 24 hours of admission. Coordinated centrally, MOVE ON included 14,540 patients in 14 hospitals, mean age 79.9 years. In interrupted time series analysis, 10.56% more patients mobilized compared to pre-intervention. Using mixed methods, including 212 staff surveys, we identified success factors for spread and sustainability. Success factors for sustainability included contextualized education, cultural shift, implementation of formal procedures (policies, role revision, and documentation), visible corporate support, collaborative resource sharing and alignment with

system priorities. The spread of MOVE ON continues, being adapted in over 40 hospitals in Ontario, and to other provinces and countries.

MOBILITY DURING AND AFTER HOSPITALIZATION IN OLDER MEDICAL PATIENTS: THE STAND-CPH TRIAL

M.M. Pedersen^{1,8}, J. Petersen^{1,2}, N.A. Beyer^{3,4}, L. Damkjær⁵, H.G. Juul-Larsen¹, A.C. Bodilsen^{1,8}, O. Andersen¹, T.Q. Bandholm^{1,6,7}, 1. *Optimed, Clinical Research Centre, Copenhagen University Hospital, Hvidovre, Hvidovre, Denmark*, 2. *Section of Biostatistics, Department of Public Health, University of Copenhagen, Copenhagen, Denmark*, 3. *Musculoskeletal Rehabilitation Research Unit, Bispebjerg and Frederiksberg Hospitals, University of Copenhagen, Copenhagen, Denmark*, 4. *Department of Clinical Medicine, Faculty of Health and Medical Sciences, University of Copenhagen, Copenhagen, Denmark*, 5. *Department of Rehabilitation, Copenhagen Municipality Health Administration, Copenhagen, Denmark*, 6. *Department of Orthopaedic Surgery, Copenhagen University Hospital, Hvidovre, Hvidovre, Denmark*, 7. *Physical Medicine Research-Copenhagen (PMR-C), Clinical Research Centre, Copenhagen University Hospital, Hvidovre, Hvidovre, Denmark*, 8. *Physical Medicine Research-Copenhagen (PMR-C), Department of Physiotherapy, Copenhagen University Hospital, Hvidovre, Hvidovre, Denmark*

During hospitalization, older adults spend most of their time being physically inactive or bedridden with a risk of losing independence. In addition, it seems that in older adults, episodes of bed rest are associated with a subsequent decline in physical activity creating a possible vicious circle of inactivity. Therefore, in a randomized-controlled trial in 80 older medical patients (>65 years) we evaluated whether a simple, minimally time-consuming supervised strength training program, consisting of two lower extremity exercises, initiated during hospitalization and continued at home after discharge, was superior to usual care on mobility during and after hospitalization. The intervention consisted of training daily during hospitalization and 3 times weekly at home for 4 weeks after discharge. We assessed 24-h mobility (time spent sitting/lying, standing and walking) throughout hospitalization and for three one week periods after discharge (immediately after discharge, after 4 weeks and after 6 months).

SESSION 3065 (PAPER)

EPIDEMIOLOGICAL STUDIES: OBESITY, GRIP STRENGTH AND BODY COMPOSITION IN OLDER ADULTS

MODERATE OBESITY IN LATER LIFE: IS IT REALLY PROTECTIVE FOR HEALTHY AGING?

D. Melzer^{1,2}, K. Bowman¹, 1. *IBCS, University of Exeter, Exeter, Devon, United Kingdom*, 2. *University of Connecticut Center on Aging, Farmington, Connecticut*

There is very contradictory evidence on whether being overweight or moderately obese (BMI 30 to 35) is protective

or risky in later life for both survival and ageing well. With the increasing prevalence of obesity world-wide, there is a need to clarify this so-called obesity paradox of later life, including addressing suggested confounders and measurement errors. We aimed to extend the current evidence using very large-scale electronic medical record data and volunteer cohort data, plus improved measures of adiposity, co-morbidity and confounding. We also aimed to quantify trajectories of BMI change in the years before death, to clarify the effect of reverse causation.

We used Clinical Practice Research Datalink (England) linked primary care, hospital and death certificate electronic medical record data on nearly 1 million patients aged ≥60 years in England from 1 January 2000 onwards. Cox survival models for each age-subgroup were adjusted for age, gender, alcohol use, smoking, calendar year, and socioeconomic status. We also used data from the UK Biobank, a volunteer study of 500,000 people aged 40 to 69, followed for up to 8 years.

Our program of work has shown that 1) In the 14 years before death there are progressive declines in BMI over the entire period, which accelerate in the last 2 years of life. 2) After accounting for the decline in BMI before death, smoking and major disease, most of the BMI risk paradoxes with mortality and cardiovascular disease (CVD) incidence in the ≥60s disappear or reverse. 3. Misclassification of central adiposity in later life by the conventional BMI measures explains more of the risk paradox. Measures combining BMI and Waist Hip ratio are associated with major excess risks for mortality and CVD incidence from both being overweight or moderately obese in otherwise healthy 60 to 69 year olds. 4. Accounting for the above issues, levels of exercise and muscle strength remain important independent predictors but do not interact with risks due to adiposity. In conclusion, when adiposity is measured appropriately, being overweight or obese is predictive of substantially worse outcomes in older people who do not have confounding conditions. Calls for changing policies on obesity prevention because of the claimed risk paradoxes are misplaced.

MYOSTATIN IN OLDER ADULTS: THE HEALTH, AGING, AND BODY COMPOSITION (HEALTH ABC) STUDY

P.M. Cawthon¹, N. Parimi¹, B. Goodpaster², A. Newman³, T. Harris⁴, S.R. Cummings¹, 1. *Research Institute, California Pacific Medical Center, Alameda, California*, 2. *Translational Research Institute, Orlando, Florida*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 4. *National Institute on Aging, Bethesda, Maryland*

Myostatin (also known as GDF8) is a negative regulator of muscle development and size. We tested the hypothesis that higher myostatin levels are associated with reduced lean mass, decreased muscle density, lower strength and slower walking speed in older adults.

We used data from 399 randomly selected men and women (mean±SD age: 78.3±2.8 years) participating in the Year 6 visit of Health ABC Study. Myostatin was detected in previously frozen serum using a validated sandwich ELISA with proprietary antibodies specific to myostatin (Eli Lilly). Muscle and function variables included appendicular lean mass assessed by whole body DXA; thigh cross-sectional

area and muscle density by QCT; walking speed by usual pace over 6 meters; and grip strength by Jamar dynamometers. Ordinary least squares regression models (adjusted for age, BMI, race, sex and self-rated health) were used to calculate adjusted mean levels of the muscle and function variables across quartiles of myostatin. We tested for interactions between myostatin and sex, and myostatin and race using linear regression.

In adjusted models, mean muscle density values increased as myostatin quartile increased (p for trend <0.001 , ~3% difference between Q1 vs Q4). No other associations between myostatin and the muscle and function variables were statistically significant. (p for trend >0.10 for all). There was no evidence for any interaction tested (p for interaction >0.10 for all).

In conclusion, myostatin levels were unrelated to measures of muscle size and physical function; the association between myostatin levels and muscle density was modest and opposite of the hypothesized direction.

GRIP STRENGTH AND LOW BODY MASS INDEX PREDICT MORTALITY: FINDINGS FROM THE LONGITUDINAL SABE STUDY

J. Ferreira Santos¹, T. Alexandre², Y. Duarte³, M. Lebrão⁴,
1. *Social Medicine, University of Sao Paulo, Ribeirao Preto, Sao Paulo, Brazil*, 2. *Federal University of Sao Carlos, Sao Carlos, Sao Paulo, Brazil*, 3. *Escola de Enfermagem - USP, Sao Paulo, Sao Paulo, Brazil*, 4. *Faculdade de Saúde Pública - USP, Sao Paulo, Sao Paulo, Brazil*

Background: Some studies showed that grip strength predicts mortality. Both muscle mass and muscle strength decline with age, but it is not clear yet how body composition acts in the process. This article investigates the relationship between grip strength, body composition and mortality of inhabitants of São Paulo, Brazil, aged 60 and plus in 2006. **Methods:** 1423 participants were interviewed during the second wave (2006) of the SABE study. Handgrip strength was collected at baseline along with data on body mass index, (BMI) number of comorbidities, income and schooling. At the end of follow-up a Poisson regression was used to evaluate mortality rate ratios (IRR), adjusted for age and sex. **Results:** After 5.9 years there were 1080 survivors, 268 deaths and 65 (4.6%) lost to follow up. Death rate was 30.3 per 1000 person-years; death rates by Hand Grip Strength in men were 23.0 (normal strength) and 78.6 (reduced strength) - a rate ratio of 3.4. In women: 15.3 (normal) and 56.7 (reduced) a ratio of 3.7. Poisson regression showed that schooling, income and number of comorbidities had no significant IRRs. Low BMI proved different from Normal (IRR = 2.1), women differed from men (0.7); ages 75+ differed from ages 60–75 (IRR = 2.4). Reduced Hand Grip strength showed a mortality rate 2.3 greater than normal strength. **Conclusions:** This study showed that Hand Grip Strength is an important tool for prognostic of survival along with low category of BMI, independent of age, sex, income, education and number of comorbidities.

DISABILITY RISK IN OLDER ADULTS WITH MUSCLE WEAKNESS: RESULTS FROM THE HEALTH AND RETIREMENT STUDY

K. Duchowny¹, M.D. Peterson³, P.J. Clarke^{1,2}, 1. *University of Michigan, Department of Epidemiology, Ann Arbor,*

Michigan, 2. *University of Michigan, Institute for Social Research, Ann Arbor, Michigan*, 3. *University of Michigan, Department of Physical Medicine and Rehabilitation, Ann Arbor, Michigan*

Background: Muscle weakness, as determined by hand-grip dynamometry, is a robust indicator of disability, chronic disease and mortality. While we recently proposed sex/race-specific cutpoints for clinical muscle weakness in a diverse, nationally representative sample of older Americans, the extent to which these cutpoints predict subsequent physical disability remains unknown.

Objective: To examine whether sub-group specific muscle weakness cutpoints predict physical disability status in a nationally representative of Americans aged 65+.

Methods: We used data from the 2008–2012 Health and Retirement Study. Fully-adjusted, weighted multinomial logistic regression models were used to quantify the odds of experiencing an onset or progression in one's activities of daily living (ADL) status among weak versus non-weak individuals over a 4-year period.

Results: In this nationally representative sample, 44% of individuals were classified as weak at baseline. Twenty-six percent of individuals had difficulty with 1+ ADL at follow-up. The odds of experiencing an onset of physical disability were 36% higher among weak individuals at baseline compared to non-weak individuals (OR= 1.37, 95% CI= 1.36, 1.37). Additionally, the odds of experiencing a progression in physical disability were substantially higher among those who were weak at baseline compared to non-weak individuals (OR= 2.23, 95% CI= 2.22, 2.24).

Conclusions: Using cut-points derived from a nationally representative sample of older Americans, we have shown for the first time that weakness is associated with greater risk of experiencing physical disability in later life. Results underscore the importance of using population-specific cutpoints to identify individuals at greatest risk for adverse health outcomes.

ASSOCIATION OF SARCOPENIC OBESITY WITH MORTALITY: DATA FROM NHANES 1999–2004

J.A. Batsis, T.A. Mackenzie, S. Bartels, *Medicine, Geisel School of Medicine at Dartmouth, Lebanon, New Hampshire*

Background: The Foundation for the NIH Sarcopenia Project validated cutpoints for appendicular lean mass (ALM). Individuals with sarcopenia (SP) and obesity are thought to be at higher risk of adverse events. We ascertained the relationship between SP obesity and mortality and identified predictors in this subgroup.

Methods: 4,984 subjects ≥ 60 years old were identified from the cross-sectional National Health and Nutrition Examination Survey 1999–2004. Mortality data from the National Death Index was linked to this dataset. SP was defined using two definitions: a) reduced ALM (men <19.75 ; females <15.02 kg); b) ALM divided by body mass index (BMI) (ALM/BMI: <0.789 ; <0.512 , respectively). Obesity was defined using dual-energy X-ray absorptiometry body fat (males $\geq 25\%$; females $\geq 35\%$). SP obesity was defined using criteria for both SP and obesity. Proportional hazard models determined the risk of death (referent=no SP obesity).

Results: Mean age was 71.1 ± 0.19 years (56.5% female). Median follow-up was 102 months (IQR: 78,124) with

1,901 deaths (35.0%). Using ALM, prevalence of sarcopenic obesity was 33.5% in females, and 12.6% in males. Risk of overall death was HR 1.31 [95%CI:1.11–1.55] and 1.59 [1.17–2.15] in males and females, respectively for those with SP obesity. Using ALM/BMI, prevalence was 27.3% and 19.1%, and risk of death was 1.14 [0.99,1.32] and 1.17 [0.98,1.39], respectively. Diabetes, cancer, kidney disease, and presence of physical limitations were associated with greater risk of death using both SP definitions.

Conclusions: Risk of death in Sarcopenic obesity is definition-dependent becoming non-significant when using the ALM/BMI definition. Having diabetes, cancer and renal disease predict a worse prognosis in both classifications.

SESSION 3070 (PAPER)

CARE PREFERENCES AT END OF LIFE

IMPACT OF ADVANCE CARE PLANNING SELF-EFFICACY AND BELIEFS ON PROFESSIONAL JUDGMENTS

K. Baughman¹, R. Ludwick^{3,4}, D. Jarjoura², D. Kropp¹, 1. *Family & Community Medicine, Northeast Ohio Medical University, Rootstown, Ohio*, 2. *Ohio State University, Columbus, Ohio*, 3. *Kent State University, Kent, Ohio*, 4. *University Hospitals Portage Medical Center, Ravenna, Ohio*

We examined the impact of advance care planning (ACP) self-efficacy and beliefs in predicting skilled nursing facility (SNF) provider judgments about initiating ACP conversations. This multi-site study of 353 nurses and social workers within 29 SNFs used a factorial survey approach in which providers judged vignettes with assigned features of a typical SNF resident. Mixed models were used to test hypotheses about vignette responses. At the vignette level, residents at high risk for hospitalization, with rapidly declining health, a diagnosis of cancer vs. diabetes, and those needing more assistance with activities of daily living were rated in more need of ACP ($p < .001$ for each variable). In addition, these disease trajectory variables also were significantly associated with providers feeling responsible for ensuring ACP conversations took place ($p < .001$ for each variable). At the provider level, providers who had more negative beliefs about ACP were less likely to judge residents in need of ACP by -0.68 points (based on a 1–9 scale, with standard deviation=2.21, and CI $-1.05, -0.32$, $p < .001$) and to feel responsible (-0.79 same scale with standard deviation=2.34, CI $-1.24, -0.34$, $p = .001$). Self-efficacy did not have a significant impact on judgments of need (estimate=0.28, CI $-0.08, 0.65$, $p = .13$), but did significantly impact judgments of responsibility (estimate=0.80, CI $0.38, 1.23$, $p < .001$). In conclusion, both negative beliefs about ACP and confidence in one's ability to conduct ACP discussions were associated with professional judgments regarding ACP. The findings illustrate the importance of addressing negative beliefs and increasing provider ACP self-efficacy through education and policies.

PROGNOSIS COMMUNICATION IN LATE-LIFE DISABILITY

T. Wong^{1,4}, R. Romo⁴, A. Au-Yeung⁴, S. Lee⁴, P. Moran², J.H. Karlawish³, A.K. Smith⁴, 1. *UCSD, La Jolla, California*, 2. *UCSF, San Francisco, California*, 3. *University of Pennsylvania, Philadelphia, Pennsylvania*, 4. *UCSF/VA, San Francisco, California*

For older adults with late-life disability, learning their long-term prognosis, or life expectancy, can inform clinical and personal decisions, but many clinicians worry that telling patients their prognosis may harm them. We therefore conducted a study to explore the safety and reactions to prognosis communication in late-life disability. We recruited community-dwelling older adults age 70+ with at least one disability in activities of daily living from the San Francisco Bay Area. We conducted qualitative in-person interviews in English, Spanish, or Mandarin. Participants were asked to estimate their own life expectancy and then were presented their calculated life expectancy using the Lee index from ePrognosis.org. Psychological and behavioral outcomes were assessed using metric measures. Outcomes were re-assessed by telephone 2–4 weeks later. The sample included 35 older adults with a mean age of 79 (56% female, 74% white, 3% black, 14% Latino, 6% Chinese). 85% responded “Not at all” or “A little bit” to statements about feeling anxious or depressed after knowing their calculated life expectancy. An overarching theme of *fitting life expectancy into one's narrative* emerged from the data. Participants interpreted the calculated prognosis based on how they understood their health conditions, life history, and factors that influence health. For example, if participants saw themselves as healthy or had long-lived family members, they often dismissed a shorter prognostic estimate. In conclusion, communicating long-term life expectancy does not appear harmful in this sample. However, many may not accept the estimated life expectancy if it does not align with their life narrative.

PREFERENCE OF DISCLOSING TERMINAL ILLNESS AMONG KOREAN OLDER ADULTS

H.K. Park¹, C. Koh², 1. *Duke university, Durham, North Carolina*, 2. *Seoul National University, Seoul, Korea (the Republic of)*

The disclosure of a terminal illness is a significant issue in terms of protecting the patient's autonomy and right to know at the end of life. However, in Korea, families are informed of the patient's condition instead of the patients, and they make medical decisions for the patients as their proxies. Therefore, it is vital to know patients' preferences regarding the disclosure of terminal illness.

Method: Disclosure preferences regarding terminal illnesses and factors related to disclosure preferences among the older adults were investigated utilizing survey. The participants were 183 community-dwelling older adults in Seoul, South Korea. Disclosure preference regarding terminal illness was measured by a questionnaire specifically developed for this study. The questionnaires also incorporated the Family APGAR score and the Information Seeking Preference Index.

Finding: One hundred one participants (58.4%) would want to be told of their terminal illness, whereas 72 participants (42.6%) would not want to be told. Older age and higher education were significantly associated with the

disclosure of terminal illness. Higher Family APGAR score and a higher Information Seeking Preference Index score were also significantly related to the disclosure. A logistic regression analysis revealed that the Information Seeking Preference Index score was a significant predictor after controlling for age, education, and the Family APGAR score ($R^2 = .352$, $p < .001$).

Conclusion: Health care providers should assess their patients' preferences to be told medical information and should provide appropriate information based on each patient's individual preference.

SPEAKING FROM THE HEART: THE CHANGING GOALS OF HEART FAILURE PATIENTS IN THE LAST YEARS OF LIFE

S. Schellinger, E.W. Anderson, M. Frazer, S. Curran, K. Fernstrom, *Allina Health, Minneapolis, Minnesota*

Heart failure is the most common admission diagnosis for older adults, with a one-month mortality rate of 11% and a 30% readmission rate. It is a condition that afflicts the whole person and burdens families over years. Knowing the goals and wishes of persons with serious illness is essential for individualizing care. This study aims to understand the evolution of medical and nonmedical serious illness goals by asking advanced heart failure patients to describe what is most important to them. As part of LifeCourse, patients received monthly in-person visits by a lay health care worker, called a care guide. Care guides promoted whole-person, family-oriented care using assessment tools, whole-person and goals of care questions, and advance care planning discussions. Patients' self-defined goals were documented in the medical record. We examined the medical records of 30 heart failure patients who received supportive care up to 920 days before death. A qualitative analysis of the medical record data affirmed goals evolved over the illness experience. Goals that originally focused on physical (66%) acquired psycho-social, emotional, and spiritual facets as patients came closer to end of life. Non-medical goals (27%) occurred in the middle of the illness experience. An emotional or psychological element was often (80%) attached to goals. Family/caregiver goals (26%) and aspirational goal statements (13%) appeared consistently throughout the study period. The dynamic nature of serious illness requires ongoing goals of care discussions to promote collaborative decision making that allows for individualized care and a whole person experience.

THE RELATIONSHIP BETWEEN DISEASE BURDEN, CARE SETTING, AND LIFE-SUSTAINING TREATMENT CHOICES

E. Chen¹, C.T. Pu², J. Ragland², J. Schwartz², M. Fairbanks², J.E. Mutchler¹, 1. *University of Massachusetts, Boston, Massachusetts*, 2. *Partners HealthCare, Boston, Massachusetts*

Over 70% of the U.S. population is expected to die from advanced chronic illness. We hypothesized that high illness burden, measured by the number and severity of comorbidities and patient age (Charlson Score), leads to low odds for choosing aggressive life-sustaining treatments.

Life-sustaining treatment preferences were collected from 593 Physician (or Medical) Orders for Life-Sustaining

Treatment forms (MOLST) at three hospitals. Logistic regression models were used to estimate the odds for choosing All Treatment (aggressive) vs. Limitations to Life-sustaining Treatments for patients with Charlson >5 (vs. ≤ 5), controlling for decision-maker (patient/proxy), care setting (with/without a palliative care practice; MD/PA/NP), and patient demographics.

Over one-third (36%) chose All Treatment. Mean Charlson Score was 8 (SD=3). Proxy decision-makers signed 43% of the forms. Mean patient age was 71 (SD=15); 49% were male; and 83% were non-Hispanic White. Palliative care clinicians administered 50%, and both non-palliative and palliative MDs administered 52% of the MOLSTs.

Patients with Charlson >5 were 70% (OR=0.31; $p \leq 0.001$) less likely to choose All Treatment than those with Charlson ≤ 5 , when controlling for only patient characteristics (pseudo $R^2=0.148$; $p \leq 0.001$). Adding care-setting variables showed that Charlson >5 still reduced the odds for choosing All Treatment. However, the participation of palliative care clinicians attenuated the magnitude of the relationship between illness burden and life-sustaining treatment preferences (OR=0.54; $p \leq 0.10$) (pseudo $R^2=0.431$; $p \leq 0.001$).

These results support our hypothesis that high illness burden is negatively associated with preferences for All Life-sustaining Treatments, but results also point to the strong influence of palliative care clinicians in these decisions.

SESSION 3075 (SYMPOSIUM)

UNREGULATED CARE PROVIDERS (CARE AIDES) IN NURSING HOMES—A RESOURCE FOR QUALITY OF CARE

Chair: M. Hoben, *University of Alberta*

Co-Chair: J. Holroyd-Leduc, *University of Calgary*

Translating Research in Elder Care (TREC) is a longitudinal program (2007–2022) of applied research, involving >40 investigators and decision makers from across Canada. TREC's aims are to find practical solutions that contribute to sustainable improvements in quality of care and life of frail older nursing home residents, and quality of worklife of their payed care providers. Unregulated care providers with little formal training (are aides) provide up to 80% of direct care in nursing homes, and are therefore a critical resource for quality of care. However, little research has focused on this provider group, and our understanding of their situation and how to best use this largely untapped resource to make improvements is limited. Therefore, care aides are an important research focus in TREC. In this symposium we will first give an overview of the TREC research program. We will specifically present findings on care aides' quality of worklife and best practice use, and the association of care aides' work environment (i.e., care unit work context) with these outcomes. We will then present specific findings on care aides' physical and mental health. The third presentation will focus on pain in nursing home residents. Furthermore, we will present two ongoing cluster randomized intervention studies, in which care aides and their leaders are systematically targeted in order to improve quality of care, life and worklife on nursing home care units.

THE TRANSLATING RESEARCH IN ELDER CARE (TREC) PROGRAM: AN INTRODUCTION

P.G. Norton², M. Doupe³, M. Hoben¹, J. Holroyd-Leduc², J.A. Knopp-Sihota⁴, A. Wagg¹, C.A. Estabrooks¹,
 1. *University of Alberta, Edmonton, Alberta, Canada*, 2. *University of Calgary, Calgary, Alberta, Canada*, 3. *University of Manitoba, Winnipeg, Manitoba, Canada*, 4. *Athabaska University, Athabasca, Alberta, Canada*

The core of the TREC research program is the TREC Measurement System (TMS): a longitudinal, representative study in urban nursing homes in Western Canada, using staff surveys and resident data (RAI-MDS 2.0) to monitor, examine and modify factors influencing organizational context, staff health/well-being, and care quality. TMS data provides outcome data for TREC implementation studies: two randomized trials (both of which will be presented in this symposium), a Social Network Analysis (SNA) to identify advice seeking networks among nursing homes in the eight Western and Atlantic provinces and the three Northern Territories, System Projects addressing stakeholder needs at various levels related to care of residents, and trainee projects. Important findings of TREC are that 1) work context influences provider and resident outcomes, 2) the care unit is a critical level at which to monitor data over time and target interventions, and 3) care aides are key to performance improvement.

PHYSICAL AND MENTAL HEALTH STATUS OF CANADIAN NURSING HOME CARE AIDES

J.A. Knopp-Sihota^{1,2}, M. Hoben², J.E. Squires³, G. Cummings², P.G. Norton⁴, C.A. Estabrooks², 1. *Faculty of Health Disciplines, Athabasca University, Edmonton, Alberta, Canada*, 2. *University of Alberta, Edmonton, Alberta, Canada*, 3. *University of Ottawa, Ottawa, Ontario, Canada*, 4. *University of Calgary, Calgary, Alberta, Canada*

Care aides work long hours providing care to an increasingly complex nursing home population. Because of related stresses, workers are at greater risk for health problems (e.g., burnout). The SF-8™, an abbreviated version of the original SF-36™, is a psychometrically sound self-report survey used to evaluate physical and mental health status.

This observational study utilized data collected in 2009/2010 in the TREC Measurement System (TMS) survey to describe the health status of 1,367 care aides within a representative sample of 30 urban nursing homes. The majority of care aides were middle aged and female. When compared to the general US and Canadian population, care aides reported on average similar mental and physical health status. This is the first study reporting normative SF-8 data for Canadian health care providers. Normative data are fundamental when comparing group or individual scores and can be used in other studies.

END-OF-LIFE PAIN FOR NURSING HOME RESIDENTS: THE ROLE OF HEALTHCARE AIDES AND CONTEXTUAL FACTORS

M. Doupe¹, G. Thompson¹, C. Reid², J. Baumbusch², J.A. Knopp-Sihota³, 1. *University of Manitoba, Winnipeg, Manitoba, Canada*, 2. *University of British Columbia, Kelowna, British Columbia, Canada*, 3. *Athabaska University, Edmonton, Alberta, Canada*

Pain management is a hallmark of quality end-of-life care. This presentation will define pain trajectories in nursing home (NH) residents' last six months of life, and show how these trajectories are influenced by health care aides (HCAs) and their working environment.

This observational study utilizes the RAI-Minimum Data Set (MDS) linked to the TREC Measurement System (TMS) survey. MDS provides resident-level longitudinal data on pain plus various clinical measures. TMS captures point-in-time metrics on HCA supply, their characteristics (e.g., time rushed, feelings of empowerment) and their working environment (e.g., team leadership, care culture). Data are available on a representative sample of NHs from Western Canada.

Data were analyzed on 982 residents in their last six months of life. Pain levels were negligible for 60.6% of residents during this time, and increased substantially or remained high for 34.4%. The effect of HCAs and contextual factors on these pain trajectories is discussed.

SAFER CARE FOR OLDER PERSONS IN RESIDENTIAL ENVIRONMENTS (SCOPE)

A. Wagg¹, J.A. Knopp-Sihota¹, P.G. Norton¹, M. Doupe², C.A. Estabrooks¹, 1. *University of Alberta, Edmonton, Alberta, Canada*, 2. *University of Manitoba, Winnipeg, Manitoba, Canada*

The majority of direct care in Canadian nursing homes is provided by care aides. This body of unregulated, variably trained staff is rarely encouraged to lead in quality improvement initiatives. SCOPE is a controlled, cluster randomised study which examines the effect of engaging and empowering care aide led teams to effect system change at the clinical unit level. This report presents the barriers and facilitators to successful operation of the intervention in the first seven intervention sites in a fully powered study. Pitfalls in fidelity monitoring will be discussed with regard to unit, leader, quality improvement team and researcher experiences.

IMPROVING NURSING HOME CARE THROUGH FEEDBACK ON PERFORMANCE DATA (INFORM)

M. Hoben¹, L.R. Ginsburg², P.G. Norton³, A. Wagg¹, C.A. Estabrooks¹, 1. *University of Alberta, Edmonton, Alberta, Canada*, 2. *York University, Toronto, Ontario, Canada*, 3. *University of Calgary, Calgary, Alberta, Canada*

INFORM is a 3.5-year pragmatic, cluster-randomized trial to systematically evaluate the effectiveness of three feedback strategies (standard feedback, and two assisted, goal-directed strategies) for improving performance within nursing home care units. Methods and results of international audit/feedback studies are heterogeneous. They have been criticized for a lack of systematic use of theory, and a lack of head-to-head comparisons of different feedback strategies. INFORM is based on theory (audit/feedback, goal setting, complex adaptive systems). Interventions target care unit managerial teams. We randomized 67 Western Canadian nursing homes with 203 care units to the three study arms: Primary outcome is the increased number of Formal Interactions (e.g., resident rounds or family conferences) involving care aides. We will present methods of INFORM and results of the initial Goal Setting Workshops. Participants were able to set performance goals and tailor improvement strategies to

identified barriers/facilitators, and participants found attending the workshops beneficial.

SESSION 3080 (SYMPOSIUM)

INTERNATIONAL, PRAGMATIC, AND MULTISITE TRIALS: DESIGN, IMPLEMENTATION AND ETHICAL CONSIDERATIONS

Chair: T. Trivison, *Beth Israel Deaconess Medical Center, Boston, Massachusetts*

Co-Chair: H. Allore, *Yale University, New Haven, Connecticut*

Discussant: M. Tai-Seale, *Palo Alto Medical Foundation Research Institute, Palo Alto, California*

Recent work drawing a clearer distinction between explanatory clinical trials (concerned with the estimation of causal effects) and pragmatic trials (focused on selection between therapeutic strategies) illuminates the interplay between internal validity and the generalizability of quantitative results. In gerontology and geriatrics, these tensions present a particular challenge, as there is often a dramatic contrast between those individuals eligible to enroll in intervention trials and the more diverse older patient populations to which conclusions would ideally apply.

In practice, large multisite trials are often designed with both explanatory and pragmatic considerations in mind. Therefore, flexible methodologies are required to insure valid design while bolstering the generalizability of results. In this symposium, we provide a series of international perspectives on modern approaches to participant recruitment and retention, randomization, statistical analysis, and research ethics in the context of complex sampling populations and flexible research designs. We focus in particular on scenarios in which clustered sampling of older participants is necessary, either because of the nature of the intervention (e.g. a change in clinical practices) or the population under study (e.g. where patient subgroups are nested within geographic regions). We then consider the ethical implications of enrollment of older subjects in complex trials with pragmatic foci, for which foundational principles may differ from those of conventional explanatory trials. Finally, we discuss a framework guiding the interplay between trial design, best statistical practices, and the ethical conduct of interventional research, and consider the application of these designs to research within differing healthcare systems.

RECRUITING OLDER PEOPLE AT NUTRITIONAL RISK FOR CLINICAL TRIALS: WHAT HAVE WE LEARNED?

V. Naganathan³, C. Piantadosi¹, I. Chapman¹, P. Hunter², I. Cameron³, R. Visvanathan¹, 1. *University of Adelaide, Adelaide, South Australia, Australia*, 2. *Alfred Health, Caulfield, Victoria, Australia*, 3. *University of Sydney, Sydney, New South Wales, Australia*

There is limited information about effective ways to screen and recruit older people into trials, and the reasons for their reluctance to enroll. This presentation examines recruitment efforts for a community-based randomized clinical trial that targeted undernourished men and women, aged ≥ 65 years in three Australian cities. Participants were allocated to either

oral testosterone and high calorie oral nutritional supplement or placebo medication and low calorie oral nutritional supplementation. 4023 potential participants were identified and 767 were screened by a variety of methods: hospital note screening, referrals from geriatric health services, advertising and media segments/appearances. 53 participants (7% of total screened) were recruited. The majority of potentially eligible participants declined participation in the trial after reading the information sheet. Media was the more successful method of recruiting, whereas contacting people identified by screening a large number of hospital records was not successful in recruiting any participants.

PARTICIPANT RANDOMIZATION IN COMPLEX TRIAL DESIGNS

T. Trivison¹, D. Esserman³, E. Greene³, H. Allore², 1. *Beth Israel Deaconess Medical Center, Boston, Massachusetts*, 2. *Yale School of Medicine, New Haven, Connecticut*, 3. *Yale School of Public Health, New Haven, Connecticut*

Clinical trial design entails specific challenges when the intervention is applied to groups of individuals, requiring them to be randomized together (as a cluster). Although the number of participants may be high, there may be few clusters, and thus simple randomization may lead to imbalances between the randomized groups. To insure statistical power and validity, one must consider the potential for these imbalances, as well as the between-cluster variation in number of eligible participants and the intra-cluster correlation in outcomes. Some of these cannot be known at design time. Where additional complexities are inherent to the sampling frame (e.g. multi-level correlation in nested samples) or the experimental design (e.g. crossover in the stepped wedge), randomization entails additional corresponding challenges. This presentation will detail implications for participant allocation of trials of cluster-level interventions for older adults, review existing and novel computational and software tools that facilitate design of complex multisite trials.

ANALYSIS OF TRIALS WITH MULTI-LEVEL CLUSTERING, RECURRENT EVENTS AND COMPETING RISKS

H. Allore¹, T. Jung², D. Esserman², P.N. Peduzzi², 1. *Yale School of Medicine, New Haven, Connecticut*, 2. *Yale School of Public Health, New Haven, Connecticut*

Oftentimes participants in randomized trials are clustered at multiple levels. For instance, they may be grouped in practices, which in turn are grouped within hospitals within healthcare systems. The complex hierarchical relationships introduced within resulting data structures must be acknowledged in data analyses to insure valid estimation of treatment effects.

When such trials are conducted among older individuals, additional complexities may present themselves, as in the case when death or other competing risks preclude observation of clinical endpoints. When the outcome of interest is a potentially recurrent event, such as fall or hospitalization, there may be interest in understanding the rates of both incidence and recurrence, but existing methods are inadequate to estimate them in this setting. In this presentation, we propose a novel analytic approach for estimation of treatment effects for time-to-event endpoints in the presence of multilevel clustering and competing risks.

PRAGMATIC COMPARATIVE EFFECTIVENESS TRIALS: INTERPLAY BETWEEN DESIGN AND ETHICS

M. Taljaard, *University of Ottawa, Ottawa, Ontario, Canada*

Pragmatic RCTs comparing effectiveness of treatments integrated in usual care can reduce variations in care, improve uptake of evidence-based practice, reduce costs and improve patient outcomes. Novel designs such as cluster crossover and stepped wedge cluster RCTs can detect small but important differences at population-level. However, these trials raise important methodological and ethical issues. Existing ethical frameworks were developed primarily for trials focusing on efficacy of experimental treatments for marketing approval. Common elements include tightly controlled conditions with individual patient recruitment, randomization and follow-up. This talk will address the importance of pragmatic comparative effectiveness trials as a tool to support decision-making by patients, clinicians and policymakers. Using a case study of a cluster RCT allocating nursing homes to high dose versus standard dose influenza vaccine, it will address the interplay between ethics and statistical design by reviewing alternative design choices and their implications for trial feasibility, generalizability, and validity.

ETHICAL CHALLENGES IN PRAGMATIC COMPARATIVE EFFECTIVENESS TRIALS

C. Weijer, *University of Western Ontario, London, Ontario, Canada*

Pragmatic RCTs raise ethical issues that have not yet been adequately addressed. Consider a trial allocating nursing homes to high dose versus standard dose influenza vaccine: if designed as an individual patient RCT, informed consent would need to be sought for randomization, intervention and outcome assessment; but if treatments are implemented institution-wide as a policy intervention, is it acceptable to proceed without patient consent? Do patients need to be informed about the trial and if so, how? Some reject the research-practice distinction by advocating that low or no-risk pragmatic RCTs do not require more stringent oversight than clinical practice. Modifications to traditional consent models have been proposed, but it is unclear if they adequately protect patients' rights. The lack of adequate ethical guidance for pragmatic RCTs presents a practical threat to the conduct of socially valuable research. If important research is to proceed, novel guidance is required.

SESSION 3085 (PAPER)

FACTORS AFFECTING DEMENTIA RISK AND BEHAVIORAL SYMPTOMS

MALNUTRITION A RISK FACTOR OF MORTALITY IN HOSPITALIZED ADULTS WITH DEMENTIA IN THE UNITED STATES

E.W. Gonzalez¹, J. Slaughter¹, R. Di Maria-Ghalili¹, P. Abeysekara¹, H. Resnick², P. Guenter³, 1. *Drexel University, Philadelphia, Pennsylvania*, 2. *NIA/NIH, Washington, District of Columbia*, 3. *American Society of Parenteral & Enteral Nutrition, Springfield, Maryland*

Background: As people live longer, the prevalence of chronic illness including dementia has become a public health concern. Although studies have found persons with dementia (PWD) are at risk for malnutrition little is known about the mortality risk among hospitalized PWD. This study examined the relationship between malnutrition and mortality among PWD.

Methods: Data are from the 2010 Nationwide Inpatient Sample (NIS), a nationally representative sample of discharges from community hospitals in the United States. The sample was restricted to inpatients ≥ 65 years with a primary or secondary diagnosis of dementia. Logistic regression was used to calculate d unadjusted and adjusted odds ratios (OR) and 95% confidence intervals (CI).

Results: Among PWD, the mean age was 83.2 (SE=0.06) years, 62.8% female, and 76% white. The majority of PWD were admitted from their homes. The prevalence of malnutrition was 12.2% (95% CI: 11.7–12.7) and in-hospital mortality was 4.8% (95% CI: 4.6–5.0). When stratified by malnutrition, mortality was 7.8% (95% CI: 7.4–8.2) for patients malnutrition versus 4.4% (95% CI: 4.2–4.5) for patient without malnutrition. Unadjusted results showed malnutrition to be significantly associated with in-hospital mortality (OR=1.86, 95%CI:1.77–1.96). After adjusting for demographics, point of origin, chronic conditions and comorbidities, and receipt of parenteral or enteral nutrition, the likelihood of mortality for PWD was 39% greater for those with a malnutrition compared to those without malnutrition.

Conclusions: The findings highlight the need to recognize nutritional risk for PWD living at home. PWD diagnosed with malnutrition are at risk of mortality.

SLEEP EARLIER IN LIFE AND LATE-LIFE DEMENTIA: MULTI-CENTER POPULATION DATA FROM SWEDEN AND FINLAND

S. Sindi^{1,2}, L.M. Johansson³, J. Skoog³, L. Sjöberg^{1,2}, H. Wang^{1,2}, I. Skoog³, M. Kivipelto^{1,2,4}, I. Kåreholt^{1,5}, 1. *Aging Research Center, Karolinska Institutet and Stockholm University, Stockholm, Sweden*, 2. *Karolinska Institutet Center for Alzheimer Research, Stockholm, Sweden*, 3. *Institute of Neuroscience and Physiology, Center for Health and Ageing AGEAP, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden*, 4. *Institute of Clinical Medicine, University of Eastern Finland, Kuopio, Sweden*, 5. *Institute of Gerontology, School of Health and Welfare, Jönköping University, Jönköping, Sweden*

Sleep disturbances commonly follow the onset of dementia. However, few longitudinal studies have assessed how sleep disturbances can increase dementia risk. The current study examines the association between sleep disturbances and dementia using population-based data.

In three population-based studies (two Swedish, one Finnish), general questions were administered about sleep quality, reduced sleep hours and terminal insomnia. The short-term follow-up analyses (9–10 years follow-up time) used all three studies (N=1446). Mean baseline ages in the three datasets were 70, 70, and 84 years. The long follow-up analyses used the Finnish dataset with 22 and 32 years follow-up (N=759) and mean age was 50 years.

We performed binary logistic and hazard regressions for the associations between sleep and dementia. The following potential baseline confounders were adjusted for: Data material, follow-up time, baseline age, sex, years of education (linear), alcohol consumption (linear), presently smoking, physically active, cohabitation, cardiovascular conditions, hypnotics (yes/no), APOE4 allele (for short follow-up data) and hopelessness.

Short follow-up results showed significant associations in all models between terminal insomnia and a higher likelihood of dementia (fully adjusted model using all covariates, odds ratio (OR)=1.94, $p=0.027$). No associations were found between reduced sleep and dementia (OR=0.99). Long follow-up results (Finnish data) showed that insomnia was associated with a higher risk for dementia (fully adjusted hazard ratio=1.24 $p=0.030$).

In conclusion, more severe insomnia earlier in life is associated with a higher risk of late-life dementia. Individuals with sleep disturbances may benefit from interventions to improve sleep.

PAIN INTERFERENCE AND DEPRESSIVE SYMPTOMS IN ALZHEIMER'S DISEASE: A PILOT STUDY

J. Wang¹, M.S. Dietrich^{1,2}, S.F. Simmons³, R.L. Cowan^{2,4}, T. Monroe^{1,2,4}, 1. *Vanderbilt University School of Nursing, Nashville, Tennessee*, 2. *Vanderbilt University School of Medicine, Nashville, Tennessee*, 3. *Center for Quality Aging, Vanderbilt University Medical Center, Nashville, Tennessee*, 4. *Department of Psychiatry and Behavioral Sciences, Vanderbilt University School of Medicine, Nashville, Tennessee*

There were five million older adults in the U.S. with AD in 2015; 43–86% of those with AD report regular pain. Yet, little is known about the degree to which pain interferes with everyday activities in this population. We conducted a cross-sectional, secondary analysis of data from 52 older (≥ 65) communicative adults with AD who were free from chronic pain. Instruments included the Mini Mental State Exam (MMSE, cognitive function), Brief Pain Inventory Short Form (BPISE, pain interference score) and the Geriatric Depressive Scale (GDS-15, depressive symptomology). Median BPI score was 0.0 with a range from 0 to 8. Reports of pain interference with specific activities included general activity (13.5%), mood (13.5%), walking ability (13.5%), normal work (11.5%), enjoyment of life (11.5%), relations with other people (9.6%), and sleep (9.6%). Average MMSE was 18.5 (SD=5.1), indicating moderate cognitive impairment. Median GDS score was 2.0 (IQR=1–6). There were statistically significant associations of pain interference with both cognitive function ($r_s=0.46$, $p=0.001$) and depressive symptomology ($r_s=0.45$, $p=0.001$), indicating that greater perceived pain interference was related to better cognitive function and more depressive symptoms. Our findings showed that the association of pain interference with cognitive impairment and depression may place older adults at risk for under-management and unnecessary suffering. Due to the disabling impact of pain interference on everyday activities, assessment of pain interference should be incorporated into routine clinical practice to better manage pain.

Accurate assessment of pain interference can also help identify older adults at high-risk for depression.

SESSION 3090 (SYMPOSIUM)

A BIOBEHAVIORAL APPROACH TO HEALTH IN MIDLIFE AND OLDER AGES

Chair: H.R. Collins-Farmer, *Pennsylvania State University*

Co-Chair: A. Thierry, *The Pennsylvania State University*

Discussant: L.A. Wray, *Pennsylvania State University*

This symposium is intended to incorporate a biobehavioral approach to understanding the biological mechanisms that may underlie patterns of health in midlife and older ages. Psychosocial and behavioral factors are related to health status, but less is known about the biological manifestations of these factors and how they are linked to the development of health problems. Current research suggests that they may lead to physiological dysregulation, a precursor to morbidity and mortality. The research presented in this symposium will focus on the associations among biological mechanisms, health status, social status, and psychosocial experience using data from the nationally representative Health and Retirement Study. First, Amy Thierry will discuss the links between the development of different measures of physical disability and telomere length, a biomarker associated with biological aging. The next two talks will examine the link between social status, health and C-reactive protein (CRP), which is an indicator of systemic inflammation. CRP has been linked to cardiometabolic problems and mortality. Heather Collins-Farmer will illustrate the complex relationships of race and all-cause mortality, by focusing on the ways that education, everyday discrimination, and CRP explain racial disparities in mortality. Finally, Marina Armendariz will explore the Hispanic paradox and test whether Mexican-Americans and those who were foreign-born have lower circulating CRP levels compared to their U.S.-born counterparts. After attending this session, participants will have a greater understanding of the roles that social status, behavior, and health status can influence physiological functioning, and thus, morbidity and mortality, in midlife and older ages.

IS TELOMERE LENGTH ASSOCIATED WITH PHYSICAL DISABILITY IN U.S. MIDLIFE AND OLDER ADULTS?

A. Thierry, I. Shalev, L.A. Wray, *The Pennsylvania State University, University Park, Pennsylvania*

Telomere length, a biomarker of accumulated cellular damage and physiological dysregulation, is negatively associated with risk of developing disabling conditions in older age. However, little is known about the telomere length-physical disability relationship. Using Health and Retirement Study data collected in 2008–2014, linear regression models tested the association between baseline telomere length and change in number of functional limitations, activities of daily living (ADLs), and instrumental activities of daily living (IADLs) in a diverse, nationally representative sample of US adults >50 years of age ($n=4,085$). In participants ≥ 65 ($n=2,602$), those with shorter telomeres accumulated more disabilities

over time, even after including demographic, socioeconomic, and health status variables ($b=-1.314$, $SE=0.50$, $p<0.05$). This relationship was driven by accumulation of functional limitations, and not ADLs or IADLs, in this age group. Because telomere length was associated with disability development, future research should further examine biobehavioral mechanisms implicated in this complex process.

AN EXAMINATION OF THE BIOPSYCHOSOCIAL MECHANISMS LINKING RACE TO ALL-CAUSE MORTALITY

H.R. Collins-Farmer, L.A. Wray, *Pennsylvania State University, University Park, Pennsylvania*

The protective and negative experiences of education and discrimination may contribute to Blacks' elevated mortality rates. C-reactive protein (CRP), linked to chronic stress and mortality, may explain this disparity. Core, biomarker, and leave-behind data from 2006 and 2008 were pooled from the Health and Retirement Study, a nationally representative sample of middle-aged and older adults, and Cox proportional hazard models were used to examine the relationship between race, education, everyday discrimination, CRP, and mortality in 2014. In the sample of 9,168 respondents, 11.30% died at follow-up. Race was associated with increased mortality ($HR = 1.45$, $p \leq .001$), and was reduced to non-significance after controlling for education, everyday discrimination, and CRP. Everyday discrimination explained 8% of the association between race and mortality, CRP explained 5%, and education reduced the association to non-significance. The relationship between race and mortality is complex: inequalities in social status and stress exposure may drive mortality.

EXAMINING THE HISPANIC PARADOX IN C-REACTIVE PROTEIN (CRP) IN MIDDLE-AGED AND OLDER AMERICANS

M. Armendariz, H.R. Collins-Farmer, A. Thierry, L.A. Wray, *Biobehavioral Health, Pennsylvania State University, University Park, Pennsylvania*

Although the Hispanic Paradox indicates that Hispanics' health is comparable to non-Hispanic Whites, empirical data suggest this paradox may not exist in biological health profiles. This study examines the Hispanic Paradox in C-reactive protein (CRP), a biological indicator of inflammation. Data were pooled from the 2006 and 2008 core and biomarker waves of the Health and Retirement Study, a nationally representative study of middle-aged and older Americans. Multiple regression analyses tested the relationship between adults of Mexican origin ($n = 727$) and CRP, net of the effects of immigrant status and survey language preference. Mexican Americans had higher CRP levels than Whites, controlling for age and sex ($\beta=.06$, $p<.01$); however, when both immigration status and language preference were controlled, the association between being Mexican American and CRP was reduced to non-significance ($\beta=.04$, $p>.05$). Future research should fully investigate how biological, social and behavioral factors link Mexican origin to higher CRP.

SESSION 3095 (PAPER)

PHYSICAL ACTIVITY AND HEALTH

ACUTE EFFECT OF DIFFERENT TYPES OF EXERCISE ON BLOOD PRESSURE OF HYPERTENSIVE OLDER WOMEN

G.O. Campos, R.F. Bertani, J.C. Moriguti, E. Ferrioli, N.K. Lima, *Ribeirão Preto Medical School - University of São Paulo, Ribeirão Preto, Sao Paulo, Brazil*

Heart disease is the leading cause of deaths worldwide. Systemic arterial hypertension contributes to raising the risk of cardiovascular events. In older women the incidence of hypertension is higher compared to men. The role of exercise in the prevention and treatment of hypertension is undeniable, however, the best mode has not been set. The present study investigated the hemodynamic responses of systolic blood pressure (BP) of 30 elderly hypertensive women under drug therapy, subjected to continuous aerobic exercise (CAE), interval aerobic exercise (IAE), resistance exercise (RE) and control (C) with a minimum interval of 7 days, in random order, with the same intensity. Systolic BP measurements were obtained before and immediately after the sessions by the oscillometric method, and 24-hour ambulatory blood pressure monitoring (24-h ABPM) was performed in 4 groups. The data were analyzed by mixed-effects model. It was observed a decrease in systolic BP in the CAE (123 ± 17 mmHg to 116 ± 19 mmHg, $p < 0.001$), in the IAE (122 ± 16 to 112 ± 16 mmHg, $p < 0.001$), with no immediate change in ER. In the 24-h ABPM was observed lower systolic BP in IAE than in CAE (< 0.001). The hypotensive effect of IAE session is larger and longer than CAE session, suggesting that the change in intensity over time of exercise can influence the magnitude of the systolic BP fall in hypertensive older women.

EFFECT OF KINECT TAI CHI ON OVERALL HEALTH OF DEMENTIA CLIENTS: A FEASIBILITY AND USABILITY STUDY

N. Neubauer, V. Fernandez, L. Liu, E. Stroulia, *University of Alberta, Edmonton, Alberta, Canada*

The prevalence of dementia is increasing worldwide. Dementia clients experience an increased risk for depression and physical inactivity. Tai Chi can enhance the physical and mental health of healthy older adults, including persons with dementia. However, programs tailored for dementia clients are scarce and barriers, such as transportation and accessibility, further limit participation in Tai Chi. The purpose of this pilot study was to evaluate the usability of a home Kinect-based Tai Chi system (K-TaiChi), and to determine its effect on perceived physical and mental health of dementia clients in preparation for a large-scale study. Using a serious-games methodology, K-TaiChi was developed to guide dementia clients through postures and movements, recognize features of their movement, and provide visual feedback and rewards when movements are performed well. Ten community dwelling individuals with mild to moderate dementia used K-TaiChi in their homes three times per week, for six weeks.

Focus groups with dementia clients and their caregivers were conducted to evaluate our system's feasibility and usability. The Cornell Scale for Depression in Dementia was administered pre and post intervention to evaluate its effectiveness on mental health. The majority of participants successfully used K-TaiChi. Results revealed improvements in depression and physical activity levels of those that completed all 18 sessions. Because of its user-friendliness and its effects on activity levels, depression, and perceived health, K-TaiChi holds promise for community-residing mild to moderate persons with dementia who are unable to participate in traditional Tai Chi programs.

TENACIOUS GOAL PURSUIT AND LIFE-SPACE MOBILITY AMONG OLDER PEOPLE WITH WALKING DIFFICULTIES

M. Saajanaho, K. Kokko, M. Rantakokko, E. Portegijs, J. Eronen, T. Poranen-Clark, T. Rantanen, *Health Sciences, University of Jyväskylä, Muurame, Finland*

Life-space mobility, defined as the spatial extent of movement in daily life, is strongly dependent on functional ability. However, active striving to reach one's goals might inspire older people to move in a larger life-space regardless of their physical abilities. We aimed to study whether tenacious goal pursuit differs according to walking difficulties and whether it is associated with life-space mobility in old age.

The participants were 186 community-dwelling older people between 79 and 93 years of age from the Life-Space Mobility and Active Aging study. Life-space mobility was assessed with the Life-Space Assessment. The Tenacious Goal Pursuit (TGP) scale was used to assess the tendency to be persistent in goal pursuit (range 1–5, higher scores indicate higher tenaciousness). Linear regression model adjusted for age, sex, years of education and self-rated health was used in the analysis. The analysis was stratified based on reporting vs. not reporting at least minor difficulties in walking two kilometers.

Participants who reported walking difficulties were less tenacious in goal pursuit compared to those who did not report such difficulties (Mean TGP score=3.45, SD=0.80 vs. M=3.71, SD=0.66; $p=.018$). Furthermore, tenacious goal pursuit was associated with higher life-space mobility only among those with walking difficulties ($B=5.47$, SE 2.6, $p=.040$).

This study indicated that tenacious goal pursuit may serve as a striving force for older people with walking difficulties to move in a larger life-space. Therefore, tenaciousness may be a key factor in counteracting the negative influences of functional decline in old age.

HELPING ELDERS LIVING WITH PAIN (HELP): A RANDOMIZED CONTROLLED PILOT STUDY

T. You¹, E. Ogawa¹, S. Thapa¹, S. Nagae¹, G. Yeh², P. Wayne³, L. Shi¹, S.G. Leveille¹, 1. *University of Massachusetts Boston, Boston, Massachusetts*, 2. *Beth Israel Deaconess Medical Center, Boston, Massachusetts*, 3. *Brigham and Women's Hospital & Harvard Medical School, Boston, Massachusetts*

Accumulating evidence supports that chronic pain is associated with poorer cognitive function and mobility, and fall risk in older adults. This study investigated the feasibility of a

randomized controlled trial of a Tai Chi intervention in older adults with multisite pain who are at risk for falls. Adults aged ≥ 65 y with multisite pain (≥ 2 sites) who reported falling in the past year or using a cane or walker were recruited from the Boston area communities through mailed invitations, community flyers, local newspaper and TV ads, and social media. Participants were randomized to either a light physical exercise (stretching, walking and weight training) program or a mind-body exercise (Tai Chi) program, offered twice weekly for 12 weeks. The primary outcomes were feasibility, acceptability and efficacy of the Tai Chi intervention. Of the 176 adults screened, 85 were eligible, and 54 enrolled (average age= 75 ± 8 y; 96% white; 76% female). The drop-out rate was 15% (12% for light physical exercise and 18% for Tai Chi). For those completing the study, exercise class attendance rate was 79% (82% for light physical exercise and 76% for Tai Chi). The main reasons for dropouts and absences included family obligations, transportation challenges, difficulty performing Tai Chi movements, musculoskeletal pain, falls, and other health complications. This study demonstrated the feasibility and acceptability of conducting a larger randomized controlled Tai Chi trial in older adults with multisite pain and at risk for falls. Data collected and challenges encountered will inform future research. (Supported by NIH Grant R21 AG043883)

AEROBIC EXERCISE PROMOTES EXECUTIVE FUNCTIONING AND ASSOCIATED FUNCTIONAL NEUROPLASTICITY

C. Hsu^{1,2,3}, J. Best^{1,2,3}, J.C. Davis^{1,3,4}, L. Nagamatsu⁵, S. Wang^{1,2,3}, R.G. Hsiung¹, M. Voss⁶, T. Liu-Ambrose^{1,2,3}, 1. *Rehabilitation Science, University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Aging, Mobility, and Cognitive Neuroscience Lab, Vancouver, British Columbia, Canada*, 3. *Djavad Mowafaghian Center for Brain Health, Vancouver, British Columbia, Canada*, 4. *Center for Hip Health and Mobility, Vancouver, British Columbia, Canada*, 5. *University of Western Ontario, London, Ontario, Canada*, 6. *University of Iowa, Iowa City, Iowa*

Vascular cognitive ischaemia (VCI) is the second most common type of cognitive dysfunction worldwide and is due to cerebrovascular disease. While targeted aerobic exercise is a promising approach to delay the progression of VCI by reducing cardiometabolic risk factors, few randomized controlled trials to date have specifically assessed the efficacy of aerobic exercise on cognitive and brain outcomes in this high-risk group. Thus, the goal of this secondary analysis study was to examine the effect of moderate-intensity aerobic exercise training on executive functions and functional neural plasticity among older adults with mild subcortical ischaemic vascular cognitive impairment (SIVCI). Seventy-one older adults with mild SIVCI were randomly assigned to: 1) a 6-month, 3x/week aerobic training (AT; $n=36$) or usual care (CON; $n=35$). This secondary analysis included 21 (mean age 71.5 years) participants; 10 from AT group and 11 from CON group. All 21 participants completed functional magnetic resonance imaging (fMRI) sessions at baseline and trial-completion. During the fMRI sessions, performance on the Eriksen flanker task and task-evoked neural activity were assessed. At trial completion, after

adjusting for baseline MoCA, baseline total white matter lesion volume, and baseline performance, compared with the CON group, the AT group significantly improved flanker task performance. Moreover, compared with the CON, the AT group demonstrated reduced activation in the left lateral occipital cortex and right superior temporal gyrus. Reduced activity in these brain regions was significantly associated with improved (i.e., faster) flanker task performance at trial completion, suggesting aerobic training increased neural efficiency. Thus, aerobic training among older adults with mild SIVCI can improve executive functions and neural efficiency of associated brain areas.

SESSION 3100 (SYMPOSIUM)

RELOCATION DECISION MAKING: FACTORS ASSOCIATED WITH DISPLACEMENT

Chair: K. DiazMoore, *University of Utah, Salt Lake City, Utah*

One of the more complex dimensions of the aging experience is associated with environmental relocation. Not all relocation is equivalent, but rather the decision-making process is often quite nuanced. Conceptualizing relocation decision-making in a coherent yet parsimonious manner would guide not only future research in this important gerontological topic, but also inform a constellation of interventions to ease place integration. The first presentation extends Antonucci's Convoy Model of Social Support to the role material objects in social support and discusses the difficulties associated therein with relocation and downsizing. The second presentation addresses the confound of disability and the impact its trajectory has upon relocation decision-making as found in Sweden. This is followed by a presentation that applies the theory of planned behaviour to understanding the appraisals of home modifications by older adults in the Netherlands. The final presentation explores the role that connectivity plays in relocation decisions through the lens of the theory of residential normalcy. The symposium as a whole illustrates the multidimensional nature of the environmental decision-making at the time of relocation/displacement and illuminates the critical role the environment plays as a barrier or prosthetic. It enlightens the differences found in third age versus fourth age moves and how the increasing awareness of the role urban design plays in health outcomes are likely to increasingly influence decision-making patterns – and it does so involving a variety of international perspectives.

MOVING THE MATERIAL CONVOY

D.J. Ekerdt, *University of Kansas, Lawrence, Kansas*

Moving residence calls the question on the entirety of one's possessions, putting up for evaluation the status and placement of every object from the all of the home's recesses. Because elders typically move to smaller quarters, the material convoy will need pruning, setting in motion the physical, cognitive, social and emotional tasks of divestment. Interviews with 100+ American households within a year of relocation indicate that moving and downsizing play out in three basic ways. First, de-accumulation prudently spans months or years in advance of a move (not the likely course).

Second, downsizing occurs proximate to a move; for good reasons this is the usual course, but stressful. Third, one moves and then empties the household afterward, a solution only if elders can bear the expense of two homes. In practice downsizing and moving are temporally intertwined, one preceding the other, precipitating the other, awaiting the other, interrupting the other.

RESIDENTIAL REASONING IN THE LIGHT OF DISABILITY IN OLD AGE: HOUSING ADAPTATIONS CLIENTS IN SWEDEN

M. Granbom¹, L. Ekstam¹, A. Malmgren-Fänge^{1,3}, 1. *Department of Health Sciences, Lund University, Lund, Sweden*, 3. *Department of Community-Public Health, Johns Hopkins School of Nursing, Baltimore, Maryland*

Housing preferences and residential reasoning in later life are closely related to older people's present health care needs and thoughts of the future. For community-living older people with disabilities in Sweden tax-based housing adaptations (HA) are offered as a strategy to enable aging-in-place. However, it is not known how the residential reasoning process changes for older people undergoing adaptations to their home. The aim was to explore how thoughts on relocation and aging in place changes over time for housing adaptation clients in Sweden. Longitudinal qualitative data from 17 HA clients and 9 partners were utilized. The results show that the residential reasoning changed during the housing adaptation process but were to a large extent influenced by the couple's changing health than the alteration of the home. The findings contribute to empirical knowledge on HA as well as to the theoretical development on relocation decision-making in later life.

OLDER HOME OWNERS' AWARENESS AND APPRAISAL OF RESIDENTIAL ENVIRONMENTAL MODIFICATIONS

D. Lager, A. Brouwer, G. de Kam, E. Kibele, *Economic Geography, University of Groningen, Groningen, Netherlands*

Ageing-in-place policies have been implemented by many Western governments in order to delay and decrease the reliance on expensive institutionalised care. While such policies, as well as a large body of research, support the idea that ageing-in-place contributes to the wellbeing of older adults, ageing-in-place also has its downsides. Health problems and physical limitations can pose hazards within residential environments, such as falling or house fires. One way of dealing with incongruences between older persons and their housing situation is the physical adaptation of the residential environment; either through home modifications or relocation. The Dutch government wants older adults to anticipate on incongruences in the residential environment by making timely changes in order to prevent incidents from happening. However, insight is lacking in older adults' awareness and perception of such modifications as a strategy to age safely in place and how they view 'timeliness' in this respect. The objective of this paper is to understand Dutch older home owners' appraisal of residential environmental modifications. The results of this research are based on a survey and semi-structured interviews with nine older home owners (aged 55 and above). We use Ajzen's theory of planned behaviour as

an interpretative framework for the analysis of the results. The insights provided by this study can provide input for policy makers and professionals in designing interventions to raise awareness amongst older adults about the possibilities for and benefits of timely residential environmental modifications.

AGING IN THE RIGHT PLACE COPING REPERTOIRES: THE SUBSTITUTABILITY OF CONNECTIVITY ALTERNATIVES

S.M. Golant, *Geography, University of Florida, Gainesville, Florida*

Older people often feel incompetent and out of control when they cannot easily reach destinations to achieve their shopping, social, recreational, and health care needs. Consequently, they have more difficulty aging in place when they lack easy-to-use transportation options. However, the availability of traditional auto and transit modes of transportation is becoming a less predictive residential relocation influence. Rather, the coping repertoires of older people now include alternative connectivity options such as demand-responsive auto services like Uber, home-delivered products and services, elder villages, new urbanism communities, housing with services, and telemedicine, smart home, and robotic information and communication technologies. Driverless cars will be available in the near future. This paper's theoretical analysis considers the psychological, social, economic, and political benefits and costs of substituting these connectivity options. Explaining the future aging in the right place behaviors of older people will require a greater understanding of these tradeoffs.

SESSION 3105 (SYMPOSIUM)

THE MOLECULAR AND ORGANISMAL BASIS OF RESILIENCE AND FRAILITY

Chair: J.D. Walston, *Johns Hopkins University School of Medicine, Baltimore, Maryland*

Co-Chair: M. Fain, *University of Arizona*

A major goal of global aging research is to prevent frailty and promote resilience in aging in older adults around the world. Key to this effort is the identification of physiological and molecular etiologies that impact the health and well-being of older adults. Over the past two decades, increasing evidence suggests that age and environment related impaired stress response systems such as the innate immune system and the renin-angiotensin system, as well as neuroendocrine and endocrine system changes help to drive organismal frailty and related vulnerability to chronic diseases and adverse health outcomes. Maintenance of these same systems promotes resiliency and robustness. Specific age-related molecular changes are thought to drive these declines, including the development of senescent cell populations, mitochondrial dysfunction, and altered autophagy. In this symposium, speakers will 1) describe the conceptualization of frailty and resiliency with aging and provide an overview of the physiological systems thought to be most influential to these processes, 2) describe the endocrine changes and how they influence mitochondrial, autophagy, and mTOR pathways, 3) describe the role of cellular senescence to these processes,

4) review the animal models used for biological discovery in this area, and 5) outline the novel biological discoveries from the European FRAILOMICS consortium. At the end of this symposium, the audience will be able to describe age-related frailty and resiliency, their biological and physiological underpinnings, and the use of animal models and omic strategies that will further that biological understanding.

CONCEPTUALIZING FRAILITY AND RESILIENCY AND THEIR PHYSIOLOGICAL BASIS

J.D. Walston, *Medicine/Geriatrics, Johns Hopkins University School of Medicine, Baltimore, Maryland*

The prevention of age-related frailty and the promotion of resiliency will depend on more basic biological etiologic discovery. The biology that underlies both frailty and resiliency in older adults is complex and multisystemic and linked to physiological stress response systems. This session will provide a brief overview of the conceptualization of physical frailty and resiliency in both clinical and in research models and how they have been used for biological discovery. Examples of how the innate immune system, the hypothalamic pituitary adrenal axis, and the renin-angiotensin system drive frailty and multisystem decline will be provided. A conceptual model of how age-related biological changes in cells and tissues sets the stage for subsequent physiological change will also be described. This will set the stage for a subsequent series of talks that will connect age-related cellular and molecular changes back to these physiological systems and to biologic discovery around frailty and resiliency.

HORMONAL IMPACT ON MEASURES OF FRAILITY AND RESILIENCE

H.M. Brown-Borg, *University of North Dakota School of Medicine & Health Sciences, Grand Forks, North Dakota*

The factors that regulate aging processes are poorly understood however, the endocrine system has been shown to be a major regulator of aging, age-related disease and lifespan. The mammalian hormonal system is highly integrated and impacts metabolism, protein synthesis, stress resistance, and reproduction among other major physiological processes. Animals with altered endocrine profiles have been shown to resist musculoskeletal frailty, cognitive decline, accumulation of senescent cells, insulin resistance and cancer. The underlying molecular mechanisms responsible for susceptibility or resistance to this array of aging-related dysfunctional outcomes will be discussed such as mitochondrial function, signaling through mTOR and autophagy. The positive news is that genetic, dietary and drug interventions have been shown to affect these systems and extend health span.

THE POWER OF ANIMAL MODELS TO DISCOVER THE BIOLOGY OF FRAILITY

L.V. Thompson, *Boston University, Boston, Massachusetts*

Fighting frailty requires insight into the biological connections between aging, physiological system changes, and disease states, as well as an understanding of the molecular and cellular processes underlying each of these contributing factors. In order to study these processes and connections, the frailty researchers began developing animal models over the past decade. The most studied mouse model is the IL-10(tm/tm) mouse, a model with mild activation of inflammation,

which mimics frail humans. Frailty has also been modelled in naturally aging mice (C57BL/6) using a frailty-phenotype score, graded by a broad range of performance measures such as grip strength, walking speed, activity levels, endurance, and body weight. This presentation highlights how these and other relevant models are forging biological discoveries in the field of frailty.

CONTRIBUTION OF THE FRAILOMIC INITIATIVE TO THE BIOLOGICAL UNDERSTANDING OF FRAILTY AND RESILIENCY

L. Rodríguez-Mañas, *Hospital Universitario de Getafe, Getafe, Spain*

Frailty is complex in its pathophysiological basis but also in terms of the prognostic and diagnostic clues it provides us with. Traditionally, clinical and anthropological characteristics have been used to provide a diagnosis of frailty and an assessment of a patient's overall prognosis. Little attention has been given to the use of laboratory parameters as biomarkers that might improve on the discriminative power and accuracy of the current frailty criteria. Clinical studies have tended to focus on the association between isolated systems and/or single biomarkers with frailty scores. This approach overlooks the complex nature of a syndrome that involves the concomitant participation of several impaired systems. FRAILOMIC adopts a unique clinical approach to the study of frailty. Not only does our study assess the role of 'sets' of biomarkers that span several systems but it also includes assessment of the involvement of novel 'omics' (genomics, proteomics and metabolomics) indicators.

SESSION 3110 (SYMPOSIUM)

AGEING IN CHINA AND AUSTRALIA: SOCIAL, ECONOMIC, AND HEALTH IMPLICATIONS

Chair: J. Byles, *The University of Newcastle, Newcastle, New South Wales, Australia*

Co-Chair: V. Yiengprugsawan, *The Australian National University*

Discussant: M. Silverstein, *Syracuse University, Syracuse, New York*

Population ageing in China and Australia are presenting significant challenges and opportunities in both countries in planning for and adjusting proactively to social and policy change. Led by a multi-disciplinary team of cross-national researchers, this Symposium will present comparative findings on determinants of health, productivity, and wellbeing in the context of each country's cultural and social structural context, drawing from a range of large scale studies from China and Australia, followed by discussion on policy implications within these contexts.

The panel themes consist of quantitative results and policy discussion. Based on the Household Income and Labour Dynamics in Australia (HILDA) survey and the China Health, Ageing, and Retirement Survey (CHARLS), Kendig and Gong will present findings on the pattern of caregiving, living standards, and life satisfaction; and Nazroo, Gong, and Kendig will discuss their comparative results on workforce engagement in later life between the two countries. Yiengprugsawan, D'Este, and Byles will investigate

socio-geographical variations on health and wellbeing based on the China component of the World Health Organization's Study on global AGEing and adult health (WHO-SAGE). Browning, Thomas, Chapman and their Chinese colleagues including Yang and Zeqi will discuss primary health care reform in China and the links to Australian approaches with a specific emphasis on the management of chronic illnesses in older people.

The Symposium is supported by the Australian Research Council Centre of Research Excellence in Population Ageing Research and Shenzhen International Institute for Primary Health Care Research.

COMPARATIVE STUDY OF CAREGIVING IN CHINA AND AUSTRALIA

H.L. Kendig^{1,2}, C. Hong Gong^{1,2}, M. Silverstein^{3,2}, 1. *Centre for Research on Ageing, Health and Wellbeing, Australian National University, Canberra, ACT, Canberra, Australian Capital Territory, Australia*, 2. *ARC Centre of Excellence in Population Ageing Research (CEPAR), Canberra, Australian Capital Territory, Australia*, 3. *Ageing Studies Institute, Syracuse University, Syracuse, New York*

Drawing on the nationally representative CHARLS and HILDA 2013, we examined patterns of caregiving by men and women aged 45 and over in both China and Australia. Caregiving is defined as ongoing care for a household or non-household member with health conditions or frailty in Australia; and care for parents or grandchildren under 16 in China.

Ageing Chinese are contributing more caregiving to parents (9%) or grandchildren (30%) although they rarely care for non-family members or do voluntary work and care rates varied significantly by age, gender and residence. In Australia only 13% provided ongoing caregiving (average 18 hours per week) while 34% did voluntary work. In contrast to Australia, overall no significant negative impacts of caregiving were identified for caregivers' health, living standards and life satisfaction in China.

The implications will be discussed for China in developing its sustainable workforce and aged care systems in contrast to Australia.

PAID WORK IN LATER LIFE IN CHINA AND AUSTRALIA: EVIDENCE FROM CHARLS AND HILDA

J. Nazroo^{1,3}, C. Hong Gong^{2,3}, H.L. Kendig^{2,3}, 1. *Cathie Marsh Institute and Sociology, School of Social Sciences, The University of Manchester, Manchester, United Kingdom*, 2. *Centre for Research on Ageing, Health and Wellbeing, The Australian National University, Canberra, Australian Capital Territory, Australia*, 3. *ARC Centre of Excellence in Population Ageing Research (CEPAR), Canberra, Australian Capital Territory, Australia*

Drawing on the nationally representative CHARLS 2013 and HILDA 2011 data, we examined patterns of paid work (including agricultural work) by men and women aged 45 to 64 in both China and Australia.

When compared to Australians, mature aged Chinese had a slightly smaller proportion in paid work while more also were informal caregivers. About 68% of the Chinese were in paid work with significant variation by age, gender, residence and health. The average working hours for those still

working was 45 hours per week. Only 11% of the mature age Chinese with health conditions were still working. In Australia 71% of the mature age population were working, dropping to 47% among those with health conditions.

The discussion will consider the varying socio-economic influences on workforce participation in the two countries; workplace flexibility and policy directions, and the consequences of paid work on wellbeing and living standards.

GEOGRAPHICAL VARIATIONS IN HEALTH, DISABILITY, AND ACTIVITIES OF DAILY LIVING AMONG OLDER CHINESE

V. Yiengprugsawan^{1,2}, C. D'este³, J. Byles^{2,4}, 1. *Centre for Research on Ageing, Health and Wellbeing, Australian National University, Canberra, Australian Capital Territory, Australia*, 2. *ARC Centre of Excellence in Population Ageing Research (CEPAR), Canberra, Australian Capital Territory, Australia*, 3. *National Centre for Epidemiology and Population Health, The Australian National University, Canberra, Australian Capital Territory, Australia*, 4. *Research Centre for Generational Health and Ageing, The University of Newcastle, Newcastle, New South Wales, Australia*

The proportion of population ageing in China will grow significantly in the next few decades but the pace of population ageing and social change vary considerably across regions. For example, eastern coastal areas are economically more advanced compared to the western region. These economic disparities could result in differing impacts on health.

This presentation will investigate geographical variations in self-rated health, disability, and limitations in activities of daily living among national representative samples of Chinese aged 50 years and older (n= 13,396) based on the WHO Study on global AGEing and adult health (WHO SAGE). Study areas include Guangdong, Hubei, Jilin, Shaanxi, Shandong, Shanghai, Yunnan, and Zhejiang. Findings highlight patterns of adverse health outcomes among older Chinese, especially in economically disadvantaged areas.

Empirical evidence on such health patterns by socioeconomic development of geographical areas could help inform policy development and national investment to improve equity in population health.

PRIMARY HEALTH CARE IN CHINA: ADDRESSING CHRONIC ILLNESS MANAGEMENT IN OLDER PEOPLE

C. Browning^{1,2,3}, S. Thomas^{2,3}, H. Yang^{2,3}, Q. Zeqi⁴, A. Chapman^{1,2}, 1. *RDNS Institute, St Kilda, Victoria, Australia*, 2. *School of Primary Health Care, Monash University, Clayton, Victoria, Australia*, 3. *Shenzhen International Primary Health Care Research Institute, Shenzhen, China*, 4. *Center for China Sociological Research and Development Studies, Peking University, Beijing, China*

Over the last decade there has been significant focus on reforming the primary health care system in China to imbed a stepped care approach whereby patients can be treated in the community with appropriate referral to services to match their medical needs.

China's health policies now strongly promote the implementation of this approach particularly in response to the increasing burden of chronic disease and population ageing.

Affordable and accessible primary health care services are critical to promote healthy ageing and the health of the Chinese community more broadly.

This presentation will discuss the implications of recent aged care and health policy reforms in China and their potential impact on the health of older people. The presentation draws on analysis of key policy documents and interviews with informants including government officials, health professionals and older consumers and data from a major chronic illness management trial implemented in Beijing.

SESSION 3115 (SYMPOSIUM)

CAREGIVER ADJUSTMENT, INVOLVEMENT, AND SUPPORT

Chair: K. Pfeiffer, *Robert Bosch Hospital, Stuttgart, Germany*

Co-Chair: G. Wilz, *Friedrich Schiller University Jena, Jena, Germany*

Most health systems are based on the premise that families will assume responsibilities for day-to-day care to persons with chronic or disabling conditions. The past three decades of research in this field have been focused on understanding caregivers' adjustment, consequences of providing protracted care as well as on developing and testing interventions. In contrast to our recent knowledge about effective strategies to support families and diminish the burdens only very few programs have been translated for delivery in service contexts. Two presentations (Wilz, Pfeiffer) of the symposium address this gap. In two randomized trials registered psychotherapists and care counselors from long-term care insurances were trained and supervised in a telephone-based cognitive-behavioral intervention (Tele.TAnDem study) or problem-solving (PLiP study). Both randomized studies evaluated the effects of the interventions on family caregivers. The data are compared with the results of previous efficacy studies. A further aspect that is covered in this symposium is the lacking empirical-based theoretical foundation of caregiver resilience concepts. Using data from a national longitudinal study, personality prototypes are extracted and compared between caregivers and non-caregivers (Elliott). Finally, qualitative data on beneficial and limiting factors affecting the inclusion of family caregivers and nursing home residents with dementia in shared-decision making are presented (Vernooij-Dassen).

CBT-BASED TELEPHONE INTERVENTION FOR FAMILY CAREGIVERS OF PEOPLE WITH DEMENTIA

G. Wilz, *Institute of Psychology, Friedrich-Schiller-Universität Jena, Jena, Germany*

To prevent caregivers from the development of stress related health impairments, effective interventions are still needed. This presentation focused on the evaluation of a telephone intervention for family caregivers of people with dementia in Germany. The individual intervention (12 sessions in 6 months, each 50 minutes) uses cognitive-behavioural therapy adapted to specific problems of the caregivers. The intervention aims to improve well-being, quality of life and to reduce body complaints and depressive symptoms. A randomized controlled trial (N = 322 primary family

caregivers) was conducted and the intervention was implemented by cognitive-behavioural therapists. Compared with caregivers in the control condition, caregivers who received Tele.TANdem demonstrated significantly greater improvements in well-being, depressive symptoms (CES-D), body complaints (GBB-24) and quality of life (WHO-Qol-Bref) at post treatment measurement. Regarding the achievement of caregivers individual goals, results showed that 77% achieved complete goal attainment. Findings support the acceptability and effectiveness of the Tele.TANdem intervention.

PROBLEM-SOLVING IN CAREGIVER-COUNSELLING (PLIP STUDY): A CLUSTER RANDOMIZED PRAGMATIC TRIAL

K. Pfeiffer¹, D. Albrecht¹, A. Pendergrass², C. Becker¹, M. Hautzinger³, 1. *Clinic of Geriatric Rehabilitation, Robert-Bosch Hospital, Stuttgart, Germany*, 2. *University of Erlangen, Erlangen, Germany*, 3. *University of Tübingen, Tübingen, Germany*

Despite the evaluation of more than 200 dementia caregiver interventions over the past three decades, only very few programs have been translated to delivery in service contexts. In this study (05/2013–10/2016) we evaluated if structured problem-solving is feasible to implement in a routine setting and effective compared to statutory care counselling of German long term care insurances (www.isrctn.com/ISRCTN86289718). Fifty-six care counselors were randomized (with district offices as clusters) from three long term care insurances with 9 million assured members. The intervention group was trained in an initial two-day workshop, a follow-up day after 4 months, and individual bi-weekly telephone supervision contacts over six months. The impact of this additional problem-solving counseling component on depressive symptoms (main endpoint) of burdened caregivers (N=138) was measured at baseline, after 3, and 6 months. Study results are presented and challenges in implementing the trial are discussed.

THE RESILIENT CAREGIVER: PERSONALITY PROTOTYPES AND DIFFERENTIAL PATTERNS OF ADJUSTMENT

T.R. Elliott, M. Walsh, *Educational Psychology, Texas A&M University, College Station, Texas*

Despite the popularity of resilience in studies of caregivers, many measures of resilience lack theoretical models with testable hypotheses or meaningful recommendations for psychological interventions. Studies guided by the Block model of the resilient personality reveal consistent differences between resilient individuals and those with overcontrolled or undercontrolled prototypes. Moreover, individuals who are not resilient lack social and psychological resources that could be addressed with empirically-based interventions. We examined the existence of the three personality prototypes in the most recent phase of the Midlife in the United States project (MIDUS; conducted 2013–2014) in the United States. “Big Five” factor scores were cluster analyzed. Consistent with prior work, the three prototypes were evident in the sample with useable data (N = 2715). Of the 333 individuals in caregiving roles, 52.3% were in the resilient prototype. We will report the different patterns of adjustment observed between these prototypes and between caregivers and non-caregivers.

SHARED DECISION MAKING IN DEMENTIA CARE PLANNING: INVOLVING FAMILY CAREGIVERS

M. Vernooij-Dassen¹, E. Mariani², Y. Engels¹, R. Chattat², 1. *IQ Healthcare, Radboud University Nijmegen Medical Centre, Nijmegen, Netherlands*, 2. *University Bologna, Bologna, Italy*

Shared decision-making (SDM) allows people with dementia to participate in making choices. Including families and dementia residents in SDM can be challenging for nursing home staff. The objective of this study was to identify barriers and facilitators regarding the implementation of an SDM framework for care planning in an Italian and Dutch nursing home. Focus group interviews were conducted with professional caregivers who applied the SDM framework. Content analysis was used to analyze the data. This study is part of a controlled trial. The results of focus group interviews (n=10 in Italy; n=10 in the Netherlands) revealed 6 overarching themes and 16 categories. Within these themes, facilitators as well as barriers were identified. Communication skills training for professionals, training of family caregivers and involvement of the management level in the implementation process, seem to be crucial factors to implement SDM in nursing homes.

SESSION 3120 (SYMPOSIUM)

SELF-NEGLECT: BUILDING EVIDENCE AND LEARNING TO INFLUENCE POLICY AND PRACTICE

Chair: M. Day, *University College Cork*

Globally self-neglect is a significant international public health issue that is associated with serious adverse outcome. Approximately one million cases arise each year in the United States; in England the recent inclusion of self-neglect within adult protection has resulted in heightened concern and awareness. The focus of this symposium is an international perspective on interdisciplinary responses to self-neglect. The objective is to bring together experts from Ireland, United States, Israel and England, and illustrate how research evidence can inform learning and changes to policy and practice. Self-neglect creates a myriad of challenges daily for health and social care practitioners. It also exposes flaws in how professions and organizations work together, and requires careful attention to building an organizational and interagency infrastructure that supports collaboration. As a phenomenon that is severely under studied, this symposium provides an unique opportunity to discuss empirical evidence and interventions in the context of legislative and policy contexts that differ across jurisdictions. The four presentations within this symposium will provide the backdrop for the critical examination and discussion on self-neglect. Discussions will focus on the fine balance from the initial assessment to diagnosis, responses and management of self-neglect (Day et al., Ireland); home care nurses observations and views of self-neglect (Johnson, United States), practice wisdom used by social workers in the encounter and choice of intervention with self-neglect phenomenon (Ban-Winterstein et al., Israel), and the organizational learning that emerges from reviews of serious cases (Braye et al., England).

SELF-NEGLECT: A FINE BALANCE FOR PROFESSIONALS

P. Leahy-Warren, H. Mulcahy, G. McCarthy Haslam, M. Day, *School of Nursing & Midwifery, University College Cork, Cork, Cork, Ireland*

Self-neglect (SN) is a serious public health issue that is largely hidden. Ageing demography will

increase the significance of self-neglect for community professionals. The aim of this qualitative study was to explore perceptions of self-neglect among Community Nurses (CNs), Public Health Nurses (PHNs), and Social Workers (SWs). Open-ended questions, reported here were part of a large quantitative cross-sectional descriptive study. From overall sample of 566, recruited from community health organisation in Ireland, 25.6% (n=87) of participants responded. The framework method was used for analysing the cross-sectional descriptive data. Findings revealed one overarching theme: 'Fine Balance' and four subthemes: Complexity of self-neglect; Personal Health Care Professionals response to SN; Challenges in Managing the case; and, Recommendations for Practice. An effective approach to self-neglect was perceived by participants to be a fine balance from initial assessment to diagnosis, responses and management. Needs of the person were central to intervening effectively.

PRACTICE WISDOM: PROFESSIONAL RESPONSES TO SELF-NEGLECT IN ISRAEL

T. Band-Winterstein¹, I. Doron¹, S. Naim², 1. *University of Haifa, Haifa, Israel*, 2. *Ben Gurion University of the Negev, Be'er Sheva, Israel*

Self-neglect amongst older adults is a social and health phenomenon that is attracting increased research interest in recent years. Very little empirical attention has been devoted to evaluating intervention programmes in this field. The aim of this qualitative study was to explore the meaning attributed to elder self-neglect by social workers (n=16) in their encounters with self-neglecting elders professionals (n=16) using a "practice wisdom" model. Data collected via in-depth semi-structured interviews, which were later transcribed and content was analyzed. Four key scenarios emerged: Immediate threat to life; potential future threat to life; avoiding deterioration in the absence of imminent risk and addressing environmental nuisance. In order to provide appropriate intervention, the social workers developed intervention strategies based on the tension and the need for balance between preserving autonomy, protecting human rights and respecting the older persons' wishes versus paternalism and client safety.

PROMOTING ORGANIZATIONAL LEARNING IN SELF-NEGLECT: EVIDENCE FROM REVIEWS OF SERIOUS CASES

S. Braye¹, D. Orr¹, M. Preston-Shoot², 1. *Social Work, University of Sussex, Haywards Heath, United Kingdom*, 2. *University of Bedfordshire, Luton, United Kingdom*

When an adult experiencing abuse or neglect dies, English statute requires the Safeguarding Adults Board (the inter-agency adult protection committee) to conduct a case review establishing what went wrong, and to ensure that learning is applied to how organizations and professions work together. Over 60 review reports were analysed. Initial analysis of each

case (characteristics, recommendations and themes) was followed by cross-case analysis to construct a systemic learning framework. Emergent learning themes related to four domains: the adult, the interprofessional team around the adult, the organisations surrounding the team, and the adult protection committee coordinating those organisations. Effective practice requires alignment between all domains, ensuring organizational support for trust-based relationships with individuals, strong legal literacy, detailed staff guidance and training, mechanisms for resolving differences, and arrangements for coordinating intervention. Reviews provide important learning for policy and practice development, adding to the evidence base on achieving positive outcomes in self-neglect work.

SESSION 3125 (SYMPOSIUM)

INNOVATIVE USES OF TECHNOLOGY IN ASSESSING PHYSICAL PERFORMANCE OF OLDER PERSONS

Chair: C.C. Quinn, *University of Maryland School of Medicine, Baltimore, Maryland*

The purpose of this symposium is to present use of technology to translate the assessment of physical functioning in older adults to clinical practice. Previous studies confirm the relationship of physical performance measures to disability onset, hospitalization, nursing home admission, falls, mortality and other outcomes. While performance measures are being used more frequently in aging research, their uptake in clinical practice has been slow, in part because of the added burden in clinical care of geriatric patients. Using technology to improve the simplicity and efficiency of these measures could have a major impact on their use in clinical practice.

In this symposium Dr. Charlene Quinn, will provide an overview of the translation of technology to clinical care.

Dr. Jack Guralnik will describe the development of a smart phone app for the administration of the Short Physical Performance Battery, a widely used assessment of gait, strength and balance.

Dr. W. Jack Rejeski will present the mobility assessment tool-short form (MAT-sf) which uses video animations to improve accuracy and precision measurement of mobility.

Dr. Miriam Morey will discuss walking speed in the 6th Vital Sign research project to establish community population walking speed norms and promote walking speed as a vital sign.

Dr. Lisa Barry will discuss use of an RFID (small electronic chip) device to measure gait speed in the clinic setting.

Dr. Antoine Piau will present the RESPECT study of a shoe insole to monitor frailty, assessing gait characteristics and transmit data for the use of patients and physicians.

A SMARTPHONE APP FOR THE SHORT PHYSICAL PERFORMANCE BATTERY

J.M. Guralnik¹, D. Rooks², T. Webb³, 1. *University of Maryland School of Medicine, Chevy Chase, Maryland*, 2. *Novartis Institutes of Biomedical Research, Cambridge, Massachusetts*, 3. *GE Healthcare - Lunar, Madison, Wisconsin*

The Short Physical Performance Battery (SPPB) is a standardized assessment of lower extremity physical performance.

It has undergone extensive methodological testing, has been used throughout the world and in high profile observational studies and clinical trials in aging research. Testing takes about 10 minutes, requires the use of paper, pencil and a stopwatch, and requires that results be transcribed into a database or clinical record. A newly developed smart phone app contains the text of the instructions read to the subject, has skip patterns built in, uses the phone as the stopwatch and records and transmits results. This makes administration much easier and quicker, helps retain standardized administration over long periods of time and eliminates errors in recording and transferring results. Results of pilot work with this app will be presented. It is expected that this technology will greatly expand the use of this battery in research and clinical practice.

ANIMATED VIDEO TECHNOLOGY: ADVANCING THE ASSESSMENT OF MOBILITY

W. Rejeski, A. Marsh, R. Barnard, J. Fanning, E. Ip, *Wake Forest University, Winston-Salem, North Carolina*

Within the past 10 years, our research group has used Animated Video Technology as a means of enriching assessment stimuli when evaluating various aspects of physical function. This session focuses on the mobility assessment tool-short form (MAT-sf) and also briefly illustrates how we have applied this methodology to a virtual assessment of the SPPB and in evaluating physical activity behavior. The MAT-sf has excellent content validity and reliability—an ICC = 0.93. Within the LIFE study, we recently showed that rates of 24-month major mobility disability were 51% for those within the lowest quartile of the MAT-sf and just 10% for those with the highest quartile. Furthermore, the MAT-sf has been found to be predictive of post-surgical complications including length of hospital stay and rates of nursing home placement.

THE 6TH VITAL SIGN: A MOBILE APP FOR POPULATION HEALTH SURVEILLANCE OF WALKING SPEED

M.C. Morey¹, S. Ryan², J. Kelly², C. Liu², K. Hawkins², K. Schwartz², J. Prvu Bettger², *1. Medicine, VAMC and Duke Medical Centers, Durham, North Carolina, 2. Duke University Medical Center, Durham, North Carolina*

Smartphone applications (apps) are a novel technique to directly reach people for research and health promotion. The 6th Vital Sign is an iPhone app designed using Apple's Researchkit to enroll and consent adults in a study that measures a 2-minute walk test using the phone's accelerometer, self-reported health, and demographics. On April 11, 2016 the app was uploaded into the iTunes store and was viewed in iTunes by 1,111 people during the first 50 days. There were 771 downloads, with 398 adults consenting to participate; 90.7% completed the walk test and 63.1% completed the health assessment. Median age of participants was 54 years, 25% were over 65 years, 58% were female, 89.2% White, and 76.1% were living with a chronic health condition. Participants spanned 27 states. This early phase of the 6th Vital Sign study demonstrates the feasibility of designing and disseminating a smartphone-based app to assess population health.

TESTING A GAIT VELOCITY DETECTION DEVICE IN A REAL -WORLD CLINICAL SETTING

L.C. Barry¹, L. Hatchman², Z. Fan³, R. Gao⁴, G. Kuchel¹, *1. University of Connecticut Center on Aging, Farmington, Connecticut, 2. UConn School of Medicine, Farmington, Connecticut, 3. UConn School of Engineering, Storrs, Connecticut, 4. Case School of Engineering, Cleveland, Ohio*

Routine, objective, and unobtrusive measurement of gait velocity in clinical settings is required to translate this research measure into practice. Our multidisciplinary team developed a wearable radio-frequency identification device (RFID) for measuring gait velocity in a typical outpatient clinical setting. A RFID reader/antenna installed on the wall of a UCONN Geriatrics Clinic walkway assesses gait velocity as patients walk to exam rooms. On July 11, 2016, we began recruiting patients for validity and feasibility testing (target population N=50 clinic patients). In the first 2 days, we recruited 8 participants (6 female; mean age 78.63 years) and compared gait velocity measured via RFID with stopwatch measurements. Staff noted device acceptance, participants either agreed (n=5) or strongly agreed (n=3) that they felt comfortable wearing the device, and 7 participants would like their medical providers to track walking speed over time. Routine gait velocity assessments could provide more personalized guidance for clinical decision-making.

SESSION 3130 (PAPER)

HEALTH PROMOTION AND PREVENTION IN AGING

A STATEWIDE COMMUNITY-BASED PROGRAM FOR IMPROVING SENIOR HEALTH: OKLAHOMA HEALTHY AGING INITIATIVE

A.N. Dentino, C. Dowers, L.Z. Rubenstein, *Geriatric Medicine, University of Oklahoma, Oklahoma City, Oklahoma*

The Oklahoma Healthy Aging Initiative (OHAI) is a senior health improvement program sponsored by the Donald W. Reynolds Department of Geriatric Medicine at University of Oklahoma. Established in 2011, OHAI has regional education centers and senior health clinics across the state for improving access to geriatric care, increasing health literacy, promoting healthy lifestyles and preventive practices, and training both family and paraprofessional caregivers. An underlying goal is to improve health and aging policy, particularly focusing on rural settings and American Indian populations. This symposium will highlight several OHAI components that demonstrate program vitality and effectiveness. These components include the caregiver training program, the telemedicine network of rural hospitals, and several evidence-based senior education and health promotion activities. A statewide needs assessment provided a framework for program planning and evaluation and documented crucial deficits that OHAI is working to improve.

SCALING AN EVIDENCE-BASED DIABETES PREVENTION PROGRAM TO ADDRESS THE NEEDS OF AN AGING POPULATION

H. Hodge, K.H. Hohman, M. Longjohn, *Membership & Programs, YMCA of the USA, Chicago, Illinois*

In an effort to bridge science into practice, the Y is leveraging its vast network to deliver the Diabetes Prevention Program to those individuals at risk for type 2 diabetes. The original NIH trial of the DPP lifestyle intervention reduced the number of new cases of type 2 diabetes among adults aged 60 years or older by 71%. These results prompted the Y to undertake a concerted effort to test the intervention with Medicare beneficiaries with a goal of improving care and health outcomes while lowering costs.

To date the Y has served 19,141 adults ages 60 or older. Participants aged 60 or greater on average attend 1 more core instructional session than those participants who are younger than 60 years old (82% of core sessions vs 76%, $p < 0.001$). Similarity, older participants lose on average 1% more of their body weight than younger participants (5.1% vs 4.2%, $p < 0.001$).

Beyond older participants experiencing positive results from participating in the Diabetes Prevention Program, collectively the Y's national network gained incredible knowledge in how to best deliver the program to older adults. Learnings from this concerted effort to serve older adults have included the need to bridge the clinic to community gap, identifying engagement methods that produce the greatest yield of participants, removing cost as a barrier to participation, and tailoring messages to attract participants.

THE ORAL HEALTH STATUS OF OLDER PATIENTS IN THE ACUTE CARE HOSPITAL SETTING: A PILOT STUDY

C. McNally^{1,2}, K. Khow^{1,4,5}, P. Shibu^{3,4,5}, S. Liberali², R. Adams^{7,6}, R. Visvanathan^{3,4,5}, 1. *School of Medicine, The University of Adelaide, Adelaide, South Australia, Australia*, 2. *Special Needs Unit, Adelaide Dental Hospital, South Australian Dental Service, Adelaide, South Australia, Australia*, 3. *NHMRC Centre of Research Excellence Transdisciplinary Frailty Research To Achieve Healthy Aging, Adelaide, South Australia, Australia*, 4. *Adelaide Geriatrics Training and Research with Aged Care Centre, Adelaide, South Australia, Australia*, 5. *Aged and Extended Care Service, The Queen Elizabeth Hospital, Adelaide, South Australia, Australia*, 6. *General Medicine, The Queen Elizabeth Hospital, Woodville, South Australia, Australia*, 7. *Discipline of Medicine, The University of Adelaide, Adelaide, South Australia, Australia*

Oral health is known to be of low priority to older people with many people not seeking care until they are in pain. The acute hospital setting provides a unique opportunity to conduct a comprehensive dental assessment and develop discharge oral care plans for patients who may otherwise not seek dental care.

This cross-sectional study was implemented over a 12-month period at the Queen Elizabeth Hospital (TQEH), Adelaide. Patients were recruited from the Fracture Ward and Geriatric Evaluation and Management Unit (GEMU). General health data was collected from patient interviews

and medical records and a comprehensive dental assessment was conducted.

Seventy-five patients aged 84.2 ± 6.7 (mean \pm SD) years agreed to participate. Fifty-five (71%) female Twenty-two (29%) experienced a hip fracture, the remaining were admitted for worsening of their general health. Patients had 6.25 ± 2.9 medical comorbidities and were taking 8.6 ± 4.4 medications. Twenty-four (32%) patients wore full dentures, 21 (28%) had natural teeth. One quarter ($n=19$) reported difficulty chewing and swallowing their food. Over half of the patients had not seen a dentist for more than two years yet 55 (73%) patients were considered in need of referral.

It is evident from this pilot work, that older people have significant dental problems and are not seeking regular dental care. It appears prudent to consider the inclusion of a dental health assessment as part of general inpatient care. The results of this study also indicate the need for intervention studies that incorporate preventive and restorative management of oral health prior to discharge.

ELDERLY WITH NATURAL TEETH REPORTED LESS FRAILTY AND BETTER QOL WHEN COMPARED TO EDENTULOUS ELDERLY

A.R. Hoeksema^{1,2}, S.S. Spoorenberg^{1,2}, L.L. Peters^{1,2}, H.J. Meijer^{1,2}, G.M. Raghoebar^{1,2}, A. Vissink^{1,2}, K. Wynia^{1,2}, A. Visser^{1,2}, 1. *University Medical Center Groningen, the Netherlands*, 2. *University of Groningen, Groningen, Netherlands*

Background: Poor oral health influences food intake, social wellbeing and general health.

Objectives: To assess oral status and self-reported oral health in home-dwelling elderly (≥ 75 years of age) and to associate findings with reported frailty, general health status and quality of life (QoL).

Methods: Oral status, oral health/dental care, frailty (Groningen Frailty Index), activity daily living (ADL)(Katz-15), complexity of care needs (IM-E-SA), general health and Quality of Life (QoL) (EQ5D) were assessed. Oral status (viz, remaining teeth, implant supported overdentures, and edentulous) and case complexity (viz, complex care needs, frail, or robust) were determined and associated.

Results: In total 1026 (77%) elderly persons (median age 80 years, IQR 77–84 years) were included in the analysis: 39% had remaining teeth, 51% was edentulous and 10% had an implant-supported overdenture. Elderly with complex care needs and frail elderly were more often edentulous and had more oral problems than robust elderly. Elderly persons with remaining teeth reported more oral health problems but less frailty, better QoL, better ADL, and used less medicines than edentulous elderly. Next they continued to visit the dentist more often when compared to edentulous elderly (90% versus 20% resp).

Conclusions: Elderly with complex care needs and frail elderly experienced more oral health problems and are more often edentulous than robust elderly. Elderly with remaining teeth and implant-supported overdentures reported less frailty, better QoL and used less medicines when compared with edentulous elderly and better QoL.

SESSION 3135 (SYMPOSIUM)

AGEING, DEMENTIA, AND THE SOCIAL MIND

Chair: P. Higgs, *University College London, London, United Kingdom*

Co-Chair: C.J. Gilleard, *University College London, United Kingdom*

The sociology of dementia has been a relatively neglected but increasingly important topic in studies of health and illness. The theme of dementia, its diagnosis and its cultural role intersects with a number of important concerns within sociology and aligned disciplines. The symposium addresses gaps in our sociological knowledge of dementia and provides a forum for the development of new themes and perspectives within social gerontology. All of the papers presented locate dementia within the context of ageing societies. The papers range in scope from an overview of the classed nature of dementia, its diagnosis and treatment to a study of embodied citizenship in long term care. The underlying theme is to integrate concepts such as class, citizenship and social exclusion with the specific effects of dementia and societal responses to what the American Psychiatric Association's Diagnostic and Statistical Manual (DSM) now calls 'major neuro-cognitive disorder'.

The first paper is concerned with the complex relationship between dementia and social class found in both epidemiology and social gerontology. This is followed by a paper examining whether issues surrounding dementia might better be understood in terms of the concept of precariousness. The third presentation engages with the contemporary debate about the relationship between embodiment and citizenship in long term care. The concluding contribution focusses on the social location of personhood within debates occurring in dementia care policy and practice. Taken together these papers map out key dimensions in the sociology of dementia

DEMENTIA, CLASS, AND SOCIAL RELATIONS

I.R. Jones, *WISERD, Cardiff University, Cardiff, United Kingdom*

Studies have shown higher risk of dementia in those with lower Socio-economic status. But socio-economic status is used and defined in different ways and it is difficult to untangle effects and causal properties. This paper discusses how the relationship between social class and dementia may be problematic in epidemiological terms but goes on to argue that social relations underpin the diagnosis, care pathways and experience of dementia and that sociological research still has an important role to play in interrogating how class and class relations influence the everyday experiences of people with dementia.

PRECARITY IN LATE LIFE: RETHINKING DEMENTIA AS A FRAILED OLD AGE

A.M. Grenier¹, C. Phillipson², E. Lloyd³, *1. McMaster University, Hamilton, Ontario, Canada, 2. The University of Manchester, Manchester, United Kingdom, 3. University of Bristol, Bristol, United Kingdom*

This paper analyses the extent to which frailty and dementia are better understood in the context of new forms of insecurity affecting the life course. Approaches to ageing that

are organized around productivity, success, and active late life have contributed to views of dementia as an unsuccessful, failed or 'fraild' old age. Operating through dominant frameworks, socio-cultural constructs and organizational practices, the 'frailties' of the body and mind are often used to mark the boundaries of health and illness in late life, and shape responses accordingly. Our concern is that whether taken for granted, or 'imagined', ideas that couple dementia and frailty can marginalize persons who occupy the locations of dementia and disablement. In this paper, we draw on the concept of 'precarity' to reconsider debates, and shift interpretations of the 'fourth age' away from age- or stage-based thinking into a recognition of the shared vulnerability and responsibilities for care. We conclude with a call to acknowledge the fragility and limitations which affect human lives, and argue that this recognition be grounded in an inclusive form of citizenship.

A RELATIONAL MODEL OF CITIZENSHIP: INSIGHTS FROM A STUDY OF ELDER-CLOWNING

P. Kontos^{1,2}, K. Miller¹, A. Kontos³, *1. Toronto Rehabilitation Institute-University Health Network, Toronto, Ontario, Canada, 2. Dalla Lana School of Public Health, University of Toronto, Toronto, Ontario, Canada, 3. Human Rights Law Section, Department of Justice Canada, Ottawa, Ontario, Canada*

The citizenship perspective in dementia has redressed some of the gaps inherent in personhood- and relationship-centred approaches to dementia care by contextualizing individuals in terms of their relationships with the state and its institutions. However, this perspective has yet to be influenced by the emerging theoretical subfield of embodiment, which places the body and embodied practices at the centre of dementia representations and care. We draw on findings from a study of elder-clowns in a long-term care facility to advance a model of "relational citizenship" for individuals with dementia. Relational citizenship foregrounds the reciprocal nature of engagement and the centrality of capacities, senses, and the experiences of bodies to the exercise of human agency and interconnectedness. Relational citizenship offers an important rethinking of selfhood, entitlement, and reciprocity. It also provides new ethical grounds to explore how residents' creative and sexual expression can be cultivated in the context of long-term care.

THE SOCIAL LOCATION OF PERSONHOOD IN DEMENTIA CARE, POLICY, AND PRACTICE

C.J. Gilleard, P. Higgs, *University College London, London, United Kingdom*

The use of the term personhood has become central in defining key aspects of policy and practice in dementia care. While much has been made of its philosophical status, rather less attention has been paid to sociological approaches to concepts such as 'self' and 'personhood'. The present paper argues that a return to the classical debates within sociology over self and society offers a useful avenue for rethinking the role of personhood in dementia care. Rather than essentialising the concept of personhood, we argue that a greater consideration needs to be given to the social realisation both of dementia and of dementia care.

SESSION 3140 (SYMPOSIUM)

PHYSICAL FRAILITY, A TARGET FOR THE PROMOTION OF HEALTH AND SOCIAL OUTCOMES

Chair: T. Lum, *The University of Hong Kong, Pokfulam, Hong Kong*

Co-Chair: J. Tang, *The University of Hong Kong, Hong Kong*

Physical frailty is increasingly identified as an important intervention target in older adults. The status and impact of physical frailty in Asian populations is less well known. In this symposium, Lum and colleagues surveyed the prevalence frailty status in a random sample of 1,612 community-dwelling elders residing in public rental housing estate, and explored how frailty status might relate to the older adults' ageing-in-place intention. They found that the prevalence of frailty did not change over 1 year. Pre-frail and frail elders showed greater intention of community living after the implementation of an ageing-in-place scheme. These are the first larger-scale data on frailty in Hong Kong to inform intervention design with implication on social and long-term care. Choy and colleagues further examined how different types of activities of the ageing-in-place scheme affected elders' preference for ageing-in-place through modifying physical frailty and other outcomes. Liu and colleagues explored the differential roles of physical frailty and chronological age in general and everyday cognition. Luo and colleagues investigated frailty in 2,380 nursing home residents using a frailty measure based on the Minimum Data Set, and show high predictive value for major adverse health outcomes over 9 years. To target this potentially modifiable risk factor significantly affecting long-term care considerations in older adults, Wong and colleagues developed an exercising habit formation protocol tailored for community-dwelling elders in Hong Kong, using an empowerment-based framework. The intervention protocol to be tested in a randomized controlled trial will provide insight on sustainable frailty intervention.

FRAILITY IN A COMMUNITY-DWELLING COHORT OF OLDER ADULTS AND THEIR PREFERENCE FOR AGEING-IN-PLACE

T. Lum^{1,2}, G. Wong^{1,2}, J. Tang¹, M. Lau¹, D. Kwok¹, 1. *Sau Po Centre on Ageing, The University of Hong Kong, Pokfulam, Hong Kong*, 2. *Department of Social Work and Social Administration, Pokfulam, Hong Kong*

Frailty is a dynamic clinical state that may influence elders' preference for ageing-in-place. **Method:** The study examined the prevalence of frailty in 1,612 elders living in public housing estates, where an ageing-in-place scheme was introduced. We used the FRAIL scale to classify elders into three groups: frail, pre-frail, and robust before the implementation of the Scheme and 1 year later. **Results:** The prevalence of frailty states remained the same over 1 year: robust (51.0% to 50.7%), pre-frail (37.9% to 38.1%), and frail (11.1% to 11.2%). There were 22.3% and 12.6% of frail and pre-frail elders who were contemplating moving into an elderly home, but the respective percentages dropped to 16.4% and 10.7% at 1 year, respectively. Similarly, fewer frail and pre-frail elders preferred to move should their health condition deteriorated (dropping from 28.7% to 22.6% and 30.2% to

13.4%). **Implications:** The AIP Scheme modifies ageing-in-place intention among frail elders.

DISSECTING AN AGING-IN-PLACE SCHEME: ACTIVITIES CONTRIBUTING TO POSITIVE OUTCOMES

J. Tang¹, J. Choy¹, G. Wong^{2,1}, M. Lau¹, T. Lum^{1,2}, 1. *Sau Po Centre on Ageing, The University of Hong Kong, Pokfulam, Hong Kong*, 2. *Department of Social Work and Social Administration, The University of Hong Kong, Pokfulam, Hong Kong*

This study aimed to examine of the type and intensity of activities of an ageing-in-place (AIP) Scheme that might contribute to the positive outcomes of elders. **Method:** A cohort of 2,081 elders from 11 AIP housing estates and 1 control estate were randomly selected within each age stratum: 65–74 years, 75–84 years, and 85 years. Elders were interviewed face-to-face at baseline and 1 year and their participation in the AIP Scheme activities was recorded. **Results:** Structured small group intervention and activities that improved the frailty states, mood, and cognitive function increased the likelihood of elder tenants' to age in place. **Implications:** Group activities that promote physical, psychological and cognitive outcome all contribute to the positive change in elders' preference for ageing-in-place. Promotion of positive social interaction is crucial in the development of an AIP program.

DIFFERENTIAL PREDICTION OF GLOBAL AND EVERYDAY COGNITION BY PHYSICAL FRAILITY AND CHRONOLOGICAL AGE

T. Liu¹, G. Wong^{2,1}, J. Tang¹, J. Xu¹, T. Lum^{1,2}, 1. *Sau Po Centre on Ageing, The University of Hong Kong, Pokfulam, Hong Kong*, 2. *Department of Social Work and Social Administration, The University of Hong Kong, Pokfulam, Hong Kong*

The present study explores whether physical frailty and chronological age independently predicts global cognition and everyday cognitive function. Data came from 1,668 community-dwelling older adults in Hong Kong. Physical frailty was measured using the fatigue, resistance, ambulation, illness, and loss of weight and grip strength. Global and everyday cognitive function were measured by Cantonese Chinese Montreal Cognitive Assessment and 4-item short Lawton Instrumental Activities Daily Living scale, respectively. After controlling for education, chronological age explained a larger variance than physical frailty in global cognition in women. Physical frailty, in contrast, had more predictive power than chronological age in estimating everyday cognitive function in both genders. While the unmodifiable chronological age predicts global cognition, physical frailty has a greater contribution to everyday cognitive function. Our findings warrant further investigation of an integrated bio-cognitive model that underpins the linkage between everyday cognition and physical frailty.

PREDICTING ADVERSE HEALTH OUTCOMES IN NURSING HOME: A FRAILITY MEASURE USING MINIMUM DATA SET 2.0

H. Luo^{1,2}, T. Lum^{1,3}, G. Wong^{1,3}, J. Kwan^{1,4}, J. Tang¹, 1. *Sau Po Centre on Ageing, The University of Hong Kong*,

Pokfulam, Hong Kong, 2. Department of Sociology, Tsinghua University, Beijing, China, 3. Department of Social Work and Social Administration, The University of Hong Kong, Pokfulam, Hong Kong, 4. Department of Medicine, The University of Hong Kong, Pokfulam, Hong Kong

This study was to create a simple frailty measure for nursing home residents using the Minimum Data Set (MDS). **Method:** MDS items comparable with the FRAIL-NH scale were extracted. Frailty status was calculated based on the following eight components: fatigue, resistance, ambulation, incontinence, polypharmacy, loss of weight, nutritional approach, and help with dressing. We included 2,380 elders residing in six nursing homes in Hong Kong between 2005 and 2013 to test the predictive validity of the resulted scale against major adverse health outcomes. **Results:** The proposed frailty scale was independently predictive of incident falls, worsening function, incident hospitalization, and mortality, with hazard ratios ranging from 2.00 to 3.73, adjusting for gender, age, education, cognitive performance, and the presence of prevalent diseases. **Implications:** We provided a simple and reliable scale to identify frail persons in nursing homes and for developing effective intervention schemes.

EXERCISING HABIT FORMATION FOR FRAILTY INTERVENTION IN THE COMMUNITY

G. Wong^{1,2}, M. Shum¹, T. Lum^{1,2}, 1. Department of Social Work and Social Administration, The University of Hong Kong, Pokfulam, Hong Kong, 2. Sau Po Centre on Ageing, The University of Hong Kong, Pokfulam, Hong Kong

Physical frailty and prefrailty is common and can be intervened or prevented with structured exercise. With limited resources, however, professional exercise training programmes are of short supply. The sustainability of the benefits beyond the programme is also unclear. Nearly 80% of older adults in Hong Kong do not engage in regular exercise at moderate level or above. From an implementation science perspective, the key issue is not about providing the exercising intervention per se, but to design a programme with components that will shift health behaviour. Older adults who are more deprived and have lower education would need more help from health promotion programmes with respect to self-efficacy to engage in exercising. We have developed a programme model that targets exercise habit formation, using design elements. The model is being evaluated in an 18-month randomized, single-blind, multicentre controlled trial of 390 community-dwelling older adults. We present here the pilot results.

SESSION 3145 (SYMPOSIUM)

EMERGING TRENDS IN MIDUS RESEARCH

Chair: J.E. Stokes, Boston College, Chestnut Hill, Massachusetts

Discussant: M.E. Lachman, Brandeis University

Since its inception in 1995–1996, the National Survey of Midlife Development in the United States (MIDUS) project

has developed into one of the most important and popular sources of data on mid- and later-life in the social and behavioral sciences. Now entering its third decade, the MIDUS study has greatly expanded, as well. This includes a recently released third wave of follow-up MIDUS data; daily stress and biomarker studies; and the MIDUS Refresher sample expansion. The four papers comprising this symposium use different modules of recent MIDUS data in order to investigate developmental, personality, and psychosocial aspects of adults' lives and their associations with health and well-being across the life course. Sin and colleagues use MIDUS Refresher data to examine the role age plays in adults' exposure and emotional responses to daily positive experiences. Lee and Cichy use NSDE II diary data to investigate day-to-day fluctuations of risk appraisal and negative affect, and the influence of individuals' neuroticism. Graham and Mroczek analyze three-wave longitudinal MIDUS data to track long-term trajectories of the Big Five personality traits, while Stokes and Moorman use the same three-wave data in order to examine links between age discrimination, psychosocial well-being, and physical health over a two-decade span. Lastly, Lachman – a MIDUS Investigator – will assess the various strengths, limitations, and implications of these papers, and discuss the potential contributions of these and future MIDUS projects to life course research.

AGE DIFFERENCES IN EXPOSURE AND EMOTIONAL RESPONSES TO DAILY POSITIVE EVENTS

N.L. Sin¹, T.L. Gruenewald², A.D. Ong³, D. Almeida¹, S.T. Charles⁴, 1. Center for Healthy Aging, The Pennsylvania State University, University Park, Pennsylvania, 2. University of Southern California, Los Angeles, California, 3. Cornell University, Ithaca, New York, 4. University of California, Irvine, Irvine, California

Positive events may facilitate aging-related improvements in emotional well-being. This study examined age differences in exposure and responses to daily positive events. In the MIDUS Refresher Study, 782 participants ages 26–77 completed telephone interviews about their daily experiences for 8 days. Age was associated with more frequent positive events, occurring on 67% of days among younger adults (ages 26–39), 76% of days among midlife adults (ages 40–59), and 81% of days among older adults (ages 60–77). Older adults were more likely to enjoy nature and report network events (i.e., events that happened to family/friends); there were no age differences in positive work, home, or social interaction events. Older adults rated their events as more pleasant and calm, whereas younger adults felt more surprised and close to others. Consistent with theories of emotional aging, findings suggest older adults experience more daily positive events and derive low-activation positive emotions from these events.

NEGATIVE AFFECT AND RISK APPRAISAL IN THE CONTEXT OF DAILY LIFE: THE ROLE OF NEUROTICISM

J. Lee, K.E. Cichy, Kent State University, Kent, Ohio

Prior studies have investigated the linkages between stressor appraisal and negative affect (NA), but have neglected

the dynamic aspects of risk appraisal in daily life. This study examines associations between day-to-day fluctuations in subjective risk appraisals and NA and individual differences in neuroticism. Daily risk appraisals (e.g., risk to self) and daily NA were modeled using diary data from the National Study of Daily Experiences (NSDE II), where respondents completed 8 days of interviews ($N = 1012$). Multilevel models revealed substantial within person variation in both risk appraisal including self and NA. Higher levels of neuroticism were associated with higher levels of and instability of risk appraisal and NA. In addition, the covariation between risk appraisal and NA was greater among individuals with higher neuroticism ($p < .05$). Findings add to research suggesting higher levels of neuroticism increase individuals' vulnerability to the negative effects of daily stressors through stressor appraisal.

TRAJECTORIES OF BIG FIVE PERSONALITY CHANGE IN MIDUS

D.K. Mroczek, E. Graham, *Psychology, Northwestern University, Evanston, Illinois*

We modeled long-term trajectories of the Big Five personality traits using the MIDUS data. MIDUS recently acquired a 3rd wave of data, allowing estimation of fixed effects parameters of 20-year trajectories as well as random effects for intercept and slope. The multilevel model for change was utilized, with centered (chronological) age as the time metric. With respect to the overall trajectory (fixed effects) all of the Big Five traits showed decline over the age range 25 to 100. With regard to the random effects, particularly the slope variances, only neuroticism and openness showed evidence of individual differences in rate of change (slope).

AGE DISCRIMINATION AND HEALTH: A LONGITUDINAL STUDY OF MIDLIFE AND OLDER ADULTS IN THE UNITED STATES

J.E. Stokes¹, S.M. Moonman², *1. Illinois State University, Normal, Illinois, 2. Boston College, Chestnut Hill, Massachusetts*

Unfair treatment of people based on their age, or age discrimination, limits people's access to opportunities and resources and increases their levels of stress. However, little is known about the long-term repercussions of day-to-day age discrimination for physical health. This study uses three waves of data from the National Survey of Midlife Development in the United States (MIDUS, 1995–2014) to examine whether perceived day-to-day age discrimination impacts adults' physical health via their psychological, emotional, and social well-being. Using 13,098 observations from 6,456 participants, we estimated multilevel generalized structural equation models (GSEM) to test both direct and indirect effects of age discrimination on self-rated health, chronic conditions, and IADL. Age discrimination had significant direct and indirect between-persons effects on all three health outcomes, and significant indirect within-persons effects on all three health outcomes. This suggests psychosocial well-being acts as a mechanism whereby age discrimination "gets under the skin" and harms health.

SESSION 3150 (PAPER)

AGE-FRIENDLY COMMUNITIES AND HOUSING

AGE-FRIENDLY COMMUNITIES AND DIVERSITY OF AGEING—LINKING ENVIRONMENTAL AND SOCIAL GERONTOLOGY

J. Stiel, *1. Technical University Dortmund, Dortmund, Germany, 2. FH Dortmund - University of Applied Sciences and Arts, Dortmund, Germany*

One of the major challenges in modern society is population ageing and therefore the development of age-friendly communities receives attention. Such a transdisciplinary topic requires a more holistic approach in contrast to the current models. Even within the field of gerontology, much of the research on ageing and community occurs in isolation from other subareas. Few research projects, mainly international ones, focus on developing age-friendly communities in a transdisciplinary way (e.g. WHO Age-friendly Cities Guide 2007) or linking corresponding subfields of gerontology to one another (e.g. Provencher et al. 2013 link social gerontology and social psychology). And while environmental gerontology is well established in Germany, it only seems to slowly regain interest internationally – also due to a lack of new theoretical developments.

This presentation proposes a theoretical model linking environmental and social gerontology. Environmental gerontologists like Lawton and Saup contributed greatly to our understanding of person-environment-interaction and there is also modern research in person-environmental views of aging (Wahl & Oswald 2016). Combining environmental gerontology with concepts of diversity and exclusion from social gerontology allows us to better understand which (age-friendly) environmental features may benefit certain subgroups of older adults or risk excluding others. Such an approach is in contrast to the prevailing homogenous views in German concepts and also the WHO-concept.

Identifying the distinct characteristics, interests and needs of older adults – a very heterogeneous group – in relation to their environment enables us to improve the established concepts for the development of age-friendly communities by targeting diversity as well as mainstream needs.

ENABLING ENVIRONMENTS: EFFECT OF LOCAL AREA ON PHYSICAL ACTIVITY IN THE OVER 55S IN IRELAND

S. Gibney¹, M. Ward², S. Shannon¹, *1. Department of Health, Dublin, Ireland, 2. Trinity College Dublin, Dublin, Ireland*

The Age-friendly Cities and Counties Survey (2016) was a population-representative cross-sectional survey of community-dwelling adults aged 55+ in 21 Local Authority areas. It measured individual-level positive ageing outcomes and attributes of the local built and social environment to provide a baseline estimate of spatial and socio-economic differences in positive ageing and local factors that support positive ageing.

This study examined the effect of perceptions of local area safety and accessibility of recreational spaces, on physical activity. Data was from the Age Friendly City and Counties survey, in ten counties in Ireland (n=4,765). A random-effects logit model was used to estimate the effect of 1) perceptions of the accessibility and availability of recreational green areas, 2) experience of crime, and 3) perceptions of safety while out and about in the local area, on the odds of meeting national physical activity guidelines (≥ 150 minutes per week). Age, sex, education, limiting illness and location (urban/rural) were adjusted for.

Difficulty accessing a recreational green space (OR=0.74, $p < 0.01$), or the unavailability of such a space (OR=0.80, $p = 0.04$), was associated with reduced odds of meeting physical activity guidelines. Respondents who had an experience that left them concerned about their safety (OR=0.78, $p < 0.01$), who felt unsafe out and about during the day (OR=0.61, $p = 0.04$) or at night (OR=0.82, $p = 0.02$) were also less likely to meet physical activity guidelines.

Improvements to the local environment may be useful for promoting increased physical activity, in addition to individual-level behaviour change interventions.

LIVING THROUGH LANDSCAPES: DESIGNING AND EVALUATING THE IMPACT OF DEMENTIA-FRIENDLY GARDENS

H.J. Swift¹, A. Towers¹, J. Babaian¹, J. Hollyhock², 1. *University of Kent, Canterbury, United Kingdom*, 2. *Learning through Landscapes, Winchester, United Kingdom*

Most dementia care settings have an outside space but many are underused because they are not suitable for people living with dementia or because providers lack the confidence and resources to optimize use. The Living through Landscapes project intends to a) improve and transform the outside spaces of 30 care settings across the UK to make them dementia-friendly, and b) deliver training and resources to staff and management teams to promote the beneficial impact of regular and frequent access to the natural environment. This paper introduces the project and the research conducted by the authors to evaluate the functionality, use and impact of the re-designed spaces. Results for the first year of the project (approx. 10 settings) are presented on qualitative (interviews with people living with dementia using talking mats, focus groups with service staff) and quantitative (an adapted Sheffield Care Environment Assessment Matrix, quality of life i.e. DEMQoL and DEMQoL proxy) measures. Pre (baseline) and post assessments (after the garden redesign) reveal improvements in use and functionality of the outside spaces, which are discussed in relation to the health, wellbeing and quality of life of service users living with dementia. The theoretical, practical and policy implications of designing and evaluating the impact of dementia friendly spaces are also discussed.

SELF-MANAGED HOUSING AS A MEANS TO DECREASE LONELINESS AND INCREASE WELL-BEING IN LATER LIFE

O.H. Jolanki², O. Teittinen², 2. *University of Jyväskylä, Jyväskylä, Finland*, 2. *GeroCenter, Jyväskylä, Finland*

This study looks at housing and moving decisions of older people and their experiences of a new living environment.

Data come from qualitative face-to-face interviews (N=18) collected in Central Finland. Majority of the interviewees were 70+. The study has adopted a longitudinal approach. First interviews were conducted a month prior to moving (2014), 1st follow-up interviews 2015, 2nd follow-up interviews 2016. The interviews will be collected annually in the future. The focus of the analysis was on the participants' reasons to move to a communal type of housing and their experiences of a life in this type of self-managed housing. The reasons to move were linked to factors like health problems, feeling lonely and unsafe, impractical apartment and inaccessible environment and long distance to amenities. However, the reasons to move were also linked to the doubts about availability of informal help and public services and wishes to find a new life and new social contacts in a new living environment. The participants' experiences were largely met and the new living environment offered new social contacts and social activities, a sense of belonging and company of likeminded people and reciprocal help and support. In conclusion, while many older people value their old home they are capable and willing to leave home and settle to a new home in their quest for a better life in old age. The results call for more positive view towards relocation in later life and more flexible interpretation of ageing in place policy goal.

SESSION 3155 (SYMPOSIUM)

RELIGIOSITY, HEALTH, AND AGING IN INTERNATIONAL AND CROSS-CULTURAL PERSPECTIVES

Chair: C. Jagger, *Newcastle University*

This symposium consists of four papers that employ robust data from different countries worldwide to examine associations between religiosity and health among older persons. Globally, older persons are experiencing gains in life expectancy. Whether gains represent healthy years is in dispute. External factors such as advances in treatments contribute to healthy aging, but evidence suggests factors internal to the individual are also influential. One such, religiosity, is increasingly recognized as a potential contributor to longer and healthier lives. Although there is wide intra-country variation in the percent that report being religious, religion is a component in the lives of a great many older persons in most countries. Moreover, evidence shows older persons engage in religious activity more frequently than younger. Given the ubiquity of religiosity in lives of elders globally, we can learn much by examining associations in international and cross-cultural perspective. Chiu et al. investigate religious activity, life and active life expectancy across a number of European countries, whilst Saito et al. report similar analyses but for Singapore, a country with diverse cultural and religious populations. Cartwright reports on aging immigrants in the U.S., representing a wide range of cultural and religious traditions. Taking the discourse to the cellular level, Hill et al. examine biomarker data from the U.S., linking religiosity and telomere length, while exposing potential intervening mechanisms. Together, these papers provide a contemporary and methodologically advanced evaluation of religiosity's role in health and aging within and across national and cultural environments.

THE IMPACT OF RELIGIOUS ACTIVITY ON LIFE AND ACTIVE LIFE EXPECTANCY IN THE EUROPEAN UNION

C. Chiu¹, Z. Zimmer², C. Jagger³, M.B. Ofstedal⁴, Y. Saito⁵,
1. *Academia Sinica, Taipei, Taiwan*, 2. *Mount Saint Vincent University, Halifax, Nova Scotia, Canada*, 3. *Newcastle University, Newcastle, United Kingdom*, 4. *University of Michigan, Ann Arbor, Michigan*, 5. *Nihon University, Tokyo, Japan*

We examine whether religious activity is associated with longer life expectancy and active life expectancy in European Union countries using data from the first five waves of the Survey of Health and Retirement in Europe (SHARE, 2004–2011). Life expectancy and active life expectancy by gender, religious activity, and country were calculated from incidence-based multistate life tables that were constructed based on estimated transition probabilities. Measures of six activities of daily living (ADLs) and seven instrumental activities of daily living (IADLs) are used to define active and inactive life with inactivity defined as having difficulty or requiring help in any one of the ADLs or IADLs. Our results show that religious activity is strongly related to life expectancy and active life expectancy at age 50. Older people who take part in religious activities live longer and spend more years active than those who do not take part.

DIFFERENTIALS IN ACTIVE LIFE EXPECTANCY BY RELIGION/RELIGIOSITY AMONG OLDER ADULTS IN SINGAPORE

Y. Saito¹, A. Chan², R. Malhotra², M.B. Ofstedal³,
C. Jagger⁴, C. Chiu⁵, 1. *Nihon University, Tokyo, Japan*, 2. *Duke-NUS Medical School, Singapore, Singapore*, 3. *University of Michigan-Ann Arbor, Ann Arbor, Michigan*, 4. *Newcastle University, Newcastle, United Kingdom*, 5. *Academia Sinica, Taipei, Taiwan*

Previous studies have indicated a relationship between religiosity, various aspects of physical and mental health and mortality. This paper expands the connection by quantifying the effect of religion and religiosity on life, active life and inactive life expectancy. Data are from a nationally representative longitudinal survey of older adults conducted in Singapore in 2009, 2011 and 2015. Health status focuses on disability, specifically defined as ability or difficulty performing ADLs and IADLs. The denominational distribution at baseline indicates: Christianity (756, 16.3%), Buddhism / Taoism (2448, 56.5%), Islam (999, 11.6%), other (358, 4.8%), no religion (439, 10.8%). Frequency of attending religious services is: every week (1589, 29.9%), every month (721, 16.0%), less than once a month (1018, 22.2%), not at all (1672, 31.8%). This paper will estimate life and active life expectancy across these religious denominations, level of religious activity, and demographic covariates such as age and sex.

RELIGION AND HEALTH OF U.S. IMMIGRANT ELDERLY: ACCULTURATION, SOCIAL SUPPORT AND HEALTH BEHAVIOR BUFFERS

K. Cartwright, *University of New Mexico, Albuquerque, New Mexico*

This paper tests theoretical frames including social support, health behaviors, and acculturation to identify mechanisms through which religion affects immigrant health in the

US. Studies investigating immigration and acculturation indicate that religion serves as a bridge and a barrier to American culture. Studies also indicate that US immigrants are more religious than their native-born counterparts, although similarly to the native born population, older immigrants are more likely to be religious. This paper uses multiple waves of the New Immigrant Survey (NIS) to explore the relationship among religion, health behaviors, and health outcomes of aging immigrants. Where prior studies mainly focus on specific religious traditions and immigrant health, the NIS enables comparative analyses inclusive of religions beyond the Judeo-Christian scope. The findings confirm that religion is a social determinant of immigrant health and identify relationships between various religious traditions and health of older immigrants.

PROCESSES LINKING RELIGIOUS ATTENDANCE AND TELOMERE LENGTH

T. Hill¹, P. Vaghela², C.G. Ellison³, S. Rote⁴, 1. *University of Arizona, Tucson, Arizona*, 2. *Florida State University, Tallahassee, Florida*, 3. *University of Texas- San Antonio, San Antonio, Texas*, 4. *University of Louisville, Louisville, Kentucky*

Although numerous studies show that religious involvement is associated with favorable health outcomes, it is unclear whether this general pattern extends to cellular aging. The mechanisms linking religious involvement and indicators of cellular aging are also undefined. We employ data from the 2008 Health and Retirement Study, a national probability sample of Americans aged 50 and older, to test whether leukocyte telomere length varies according to level of religious attendance. We also test several potential mechanisms linking religious attendance with telomere length, including stressful life events, depression, and smoking. Although we find that religious attendance is not directly associated with telomere length, our mediation analyses revealed significant indirect effects through depression and smoking, but not stressful life events. Religious attendance may indirectly promote telomere length by reducing the risk of depression and smoking, but there is no evidence to support stressful life events as a mechanism of religious attendance.

SESSION 3160 (SYMPOSIUM)

EXPANDING USE OF UNIVERSAL ASSESSMENTS FOR LONG TERM SUPPORTS AND SERVICES: CHALLENGES AND BENEFITS

Chair: C. Wendel-Hummell, *University of Kansas, Lawrence, Kansas*

Co-Chair: B. Fries, *University of Michigan, Ann Arbor, Michigan*

Discussant: R.K. Chapin, *University of Kansas*

Many countries are now recognizing the need for uniform assessment instruments across populations, settings and programs. Motivated by federal recommendations as well as by knowledge of global best practices and trends, several states in the United States are adopting a uniform assessment instrument for their publicly funded long term support and services, particularly Medicaid waiver programs. A universal, standardized assessment is a critical tool for streamlining

access to care for people seeking services. A well-designed assessment instrument can be used to determine eligibility for public programs, care planning, data collection, rate setting, and quality assurance. A universal assessment can also: promote choice for customers when the assessment determines eligibility for multiple programs; reduce administrative burdens by using one assessment for multiple purposes; promote equity by using the same assessment criteria for all individuals in need of services; and capture standardized data to help policymakers do longitudinal analysis of client outcomes and program effectiveness.

Participants will overview key factors that informed selection of a base instrument in their states and outline key policy decisions regarding implementation, including level of care determinations and how outcome measures can be used to improve quality of care. Participants will also demonstrate how standardized data can be used to compare populations across states and countries, and thus inform key LTSS policy decisions. Strategies for overcoming challenges in implementing uniform assessments, which could help other states as well as international entities considering adopting universal assessment instruments, will be detailed.

CHARACTERISTICS OF PERSONS USING LONG-TERM SERVICES AND SUPPORTS: AN INTERNATIONAL PERSPECTIVE

B. Fries, M. James, M. Thomasson, *University of Michigan, Ann Arbor, Michigan*

The interRAI Home Care assessment was developed by an international consortium to inform evidence-based clinical practice and policy decisions through the collection and interpretation of standardized data about the characteristics and outcomes of persons served across a variety of settings. The Home Care tool is used by Medicaid agencies in 24 states in the United States and in more than 37 countries worldwide. In this session, we highlight the ability to compare populations across states and countries, using these data to profile the characteristics of home- and community-based (“waiver”) participants in five US states and show substantial inter-state variation despite similar program objectives. When compared with participants in 11 European countries included in the Aged in Home Care (AdHOC) Study, however, the waiver populations are relatively less varied and more disabled.

CREATING AND TESTING CONNECTICUT'S UNIVERSAL ASSESSMENT TOOL ACROSS MULTIPLE POPULATIONS

N.A. Shugrue¹, D. Charles¹, C. Gruman², R. McManus², T. Tsay², C. Bredfeldt², D. Lambert³, J.T. Robison¹, 1. *University of Connecticut Center on Aging, Farmington, Connecticut*, 2. *The Lewin Group, Falls Church, Virginia*, 3. *Connecticut Department of Social Services, Hartford, Connecticut*

In order to increase access to non-institutional long-term services and supports and facilitate level-of-need determinations, Connecticut developed a Universal Assessment (UA) for use across multiple populations through an intensive, multi-stakeholder process including a cross-walk of existing assessment tools (n=10) across the domains of ADLs, IADLs, medical/psychiatric conditions, behavior, and cognition.

Additional analysis of approaches taken by other states (n=15) and other standardized tools (n=7) included item-by-item selection across domains. Screens included relevance, person-centeredness, validity, and reliability. The UA tool selected was the interRAI Home Care Assessment, modified for Connecticut's needs. An algorithm to determine level-of-need and budget allocation from UA data was developed and tested across populations, modified from the intellectual/developmental disability population (n~10,000) and cross-applied to data for elder/disabled individuals (n~5300) to compare 8 levels of need. Average costs lined up as expected, but variation within each level required further refinement and testing.

IMPLEMENTING KANSAS'S UNIVERSAL ASSESSMENT IN A MANAGED LONG-TERM SERVICES AND SUPPORTS ENVIRONMENT

C. Wendel-Hummel, A. Sellon, H. Kang, H. Lassmann, L. Swartzendruber, C. Holmes, D. Nary, T.A. LaPierre, *University of Kansas, Lawrence, Kansas*

The state of Kansas partnered with the University of Kansas to develop and implement a universal assessment instrument for Medicaid services in a managed LTSS environment. After consulting stakeholders and best practices, the interRAI-Home Care and interRAI-Intellectual Disability tools were selected for use with frail older adults and people with physical disabilities, traumatic brain injuries, or intellectual/developmental disabilities. InterRAI assessments are designed to contribute to both eligibility screening and care-planning. However, in a Medicaid managed LTSS environment, level-of-care (LOC) eligibility determinations must be completed by an independent assessor, whereas plans-of-care are developed by MCO care coordinators. We will discuss the process of testing the draft instrument for translating state LOC policy into the new assessment instrument and developing a state-specific LOC screen. We will also detail strategies used to overcome challenges encountered in planning the interface between conflict-free LOC determination and MCO careplanning, and successfully transitioning to a new instrument.

USING ASSESSMENT DATA TO PERFORM OUTCOME-BASED QUALITY MEASUREMENT

M. Mccaffrey, *University of Massachusetts Medical School, Shrewsbury, Massachusetts*

Outcome-based measures are an essential but often missing puzzle piece for assuring the quality of home-based services. Like many states, Massachusetts found itself struggling to identify *outcome-based* measures (e.g., social isolation and decline in activities of daily living). On behalf of Massachusetts, the University of Massachusetts Center for Health Law and Economics turned to 16 validated outcome-based measures based on the Minimum Data Set Home Care assessment (MDS-HC) developed by InterRAI, an international quality measurement collaborative. The measures are readily available and published in peer-reviewed journals. Responses to fifty-six questions from assessments conducted over a two-year period were evaluated to determine data quality and completeness. Preliminary findings show the feasibility of constructing many of the measures. InterRAI's outcome-based measures can be used to create benchmarks

for participant outcomes, help service providers identify best practices, align service offerings with clients' needs, and promote advanced payment models.

USING STANDARDIZED DATA TO COMPARE ACCESS TO LONG-TERM SERVICES AND SUPPORTS IN FIVE U.S. STATES

M. Thomasson, M. James, B. Fries, *University of Michigan, Ann Arbor, Michigan*

In the United States, access to long term services and supports is restricted, rather than a universal health care "right." State governments are responsible for setting "level of care" (LOC) policy to identify the persons eligible to receive publicly-funded services. These policies can exert powerful effects on states' budgets and individuals' access to care. Standardized assessment data is now being used for LOC determinations, with the hope that objective measurement will ensure the consistent application of these criteria. We compare LOC policies across four US states that have adopted the interRAI Home Care instrument, thus permitting "head-to-head" comparisons. While states' systems have the same overall goals, individual states vary in their interpretation of LOC policy, using state-specific algorithms created from different combinations of these standardized assessment items. We will apply these several algorithms to data from a fifth state to demonstrate substantial inter-state differences in access.

SESSION 3165 (SYMPOSIUM)

LABOR FORCE AND HEALTH IN LATER LIFE FROM A CROSS-NATIONAL PERSPECTIVE

Chair: E. Calvo, *UDP / Columbia University, RM, Chile*

This symposium will feature cross-national studies on labor-force and health in later life. Drawing on current internationally harmonized data, this symposium will present papers exploring cross-national variations and group differences in labor-force participation rates and health at older ages, as well as in the relationship between the two.

LABOR FORCE PARTICIPATION RATES OVER 65: WHAT IS THE RIGHT LEVEL?

R. Finkelstein, *Robert N. Butler Columbia Aging Center, New York, New York*

An analysis of the labor force participation rates for people 65+ (LFPR65+) by country-income revealed a strong inverse relationship between participation and country's income. Globally, countries with lower income levels have much higher labor force participation in old age. In general, high income countries have lowest LFPR65+ rates, though there is variability across countries, between genders, and a generally upward trend through time. We use the International Labor Organization's definition of labor-force participation and The World Bank's classification of countries into high-income, upper middle-income, lower middle-income, and low-income in our analyses. This analysis highlights the centrality of policy, economic, and cultural context in influencing people's decisions about when to stop working. This

supports the need to go beyond individual-level factors and microeconomic context in analyzing work decisions and disrupts over-simplified calls for people to work longer since they are living longer.

DO ACTIVITY PATTERNS ACROSS TIME PREDICT COGNITIVE AGING?

Y. Yu, U.M. Staudinger, *Columbia Aging Center, Columbia University, New York, New York*

We investigated how engagement in mentally stimulating activities in the domains of work, volunteering, and leisure across time influence longitudinal change in cognitive performance during adulthood via novel information processing. Two aspects of this approach are innovative: (1) Focusing specifically on the degree to which activities require novel information processing, and (2) studying the three activity domains conjointly to ascertain their respective unique and interactive contributions. The focus on novelty allows studying the effects of mental stimulation across different levels of education rather than being confounded with it. Given that the majority of a given population will never achieve higher levels of education, this is crucial knowledge for maintaining productivity in the face of an aging population. Initial longitudinal analyses of the HRS data set including information from O*Net seem to confirm the hypothesis that at all levels of education the degree of novelty processing predicts better cognitive aging.

MARRIAGE, STRENGTH, AND MORTALITY RISK AMONG SUCCESSIVE COHORTS OF NORWEGIAN OLDER ADULTS

V. Skirbekk^{1,2}, B. Strand², 1. *Columbia Aging Centre, New York, New York*, 2. *Norwegian Institute of Public Health, Oslo, Norway*

Low grip strength is a major health concern, but being married can offset some of the negative effects as spouses may help and support each other when one's partner does not manage alone. Growing shares of older adults are unmarried, and we aim to study how their low grip strength relates to the risk of mortality. Inequality in life expectancy at older ages have been demonstrated for both marital status and grip strength, but the joint effects have not been focused on. Our research was carried out from a population based survey and register study, including residents in the Norwegian city of Tromsø aged 59–71 in period 1994/5 to 2007/8. We found that differentials in life expectancy by marital status and strength became greater over time. Both greater strength and being married were associated with longer lives.

GENDERED LATE CAREERS IN THE UNITED STATES AND THE UNITED KINGDOM: A SEQUENCE ANALYSIS

M. van der Horst³, D. Lain⁴, I. Madero-Cabib^{2,5}, E. Calvo^{1,2}, S. Vickerstaff³, 1. *Columbia University, New York, New York*, 2. *Universidad Diego Portales, Santiago, Chile*, 3. *University of Kent, Canterbury, United Kingdom*, 4. *University of Brighton, Brighton, United Kingdom*, 5. *Universidad de Chile, Santiago, Chile*

Numerous policy reforms in the 21 century have tried to extend working lives without paying enough attention to

the gendered nature of late careers. Combining a life-course approach with sequence analysis techniques, this study empirically explores how gendered are late careers in the United States and the United Kingdom. Drawing on data for the last decade from the Health and Retirement Study (HRS) and the English Longitudinal Study on Ageing (ELSA), we identify multiple types of labor force sequences. Preliminary results suggest that labor force sequences five years before and after the legal retirement age are more unstable and diverse for women in the United Kingdom. In contrast, labor force sequences for males are similarly stable and homogeneous in both countries. We discuss the policy implications of these results for the financial security and health of both females and males in old age.

LATE CAREERS AND HEALTH: A PANEL STUDY IN THE UNITED STATES AND THE UNITED KINGDOM

E. Calvo^{1,2}, I. Madero-Cabib², U.M. Staudinger¹, 1.

Columbia University, New York, New York, 2. Universidad Diego Portales, Santiago, Chile

Using a life course approach to look at trajectories and transitions in context, this study explores the association between late careers and health in the United States (US) and the United Kingdom (UK). We hypothesize that precarious retirement sequences are associated with worse health in old age and that this correlation is stronger in the US than in the UK. Drawing on panel data from the Health and Retirement Study (HRS) and the English Longitudinal Study on Ageing (ELSA), we use sequence analysis to construct labor force sequences five years before and after the legal retirement age. We use discrete time models with Heckman correction, survival models, and growth curve models to estimate the association with mortality as well as objective and subjective health outcomes. Preliminary results suggest that retirement sequences characterized by full-time jobs, continued employment, and late retirements are associated with better health outcomes, especially within the US.

SESSION 3170 (SYMPOSIUM)

FROM RESEARCH TO POLICY: ISSUES FOR THE BUILT ENVIRONMENT

Chair: S.M. Schmidt, *Lund University, Sweden*

Co-Chair: B. Slaug, *Lunds Universitet*

Discussant: H. Chaudhury, *Simon Fraser University, British Columbia, Canada*

The design of the built environment can enhance or impede the activities of our aging society, and a well-designed environment can help the aging population maintain a high level of well-being throughout the life course. As the built environment is highly regulated in most countries, policy change presents a path towards implementation of research results. In this symposium we will present empirical examples of research from five countries that are relevant for policy decisions in the built environment. Starting with outdoor environments, researchers from Germany (Penger et al.) will discuss the relationships among personal and environmental factors that influence out of home mobility. Colleagues

from Wales (Roberts et al.) will then present a tool that can be used to identify targets to improve the age-friendliness of neighborhoods. Switching to indoor environments, researchers from Japan (Hayashi et al.) will describe how the design of nursing homes effects the health of the residents through indoor temperature. A Swedish research team (Slaug et al.) will present a simulation that identifies the most severe environmental barriers in ordinary housing among people with different combinations of functional limitations. Finally, a joint Italian-Swedish team (Chiatti et al.) will present the implications of home monitoring technologies in ordinary housing among people with dementia. A discussant from Canada (Habib Chaudhury) will also tie the presentations into the North American context. Hence, this symposium will present a broad perspective on potential policy changes to allow the built environment to better support the WHO initiative for an Age-Friendly World.

SUMMER IN THE CITY: BEING OUT AND ABOUT IN THE FACE OF FUTURE CLIMATE CHANGE

S.G. Penger¹, F. Oswald¹, K. Conrad², S. Siedentop²,

D. Wittowsky², 1. *Frankfurt Forum for Interdisciplinary Ageing Research (FFIA), Interdisciplinary Ageing Research (IAW), Goethe University Frankfurt, Germany, Frankfurt Main, Germany, 2. ILS-Research Institute for Regional and Urban Development GmbH, Dortmund, Germany, Germany*

Western societies are facing major challenges, such as urbanization, climate and demographic change. Therefore, policy in communities has to be prepared to maintain mobility, social participation and well-being of older citizens in the future of hot summers and dense inner city districts. The aim of our study is (1) to identify personal (e.g., attitudes) and environmental (e.g., climate) determinants of daily out-of-home mobility and (2) to analyze how they may affect health and well-being of elders. We developed instruments to assess mobility-related behavioral flexibility and climate experience that are used in a survey in two climatically different districts of the city of Stuttgart, Germany. Data will be drawn from face-to-face interviews and trip diaries with 200 community-dwelling elders aged 65 years and older. Findings on out-of-home mobility in relation to personal and environmental factors will be presented and furthermore be used to ensure sustainable use of urban planning measures.

DOES GEOGRAPHIC SETTLEMENT TYPE MODERATE THE ASSOCIATION BETWEEN DEPRIVATION AND AGE-FRIENDLINESS?

V. Burholt, M. Roberts, C. Musselwhite, *Centre for Innovative Ageing, Swansea University, Swansea, United Kingdom*

The Older People's External Residential Assessment Tool (OPERAT) enables the assessment of the residential environment based on what is important to older people as identified by older people themselves, providing a measure of 'age-friendliness'. OPERAT scores are derived from 17 items distributed across four domains corresponding to Natural Elements, Incivilities and Nuisance; Navigation and Mobility; and Territorial Functioning. This presentation will show that an association between OPERAT scores

and broader area level deprivation scores varies according to the nature of the geographic settlement type. We conclude that although deprivation levels for a large area predict 'age-friendliness' for smaller constituent areas, this association varies by rurality and population density. These results highlight the variance in 'age-friendliness' between different types of area, and the utility of OPERAT in identifying these differences. This information has potential application for planners, policy makers and practitioners, in correspondence to the WHO drive for age-friendly environments.

REGULATING INDOOR TEMPERATURE AND HUMIDITY: SUCCESSFUL CARE PREVENTION IN WARMER NURSING HOMES IN JAPAN

Y. Hayashi¹, T. Ikaga¹, S. Ando², S.M. Schmidt³, T. Hoshi⁴,
1. Graduate School of Science and Technology, Keio University, Yokohama, Kanagawa, Japan, 2. University of Kitakyushu, Kitakyushu, Fukuoka, Japan, 3. Lund University, Lund, Sweden, 4. Tokyo Metropolitan University, Tokyo, Japan

As society has aged in Japan, residents of nursing homes are needing more advanced levels of care, which is increasing costs. Accordingly, strategies to prevent further deterioration of health are necessary. The effects of indoor air temperature on health aspects such as blood pressure and mortality have recently attracted attention. We measured indoor air temperature and assessed changes in the level of care needed among 1337 residents in 27 nursing homes during winter 2015. The nursing homes were classified into two groups (warm or cold) according to UK National Health Service guidelines regarding indoor air temperature. Cox regression analysis revealed that residents in warm nursing homes were less likely to deteriorate to a higher level of care (HR = 0.48, 95% CI 0.31 – 0.75). The result suggests that policies to regulate indoor temperature may be one ingredient to delay declines in health of nursing home residents and reduce care costs.

INVENTORY OF BARRIERS AND ACCESSIBILITY PROBLEMS IN ORDINARY HOUSING: IMPLICATIONS FOR POLICY-MAKERS

B. Slaug, M. Granbom, M. Kylberg, C. Pettersson, S. Iwarsson, *Lunds Universitet, Lund, Sweden*

Promotion of accessible housing for senior citizens gains increased attention by policy-makers. Housing environments which make activity performance difficult and impede social participation, increase risks of isolation and higher health care needs and costs. The appropriateness of the ordinary housing stock for accommodating senior citizens is therefore important to examine from a public health perspective. Utilizing existing databases of environmental barriers in the Swedish ordinary housing stock (N=1,021), the aim was to survey environmental barriers (EB) and housing accessibility problems for senior citizens with different complexity of functional limitations. Type profiles of functional limitations prevalent in the aging population were targeted by simulated analyses. Both one-family houses and multi-dwellings had substantial proportions of EB. The EB generating the most severe accessibility problems varied depending on type profile, and the problems were considerable also for less complex

profiles. Large-scale and systematic efforts are required to promote accessible housing for senior citizens.

TECHNOLOGY IN DEMENTIA HOME CARE: LEGAL, ETHICAL, AND POLICY ISSUES

S.M. Schmidt¹, A. Malmgren-Fänge¹, M.H. Nilsson¹, G. Carlsson¹, C. Dahlgren Bergström¹, P. Olivetti², P. Johansson³, C. Chiatti², 1. Lund University, Lund, Sweden, 2. Italian National Research Institute on Ageing, Ancona, Italy, 3. Region Skåne, Ängelholm, Sweden

People with dementia and their informal caregivers are at risk from other physical, psychological and social problems beyond the dementia. As society is ageing and with a push to age in place, informal caregiving is common. We are evaluating an information and communication technology (ICT) home monitoring kit to see if it can reduce caregiver burden and allow people with dementia to live more independently. We will show results from two clinical trials in Italy and Sweden (namely Up-Tech and Tech@Home), preliminary showing that caregiver burden can be reduced and that those using the ICT kits generally are satisfied with them. These devices generate large amounts of personal data, and they are potentially invasive, while those with dementia may have minimal capacity to decide if they want to have their homes monitored. Therefore, even with positive findings, we must resolve important legal, ethical, and policy questions before implementing such solutions.

SESSION 3175 (SYMPOSIUM)

CONFLICTING MEANINGS OF CARE: INSIGHTS FROM CULTURAL GERONTOLOGY AND CRITICAL THEORY

Chair: C. Kelly, *University of Manitoba, Winnipeg, Manitoba, Canada*

Multiple and conflicting meanings of 'care' circulate in an array of social sciences and humanities disciplines. In varied theorizing and empirical studies, care refers to a gendered form of labour that is socially devalued and poorly compensated. In the lively feminist ethics of care scholarship, care refers to a relational ethics that can radically transform individual moral codes, policy frameworks and even international relations in contrast to prevailing justice-based ethics systems. It is also frequently used without reflection in many healthcare contexts to refer to the material tasks of healthcare as well as an indicator of quality. Perhaps most controversially, in disability studies and activism care is regarded a complex form of oppression with roots and ongoing links to mass institutionalization, paternalism, and other systemic exclusions of differing embodiments. This symposium draws on cultural gerontology and critical theory to consider the contested terrain around 'care' in relation to aging in conceptual, policy and practices settings. In doing so, we help to both complicate and clarify 'care' to challenge theorists, practitioners and researchers to consider the weighty history and implications of terminology that often circulates without pause. Further, we call on the audience to consider what these conflicting and complex meanings of care might mean for their own practice and work.

EXPLORING DISABILITY POLITICS IN DIRECT-FUNDED HOME CARE FOR OLDER ADULTS

C. Kelly, *Community Health Sciences, University of Manitoba, Winnipeg, Manitoba, Canada*

Directly funded home care has long been connected to disability activism in North America and the United Kingdom. This model of home care provides funds to individuals to hire, train and manage workers who assist them with daily life. While sometimes critiqued for advancing a neoliberal rhetoric of individual responsibility, direct funding programs are also seen as flexible, empowering, and culturally sensitive-- setting up a contemporary paradox. The roots of these programs can be found in disability activism, particularly in messages that reject a patronizing, charitable or medicalized concepts of 'care.' This presentation aims to uncover and trace the legacies of disability activism in a context of expanding direct funding programs more explicitly to older people in Ontario, Canada. Through presenting the results of a public domain analysis, this presentation argues disability movements have fundamentally changed the ways we understand 'care' beyond the context of physical disability.

THE POLITICS OF CARE AND AGING FOR DISABLED ONTARIANS UNDER AUSTERITY

M. Hande, *University of Toronto, Toronto, Ontario, Canada*

As Canada's population ages and public policies are increasingly structured by financialized debt and austerity, policy makers are scrambling to find innovative and "cost-effective" ways to provide care for older Canadians. Similarly, healthcare entrepreneurs are developing ways of capitalizing on the "aging market." Innovations include public-private partnership financing for healthcare infrastructure and expanded direct funding home care program for older people. Many disabled Ontarians, however, do not have the resources to access these individualized care options and so are forced to cobble together entrepreneurial and community-based survival strategies. Based on a review of current provincial policy and extensive qualitative focus group data from aging disabled Ontarians, this presentation reviews how austere public policy innovations are shaping the politics of aging and care for older disabled Ontarians. Key care strategies and political responses are analyzed thematically.

BRINGING AGING TO THE FOREFRONT IN INTERSECTIONAL DISABILITY STUDIES

K. Aubrecht, *Mount Saint Vincent University, Halifax, Nova Scotia, Canada*

Although there is impressive intersectional disability studies scholarship and activism that explores heterosexism, racialization, disablement and transinstitutionalization (e.g., Ben-Moshe, 2011), analyses which include a consideration of aging are virtually absent. Genealogical research makes the absence of aging and older adults within intersectional disability studies scholarship and activism more present. In this presentation I share findings from a genealogy of nursing homes in Nova Scotia which traces their appearance to the English Poor Laws. Documents from the Nova Scotia Archives, and secondary research that included peer-reviewed academic publications and publicly available information, were analyzed to understand the social and

historical emergence of nursing homes as a form of care for older adults. This work sought to identify and understand the dominant ideologies that shape current policies and popular understandings of nursing homes, and that organize practices and perceptions of people who live in nursing home settings.

SESSION 3180 (SYMPOSIUM)

OPTIMIZING THE NURSING HOME ENVIRONMENT FOR PEOPLE LIVING WITH DEMENTIA

Chair: O.F. Jarrin, *Rutgers, The State University of New Jersey, Devon, Pennsylvania*

Co-Chair: S. Crystal, *Rutgers University, New Brunswick, New Jersey*

Discussant: V. Mor, *Brown University, Providence, Rhode Island*

This symposium explores interventions to improve care and reduce the use of antipsychotic medication for nursing home residents with dementia. Behavioral and psychological symptoms of dementia (BPSD) are the leading causes for assisted living or nursing home placement. While non-pharmacologic management of BPSD are universally recommended and antipsychotic medications carry a black-box warning for treatment of dementia, they are prescribed to more than half of patients with dementia in the United States. We begin with an overview of public policy and advocacy efforts at the state and national level to reduce antipsychotic use in nursing home residents with dementia and the effectiveness of these programs. We then describe the relationship between nursing home staffing, staff education, and resident outcomes including infections, pain, depression, and use of antipsychotic, antianxiety or hypnotic medications in long-stay residents. Next we shift the research approach from big data to stakeholder perspectives of medical directors, physicians, consulting pharmacists, and directors of nursing in facilities that have been successful in reducing antipsychotic medication prescribing patterns across the country. Finally implementation research on two different facility-level interventions to improve nursing care will be described that reframe behavioral symptoms of dementia as a form of communication. M. Powell Lawton's ecological theory of aging and environmental press model provide a lens for discussing policy and practice patterns that aim to reduce negative and maladaptive behavior of nursing home residents living with dementia. Taken together the papers in this session present a comprehensive overview of dementia intervention and evaluation efforts at the individual, interpersonal, facility, societal, and public policy level.

ANTIPSYCHOTIC USE TRENDS IN U.S. NURSING HOMES AND IMPACT OF IMPROVEMENT CAMPAIGNS

S. Crystal^{1,2}, S. Neese-Todd¹, A. Akincigil^{1,2}, 1. *Institute for Health, Health Care Policy and Aging Research, Rutgers University, New Brunswick, New Jersey*, 2. *School of Social Work, Rutgers, The State University of New Jersey, New Brunswick, New Jersey*

Use of antipsychotic medication to manage behavioral and psychological symptoms of dementia, associated with

significantly increased mortality, represents an international quality and safety challenge. In the US, state and national campaigns for reduced antipsychotic use in nursing homes were launched beginning in 2012. Antipsychotic use for long-stay residents declined from 23.9% in 2011 to 17.0% in 2015 (fourth quarter), a relative decrease of 28.8%. State quality improvement strategies varied widely, some relying more on education and others on regulation. In this presentation, we will discuss the approaches taken by several of the state initiatives, and impacts to date. We will discuss the effectiveness of different states' improvement strategies, and provide updated regression analyses on the impact of staffing and other facility characteristics on antipsychotic use and on improvement rates. Implications for effective, large-scale, sustainable quality improvement strategies, and roles of educational and regulatory components, will be discussed.

VALUING INVESTMENTS IN NURSING HOME STAFFING AND STAFF EDUCATION FOR RESIDENTS AND PAYERS

O.F. Jarrin^{2,3}, D. Francel Bautista¹, C. Cho¹, W. Tay¹, R. Hermida¹, 1. *School of Nursing, Rutgers, The State University of New Jersey, Devon, Pennsylvania*, 2. *Rutgers, The State University of New Jersey, School of Nursing, Newark, New Jersey*, 3. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania*

This session will describe the relationship between nursing home staffing, staff education, and resident outcomes including infections, pain, depression, and use of antipsychotic, antianxiety or hypnotic medications in long-stay residents. Staff education variables include nurse-level and facility-level credentialing programs in addition to mandatory education at the state-level. Nursing home staffing variables, facility demographic variables and primary facility-level, risk-adjusted resident outcomes are drawn from the most recent (2015) Center for Medicare and Medicaid Services (CMS) Nursing Home Compare dataset that includes 15,000 nursing homes. Economic costs and potential cost savings are estimated from Office of Inspector General (OIG) reports. The relationship between nursing home staffing, staff education, resident outcomes and costs of care will be discussed with policy recommendations.

REDUCING ANTIPSYCHOTIC USE IN NURSING HOMES: PRESCRIBER AND FACILITY PERSPECTIVES

M. Rosenthal¹, B. Angell², S. Crystal^{1,2}, J. Poling³, A. Wec³, 1. *Institute for Health, Health Care Policy and Aging Research, Rutgers University, New Brunswick, New Jersey*, 2. *School of Social Work, Rutgers, The State University of New Jersey, New Brunswick, New Jersey*, 3. *Department of Sociology, Rutgers, The State University of New Jersey, New Brunswick, New Jersey*

Since 2012, some states have reduced inappropriate prescription of APs in nursing homes (NHs) by 20–25%, while others show little change. To assist attendees in replicating quality improvement across facilities and states, case studies from the field will provide successful facility-level dementia care strategies. As part of an AHRQ-funded study, administrators and prescribers (medical directors, physicians, consulting pharmacists, and directors of nursing) are interviewed by

phone at 14 NHs in 7 states. They describe the decision process for prescribing APs, and issues prescribers face including how they are affected by changes in regulations, barriers to change, and sources of improvement. Their descriptions cover a range of NHs by facility size, organizational status (for profit/not-for-profit), proportion of Medicaid-covered residents, and progress in reducing AP use. These case studies of high success vs. limited success will provide examples of points of intervention, and effective alternative strategies for addressing dementia in NHs.

HOW NURSING HOME STAFF MANAGE CHALLENGING FEEDING BEHAVIORS IN RESIDENTS WITH DEMENTIA

M. Batchelor-Murphy¹, E.S. McConnell^{2,3}, R.A. Anderson⁶, A. Barnes¹, T. Yap¹, S. Kennerly⁴, C. Colon-Emeric^{3,5}, 1. *Duke University, School of Nursing, Durham, North Carolina*, 3. *Geriatric Research, Education and Clinical Center (GRECC) of the Department of Veterans Affairs Medical Center, Durham, North Carolina*, 4. *East Carolina University, College of Nursing, Greenville, North Carolina*, 5. *Duke Medicine, Durham, North Carolina*, 6. *University of North Carolina Chapel Hill, School of Nursing, Chapel Hill, North Carolina*

This session will describe the adaptive challenges nursing home (NH) staff experience when residents with advanced dementia exhibit feeding behaviors (e.g., turning head away) during meals. As part of a larger mixed methods study to re-design a dementia feeding skills training program, ten focus groups were conducted with NH staff (N = 52) in 8 NHs. Transcripts were analyzed using four *a priori* codes: dementia skills training, feeding behaviors, interventions, and communication. NH staff report no formal dementia feeding skills training, but did report training for dealing with aggressive behavior during other daily care activities (e.g., bathing). Transferring this training to feeding behaviors, NH staff reported their most frequent intervention is to walk away. Mealtime challenges included feeding behaviors, including behaviors perceived as aggressive. Implications of this emerging work include reframing feeding behaviors as communication, and training staff to respond appropriately to these behaviors to promote meal intake.

THE USE OF MUSICAL CUEING TO FACILITATE AND IMPROVE CARE PRACTICES IN NURSING HOMES

T. Yap¹, S. Kennerly², 1. *Duke University, School of Nursing, Durham, North Carolina*, 2. *East Carolina University, College of Nursing, Greenville, North Carolina*

This session will describe use of a musical cueing innovation to facilitate nursing staff in their implementation of care for nursing home (NH) residents observed. Staff perceptions of innovation characteristics and sustainability were collected via focus group interviews held in each of eight intervention NHs using a semi-structured interview protocol. Transcripts were analyzed using thematic content analysis, and summaries for each category were compared across groups. Responses to the musical cueing and the impact of this environmental stimulation on behaviors of staff and residents with dementia and overall nursing home culture demonstrated that cueing NH staff using music offers an environmentally friendly approach to prompting staff and

resident interaction and improving care practices. Exemplars of how the innovation was tailored to fit individual NH needs, such as music choices and cueing times will be presented along with lessons learned about integrating and sustaining practice change.

SESSION 3185 (SYMPOSIUM)

GERONTECHNOLOGY ACROSS THE CONTINUUM: FROM INDEPENDENT TO ASSISTED LIVING

Co-Chair: C.R. Bolkan, *Washington State University, Oregon*

R. Fritz, *Washington State University, Vancouver, Washington*

Discussant: K.A. Hooker, *Oregon State University*

The dramatic growth in the world's older population will have a significant effect on healthcare, social services, communities, and families; it will require innovative interdisciplinary solutions. The emergence of gerontechnology may address many aging-related challenges in the continuum of care for older adults. Telehealth, combined with patient education, engages independent community-dwelling chronically ill older adults in their own care. Health-assistive smart homes assist independent and assisted-living older adults with safety and health via ambient motion sensors and machine learning algorithms that may identify and predict health events, as well as provide timely alerts to facilitate earlier interventions. Mindful implementation and evaluation of the efficacy of gerontechnologies will be needed as more technological solutions become available and are employed. A focus on personhood and an emphasis on patient-centered care will help ensure safe and ethical use of technology, which is designed by digital natives for use by a non-digital native older adult population. In this symposium, we will present research findings from four distinct studies that describe: (a) the implementation and evaluation of smart home sensors or telehealth technology for remote patient monitoring in community and institutional settings and (b) the challenges to adoption of such technologies among older adults. We will also discuss the need for health care and human service professionals to be cognizant of technological resources in order to increase adoption and implementation. Gerontechnology may improve quality of life among older adults, increase their ability to age-in-place, and decrease health care costs while maintaining function and dignity.

HEALTH-ASSISTIVE SMART HOMES WITH A CLINICIAN-IN-THE-LOOP

R. Fritz², M. Schmitter-Edgecombe¹, A. Crandall¹, D. Cook¹,
1. *Washington State University, Pullman, Washington*, 2.
Washington State University, Vancouver, Washington

Smart homes using ambient sensor monitoring and activity-aware algorithms designed to assist older adults with maintaining health and extending their independence are under development. In this ongoing 5-year pilot study, we deploy five smart homes each year to independent older adults with chronic illness and add a nurse-clinician to the motion sensor, data collection, and machine learning algorithm loop. A nurse conducts a complete medical record review, weekly telehealth assessments, and monthly in-home

health assessments and compares health information alongside raw sensor data as well as data tagged by machine learning algorithms with higher-level information including resident activity. Data patterns are evaluated for their relationship to known or discovered changes in health. Findings are reported to a team of software engineers who specialize in machine learning and who train the algorithms to identify changes in health status. Formative findings reveal algorithms may accurately detect changes in health status.

CHANGES IN ACTIVITY PATTERNS AND HEALTH OF OLDER ADULTS CAPTURED WITH IN-HOME SENSOR NETWORKS

M. Yefimova¹, D. Woods², J.C. Menten¹, M. Rantz³, 1.
UCLA School of Nursing, Los Angeles, California, 2. *Azusa Pacific University School of Nursing, Azusa, California*, 3.
University of Missouri, Columbia, Missouri

Remote monitoring technology may enable proactive care by alerting health providers to early signs of health decline in frail older adults with multiple chronic conditions. Devices embedded in the living environment may identify prodromal symptoms based on deviations from in-home activity patterns that comprise an individual's daily routine. A retrospective multiple case study used secondary data from TigerPlace, a retirement facility that evaluates health technology. Ten participants lived in apartments equipped with networks of unobtrusive motion and bed sensors. Thirty months of continuous sensor data were analyzed in the context of clinical notes in the electronic health record. Individuals' routine activity patterns were affected by temporal and environmental factors. Adjusted for personalized baselines, changes in time spent in various apartment areas were associated with geriatric syndromes. These preliminary insights may guide further development of in-home health monitoring to support clinical decisions about timely and effective care for frail older adults.

TECHNOLOGY TO SUPPORT AGING IN PLACE: A COMMUNITY-BASED PILOT PROJECT

C.R. Bolkan, E. Kim, R.C. Hoeksel, *Washington State University, Vancouver, Washington*

Low-income older adults in poor health often require intensive in-home services and are at greater risk of morbidity and mortality. We evaluated a pilot educational program implemented by a community-based organization (Area Agency on Aging/AAA) in partnership with local clinics/hospitals. Program aims were to reduce hospital readmissions, enhance chronic illness self-management among high-risk clients, maintain aging-in-place, and improve quality of care. Fifty participants aged 60+, diagnosed with heart failure, enrolled in a Care Coordination program with AAA, and living in the community each received a Bluetooth-enabled smart scale, blood pressure cuff, electronic journal, and medication management system for six months. Daily health monitoring data were accessible to participants and their Care Coordinators in an effort to prevent health status declines. Initial results underscored challenges in implementation (e.g., partnering with health care clinics and specialty providers; training staff), but also highlighted improvements in client care and health outcomes.

PROVIDER KNOWLEDGE REGARDING ASSISTIVE TECHNOLOGIES THAT SUPPORT OLDER ADULTS' INDEPENDENCE

C.R. Van Son¹, A. Weakley², M. Schmitter-Edgecombe², J. Tam², 1. *Washington State University, Vancouver, Washington*, 2. *Washington State University, Pullman, Washington*

Aging Services Technologies (ASTs) can assist older adults to maintain their highest level of functioning in the least restrictive environment. However, the adoption of ASTs is poor among older adults. Healthcare providers are a trusted resource for health education and must be aware of and recommend available ASTs for their patients. Sixty-five healthcare providers completed an AST related questionnaire to assess their knowledge about ASTs. More than 60% reported that they have clients who need additional assistance with instrumental activities of daily living and at least 78% reported their clients would benefit from ASTs. However, 42% of the providers had little to no familiarity with ASTs. Only 37% were able to correctly identify up to six AST items from a 12-item visual identification tool. Additional results from this assessment demonstrates the need for interventions that promote provider knowledge of ASTs to facilitate maximum function and safety in older adults.

SESSION 3190 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: AGE-FRIENDLY ENVIRONMENTS: CRITICAL DISCUSSIONS ON PRESENT PRACTICES AND FUTURE PATHWAYS

Chair: T. Moolaert, *iUT 2 Université de Grenoble Alpes, Ramillies, Belgium*

Discussant: C. Phillipson, *The University of Manchester*

Age-Friendly Cities and Communities (AFCC) and Age-Friendly Environments (AFE) initiatives and practices offer significant potential for improving social inclusion, health and wellbeing of older people worldwide. With the support of the World Health Organization, they present an experimental landscape for municipalities to adapt physical and social environments and a platform for researchers to discuss age friendliness.

A. Scharlach presents the complexities and controversies regarding the concept of age friendliness and its implications, including potential benefits and limitations of an emphasis on individual health and functional ability, as embodied in WHO's 2015 World Report on Ageing and Health as opposed to social inclusion and community well-being.

AFCC and AFE initiatives have expanded worldwide. However, little is known about their effects, their embeddedness in existing policies and their sustainability, or how best to adapt to local needs. Meeting these challenges, S. Garon and colleagues present data from Quebec and use three theories of evaluation (experimental, logic model, participatory) adapted to distinct variable contexts. At a global level, A. Ross similarly exposes the need to critically consider such contexts as a key factor in adapting a global WHO monitoring framework and core indicators to measuring age-friendliness of places. With a focus on dementia, S. Biggs and I. Haapala offer a complementary view on the competing narratives at stake within age friendliness in Australia.

In conclusion, T. Moolaert uses comparative material from Quebec, France and Belgium to advocate for the need for theory to understand local mediations and how they are embedded in shared values, language and interests.

AGE FRIENDLINESS: A CRITICAL ANALYSIS OF ITS HISTORY AND FUTURE

A.E. Scharlach, *University of California at Berkeley, Berkeley, California*

This paper addresses complexities and controversies regarding the concept of age friendliness, and its implications for creating age-friendly environments. The presentation begins by examining current perspectives on age friendliness, and their conceptual and empirical underpinnings. It then reviews a brief history of age-friendly approaches, from segregated communities to age-integrated environments to social inclusion, accompanied by a critical examination of existing evidence regarding three types of systemic approaches for helping cities and communities become more age-friendly. The presentation concludes with an analysis of unresolved issues concerning age friendliness, including the potential benefits and limitations of an emphasis on individual health and functional ability, as embodied in WHO's 2015 *World Report on Ageing and Health*, as opposed to social inclusion and overall community well-being, as reflected in social developmental perspectives on social capital formation.

THEORIES OF EVALUATION AND THE MEANING OF A SUCCESSFUL AFCC PROGRAM

S. Garon^{1,2}, A. Veil¹, M. Paris¹, S. Vallette¹, 1. *École de travail social, Université de Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *Research Centre on Aging, Sherbrooke, Quebec, Canada*

This presentation aims to describe the experience of the Age-Friendly Cities and Communities in Quebec, Canada (AFCC-QC), in order to contribute to knowledge building related to the evaluation process and to reflect on the pattern of evidence of what could mean a successful AFCC program regarding to different contexts. AFC-QC started with 7 pilot projects in 2008 and is now in implementation in 766 municipalities in 2016. It's based on a mixed methods design, which provides an important body of data. This experience raises the question of how do we evaluate an AFCC program? There are more than a dozen of affiliated programs in the WHO Global Network of Age Friendly Cities and Communities (GNAFCC). Each of them takes place in different contexts. The theory of evaluation states explicitly the importance of these contexts. Through the lens of three different types of evaluation models (experimental, logic model, participatory), we'll discuss how these models can or cannot address the different realities of AFCC.

THE SECRET OF SUCCESSFUL AGE-FRIENDLY CITIES AND COMMUNITIES: MEASUREMENT

A. Ross, *Centre for Health Development, World Health Organization, Kobe, Hyogo, Japan*

Key to garnering political and financial support for programmes to achieve age friendly cities and communities is the availability of information on the impact and cost of various interventions, access, and population inequities. The WHO Centre for Health Development (Kobe) researched,

developed, tested and disseminated a Monitoring Framework and Core Set of Indicators for cities and communities to monitor and measure their “age friendliness”. Evidence enables cities to set targets and policy, and to enhance collaboration between governments, researchers, non-profits, and other members of communities concerned about our health and well-being as we age.

The Framework and indicators are grouped into physical environment, the social environment, impact and equity. They were robustly tested in 15 cities worldwide, and are designed to be tailored to local conditions. We will discuss the indicators, examples of metrics, and the empirical results from a number of cities that have used the Guide.

COMPETING NARRATIVES ON DEMENTIA FRIENDLINESS: THE AUSTRALIAN CASE STUDY

S. Biggs^{1,2}, I. Haapala¹, 1. *University of Melbourne, Melbourne, Victoria, Australia*, 2. *The Brotherhood of St Laurence, Melbourne, Victoria, Australia*

The growing numbers of people living with dementia and a progressive trend toward age friendliness in urban neighborhoods raises the issue of how dementia is perceived in the public domain. This paper critically addresses competing narratives on dementia arising from professions and from the growing voices of consumers and dementia activists in Australia. The interconnection between narratives, public perceptions and public interventions will, it is argued have implications for policy, the co-creation of community and future conceptions of citizenship. Empirical material from Australia consequently addresses global discussion and potential relation between dementia / age friendliness.

UNLOCKING THE BLACK BOX OF AGE-FRIENDLY CITIES AND COMMUNITIES: CONTEXTUALISATION AND MEDIATION

S. Garon^{2,3}, T. Moulart¹, 1. *PACTE, iUT 2 Université de Grenoble Alpes, Ramillies, Belgium*, 2. *École de Travail Social, Université de Sherbrooke, Sherbrooke, Quebec, Canada*, 3. *Research Centre on Aging, Sherbrooke, Quebec, Canada*

Age-Friendly Cities and Communities (AFCC) practices have emerged as an appealing field for experimentations, local initiatives, and they, sometimes, received the support of social research. Today, there is a need to critically discuss their development in different parts of the world and to support more theoretical perspectives.

The *Programme d'Etude Internationale sur le Vieillessement* (PEIV) led by REIACTIS (www.reiactis.com) in 2013–2016 offers empirical observations and interviews with stakeholders from AFCC in France (N=18) and Quebec (N=29); furthermore, we observe the long-term evolution of a Walloon program on AFCC in Belgium since 2002, where we are now leading a pilot project in 6 municipalities offering stronger methodological directions.

Inspired by critical gerontology and sociology of public policies, we theoretically propose to insist on the variety of contexts and mediations between local stakeholders, including researchers, when present, to better understand how practices are deeply embedded in shared values, language and interests.

SESSION 3195 (SYMPOSIUM)

ACTIVE AGING IN ASIA: COMMUNITY CARE POLICIES AND PROGRAMS IN HONG KONG, JAPAN, KOREA, AND SINGAPORE

Chair: K.L. Braun, *University of Hawaii at Manoa, Honolulu, Hawaii*

Discussant: C. Conybeare, *University of Hawaii West Oahu, Kapolei, Hawaii*

Counties across Asia are experiencing rapid growth of the number and percent of older adults in their societies. Although several countries have looked at paying for nursing home care, Hong Kong, Japan, Korea, and Singapore have realized the creating home and community-based services will maximize independence and minimize costs. The purpose of this symposium is to share practices and policies from these four countries as they develop and test policies and programs that favor home and community services over nursing home care. Presenters are country representatives of ACAP (Active Aging Consortium Asia Pacific) who work within their countries to educate and facilitate change. The moderator (Braun, USA) will provide a brief overview of the trends that have led to rapid aging in Asia and describe ACAP's individual-family-community-social policy framework. Dr. Han (South Korea) will describe South Korea's efforts to build an active aging society, with specific examples from Busan city, as well as the national policy level. Dr. Ogawa (Japan) will introduce several initiatives from Fukuoka Prefecture, including Fukuoka City's “active aging” plan and efforts of the Asia Aging Business Center to promote a community-based comprehensive care system. Ms. Kay (Singapore) will discuss community-based initiatives in Singapore to support older adults in an inclusive “nation for all ages.” Ms. Tsien (Hong Kong) will describe Hong Kong's community-based work with older adults and policy makers to improve the age-friendliness of selected neighborhoods. Dr. Conybeare will discuss the similarities and differences in country approaches.

COMMUNITY MODEL OF CARE AND SERVICES IN SINGAPORE: A NATION FOR ALL AGES

T. Kay, *Consultant, Singapore, Singapore*

In rapidly ageing Singapore, 1 in 4 Singaporeans will be over 65 by 2030. Efforts are being taken to build an inclusive “Nation for All Ages”, and several initiatives are underway to enable older persons to age-in-place and within the community. For example, Singapore is developing age-friendly “communities of care” through integrated health and social services, home services and home visitations. Continued participation is being facilitated through senior activity centres, community clubs, senior volunteerism, lifelong learning, community kitchens, and multigenerational activities. Age-friendly environments are also fostered, especially in housing, public spaces and transport services. Innovative community-based programmes are being implemented, such as care integration in a “community model of care”, community rehabilitation (for recovery and re-ablement), dementia-friendly communities and the Singapore Programme for Integrated Care for the Elderly (SPICE). Singapore's “Smart

Nation” initiative will also leverage technology to enable older people to age actively and productively.

INTEGRATED COMMUNITY CARE IN FUKUOKA: A PARADIGM SHIFT FOR A HYPER-AGED SOCIETY

T. Ogawa, 1. *Fukuoka Asian Urban Research Center, Fukuoka, Japan*, 2. *(NPO) Asian Aging Business Center, Fukuoka, Japan*

In Japan, the demographic transition of rapid aging is considered a hindrance to economic growth. Neither public nor private sector will be able to survive using “business as usual” models in the coming future. Therefore, every sector must modify its planning framework, from forecasting to backcasting and from division of labor to collaboration. The Japanese government is now engaged in planning process to expected futures for 2025 and 2035, and working backwards to see how to best intervene to keep people healthy and independent in old age. An integrated community care system is being developed to reduce costs associated with long-term care, which has been institution based. More, less expensive options of paraprofessional and family care are being developed. Within this framework, the specific work of Fukuoka-city to enhance health and social programs as an Advancing Healthy City will be shared.

BEST PRACTICES OF ACTIVE AGING AS A COMMUNITY MODEL IN KOREA

D. Han, *Research Institute of Science for the Better Living of the Elderly, Busan, Korea (the Republic of)*

South Korea is rapidly aging society. The proportion of adults age 65+ in Korea will be 40% by 2060. To find best practices for community-based active aging in Korea, data were collected from older adults and providers affiliated with welfare centers for the elderly in Yangsan and Busan. Data on values, needs, and preferences for senior services were gathered. The result suggest the importance of the concept of “active aging” among elders and providers. Older persons overwhelmingly saw value in being active, staying healthy, and engaging in positive social participation in their older years. Program providers felt maintaining respected social roles and participation were important for older adults. The findings underscore the need for more community-based services to increase access to exercise, work opportunities, volunteer opportunities, digital literacy, health literacy, and intergenerational exchange. In Korea, community-based welfare centers for the elderly are important platforms to spread active aging.

BUILDING AN AGE-FRIENDLY HONG KONG: A BOTTOMS-UP APPROACH

T.B. Tsien, *Hong Kong Polytechnic University, Hong Kong, Hong Kong*

As many countries in Asia, Hong Kong is rapidly ageing. The Institute of Active Ageing of the Hong Kong Polytechnic University has implemented research, funded by the Hong Kong Jockey Club Charities Trust, to assess the current age-friendliness in two districts with high proportions of older adults and to identify appropriate action. The research has shed light on three priority directions for action, namely building Hong Kong into a friendly city for people of different ages; encouraging the elderly to participate in community

activities; and promoting social inclusion. Moving forward, the project team will work closely with District Councils, mass media, and community partners to develop three-year action plans with indicators to monitor progress. This paper will discuss the experience of this bottom-up and district-based approach and why it proves to be an effective way of building an age-friendly city and ensuring a long-lasting and sustainable impact on local communities.

SESSION 3200 (SYMPOSIUM)

REALISING THE POTENTIAL OF ACTIVE AGEING IN EUROPE

Chair: A.C. Walker, *University of Sheffield*

Discussant: J. Beard, *World Health Organization*

This symposium reports the findings of the most comprehensive scientific investigation of the challenges presented by population ageing undertaken so far in Europe. The MOPACT (Mobilising the Potential of Active Ageing in Europe) was a four year multi-disciplinary collaboration involving 13 countries, which concluded in early 2017. Its objectives were to conduct systematic reviews of the social and economic challenges of ageing, generate new knowledge on key policy-related dimensions such as late working lives and healthy ageing, collect and analyse social innovations and policy initiatives and map the steps required to realise active ageing. As well as investigating the most important social and economic aspects of ageing, from pension system sustainability to social cohesion, MOPACT also included research on the built and technological environments and biogerontology. The major objectives of the symposium are to report findings from specific parts of this comprehensive project, namely new evidence on extending working lives and the challenge of increasing healthy life expectancy, and to provide a picture of the policy regimes that are associated with different degrees and forms of active ageing. In addition there is an overview of the MOPACT project and the strategy it adopted to enhance the policy relevance of its research. Symposium participants will encounter clear and concise summaries of the key findings from this unique project and take away fresh ideas about the promotion of active ageing in policy and practice.

THE MOPACT PROJECT

A.C. Walker, *Sociological Studies, University of Sheffield, Sheffield, United Kingdom*

This paper will provide an overview of the MOPACT project. Specifically it will outline the mission and objectives of the project and the strategies it developed to link scientific research to real world policy questions and, then, to ensure that the research findings were as policy relevant as possible. It will explain too why the active ageing concept was central to the project. This overview will be followed by a summary of the key findings not covered by other papers in the symposium. The main topics covered are national variations in the achievement of active ageing, the projected increase in the numbers of people aged 80+ living alone, measures required to improve pension system sustainability, the potential of biogerontology to increase healthy life expectancy, the barriers to take-up of ICT products, the need to transform long term care and the political gerontocracy question.

REALISING ACTIVE AGEING IN EUROPE

A. Zaidi^{1,2}, A.C. Walker³, 1. *Ageing/ Gerontology, University of Southampton, Southampton, United Kingdom*, 2. *London School of Economics and Political Science, London, United Kingdom*, 3. *University of Sheffield, Sheffield, United Kingdom*

The potential of older people to contribute to societal progress is now widely accepted. The active ageing paradigm has encouraged policymakers to generate additional opportunities for older people, to be successful in their active and healthy experiences of ageing. The MOPACT project operationalised the concept of active ageing to generate evidence highlighting the optimistic view on ageing, taking the Active Ageing Index “AAI” as its starting point. This paper will report the results of this work, with a particular focus on identifying contexts and strategies across European countries that stimulate and sustain the activity, health, independence, and security of people of all ages. It combines the AAI evidence with the findings of rigorous scientific reviews undertaken across MOPACT WPs to develop an understanding about the active ageing regimes. It highlights key strategies required in promoting active and healthy ageing in different institutional and cultural contexts of the European countries.

SOCIAL PARTICIPATION AND HEALTHY LIFE EXPECTANCY OF OLDER PEOPLE IN POOR HEALTH: A SENARIO ANALYSIS

D.J. Deeg¹, B.C. Smid², B. Wouterse², 1. *VU University Medical Center/Dept. of Epidemiology & Biostatistics, Amsterdam, Netherlands*, 2. *CPB Netherlands Bureau for Economic Policy Analysis, The Hague, Netherlands*

The European Union has formulated an increase in healthy life expectancy (HLE) by two years as one of the Horizon 2020 goals. Given the increasing prevalence of multimorbidity, it is important to limit the disabling effect of chronic diseases, and thus increase disability-free life expectancy. This MOPACT-study considers the promotion of social participation among older individuals with multimorbidity as one of the tools to do so. Three scenarios that foster social engagement in older people with multimorbidity are generated, and the effects of these scenarios on HLE are assessed for sixteen European countries. We found only very modest effects on HLE. Our most realistic scenario results in improvements in HLE between 0 and 0.1 years. We conclude that substantial increases in HLE cannot be expected to come from a single intervention alone but will have to be the result of combined efforts on several fronts.

LONGER WORKING LIVES IN EUROPE: THE WIDENING GAP BETWEEN FINANCIAL INCENTIVES AND ENABLING STRATEGIES

G. Naegele, J. Bauknecht, *Institute of Gerontology at TU Dortmund University, Dortmund, Germany*

Based on MoPAct research, this paper provides an overview and discussion of European macro and meso level measures aimed at higher older worker labor supply and later labor market exit. On the macro level, political reforms in the fields of pensions, unemployment and disability were implemented similarly in Western Europe and Central and Eastern Europe (CEE) with merely marginal differences despite significant lower employability (especially health-wise) in CEE. In contrast, on the meso level pro-employability measures on

the level of employers and social partners are far more innovative and widespread in Western Europe. Against this background, the gap between financial incentives for older people to extend working lives and insufficient pro-employability measures will exist in Western Europe only to some extent, yet be far more widespread in CEE. In combination with the adverse initial situation this will exacerbate the existing problem of work despite low employability/bad health especially in CEE.

SESSION 3205 (SYMPOSIUM)**GSA M. POWELL LAWTON AWARD LECTURE: USING SCIENCE AS EVIDENCE TO INFORM PRACTICES AND POLICIES—EXAMPLES FROM NUTRITION AND AGING**

Chair: J.L. Locher, *University of Alabama at Birmingham, Birmingham, Alabama*

As a scholar committed to the goal of translating scientific evidence into real world applications designed to improve the lives of older persons, M. Powell Lawton confronted multiple challenges along the way to fully realizing his goal. The challenges he encountered in making seminal contributions to gerontological treatment, service, and policy include those related to the methods, validity, and scope of research that are not unique to either the environmental and aging studies in which he was a pioneer or the twentieth century in which he lived. In fact, one might speculate that within the past decade: 1) the greater role of the media in the communication of science to the public, 2) the increased politicization of science (especially as it relates to nutrition), and 3) the decreased resources available for aging services may have amplified those challenges. This talk will address challenges and opportunities related to applied gerontological research with examples used from the field of nutrition and aging. Two themes will be emphasized: 1) In the absence of scientific evidence, why are unproven practices and policies adopted and maintained? And 2) In the presence of scientific evidence, why are decision makers unwilling to implement the results of science that could benefit the lives of older adults?

SESSION 3210 (SYMPOSIUM)**ACHIEVING 21ST CENTURY FUNCTIONAL ABILITY THROUGH MORE EFFECTIVE ELDER CAREGIVING**

Chair: M. Hodin, *Global Coalition on Aging, New York, New York*

Discussant: P. Nicholson, *Nestlé Skin Health, Lausanne, Switzerland*

I. Philp, *Warwick Business School, Coventry, United Kingdom*

The 2015 World Health Organization World Report on Ageing and Health defined Healthy Ageing as “the process of developing and maintaining the functional ability that enables well-being in older age.” This new public health guideline focused on functional ability serves as a call-to-action aligned with 21st century longer lives, and it requires an innovative view of wellness and prevention, in addition to more effective treatment paradigms, as core focus areas of health.

The symposium will present the public policy and business imperatives of making functional ability a priority in public health through the presentation of new data and case studies from the EASYCare Program and Home Instead Senior Care, two globally engaged sources interacting with seniors every day. Further, as case studies, we will examine the impact of more effective skin and nutritional health on seniors' quality of life and ability to help reduce the burdens of family and community caregivers.

Focus in these health areas will reveal unique opportunities to reduce hospital visits, limit re-hospitalization and address the impact of healthy aging on family and friends' mental and physical health. The symposium will identify opportunities to improve caregiving practices that pursue a more active aging, thereby adding quality to longer lives. It will further identify key areas for further investigation and research on elder caregiving that goes beyond disease treatment, focuses on prevention and wellness, and therefore leads to more effective elder caregiving.

THE EASYCARE PROJECT

I. Philp^{1,2}, N. Burgess¹, F. Shiraz³, 1. *University of Warwick, Coventry, United Kingdom*, 2. *Heart of England NHS Foundation Trust, Solihull, United Kingdom*, 3. *National University of Singapore, Singapore, Singapore*

The EASYCare Project is a global initiative to improve the lives of older people, by using standardised assessment methods for identifying the concerns of older people living at home. Questions pertain to health, independence and well-being, and are geared toward mobilising responses from local resources to provide support based on the older person's priorities. The Project has been developed over 27 years, with validation in 48 poor, middle income and rich countries throughout the world. Participants will:

1. Through survey data from EASYCare International network members, learn about adoption of innovation and the perceptions of the barriers to this approach.
2. Learn about patterns of needs and wants of older people from an analysis of population data collected in studies across the world using EASYCare assessment data.
3. Understand how to engage with the Project for research, training in the EASYCare person-centred approach to assessment, and/or implementation of the approach.

A FOCUS ON SKIN AND NUTRITIONAL HEALTH TO DRIVE FUNCTIONAL ABILITY

P. Nicholson, *Nestlé Skin Health SHIELD, Lausanne, Switzerland*

Skin and nutritional health can provide powerful indicators for other health issues occurring in the body. For instance, inattention to skin and nutritional health can lead to vulnerabilities including dry, cracked skin that can leave one susceptible to bacterial infections or inadequate nutritional intake that can signify oral health deterioration. Untreated, these issues can also lead to social isolation and resulting mental health concerns. By focusing on skin and nutritional health as opportunities for prevention and wellness, healthcare professionals and other caregivers can help promote and drive functional ability and healthier aging.

Participants will learn about the connection between skin health and falls prevention, tools for more effective

Alzheimer's management through reduction of itch/pruritus, and concepts for bringing better nutrition to older adults through more effective caregiver interactions.

CARE IN THE HOME AS A TOOL FOR HEALTHIER AND FULLER LIVES

P. Hogan, *Home Instead Senior Care, Omaha, Nebraska*

Since 1994, Home Instead Senior Care has provided in-home care for seniors around the world. Today, Home Instead's franchise network is the world's leading provider of home care services for seniors, providing more than 60 million hours of care annually in 12 countries. Home Instead's experience caring for seniors has generated data and expertise proving the benefits of keeping seniors independent, mobile, active, healthy and in their homes. In addition to benefiting seniors, home care services have been shown to help alleviate burdens on family caregivers, lower healthcare costs, reduce strains on government-funded programs, create jobs and contribute to economic growth. This symposium will discuss findings from a new report titled *The Value of Home Care: Caring for America's Seniors*, which showcases these benefits and highlights this growing and rewarding profession.

SESSION 3215 (SYMPOSIUM)

EARLY CAREER SCIENTIST OPPORTUNITIES—U.S. NATIONAL INSTITUTE ON AGING, NIH

Chair: M.A. Bernard, *NIA NIH, Maryland*

Co-Chair: R.J. Hodes, *National Institutes of Health*

Discussant: R.A. Barr, *National Institute on Aging*

The U.S. National Institute on Aging (NIA) at the National Institutes of Health, Department of Health and Human Services, supports biomedical and behavioral research with a life-span focus. There is attention to understanding basic processes of aging, improving prevention and treatment of diseases and conditions common in later years, and improving the health of older persons. It is the federally designated lead in research on Alzheimer's disease. The NIA also supports the training and career development of scientists focusing on aging research and the development of research resources. The symposium, meant for junior faculty and emerging scholars, will provide an update on the latest research findings from the NIA followed by a brief update on funding mechanisms available to U.S. citizens and foreign nationals. An opportunity is provided to meet and consult with NIA extramural staff.

OVERVIEW OF NIA RESEARCH

M.A. Bernard, *NIA NIH, Bethesda, Maryland*

Dr. Richard Hodes, Director of NIA, will provide an overview of research supported by the Institute, including basic biology, neuroscience, behavioral and social science, and geriatrics and clinical gerontology. Particular emphasis will be placed on studies with international reach.

FUNDING OPPORTUNITIES AND MECHANISMS AT NIA

M.A. Bernard, *NIA NIH, Bethesda, Maryland*

Dr. Robin Barr, Director of the Division of Extramural Activities at NIA, will review funding mechanisms that are

appropriate for early career researchers. Emphasis will be placed on steps to obtaining a first R01, and opportunities that may be appropriate for international researchers.

SESSION 3220 (SYMPOSIUM)

HOW YOUNG AND FULL ADULT LIFESPAN COHORTS CONTRIBUTE TO OUR UNDERSTANDING OF LATE-LIFE FUNCTION

Chair: M.C. Morey, *VAMC and Duke Medical Centers, Durham, North Carolina*

Discussant: H.J. Cohen, *Duke University*

Physical function in the context of older populations has been well studied. Much of what is known about late-life function has been derived from studies that are often comprised exclusively of older adults. There is a paucity of studies that have common measures directly assessing physical performance across a full life span. Such studies present a unique opportunity to examine trajectories of successful or premature aging and identify characteristics associated with each. Furthermore, recent research has elucidated the influence of early childhood characteristics associated with accelerated aging.

This symposium brings together unique cohorts that inform our understanding of late life health and function as a consequence of early and mid-life experiences. The first paper will examine functional outcomes based on trajectories of sedentary behaviors across cohorts representing decades of life from ages 30 and above. The second paper will examine, in a birth cohort followed to mid-life, characteristics stemming from early childhood adversity that are associated with mid-life accelerated biological aging. The third paper will discuss the development and impact to two novel indices, derived from markers of inflammation and metabolism, representing “robustness” and “burden” and how they relate to physical performance. The fourth paper will examine and model latent group grip strength trajectories from early to mid-adulthood, and their predictors, using data from the Fels Longitudinal Study. We conclude with findings from the Helsinki Businessmen Study that will discuss how differences in midlife physical fitness affect the association between midlife cardiovascular risk factors and physical functioning in old age.

EXPLORING THE LINK BETWEEN SEDENTARY BEHAVIOR AND DIMINISHED FUNCTIONAL HEALTH OUTCOMES IN ADULTHOOD

K.S. Hall, *Medicine-Geriatrics, Veterans Affairs/Duke University Medical Centers, Durham, North Carolina*

Sedentary behavior (SB) in the absence of physical activity is expected to exert a deleterious effect on functional health outcomes. We examined age-related trends, by decade, in SB and explored whether SB was inversely associated with functional health across adulthood. Analyses included nearly 800 adults (aged 30–90+ years at baseline) in the MURDOCK health study. SB was measured objectively with an accelerometer. Functional health was measured using a series of physical performance tests and biochemical markers. SB was relatively high across the range of age cohorts, showing a

steady increase with increasing age, particularly in the 6th & 7th decades of life. Significant sex differences were observed for SB, with women, in general, recording more sedentary time. Time spent in sedentary activities was strongly associated with diminished physical function and pronounced metabolic and inflammatory dysfunction. Findings suggest that reducing SB may help preserve functional independence and physiologic regulation with aging.

IMPACT OF EARLY PERSONAL HISTORY CHARACTERISTICS ON THE PACE OF AGING

D.W. Belsky, *Medicine, Duke University School of Medicine, Durham, North Carolina*

Aging is a lifelong process. Theory predicts that early-life adversity will accelerate biological processes of aging, leading to early-onset disease and frailty. Supporting evidence comes from studies of older adults that retrospectively assess histories of adversity and correlate them with current health status. We tested if early-adversity accelerated biological aging could be detected already during midlife, in time for preventive intervention to extend healthspan. We studied a 1972–3 birth cohort (N=954) followed prospectively through their 38th year of life, the Dunedin Study. We measured early adversity from records accumulated prospectively during Study members’ childhoods. We measured biological aging from biomarker data using three published algorithms, Biological Age, Age-related Homeostatic Dysregulation, and Pace of Aging. Findings show that exposure to early adversity accelerates the rate of biological aging already by the middle of the life course. Implementing geroprotective therapies during midlife may prolong healthspan for individuals with histories of early adversity.

CREATING BIOMARKER BURDEN AND ROBUSTNESS INDICES FOR PHYSICAL PERFORMANCE IN OLDER ADULTS

X. Zuo^{1,2}, A. Luciano², C.F. Pieper², H.J. Cohen², *1. Duke-NUS Medical School, Singapore, Singapore, Singapore, 2. Duke University Center for Study of Aging, Durham, North Carolina*

The human aging process is associated with decline in physical performance resulting from dysregulated inflammatory and metabolic systems; each has an effect on circulating serum markers of inflammation and metabolism. Biomarker burden and robustness indices were developed from twenty inflammatory and metabolic markers using a combination of three cross-sectional studies conducted in older adults. Each biomarker was individually correlated with gait speed, and all biomarkers underwent selection by step-wise regression on multiple bootstrap samples with respect to burden and robustness of physical performance. Twelve and eight biomarkers, respectively, were included in the indices that correlated with steady, step-wise change in outcome. The biomarker indices predict physical performance better than individual markers and are the first of such indices to link multiple inflammatory/metabolic markers with physical performance. The biomarkers included in the model have physiological and clinical implications on development of, or resilience to, physical performance decline in the older adults.

GRIP STRENGTH TRAJECTORIES FROM EARLY ADULTHOOD THROUGH MIDLIFE: THE FELS LONGITUDINAL STUDY

M. Peterson, *Wright State University, Kettering, Ohio*

Grip strength is a measure of overall strength that predicts adverse outcomes in old age. Grip strength trajectories throughout adulthood and their predictors are not well understood. We modeled growth trajectories of grip strength from Fels participants aged 18–60. Data from 403 participants (55% female) aged 29.4±6.6 years with subsequent visits through age sixty were included. We modeled latent grip strength groups, with predictors including demographic, health, behavioral, and biomarker variables. Multiple, differing trajectory groups were observed in men and women. In initial models, 16% and 12% of men and women, respectively, had persistent poor grip strength throughout adulthood. A high grip strength group was identified in men and women that peaked in the sixth decade and associated with higher BMI in women and non-smoking in men. Group grip strength trajectories were evident, and membership predictors differed between sexes. Additional biomarker and health predictor group membership models will be discussed.

MIDLIFE CARDIOVASCULAR RISK FACTORS AND PHYSICAL FUNCTIONING TRAJECTORIES IN OLD AGE

M. von Bonsdorff¹, T. Törmäkangas¹, S. Stenholm², K. Pitkälä³, T. Strandberg³, 1. *Jyväskylä Yliopisto, Jyväskylä, Finland*, 2. *University of Turku, Turku, Finland*, 3. *University of Helsinki Department of General Practice and Primary Health Care and Helsinki University Hospital, Helsinki, Finland*

We investigated whether there are differences according to midlife physical fitness for the long-term association between cardiovascular disease (CVD) risk factors and physical functioning in old age. We studied Caucasian men born in 1919–1934 in the Helsinki Businessmen Study (HBS initial n=3490). Data on CVD risk factors (body mass index [BMI]), 1-hour glucose tolerance test and total cholesterol) and self-reported physical fitness (good vs. average or poor) were assessed in 1974. 26 years later in old age physical functioning was assessed using the Short Form SF-36 survey. Among men who had good midlife physical fitness, lower BMI, glucose and cholesterol were associated with better physical functioning. Among men who reported average or poor physical fitness, only lower BMI was associated with better physical functioning. Among businessmen, a more favorable CVD risk profile was associated with better physical functioning in old age particularly among those who felt physically fit in midlife.

SESSION 3225 (SYMPOSIUM)

TRANSLATING KNOWLEDGE ABOUT DEPRESCRIBING INTO PRACTICE TO OPTIMIZE MEDICATION USE IN OLDER ADULTS

Chair: E. Reeve, *University of Sydney, Sydney, New South Wales, Australia*

Co-Chair: J.P. Turner, *University de Montreal, Montreal, Quebec, Canada*

Medications play a significant role in the management of chronic medical conditions in older adults. Polypharmacy (concurrent use of multiple medications) can be appropriate and highly beneficial to the individual. The decision to initiate a medication involves determining the necessity of the medication, then weighing up the potential benefits and potential risks of the medication for the individual. However, the necessity, benefits and risks of medication use in an individual may change with time and the ageing process. Therefore, to achieve quality use of medications in older adults “deprescribing” may be required.

Deprescribing is the process of withdrawal (or dose reduction) of medications that are no longer necessary, are high risk, or do not fit with the preferences and treatment goals of the individual (inappropriate medications). Evidence internationally shows that approximately half of all older adults are taking a medication which is potentially inappropriate and, therefore, deprescribing is not occurring in practice as often as it should be.

Research is being conducted internationally to highlight the prevalence and associated harms of inappropriate medication use as well as determining the potential benefits and harms of deprescribing. It is imperative that knowledge gained from this research is translated into practice. We have a worldwide ageing population and use of medications in this population is unavoidable. This symposium will present international research and knowledge translation activities that are leading the way to a clinical practice where medications are prescribed and deprescribed judiciously.

BARRIERS AND FACILITATORS TO DEPRESCRIBING IN PRACTICE

J.P. Turner^{1,2}, S. Edwards³, M. Stanners⁴, S. Shakib^{5,6}, J. Bell², 1. *Institut universitaire de gériatrie de Montréal, University de Montreal, Montreal, Quebec, Canada*, 2. *Monash University, Melbourne, Victoria, Australia*, 3. *Drug and Therapeutics Information Service (DATIS), Adelaide, South Australia, Australia*, 4. *Torrens University, Adelaide, South Australia, Australia*, 5. *The University of Adelaide, Adelaide, South Australia, Australia*, 6. *Royal Adelaide Hospital, Adelaide, South Australia, Australia*

Identifying barriers and facilitators to deprescribing is a prerequisite for successful medication cessation. This study investigated barriers and facilitators to deprescribing in long-term care from the perspectives of patients, physicians, nurses, pharmacists and multidisciplinary teams.

Semi-directed focus groups were conducted using nominal group technique with 56 key informants working or residing in long-term care in South Australia. Nineteen physicians, 12 nurses, 11 pharmacists, and 11 patients discussed the barriers and facilitators to deprescribing that they perceive. Thematic content analysis and ranking was performed by each group to generate a prioritized list of barriers and facilitators.

Common themes were identified although priorities differed between focus groups. Barriers included evidence for deprescribing, poor communication, and fear of deterioration while ability to identify patient’s goals of care was an enabler. Awareness of barriers and facilitators can inform future research and development of tools to assist clinicians to deprescribe.

SHARED DECISION MAKING AND PATIENT-CENTERED DEPRESCRIBING

E. Reeve, 1. *University of Sydney, Sydney, New South Wales, Australia*, 2. *Dalhousie University, Halifax, Nova Scotia, Canada*

Older adult (or caregiver) resistance/refusal is often cited by prescribers as a barrier to deprescribing. Shared decision making is advocated not only because it is ethically appropriate, but also because it can prevent waste of resources and improve health outcomes. This session will present a portfolio of research into how older adults and caregivers feel about deprescribing and discuss strategies on how this knowledge can be translated into practice.

Research conducted using the Patients' Attitudes Towards Deprescribing (PATD) questionnaire in hospitals, aged care facilities and the community in Australia, Canada and Italy found that between 80 and 90% of older adults and caregivers of older adults are willing to have a medication deprescribed if their doctor said it was possible. Qualitative and quantitative studies have found common barriers and facilitators to deprescribing including patient belief in the appropriateness of the medication, the burden of medication taking and fear/concerns surrounding withdrawal.

INTEGRATION OF AN ELECTRONIC MEDICATION RISK ASSESSMENT TOOL INTO HOME MEDICINES REVIEWS

L. Kouladjian O'Donnell, D. Gnjidic, T. Chen, S.N. Hilmer, *University of Sydney, St Leonards, New South Wales, Australia*

The Drug Burden Index (DBI) pharmacologically measures the cumulative effect of anticholinergic and sedative medications (ACh-Sed). Increasing DBI has been associated with poorer outcomes in older adults, including those with dementia. There is a need to highlight the risks of prescribing ACh-Sed in clinical practice.

This study assessed the feasibility and impact of integrating a DBI report generated by The DBI Calculator[®] (a reliable electronic clinical decision support tool), into the pharmacist-led Home Medicines Review service - an Australian government-funded medication review model in the primary care setting. Three-months after the intervention, the median DBI for patients (n=100) significantly decreased (p=0.014), and 36.4% of patients with DBI>0 (n=66) at baseline had a reduction in their DBI scores. This study demonstrates the feasibility of integrating The DBI Calculator[®] in practice to facilitate deprescribing of ACh-Sed in older adults.

DEVELOPMENT AND IMPLEMENTATION OF DEPRESCRIBING GUIDELINES

B. Farrell^{1,2,3}, J. Conklin^{1,6}, L. Raman-Wilms⁴, L. McCarthy^{4,7}, K. Pottie^{1,2}, C. Rojas-Fernandez⁵, L. Bjerre^{1,2}, H. Irving¹, 1. *Bruyere Research Institute, Ottawa, Ontario, Canada*, 2. *University of Ottawa, Ottawa, Ontario, Canada*, 3. *University of Waterloo, Kitchener, Ontario, Canada*, 4. *University of Toronto, Toronto, Ontario, Canada*, 5. *McMaster University, Hamilton, Ontario, Canada*, 6. *Concordia University,*

Montreal, Quebec, Canada, 7. *Women's College Hospital, Toronto, Ontario, Canada*

Class-specific deprescribing guidelines are a potential solution to address polypharmacy. This study aimed to understand factors associated with successful deprescribing guideline implementation and whether self-efficacy for deprescribing was affected.

Deprescribing guidelines were developed using AGREE-II (Appraisal of Guidelines for Research and Evaluation), and GRADE (Grading of Recommendations Assessment, Development, and Evaluation) to rate certainty of evidence and recommendation strength. Decision-support algorithms were developed based on guideline content. Developmental evaluation was performed using ethnographic methods: observations and interviews with site implementation teams (three Family Health Teams and three Long-Term Care sites in Ottawa, Canada). Self-efficacy surveys were completed.

Three evidence-based deprescribing guidelines were developed (proton pump inhibitors, benzodiazepine receptor agonists and antipsychotics). Implementation was supported by incorporation of algorithms into pharmacist/physician medication reviews. Practice site priorities and processes shaped ability to incorporate recommendations; aligning guidelines with existing processes is critical for implementation. Self-efficacy increased among 9 consistent respondents across all guidelines.

ENABLING KNOWLEDGE TRANSLATION THROUGH THE CANADIAN DEPRESCRIBING NETWORK

C. Tannenbaum¹, S. Morgan⁵, B. Farrell⁴, J. Trimble⁵, J. Currie⁵, J. Shaw⁶, J. Silvius^{2,3}, 1. *University de Montreal, Montreal, Quebec, Canada*, 2. *Alberta Health Services, Calgary, Alberta, Canada*, 3. *University of Calgary, Calgary, Alberta, Canada*, 4. *Bruyere Research Institute, Ottawa, Ontario, Canada*, 5. *University of British Columbia, Vancouver, British Columbia, Canada*, 6. *Women's College Hospital, Toronto, Ontario, Canada*

In Canada 66% of people aged ≥65 years take five or more medications per day, and 1-in-3 consumes a Beers List inappropriate prescription. The Canadian Deprescribing Network was launched in 2016 to mobilize older adults, clinicians, health care organizations and policy-makers to reduce inappropriate prescriptions by 50% over the next 3–5 years.

The questions “who needs to do what, when, and with whom?” and “how should we communicate our messages?” drive our knowledge translation strategy. Building on system and individual-level levers for increasing capability, opportunity, and motivation to deprescribe, we struck sub-committees and developed an action plan to influence and achieve buy-in from the different target audiences in a distributed leadership fashion. A Deprescribing Fair was set-up to showcase deprescribing tools and methods being used across Canada. Media attention, the launch of the deprescribing.org website, promoting deprescribing champions within organizations, and disseminating newsletters has led to collaborative engagement in deprescribing.

SESSION 3230 (SYMPOSIUM)

WHO CLINICAL GUIDELINES ON INTEGRATED CARE FOR OLDER PEOPLE

Chair: J. Barratt, *International Federation on Ageing, Toronto, Ontario, Canada*

Co-Chair: B. Vellas, *CHU Toulouse, Toulouse, France*

Discussant: J. Beard, *World Health Organization*

The added years of life being experienced so widely are one of the great achievements of the 20th Century. Ensuring they can be enjoyed in good health will be one of the biggest public health challenges of the first half of the 21st Century. It will require significant changes in the way health systems are designed, the way we deliver health care and long-term care.

In 2015 WHO released the first ever *World report on ageing and health* and the *Global Strategy and Implementation Plan on Ageing and Health* that was adopted by the 2016 World Health Assembly. Both reflect a new conceptual model for *Healthy Ageing* that is built around the functional ability and intrinsic capacity of older people, rather than the absence of disease. While both identify strategies that can be taken by countries, they also emphasise the stark knowledge gaps that are a major barrier to global action.

This Symposium brings together global experts in the area of muscle skeletal health, geriatrics and public health to discuss how the new WHO healthy ageing framework can be operationalized in clinical and primary health care settings.

CAPTURE THE FRACTURE: INTEGRATED CARE PREVENTS THE DECREASE IN INTRINSIC CAPACITY IN ELDERLY SUBJECTS

J. Reginster^{1,2}, C. Cooper^{1,3,4}, J. Kanis^{1,3}, M. Schneider⁶, E. McCloskey⁵, O. Bruyère^{1,2}, R. Rizzoli^{1,7}, 1. *ESCEO ASBL, Liège, Liège, Belgium*, 2. *Department of Public Health, Epidemiology and Health Economics, University of Liège, Liège, Liège, Belgium*, 3. *MRC Lifecourse Epidemiology Unit, University of Southampton, Southampton, United Kingdom*, 4. *NIHR Musculoskeletal Biomedical Research Unit, University of Oxford, Oxford, United Kingdom*, 5. *Collaborating Centre for Metabolic Bone Diseases, University of Sheffield, Sheffield, United Kingdom*, 6. *International Osteoporosis and Other Skeletal Diseases Foundation, Nyon, Switzerland*, 7. *Service of Bone Diseases, Faculty of Medicine, Geneva, University Hospitals, Geneva, Switzerland*

Whereas osteoporosis is recognized, worldwide, as a major Public Health issue, with one in two women and one in five men over the age of 50 years presenting a fragility fracture, a vast proportion of women at high risk remain untreated (treatment gap). Case-finding strategies prioritizing assessment of women with prior fracture could identify 50% of potential hip fracture cases from 16% of the population. More than 80% of patients receive inadequate care after their fragility fracture. The International Osteoporosis Foundation (IOF) developed “Capture the Fracture”, a global programme for the prevention of secondary fractures by facilitating the implementation of Fracture Liaison Services (FLS). The project is based on 13 internationally endorsed standards to guide FLS, ensuring quality in secondary fracture prevention and providing support for FLS

implementation, getting started and improving. 128 FLS are now registered on the worldwide map, located in all WHO regions, with a range of fracture patients per year from 180 to 6200. When properly implemented, FLS was shown to be cost-effective. A best Practice Framework tool was developed in 9 different languages including 5 out of the 10 most spoken languages in the world to benchmark services internationally. FLS is expected to help closing the gap in osteoporosis treatment.

Capture the Fracture[®] name and logo are registered trademark of IOF.

INTERSECTIONS BETWEEN FRAILTY AND THE CONCEPT OF INTRINSIC CAPACITY

M. Cesari, 1. *Université de Toulouse III Paul Sabatier, Toulouse, France*, 2. *Centre Hospitalier Universitaire de Toulouse, Toulouse, France*

Global ageing is threatening the sustainability of health-care systems. Traditional medicine is facing major challenges in the attempt to address the novel needs presented by the older and more complex populations referring to clinical services.

Some years ago, the concept of frailty was developed in order to intercept the excessive vulnerability of the individual and propose adapted interventions and models of care. Frailty is today a condition of clinical interest well beyond the boundaries of geriatric and gerontological practice. Different disciplines and specialties are today getting familiar with this notion, perceiving it as the means for reshaping the obsolete approach to elders and age-related conditions. Nevertheless, heated debates are ongoing in the field and a gold standard definition for translating into practice the theoretical concept of frailty is currently missing.

In the recent World Report on Health and Ageing, the concept of intrinsic capacity was introduced and described. Intrinsic capacity was defined as the composite of all the physical and mental capacities that an individual can draw on. It is part of the functional ability (i.e., the health-related attributes that enable people to be and to do what they have reason to value), together with environmental characteristics and the interactions between the individual and these characteristics.

The framing of frailty and intrinsic capacity are very close, probably complementary. Frailty might be perceived as the age-related decline of physiological systems determining the reduction of intrinsic capacity, consequently leading to increased risk of negative health outcomes.

In this presentation, the theoretical foundations of frailty and intrinsic capacity will be presented. Potential issues to be considered in the practical translation of intrinsic capacity will also be discussed at the light of the experience coming from the history of frailty.

PREVENTING AND STOPPING DECLINES IN INTRINSIC CAPACITY: INTERVENTIONS AND CLINICAL RECOMMENDATIONS

I. Araujode Carvalho¹, A. Jotheeswaran¹, J. Beard¹, M. Prince², 1. *Ageing and Life Course, World Health Organization, GENEVA, Switzerland*, 2. *Centre for Global Mental Health, London, United Kingdom*

WHO, with support from 30 experts in geriatric medicine, has initiated the development of evidence-based guidelines on integrated care for older people (ICOPE). Targeted at non-specialist health professionals, they will guide home-based interventions for older people that can prevent, reverse or slow declines in intrinsic capacity.

The Guidelines covers issues such as malnutrition, mobility loss, urinary incontinence, falls, hearing and visual impairments, depression, and cognitive declines. Guidance will be given on how to ensure an integrated approach focusing on 'problems' that matter most for older people, rather than on specific diseases. This presentation will share the main findings and recommendations from the 10 Systematic Reviews undertook for the development of the WHO clinical guidelines, it will focus specifically on mental health, vision, hearing and nutrition, and the integrated service deliver model in which these interventions will be delivered.

DETERMINING THE ROLE OF SARCOPENIA IN THE DECLINE OF INTRINSIC CAPACITY IN ELDERLY SUBJECTS

E. McCloskey¹, J. Kanis¹, J. Reginster³, C. Cooper², R. Rizzoli⁴, A. Cruz Jentoft⁵, F. Landi⁶, 1. *Centre for Integrated Research in Musculoskeletal Ageing, University of Sheffield, Sheffield, United Kingdom*, 2. *University of Southampton, Southampton, United Kingdom*, 3. *University of Liège, Liège, Belgium*, 4. *University Hospitals Geneva, Geneva, Switzerland*, 5. *Hospital Universitario Ramón y Cajal, Madrid, Spain*, 6. *Universita Cattolica del Sacro Cuore, Rome, Italy*

Sarcopenia is the progressive loss of skeletal muscle mass, quality, strength and functional decline associated with aging. Sarcopenia has been estimated to affect 11–50% of those older than 80 years and poses a huge socio-economic burden. The clinical significance of sarcopenia rests in the adverse outcomes, particularly falls, fractures, disability, hospitalisation, loss of independence and mortality that arise as a consequence. A consensus on the definition of sarcopenia in a global setting should be driven by determining its role in predicting such poor health outcomes, analogous to the approach used in the successful development of the FRAX fracture risk assessment tool. While the assessment of the risk of adverse outcomes might encompass all three measurable aspects of sarcopenia, a number of factors need to be considered, particularly the ease with which measures can be used in non-specialist or community-based settings.

SESSION 3235 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: DEMENTIA-RELATED STIGMA—INTERNATIONAL PERSPECTIVES IN ADDRESSING THE STIGMA OF DEMENTIA

Chair: S. Kim, *Australian National University, Canberra, Australian Capital Territory, Australia*

Co-Chair: B.L. Casado, *Colorado State University, Fort Collins, Colorado*

People with dementia and their caregivers are often isolated due to the stigma attached to the disease. Stigma can also discourage people from seeking health services resulting in the delayed diagnosis and timely treatment of

dementia. Indeed, dementia-related stigma is being increasingly acknowledged by governments and policymakers around the world as an important public health issue and one of the priority areas in dementia research. For example, Alzheimer's Disease International published a report solely focusing on dementia stigma in 2012, highlighting the need to reduce the stigma. However, despite the known negative effects of stigma and the need to reduce it, there is very limited research investigating dementia-related stigma and strategies to address the stigma. This symposium aims to shed light on dementia-related stigma and draw attention to this important issue. The first paper in this session will address dementia-related stigma amongst Australians and its effects on help-seeking intentions (Kim). The second paper will examine the effect of dementia-related stigma on a minority ethnic Korean group in the USA (Casado). The third paper will present the results of an online module developed to promote social inclusion and combat stigma in the UK (Downs). The fourth paper will explore the effectiveness of intergenerational schools project addressing dementia-related stigma in the UK (Evans). Lastly, the fifth paper will address stigma in psychosocial dementia research (Vernooij-Dassen).

DEMENTIA-RELATED STIGMA, CULTURAL DIVERSITY, AND HELP SEEKING INTENTIONS

S. Kim, M. Mortby, *Australian National University, Canberra, Australian Capital Territory, Australia*

Despite the high prevalence of dementia, negative community attitudes and/or stigma towards dementia are still common. This study reports findings from a nationally representative telephone survey with a sample of 1000 Australian adults examining dementia-related stigma, cultural identity and help-seeking behaviours. Significant differences were found between the age cohorts for stigma, demonstrating dementia-related stigma to be higher in older age. Men reported significantly higher levels of stigma than women. Stigma was also higher amongst non-English speakers and those born outside of Australia. While 91% of participants indicated help-seeking intentions, only 36.3% reported they would seek help immediately when symptoms appeared. Dementia-related stigma was associated with help-seeking intentions among younger cohorts only. These findings suggest that dementia-related stigma is specific to age, gender and cultural background. These findings are of particular importance as they highlight the need to develop dementia-stigma reduction strategies tailored specifically to different age-cohorts, gender and culture groups.

STIGMA OF ALZHEIMER'S DISEASE AND CARE-SEEKING AMONG KOREAN AMERICANS

B.L. Casado, *School of Social Work, Colorado State University, Fort Collins, Colorado*

Stigma of AD has been identified as a barrier to care-seeking for AD. This study examined three domains of stigma of AD (public avoidance, pity, shame) and their roles in the intention, attitude, subjective norm, and perceived behavioral control regarding care-seeking from primary care physician (PCP) and AD specialist among Korean Americans (KA). A cross-sectional survey collected data from 254 KA adults. Beliefs about the stigma of pity were most prominent, followed by the stigma of public avoidance and shame.

Path analyses showed that none of the three stigma domains directly affected KAs' intention for care-seeking. However, each domain specific stigma showed varied indirect effects: public avoidance stigma indirectly affected KAs' care-seeking intention from both PCP and AD specialist via attitude toward the behavior; and pity stigma affected care-seeking intention from PCP via attitude and subjective norm. The stigma of shame had neither direct nor indirect effects on KAs' care-seeking.

CREATING A DEMENTIA-FRIENDLY WORKFORCE: THE ROLE OF PERSONAL NARRATIVES IN ONLINE TRAINING

M.G. Downs¹, C. Powell¹, N. Baj², M. Drury-Payne¹,
1. School of Dementia Studies, University of Bradford, Bradford, Yorkshire, United Kingdom, 2. Health Education England, London, United Kingdom

In the UK a key challenge to living well with dementia is stigma. Training in dementia is considered to be the cornerstone of challenging stigma and improving the quality of care for people living with dementia and their families. Online training is increasingly relied upon as offering a cost effective and flexible approach. At the same time there is growing recognition of the role of personal narratives in education and training. In this paper we will describe the development and preliminary evaluation of a freely available online dementia awareness module designed to challenge the stigma of dementia. 426 learners of over 1,000 of whom completed the module provided feedback. Learners found the personal narrative aspects of the module most compelling. Online training which includes the perspective and experience of people living with dementia and their families has the potential to create a dementia-friendly workforce.

AN INTERGENERATIONAL APPROACH TO ADDRESSING STIGMA

S. Evans, T. Atkinson, *Association for Dementia Studies, University Of Worcester, Gloucester, United Kingdom*

In the UK there is a government commitment to enabling people to 'live well with dementia', particularly through the Dementia Strategy, the Prime Ministers Dementia Challenge, and the Dementia Friendly Communities programme. These initiatives have led to a growing recognition of the need to raise awareness of dementia and reduce stigma across society.

This paper reports on the Prime Minister's Challenge Intergenerational Schools project which embedded dementia as a topic within the school curriculum. Intergenerational working has been proven to reduce stigma and formulate positive images of marginalised populations. Evidence from this study demonstrates a shift in pupil knowledge and understanding, and also shows that meeting someone with dementia makes a significant difference to pupils' attitudes towards people living with the disease. Educating children at an early age helps to build resilience and form the bonds that will support community in future generations.

STIGMA IN PSYCHOSOCIAL DEMENTIA RESEARCH

M. Vernooij-Dassen¹, L. Groen - van de Ven², M. Span², Y. Engels¹, B. Tilburgs¹, 1. IQ Healthcare, Radboud University Nijmegen Medical Centre, Nijmegen, Netherlands, 2. Windesheim University Applied Sciences, Zwolle, Netherlands

Stigma attached to dementia has many aspects. The focus of psychosocial dementia research on negative outcomes and interventions reducing deficits, rather than on capacities contributing to this stigma. We study whether and how people with dementia have the capacity to contribute to shared decision making about day-care. A multi-perspective qualitative study with eighteen care networks (18 dementia patients, 34 informal caregivers and 36 professionals) was conducted. Three themes emerged using content analysis: emotionally charged preferences (verbal and non-verbal expressions of what participants want or do not want), considerations (concerns of professionals) and actions (participants' activities in decision making process). The emotionally charged preferences of the person with dementia triggers reactions in other participants. People with dementia have the capacity to participate in decision-making by verbal and non-verbal expressions. These findings are the base of an intervention on shared decision making in advanced care planning in dementia, thereby highlighting these capacities.

SESSION 3240 (PAPER)

NUTRITIONAL ISSUES IN OLDER ADULTS II

HETEROGENEITY OF GAIT SPEED RESPONSE TO INTENTIONAL WEIGHT LOSS IN OLDER ADULTS

D.P. Beavers¹, K.M. Beavers², J.J. Newman², B.J. Nicklas¹, S. Mihalko², G.D. Miller², S.P. Messier², 1. Biostatistical Sciences, Wake Forest School of Medicine, Winston-Salem, North Carolina, 2. Wake Forest University, Winston-Salem, North Carolina

Randomized controlled trial results in obese older adults consistently associate intentional weight loss of 5–10% with clinically meaningful improvement in gait speed, on average. Consideration of individual differences in response, however, has been largely ignored. The purpose of this study is to describe the inter-individual variability in gait speed response to intentional weight loss in overweight and obese older adults. Participants from the Intensive Diet and Exercise for Arthritis trial (NCT00381290), randomized to a caloric restriction intervention targeting 10% weight loss over 18 months were included, with fast-paced 6-minute walk assessed at baseline and 6 months. Of 112 participants (BMI: 33.6 ± 3.7 kg/m²; age: 66.7 ± 5.9 years), 79 experienced at least 5% weight loss at 6 months and increased gait speed by 0.05 ± 0.10 m/s ($p < 0.001$). Individual changes, however, varied from -0.27 to 0.29 m/s, with 24% ($n=19$) experiencing no improvement (i.e. change ≤ 0.0 m/s). At $\geq 10\%$ achieved weight loss at 6 months, mean gait speed increased by 0.06 ± 0.10 m/s (range: -0.16 to 0.29 m/s) and the subset of non-responders increased to 29% ($n=14/48$). When considering gender, age, race, baseline BMI and baseline gait speed, change in gait speed was negatively associated with both baseline gait speed and African-American race (both $p < 0.05$). Data suggest large variation in the magnitude of gait speed change for a given amount of weight loss and highlight a subset of participants likely to experience no improvement. Better understanding of the characteristics influencing weight loss-associated functional change is necessary to optimize individualized weight management strategies for this population.

NUTRITIONAL STATUS OF ELDERLY PATIENTS VISITING THE GERIATRIC CLINIC—RESULTS FROM NORTH INDIA

I.S. Gambhir, S. Chakrabarti, B. Singh, U. Kaur, *Institute of Medical Sciences, Varanasi, Uttar Pradesh, India*

Malnutrition is a major concern among the elderly population. The Mini-Nutritional Assessment is a validated scale for determining elderly malnutrition. A study was conducted to determine the prevalence of malnutrition among elderly patients visiting the geriatric out-patient services of a tertiary care center in north India and analyze various attributes.

225 elderly (≥ 60 yrs) randomly selected patients (M = 154, mean age 67.42 ± 13.82 yrs; F = 71, mean age 64.69 ± 10.51 yrs) were assessed using the MNA questionnaire. Information regarding chronic illnesses for 145 patients (M = 97, F = 48) was entered into a pre-designed case report form. The data was analyzed using SPSS ver 16.0. Mean BMI was 22.58 ± 8.55 kg/m² (M) and 23.76 ± 10.79 kg/m² (F) ($p=0.084$). 180 patients scored ≤ 11 points on screening test and full assessment was completed on them only. Among the 180 patients (M = 117, F = 63), 73 were classified as malnourished (< 17 total score) and 107 were at risk of malnutrition (17–23.5 total score). 36% males undergoing full assessment were malnourished as compared to 49% females ($p=0.083$). 100% patients lived independently or with families. 92.8% patients were taking > 3 prescription drugs daily. 68% patients were unaware of their weight loss patterns. Whereas fruit/ vegetable consumption was adequate among most (84%) patients, 83% had intermediate protein consumption and as many as 71% had inadequate fluid intake. 50 out of 145 evaluated patients had at least 2 chronic co-morbidities. Hypertension was the commonest co-morbidity (40.7%) followed by T2DM (23.4%).

A high prevalence of malnutrition in the Indian elderly visiting hospitals was demonstrated. The average BMI was found to be in the normal range. Prescription drug use was quite common in the elderly. Whereas fruit/ vegetable consumption was adequate, fluid intake fell short.

The study highlighted important aspects of elderly nutrition in north India.

AGE-DEPENDENT INCREASE IN ENDOTHELIAL MICROPARTICLES IN HEALTHY SUBJECTS: IMPACT OF COCOA FLAVANOLS

P. Hoeffken, R. Sansone, A. Rodriguez-Mateos, P. Horn, R. Westenfeld, M. Kelm, C. Heiss, *Vascular Medicine, University Duesseldorf, Medical Faculty, Duesseldorf, Germany*

Background: Clinical studies show that cocoa flavanols (CF) can decrease vascular stiffness and blood pressure and improve endothelial function even in healthy elderly subjects. We investigated whether age-dependent changes in circulating endothelial microparticles (EMPs) exist, whether these correlate with age-dependent vascular changes, and whether a CF-intervention also affects EMPs.

Methods: EMPs were determined in 52 healthy subjects (22-75years) by flow cytometry. Endothelial function (flow-mediated-vasodilation; FMD), blood pressure, and wall-shear-stress (WSS) were measured. Using pulse-wave-analysis, pulse wave velocity (PWV) and aortic augmentation index (AIX) were measured. 22 young (<35 ys) and

20 elderly (50-80yrs) non-smoking healthy male consumed either CF-containing-drink [450mg] or nutrient-matched, CF-free-control BID for 14 days. Measurements were taken after overnight fasting before and 1h after the first drink on day 1 and day 14.

Results: With increasing age, CD62e⁺ but not CD31⁺/41⁻ and CD144⁺-EMPs, increased. Significant correlations were found between age and systolic blood pressure (SBP) and AIX. In elderly subjects, we observed an increased BA diameter and hence reduced WSS and FMD. CD62e⁺ correlated with SBP and inversely with FMD. Following 2 weeks of daily CF intake, FMD and PWV improved in young and elderly individuals. CF decreased AIX and thus SBP in elderly. CD62e⁺ and CD31⁺/41⁻-MPs but not CD144⁺ significantly decreased in both groups. The decrease in CD62e⁺ correlated with decreases in SBP, AIX, and inversely with FMD improvements.

Conclusion: In healthy humans, cardiovascular aging is associated with EMPs indicative of endothelial injury and can be modulated by dietary CFs along with improvements in vascular function.

INADEQUATE HYDRATION STATUS AND OVERWEIGHT AMONG OLDER ADULTS: DATA FROM NUTRITION UP 65

P. Padrao^{1,2}, P. Moreira^{1,3,2}, A. Santos¹, N. Borges¹, C. Afonso¹, A. Sousa¹, R. Guerra¹, T. Amaral¹, *1. Faculty of Nutrition and Food Sciences, University of Porto, Porto, Portugal, 2. EpiUnit - Institute of Public Health, University of Porto, Porto, Portugal, 3. Research Center on Physical Activity and Leisure, University of Porto, Porto, Portugal*

Data on the association between hydration status and overweight in the elderly is scarce. Therefore, the objectives of this study were to evaluate the hydration status in a representative sample of Portuguese older adults and to assess the association between inadequate hydration and overweight (including obesity).

A cluster sampling approach was used, representing Portuguese older adults (≥ 65 years) according to age, sex, education level and regional area within the Nutrition UP 65 study. This cross-sectional evaluation was conducted in 2015 and 2016. From a sample size of 1500 participants, 1312 were eligible for the present analysis, 57.3% were women and 23.5% were aged ≥ 80 years. Inadequate hydration was defined as one 24h urine osmolality >500 mOsm/kg. Overweight group includes also the obese and was defined as BMI >27 kg/m², according to the Nutrition Screening Initiative criteria for older adults. A multivariable binary logistic regression model was conducted to evaluate the association between hydration status and overweight/obesity. Odds Ratios (OR) and respective 95% Confidence Intervals (95%CI) were calculated.

Inadequate hydration was observed in 37.5% participants and 69.6% were overweight or obese. After adjusting for potential confounders, inadequate hydration (OR=1.52, 95%CI: 1.17–1.98) was associated with overweight/obesity.

These results highlight the need for implementing nutritional strategies towards the improvement of hydration status in this age group, and particularly in the overweight or obese.

This project was granted by the Public Health Initiatives Programme (PT06), financed by EEA Grants Financial Mechanism 2009–2014.

CHANGES IN BODY WEIGHT AND NUTRITIONAL STATUS IN SOUTH AUSTRALIAN NURSING HOME RESIDENTS

T. Arjuna^{1,2}, N. Luscombe-Marsh^{1,3}, K. Lange¹, A. Kang⁴, C. Edwards⁴, S. Reid⁴, I. Chapman¹, S. Soenen¹, 1. *Discipline of Medicine and National Health and Medical Research Council (NHMRC) Centre of Research Excellence in Translating Nutritional Science to Good Health, The University of Adelaide, Adelaide, South Australia, Australia*, 2. *Department of Nutrition and Health, Faculty of Medicine, Universitas Gadjah Mada, Yogyakarta, Yogyakarta, Indonesia*, 3. *CSIRO Health and Biosecurity, Adelaide, South Australia, Australia*, 4. *Southern Cross Care (South Australia & Northern Territories) Inc., Adelaide, South Australia, Australia*

Ageing related changes in body weight and composition impact quality of life of older people. Therefore the aim of the retrospective study was to determine body weight, body mass index (BMI), nutritional status assessed by malnutrition universal screening tool (MUST), pain, and length of stay, of a cohort of elderly nursing home residents in Adelaide, South-Australia, as well as the factors associated with changes in body weight over 6–12 months. 1,020 residents aged 87 ± 8 years were in the 6-months retrospective analysis, and a subset of 752 residents in the 12-months sub-group. The average weight and BMI for the overall cohort were 66 ± 16 kg and 25 ± 6 kg/m². Almost 30% of residents were at medium or high nutritional risk (14% and 16%). Body weight decreased 0.4 ± 4.1 kg ($0.5 \pm 6.4\%$) over 6-months ($P=0.006$) and 0.9 ± 5.2 kg ($1.3 \pm 7.8\%$) over 12-months ($P<0.001$). 46% of residents had marked weight change ($\geq 5\%$ loss or gain) over 12-months. Residents in the lowest BMI tertile (≤ 23 kg/m²) were most likely to experience both marked weight change (52%) and weight reduction (30%). Weight loss was associated with higher pain scores ($P=0.012$) and greater length of stay in the nursing home ($P=0.002$). In conclusion on average these older people lost weight, with high rates of both substantial weight loss and gain, particularly among those in the lowest BMI tertile. Almost a third in the lowest BMI tertile lost 5% or more body weight, putting them at increased risk of undernutrition-related morbidity, suggesting greatest attention to prevent and treat such morbidity should be focused on that group.

SESSION 3245 (PAPER)

EPIDEMIOLOGICAL STUDIES: MORBIDITY AND MORTALITY

A STUDY ON THE RELATION BETWEEN SLEEP AND BETA-AMYLOID-42 IN CEREBROSPINAL FLUID IN 70-YEAR-OLDS

J. Skoog, S. Kern, H. Zetterberg, K. Blennow, B. Johansson, I. Skoog, *Gothenburg University, Gothenburg, Sweden*

Recent research indicates that beta-amyloid-42 is reduced in cerebrospinal fluid (CSF) decades before onset of Alzheimer's disease. There is a need to know more about the clinical correlates of this preclinical stage. A representative population sample of 70-year-olds ($N=1202$, response rate=72%) were examined between 2014 and 2016 with comprehensive neuropsychiatric examinations. A subsample of 301 individuals (25%) consented to a lumbar puncture and had data on sleep disturbance. Six individuals were excluded due to dementia, leaving 295 for the analysis. Individuals with any sleep disturbance had lower mean beta-amyloid-42 levels than those without (660.05 ng/L versus 733.35 ng/L; $p=0.010$). Both those with increased sleep (595.60 ng/L versus 730.90 ng/L; $p=0.026$), and those with decreased sleep (667.96 ng/L versus 730.90 ng/L; $p=0.038$) had lower mean beta-amyloid-42 levels than those without. Sleep disturbances, both decreased and increased sleep, are associated with lower levels of beta-amyloid-42 in individuals without dementia. It needs to be elucidated whether sleep disturbance is a consequence or a cause of preclinical Alzheimer's disease.

CHANGES IN MEDICATION USE IN LONG-TERM CARE FACILITIES IN FINLAND OVER AN EIGHT-YEAR PERIOD

N. Jokanovic¹, J. Bell¹, A. Juola², H. Hosia², M. Teramura-Gronblad², H. Soini³, N. Savikko², K.H. Pitkala², 1. *Centre for Medicine Use and Safety, Monash University, Parkville, Victoria, Australia*, 2. *University of Helsinki, Helsinki, Finland*, 3. *Social Services and Health Care Department, City of Helsinki, Helsinki, Finland*

Background: Polypharmacy is highly prevalent and burdensome to residents and staff. The aim of this study was to investigate the change in medication use over an eight-year period in nursing home and assisted living facilities in Finland.

Methods: Data from three cross-sectional studies of residents aged ≥ 65 years in nursing homes in 2003 ($n=1987$) and 2011 ($n=1576$) and in assisted living facilities in 2007 ($n=1377$) and 2011 ($n=1586$) in Finland were combined. The prevalence of medication use across time periods were compared. Polypharmacy was defined as the use of nine or more regular medications.

Results: Polypharmacy increased in assisted living facilities (44.7% to 50.6%, $p<0.001$) but decreased in nursing homes (40.4% to 32.4%, $p<0.001$). The prevalence of cardiovascular medications decreased in nursing homes (67.0% to 52.9%, $p<0.001$) and assisted living facilities (72.5% to 66.8%, $p<0.001$). The prevalence of diuretics, nitrates and digoxin decreased, but the prevalence of statins increased in both settings. The prevalence of antithrombotics decreased in both nursing homes (55.4% to 49.0%, $p<0.001$) and assisted living facilities (62.2% to 55.8%, $p<0.001$). The prevalence of dementia medications increased in both settings.

Conclusions: The prevalence of polypharmacy significantly decreased in nursing homes but has increased in assisted living facilities. Significant reductions in the use of cardiovascular and antithrombotics suggest improved assessment of the risk-to-benefit ratio of these medications in the long-term care setting.

PARALLELS ACROSS THE POND: WEALTH ASSOCIATED DISPARITY IN DEATH AND DISABILITY IN THE U.S. AND ENGLAND

L.K. Makaroun^{1,2}, R. Brown^{3,4}, L. Diaz-Ramirez³, C. Ahalt³, J. Boscardin³, S. Lang-Brown³, S. Lee^{3,4}, 1. *University of Washington, Seattle, Washington*, 2. *VA Puget Sound Healthcare System, Seattle, Washington*, 3. *University of California San Francisco, San Francisco, California*, 4. *San Francisco VA Medical Center, San Francisco, California*

Low income is strongly associated with adverse health outcomes. Wealth may be a better marker of resources in late life than income. Our objective was to determine the relationship of wealth with mortality and disability (defined as activity of daily living difficulty) among older adults in the US and England. The US Health and Retirement Study (HRS) and English Longitudinal Study on Ageing (ELSA) are nationally representative cohorts of community-dwelling older adults. We examined participants enrolled in HRS (N = 13,533) and ELSA (N = 8,886) in 2002, stratifying our analyses by age (50–64 vs 66–80) as many safety-net programs commence around age 65. Wealth quintile was based on total net-worth in 2002. Participants were followed until 2012 for mortality and disability. We found increased risk of both death and disability as wealth decreased. In the US, participants age 50–64 in the lowest wealth quintile (Q1) (<\$38,000) had a 19% risk of mortality and 41% risk of disability while the highest wealth quintile (Q5) participants (>\$553,000) had a 6% risk of mortality and 15% risk of disability. In England, 50–64 year olds in Q1 (<£31,015) had a 17% risk of mortality and 39% risk of disability, while Q5 participants (>£303,000) had a 4% risk of mortality and 11% risk of disability. In 66–80 year olds, the absolute risks of mortality and disability were higher, but the risk gradient across wealth quintiles did not differ. Low wealth was similarly associated with death and disability in both the US and England.

INCIDENCE AND DURATION OF POLYPHARMACY IN OLDER ADULTS: A NATIONWIDE LONGITUDINAL COHORT STUDY

J.W. Wastesson, L. Morin, K. Johnell, *Aging Research Center, Karolinska Institutet & Stockholm University, Stockholm, Sweden*

Polypharmacy is highly prevalent among older adults, and is associated with negative health outcomes. Studies on polypharmacy are often based on single point-prevalence measures of polypharmacy. Little is known about the incidence and the duration of polypharmacy over time. Using the Swedish Prescription Drug Register linked with several other registers with national coverage in Sweden, we followed the complete population ≥ 65 years ($n \approx 1,700,000$) from 31 October 2010 to 31 December 2013, and measured the monthly prevalence of polypharmacy (≥ 5 concomitant drugs) every three months. Out of 971,315 older adults free of polypharmacy at baseline, the incidence rate of polypharmacy was 15.2 per 100 person-years (ranging from 12.1% in people aged 65–70 to 24.9% in people aged 95+). Among the 59,613 incident polypharmacy users during the first month of follow-up, 46.1% were still exposed 6 months later and 20% were on polypharmacy at each time point during the 3-year period. In conclusion, about half of the

polypharmacy-free individuals at baseline transitioned into polypharmacy over a 3-year period, with higher incidence in older age groups. Of the incident polypharmacy users at baseline, almost half were only exposed to polypharmacy for a shorter time period (6 months), but a considerable share was on constant polypharmacy for 3 years.

CHARACTERIZING THE COMPLEXITY OF MULTIMORBIDITY IN OLDER ADULTS USING A NETWORK APPROACH

B.T. Burke, T.A. Glass, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

There is no evidence that any single multimorbidity measure captures the multifactorial nature of health and function in older adults. Current measures are generally based on the concept of multimorbidity as two or more co-occurring chronic diseases, while symptoms and geriatric syndromes are frequently excluded. To better characterize the complexity of multimorbidity, we used a network approach to evaluate the co-occurrence of diseases, symptoms, and geriatric syndromes in older adults. We estimated sex-stratified networks of 26 self-reported diseases, symptoms, and geriatric syndromes in 9,267 participants aged 65+ from the Health and Retirement Study. A network depicts relationships among interacting elements. Diseases, symptoms, and geriatric syndromes were represented as points (“nodes”) and pairwise correlations were represented as lines. Network structure was evaluated using centrality measures, crisp clustering, and fuzzy clustering. Cluster analysis grouped strongly co-occurring nodes. Crisp clustering placed each node into one group, while fuzzy clustering provided probabilities of belonging to multiple groups. Symptoms and geriatric syndromes played a more important role, measured by degree centrality, in network structure than diseases. Diseases, symptoms, and geriatric syndromes clustered differently in males and females. Fuzzy cluster analysis revealed symptoms and geriatric syndromes were more likely than diseases to occur in multiple clusters. The approach to measuring multimorbidity based solely on diseases likely underestimates complexity by disregarding symptoms and geriatric syndromes. The network approach revealed how diseases, symptoms, and geriatric syndromes commonly co-occur in older adults. This work illustrates the potential of network methods to improve the measurement of multimorbidity in older adults.

SESSION 3250 (SYMPOSIUM)

DEVELOPING SELF-MANAGEMENT INTERVENTIONS FOR AGING CANCER SURVIVORS: FROM TRIAL TO TRANSLATION

Chair: R. Walker, *University of Massachusetts-Amherst, Amherst, Massachusetts*

Discussant: C.R. Leach, *American Cancer Society*

Cancer survivors worldwide experience unique combinations of cancer-related and non-cancer-related changes that may require different strategies for self-management as they age and move into different phases of survivorship. Organized by phases of Gitlin’s behavioral ‘trial-to-translation pipeline’, this symposium presents current evidence and important considerations when developing self-management

interventions for aging cancer survivors. Starting with the preclinical phase of the pipeline, Dr. Mary H. Parker will present epidemiological evidence from 6 countries regarding exercise as a mechanism underlying the health benefits of dragon boat paddling. These results could guide development of future interventions for aging breast cancer survivors. The next two phases of the pipeline involve determining intervention acceptability, feasibility, and safety (Phase 1) and assessing preliminary effect sizes, side effects, and dosing (Phase 2). Dr. Sandra Spoelstra will discuss these phases in relation to outcomes of an APRN-led intervention to promote medication adherence in older adults newly-prescribed anti-cancer agents. Dr. Mei Fu will also present development and testing of an mHealth intervention for lymphedema self-management. Finally, we will discuss how interventions that have already moved through later phases of the pipeline (efficacy and effectiveness-testing, implementation, & sustainability) can be adapted for new populations and clinical problems. Dr. Rachel Walker will share stakeholder perspectives on adaptation of an existing aging-in-place intervention to meet the needs of aging cancer survivors in a rural region. This symposium provides researchers and clinicians with empirical examples of strategies for accelerating translation of the science of self-management from research to policy and practice change.

BREAST CANCER SURVIVORS AGE 60–86 FROM 6 COUNTRIES PADDLE DRAGONBOATS TO RECOVERY

M.H. Parker, *Institute for Palliative & Hospice Training, Inc., Oakpark, Virginia*

750 women answered an Internet Survey 2011–2013 sent to Breast Cancer Survivor dragonboat teams. 356 (47%) aged 60 to 86 resided in the United States (48%), Canada (28%), Australia (17%), New Zealand (5%), England (1%), and South Africa (1%). The 32 question instrument recorded their experience of breast cancer: exercise, treatments, lymphedema and other after effects, and the effect of dragon boat paddling on their well-being after breast cancer. 99% had not paddled before cancer and selected BCS dragonboating as recovery exercise. Data illustrate types of cancer treatment reported by women in each country and after effects. 79 (25%) reported having lymphedema. 56% reported paddling had made their lymphedema “better”. Research reports exercise using large skeletal muscles produces “myokines” a “hormone” factor reducing inflammation. 59% reported manual lymphatic drainage was an effective therapy. 98% reported increased fitness from paddling. 87% said they would continue to paddle to keep physically active.

THE EFFECT OF A NURSE-LED INTERVENTION TO PROMOTE ADHERENCE IN PATIENTS PRESCRIBED ORAL AGENTS

S. Spoelstra¹, A. Sikorskii², M. Schueller¹, 1. *Grand Valley State University, Grand Rapids, Michigan*, 2. *Michigan State University, East Lansing, Michigan*

Symptoms and poor adherence to oral anti-cancer agents in adult cancer patients remain a significant clinical problem, and depressive symptoms and self-efficacy affect both. Sixty-one adult patients newly prescribed an oral anti-cancer agent

were recruited from 3 community cancer centers. Nurse practitioners provided the intervention - one semi-structured, face-to-face session followed by 3 weekly phone sessions using motivational interviewing, brief cognitive behavioral therapy, and a Toolkit to promote self-management. Least square (LS) means and standard errors (SE) were conducted and Effect Size (ES) determined. All data were collected from 2014 -2016. Effect Size were: depressive symptoms 0.13 ($p = 0.55$) and medication self-efficacy -0.47 ($p = 0.04$). The number of cancer patients who receive treatment in pill form is increasing, and improving depressive symptoms and self-efficacy may enable patients to self-manage symptoms and adhere to their cancer medication.

MHEALTH SELF-CARE INTERVENTIONS FOR LYMPHEDEMA SYMPTOMS FOLLOWING BREAST CANCER TREATMENT

M.R. Fu, *New York University Rory Meyers College of Nursing, New York, New York*

Lymphedema, an abnormal accumulation of lymph fluid in the ipsilateral body area or upper limb, remains an ongoing major health problem affecting more than 40% of 3.1 million breast cancer survivors in the United States. Patient-centered care related to lymphedema symptom management is often inadequately addressed in clinical research and practice. To provide patient – centered care, we developed *The-Optimal-Lymph-Flow* health IT system (TOLF), a web-and-mobile-based educational and behavioral mHealth intervention focusing on safe, innovative, and pragmatic electronic assessment and self-care strategies for lymphedema symptom management. Findings from psychometric, usability, and pilot feasibility studies demonstrate that women using TOLF for 12 weeks experienced significantly less pain ($p=0.031$), fewer numbers of lymphedema symptoms ($p=0.003$), and improved symptom distress ($p=0.000$). The study findings suggest that innovative web-and-mobile-based educational and behavioral mHealth interventions, such as TOLF, are easily accessible and have potential to improve breast cancer survivors’ quality of life.

ADAPTATION OF AN AGING-IN-PLACE INTERVENTION TO ADDRESS THE NEEDS OF RURAL-DWELLING CANCER SURVIVORS

R. Walker¹, S.L. Szanton², 1. *University of Massachusetts Amherst College of Nursing, Amherst, Massachusetts*, 2. *Johns Hopkins University School of Nursing, Baltimore, Maryland*

Rural-dwelling cancer survivors face multiple socioeconomic, behavioral, and environmental barriers to achieving recommended exercise levels. Many older cancer survivors also report that symptoms of cancer and other chronic conditions interfere with functioning, leading to more time spent sitting or lying down. These prolonged periods of inactivity negatively-impact overall health and cancer rehabilitation. Reducing sedentarism (distinct from promoting exercise) may be a more achievable goal for rural-dwelling cancer survivors experiencing symptom-related disability. Therefore, we adapted an intervention originally developed for urban-dwelling disabled older adults to

meet the needs and activity goals of rural-dwelling older cancer survivors living in the Northeastern United States. Drawing on methods outlined by Dr. Anna Marie Napoles, we established the infrastructure for a translation partnership, identified clinician and community stakeholders, and sought their input. This presentation highlights survivor advocate and clinician perspectives on critical components of the adapted intervention, and key considerations for implementation and evaluation.

SESSION 3255 (PAPER)

INTERNATIONAL PERSPECTIVES IN PRIMARY CARE OF OLDER ADULTS

PHOSPHATE AND CALCIUM ASSOCIATION WITH CARDIAC EVENTS IN OLDER PEOPLE: RETROSPECTIVE COHORT ANALYSIS

S. de Lusignan^{1,2,3}, N. Hayward¹, A. McGovern¹, B. Arrowsmith¹, S. Jones^{1,4}, 1. *Clinical and Experimental Medicine, University of Surrey, Guildford, Surrey, United Kingdom*, 2. *Royal College of General Practitioners, London, United Kingdom*, 3. *Woodbridge Hill Surgery, Guildford, Surrey, United Kingdom*, 4. *NYU School of Medicine, New York, New York*

This study builds on our work exploring the association between serum phosphate and cardiovascular risk. We made a 10-year retrospective cohort analysis of the Royal College of General Practitioners (RCGP) Research and Surveillance Centre (RSC) database. This is one of the oldest UK primary care sentinel networks with data from >1 million patients.

We included patients aged over 65 years with at least one phosphate measurement and no pre-existing cardiovascular disease (N=19,418). The odds ratio (OR) represents the odds of developing a cardiac event (myocardial infarction, acute coronary syndrome or revascularisation procedure) within 5 years of the first phosphate measurement. We included demographic and cardiovascular risk variables in a stepwise logistic regression analysis.

With a reference age of 65–70 years, the OR increased to 1.46 (95%CI 1.26–1.70, $p<0.0001$) and 2.27 (1.87–2.75, $p<0.001$) for ages 70–79 years, and 80–89 years, respectively. Older men had a higher risk of cardiac events (1.891, 1.64–2.18, $p<0.0001$). Diabetic patients had more outcomes (1.55, 1.31–1.82, $p<0.0001$). Hypophosphatemia (1.67, 1.16–2.35, $p<0.01$) and high-normal phosphate (1.38, 1.13–1.67, $p<0.01$) conferred risk. Severe hypocalcemia <2.0 mmol/l (9.67, 1.94–40.28, $p<0.01$) or unrecorded calcium (2.09, 1.71–2.55, $p<0.0001$) were also of interest. Our findings were independent of renal function.

To our knowledge, this is the first study to demonstrate significant cardiac risk associated with either low or high-normal serum phosphate in older adults. Hypocalcemia, or a lack of calcium surveillance, were also associated with primary cardiac events. We conclude that close monitoring and management of these common electrolytes is indicated in older patients.

ASSOCIATION OF AGE WITH PATIENT EXPERIENCE OF CARE IN MEDICALLY COMPLEX VETERANS

S. Hastings^{1,2}, K. Stechuchak¹, E. Mahanna¹, C. Coffman^{1,2}, 1. *Durham VA, Durham, North Carolina*, 2. *Duke University, Durham, North Carolina*

A barrier to improving care for high need, high cost patients is the heterogeneity of this population. The goal of this cross-sectional analysis was to determine how patient characteristics and experience of care differ among medically complex Veterans according to age. Data were obtained from an ongoing RCT examining nurse care management for medically complex Veterans after an ED visit. We examined associations between baseline characteristics and age groups (18–54, 55–64, ≥ 65) using Pearson chi-square statistics. Logistic regression models examined age group association with probability of high self-rated quality of chronic illness care (PACIC ≥ 3.5) and high satisfaction with overall care (CAHPS =10). Among 513 subjects, 30% were aged 18–59, 31% 55–64, and 39% ≥ 65 . The oldest age group included more males, fewer Veterans of Black race, lower education ($P<0.01$ for all). Fair/poor self-rated health and frequent mental distress were common, especially in the younger and middle age groups (64–65% and 60–38% respectively; $P<0.01$). In models adjusted for socio-demographics and health status, odds of reporting high quality of chronic illness care were no different across age groups ($P=0.5$); however younger age groups had lower odds of high overall satisfaction compared to ≥ 65 (OR=0.22 and 0.36; $P<0.01$). In this group of medically complex Veterans, overall satisfaction differed by age although assessment of quality of chronic illness care did not. Improving coordination and delivery of chronic disease care may have more positive impact on patient experience among older adults than their younger counterparts.

TRANSITIONAL CARE EFFECTIVENESS FOR CHRONICALLY ILL OLDER ADULTS: SYSTEMATIC REVIEW AND META-ANALYSIS

M. LeBerge¹, N. Sourial^{1,2}, G. Maimon¹, M. Guériton¹, I. Vedel^{2,1}, 1. *Lady Davis Institute of Medical Research, Montreal, Quebec, Canada*, 2. *Department of Family Medicine, McGill University, Montreal, Quebec, Canada*

Healthcare systems are facing an increasing number of vulnerable older patients with chronic diseases (CD). Transitions in care from hospital to primary care for this population are complex and lead to increased mortality and service use. In response to these challenges, transitional care (TC) interventions are being widely implemented to increase continuity and quality of care. They encompass education on self-management, discharge planning, structured follow-up and coordination among the different healthcare professionals. A systematic review of interventions targeting transitions from hospital to the primary care setting was conducted in order to determine the effectiveness of TC on all-cause mortality, ED visit, readmission, readmission days and quality of life (QoL). Randomized controlled trials on TC were identified through Medline, CINAHL, PsycInfo, EMBASE (1995–2015). Two independent reviewers performed the study selection, data extraction and assessment of study quality (Cochrane “Risk of Bias”). Relative risks and mean differences were calculated using a random-effects

model. From 10,234 references, 92 studies were included. Compared to usual care, significantly better outcomes were observed in chronically ill older patients benefiting from TC: a lower mortality at 3, 6, 12 and 18 months post-discharge, a lower rate of ED visits at 3 months, a lower rate of readmissions at 6 and 12 months and a lower mean of readmission days at 3, 6, 12 and 18 months. No significant differences were observed in quality of life. In conclusion, TC improves transitions for older patients and should be included in the reorganization of healthcare services.

ENGAGING URBAN AND RURAL SENIORS AS RESEARCH PARTNERS TO IMPROVE CHRONIC DISEASE MANAGEMENT

S.A. Ali, K. Walsh, M. Kloseck, *Western University, London, Ontario, Canada*

Osteoarthritis is a chronic disease that affects 50% of people over the age of 65. There is no cure, but there are evidence-based strategies that can reduce the burden of this disease. The challenge lies in conveying and implementing those strategies in the target population, community-dwelling seniors in both urban and rural centers, particularly given the decreased availability of physicians, health services, and community programs in rural centers. In this qualitative study, we directly engage seniors in identifying barriers and facilitators to daily osteoarthritis management. We use hermeneutic phenomenology to explore their lived experiences. Purposeful sampling was used to recruit urban-community-dwelling seniors (N=11) and rural-community-dwelling seniors (N=9) with confirmed osteoarthritis in Ontario, Canada. Interviews were guided using three open-ended questions: 1) Where do you get information related to osteoarthritis? 2) How do you manage your osteoarthritis pain? 3) What can be done to improve osteoarthritis management for seniors? Interviews were transcribed verbatim and coded using NVivo® Pro 11 by two independent researchers. Strikingly, despite the differences between urban and rural centers, highly similar themes relating to osteoarthritis management emerged from the data from both urban- and rural-dwelling seniors. Three central themes were identified: *psychological impact*, *personalized approach*, and *physician reliance*. For rural-dwelling seniors, an additional theme of *resource accessibility* was identified. This study highlights the importance of capturing stakeholder-identified areas for improvement in chronic disease management.

SESSION 3260 (PAPER)

FUNCTIONAL DECLINE IN ACUTE CARE ENVIRONMENTS

EAT WALK ENGAGE: IMPROVING NUTRITIONAL CARE AND INTAKE OF HOSPITALISED ELDERLY

A. Young^{1,2}, A.M. Mudge^{2,3}, P. McRae³, M. Banks^{1,2}, 1. *Nutrition and Dietetics, Royal Brisbane and Women's Hospital, Brisbane, Queensland, Australia*, 2. *Queensland University of Technology, Brisbane, Queensland, Australia*, 3. *Internal Medicine and Aged Care, Royal Brisbane and Women's Hospital, Brisbane, Queensland, Australia*

Malnutrition is a common and costly problem that affects 30–50% of older hospital inpatients. Approximately half of hospital patients eat 50% or less of the food provided to them at meals. Barriers to adequate nutrition are numerous and complex and include patient and illness factors, mealtime care processes and the hospital environment. Eat Walk Engage (EWE) is a unique ward-based program which aims to improve care practices and health outcomes of older inpatients through the implementation of strategies to support mobility and independence, nutrition and hydration, and meaningful cognitive activities. From data collected during structured EWE meal audits (n=601 meals), we identified two key barriers to meal intake of hospitalised patients: mealtime positioning and timely assistance. In a separate study, we observed the intake of three cohorts of older medical patients (total n=320) as we introduced EWE and other dietary changes to the ward. This study found that patients have improved intake (energy: cohort 1: 5073kJ/d; cohort 2: 5403kJ/d; cohort 3: 5989 kJ/d, $p=0.04$; protein: cohort 1: 48 g/d, cohort 2: 50 g/d, cohort 3: 57 g/d, $p=0.02$). These findings suggest that changes to dietary and mealtime care processes are associated with measureable and sustained improvements in nutritional intake of older inpatients.

ACUTE CARE UNITS FOR ALZHEIMER'S PATIENTS

D. Zekry, A. Mendes, F.R. Herrmann, G. Gold, *Internal Medicine, Rehabilitation and Geriatrics of Geneva University Hospitals, Geneva, Switzerland*

Patients with behavioral and psychological symptoms of dementia (BPSD) due to a concomitant acute somatic disease are at risk of not being adequately treated in respect to all their problems either in a somatic or in a psychiatric setting. This results in frequent and often repetitive transfers between institutions. The need for new models of care for patients with dementia hospitalized for somatic disease concomitant with challenging BPSD has led to the development of acute care units for Alzheimer patients. The main target of these units is an improvement in quality of care resulting in better outcomes for these patients. In addition, important issues are the safety for wandering patients, reduction of psychological stress and workload for the staff and better integration of proxies in the care process. To reach these goals a training program of the multidisciplinary team is mandatory.

However, these special acute care units, located for the majority in the somatic geriatric hospital, are still rare. Similarity and differences between these units will be presented. To validate our model in our unit (SOMADEM, somatic and dementia) in the Department of Internal Medicine, Rehabilitation and Geriatrics at the Geneva University Hospital in Switzerland, we compared clinical features between SOMADEM unit and a normal general geriatric unit in the same hospital. Results on cognitive, functional, nutritional status and adverse hospitalization outcomes (longer length of stay, institutionalization and mortality) will be presented.

These units represent an innovative advance in the care of acutely ill hospitalized old persons with dementia.

BRIEF PRE-INJURY FUNCTIONAL STATUS MEASURE PREDICTS TWO-YEAR DECLINE AND DEATH AFTER GERIATRIC TRAUMA

L. Min^{1,2}, J. Ha¹, P. Park³, J. Cherry-Bukowiec³, 1. *University of Michigan, Department of Internal Medicine, Division of Geriatric and Palliative Medicine, Ann Arbor, Michigan*, 2. *VA Ann Arbor Healthcare System and the Geriatric Research Education Clinical Center (GRECC), Ann Arbor, Michigan*, 3. *University of Michigan, Department of Surgery, Ann Arbor, Michigan*

The American College of Surgeons recommends a 5-item functional status (ACS-FS) evaluation of geriatric trauma patients, but it is not yet validated. Alternatively, the 5-item Short Functional Status (SFS) survey, validated in a single-hospital trauma center, overlaps with the ACS measure in only 2 activities of daily living (ADLs). We examined if ACS-FS predicts mortality and functional decline using national Health and Retirement Study (HRS) linked with Medicare data.

Between 1998–2010, 3628 trauma hospitalizations among participants age 65+ occurred within two years of interview or death. We predicted multinomial outcomes: no decline vs decline (1+ loss of 12 ADLs between pre-injury to post-injury interview) vs death. Our functional predictors of interest were pre-injury function (12 ADLs, SFS, or ACS-FS), categorized as no vs mild vs severe impairment. All models also controlled for age and injury severity using the Trauma Mortality Program Model score. We bootstrapped the Area Under the Curve (AUC). One-quarter died and 42% declined by 2 years. **Pre-injury functional category defined by the pre-injury ACS-FS performed as well as categories defined by full ADLs (AUC .79 vs .81), whereas SFS performed modestly (AUC .72). Using ACS-FS, mild impairment (compared to none) was associated with OR 1.53 [95%CI 1.20–1.94] for decline and OR 3.28 [2.52–4.28] for death (vs no decline). Severe pre-injury impairment was unassociated with further decline, OR .882 [.669–1.16], but strongly predicted mortality OR 3.46 [2.62–4.56].**

The brief pre-injury ACS-FS predicts long-term post-trauma outcomes with excellent fit and dose-response, suggesting strong avenues for prospective clinical research.

MULTICOMPONENT EXERCISE PROGRAM EFFECTS ON FUNCTIONAL CAPACITY IN FRAIL HOSPITALIZED PATIENTS

A. Casas Herrero¹, N. Martinez-Velilla¹, F. Zambom Ferraresi², M. López-Sáez de Asteasu², F. Alonso Renedo¹, M. Izquierdo², 1. *Complejo Hospitalario de Navarra, Pamplona, Navarra, Spain*, 2. *Universidad Publica de Navarra, Pamplona, Spain*

Randomized clinical trial conducted in 193 patients admitted in a Geriatrics Acute Unit Hospitalized patients who met inclusion criteria (75 years and older, medical stable, frail or prefrail – SPPB 4–9-, previous ability to walk, able to communicate) were randomly assigned to the intervention or control group. The intervention consisted of a multicomponent exercise training programme, composed of supervised progressive resistance exercise training at low-moderate intensities, balance-training, and walking for 5–7 consecutive days. Evaluations of functional capacity (SPPB,

Usual Gait velocity and under dual task conditions, Barthel index), strength and power assessments were conducted at admission and previous to discharge in the control and intervention group. 193 completed pre/post evaluations (control group (CG) n= 83, intervention group (IG) n=81). 29 drop-out due to medical reasons. Mean age 87.10. In the IG, significant improvements were observed after the intervention in all strength and power assessments (knee extension, hip flexion, maximal power) and functional capacity parameters (SPPB, hand grip, Gait velocity, gait velocity with dual task conditions and Barthel index) In contrast, in the CG, no significant improvements after evaluations were detected in any of the strength, power or other functional parameters studied. A multicomponent exercise program, with special emphasis in progressive resistance training, is an effective therapy to improve functional capacity in frail patients during hospitalizations. Individualized an planned exercise programs should be prescribed routinely in all frail patients admitted to hospitals, as same as other medical treatments, in order to prevent functional impairment

SHORT PHYSICAL PERFORMANCE BATTERY TO PREDICT SHORT-TERM OUTCOMES IN OLDER OUTPATIENTS IN ACUTE CARE

M.R. Aliberti², J.A. Melo^{1,2}, S.Q. Fortes-Filho^{1,2}, D. Apolinario², W. Jacob-Filho², L.E. Gracez Leme¹, 1. *Department of Orthopedics and Traumatology, University of São Paulo Medical School, São Paulo, São Paulo, Brazil*, 2. *Division of Geriatrics, Department of Internal Medicine, University of São Paulo Medical School, São Paulo, São Paulo, Brazil*

Physical performance could be performed safely and in a short time in older hospitalized patients with good predictor for long-term outcomes, however has not been evaluated for outpatients in acute care conditions. To evaluate the predictive value of short physical performance battery (SPPB) for 6-month hospitalization and functional decline, defined as a decline at least one activity of daily living, in elderly outpatients attending in acute day hospital care. A prospective cohort study with 511 older adults who were able to walk admitted to a Geriatric Day Hospital (GDH) with acute problems in São Paulo, Brazil. Physical performance was evaluated at admission. High-risk group was defined as SPPB ≤ 4 points, median-risk group as SPPB between 5 and 8 points, and low-risk group as SPPB ≥ 9 points. Kaplan-Meier curves and hierarchical adjusted Cox proportional hazards models were calculated for each outcome. The 6-month incidence of hospitalization and functional decline were significantly more frequent in the high-risk group at Kaplan-Meier curves (p=0.001 and p<0.001). After adjusting for demographic and clinical variables, participants with high-risk and median-risk were more likely to hospitalization (HR=2.2; 95%CI 1.3–3.7 and HR=1.7; 95%CI 1.1–2.7, respectively) compared with participants with a low risk. High-risk and median-risk group were also independently associated with functional decline (HR=4.4; 95%CI 2.2–9.0 and HR=2.8; 95%CI 1.4–5.5, respectively). In acute care older outpatients patients admitted at GDH, SPPB was a good predictor of hospitalization and functional decline in six months.

SESSION 3265 (SYMPOSIUM)

ANTECEDENTS AND OUTCOMES OF DISABILITY ACROSS THE ADULT LIFESPAN

Chair: F.J. Infurna, *Arizona State University, Tempe, Arizona*

Co-Chair: S.Y. Schaefer, *Arizona State University, Tempe, Arizona*

Discussant: M. Ernsth Bravell, *Jonkoping University, Sweden*

Health adversities, such as disability and disease, become more common and prominent in midlife and especially in old age. The impact of disability and disease on development varies greatly, with some individuals displaying positive adaptation, whereas others may succumb. The goal of this symposium is to bring together a collection of papers that examine factors that are predictive of disability onset and the ways through which disability shapes the course of development. *Schaefer and colleagues* examine the predictive ability of level and rates of change in grip strength for disability onset over 8 years of time. Higher levels of and stability in grip strength were protective against the onset of disability onset, independent of covariates. *Fauth and colleagues* use longitudinal data on older adults to examine whether social embeddedness changes before and after disability and found that social embeddedness substantially decreased at the time of disability onset and showed sustained lower levels thereafter, with older age at disability being associated with stronger declines. *Infurna* examines changes in life satisfaction, positive affect, and negative affect before and after disability onset using longitudinal panel survey data in an adult lifespan sample and found that the likelihood of resilience differs for each indicator and that strong social connections increase the likelihood of resilience. The discussion by *Marie Ernsth Bravell* will integrate the three papers, highlight the importance of examining the implications of disability onset across the adult lifespan using different methodological approaches and consider future routes of inquiry.

GRIP STRENGTH CHANGE OVER TIME PREDICTS DISABILITY ONSET IN OLDER ADULTS: FINDINGS FROM HRS DATA

S.Y. Schaefer, F.J. Infurna, *Arizona State University, Tempe, Arizona*

Grip strength is a useful biomarker of age-related processes, but less is known about whether its change over time has prognostic value in determining future events such as mortality or disability. To address this, we used data from 7,405 participants from the Health and Retirement Study (waves 2006–2014, mean±SD age of 67.7±10.7 years) to examine whether rates of change in grip strength were predictive of disability onset over 8 years of time. Higher grip strength in 2006 was protective against disability onset; each one-unit increase was associated with a 3% decreased likelihood of disability. More positive 4-year changes in grip strength was protective against disability, translating to a 4% decreased likelihood. Findings were independent of age, gender, years of education, depressive symptoms, and health conditions. While numerous factors contribute to grip strength, these findings indicate that grip strength is a dynamic variable whose trajectory may be prognostic of future disability.

DECLINE IN SUBJECTIVE SOCIAL SUPPORT: A FUNCTION OF DISABLEMENT PROCESSES

E. Fauth¹, F.J. Infurna², N. Ram³, D. Gerstorff⁴, 1. *Utah State University, Logan, Utah*, 2. *Arizona State University, Tempe, Arizona*, 3. *Pennsylvania State University, State College, Pennsylvania*, 4. *Humboldt-Universität zu Berlin, Berlin, Germany*

Lower subjective social support is associated with late-life disability in Activities of Daily Living (ADL), however prior research suggests it may be less protective postdisability onset. Using linear mixed models we examine subjective support changes over time in two phases: predisability and post-disability. Data were pooled from four longitudinal Swedish studies (GENDER, OCTO, OCTO-TWIN, NONA) where participants ($N = 1149$) were assessed every 2 years (4, for GENDER) for up to 8 years. Mean Age = 83.42 (SD=5.39), 64.8% female, and 32% married at baseline. Disability onset was the first wave where impairment in 1+ Personal ADL and/or 2+ Instrumental ADL emerged. Social embeddedness was measured via five items ($\alpha = .74$). In the predisability phase, subjective support declined (Est.=-.02; $p < .01$), but decline was more pronounced postdisability (Est.= -0.10; $p < .01$). Progression to and from disability onset is related to declining subjective support. Intervention and care should target instrumental, and subjective support.

DIFFERENTIAL EFFECTS OF DISABILITY ON SUBJECTIVE WELL-BEING ACROSS THE ADULT LIFESPAN

F.J. Infurna, *Psychology, Arizona State University, Tempe, Arizona*

This study explores trajectories of subjective well-being (SWB) before and after disability. Previous research has typically included single outcomes of doing well, showing that most people experience high SWB despite adversity (deemed resilient). However, it is an open question if resilience is found when across multiple facets of SWB. Using data of the HILDA study ($N=7,552$, ages 16–101, 53% female) we examined trajectories of life satisfaction, positive affect and negative affect before and after disability onset and predictors of resilience. The proportion of people exhibiting resilient trajectories varied greatly across the facets of SWB (between 22% and 67%). Only 19% of individuals were resilient in all three SWB facets. Stronger social relationships were the strongest predictor of being resilient. Our discussion focuses on how resilience differs based on the indicator of SWB and directions for future research, including research designs that provide for studying the processes leading to resilience.

SESSION 3270 (PAPER)

ORGANIZATIONAL CULTURE AND WORKFORCE CONTRIBUTIONS TO QUALITY IN LONG-TERM CARE

ORGANISATIONAL CULTURE CHANGE IN RESIDENTIAL AGED CARE

C. Etherton-Beer^{1,2}, L. Venturato³, B. Horner⁴, 1. *Royal Perth Hospital, Perth, Western Australia, Australia*, 2. *University of Western Australia, Perth, Western Australia*,

Australia, 3. University of Calgary, Calgary, Alberta, Canada, 4. Curtin University, Perth, Western Australia, Australia

There is increasing demand for quality residential care services in the face of constrained resources. In previous work, we developed an intervention comprising external facilitation of change cycles ('TOrCCh': Towards Organisational Culture Change), implemented by staff work teams. This study was undertaken to develop, and evaluate a toolkit and training resource to support sustainable culture change in residential aged care facilities (RACF), eventually with minimal external facilitation. Eight RACFs across two Australian States participated. A toolkit was drafted iteratively engaging participating sites and a reference group. Participating facilities undertook one change cycle with some external facilitation by research staff. The toolkit was then refined, and a second change cycle was undertaken using the toolkit, with minimal external facilitation. Qualitative data were collected from project sponsors and/or managers, work teams, and other care staff. Participants perceived benefits including staff development, increased communication, teamwork and leadership. The intervention was perceived to provide a generic approach which could be applied to solve agreed challenges in the work place ("Let's TOrCCh it!"), generating useful outcomes. The role of a project sponsor, and organisational support, were perceived as important for sustainability. Challenges were the complexity and application of the toolkit resource and management of work place constraints. Final products for the TOrCCh Project comprised Workteam Members and Leaders Guides as well as additional tools and resources accessible from <https://www.perkins.org.au/wacha/torcch/>. Our findings demonstrate that staff teams can work together to achieve change when provided with a toolkit and process.

IMPACT OF NURSE PRACTITIONER CARE OF NURSING HOME RESIDENTS ON EMERGENCY ROOM USE AND HOSPITALIZATIONS

D. Bakerjian, M. Dharmar, *Betty Irene Moore School of Nursing, University of California, Davis, Sacramento, California*

The acuity and complexity of the nursing home (NH) population has increased causing greater use of the emergency department (ED) and more acute hospitalizations. Simultaneously, CMS has emphasized the need to reduce ED use and avoidable hospitalizations. Nurse practitioners (NPs) have been shown to provide high quality care in NHs at equivalent or lower costs; however, there is significant variability in scope of practice between states. Little is known about how NPs impact ED visits and hospitalizations of NH residents or if practice restrictions change outcomes. The purpose of this study was to examine whether a higher prevalence of NP care in NHs was associated with fewer ED visits and hospitalizations in this frail population and whether there were further differences in states where NPs have full practice authority. We used administrative data from the CMS Chronic Condition Warehouse to examine the impact of NP care on ED visits and acute hospitalization. In a 5% random sample of all NH residents in U.S. (n=187,789), NPs and primary care physicians provided 87% of all NH visits. Patients with NP involvement had fewer ED visits (mean,

2.01 vs. 2.26, p=.007) compared with physician only care and there were fewer acute hospitalizations (mean, 3.08 vs 3.32 p=.02) when NPs provided care. States where NPs had full practice authority had better outcomes compared with states that did not. NPs can significantly reduce NH residents' use of the ED and acute hospitalizations, which endorses the need for policy changes to support NP full practice authority.

ACHIEVING PERSON-CENTRED LONG-TERM CARE THROUGH VOLUNTEERING

A. Robitaille^{1,2}, L. Garcia^{2,3}, L. McCleary⁴, M. Bilodeau^{2,3}, G. Lemay², J. Savard², M. Egan², M. Agapitos², 1. University of Victoria, Markham, Ontario, Canada, 2. University of Ottawa, Ottawa, Ontario, Canada, 3. Bruyère Research Institute, Ottawa, Ontario, Canada, 4. Brock University, St. Catharines, Ontario, Canada

Person-centred care (PCC) is designed to focus care delivery on the needs and preferences of the individual. Transferring PCC principles into practice is especially difficult when staffing levels are insufficient to allow time to respond to individual needs. The objective of this project was to develop and implement a volunteer program that sensitizes students to person-centred approaches including an emphasis on language. University students were recruited to volunteer for three hours, twice a week, for the duration of 12–18 months. Each resident was paired with two volunteers who focussed on improving access to residents' preferred activities, interaction with other residents and participation in home life. Continued learning for volunteers was maintained through monthly discussion groups with experts and fellow volunteers. Data was collected through journal entries, focus groups every three months, MDS data on residents and Likert scales assessing volunteer interest in working in this field. Results indicate a strong preference for one-on-one volunteer work as well as extended volunteering experience. Volunteers spoke of acting as advocates and facilitators for residents; and families spoke of respite for their visits. Continued learning was expressed as a benefit to students. Residents were able to participate in activities not normally available to them, such as outdoor activities. The results and lessons learned, within the context of PCC, as well as the avenues for future research and standardization of approach will be discussed.

BEHAVIORAL ENGAGEMENT AND ITS MEASUREMENT: IMPROVING DIRECT CARE WORKER OUTCOMES

G. McGhan¹, D. McCaughey¹, R. Herald¹, C. Baumgardner², 1. University of Alabama at Birmingham, Birmingham, Alabama, 2. Penn State University, University Park, Pennsylvania

With the evolving nature of work combined with the aging of the workforce, engaged employees are key as low levels of engagement can result in poor outcomes. Behavioral engagement (BE) is a core element of employee engagement and involves the amount of discretionary effort expended. Using the Macey and Schneider (2008) framework, we posit BE is reflective of individual and leadership factors in the workplace. The purpose of this study was to determine leadership contributions to direct care worker (DCW) engagement and

the relationship between BE and outcomes. Using data from the 2007 National Home Health Aide Survey and the 2004 National Nursing Assistant Survey, factor analysis and hierarchical linear regression were used to develop a BE scale and examine the relationships between engagement and outcomes for DCWs and organizations. The findings support the validity of the proposed BE scale in both datasets ($\alpha = .76$). Behavioral engagement was negatively associated with turnover intentions (Home Health Aide (HHA), $\beta = -.36$); (Nursing Assistant) (NA), $\beta = -.29$ p-value $<.001$) and positively associated with job satisfaction (HHA, $\beta = .47$; NA, $\beta = .38$, p-value $<.001$); employee willingness to recommend their organization as place to seek care (HHA, $\beta = .34$; NA, $\beta = .45$, p-value $<.001$) and as a place to work (HHA, $\beta = .33$; NA, $\beta = .51$, p-value $<.001$). This study contributes to the growing literature on leadership having a direct influence on the BE of DCWs and offers an innovative scale for long-term care organizations to measure and improve the working environment for DCWs.

COMMUNITY RESIDENTIAL CARE: OPPORTUNITIES FOR RICH AND VARIED CLINICAL LEARNING EXPERIENCES

J.C. Cartwright¹, R. Tadesse¹, D.L. White², J.O. Lottes², 1. *School of Nursing, Oregon Health & Science University, Portland, Pennsylvania*, 2. *Portland State University, Portland, Oregon*

The expanding population of older adults has generated a range of residential care options and roles for nurses in new settings. Yet, long-term and residential care facilities are often overlooked by schools of nursing as potential sites for learning beyond foundational courses. This paper describes how an academic-clinical partnership model has led to use of these settings for excellent student experiences across multiple courses in a baccalaureate nursing program.

Intentionally developed partnerships between faculty and facility nurses resulted in clinical experiences that are highly rated by students and faculty for achieving course outcomes and developing ‘real world’ skills that are transferable across all practice settings. Staff highly rate the experiences as valuable to their aging residents and positive for the facility.

For the past five years, courses routinely taught at partner sites have included health promotion, chronic illness care, nursing leadership, population health, and the final, integrated practicum course. Over 15 residential care facilities representing nursing homes, assisted living, and residential care homes have participated as clinical sites along with 12 faculty and over 100 students across 6 campuses of the state-wide School of Nursing.

Described will be the types of learning activities implemented in specific courses along with findings from faculty, student, and agency staff evaluations of course delivery. Key issues that need to be addressed in planning the clinical experiences will also be identified.

SESSION 3275 (SYMPOSIUM)

SENIOR-FRIENDLY PRACTICES: ACHIEVING EXCELLENCE ACROSS THE CONTINUUM OF CARE

Chair: B.A. Liu, *University of Toronto, Regional Geriatric Program, Toronto, Ontario, Canada*

Co-Chair: D. Brown, *Sunnybrook Health Sciences Centre, Univ of Toronto, Toronto, Ontario, Canada*

As the world's population ages and health concerns become increasingly complex, care settings are challenged to recognize and intervene effectively to achieve favorable patient outcomes. Care processes themselves at times lead to deleterious outcomes. Clinicians must acknowledge and embrace a new culture; new ways of providing elder care with efficiency as we also face unprecedented financial imperatives.

Sunnybrook Health Sciences Centre has been strategically implementing and sustaining exemplary care processes targeted to the unique needs of older persons in partnership with other academic centres in the Toronto Academic Health Sciences Network. Across more than 30 inpatient units that include acute, long-term care and rehabilitation, patients experience interprofessional care inclusive of: three times daily mobility activities; accurate delirium screening; non-pharmacological interventions to prevent or mitigate the effects of delirium; antipsychotic stewardship; in addition to respectful verbal and documented communication.

With an interprofessional team approach, all staff have a role to play in optimizing patient outcomes.

This symposium will share the challenges overcome, successes achieved, how interventions have been customized across patient populations and sectors, team tenacity to address hard realities and ways in which the work is and will be sustained for patients in our hospital. As a result of work accomplished by a large contingent of individuals, a culture sensitive to the vulnerability and the unique needs of older persons has developed and our hospital is acknowledged among peers as a leader in the care of older patients. We will present results of our collaborative implementation based on mixed-method evaluation.

PERSON-CENTERED LANGUAGE FOR RESPONSIVE BEHAVIOURS

M. Peters^{1,2}, D. Brown^{2,3}, L. Whelan^{2,5}, S. Davidson^{2,4}, C. Uranis^{2,8}, K. Reece⁶, N. Spira^{2,7}, 1. *Trillium Health Partners, Toronto, Ontario, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*, 3. *Sunnybrook Health Sciences Centre, Toronto, Ontario, Canada*, 4. *Baycrest Health Sciences, Toronto, Ontario, Canada*, 5. *St. Michael's Hospital, Toronto, Ontario, Canada*, 6. *University Health Network, Toronto, Ontario, Canada*, 7. *Michael Garron Hospital, Toronto, Ontario, Canada*, 8. *Centre for Addiction and Mental Health, Toronto, Ontario, Canada*

Care providers often use the terms ‘aggressive’, ‘difficult’ and ‘inappropriate’ when encountering a patient presenting with responsive behaviours. Language such as this influences our thinking and contributes to a culture of labelling and blame, often impeding the development of a supportive and caring relationship between care provider and patient. When describing responsive behaviours it is critical that the language used be specific and objective in order to facilitate an understanding of the person behind the behaviour and appropriate care planning at all levels. In 2014, a working group with the Toronto Academic Health Science Network, Senior Friendly Hospital Community of Practice (TAHSN CoP) created a unique language guideline to provide a means of communication for use amongst care

providers when caring for patients with responsive behaviours. The document is reflective of a person-centered culture of care and will be integrated in various education and documentation platforms across all TAHSN hospitals.

A STANDARD OF CARE FOR MOBILIZATION: STEPPING INTO THE FUTURE OF SENIOR-FRIENDLY CARE

B.A. Liu^{1,2,3}, J.E. Denomme^{1,2}, D. Brown^{1,2}, B. O'Leary¹, U. Almaawiy^{3,1}, 1. *Sunnybrook Health Sciences Centre, Toronto, Ontario, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*, 3. *Regional Geriatric Program of Toronto, Toronto, Ontario, Canada*

Low mobility during hospitalization is an under recognized epidemic leading to adverse outcomes. Early mobilization interventions have been shown to decrease length of stay and improve functional status. Sunnybrook Health Science Centres has a standard of care for mobility to ensure seniors maintain optimal function during hospitalization. The standard requires early and daily assessment of mobility status by the inter-professional health care team using an algorithm to create an individualized mobilization plan that promotes a minimum of 3 mobility activities daily.

Mobility has been integrated into rounds, transfer of accountability and documentation. Patients meeting the mobility standard of care have increased from 16% to 81%, patients with documented mobility level from 29% to 96% and those with "out of bed" activities have increased from 35% to 71%. There has been a 5% increase in patients discharged home without support, no increase in injurious falls and LOS has remained stable.

THE HEALTHY STAY VOLUNTEERS AS PARTNERS IN SENIOR-FRIENDLY CARE

J.E. Denomme^{1,2}, D. Brown^{1,2}, B. O'Leary¹, J. Lee^{1,2}, B. Singleton¹, 1. *Sunnybrook Health Sciences Centre, Toronto, Ontario, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*

The goal of the Healthy Stay Volunteer Program is to help patients keep a healthy mind and stay physically active during a hospital stay. Since the fall of 2015, over 150 volunteers have been trained to support our strategy to prevent delirium and promote mobilization.

Volunteers serve 11 acute care units encouraging patients to ambulate and/or perform simple exercises depending on their level of mobility. They provide friendly visiting, promote orientation, assist with practical matters like using the telephone, and provide cognitive stimulation. The program provides the volunteer with an interactive experience to work with an elderly population in an acute care setting with the support of a dedicated interprofessional team. The Healthy Stay Volunteer program has flourished and supports the sustainability of process change implemented through our corporate senior friendly strategy.

IDENTIFYING PATIENT DELIRIUM: RELYING ON SCREENING IS NOT ENOUGH

B. O'Leary¹, J.E. Denomme^{1,2}, T. Kitchen-Clark^{1,2}, J. Contreras^{1,3}, F. Li-Wong^{1,2}, S. Evans¹, T. Sahota¹, T. Abji¹, 1. *Sunnybrook Health Sciences Centre, Toronto, Ontario, Canada*, 2. *University of Toronto, Toronto, Ontario,*

Canada, 3. *Regional Geriatric Program of Toronto, Toronto, Ontario, Canada*

Delirium in hospital is common, contributes to adverse outcomes and in many cases, is preventable.

At Sunnybrook Health Sciences Centre (SHSC), we provided education on delirium. Within months of education, we saw favorable uptake in screening. However the rate of positive delirium screens was much lower than expected. Accuracy of screening was suboptimal.

Staff focus groups identified that accurate delirium detection was impeded by lack of knowledge of patient baseline status, team communication challenges and tendency to perceive CAM screening as a moment-in-time determination.

Interventions on 3 acute care units, facilitated by chart reviews and rapid cycle improvement has improved accuracy by 18%, 30% & 39% on each unit over a period of 6 months.

Knowledge of delirium is often lacking in healthcare settings. SHSC has implemented a successful program which goes beyond compliance with delirium screening to ensure accurate identification of patients at risk of delirium.

ANTIPSYCHOTIC STEWARDSHIP FOR OLDER PATIENTS IN ACUTE CARE: PROMOTING APPROPRIATE PRESCRIBING

D. Brown^{1,2}, M. Norris^{1,2}, D. Gandell^{1,2}, R. Jaunkalns^{1,2}, J. Contreras^{1,3}, B.A. Liu^{1,2,3}, 1. *Sunnybrook Health Sciences Centre, Toronto, Ontario, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*, 3. *Regional Geriatric Program of Toronto, Toronto, Ontario, Canada*

Antipsychotics are associated with significant adverse effects and evidence to guide the choice of specific antipsychotic and the appropriate dose in older acutely ill patients is not robust. Our stewardship program is a novel approach to improve appropriateness of antipsychotics in acute care. In addition to the antipsychotic review, the stewardship team offers case-based learning sessions and integrates best practices in delirium management with front-line staff. Other antipsychotic stewardship programs have focused on audit and feedback of prescribing patterns. In contrast, our approach has been to provide education and reinforce non-pharmacologic strategies to behaviour management as an alternative or adjunct to antipsychotic use. In preliminary analysis, 55% of patients receiving antipsychotics were male and 77% of orders were for new prescriptions. Quetiapine and haloperidol were the most frequently ordered antipsychotics at 43% and 41% of orders, respectively. We discontinued or decreased the dose of antipsychotic in 62% of orders.

SESSION 3280 (SYMPOSIUM)

SARCOPENIA: REVISITING CRITERIA DEFINITION AND ASSOCIATION WITH PROTEIN INTAKE AND INSULIN RESISTANCE

Chair: J.A. Morais, *McGill University, Montreal, Quebec, Canada*

Co-Chair: S. Chevalier, *McGill University, Montreal, Quebec, Canada*

Sarcopenia is an important component of frailty and its diagnosis could lead to specific intervention to improve

functional capacity in older adults. There are several clinical oriented criteria definitions of sarcopenia available in literature for case finding based on low gait speed and handgrip strength. These criteria may be too sensitive, mandating unnecessary body composition measures. Total protein intake is important for muscle mass maintenance but we will present evidence from the Quebec Longitudinal Study on Nutrition and Successful Aging (NuAge) Study that distribution across meals may also prevent losses. Although muscle is considered the principal site of glucose uptake and its loss to contribute to the development of insulin resistance, these assumptions have not always been verified. The method used to present muscle mass index correcting absolute mass by either height squared or weight could account for the discrepancies in establishing the relationship with insulin resistance. Data from the NuAge Study will illustrate this concept and arguments will be brought forth to propose the most appropriate method. Furthermore, several hormonal and inflammatory factors associated with insulin resistance are also responsible for loss of muscle mass, therefore creating a false relationship between insulin resistance and low muscle mass. Using data from the NuAge Study, we will show how the application of logistic regression analysis of these factors along with muscle mass index will disentangle this spurious association.

SARCOPENIA AND FRAILTY: WHAT ARE THE ISSUES RELATED TO GAIT SPEED AND HANDGRIP STRENGTH CUTOFF VALUES?

R.A. Lourenço, 1. *Internal Medicine, Rio de Janeiro State University, Rio de Janeiro, RJ, Brazil*, 2. *Pontifícia Universidade Católica - Rio de Janeiro, Rio de Janeiro, RJ, Brazil*

There is still no consensus on the strategies to diagnose frailty and sarcopenia. Gait speed (GS) and handgrip strength (HS) are included in most of the diagnostic criteria of sarcopenia – e.g., European Working Group (EWGSOP) – and frailty – e.g., Fried's scale. However, their cutoff points to select individuals with poor performance are not adequately determined. For instance, there is evidence that the cutoff points suggested by EWGSOP to screen elderly to muscle mass measurement select a very high proportion of individuals. Recently, three studies from Brazil, Mexico, and Spain reported that 83.4% of their cohorts were selected as suspected of sarcopenia using EWGSOP criteria. Cutoff-values tailored for these cohorts reduced the proportion of abnormal results to 34.2%. Also, in frailty studies, using inadequate GS and HS cutoff-values may overestimate in almost 10% their prevalence. In conclusion, to be epidemiologically/clinically useful, the cutoff-values of GS and HS must be adapted to specific populations.

MEALTIME DISTRIBUTION OF PROTEIN INTAKE AND LEAN MASS AND MUSCLE STRENGTH IN NUAGE PARTICIPANTS

S. Farsijani^{1,2}, J.A. Morais^{1,2}, H. Payette³, P. Gaudreau⁴, B. Shatenstein⁴, K. Gray-Donald¹, S. Chevalier^{1,2}, 1. *Medicine, McGill University, Montreal, Quebec, Canada*, 2. *MUHC-Research Institute, Montreal, Quebec, Canada*, 3. *University of Sherbrooke, Sherbrooke, Quebec, Canada*, 4. *University of Montreal, Montreal, Quebec, Canada*

In addition to total intake, protein distribution across meals may affect sarcopenia. An even distribution further increased muscle protein synthesis compared to a skewed intake, in young adults. We studied whether this short-term result translates into long-term preservation of lean mass (LM) and muscle strength in healthy older adults of the NuAge study (827 men, 914 women). Outcomes were measured at baseline and 2-3-year follow-up. Protein intake was calculated from 6x24-h food recalls. **Results:** In men and women, LM declined by 2.5% and 2.0%, muscle strength by 20.0% and 18.2%, and mobility score by 6.5% and 7.8 % ($P < 0.05$). Rates of decline were not independently affected by the quantity and distribution of protein intake. Yet, participants with more evenly distributed protein intake had higher LM and muscle strength throughout follow-up, even after controlling for confounders ($P < 0.05$). This could translate in delaying reaching a sarcopenic threshold, affecting functionality.

DIFFERENT INDICES OF MUSCLE MASS MAY LEAD TO DIFFERENT ASSOCIATIONS WITH THE HOMA-IR SCORE

J.A. Morais, *Medicine, McGill University, Montreal, Quebec, Canada*

Muscle is considered the principal site of glucose uptake and its loss thought to contribute to the development of insulin resistance. The method used to present muscle mass index could account for the discrepancies in establishing the relationship with insulin resistance. We wished to determine the association of the HOMA-IR with two indices of muscle mass: height-muscle mass index (HMMI; kg muscle/height in m^2), and weight muscle mass index (WMMI; kg muscle/body weight X 100) in 440 non-diabetic, men and women of the Quebec Longitudinal Study NuAge. HMMI was positively correlated with HOMA-IR ($r = 0.340$, $p < 0.001$) and WMMI negatively ($r = -0.211$, $p < 0.001$). Correcting for fat mass made the association to disappear for the WMMI. Since correcting for fat mass eliminates this association for the WMMI, one can infer that this index gives a spurious inverse relationship, likely by creating a false relative low MMI for persons with higher adiposity.

PREDICTORS OF INSULIN RESISTANCE IN COMMUNITY-DWELLING OLDER ADULTS OF THE NUAGE STUDY

J. Matta¹, P. Gaudreau², T. Fülöp³, I.J. Dionne³, D. Tessier³, B. Shatenstein², H. Payette³, J.A. Morais⁴, 1. *Holy Spirit University, Jounieh, Lebanon*, 2. *University of Montreal, Montreal, Quebec, Canada*, 3. *University of Sherbrooke, Sherbrooke, Quebec, Canada*, 4. *McGill, Montreal, Quebec, Canada*

We determined insulin resistant subjects over a 3-year period by trajectory analyses of the HOMA-IR in a sample of non-diabetic, participants of the NuAge Study. Muscle mass index and % body fat were derived from DXA and bioimpedance. Physical activity was assessed. Protein intakes were calculated. Serum biomarker profile included adiponectin, leptin, CRP, TNF- α , IL-6, IL-10, lipid profile, IGF-1 and IGFBP-3. Using path analysis without biomarkers, positive associations were observed for HOMA-IR score with MMI ($\beta = 0.42$) and % body fat ($\beta = 0.094$). Logistic regression

without biomarkers provided only 3 significant predictors of insulin resistance: MMI [OR (95% CI): 1.72 (1.26–2.3)]; %body fat [1.18 (1.12–1.25)]; male sex [0.145 (0.04–0.45)]. When the biomarker profile was included, adiponectin [0.58 (0.35–0.95)], TNF- α [1.12 (1.00–1.23)] and leptin [2.92 (1.29–6.64)] were independent predictors of insulin resistance. Our analyses showed that positive association between muscle mass and HOMA-IR is likely mediated through higher levels of TNF- α and leptin and lower adiponectin.

NEUROPROTECTIVE EFFECTS OF DANCING IN OLD AGE

M.V. Narici¹, K. Rehfeld³, N. Müller², A. Hökelmann³,
1. School of Graduate Entry Medicine, University of Nottingham, Derby, Derbyshire, United Kingdom, 2. German Centre for Neurodegenerative Diseases (DZNE), Magdeburg, Germany, 3. Institut für Sportwissenschaft 'Otto-von-Guericke', Universität Magdeburg, Magdeburg, Germany

Neuromuscular junction (NMJ) degeneration and loss of motor units (MUs), markedly contribute to sarcopenia. NMJ damage in sarcopenic individuals can be assessed from serum measurements of c-terminal peptide agrin fragment (CAF) (Hettwer et al. *Exp Gerontol* 2013). Interestingly, aerobic exercise protects against NMJ degeneration (Valdez et al. *Proc Natl Acad Sci* 2010) in senile rats and in humans, no decline in MUs has been found in master runners (Power et al. *Med Sci Sports Exerc* 2010). The present study aimed to investigate whether ball-room dancing could have neuroprotective effects compared to gym training (endurance, strength-endurance and flexibility training). Thirty-seven older individuals (aged 71.6 \pm 3.5 yr, 18 female and 19 male) were randomly assigned to a Dance Group (DG) or Gym Exercise Group (GEG). Both groups trained twice/week, 90 min/session, for 6 months. Blood serum CAF levels (Neurotune AG, Schlieren, Switzerland) were measured before and after the intervention. Data were compared to those of older sarcopenic and young controls. Values are means \pm S.D., paired/unpaired Student's t-Test were used. Pre-training, CAF values of the DG and GEG groups were respectively 1.9 and 2.2-fold higher than of young controls. However, after the intervention, CAF levels decreased by 15% ($P < 0.001$) in DG, while no changes were found in the GEG. These findings suggest a reduction of neuromuscular degeneration in older humans as a result of six-month recreational dancing but not by general fitness training. This neuroprotective effect of dancing may be due to improved neurotrophin levels, reduced oxidative stress and inflammation.

SESSION 3285 (PAPER)

COGNITION: INTERNATIONAL PERSPECTIVES

PHYSICAL ACTIVITY IN MIDLIFE AND 20-YEAR CHANGE IN GLOBAL COGNITIVE FUNCTION: THE ARIC-NCS STUDY

P. Palta¹, K.R. Evenson¹, K. Pettee Gabriel³, A. Gross², A. Folsom⁴, A. Kucharska-Newton¹, T.H. Mosley⁵, G. Heiss¹, 1. University of North Carolina at Chapel Hill,

Chapel Hill, North Carolina, 2. Johns Hopkins University, Baltimore, Maryland, 3. University of Texas Health Science Center, Houston, Texas, 4. University of Minnesota, Minneapolis, Minnesota, 5. University of Mississippi Medical Center, Jackson, Mississippi

Reducing the high burden of cognitive impairment and its sequelae in our aging population is a high priority that may be attainable by intervening on modifiable behaviors such as physical activity. We determined the cross-temporal associations between mid-life physical activity and change in global cognitive function among 14,203 participants (mean age: 57 years (SD: 5.7); 24.7% Black) of the Atherosclerosis Risk in Communities Neurocognitive Study (ARIC-NCS). Using the interviewer-administered Baecke Physical Activity Questionnaire from the visit 1 examination (1987–1989), we categorized participant's physical activity according to the American's Heart Association's Life's Simple 7 cardiovascular health criteria: ideal ($n=5731$), intermediate ($n=3200$), or poor ($n=5272$). Cognitive tests of working memory, language, and executive function were administered at visits 2 (1990–1992), 4 (1996–1998), and 5 (2011–2013). Cognitive test scores were standardized to z-scores and averaged to yield a global cognition score. Race-stratified linear mixed models, with random intercepts and random slopes, estimated the associations of ideal, intermediate and poor physical activity with change in global cognitive function, adjusted for age, sex, education, and smoking. Among Whites and Blacks, no significant differences were observed in 20-year rates of change in global cognition comparing participants with ideal physical activity to those with poor physical activity (Beta=-0.03, 95% CI: -0.08, 0.02; Beta=0.01, 95% CI: -0.09, 0.11), respectively. Results were robust to adjustment for attrition. Future work should further evaluate the impact of the joint and independent effects of type, duration and intensity of physical activity on cognitive function.

ASSOCIATIONS OF SOCIAL NETWORKS WITH COGNITION IN OLD AGE: RESULTS FROM THE BERLIN AGING STUDY

T. Windsor¹, D. Gerstorff², 1. Flinders University, Adelaide, South Australia, Australia, 2. Humboldt University, Berlin, Germany

Leading an engaged lifestyle is recognised as one means of contributing to cognitive health across adulthood. This has led to several studies examining associations of social network attributes with cognition in older adults. Most have focused on structural aspects of networks (e.g., network size and activity engagement), however social networks are multi-faceted and different aspects of social behaviour could affect cognition through different mechanisms. This study used data from the Berlin Aging Study (BASE), a population-based study of 516 adults (age range 70 – 103) to examine associations of baseline social network structure (number of close others, network members lost through death), and network quality (social and emotional loneliness, number of upsetting network members) with levels and rates of change in processing speed and verbal fluency. Number of close others, and number of network members lost were not associated with levels, or rates of decline in speed or fluency across the 13 year study interval. Among the network quality indicators, greater social and emotional loneliness were

each related to poorer levels of cognitive performance, but were unrelated to rates of change. Having a greater number of problematic network members was associated with higher levels of fluency. The discussion focuses on the different mechanisms through which social functioning could affect cognition, and considers issues of possible reciprocal causation.

COGNITIVE TRAJECTORY PATTERNS PREDICT INCIDENT DEMENTIA RISK IN OLDER SWEDISH ADULTS

E. Munoz¹, M. Gatz^{2,3}, N.L. Pedersen^{2,3}, E. Schoenhofen Sharp⁴, C.A. Reynolds¹, 1. *University of California, Riverside, Riverside, California*, 2. *University of Southern California, Los Angeles, California*, 3. *Karolinska Institute, Stockholm, Sweden*, 4. *Yale School of Medicine, New Haven, Connecticut*

Lower average performance levels and decline in memory and executive function tasks have been associated with dementia risk. In this study, we aimed to establish a forward-prediction line of reasoning by applying growth-survival models to examine the relationship between cognitive trajectories and incident dementia risk. We used data from 981 Swedish adults (mean baseline age = 65.89 (SD = 10.72)) who were evaluated in both the Swedish Adoption/Twin Study of Aging (SATSA) and the HARMONY study. Cognitive performance measures were available for up to 10 assessments and up to 22.9 years of follow-up (median = 9.37 years). Of the total sample, 219 individuals (22.32%) were diagnosed with incident dementia. Cognitive data obtained after the estimated age of dementia onset were not included in the analysis to consider trajectory patterns that emerged prior to discernible disease. Accounting for sex and age at entry, the simultaneous growth-survival models revealed that linear declines at age 65 in processing speed ($p < .001$) and spatial ability ($p = .08$) were associated with increased dementia risk, whereas neither level of performance at age 65 nor nonlinear change were significant. For episodic memory, lower level of performance at age 65 ($p < .001$) and nonlinear accelerations in decline ($p < .01$) across age predicted increased dementia risk, but linear change at age 65 did not; this result remained significant when adding education as a covariate. We will consider additional tasks in the verbal domain and compare results to those in other Swedish studies of aging (e.g., OCTO Twin, GENDER).

GENDER DIFFERENCES IN COGNITIVE IMPAIRMENT AMONG THE OLD AND OLDEST-OLD IN CHINA

C.E. Miyawaki¹, M. Liu², X. Zhang³, 1. *Graduate College of Social Work, University of Houston, Houston, Texas*, 2. *University of Washington, Seattle, Washington*, 3. *Zhengzhou Railway Vocational & Technical College, Zhengzhou, China*

Research has shown that among the oldest-old in China, women have higher risk of cognitive impairment than men. Building off previous research and using the latest waves (2008–2011) from the Chinese Longitudinal Healthy Longevity Survey (N=13,586), we explored gender differences in cognitive impairment across two age cohorts in

China: the old (ages 65–79) and oldest-old (ages 80–116). Regression analysis was employed to model the gender effects on baseline cognitive function and onset of cognitive impairment. Independent variables included demographic background, socioeconomic status (SES), social network, leisure activities, and dementia status. Among the oldest-old, women (32.9%) were twice as likely as men (15.7%) to have cognitive impairment. For the old, women (2.2%) were only slightly more likely than men (1.9%). Regression models found that the oldest-old women remained at significantly higher risk of having cognitive impairment compared to men ($p < .001$), even after introducing independent variables. However, no significant gender differences were found among the old cohort. Of the independent variables examined, the gender effects were reduced the most when incorporating SES in these regression models for both age cohorts. For the oldest-old, gender differences in cognitive impairment could be due to differences in SES between men and women. As for the old, the lack of gender differences could be attributed to the very low percentages of cognitive impairment to begin with. Perhaps as they age, gender differences may emerge as seen in the oldest-old. Future research should follow up with this current old cohort about possible gender differences in cognitive impairment.

SESSION 3290 (SYMPOSIUM)

SOCIAL, PSYCHOLOGICAL, AND HEALTH-RELATED RISK FACTORS FOR LATE-LIFE SUICIDE

Chair: J. Lutz, *West Virginia University*

Co-Chair: R. Cui, *West Virginia University, Morgantown, West Virginia*

Discussant: Y. Conwell, *University of Rochester*

Older adults, particularly males, are at comparatively high risk for suicide in many countries around the world. Therefore, suicide among older adults is a major public health problem, and it is crucial to identify risk and protective factors for suicide in this population. This symposium will present current research on social, psychological, and health-related risk factors for late-life suicide.

First, Kadija Williams, M.A., will present research on younger and older adults' perceptions of risk and protective factors for suicide. Then, Ehud Bodner, Ph.D., will discuss research on subjective age as a moderator of the relation between daily stressors and passive death wishes in younger and older adults. Third, Danielle Jahn, Ph.D., will discuss a study testing whether use of healthcare services and quality of experience with healthcare providers are associated with perceived burdensomeness, thwarted belongingness and suicidal ideation among older male veterans. Next, Briony Murphy, B.A., will present results of a national case series study of death by suicide among nursing home residents in Australia. Finally, Lydia Li, Ph.D., will present research on the association between self-reported discrimination and suicidal ideation in older Chinese Americans. Yeates Conwell, M.D., director of Geriatric Psychiatry and co-director of the Center for the Study and Prevention of Suicide at the University of Rochester Medical Center, will serve as discussant.

OLDER AND YOUNGER ADULTS' PERCEPTIONS OF PRECIPITANTS AND PROTECTANTS FOR LATE-LIFE SUICIDE

K. Williams, D.L. Segal, *University of Colorado – Colorado Springs, Colorado Springs, Colorado*

This study examined perceptions of and attitudes toward late-life suicide among older and younger adults. A sample of 462 adults (391 young adults, 18–29 years; 71 older adults, 60–81 years) read a fictional obituary of an older adult who died by suicide and rated the importance of 10 precipitating events and eight protective factors. Results indicated that regarding precipitants, older adults attributed personal terminal illness with significantly more risk than younger adults ($p = .04$; $d = .28$) whereas younger adults attributed greater risk to illness of a first degree relative ($p = .013$; $d = .57$). Regarding protectants, older adults rated financial resources as more protective than younger adults ($p = .017$; $d = .30$). Correlational results revealed that agreement with late-life suicide was associated with agreement with age-stereotyping and the Geriatric Suicide Ideation Scale total score. An implication is that older and younger adults differ on the attribution of importance of some risk and protective factors over others

YOUNGER SUBJECTIVE AGE, DAILY HASSLES, AND PASSIVE DEATH WISHES IN ADULTHOOD AND LATE LIFE

E. Bodner¹, A. Shriram¹, Y. Palgi², *1. Bar-Ilan University, Ramat Gan, Israel, 2. University of Haifa, Haifa, Israel*

Passive death wishes increase in old age. Having a younger subjective age relates to lower vulnerability to daily hassles. We examined whether subjective age moderates the effect of daily hassles on daily passive death wishes. Participants at the age range of 30 to 96 ($N=334$, $M=57.6$, $SD=17.1$) reported their subjective age, exposure to daily hassles and passive death wishes, on each day over a period of two weeks. Multilevel models showed that the interaction between subjective age and daily hassles was significant at the .002 level and the basic model explained 11% in the within-person variance in passive death wishes. The effect of daily hassles on death wishes was weaker among individuals with younger subjective age, even after controlling for depression and background variables. These findings join previous ones in establishing subjective age as an important developmental marker, regulating vulnerability to stress.

INTERACTIONS WITH THE HEALTHCARE SYSTEM AND SUICIDE RISK FACTORS AMONG OLDER MALE VETERANS

D. Jahn, *1. University of Maryland School of Medicine, Baltimore, Maryland, 2. VA Capitol Health Care Network (VISN 5) Mental Illness Research, Education, and Clinical Center, Baltimore, Maryland*

Suicide risk is high among older men (CDC, 2016). Using healthcare services may increase healthcare-related perceived burdensomeness and thwarted belongingness (both suicide risk factors; Cukrowicz et al., 2013), depending upon the quality of interactions with providers. Therefore, we sought to examine how use of services and experiences with providers influenced suicide risk among older male Veterans. We found that frequency of healthcare service use was *not* correlated with perceived burdensomeness ($r=.19$, $p=.34$) or

thwarted belongingness ($r=-.02$, $p=.93$), though perceived mental illness-based discrimination ($r=.52$, $p=.004$; $r=.50$, $p=.01$, respectively) and stereotyping by providers ($r=-.49$, $p=.01$; $r=-.43$, $p=.02$, respectively) were. Perceived burdensomeness and thwarted belongingness separately mediated the relations between perceived discrimination (95% CI=0.31,12.71; 95% CI=1.06, 5.19, respectively) or stereotyping (95% CI=-1.29,-0.12; 95% CI=-0.96,-0.09, respectively) and suicide ideation. These results suggest that it is not frequency of healthcare service utilization, but quality of interactions with healthcare providers, that influences suicide risk in older men.

SUICIDE AMONG NURSING HOME RESIDENTS IN AUSTRALIA, 2000–2013: A CASE SERIES STUDY

B. Murphy, L. Bugeja, J. Pilgrim, J. Ibrahim, *Monash University, Clayton, Victoria, Australia*

Little is known about suicide of residents in the nursing home setting. This research aims to describe the frequency and nature of suicides among nursing home residents in Australia, and examine associated individual, incident-level, organisational, and societal factors. Data on every suicide was obtained by reviewing the original coroner's (medical examiner) investigation file. The study identified 141 suicides among nursing home residents (2000–2013). Individual risk factors included being male ($n=97$, 68.8%); having a mood disorder ($n=93$, 66.0%); and suffering from one or more physical health conditions ($n=122$, 86.5%). Common methods included hanging ($n=45$, 31.9%), fall from height ($n=24$, 17.0%), and plastic bag asphyxia ($n=20$, 14.2%). High risk periods and organisational factors were also identified. This is the first national Australian study describing suicides among nursing home residents and will assist in developing prevention policies. This study contributes new knowledge internationally as it addresses incident-level and organisational factors.

SELF-REPORTED DISCRIMINATION AND SUICIDAL IDEATION IN OLDER CHINESE AMERICANS

L.W. Li¹, X. Dong², *1. University of Michigan, Ann Arbor, Michigan, 2. Rush University Medical Center, Chicago, Illinois*

This study examines the association between self-reported discrimination and suicidal ideation in older Chinese Americans. The sample included 3,033 Chinese adults (age 60+) in Chicago Area. Suicidal ideation was dichotomously coded, based on one item: "Have you felt suicidal or wished to be dead in the last 12 months." Self-reported discrimination was coded yes vs. no experience of discrimination, based on respondents' reports of discrimination experience in nine situations due to their race/ethnicity/color. Covariates included socio-demographics, acculturation, Chinatown residence, and neuroticism. About 4.8% of the sample reported having suicidal ideation and 21.5% having experienced discrimination. Logistic regression results show that self-reported discrimination was significantly associated with suicidal ideation before (OR=2.21, 95% CI=1.57–3.11, $p<.001$) and after adjusting for the covariates (OR=2.18, 95% CI=1.47–3.23, $p<.001$). This is the first study to report the association between self-reported discrimination and suicidal ideation, and among the few focusing on suicidal ideation in older Chinese Americans.

SESSION 3295 (SYMPOSIUM)

COORDINATED ANALYSIS OF ECOLOGICAL MOMENTARY AND DAILY DIARY STUDIES OF EVERYDAY STRESS AND AFFECT

Chair: M. Sliwinski, *Penn State University, Pennsylvania*

Co-Chair: S.B. Scott, *Stony Brook University*

Discussant: L. Nielsen, *Division of Behavioral and Social Research, National Institute on Aging*

Emotional responses to everyday stress have been linked to important age-related health outcomes, such as chronic disease, cognitive decline and dementia, and mortality. This symposium illustrates the value of conducting coordinated analyses across multiple intensive repeated measures studies that assessed everyday stress and affect for answering these questions for elucidating the proximal mechanisms through which everyday stress impacts health and health behaviors. Sliwinski provides an overview of some of the unresolved questions regarding age difference in everyday stress, the differences between momentary and end-of-day (EOD) assessments, and how conducting coordinated analyses of multiple data sets can advance scientific knowledge. Scott & Sliwinski presents a paper that examines age differences in the affective variability across different time scales (within-day vs. between-days) and whether this variability can be reliably measured. Zawadzki, Almeida & Smyth directly contrast momentary vs. typical EOD reports of stressor to illustrate how assessment methods and the temporal frame of self-report assessments interact with age to influence the frequency of stress reporting. Stawski & Almeida attempt to explain the variability in findings regarding age differences in emotional reactivity to everyday stressors by contrasting results across multiple studies that utilized momentary and EOD reports of stressors and affective experiences. Lis Nielsen will provide a discussion that integrates findings from these papers in the context of initiatives advanced by the National Institutes of Health (NIH) Science of Behavior Change Common Fund Program.

DECOMPOSING AFFECT VARIABILITY ACROSS MOMENTARY AND DAILY TIMESCALES

S.B. Scott², M. Sliwinski¹, 1. *Penn State University, University Park, Pennsylvania*, 2. *Stoney Brook University, Stoney Brook, New York*

Recent research has taken a lifespan developmental perspective on emotion regulation and examined whether there are age differences in variability in emotional experiences. Multiple factors, however, contribute to affect variability - stable individual differences, daily shifts, and momentary fluctuations. This coordinated analysis of seven independent daily diary and ecological momentary assessment studies (age = 18–84 years) decomposed negative affect (NA) and positive affect (PA) variability. Within-person variability was sizeable (NA: 45–74%, PA: 24–66%), with most at the momentary level. PA and NA reliability were high (0.77–0.91) despite different items and designs. Heterogeneous variance models by age group indicated greater proportion of momentary variability among older adults. Theorized processes underlying moment-to-moment fluctuations are conceptually distinct from those differentiating good from bad days and one individual's typical state from another person's.

Imprecise labeling of variability may impede progress when researchers attempt to find the same patterns and predictors across different time scales.

ASSESSING STRESS: DOES METHOD, TEMPORAL FEATURES, OR AGE INFLUENCE REPORTED STRESSOR FREQUENCY?

M. Zawadzki¹, D. Almeida², J. Smyth², 1. *University of California, Merced, Merced, California*, 2. *Penn State University, University Park, Pennsylvania*

Although exposure to stressors in daily life is a common experience, reports of stressor frequency may be influenced by how they are assessed. Moreover, age differences in attending to negative stimuli might influence rates of stressor reporting across the lifespan. We conducted a coordinated analysis of seven large data sets that assessed stressor frequency using end of day [EOD; one overall report daily], ecological momentary assessment [EMA; multiple reports throughout a day], or hybrid designs [both EOD and EMA]. Our analysis examined if the frequency of stressor reporting differs by: (1) the approach used (i.e., EOD/EMA/hybrid); (2) temporal features (e.g., day of week, number or position of measurement days); or (3) a function of age. Analyses suggest that assessment method, temporal features, and age can impact the frequency of stress reporting. These results have important implications for how stress is assessed and interpreted in studies using EOD and EMA designs.

AGE DIFFERENCES IN EMOTIONAL REACTIVITY TO DAILY STRESSORS: A COORDINATED ANALYSIS

R.S. Stawski¹, D. Almeida², 1. *Oregon State University, Corvallis, Oregon*, 2. *Penn State University, University Park, Pennsylvania*

Theories of stress, emotion and aging posit age-related decreases in emotional reactivity to stressors. Ecological momentary assessment (EMA) and end-of-day diary (EOD) approaches have been employed to study age differences in stressor-related increases in negative affect, yielding mixed results. Some studies show age benefits, some show age decrements, and others show no difference. Data from 7 independent studies, 5 EMA and 6 EOD, were analyzed to address these inconsistencies. Preliminary analyses of 2 EMA (Study 1: N=240, 14 days, 5 beeps/day, Ages=25–65; Study 2: N=175, 7 days, 5 beeps/day, Ages=20–80) and EOD (Study 1: N=2,022, 8 days, Ages=35–84; Study 2: N=311, 8 days, Ages=21–63) studies revealed significant stressor-related increases in negative affect across all studies. Age-related decreases in reactivity were observed across all studies, but only statistically significant for EOD studies. Discussion will focus on design and measurement considerations for EMA and EOD studies for understanding stress processes and aging.

SESSION 3300 (SYMPOSIUM)

REAL-TIME LOCATION SYSTEMS FACILITATE INDEPENDENCE IN LONG-TERM AND SPECIALIZED CARE SETTINGS

Chair: D.H. Sullivan, *Central Arkansas Veterans Healthcare System, Little Rock, Arkansas*

Co-Chair: W. Kearns, *University of South Florida, Tampa, Florida*

Discussant: A. Mihailidis, *University of Toronto, Toronto, Ontario, Canada*

In this symposium, speakers will discuss clinical and research initiatives utilizing real-time location systems (RTLS) to promote functional independence of vulnerable adults in home and clinical environments. The intended use of RTLS to inform clinical decision-making will be described. Session one will focus on RTLS to monitor older residents' movements in an assisted living environment; data reduction and analysis techniques that map resident ambulation patterns around the facility and reveal intra-individual pattern changes in order to predict falls in this vulnerable population will be presented. Session two presents a unique integration of RTLS with bed monitors to support a nurse-driven clinical initiative promoting early and progressive ambulation in hospitalized Veterans. The validity, sensitivity and specificity of system-generated reports of patient time in motion, out of bed but sedentary, and at bed rest and the challenges of differentiating various modes of Veteran movement will be discussed. In the final session, ongoing work on model "Smart Home" integrated systems to support Veterans with traumatic brain injury in various environments will be presented. The session will describe a system that prompts a patient to perform specific functional tasks, the data integration strategies used to detect the behavior sequences in the task, and planned enhancements to the system that will reengage a Veteran to resume interrupted behavior sequences at the point in the sequence where the requisite behaviors have been omitted.

CHANGES IN AMBULATION AND FALL RISK

M.E. Bowen^{1,2}, M. Rowe³, 1. *Michael J. Crescenz VA Medical Center, Philadelphia, Pennsylvania*, 2. *West Chester University of Pennsylvania, West Chester, Pennsylvania*, 3. *University of South Florida, Tampa, Florida*

The aim of this prospective study is to examine how intra-individual changes in ambulation characteristics may be used to predict falls. The ambulatory characteristics of 26 residents of an Assisted Living Facility were measured continuously for up to 8 months by a real-time locating system (RTLS). Ambulation characteristics include: time and distance walked, speed and path distance (at least 60 seconds of uninterrupted walking separated by at least a 30 second stop). Fall (yes/no) and cognitive impairment (CI) data were also collected. In Hierarchical Linear Models, path distance (OR=1.02; $p \leq 0.001$) was associated with an increased fall risk. In the short term, intra-individual changes in path distance were associated with a fall within the 4-week interval the change was noted. Path distance had fair sensitivity (0.74) and specificity (0.66) to a fall (AUC=0.70). Study findings suggest interventions focused on reducing path-associated fatigue may effectively reduce fall incidence in this population.

USE OF REAL-TIME LOCATING SYSTEM AND OTHER TECHNOLOGIES TO INCREASE HOSPITAL PATIENT MOBILITY

D.H. Sullivan^{1,2}, T.S. Taylor¹, S. Gray-Staples¹, C. Rice¹, F.A. Martin¹, J.S. Cheek¹, M.M. Bopp¹, 1. *Central Arkansas Veterans Healthcare Systems, Little Rock, Arkansas*, 2. *University of Arkansas for Medical Sciences, Little Rock, Arkansas*

As part of a quality improvement initiative to increase the time patients spend ambulating while hospitalized, a high resolution real-time locating system (RTLS) was installed on one hospital wing to provide the clinical staff with accurate assessments of the effectiveness of their interventions. The system, which is comprised of multiple sensors mounted near the ceiling and active tags attached to wheelchairs or worn as wristbands by patients, has a resolution to within 20 cm. After detailed validation testing, the clinical staff began utilizing the system to produce comprehensive reports on their patients' activity level including movement trails, gait speed, time ambulating, sedentary, and in bed, and distance traveled by day or shift. We describe how we link this system to a second bed monitoring system, the types and accuracy of the data produced, different methods utilized to differentiate ambulatory from non-ambulatory movement, and how the system reports inform clinical decision-making.

VA SMART HOME TECHNOLOGY FOR COGNITIVE IMPAIRMENT

S.L. Phillips¹, S.G. Scott¹, J. McCarthy¹, K.M. Martinez¹, K. Mann³, C. Reich³, R.G. Archer³, W. Kearns², 1. *James Haley VA Hospital, Tampa, Florida*, 2. *University of South Florida, Tampa, Florida*, 3. *Ubisense, Inc, Denver, Colorado*

The VA Smart Home at the James A. Haley Veterans Administration Hospital in Tampa provides advanced behavioral prompting to veterans with injury related cognitive impairment and their caregivers in order to monitor and improve the quality of health service delivery in three settings: 1) integrated logistical support for multiple caregivers providing care to veterans with TBI considered "emerging consciousness" cases. 2) in-home location and ADL tracking for semi-independent veterans with traumatic brain injury (TBI) and 3) an inpatient residential unit that uses location and time-based prompts for activities of daily living (ADL). Each setting poses unique design challenges for specific pervasive monitoring solutions, obviating a "one size fits all" approach. Lessons learned and design considerations will be discussed. Results from longitudinally gathered measures of caregiver burden, task and medication compliance, walking speed, and movement path variability (path tortuosity) will be presented.

SESSION 3305 (SYMPOSIUM)

OLDER ADULTS WITH INTELLECTUAL DISABILITY: PERSPECTIVES ON AGING-RELATED HEALTH STATUS AND DISPARITIES

Chair: M.P. Janicki, *University of Illinois, Rockport, Maine*

Discussant: L.W. Kaye, *University of Maine*

Older adults with intellectual disability (ID), like many disadvantaged older adults, represent various health statuses and often experience disparities in health access. Yet, knowing more about the health and function manifest in this broad group of older adults can help provide for more effective screening and management of daily health and medical services delivery. Variables that contribute to these variations include geographic location, presence of neuropathies, and extent of comorbidities. The symposium explores three aspects on this issue drawn from extant studies, one from an examination of older rural- and urban-dwelling adults with

ID in Australia compared with geo-equivalent neuro-typical older adults, another from analyses of data in the US-based national LHIDD dataset related to comorbidity and preventative health in older adults w/ID, and the third from comparisons of how the health of adults with ID and dementia differ from non-affected adults. These studies show that for most conditions there is a noted discrepancy in the proportion of respondents with a chronic disease diagnosis versus those who were prescribed medications, which may point to inadequacy of appropriate healthcare primary-care physicians. They also show that adults w/ID in general have many comorbidities, and that among those adults with dementia varied health status and comorbidities are significant and there are marked behavioral changes when compared to unaffected adults. Noted is the higher than normative poorer health status and rates of comorbidities, which signal a greater need for health surveillance, more frequent health reviews, systematic health advocacy, and health provider education.

BURDEN OF CHRONIC DISEASE FOR OLDER AUSTRALIANS WITH INTELLECTUAL DISABILITY

R. Hussain¹, S. Wark², M.P. Janicki³, T. Parmenter⁴, M. Knox⁴, 1. *Australian National University, Canberra, Australian Capital Territory, Australia*, 2. *University of New England, Armidale, New South Wales, Australia*, 3. *University of Illinois, Chicago, Illinois*, 4. *University of Sydney, Sydney, New South Wales, Australia*

The preliminary findings from an ongoing large-scale Australian study assessing health, well-being and health service use for older people with intellectual disability (PwID), compared to their normative age-peers, have revealed the nature of the burden of chronic disease experienced by PwID aged ≥ 60 years ($n=356$). Preliminary results confirm a significant burden of chronic disease including: arthritis (41%), persistent pain (28%), diabetes (23%), asthma (16%), heart disease (15%), cancers (8.7%), depression (22%), anxiety (20%), schizophrenia/bipolar (3.3%) and dementia (2.2%). Many respondents reported multiple comorbidities. For most conditions, there was a noted discrepancy in the proportion of respondents with a chronic disease diagnosis versus those who were prescribed medication, which alludes to inadequacy of appropriate healthcare for PwIDs by primary-care physicians. Comparative data from OECD countries reveal patterns of chronic disease for older PwID; given this there are significant challenges of healthcare service provision across disability and aged-care services.

LIFESTYLES, HEALTH, AND PREVENTIVE HEALTH CARE OF OLDER ADULTS WITH INTELLECTUAL DISABILITIES

K. Hsieh, T. Heller, S. Murthy, *Disability and Human Development, University of Illinois at Chicago, Chicago, Illinois*

Data from a subset ($N=373$) of the US Longitudinal Health and Intellectual Disability Study (LHIDS) were examined to compare health factors and rates of preventive care use with data from the general population. Results show that older

adults with intellectual disability (ID) had higher prevalence rates of obesity, heart conditions, anxiety disorders, and falls across two age groups (50–59, 60+); only among adults age 60+ was a higher rate of depression noted. Conversely, older adults with ID had lower rates of arthritis, stroke, diabetes, asthma, and cancer. Disparities in breast and cervical cancer screenings were noted. Compared to their peers without ID, older adults with ID were more likely to be physically inactive and insufficiently consume fruits and vegetables. The findings suggest that older adults with ID need to improve their health through adopting lifelong healthy lifestyles and practices and by gaining greater access to cancer screenings, especially among women.

HEALTH STATUS AND COMORBIDITIES OF ADULTS WITH DEMENTIA AND ID-IMPLICATIONS FOR SCREENING AND HEALTHCARE

M.P. Janicki, 1. *University of Illinois, Chicago, Illinois*, 2. *National Task Group on Intellectual Disabilities and Dementia Practices, Rockport, Maine*

Declining health status and comorbidities are often markers for associated mild cognitive impairment or dementia. A group of community-dwelling adults with intellectual disability diagnosed with dementia (along with controls) have been tracked longitudinally with respect to their health and function. With time, the dementia-capable group home residents with dementia are showing significantly varied health status and comorbidities as well as marked behavioral changes. By tracking the health and function longitudinally, outcome information can pinpoint markers that are associated with premorbid dementia and can help health providers maintain surveillance over select functions and health conditions of those adults already affected. Screening instruments, incorporating these markers, can more precisely be used to identify at-risk adults for ADRD and aid providers design remediation programs earlier.

PREVENTIVE HEALTH CARE AMONG OLDER ADULTS WITH INTELLECTUAL AND DEVELOPMENTAL DISABILITIES

T. Heller, *University of Illinois, Chicago, Illinois*

Little research using large scale data focuses on preventive health care compliance and the associated factors among older adults with intellectual and developmental disabilities (IDD). Objectives were: (1) To examine preventive health care utilization rates and compliance among older adults with IDD (aged 50 years or older) by residential type; (2) To identify associated factors of preventive health care compliance among older adults with IDD. We analyzed the subset ($N = 1,732$) of the multi-state National Core Indicators 2009–2010 data. Descriptive statistics and logistic regressions were conducted to examine the associated factors with preventive health care compliance. Older adults with IDD living with family had the lowest rates of preventive health care with regard to physical exams, dental visits, vaccinations, colorectal cancer screening, and mammograms. Preventive health care compliance was related to being older, not Hispanic, and living in specialized institutions or agency-operated apartments.

SESSION 3310 (SYMPOSIUM)

CREATING SUSTAINABLE AND RESILIENT INTERGENERATIONAL COMMUNITIES: LESSONS FROM FOUR SOCIETIES

Chair: C.T. Hayashida, *St. Francis Healthcare System of Hawaii*

Rapid population aging points to significant challenges for the 21st Century including the maintenance of sustainable and resilient intergenerational communities. While on-going work is done on achieving increased healthy life expectancy for active retirees, it is clear that there will always be a need for more understanding by the younger and older generations about the aging process, their changing roles and responsibilities to assure intergenerational community integration. Lacking that awareness and commitment by both the young and old, the prospects for intergenerational conflict is great.

This symposium will showcase four (4) presentations from Indonesia, Singapore, Hong Kong and Hawaii that collectively provides cross-national recommendations for the creation of intergenerational communities. The Indonesian study report on the positive value of informal intergenerational caregiving programs which moderate the cost of elder-care services provided with public funds. However, this study also notes that the implementation of these types of programs throughout Indonesia is dependent upon intergenerational leadership to mobilize the generations. The Singapore study is based on paying attention to what older adults are saying as what is important to age well. The study suggests that the next step calls for increased intergenerational awareness early in life for all generations. Hong Kong reports on its approach to intergenerational programs and the emerging lessons from that experience for the community. The Hawaii presentation reports on its Age-Friendly Initiative that embraces an intergenerational approach with its first calls for building awareness, promoting active aging and reducing ageism. This session will provide some common universal threads to build sustainable and resilient intergenerational communities.

COMMUNITY SERVICES FOR OLDER PERSONS PROVIDED BY FAMILIES AND THE YOUNG IN INDONESIA

T. Rahardjo, 1. *University of Indonesia, West Java, Indonesia*, 2. *University of Respati, Depok, Indonesia*, 3. *Active Aging Consortium Asia Pacific (ACAP), Fukuoka, Japan*

By 2050, the number of older people in Indonesia will approach 80 million. To enhance the health status of older persons, a referral program of networking hospitals and health clinics have been created. A survey of health centers in 33 provinces found them to be age-friendly. Our evaluation showed that the health status and daily life activity levels of older persons were maintained but depended on the number and dedication of *cadres* (*i.e.* young generations) providing services. Based on the programs reviewed, we conclude that there is national and community awareness of the issues surrounding the provision of care of older persons. However, it seemed that Indonesia is experiencing a decreasing number of the young supporting older persons. Suggestions are

provided to reverse this trend to maintain community resilience and sustainability.

WHAT IT MEANS TO AGE WELL? LAY PERSPECTIVES FROM OLDER ADULTS IN SINGAPORE

E. Wee¹, W. Lim^{1,2}, L. Thang^{3,4}, T. Gwee⁵, W. Cheong⁴, 1. *Nanyang Polytechnic, Singapore, Singapore*, 2. *Fei Yue Community Service, Singapore, Singapore*, 3. *National University of Singapore, Singapore, Singapore*, 4. *Active Aging Consortium Asia Pacific (ACAP), Fukuoka, Japan*, 5. *Presbyterian Community Services, Singapore, Singapore*

Knowledge about aging through lay perspectives is increasingly important and in a way serves as an empowerment effort to determine what matters most to the old. In this qualitative study set in the context of studio apartments for older adults in Singapore, the lay perspectives of residents from age 62 is explored on what it means to age well. Using a ground theory approach and applied thematic data analysis, the study uncovered main themes and key patterns in the data.

Health and finances were cited as two basic determinants of well-being in old age, reflecting the human condition espoused by Maslow's hierarchy of needs. Other important determinants include family relationship, remaining socially active and maintaining a positive mindset. The perceived pivotal role of family has encouraged older adults to place importance in maintaining close family ties while preferring to live apart. The importance of a positive outlook in old age suggests the significance of cultivating positivity early and nurturing the mindset over time so that it could become a source of resilience in old age. In general, the study shows that aging well is developmental in nature, in which relationships and mindset need to be cultivated and maintained over a long period of time. This implies that active aging programs and activities should not merely reach out to older adults, but should begin intergenerationally with young cohorts so as to raise awareness of preparing for old age and to cultivate these qualities and relationships early on.

INTERGENERATIONAL ACTIVITIES IN HONG KONG: EMERGING PRINCIPLES FOR A SUSTAINABLE PROGRAMME

T.B. Tsien, 1. *Hong Kong Polytechnic University, Institute of Active Aging & Dept of Applied Social Sciences, Hong Kong, Hong Kong*, 2. *Active Aging Consortium Asia Pacific (ACAP), Fukuoka, Japan*

In Hong Kong, there is increasing tension between the young and the old on how they view social, economic and human service issues. These changing relationships are often characterized by a lack of mutual understanding. Intergenerational programs are vehicles for promoting mutual understanding, the purposeful and ongoing exchange of resources and learning among older and younger generations for individual and community benefits. This presentation will begin with the definition of intergenerational programs, an overview of aging policies and services promoting intergenerational activities in Hong Kong. A few examples of intergenerational programs initiated at the Hong Kong Polytechnic University such as Overseas Study Tour, Life Mentorship and English Language Training will be discussed. Evaluations based on several indicators such

as the promotion of mutual understanding, and benefits and the establishment of new roles will be shared. Finally, lessons learned for creating sustainable programmes and communities will be summarized.

STRONGER TOGETHER: INTERGENERATIONAL APPROACHES TO BUILDING AN AGE-FRIENDLY HONOLULU

C.M. Nishita, 1. *University of Hawaii at Manoa, Honolulu, Hawaii*, 2. *Active Aging Consortium Asia Pacific (ACAP), Fukuoka, Japan*

Honolulu's Age-Friendly City Initiative embraces an intergenerational approach to implementing programs and solutions. The initiative, backed by Honolulu's Mayor and AARP Hawaii, began in 2014 and promotes age-friendly solutions that benefit individuals of all generations. Intergenerational approaches were used during the planning phase to develop policy recommendations in the city's Action Plan. Individuals from multiple generations engaged in walkability audits, focus groups, and a public age-friendly summit. Now, generations are brought together to implement community solutions. A key first step for building an age-friendly city will be to build awareness, promote active aging, and reduce ageism within the community and across the generations. Intergenerational age-friendly teams will work on media campaigns, community events, and toolkits to promote active aging and age-friendly practices. This presentation will describe intergenerational strategies and outcomes.

SESSION 3315 (SYMPOSIUM)

HIV AND AGING AMONG VULNERABLE POPULATIONS: SEXUAL AND RACIAL MINORITIES, AND CAREGIVERS

Chair: M.J. Brown, *University of South Florida, Tampa, Florida*

Discussant: M.G. Brennan-Ing, *ACRIA, New York, New York*

HIV continues to be a public health challenge for older adults in the U.S. and globally. With the improvements in antiretroviral therapy and with older adults continually being exposed to HIV risk factors, estimates suggest that by 2020, seven in ten adults living with HIV will be 50 and older. Compared to other racial/ethnic groups, Black populations have the highest HIV rates. In the U.S., men who have sex with men (MSM) continue to bear the grunt of the epidemic. HIV rates among transgender women are also staggering with approximately three in ten living with HIV. Nevertheless, research among older vulnerable populations who are at high risk for or living with HIV is lacking. This symposium, sponsored by the GSA HIV and Aging Interest Group, will examine opinions on HIV prevention; caregiving; and mental and sexual health among older, sexual minorities living with HIV. Specifically, Dr. Davis will assess the perspectives of older African-Americans on HIV prevention in primary care settings. Dr. Porter will examine vulnerabilities and resilience among older adults living with HIV, and are caregivers for their grandchildren. Dr. Brown will assess the association between age, depressive symptoms and substance use among older MSM living with HIV. Dr. Taylor will examine age-related changes on sexual health of older transgender women living with HIV. Our discussant,

Dr. Brennan-Ing, will highlight the public health implications and key focal points for HIV prevention and improving the lives of older adults living with HIV, especially for those who are most vulnerable.

HIV PREVENTION IN PRIMARY CARE SETTINGS: PERSPECTIVES FROM OLDER AFRICAN AMERICANS

T. Davis, *Interdisciplinary Studies, Rutgers University, Stratford, New Jersey*

The number of older adults diagnosed and living with HIV is increasing steadily. Sources estimate that by 2020, 70% of those living with HIV will be over the age of 50. It is imperative to increase HIV prevention efforts among older adults in order to reduce the number of older adults diagnosed with HIV and dying from AIDS. The purpose of this study was to better understand older adults' perceptions regarding HIV prevention in primary care settings. Data were collected using semi-structured interviews. Thus far, 15 African-Americans over age 50 have been interviewed. Data collection will continue until saturation is reached. Preliminary findings indicate that older adults are unaware of changes in HIV-related demographics, including the increase in HIV rates among adults over 50, but thought that primary care providers should increase HIV prevention efforts for older adults. Findings from this study will be used in developing HIV prevention interventions.

GRANDPARENTS WITH HIV IN SOUTH AFRICA CARING FOR GRANDCHILDREN: VULNERABILITIES AND RESILIENCE

K.E. Porter¹, M.G. Brennan-Ing¹, C. MacPhail², V. Minichiello³, S. Karpiak¹, J. Negin⁴, F. Venter⁴, 1. *Center on HIV & Aging, ACRIA, Quincy, Massachusetts*, 2. *University of New England, Armidale, New South Wales, Australia*, 3. *La Trobe University, Melbourne, Victoria, Australia*, 4. *University of Sydney, Sydney, New South Wales, Australia*

Older adults with HIV in Sub-Saharan Africa are frequently involved in grandchild care, but there are little data on how this impacts well-being and the ability for self-care. We examined a sample of older grandparents with HIV in South Africa (N=90), of whom 40% were caring for grandchildren. Significant differences were examined using *t*-tests and Fisher's Exact Tests ($p < .05$). Caregivers were vulnerable with significantly higher average levels of comorbidities (1.61 vs. .94), loneliness scores (5.19 vs. 4.53), and greater physical, emotional and financial strain due to HIV. They also had more difficulty following medication instructions (45.7% vs. 28%). However, compared to non-caregivers, caregivers showed resilience with greater HIV disclosure and were more likely to endorse the importance of religion (81.2% vs. 65.1%). Findings highlight the need for a programmatic response to address the vulnerabilities and enhance the resilience of older grandparent caregivers living with HIV in South Africa.

AGE, DEPRESSIVE SYMPTOMS, AND SUBSTANCE USE AMONG MEN WHO HAVE SEX WITH MEN LIVING WITH HIV

M.J. Brown, J. Serovich, J.A. Kimberly, *University of South Florida, Tampa, Florida*

Depressive and substance use disorders vary by age, and MSM tend to show higher rates of mental health issues

compared to the general population. However, research examining the association between age and mental health among men who have sex with men living with HIV (MSMLH) is lacking. The aim of this study was to determine the association between age, depressive symptoms, and substance use among MSMLH. Data were obtained from 338 MSMLH. Multivariable logistic regression was used to determine the association between age, and being at risk for clinical depression, and substance use. After adjusting for time since diagnosis, compared to MSM 35–49, MSM aged 50+ had 46% lower odds of being at risk for clinical depression (OR: 0.54; 95% CI: 0.31–0.92) and 51% lower odds of substance use (OR: 0.49; 95% CI: 0.27–0.87). Interventions geared towards reducing depressive symptoms and substance use among MSMLH should consider these age differences.

SEXUAL HEALTH AND AGING NEEDS OF TRANSWOMEN WITH HIV

T. Taylor, *Medicine, SUNY Downstate Medical Center, Brooklyn, New York*

Transwomen with HIV (TWH) are an extremely vulnerable population. Many face social rejection and marginalization, physical and sexual abuse and denial of educational, employment, and housing opportunities. For many, insensitivity to their transgender identity has also resulted in barriers to quality HIV care and treatment; consequently, TWHs are less likely to be on antiretroviral therapy or achieve viral suppression. Few HIV providers have had training or are knowledgeable about transgender health, especially their unique sexual health needs that change as they age. Using qualitative methods (focus groups and interviews) we assessed the sexual health needs of TWHs in Brooklyn to identify factors that impact their sexual health as they age. We found that TWH are often reluctant to seek sexual health care, such as pelvic exams or screenings for STIs and prostate cancers out of fear of discrimination, discomfort with the physical exams, or a lack of money or insurance.

SESSION 3320 (SYMPOSIUM)

SOCIAL BARRIERS TO ADVANCE CARE PLANNING IN THE UNITED STATES

Chair: S.M. Moorman, *Boston College, Chestnut Hill, Massachusetts*

Discussant: D.P. Waldrop, *University at Buffalo, Buffalo, New York*

Twenty-seven years after the passage of the Patient Self-Determination Act, a significant minority of older adults in the United States still lack complete, actionable advance care plans. Issues of access and information are important, but are not the full story. Barriers including cultural values and attitudes and social ties also prevent older adults from engaging in this important preventive health care behavior. This symposium delves into these barriers from the perspectives of human development, nursing, social work, and sociology. Three papers take up the theme of cultural values and attitudes. Noh's focus groups indicated that African American older persons preferred greater use of life-sustaining treatments than white older persons did, not only because of lack of rapport with doctors but also because of belief and hope

in recovery. Supiano and colleagues analyzed narratives of anticipated conditions at end-of-life to explore the role that values played in determining care preferences. Ahmed and colleagues found that just as with other preventive health behaviors, men who endorsed a hegemonic masculinity were less likely to engage in advance care planning. Two papers investigated personal relationships. Koss looked at a spouse's role in promoting planning, finding that men's experiences had a greater effect on their wives than vice versa. Moorman and Boerner concluded that variations in the size, composition, and quality of older adults' social networks are a significant influence on who they prefer to involve in end-of-life decision-making. Discussant Waldrop will make connections across disciplines and draw out implications for policymakers and practitioners.

COMMUNITY-DWELLING BLACK AND WHITE OLDER ADULTS' PERCEPTIONS OF ADVANCE CARE PLANNING

H. Noh, K. Anderson, C.D. Ford, Y. Guo, R.S. Allen, A. Halli-Tierney, K.L. Burgio, *University of Alabama, Tuscaloosa, Alabama*

To address racial disparity in advance care planning (ACP), this study aimed to 1) examine knowledge of and attitudes toward life-sustaining treatments (LSTs) and 2) explore perceptions of ACP among community-dwelling, white and black elders. Fifty-eight participants were recruited and assigned to 8 focus groups by their race. Findings from content analysis revealed that whites had more knowledge about risks of LSTs than blacks; however, knowledge was limited to CPR. Both groups had some knowledge and favorable views of hospice care. While whites preferred comfort care, blacks preferred limited medical care or all life-support. Both wanted further information about when to stop LSTs. Blacks were more hesitant toward ACP with doctors than whites, especially when patient-doctor rapport lacked. Both expressed concerns for potential family conflict in ACP. In-depth information about risks of LSTs and trusted patient-doctor relationship are crucial to promote ACP, particularly among black elders.

THE INFLUENCE OF ANTICIPATED DEATH TRAJECTORIES AND PERSONAL VALUES ON END-OF-LIFE CARE PREFERENCES

K.P. Supiano, N. McGee, K.A. Dassel, R.L. Utz, *University of Utah, Salt Lake City, Utah*

We examined narrative responses of 365 respondents in a national sample of healthy older adults who completed a survey on their anticipated preferences for end of life (EOL) care in the context of various terminal disease scenarios. We explored the relationship between personal values and anticipated diseases and conditions that would influence EOL care choices. Reluctance to burden close others was the most frequently voiced personal value across all conditions affecting EOL preferences, followed by the personal value of quality of life. Concern about whether one's wishes would be honored was more commonly voiced in the context of prospective terminal cancer than in neurological conditions. Respondents who voiced desire for autonomy in how they would die clearly attributed extreme pain as the primary influence on EOL preferences. Because personal values do

influence EOL preferences, care should be taken to ascertain patient values when presenting diagnoses, prognoses, and treatment options.

MASCULINITY BELIEFS AND END-OF-LIFE PLANNING: DOES HEGEMONIC MASCULINITY INHIBIT PLANNING?

M. Ahmed, K. Springer, D. Carr, *Rutgers University, New Brunswick, New Jersey*

Hegemonic masculinity refers to cultural beliefs and expectations regarding the masculine role, such as beliefs that men should be strong, self-reliant, and unemotional. Although these beliefs have been linked to avoidance of preventative health behaviors, we know of no studies exploring the ways masculinity shapes advance care planning (ACP). Using data from the Wisconsin Longitudinal Study, a long-term study of high school graduates from the class of 1957 and their siblings, we evaluate whether masculinity beliefs predict whether a man has a living will, durable power of attorney for health care (DPAHC), and has discussed his treatment preferences with care providers. We find that men who strongly endorse masculine beliefs are less likely to do ACP, although these associations are partly accounted for by socioeconomic status and family structure. We discuss potential health disadvantages associated with beliefs in self-reliance and stoicism, and potential benefits of adherence to the “protector” role.

SPOUSAL INFLUENCES ON ADVANCE DIRECTIVE COMPLETION

C. Koss, *California State University, Sacramento, Sacramento, California*

Using the Actor-Partner Interdependence Model, this study examined how spouses' characteristics influence their own and each other's advance directive (AD) completion. Health and Retirement data on 2,243 heterosexual married couples 65+ were analyzed. Both one's own age and spouse's age were positively associated with a higher likelihood of completing an AD. The worse a spouse's health, the less likely the other spouse would have an AD. Men's education was positively associated with AD completion for both spouses, but women's education only increased their own likelihood of having an AD. Men's prior hospitalization or outpatient surgery also increased the likelihood of having an AD for both themselves and their wives, whereas women's hospitalization/surgery had no significant effect on either spouse. These findings highlight the need to account for the characteristics and experiences of both husbands and wives in advance care planning research and point to important gender differences in spousal influences.

THE SOCIAL NETWORKS OF UNCONVENTIONAL END-OF-LIFE DECISION-MAKERS: STRENGTHS AND VULNERABILITIES

S.M. Moorman¹, K. Boerner², *1. Sociology, Boston College, Chestnut Hill, Massachusetts, 2. University of Massachusetts-Boston, Boston, Massachusetts*

Most older adults choose a spouse or adult child to serve as a surrogate on their behalf should they become decisionally incapacitated at the end of life. However, some older adults make unconventional choices because they

lack immediate family or cannot expect to rely upon them when dying. Unconventional decision-makers are at risk of receiving lengthy, invasive care at the end of life. We investigated the size, composition, and quality of the social networks of 542 unconventional decision-makers and 1,543 conventional decision-makers who participated in the 2005 wave of the nationally-representative National Social Life, Health and Aging Project. We found four distinct groups of unconventional decision-makers: those who had no surrogate preference, those who preferred a surrogate who was not a member of their social network, unmarried parents who bypassed their adult children, and unmarried nonparents. Groups faced different end-of-life risks based on the strengths and vulnerabilities of their networks.

SESSION 3325 (PAPER)

FAMILY CAREGIVING IN CONTEXT

FAMILY CARE WORK IN LONG-TERM RESIDENTIAL CARE: A CASE STUDY OF MEN'S EXPERIENCES AND PERSPECTIVES

A. Phinney, J. Baumbusch, D. Beaton, *University Of British Columbia, Vancouver, British Columbia, Canada*

Many older people are admitted to long-term residential care (LTRC) when families are unable to support them living at home. However, this does not mean that families cease to be involved, or that they simply adopt the role of “friendly visitor”. Rather, it is increasingly recognized that families make important contributions to care work in these settings which are complex and poorly understood. To address this gap in understanding, we are conducting a critical ethnography of family care work in three LTRC settings in British Columbia, Canada. We discuss a sub-set of findings as a case study directly addressing the role of gender in how family care work is enacted. We conducted a thematic analysis of data from the family of an 87 year old woman living in a 75 bed publicly-owned facility. This included in-depth interviews with three sons (5 hrs), a room-mate (1.5 hrs), and participant observation of family visits (4 hrs). Findings are integrated around concepts of masculine roles and relations in the evolving context of family caregiving, drawing attention to themes of *organizing care*, *expressing commitment*, and *creating comfort*. These practices are further interpreted in light of how the men took up issues of age and culture through family story. We discuss these findings in relation to our knowledge translation goals: namely, transforming family involvement in the complex socio-political milieu of LTRC will mean taking into account issues of gender, and specifically the experiences and perspectives of men who are involved in family care work.

CAREGIVING GENDER DISPARITY IN THE CONTEXT OF CHANGING SOCIAL POLICIES: A TALE OF JAPAN

N. Muramatsu, L. Yin, *School of Public Health, University of Illinois at Chicago, Chicago, Illinois*

Globally, women disproportionately bear family caregiving responsibilities. Gender disparity in caregiving is often attributed to culture, rather than to social policies. This

presentation aims to put gendered work of family caregiving in the social policy contexts of Japan, one of the most gendered and rapidly aging societies. In 2000 Japan introduced mandatory long-term care insurance (LTCI), making access to long-term services and supports (LTSS) universal for all persons aged 65+ who need help with daily activities. Using data from large national repeated cross-sectional time use surveys conducted in 1991, 1996, 2001, and 2006, this study examined whether gender disparity in family caregiving declined after the LTCI implementation. Time use was reported for 20 pre-coded activities in 15 minute intervals for two consecutive days (48 hours). The analysis accounted for age, marital status, employment status, education, household income, living arrangement, urban/rural residence, and weekday/weekend. Caregiving gender disparity decreased significantly after 2000 among adults aged 40 to 64. On average, women daily spent 37 minutes more than men on family caregiving before 2000. The gender gap narrowed to 14 minutes after 2000. Universal access to LTSS among older adults is likely to have freed women from some family caregiving and facilitated men to participate in caregiving. Future research should pay increased attention to social policy contexts in understanding gender disparity in caregiving and their impact on the health and well-being of aging caregivers and on gerontological practice in the era of global aging.

TRAJECTORIES OF POSITIVE ASPECTS OF CAREGIVING AMONG FAMILY CAREGIVERS OF STROKE-SURVIVORS

R. Malhotra¹, C. Chei¹, E.B. Menon², W. Chow³, S. Quah¹, A. Chan¹, D. Matchar¹, 1. *Health Services and Systems Research (HSSR), and Centre for Ageing Research and Education (CARE), Duke-NUS Medical School, Singapore, Singapore, Singapore*, 2. *Saint Andrew's Community Hospital, Singapore, Singapore*, 3. *Health Services Research, Eastern Health Alliance, Singapore, Singapore*

Research on family caregivers of stroke-survivors has mostly focused on the negative impact of care provision. Recent theoretical and empirical work demonstrates presence of positive feelings resulting from care provision among family caregivers in general. However, less is known about such positive feelings specifically among family caregivers of stroke-survivors, especially their longitudinal pattern, and their association with the important time-varying covariate of stroke-survivor functional disability. We delineate short-term trajectories of 'Positive Aspects of Caregiving' (PAC) (measured using Tarlow et. al.'s PAC scale) among family caregivers of stroke-survivors and assess the influence of change in stroke-survivor functional disability over time on the level of the delineated trajectories. Longitudinal data on 173 stroke-survivor/caregiver dyads in Singapore, interviewed thrice over 6 months, was utilized. Group-based trajectory modelling was applied to delineate PAC trajectories and identify the influence of change in stroke-survivor functional disability over time. Two distinct PAC trajectories (*low, and stable* [41.9% caregivers] and *high, and stable* [comprising 58.1% caregivers]) were delineated. Increase in stroke-survivor functional disability resulted in an upward shift (~more positive feelings) of the *high, and stable* trajectory, but resulted in a downward shift (~less positive feelings)

of the *low, and stable* trajectory. Care professionals should be mindful of the heterogeneity in the longitudinal pattern of positive feelings resulting from care provision among family caregivers of stroke-survivors. Family caregivers who have both low positive feelings at the start of their caregiver journey and a care recipient (stroke-survivor) with worsening functional disability over time require greater attention and support.

WIDENING THE GULF BETWEEN HAVES AND HAVE-NOTS: AN INQUIRY INTO DIVERSITY IN CAREGIVING SONS IN JAPAN

R. Hirayama, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

What represents recent changes in informal caregiving to aging family members in Japan involves a rapid increase in adult sons who serve as primary caregivers for their parents. At the same time, national estimates indicate considerable heterogeneity in the population of Japanese caregiving sons. In this study, focusing on two typical groups of son caregivers in Japan, that is, married sons with a regular job and single sons who are unstable in their employment, I sought to clarify differences in care experiences between these two groups particularly in relation to the sources and amounts of informal and formal support available for each. Data were collected using personal interviews with 36 caregiving sons from suburban and rural areas in Japan. These sons were mostly in their 50s and provided care for their parents at home. Findings from qualitative analysis on interview transcripts highlighted a gap between "haves and have-nots." Married sons with a regular job benefitted from both direct and indirect assistance from their wives while maximizing the use of public care services covered by national long-term care insurance. By contrast, single sons who suffered from job insecurity limited their use of care services for financial reasons; thus, to manage care responsibilities mostly by themselves, they had to reduce work hours, which further declined their income. On the basis of these findings, I argue that the widening socioeconomic gap among caregiving sons is linked with Japan's familistic welfare system as well as familial institutions that guide assignment of parent care responsibility.

THE EFFECT OF PARENT-CHILD RELATIONSHIPS ON THE WELL-BEING OF PARENTS OF ADULTS WITH MENTAL ILLNESS

E. Namkung, J. Greenberg, *University of Wisconsin-Madison, Madison, Wisconsin*

Previous research found that caring for adult children with serious mental illness (SMI) takes a long-term toll on the well-being of aging parents. A stress process model suggests that having a child with SMI has rippling effects on the parents' relationships with their other children that have the potential to negatively affect parental well-being. However, this has rarely been tested in empirical research. We examined (1) whether the quality of relationships between aging parents and their non-disabled children mediates the effect of having a child with SMI on psychological and physical well-being of parents, and (2) whether mothers and fathers are differentially affected. Using the Wisconsin Longitudinal Study, we analyzed 7,411 aging parents ($M_{age}=71$) regarding

their relationship quality (i.e., feeling of ambivalence, and its positive (solidarity) and negative (conflict) components) with each of their adult children ($n=23,440$, $M_{age}=44$). Structural Equation Modeling was used to estimate the mediation models. Results indicated that parental ambivalence fully mediated the association of parenting a child with SMI on depressive symptoms, and it partially mediated the association on physical health outcomes, including self-rated health, physical symptoms, and health-related quality of life. When feelings of solidarity and conflicts were modeled as separate mediators, only feeling of conflicts significantly mediated the associations. Feelings of ambivalence toward children had stronger effects on the well-being of mothers relative to the effects on the well-being of fathers. In consideration of the role of intergenerational relationships in parental well-being, these findings call for family-level interventions when working with individuals with SMI.

SESSION 3330 (SYMPOSIUM)

LOSS OF VOCATIONAL CAPACITY IN SENIOR PROFESSIONALS

Chair: M.L. Gilhooly, *Brunel University London, Uxbridge, England, United Kingdom*

Co-Chair: C. Hutchins, *Merrill Lynch & Co., Inc.*

Discussant: P.A. Lichtenberg, *Wayne State University, Detroit, Michigan*

This is the third of three symposia organized by the GSA Lifelong Financial Health Workgroup. Symposium 3 is concerned with loss of vocational capacity in senior professionals. Many professionals are now working well beyond the normal retirement age of 65 years. This may include professionals in highly technical and responsible positions, for example, doctors, lawyers, financial advisors and accountants. Ageing is associated with many forms of diminished cognitive capacities and these professionals are just as prone to cognitive decline as the general population. Adverse consequences for financial firms might include reputational damage, loss of business, legal liability and regulatory actions. Adverse consequences for physicians might even include loss of patient life and a charge of medical negligence. In paper 1 Marson provides an introduction to this topic and considers diminished capacity in senior financial advisors. In paper 2 Long outlines capacity issues from a legal standpoint. The serious issue of diminished capacity amongst senior attorneys is considered by Marson in paper 3. Gilhooly considers creativity and cognitive decline in ageing academics in paper 4. Finally O'Neill examines the response of medicine and occupational health in paper 5 and argues for a balanced perspective on the impact of neurocognitive disorders on professional performance.

DIMINISHED VOCATIONAL CAPACITY IN THE SENIOR FINANCIAL ADVISOR: ISSUES AND RESPONSES

D.C. Marson, *University of Alabama at Birmingham, Birmingham, Alabama*

An important aspect of our aging society is that many professionals (eg., attorneys, physicians, accountants, financial advisors) continue to work long after the traditional

retirement age of 65. As a consequence, these professionals become increasingly vulnerable to cognitive decline and diminished vocational capacity (DVC) related to the effects of normal cognitive aging and dementias of aging. This paper addresses DVC in the senior financial advisor (FA), and associated challenges for clients, investment firms and the financial industry, and regulatory agencies. DVC in the senior FA can take multiple forms, including inappropriate investment decisions for clients, absent or failed succession planning, and impaired general workplace performance and behavior. Adverse consequences for investment firms include loss of clients and business, reputational damage, legal liability, and regulatory actions. The paper concludes by discussing possible investment firm responses and programs for identifying and managing DVC in their senior FA workforce.

CAPACITY ISSUES FROM A LEGAL STANDPOINT

R.C. Long, L. Peterson-Sakai, J. Srouji Gantner, *Wells Fargo Advisors, St Louis, Missouri*

This paper investigates the legal aspects regarding cognitive impairment among client-facing professionals. These issues are becoming increasingly more prominent and can be caused by everything from substance abuse to dementia. As such, they can severely impact a person's ability to perform one's job – presenting multi-faceted issues for organizations. Regulatory bodies have not provided much guidance on how to manage or respond to these issues, which often can create age and disability discrimination, leaving firms to develop their own key messages and resources to address these matters. In order to move forward, industry and thought leaders need to help develop forums in which firms and regulators can more openly discuss these complex issues, share best practices, and ultimately identify consistent, effective solutions. By doing so, organizations will be better equipped to serve their clients and employees while simultaneously mitigating this growing risk.

ASSESSMENT OF THE COGNITIVELY IMPAIRED SENIOR ATTORNEY: CONCEPTUAL AND CLINICAL ASPECTS

D.C. Marson, *University of Alabama at Birmingham, Birmingham, Alabama*

This presentation addresses conceptual and clinical issues concerning the senior attorney with cognitive impairment and diminished vocational capacity (DVC). Increasingly attorneys are choosing not to retire at the traditional age of age 65 and instead are working past age 70 and beyond. As a consequence, the legal profession is aging and is vulnerable to cognitive declines related to cognitive aging and dementias of aging. Assessment and appropriate management of the senior attorney with cognitive impairment and DVC represents a growing national problem faced by lawyer assistance programs and state legal disciplinary commissions. Clinicians with knowledge of capacity assessment can play a valuable role in helping these agencies accurately assess and obtain successful disposition in often challenging cases. This presentation will discuss the senior attorney with cognitive impairment, the role of the clinician, conceptual and clinical aspects of such assessments, and will include an instructive case study.

CREATIVITY, COGNITION, AND THE AGEING ACADEMIC

K.J. Gilhooly^{1,2}, M.L. Gilhooly¹, 1. *Department of Clinical Sciences, Brunel University London, Uxbridge, England, United Kingdom*, 2. *University of Hertfordshire, Hatfield, England, United Kingdom*

Academics are amongst the keenest people to postpone retirement. Creativity and high levels of research and scholarly performance are expected of academics. This paper will outline what is known about declines in creativity, problem solving and general cognitive performance, comparing and contrasting academics with the general population. Longitudinal and cross sectional research indicates that fluid cognitive ability tends to decline with age, starting in the early 20s. However, crystallised abilities show little decline until around 60 years and decline quite slowly. Studies of psychometric divergent thinking tests indicate a peak in early middle age with decline thereafter. Overall, the prospects for creative, flexible thinking in later life may seem dim. A more positive view is that cognitive decline can be mitigated by arduous mental activity (“use it or lose it” hypothesis). Although studies of short term “brain training” have lent little support to this idea, longer term activity associated with different occupations does seem to have some benefits, perhaps by building up “cognitive reserves”. The possibility that academics particularly benefit from their mentally active occupations will be discussed. Our own research on mid-life risk factors for cognitive decline in old age will highlight some of the key issues associated with working past the age of 65 years, including how aged academics manage their retirement finances.

KEEPING A BALANCED PERSPECTIVE ON THE IMPACT OF NEUROCOGNITIVE DISORDERS ON PROFESSIONAL PERFORMANCE

D. O’Neill, *Trinity College Dublin, Dublin, Ireland*

The interaction of age-related cognitive disorders on occupational performance among senior professionals is a neglected area of both research and practice, and research from our group indicates that professional and regulatory bodies are unprepared for responding to the challenges that may arise from this condition (1). While increased working life and early detection of dementia call attention to the phenomenon, it is also important that due consideration is given to the problems of ageism and stigmatization of dementia. This presentation will synthesize evolving research from occupational medicine, geriatric medicine and gerontology, along with insights also arising from diverse fields such as traffic/aviation medicine and literature, and in particular aims to contextualize the impact of early dementia on occupational performance relative to conditions occurring across the lifespan such as depression and alcohol/substance abuse.

1. FitzGerald D, Keane RA, Reid A, O’Neill D. Ageing, cognitive disorders and professional practice. *Age Ageing*. 2013 Sep;42(5):608–14.

SESSION 3335 (SYMPOSIUM)

QUALITY IN ASSISTED LIVING: INTERNATIONAL AND CULTURAL FINDINGS AND RECOMMENDATIONS

Chair: L. Schwartz, *American Health Care Association/ National Center for Assisted Living*
IAGG 2017 World Congress

Discussant: P.C. Carder, *Portland State University, Portland, Oregon*

One way to understand the quality of care provided by assisted living (AL) settings is to examine the use of medical and health-related services, including hospitalizations, hospice, and home health care. This symposium includes four papers that describe medical and healthcare outcomes for AL residents in the U.S. and Canada, and quality improvement concepts and tools. Thomas et al. describe findings comparing state differences in the annual rate of hospitalizations, readmissions, hospice use, nursing home (NH) admission, and home health use among a national cohort (n=365,922) of Medicare fee-for-service beneficiaries residing in AL residences. Findings include state-wide hospitalization rates ranging from 19 to 41 percent. For an international comparison, Maxwell et al. describe findings from a study of over 2,000 assisted living and NH residents from 109 settings in Alberta, Canada. The annual incidence of hospitalization was three times higher for AL compared to NH residents. The third paper, by Kemp et al., provides resident and family (n=224) experiences of quality based on a 5-year longitudinal sociocultural study in eight diverse AL communities in one state in the U.S. Findings include a new understanding of how shared perceptions of quality led to the best resident and caregiver outcomes. The final paper, by Zimmerman et al., describes a set of quality improvement tools based on an environmental scan and critique of published tools for improving AL quality. The scan identified tools as well as gaps that require additional research attention. The discussant will summarize cross-cutting quality issues, including staffing and regulation.

HEALTHCARE UTILIZATION OF ASSISTED LIVING RESIDENTS ACROSS THE UNITED STATES

K. Thomas^{1,2}, D.M. Dosa^{1,2}, P. Gozalo¹, V. Mor^{1,2}, 1. *Brown University, Providence, Rhode Island*, 2. *U.S. Department of Veterans Affairs, Providence, Rhode Island*

The U.S. assisted living industry is largely regulated on a state level. Yet, there is little known about the health and healthcare utilization of assisted living (AL) residents across the states. In this paper, we present state differences in the annual rate of hospitalizations, readmissions, hospice use, nursing home admission, and receipt of home health among a national cohort of Medicare fee-for-service beneficiaries residing in large (25+ bed) AL communities. Data come from the 2013 Medicare Master Beneficiary Summary File and claims. Residents (n=365,922) were identified as living in large AL communities based on validated 9-digit ZIP codes. Results suggest that states vary, in some cases dramatically, in their rates of AL residents hospitalized (19%-41%), readmitted to an acute care hospital (4%-8%), admitted to a nursing home (14%-24%), and using hospice (4%-14%) or home health care (14%-44%) annually. Implications and relationships among utilization rates and state regulations will be discussed.

CLINICAL AND HEALTHCARE OUTCOMES OF ASSISTED LIVING RESIDENTS: A CANADIAN PERSPECTIVE

C.J. Maxwell^{1,2}, D.B. Hogan², J.E. Amuah^{3,4}, L.A. Strain⁵, 1. *Schools of Pharmacy and Public Health/Health Systems, University of Waterloo, Waterloo, Ontario, Canada*, 2. *University of Calgary, Calgary, Alberta, Canada*, 3. *CIHI, Ottawa, Ontario, Canada*, 4. *University of Ottawa*,

Ottawa, Ontario, Canada, 5. University of Alberta, Edmonton, Alberta, Canada

Assisted living (AL) has emerged as a popular residential care option for older adults in Canada. Similar to the U.S. experience, its introduction has raised concerns about regulatory oversight, eligibility criteria, staffing levels and quality of care. The Alberta Continuing Care Epidemiological Studies (ACCES) is the first prospective cohort study in Canada to examine AL residents' health and social needs and healthcare outcomes. ACCES included 1,089 older (65+) residents from 59 AL residences and 1,000 residents from 54 nursing homes (NHs) across Alberta. In both settings, dementia was the most common diagnosis (58% AL, 71% NH). Despite being less impaired, AL residents exhibited an annual incidence of hospitalization 3-times higher than NH residents (38.9% vs. 13.7%). They also showed an annual incidence of NH placement of 18.3%. Key drivers of both outcomes included AL resident characteristics (health and social vulnerability) and residence factors (size, staffing levels and oversight).

QUALITY OF CARE AND LIFE IN ASSISTED LIVING: WHAT MATTERS MOST TO WHOM

C.L. Kemp¹, E.O. Burgess¹, M.M. Ball², J.C. Morgan¹, A.F. Fitzroy¹, J.A. Dillard¹, M.M. Perkins², 1. *Gerontology, Georgia State University, Atlanta, Georgia*, 2. *Emory University, Atlanta, Georgia*

Assisted living (AL) residents are embedded in care convoys (i.e., networks) comprised of the evolving collection of individuals who provide informal support and formal care. Although convoy members directly and indirectly influence resident quality of care and life, few studies include the full range of stakeholders. In this paper, we present findings from a 5-year longitudinal qualitative study involving 50 residents and their informal and formal caregivers (n=225) drawn from eight diverse AL communities in the southern United States. Our aim was to identify the ways residents and their convoy members describe what matters most for resident quality of care and life. Perceptions of quality frequently varied by resident and convoy member and were influenced by individual, cultural, and AL residence factors. Within convoys, shared perceptions of quality led to the best resident and caregiver outcomes. Findings suggest that aligning perceptions of quality within convoys is essential to achieving it.

TOOLS FOR QUALITY IMPROVEMENT IN ASSISTED LIVING

S. Zimmerman¹, L. Cohen², T. Washington³, K. Ward¹, P. Giorgio⁴, 1. *University of North Carolina, Chapel Hill, North Carolina*, 2. *Duke University, Durham, North Carolina*, 3. *University of Georgia, Athens, Georgia*, 4. *Evergreen Estates, Cedar Rapids, Iowa*

Assisted living (AL) has been in evolution for decades; now more than ever, providers must attend to quality in light of variations across settings, increased resident acuity, and changes spurred by health care reform. Unfortunately, quality improvement is hindered because few are aware of valid and reliable measures and instruments that have been used in AL or other health and long-term care settings that

serve similar populations. This project conducted a comprehensive environmental scan and critique of tools applicable for quality improvement in five domains. Literature searches generated 9,048 citations, 361 grey literature sources, and 51 websites, ultimately identifying 254 tools. After critiquing tools in relation to their psychometrics and utility for quality improvement, 96 were recommended to improve person-centered care (6 tools), medication management (10), care coordination/transitions (17), resident/patient outcomes (35), and workforce (28). A gap analysis indicated need to develop tools to assess staff sufficiency and overall quality.

SESSION 3350 (PAPER)

LONG-TERM CARE I

THE IMPACT OF LONG-TERM CARE POLICY ON FAMILY ELDERCARE COSTS IN CHINA: A SYSTEM DYNAMICS SIMULATION

R. Peng¹, X. Huang¹, B. Wu^{1,2}, 1. *Guangdong University of Finance and Economics, Guangzhou, China*, 2. *New York University, New York, New York*

Due to lack of long-term care (LTC) insurance in China, Chinese families bear most of the long-term care costs for frail older adults. This study aims to understand the impact of current and future LTC policies on family eldercare hours and costs in China. System dynamics methodology was used to construct a LTC system model in order to analyze and simulate LTC cost-sharing and service allocation models across three different LTC settings (family, community, and LTC facilities). Based on the data from the Chinese Longitudinal Healthy Longevity Survey and other public available data, using variables on time adjustment and LTC insurance, we estimated the impact of LTC policies on family eldercare expenditures and hours respectively. Results showed that both average weekly hours and expenditures for family eldercare are projected to increase approximately 30% from 2015 to 2030 if there is no policy changes. Family eldercare hours and expenditures were significantly reduced by increasing the capacity of nursing home care and community care, and implementing long-term care insurance compensation. This study suggests that policy makers in China should plan the long-term care capacity for elders, and explore the possibility of establishing public long-term care insurance to help Chinese families to meet their LTC needs.

FOSTERING HOMELIKENESS IN NURSING HOMES: QUALITATIVE RESULTS FROM FAMILY AND FRIENDS OF RESIDENTS

L.E. Weeks¹, R. Stadyk¹, S.A. Chamberlain³, J. Keefe², 1. *Dalhousie University, Halifax, Nova Scotia, Canada*, 2. *Mount Saint Vincent University, Halifax, Nova Scotia, Canada*, 3. *University of Alberta, Edmonton, Alberta, Canada*

Identifying how to enhance the quality of life for older adults living in nursing homes can contribute to transforming health care institutions into person-centered homes, an approach to care that places residents' relationships, life

experiences, abilities, preferences and dignity at the forefront. One component of a federally-funded study of 23 nursing homes in Nova Scotia, Canada, focused on how to enhance the quality of life in nursing homes from the perspective of the family members and friends of the residents. Quantitative results clearly showed that from their perspective, homelikeness is associated with higher resident quality of life. We will present qualitative results to provide further insights into how to foster homelikeness within the nursing home environment. We thematically analyzed data collected from family members and friends of nursing home residents through 1) open-ended survey questions from 397 family members and friends, and 2) focus groups with 20 family members and friends who participated in the survey. Analysis of open-ended survey questions resulted in identifying key features that either strengthen or limit homelikeness in nursing homes. Analysis of the focus group data resulted in further identifying how homelikeness can be fostered in three key ways: care provided and relationships (e.g. staffing models that allow for individualized care), public spaces (e.g. the effective use of public spaces to support relationships), and private spaces (e.g. personalization). Our results provide evidence to nursing home decision makers about how to improve resident quality of life through creating a homelike environment.

PROMISES AND PERILS OF PERMANENT RESIDENT ASSIGNMENT IN RESIDENTIAL CARE FACILITIES

S. Caspar, *Health Sciences: Therapeutic Recreation, University of Lethbridge, Lethbridge, Alberta, Canada*

Purpose: Permanent resident assignment (PRA) is the practice of assigning resident care aides (RCAs) to care for the same residents every shift they work. It has been touted as “the magic bullet” of culture change in residential care facilities (RCFs) and is considered by many to be essential to person-centred care. The purpose of this study was to explore how staff assignment practices affect the care giving experience from the perspectives of RCAs, residents, and family members.

Methods: We conducted an institutional ethnography to explore the social organization of care in RCFs. The study was set in three RCFs: one with consistent PRA; one with PRA in one area of the facility and six week staffing rotations in another area of the facility; and one that had recently switched from PRA to three month staffing rotations. Data included 104 hours of naturalistic observation and 76 in-depth interviews.

Results: The RCAs and residents described the primary benefit of PRA as being able to “get to know” each other well. Family members indicated that it assisted them in knowing who to go to when they had questions or concerns. However, RCAs also indicated that PRA had a negative impact on team work and diminished the exchange of individualized resident-care information amongst the care staff.

Implications: Management initiatives are needed to ensure that the implementation of PRA does not result in the unintended consequence of diminishing staff members’ experience of teamwork or their ability and willingness to exchange pertinent, individualized resident-care information.

DETECTING IMPROPER TRANSFER TECHNIQUES TO REDUCE CAREGIVER INJURIES

Y. Young¹, M. Leventhal¹, J. Muckell¹, P.E. Raymond², F. Erlich³, C. Paynter¹, 1. *State University of New York at Albany, Albany, New York*, 2. *Humancondition Safety, New York, New York*, 3. *Living Resources, Inc, Albany, New York*

Background: Home health aides (HHAs) often suffer injuries as a result of improperly lifting and transferring patients from one location to another. The objective of this pilot study was to find innovative solutions to prevent work-related injuries among this population.

Methods: This was a cross-sectional study. Seven HHAs were recruited and given a questionnaire about their work experiences and history of injuries. A trained physical therapist was consulted to determine what improper lifting techniques and body mechanics would lead to work-related injuries. Next, motion sensors were attached to the seven HHAs while they performed patient transfers. The extent to which home health aides followed correct procedures was assessed using the motion capture data. The lifting technique and body mechanics ratings were both analyzed with multivariate linear and logistic regression models while controlling covariates in the model.

Results: Obesity was associated with a worse body mechanics score ($p < 0.0001$), while fear of injury was associated with better body mechanics ($p < 0.0001$). Generalized estimating equations identified that twisting the spine during transfers (OR = 6.3; 95% CI: 1.09–36.7) and not using a wide support base when lifting from supine to sitting (OR= 6.0, 95% CI: 2.03–17.7) were both associated with improper lifting technique and body mechanics.

Conclusions: This study identified two modifiable risk factors (obesity and lacking a fear of injury) and two individual transfer items that are associated with improper transfer techniques and body mechanics. A larger study subjects with multiple sites is underway.

SESSION 3355 (SYMPOSIUM)

AGING IN PLACE—THE VILLAGE MODEL AND ITS IMPACT ON OLDER ADULTS’ QUALITY OF LIFE

Chair: S. Hou, *University of Central Florida College of Health & Public Affairs, Orlando, Florida*

Co-Chair: N. Galucia, *Village to Village Network, St Louis, Missouri*

Discussant: A.E. Scharlach, *University of California, Berkeley, California*

This symposium introduces the growing popularity of the Village model. Villages are a new, consumer directed organization that aim to promote aging in place through a combination of social engagement, member-to-member support, and collective bargaining for services. These membership organizations are expanding rapidly in the US due to the increased cognizance of the benefits of aging in community and avoiding institutionalization. A representative from the Village to Village Network will join the symposium and provide an overview of the history and current state of this unique social movement. Researchers from the University of California will give an overview of Village organizational characteristics

from their 2016 national survey of Village directors. They will also present results from their national survey of Village members (N=1,900) focusing on the perceived impact of village membership on social engagement and quality of life. Additionally, researchers from the University of Central Florida will highlight one unique innovative village model as a case study. The Thriving-in-Place (TIP) village locates in the Celebration community in Orlando. Founded by the Walt Disney Company, this resort-style community environment was formed with the concept of building a better place to live and age gracefully. This symposium will further discuss promises and challenges of the village model on promoting aging in place.

REDEFINING AGING IN COMMUNITY THROUGH THE VILLAGE MODEL

N. Galucia, *Village to Village Network, St Louis, Missouri*

Hill Neighborhood of Boston, MA in 2001, has now spread across the US into Canada, the Netherlands and Australia. The Village model is a consumer-driven, affordable option for older adults who wish to remain in their homes and communities as they age. Each Village is a little different as the model adapts to meet the needs of each community, but the guiding principles of aging in community, working together and living vibrantly remain the same. Village to Village Network is a national organization that collaborates to maximize the growth, impact and sustainability of individual Villages and the Village Movement. The Network provides expert guidance, resources and support to help communities establish and maintain their Villages. VtV Network shares best practices, lessons learned and studies the model as it emerges across the world. An overview of the Village Model and several Village examples of Villages in different countries will be discussed.

RESULTS OF A NATIONAL STUDY OF VILLAGES AND MEMBER IMPACTS

C.L. Graham, A.E. Scharlach, *School of Public Health, University of California, Berkeley, Berkeley, California*

UC Researchers will present results of both a national survey of 1,900 Village members and 120 Village directors. The Village movement more than doubled between 2012 and 2016, from 80 to 160 in the US. Most Villages are freestanding and not for profit, with less than 2 paid staff members. Villages are expanding; with the average number of members increasing to over 100. The most common Village services include social and educational activities. Over 40% of members volunteer, providing other members with transportation, companionship or other support services. Over half of members say that they are more socially engaged and have better quality of life because of the Village. But only 8% report more positive health outcomes. Members who participate in more village activities like social events and volunteering are more likely to report positive benefits. Villages may face challenges serving more frail seniors as they age.

QUALITY OF LIFE AMONG YOUNG OLD, OLD, OLD OLD, AND THE OLDEST IN THE THRIVING VILLAGE

S. Hou¹, G. Niec², P. Kinser², D. Cummings^{3,4}, 1. *Health Management & Informatics, University of Central Florida College of Health & Public Affairs, Orlando, Florida,*

2. *Celebration Foundation, Orlando, Florida,* 3. *Florida Hospital Foundation, Orlando, Florida,* 4. *IQ Orlando, Orlando, Florida*

This study examined quality of life (QOL) among village older adults in a small town community in Florida. The 13-item Older People's Quality of Life (OPQOL-brief) was used. A total of 49 village members and volunteers participated. About 75% were females, 89% were whites, 56% were married, 85% had college education, 35% living alone, and 55% were volunteers. Mean age was 70.5 (SD=10.49). OPQOL Reliability was satisfactory ($\alpha = .92$). The overall OPQOL scores were high (mean=59.3; SD=6.13), and were significantly different by age groups ($p < .001$). Data showed that late middle-age had higher QOL scores than young old (mean of 63.62 vs. 57.47) and the oldest old adults (mean of 63.62 vs. 53.25) ($p < .05$). The study village consists of highly educated white older adults. More village studies and larger study samples are recommended. Results provide needed data for developing older age-tailored programs to promote healthy aging in village communities.

A MIXED-METHOD STUDY ON QOL BY VOLUNTEER STATUS AND LIVING ARRANGEMENT AMONG VILLAGE MEMBERS

R. Purdie, M. Vance, S. Hou, *Health Management & Informatics, University of Central Florida College of Health & Public Affairs, Orlando, Florida*

This study examines how volunteer status and living arrangement influence quality of life (QOL) quantitatively, and what qualitative barriers, facilitators, and strategies to enhance healthy lifestyle were suggested among village members. A convergent, parallel mixed method design was utilized. A total of 44 village members and volunteers participated. About 75% were females, 89% were whites, 35% living alone, and 55% were volunteers. Overall participants reported high QOL and there were no significant differences by volunteer status or living arrangements. Physical impairment and motivation were common barriers mentioned, while those who live alone also reported transportation as a barrier. Those who live alone preferred informal socialization while those who live with others preferred formal socialization. Volunteers were less likely to report physical barriers and identified more strategies to promote healthy lifestyle. Study results have implications on designing health promotion programs for village older adults with different status and needs.

SESSION 3360 (SYMPOSIUM)

ENVIRONMENTAL GERONTOLOGY: OLDER ADULT PARTICIPATION IN DESIGN FROM NURSING HOME TO NEIGHBORHOOD

Chair: A.B. Mitchell, *Thomas Jefferson University, Philadelphia, Pennsylvania*

Co-Chair: A.R. Eisenstein, *CJE SeniorLife, Chicago, Illinois*

Discussant: F. Oswald, *Goethe University Frankfurt, Frankfurt, Germany*

The design of the built environment can facilitate or hinder older adults as they navigate their living space in the home and community. This symposium sponsored by

the Environmental Gerontology Interest Group examines the challenges of design implementation in nursing homes, assisted living facilities, and neighborhoods to create an age friendly environment. These four presentations offer findings from studies in which older adults participated with researchers and community members in various environments to identify specific features of the built environment to enhance their physical activity, and engage in social interaction. Each setting presents its unique challenges for funding and implementing the design recommendations.

ENVIRONMENTAL ATTRIBUTES OF PERSON-CENTERED CARE

M. Kaup, J. Poey, *Kansas State University, Manhattan, Kansas*

Implementation of person-centered care (PCC) in nursing homes requires multiple strategies related to organizational, operational, and environmental practices. Understanding the details of the combinations of these practices and the environmental features that work in co-occurrence will be critical in advancing and sustaining meaningful change for residents and staff in long-term care settings. This presentation will describe the strategies and processes for conducting detailed environmental assessments on ten nursing homes participating in a pay-for-performance program linked to PCC in Kansas (PEAK). Unlike assessment instruments that score facilities based on a checklist of attributes, this assessment strategy was designed to provide a descriptive narrative of the combination of organizational, operational, and environmental variables present. Results of the assessments demonstrate that there are environmental features that are integral to patterns of effective and meaningful organizational and operational practices. Spatial characteristics that distinguish facilities that have achieved high-levels of PCC will be demonstrated.

NAVIGATING THE HUMAN PATH IN AN INTERGENERATIONAL DESIGN STUDIO

D. Gillette^{2,5}, J. Fisher^{3,4}, J.C. Yeh⁷, P. Moore⁶, C. Gladstone⁷, D. Fishman⁷, 2. *Center for Information Technology Research in the Interest of Society (CITRIS), Berkeley, California*, 3. *Training for Development of Innovative Control Technologies (TDICT) Project, San Francisco, California*, 4. *Aging 2.0, San Francisco, California*, 5. *Public Health Institute, Oakland, California*, 6. *MooreDesign Associates, Phoenix, Arizona*, 7. *University of California, San Francisco, Institute for Health & Aging, San Francisco, California*, 7. *University of California, Berkeley, Berkeley, California*

Design is an important concept for environmental gerontology because it exposes opportunities to modify or optimize relations between people and their environment. Following autocratic protocols or targeting a single end-user group limits the effectiveness of design. Co-design is a participatory approach that subverts relations of power by actively involving all stakeholders throughout the process to imagine and create usable products, services, and experiences that meet broader needs. This presentation describes lessons learned from an innovative pilot course involving 16 college undergraduates and 15 elders who explored how co-design

can better facilitate affordable, healthy, and meaningful aging in our society. Applying a user-centered lens of mobility and interconnectedness, participants worked in intergenerational teams as designers, students, teachers, coaches, and users to create transportation and community connection projects. This course advances a co-design movement aimed at developing exceptional, ethical, and inclusive products to better support navigating the human path throughout the lifespan.

AGE-FRIENDLY WEST PHILADELPHIA: ENGAGING COMMUNITY TO IMPROVE THE BUILT ENVIRONMENT

J. Russell, N.E. Strumpf, J. Lukach, *Ralston Center, Philadelphia, Pennsylvania*

Ralston Center, a nonprofit provider of senior services, collaborated with over fifty stakeholder groups, including community organizations, academic institutions, and city government, to develop its Age-Friendly West Philadelphia Initiative and create positive age-friendly change. Advisory committees helped develop programs on resource access and navigation, social connection, and improvements to public spaces. Ralston teamed with a local civic organization and two artist-led organizations to conduct a walkability audit, design outdoor furniture, and improve accessibility in a high-poverty neighborhood. Volunteers documented improvements needed to facilitate neighborhood walkability, identified locations for benches specifically designed for older residents, and locate appropriate wayfinding signs that highlight and honor community assets. Intergenerational design sessions, fabrication sessions and a community celebration follow, engaging and empowering older residents at each phase. The ongoing project informs age-friendly endeavors in a high-poverty urban area, and leads to new partnerships to benefit the community at large.

SESSION 3365 (SYMPOSIUM)

DEVELOPMENTS IN AFRICAN GERONTOLOGY AND GERIATRICS: TAKING STOCK AND LOOKING AHEAD

Chair: I. Aboderin, *African Population and Health Research Center*

Co-Chair: J.R. Hoffman, *Noth-West University, SA, Vanderbijlpark, South Africa*

About a decade since the formal establishment of an IAGG Africa region in 2009, and an earlier attempt to forge directions for research on ageing in the region, this symposium takes stock of, and reflects on the evolution of the African endeavour on gerontology and geriatrics over the past 10 years. The four key speakers, all of which have played central roles in the development of the field, will reflect on both major step changes and initiatives that have emerged in Africa policy, scientific inquiry, capacity building and exchange on ageing, as well as on continued and newly arising challenges to further progress in these areas. A joint discussion on opportunities for addressing the difficulties and strengthening the African aging endeavour, including through greater engagement with other IAGG regions will conclude the session.

A SUMMARY OF CURRENT AGING RESEARCH IN SUB-SAHARAN AFRICA

P. Kowal^{1,2}, J. Byles², 1. SAGE, WHO, Yangon, Myanmar, 2. University of Newcastle Research Centre for Generational Health and Ageing, Newcastle, New South Wales, Australia

“Good data are public goods for both policy and research.”

- p. 7, National Research Council (2001) Preparing for an Aging World: The Case for Cross-National Research. Washington DC: National Academy Press.)

Information on the status and specific needs of older people in Africa is needed to advocate for policy changes and to target programmes and support. Rapid population ageing and the growing absolute numbers of older persons in Africa, demand the full and comprehensive inclusion of ageing matters into the formulation of many of the current sustainable development goals and targets. We will describe efforts undertaken to document and describe research on aging in sub-Saharan Africa between 2004 and 2015, using a variety of techniques. The presentation will also include a summary of how identified research during this period addressed the policy directions described by the Madrid International Plan of Action on Ageing (MIPAA), and the research methods that were used (qualitative, quantitative, mixed). Taken as a whole, the Directory demonstrates the growing body of rigorous and in-depth aging research across Africa. While not all aging research in Africa has been included here, a review of the updated Directory indicates that research has been less active in some countries, and that some high-priority areas of research remain under-investigated. It is hoped that the updated Directory spurs additional research and discussion.

EVOLUTION OF THE IAGG AFRICA REGION AND CONTINENTAL AGEING POLICY ARCHITECTURE: FUTURE IMPLICATIONS

I. Aboderin, 1. African Population and Health Research Center, Nairobi, Kenya, 2. Centre for Research on Ageing, University of Southampton, Southampton, United Kingdom

An Africa region of the IAGG was established formally in 2009 in recognition, first, of the profound omission that the non-representation of the continent among IAGG's regions constituted and second, of an intensifying endeavour, which had emerged a few years prior, to promote and foster directions for African research and capacity building on aging. Over the past seven years important steps have been made toward an expansion of gerontology and geriatrics in the Africa region - yet major difficulties remain in consolidating this progress. In the same period the national, regional and global policy and legal architecture that commits African countries to action on ageing has expanded tremendously, heightening the need for gerontological and geriatric evidence and competence. This presentation reflects on key experiences in the evolution of the IAGG Africa region, and discusses implications of the new policy and legal regime for a further advancement of IAGG-connected inquiry, training and exchange activities in the region.

FORMAL GERIATRIC MEDICINE TRAINING IN SOUTH AFRICA AND BEYOND: DEVELOPMENTS AND CHALLENGES

B. Cassim, University of KwaZulu-Natal, Durban, South Africa

The absolute number of older people in sub-Saharan Africa (SSA) is rising rapidly within a context of an increasing burden of non-communicable diseases. Multimorbidity, geriatric syndromes and declines in intrinsic capacity in the region's growing older population require concerted health care responses. Yet, Geriatric Medicine training and services have not kept pace. South Africa, for example, where geriatrics is more established than elsewhere in SSA, has just one geriatrician per 275,000 older persons.

To address the gap, the South African Geriatrics Society (SAGS) has initiated a Diploma in Geriatric Medicine aimed at primary health care physicians, with private funding sought to support the course. Many challenges remain however in South Africa and SSA, broadly. This presentation discuss the format of the Diploma, its expansion to other parts of Africa and possible approaches to addressing persistent impediments to an SSA-wide training of a critical mass of specialist geriatricians.

AFRICAN RESEARCH ON AGEING NETWORK (AFRAN)—ADVANCES, CHALLENGES, AND PROSPECTS

J.R. Hoffman, 1. North West University, Vanderbijlpark, South Africa, 2. Oxford Institute of Population Ageing, University of Oxford, Oxford, United Kingdom

The African Research on Ageing Network (AFRAN) is a network that offers a collaborative platform of African and international institutions and individuals from academia, policy and practice. It was established in April 2005 to address the substantial gaps in ageing research, and to promote coherent direction for research and training on ageing in Africa. Having grown to 154 individual members, representing 25 different countries and 10 organisations, from 8 countries, ageing issues in Africa are now thoroughly mainstreamed by AFRAN-members on the international ageing agenda. Members work on issues ranging from poverty, general health issues, HIV/AIDS, and intergenerational / family dynamics. Drawing on the past ten years' experience, this presentation will offer key advances in, and challenges to the expansion of the community of scholars and practitioners on ageing in sub-Saharan Africa and share the unfolding debate, exchange and capacity building among them

SESSION 3370 (SYMPOSIUM)

SURVEILLANCE TECHNOLOGIES IN LONG-TERM CARE: A BLIND SPOT FOR GERONTOLOGISTS?

Chair: C. Berridge, University of Washington, Seattle, Washington

The commercial visibility of technological devices that monitor in the name of care has exploded with the expansion of internet-connected home surveillance products. Cameras that are popular for pet or child monitoring are now accessible for a variety of purposes in elder care. In multiple countries, public interest in the use of surveillance cameras in nursing home resident rooms is renewed periodically when major news outlets highlight a case of abuse captured by a hidden camera. Whether initiated by facilities or family members, camera use is at once a complex practice, policy, and ethical issue. Neither facility staff nor the resident who is placed under surveillance is likely to be a decision-maker when the question of camera use comes up

in long-term care facilities. Policy makers, facilities, and family members thus carry a heavy responsibility to understand the nuances and consider all consequences of camera use in older adults' living spaces. In this symposium, gerontologists from Canada, Scotland, and the U.S. will present findings from their research on camera use in nursing homes, assisted living communities, and private homes. Drawing on research in long-term care facilities, we will consider how cameras are used in practice by facilities to monitor the behavior of residents and care workers. The experiential complexities of living with surveillance technologies at home will be described along with ethical implications. We will then present a legal analysis of U.S. state nursing home electronic monitoring laws to examine how these laws balance multiple stakeholders' vulnerabilities.

CHALLENGES AND OPPORTUNITIES OF USING SURVEILLANCE TECHNOLOGIES IN RESIDENTIAL CARE

R. Woolrych, *Heriot Watt University, Edinburgh, United Kingdom*

Surveillance technologies are becoming an increasingly pervasive tool for monitoring older adults in long-term care. A number of these technologies have been designed to support independence and well-being through monitoring everyday lifestyles and behaviours. However, in acting as an observational tool, concerns have been raised about how these technologies may impact privacy and autonomy, and affect care delivery. This study reports on qualitative research conducted in a long-term care home in Vancouver, Canada where video surveillance cameras were deployed to observe the behaviours of older adults in long-term care. The findings identify some of the potential benefits of surveillance (as an intervention and care management tool) alongside challenges and unintended consequences (on resident behaviour and care relationships). Understanding the consequences of surveillance technologies is important in order to better assess their efficacy in formal care settings.

A LEGAL ANALYSIS OF PIONEERING U.S. STATE LAWS REGULATING RESIDENT-ROOM CAMERAS IN NURSING HOMES

C. Berridge¹, K. Levy², *1. School of Social Work, University of Washington, Seattle, Washington, 2. Cornell University, Information Science, Ithaca, New York*

There is little published research on the effects or desirability of cameras used in nursing home resident rooms to detect or deter abuse, yet policy makers are making decisions about how to regulate their use for this purpose. In the United States, there is no federal law to regulate camera use, but five states now have electronic monitoring laws allowing residents or family members to install cameras in nursing home resident rooms. Using analyses of bills, amendments, committee sessions, floor votes, and public comments, this paper provides an in-depth socio-legal policy analysis of the development and content of these five state electronic monitoring laws. Particular focus is given to how residents', family members', nursing home facilities', and care workers' privacy and other interests are prioritized and protected. This research has important policy implications in the context of rapid policy movement on this issue in the U.S. and beyond.

SURVEILLANCE TECHNOLOGY IN ELDER CARE: SOME THEORETICAL OBSERVATIONS ABOUT OBSERVATION

A. Sixsmith, *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

Foucault's representation of a town contaminated by plague and the measures to stop the disease describes how a system designed to contain the disease has an impact on an individual's actions. Their behaviours and personalities become increasingly shaped by the parameters of the system. In monitoring older people, surveillance technology has the potential to not only observe, but also determine their behaviour, actions and routines and make inferences about the individual. If we are to rely on this observational data alone, the surveillance technology becomes a lens through which we construct the individual – their personality, their character and the ways in which the observer/care provider can control and intervene to ensure that they lead a "safer and healthier life". Theoretical ideas about the tensions between the observer and the observed are discussed to better understand the nature of surveillance technologies within the elder care sector.

SESSION 3375 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: COMPARATIVE PERSPECTIVES ON THE FINANCIAL EXPLOITATION OF OLDER ADULTS

Chair: B. Penhale, *University of East Anglia, Norwich, United Kingdom*

Co-Chair: P. Lloyd-Sherlock, *University of East Anglia, Norwich, United Kingdom*

Discussant: M.S. Lachs, *Weill Medical College of Cornell University*

In recent years, the financial exploitation of older people has emerged as a virtual epidemic in high-income countries. There has been increasing attention to this issue, including research, development of assessment tools and involvement of the financial services industry as concern has grown.

Concurrently, less wealthy countries are seeing the fastest rates of population ageing and many have rapidly expanded pension coverage. However, the possibility that pensioners may be vulnerable to financial exploitation by family members and others, including through such mechanisms as pension pooling, predatory credit schemes and fraudulent selling of products such as bogus health insurance and legal services, has not been systematically assessed.

Papers in this symposium will provide, for the first time, a comparative analysis of financial abuse across developed and developing countries. Following introductory comments from the Chair (Penhale), papers will identify key areas of similarity and divergence, with reference to issues such as risk factors (Burnes/Pillemer), forms and consequences of abuse (Lloyd-Sherlock; Redondo; Conrad) and policy responses. Analysis will include cultural influences on how financial abuse is understood, perceived and experienced, by older victims and perpetrators. We will include comparative perspectives on the issue from the financial services sector (Gresham), as a key stakeholder. Finally, the discussant (Lachs) will synthesise the presentations and open the symposium for discussion.

This symposium will be of interest to academics seeking to develop collaborative, comparative research on abuse of older people, and aims to promote an international action agenda on this emergent and important topic.

PREVALENCE OF ELDER FINANCIAL FRAUD AND SCAMS: A SYSTEMATIC REVIEW AND META-ANALYSIS

D. Burnes¹, K.A. Pillemer², C. Henderson², C. Sheppard³, R. Zhao¹, M.S. Lachs⁴, 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *Cornell University, Ithaca, New York*, 3. *University of Waterloo, Waterloo, Ontario, Canada*, 4. *Weill Cornell Medical College, New York City, New York*

Elder financial exploitation research to date has largely focused on scenarios occurring within relationships of trust (e.g., family). Little is known about elder financial fraud and scam (EFFS) forms of exploitation perpetrated by strangers, including foundational prevalence knowledge. This paper presents on EFFS prevalence estimation in the United States based on a systematic review and meta-analysis of state- and national-level population-based studies. Systematic review of the literature using multiple screeners/reviewers resulted in 12 eligible studies. To estimate EFFS prevalence, meta-analysis used generalized mixed modeling containing binomial error assumption and a logistic link function, with studies included as levels of a random classification factor. Overall EFFS prevalence (one- to five-year period) was 5.64% (95% CI: 4.04%-7.83%). Sub-analysis on study methodological differences revealed no significant effect on prevalence estimation. This study provides the most valid EFFS prevalence estimate to date, which is a necessary foundational piece for further research on the topic.

ELDER FINANCIAL ABUSE IN LOW- AND MIDDLE-INCOME COUNTRIES: AN UNCHARTED RESEARCH AGENDA

P. Lloyd-Sherlock, *University of East Anglia, Norwich, United Kingdom*

There is almost no published research on the financial abuse of older people in low and middle income country (LMIC) settings. This paper notes that, despite the absence of robust prevalence studies, individual and environmental risk factors indirectly indicate that the problem is widespread. For example, the number of people at old ages is growing rapidly and many have limited experience of managing personal finance. In many LMICs, increasingly extensive pension coverage and high rates of home ownership among elders contrast with limited livelihood opportunities for other age groups. The paper notes a reluctance to engage with this issue, among both national stakeholders and international development agencies, who focus overwhelming on the positive effects of extending pension coverage. Drawing on available evidence from Brazil, the paper identifies different forms of financial abuse and puts forward a strategy to stimulate research on this issue in LMICs.

FINANCIAL ABUSE IN ARGENTINA: A CASE OF ABUSOGENIC ENVIRONMENT

N. Redondo, 1. *Universidad Isalud, Buenos Aires, Argentina*, 2. *Maestria en Gestion de Servicios Gerontologicos, Universidad Isalud, Buenos Aires, Argentina*

This paper analyzes empirical evidence provided by data sources from the Argentina National System of Statistics as well as qualitative research carried out in two main cities of the country. On the basis of such evidence, the article described patterns of ownership, coverage of pensions, and type of households of the elderly population. It is argued that these patterns have combined to social factors such as the legal framework, macroeconomic instability, and downward social mobility contributing to generate an “abusogenic” environment for the elderly population. The fragility and dependence in instrumental activities of daily life are individual risk factors that contribute to financial abuse on their pensions and their properties, if any, mainly among widows or single women. The information provided by the qualitative research shows that abuse situations are not perceived as such by the elderly because the prevailing family relationships in society.

VALIDATION OF FINANCIAL EXPLOITATION PREDICTORS USING SUBSTANTIATION DECISION AS THE CRITERION

K.J. Conrad^{1,2}, S.R. Beach³, M. Liu⁴, M. DeLiema⁵, Z.D. Gassoumis⁷, M. Iris⁶, 1. *University of Illinois at Chicago, Chicago, Illinois*, 2. *Chestnut Health Systems, Normal, Illinois*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 4. *University of California San Francisco, San Francisco, California*, 5. *Stanford University, Palo Alto, California*, 6. *CJE Senior Life, Chicago, Illinois*, 7. *University of Southern California, Los Angeles, California*

This paper compares financial exploitation (FE) to physical abuse, emotional abuse, and neglect on theory-based predictors of abuse, including abuser risk factors, isolation, and victim vulnerabilities using data from the Elder Abuse Decision Support System study. The dataset contains assessments of elder abuse and its causes on 948 investigations of persons age 60 and older. Sensitivity and specificity analyses are presented of all *theoretical predictors* listed above and FE measures and items using caseworker substantiation decision as the criterion. Using specificity of greater than 30%, the best predictors of FE were selected. This procedure was repeated to test emotional/psychological abuse, physical abuse, and neglect measures and their best theoretical predictors and items. The three risk factor comparisons were examined to discern the unique characteristics of FE. The analyses provided empirical evidence from elder abuse investigations indicating which items are most predictive of FE. Such evidence may support prevention and intervention.

A BULL MARKET FOR ELDER FINANCIAL ABUSE IN NORTH AMERICA

S.D. Gresham, 1. *Brown University, Providence, Rhode Island*, 2. *Cornell University, New York, New York*

More than 30 years of financial market growth has helped spread the ownership of financial assets across a broad range of investors -- ushering in a new era of personal, empowered capitalism while increasing the opportunities for financial abusers. Stock and bond markets have flourished with the former rising 20-fold to over \$20 trillion market value in the US. Total financial assets owned by individual North American investors now exceed \$150 trillion and more than 50 million individuals directly manage their own retirement accounts. Additional trends increase the vulnerability of this

newfound wealth, especially among the elderly, including the rise of self-directed accounts and the pervasiveness of online and mobile financial management.

SESSION 3380 (SYMPOSIUM)

ADDRESSING AGING ATTITUDES ACROSS THE LIFESPAN THROUGH INTERGENERATIONAL EDUCATION AND EXPERIENCES

Chair: C.R. Bolkan, *Washington State University, Oregon*

Discussant: R. Hanks, *University of South Alabama, Mobile, Alabama*

Ageism is prominent around the world. It significantly influences how we treat elders and how we respond to our own aging process. A growing body of evidence indicates that age stereotypes and negative perceptions about aging are strongly associated with later physical frailty. Further, age stereotypes can emerge very early in childhood and persist across the lifespan. As such, at a time when the world's population of people aged 60+ is expected to triple to almost 2 billion by 2050, it is imperative to increase gerontological/geriatric training and outreach, especially to children and young adults. This drastic population shift will also dramatically affect family configurations as increased life expectancy will mean longer intergenerational relationships between children and older family members, further underscoring a need for increased focus on intergenerational education and experiences. Although gerontological/geriatric education and training resources exist, they are underutilized. In addition, more evidence-based interventions and guidance regarding how to effectively implement intergenerational activities in a variety of contexts are needed to bridge the gap between science to practice. In this symposium, attendees will learn about four applied research examples of intergenerational education aimed to combat negative attitudes about aging from multiple perspectives. More specifically, we will highlight: (a) implications and interventions that address young children's attitudes on aging; (b) educational strategies to address attitudes of health profession students toward older adults, (c) international intergenerational programming efforts to explore aging attitudes in Nicaraguan youth; and (d) an intergenerational lifelong service-learning project to teach undergraduate students about aging.

TEACHING AGING THROUGH SERVICE LEARNING IN AN INTERGENERATIONAL LIFELONG LEARNING ENVIRONMENT

L.K. Donorfio, *University of Connecticut, Storrs, Connecticut*

The emergence of lifelong learning programs situated on College and University campuses over the last decade present an opportunity for intergenerational relationships, learning activities, service learning projects, and research. This presentation will describe the engagement of forty-two (42) undergraduate students in an Adulthood and Aging class who embarked on an intergenerational lifelong service-learning project with an Osher Lifelong Learning Institute (OLLI) on the university campus. Specifically, initial service-learning objectives will be shared, as well as the educational

methodology chosen, qualitative outcomes, and significant lessons learned. Qualitative findings from participants included an awareness and change related to bi-directional ageism, an understanding of andragogy and appreciation of lifelong learning, and positive influence on views of career options in the field of Aging. While intentional intergenerational interactions were initially aimed at demystifying older adults and the aging process, the final outcomes illuminated an appreciation of lifelong learning and an eradication of ageist attitudes.

CHILDREN'S ATTITUDES ON AGING: IMPLICATIONS AND INTERVENTIONS

S.L. McGuire, *University of Tennessee, Knoxville, Tennessee*

Numerous aging education resources to combat ageism exist that are powerful and inexpensive yet woefully underutilized. Chief among these are early children's literature (Preschool-Primary) and intergenerational activities. Research has consistently shown that young children evidence ageist attitudes that become more negative as children grow older, and ultimately become self-fulfilling prophecies. Today's children are living longer than ever before underscoring the urgency to promote positive aging. Lifespan aging education as an intervention to promote positive aging has been endorsed since the first White House Conference on Aging in 1960, however, little progress has been made. This presentation will facilitate utilization of these resources by integrating literature and experience about children's attitudes about aging, resources for early childhood educators about children's literature and aging, and guidance for selecting appropriate books that promote positive aging intergenerational activities. Gerontologists can and should be champions of combating ageism and preparing people for their increased longevity.

INTERGENERATIONAL EDUCATION AND TRAINING IN NICARAGUA

C.R. Bolkan¹, M.B. Neal², A. DeLaTorre², I. Wernher², 1. *Washington State University, Vancouver, Washington*, 2. *Portland State University, Portland, Oregon*

By mid-century, 80% of the world's older population will live in low/middle-income countries, many of which lack expertise in gerontology and geriatrics. As part of a study-abroad service-learning program focused on improving health and well-being of older adults in Nicaragua, students and faculty at Portland State University, in cooperation with in-country partners, developed and implemented evidence-based trainings in Nicaraguan communities to promote intergenerational relationships. Formal intergenerational programs do not exist in Nicaragua, despite expressed community interest. To date, we have trained over 100 community members (e.g., Rotary clubs, church groups), high school, and college students. This presentation will detail our intergenerational program efforts in Nicaragua, the qualitative results (e.g., insights gained about aging, increased empathy for older adults) as well as the results of a survey of college students (N = 483) about their perceptions on aging (e.g., students' age stereotyping despite significant time spent with older family members).

HEALTH PROFESSION STUDENTS' ATTITUDES TOWARD AND BELIEFS ABOUT OLDER ADULTS

L. White, *University of South Alabama, Mobile, Alabama*

Attitudes and beliefs of health profession students' toward older adults can influence their desire to join the geriatric healthcare workforce. Therefore, health profession educators are challenged to design educational interventions that positively impact these attitudes and beliefs. Studies on the effectiveness of educational interventions to change students' beliefs and attitudes toward older adults have yielded mixed results; however, common features of effective educational interventions are beginning to emerge. Students in the University of South Alabama Doctor of Physical Therapy program participate in a learning module on physical activity in older adults during a first-semester exercise physiology course. The module includes an experiential activity in which students exercise with older adults in group exercise classes at an intergenerational community center. Student evaluation of the module indicates increased interest in the topic and changes in beliefs about older adults' participation in physical activity.

SESSION 3385 (SYMPOSIUM)

LATE-LIFE CHANGES IN HOUSING: CHOICES, CONSTRAINTS, AND IMPACTS ON CARE

Chair: J. Byles, *The University of Newcastle, Newcastle, New South Wales, Australia*

Co-Chair: H. Barrie, *University of Adelaide, Adelaide, South Australia, Australia*

Discussant: V. Cornell, *University of Adelaide, Adelaide, South Australia, Australia*

This symposium is presented by the International Longevity Centre - Australia (ILC-AUS) – involving researchers, service providers, and advocacy organizations. It considers changes in housing in late life, and how housing affects people's access to care as they age. Individuals, service providers, and governments share a common goal to enable older people to remain at home for as long as possible. However, many older people need, or choose, to move to smaller or more supportive accommodation as they age and as they encounter changes in their needs and capacities. This symposium will discuss housing needs of older people, age friendly housing options, and how housing affects access to community supports and services. The symposium will also consider the increasing risk of homelessness among older people, and how the care needs of these people can be met. The discussion will pay particular attention to the needs of women, single older men, and people with precarious housing tenure.

HOME AND CARE: ANALYSIS OF 12 YEARS OF DATA FROM THE AUSTRALIAN LONGITUDINAL STUDY ON WOMEN'S HEALTH

J. Byles, *Research Centre for Generational Health and Ageing, The University of Newcastle, Newcastle, New South Wales, Australia*

We analysed data for 9575 women from the 1921–1926 cohort of the Australian Longitudinal Study of Women's Health, linked to Australian National Death Index, and aged care records. The aim was to assess changes in housing, and

how housing type affects the timing and type of aged services used by older women. Seven housing patterns were identified. Four stable patterns: living in a house for most surveys (47.0%), living in a house but with earlier death (13.7%), living in an apartment (12.8%), living in a retirement village (5.8%). Three patterns showing transition: downsizing - moving from a house to retirement village (6.6%), moving from an apartment/retirement village to residential care (7.8%), and from house to residential care (6.4%). Compared to living in a house, women in apartments were more likely to receive community services, while women in retirement villages were more likely to move into residential care.

HEARING OLDER PEOPLE'S VOICES: WHAT MATTERS IN HOUSING DESIGN?

A. Herd, A.F. Street, Y.D. Wells, *La Trobe University, Melbourne, Victoria, Australia*

This study sought older people's views on characteristics of their housing that support life satisfaction in order to assess the impacts of a range of housing settings and inform future age-specific housing design.

This study was part of a larger investigation of the impacts of housing and services on quality of life and social participation. Forty older people living in retirement villages, retirement apartments, and independent living units, or at home and receiving community support, were interviewed in-depth about their perceptions of their housing.

Key themes dealt with features that discretely support ageing in place, including functional design (acceptability, usability, maintenance, sustainability, and space), location (position, views and proximity to others), and neighborhood (especially walkability). Participants were keen to have more meaningful input into the planning and design of housing for older people. Older people want to be co-producers of their homes, not just end-users.

HEALTH AND WELFARE PROFILE OF AUSTRALIAN BABY BOOMERS WHO RENT—IMPLICATIONS FOR THE FUTURE

H. Barrie, 1. *Australian Population and Migration Research Centre, University of Adelaide, Adelaide, South Australia, Australia*, 2. *Australian Association of Gerontology, Melbourne, Victoria, Australia*

This study assessed socio-economic and health-related factors associated with renting. While some baby boomers have never owned a home, a proportion have also moved to rental accommodation as a result of changes in marital status, household composition, or due to economic and health related factors (sickness, disability, unemployment). Data from telephone interviews conducted monthly between 2007 and 2013 were combined, with 18,844 baby boomer respondents included in the analysis. Overall 17.4% were renting, either privately or using government subsidised housing. Renters of government housing were more likely to be female, be living alone, report being 'unable to work', have low education levels, be in the lowest quintile of socio-disadvantage, have a low income, and have a poorer health profile. This research provides empirical evidence of the considerable differences in health, socio-economic indicators and risk factors between baby boomers who rent and those who own, or are buying, their own homes.

A PROGRAM FOR HOMELESS PERSONS

D.P. Goeman, *RDNS Institute, Melbourne, Victoria, Australia*

A large community health care organisation expanded their community-based assertive outreach Homeless Persons Program (HPP) to address a significant level of unmet health care need among people experiencing homelessness in a south-eastern region of Victoria despite the presence of well established homeless and healthcare services.

Evaluation of HPP program showed that the majority of assisted clients were successfully referred to at least three services. Key to clients accessing the services was the strong advocacy provided by the HPP nurse. This program has also helped establish various initiatives to improve clients' social inclusion. The HPP model has positively impacted on clients' lives and improved their capacity to engage with health and welfare services. This engagement has led to an increased sense of self-belief, resilience and improved social connections which have helped in reclaiming aspects of their lives.

SESSION 3390 (SYMPOSIUM)**ENHANCING THE INFORMED CONSENT PROCESS IN CLINICAL DEMENTIA RESEARCH**

Chair: J. Haberstroh, *Goethe University Frankfurt, Frankfurt am Main, DEUTSCHLAND, Germany*

Co-Chair: J. Vollmann, *Ruhr University Bochum, Bochum, Germany*

Discussant: J. Moye, *VA Medical Center, Jamaica Plain, Massachusetts*

The high number of people suffering from dementia will significantly increase in European countries and elsewhere in the coming decades. No treatments are currently available that can reverse or even halt the neurodegenerative process, and dementia is a considerable burden on patients and caregivers, as well as on societies as a whole. For this reason, there is a substantial need for further medical dementia research. People with dementia have the right to decide whether or not they want to participate in clinical research and to give their free, prior and informed consent. However, as dementia progresses, they can lose their ability to give informed consent to complex medical research because of an increasing loss of cognitive functions. At first sight, it seems ethically problematic to involve dementia patients in research, as people with impaired mental capacity must be protected against the risks of research participation. Furthermore, in contrast to informed consent to medical treatment, an individual benefit from participation in research can rarely be taken for granted. However, people with dementia also have a right to benefit from medical research in particular, so their categorical exclusion would appear to be ethically problematic too. High standards for the informed consent process and a thorough assessment of mental capacity are therefore important for the protection of research participants. In this Symposium, the international, interdisciplinary ENSURE project will be presented. This project aims to contribute towards achieving an adequate balance between autonomy and the protection of dementia patients in clinical research.

ENSURE PROJECT: SUPPORTED DECISION-MAKING AND CAPACITY ASSESSMENT IN CLINICAL DEMENTIA RESEARCH

J. Haberstroh, F. Oswald, J. Pantel, *Frankfurt Forum for Interdisciplinary Ageing Research, Goethe University Frankfurt, Frankfurt am Main, DEUTSCHLAND, Germany*

This talk opens the symposium "Enhancing the Informed Consent Process in Clinical Dementia Research" and gives an overview of the project "Enhancing the Informed Consent Process: Supported decision-making and capacity assessment in clinical dementia research" (ENSURE). ENSURE aims to provide interdisciplinary recommendations to support the development of an action model of an informed consent process in clinical dementia research that a) enhances the capacity to consent of people with dementia, b) improves the assessment of decision-making capacity, c) protects those who do not have the capacity to consent, and d) guarantees the ethically justified inclusion of research subjects in clinical dementia research. To achieve this, four international project partners cooperate on four interdisciplinary interlinked subprojects to be conducted in three successive phases. The disciplines involved are gerontology, ethics and law. In the symposium, the project partners will present the results of the first project phase of three of the subprojects.

OPPORTUNITIES AND RISKS OF SUPPORTED DECISION-MAKING IN DEMENTIA RESEARCH. AN ETHICAL ANALYSIS

J. Vollmann, J. Gather, M. Scholten, *Ruhr University Bochum, Bochum, Germany*

According to the interpretation of the Committee on the Rights of People with Disabilities (the Committee), article 12 of the United Nations Convention on the Rights of People with Disabilities (CRPD) represents a radical departure from the widely accepted functional approach to assessing competence, along with acknowledged procedures of substitute decision-making, in favor of a new paradigm of supported decision-making (SDM). Although sharing the Committee's concerns about the discrimination of mentally disabled people and welcoming the development of new measures for the enhancement of decision-making capacity, we have several reservations regarding the Committee's interpretation. Our main worry is that the SDM model runs the risk of failing to distinguish between substitute and supported decision-making. We therefore recommend a more limited and case-specific application of SDM with a clear and transparent idea of the individual competence of patients involved in clinical dementia research.

ETHICAL FRAMEWORK OF INFORMED CONSENT AND DECISION-MAKING IN DEMENTIA RESEARCH

A. Carvalho, P. Hernández-Marrero, *Instituto de Bioética, Universidade Católica Portuguesa, Porto, Portugal*

Impaired decision-making capacity is a symptomatic feature in a number of neurodegenerative diseases, but the nature of these decision-making deficits depends on the particular disease. The level of impairment that renders a patient unable to make valid decisions should ideally reflect a societal judgment about the appropriate balance between respecting the patient's autonomy and protecting the patient from the potentially negative consequences of such a decision.

Although many types of decision-making exist, studies of decision-making in patients with neurodegenerative diseases generally use two decision-making paradigms; decision-making under ambiguity and decision-making under risk. The main objective of this study is to determine the issues that should be taken into account during the informed consent process. This study encompasses two intertwined phases. The results will be integrated into an in-depth normative analysis of the conceptual and ethical issues raised by the informed consent process in clinical dementia research.

GERONTOLOGICAL DEMANDS AND ACTUAL CONDITIONS OF INFORMED CONSENT PROCEDURES IN DEMENTIA RESEARCH

M. Knebel, T. Wied, V. Tesky, *Goethe University Frankfurt, Frankfurt am Main, Germany*

In phase 1, the subproject Gerontology aims to identify the country-specific demands and actual conditions governing informed consent procedures in clinical dementia research in the participating countries. About 90 people with early stage dementia, and 90 caregivers/legal guardians (all involved in clinical dementia research) will be included. For the recruitment of potential subjects, we contact dementia researchers in Germany, Spain, and Portugal and ask them to share our online-study with their study participants. Semi-structured online-interviews are conducted over a period of 6 months. Participants are interviewed in order to gather information on existing informed consent conditions in clinical dementia research. Furthermore, participants are asked to formulate and rate their needs, whereby the emphasis lays on the assessment of p-e fit indices in the domains of spatial and social needs versus existing conditions. Phase 1 will be finished in June 2017. The results of phase 1 will be presented.

SESSION 3340 (SYMPOSIUM)

TOWARD THE DEVELOPMENT OF A PERSON-CENTERED INDEX OF AGING WELL IN CANADA AND MEXICO

Chair: E. Belanger, *Brown University, Providence, Rhode Island*

Co-Chair: U. Perez-Zepeda, *Instituto Nacional de Geriatria*

Discussant: M. Zunzunegui, *Universite de Montreal, Montreal, Quebec, Canada*

Despite a growing interest in successful aging among gerontologists, there remains a lack of consensus about the definition of this concept. The most common definition was proposed by Rowe & Kahn (1997): "a low probability of disease and disease-related disability, high cognitive and physical functional capacity, and active engagement with life" (p. 433). This appears unrealistic for the majority of older adults with no more than 11.9% percent of Americans, and a mean of 8.5% of older adults across European countries being free from major chronic diseases, physical disability, cognitive impairment, and participating in social and productive activities. When asked, the perspective of older adults themselves is broader, less medical, and more positive than those of the aforementioned researchers, and not dependent upon absence of disability or chronic illness. Literature reviews of lay perspectives confirm the importance of psychosocial components such as life satisfaction and

self-mastery. This symposium includes three presentations as well as a thorough introduction about different models of successful and positive aging, and their prevalence and limitations. The first presentation is a qualitative description of older adults' perceptions of aging well in Canada. The second concerns the development of a person-centered index of aging well and description of its distribution in Canada and Mexico, while the last addresses the individual and structural determinants of aging well from the perspective of older adults. Developing comprehensive measures of positive aging processes is important for health promotion if we are to tackle outcomes that truly matter to older adults.

OLDER ADULTS' LAY PERCEPTIONS OF AGING WELL: A QUALITATIVE STUDY IN CANADA

E. Belanger³, U. Perez-Zepeda², R.C. Castrejon-Perez², G. Moullec¹, 1. *University of Montreal, Montreal, Quebec, Canada*, 2. *Instituto Nacional de Geriatria, Mexico City, Mexico*, 3. *Brown University School of Public Health, Providence, Rhode Island*

Literature reviews about lay perspectives on successful aging suggest additional psychosocial components to the biomedical definition proposed by Rowe and Khan (1997). The research question guiding this study was: What is the perspective of older adults on aging well in Canada? A descriptive study was carried out, using inductive qualitative content analysis to explore the domains of aging well that Canadian older adults report on, as compared with existing literature on lay perspectives. A random sub-sample of 40 older adults was selected from the ongoing International Mobility in Aging Study at two Canadian sites (Saint-Hyacinthe and Kingston), using a stratified selection process to ensure a diversity of ages, genders and education levels. Forty semi-structured qualitative interviews were carried out with participants to explore their perspectives on aging well. The results confirm the importance of symptomatic health conditions including pain, as well as psychosocial components, such as attitude toward aging.

DEVELOPMENT OF A PERSON-CENTERED INDEX OF AGING WELL IN CANADA AND MEXICO

R.C. Castrejon-Perez², E. Belanger^{1,3}, U. Perez-Zepeda², M. Zunzunegui^{1,3}, 1. *University of Montreal, Montreal, Quebec, Canada*, 2. *Instituto Nacional de Geriatria, Mexico City, Mexico*, 3. *Public Health Research Institute (IRSPUM), Montreal, Quebec, Canada*

Starting from the results of a qualitative study in Canada and existing literature in different contexts, an index capturing most of the domains used in definitions of successful aging was constructed, with a particular focus on lay perspectives. The index was developed using data gathered in 2014 from 663 Canadian participants in the International Mobility in Aging Study (IMIAS) and 15,698 Mexican participants in the Mexican Healthy Aging Study (MHAS). It was computed as a continuous score (0 to 100) containing health-related components (ADL disability, mobility disability, pain, self-rated health, and cognitive function), and psychosocial components (mood, productive activities, social relations, life satisfaction, and self-mastery). Mean scores on aging well were 80 among Canadian older adults and 59 among Mexican participants. The detailed scores indicate aspects of

the health and psychosocial well-being that deserve improvement according to older adults themselves, particularly pain management in Canada and mobility disability in Mexico.

THE INDIVIDUAL AND STRUCTURAL DETERMINANTS OF AGING WELL IN CANADA AND MEXICO

U. Perez-Zepeda², R.C. Castrejon-Perez², E. Belanger^{1,3}, M. Zunzunegui^{1,3}, 1. *University of Montreal, Montreal, Quebec, Canada*, 2. *Instituto Nacional de Geriatria, Mexico City, Mexico*, 3. *Public Health Research Institute (IRSPUM), Montreal, Quebec, Canada*

The literature suggests that successful aging is largely determined by health behaviors and the social and physical environment of older adults. For this presentation, we examined the determinants of a person-centered index of aging well (0–100), as inspired by the determinants of the WHO concept of active aging, namely socioeconomic, behavioral, and environmental determinants. In both contexts, older participants were less likely to age well. Those with less than very sufficient income also had lower scores on the index. In Canada, smoking (past and present) was associated with lower scores, while physical exercise had a small but significant positive association. In Mexico, men aged well significantly more than women, as did those with more education and those who exercised at least 60 minutes a week. This presentation sheds light on modifiable determinants of aging well that can be addressed through health and social policies, particularly health behaviors and income sufficiency.

SESSION 3345 (SYMPOSIUM)

U.S. NATIONAL INSTITUTE ON AGING SYMPOSIUM FOR ESTABLISHED RESEARCHERS—A CHAT WITH SENIOR LEADERSHIP

Chair: M.A. Bernard, *NIA NIH, Maryland*
Co-Chair: R.J. Hodes, *National Institutes of Health*
Discussant: R.A. Barr, *National Institute on Aging*

The U.S. National Institute on Aging (NIA) at the National Institutes of Health, Department of Health and Human Services, is the federally designated lead agency on aging research, and has supported significant research on aging as a life-long process. In Fiscal Year 2016, NIA experienced a 33% increase in its budget. Although much of this funding was targeted to Alzheimer's disease research, there was an increase in funds allocated to non-AD research that was greater than the NIH average. This symposium will provide a forum for exploration of the implications of the budget increases for the general research community, including support of research developed by non-U.S. citizens. It will involve NIA's senior staff discussing research priorities and programs supported by the Institute. A question-and-answer session will follow brief introductory remarks on current funding and future priorities and research directions of NIA.

ADVANCES IN AGING BIOLOGY AND GEROSCIENCE

M.A. Bernard, F. Sierra, *NIA NIH, Bethesda, Maryland*

Felipe Sierra, director of the NIA Division of Aging Biology (DAB), will provide a brief overview of DAB research priorities, with particular attention to developments across NIH and beyond in geroscience.

NIA BEHAVIORAL AND SOCIAL SCIENCE ADVANCES AND PRIORITIES

M.A. Bernard, J. Haaga, *NIA NIH, Bethesda, Maryland*

Dr. John Haaga, director of the NIA Division of Behavioral and Social Science Research (BSR), will briefly outline BSR research priorities and recent science advances, many of which involve international collaborations and comparisons.

RESEARCH DIRECTIONS IN GERIATRICS AND CLINICAL GERONTOLOGY

M.A. Bernard, E. Hadley, *NIA NIH, Bethesda, Maryland*

Evan Hadley, director of NIA's Division of Geriatrics and Clinical Gerontology (GCG), will provide a brief overview of GCG's research priorities and advances, including those areas with international ramifications

NIA NEUROSCIENCE ADVANCES AND PRIORITIES, INCLUDING ALZHEIMER'S DISEASE

M.A. Bernard, E. Masliah, *NIA NIH, Bethesda, Maryland*

Dr. Eliezer Masliah, director of the Division of Neuroscience (DN) at NIA, will provide a brief overview of neuroscience advances and priorities. He will also highlight Alzheimer's disease funding and research opportunities for U.S. and non-U.S. based researchers.

SESSION 3395 (SYMPOSIUM)

THE CANADIAN LONGITUDINAL STUDY ON AGING (CLSA): A PLATFORM FOR RESEARCH ON AGING

Chair: S. Kirkland, *Dalhousie University, Halifax, Nova Scotia, Canada*

Discussant: A. Wister, *Simon Fraser University, Vancouver, British Columbia, Canada*

Over the next twenty years, the Canadian Longitudinal Study on Aging (CLSA) will generate a wealth of information to contribute to the advancement of the science of aging and policy development. As a study, CLSA objectives are to examine aging as a dynamic life-course process; investigate the inter-relationship among intrinsic and extrinsic factors from mid-life to older age; and capture the transitions and trajectories of aging-related processes. As a platform, CLSA objectives are to provide infrastructure and build capacity for state-of-the-art, interdisciplinary, population-based research and evidence-based decision making to support the nation as it transitions into several decades of rapid population aging. Information on the changing biological, physical, psychological, and social aspects of people's lives is being collected to understand how, individually and in combination, they influence the maintenance of health and well-being, and the development of disease and disability as people age. The CLSA is one of the most comprehensive studies of its kind undertaken to date. Its large sample, multidisciplinary focus, and longitudinal design provide ongoing research opportunities unprecedented in Canada and internationally.

Recruitment of over 50,000 participants is now complete, and baseline data are available to the research community. The objectives of this Symposium are to: 1) Update on study progress and milestones achieved; 2) Report on key methodological aspects of recruitment, sampling, data collection, outcomes ascertainment; 3) Present findings from initial projects using CLSA data; and 4) Give researchers an

understanding of the scope and potential of the CLSA as a platform for research on aging.

THE CANADIAN LONGITUDINAL STUDY ON AGING: STUDY DESIGN AND METHODS

S. Kirkland¹, C. Wolfson³, P. Raina², L. Griffith², M. Oremus⁴, 1. *Dalhousie University, Halifax, Nova Scotia, Canada*, 2. *McMaster University, Hamilton, Ontario, Canada*, 3. *McGill University, Montreal, Quebec, Canada*, 4. *University of Waterloo, Waterloo, Ontario, Canada*

The Canadian Longitudinal Study on Aging is following 50,000 men and women aged 45–85, every three years for at least 20 years. Of the total, 20,000 (Tracking participants) are randomly selected within age/sex strata in each province, and 30,000 (Comprehensive participants) are randomly selected within age/sex strata from within 25–50 km of 11 sites across the country (Victoria, Vancouver, Surrey, Calgary, Winnipeg, Ottawa, Hamilton, Montreal, Sherbrooke, Halifax, and St. Johns). Data collection methods include telephone and face-to-face interviews, physical assessments, biological samples, and linkage to administrative databases. Initiated in 2010, the second wave of data collection is currently underway. The CLSA has engaged in a number of “firsts” in Canada. In this presentation we will highlight the study design and content, sampling, recruitment, baseline data collection, and ascertainment of health outcomes. Ethical legal and social issues, as well as accommodation strategies to improve retention in future waves will be presented.

MULTIPLE CHRONIC CONDITIONS IN RELATION TO DISABILITY AND SOCIAL PARTICIPATION: DATA FROM THE CLSA

L. Griffith¹, A. Gilsing¹, E. van den Heuvel², S. Nazmul¹, P. St. John³, P. Raina¹, 1. *McMaster University, Hamilton, Ontario, Canada*, 2. *Eindhoven University of Technology, Eindhoven, Netherlands*, 3. *University of Manitoba, Winnipeg, Manitoba, Canada*

While much is known about the effect of individual chronic conditions (CCs) on people’s ability to undertake their everyday activities, less is known about effect of having multiple CCs. We will present data from over 20,000 Canadian men and women on population patterns of self-reported CCs and how different combinations of CCs impact disability and social participation. Preliminary data suggest that although the proportion of people with 2+ CCs increases with age (22% in 45–54 vs. 52% in 75–89 year olds) and tends to be higher in females than males (36% vs. 30%), the difference between genders narrows with age. As well, combinations of chronic conditions with the same disease count differentially impact activities of daily living and social participation in men compared to women, and in middle-aged compared to older adults. Understanding these differences could help to increase the efficiency and quality of clinical care and improve public health.

ASSOCIATIONS BETWEEN SENSORY LOSS AND SOCIAL NETWORKS, PARTICIPATION, SUPPORT, AND LONELINESS

P. Mick¹, M. Pichora-Fuller², W. Wittich³, 1. *University of British Columbia, Kelowna, British Columbia, Canada*,

2. *University of Toronto, Toronto, Ontario, Canada*, 3. *Universite de Montreal, Montreal, Quebec, Canada*

The effects of sensory loss on social structure and function in different age and sex groups are poorly understood. We analyzed a population based sample of 21,241 Canadian adults to determine if hearing loss (HL), vision loss (VL) or dual sensory loss (DL) were associated with social network size, social participation, availability of social support, and loneliness, respectively, and whether age or sex modified the associations. VL was associated with reduced social network size in males and low social participation in all age/sex groups. DL was associated with reduced network size and participation in 65–85 year olds. All forms of sensory loss were associated with reduced social support and loneliness. The results might be explained by mobility challenges resulting from VL and DL, and communication problems arising from HL, VL and DL. Individuals with sensory impairments should be targeted for interventions that increase social engagement and support and reduce loneliness.

UNDERSTANDING INEQUALITIES AND INEQUITIES IN HEALTH AND WELLNESS AMONG OLDER CANADIANS

Y. Asada¹, J. Hurley², S. Kirkland¹, M.L. Grignon², 1. *Community Health and Epidemiology, Dalhousie University, Halifax, Nova Scotia, Canada*, 2. *McMaster University, Hamilton, Ontario, Canada*

This presentation focuses on equity in successful aging among older Canadians. By taking advantage of rich information offered by a new, national flagship study, the Canadian Longitudinal Study on Aging (CLSA) and by advancing the health inequity measurement approach that we have developed, we report inequalities and inequities in health and wellness of older Canadians. Results of our study provide rich understanding of the diverse experience of and heterogeneity in health and wellness among older Canadians. Our study also lays the methodological foundation for tracking inequalities and inequities in successful aging of the Canadian population over time as follow-up data become available in the coming years. Moreover, by examining multiple dimensions of successful aging, this study informs policy interventions with respect to some of the key priority health areas among older Canadians, such as frailty and overall strength.

SESSION 3400 (SYMPOSIUM)

IAGG NORTH AMERICAN REGION: FALLS PREVENTION—NEW INITIATIVES FROM THE CANADIAN GERIATRICS SOCIETY FALLS SPECIAL INTEREST GROUP

Chair: M. Montero Odasso, *University of Western Ontario, London, Ontario, Canada*

Discussant: D.B. Hogan, *University of Calgary, Calgary, Alberta, Canada*

Falls are a quintessential geriatric syndrome. Its study and the approaches developed for their prevention contributed to the establishment of geriatric medicine as a distinct field

of specialty practice. Despite the myriad of studies aimed at improving our understanding of their pathophysiology and the clinical trials designed to establish effective strategies to prevent falls and fall-related injuries, there are still important gaps in what we know about this challenging and complex syndrome. This symposium will outline some of the work on fall prevention being done by members of the Falls Prevention Group, a national initiative designed to address knowledge gaps in falls prevention started by the Canadian Geriatrics Society.

The Falls Prevention Clinics (University of British Columbia) have developed a physiological approach to falls prevention focusing on an innovative use of the Physiological Fall Profile and new methods of addressing syncopal etiologies of falls such as orthostatic hypotension and postprandial hypotension.

The Gait and Brain Laboratory (University of Western Ontario) focuses on the complex interplay between gait, cognition and fall risk. This group will discuss how gait assessment provides a window into future interventions to prevent falls in cognitively impaired patients, a group of patients that have been notoriously resistant to standard preventative interventions.

The Calgary Falls Prevention Clinic (Alberta Health Services – Calgary Zone) has developed a standardized approach to preventing falls in older adults. The success and challenges of implementing this protocol for community-dwelling older adults and integrating its activities within the health care system will be presented.

CANADIAN GAIT AND BRAIN STUDY: COGNITION, GAIT AND THE RISK OF FALLING

M. MonteroOdasso, 1. *University of Western Ontario, London, Ontario, Canada*, 2. *Gait and Brain Laboratory, London, Ontario, Canada*

One of the main goals of geriatric medicine is to reduce the gap between overall life expectancy and disease free life expectancy. Two of the main contributors to this gap are increased rates of cognitive impairment and gait impairment. Older adults with cognitive impairment have a higher risk of falls, have twice the fall rates of cognitively normal older adults, and are notoriously resistant to fall prevention interventions. The precise mechanisms underlying the complex interplay between gait and cognitive impairment are poorly understood, and are the focus of the Gait and Brain Laboratory (The University of Western Ontario). This session will present evidence from the Canadian Gait and Brain Study showing that even mild cognitive impairment can affect gait and balance and the implications this has for fall prevention strategies in older adults with cognitive deficits.

IMPLEMENTING EVIDENCE-BASED FALL PREVENTION IN THE COMMUNITY SETTING

D.B. Hogan, *University of Calgary, Calgary, Alberta, Canada*

Evidence-based recommendations for the prevention of falls have been developed, but adherence to them by physicians, community service providers and older persons is generally poor. The Calgary Fall Prevention Clinic is a team-based

service that assesses upon request older persons in their own homes who are at risk for falls. Based on a comprehensive assessment, a care plan is developed that is shared with the older person and their primary care provider. A consultative approach that respects the prerogatives of primary care and utilizes existing community resources is taken. Drawing on our 20 years of experience, this session will focus on the challenges we faced in implementing a fall prevention service and integrating its activities with other components of the health care system involved in the assessment and management of older persons experiencing falls and fall-related injuries.

SESSION 3405 (SYMPOSIUM)

H-TYPE HYPERTENSION, GENE, FOLATE: CHINA STROKE PRIMARY PREVENTION TRIAL

Chair: X. Wang, *Johns Hopkins University, Baltimore, Maryland*

Co-Chair: X. Li, *Chinese General Hospital of PLA, Beijing, China*

Hypertension, as a major modifiable risk factor for CVDs, is fairly common among adults in China. The treatment and control of prevalent hypertension have been improved in many high-income countries. By contrast, although the treatment and control rates of hypertension have increased, it remains unacceptably low in China. This symposium consists of four abstracts which will mainly deal with the trend in the prevalence of hypertension as well as in the treatment and control rates of prevalent hypertension. The first one will discuss the controversies related to folic acid supplementation in cardiovascular disease and stroke, focusing on the new evidence of effect of folic acid therapy on incident stroke and key genetic and nutrition modification. Another talk will provide an overview of recent advances in this field; highlight the findings from a sub-study of the China Stroke Primary Prevention Trial (CSPT) and focus on the effect of folic acid therapy on renal endpoints. The third presentation will discuss the perennial interest in and debate on blood pressure control targets and the notion of a “J” shaped curve. It will also present findings from several groundbreaking studies in eastern and western populations. The last presentation will describe the *MTHFR* C677T gene polymorphism and the concept of gene-nutrition interaction and illustrate the concept by presenting the findings from the CSPT, which has clearly demonstrated the interactive effect of *MTHFR* C677T polymorphism and folic acid on serum homocysteine (Hcy) levels and lowering in response to folic acid therapy among Chinese hypertensive adults.

EFFICACY OF FOLIC ACID SUPPLEMENTATION ON REDUCING THE RISK OF STROKE AMONG HYPERTENSIVE PATIENTS

M. Zhao^{5,4,3}, X. Qin^{4,3,1}, B. Wang^{4,3,1}, J. Li⁶, M. He, G. Tang⁹, X. Li, D. Yin⁸, 1. *Renal Division, Nanfang Hospital, Southern Medical University, Guangzhou, China*, 3. *State Key Laboratory for Organ Failure Research, Guangzhou, China*, 4. *National Clinical Research Study Center for Kidney Disease, Guangzhou, China*, 5. *Department of*

Neurology, Guangdong Provincial Hospital of Chinese Medicine, Guangzhou, China, 6. Department of Cardiology, Peking University First Hospital, Beijing, China, 7 4. Department of Neurology, First People's Hospital of Lianyungang, Lianyungang, China, 8. Department of Cardiology, First People's Hospital of Lianyungang, Lianyungang, China, 9. Institute for Biomedicine, Anhui Medical University, Hefei, China

There has been long-standing debate over whether folic acid supplementation, which corrects folate insufficiency and lowers homocysteine, can prevent stroke. Although early epidemiologic studies showed a dose-response association between homocysteine(Hcy) levels and cardiovascular diseases(CVD), subsequent randomized trials failed to show a beneficial effect of folic acid supplementation in preventing CVD. Such discrepancy could be due to two important reasons: (1)most recent trials were conducted in populations already undergoing folic acid fortification, and there has been a particular lack of studies in low folate regions; and (2)most studies have focused on CVD rather than stroke as primary end points. The China Stroke Primary Prevention Trial(CSPPT) is the first and largest randomized trial to test the efficacy of folic acid supplementation in the primary prevention of stroke in a country without folic acid fortification. The CSPPT was conducted among 20,702 Chinese hypertensive adults(>60 years) without pre-existing stroke and myocardial infarction, with a median treatment period of 4.5 years. The CSPPT demonstrated that enalapril-folic acid therapy, compared with enalapril alone, significantly reduced the risk of first stroke by 21%(HR, 0.79; 95%CI: 0.68–0.93). Although the stroke risk increased with the increasing age, age(45-<55, 55-<65, 65-<75 years) did not substantially affect the beneficial effect(P for interaction=0.427).In light of the growing aging population in the world, and large number of individuals with hypertension and at high risk for stroke in China, other Asian countries and worldwide, the public health benefit of folic acid as a simple, effective, and safe intervention could be substantial.

EFFECT OF FOLIC ACID THERAPY ON RENAL FUNCTION IN HYPERTENSIVE ADULTS

Y. Li^{2,3,4}, X. Xu^{2,3,4}, X. Qin^{2,3,4}, B. Wang^{2,3,4}, M. Liang^{2,3,4}, M. He⁵, G. Tang^{6,7}, Z. Lin¹, 1. Department of Cardiology, Guangdong General Hospital, Guangzhou, China, 2. National Clinical Research Center for Kidney Disease, Guangzhou, China, 3. State Key Laboratory for Organ Failure Research, Guangzhou, China, 4. Renal Division, Nanfang Hospital, Southern Medical University, Guangzhou, China, 5. Department of Neurology, First People's Hospital of Lianyungang, Lianyungang, China, 6. Institute for Biomedicine, Anhui Medical University, Hefei, China, 7. School of Health Administration, Anhui Medical University, Hefei, China

This renal sub-study of the China Stroke Primary Prevention Trial (CSPPT) included 15104 participants (mean age: 59.4 years) with hypertension who were randomized to receive a daily single tablet containing either 10mg enalapril and 0.8mg folic acid (n=7545), or 10mg

of enalapril alone (n=7559). The primary outcome was CKD progression, defined as a decrease in eGFR of $\geq 30\%$ and to a level of $<60 \text{ ml/min/1.73m}^2$ if the baseline eGFR was $\geq 60 \text{ ml/min/1.73m}^2$, or a decrease in eGFR $\geq 50\%$, or ESRD if the baseline eGFR was $<60 \text{ ml/min/1.73m}^2$. After a median follow-up of 4.4 years, compared with enalapril alone, enalapril-folic acid significantly increased serum folate and decreased Hcy concentrations. Furthermore, the enalapril-folic acid group had a 21% reduction in the adjusted risk of CKD progression (OR, 0.79; 95% CI, 0.62–1.00). More importantly, among those with CKD at baseline, the enalapril-folic acid group had a 56% reduction (OR, 0.44; 95% CI, 0.26–0.75) in the adjusted odds of CKD progression, as compared with the enalapril group. Although the risk of CKD progression increased with the increasing age (P for trend <0.01), age (45-<55, 55-<65, 65-<75 years) did not substantially affect the beneficial effect (P for interaction=0.73).Furthermore, folic acid therapy has shown benefits in significantly preventing new-onset proteinuria in hypertensive patients with diabetes, and significantly reducing uric acid concentrations among hypertensive patients.Taken together, in the CSPPT, folic acid therapy can reduce the incidence and progression of CKD and lower proteinuria and uric acid in hypertensive patients.

IDENTIFYING AN OPTIMAL BLOOD PRESSURE TARGET: DOSE ONE TARGET FIT ALL?

X. Zhang^{1,2,3}, F. Fan⁶, X. Qin^{1,2,3}, X. Huang⁴, H. Bao⁴, J. Li⁶, Y. Zhang⁶, J. Tao⁵, 1. National Clinical Research Study Center for Kidney Disease, Guangzhou, China, 2. State Key Laboratory for Organ Failure Research, Guangzhou, China, 3. Renal Division, Nanfang Hospital, Southern Medical University, Guangzhou, China, 4. Department of Cardiology, Second Affiliated Hospital, Nanchang University, Nanchang, China, 5. Department of Hypertension and Vascular Disease, The First Affiliated Hospital, Sun Yat-Sen University, Guangzhou, China, 6. Department of Cardiology, Peking University First Hospital, Beijing, China

The Action to Control Cardiovascular Risk in Diabetes (ACCORD) trial showed no significant difference in cardiovascular events between a systolic BP target of less than 120 mm Hg vs. less than 140 mm Hg among patients with type 2 diabetes. In contrast, the SPRINT study strongly supports a systolic goal of less than 120 mm Hg for people at high cardiovascular risk, particularly in those aged ≥ 75 years. The post-hoc analyses of the CSPPT indicated that a BP goal (120–130 mmHg) that is lower than that recommended by the existing guidelines may be associated with a greater reduction in risk of stroke and all-cause mortality in general hypertensive patients (mean age: ~ 60 years) without history of stroke and myocardial infarction. The beneficial results were consistent across the age (<60 versus ≥ 60 years; <65 versus ≥ 65 years). These findings raise new questions for future research and challenge us to improve BP management. Given that the risk of hypertension and stroke are particularly high in Chinese populations compared to western populations, future

research should include diverse populations and important epidemiological and clinical characteristics: race/ethnicity, environment, nutritional status, lifestyle, and co-morbidities. It is expected that this line of research will provide evidence-based guidelines for BP targets that are tailored for specific populations and individuals.

THE INTERACTION OF THE MTHFR GENE AND FOLIC ACID ON HOMOCYSTEINE AMONG HYPERTENSIVE ADULTS

X. Huang⁹, J. Yang^{2,3,4}, X. Qin^{2,3,4}, M. Zhao^{2,3,5}, H. Wang⁶, M. He⁷, G. Tang⁸, X. Wang¹, 1. *Johns Hopkins University, Baltimore, Maryland*, 2. *National Clinical Research Study Center for Kidney Disease, Guangzhou, China*, 3. *State Key Laboratory for Organ Failure Research, Guangzhou, China*, 4. *Renal Division, Nanfang Hospital, Southern Medical University, Guangzhou, China*, 5. *Department of Neurology, Guangdong Provincial Hospital of Chinese Medicine, Guangzhou, China*, 6. *Centers for Metabolic Disease Research, Temple University School of Medicine, Philadelphia, Pennsylvania*, 7. *Department of Neurology, First People's Hospital of Lianyungang, Lianyungang, China*, 8. *Institute of Biomedicine, Anhui Medical University, Hefei, China*, 9. *Department of Cardiology, Second Affiliated Hospital, Nanchang University, Nanchang, China*

Blood homocysteine(Hcy) levels, a known risk factor for cardiovascular diseases, are affected by folate intake and genetic factors. Individuals with the methylenetetrahydrofolate reductase(MTHFR) TT genotype(a functional mutation affecting enzyme activity) are more likely to have elevated Hcy. Folic acid(FA) treatment can lower Hcy, but the effect of gene-folate interaction on Hcy lowering has not been evaluated in a large randomized trial.

In this post-hoc analysis of the CSPPT, we sought to 1) assess individual variability in Hcy-lowering response after a median of 4.5 year 0.8mg daily FA therapy in Chinese, hypertensive adults with no history of stroke and myocardial infarction, and 2) identify important effect modifiers including MTHFR C677T genotypes and folate levels.

In the CSPPT, eligible participants, stratified by MTHFR C677T genotype(CC, CT and TT), were randomly assigned to two double-blind treatment groups: a daily, single tablet containing 10mg enalapril and 0.8mg FA(enalapril+FA group, n=10,348) or a daily, single tablet containing only 10mg enalapril (enalapril group, n=10,354). The analysis included 16,867 participants(mean age: ~60 years) with complete data on serum Hcy measurements at baseline and exit visits. MTHFR TT genotypes, individually and interactively with folate levels (quartile) or age(<55, 55-<65, and ≥65 years), affected serum Hcy levels and the degree of Hcy lowering.

The CSPPT provides new evidence for precision folic acid therapy: individuals with TT genotype need to maintain serum folate levels above 15ng/mL in order to overcome the enzyme defect due to a TT mutation. This group is also more likely to respond to FA therapy.

SESSION 3410 (PAPER)

RISKS AND OUTCOMES ASSOCIATED WITH DECLINE IN MOBILITY

ANTIHYPERTENSIVE MEDICATION AND INCIDENT DISABILITY IN OLDER ADULTS—A LONGITUDINAL STUDY

A. Perlman², R. Shah¹, D.A. Bennett¹, A. Buchman¹, I. Matok², 1. *Rush Alzheimer's Disease Center, Chicago, Illinois*, 2. *Hebrew University of Jerusalem, Jerusalem, Israel*

There is concern regarding the safety of antihypertensive medication use among older adults. This study aimed to evaluate whether antihypertensive medications are associated with incident disability in older adults, using a longitudinal cohort design.

Participants of two ongoing cohort studies of community dwelling older adults were recruited between 1993–2015 (n=3091). Self-reported disability was assessed using three scales: basic activities of daily living (ADL), mobility, and functions required for independent living (IADL). All medications received by participants were inspected and identified. Demographic characteristics and medical history were obtained by detailed interview and medical examinations. Motor and cognitive function were summarized using composite scores of several tests.

We used time varying multivariable cox models to assess the association between antihypertensive medications and incident disability. Models included adjustments for differences in demographics, comorbidity, and baseline motor and cognitive function. Analyses excluded participants with dementia or disability at baseline.

Our study found that individuals receiving antihypertensive medications had an increased risk for the development of disability in basic activities of daily living, and in mobility, compared with individuals not receiving these medications, after adjusting for differences in age, sex, and education (Hazards Ratios [95% Confidence Interval]: ADL 1.29 [1.12–1.47], IADL 1.06 [0.94–1.21], Mobility 1.24 [1.09–1.41]). Further analyses demonstrated that these associations were independent of baseline cognitive and motor function, and of cardiovascular comorbidity (hypertension, diabetes, stroke, heart disease, etc.). However, increased age modified these associations, such that no association was found between antihypertensive use and disability among participants aged 80 and over at baseline.

DOES ADDITIONAL PHYSICAL ACTIVITY IMPROVE WALKING IN OLDER PEOPLE DURING INPATIENT REHABILITATION?

C.M. Said^{1,2,3}, M. Morris^{4,3}, J. McGinley², C. Szoek², B. Workman^{5,6}, M. Woodward^{1,2}, J. Bernhardt⁷, 1. *Austin Health, Heidelberg, Victoria, Australia*, 2. *The University of Melbourne, Parkville, Victoria, Australia*, 3. *La Trobe University, Bundoora, Victoria, Australia*, 4. *Healthscope, Bundoora, Victoria, Australia*, 5. *Monash Health, Cheltenham, Victoria, Australia*, 6. *Monash University,*

Cheltenham, Victoria, Australia, 7. The Florey Institute of Neuroscience and Mental Health, Heidelberg, Victoria, Australia

Older people with a variety of health conditions are often admitted for inpatient rehabilitation to improve mobility, but it is not known how to maximize their recovery. The purpose of this single blinded, multisite randomized controlled trial was to determine whether providing increased physical activity to older people receiving inpatient rehabilitation leads to better mobility outcomes at discharge. Older people ($n = 198$, median age 80.9 years, IQR 76.6–87.2) undergoing inpatient rehabilitation to improve mobility were recruited from geriatric rehabilitation units at two Australian hospitals. All participants received multidisciplinary usual care, including physical therapy. Participants were randomized to either an intervention group, which received additional daily physical therapy sessions focused on mobility activities or control group, which received social activities. Self-selected gait speed was measured using a 6-meter walk test at discharge by an assessor blinded to group. An intention-to-treat analysis was performed using a linear regression model, with baseline gait speed as a co-variate. The intervention group received a median of 20 additional minutes per day (IQR 15.0–22.5) of standing or walking activities throughout their inpatient stay; median 16.5 days (IQR 10.0–25.0). Gait speed improved in both groups, but there was no difference between groups at hospital discharge [median intervention 0.52 m/s (IQR 0.35–0.73); control 0.59 m/s (IQR 0.41–0.74); $p = 0.145$]. This suggests while clinically significant gains in mobility were achieved by older people receiving in-patient rehabilitation, additional physical activity sessions did not lead to better walking outcomes at discharge.

ATTENTION MEDIATES THE RELATION BETWEEN PAIN AND GAIT IN OLDER ADULTS

S.G. Leveille^{1,2,3}, J.M. Hausdorff⁴, R. McLean^{5,3,2}, L. Shi¹, Z. Dong¹, B. Manor^{5,3}, J. Bean^{6,3}, 1. College of Nursing and Health Sciences, University of Massachusetts Boston, Boston, Massachusetts, 2. Beth Israel Deaconess Medical Center, Boston, Massachusetts, 3. Harvard Medical School, Boston, Massachusetts, 4. Tel Aviv University, Tel Aviv, Israel, 5. Hebrew SeniorLife, Boston, Massachusetts, 6. Boston VA Healthcare System, Boston, Massachusetts

With aging, walking becomes more and more of a conscious effort. Chronic pain in older adults contributes to gait limitations and falls possibly by drawing attention away from the task of walking, leading to slow gait and gait variability. We studied 249 adults aged 71–99y (mean=83.9y, 64.7%female) in the MOBILIZE Boston Study II to evaluate the potential mediating role of attention in the relation between pain and gait performance. Attention was assessed using the Test for Everyday Attention (TEA), measuring selective attention, sustained attention and attentional switching. Gait speed and variability were measured using a gait mat (CIR Systems, Inc., Franklin, NJ). Means adjusted for age, sex and education were derived from GLM models. Mediation was assessed comparing direct and indirect effects of joint pain on gait performance by adding TEA measures to the models. Gait was slower among those with multisite pain compared to single site or no pain (mean gait

speed, 0.77 ± 0.02 ms in multisite pain, 0.8 ± 0.03 ms in single site pain, 0.92 ± 0.02 ms in no pain, p -value<0.001), and more variable (mean stride length CV, 4.95 ± 0.21 in multisite pain, 4.81 ± 0.27 in single site pain, 4.18 ± 0.24 in no pain, p -value<0.001). Adjustment for selective attention but not sustained attention or attentional switching, attenuated nearly all associations between multisite pain and gait performance (Sobel test for mediation, p -value<0.05). These findings suggest that chronic pain may contribute to gait limitations in part due to distracting effects of pain. Attentional challenges related to pain may offer a potential novel target for mobility interventions in older adults.

A CRITICAL REVIEW OF THE LONG-TERM DISABILITY OUTCOMES FOLLOWING HIP FRACTURE

S.M. Dyer^{1,2}, M. Crotty^{1,2}, N. Fairhall³, J.S. Magaziner⁴, L.A. Beaupre⁵, I. Cameron⁶, C. Sherrington³, 1. Rehabilitation, Aged and Extended Care, Flinders University, Adelaide, South Australia, Australia, 2. NHMRC Cognitive Decline Partnership Centre, Sydney, New South Wales, Australia, 3. The George Institute for Global Health, Sydney, New South Wales, Australia, 4. University of Maryland, Baltimore, Maryland, 5. University of Alberta, Edmonton, Alberta, Canada, 6. John Walsh Centre for Rehabilitation Research, Sydney, New South Wales, Australia

Hip fractures are a common consequence of falls and are associated with a high risk of death and reduced function. This review aims to quantify the impact of hip fracture on older people's abilities and quality of life (QOL) over the medium to long term. Cohort studies of hip fracture patients reporting outcomes three months post-fracture or longer were reviewed. Outcomes of mobility, participation in domestic and community activities of daily living (ADLs), health or quality of life were categorised according to the World Health Organization's International Classification of Functioning. Risk of bias was assessed based on the Strengthening the Reporting of Observational Studies in Epidemiology (STROBE) statement. The review included 38 studies, most followed participants from the time of fracture and included a clearly defined sample. This review showed that most recovery occurs within six months after fracture; 40–60% of survivors recover their pre-fracture level of mobility and ability to perform instrumental ADLs and 40–70% regain their level of independence for basic ADLs. For survivors independent in self-care pre-fracture, 20–60% require assistance for various tasks 1–2 years after fracture. Hip fracture has a significant impact on QOL; 10–20% of survivors are institutionalised following fracture, with poorer outcomes for people living in residential care pre-fracture. These studies indicate the range of current outcomes rather than potential improvements with different interventional approaches. Future studies should measure impact on life participation and determine the proportion of people that regain their pre-fracture level of functioning to investigate strategies for improving these important outcomes.

MOBILITY DOES NOT PREDICT DECLINES IN COGNITIVE FUNCTION IN COMMUNITY-DWELLING OLDER ADULTS

O. Donoghue¹, J. Feeney², N. O'Leary¹, A.M. O'Halloran¹, R. Kenny¹, 1. *Trinity College Dublin, Dublin, Ireland*, 2. *Queens University, Belfast, United Kingdom*

Slow gait speed has been associated with longitudinal decline in cognitive function, however few studies have examined the longitudinal relationship between Timed Up-and-Go (TUG) and cognitive function. In this analysis, we examine if slow TUG and gait speed at baseline are associated with poorer cognitive function at four years follow-up. This analysis is based on data from Waves 1 and 3 of The Irish Longitudinal Study on Ageing (TILDA). Participants completed a home-based interview and a health centre- or home-based health assessment at both waves. Community-dwelling adults aged ≥ 65 years (mean age 71.4 years; range 65–93 years), with a Mini Mental State Examination (MMSE) score ≥ 18 and no history of memory impairment, dementia, Alzheimer's disease or Parkinson's disease were included ($n=2,250$). TUG and usual gait speed were measured at baseline while choice reaction time and Colour Trails Test was assessed at baseline and follow-up. Individual mixed effects Poisson regression models were used to determine longitudinal associations between TUG/gait speed and each cognitive test, adjusting for socio-demographics, physical and mental health. There was very little evidence of an association between mobility measures and cognitive function based on the size and pattern of associations across this range of cognitive measures. TUG and UGS are not sensitive predictors of cognitive decline in this high functioning, community-dwelling sample suggesting that more challenging mobility tasks and longer follow-up is required.

SESSION 3415 (PAPER)

THE ROLE OF CAREGIVERS IN IMPROVING OUTCOMES

CAREGIVERS INCLUDED IN DISCHARGE PLANNING REDUCES HOSPITAL READMISSIONS: A META-ANALYSIS

J. Rodakowski², P. Rocco³, J. Ortiz¹, B. Folb⁵, R. Schulz⁴, S. Morton⁶, S. Leathers¹, E. James¹, 1. *Health Policy Institute, University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *School of Health and Rehabilitation Sciences, University of Pittsburgh, Pittsburgh, Pennsylvania*, 3. *Department of Political Science, Marquette University, Milwaukee, Wisconsin*, 4. *University Center for Social and Urban Research, University of Pittsburgh, Pittsburgh, Pennsylvania*, 5. *Health Sciences Library System, University of Pittsburgh, Pittsburgh, Pennsylvania*, 6. *College of Science, Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

Proposed Medicare regulations require hospitals to engage caregivers in the discharge planning processes. The purpose of this meta-analysis was to examine the influence of integrating caregivers into discharge planning process on hospital readmission rates among older adults. We searched

MEDLINE, EMBASE and the Cochrane Library databases for all English language articles published between 1990 and April 2016. We included randomized trials that examined discharge-planning interventions from hospitals to the community for older adults. All included interventions began prior to patient discharge, addressed at least one discharge planning element with a caregiver, and evaluated efficacy of discharge plan elements on hospital readmissions. We incorporated two levels of screening by three primary reviewers on 10,715 references. Study quality was assessed with the Cochrane risk of bias tool. We used a random-effects meta-analysis of pooled data to assess effect of the discharge planning interventions on hospital readmission rates. Fifteen studies met the inclusion criteria. Eleven studies provided sufficient detail to calculate readmission rates for treatment and control. Discharge planning with caregiver inclusion was associated with a 25 percent reduction in readmissions at 90 days (Relative Risk [RR], .75 [95% CI, .62-.91]) and a 24 percent reduction in readmissions at 180 days (Relative Risk [RR], .76 [95% CI, .64-.90]) compared to controls. The inclusion of caregivers into the discharge planning process reduces the risk of hospital readmission rates for older, hospitalized adults. These findings suggest that policies that incentivize and require inclusion of caregivers may benefit the patients and payers.

PERCEPTION IS IMPORTANT: THE MODERATING ROLE OF RESOURCE ADEQUACY ON FAMILY CAREGIVER OUTCOMES

G. McGhan, D. McCaughey, *University of Alabama at Birmingham, Birmingham, Alabama*

Caring for a loved one is a universal and common occurrence, with 70–80% of community care for older adults being provided by family caregivers. Previous research has established caregiving can have negative effects on the caregivers' mental and physical health. Culminating in perceived burden, these negative outcomes have been associated with premature institutionalization and unmet needs for the older adults receiving the care. What is less well known, however, is how resources, both utilization and perception of adequacy, in the caregiving role may improve family caregiver outcomes. Using the Conservation of Resources Model, this study examined if resource utilization and perception of adequacy moderate the relationship between caregiving demands and the outcomes of caregiver satisfaction and strain. Secondary analysis of the Informal Caregiver Survey, ($n = 1,907$) which examines family caregivers of older adults residing in the community, was conducted using hierarchical multivariate regression with moderation. No significant relationships were found for caregiver satisfaction. Resource utilization revealed a positive relationship with caregiver strain ($\beta = .221, t=10.594, p<.001$). Resource adequacy revealed a negative relationship with caregiver strain ($\beta = -.076, t=-3.803, p<.001$) and moderated the relationship between caregiving demands and strain ($\beta = -.040, t= -2.007, p <.05$). Findings from this study contribute to the importance of providing targeted resources and support to family caregivers, which may be especially salient for those whose needs are unmet in the caregiving role. Policies and practices need to promote improving caregiver outcomes so they may remain and thrive in their critical role.

COMMUNICATION OUTCOMES OF A PROGRAM TO SUSTAIN RELATIONSHIPS IN COUPLES AFFECTED BY DEMENTIA

C.L. Williams¹, D.L. Newman¹, L.M. Hammar², 1. *Florida Atlantic University, Boca Raton, Florida*, 2. *Högskolan Dalarna, Falun, Dalarna, Sweden*

In the future, more persons with AD will be cared for by spouses. Spouses report that communication with partners with dementia causes considerable relationship strain. The purpose of the study was to examine the effects of a 10-week, home-based, psychoeducational intervention to support marital relationships on caregiver (CG) and care receiver (CR) communication. Fifteen couples aged 55+, community-dwelling, with mild-moderate dementia participated. Weekly, 10-minute video-recorded conversations over 10 weeks resulted in 118 recordings for the analysis. Observer rated communication was analyzed using Verbal/Nonverbal Interaction Scale. Communication breakdowns/resolutions were measured as described by Orange (1998). Marital quality was measured with Norton's Marital Quality Index.

Spouse caregiver (CG) disabling communication was associated with communication breakdowns ($r = .87, p < .01$) and fewer resolutions ($r = -.80, p < .01$). Spouse's ratings of marital quality were negatively associated with disabling nonverbal ($r = -.32, p < .05$) and verbal ($r = -.27, p < .05$) communication. Controlling for CR MMSE, the ratio of social to unsocial CR communication showed significant improvement across sessions-average of 4.46 points per session [$\beta = 4.46, t(10) = 1.96, p = .039$]. Disabling CG communications decreased significantly with approximately .65 decrease in negative comments per session [$\beta = 0.654, t(11) = -2.61, p = .024$]. The improvement in ratio of positive to negative CG comments was greater for CR with a lower MMSE (14–16) compared to those with higher MMSE (21). Creative interventions for couples are needed to help them sustain their relationships and maintain their health.

FAMILY CAREGIVER PERCEPTIONS ABOUT MOBILITY SUPPORT OF OLDER ADULTS DURING AND AFTER HOSPITALIZATION

T. Floegel¹, J. Wu², 1. *College of Nursing, East Carolina University, Raleigh, North Carolina*, 2. *University of North Carolina-Chapel Hill, Chapel Hill, North Carolina*

Purpose: Informal family caregivers are a natural group to assist in mobilizing older hospitalized adults. However, little is known about the perceptions and needs of informal family caregivers related to mobility or functional support for their older loved one during acute hospitalization for illness and after hospital discharge. This study sought to understand these experiences of the informal caregiver.

Methods: Informal family caregivers (N=30, mean age=63.03 ± 13.15 years; 46.7% spouse, 46.7% adult child) of recently hospitalized older adults with cardiac or medical diagnosis (N=30, mean age=79.10 ± 7.12) completed the Caregiver Burden Scale (CBS), Caregiver Strain Index (CSI) and were interviewed about their perceptions and needs regarding mobility and functional support of their older loved one during and after hospitalization. Mixed-methods analyses using thematic content analysis of interview data were conducted.

Results: Caregivers reported low to moderate burden (CBS mean=39.83 ± 2.04, range 17–68) and low to moderate caregiver strain (CSI mean=3.77 ± 2.91, range 0–10). Caregivers of older family members with a longer hospital stay (≥4 days) reported significantly higher strain, $t(28) = -2.30, p = 0.03$. Themes included positive and negative constructs surrounding caregiver encouragement for continued activity, confidence in mobility assistance techniques, activity discussion/assistance from nurses, and temporary role adjustments at home.

Conclusions: Family caregivers described challenges in the hospital including informational support from staff. Caregivers felt more confident assuming mobility support roles at home after discharge. Hospitals should prepare caregivers and patients with information, resources, and encouragement regarding mobility and functional activities during hospitalization and after discharge.

SESSION 3420 (SYMPOSIUM)

APPROPRIATE PRESCRIBING AS A PART OF MULTI-MORBIDITY CARE OF COMPLEX OLDER ADULTS

Chair: D. Gnjdjic, *University of Sydney, Sydney, New South Wales, Australia*

Co-Chair: H. Allore, *Yale University, New Haven, Connecticut*

Discussant: S.N. Hilmer, *The University of Sydney and Royal North Shore Hospital, St Leonards, New South Wales, Australia*

Older adults with multi-morbidity, including cognitive impairment, continue to be prescribed medications for which the risks may outweigh the benefits. This symposium of multidisciplinary international presenters, and GSA members spanning across Behavioral, Social and Health Sciences interest groups, will draw on expertise in (pharmaco)epidemiology, advanced biostatistical methods, geriatric medicine, clinical and geriatric pharmacology to discuss new research and application to the practice of prescribing among complex older adults with multi-morbidity and geriatric syndromes.

Dr Gnjdjic (Pharmaco-epidemiologist, Sydney, Australia) will discuss the pharmaco-epidemiology research about the complex interactions between multi-morbidity including dementia and polypharmacy.

Professor Allore (founder of Gerontologic Biostatistics, Yale, USA) will present work that investigates the role of new innovative method for determining individualized absolute risk calculations by presenting the probabilities of outcomes in absolute terms to inform treatment decisions among patients with multi-morbidity.

Assistant Professor Moga (Pharmaco-epidemiologist, University of Kentucky, USA) will discuss her recent work that investigates the relationship between dementia diagnosis and prescribing practices in older people, and multidisciplinary interventions used to minimize inappropriate polypharmacy in older adults.

Associate Professor Husebo (Anesthesiologist and Nursing Home Physician, Bergen, Norway) will present the findings of a cluster randomized clinical trial investigating the complex interplay of pain and behavioral symptoms among people with dementia residing in nursing homes.

Professor Petrovic (Geriatrician and Clinical Pharmacologist, Ghent, Belgium) will discuss prescribing considerations for people with multi-morbidity and polypharmacy. Professor Hilmer, Discussant (Geriatrician and Clinical Pharmacologist, Sydney, Australia), will summarize and discuss the application of these concepts to the treatment of complex older patients.

MULTI-MORBIDITY, GERIATRIC SYNDROMES, AND POLYPHARMACY IN OLDER ADULTS: UNTANGLING THE EVIDENCE

D. Gnjdic, *Faculty of Pharmacy, University of Sydney, Sydney, New South Wales, Australia*

Multimorbidity (≥ 2 chronic conditions), polypharmacy (≥ 5 medicines) and geriatric syndromes (e.g. frailty) are common in older adults. Evidence from pharmaco-epidemiological studies suggests that polypharmacy contributes to risk of developing geriatric syndromes including frailty and cognitive impairment. In our study of community-dwelling men, we found that increasing medication burden was associated with transition to frailty states, namely from robust to frail state and subsequent increased risk of mortality in older people. Recently, efforts have been made to quantify complex patterns of multimorbidity and polypharmacy in older adults using novel analysis such as Association Rule and Frequent-set analysis. In our study, using the Association Rule methodology we found several morbidity clusters. In relation to polypharmacy exposure, Frequent-set analysis showed that medication combinations differed according to geriatric syndrome status. Observational studies continue to provide important evidence on outcomes to evaluate medicine use in older adults.

INDIVIDUALISED ABSOLUTE RISK CALCULATOR FOR PERSONS WITH MULTIPLE CHRONIC CONDITIONS

H. Allore^{1,3}, G.J. McAvay¹, T.E. Murphy¹, G. Agogo¹, C. Fragoso^{1,2}, 1. *Internal Medicine, Yale University, New Haven, Connecticut*, 2. *Veterans Affairs Medical Center, West Haven, Connecticut*, 3. *Yale School of Public Health, New Haven, Connecticut*

Few treatment guidelines exist for multi-morbid patients. Individualized absolute risk calculators for competing patient-centred outcomes are a way to help with treatment decisions that account for patient preferences. The absolute risk of an outcome is the probability that a person receiving a given treatment will experience that outcome within a pre-defined time interval, during which they are simultaneously at risk for other competing outcomes. We developed an individualized absolute risk calculator for competing outcomes using doubly robust propensity scoring that strengthens causal inference for specific treatments. Heterogeneous treatment effects among multi-morbid patients largely depends on coexisting conditions and patient characteristics which are explanatory factors used in estimating the treatment effects. This innovative method has wide-spread application for determining individualized absolute risk calculations by presenting the probabilities of outcomes in absolute terms to help the increasing population of patients with multi-morbidity facing complex treatment decisions.

FROM OBSERVATION TO MAKING A CHANGE: ADDRESSING INAPPROPRIATE MEDICATION USE IN OLDER ADULTS

D. Moga, *Pharmacy Practice and Science, University of Kentucky, Lexington, Kentucky*

Pharmacotherapy, although a fundamental component of care of older patients with multi-morbidity, is often inappropriate. Despite careful review, medication counseling, and medical care provisions by licensed prescribers involved in the National Alzheimer's Coordinating Center (NACC), 44% of the enrollees ≥ 65 years reported at least one, and about 31.5% used multiple anticholinergic drugs between 2005–2013. Furthermore, anticholinergic drugs were frequently used together with cognitive enhancers or antipsychotics. Our pharmacist-physician intervention reduced anticholinergic use in 56% of those in the intervention arm as opposed to 8% in the control arm and improved medication appropriateness index (mean difference from baseline 4.16 vs 1.13). Our follow-up intervention will address the entire spectrum of potentially inappropriate medications (Beers 2015 list) and will evaluate its impact on expanding cognitive reserve. Finding the right balance between treating multi-morbidity and avoiding medication-related negative effects, an important objective for healthcare providers, might be hard, but not impossible to achieve.

INTERACTIVE RELATIONSHIP BETWEEN PAIN, PSYCHOSIS, AND AGITATION IN PEOPLE WITH DEMENTIA: AN RCT TRIAL

B.S. Husebø¹, T. Habiger¹, W. Achterberg², E. Flo¹, 1. *University of Bergen, Bergen, Hordaland, Norway*, 2. *University of Leiden, Leiden, Netherlands*

Neuropsychiatric symptoms are common in people with dementia, and pain is thought to be a relevant underlying factor for increased agitation and depression. The association between pain and psychosis, and the effect of pain management on psychosis as a possible trigger for psychosis, is unclear. This cluster-randomised controlled trial, including 352 patients with advanced dementia and agitation from 18 Norwegian nursing homes (NH), investigates the efficacy of a stepwise protocol for treating pain (SPTP) on psychosis and agitation measured with the Neuropsychiatric Inventory – Nursing Home version (NPI-NH), and tested the effect of opioid analgesics on psychosis. Pain was associated with disinhibition (adjusted OR: 1.21; 95% CI: 1.10–1.34) and irritability (adjusted OR: 1.10; 95% CI: 1.01–1.21), at baseline. SPTP reduced agitation ($p < 0.001$) and aberrant motor behaviour ($p = 0.017$). Psychosis was reduced in people with at least one symptom at baseline ($p = 0.034$), and opioid analgesics did not increase psychotic symptoms.

CLINICAL CHALLENGES OF CARING FOR OLDER ADULTS WITH MULTI-MORBIDITY AND POLYPHARMACY

M. Petrovic, *Geriatrics, Ghent University, Ghent, Belgium*

Older adults with multi-morbidity, geriatric syndromes and polypharmacy are susceptible to adverse drug-related events. The available measures to ensure appropriate and patient tailored pharmacotherapy include adverse drug reaction risk and medication assessment tools, and specific interventions to tackle inappropriate prescribing. These

interventions include: educational interventions, computerized decision support systems, pharmacist-based interventions, and comprehensive geriatric assessment.

Screening to identify older adults at risk of adverse drug reactions is the initial step within a multistep approach to geriatric pharmacotherapy.

The integrative pharmaceutical care consists of four steps, i.e. identification of all medications that the patient is taking, medication appropriateness assessment, design and the follow-up of a pharmaceutical care plan.

None of the existing interventions shows a clear positive effect on patients' health outcomes if applied separately. But, when these interventions are combined within the context of a multidisciplinary teamwork and comprehensive geriatric assessment, positive effects on patients' health outcomes might be expected.

SESSION 3425 (SYMPOSIUM)

THE CANDRIVE/OZCANDRIVE PROSPECTIVE OLDER DRIVER COHORT STUDY RESULTS

Chair: S. Marshall, *Ottawa Hospital Research Institute, Ottawa, Ontario, Canada*

Co-Chair: J. Charlton, *Monash University, Melbourne, Victoria, Australia*

This symposium will describe results for the Candrive/Ozcandrive Prospective Older driver Study. The Candrive study involves 928 actively driving older adults (age 70 and above) who were recruited across 7 Canadian sites to participate in a 5 year prospective study of older drivers. The linked Ozcandrive study includes 257 older drivers (age 75 and older) from Australia and New Zealand. All participants had comprehensive annual assessments and driving patterns were monitored using in car recording devices with GPS tracking capabilities. This symposium will confirm that the Canadian population of older drivers recruited is similar to the older Canadian driving population by comparison with the Canadian Community Health Survey. Changes in driving patterns over the course of the study for the Australian Ozcandrive participants will be described. Similarly, for Canadian drivers results will be presented in relation to preparation and readiness to transition from active driving to cessation. This cohort provided the unique opportunity to link driver reaction time measured through the Attention Network Test to traffic violations where it was demonstrated that drivers with faster reaction times had higher rates of traffic violation. Finally, the investigators will report on the predictors for at-fault collisions in older drivers that will ultimately contribute to the derivation of an older driver risk stratification tool.

DOES SAMPLE ATTRITION DECREASE THE GENERALIZABILITY OF THE FINDINGS IN THE CANDRIVE II COHORT STUDY?

S. Gagnon¹, A. Stinchcombe^{2,1}, Y. Kadulina¹, B. Mazer³, M.J. Rapoport⁴, M.M. Porter⁵, S. Marshall^{6,1}, B. Vrkljan⁷,
1. *Psychology, University of Ottawa, Ottawa, Ontario, Canada*, 2. *Lakehead University, Thunder Bay, Ontario, Canada*, 3. *McGill University, Montreal, Quebec, Canada*, 4. *University of Toronto, Toronto, Ontario, Canada*, 5.

University of Manitoba, Winnipeg, Manitoba, Canada, 6. *OHRI, Ottawa, Ontario, Canada*, 7. *McMaster University, Hamilton, Ontario, Canada*

The Candrive II cohort researchers have followed a convenient sample of older drivers, aged 70 and older, for five to seven years. One of the goals of this study consists in developing a risk stratification tool that would help identify unsafe older drivers. The validity of such tools depends on how representative the study sample is. We have demonstrated that the Candrive II sample at baseline was representative of older Canadian driver through demonstration of equivalence on variables extracted from the Canadian Community Health Survey – Healthy Aging (CCHS-HA). At baseline, 928 older drivers (mean age = 76.21 5) volunteered in the Candrive II study with 583 of them remaining 5 years later (mean age = 79.8). We make again use of the equivalence testing approach to compare Candrive II sample at year 5 to CCHS-HA drivers of the same age.

CHANGES IN DRIVING PATTERNS OF OLDER AUSTRALIANS: FINDINGS FROM THE CANDRIVE/OZCANDRIVE COHORT STUDY

J. Charlton¹, S. Koppel¹, P. Darzins², M. Di Stefano³, W. Macdonald³, M. Odell⁴, A. D'Elia¹, M.M. Porter⁵, 1. *Monash University Accident Research Centre, Monash University, Victoria, Australia*, 2. *Eastern Health, Burwood, Victoria, Australia*, 3. *LaTrobe, Bundoora, Victoria, Australia*, 4. *Victorian Institute of Forensic Medicine, Melbourne, Victoria, Australia*, 5. *University of Manitoba, Winnipeg, Manitoba, Canada*

This paper describes changes in driving patterns for a cohort of older Australians. In-vehicle data-loggers installed in participants' own vehicles monitored spatio-temporal characteristics of driving trips across three years for 164 participants aged 75+ years (Year 1: Male = 68.9%; Mean Age = 79.5 years, SD = 3.4 years, Range = 75 - 88 years). The majority (60–65%) of trips were within 5km from home across the three years. On average, in Year 1, participants drove 1,276 trips (SD = 479), totalling 9,468km (SD = 5,215) annually, decreasing significantly to 1,175 trips (SD = 541) and 8,253km (SD = 4,813) annually in Year 3. Generalised Estimating Equations revealed that reduced driving (annual distance, trip frequency, night-time trips, peak-traffic trips) were associated with: increased age, being female, reduced cognitive function, poorer contrast sensitivity, and those that discontinued driving for health reasons. Results are considered in terms of implications for safe mobility.

CHANGES IN DRIVERS' READINESS FOR MOBILITY TRANSITION, SELF-RESTRICTION, AND HEALTH

A. Stinchcombe¹, H. Maxwell^{1,8}, N. Mullen¹, B. Weaver^{1,9}, H.A. Tuokko², G. Naglie^{3,4,5}, S. Marshall^{6,7}, M. Bedard^{1,8,9},

Toronto, Ontario, Canada, 6. University of Ottawa, Ottawa, Ontario, Canada, 7. Ottawa Hospital Research Institute, Ottawa, Ontario, Canada, 8. Centre for Applied Health Research, St. Joseph's Care Group, Thunder Bay, Ontario, Canada, 9. Northern Ontario School of Medicine, Thunder Bay, Ontario, Canada

Many older drivers will eventually stop driving. Increased readiness to transition to non-driving status mitigates some of the adverse consequences of driving cessation. The Assessment of Readiness for Mobility Transition (ARMT, Meuser et al., 2011) measures attitudinal and emotional preparedness to transition to non-driving. Using data from the Candrive cohort study, we examined changes over time in older drivers' readiness to transition to non-driving in relation to changes in driving and health-related variables. A sub-sample of the Candrive cohort was recruited from 4 Canadian sites (N=183, mean age at baseline = 77.60 years, SD=4.52). Participants completed a set of measures annually for three years, including the ARMT, health-related measures (e.g., medications, medical conditions), Activities of Daily Living (ADLs), driving restriction, and driving situational avoidance. There were no statistically significant changes in ARMT scores over the 3-year period, $F(2, 298)=.51, p=.603$. However, there were statistically significant changes in health status as evidenced by an increase in daily medications, $F(2, 286)=5.18, p=.006$, and medical conditions, $F(2, 286)=13.28, <.001$, as well as a decrease in ADLs, $F(2, 286)=5.04, p=.007$. There was also a statistically significant increase in self-restriction of driving to avoid complex situations, $F(3, 274)=10.99, p<.001$. No statistically significant associations were observed between changes in ARMT scores and changes in either health or driving-related variables. Unlike health and driving-related variables, ARMT scores were relatively stable over a three-year period. Change in ARMT scores over time appears to be independent from changes in other variables known to be associated with driving.

REACTION TIMES ON THE ATTENTION NETWORK TEST ARE ASSOCIATED WITH TRAFFIC VIOLATIONS

M. Bedard¹, H. Maxwell¹, B. Weaver¹, S. Marshall², G. Naglie³, M.J. Rapoport⁴, H.A. Tuokko⁵, 1. Lakehead University, Thunder Bay, Ontario, Canada, 2. University of Ottawa, Ottawa, Ontario, Canada, 3. Baycrest Health Sciences Centre, Toronto, Ontario, Canada, 4. University of Toronto, Toronto, Ontario, Canada, 5. University of Victoria, Victoria, British Columbia, Canada

The Attention Network Test (ANT) measures choice response time (RT) and the efficiency of three functions of attention (alerting, orienting, and executive function). Using data from the Candrive cohort study, we looked for associations between overall median RT from the ANT and traffic violations. Participants (N = 451) were aged ≥ 70 . Violations data were obtained from provincial ministries of transportation and dichotomized as the primary outcome measure (yes/no). Our logistic regression included ANT median RT, gender, number of self-reported medical conditions, and self-reported kilometers driven (low = 1–10,000km/year, high = >10,000km/year) as explanatory variables. In the adjusted model, drivers with higher RT had greater odds of traffic violations (OR=1.32, $p < .001$) as did participants who drove greater distances (OR=2.67, $p < .001$). Gender

and the number of medical conditions were not associated with violations. These results suggest the ANT may provide insight into cognitive processes supporting safe driving.

CANDRIVE OLDER DRIVER STUDY: OBJECTIVE VARIABLES PREDICTIVE OF AT-FAULT COLLISION

S. Marshall^{1,2}, G. Naglie^{4,9}, B. Vrkljan³, I. Gelin⁵, M. Bedard⁶, H.A. Tuokko⁷, M.M. Porter⁸, M.J. Rapoport⁴, 1. Medicine, Ottawa Hospital Research Institute, Ottawa, Ontario, Canada, 2. University of Ottawa, Ottawa, Ontario, Canada, 3. McMaster University, Hamilton, Ontario, Canada, 4. University of Toronto, Toronto, Ontario, Canada, 5. McGill University, Montreal, Quebec, Canada, 6. Lakehead University, Thunder Bay, Ontario, Canada, 7. University of Victoria, Victoria, British Columbia, Canada, 8. University of Manitoba, Winnipeg, Manitoba, Canada, 9. Baycrest, Toronto, Ontario, Canada

One of the aims of the Candrive Prospective Older Driver Study was to prospectively identify older drivers who were medically at risk for driving. 928 active older drivers were recruited across 7 Canadian sites and followed up to 7 years. The primary outcome was at-fault collision. Using Generalized Estimating Equations univariate analysis revealed 81 variables with a significance of $p<0.1$. Multivariate analysis of objective variables with adjustment for driving exposure resulted in a model where 6 variables including MVPT correct responses ($p=0.008$), previously being pulled over by police ($p=0.023$), previous crash involvement ($p=0.006$), left rapid foot taps ($p=0.024$), left wrist extension strength ($p=0.020$) and overall calmness ($p=0.023$) significantly contributed to identifying medically at risk older drivers. With further ongoing analysis these variables will assist in deriving an objective risk stratification tool that can be used by clinicians in an outpatient clinic setting.

SESSION 3430 (SYMPOSIUM)

INTERDISCIPLINARY DRIVERS FOR QUALITY AGED CARE: THE WICKING TEACHING AGED CARE FACILITY PROGRAM

Chair: A.L. Robinson, University of Tasmania, Hobart, Tasmania, Australia

The residential aged care sector is challenged to provide high quality care to increasingly frail residents. Central to this is developing new models of interdisciplinary practice to support holistic person centred care. The Wicking Teaching Aged Care Facilities Program (TACFP), implemented in six Australian Residential Aged Care facilities (RACFs), drives an innovative interdisciplinary aged care agenda by bringing together large numbers of students from different disciplines to undertake aged care clinical placements. The students' placement program is underpinned by an action research framework, that supports the development of inter-professional learning and inter-disciplinary engagement in resident care. To ensure sustainability a second TACFP strand was implemented concurrently to build leadership structures and processes to facilitate organisational engagement in the innovative program. This involved undertaking a systematic organisational review and redesign in each RACF to drive a high performance culture that could sustain clinical

innovation and build research readiness. Since its implementation in 2011, the outcome of the TACFP has seen expanding numbers of inter-disciplinary students on placement in the RACFs and an appetite to move into a third TACFP strand to develop programs of inter-disciplinary research that focus on care redesign to model evidence based care that will support improved quality of life and clinical outcomes for residents. This symposium will involve an inter-disciplinary group of presenters who will provide an overview of the program and its broad outcomes, a case study to address inter-disciplinary student placements and two case studies which address the emergent program of care redesign.

INTERDISCIPLINARY INNOVATION IN AGED CARE: THE WICKING TEACHING AGED CARE FACILITY PROGRAM

A.L. Robinson, E. Lea, K. Elliott, M. Annear, C. Eccleston, K.V. Doherty, *Wicking Dementia Research and Education Centre, University of Tasmania, Hobart, Tasmania, Australia*

In 2011 the Wicking Centre at UTAS initiated a program to develop Teaching Aged Care Facilities (TACF). The TACF program deployed an action research approach to support the implementation of large scale multi-disciplinary student placements, while concurrently executing a program of organisational development. The program findings reveal a 1400% increase in student placements, involving nine disciplines and 716 students across six RACFs over four years. Moreover, in four RACFs student placements have not only been sustained since 2014, but have expanded to include additional disciplines. Evidence of statistically significant improvements in dementia knowledge ($p=.01$) (DKAT2) and improvements in students' collaborative practice ($p=.01$) and inter-professional attitudes ($p=.02$) (UWEIPQ) are apparent, while qualitative data indicates improved care for residents. A key outcome has been enhanced organisational research readiness, with 72 staff functioning as active research participants, such that it now includes a third stream related to care redesign.

THE VALUE OF SYSTEMATIC INTERPROFESSIONAL EDUCATION FOR EFFECTIVE PRACTICE IN DEMENTIA CARE

L. Goldberg¹, C. Eccleston¹, E. Lea¹, D. Griffiths², A.L. Robinson¹, 1. *Wicking Dementia Research and Education Centre, University of Tasmania, Hobart, Tasmania, Australia*, 2. *Curtin University, Perth, Western Australia, Australia*

In line with the emerging focus on the need for interprofessional, evidence-based care for adults in residential communities, the Wicking Teaching Aged Care Facilities program provides a systematic and effective approach. As an example, in multiple, 3-day per week placements, 6 speech pathology, 48 nursing, 12 occupational therapy, 10 physiotherapy, and 22 pharmacy students worked together. Weekly IPE learning opportunities included rounds led by a General Practitioner, 3.5-hour case study and reflection sessions, and 2-hour clinical meetings. Onsite IPE mentors from varying professions provided ongoing support and feedback. Qualitative analysis of students' reflective comments documented competencies under all four core domains needed for interprofessional

collaborative practice. Quantitative analysis of students' responses to validated interprofessional competency and dementia knowledge scales, pre- and post-placement, documented significant ($p < .05$, moderate effect size) increases in their perceptions of the importance of communication, teamwork, interprofessional interaction, evidence-based care, and knowledge of dementia.

OPTIMISING NUTRITION FOR ADULTS WITH DEMENTIA: RESIDENTIAL COMMUNITIES' CARE REDESIGN OPPORTUNITIES

E. Lea, L. Goldberg, A. Price, L. Tierney, F. McInerney, *Wicking Dementia Research and Education Centre, University of Tasmania, Hobart, Tasmania, Australia*

Malnutrition is highly prevalent amongst aged care facility residents, with dementia increasing malnutrition risk. The severity of this situation has been recognised for many years, but translation of knowledge into provision of evidence-based, person-centred care practices to improve nutrition care has not occurred. One of the first projects in the Wicking Teaching Aged Care Facilities Program's care redesign stream was an ethnographic case study conducted by an inter-disciplinary team in one Australian facility to examine care practices. This included a facility document audit, observations of 7 residents with dementia, and 7 family- and 11 staff-member interviews. Study findings identified a range of barriers to evidence-based, person-centred care practices. Barriers included lack of monitoring of body mass index, ineffective prompting to encourage eating/drinking, absence among staff of a 'big picture' view of the relationship between nutrition/hydration and key clinical health indicators, and eating/drinking viewed as tasks rather than enjoyable social activities.

TOWARD EFFECTIVE MANAGEMENT OF CHRONIC RESPIRATORY CONDITIONS IN RESIDENTIAL AGED CARE

K.V. Doherty, E.H. Walters, L. Tierney, K. Elliott, M. Annear, A.L. Robinson, *Wicking Dementia Research and Education Centre, University of Tasmania, Hobart, Tasmania, Australia*

Chronic respiratory conditions are poorly managed in residential aged care settings. As part of the Respiratory Care Redesign research stream, our team (respiratory physician, aged care specialist, psychologist and health services researchers) has demonstrated that chronic respiratory conditions are incorrectly diagnosed in 78% of cases, severity is underestimated in 52%, and treatment is inadequate or inappropriate in 82%. To further inform redesign of respiratory care, we assessed the perceptions of residents' respiratory status from the perspective of residents, nurses, careworkers and family members. Interviews and focus groups revealed that all groups under-estimated the importance of chronic respiratory symptoms despite their impact on daily living; there was no systematic approach to management or review and there was an identified need for education, particularly for careworkers. In response to this we have now developed an Optimising Respiratory Care educational module to reduce impact of poor respiratory health through better management strategies.

SESSION 3435 (SYMPOSIUM)

CO-HOST AFAR: TARGETING AGING—THE NEXT BIG MEDICAL BREAKTHROUGH

Chair: S.N. Austad, *The University of Alabama at Birmingham, Gardendale, Alabama*

Co-Chair: O. van der Willik, *American Federation for Aging Research*

Aging underlies all the major causes of death and disability in humans. Over the past two decades, basic researchers have been remarkably successful in identifying the underlying processes of aging, and by modifying those processes have discovered multiple methods of extending life and preserving health in experimental laboratory animals. Although early work relied mostly on dietary or genetic interventions, recently a number of pharmaceutical treatments also appear to slow aging in the laboratory. These successes, combined with the demographic imperative of an aging globe, suggest that it is time to begin to translate these successes into human therapies that in principle could delay many or most diseases and debilitating conditions of later life. Symposium participants will present recent research illuminating the promise for human health. Dr. Austad will present a brief overview of the current state of basic aging research. Dr. Kaerberlein will describe how inhibition of a key biochemical network in mice has already been successfully used to dramatically improve health and how its use in dogs is preparing the stage for human trials. Dr. Kirkland will describe the remarkable health effects brought about by eliminating senescent cells in mice. Finally, Dr. Barzilai will outline the rationale and a specific research plan for the first drug trial in humans aimed at delaying aging.

TRANSLATIONAL GEROSCIENCE: TARGETING MTOR SIGNALING TO PROMOTE HEALTHY LONGEVITY

M. Kaerberlein, *University of Washington*

The FDA approved drug rapamycin delays aging and increases lifespan in yeast, nematodes, fruit flies, and mice. Nevertheless, important questions exist regarding the translational potential of rapamycin and other mTOR inhibitors for human aging, and the optimal dose, duration, and mechanisms of action remain to be determined. Here I will report on the effects of short-term treatment with rapamycin in middle-aged mice and companion dogs. We find that transient treatment with rapamycin is sufficient to increase life expectancy by more than 50% and improve measures of healthspan in middle-aged mice. This treatment is associated with a remodeling of the gut microbiome and a dramatic shift in the cancer spectrum of female mice. In dogs, we have defined a dose of rapamycin that is well tolerated, and initial results are consistent with improvements in age-associated cardiac function. These data suggest that a transient treatment with rapamycin may yield robust health benefits in mice, dogs, and perhaps humans.

THE PATH TOWARD TRANSLATING SENOLYTIC DRUGS INTO CLINICAL TREATMENTS

J.L. Kirkland, *Mayo Clinic Kogod Center on Aging, Rochester, Minnesota*

Senescent cells, which can secrete inflammatory cytokines, immune cell chemokines, tissue-damaging proteases, and factors causing stem cell dysfunction, accumulate with aging

and at sites of chronic disease pathology. Senolytic drugs promote selective removal of senescent cells, some by interfering with pathways that confer apoptosis-resistance to senescent cells. Genetically- or pharmacologically-removing senescent cells increases life- or health-span, restores stem cell function, alleviates age- or disease-related cardiovascular, joint, bone, pulmonary, and cognitive dysfunction, frailty, and radiation- and chemotherapy-induced damage, among other effects. Some senolytic drugs are more effective in eliminating particular senescent cell types than others. Senolytics are entering or will soon enter short-term proof-of-concept clinical trials for a range of indications, including certain senescence-associated disabilities and diseases, alleviation of cancer treatment side-effects, restoration of stem cell function, and frailty, among others. If effective and free of serious side-effects, senolytic agents and other drugs that target fundamental aging mechanisms could be transformative.

TARGETING AGING WITH METFORMIN (TAME)

N.R. Barzilai, *Albert Einstein College of Medicine, Bronx, New York*

Metformin is one drug that targets the biology of aging and extends life- and health-span in animals. It is used for the treatment of and to delay type 2 diabetes mellitus (T2DM), with an over 60 years outstanding safety record. Metformin use is also associated with lower rates of cancer, CVD, all-cause mortality and possibly less cognitive decline. We designed TAME, a placebo controlled, multi-center study in ~3000 elderly aged 65–79, with a novel primary outcome of delaying the incidence of a composite of multiple age-related diseases. Additional outcomes relate to geriatric syndromes and functional health. The study was developed in consultation with the FDA to obtain a new FDA indication to target aging. This indication would allow industry to justify the development of next-generation drugs to target aging and will further extend healthy life span in the next decade, utilizing the experimental template provided by TAME.

SESSION 3440 (SYMPOSIUM)

REPRODUCTIVE AND PARENTAL CORRELATES OF CARDIOMETABOLIC RISK IN GLOBAL POPULATIONS OF OLDER ADULTS

Chair: C.M. Pirkle, *University of Hawaii- Manoa, Honolulu, Hawaii*

Co-Chair: Y. Wu, *University of Hawaii at Manoa*

Discussant: M. Zunzunegui, *Universite de Montreal, Montreal, Quebec, Canada*

A substantial body of research investigates potentially-modifiable individual risk factors for cardiovascular (CVD) diseases including tobacco use, physical inactivity, and clustered metabolic risk factors. In older adults, however, many of these “modifiable” factors are conditioned by exposure to a lifetime of socially- and culturally-established determinants. Some of the most intractable are tied to gender norms, which strongly influence reproductive timing and frequency and are among the most life-altering events in the human experience, both physiologically (women) and socially. To date, numerous studies investigate female lifetime parity and CVD, as well as adolescent childbirth and all-cause mortality. Many observe robust associations and attribute the findings

to the physiological consequences of pregnancy. Almost all of this research takes place in high-income settings and few interrogate the complex constellation of influences on reproduction and its long-term health consequences. Very few look at male populations.

In this symposium, we present findings from middle and high-income populations investigating age at first childbirth (AFB) and number of children on cardiometabolic diseases. We begin with results of a systematic review investigating associations between AFB and CVD. It highlights conceptual and methodological gaps in previous approaches to the topic. The next two studies present results from an international cohort of community-dwelling older adults with sites in Canada and middle-income countries, each characterized by divergent gender norms and human development indices. Finally, we present results on lifetime number of children in men and women in the United States and associations with heart disease and stroke.

MATERNAL AGE AT FIRST BIRTH AND RISK OF LATER-LIFE CARDIOVASCULAR DISEASE: A SYSTEMATIC REVIEW

C.M. Pirkle, N.T. Rosendaal, *Office of Public Health Studies, University of Hawaii, Honolulu, Hawaii*

Review of the literature on age at first childbirth (AFB) and CVD, including hypothesized causal pathways. PubMed and Web of Science databases were searched for observational studies published between 1980–2015. Data were extracted using a pre-defined list. 19 publications, reporting on 30 associations, were included in the review, all from high-income settings. Eight of 13 studies that defined young AFB as ≤ 20 found a positive association between early AFB and CVD, while two reported a positive association between later first childbirth and CVD. Substantial methodological limitations were observed related to: operationalization of risk categories, choice of reference category, sample size, follow-up time and statistical over-adjustment. Only two studies explicitly reported employing a theoretical framework when investigating the relationship. Early AFB is possibly related to CVD. Better conceptualization of causal pathways linking reproductive timing to CVD risk is needed.

EARLY AGE AT FIRST BIRTH ASSOCIATED WITH GREATER FRAMINGHAM RISK SCORES FOR CARDIOVASCULAR DISEASE

C.M. Pirkle, Y. Wu, N.T. Rosendaal, *University of Hawaii, Honolulu, Hawaii*

Investigate the association of age at first childbirth (AFB) with Framingham Laboratory Risk Scores (FRS) for CVD. Multivariate linear regression analyses were conducted with baseline data from a multisite study of community-dwelling older female adults (N=868). Women with adolescent childbirth (AFB <19) were compared to those with AFB of 19–24, 25–29, 30+ and nulliparous women. Lifetime parity was considered. Adolescent childbirth was positively associated with FRS. Women with adolescent childbirths had 6.8 points higher mean FRS (95%CI 3.8–9.9) than women in the lowest AFB risk-group (25–29yr). Women with adolescent childbirths also had significantly higher scores compared to women with AFB 19–24, AFB 30+ and nulliparous women ($\beta 4.4$, $\beta 4.3$, $\beta 7.1$, respectively). No association with parity was observed. To our knowledge, this is the first study to document a positive

association between young AFB and greater FRS in later life. Young AFB in women may contribute to later life CVD risk.

MODEL-BASED RECURSIVE PARTITIONING IDENTIFIES RISK CLUSTERS FOR METABOLIC SYNDROME AND ITS COMPONENTS

Y. Wu¹, C.M. Pirkle¹, M. Zunzunegui², 1. *Office of Public Health Studies, University of Hawaii- Manoa, Honolulu, Hawaii*, 2. *Universite de Montreal, Montreal, Quebec, Canada*

Examine risks clusters for metabolic syndrome (MetS) and its components (hypertension, abdominal obesity, dyslipidemia, insulin resistance) in highly distinct societies (St. Hyacinthe and Kingston, Canada; Tirana, Albania; Manizales, Colombia; Natal, Brazil). With baseline data from a multisite study (N=1587), we employed model-based recursive partitioning to cluster subjects into age-adjusted groups according to: sex, living arrangements, smoking, childhood adversity, education, income and work status. Women were separately analyzed to investigate if age at first childbirth and parity contributed to clustering. MetS was observed in 43% of participants. The highest predicted prevalence was among women from middle-income sites (58–69%). For all components, except high density lipoprotein, study site was the primary partitioning variable, followed by sex. MetS was particularly prevalent among middle-income women, but female reproductive characteristics were not explanatory variables. Individual risk characteristics appeared to so strongly conditioned by study site that they could not be captured in the models.

SOCIAL PATHWAYS LIKELY LINK PARENTHOOD TO HEART DISEASE AND STROKE IN UNITED STATES OLDER ADULTS

Y. Wu, N.T. Rosendaal, C.M. Pirkle, *Office of Public Health Studies, University of Hawaii- Manoa, Honolulu, Hawaii*

Examine the association of number of lifetime children with heart disease and stroke in United States older adults. We analyzed the 2012 wave of the Health and Retirement Study, a representative study with six cohorts born between 1890–1959. Participants self-reported number of children and doctor-diagnosed heart disease/stroke. In two sex-stratified logistic regression models (n \approx 19000), we included: cohort, census region, race/ethnicity, and then education. Compared to nulliparous women, those with 3–4, 5–6, and 7+ children had 1.21, 1.26, & 1.46 the odds of heart disease (p<0.05). With education, parity was no longer associated to heart disease. Similar results were observed for stroke. In men, compared to no children, having 3–4 and 5–6 children was significantly positively associated with heart disease (OR:1.20 & 1.56). For stroke, an association was only observed for 5–6 children. Adding education did not change the results. Findings suggest social pathways linking parenthood to cardiovascular health.

SESSION 3445 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: COLLABORATIVE URBANISM AND COPRODUCTION: GLOBAL PERSPECTIVES ON BUILDING AGE-FRIENDLY COMMUNITIES

Chair: T. Buffel, *The University of Manchester, United Kingdom*

Co-Chair: C. Phillipson, *The University of Manchester*

There are now over 300 members of the World Health Organization's Global Network of Age-friendly Cities and Communities. The growth of the network since its establishment in 2010 has raised a variety of social, organizational and political challenges in respect of implementing the age-friendly approach. This symposium will develop a new framework for analyzing opportunities and barriers to implementing the age-friendly model in a variety of urban contexts in North America and Europe. The approach taken develops the concepts of 'collaborative urbanism' and 'coproduction' with older people, these highlighting the importance of partnerships between older people, families, and statutory and non-statutory organisations. This symposium brings together presentations from different social and cultural settings: (1) Chris Phillipson and Tine Buffel will provide a critical perspective on the development of age-friendly cities by exploring this approach in the context of urban processes affected by globalisation, urban regeneration and economic austerity. (2) Lindsay Goldman will examine recent developments in the implementation of Age-Friendly New York City, reviewing challenges associated with ownership, funding, and sustainability through political change and shifting priorities. (3) Samuele Remillard-boilard will compare age-friendly policies and initiatives in Manchester (UK), Montreal (Canada) and Brussels (Belgium), focusing on the challenges for developing age-friendly environments in socially and ethnically diverse cities. (4) Finally, Liesbeth De Donder and An-Sofie Smetcoren will reflect on the challenges and opportunities of using a co-construction approach in developing age-friendly communities in disadvantaged urban neighbourhoods in Belgium.

ARE AGE-FRIENDLY CITIES PLANNING FOR DIVERSITY? CASE STUDIES FROM MANCHESTER, MONTREAL, AND BRUSSELS

S. Remillard-Boilard, 1. *The University of Manchester, Manchester, United Kingdom*, 2. *Manchester Urban Ageing Research Group, Manchester, United Kingdom*

This paper compares age-friendly policies and initiatives in Manchester (UK), Montreal (Canada) and Brussels (Belgium). Drawing on in-depth interviews with key stakeholders (e.g. policymakers, researchers, practitioners, older people), this paper focuses on the challenges for developing age-friendly environments in socially and ethnically diverse cities. This theme is developed by, first, exploring how each city has addressed the notion of diversity following their admission to the World Health Organization's Global Network of Age-Friendly Cities and Communities. Second, through a comparison of the mechanisms adopted for implementing age-friendly policies. Third, by examining the extent to which each city has integrated different groups within their ageing strategies. Planning for diversity, it is argued, is essential to the creation of supportive and inclusive environments for older citizens. The paper concludes by discussing the need for age-friendly developments to reflect a wide variety of ageing experiences and presents possible strategies to achieve this goal.

CAN GLOBAL CITIES BE AGE-FRIENDLY CITIES? URBAN DEVELOPMENT AND AGEING POPULATIONS

C. Phillipson, T. Buffel, *The University of Manchester, Manchester, United Kingdom*

IAGG 2017 World Congress

Understanding the relationship between population ageing and urban change has become a major issue for public policy. An emerging theme has concerned the need to develop supportive urban communities for older citizens. This paper provides a critical perspective on the development of 'age-friendly cities and communities' by exploring such policies in the context of urban change arising from globalisation, urban regeneration and austerity. A key argument is that research and policies on age-friendly cities require stronger integration with analyses of the impact of global forces transforming the physical and social context of cities. This theme is developed by examining: first, the arguments behind the development of the 'age-friendly' approach; second, the pressures affecting urban environments; and third, challenges for improving the urban environment for older populations. The article concludes by discussing the need to combine a conceptual model of 'age-friendliness' with analysis of the economic and social forces transforming urban environments.

CO-CONSTRUCTION WITH OLDER PEOPLE IN DISADVANTAGED NEIGHBOURHOODS: TOWARDS A CONCEPTUAL FRAMEWORK

L. De Donder, A. Smetcoren, *Adult Educational Sciences, Vrije Universiteit Brussel, Brussel, Belgium*

This contribution seeks to reflect on the challenges and opportunities of using a co-construction approach in developing age-friendly communities. In particular we aim to identify what professionals understand under co-construction (1); which different forms of co-construction can be distinguished (2); and if and how co-construction with older people can be realised in disadvantaged neighbourhoods (3)? This paper uses qualitative data collected from 24 neighbourhood professionals working in urban care living labs in Belgium. The argument will be developed that although all the project proposals stress the central role of the user in the research, development and innovation, professionals lack a common vision, knowledge and experience in executing such a co-construction approach. Based on the interviews and feedback of the participants, the paper develops a conceptual "co-construction framework" along 3 key-labels: who (openness - ownership), how (type of sessions - intensity of participation) and results (capacitybuilding - knowledge/action).

COMPETITIVE OR COMPLEMENTARY: AGE-FRIENDLY NYC AND MOVEMENTS FOR URBAN HEALTH, SOCIAL JUSTICE AND EQUITY

L. Goldman, *Center for Health Policy and Programs, New York Academy of Medicine, New York, New York*

Founded in 2007, Age-friendly NYC (AFNYC) is a partnership between the Office of the Mayor, the New York City Council, and the New York Academy of Medicine that works to maximize the physical, social, and economic participation of older people and thereby improve their overall health and wellbeing and strengthen communities. Among the "oldest" of the initiatives implementing the WHO age-friendly cities framework, AFNYC is in its second phase of implementation. This presentation will critically reflect on challenges of ownership, funding, and sustainability through political change and shifting priorities. In addition, it will highlight the evolution of our multi-sectoral work in housing, public safety, media, arts, and culture, and primary care. Finally, it

will illustrate our successes and failures working to embed aging within existing and emerging efforts to achieve social justice, equity, and a culture of health within NYC.

SESSION 3450 (SYMPOSIUM)

INNOVATIONS IN INTERVENTIONS FOR REMINISCENCE AND LIFE REVIEW

Chair: G.J. Westerhof, *University of Twente*

Discussant: J.D. Webster, *Langara College, Vancouver, British Columbia, Canada*

This symposium focuses on innovations in interventions for reminiscence and life review. First, diversity in aging is increasingly recognized in studies on reminiscence and life review. Interventions are discussed that are tailored to specific target groups, like persons with dementia, minority elders, or older adults with depression. Second, societal change plays a role in how interventions are delivered. Given the contemporary focus on self-management in (mental) health, peers play an increasingly important role in supporting each other in reminiscence and life review interventions. Third, technological advancements are taken up in this symposium. New methods to induce autobiographical memories are studied. Innovative information and communication technologies are discussed: digital life story books, online therapy, virtual reality, and smart environments. Fourth, the symposium brings together multiple research methods in assessing how acceptable innovations are for older adults themselves and how effective they are in contributing to lifespan development. Together, the four papers present a design process, from accumulating existing knowledge in a systematic review, the co-creation of interventions in community-based methods, the proof of concept of new technologies in experiments to the evaluation of innovations in randomized controlled trials and interviews. The symposium brings American, Dutch, Spanish, and Canadian researchers together, who are members of the International Institute for Reminiscence and Life Review.

THE USE OF LIFE STORY BOOKS FOR PEOPLE WITH DEMENTIA: A SYSTEMATIC REVIEW

T. Elfrink, G.J. Westerhof, *University of Twente, Enschede, Netherlands*

Life story books (LSB) are frequently used to support reminiscence therapy for people with dementia. We conducted a systematic review to study its use and effectiveness. Three electronic databases were searched. Out of the 62 studies found, 19 were eligible. Most LSB were tangible, non-technical, whereas some were digital. The LSB were sometimes part of another intervention, like support for daily routines. Most of the LSB were created in (max. 12) individual sessions in nursing homes. Some studies focused on the person with dementia, whilst others also examined effects on caregivers. Most studies used a single case or (pilot) RCT approach with small sample sizes. The aims varied from improving cognitive functions, wellbeing, and conversation skills to decreasing depressive symptoms. This systematic review confirms that the use of LSB to support reminiscence therapy and personalized care is promising, although solid effect studies are lacking.

DEVELOPMENT OF A CULTURALLY TAILORED REMINISCENCE INTERVENTION FOR MINORITY ELDERS

J.M. Shellman¹, M. Mokel², N. Walton¹, 1. *University of Connecticut School of Nursing, Storrs, Connecticut*, 2. *St. Joseph University, West Hartford, Connecticut*

The Peer Reminiscence Intervention for Minority Elders (PRIME) is a culturally-tailored reminiscence intervention that utilizes the strengths of oral traditions of older Black adults as well as their informal support networks to mitigate barriers associated with underutilization of mental health services and decrease depressive symptoms and prevent major depression. Using community-based research methods older Black adults at an urban senior center in partnership with an academic institution developed the Reminiscence Resource Guide that structures the reminiscence intervention. Two phases of six focus groups (N = 36) provided insight into culturally appropriate learning styles and strategies for discussing culturally sensitive terms as well as understandability, cultural acceptability, and feasibility of the Guide. The Guide is utilized to train peer facilitators to deliver the integrative reminiscence intervention and to provide linkages to mental health services to impact the disparities that exist in the provision of mental health services for older Black adults.

NEW TECHNOLOGIES TO IMPROVE MOOD BY ELICITING AUTOBIOGRAPHICAL MEMORIES IN OLDER ADULTS

J. Serrano Selva, L.F. Aguilar, L. Ros Segura, J. Ricarte Trives, M. Nieto López, J.M. Latorre Postigo, *University Castilla-La Mancha, Albacete, Spain*

New technologies such as virtual reality and smart environments allow for innovative ways of eliciting autobiographical memories. Several experiments were carried out to evaluate how new technologies can contribute to the recollection of autobiographical memories that raise positive emotions. The first experiment used autobiographical pictures about the participant. The second experiment used virtual reality and audio stimuli to facilitate memory retrieval and positive feelings. The third experiment used an adaptation of REVISEP (a life review based on remembering specific positive events in active aging) in a visual format, that shows questions and pictures reflecting autobiographical memories in each participant at the same time. The studies show that different cueing methods that are based in virtual reality and smart environments are useful to elicit autobiographical memories. The application of these information and communications technology to improve mood state in older adults are discussed.

A QUANTITATIVE AND QUALITATIVE EVALUATION OF AN ONLINE LIFE-REVIEW INTERVENTION FOR DEPRESSION

E. Bohlmeijer¹, S. Lamers², M. Postel¹, G.J. Westerhof¹, 1. *University of Twente, Enschede, Netherlands*, 2. *GGNet, Apeldoorn, Netherlands*

This study assessed an online life review intervention for depressed middle-aged and older adults. Participants were randomized to a waiting list group (n=19), online life review with a trained counselor (n=19) or online life review with peer feedback (n=20). They filled out questionnaires

on depression as primary outcome at four measurement points up to twelve months after baseline. Semi-structured interviews (n=33) assessed participants' experiences. All three groups improved significantly on depressive symptoms across time. There were no significant differences between the conditions, but there was a strong effect size for the counselor-led intervention (Cohen's $d=.83$), but not for the peer-feedback intervention (Cohen's $d=.28$). Participants evaluated the online delivery positively, but were more critical about peer feedback. An online delivery seems suitable and promising for a life-review intervention, in particular when led by a counselor. Adaptions are necessary to stimulate a positive and constructive atmosphere and communication within peer groups.

SESSION 3455 (SYMPOSIUM)

FRAILITY IN OLDER ADULTS AND CHANGES IN THE PATTERN OF HEALTHCARE USE

Chair: N. Sirven, *University Paris Descartes - Sorbonne Paris Cité, Paris, France*

Discussant: M.L. Grignon, *McMaster University, Ontario, Canada*

Frailty in elderly persons, defined as a loss of physiological reserve, is an issue for the spectrum of care provided in health services systems. In frail elderly persons, resistance to physiological stress, ability to sustain aggressive treatments, needs for supportive services aimed at disabled persons, and regaining health at the level experienced before the occurrence of an episode of care are reduced. Thus, frailty should be a concern for all of healthcare policies and services at all levels of healthcare systems: screening and preventing frailty through public health interventions; integrating frailty in diagnosis and treatments of health conditions in primary, secondary and tertiary care and in outpatient and inpatient care; and in designing long-term residential care. But, should it be? A first step in the examination of this issue is to estimate the extent to which frailty changes the pattern of healthcare use at different levels of care.

SCREENING FOR FRAILITY: PUBLIC HEALTH AND CLINICAL PERSPECTIVES

B. Santos-Eggimann¹, N. Sirven², 1. *IUMSP, Lausanne, Switzerland*, 2. *LIRAES, U. Paris Descartes, Paris, France*

Although frailty is a well-known concept in the health science, its operational definition is still debated. From a diversity of models, two emerged in the early 2000 from epidemiological studies conducted in large population-based aging cohorts: the frailty phenotype (Fried 2001), and the frailty index (Rockwood 1994) measuring the accumulation of deficits and death. These tools have been applied as screening instruments in clinical settings to guide individual decision-making and orient treatments. New interrogations are raised by the use of instruments developed to screen frailty in epidemiological research for assessing individual situations. Open questions remain on the feasibility of frailty screening, the properties of screening tools, the relevance of an integration of socioeconomic dimensions in screening tools, and the effectiveness of interventions targeting frailty. This

article presents an overview of current perspectives and issues around frailty screening in populations and in individuals.

DOES FRAILITY CONTRIBUTE TO HIGHER HEALTH CARE EXPENDITURES?

N. Sirven¹, T. Rapp¹, M. Herr², 1. *University Paris Descartes, LIRAES, Paris, France*, 2. *UVSQ, Saint-Quentin-en-Yvelines, France*

The objective of this work is to explore the incremental costs of frailty associated with ambulatory health care expenditures among the French population of community-dwellers aged 65 or more in 2012. We make use of a unique dataset that combines nationally representative health survey with respondents' National Health Insurance data on ambulatory care expenditures. Multivariate regression models adjusted for potential confounders, including chronic diseases, are developed to investigate the influence of frailty among the determinants of (i) ambulatory health expenditures, and a focus on (ii) pharmaceutical expenditures. In the case of pharmaceutical expenditures, crossed terms between potentially inappropriate prescribing (PIP, Laroche list) and frailty are used to account for potential confounding effects. Our results indicate that frail individuals are more likely to receive PIP than their non-frail counterparts. Frailty has an incremental effect of roughly €750 additional euros for pre-frail individuals, and €1,500 for frail individuals.

FRAILITY AND HOSPITAL USE IN AGED ADULTS: A COMPARATIVE ANALYSIS OF FRANCE AND QUÉBEC

N. Sirven¹, F.P. Bland³, T. Rapp¹, C. Galand², J. Fletcher², 1. *University Paris Descartes, LIRAES, Paris, France*, 2. *Jewish General Hospital, Montreal, Quebec, Canada*, 3. *Université de Montreal, Montreal, Quebec, Canada*

The aim of this article is to provide comparative population-based approach of the determinants of hospital use, in France 2012 and Québec 2011, with a focus on the frailty phenotype once netted out from other health and other covariates. We used comparable surveys of community-dwelling individuals matched with their National insurance claims and hospital episode records. Two-part models were used for access to hospital and length-of-stay. Our results suggest that ER use is more frequent in Québec while the hospitalization rate is lower in Québec after a venue at ER – suggesting that ER play the role of primary care in Québec. The length-of-stay is shorter in France where pay-for-performance scheme give hospital professionals the incentive to increase the number of inpatient care. We also found that frailty is associated with hospitalization through ER use in both countries, while the phenotype is neither associated with elective hospitalizations or the length-of-stay.

IMPACT OF STATE MEDICAID GENEROSITY ON NURSING HOME ENTRY OF FRAIL INDIVIDUALS

T. Rapp¹, D.C. Grabowski², 1. *Harvard T.H. Chan School of Public Health, Boston, Massachusetts*, 2. *Harvard Medical School, Boston, Massachusetts*

Historically, US states have dedicated most of their Medicaid long-term services and supports expenditures to nursing homes. Since the 1990's, a key aspect of U.S. policy for disabled elders has been to shift state Medicaid

expenditures away from institutional nursing home care and towards home- and community-based services (HCBS). Less is known about the impact of increased HCBS spending on elderly Medicaid beneficiaries' care pathways. We explore the impact of state Medicaid HCBS spending on the elderly beneficiaries' risks of nursing home admission using four waves of the Health and Retirement Study (2006–2013). Using instrumental variable estimations, we find that being eligible for Medicaid HCBS coverage is associated with a 28% point increase in nursing home use. Moreover, a \$100 increase in state-level Medicaid spending towards HCBS is associated with a 0.28% point reduction in the risk of nursing home entry for Medicaid eligible elders relative to non-eligible elders.

SESSION 3460 (SYMPOSIUM)

CARING WITH GRIT AND GRACE: LONG-TERM FAMILY CAREGIVERS OF PERSONS WITH DEMENTIA

Chair: J.S. Savla, *Virginia Polytechnic Institute & State University, Blacksburg, Virginia*

Co-Chair: K.A. Roberto, *Virginia Polytechnic Institute & State University*

Discussant: A. Horowitz, *Fordham University, New York, New York*

A central question about providing daily care for a relative with dementia is, What effects does caregiving have on the caregiver over time? Although short-term longitudinal studies have begun to address this question, few studies of family caregivers for persons with cognitive impairment extend beyond a few years and even fewer begin data collection with the initial diagnosis. We present findings from the Virginia Tech Families with Mild Cognitive Impairment (MCI) project, a mixed methods longitudinal study designed to understand the lives of long-term family caregivers and caregiving consequences for their health and well-being. Data consist of rich qualitative interviews and responses to structured scales from old adults and their primary caregiver, beginning at the MCI diagnosis and following the families for 10 years as cognitive changes unfolded. Savla and colleagues' examination of early care relationship indicators that predict caregiver mortality found that more perceived memory and behaviour problems, poorer health, and older age portended earlier death whereas stronger mastery was a protective factor. Analysis of caregiver mental health by Blieszner and colleagues revealed the impact of greater burden, more memory and behaviour problems, and lower mastery on increased depressive symptoms. Roberto and colleagues used case studies to detail the caregivers' long journey, providing a deep understanding of their daily challenges and resiliency as they faced unrelenting and frequently changing circumstances. Amy Horowitz will discuss the findings in light of earlier identification of cognitive impairment and implications for future research and practice focused on long-term caregivers of old persons.

EARLY PREDICTORS OF MORTALITY AMONG FAMILY CAREGIVERS OF PERSONS WITH DEMENTIA

J.S. Savla, Z. Wang, N. Brossoie, K.A. Roberto, R. Blieszner, *Virginia Polytechnic Institute & State University, Blacksburg, Virginia*

Researchers have assumed without controversy that providing care for a family member with dementia is hazardous for the caregivers' health. Although great strides have been made in the last two decades in understanding how caregiving stressors upset physiological processes and proliferate into chronic health conditions, it is not known if caregiving also leads to early mortality. In the current study, we utilize longitudinal data collected from 106 primary caregivers of persons diagnosed with Mild Cognitive Impairment during Wave 1. Cox regression models with right censoring were used to analyze time to death of caregivers. During the 10 years of data collection, 17 caregivers (16%) died. Greater memory and behaviour problems of the care recipient and advanced age and poorer health of the caregiver at Wave 1 predicted time to death. Conversely, greater environmental mastery protected caregivers against the risk of early death. These findings have implications for ongoing caregiver support.

TRACING THE TRAJECTORY OF MCI CARE: LONG-TERM WELL-BEING OF CARE PARTNERS

R. Blieszner, J.S. Savla, K.A. Roberto, *Virginia Polytechnic Institute & State University, Blacksburg, Virginia*

Grounded in Pearlin and colleagues' stress process model, we examined changes in the psychological well-being of primary care partners (PCP, $N=92$) of old adults diagnosed with Mild Cognitive Impairment. Data were collected in 3 Waves (shortly after diagnosis and at mean 13.2 and 36.8 months after W1). Regarding stressors, older adults' MMSE scores declined ($p<.001$) and PCP perception of memory and behavior problems increased ($p<.05$) from W1 to W3. Strains were assessed with Ryff Environmental Mastery and Zarit Burden Interview; a W1 resource was frequency of using coping strategies; CES-D indexed psychological well-being. Resilience was evident in PCP use of coping strategies and stability of mean CES-D over time. Nevertheless, younger PCP age and more coping strategies predicted higher CES-D at W3, and as PCP perceptions of burden and problematic behaviors increased and mastery decreased over time, CES-D increased. The findings point to ongoing detrimental effects of long-term dementia care.

A LONG AND WINDING ROAD: 10 YEARS OF CARING FOR A RELATIVE WITH MEMORY IMPAIRMENT

K.A. Roberto, R. Blieszner, R.H. Weaver, J.S. Savla, N. Brossoie, *Center for Gerontology, Virginia Polytechnic Institute & State University, Blacksburg, Virginia*

More than one-third of family caregivers provide care for a relative with dementia for six years or more. Guided by Pearlin's stress process model, we used a case-study approach to analyze data from four interviews spanning 10 years, with 10 women aged 28 to 72 at the time their relative was diagnosed with mild cognitive impairment. Findings revealed the women used a wide array of strategies to manage daily life and sustain themselves in meaningful ways. As their care journey progressed, they sought information about memory impairment, engaged in self-care activities, maintained social relations and activities as best they could, and relied on friends and family for support. Although they discussed the stress and burden of providing care, the caregivers showed

resilience as they faced unrelenting and frequently changing psychological, social, and physical challenges both personally and in the family. Findings have implications for addressing the needs of long-term caregivers.

SESSION 3465 (SYMPOSIUM)

USER PARTICIPATION IN AGING AND HEALTH RESEARCH—BRIDGING SCIENCE, POLICY, AND PRACTICE

Chair: S. Iwarsson, *Lund University, Lund, Sweden*

Co-Chair: E.J. Hanson, *Linnaeus University, Kalmar, Sweden*

Discussant: J.E. Phillips, *University of Stirling*

Addressing active and healthy aging and related challenges in welfare systems demands new solutions, but the translation of new knowledge to practice is slow. User participation in research is an underutilized way to bridge science, policy and practice, but the impact in terms of effects on, changes for or benefits to society remains to be demonstrated. Problematized by Arnstein already in 1969, user participation ranges from non-participation over tokenism to actual citizen power. Instead of being a study object, the user is an active partner in the research process. With user participation in aging and health research being an emerging field of inquiry, gaps in knowledge that urgently need filling include conceptual definitions and theoretical foundations as well as development of valid methods for evaluating research with user participation. In addition, ethical considerations deserve attention. Based on a scoping review and results and experiences from ongoing research on aging and health at four universities, in this symposium we will describe, problematize and discuss current conceptual, theoretical and methodological developments and outline meta-level research needs. We will exemplify ongoing research with user participation and present user experiences as well as practice and policy developments. The discussion will focus on what user participation actually achieves and what impact it has on older people. Can it lead to innovation in our conceptual and methodological repertoire? Does it add meaning and legitimize research findings? Drawing on four different but related presentations we will discuss how transferable user participation is in an international context.

UNDERSTANDING USER PARTICIPATION IN RESEARCH: CONCEPTUAL AND THEORETICAL UNDERPINNINGS

S. Iwarsson¹, O. Jonsson¹, S. Dahlin Ivanoff³, A. Edberg²,

E.J. Hanson⁴, 1. *Lund University, Lund, Sweden*, 2.

Kristianstad University, Kristianstad, Sweden, 3. *University of Gothenburg, Gothenburg, Sweden*, 4. *Linnaeus University, Kalmar & Växjö, Sweden*

The rationale for involving users in research has its origin in ideas of empowerment, with a striving to shift power in the research process from the researchers to the users. User oriented research showcases a plethora of conceptual and theoretical foundations. We will problematize the variety of terms being used, such as user-driven research, co-design, participatory design, patient and public involvement (PPI), transdisciplinary and collaborative research. Addressing

the paucity of theoretical support in the literature we will relate to promising theoretical approaches emanating from implementation science and the participatory design paradigm. Research with user participation can include the entire research process, from definition and understanding of the research question to the communication and translation of the results. Referring to the WHO (2012) framework for knowledge translation in aging and health, we will conclude this presentation by outlining research priorities aiming to increase the understanding of user participation in research.

UNDERSTANDING USER PARTICIPATION IN RESEARCH: METHODOLOGICAL CONSIDERATIONS

E.J. Hanson^{1,2}, A. Edberg³, S. Dahlin Ivanoff⁴, S. Iwarsson^{5,6},

1. *Health and Caring Sciences, Linnaeus University, Kalmar, Sweden*, 2. *Swedish Family Care Competence Centre, Kalmar, Sweden*, 3. *Dept. Health & Society, Kristianstad University, Kristianstad, Sweden*, 4. *AgeCap, University of Gothenburg, Gothenburg, Sweden*, 5. *Dept. Health Sciences, Faculty of Medicine, University of Lund, *Lund, Sweden*, 6. *Centre for Ageing & Supportive Environments (CASE), University of Lund, Lund, Sweden*

Methodological issues are of central importance as research funders increasingly stipulate user participation in program/project calls. We will explore whether user involvement is always beneficial and highlight the challenges of involving users in research. We will discuss the ways in which the voices of older people in general as well as of vulnerable groups can be heard and explore the need to develop and test innovative approaches. More broadly, we will examine current methodological approaches available. Further, as they are predominantly comprised of qualitative methods, we will lay the claim for a broader arsenal of scientific methods, including qualitative and quantitative approaches, mixed methods, including state-of-the-art and newly developed methods. Finally, we will share ways forward, including interdisciplinary and cross-national collaborations, to develop more reliable and valid methodologies for the evaluation of research involving user participation. Ultimately, this will lead to the development of generalizable knowledge and cumulative knowledge building.

APPLYING THE WORLD CAFÉ METHOD TO INVOLVE USERS IN AN INTERACTIVE ANALYSIS OF RESEARCH RESULTS

J. Andersson¹, L. Ekstam¹, G. Nilsson², 1. *Centre for Ageing*

and Supportive Environments (CASE) & Department of Health Sciences, Lund University, Sweden, Lund, Sweden, 2. *Department of Arts and Cultural Sciences, Lund University, Lund, Sweden*

This presentation will discuss how the World Café method can be used to analyze data interactively together with users, in this case, organizers of senior camps. As part of the Senior Camp Study we were particularly interested in ways of “doing age” and how discourses on age influenced the organization of senior camps. The World Café was arranged with two main purposes: 1) involve users to discuss preliminary findings to validate and problematize the results; 2) use the discussions recorded during the World Café session as data to deepen the analysis. We experience that combining those two purposes was a challenge in the sense that the users were

more keen on validating the results and explaining their standpoint than problematize around conceptions of age. We will elaborate and discuss this further in our presentation and also share our experiences of involving users in this stage of the research process.

THE CRITICAL ROLE OF USER INVOLVEMENT IN CREATING SOCIETAL RESEARCH IMPACT

J. Goodwin^{1,2}, A. Barnes³, 1. AGE UK, London, United Kingdom, 2. Loughborough University, Loughborough, United Kingdom, 3. AB Consulting, Nottingham, United Kingdom

A new paradigm of research is evolving in which it is insufficient to generate high quality research published in specialised academic journals or delivered to expert audiences. In Europe, both in the UK and in the EU, a new model is evolving in which researchers are expected by their funders to work with the users of research, in order to generate high levels of economic and social impact in society. In this context, we will review new models of knowledge translation, such as that developed by the WHO, the Global Council for Brain Health in the USA and the European Institute of Technology. Moreover, we will show by reference to real world experience with lay older people, the way in which these principles can guide researchers to develop effective means of creating highly effective partnerships, improve the transferability of new knowledge and generating tangible research based benefits to older people.

SESSION 3470 (SYMPOSIUM)

AGING WITH HIV AROUND THE WORLD: VULNERABILITY, RESILIENCE, AND IMPACTS ON OLDER ADULTS

Chair: J. Mugisha, *Medical Research Council, Entebbe, Uganda*

Discussant: M.G. Brennan-Ing, *ACRIA, New York, New York*

More than 4 million person aged 50 years and older are living with HIV around the world including more than 2.5 million in sub-Saharan Africa alone. With the successful roll-out of antiretroviral treatment along with continued HIV vulnerability among older people, these figures are increasing. Despite this, the global HIV response has largely ignored the unique needs, characteristics and resilience of older populations. After years of neglect, UNAIDS acknowledged older adults in their 2014 report but issues of co-morbidities, ageism, inappropriately targeted services and the burden of caregiving continue to hamper effective and rights-based responses. This symposium - facilitated by the Gerontological Society of America's HIV and Aging Interest Group - brings together perspectives from Africa and Canada to highlight the diverse challenges facing older people. The symposium will allow participants to share experiences and examine issues of access to care, burden of disease, cognitive decline and social isolation with a view to improving policy development and quality of care.

PREVALENCE AND CORRELATES OF HIV TESTING AMONG OLDER ADULTS IN BOTSWANA

D. Burnette², N. Ama¹, S. Shaibu¹, 1. *University of Botswana, Gaborone, Botswana*, 2. *Virginia Commonwealth University, Richmond, Virginia*

Botswana has the third highest HIV prevalence worldwide, yet testing remains <70%. The 2013 Public Health Act obligates the state to extend confidential testing to all citizens. Using the 2013 Botswana AIDS Impact Survey, we estimated 58.7% of persons aged 50–64 (N=970) had tested in prior 12 months, compared to 66.1% of those aged 15–49. Drawing on the Behavioral Model of Health, we used logistic regression to explore the association of predisposing (demographics), enabling (knowledge, attitudes, service availability and prior use) and need (at least 1 of 9 HIV risk) factors with likelihood of testing. The model was significant ($\chi^2(15)=25.99$, $p < .001$) and correctly classified 80% of cases. All three sets of factors contributed significantly to being tested. Being younger, unmarried, more educated, Christian and city-dwelling were associated with higher odds of testing, as were greater knowledge and positive attitudes about HIV, and presence of one or more risk factors.

LEAVING NO ONE BEHIND: SUPPORTING ART ACCESS AND ADHERENCE AMONG OLDER UGANDANS LIVING WITH HIV

E. Schatz³, J. Seeley², J. Negin¹, J. Mugisha⁴, H. Weiss², 1. *School of Public Health, University of Sydney, Sydney, New South Wales, Australia*, 2. *London School of Hygiene and Tropical Medicine, London, United Kingdom*, 3. *University of Missouri, Columbia, Missouri*, 4. *Medical Research Council, Entebbe, Uganda*

Building on survey research on HIV prevalence, co-morbidities and experiences living with HIV, we conducted in-depth interviews with older Ugandans to understand their barriers to antiretroviral treatment access and adherence. Access and adherence interventions must be developed within communities and societal contexts to address the specific barriers faced by older Africans which means moving beyond seeing access and adherence as individual-level issues. In African contexts, structural barriers include poverty, transportation costs, overburdened health systems, and gender inequality. Older Ugandans experience economic frustration, responsibility to dependents, sadness and isolation, co-morbidities and little social support. Many living in rural areas, with endemic poverty and scarce services and resources, find distance to facilities a particular problem. In addition, older Ugandans report poor treatment by health staff who have little understanding of older persons' needs. Further, they are reluctant to honestly discuss symptoms and diagnosis related to sexual health with younger health providers.

OLDER GRANDPARENTS AS PRIMARY CAREGIVERS

S. Matovu, M.I. Wallhagen, *University of California - San Francisco, San Francisco, California*

The purpose of this study was to seek understanding of the experiences of Ugandan grandparents (50-years and older) who provide primary care for their grandchildren. In Uganda, as in the rest of sub-Saharan Africa, the AIDS

epidemic has placed a tremendous burden on elderly caregivers. However, limited research has been conducted to explore the impact of this caregiving experience on the physical and mental health of this elderly population. Using Grounded Theory qualitative method, interviews were conducted with grandparents recruited from general population impacted by the HIV/AIDS epidemic. Narratives revealed underlying factors that influenced grandparents' caregiving experiences. These ranged from Micro (family structure and relationships; community) to Macro (Cultural, national and global). These findings could inform other researchers and clinicians who seek explanatory models upon which to design interventions and social services such as childcare and respite care for older adult caregivers to grandchildren.

OLDER PERSONS WITH HIV IN CANADIAN HOME AND LONG-TERM CARE CONTEXTS

A.D. Foebel¹, J. Hirdes², C. Boodram³, R. Lemick, J. Tai³, R. Comeau³, 1. *Medical Epidemiology & Biostatistics, Karolinska Institutet, Stockholm, Sweden*, 2. *University of Waterloo, Waterloo, Ontario, Canada*, 3. *Public Health Agency of Canada, Toronto, Ontario, Canada*

Population aging and successful HIV drug therapy mean that more people are living longer with HIV. As these individuals seek formal care services, understanding their particular needs is becoming important. This study examined the sociodemographic, clinical and mental health characteristics of 1608 people living with HIV in home and long-term care settings across Canada. Worsening depression, cognitive decline and hospitalizations over a 6-month follow-up were explored among a smaller subsample. Data were collected using setting-specific interRAI standardized assessment instruments from 1996–2014. Chi-square analyses tested differences between individuals living with and without HIV in each setting. People living with HIV had more co-infections, depression and social isolation, but fewer chronic diseases than their HIV-negative counterparts. Longitudinal outcomes were also worse among the HIV-positive group. These results highlight some of the unique aspects of this population which will help to develop strategies to improve care and quality of life of this group.

SESSION 3475 (PAPER)

QUALITY OF LIFE AND WELL-BEING: INTERNATIONAL PERSPECTIVES

IMPROVING QUALITY OF LIFE FOR LATE-LIFE PATIENTS: KEY FINDINGS FROM LIFECOURSE INTERVENTION

T.P. Shippee¹, N. Shippee¹, K. Fernstrom², P. Mobley², M. Frazer², H. Britt², 1. *University of Minnesota, Minneapolis, Minnesota*, 2. *Allina Health, Minneapolis, Minnesota*

Quality of life (QOL) for patients with chronic conditions at the end of life is a concern among policymakers and consumers, and has implications for improved care delivery outcomes. QOL indicators enable understanding of healthcare delivery beyond system oriented outcomes, shedding light on

the effect of holistic, supportive care for those living with complex chronic illness in late life. In this mixed methods evaluation, we examine the effectiveness of a new patient-centered approach to late life care—*LifeCourse* intervention. A key component is ongoing, across-setting assistance by layperson care guides, supported by a clinical team. We investigate whether participation in *LifeCourse* improves QOL for patients, compared to usual care controls. QOL is assessed through quarterly administration of the Functional Assessment of Chronic Illness Therapy-Palliative Care survey (n=190 intervention patients and 157 controls). Data is presented as change in QOL indicators between baseline and 6 months. Mixed-methods analysis includes longitudinal examination of scores and qualitative data analysis. Multivariate analyses reveal that *LifeCourse* intervention had a significant positive effect on QOL for intervention patients when compared to controls. Additional analyses show that most changes happen for social quality of life domains. Interview data reveal that participants actively seek out ways to maintain QOL and exhibit resilience in the face of decline. Overall, our findings show that *LifeCourse* has a positive impact on QOL when compared to usual care patients. These trends indicate whole-person supportive care like *LifeCourse* is a promising approach for patients affected by complex chronic illness in late life.

CAN YOU PROVE THAT YOUR LONG-TERM CARE SERVICE IS PROMOTING QUALITY OF LIFE?

T.T. McDonald, 1. *Faculty of Health Sciences, Australian Catholic University, Sydney, New South Wales, Australia*, 2. *RSL LifeCare War Veterans Village, Narrabeen, New South Wales, Australia*

Feedback on quality of life is usually anecdotal or service providers rely on assumptions about what affects client satisfaction with services. Often this aspect of service quality is negatively monitored by tallying complaints and hoping that what is unknown is positive. Quality of life has importance for care providers and practitioners who want to judge the quality of their services and prove that their efforts actually promote life quality.

Issues of life quality and what that means for those becoming frail in vast numbers has prompted the application of quality-of-life theory to a practical strategy that enhances the experience of living in aged care contexts.

Long term care admission usually follows advanced normal age changes or the accumulated deterioration of biological systems due to pathological processes. The diversity of conditions that cause admission means that assessing life quality in relation to their individual diseases and disabilities is not feasible. Even if it were, there is robust evidence that the presence or absence of disease or disability does not determine life quality.

The long term care quality of life scale (LTC-QoL) developed to overcome the above issues, is offered as a means of focusing support for positive experiences during late age. The LTC-QoL reliably assesses the nine factors necessary to promote quality of life in this context; and provides specific diagnostic information to guide interventions to strengthen weak elements and maintain strong ones. In this way it becomes feasible to create legitimate resourcing of services geared to promoting contentment.

A CROSS-CULTURAL ADAPTATION OF THE ICECAP-O: RELIABILITY AND VALIDITY IN SWEDISH 70-YEAR-OLDS

S. Gustafsson^{4,2}, H. Hörder^{4,3}, T. Rydberg^{3,2}, I. Ottenvall Hammar^{1,2}, M. Waern^{3,2}, I. Skoog^{3,2}, 1. *The Sahlgrenska Academy at the University of Gothenburg, Institute of Neuroscience and Physiology, Department of Health and Rehabilitation, Göteborg, Sweden*, 2. *University of Gothenburg Centre for Ageing and Health (AgeCap), Gothenburg, Sweden*, 3. *The Sahlgrenska Academy at the University of Gothenburg, Institute of Neuroscience and Physiology, Department of Neuropsychiatric Epidemiology, Gothenburg, Sweden*, 4. *Institute of Neuroscience and Physiology, Department of Health and Rehabilitation, Sweden, The Sahlgrenska Academy at the University of Gothenburg, Gothenburg, Sweden*

Investigating Choice Experiments for the Preferences of Older People-CAPability index (ICECAP-O) is one of few Quality of Life measures that tap into the concept of capability, i.e. genuine opportunities to 'do' and 'be' the things that a person deems important in life. This presentation includes test-retest reliability, item relevance, face- and content validity, and accessibility of the ICECAP-O in a Swedish context. Thirty-nine 70-year-olds completed the Swedish version of ICECAP-O on two occasions. Test-retest reliability was analyzed for the index and separate items, and participants rated item relevance on a Visual Analogue Scale. Eighteen additional persons filled in the ICECAP-O during cognitive interviews and a standardized classification scheme was used to quantify response problems. Thematic analysis was applied to capture participants' experiences of completing the measure and perceptions of included attributes. Test-retest showed that the index score had good stability, ICC of 0.80 (95 % CI 0.62–0.90). However, Kappa values for the individuals items were low, ranging from 0.18 (*Control*) to 0.41 (*Role*). Participants gave their highest relevance rating to *Attachment* and the lowest to *Enjoyment*. In the cognitive interviews, three participants (18%) had problems completing ICECAP-O, and 5 of 80 question segments (6%) were found to be problematic. Most participants perceived the attributes as understandable even though the meaning of *Control* brought some uncertainty. Our findings suggest that the Swedish version of the ICECAP-O requires further refinement. Problems identified in our study point to areas requiring special attention by the developers of ICECAP-O versions working in other language contexts.

ESTIMATING QALY IN LONGITUDINAL COHORT STUDIES, AND AN APPLICATION IN PATIENTS WITH DIABETES

I. Cenger^{1,2,3}, M. Laxy⁵, A. Peters⁴, S. Lee^{2,3}, R. Holle⁵, 1. *Ludwig Maximilian University of Munich, Munich, Germany*, 2. *University of California, San Francisco, San Francisco, California*, 3. *San Francisco VA Medical Center, San Francisco, California*, 4. *Institute of Epidemiology II, Helmholtz Zentrum München, German Research Center for Environmental Health (GmbH), Neuherberg, Germany*, 5. *Institute of Health Economics and Health Care Management, Helmholtz Zentrum München, German Research Center for Environmental Health (GmbH), Neuherberg, Germany*

Studies on burden of disease and its determinants often take into account either survival time or quality of life (QoL) as outcomes. The calculation of Quality Adjusted Life Years (QALYs) is an approach which combines these outcomes. The aim of the study is to quantify QALY loss due to diabetes and diabetes treatment over a longer time period.

We analyzed data from the population based KORA S4 (Cooperative Health Research in the Region Augsburg, Survey 4) cohort. We included 1047 participants who were ≥60 years of age at the time of the first interview. Follow up time was 14 years.

The mean age of participants was 66.4, 49.6% were women, and 8.7% had diabetes. The mean QoL value reported at the beginning of the study was 0.9 (on a scale 0–1). 28.7% of the participants died during the 14 year follow up. There were significant differences in accumulated QALY between subgroups. Men had lower QALY than women (10.5 vs 11.0, $p=0.008$), and as expected younger (60–70) patients had higher QALY than older (70+) patients (11.0 vs 9.62, $p<0.001$). In preliminary analysis, patients with diabetes had lower QALY than those without. Among patients with diabetes, treatment type was significant factor. Sensitivity analysis restricted to those 60–65 years old, accounting for possible effect of age, showed similar results.

While it has been shown in the past that diabetes and diabetes treatments are associated with higher mortality and lower quality of life, our study helps quantify the burden of the disease.

DOES WHOLE-BODY PERIODIC ACCELERATION REDUCE NON-MOTOR SYMPTOMS IN PERSONS WITH PARKINSON'S DISEASE?

V. Southard¹, S. Roumba¹, I. Schwartz¹, N. Sparacino¹, K. Weddingfeld¹, J. Donoghue², 1. *Physical Therapy, NYIT, Old Westbury, New York*, 2. *NYITCOM, Old Westbury, New York*

Sleep disturbances, depression, and inactivity are common non-motor problems in Parkinson's disease (PD). The effects of Whole Body Periodic Acceleration (WBPA) in persons with PD on sleep regulation and activity levels have yet to be evaluated. The objective was to assess whether WBPA improves sleep and activity in persons with PD over 4 weeks compared to gender matched controls. Participants included 5 PD and 5 controls (8 men; 2 women), age 74.10 ± 9.25 . Activity trackers monitored sleep, awakenings, and step counts over 24 hours for 6 weeks. Baseline measurements included sleep 30 days prior to study, depression (PHQ-9), and Quality of Life (PDQ-8). WBPA duration was 45 minutes, 3 times per week for 4 weeks. A 2 by 6 repeated measure and paired t tests were used to assess data. A significant decrease was found in BP pre vs. post $p .019$; PD group had improved depression $p .025$. Minimally Clinically Significant Differences (MCID) were also found in the PD participants, the PSQI (4.25) points. Self-reports for WBPA displayed improvements in depression and sleep. Decreased physical activity in those with mild to moderate PD was evidenced. WBPA may have a significant role in PD management of non-motor symptoms. Further study with larger groups is warranted using WBPA.

SESSION 3480 (PAPER)

LGBTQ AGING

PERCEPTIONS OF OLDER BLACK MEN IN THE UNITED STATES: MAKING SENSE OF THE ROLE OF SEXUAL ORIENTATION

A. Perone, *University of Michigan, Ypsilanti, Michigan*

Research on Black older men suggests that bias contributes to negative health outcomes and discrimination in benefits, employment, and the criminal justice system. However, a gap in research exists in how these biases change depending on context, especially when conflicting biases present toward persons with intersectional positionalities (e.g. Black, gay, older adult). This pilot study investigates bias by asking: how do perceptions about Black older men in the United States change when comparing gay and straight men. This pilot study collected primary data ($n = 143$) using a cross-sectional survey design. Survey participants read one of four randomized vignettes about an older Black man. All four scenarios contained identical language except for age and sexual orientation (gay/heterosexual; 20-years-old/70-years-old). The survey tested stereotypes about strength, activity, sociability, health, mental acuity, independence, trustworthiness, sexuality, and demeanor. Perceptions about health, independence, and trustworthiness yielded statistically significant results ($p = 0.05$). Participants rated him as unhealthy (vs. healthy) when a Black, young, heterosexual man; independent (vs. dependent) when identified as a Black, young, gay man, and trustworthy (vs. untrustworthy) when a Black, older heterosexual man, compared to other groups. Participants also rated him as most peaceful when labeled young and gay versus older and gay; less active when heterosexual versus gay, regardless of age; least sexual as older and gay versus older and heterosexual; least clear-headed when younger and heterosexual versus older and gay. The survey underscores the importance of understanding how age, race, gender, and sexual orientation interact to shape bias.

ELDER ABUSE IN THE LGBT COMMUNITY: A HIDDEN PROBLEM

G.M. Gutman, C. Robson, J. Marchbank, K. Blair, *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

Compared to heterosexual age peers, LGBT older adults are more likely to live alone, less likely to be partnered, less likely to have children and have higher rates of loneliness and isolation - well known risk factors for elder abuse. Our goals were to raise awareness of elder abuse 1) within the LGBT community and familiarize current/potential victims with locally available services and 2) among service providers. Method: Stage 1, intergenerational and collaborative, brought together queer older adult creative writers, queer youth activists and elder abuse/family violence researchers to create LGBT-relevant videos, posters and fact sheets. Stage 2 featured Town Hall meetings in 6 communities in British Columbia, Canada plus two "Dialogue Sessions" with service providers to the two largest ethnic minorities in the province (Chinese; SAsian). Results: 3 videos and 5 poster/fact sheets were produced. The videos illustrated neglect of a transgender man in a care facility, psychological and physical abuse in a lesbian couple, and financial

abuse in a gay couple. The poster/fact sheets defined the 5 main types of abuse and listed local services providing help. These tools were well received by Town Hall/Dialogue Session attendees ($n=21-57/gp$), triggering active discussion and visits to our website (www.sfu.ca/lgbteol) where they may be downloaded free of charge Conclusion: This project demonstrated that the silos that characterize services to abused older adults, the LGBT community, minority seniors, and the general population of seniors can be bridged. The tools developed fill a gap in relevant resources for this often marginalized seniors sub-population.

JOINT RETIREMENT IN SAME-SEX COUPLES IN SWEDEN: A REGISTER-BASED STUDY, 1995-2012

L. Kridahl, M. Kolk, *Department of Sociology, Stockholm University Demography Unit, Stockholm, Sweden*

The paper explores same-sex couples' propensity to retire jointly during 1995-2012 in Sweden. It is well-established that opposite-sex couples retire jointly or close in time. Little is known about retirement preferences for same-sex partnerships/marriages. This lack of knowledge is related to that few countries have legalized same-sex partnerships/marriages until very recently, and lack of large enough representative samples of gay and lesbians. In Sweden, same-sex couples have been able to register partnership since 1995 and marriages since 2009, having the same rights as opposite-sex marriages. Swedish unique population data makes it possible to study all registered same-sex partnerships/marriages in relation to labor market attachments. The use of the complete population provides a sufficient population of older spouses to create reliable estimates of retirement decisions. The studied population consists of 873 female and male same-sex partnerships/marriages where at least one of the spouses is born 1947 or earlier. We also include a sample of all opposite-sex marriages. We use descriptive techniques and multinomial logistic regression to analyze same-sex couples' and opposite-sex retirement behaviors. In the regression models the outcome is whether the couple retires jointly; not jointly; not yet retired; and one spouse retired. All models are controlled for age difference, duration of partnership/marriage, income, education, birth year and gender. The study's novelty contributes to a broader understanding of family-life and retirement behavior among same-sex couples in relation to opposite-sex couples, including differences between female and male same-sex couples. Overall, we find a pattern of joint retirement also among same-sex couples.

QUEER AGING: THE ARRIVAL OF GAYBY BOOMERS AND THE NEW CHALLENGES OF GERONTOLOGY

J. Ramirez-Valles, *Community Health Sciences, University of Illinois, Chicago, Illinois*

The aging of gay men of the Baby Boomer generation (i.e., Gayby Boomers) is as novel and revolutionary as the gay liberation and AIDS movements were. It is transforming our views of old age, the composition of LGBTQ communities, and the field of gerontology.

I address the questions: What is like to be Gayby Boomer, e.g., a gay man of the Baby Boomer generation? And what are the implications of Gayby Boomers' aging for gerontology?

This research draws on ethnographic research (e.g., in-depth interviews and participant observation) with a group

of men Gayby Boomers: White, African American, Latino, and HIV-positive and negative in Chicago.

I argue that older gay men are trapped between expressing who they are and the stigma towards gender nonconformity, age, and HIV/AIDS (and race, for some), as they have been for the last 40 years. Yet, they are creating structures to define life as an older gay person. One participant noted, "My generation probably lost a lot of people, but the ones of us that are left are sort of defining what it means to be older because we are out." While the recent visibility of the older gay men is an important step against discrimination, it has reinforced (heterosexual) norms about aging and masculinity that might, unintentionally, create undue stress on gay men. This is partly due to gerontology's heteronormative notions about old age.

I further suggest that older age is being transformed, "queered," and the field of gerontology must follow that change.

SESSION 3485 (SYMPOSIUM)

MUSIC AND MEMORY: PARTNERSHIPS TO STIMULATE EMOTIONS AND BEHAVIORS IN INDIVIDUALS WITH DEMENTIA

Chair: C.J. Tompkins, *George Mason University, Virginia*
 Discussant: D. Cohen, *MUSIC & MEMORY, Inc., Mineola, New York*

The prevalence of dementia among older adults in the U.S and across the world is expected to increase dramatically over the next 30 years and beyond. It is imperative that researchers and practitioners collaborate on understanding interventions that will stimulate memories, emotions, and behaviors of individuals at all stages of the disease.

Music & Memory is a program that is prevalent across the U.S., Canada and eight other countries, that brings personalized music into the lives of older adults with dementia and people with disabilities. Positive outcomes from programs like Music and Memory for individuals with dementia are often found to be related to the level of significance that music had in the person's life prior to the onset of cognitive decline. The first paper presented in this symposium will introduce the effects that the Music & Memory program has had on participants with dementia in five different adult day health care centers located in one county. The second paper will examine the perceptions of the Music and Memory program from family caregivers and the third paper explores a partnership between a community agency and a University that has increased the prevalence of the implementation of the Music & Memory program within the surrounding communities. The third paper will also examine the effects of the Music and Memory program from the perceptions of the professional care staff.

RESULTS FROM A MUSIC AND MEMORY INTERVENTION FOR INDIVIDUALS WITH DEMENTIA IN ADULT DAY CARE CENTERS

E.S. Ihara¹, S.S. Sonneman², *1. Social Work, George Mason University, Fairfax, Virginia, 2. Fairfax County Kinship Family Institute, Fairfax, Virginia*

Individuals with dementia struggle with memory impairment and a reduced ability to interpret their surrounding

environments. Music has been used successfully in various settings (medical, institutional, and adult day care) to decrease agitation, anxiety, medication use, stress and distress, and increase pain control, wellness, and overall sense of control. This presentation will discuss the results from our study which implemented a personalized music intervention for approximately 50 individuals with dementia in five adult day centers. A team of researchers spent eight months observing participants and video recording sessions twice a week for six weeks at each center. We developed an observation tool based on the behaviors we observed during our pilot study, and our tool captures behavioral changes related to music and common behaviors for individuals with dementia. Overall, participants were engaged with their personalized music during the intervention, and key findings indicate an increase in smiling and talkativeness.

THE IMPACT OF THE USE OF PERSONALIZED MUSIC WITH PEOPLE WITH DEMENTIA ON THEIR FAMILY CAREGIVERS

M. Inoue, A. Harris, *George Mason University, Fairfax, Virginia*

Caring for a loved one with dementia is often a challenging experience. This session will discuss experiences of caregivers of family members with dementia and their perspectives on the effects of the personalized music intervention. Family caregivers were interviewed before and after the intervention, and asked to complete two instruments to measure agitation and depression – results indicate that family caregivers perceived a slight decrease in physically and verbally aggressive behaviors. Using a grounded theory approach to analyze the transcribed interviews, the two themes that emerged pertaining to caregivers were "coping" (finding patience, avoiding loneliness, increasing understanding) and "finding relief" (additional support, taking breaks, music intervention). Emerging themes pertaining to their care recipients included "changing behavior" (relearning, agitating, becoming anxious) and "stimulating" (maintaining dignity, praising efforts). The session will conclude with a potential impact of the use of personalized music on caregivers and application to various caregiving settings.

MUSIC AND MEMORY: THE IMPORTANCE OF RESEARCH-INFORMED INTERVENTIONS FOR COMMUNITY-BASED AGENCIES

C. Clark, *Insight Memory Care Center, Fairfax, Virginia*

Interventions for individuals with dementia are important for adult day health care center (ADHCC) staff to implement. Participants with varying levels of dementia may attend the centers for 10 hours a day. This session will discuss one ADHCC's partnership with a university to examine the effectiveness of the national Music & Memory program. Agency staff were trained to implement the program and then a partnership was formed with a local university to establish effectiveness. Staff assessed participants' mood and behavior prior, during, and at two-points-in-time after the intervention. As a result of the partnership, a community awareness highlighting the benefits of the Music & Memory program was created and caregivers, agency staff, and others throughout the community began to implement the program. The partnership has also been valuable in allowing for the continuation of data collection for an evidenced-based music intervention benefiting older adults with dementia and their caregivers.

SESSION 3490 (PAPER)

MINORITY ELDERS

AGEING WELL WITH HIV: INSIDER STRATEGIES FROM LONG-TERM SURVIVORS IN ONTARIO, CANADA

C.A. Emler^{1,4}, L.M. Harris², D. Brennan³, C. Furlotte⁴, C.M. Pierpaoli⁵, 1. *Social Work, University of Washington, Tacoma, Washington*, 2. *University of Louisville, Louisville, Kentucky*, 3. *University of Toronto, Toronto, Ontario, Canada*, 4. *McMaster University, Hamilton, Ontario, Canada*, 5. *University of Alabama, Tuscaloosa, Alabama*

Worldwide approximately 3.6 million people age 50 and older are living with HIV. Few studies have explored successful ageing from the insider perspective of those living well with HIV infection. This study draws upon the lived experience and wisdom of older, HIV-positive adults from Ontario, Canada to understand their strategies for successful ageing. This qualitative study involved semi-structured interviews with 30 HIV-positive individuals age 50 + years. Purposive sampling techniques were used to recruit individuals, and constructivist grounded theory coding techniques were used for analysis. Participants ranged from 50–73 years ($M=58$, $\pm=6.1$), were predominantly male (66.7%) and White (66.7%). Thirteen percent were Black Canadians, some of whom were immigrants to Canada from endemic African countries. Sixty percent identified as gay. The average time since first HIV diagnosis was 18 years (range: 4–30, $\pm=7.6$) and 56% were diagnosed before active antiretroviral therapy (ART) became available. Themes of successful ageing were: 1) Resilience strategies, including subthemes of self-care, spirituality, HIV identity and mastery; 2) Social support, including the evaluation of positive versus negative influences in social network; and 3) Environmental contexts, i.e. financial precariousness and environmental support. Stigma and struggles to maintain health were identified as impediments to successful ageing. Models of successful ageing must take into account the need for subjective appraisals of success in populations suffering from life threatening illnesses including HIV. Practitioners should consider organically existing strengths in this population in order to provide intervention development for older adults who are working to manage their HIV.

EMPOWERMENT OF OLDER IMMIGRANT WOMEN THROUGH IMPROVED FINANCIAL LITERACY

R.M. Mirza¹, M. Rhyason¹, L. McDonald¹, M.A. Syed¹, L. Kryzanowski³, V. Iafolla^{1,2}, K. David⁴, A. Dillman, 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *University of Alberta, Edmonton, Alberta, Canada*, 3. *Concordia University, John Molson School of Business, Montreal, Quebec, Canada*, 4. *Institute for Life Course and Aging, University of Toronto, Lakehead University, Toronto, Ontario, Canada*

A lack of financial literacy has far-reaching implications for economic security in old age for women as it may diminish women's ability to plan effectively for later life and/or retirement. To understand and address these issues the National Initiative for the Care of the Elderly (NICE) led a research study to improve the financial literacy of low-income,

older, unattached, and immigrant women in the Vancouver (N=201), Montréal (N= 65) and Toronto (N=204). Evidence-based financial literacy tools and workshops on topics related to money management, financial planning, and government assistance programs were developed and delivered. Survey data was collected at baseline prior to workshop and at three-months post-workshop, once a financial action-plan was implemented. Participants reported satisfaction with the workshops and information on: 1) budgeting, 2) estate planning, and 3) recognizing financial abuse. Participants indicated that resources being aligned with the socio-economic conditions of the participants was important. A gendered/feminist lens applied to the findings indicates that older women may have less opportunity to become financial literate if prescribed marriage roles and family dynamics lead to male spouses taking on the money management roles in earlier to late-life. A lifecourse approach is necessary to support financial literacy for women earlier in life and continued programs providing relevant financial information at predictable life transitions in later-life such as widowhood. Despite baseline differences, participants who completed the workshops felt they had enhanced their knowledge and were able to identify how they may be more responsive with money matters in the future.

QUALITY OF LIFE IN RESIDENTIAL LONG-TERM CARE: CHINESE-SPEAKING IMMIGRANTS IN BRITISH COLUMBIA

S.D. Koehn^{1,2}, K.N. Li¹, C. Reid³, J. Baumbusch⁴, 1. *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*, 2. *Providence Health Care, Vancouver, British Columbia, Canada*, 3. *University of British Columbia-Okanagan, Kelowna, British Columbia, Canada*, 4. *University of British Columbia, Vancouver, British Columbia, Canada*

Objectives: The care provided by a majority of 'mainstream' Residential Long-Term Care (RLTC) facilities is incompatible with the needs of immigrant older adults. In British Columbia (BC), Canada, Chinese-origin older adults are a substantial and growing minority and research indicates that RLTC facilities not targeted at this population need direction to assist them in providing culturally competent care. Accordingly, our study seeks to identify which features of RLTC have the greatest impact on the quality of life of this subpopulation. **Methods:** A qualitative pilot study conducted in BC included 9 in-depth one-to-one interviews in two RLTC facilities with Chinese-origin residents and 11 family members who regularly visit such residents. We captured perspectives on residents' quality of life (QoL) using an adapted version of an interview protocol established as trustworthy among diverse older adults in the U.K. This framework, developed by the National Centre for Social Research, understands the QoL of older adults to be contingent on their *capability* to pursue five conceptual attributes: *attachment, role, enjoyment, security and control*. **Results:** Participants perceived that the capability of residents to pursue the following dimensions of QoL was influenced by the organizational, social and/or physical features of the facilities in which they resided: Attachment (especially connection to the outside world), Control (especially decision-making), Enjoyment and Safety/Security. **Conclusions:** Findings concerning both positive and negative influences on older immigrant QoL that the

facility can modify will provide direction and highlight priorities for RLTC administrators and policy makers.

PATIENT CONTINUITY OF CARE AND PHYSICIAN MANAGEMENT OF OLDER ADULTS WITH COMPLEX CHRONIC CONDITIONS

K.J. Johnston¹, J.M. Hockenberry², 1. *Health Management and Policy, Saint Louis University, St. Louis, Missouri*, 2. *Emory University, Atlanta, Georgia*

Recent studies find that patient continuity of care (COC) has beneficial effects on patient outcomes and costs in the general patient population. We focus on older adults with complex chronic conditions who have care needs that differ from the average patient. Our objective is to identify patient and market characteristics that predict annual physician involvement in evaluation and management (E&M) of such patients as well as patient COC.

We identify Medicare beneficiaries with diabetes and/or heart failure in the Medicare Current Beneficiary Survey during 2006–2012, a nationally representative sample of 23,736 person-years.

We estimate multivariable regression models to assess the effect of patient characteristics and market factors on patient COC and physician E&M. COC is measured with the Bice-Boxerman and Usual Provider of Care indices. Physician E&M is measured as the count of unique physicians visited annually, and involvement by a primary care physician or a disease-relevant specialist.

Local market factors such as primary care and specialist physician supply are significant ($p < .05$) predictors of physician E&M involvement and patient COC. Patients who have higher incomes, more private supplemental insurance, and more education see more physicians for E&M ($p < .05$). Patients who have higher incomes and education are also more likely to see a disease-relevant specialist, but have lower COC ($p < .05$).

Medicare beneficiaries with complex chronic conditions who are socially and financially disadvantaged see fewer physicians and have less E&M visits. Although this results in better COC, it comes at the cost of having less access to disease-relevant specialists.

SESSION 3495 (SYMPOSIUM)

ADVANCE CARE PLANNING IN ASIAN POPULATIONS: KNOWLEDGE, ATTITUDES, AND BEHAVIORS

Chair: C. Berkman, *Fordham University, New York, New York*

Advance care planning is widely endorsed as desirable by individuals in Western European countries and the United States. Less is known about the degree to which Asian populations are knowledgeable and have positive attitudes about advance care planning. This symposium describes findings on advanced care planning knowledge, attitudes and behaviors from three studies of Asians and Asian Americans. The first presenter describes attitudes toward end-of-life treatment in China comparing young, middle-age, and older adults. Age differences in preferences for making medical decisions and for life-sustaining treatment, and the relationship between these preferences and educational attainment are described. The second presenters describe

completion rates for advance directives using the 2015 Asian American Quality of Life survey. The direct and moderating effects of knowledge of advance directives, education, and acculturation in predicting AD completion are described. The third presenters describe findings from a study of Chinese American older adults in New York City. The gap between perceived and actual knowledge about living wills and health care proxies, and the low rate of having an advance directive, are described. The relationship among, knowledge, attitudes, and behaviors with respect to advanced directives is discussed. The fourth presenters use data from this same study of Chinese American older adults to describe knowledge and attitudes about hospice. They report on the low level of knowledge and common misconceptions about hospice. Each of the presenters discuss the consequences of these findings and implications for interventions.

ATTITUDES TOWARDS END OF LIFE BY AGE GROUP IN CHINA

X. Ning, *Peking Union Medical College Hospital, Beijing, China*

The study aim was to assess attitudes toward end-of-life treatment in China among adults age <30 ($n=499$), age 30–65 ($n=920$), and age >65 (110). Middle-aged were more likely (92.2%) than younger (86.4%) and older (85.4%) to want to talk about death ($p < 0.001$). Middle-aged were more likely (85.2%) to prefer making their own medical decisions as compared with younger (76.8%) and older (61.7%) ($p < 0.001$). Youngest were most likely to want life-sustaining treatment at end of life (13.2%), compared to middle-aged (3.8%) and oldest (5.5%) ($p < 0.001$). Among age 65+: 1) educational attainment was positively correlated with wanting to talk about death ($G = -0.55$, $p < .01$); 2) 76.7% with higher educational attainment wanted to make end-of-life treatment decisions by themselves, compared with 46.2% with lower educational attainment ($p < .001$); 3) they were more likely to choose life-sustaining treatment for family (17.4%) than themselves (5.5%) ($p < 0.001$). Implications of these attitudes and the age differences will be discussed.

THE KNOWING-DOING GAP IN ADVANCE DIRECTIVES IN ASIAN AMERICANS

Y. Jang¹, N.S. Park², D.A. Chiriboga², 1. *The University of Texas at Austin, Austin, Texas*, 2. *University of South Florida, Tampa, Florida*

The purposes of the present study were (1) to explore the completion rate of advance directives (ADs) in a sample of Asian Americans and (2) to examine the direct and moderating effects of knowledge of AD, education, and acculturation in predicting AD completion. Education and acculturation were conceptualized as moderators in the link between knowledge and completion of ADs. Data were derived from 2,609 participants (aged 18–98) in the 2015 Asian American Quality of Life survey. The AD completion rate in the present sample was about 12% (cf., 26%–36% in the U.S. general population). AD knowledge and acculturation independently predicted AD completion. No direct effect of education was found; however, it interacted with AD knowledge. AD knowledge was more likely to be translated into completion in the group with higher education. The interactive role of education explains the gap between AD knowledge and completion and suggests intervention strategies.

KNOWLEDGE, ATTITUDES, AND BEHAVIORS RELATED TO ADVANCE DIRECTIVES AMONG CHINESE AMERICAN OLDER ADULTS

C. Berkman, X. Liu, *Graduate School of Social Service, Fordham University, New York*

The study purpose was to describe knowledge, attitudes and behaviors about advance directives in Chinese American older adults. Chinese American senior center members (n=150) were interviewed. One-quarter reported knowledge of a health care proxy (HCP) and 22% had heard of a living will (LW), but few gave correct definitions of either. Few had appointed a HCP (11%) or had a LW (4%). Most (83%) had negative attitudes toward having an HCP. Only 41% thought a LW was needed when in good health. Beliefs included: an HCP controls medical decisions even when the individual can make decisions (37%); putting wishes in writing is too binding (41%); once end-of-life preferences are documented, they cannot be changed (43%); they trust the doctor to make decisions about end-of-life care if they were unable to (86%) and make decisions about life-sustaining treatment (60%). Misconceptions and negative attitudes about advance directives were prevalent in this population.

KNOWLEDGE AND ATTITUDES ABOUT HOSPICE CARE AMONG CHINESE AMERICAN OLDER ADULTS

X. Liu, C. Berkman, *Graduate School of Social Service, Fordham University, New York*

The study purpose is to explore knowledge and attitudes about hospice care among Chinese American older adults. Among senior center members (n=150), 20.7% had heard of hospice. Among these participants, 89.7% knew that hospice was care provided when there is a terminal illness and the individual is near the end of life. Few knew about other components of hospice care, including that it could be provided at home, or the services and benefits included. Most (74.7%) would want hospice only at the end of life. Beliefs included: hospice is a place where people go to die (78.6%); hospice is not as good as treatment in the hospital (58.3%); hospice is unnecessary if they were dying because their family (34.3%) or God (30.6%) would take care of them; choosing hospice means that you are not fighting for your life (38.3%); and hospice causes people to die before their time (34.1%).

SESSION 3500 (SYMPOSIUM)

THE AGE-FRIENDLY COMMUNITIES MOVEMENT: CREATING, MANAGING, AND SUSTAINING COMMUNITIES FOR ALL

Co-Chair: J. Beard, *World Health Organization*

J.N. Feather, *Grantmakers in Aging, Arlington, Virginia*

Discussant: G. Chan, *The Hong Kong Council of Social Service*

The Age Friendly Communities movement is one of the fastest growing developments in aging. In the decade since the publication of the landmark World Health Organization document "Global Age-friendly Cities: A Guide" in 2007, 287 cities and communities in 33 countries officially enrolled in the WHO process, with many other communities taking elements of the framework and

moving forward on their own. The efforts are enormously varied, but they all try to bring together all of the elements (healthcare, transportation, housing, social support, civic engagement, etc.) that are needed to ensure that older persons can remain and thrive in their communities as they age. As the movement has matured, it has faced many challenges. How do we best engage political leadership? Do the same models apply to rural areas? How do we focus on the older population while making it clear that these programs benefit the whole community? And, perhaps most pressing for many of the pioneers of the movement, how do we sustain these programs once the initial flush of enthusiasm and funding is gone? The three speakers in this symposium bring many years of experience in this area and will focus on: the world-wide perspective (John Beard); the experience in the United States, particularly in rural areas and small towns (John Feather); and the work being done in one of the countries with the fastest growing older populations, China (Grace Chan). Each will provide research information and resources that have been prepared by their respective organizations.

THE AGE-FRIENDLY COMMUNITIES MOVEMENT: HISTORY, UPDATE, AND THE FUTURE

J. Beard, *World Health Organization, Geneva, Switzerland*

The Age Friendly Communities movement is usually described as beginning with the publication of the landmark World Health Organization report in 2006 and has since expanded rapidly throughout the world. Dr. John Beard, Director, Department of Ageing and Life Course at WHO, will briefly outline the history of the movement and update the audience as to the present status. He will focus on what the field is learning from the implementation of this framework from throughout the world, including in Africa, Europe, and Asia. He will also discuss some of the issues that have arisen from the movement's rapid success: How do we sustain these efforts over time? Should there be a coordinating entity among all of these programs or is that not feasible? Is the model flexible enough to meet the emerging challenges of aging? Finally, he will discuss what he sees for the future of the movement.

EXPANDING THE RANGE OF AGE-FRIENDLY COMMUNITIES: THE SUSTAINABILITY FRAMEWORK AND RURAL COMMUNITIES

J.N. Feather, *Grantmakers in Aging, Arlington, Virginia*

Dr. John Feather will discuss two important aspects of the age friendly communities movement: how to sustain them after the initial rush of enthusiasm and funding; and how to expand them into rural areas. Feather will report on the "Community AGenda" project of Grantmakers in Aging that focused on five areas within the United States: the greater Phoenix area; metropolitan Atlanta; Miami-Dade County; greater Kansas City; and the state of Indiana. As part of this project, GIA brought together leaders from a variety of major aging organizations to create a framework for sustaining age friendly communities over time. The project also focused on several areas of the country that were rural, rather than the city-based programs that are more common. He will also discuss the prospects for expanding these programs in coming years.

SESSION 3505 (SYMPOSIUM)

WORKING WITH AND FOR CARE HOMES TO RESEARCH AND DEVELOP PRACTICE

Chair: H. Verbeek, *Maastricht University, Netherlands*

Co-Chair: J. Hamers, *Department of Health Services Research, CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*

Discussant: K.N. Corazzini, *Duke University, Durham, North Carolina*

In long-term care, new care models and person-centered care philosophies are being developed, focusing on increasing patient's autonomy, meaningful activities, and enabling residents to keep their own lifestyle for as long as possible. However, the uptake and spread of these models depends on academic institutions being able to work in good relationship with long term care providers. This symposium presents two successful models of partnership working between universities and providers, which were developed independently in the UK and the Netherlands. The first presentation describes My Home Life, a UK wide initiative to promote quality of life for those living, dying, visiting and working in care homes for older people through appreciative, relationship-centred and evidence based practice. This culture change initiative focuses on changing the way people talk to each other, through having Caring Conversations. The second presentation focuses on the Living Lab in Ageing and Long-Term Care, a model developed in the Netherlands that is characterized by interdisciplinary partnership and joint appointments, positively influencing the link between science, practice, policy and education. Whilst, My Home Life focuses on practice development informed by research, the Living Lab focuses on research driving quality improvement. Combined, they offer an innovative approach to enhance research impact, by encouraging academics to work in a different way with and for care homes. The final presentation offers insights into the active working mechanisms of both programs and reflects on lessons learnt from working with the care home sector over time.

MY HOME LIFE: MEASURING IMPACT THROUGH PRACTICE DEVELOPMENT

J. Meyer¹, B. Dewar², K. Barrie², 1. *Centre for Health Services Research, City University of London, London, United Kingdom*, 2. *Institute of Care and Practice Improvement, University of West of Scotland, Hamilton, United Kingdom*

This paper examines the learning and perceived difference that the MHL Leadership Support programme has made to practice development in care homes, from the perspectives of participants. It draws on self-report findings from a multi-method study of 11 cohorts of care/nursing home managers (n=119) participating in the programme in Scotland (January 2013-April 2015). Findings demonstrate positive impact on managers, enhanced leadership skills, better communication and relationships with staff, and positive benefits for residents & relatives. Whilst these findings should be interpreted with caution due to their self-report nature, participants demonstrated discernible

difference in identifying positive change over time related to their own circle of influence. The paper flags up a number of issues for consideration when trying to measure impact of complex interventions, in complex settings. It highlights the possible need to develop new process measures to gauge the spread of impact throughout the various circles of influence.

LIVING LAB ON AGEING AND LONG-TERM CARE: MEASURING IMPACT THROUGH RESEARCH

H. Verbeek, S. Zwakhalen, J. Schols, J. Hamers, *Maastricht University, Maastricht, Netherlands*

Structural multidisciplinary collaboration between research, policy, education and practice is essential to develop, evaluate and implement interventions improving quality of life and care in nursing homes. The Living Lab in Ageing and Long-term Care is a model to achieve this goal. It was developed in the southern part of the Netherlands. Two characteristics of the model have proven vital for successful collaboration. First, the interdisciplinary partnership, with nursing-home administrators, clinical and nursing staff, researchers and teaching staff as collaborating partners; nursing science, old age medicine, physiotherapy, psychology and gerontology being the core disciplines. Second, joint appointments of senior researchers working at both the university and a long-term care organization. Within the Living Lab, innovative small-scale, homelike care environments and green care farms were evaluated according to these principles. Care organizations themselves gave rise to the main research questions and staff have been involved from the start throughout the whole trajectory.

EXPERIENCES, CHALLENGES, AND BENEFITS OF ACADEMICS WORKING WITH CARE HOMES FOR RESEARCH AND PRACTICE

B. Dewar¹, K. Barrie¹, J. Meyer², 1. *Institute of Care and Practice Improvement, University of West of Scotland, Hamilton, United Kingdom*, 2. *Centre for Health Services Research, City University of London., Hamilton, United Kingdom*

Internationally, some of the sickest and most vulnerable citizens in society are residing in care homes for older people. As the population ages, there is an urgent need for academics to work with and for this sector to ensure research and practice development is taken forward to meet changing needs. This paper draws on findings from an exploratory study of the experiences, challenges and benefits of academic facilitators engaging with care homes on research and practice development. In-depth interviews were conducted with facilitators working with care homes in the Netherlands (n=8) and United Kingdom (n=15) to explore the active working mechanisms of their work and reflects on lessons learnt. Emergent key themes included: challenging/invigorating context for partnerships in research; importance of emergent design; opportunities for data generation; working alone/working together; development of practice based theory. Findings highlight the importance of universities considering new ways of working with care homes.

SESSION 3510 (SYMPOSIUM)

ICT AND AGING—DETERMINANTS AND NEW CONCEPTS OF DIGITAL INCLUSION

Chair: M. Doh, *Institute of Psychology, Heidelberg, Baden-Württemberg, Germany*

Discussant: F. Oswald, *Goethe University Frankfurt, Frankfurt, Germany*

The ongoing aging and mediatised society offers for older persons a broad range of opportunities and resources for successful aging. At the same time, becoming a digital citizen imposes economic and psychological costs and generates challenges in connection with life-long learning. Therefore social inequalities between older persons are evident during the adoption and usage of new technologies such as the Internet and (mobile) information and communication technologies (ICT). Given this background, this symposium presents research results from Europe and Brazil, with focus on the following aspects: Seifert discloses cross-national and country-specific determinants on a micro- and macro-level for explaining digital gaps. In a next step, new concepts and possibilities for digital inclusion for older persons are presented. Based on the Initiative “Senior-Technology-Experts” in Germany, Doh explains the benefits of older experts acting as role models, and of training offerings combining formal with informal learning, and advantages of mobile ICT such as Tablet-PCs and Laptops. Leen-Thomele focuses on the benefits of mobile learning and special e-learning programs for older persons from Germany, Spain and France. Under an educational perspective Doll describes similar and specific strategies and concepts from Brazil. Jokisch presents his quantitative analysis of ICT trainings for older novices which emphasize the importance of self-efficacy and the sources of mastery and vicarious experiences (according to Bandura’s Social Learning Theory). In this context the well-established theory of the Technology Acceptance Model (TAM, by Davis) will be discussed.

INTERNET DIFFUSION AMONG OLDER PERSONS IN EUROPE—A STATISTICAL ANALYSIS OF SHARE DATA

A. Seifert^{1,2}, R. König³, M. Doh⁴, 1. *Center Center of Competence for Gerontology, University of Zurich, Zurich, Switzerland*, 2. *URPP Dynamics of Healthy Aging / University of Zurich, Zurich, Switzerland*, 3. *Institute of Sociology, University of Zurich, Zurich, Switzerland*, 4. *Department of Psychological Ageing Research, Institute of Psychology, Heidelberg University, Heidelberg, Switzerland*

A digital gap between younger and older persons still exists. This study investigates Internet usage by older persons using representative data from 14 countries acquired from the Survey of Health, Ageing and Retirement in Europe (SHARE). Data obtained from the responses of 30,227 Europeans aged >60 was analyzed, and the results emphasize that, on average, 35% of all respondents used the Internet at least once a week. The situation, however, varies widely among European countries. The analysis suggests that cross-national individual indicators such as age, gender, social class, previous experience with computers and person’s social circle influences the Internet usage. In addition, country-specific differences in Internet usage are dependent from contextual structures, such as area of residence, wealth, and technology

infrastructure. Overall, this study concludes that Internet access is influenced by individual indicators and social and structural resources.

NEW CONCEPTS FOR DIGITAL INCLUSION IN GERMANY—THE INITIATIVE SENIOR-TECHNOLOGY-EXPERTS

M. Doh^{1,2}, M.R. Jokisch¹, H. Wahl¹, 1. *Department of Psychological Ageing Research, Institute of Psychology, Heidelberg, Baden-Württemberg, Germany*, 2. *Network Aging Research, Heidelberg, Baden-Württemberg, Germany*

There is a constant digital gap between older age groups in Germany. For fostering digital inclusion, a nationwide initiative named “Senior-Technology-Experts” was launched in 2013 and funded by a German ministry (BMBF). 18 regional sub-projects empowered technically experienced older persons to explain the use of modern ICT to technically inexperienced older persons for one year. At the end 2014, a research project was started to examine the supporting and limiting factors for ICT exposure. A sample of 134 experts, aged 50–88 years (MD=68), and 145 novices, aged 51–95 years (MD=68) completed an online or paper questionnaire. 5 qualitative focus groups (N=25) were also conducted. The following main results from the supporting factors are highlighted: 1) benefit of older experts acting as role models (see Bandura’s Social Learning Theory), 2) benefit of training offerings which combine formal and informal learning, and 3) benefit of mobile learning, especially with Tablet-PCs and Laptops.

NEW CONCEPT FOR DIGITAL INCLUSION—ONLINE AND MOBILE LEARNING PROGRAMS FOR OLDER PERSONS

E. Leen-Thomele, E. Coroian, A. Lipphardt, P. Held, *Friedrich-Alexander-University Erlangen-Nuremberg, Fürth, Germany*

This paper sums up the evaluation results of two e-learning ICT courses for older adults: a tablet computer course and a regular computer course, and discusses the advantages of mobile learning and e-learning for older adults. As part of an European research project, the SenApp project, online course modules were developed, to teach older adults the first steps on a tablet computer, and evaluated (N=37, age range 58–93). The other course we analyzed, was an online learning course with regular computers and part of the LernHaus project in Germany (N=29, age range 50–89). The evaluation focused on differences in satisfaction with support and course contents and in learning routines between age groups, education level, countries and pre-experience conditions. Main findings suggest that all courses were rated good, compliance was very good and that support was a key factor for course success. Mobile learning was slightly easier for new learners.

NEW CONCEPTS FOR DIGITAL INCLUSION IN BRAZIL—AN EDUCATIONAL PERSPECTIVE

J. Doll, *Federal University of Rio Grande do Sul, Porto Alegre, Rio Grande do Sul, Brazil*

This paper gives an overview of the different concepts of digital inclusion for older people in Brazil from an educational perspective. Computers became common in Brazil not before 2000 and older people entered latest. First courses

designed for older persons appeared 15 years ago, generally linked to Third Age Universities. Beside more traditional courses (teacher – students), new forms appeared in the last ten years such as Senior teaches Senior, high school students teaching older persons, distance learning, mobile learning, literacy courses linked to computer courses. Even with the same objective – introducing older people in the digital world – the educational concepts, the learning theories behind and the main focus are quite different. Beside the efforts, the digital exclusion of the elderly continues strong, principally by educational, cultural and biographical issues. Actually, only 14% of the 60+ population is using a computer, against 86% of the population 10–15 years.

ICT TRAINING FOR OLDER PERSONS: PSYCHOLOGICAL CONSIDERATIONS

M. Jokisch¹, M. Doh^{1,2}, H. Wahl¹, 1. *University of Heidelberg, Heidelberg, Germany*, 2. *Network Aging Research, Heidelberg, Germany*

Information and communication technologies (ICT) offer great opportunities but also impose new challenges, especially for older persons who report higher difficulties in learning new technologies. Regarding training, self-efficacy can be expected as crucial to overcome barriers regarding adoption and efficient use. According to Bandura, the most influential sources of self-efficacy are mastery and vicarious experience. The present study examines the role of ICT specific self-efficacy, the influence of experience and the impact of breadth of web use. 130 ICT novices, aged 52–96 years ($M=69.6$) participating in ICT classes (computer, smartphone, tablet) completed a respective questionnaire. Mastery experience was operationalized by questions about succeeding ICT tasks during the course, whilst observations of the teacher and participants referred to vicarious experience. Hierarchical regression analysis supports the influence of ICT related self-efficacy on competent technology use as well breadth of web activities. Results are discussed in the context of the technology acceptance model.

SESSION 3515 (SYMPOSIUM)

FROM EVIDENCE TO PRACTICE AND POLICY: TRANSLATING PROMISING PRACTICES INTO SUSTAINABLE PROGRAMS

Chair: H.B. Degenholtz, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Co-Chair: S. Zimmerman, *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Discussant: B. Resnick, *University of Maryland School of Nursing*

A common experience shared by researchers across the globe is that promising, evidence-based practices often do not find widespread adoption or become known to policy makers. Consequently, daily practices are not well-informed, and policy makers are left to make decisions in the absence of reliable information. There are many policy and practical reasons why good, evidence-based research does not become standard of care. For example, in some cases, researchers demonstrate improvement in outcomes that are not highly valued by policy makers or reimbursed by the health care system.

In other cases, the transition to a new model of care, even one that is cost-saving, can pose a seemingly insurmountable burden on an overworked system. In this symposium, we will discuss a universal framework for organizing evidence that is designed to bring policy makers and researchers together into a common agenda. Next, we will present three effective, programmatic innovations in gerontology and using case-based evidence, discuss not only the impact that each has had on the field, by why it has had impact: one intended to reduce hospitalizations, one approach for improving person centered care in nursing homes; and one promoting culture change in nursing homes. Each presenter and the discussant will highlight the implications of the findings for an international audience. This symposium is sponsored by the Social Research, Practice, and Policy Section of the Gerontological Society of America.

EVIDENCE-BASED POLICY RESEARCH ON THE HEALTH OF THE AGING POPULATION: LINKING SUPPLY AND DEMAND

P. Rocco, 1. *Marquette University, Milwaukee, Wisconsin*, 2. *Stern Center for Evidence Based Policy, University of Pittsburgh, Pittsburgh, Pennsylvania*

In recent years, researchers and policymakers have increasingly called for the application of evidence-based research technologies (e.g. systematic reviews and meta-analysis) to policy-relevant research questions. Given the large quantity of available research literature, these methods hold promise for addressing policy challenges related to the health of the aging population. Yet, as political science research makes clear, evidence alone does not advance policy debates. Rather, cross cutting stakeholder support is an essential ingredient of significant policy change. To solve this problem, this paper demonstrates a methodology for mapping the overlap of existing research evidence and stakeholder demand for policy. From an initial search return of over four hundred thousand literature citations and over 493 health stakeholder organizations, researchers conducted a scoping study and policy scan to identify unique stakeholder policy recommendations and studies related to the health of the aging population. An expert panel used these results to organize the information into 10 usable policy categories (further divided for easy reference into 75 subtopic areas), which combine to present a comprehensive and unbiased view of the best-available evidence and policy activity around healthcare for older adults. The study intends to inform future policymaking in this critical area with an easily applied index of evidence-based policy research mapped to the full range of policy options.

NATIONAL DISSEMINATION OF PERSON-CENTERED CARE IN NURSING HOMES: BARRIERS TO IMPLEMENTATION

H.B. Degenholtz¹, K. Van Haitsma², A. Mihelic³, K.M. Abbott⁴, A. Elliott⁵, T. Roberts⁶, C. Benner⁷, P. Chiorello⁸, 1. *Health Policy and Management, University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *Pennsylvania State University, State College, Pennsylvania*, 3. *Telligen, Inc., Greenwood Village, Colorado*, 4. *Miami University, Oxford, Ohio*, 5. *Pioneer Network, Rochester, New York*, 6. *University of Wisconsin, Madison, Wisconsin*, 7. *LeadingAge, DC, District of Columbia*, 8. *Atrium Health, New York, New York*

The Advancing Excellence Campaign (AE) is a national quality improvement initiative sponsored by a consortium of stakeholder organizations. The campaign selects and disseminates evidence-based best practices. The person-centered care (PCC) goal is based on established, effective programs for improving quality of life. The PCC toolkit includes a brief assessment of congruence between residents' preferences and their daily lives, and techniques for quality improvement. To identify barriers to implementation, a national survey was sent out to representatives of 954 communities that had registered with AE to use the PCC tool. Of the 105 complete surveys, 45.7% were still using the materials, 8.5% had considered using the toolkit but decided not to implement it, and 21.7% discontinued using the toolkit. Common barriers to implementation were: time for staff training, staff turnover, time to conduct interviews, and staff resistance. This experience is illustrative of the challenges of dissemination and implementation in long-term care.

CARE COORDINATION FOR HOME CARE RECIPIENTS

D.C. Grabowski¹, L. Hatfield¹, A. Jena¹, D. Cristman², M. Flair³, K. Kator³, K. Dean¹, G. Nudd², 1. *Harvard Medical School, Boston, Massachusetts*, 2. *Clear Care Online, San Francisco, California*, 3. *Right at Home, Omaha, Nebraska*

Home care recipients are often hospitalized for potentially avoidable reasons. The Intervention in Home Care to Improve Health Outcomes program was designed to help home care providers identify acute clinical changes in condition and then manage the condition in the home and thereby avoid a costly hospitalization. Caregivers answer simple questions about the care recipient's condition during a telephone-based "clock-out" at the end of each shift. Responses are electronically captured in the agency management software that caregivers use to "clock-out" on every shift. These are transmitted to the agency's care manager, who follows up on the change in condition and escalates appropriately. In an early review of the program, caregivers reported a change in condition after 2% of all shifts, representing an average of 1.9 changes per care recipient in a 6-month period. In an ongoing randomized trial, we are evaluating the impact of the program on hospitalizations.

FROM RESEARCH TO POLICY: WIDESPREAD ADOPTION OF THE INTERACT PROGRAM IN LONG-TERM CARE

A.F. Bonner, 1. *Office of Elder Affairs, Commonwealth of Massachusetts, Boston, Massachusetts*, 2. *Northeastern University, Boston, Massachusetts*

Between 2011 and 2013, increasing attention was paid to the issues of unnecessary hospitalizations and rehospitalizations of nursing home residents. Studies suggested that many hospital transfers were not necessary, and not in many residents' best interest.

During this time, the Interventions to Reduce Acute Care Transfers (INTERACT) program was being evaluated in various research trials. Results suggested that this quality improvement program could improve clinical outcomes and reduce unnecessary cost.

Because the Centers for Medicare and Medicaid Services (CMS) was interested in improving quality of care in U.S. nursing homes, they explored various models, programs and services that might reduce unnecessary hospital transfers. This session will describe how new programs such as INTERACT may be reviewed by CMS or other state or federal agencies, and the decision-making process that can lead to broader dissemination of evidence-based or evidence-informed programs.

SESSION 3520 (SYMPOSIUM)

GSA MAXWELL A. POLLACK AWARD FOR PRODUCTIVE AGING LECTURE: INTERNATIONAL TRANSFER OF RESEARCH ON AGING SERVICES POLICY AND PRACTICE—WHY IT MATTERS

Chair: R.I. Stone, *LeadingAge, Washington, District of Columbia*

This lecture highlights the value of sharing findings from applied research across countries to help shape better aging services policy and practice domestically and internationally. Dr. Stone uses three examples from her work in international research and knowledge transfer over her 30-year career to illustrate the importance of these activities. Stone begins by summarizing her policy research in Western Europe during the early 1990s to better understand the evolution of consumer-directed programs within the long-term services and supports financing schemes in Germany, Austria, and the Netherlands. Preliminary findings from studies in these countries indicated success in "cashing out" benefits with no significant consumer abuse and deterioration in quality. She brought these lessons back to the United States and worked with her staff in the US Department of Health and Human Services to develop the seminal Cash and Counseling Demonstration and Evaluation in Arkansas, New Jersey and Florida. The second example describes how Dr. Stone used findings from her case studies and program evaluations of programs linking affordable senior housing and services to help Singapore develop and test similar models in several of its low-income neighborhoods. The third example highlights how countries have mutually benefited from sharing findings from their respective policy and practice research in the area of long-term care workforce recruitment, retention, training and compensation. Dr. Stone concludes her lecture with some personal reflections on the challenges to and opportunities for increased knowledge transfer across countries, particularly from higher- to lower-income countries which are rapidly aging.

SESSION 3525 (SYMPOSIUM)

INEQUALITIES IN ACTIVE AGING: A EUROPEAN PERSPECTIVE

Chair: C. Nilsen, *Aging Research Center (KI/SU)*
Co-Chair: G. Lamura, *INRCA - National Institute of Health and Science on Ageing, Ancona, Marche, Italy*
Discussant: S.H. Harper, *The Oxford Institute of Population Ageing, Oxford, United Kingdom*

The concept of active ageing has become central to the European policy discourse in recent years. Aiming to optimize

opportunities for health, participation and socioeconomic security, active ageing policies suggest that one way that disadvantages in health and living conditions in old age can be mitigated is by fostering older people's own contributions to the labour market and to society. Crucially, however, the ability to contribute depends on socio-demographic and socioeconomic factors, and the access to resources that these afford. For instance, for women these resources are frequently less readily available, due to their reproductive roles over the life course, and their higher likelihood to become widowed and live alone in older age. To date, research on active ageing has paid little attention to these factors and how they influence the degree to which it is possible to 'actively' age for older women and men, and for different socio-economic groups of older people.

This symposium aims to highlight inequalities in the experiences of active ageing from a comprehensive European perspective, as well as focussing in-depth on three countries representing three distinct welfare regimes in Europe: Germany, England and Sweden. The three single-country case studies showcase how inequalities in workability, pension literacy and living situation influence participation in the labour market and in society. In addition, an alternative policy framework is suggested, going beyond aggregated measures of 'active ageing' by acknowledging the role of socio-demographic and socioeconomic inequalities across the life course.

AGING IN PLACE: CAN LEISURE PARTICIPATION ENHANCE SURVIVAL?

C. Nilsen¹, N. Agahi¹, B.A. Shaw², 1. *Aging Research Center (Karolinska Institutet/Stockholm University), Stockholm, Sweden*, 2. *University at Albany, Albany, New York*

People living alone are a growing vulnerable population. We aim to see what kind of activities in old age (76+) may enhance survival for people living alone, and determine if these activities have different associations with survival in people not living alone, and whether these associations differ based on socioeconomic position and gender. The Swedish nationally representative SWEOLD study, 2011 and the Swedish cause of death register were used to conduct Cox regression analyses ($n = 742$). Incident mortality: 35.6%. In our preliminary results, participation in any activities in old age was related to reduced mortality compared to no participation. However, different types of activities seemed beneficial depending on living situation. Interacting with relatives and friends was protective among people living alone, while having hobbies and solving crosswords was protective among those not living alone. Socioeconomic position did not explain these associations. Most results were similar in women and men.

PREFERRED AND EXPECTED RETIREMENT AGES—RISING SOCIAL INEQUALITY

M. Hess, *Institut für Gerontologie, Dortmund, Germany*

In response to demographic aging policymakers have implemented several reforms aimed at extending working life. I extend previous research by studying how current older workers have adapted to these reforms. The paper consists of four empirical studies, which are based on different data

sets (ESS; EB; SOEP; DEAS), that investigate the *preferred* retirement age – the age at which older workers wish to retire – and the *expected* retirement age – the age at which older workers anticipate to retire. Its results show that both have increased over the last ten years. While high skilled, white-collar 'Silver Workers' are able to synchronize their preferred and expected retirement age, low qualified workers in often unfavorable working conditions are increasingly forced to delay their retirement to ensure a sufficient pension and, thus, expect to work longer than they prefer. This finding supports recent warnings of a (re)emergence of social inequality in the retirement process.

PENSION LITERACY AND SOCIAL INEQUALITY IN THE UNITED KINGDOM

D. Holman¹, M. Hess², 1. *Sociological Studies, University of Sheffield, Sheffield, South Yorkshire, United Kingdom*, 2. *Technical University of Dortmund, Dortmund, Germany*

Population aging is threatening the financial long-term sustainability of pension systems. The UK government has reacted by bringing the state pension age for women in line with that of men, raising it from 60 to 65, over the 2010–2020 period. This will have differential implications for women's health and wellbeing depending on their awareness of the change and their level of pension literacy more generally. In this study we analyze questions from the English Longitudinal Study of Ageing (ELSA) dataset asking women whether they were aware of these changes and at what age they expect to receive their state pension. Preliminary results show socioeconomic differences in pension literacy according to education, income and occupation. Policy makers need to be aware of the effect on social and health inequalities the reforms might cause.

A BIRD'S EYE VIEW: ANALYSING GENDER AND SOCIAL class INEQUALITIES IN ACTIVE AGEING IN EUROPE

S. Ilinca¹, R. Rodrigues¹, A.E. Schmidt², E. Zólyomi¹, 1. *Health & Care, European Centre for Social Welfare Policy and Research, Vienna, Vienna, Austria*, 2. *Austrian Public Health Institute, Vienna, Austria*

The distribution of resources for older people to actively participate in society has received limited attention in ageing research despite growing relevance. We provide a compendium of indicators based on the analysis of large-scale surveys (including ESS, SHARE, SHARELIFE, SILC) with the aim to investigate gender and socio-economic inequalities in the employment, health and social participation of older people in Europe. We start from standard outcome active ageing indicators, which often mask core differences between gender and socio-economic groups. We then propose a three-tier analytical framework using indicators better reflecting existing inequalities and life course processes. Our results reveal that patterns of inequalities in old-age cannot be easily classified along traditional lines of welfare regime differences. We conclude that active ageing policies should look more closely at the underlying reasons for these patterns and develop tailored approaches to address them, both in later life and over the life cycle.

SESSION 3530 (SYMPOSIUM)

HOW TO PUBLISH: FROM START TO FINISH AND BEYOND

Chair: N.J. Webster, *University of Michigan*

This symposium, organized by the Gerontological Society of America's (GSA) Publications Committee will provide information on the publication process from the perspective of a number of journals publishing diverse types of gerontological research, basic to applied across multiple disciplines. This session is comprised of three parts including: 1) Podium presentations from editors-in-chief from GSA's Journals of Gerontology-Series A, Medical Sciences, Journals of Gerontology-Series B, Psychological Sciences, Innovations in Aging (GSA's new open access journal) as well as the Association of Gerontology in Higher Education's journal, Gerontology and Geriatrics Education, and the European Journal of Ageing. General best practices as well as specific advice for emerging and international scholars will be provided. 2) Presentation on how to assess and maximize the impact of published work given by representatives from Oxford University Press (OUP), including David Crotty, Director of Journals Policy. 3) Round table discussions with OUP representatives and editors from the Journals of Gerontology-Series A (Medical Sciences) and B (Psychological and Social Sciences), Innovations in Aging, The Gerontologist, Gerontology and Geriatrics Education, European Journal of Ageing, Journal of Aging and Social Policy, Research on Aging, and Journal of Applied Gerontology. Participants will provide journal specific information and answer questions related to podium presentation topics and others raised by attendees. Intended audiences include emerging and international scholars, and generally authors interested in learning more about best practices and tips for getting their scholarly work published. Current and future published authors will also gain information on how to leverage already published work.

HOW TO PUBLISH: EDITORS' PERSPECTIVES

N.J. Webster^{1,2}, A. Newman⁷, B.G. Knight³, L.P. Sands⁴, J.L. Howe⁵, H. Wahl⁶, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *Gerontological Society of America, Publications Committee, Ann Arbor, Michigan*, 3. *The University of Queensland, Brisbane, Queensland, Australia*, 4. *Virginia Polytechnic Institute & State University, Blacksburg, Virginia*, 5. *Icabn School of Medicine at Mount Sinai, New York, New York*, 6. *University of Heidelberg, Heidelberg, Germany*, 7. *University of Pittsburgh, Pittsburgh, Pennsylvania*

Part I of this 'How to Publish' symposium will last 45 minutes, including a session overview and podium presentations from the following journal editors-in-chief: 1) Stephen Kritchevsky from the Gerontological Society of America's (GSA) Journals of Gerontology-Series A, Medical Sciences; 2) Bob Knight from GSA's Journals of Gerontology-Series B, Psychological Sciences; 3) Laura Sands from Innovations in Aging, GSA's new open

access journal; 4) Judith Howe from the Association of Gerontology in Higher Education's journal, Gerontology and Geriatrics Education; and 5) Hans-Werner Wahl from the European Journal of Ageing. Presentations will provide guidance on how to publish from multiple disciplines and perspectives. General best practices as well as advice for emerging and international scholars will be provided. Presentations will also address: 1) preparing submissions, e.g., choosing the right journal, developing titles, articulating research questions, complying with journal requirements; 2) revising and resubmitting, e.g., overview of the process, responding to reviews.

HOW TO MAXIMIZE THE REACH OF YOUR PUBLISHED WORK

D. Crotty, *Oxford University Press, New York, New York*

Part II of this 'How to Publish' symposium will include a 10 minute presentation on how to maximize the reach and impact of already published work. Presenters include David Crotty, Director of Journals Policy at Oxford University Press (OUP) and a representative from OUP Marketing. Researchers are under increasing pressure to demonstrate the impact of their work. While the best understanding of the impact of a published study comes from a thorough reading, university administrators and funding agencies rely heavily on numerical metrics for decision-making. This presentation will look at the needs that metrics serve and provide an overview of how the dominant metric, the Impact Factor, is determined (along with a discussion of the metric's flaws). The value of newer methodologies and alternative metrics (altmetrics) will also be discussed. The presentation will also cover practical steps for how researchers can increase the reach and potential impact of their work.

HOW TO PUBLISH: ROUNDTABLE DISCUSSIONS WITH JOURNAL EDITORS

N.J. Webster, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *Gerontological Society of America, Publications Committee, Ann Arbor, Michigan*

Part III of this 'How to Publish' symposium will include a 35 minute round table discussion session beginning with identification of participants available to facilitate discussions. Participants will include editors-in chief, deputy and/or, associate editors from the following journals: Journals of Gerontology-Series A: Medical Sciences; Journals of Gerontology-Series B: Psychological and Social Sciences; Innovations in Aging, The Gerontologist, Gerontology and Geriatrics Education, European Journal of Ageing, Journal of Aging and Social Policy, Research on Aging, and Journal of Applied Gerontology. Participants will provide journal specific information and answer questions related to podium presentation topics and others raised, e.g., writing strategies for specific journals, how editorial decisions are made, etc. Representatives from Oxford University Press will also be available to discuss in greater detail strategies for assessing and maximizing the impact of published work. Attendees will be encouraged to visit as many tables as they are able during this time.

SESSION 3533 (SYMPOSIUM)

UNDERSTANDING AND COMMUNICATING VACCINE TECHNOLOGIES

Discussant: L. Friedland, *GSK Vaccines*
J. Stoddard, *GSK Vaccines*

Understanding the science behind vaccine technology is critical to making informed decisions about which vaccines are appropriate for patients, as well as providing a confident recommendation. A better understanding of adjuvants is needed. This session will discuss the progression of vaccine technologies over the past century and tips for communicating about those technologies with patients. To enhance the audience understanding of the role and impact of new vaccine technologies, the symposium will include a case study on the efficacy, immunogenicity and safety of a novel adjuvanted investigational shingles vaccine in older adults.

SESSION 3535 (PAPER)

SUCCESS, AGING, AND QUALITY OF LIFE

PROMOTING ACTIVE AGEING AT THE LOCAL LEVEL: LEARNINGS FROM A CASE STUDY OF ITALY

A. Genova^{1,2}, L. Di Furia³, A. Zaidi^{4,5}, 1. *Economics, Society, Politics, University of Urbino Carlo Bo, Fossombrone, Italy*, 2. *Fondazione Giacomo Brodolini, Rome, Italy*, 3. *Regione Marche, Ancona, Italy*, 4. *University of Southampton, Southampton, United Kingdom*, 5. *London School of Economics, London, United Kingdom*

Population ageing is a global challenge but many of the policy responses required are best implemented at the local level. The European Commission provided an operationalised definition of active ageing, in developing the Active Ageing Index, in the research led by Asghar Zaidi, during the 2012 European Year of Active Ageing and Solidarity between Generations. The AAI work has spurred research and policy actions not just at the European level, but also at the national and the local level in many European countries. This paper provides a critical analysis of the potential and limitations of the AAI policy framework, by focusing on a local level case study for Italy, by analyzing the regional regulative frameworks and by taking on board the point of view of a large number of local stakeholders through a qualitative survey.

Italy is an example of a European country where the level and speed of population ageing is high. However, the policy responses at the national as well as at the local level have not been adequately developed. This paper shows that the active ageing policy has only recently been put on the agenda at the local level policy making, and severe regional differences persist with heterogeneous local modes of governance, a low attention to intergenerational solidarity approach and a missing life course perspective. Nevertheless, AAI framework offers crucial foundations to develop an innovative and integrated active ageing policy for the elderly, especially with an integrated policy response of the health, social and labour policy sector.

TESTING THE PATIENT-CENTERED MEDICAL HOME PLUS TRANSITIONAL CARE MODEL

M.D. Naylor^{1,4}, K.B. Hirschman^{1,4}, A. Hanlon^{1,4}, R. Barg², K. McCauley^{1,4}, E. Shaid^{1,4}, M. Pauly³, 1. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*, 2. *University of Pennsylvania Health System, Philadelphia, Pennsylvania*, 3. *Wharton School, University of Pennsylvania, Philadelphia, Pennsylvania*, 4. *NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania*

The Patient-Centered Medical Home (PCMH) and the Transitional Care Model (TCM) are among the few care management approaches that have targeted chronically ill adults and demonstrated improvements in multiple dimensions of patients' health, while decreasing costs. With the guidance a multi-stakeholder advisory group including nationally recognized experts and in collaboration with partnering primary care clinicians, a PCMH+TCM intervention was designed and pilot tested. 54 patients were enrolled in the PCMH+TCM group and 25 patients enrolled in the PCMH only group. Data on patient outcomes and resource use were collected at enrollment, 1-, 3-, 6- and 12-months. Propensity score weighted mixed effects and Cox proportional hazard models were used to compare the PCMH+TCM vs. PCMH only groups on outcomes. The PCMH+TCM group demonstrated improvements in emotional health (decreased depression) and quality of life over time when compared to the PCMH only group. For a subset of patients with hospitalizations in the 30 days prior to enrollment (N=36), the PCMH+TCM group (n=15) had a longer time to first rehospitalization than the PCMH only group (n=21). 25% of the PCMH+TCM group were rehospitalized by day 228 vs. day 27 for the PCMH only group. The hazard of being rehospitalized in the PCMH+TCM group was 40% lower than the PCMH only group. While the effect size was strong, small sample sizes influence the power to detect statistically significant differences. Findings from this pilot suggest that this co-management care model can improve patient reported outcomes and reduce costly resource use among at-risk, community-dwelling older adults.

ARE HEALTH PROFESSIONALS AGEIST? INSIGHTS FROM AUSTRALIAN SURVEY OF SOCIAL ATTITUDES

R. Hussain¹, H.L. Kendig¹, L. Cannon¹, K. O'Loughlin², 1. *Research School for Population Health, Australian National University, Canberra, Australian Capital Territory, Australia*, 2. *The University of Sydney, Sydney, New South Wales, Australia*

There is widespread belief and evidence from clinical practice that health professionals are implicitly and explicitly ageist in their dealings with older people. However, apart from hospital and health-systems reviews, there are few large-scale population-based studies that have explored this issue across age-cohorts. The data for this paper comes from two consecutive waves of the Australian Attitudes to Ageing (AAA) module of the Australian Survey of Social Attitudes (AuSSA), conducted in 2009–10 (n=1520) and replicated in 2015–16 (n=1211). AuSSA is a cross-sectional, nationally-representative postal survey of adults (>18 years).

In both survey waves, relatively few of the respondents across all age groups perceived that older people received worse treatment from healthcare professionals compared to younger people (18.6% in 2009–10 & 11.1% in 2015–16). With increasing age, a linear pattern was observed for perceptions of worse treatment within age-cohorts ($p < 0.01$) but gender was not a significant factor. A higher proportion of respondents with tertiary education perceived healthcare professionals treatment of older people to be worse compared to respondents with secondary-school education (45.5% vs 14.1%). Self-reported health status was not a statistically significant factor in the 2009–10 survey, but was significant in the 2015–16 survey with those with poor health reporting more ageist attitudes ($p < 0.05$).

Individuals having negative perceptions of ageist attitudes by healthcare professionals may not necessarily get poor quality medical care. However, as with any form of systematic and ongoing prejudice, the effects can be insidious both in relation to physical and mental health.

SESSION 3540 (SYMPOSIUM)

KEYNOTE: EMERGING ISSUES IN MOBILITY AND AGING

Chair: S.A. Studenski, *National Institute on Aging, Baltimore, Maryland*

Co-Chair: S. Lord, *Neuroscience Research Australia, Sydney, New South Wales, Australia*

Over the last decade and more, mobility has emerged as a fundamental indicator of health during aging, gaining attention from basic, clinical, social and health services researchers, as well as health care providers and systems. What is known, where are the most important gaps in knowledge, and what are the highest impact opportunities for future work?

MOBILITY AND AGING: FROM GEROSCIENCE TO HEALTH POLICY

S.A. Studenski, *Intramural Program, National Institute on Aging, Baltimore, Maryland*

From biosciences to social sciences, mobility is emerging as a core indicator of health and aging. In animal models, scientists studying the molecular underpinnings of aging have moved beyond longevity to assess “healthspan”, often based on mobility indicators. Human studies continue to elucidate the causes and consequences of dysmobility. In health care settings and in numerous clinical populations, mobility indicators are emerging as clinically useful predictors and outcomes. This presentation will highlight landmark contributions to the field and recent advances, then propose key gaps in knowledge and fruitful directions for the future.

CURRENT AND FUTURE APPROACHES TO EVALUATING AND TREATING AGE-RELATED MOBILITY PROBLEMS

S. Lord, *Neuroscience Research Australia, Sydney, New South Wales, Australia*

Recently gait assessments have moved beyond measures of velocity, stride length and cadence to include assessments of variability, smoothness and jerk. Ecological assessments

have also assessed voluntary and protective stepping, gait initiation and adaptability as well as every-day gait measured with freely worn sensors. Brain imaging and dual task studies have highlighted the important role of central processing in balance and mobility, and several studies have demonstrated depression is a key determinant of reduced mobility. This presentation will review the above work as well as key studies that have conducted interventions for improving mobility; systematic reviews of exercise components crucial for preventing falls and novel interventions such as voluntary and reactive step training and dance. Finally, the presentation will address possible future developments: continuous activity monitoring as part of telehealth services, automated activity programs, interventions for “inoculating” people against falls and pharmaceutical treatments for improving mobility in frail older people.

SESSION 3545 (SYMPOSIUM)

KEYNOTE: HEALTHY BRAIN AGING—A LIFESPAN PERSPECTIVE

Chair: D. Blazer, *Duke University Medical Center, Durham, North Carolina*

Co-Chair: K. Yaffe, *University of California, San Francisco*

Discussant: L. Fratiglioni, *Aging Research Center - Karolinska Institutet*

In this session we will focus upon factors throughout the lifespan which contribute to healthy brain aging. We begin with a discussion of early life influences upon later cognitive function. Next we focus upon cognitive aging, that usual progression of cognitive function through the life cycle. This discussion will rely upon and update the IOM report on cognitive aging released in 2015. We will focus specifically on those interventions in later life for which evidence exists which promote health brain aging. Finally we will focus upon dementing disorders, especially Alzheimer’s Disease. A common theme which will pervade all discussions will be those factors which can prevent or retard normal cognitive aging and the onset of dementing disorders

THE INFLUENCES OF EARLY LIFE RELATED FACTORS ON COGNITIVE DECLINE AND DEMENTIA RISK

L. Fratiglioni, *Karolinska Institute, Stockholm, Sweden*

Individual differences in cognitive decline and dementia risk have been explained by life-long differential exposure to contextual factors and their interactions with genetic susceptibility. Specifically, low education is associated with increased dementia risk. Few years of schooling could be a marker of different cognitive abilities but higher education could also help to build a cognitive reserve, which increases individual ability to cope with brain lesions later in life. Further, socioeconomic status in childhood is related to dementia development in late life. Poor-quality environment during childhood or adolescence may prevent the brain from reaching full levels of maturation leading to low cognitive reserve, which in turn leads to higher dementia risk. Using pooled data from three major population-based studies in Northern Europe, we found that higher education not only was related to a 50% reduced risk of dementia, but could

also strongly reduce the risk effect due to the genetic risk factor APOE ε4. Finally, early life factors may affect dementia risk indirectly by influencing adult- and late-life related factors, such as work complexity and life habits. In conclusion, there is an increasing evidence suggesting the first decades of life as a critical period for developing dementia later in life.

COGNITIVE AGING: THE EVIDENCE FOR SUCCESSFUL MEDICAL AND LIFESTYLE INTERVENTIONS

D. Blazer, *Psychiatry and Behavioral Sciences, Duke University Medical Center, Durham, North Carolina*

A plethora of studies have emerged in the literature to empirically test the effectiveness of medical and lifestyle interventions to promote healthy brain aging. Three interventions exhibit the most solid evidence for success: exercise, decreasing the risk of cardiac and cerebrovascular risk factors, such as lowering blood pressure and cholesterol, and carefully monitoring medications. Evidence for other interventions is less solid but promising, such as improving sleep quality and diet as well as actively engaging and social and intellectual pursuits. Many potential often thought promising interventions such as nootropic medications and computer based cognitive stimulation remain to be proven effective.

ALZHEIMER'S DISEASE AND OTHER DEMENTIAS: FACTORS WHICH MAY RETARD THEIR ONSET OR PROGRESSION

K. Yaffe, 1. *University of California San Francisco School of Medicine, San Francisco, California*, 2. *Veterans Administration Medical Center, San Francisco, California*

Interventions that delay the onset of dementia could have a considerable impact on caregiver burden and healthcare costs, and modifiable factors may play a pivotal role in effective prevention strategies. Numerous large, observational studies have demonstrated that cardiovascular and metabolic risk factors including hypertension, obesity, and diabetes are associated with increased dementia risk. Likewise, extensive data suggests that there may be multiple pathways linking physical and cognitive activity to decreased risk of dementia. Evidence is also evolving for risk factors like depression, sleep disturbances, and traumatic brain injury. Combined with recent trends documenting declines in the prevalence and incidence of dementia, observational studies and some trials suggest that modifiable risk factor reduction at the population-based level could considerably affect dementia prevalence. However, in order to further optimize the potential for efficacy, strategies which target multiple risk factors with a better understanding of cognitive aging across the life course are needed

SESSION 3547 (SYMPOSIUM)

KEYNOTE: JACK WATTERS MEMORIAL SYMPOSIUM: COMING OUT AS A CAREGIVER

Chair: Jane Barratt, *International Federation on Ageing, Toronto, Ontario, Canada*

The symposium, co-sponsored by The Geriatric Society of America and Pfizer, is held in memory of Jack T Watters, Vice President of External Medical Affairs at Pfizer Inc. who

died in 2015 at the young age of 63. His service to patients was evident in the various leadership roles he held around the globe over his 21 years at Pfizer. He was the draftsman of The Diflucan Partnership, which continues to bring an important Pfizer medicine to millions of patients afflicted with infectious disease, including HIV/AIDS. He spearheaded Pfizer's approach to healthy aging, establishing a center of excellence, serving on the board of organizations focused on this field, as well as being a tireless spokesperson on the topic in numerous international forums. He was an activist fostering positive change to enhance the lives of millions within the health arena and within areas of social justice, including LGBTQI rights.

Jack was a lover of numerous art forms ranging from the sublime, theater, opera, and ballet to the bawdy tradition of English panto. He was born in Scotland, and never lost the cultural gift of storytelling, one of the oldest art forms, aimed at stimulating the imagination while building a sense of community. In tribute to Jack, Dr Jane Barratt, Secretary General of the International Federation of Ageing, and four renowned leaders in the field of ageing will use storytelling to provide a cross-cultural perspective on Caring. The session will address caring in the context of gender, the LGBTQI community, conflict zones, low economy country perspectives and psychological factors.

SESSION 3550 (SYMPOSIUM)

KEYNOTE: LONGITUDINAL STUDIES ON AGING—FROM SCIENCE TO POLICY

Chair: R. Kenny, *Dublin, Co. Dublin, Ireland*

Healthy life expectancy, that is, years without disability or disease, does not match life expectancy. Aging itself is not a disease or disorder, and the aging process (biological, environmental and behavioural) may be modifiable. Certainly, many risk factors for age-related diseases are modifiable – if recognised at an early stage. Furthermore, aging, a heterogeneous concept, may be influenced by childhood events or lifelong factors. A better understanding of the mechanisms of aging processes, recognition of early biomarkers and solutions to improve quality of life and independent living will provide the end user (individual, clinician, society) with means to increase healthy life years, closing the gap between life span and healthy life span. Longitudinal studies on aging afford an opportunity to better understand mechanisms underpinning the aging process. These studies are multidimensional and as such afford an opportunity to explore many hypotheses underpinning the aging process, such as inflammation, genetic predisposition, childhood experiences, socioeconomic status, social engagement and the interactions between these factors. Demographic aging is a global phenomenon and informing and influencing policy and practice will vary enormously between different countries. In this symposium we will highlight new information on epigenetic factors which influence aging, the role of longitudinal studies for original research and policy and practice in developing nations and provide a case study of vascular senescence, implications for new technologies for blood pressure and heart rate measurement and impact of modifiable blood pressure behaviours on brain health and mobility.

HEALTHY AGING, THE GENOME OF ELDERLY INDIVIDUALS AND THEIR ENVIRONMENT—THE LEIDEN LONGEVITY STUDY

E. Slagboom, *Molecular Epidemiology, Leiden University Medical Centre, Leiden, Netherlands*

Despite the continuous increase in life expectancy in our societies, the diversity in health span is enormous (<http://ec.europa.eu/health/indicators>). Such heterogeneity can be observed at the level of metabolites and immune factors in blood and also in the genome, its regulation by epigenetic mechanisms and its expression. We investigate to what extent the heterogeneity in the rate and nature of physiological decline among elderly is driven by parameters of metabolic health that can be detected in the circulation, muscle and fat tissue. How can we include epigenetic, metabolomics and other omics data in studies of ageing and mortality and what do these marker sets add to more traditional markers of metabolism. The heterogeneity among elderly can be investigated in longitudinal and in intervention studies. Therefore we apply functional, metabolomic, epigenetic and gene expression measures in challenge tests, clinical and intervention studies. Metabolomics studies indicate which parameters associate to disease and lifespan in prospective studies on the one hand and metabolic improvement after interventions on the other. We also investigate how such biomarkers in the circulation relate to aspects of metabolic health measured in muscle tissue of the same individuals depending on the environment.

LASI: AN INNOVATION TO ADDRESS FUTURE HEALTH NEEDS OF INDIA

A.B. Dey, *Geriatric Medicine, All India Institute of Medical Sciences, New Delhi, India*

Transformation of an ancient country to a global economic power-house, has ushered in several changes in Indian society. Some of these include changes in family and care system; social cohesion; health and wellbeing; and above all living and aging. The number of older people in India will rise to over 300 million in 2050 and the proportion of 60+ will double from 10 to 20% in 25 years before that. Older Indians while living longer will also carry a large burden of chronic diseases and disabilities. Care of such a huge population with huge burden of disease, will be incrementally challenging for the health system. In tune with the national policy directives, the Longitudinal Aging Study in India is designed to periodically assess over 60,000 people over 45 years of age from across the country for next 25 years. LASI will examine every possible determinant of health and disease and will influence the health system structurally and functionally in future. LASI uses a rigorous instrument for assessment, which has been pilot tested in 1600 subjects for socio cultural appropriateness. In addition, LASI participants will be also be subjected to detailed assessment of other crucial geriatric health issues such cognitive impairment, visual disability etc. The health system after controlling fertility issues is struggling hard to address old communicable diseases and rising tide of non-communicable diseases. LASI will contribute to prepare the Indian health system to address the challenges of an aging population with huge burden of communicable and non-communicable diseases.

THE CHALLENGES OF BLOOD PRESSURE BEHAVIOR—LESSONS FROM TILDA

R. Kenny, *Trinity College Dublin, Dublin, Co. Dublin, Ireland*

Orthostatic Hypotension (OH) is defined as a drop in systolic and/or diastolic blood pressure triggered by standing upright. OH is more common with advancing years – present in 40% of community dwelling persons (TILDA) over 80 compared with 7% of 50 year olds. Supine hypertension is also more common with age (TILDA) and aggravates OH as do medications to treat hypertension, particular anti-hypertensive agents such as beta blockers. The duration of the BP drop relevant to brain health is controversial but failure to stabilise BP at 40s after stand is consistently relevant to mood and cognition, coupled with fear of falling, dizziness and injurious falls. In cross sectional and longitudinal data, OH is associated with impairment of global cognition, executive function, memory, attention and depression. The relationship and management of OH in the context of brain health is therefore complex and challenging and currently should be personalised to individual BP behaviours, symptoms and overall function. OH should be routinely assessed in MCI patients given that MCI patients with OH are more likely to convert to dementia and experience falls and injuries. Conversely, diagnostic and therapeutic approaches to OH should routinely take into consideration brain health.

SESSION 3555 (SYMPOSIUM)

KEYNOTE: SOCIAL INEQUALITY AND SOCIAL JUSTICE

Chair: J. Baars, *University for Humanistic Studies, Netherlands*

Discussant: D. Dannefer, *Case Western Reserve University, Cleveland, Ohio*

C. Phillipson, *The University of Manchester*

The session will begin with giving an overview of different dimensions of social inequality. The initial preoccupation with inequality *between* age groups and old-age poverty has been supplanted with a concern with inequality *within* age strata, and how it develops over the life course. Inequality of quality of life, health and resource characteristics all appear to increase with age and are greatest in later life, reflecting processes of cumulative dis/advantage. Next, this diagnosis is confronted with recent structures of regulation and support that have emerged following the demise of the welfare state, especially in the EU. It can be shown that these reinforce widening inequalities within the older population. In this way they are a significant part of the processes of cumulative advantage/disadvantage. In a third step, it will be argued that dominant discourses on social justice have not kept up with intra-cohort inequalities and still focus on inequalities between age groups or generations.

AGING, SOCIAL INEQUALITY, AND SOCIAL JUSTICE

J. Baars, *University for Humanistic Studies, Utrecht, Netherlands*

Concerns about Social Inequality and Social Justice in aging can arise from confrontations with old people who live in miserable poverty next to others of the same age who enjoy flourishing abundance. Apart from the need to support those in destitute circumstances questions arise about the ways in which such differences develop and whether they might be considered just or unjust. Answering these questions requires

going beyond generalizations such as generations, age groups and cohorts to identify processes of intra-cohort differentiation that tend to reproduce unequal life chances over subsequent cohorts. In terms of Social Justice it will be necessary to go beyond abstract declarations that people are 'born equally', 'age naturally' and 'choose freely'. Seen in a life span or life course perspective aging reminds us of the social nature of human life which should not be seen as its determination but as a precondition of its emergent autonomy.

THE INTERSECTION OF AGE AND INEQUALITY: ENDURING TENSIONS, EMERGING CHALLENGES

D. Dannefer, *Case Western Reserve University, Cleveland, Ohio*

As attention to the intersection of age and inequality grows among gerontologists, a number of key issues remain to be clarified and resolved, beginning with the definition of inequality and questions of assessment and evaluation. Beyond these basic issues, an increasing range of alternative explanations for the phenomenon of inequality have been proposed. This paper reviews some of the key issues currently in need of clarification. The initial preoccupation with inequality *between* age groups and old-age poverty has been supplanted with a concern with inequality *within* age strata, and its life-course development. Interest in intracohort inequality has been fueled by the recognition that inequality of QOL, health and resource characteristics tend to increase with age, reflecting processes of cumulative dis/advantage and the socioeconomic gradient. While the relevance of social policy and environmental conditions is recognized, increasing attention is being paid to individual resilience as a competing personological hypothesis.

DEVELOPING A POLITICAL ECONOMY OF AGEING: NEW APPROACHES TO SOCIAL JUSTICE AND INEQUALITY

C. Phillipson, *School of Social Sciences, The University of Manchester, Manchester, United Kingdom*

The political economy of ageing developed – during the 1970s and 1980s – in a context of crisis affecting western economies. A number of theoretical perspectives emerged during this period, these drawing on neo-marxist and related approaches. However, progress slowed during the 1990s with limited responses made to the new situation facing older people following the financial crash of 2007/2008. Nonetheless, current conditions have confirmed the need for a distinctive political economy of ageing, taking account of new types of inequality affecting the lives of older people. The paper will explore the basis for this change, one which incorporates a post-welfare state agenda and which is situated within a rigorous analysis of the consequences of neo-liberalism for the lives of older people. The discussion will highlight the tension between longevity and conditions of austerity, these transforming ageing into one of the unwanted risks, and hazards of contemporary life.

SESSION 3560 (POSTER)

AGE-FRIENDLY INITIATIVES AND ENVIRONMENTAL ISSUES

A STUDY ON DISASTER MANAGEMENT SERVICES FOR ELDERLY IN SOUTH KOREA

S. Lee, D. Kim, J. Kim, S. Choi, M. Kim, *Pusan National University Korea Disaster Welfare Agency Training Professionals, Busan, Korea (the Republic of)*

Old people are more subject to the impacts of emergencies and disasters because of their socio-economic and physical vulnerability. "Disaster Risk and Age Index" was released in June, 2016, which provides a country-by-country analysis of the disaster hazard faced by old populations in 190 countries based on three dimensions: exposure to hazard, vulnerability, and lack of coping capacity. According to the report, developed countries such as the United States and Japan have strong capacity and low vulnerability scores which help reduce the risk to older people despite high hazard exposure values. On the contrary, it reveals elderly in South Korea have weak capacity and high vulnerability scores despite comparatively low disaster risk.

Accordingly, this study aims to figure out the problems of disaster management services in South Korean elderly and discuss implications through the example of U.S. For this study, it may be useful to start out by understanding the concept of old people as a vulnerable population during disasters through preceding research. Next, the analysis on current disaster management services for elderly in South Korea will be conducted focusing on vulnerability and coping capacity as a framework. Finally, the study will take a look at an example of disaster management services for elderly in the U.S. to suggest implications and strategies for improvement.

PROVIDING INTERGENERATIONAL PROGRAMS AND SERVICES FOR QUALITY AGEING IN DIFFERENT LOCAL ENVIRONMENTS

K. Ramovs, A. Vujovic, *Anton Trstenjak Institute of Gerontology and Intergenerational Relations, Ljubljana, Slovenia*

In most European societies with ageing population, such as Slovenia, where 25.4% of people are older than 60 years, it is increasingly difficult to meet the needs of older people. In Slovenia most of the elderly live on relatively low pensions, which on average amount to around 612.54 EUR. They are emotionally and physically attached to their houses, which is understandable, since 93% of people in Slovenia are owners of their dwellings. That is why elderly people in Slovenia rely both on the help of their relatives and on the government and institutional forms of assistance.

The Institute has developed a successful model of synergy for quality aging between local administrations, non-governmental sector and households. A network of intergenerational programs is co-financed by Ministry of Labour, different Slovenian communities or institutions. The purpose of the network is provision of high-quality long-term care for the infirm elderly, prevention of social exclusion of elderly with programs for active and healthy aging, and systematic strengthening of solidarity between generations at all levels. The network comprises over twenty inter - connected programs. Programs are built using bottom up approach - a program of intergenerational volunteering, through which we trained over 3000 intergenerational volunteers is an example of such approach. At the same time the network also uses up bottom approach as well, especially through cooperation with Slovenian network of age-friendly cities and municipalities, which aims at disseminating

good practices and experiences together with the implementation of soft approaches for quality ageing and intergenerational relations.

ENVIRONMENT, VOLUNTEERING, AND LIFE SATISFACTION AMONG OLDER ADULTS IN SOUTH KOREA

Y. Wang¹, S. Park¹, S. Lee², 1. *School of Social Work, Washington University in St. Louis, Saint Louis, Missouri*, 2. *Dong Seoul College, Seoul, Korea (the Republic of)*

Drawing on the Person-in-Environment perspective, this study examined the role of physical and social environments on volunteering and well-being of older adults in Seoul, Korea. Using indicators identified by the World Health Organization's (WHO) Age Friendly City (AFC) framework, this study aims 1) to investigate effects of environments on volunteering and life satisfaction, and 2) to explore whether the effect of environments on life satisfaction was mediated by volunteering.

Data were obtained from a representative study: the 2011 Seoul City-wide Needs Assessment of Middle- and Old-aged Adults. A sample of 4,000 respondents subjectively rated the environment in which they are embedded. General Structural Equation Models (SEM) integrated environmental characteristics as latent variables. Volunteering and life satisfaction were included as observed variables. Path analysis was conducted to test mediating hypotheses.

Older adults living in environment with better "social participation" ($OR=1.09, p<0.000$) and "employment and civic engagement" ($OR=1.05, p=0.002$) characteristics were more likely to volunteer. Respondents reported higher level of life satisfaction if they lived in environments with better features of "respect and inclusion" ($b=3.18, p<0.000$), "communication and information" ($b=3.48, p<0.000$), "employment and civic engagement" ($b=0.72, p<0.000$), and "social participation" ($b=1.59, p<0.000$). No physical environment characteristic ("housing", "transportation", "outdoor space and buildings") was found significant. Mediation effect of volunteering was not found.

As an innovative attempt to use SEM for analyses of WHO AFC indicators in a non-Western context, our study provides empirical evidences for efforts to design age-friendly environments to increase older adults' civic participation, and ultimately improve their well-being.

THE SOCIAL CONSTRUCTION OF EMERGING ELDERLY: IMPLICATIONS FOR AGE-FRIENDLY COMMUNITY ASSESSMENTS

N. Fields¹, G. Adorno¹, B. Felderhoff¹, R. Parekh¹, K. Magruder², 1. *The University of Texas at Arlington, Arlington, Texas*, 2. *The Senior Source, Inc., Dallas, Texas*

The age-friendly movement to foster improved quality of life for older adults is expanding worldwide. Cities and communities across the world are examining what it means to be "age-friendly" by exploring the strengths and needs of their aging populations with respect to their unique environments. The term "emerging elders" has surfaced in age-friendly community assessment tools to denote a subset of older adults; however, limited guidance is provided in the lay or empirical literature on its application to aging populations. The goal of this study was to develop a data-driven definition for "emerging elders" as part of an age-friendly community assessment. Adults, age 55 and older, were asked about their subjective

IAGG 2017 World Congress

meaning of "emerging elder" within the context of aging well in a large U.S. metropolitan city. Using inductive and deductive methods, the researchers analyzed qualitative data ($N=38$) collected from individual interviews with homebound older adults ($n=15$) and participants of three focus groups ($n=23$). Four themes suggest that emerging elderhood is related to chronological age, functional ability, life transitions, and redefining aging. Findings suggest that the term emerging elderhood may foster negative images of older adults consistent with Western cultural discourse, despite the positive connotations associated with "emerging elder" in indigenous and spiritual communities. We conclude with a call to action underscoring the need to further refine age friendly community assessments that take into account the cultural and social constructions ascribed to older adults and recommend strategies to engage emerging elders in future research of age-friendly communities.

GENDER DIFFERENCES IN THE EFFECTS OF ENVIRONMENT AND ACTIVITY PARTICIPATION ON LTC RESIDENTS' MORALE

S. Chao, *Department of Social Work, National Taiwan University, Taipei, Taiwan*

This study examined gender differences in the effects of facility-level objective environment, resident-level subjective environment, and activity participation on older residents' morale in LTC settings. This investigation included a nationally representative sample comprised 634 adults aged 60 years or older from 155 institutions in Taiwan. Random effects modeling was used to analyze the multilevel data. The analytical results found:

1. Perceived relationship with staff was the most prominent environmental determinant of morale for both males and females.

2. The presence of public kitchens and birthday party frequency was associated with males' morale.

3. Having electronic message chairs, outdoor chairs and gardens, and full time social workers was related to females' morale.

4. Engagement in leisure activities within institutions was more beneficial to males' morale, while participation in interpersonal interaction activities yielded a greater association with females' morale than other activities.

Even residing in the same facility, the experiences and needs may differ between older males and females. Making LTC objective environment becomes more "home-like" can be particularly helpful for male residents' morale. Public spaces and amenities that can promote interpersonal interactions can be especially advantageous for females. The relationship with staff is the key to boost both males and females' morale. More efforts would be needed to foster positive interactions and mutual understanding between staff and residents. Also, activities should be designed with a consideration of cultural norms about gender roles in order to maximize the benefits of activity participation to residents of different genders.

AGE-FRIENDLY COMMUNITIES AND SOCIAL ENGAGEMENT: AN EXPLORATION OF CHINESE ELDERLY

L. Xie¹, X. Wang², 1. *Department of Social Work, Chinese University of Hong Kong, Hong Kong, China*, 2. *Renmin University of China, Beijing, China*

Social engagement is an important component in later life. While an extensive body of studies in China has focused on the factors that influence social engagement in older adults at the individual level, this study aims to explore the impacts of the community environment.

A sample of 8049 adults aged 60 and above was obtained from the China's Urban and Rural Older Population Study, conducted by the China Aging Research Center in urban areas in 2010. Social engagement consisted of volunteering, paid work, life-long learning, physical activities and leisure activities. Livability of the community was measured by older people's perceptions of living facilities, outdoor spaces, housing, social environment, institutions, and health services in the community. Structural equation modeling was applied to explore associations between livability of the community and social engagement while controlling for social demographic characteristics.

According to the results, except for paid work, older people who perceive a higher degree of livability of their community are more likely to participate in volunteering-related, learning, physical, and leisure activities. In addition, disadvantaged older people demand more support from the community compared to older people in better economic conditions and older people who have higher education.

Findings indicate that building livable communities might be a practical and effective way to encourage diverse older people's social engagement.

THE POLICY ACTION PLAN FOR MAKING AGE-FRIENDLY COMMUNITY IN JEJU, SOUTH KOREA

S. Lee, S. Koh, *Jeju Development Institute, Jeju City, Korea (the Republic of)*

The purpose of this study is to develop policy action plans that Jeju Island needs to promote consistently to join the World Health Organization (after WHO) Global Network of Age-Friendly Cities and Communities. Jeju is a largest island across the country, and a province with self-governing system. Also it is well known as an island of longevity. Moreover Jeju is ageing rapidly compared to the rest regions of the country being forecasted to be aged-society soon. In order to cope with the various problems associated with population ageing, it is urgent for Jeju to develop various policy options. Jeju local government has been preparing for joining a member of WHO Global Network Age-Friendly City and Community as one of the ways to confront population ageing in Jeju. To meet the research goals, the researchers have reviewed previous researches and statistical analysis from the central government or other institutes. Also current situations and issues Jeju elderly citizens facing such as physical environment, employment, social participation, and so on were analyzed. We have suggested some significant policy implications based on policy action plans coming from the research outcomes.

AN AGE-FRIENDLY PROJECT ON SOCIAL ISOLATION AND LONELINESS: LESSONS FROM TORONTO'S CHINESE COMMUNITY

M.A. Syed¹, L. McDonald¹, R.M. Mirza¹, C. Smirle¹, K. Lau¹, E. Relyea¹, A. Austen³, S. Hitzig^{2,1}, 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *Sunnybrook Health Sciences Centre, Toronto, Ontario, Canada*, 3. *City of Toronto, Toronto, Ontario, Canada*

The World Health Organization's (WHO) age-friendly cities (AFC) framework is a global movement to promote healthy and active aging in localized contexts. This study provides results from a local AFC initiative addressing social isolation and loneliness in Chinese older adults in Toronto, Canada. A multi-phase methodology using survey and secondary data analysis methods was adopted. First, a scoping review of peer-reviewed and grey literature was conducted to triangulate survey findings. The review included 19 studies indicating a lack of social support as the main risk-factor to feeling isolated and lonely in this population. Second, telephone surveys were conducted in Cantonese, Mandarin and English with Chinese older adults (n=100) living in a local Chinatown neighbourhood. Survey questions addressed issues of social and community connectedness and uptake of community services. 80% of respondents reported easy access and use of services in their neighbourhood. However, moderate levels of social connectedness outside the household were also reported with the greatest percentage of participants (40%) reporting that they had not participated in a social activity with others in the past year. Living arrangements may influence these outcomes as evidenced by the majority of the sample living with a spouse (55%) or living alone (40%). Findings from this study can assist in addressing global social challenges of aging such as social isolation and loneliness in ethnically-diverse older adult populations. Interventions such as multi-lingual services and activities promoting positive social networks among older adults can be beneficial strategies for address this social issue in urban neighbourhoods.

COMMUNITIES AND DEPRESSION AMONG COMMUNITY-DWELLING OLDER ADULTS IN CHINA: A MULTILEVEL PERSPECTIVE

Y. Wang¹, Y. Chen¹, H. Shen², N.L. Morrow-Howell¹, 1. *School of Social Work, Washington University in St. Louis, Saint Louis, Missouri*, 2. *University of Missouri-St. Louis, Saint Louis, Missouri*

Individual characteristics are identified to be associated with depression in old age; yet little is known about the influence of community characteristics on depression. Further, most research that investigates the relationships between community features and depression was conducted in western societies utilizing cross-sectional data. Guided by Pearlin's Stress Process Model and included community features as stressors, this study examines the effects of community characteristics on depressive symptoms among older community-dwelling Chinese. Using nationally representative data from 2011 and 2013 China Health and Retirement Longitudinal Study, 6,548 older adults (60+) residing in 447 communities in 2011 and followed up in 2013 were included. Predictors (individual and community characteristics) were drawn from 2011 baseline; and outcome (CES-D) was extracted from 2013 wave. Multilevel modeling results showed that after controlling for baseline depressive symptoms, on the individual level, depressive symptoms decreased with higher levels of education, greater economic security, and better health status. On the community level, depressive symptoms decreased when physical environment (more number of days when roads were passable, closer to bus stop, and having a sewer system) and social environment (having outdoor exercising facilities, and having health center within the community) improved. This study shows the role the community may play in reducing depressive symptoms in

later life. Community organizers and policy makers are encouraged to ameliorate community environment to improve mental health among older adults in China. Future research is encouraged to identify other community characteristics that may be influential to mental well-being of older Chinese.

THE EVOLVING ROLE OF SENIOR CENTERS IN AN ERA OF THE AGE-FRIENDLY COMMUNITY MOVEMENT

C. Coyle, C. Somerville, C. Wickersham, J.E. Mutchler, *University of Massachusetts Boston, Boston, Massachusetts*

Senior centers across the nation continue to serve as important access and focal points for older adults to voice their desires, meet their independent living needs, and to engage in opportunities that support many of the key concepts to Age-Friendliness (i.e., social participation, respect and social inclusion, civic engagement, transportation and community supports and health services). Senior Centers are the front line of aging services and thus in a position to implement programs and raise public awareness about such initiatives. The purpose of this presentation is to present and discuss challenges, opportunities and outcomes of senior center involvement in Age Friendly activities. Data from three towns were pooled to conduct descriptive analysis of resident users (n=740) and nonusers (n=2,560) of senior center services. Compared to residents that do not report using the senior center, resident users are mostly female, have lived in the community for a longer duration and live alone at higher rates. This cross-sectional analysis also shows that users of senior centers have higher rates of self-reported fair or poor physical health compared to those residents who do not use the senior center (10.7% v. 17.5%); and those who use the senior center have higher rates of self-reported fair or poor emotional health (5.0% v. 7.7%). This presentation will discuss how these results support strategies by which senior centers support some of the most vulnerable members of an aging community; but also how they can emerge as leaders in the development of age friendly communities.

SELF-ESTIMATED LIFE EXPECTANCY COMPARISON BETWEEN DAMAGED AND UNDATED HOUSEHOLDS IN DISASTER

H. Mi, X. Lin, *Zhejiang University, Hangzhou, Zhejiang, China*

There is an old saying in Chinese, 'fortune is given to those who survive from big disasters'. This research is trying to test if people's expectation for the future life is influenced by their losses in disaster. Since Chinese people believe longevity is a blessing, this research use self-estimated life expectancy as an instrumental variable of that.

Data used in this research is from a 5 year-retrospective questionnaire survey of 493 middle-aged and elderly residents, took place in Baoji City, Shaanxi province of western China. Baoji is a city of heavy industry and moderately developing economy, located right between Xi'an and Wenchuan. The 2008 Wenchuan big earthquake, whose magnitude was 8.0 and caused 87150 deaths and missing, was a miserable memory for all Chinese people. After that, debate about state catastrophe insurance has been heated. This research is mean to examine how people estimate their life expectancy after such a huge disaster, and will their self-estimation differs according

to their loss. This research also tries to offer useful suggestions for establishing Chinese state catastrophe insurance.

Based on the data and the assumptions made before, with the implication of cross analysis and logistic regression, this research comes to following conclusions:

1. Suffering from a disaster without property loss do lead to a positive self-estimation.
2. The female and the old is more negative in self estimation, because women and the elderly are often more vulnerable.
3. A rise in annual income and children number lead to a positive self-estimation.

IDENTIFICATION AND IMPROVEMENT ON ORGANIZATIONAL WEAKNESSES IN AGE-FRIENDLY HEALTH CARE IN TAIWAN

S. Chiou^{1,2}, Y. Hu³, 1. *Taoyuan General Hospital, Ministry of Health & Welfare, Taoyuan, Taiwan*, 2. *School of Medicine, National Yang-Ming University, Taipei, Taiwan*, 3. *health promotion administration, Taipei, Taiwan*

To promote active aging in and by health service organizations, Taiwan developed "the framework of age-friendly health care" and applied it for voluntary recognition to help hospitals and health services identify their weaknesses, develop action plan, and continuously improve their quality of care to promote active aging.

This framework contains 4 standards (i.e. management policy, communication and services, care processes, physical environment), 11 sub-standards and 60 measurable elements. After pilot-testing and validation, it was used for recognition of "age-friendly hospitals and health services". The results of earliest applicants were analyzed and compared with those of 2014.

There were 20 and 41 applicants in 2011 and 2014, respectively. In 2011, weakness was identified on 6 elements with average score lower than 80 against the full score of 100, including IT support for implementation and evaluation of the age-friendly policy, staffing in geriatric care, basic training for all staff, training in core competence for clinical staff, existence of quality assessment program, and existence of guidelines on multidisciplinary comprehensive geriatric assessment and interventions on high-risk seniors. These became the targets of improvement in training and communication, and further guidance on these elements was developed, too. Assessments done on 2014 applicants showed that all 6 elements had statistically significant higher average scores than those of 2011.

Our study found that the recognition of "age-friendly hospitals and health services" helped identify shared weaknesses among participating organizations and has achieved significant improvements on late participants.

DELIVERING AGEING IN PLACE IN THE HIGH DISASTER RISK COMMUNITIES IN TAINAN CITY AND HONG KONG

C. Tzuyuan¹, Y. Sun², H. Huang¹, 1. *National Cheng Kung University, Tainan, Taiwan*, 2. *The Chinese University of Hong Kong, Hong Kong, China*

Delivering ageing-in-place in the high disaster risk communities- a comparative study of Tainan City and Hong Kong

Since the population ageing trend has increased rapidly in the beginning of 21st Century, “ageing in place” become a core concept in most ageing related policies. Among all the issues regarding population ageing, high vulnerability from natural disasters would be the most challenging. With the increasing casualty reports of older residents at high-disaster-risk areas, urgent responses to this increasing threats to enhance the survival chances of older people under disasters are needed. Latest World Cities Risk (2015–2025) report by the Cambridge Centre for Risk Studies in 2015 has pointed out that Taipei City is ranked as top one city with high exposure to natural disaster hazards in the world in the next decade. Hong Kong, whereas, is also identified with significant vulnerability by the threat of human pandemic under disaster strikes. (Cambridge Centre for Risk Studies, 2015) According to the past survey, urban or rural, most elderly population in the community are not only with very little knowledge of disaster risk reduction but also lack of interests in learning such information. (Chao & Huang, 2016) Hence, this paper argues that it is necessary to develop a bottom-up Disaster Risk Reduction (DRR) strategy that involves older adults from the beginning of planning process. In this paper, we explore the possibility of creating a comprehensive community disaster risk reduction (DRR) system by incorporating the idea “ageing-in-place” and “active ageing” through literature review and questionnaire survey of older adults in both Taiwan and Hong Kong. We expect to identify the key factors of the gap between disaster perceptions of older people and DRR policy design and further suggest an ageing-active DRR strategy in both cities.

A COMPARATIVE STUDY ON THE ACKNOWLEDGMENT OF DISASTERS BY ELDERLY LIVING STATUS

Y. Choi, S. Choi, H. Kim, S. Kweon, *Busan National University, Busan, Korea (the Republic of)*

Design

Due to some kinds of natural disasters caused by the recent change in climate, such as, heat waves and cold waves, etc., the damages are being expanded centered on the elderly class. In case of the elderly, it can be said that the levels of their exposure to a safety accident are higher than those of the other age classes due to their psychological and social vulnerabilities as well as their physical one. Accordingly, various kinds of programs, such as, Disaster Response Manuals and Disaster Helpers, etc., are being disseminated. However, this study was started under the assumption that the damage levels might be different depending on the actual acknowledgment levels of disasters by the elderly and the levels of their preparedness. Especially, it is intended to conduct a comparative analysis of what kinds of differences are made depending on the environments of the houses that the elderly live.

It is considered that this study has its meaning as an exploratory study in the aspect that a comparative survey has not been conducted regarding to the special situation so called a disaster even though the importance of the living space is very important for the elderly.

Method

Busan Metropolitan City entered into the aged society quickly the most among the Special City and all of the Metropolitan Cities. Accordingly, the survey targets are the elderly who live at the welfare facilities and at their homes

located in Busan. And the survey will be conducted regarding to the acknowledgment levels of disasters by the elderly and the levels of their preparedness. The collected data shall be used for conducting a regression analysis using SPSS 22.0 in order to find out what kinds of effects are influenced on the acknowledgment levels and the disaster preparedness of the elderly who live in the welfare facilities and at their homes.

SESSION 3565 (POSTER)

ASSESSMENT I

FAMILY FUNCTIONALITY IN COMMUNITY ELDERLY

L. Rodrigues, D.M. Tavares, N.F. Molina, T. Silveira, S.E. da Silva, *Nursing in Education and Community Health, Universidade Federal do Triângulo Mineiro - UFTM, Uberaba, Minas Gerais, Brazil*

This work analyzed the influence of socio-demographic, economic and health variables, as well as functional capacity about family functionality. It was a cross-sectional quantitative study of 637 elderly living in Uberaba, MG, using Mini-Mental State Examination, structured questionnaire with socio-demographic, economic and health information, Katz Index, Lawton and Brody Scale and family APGAR. Analysis was conducted using the tests: t Test, Pearson's and Spearman's correlation and multiple linear regression model ($p < 0.05$). Highly functional families prevalence (87.8%) was found, with severe dysfunction (6.4%) and moderate dysfunction (5.8%).

Factors associated to family functionality were: health perception ($p < 0.001$), age ($p = 0.003$), falls ($p = 0.004$) depression ($p = 0.007$). Higher family functionality was associated to better health perception and older age to depression and falls. Detection of factors generating family dysfunction provides health professionals with action planning directed towards the prevention or re-establishment of the balance of the intra-family bonds, promoting the well-being of elderly and their family.

SARCOPENIA PREVALENCE ACCORDING TO DIFFERENT MUSCLE MASS ASSESSMENT METHODS IN DWELLING ELDERLY

C.H. Schwanke¹, K.M. Margutti², A.R. Costodio², N.J. Schuch², M. Daroncho², *1. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, RS, Brazil, 2. Centro Universitário Franciscano, Santa Maria, RS, Brazil*

Introduction: The European Working Group on sarcopenia in Older People proposes different methods to diagnose sarcopenia. In this context, this study aimed to determine the prevalence of sarcopenia, using different methods for assessing muscle mass.

Methods: Cross-sectional study with 404 elderly subjects (60 years old or more) who participate in social groups in Santa Maria/Brazil. Muscle mass was assessed by three different methods [method 1 (Lee equation, improper $\leq 8.90 \text{ kg/m}^2$ for men and $\leq 6.37 \text{ kg/m}^2$ for women); method 2 (bio impedance, inadequate $\leq 8.87 \text{ kg/m}^2$ for men and $\leq 6.42 \text{ kg/m}^2$ for women); and method 3 (calf circumference, inadequate $< 31 \text{ cm}$)]. We considered inadequate hand grip strength (HGS) $< 30 \text{ kg/f}$ for men and $< 20 \text{ kg/f}$ for women, and physical performance

(assessed by Gait Speed - GS) $\leq 0,8\text{m/s}$. We considered sarcopenic individuals who had low muscle mass associated with low physical performance or reduced strength. Three diagnostic criteria were established: criterion 1 (method 1 + HGS + GS), criterion 2 (method 2 + HGS+ GS) and Criterion 3 (method 3 + HGS+ GS). Data were analyzed through the SPSS® 22.0.

Results: The mean age was 70.23 ± 6.40 years. The sarcopenia prevalence by criterion 1 was 11.6% and 10.2% in women and men respectively ($P = 0.923$), 27.9% and 55.9% ($P = 0.000$) by criterion 2, and 1.2% and 1.7% ($P = 1.000$) by criterion 3.

Conclusion: The prevalence of sarcopenia differs among the methods of muscle mass assessment and calf circumference underestimated its prevalence.

EASYCARE STANDARD INSTRUMENT FOR EARLY DETECTION OF GERIATRIC SYNDROMES IN THE VERY OLD

A. Haldar, A.B. Dey, P. Chatterjee, A. Chakrawarty,
GERIATRIC MEDICINE, ALL INDIA INSTITUTE OF MEDICAL SCIENCES(AIIMS), NEW DELHI, DELHI, India

In a country with a large ageing population and a health system of debatable efficiency, accessing and receiving health care in twilight years is not an easy proposition. Chronic disease, functional impairment, cognitive decline, lack of social and health security; and declining traditional support system render the “older” segment of the population extremely vulnerable. With very little orientation in old age care, health professionals do not have capacity to resolve complex geriatric syndromes in busy outpatient clinics. We assessed the ability of EASYCare in assessment of vulnerable older clients in outpatient department in detecting geriatric syndromes vis-à-vis comprehensive geriatric assessment. In this cross sectional study persons aged 65 years or more seeking care from Outpatient Department(OPD) of Geriatric Medicine service of All India Institute of Medical Sciences Hospital in India were included.600 consenting participants were assessed with the EASYCare Standard 2010 instrument, which was self-administered with the help of a trained Medical Social Worker. This was followed by independent comprehensive assessment by a geriatrician which specifically included of Hindi Mental State Examination (HMSE), Geriatric Depression Scale (GDS), International Consultation on Incontinence Questionnaire (ICIQ), and fall questionnaire. Four geriatric syndromes, namely, cognitive impairment, depression, falls and urinary incontinence were used as index syndromes for this study. The mean age of the participants was 71 years with a significant male predominance (70%).One or more geriatric syndromes were present in 77% of the individuals with 2% having all four geriatric syndromes and 42% having two or more geriatric syndromes. Based on EASYCare assessment, cognitive impairment was the most common geriatric syndrome (62%),followed by depression (36%), falls (24%), and urinary incontinence (14%).The prevalence of incontinence and cognitive impairment showed significant association with increasing age $\{(p<0.05), (p=0.01)\}$.EASYCare assessment data showed a concordance of 98%,70%,and 40% with CGA assessment for incontinence, depression, cognitive impairment respectively EASYCare could detect very relevant geriatric syndromes in

older patients in an OPD setting in a time and cost efficient manner.

THE ESTABLISHMENT OF COMPREHENSIVE EVALUATION PERIOPERATIVE EVALUATION SYSTEM AMONG ELDERLY PATIENTS

B. Dong, A. Yang, Q. Hao, *West China Hospital, Sichuan University, Chengdu, Sichuan, China*

Background: The rate of postoperative complication in older patients is significantly higher than younger patients. However, there is no standard, effective perioperative evaluation strategy which is particularly developed for older adults in China. Thus, this study was conducted to develop a perioperative assessment system for the elderly according to several guidelines and the national condition in China, evaluate its feasibility and reliability. **Methods:** According to the Best Practices Guidelines: Optimal Preoperative Assessment of the Geriatric Surgical Patient established by the American College of Surgeons (ACS) and the American Geriatrics Society (AGS), the suggestion of geriatrician, psychiatrist, statistician and neurology expert and national condition in China, we developed a perioperative assessment system for the elderly in China. According to the data of preliminary study, we evaluated the quality of the perioperative assessment system, including feasibility and reliability. **Results:** The content of our perioperative assessment system, including cognitive function, depression, function status, swallowing function, nutritional status, medication, pain, sleep, delirium, frailty, vision and hearing. Feasibility : Both of the acceptance rates were 100%, the completion rates were 97.3% and 100% respectively. The mean time to finish the assessment was 12.64 ± 1.89 minutes. Reliability : The test-retest coefficients of each result of assessment for risk factor were all higher than 0.9 except for the “Frailty” which test-retest coefficient was 0.895. **Conclusion:** The perioperative assessment strategy has been proved to have good feasibility and reliability, and therefore offers a valid tool to evaluate perioperative risk factors for poor surgical outcomes in Chinese elderly.

AGE-RELATED DIFFERENCE IN PERFORMANCE OF A COMPLEX ACTIVITY IN A REAL VERSUS SIMULATED SHOPPING MALL

R. Kizony^{1,2}, I. Baum-Cohen³, P.L. Weiss², G. Zeilig^{3,4}, M. Bondi³, M. Kafri², 1. *Center of Advanced Technologies in Rehabilitation, Sheba Medical Center, Tel Hashomer, Israel*, 2. *University of Haifa, Haifa, Israel, Israel*, 3. *Sheba Medical Center, Tel Hashomer, Israel*, 4. *Tel Aviv University, Tel Aviv, Israel*

Age-related decline in physiological, physical and cognitive functions may interfere with task performance in complex life situations. This study aims to compare the performance of young and older adults during real and simulated complex daily shopping activities considering physiological, motor and cognitive performance. Fifteen adults aged 25.80 ± 4.25 years and 16 older adults aged 72.12 ± 5.58 years were tested in real and simulated shopping malls. Participants performed the Multiple Errands Test (MET) that assesses executive functions during a complex daily task in the real mall. They performed the Virtual MET (VMET) in the simulation while walking on a self-paced

treadmill and navigating with a joystick. Gait parameters and Metabolic Equivalents were recorded. The elderly participants performed the MET (4.56 ± 2.12) significantly worse than the younger participants (2.33 ± 1.75 , $U = 51.00$, $p < 0.01$). They also performed the VMET (5.00 ± 2.94) significantly worse than the younger (2.64 ± 2.34 , $U = 45.50$, $p < 0.03$). No significant between groups differences were found in gait speed in either setting. For the elderly group, strong significant correlations were found between the MET and VMET scores ($r_s = 0.88$, $P < 0.01$) and execution times ($r_s = 0.65$, $P < 0.02$). The Metabolic Equivalents indicated a low energy cost for the activity with no differences between the groups or settings. These results highlight the differences in performance patterns of daily tasks between young and older adults. Additionally, the similarities of performance of real and virtual complex tasks in the elderly support the clinical use of realistic virtual environments for assessment and treatment of age-related functional decline.

ONE- AND THREE-YEAR HOSPITALIZATION RATES AMONG HIGH FRACTURE RISK ADULTS USING THE SFM-3

D.J. Van Dussen¹, A.J. Plant¹, A. Weaver¹, C.P. Recknor², J.C. Recknor², 1. *Youngstown State University, Youngstown, Ohio*, 2. *United Osteoporosis Centers, Gainesville, Georgia*

The current paper examines the one and three year hospitalization using the Safe Functional Motion Test 3 (SFM-3) clinical assessment tool. The SFM-3 is a quantitative assessment of habitual motion designed and validated on high fracture risk adults. The risk of hospitalization among adults is a significant health and health financing concern. The SFM-3 is designed to be a five minute test to predict fracture and hospitalization risk. The current sample is drawn from 1700 patients from the southeastern United States who are clinically deemed as high risk for fractures (mean 74.7 years; $SD \pm 22.2$). Of this sample 8.2% were hospitalized at least once during the 36 month study. After accounting for age, gender, and prior hospitalization, logistic regression analyses indicated that the SFM-3 significantly predicted hospitalization at one year (OR 1.206 CI 1.114, 1.307; $P > .0001$) and three year follow up (OR 1.222 CI 1.134, 1.317; $P > .0001$). For every 10 point decrease in the SFM-3 score, the risk of hospitalization within one year increased by 20%. At the three yr. followup, this risk was increased to 22% for each 10 point decrease in SFM score. The SFM-3 is a parsimonious and strong predictor of hospitalization among high fracture risk adults and can be used in a clinical setting to identify high risk adults for hospitalization

SARCOPENIA IS ASSOCIATED WITH PHYSICAL AND MENTAL COMPONENTS OF QUALITY OF LIFE IN OLDER ADULTS

B. Manrique-Espinoza¹, A. Salinas¹, J. Avila-Funes², L. Gutierrez-Robledo³, 1. *Statistics, National Institute of Public Health, Cuernavaca, Morelos, Mexico*, 2. *National Institute of Medical Sciences and Nutrition, Ciudad de Mexico, Ciudad de Mexico, Mexico*, 3. *National Institute of Geriatrics, Ciudad de Mexico, Mexico*

Currently, sarcopenia is considered a geriatric syndrome of growing importance in the world. Prevalence of this syndrome is highly variable, with range 5% to 13%, in older adults aged 60–70 years; and 11% to 50% in people aged

80 and plus. Evidence suggests that sarcopenia is associated with poor health-related outcomes, such as physical limitation, disability and mortality. The aim of this study was to determine the association between sarcopenia and health-related quality of life (HRQoL) in a sample of rural older Mexican adults. Cross-sectional study conducted in 2013 in Mexican rural settings with 668 older Mexican adults. Health-related quality of life was measured using the Medical Outcomes Study 36-item Short Form Healthy Survey questionnaire (SF-36). Sarcopenia was defined according to the three dimensions suggested by the European Working Group on Sarcopenia in Older People. Multivariate linear regression models were used to estimate the association between sarcopenia and quality of life. Prevalence of Sarcopenia was 35.9% (14.8% and 21.2% for severe and moderate sarcopenia, respectively). Severe sarcopenia status was associated with worse scores in both, physical ($b = -8.28$; $P = 0.001$) and mental components ($b = -4.86$; $P = 0.041$) of the SF-36. Our study shows that sarcopenia is associated with HRQoL, in both components, physical and mental. This finding highlights the importance of identify sarcopenic individuals even in the primary care units, since this is not part of a routine diagnostic in Mexico. This fact is even more important due to the adverse implications of sarcopenia on quality of life of older adults.

DEVELOPING AN INSTRUMENT TO SELECTING APPROPRIATE PATIENTS FOR POST-ACUTE CARE IN TAIWAN

L. Peng^{1,2}, L. Chen^{2,1}, 1. *Taipei Veterans General Hospital, Taipei, Taiwan*, 2. *National Yang Ming University, Taipei, Taiwan*

Aim: To develop a prediction model to select appropriate patients for post-acute care (PAC) services to regain functional independence

Methods: Data of Taiwan Veteran Affairs PAC services from January of 2014 to June 30 of 2016 were retrieved for study. Data from January to December of 2014 were defined as the developmental cohort, and patients regained Barthel Index of >80 was considered as functional independence. Independent risk factors for failure of achieving functional independence were identified and a prediction model was developed based on the results. Data from January of 2015 to June of 2016 were used as the validation cohort to evaluate the effectiveness of the prediction model.

Results: Overall, data of 622 patients were classified in the developmental cohort with the mean age of 85.5 ± 38.9 years and baseline Barthel Index <40 , MMSE <24 and Braden scale <19 were independent risk predictive factors for failure of regaining functional independence. Using the beta coefficient of the regression model, a prediction model was developed (Barthel Index <20 : 2 points, MMSE <24 : 2 points and Braden Scale <19 : 1 point) with the cutoff of 2 points. In the validation cohort, using the 2 points of the prediction model as the cutoff can successfully predict the failure of regaining functional independence (area under curve: 0.894, positive predictive value was 90.5%).

Conclusions: A prediction model composed of physical disability, cognitive impairment and risk of pressure sore effectively predicted the failure of regaining functional independence for patients receiving PAC in Taiwan.

SELF-RATED HEALTH PREDICTS MORTALITY IN OLDER AFRO-CARIBBEANS HOSPITALIZED VIA THE EMERGENCY DEPARTMENT

L. Godaert¹, L. Allard Saint-Albin¹, C. Godard-Sebillotte², J. Fanon¹, M. Drame^{3,4}, 1. *Geriatry, University Hospital of Martinique, Fort-de-France CEDEX, Martinique*, 2. *Mc Gill University, Montreal, Quebec, Canada*, 3. *Faculty of Medicine, EA3797, University of Reims Champagne-Ardenne, Reims, France*, 4. *University Hospital of Reims, Reims, France*

The aim of this study is to determine whether self-rated health (SRH) is an independent prognostic factor for mid- and long-term mortality in older Afro-Caribbean patients hospitalized for an acute condition.

This study was a prospective cohort that recruited patients from the University Hospitals of Martinique Acute Care for Elders (ACE) unit (French West Indies) from January to June 2012. Patients aged 75 or older and hospitalized for an acute condition were eligible. The primary outcome was time to death within the 36-week follow-up. SRH was the explanatory variable of interest. Demographic and clinical characteristics were recorded. Cox's Proportional Hazards model was used to estimate the relationship between SRH and mortality.

In total, 223 patients were included; average age 85.1 ± 5.5 years, mainly women (61.4%). In total, 123 patients reported "very good to good" health, and 100 "medium to very poor" health. Crude mortality rates at six months, 1, 2 and 3 years were 30.5%, 34.8%, 48.4%, and 57.0%, respectively. SRH reached significant relationship for all mortality endpoints, after adjustment for baseline demographic and clinical characteristics. The adjusted hazard ratios for subjects who perceived their health as medium, poor or very poor was 1.6 to 2.7 times greater than that of subjects who reported good or very good health.

In conclusion, the association between self-rated health and mid- to long-term mortality in elderly subjects could have implications for clinical practice, particularly in helping practitioners to better estimate prognosis in the acute care setting.

ADAPTATION OF THE BRITISH SIGN LANGUAGE COGNITIVE SCREENING TEST IN QUÉBEC SIGN LANGUAGE

S. Luna^{1,2}, S. Joubert^{1,2}, J. Gagné^{1,2}, 1. *Université de Montréal, Montréal, Québec, Canada*, 2. *Centre de recherche de l'Institut universitaire de Geriatrie de Montréal, Montréal, Québec, Canada*

Using standardized tests such as the Mini Mental State Examination (Folstein *et al.*, 1975) to assess cognition of deaf persons using sign language lacks validity due to the fact that norms used come from normal hearing individuals (Baker & Baker, 2011). In addition, previous research reported the unreliability of using an interpreter for cognitive evaluation due to language and cultural differences between deaf signers and hearing oral speakers (Hill-Briggs *et al.*, 2007; Dean *et al.*, 2009). According to Atkinson *et al.* (2015), the assessment tools to evaluate cognitive deficits of older adult deaf signers should be designed in sign language. The aim of this research was to present an adapted version of the *British Sign Language Cognitive Screening Test* (BSL-CST) in Québec Sign Language (LSQ - used in Québec and part of Ontario). The BSL-CST is a cognitive assessment tool

developed in British Sign Language, validated and normed with a British deaf population (Atkinson *et al.*, 2015). The proposed test adapted in LSQ will be presented in a video format. We thus will present the cultural adaptation steps following the protocol of Vallerand (1989) with the considerations of Atkinson *et al.* (2015). The linguistic adaptation follows the steps of the World Health Organization's (2016) protocol of adaptation and translation of instruments. Every phase of the adaptation has been validated with a team of deaf signers and French-LSQ expert interpreters. This tool adapted in LSQ, when normed, will represent a valid assessment tool for cognitive deficits of deaf signers using LSQ.

MEDIAL GASTROCNEMIUS MUSCLE ARCHITECTURE AND PLANTIFLEXORS TORQUE IN COMMUNITY OLDER WOMEN

J. Melo Filho¹, L.H. Gallo¹, E.V. Rodrigues^{2,1}, C.T. Silva¹, A.S. Wojciechowski¹, A.R. Gomes¹, 1. *Physical Education Department, Federal University of Paraná, Matinhos, Paraná, Brazil*, 2. *Federal Institute of Parana, Curitiba, Brazil*

The aging process can lead to changes in muscle architecture, such as reduction of muscle thickness (MT), pennation angle (PA) and fascicle length (FL), which may contribute to dinapenia. Thus, the aim of the study was to correlate the medial gastrocnemius (MG) muscle architecture and plantiflexors peak of torque (PT) of community older women. Cross-sectional study approved by the Research Ethics Committee of Federal University of Paraná (36003814.2.0000.0102). The study included 48 older women (70.4 ± 5.1 years-old; BMI: 27.8 ± 4 Kg/m²). MG architecture was evaluated at 30% of the distance between medial tibia condyle and medial malleolus, using a B-mode ultrasonography imaging device (Logiq Book-XP, General Electric®) with a linear-array probe (50mm, 4cm of depth, 11 MHz). The ImageJ software was used to analyze MT (mean distance between deep and superficial aponeuroses), PA (angle of insertion of muscle fiber fascicles into the deep aponeurosis) and FL (fascicle length between the superior and deep aponeuroses). The concentric plantiflexors PT was evaluated by an isokinetic dynamometer (System4, Biodex®) with 30° of range of motion, three repetitions each set performed at 60°/s and 180°/s. To verify the association between variables the Pearson correlation test was used ($p < 0.05$). The mean \pm SD were: MT = 1.6 ± 0.2 cm; PA = $26.7 \pm 3.4^\circ$; FL = 3.8 ± 0.5 cm; PT60°/s = 39.8 ± 11.4 Nm; PT180°/s = 31 ± 9.2 Nm. It was observed correlation between MT and PT60°/s ($r = 0.412$, $p = 0.004$); MT and PT180°/s ($r = 0.387$, $p = 0.007$); FL and PT60°/s ($r = 0.334$, $p = 0.020$). It can be concluded that the greater MG thickness and FL, the greater is the plantiflexors power and strength of community older women.

ASSESSING FUNCTIONAL FRACTURE RISK: AN INDEPENDENT PREDICTOR OF INCIDENT FRACTURES AT SKELETAL SITE?

A.J. Plant¹, D.J. Van Dussen¹, A. Weaver¹, N.J. MacIntyre², C.P. Recknor³, J.C. Recknor³, 1. *Youngstown State University, Youngstown, Ohio*, 2. *McMaster University, Hamilton, Ontario, Canada*, 3. *United Osteoporosis Centers, Gainesville, Georgia*

The purpose of this study was to determine if 'unsafe' functional movements as measured by short forms of the Safe Functional Motion test (SFM-6 and SFM-3) predict incident fragility fracture at any skeletal site. An osteoporosis clinic database was queried for adults with baseline SFM scores and corresponding data for prevalent fracture, history of injurious falls, femoral neck bone mineral density (fnBMD), bone-sparing medication use, and incident fracture at 1yr, and 3yr follow-up (n= 1700) Multiple logistic regressions, adjusted for gender, age, history of injurious fall(s), fnBMD, bone-sparing medication use, and any prevalent fracture at baseline to determine whether baseline SFM-6 and SFM-3 scores were associated with fragility fracture at any skeletal site at follow-up. According to the analyses, the SFM-6 score was a significant independent predictor of fracture at any site at 1y ($p=0.014$), and 3y follow-up (adjusted odds ratio (95%CI) = 1.26 (1.140, 1.396) for each 10 point decrease; $p < 0.0001$). Similarly, SFM-3 score was also a significant independent predictor of any fracture at 1y ($p=0.01$), and 3y follow-up (adjusted odds ratio (95%CI) = 1.183 (1.098, 1.274) for each 10 point decrease; $p < 0.0001$). For all analyses, no other variables were significant predictors at 1yr. Age and fnBMD also were significant at the 3y follow-up. 'Unsafe' movement strategies, as measured using the SFM-3 or SFM-6, increase fracture risk by 18–25% for each 10 point drop in score independent of altered risk associated with age, and bone mineral density

CORRELATION BETWEEN PEAK TORQUE WITH THE CROSS-SECTIONAL AREA OF QUADRICEPS IN COMMUNITY OLDER WOMEN

A.S. Wojciechowski¹, E.V. Rodrigues^{2,1}, J. Melo Filho¹, L.H. Gallo¹, C.T. Silva¹, A.R. Gomes¹, 1. *Departament of Physical Education, Federal University of Parana, Curitiba, Parana, Brazil*, 2. *Federal Institute of Paraná, Curitiba, Brazil*

Aging is related to changes in the neuromuscular system that can lead to decrease muscle mass (sarcopenia) and strength (dynapenia). The aim of this study was to correlate the concentric (CON) and eccentric (ECC) quadriceps (Q) peak of torque (PT) and the quadriceps cross sectional area (CSA). Cross-sectional study, approved by the Research Ethics Committee of Federal University of Paraná (36003814.2.0000.0102), included 48 older women (70.4 ± 5.1 years-old; BMI: 27.8 ± 4 Kg/m²). The CON and ECC quadriceps PT was evaluated by an isokinetic dynamometer (System4, Biodex®) with 60° of range of motion, three repetitions each set performed at 60°/s. The CSA was evaluated by Magnetic Resonance Image and the ImageJ software was used to calculate the muscle area in cm². To verify the association between variables the Pearson correlation and simple linear regression tests were used ($p < 0.05$). There were positive and moderate correlation between CON Q PT and Q CSA ($r=0.59$, $r^2=0.35$, $p=0.0001$) and between ECC Q PT and Q CSA ($r=0.48$, $r^2=0.23$, $p=0.0001$). It can be concluded that greater is the quadriceps PT, greater is the quadriceps CSA. However, the CSA influence 35% of the concentric quadriceps PT and 22% of eccentric quadriceps PT.

ASSESSING RISK OF FALLING—A COMPARISON OF THREE DIFFERENT METHODS

S. Strupeit, A. Buss, *Nursing Science, Munich University of Applied Sciences, Munich, Germany*

The study's aim was to evaluate the diagnostic accuracy and clinical effectiveness of a standardized fall risk assessment relative to clinical and self-report assessment.

A single-site, prospective, longitudinal study was performed in a group of geriatric patients. Participants were patients being admitted to a geriatric rehabilitation hospital. The St. Thomas's risk assessment tool (STRATIFY), clinical assessment, and a self-report assessment (fear of falling) were used to assess fall risk at two time points (at baseline and 3-weeks follow-up). The primary outcome was fall events. Contingency tables were used to calculate sensitivity, specificity, positive predictive values, and negative predictive values. Fisher's exact test was used to test the association between assessments and fall events.

A total of 124 patients participated in the study. The self-report technique demonstrated the highest sensitivity and negative predictive validity. The STRATIFY tool showed the highest specificity but the lowest sensitivity. The self-report technique was associated with a lower number of fall events.

Given the lack of diagnostic accuracy of all three assessment techniques and the lack of evidence regarding clinical effectiveness, the usefulness of these fall risk assessments can be challenged.

Linking evidence to action: It is questionable whether time-consuming assessments examined in this study are necessary. Further studies are needed to examine the diagnostic accuracy and clinical effectiveness of fall risk assessments. At least in settings in which fall prevention programs are a part of standard care, additional time consuming assessments may not be required.

DYNAPENIA IS A SIMPLE INDICATOR FOR COMPLEX CARE NEEDS OF OLDER MEN IN VETERANS CARE HOMES IN TAIWAN

M. Chou^{1,2}, T. Huang^{1,3}, C. Liang^{1,2}, H. Shen¹, H. Chen³, M. Liao¹, Y. Lin¹, H. Lam¹, 1. *Center for Geriatrics and Gerontology, Kaohsiung Veterans General Hospital, Kaohsiung, Taiwan*, 2. *Aging and Health Research Center, National Yang Ming University, Taipei City, N/A, Taiwan*, 3. *Department of Family Medicine, Kaohsiung Veterans General Hospital, Kaohsiung, N/A, Taiwan*

This cross-sectional study was conducted to evaluate the relationship between dynapenia and the complexity of care in two veterans care homes in Taiwan. Demographic characteristics, body mass index (BMI), minimum data set (MDS), resident assessment protocol (RAP) triggers, Charlson's comorbidity index (CCI), handgrip strength, and gait speed were assessed. Overall, 504 male residents (mean age 82.6 ± 4.7 years) participated in this study. Subjects with DEWGSOP (dynapenic components of the European Working Group of Sarcopenia for Older People) or DLMS (dynapenia defined by low muscle strength) were older ($p < 0.001$ for DEWGSOP, $p < 0.001$ for DLMS), having slower gait speed ($p < 0.001$ for DEWGSOP, $p < 0.001$ for DLMS), lower handgrip strength ($p < 0.001$

for DEWGSOP, $p < 0.001$ for DLMS) and higher numbers of RAP triggers ($p < 0.001$ for DEWGSOP, $p < 0.001$ for DLMS). Adjusted for age, educational level, BMI, and CCI, only DEWGSOP was significantly associated higher numbers of RAP triggers ($p = 0.001$), but not DLMS. Among components of dynapenia, only gait speed ($p < 0.001$), but not handgrip strength was independently associated with higher numbers of RAP triggers. By dividing subjects into groups based on the quartiles of gait speed, Q3 and Q4 group (gait speed ≤ 0.803 m/s) was significantly associated with higher complexity of care needs than the reference group (gait speed > 1 m/s). Dynapenia was significantly associated with complex care needs for older people. In particular, slowness alone was highly associated with various care needs among these subjects.

SESSION 3570 (POSTER)

CARDIOVASCULAR DISEASE

PREVENTIVE EFFECTS OF TESTOSTERONE ON DEVELOPMENT OF ABDOMINAL AORTIC ANEURYSM

B. Son^{1,2}, S. Ogawa¹, M. Akishita^{1,2}, 1. *Department of Geriatric Medicine, Graduate School of Medicine, the University of Tokyo, Tokyo, Japan*, 2. *Institute of Gerontology, the University of Tokyo, Tokyo, Japan*

Background: Abdominal aortic aneurysm (AAA) is one of phenotypes of arterial aging characterized by aortic dilation with impaired arterial wall integrity. Recent studies have shown that men with AAA have lower serum testosterone compared to men without AAA, suggesting the preventive roles of testosterone. However, underlying mechanisms are not clear. In this study, we investigated effects of testosterone on the development of AAA using *in vivo* model.

Methods and Results: In wild-type mice (C57BL/6J, male, 12 week-old), testosterone deficiency was induced by castration. At 4 weeks after castration, AAA was induced by CaCl_2 application in infrarenal aorta and angiotensinII (2000 ng/kg/min) infusion using osmotic-micropump for 4 weeks. When AAA was induced, castrated mice showed remarkable development of AAA compared to sham mice. Histological analysis revealed that by EVG staining, significant enlargement of aortic diameter and medial degeneration were seen in AAA-induced mice with castration. Mechanistically, infiltration of F4/80-positive macrophages was seen in the developed AAA of castrated mice. We further found that circulating IL-6 and aortic IL-6 expression were elevated and aortic STAT3 phosphorylation was increased, suggesting IL-6/STAT3-dependent inflammatory responses are attributed to the development of AAA in castrated mice.

Conclusion: These results demonstrate that testosterone deficiency proceeds AAA by IL-6/STAT3-mediated inflammation. Uncovering the effects of testosterone on inflammation in vessel provides mechanistic insight into the cardioprotective effects of testosterone.

GINSENOSIDE RB1 INHIBITED VASCULAR SMOOTH MUSCLE CELLS CALCIFICATION THROUGH ANDROGEN RECEPTOR

M. Nanao-Hamai, B. Son, T. Hashizume, S. Ogawa, M. Akishita, *The University of Tokyo, Tokyo, Japan*

Background: Vascular calcification is a significant pathological phenotype that increases with arteriosclerosis and aging. Given that ginsenoside Rb1 (Rb1), a major component of Korean Ginseng has a steroid structure, we hypothesized Rb1 has androgen-like protective actions in vessel. In the present study, we examined the effect of Rb1 on vascular calcification as well as carcinogenic actions observed by testosterone in prostate cancer cells. **Methods / Results:** In human aortic smooth muscle cells (HASMC), calcification was induced by inorganic phosphate (Pi, 2.6mmol/L). Rb1 significantly inhibited calcium deposition in a concentration-dependent manner, as shown by testosterone. Furthermore, bicalutamide, an androgen receptor (AR) antagonist abrogated the inhibition of calcification by Rb1, suggesting involvement of AR in the action of Rb1. Using luciferase assay, we found activity of androgen response element (ARE) was significantly enhanced by Rb1 in a concentration-dependent manner. Mechanistically, because apoptosis is one of the important regulatory mechanisms of HASMC calcification, we examined effects of Rb1 on Pi-induced apoptosis. Rb1 significantly inhibited apoptosis and this inhibition was also abolished by bicalutamide as observed by testosterone. Interestingly, unlike testosterone, Rb1 had no effect on proliferation and ARE activity of prostate cancer cells line (LNCaP). **Conclusion:** These findings demonstrate that Rb1 has beneficial effects both on vessel and prostate. If we could uncover the molecular mechanisms of Rb1, it is conceivable that Rb1 could be alternative to androgen as a selective androgen receptor modulator in clinical fields.

OXIDATIVE STRESS AND VITAMIN D LEVELS IN ELDERLY PATIENTS WITH HIGH RISK FOR ATHEROSCLEROTIC DISEASE

Y.M. Garcia, A.C. Seguro, M.H. Shimizu, E.L. Thenquini, G.V. De Marco, W. Jacob-Filho, *Clinical Medicine, São Paulo University Medical School, São Paulo, São Paulo, Brazil*

Atherosclerotic cardiovascular disease (ACD) is highly prevalent among elderly persons and a great contributor to morbidity and mortality at this age. A group of 51 elderly patients, with risk factors or established CVD were studied. Their levels of tiaminobutiric acid (TBARS), glutation peroxidase (GSH) and vitamin D. Results were compared by ANOVA and regression analysis. Their ages varied from 63 to 97 years, mean=78,2. There were 44 females (86,3%). TBARS and GSH levels were classified in low, normal or high, and vitamin D in insufficient or sufficient. Levels of vitamin D were insufficient in 79,6% (mean=23,73ng/ml); TBARS levels were high in 49,0%, normal in 37,3% and low in 13,7% (mean=1,14nmol/ml); GSH levels were low in 3,9% and normal in 96,1% (mean=1,66umol/ml). ANOVA was significant for TBARS and vitamin D ($p=0,001$), and close to it for GSH and vitamin D ($p=0,056$). Regression analysis was significant for TBARS and vitamin D ($p=0,009$). **Conclusion:** there was a high prevalence of insufficient levels of vitamin D and high TBARS; higher levels of TBARS occurred simultaneously with higher levels of vitamin D, suggesting oxidative stress is probably a problem for this population and vitamin D may not have a protective role. Studies including clinical variables are needed to better understand those results.

THE RELATIONSHIP BETWEEN LEPTIN AND CARDIOVASCULAR RISK FACTORS IN OLDER AFRICAN AMERICANS

O. Caffo¹, P.A. Ralston¹, J. Lemacks², I. Young-Clark¹, J.Z. Ilich¹, 1. *Florida State University, Tallahassee, Florida*, 2. *University of Southern Mississippi, Hattiesburg, Mississippi*

African Americans (AAs) have high prevalence of cardiovascular disease (CVD), possibly resulting from higher obesity rates and accompanying serum leptin levels. This study examines the relationship between serum leptin levels, physical health (diastolic and systolic blood pressure [DBP, SBP], Body Mass Index [BMI]) and health behaviors (hours of sleep, physical activity [PA]) in mid-life and older African Americans (n=89), using data from six churches in two counties in North Florida, USA. Three multiple linear regression block analyses were performed with leptin as a dependent variable: Model 1 included confounding factors (taking aspirin regularly, currently smoking, taking BP medication, age, gender, LDL cholesterol, HDL cholesterol, C-reactive protein, glucose, and triglycerides); Model 2 added DBP, SBP and BMI (log-transformed); and Model 3 included hours of sleep and PA. Model 1 showed that 60.7% of the variance in leptin levels was accounted for by the confounding factors ($p < .001$). Model 2, accounted for an additional 13.5% of the variance ($p < .001$), and showed significant influence of gender ($p < .001$), glucose ($p < .01$), and BMI ($p < .001$). Model 3 accounted for an additional 3.1% ($p < .001$) with glucose ($p = .006$), gender ($p < .001$), and BMI ($p < .001$) remaining significant along with PA ($p < .05$). This study showed that higher BMI's and to a lesser extent lower PA were significantly associated with leptin levels. Further, being female and having higher serum glucose levels also were significant predictors of leptin levels. Implications for health care providers will be discussed.

TRAJECTORY PATTERN OF ARTERIAL STIFFNESS AND MORTALITY RISK AMONG OLDER JAPANESE

Y. Taniguchi¹, S. Seino¹, H. Murayama², M. Nishi¹, H. Amano¹, Y. Fujiwara¹, A. Kitamura¹, S. Shinkai¹, 1. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 2. *Institute of Gerontology, The University of Tokyo, Tokyo, Japan*

Arterial stiffness (brachial-ankle pulse wave velocity; baPWV) is good predictor of mortality in later life. This prospective study used repeated measures analysis to examine potential baPWV trajectory patterns, and determine whether baPWV trajectory patterns were associated with all-cause mortality. 1,744 adults (mean age, 71.0 years; women, 57.0%) aged 65 years or older underwent tests of baPWV during 2003–2015 (total observation number was 7,419). We ascertained all death by checking local registry; 294 (16.9%) deaths occurred during the follow-up period (median follow-up of 7.2 years). We identified four major trajectory patterns of baPWV: lowest, second, third, highest trajectory groups. The mean baPWV for low level group (28.8%) was 1386cm/sec at age 65. Likewise, those for the second (46.2%), third (21.2%), and highest trajectory groups (3.8%) were 1667cm/sec, 2026cm/sec, and 2611cm/sec at 65y, respectively. All four group tracked parallel declining trajectory after 65 year-old. Compared with those in the lowest trajectory group, participants in

the second, third, and highest trajectory groups showed 1.20 (95% CI: 0.87–1.65), 0.95 (0.65–1.40), and 1.78 (1.02–3.12) times higher risks for all-cause mortality even after adjusting for important confounders. Regardless of initial level, baPWV tended to show similar age-related change in later life. Our findings indicate that individual in highest baPWV trajectory group was at increased risk for mortality, which highlights the importance of interventions that improve arterial stiffness, even among older adults with high baPWV.

GERIATRIC SYNDROMES WITH HEART FAILURE, CROSS-SECTIONAL STUDY WITH IMPLICATION IN CLINICAL PRACTICE

H. Singh¹, P. Chatterjee¹, R. Narang², A. Dey¹, 1. *ALL INDIA INSTITUTE OF MEDICAL SCIENCES, NEW DELHI, NEW DELHI, India*, 2. *CARDIOLOGY, ALL INDIA INSTITUTE OF MEDICAL SCIENCES, NEW DELHI, NEW DELHI, India*

Introduction: Heart failure (HF) is a common health problem and its prevalence follows an exponential pattern, rising with age, and may affect up to 10 % of population over the age of 65, worldwide. Geriatric syndromes (GS) like polypharmacy, frailty, cognitive impairment, depression are very loosely defined and in India data about its association and co-occurrence with HF is extremely sparse. The purpose of this study is to assess the co-occurrence and association of major geriatric syndromes with heart failure in older patients of a tertiary care hospital in India

Materials and method: In this cross sectional case-control study, conducted in the Department of Geriatric Medicine, 220 patients with clinical and radiological features of HF (Boston criteria) and equal number of age and sex matched controls (patients without HF) were evaluated. They were subjected to detailed clinical examination, chest X-Ray, echocardiography along with comprehensive geriatric assessment. **For cognitive impairment Hindi MMSE, GDS for depression was used. patient evaluated based on Fried's criteria for frailty and self-report information respectively.** Patients were managed as per standard treatment protocol for HF

Results: Out of the 220 case and 220 controls, 94% of patients with HF were below 80 years of age. Polypharmacy (58.20 %) was the most common GS, present in patients of HF followed by frailty (38.18 %). Compared to controls, frailty ($p=0.05$), depression ($p<0.01$), cognitive impairment ($p<0.01$) showed significant association with heart failure

Conclusion: HF has significant association with major GS because of shared risk factors. Coordinated management of both heart failure and geriatric syndromes is important.

POOR SLEEP QUALITY, VITAMIN D DEFICIENCY, AND COGNITIVE IMPAIRMENT IN ELDERLY WITH HEART FAILURE

E. Song¹, Y. Lee^{2,3}, 1. *Department of Nursing, University of Ulsan, Ulsan, Korea (the Republic of)*, 2. *Ulsan University Hospital, ULSAN, Korea (the Republic of)*, 3. *University of Ulsan College of Medicine, ULSAN, Korea (the Republic of)*

Background: Poor sleep quality and low vitamin D intake are associated with higher risk for global cognitive impairment in healthy adults. However, the relationship between

sleep quality, vitamin D intake, and cognitive impairment was unknown in elderly with heart failure (HF).

Purpose: To determine whether vitamin D intake mediates the link between sleep quality and cognitive impairment in elderly with HF.

Methods: A total of 160 HF patients completed the Mini-Mental Status Examination (MMSE) to assess cognitive impairment. Sleep quality was measured by the Pittsburgh Sleep Quality Index (PSQI). Vitamin D deficiency was defined as <15 mcg/day of average intake through a 3-day food diary. Hierarchical linear regressions and mediation analysis were used for data analysis.

Results: Forty patients (25%) had high risk for cognitive impairment ≤ 19 of total MMSE score; 120 (75%) reported poor sleep quality (PSQI >5) and 88 (55%) had vitamin D deficiency. The first equation regressed vitamin D deficiency ($\beta=-0.41$, $p<0.001$) on cognitive impairment. The second equation regressed poor sleep quality on cognitive impairment ($\beta=-0.18$, $p=0.021$). Poor sleep quality was associated with vitamin D deficiency (OR=2.26, $p=0.033$). When both poor sleep quality and vitamin D deficiency were entered in the third equation, the relationship between poor sleep quality and cognitive impairment was not significant ($\beta=-0.13$, $p=0.076$).

Conclusions: The impact of sleep quality on cognitive impairment is mediated by vitamin D intake in elderly with HF. Further work is required to examine the protective role of vitamin D adequacy against cognitive impairment, particularly in HF patients with poor sleep quality.

URINARY ALBUMIN-TO-CREATININE RATIO AND CAROTID ATHEROSCLEROSIS IN THE VERY OLD

Y. Arai¹, T. Hirata¹, M. Takayama¹, Y. Abe¹, T. Ishizaki², Y. Masui², K. Kamide³, Y. Gondo⁴, 1. *Center for Supercentenarian Medical Research, Keio University School of Medicine, Tokyo, Japan*, 2. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 3. *Osaka University, Graduate School of Medicine, Osaka, Japan*, 4. *Osaka University, Graduate School of Human Sciences, Osaka, Japan*

The aim of this study was to investigate the association between urinary albumin-to-creatinine ratio (UACR), a biomarker of renal injury and carotid atherosclerosis in two independent cohorts of the very old. In the TOOTH study, UACR was measured in 531 community-living seniors aged 85 years or older, and all-cause mortality was followed for 6 years. In the SONIC study, UACR was measured in 1,125 community-living seniors (503 individuals aged 70 years, 462 individuals aged 80 years, and 160 individuals aged 90 years). In both studies, carotid atherosclerosis was evaluated with B-mode ultrasonography. In the TOOTH study, median UACR was 11.2mg/g. In the multivariate logistic regression analysis adjusted for age, sex, hypertension, hyperlipidemia, stroke, and heart disease, UACR was significantly associated with carotid atherosclerosis (odds ratio 1.001, $p=0.041$), however, further adjustment for chronic kidney disease (CKD) and diabetes attenuated the association. UACR was significantly associated with all-cause mortality in the fully-adjusted model (hazard ratio; 1.001, $p=0.001$). In the SONIC study, the median UACR was 5.7mg/g, 9.3mg/g, and 10.1mg/g

in 70 year, 80 years, and 90 years, respectively. We replicated significant associations between UACR and carotid atherosclerosis in 70 years and 80 years (odds ratio; 1.006, $p=0.040$, odds ratio; 1.005, $p=0.017$, in 70 years and 80 years, respectively), however, further adjustment for CKD and diabetes attenuated the association in 70 years. Findings from the two independent cohorts confirmed the association between UACR and carotid atherosclerosis in the very old. Diabetes and CKD could be the pathogenesis of UACR.

THE INFLUENCE OF BMI FROM CHILDHOOD TO ADULTHOOD ON COGNITION AND PHYSICAL PERFORMANCE IN MIDDLE AGE

P. Stuchlik¹, B.D. Pollock¹, T. Shu¹, J.M. Guralnik², J. Gustat¹, W. Chen¹, E.W. Harville¹, L. Bazzano¹, 1. *Tulane University, New Orleans, Louisiana*, 2. *University of Maryland, Baltimore, Maryland*

It is unclear whether BMI from childhood and young adulthood predicts cognition and physical performance in mid-life. Using data from Bogalusa Heart Study (n=880; mean (SD) age at baseline=10.6 years (2.8), BMI=18.1 (3.6), 64.1% female, 33.0% black), we examined the longitudinal association of BMI, measured at recurrent clinic visits, with cognition (the sum of standardized scores on 11 validated neuropsychological tests) and physical performance (the Short Physical Performance Battery [SPPB]). A one-unit increase in BMI was associated with a decrease of 0.14 points ($p<0.001$) on the SPPB and of 0.001 ($p=0.02$) standard deviations in the global cognitive z-score in multivariable GEE models. The association disappeared in whites but remained for blacks when analyzed separately, suggesting a possible difference by race. Models investigating rate of change of BMI provided similar results, suggesting that interventions targeting BMI reduction or preventing obesity in childhood may improve cognition or physical function in middle age.

ARTERIAL STIFFNESS A CHOICE MAKER OF THE CARDIOVASCULAR TREATMENT AT ELDERLY WITH DIABETES

S.M. Aurelian^{1,2}, R. Dascalescu², A. Zamfirescu^{1,2}, J. Aurelian¹, S. Nica¹, A. Capisuzu^{1,2}, 1. *Geriatrics, University of Medicine and Pharmacy "Carol Davila", Bucharest, Romania*, 2. *Chronic Hospital St Luke, Bucharest, București -, Romania*

Introduction: Previous research has indicated that treatment with more than one antihypertensive medication class is related to elevated levels of PWV. The aim of the study was to follow the link of antihypertensive treatment and arterial stiffness at elderly with diabetes.

Methods: 143 participants were included; 81.2% female and 18.8% males; mean age was 72.28 ± 10.098 years. Parameters of arterial stiffness aPWV were measured using an oscillometric device (Arteriograph) in addition to a medical history, physical examination, and laboratory tests. Depending on the diagnosis of diabetes we have 2 groups.

Results: Age is positively correlated with Aortic PWV ($r=0.65$, $p<0.001$) and also brachial augmentation index ($p=0.02$) but not with diabetes. We observe a high rate of 28% converting enzyme inhibitor used in people with diabetes. The proportion of diuretic class exceeds 16% in diabetic

patients compared with 10% in those without diabetes ($p=0.020$). Diabetic patients appear to be more educated on the importance of treatment, 61% of them constantly taking him to those without diabetes. Those with uncontrolled blood pressure group presents a mean aortic pulse wave velocity statistically significantly higher (Student t-test, $p=0.043$). We see a lower PWV on those who have diuretic treatment (17%).

Conclusions: The evaluation of arterial stiffness represents a valuable tool for elderly with diabetes. It should be noted that the effects of pharmacologic agents on stiffness are slight or modest, but not substantial and new therapeutic approaches to decrease arterial stiffness are needed.

EFFECTS OF A COMBINED EXERCISE ON CAROTID ARTERY PARAMETERS IN ELDERLY WOMEN WITH SARCOPENIC OBESITY

J. Park¹, H. Park², 1. *Institute of Taekwondo for Health and Culture, Dong-A University, BUSAN, Korea (the Republic of)*, 2. *Department of Health Care Science, Dong-A University, Busan, Korea (the Republic of)*

Sarcopenic obesity is more closely associated with cardiovascular disease (CVD) than non sarcopenic obesity the older population. Higher body fat mass and age-related loss of the skeletal muscle mass is closely associated with increases of carotid artery intima-media thickness (CIMT). The aim of this study was to examine the effectiveness of a 24 week combined exercise program on carotid parameters in elderly women with sarcopenic obesity.

Fifty sarcopenic obesity elderly women (74.1 ± 6.1 years) were randomly allocated into either the exercise or control groups. The exercise group performed supervised strength and aerobic combined exercise over 24 weeks, for a 50–80 minutes, 5 times a week. CIMT, systolic flow velocity (PSV), carotid luminal diameter (CLD), diastolic flow velocity (EDV), and wall shear rate (WSR) were measured using B mode ultrasound. The differences in all carotid variables and the relative changes between baseline and 24 weeks, follow up were evaluated. In the analysis of variance results, CIMT ($p = 0.013$), PSV ($p = 0.007$), EDV ($p = 0.006$), and WSR ($p = 0.010$) showed significant group \times time interactions. Despite the CLD did not change, CIMT significantly decreased ($p < 0.01$), PSV ($p < 0.01$), EDV ($p < 0.001$), and WSR ($p < 0.05$) were significantly increased after 24 weeks in exercise group.

The results suggest this combined exercise intervention could be an effective approach to reduce CAD risk by ameliorating the risk factors for CAD in elderly community-dwelling women with sarcopenic obesity.

FIFTEEN-YEAR EXPERIENCE IN APPLICATION OF PINEAL GLAND PEPTIDES IN ELDERLY SUBJECTS

O. Korkushko², V. Shatylo¹, V. Khavinson³, 1. *Department of clinical physiology and pathology, D.F. Chebotarev Institute of Gerontology NAMS of Ukraine, Kiev, Ukraine*, 2. *D.F. Chebotarev Institute of Gerontology NAMS of Ukraine, Kiev, Ukraine*, 3. *St.Petersburg Institute of bioregulation and Gerontology, St. Petersburg, Russian Federation*

In recent years discussions have been held on the significance of pineal gland functioning changes in aging and age related pathologies.

The purpose of study was to evaluate the latest results of long-term use of pineal gland peptides (PGP) in elderly patients with coronary artery disease (CAD).

79 patients with stable angina (2nd functional class), aged 65 ± 3 , with low nocturnal pineal melatonin level (PML < 40 ng/l at 3 a.m.) were selected and divided into 2 groups. The 1st group patients ($n=39$) were administered PGP during 3 years (i.m. 10 mg once in 3 days, 5 injections during each course, intervals between courses being 6 months). The 2nd group patients ($n=40$) were not prescribed PGP. Patients of each group were receiving low doses of acetylsalicylic acid, ACE inhibitor, beta-blocker and statin. Results were assessed by measuring PML, indices of physical working capacity, changes in blood lipids and glucose. In addition, over 15 years we have verified causes of fatalities.

After 1st and subsequent courses with PGP there occurred a more than 2-fold increase in the nocturnal PML. Against this background, exercise endurance was improved and thereafter physical capacity kept higher levels. Within PGP administration, the elevated LDL cholesterol levels decreased. Plasma glucose levels also decreased at fasting and at standard oral glucose tolerance test. The number of patients with glucose intolerance reduced from 56% to 24%. No positive changes were seen in 2nd group. After 15 years since we began using PGP in our patients, there remained 26 of 39 survivals (66.7%) among them. In the 2nd group only 16 of 40 (40%) CAD patients have survived over the same period. Prolonged use of PGP has reduced cardiovascular mortality.

So, pineal gland peptides has restored pineal gland activity in elderly CAD patients, improved their physical working capacity, lipid and carbohydrate metabolism, and significantly reduced a risk of premature death due to cardiovascular events.

ORTHOSTATIC HYPERTENSION IN THE OLDEST OLD

J.M. Jacobs^{1,3}, M. Bursztyn^{2,3}, J. Stessman^{1,3}, 1. *Hadassah-Hebrew University Hospital, Department of Geriatrics and Rehabilitation, Jerusalem, Israel*, 2. *Hadassah-Hebrew University Hospital, Department of Medicine, Jerusalem, Israel*, 3. *The Jerusalem Institute of Aging Research, Jerusalem, Israel*

We investigated the prevalence and association with mortality of orthostatic hypertension (OHYPER) amongst the oldest-old.

Data were collected from The Jerusalem Longitudinal Study, which prospectively follows a representative birth cohort, born 1920–1921. Comprehensive assessment at ages 85 ($n=1004$), and 90 ($n=437$) included averaged sitting blood pressure (BP), (measured three times on two occasions) compared to 1-minute standing BP. OHYPER, orthostatic hypotension (OHYPO) or normotension (ONORM) were defined if standing–sitting SBP increased or decreased by ≥ 20 mmHg. Mortality data between ages 85–95 were collected.

We found that OHYPO, ONORM, OHYPER prevalence was 5 % ($n=48$), 91% ($n=915$), and 4% ($n=41$) at age 85, and 9% ($n=39$), 88% ($n=385$), and 3% ($n=13$) at age 90. OHYPER was associated ($p < 0.05$) with financial hardship, higher weight, loneliness, and anemia at age 85, and anemia and low rate of poor self-rated health at age 90. Sitting SBP was $157 \pm 22/75 \pm 11$, $147 \pm 21/74 \pm 11$,

and $140 \pm 16/74 \pm 10$ mmHg among OHYPO, ONORM, and OHYPER at age 85 ($p < 0.0001$), and $166 \pm 28/75 \pm 10$, $145 \pm 23/69 \pm 11$, and $138 \pm 23/74 \pm 9$ mmHg at age 90 ($p < 0.0001$) respectively. Ten-year survival was 27%, 30%, and 27% respectively at age 85 (log-rank $p = 0.34$). Five-year survival was 57%, 67%, and 55% respectively at age 90 (long-rank $p = 0.14$). After adjusting for gender, physical inactivity, anemia, ADL dependence, diabetes, and ischemic heart disease, OHYPER at age 85 was not associated with mortality (Hazards Ratio=0.95, 95% CI 0.65–1.39). Few OHYPER at age 90 precluded modeling.

Our findings show that OHYPER is uncommon among community-dwelling oldest old, and is not associated with increased mortality.

IMPACT OF BETA BLOCKERS ON FUNCTIONAL OUTCOMES IN NURSING HOME RESIDENTS AFTER MYOCARDIAL INFARCTION

A.R. Zullo¹, Y. Lee¹, L. Daiello¹, V. Mor¹, J. Boscardin^{2,3}, D. Dore^{4,1}, M. Steinman², 1. *Health Services, Policy, and Practice, Brown University, Providence, Rhode Island*, 2. *Division of Geriatrics, University of California San Francisco and the San Francisco VA Medical Center, San Francisco, California*, 3. *Division of Biostatistics, University of California San Francisco, San Francisco, California*, 4. *Optum Epidemiology, Boston, Massachusetts*

Beta blockers are a mainstay of treatment after acute myocardial infarction (AMI). Yet, these medications are commonly not prescribed for older nursing home residents after AMI, in part owing to concerns about potential functional harms and uncertainty of benefit. We conducted a propensity score-matched cohort study of the impact of beta blockers on functional decline, mortality and rehospitalization in the first 90 days after AMI among long stay nursing home residents 65+. The study cohort included 5,496 new beta blocker users and an equal number of non-users. Mean age was 84 years. Beta blocker users were more likely than non-users to experience functional decline (OR 1.14, 95% CI 1.02–1.28). Conversely, beta blocker users were less likely than non-users to die (HR 0.74, 95% CI 0.67–0.83) and had similar rates of re-hospitalization (HR 1.06, 95% CI 0.98–1.14). Nursing home residents with moderate or severe cognitive impairment or severe functional dependency were particularly likely to experience functional decline (OR 1.34, 95% CI 1.11–1.61 and OR 1.32, 95% CI 1.10–1.59, respectively). In contrast, there was little evidence of functional decline in subjects with better cognitive and functional status (ORs 0.99 to 1.05; P value for interaction 0.03 and 0.06, respectively). Mortality benefits of beta blockers were similar across all subgroups. Use of beta blockers after AMI is associated with functional decline in older nursing home residents with substantial cognitive or functional impairment, but not in those with relatively preserved mental and functional abilities. Beta blockers yielded considerable mortality benefit in all groups.

CHURCH INTERVENTION TO REDUCE CARDIOVASCULAR RISK IN OLDER AFRICAN AMERICANS: SIX-MONTH FOLLOW-UP

A. Carter, P.A. Ralston, I. Young-Clark, J.Z. Ilich, *Florida State University, Tallahassee, Florida*

African American (AA) adults have higher morbidity and mortality rates for cardiovascular disease (CVD) in comparison to other racial/ethnic groups in the U.S. Key risk factors for CVD include poor dietary intake and inactivity, hypertension, diabetes, and dyslipidemia. Although research suggests church-based health programs are effective in addressing these risk factors, few longitudinal studies have been conducted. This paper examines the six-month outcomes of a church-based health intervention to reduce CVD risk in AAs conducted with mid-life and older African Americans in six churches (three treatment, three comparison) in North Florida, using a clinical subsample ($n = 78$). The first six months of the intervention, developed using community-based participatory processes and undergirded by socio-ecological theory, included an emphasis on CVD awareness and nutrition (i.e., training sessions for church steering committees, kick-off events planned by the churches that focused on dietary health, and culturally tailored materials). Variables investigated in the study were related to diets (fat and fruit/vegetable intake), anthropometrics (weight, BMI, circumferences), blood pressure (diastolic, systolic), diabetes indicators (glucose, insulin), cholesterol (HDL, LDL, VLDL and Total CHOL), and other biomarkers (adiponectin, Apo A1, Apo B, C-reactive protein), controlling for medication use. Findings showed significant improvement between baseline and six months in C-reactive protein ($t = 2.368$, $p = .02$) and trends for lower LDL and BMI's. Other findings and implications for practice will be discussed.

HYPERHOMOCYSTEINEMIA IS ASSOCIATED WITH COGNITIVE IMPAIRMENT IN ELDERLY PATIENTS WITH HYPERTENSION

B. Lu, X. Ouyang, *Jiangsu Province Institute of Geriatrics, Nanjing, China*

Methods: Fifty-nine elderly patients with hypertension were enrolled from January 2016 to June 2016. All patients were divided into two groups: lower homocysteine level group (Group H) or hyperhomocysteinemia group (Group HH). Hyperhomocysteinemia (HH) was defined as serum Hcy level more than or equal to $10 \mu\text{mol/L}$. The degree of WML was rated by Fazekas scale using magnetic resonance imaging (MRI) analysis. Neuropsychological examinations including mini-mental state examination (MMSE) and Montreal cognitive assessment (MoCA) were taken to assess cognitive function.

Results: Compared with group H, the score of Fazekas scale and deep white matter hyperintensity on MRI in HH group were significantly increased (3.17 ± 0.96 vs 2.50 ± 1.04 and 1.72 ± 0.75 vs 1.27 ± 0.66 , both $P < 0.05$). The scores of MMSE and MoCA were lower in HH group than in H group (24.86 ± 3.28 vs 27.72 ± 1.81 and 18.55 ± 3.91 vs 25.00 ± 3.0 , both $P < 0.05$). Levels of serum homocysteine were positively correlated with the degree of WML ($r = 0.430$, $P < 0.01$) and negatively correlated with cognitive function scores ($r = -0.406$ in MMSE and -0.663 in MOCA, both $P < 0.01$).

ARTERIAL COMPLIANCE CHANGES AND IMPAIRED COGNITIVE/PHYSICAL FUNCTION: A RACE-DEPENDENT ASSOCIATION

C. Fernandez^{1,2}, R.P. Barshop¹, B.D. Pollock¹, P. Stuchlik¹, L. Bazzano¹, 1. *Medicine, Tulane University, New Orleans, Louisiana*, 2. *HeartGEN Institute, Boston, Massachusetts*

Decreased cerebral perfusion due to reduced arterial compliance is linked to cognitive and physical impairment in aging adults with overt vascular disease. However, this association, as well as its racial (black-white) disparities, have not been thoroughly elucidated in non-institutionalized middle-aged adults. Our analyses considered 471 participants of the Bogalusa Heart Study (mean age 48.2 years, 33.8% blacks, 58.6% females) with available information on arterial compliance—assessed non-invasively via aorto-femoral pulse wave velocity (aPWV)—in two time points (mean follow-up 12.7 years), as well as cognitive and physical function assessed later in life. Black participants with impaired physical and cognitive function showed significantly greater yearly progression of aPWV compared to white participants. In multivariable-adjusted logistic regression analyses, yearly progression of aPWV was significantly associated with decreased cognitive and physical function, in black participants only. These findings suggest a race-specific differential impact of decreasing vascular compliance over time on impaired cognitive/physical function in middle-aged adults. More multidisciplinary research initiatives should be undertaken to explore race-specific physiopathological mechanisms involved in the effect of vascular aging on cognitive and physical function deterioration.

COGNITIVE DEFICIT AND CARDIOVASCULAR RISK IN COMMUNITY-DWELLING ELDERLY

M.M. Monteiro Bezerra, S.M. Borges, I. Vivas, J. Rosa, J.E. Uchida, *Physical Therapy, Santa Cecília University, Cubatão, São Paulo, Brazil*

The aim of this study was to verify the relationship between cardiovascular disease (CVD) risk factors and cognitive deficit in community-dwelling elderly. In a cross-sectional study with 154 older adults divided into three groups: Group 0 (G0): without cognitive deficit (n = 58; 38%); Group 1 (G1): suggestion of cognitive deficit in one cognitive screening test (n = 65; 42%) and Group 2 (G2): suggestion of cognitive deficit in two cognitive screening tests (n = 31; 20%), using the Mini-Mental State examination (MMSE) and Verbal Fluency (VF) animal category. The ascertained CVD risk factors were self-reported and/or directly measured hypertension, diabetes mellitus, sedentary lifestyle, dyslipidemia, central obesity (conicity index) and smoking. The most prevalent CVD risk factor was central obesity (84.4%) and the lowest one was smoking (4.5%). Self-reported diabetes mellitus was more prevalent in G2 (51.6%) participants when compared with G0 (19%) and G1 (24.6%) participants (Chi-Square test: P=0.002). Ordinal regression was significant (p=0.006) only to diabetes mellitus with Odds Ratio of 0.628 (IC95%: 0.184–0.754). Therefore, older adults without diabetes mellitus had a 62.8% (1-0.628X100% = 62.8%) lower odds of having a cognitive deficit in two cognitive screening tests in the population studied. We concluded that central obesity was highly prevalent among the total sample. In conclusion, older people with cognitive deficit in two cognitive screening tests corresponded to a larger proportion of diabetes

mellitus, highlighting the need for preventive strategies in order to avoid the relationship between chronic disease that compose the CVD risk with cognitive impairment.

GAIT SPEED IS RELATED TO THE ARTERIAL STIFFNESS OF ELDERLY?

R. Dascalescu^{1,2}, S.M. Aurelian^{2,1}, A. Zamfirescu^{2,1}, J. Aurelian², A. Capisizu^{2,1}, 1. *Geriatrics, "Sf. Luca" Chronic Disease Hospital, Bucharest, Romania*, 2. *University of Medicine and Pharmacy "Carol Davila", Bucharest, Romania*

Background: Arterial stiffness is increasingly recognized as an important predictor of cardiovascular events and even mortality in older adults. Few studies have evaluated the association of arterial stiffness with gait performance.

Purpose: We examined associations between physical performance and vascular or hemodynamic parameters at elderly.

Methods: Is a prospective study on 143 subjects (mean age 72.85 ± 10.07 years). We assessed physical activity with Short Physical Performance Battery (balance test, 4m walk test, chair stand test). Arterial stiffness was measured oscillometrically by means of the aortic pulse wave velocity (PWVao) and pulse pressure (PP) by Arteriograph.

Results: In the age group "very old" (>85y), 53% of those were with low physical activity, and only 30% with average and good physical performance (Chi square test, p<0.001). PWVao had a statistically significant difference (p=0.094) in those with low physical performance (10.37 ± 1.89 m/s) than those with medium or good physical performance (9.85 ± 1.73 m/s). Gait speed is statistically significant (p<0.001) between groups with low physical performance and those with medium and good physical performance. PWVao means were significantly increasing from 9.95 ± 1.63 m/s in the group without risk of disability to 10.37 ± 1.74 m/s in the group at high risk of disability. The relationship between arterial stiffness and speed is not statistically significant, but it is with central systolic blood pressure (SBPao). Pulse pressure is correlated significantly with gait speed in our study.

Conclusion: PWVao has a direct statistical relationship with physical activity increasing significantly in the group with higher risk of disability. Arterial stiffness and blood pressure are directly related significant. Gait speed depends on both physical performance and pulse pressure but not correlated with pulse wave velocity. These results warrant further investigation in larger outcome studies.

IMPROVING THE KNOWLEDGE AND INTERPROFESSIONAL CARE FOR HEART FAILURE IN NURSING HOMES: A PILOT STUDY

V. Boscart¹, G. Heckman², K. Huson¹, R. McKelvie³, 1. *School of Health & Life Sciences and Community Services, Conestoga College, Bright, Ontario, Canada*, 2. *University of Waterloo, Waterloo, Ontario, Canada*, 3. *McMaster University, Hamilton, Ontario, Canada*

This pilot study assessed the preliminary impact of an intervention designed to: improve staff heart failure (HF) knowledge; develop efficient interprofessional (IP) communication processes for improved HF management; and integrate both into routine practice in nursing homes (NHs).

The intervention was implemented on single units in two NHs. A mixed methods approach was used to collect qualitative (interviews, observations) and quantitative (surveys) process and outcome data at baseline and three months post-intervention.

Results identified trends towards improvement in HF knowledge, self-efficiency and IP communication. Unregulated care providers and clinicians benefited from the education to a similar extent, and collaboratively developed innovative IP communication processes to better manage HF in NHs.

The findings of this pilot study suggest that the intervention is acceptable, feasible, and has a favourable impact on HF knowledge and IP communication among NH staff. Investigators are proceeding to conduct a larger trial to determine further outcomes.

INCREASED INCIDENCE OF HEART FAILURE HOSPITALIZATION IN ELDERLY PATIENTS AFTER MAJOR EARTHQUAKES

Y. Nagayoshi, 1. Aso Medical Center, Aso, Japan, 2. Department of Cardiovascular Medicine, Graduate School of Medical Sciences, Kumamoto University, Kumamoto, Japan

Acute stress after natural disaster can trigger cardiovascular events, including acute myocardial infarction (AMI), arrhythmias and worsening of heart failure (HF). On April 16, 2016, a series of strong earthquakes struck the Kumamoto region of southern Japan. Aso city is a small rural city with a population of approximately 30,000. More than 30% of the population is over the age of 65. We examined the patients admitted to our hospital for cardiovascular events after the earthquakes in this area. We also compared them to the patients during the corresponding period in the prior 2 years (2014 and 2015) as a control. There were a total of 54 cardiovascular events from April 16 to June 30, 2016 (27 HF, 10 cardiopulmonary arrest, 5 arrhythmias, 4 AMI, 3 angina attack, 3 symptomatic venous thromboembolism, 2 others). The total incidence of HF was significantly higher compared with the average of the past 2 years (27 in 2016 vs 5.5 in the past 2 years, $P < 0.01$). In the patients with HF, 22 patients (81%) were defined as elderly patients (>75 years old). Eleven patients (40%) had a preserved left ventricular ejection fraction. Twenty patients (74%) had a previous history of HF. Disaster influence on deterioration of HF was suggested by patient history in the twenty patients (74%). Precipitating factors included anxiety, sleep disorder, interruption of medication, malnutrition, uncontrolled hypertension, arrhythmias, myocardial ischemia and infection. Our results suggest the importance of preventing HF in catastrophic disasters, especially in elderly people.

SELF-MONITORING OF BLOOD PRESSURE IN PATIENTS TREATED WITH ANTI-ANGIOGENIC DRUGS

S. Henni^{1,2,3}, F. Delamarre-Damier³, P. Bigot¹, S. Maréchal-Girault¹, S. Piessard^{4,3}, S. Abadie-Lacourtoisie⁵, P. Abraham^{1,2}, G. Leftheriotis^{1,2}, 1. University Hospital Center, Angers, France, 2. INSERM UMR 1083 / CNRS

UMR 6214, Angers, France, 3. AGREE, Nantes, France, 4. Vertou Hospital, Nantes, France, 5. ICO Paul Papin, Angers, France

Introduction: Anti-angiogenic treatments (AAGG) are increasing used among therapeutic drugs in cancers. By their systemic action, they are often responsible for an increase in arterial pressure (hypertension), requiring regular blood pressure control. To date the interest of non-supervised blood pressure self-measurement at home (BPSM) compared to supervised blood pressure monitoring telemonitoring (TM) have not been formally established.

Materials and Methods: Seventeen patients (mean 71 yrs +/-5 years) were enrolled at the University Hospital of Angers and ICO Paul Papin and treated by an AAGG (Sunitinib - or Bevacizumab). They realized self-measurement of blood pressure according to the two different protocols (BPSM and TM) during two treatment cycles. We studied the impact of the monitoring protocols on the hypertension diagnosis, and the contribution of supervised monitoring in the therapeutic management and finally the impact on quality of life assessed by questionnaire.

Results: We have demonstrated a significant impact of self-measurement protocol in terms of number of diagnosis of hypertension ($p < 0.0005$). The difference in term of therapeutic modification was 3 days (± 3) for TM vs. 4 days (± 3) for conventional BPSM (NS*).

Conclusion: These preliminary results encourage the use of supervised rather than non-supervised blood pressure monitoring to early detect hypertension. Supervised blood pressure monitoring, increases the quality of data collection, facilitating their interpretation and allows the diagnosis of acute events with alerts. Furthermore, this supervised monitoring method enhances patients' sense of security without being experienced as binding.

SESSION 3575 (POSTER)

CAREGIVING AND CARE VALUES I

STRESS AND DEPRESSION AMONG CAREGIVERS FOR OLDER MEXICAN AMERICANS WITH AND WITHOUT STROKE

S. Krishnan, J. Graham, S. Al Snih, UTMB, Galveston, Texas

The purpose of this study was to examine the association between caregiver stress and depression among caregivers for older Mexican Americans with and without stroke. The older adult and caregiver ($n=864$) data were from the Hispanic Established Population for the Epidemiologic Study of the Elderly (H-EPESE) – Wave-7. Caregivers were mostly female (73%) and their average age was 58 years. The older Mexican Americans were mostly female (65%) with an average age of 86 years. We used the Center for Epidemiologic Studies Depression Scale (CES-D) and Perceived Stress Scale-4 (PSS-4) to assess caregiver depression (CES-D > 16) and stress (PSS-4 > 4), respectively. Caregivers were divided into four groups based on whether the person they cared for previously had a stroke and their own level of stress: not stroke and no stress

(n=508) – reference group, stroke and no stress (n=67), not stroke and stress (n=251), stroke and stress (n=36). Sixty-two (7%) caregivers demonstrated clinical depression. The multivariate analyses revealed that caregivers with higher stress caring for individuals with and without stroke were more likely to be depressed (OR 6.2, 95% CI=2.0–19.3 and OR 8.2, 95% CI =4.2–16.1, respectively) compared to those with no stress caring for individuals without stroke – after adjusting for caregiver and individual demographics, and caregiver comorbidities. Caregivers provide a unique perspective of the individual and often experience their own health problems when coping with the challenges of caring for a loved one with functional needs; hence it is essential to account for their burden and enhance their support.

PERSPECTIVES OF OLDER PEOPLE RECEIVING INFORMAL CARE ON FRAILTY, QUALITY OF LIFE, AND AUTONOMY

D. Lambotte¹, B. Fret¹, T. Kardol¹, L. De Donder¹, D. Consortium^{2,3}, 1. *Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium*, 2. *Vrije Universiteit Brussel; Katholieke Universiteit Leuven; Hogeschool Gent; Universiteit Antwerpen, Brussels, Belgium*, 3. *Universiteit Maastricht, Maastricht, Netherlands*

Despite numerous researches concerning frailty in older people, frailty is often approached in relation to negative outcomes (mortality, institutionalization, co-morbidity, etc.) and do not consider positive outcomes such as quality of life and autonomy. Furthermore research often provides evidence of the effects of informal care on the wellbeing of informal caregivers and not of the older care recipient. Consequently, this paper aims to explore the quality of life and autonomy of older people, and how informal care contribute to this. Therefore, we analyze semi-structured, qualitative interviews among community-dwelling older people from Belgium (N = 121) from the D-SCOPE study, an international research project that focuses on prevention and detection of frailty in older people. Results indicate that older people receive informal care from different types of informal caregivers (partner, daughter, neighbor, etc.), which provides support within different domains of frailty. Although informal care can improve the quality of life of older people in several ways, older people often experience losses in their autonomy resulting in a decrease in quality of life. Older care recipients furthermore acknowledge that informal caregivers can also be frail. Conclusively, this study provides evidence that informal care counteracts the feeling of frailty in older people, and enforces their quality of life. However, informal caregivers need to be supported, as frailty not only occurs in older care recipients but also in informal caregivers.

RESILIENCE AND RESOURCEFULNESS IN ALZHEIMER'S FAMILY CARE PARTNERS: OBSERVATIONS OVER FIVE YEARS

B. Matchar, L.P. Gwyther, *Duke Family Support Program, Duke University, Durham, North Carolina*

Care partner strengths are often overshadowed by the well-documented negative consequences of caring for a family member with dementia. Since spring 2012, twelve cohorts of care partners (n=125) participated in Memory Makers, an eight-week Alzheimer's education and support group. After

“graduating,” many chose to stay connected to each other and the facilitators via the Alpha Community, a friendship group, named by one of the participants, with activities chosen by members, and a social worker to handle the logistics and lead discussions. The Alphas gather for monthly lunches, museum and music programs, support groups, tailored workshops and less structured activities. The Alpha Community care partners have displayed unanticipated resilience and resourcefulness while facing progressive challenges. Heroic efforts were observed in caring for relatives with acceptance and dignity, even as Alzheimer's advanced over four years. These strengths may be attributed to traits and resources of the individuals, but also to distinctive interactional characteristics of the community. Although just being “in the same boat,” and knowing “you are not alone,” seems to foster resilience and resourcefulness, the unique social engagement of the Alpha Community allows participants to learn from each other, rely on one another and share a survivorship frame of reference. Observation of resilient, resourceful themes in Alpha Community participation indicate beneficial outcomes in several domains, including increased self-confidence, validation of feelings, decreased isolation and increased use of respite. The Memory Makers group has been integrated into the Duke Geriatric Workforce Enhancement Program inter-professional team education activities.

CHARACTERISTICS OF FAMILY CAREGIVERS OF OLDER PEOPLE IN IRELAND: A NATIONAL PROFILING STUDY

G.M. Fealy¹, A. Lafferty¹, C. Downes³, J. Drennan², 1. *UCD School of Nursing, Midwifery and Health Systems, University College Dublin, Dublin, Ireland*, 2. *University of Southampton, Southampton, United Kingdom*, 3. *Trinity College Dublin, Dublin, Ireland*

Profiles of family caregivers indicate that most are female in the middle to older years and carry substantial caregiving responsibilities for, typically, one family member. This paper reports the findings of a national study, which profiled family carers of older people in Ireland. Based on a sample of 2,311 family caregivers, the survey generated profiling data on caregivers' demographic characteristics, caregiving activities, and care recipient characteristics. Our sample contained a higher proportion of female caregivers in the older age category than that reported in recent profiling studies and our care recipient profile indicated a high proportion of older women with high levels of dependency. We observed a statistically significant difference between the perceived relationship quality before and after caregiving had commenced. Providing fine-grained information on family caregiving in Ireland, the study complements national census data and provides evidence that can inform national social policy and enable international comparisons.

LATENT CLASS APPROACH TO DIFFERENTIATE REASONS CAREGIVERS SEEK RESPITE CARE SERVICE

A. Georges, H. Uppal, W. Fung, *JBS International, Inc., Burlingame, California*

The Corporation for National and Community Service's Senior Companion (SC) program offers opportunities for adults to provide assistance to individuals who have difficulty with daily tasks, and provide respite to their families.

The sample consisted of 72 caregivers seeking respite service for the first time, and included females (83%), White (53%), married or living with a partner (64%), caring for their spouse/partner (39%) or parent (35%), and ages 29–88. Respondents were asked to rate the ways in which a SC might support them as caregivers for an aging friend or relative. A latent class analysis, based on 12 motivations for seeking SC respite services, suggests that caregivers have difficulty meeting their own needs, some in more areas than others. The analysis identified three distinct types of motivation based on caregivers' need for respite service and the needs of their care recipient: Critical (46%), Essential (17%), and Moderate (37%) Need. A multinomial logistic regression analysis found that motivation was not associated with caregiver's employment status. Caregivers were more likely to belong in the Critical and Essential Need groups if the care recipient had the following characteristics: difficulty preparing meals, getting in and out of bed, and need transportation services. The findings advance knowledge about variance in caregivers' respite needs and could inform programmatic efforts required to support individuals in their caregiving roles, spur creative thinking about identifying families most in need of service, finding additional ways of helping families support elders in their homes, and training SC volunteers and supervisors.

COST OF FAMILY CAREGIVING: SHORT AND LONG-TERM FINANCIAL CONSEQUENCES OF CANADIAN CAREGIVERS

L. Li, Y. Lee, *Faculty of social work, University of Calgary, Edmonton, Alberta, Canada*

Due to the progressive aging of population, family caregiving is in greater need in Canada. However, accumulative evidences have identified the negative financial issues family caregivers would encounter. Current study, based on the Canada General Social Survey (cycle 26): caregiving and care receiving, intends to understand the financial consequences of becoming family caregiver from both short-term and long-term perspectives. Bivariate and multivariate analyses are conducted to explore the financial consequences in short and long term. Bivariate analysis indicates that when compared to non-caregivers, family caregivers would have more out-of-pocket expenses for home modification, professional services and medicine and so on. Additionally, caregivers report more financial behaviors, including borrow money, take loan, use saving and sell off assets, which would cause them financially disadvantage. What's more, results also indicate the greater amount of working accommodations caregivers make to meet their caregiving responsibilities. These working adjustments, including reduce working hours, shift to part-time position, turndown job promotion and so on, would certainly affect caregivers' income level and the entitlement of pension or other income security for future. Further multivariate analysis indicates that family caregivers who are female, lower education level, from ethno-cultural background, and providing higher intensive caregiving, with limited access to community services tend to suffer from negative short and long term financial consequences. The findings increase the evidence of negative financial impacts on family caregivers; also emphasize the importance of providing necessary support to caregivers from a long-term perspective.

TECHNOLOGY PERCEPTIONS AMONG CHINESE FAMILY CAREGIVERS OF PERSONS WITH DEMENTIA: A SEX-GENDER LENS

C. Xiong¹, A. Sixsmith², A.J. Astell¹, L. Liu³, A. Mihailidis¹, A. Colantonio¹, 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *Simon Fraser University, Vancouver, British Columbia, Canada*, 3. *University of Alberta, Edmonton, Alberta, Canada*

Background: Dementia is a major public health concern associated with significant caregiver demands. While technologies are available to assist with caregiving, there is a paucity of information on caregiver needs and preferences for these technologies, especially among Chinese family caregivers of persons with dementia.

Objective: The purpose of this study was to examine the technology needs and preferences of Chinese family caregivers of persons with dementia in Canada.

Methods: A cross-sectional pilot survey was conducted through the Yee Hong Centre of Geriatric Care in Ontario, Canada in English and Mandarin. Respondents could complete the questionnaire over the phone, internet, or by mail. Frequency distributions, Wilcoxon Signed Ranks Test and multiple regression analyses were used to examine difference by sex/gender.

Results: The majority of the 40 respondents to date did not demonstrate knowledge about technology that can assist with caregiving. Ease of installation and reliability were identified as the most important features when installing and using technology. Despite little knowledge about technology, respondents demonstrated a positive attitude towards technology use during caregiving. Controlling for age, female respondents were significantly more receptive to technology compared to males.

Conclusions: Our findings suggest a need to increase awareness of technology options to assist with caregiving in this population. They provide insights for future development and marketing of technologies that better align with the needs and preferences of male and female caregivers. Further exploration of additional environmental and social influences on technology perception is warranted to better understand and tailor technologies for this population.

INTERACTIVE ONLINE COUNSELING FOR FAMILY CAREGIVERS OF PEOPLE WITH DEMENTIA

P.A. Wagner, *Seniorenberatung Online, Unterschleissheim, Germany*

The elderly population continues to grow in all European countries. With age being the strongest known risk factor for dementia, the prevalence of people with dementia is increasing, too.

The care and support needed by these mentally ill people is primarily provided by relatives within the home environment. Most of them are at high risk of developing depression and becoming socially isolated.

In the context of the EUROFAMCARE study it becomes obvious that the use of support services (e.g. counseling services) is very low in Germany. Dementia is still a topic out of bounds and 78% of family caregivers do not even make use of support services at all.

An increase in service usage can be assumed if low-threshold access to available information and support services is provided.

Online counseling could be such a low-threshold possibility of access.

An honorary and fourfold web-based online counseling service for family caregivers of people with dementia is presented. The counseling concept and several low-threshold elements are defined. One-year access statistics are shown regarding a variety of counseling offers.

Statistics and data visualization methods are included in the website, such as dementia city maps showing proportions of demented people in different urban districts. Easy access to regional epidemiological data is suggested to have a taboo-breaking effect with positive impact on “silent” family caregivers, thus promoting the usage of counseling and support services.

Conclusions are drawn concerning further improvements to increase community awareness of dementia and to ensure accessibility to target groups of family caregivers.

IMPACT OF WORLD WAR II-RELATED EXPERIENCES ON CURRENT INFORMAL CARE IN GERMANY

I. Wilhelm, S. Zank, *Special Education & Rehabilitation, University of Cologne, Cologne, Germany*

Some of the worst crimes against humanity in history were committed by Nazi Germany, with many of the victims still suffering from their experiences today. Until about 15 years ago, it was difficult to discuss the psychological consequences of experiences undergone by non-persecuted German individuals during World War II, such as bombing, sexual assault or displacement. However, as the people concerned are now getting old, the topic has become increasingly important in current care situations. This study represents the first empirical research on the effects of war-related experiences on informal care in Germany.

The study is based on 21 interviews with informal caregivers caring for someone with WWII-related experiences. Most of the interviewees were women caring for a parent. The data was analysed with Content Analysis.

The results show that care recipients' war-related experiences seem to influence their relationship with the caregiver, both prior to and during the care situation, and also the burden perceived by the caregiver. Most caregivers describe the relationship with the person being cared for as ambivalent or even problematic. For instance, they found callousness on the part of the care receiver, a potential consequence of WWII-related experiences, to be a burden.

Understanding the psychological effect of war-related experiences as a potential source for care recipients' behaviour will make it easier for caregivers to interpret such behaviour appropriately and to comprehend how some of their emotional bonds with the care receiver have emerged.

HOME CARE SERVICES EFFECTS ON SUBJECTIVE HEALTH AND CARE BURDEN OF FAMILY CAREGIVERS IN EAST ASIA

J. Kim¹, K. Kojima², 1. *Tokyo University of Social Welfare, Isesaki, Gunma, Japan*, 2. *National Institute of Population and Social Security Research, Tokyo, Tokyo, Japan*

Family caregivers experience poor health and high care burden levels as a consequence of continuing to provide intense care to their relatives. Previous research shows that poor health and care burden of family caregivers is not only a risk to the caregivers themselves, but also has negative effects

on the quality of care for frail elderly. However, there has been less published about home care services in East Asia. The study was to explore the effects of home care services on the subjective health status and care burden of family caregivers caring for their frail elderly who live with them at home in East Asia. The study used the 2013 survey data of the family caregivers who live with frail elderly in Japan, Korea, China, and Taiwan. The survey methods were the interview method. The overall sample data included 783 Japanese, 611 Koreans, 800 Chinese, and 555 Taiwanese. Multilevel models with data were used to examine the subjective health status and care burden. This survey was approved by the ethics committee of Tokyo University of Social Welfare. The care burden of family caregivers was negatively associated with the use of visits, short stay services and adult day-care services. The subjective health status of family caregivers was negatively associated with use of home-visiting nurses and visits short stay services. These findings support that some home-care services may affect the health status and care burden of family caregivers in East Asia both positively and negatively.

IMPACT OF OLDER ADULTS' TECHNOLOGY USE ON THEIR SPOUSE CAREGIVERS' CAREGIVING AND SOCIAL ENGAGEMENT

J. Kim¹, H. Lee², 1. *Sociology, Social Work, and Criminology, Idaho State University, Pocatello, Idaho*, 2. *University of Minnesota, Twin Cities, St. Paul, Minnesota*

Introduction: Digital technology enables older adults to maintain independent life and involve in social engagement. Older adults' digital technology use also can affect their caregivers' caregiving experience and their life styles. However, little attention has been paid to whether older care recipients' digital technology use affects spouse caregivers' care involvement or their social engagement.

Methods: This study used 233 couples of community-dwelling older adults and their spouse primary caregivers from the 2011 National Health and Aging Trend Study and its companion National Study of Caregiving. Multiple regression analysis and Poisson analysis were performed to examine the associations between older adults' technology use and their spouse caregivers' hours of care and social engagement respectively. Older adults' technology use was measured by the online activities for a) health information (e.g., communicating with providers) and b) instrumental tasks (e.g., grocery shopping).

Results: Older adults' Internet use for instrumental tasks was negatively associated with their spouse caregivers' hours of care, but positively associated with spouse caregivers' social engagement after controlling for other relevant variables. However, older adults' health information technology use was not associated with their caregivers' care involvement or social engagement.

Discussion: Older adults' digital technology use for instrumental tasks reduced time invested in informal care and increased probabilities of engaging in social activities among their spouse caregivers. The findings imply that the online activities for instrumental tasks not only help to maintain independence in later life, but also support spouse caregivers to spend more time on socializing with family, friends, or relatives.

EXHIBITING CREATIVE STRENGTH IN THE COMMUNITY: FAMILIAL CAREGIVING, THE ARTS AND DEMENTIA

M. Morrison, *Community Health & Humanities, Memorial University of Newfoundland, St. John's, Newfoundland, Canada*

This research took place in St. John's, Newfoundland, Canada between 2012 and 2014. This qualitative arts-informed research elicited the stories of ten individuals with the experience of caring for a loved-one with dementia. Beginning with one on one semi-structured interviews, the participants described their caregiving journey and their understanding of creativity as well as its connection to dementia and dementia care. Following the interviews, the participants engaged in the process of creating a piece for an exhibit in the community. Through poetry, photo, painting, short story, geo-caching, mixed media, digital story, singing and song-writing, the ten participants exhibited their creative strengths. Findings show that encouraging creativity in caregivers addresses the health and well-being of caregivers, those living with dementia, and the community. This paper explores the potential of a strengths-based perspective when combined with creativity. This talk provides an overview of the arts-informed research process, a photographic walk-through of the "Care-full Pieces of Creativity" exhibit, and a discussion of its impact.

THE EFFECT OF CAREGIVING FOR OLD DIABETIC INPATIENTS' ONE-YEAR READMISSION IN SOUTHWEST OF CHINA

Q. Sun¹, Y. Li¹, Y.P. Zou¹, J. Li¹, X.F. Jing², B. Dong¹, S. Wang¹, 1. *The Center of Gerontology and Geriatrics, West China Hospital, Sichuan University, Chengdu, Sichuan, China*, 2. *Department of Clinical Nutrition, West China Hospital, Sichuan University, Sichuan, China, Chengdu, China*

Objective: Diabetes is one of the most common chronic diseases in older adults in China, accompanied with higher demanding on caregiver. But the impact of caregiver on old diabetic inpatient in one-year readmission still unknown.

Method: This longitudinal study was conducted at the Center of Gerontology and Geriatrics, West China Hospital from December 2011 to October 2012. All participants were followed up until December 2013. Demographics of diabetic inpatients (60 years and older) and ADLs, IADLs, timed "Up and Go" test (TUG), frailty were assessed, their caregiver were assessed by the Chinese version of the validated Zarit Burden Interview. The demand of caregiver was defined as following: more than two dependence of ADL and/or IADL and TUG more than 30s. The number of one-year readmission were collected by HIS or phone.

Results: A total of 145 diabetic inpatients were enrolled. Patients with caregiver were 67(46.21%), only 37(55.23%) of them targeted the standard of caregiver demand. Average age of all caregivers were 59.39 ± 14.35 (range 24 to 90), 52(78.8%) of them were female, 54.5% were patients' spouses. Half of patients 39(58.21%) with caregiver readmitted to hospital less than 1 time in a year. After adjusting by age, gender, Marital status, level of education, evaluation of caregiver's current health status (OR 0.391), occupation

besides caregiver, caregiver's attitude (OR 3.259) and their mood to their patients (OR 2.071) were the risk factors for one-year readmission.

Conclusion: For diabetic inpatients in China, the standard of caregiver demanding criteria need to set up. Caregiver's psychological problems should be paid more attention.

MENDING MAYA: AN ANALYSIS OF AGING AND INTERGENERATIONAL CONNECTION IN DELHI, INDIA

A. Chandra, *Connecticut College, New London, Connecticut*

Past research suggests that intergenerational programming can have positive effects in bridging generational gaps. In an effort to explore intergenerational programming in one specific, cosmopolitan community in India, this research examined intergenerational connection and understanding and tested the effectiveness of implementing an art-based intergenerational intervention called Mending Maya. The intervention engaged seven young adults from a young adult's empowerment and learning center and eight seniors at an old age home. This eight-week intergenerational intervention connected both young adults and seniors through three specific art forms: music, arts and crafts, and theater/meditation. Before and after the conclusion of this intergenerational intervention, intergenerational connection and understanding were explored in semi-structured interviews with senior program participants and young adults from the surrounding community (pre-program interviews), and with young adult intervention participants (pre and post-program interviews and structured assessments). Results revealed that intergenerational arts programming in New Delhi, India can be an effective way to repair and restore webs of attachments between generations both inside and outside the actual parameters of the program. Aspects of the program that appeared essential to supporting these effects were utilization and maximization of existing community resources and a focus on cultural values that emphasize family and community. The final discussion synthesizes perceptions of aging in a changing world and program evaluations in order to paint a picture of aging as it is currently understood in Delhi, India. The discussion also suggests ways the Delhi community can utilize intergenerational programming to enhance personal and community development through civic engagement.

EXAMINING INTERGENERATIONAL RELATIONSHIPS AMONG OLDER ADULTS IN TWO CITIES IN TRANSITION

J. Gangopadhyay, *IIT Gandhinagar, Gandhinagar, India*

The successful aging model marked by an emphasis on the self has dominated the gerontological tradition in a majority of the western industrialized countries. However, this narrative of active, socially engaged and consumer centric aging is not a contextually homogenized process as experienced by older adults elsewhere, where "meaningful decline" defines older adults' renegotiation with familial relationships, expectations, religion and death. Borrowing social-psychological and gerontological perspectives the current study examined the co-existence of these two contrary models-disengagement

and successful aging in two cities that are in transition Ahmedabad (Gujarat, India) and Saskatoon (Saskatchewan, Canada). Drawing from in-depth interviews this study examined intergenerational relationships and expectations around filial ties, emotional bonds, network ties, cultural ideologies and their contribution in forging the aging identity in these two contexts among older Indians in Ahmedabad and those in the transnational setting. Findings suggest that despite the Asian traditional values and expectations surrounding caregiving and support from adult children older Indians in Saskatoon have reconfigured their expectations and are re-negotiating between the two cultural worlds by embracing the successful aging model. In contrast, a structured dependency in terms of economic support and psychological needs is preserved, legitimized and nurtured in the older adult-adult children relationship in Ahmedabad where older parents contribute to household and grandparenting duties while expecting caregiving, support and respect in exchange. By adopting a comparative perspective, the study demonstrates how everyday life of older adults is constructed, lived and produced and role of cultural forces shaping the experience of growing old.

LEARNING HEALTHY AGING ACROSS GENERATIONS: THE CONTRIBUTIONS OF OLDER ADULTS

S.Y. Chen, *Graduate Institute of Elder Education, National Chung Cheng University, Chia-yi, Taiwan*

This study aims to explore the contributions and impact of older adults in the college course of elderly health promotion. There were 83 undergraduate students taking an intergenerational course between 2015 and 2016, learning with the active older adults in eighteen weeks. The course was designed with life course theory and the transtheoretical model to increase the students' awareness of health and cared about family older adults. It also involved intergenerational teaching strategy to let students and older adults learned together about elderly health. Furthermore, students were acquired to conduct a healthy lifestyle project and wrote three reflection papers between the learning processes. This study adopted qualitative method that triangle analyzed 249 reflection papers, 83 healthy lifestyle reports and 32 curriculum observation records, and doubly recorded by a health educator. The result showed

that the intergenerational learning increased the students' health awareness and improved understanding what is aging. Older adults were as a role model of healthy aging, provided the real living experiences, let the students understood that aging is a continuing process which is not always accompanied with a weak body. Healthy aging is based on practicing healthy lifestyle everyday from young to old. The active engagement of the older adults allowed students to realize the importance of mental health in the later life. Health assessment and health lifestyle project had aroused students' concerns that their unhealthy lifestyle had been harmful for their health, so improved to practice healthy life actively. Active older adults enhanced the learning effects.

SESSION 3580 (POSTER)

CRITICAL AND CULTURAL GERONTOLOGY

OLD AGE, NEW SCIENCE: GERONTOLOGISTS AND THEIR BIOSOCIAL VISIONS, 1900–1960

H. Park, *History, Nanyang Technological University, Singapore, Singapore*

My presentation is based on my new book, *Old Age, New Science: Gerontologists and Their Biosocial Visions, 1900–1960* (Pittsburgh: University of Pittsburgh Press, 2016). This book offers a novel interpretation of gerontology's origins, after W. Andrew Achenbaum's pioneering monograph, *Crossing Frontiers* (1995). I argue that what I call the "biosocial visions" profoundly shaped the structure of American and British gerontology in their early years as well as early gerontologists' effort for public engagement, which left persistent problems regarding gender, race, and class. While Achenbaum concentrated on the history of social gerontology, I focus on biological and medical scientists in the first half of the twentieth century, because they and their visions constructed gerontology as a multidisciplinary science. I show how their biomedical research fostered their individualistic discourse of seniors' self-help based on scientific experts' advice as well as their rhetorical resources for cooperating with social gerontologists. I also analyze the notion of "scientific rigor," which Achenbaum took for granted in his historical study of biogerontologists, such as Nathan Shock. In my presentation, I deal with scientific rigor as a contentious discursive strategy subject to constant negotiations. While these negotiations were instrumental in gerontology's emergence as a respected science in America, the situation was different in Britain, where institutionalized public welfare and national health insurance was considered prior to scientific studies of aging, especially during the post-Second World War efforts for promoting a welfare state. This resulted in the underdevelopment of gerontology in Britain, while seniors there enjoyed a better provision of national insurance and pension, which American gerontologists deeply suspected with their individualist ideal of self-help.

SYSTEMATIC REVIEW OF THE IMPACT OF ARTS FOR HEALTH ACTIVITIES FOR OLDER PEOPLE IN CARE HOMES

A. Curtis, *Faculty of Health and Social Care, Edge Hill University, Deeside, Flintshire, United Kingdom*

As the population of older adults increases, so too will the number of older people requiring long-term care. Older people who live in care homes are vulnerable to stressors which may impact upon both physical and psychological wellbeing. There is interest in the benefits of arts for health for older people in care homes, but no systematic review has yet been carried out. In this systematic review, potentially relevant qualitative and quantitative empirical studies were sourced from EMBASE, AMED, CINAHL, PsychInfo and Medline, without date restrictions. Additional hand-searching and 'grey literature' searches were also conducted. An inclusion/exclusion form was used to screen for eligibility and all studies underwent data extraction and quality appraisal. PRISMA (Liberati et al, 2009; Moher et al. 2009) guidelines were adhered to throughout. A total 1091 papers were identified from the searches. Of these,

179 were potentially eligible for inclusion and screened, leaving a total of 88 relevant studies that were included. These studies covered a range of arts activities, designs, methods and different outcomes related to overall health, wellbeing and quality of life. Findings were then synthesised mapped to form a typology of arts activities and their benefits. This systematic review showed that evidence of the impact of Arts for Health on wellbeing in older people who reside in care homes is varied and encompasses a range of arts activities and outcome measures. Furthermore, the quality of evidence was shown to vary across studies.

THE ASSOCIATION OF LIVE PERFORMANCE ATTENDANCE AND COGNITIVE DECLINE IN A BIRACIAL POPULATION STUDY

R.S. Rajan², K.B. Rajan¹, L.K. Manning², 1. *Rush University Medical Center, Chicago, Illinois*, 2. *Concordia University Chicago, River Forest, Illinois*

Research on healthy aging practices continues to explore innovative ways of supporting older adults and there is a growing need for understanding how cognitive decline may be associated with the aging process (Rajan, Hebert, Scherr & Evans, 2012; 2013). In examining the long-term association of musical performance attendance on changes in cognitive functioning for older adults, we tested the hypothesis that attendance at live performances (concert, play, or musical) will be associated with slower cognitive decline. This study used a sample of 5,567 older Americans age 65 and older with two or more cognitive assessments over 15 years from the Chicago Health and Aging Project. A linear mixed effects regression model adjusting for demographic variables was used to assess cognitive decline in a biracial population sample of African Americans (AAs) and European Americans (EAs). More frequent arts attendance was associated with a higher level of baseline composite cognitive function among older African Americans and European Americans; this association was almost twice as high among EAs than AAs. Attending 10 or more musical events per year was associated with 15% slower cognitive decline among AAs and 30% slower cognitive decline among EAs. A similar association was observed for change in MMSE among AAs and EAs. Our findings suggest that attending a higher frequency of live performances was associated with slower decline in cognitive function and that attending live performances should be encouraged as a valuable component of arts participation and enrichment in the lives of older adults for its cognitive benefits.

LIVING CANVASES: BRIDGING INTERGENERATIONAL UNDERSTANDING AND CONNECTIONS THROUGH ART

T.L. Gruenewald^{1,2}, C. Cady², S. Kariyawasam², A. Puckett², P. San Pedro³, 1. *California State University, Long Beach, California*, 2. *University of Southern California, Los Angeles, California*

Living CanvasesSM is an intergenerational life review and art-making program designed to bring together younger and older individuals and the community as a whole. During a series of workshop discussions, elder participants chart their life stories and share important turning points in the life course. Audio recordings of workshop discussions and

written descriptions of turning point experiences are then shared with young artists who use elders' stories as inspiration for the creation of visual, performance or other forms of art. Turning point stories and the art the stories inspired are then shared during a recognition reception which brings together elder workshop and young artist participants and the broader community. This presentation will share findings from an implementation feasibility assessment of the institution of the program in older adult community service and residential organizations. To date, 69 older adults, 46 young adult artists, and six community organization collaborators have participated in the program. Initial findings of the implementation feasibility assessment indicate overwhelming positive experiences among program participants. Older adult participants positively endorsed participation in the workshops and perceptions of the recognition reception (e.g., 90% felt they learned something valuable, 93% enjoyed sharing their life experiences, 93% felt honored). Young adult artist participants also reported many benefits (e.g., 100% learned valuable life lessons, 82% were inspired). Our presentation will address the challenges and promises of utilizing art inspired by elders' life stories as a tool for intergenerational connection and community building.

EXPERIENCE OF HEALTH AMONG CENTENARIANS: EXPECTATIONS AND ADJUSTMENTS

M. del Rio Carral, M. Santiago-Delefosse, D.S. Jopp, *Psychology, University of Lausanne, Lausanne, Switzerland*

Health issues among very old age concern concomitant illnesses and other physical or cognitive impairments that affect daily functioning. This situation often results in the loss of autonomy, including giving up of leisure activities that used to be part of everyday life and that used to give meaning to it. Particularly, research on centenarians has pointed out a discrepancy between the objective assessments of their health versus their health experience. The present study examines how centenarians experience health in daily life with the aim to better understand their own needs. Part of a broader survey conducted in the U.S. (Fordham Centenarian Study, N = 119; 78.2% females; 19.3% African American and 79.8% White), we analyzed the answers given by 77 centenarians to open-ended questions about their current challenges, by applying a thematic content analysis technique (Braun & Clarke, 2006). Findings indicate 3 different types of perceived challenges: 1) lived corporeality, 2) sociocultural activities and interactions, and 3) existential being and psychological adjustments. These challenges are embedded in concrete living conditions, and their integration at psychological level implies constant modifications. Centenarians' health experience appears as a dynamic process where representations and expectations are continuously readjusted to both, corporeality and sociality. Aging successfully appears related to the progressive transition to a different "lived world" with specific needs. In this "world", loss is an overarching key issue where new ways of living that can provide pleasure are found. This study points the interest of adopting a comprehensive perspective to the understanding of ageing.

AGEING, IDENTITY, AND EDUCATION—THE ROLE OF EDUCATIONAL GUIDANCE IN THE THIRD AGE

V. Gallistl, A. Wanka, F. Kolland, *University of Vienna, Vienna, Austria*

Research on late-life learning emphasizes its contributions to wellbeing, autonomy and inclusion in older age (Jenkins & Mostafa 2015), and even though participation rates in adult education in most European countries are rising (UNESCO 2013), senior education can't yet be considered a fundamental part of older adults' lifestyles. Policy has discovered the concept of educational guidance to attend to this challenge (CEDEFOP, 2009), but its role for retired adults is yet to be researched.

Taking a cultural gerontological approach, this paper analyzes how older adults perceive and construct the role of education and guidance for their own doing of age. Analyzing 15 qualitative interviews with retired adults (57–75 years), we explore the role education and activity play in identity management and how guidance can open possibilities for new forms of education and ageing.

Results show an ambiguity of ageing as an experience of 'late freedom' on the one hand and fear of health decline, often accompanied by social and spatial disengagement on the other. Older age as a time of freedom is perceived as a life-stage of self-management. This perspective opens potential for guidance as individual coaching. Older age as physical decline is perceived as a biological determination that needs to be postponed as long as possible. This perspective opens potential for guidance as preparation for the transition to fourth age. Both perspectives follow, however, a determinist logic that calls for a third potential of guidance, namely the reflection of images of ageing that facilitate a humanization of older age.

HOPE AND HEALTH IN AGING MEXICAN-AMERICAN WOMEN WITH A LIVED EXPERIENCE OF INTIMATE PARTNER VIOLENCE

C. Divin, D. Volker, J. Champion, J.L. Angel, *University of Texas at Austin, Austin, Texas*

Intimate partner violence (IPV), a serious preventable public health problem, affects one in three women worldwide and crosses all boundaries including age, ethnicity, religion, and socioeconomic. From a salutogenic perspective, this qualitative study, guided by Interpretive Interactionism, not only explored the lived experience of IPV in aging Mexican-American women but captured the healing journey of 12 women, aged 55–85, recruited from the U.S.-Mexico border region. Each of the women, four of whom were Spanish speaking only, completed two semi-structured 60–90 minute audiotaped interviews. The interviews were coded and categorized. Epiphanies, transformational moments within the IPV experiences, were identified and major themes interpreted. The narratives revealed six themes that portrayed strength throughout and beyond IPV and highlighted influential factors in health and healing: "Un torbellino"... "A whirlwind of violence and emotions;" "A decision to leave for good;" "Healing and salutogenesis;" "A desire to break the cycle;" "Who am I today?"... "Proud, courageous, and content"... "Orgullosa, valiente, y contenta;" and "Life teaches us so much." All of the women in this study voiced a desire to break the cycle of violence for future generations and their wisdom offers hope. The findings underscore the

importance of holistic, culturally sensitive models of healing to improve health outcomes for aging women affected by IPV among other adversities. Given the mandate for an upstream approach to decrease IPV, the inclusion of aging survivors in primary prevention efforts merits further exploration.

TOWARD A GLOBAL GERONTOLOGY? HOW DO GERONTOLOGISTS THINK ABOUT GLOBALIZATION?

M. Hyde², P. Higgs², *2. Centre for Innovative Ageing, Swansea University, Wales, United Kingdom, 2. University College London, London, United Kingdom*

It is acknowledged that globalization is becoming more and more important for establishing a better understanding ageing and later life. The effects of the global economic crisis have destabilized many of the assumptions and policies around old age and challenged assumptions about ageing and place. These transformations increasingly question what has been described as the 'methodological nationalism' of much gerontological research. However, we would argue that globalization has often been undertheorised within gerontology and within research on older age. This paper outlines the differing ways in which gerontologists have conceived and deployed definitions of globalization. Drawing on Appadurai's model of differentiated dimensions of globalization we argue for the need to move away from unidimensional conceptualisations of globalization and towards the examination of how these dimensions, from the economic to the cultural, combine to create the uneven landscapes of global ageing. We contend that globalization should not be simply reduced to one over-riding logic which leads to 'a race to the bottom'. Neither should it be 'added' un-problematically to existing gerontological theories and approaches as just one more factor to take into consideration. Our paper argues that the relationship between globalization and later life is not simply about determining structures but is also about the changes to their lives that older people themselves have brought about through their own social and cultural engagements. These differing levels are now increasingly central to understanding the implications of the global transformation of ageing and later life.

AGING AS A BIOCULTURAL CONCEPT: A CASE STUDY OF ACTIVE AGING IN JAPAN

E. Ricart, G.W. Hougham, *Battelle Memorial Institute, Seattle, Washington*

Japan has the world's most aged nation with a large baby boomer population transitioning from young-old to old-old age. In an attempt to compress morbidity and minimize demands on the nation's generous long-term care insurance program, the government has been promoting preventive self-care that emphasizes activity. Drawing from over a year of ethnographic research in Japan on disease prevention in old age, we propose a new cultural analysis of how activity is understood to lead to health in old age.

In the discourse and practice of prevention in Japan, mental, physical, and social activity is said to be intrinsically beneficial to health in old age, but the discourse also allows for resetting social norms about how healthy seniors

should behave. In a climate of global exchange of knowledge, more explicitly binding activity with health in old age can be regarded as a direct reference to “Successful Aging” or “Active Aging.” However, the activity spoken of in gerontology, policy, and among lay seniors in Japan also indexes a cultural worldview wherein the body and surrounding environments are said to emit and circulate energies reminiscent of popular or shrine Shinto and Confucian notions of *ki*. “Activity” in this frame stimulates and restores latent energetic potentials within individuals to flow from the self into the world that in turn leads to healthy aging. We discuss how activity and healthy aging are inherently bio-cultural concepts, and ask how governments might expressly condition discourse around healthy aging to align with those alternate framings.

LIFE REVIEW AND REMINISCENCE: THE VALUE OF BEING HEARD

P. Mahoney, *Gerontology, San Francisco State University, Pacifica, California*

Life Review and Reminiscence: The Value of Being Heard

From the beginning of time there have been storytellers, before the written word there was the spoken word. Telling stories about ourselves is part of what makes us human. If we are not given the opportunity to be heard, we lose a significant part of our identity. There is growing research that giving an older person an opportunity to tell their story not only alleviates stress, loneliness and depression but can save money.

Researchers; Bohlmeijer, Valenkamp, Westerhof, Smit, and Cuijpers (2005) used a pre-post test design that consisted of 12 group sessions, 2.5 hours each, engaged participants in reminiscence and creative expression, the goal of which was to reduce levels of depression. The pretest and posttest (one week after the intervention) included well-established depression scales, measuring in part, -mastery and meaning of life. There were 79 participants and their average age was 66 years, 70 % were female, and 55.7% lived independently. Results from the pre- and post-test analyses showed marked improvement on the depression scale (i.e., a reduction of 3.4 points) and on the mastery scale.

A Netherlands Study at the University of Twente (2015) asserts improvement in the mental health of older adults after “life reviews” were conducted compared with usual care conditions: 6-month follow-up treatment response was 54.0% and 27.5% in the life-review and usual-care conditions, respectively. The difference in effectiveness was statistically significant at $p=.001$. In addition, this intervention cut medical costs.

THE IMPACT OF RELIGIOSITY ON MEANING-MAKING AMONG OLDER ADULTS

J. Walsh¹, C. Hosseini¹, J. Allen², F. Alpass², C. Stephens², L.M. Brown¹, 1. *Palo Alto University, Los Gatos, California*, 2. *Massey University, Palmerston, New Zealand*

Recent research has examined the construct of religiosity in relation to meaning-making and purpose of life. Additional studies have found that religious coping is strongest in older adults compared to younger cohorts. Using data from two Massey University studies: The Health, Work,

& Retirement Longitudinal Study (HWR) and The New Zealand Longitudinal Study of Ageing (NZLSA), the purpose of this study was twofold. First, the study aims to identify the extent to which older adults utilize religion. Second, the study analyzes the impact of religiosity, or lack thereof, on their sense of meaning and purpose in life. In 2008, data was collected nationwide with 2-year reassessment intervals. The sample consisted of 6,653 older adults between the ages of 55 to 70 who were living in New Zealand and were randomly selected from the electoral roll. Of participants surveyed, 32% reported attending religious services and 20% reported that their faith was an important piece of their lives. A logistical regression was run and a significant association was found between religiosity and meaning-making. While it is not the role of clinicians to advocate any specific systems of beliefs, they should remain cognizant of the manifold spiritual questions which may arise throughout the aging process. This analysis posits that religiosity may offer a unique cognitive framework and may be a valuable resource in mitigating older adults’ feelings of loss of control, improving their life satisfaction, and strengthening their sense of purpose and meaning in life.

CULTURAL AND LINGUISTIC ADAPTATION OF AN EVIDENCE-BASED STRESS-BUSTING PROGRAM FOR CAREGIVERS

M. Chung¹, T.V. Gonzalez², S. Lewis³, D. Billa⁴, L.C. Arevalo-Flechas⁵, 1. *University of Texas at San Antonio, San Antonio, Texas*, 2. *University of Texas Health Science Center, San Antonio, Texas*, 3. *Stress Busting Program LLC, San Antonio, Texas*, 4. *WellMed Charitable Foundation, San Antonio, Texas*, 5. *South Texas Veterans Health Care System - GRECC, San Antonio, Texas*

In the United States, 17.6% of the population is Hispanic, yet many preventative health programs are not culturally or linguistically adapted for Hispanic communities. This gap hinders Hispanics, especially those who prefer to speak Spanish, from accessing culturally appropriate health information and overcome health disparities. Hispanics are 1.5 times more likely to develop Alzheimer’s disease than non-Hispanics. The Stress-Busting Program for Family Caregivers, rated by the Administration of Aging at the highest level of evidence, addresses the needs of caregivers of people living with dementia. The Spanish version of the program was produced following translation and consensus protocols, culturally adapting the translation and format to reflect core Hispanic cultural values. The translation, adaptation, and delivery methodology of the program meet eight criteria (Meleiss, 1996) needed to consider the Spanish version of the Stress-Busting Program for Family Caregivers culturally competent. The criteria are: contextuality, relevance, communication styles, awareness of identity and power differentials, disclosure, reciprocation, empowerment, and time. The incorporation of these methodological practices for program translation and adaptation can serve as a model for translational research for other interventions that need cultural adaptations for ethnic minorities. This project contributes to closing the gap in health disparities experienced by Hispanics.

SESSION 3585 (POSTER)

CULTURAL, DIVERSITY, AND MINORITY ISSUES, ABUSE AND DISCRIMINATION

PARTICIPATION IN LOW-INCOME FINANCIAL ASSISTANCE PROGRAMS BY OLDER ADULTS IN CHINA

H. Li, *School of Social Work, University of Illinois, Urbana, IL, Afghanistan*

Objective: Guided by Andersen's help-seeking behavior model, this study identified factors that contributed to older adults' participation in low-income financial assistance programs in mainland China.

Methods: The data used were extracted from the 2008 Chinese Longitudinal Healthy Longevity Survey (CLHLS). This study included 11,720 community dwelling older adults who were of 80 years or older. A logistic regression analysis was used to identify factors contributing to older adults' participation in low-income financial assistance programs.

Results: The study results showed that 32.1% of older adults participated in low-income financial assistance programs. With respect to predisposing factors, older adults' age (OR=1.09, $p<0.0001$), co-residence status (OR=0.78, $p=.0003$), and marital status (OR=1.56, $p<0.0001$) were significantly related to their participation in the programs. With respect to enabling factors, older adults' residential locations (OR=1.31, $p=0.0001$), financial strain (OR=1.09, $p=0.01$), pension status (OR=.26, $p<0.0001$), perceived instrumental support (OR=.64, $p<0.0001$), and perceived emotional support (OR=1.41, $p=0.002$) were significantly related to their participation in the programs. In addition, older adults' self-reported health status (OR=.89, $p<0.0001$), felt loneliness (OR=1.11, $p<0.0001$), and functional limitations in instrumental activities of daily living (OR=1.02, $p=0.01$) were significant need factors to their participation in the programs. The study findings suggest that low-income financial assistance programs seem to reach the vulnerable older adults. However, the study findings also reveal potential urban biases of the programs. Research and policy implications of these findings will be discussed.

LIFE COURSE ANALYSIS OF GAMBLING AMONG OLDER CHINESE-CANADIANS

H. Luo, *University of Manitoba, Winnipeg, Manitoba, Canada*

It is evident that cognitive, personality, and psychological aspects cannot explain all gambling behaviors among older Asian-Canadian people. Cultural and structural variables also play a role in the development of gambling among older people, as well as their previous life histories and their social supports. Applying life course analysis with a constructivist grounded theory approach, this study drew a sample of six Chinese and seven Filipino older gamblers in a central Canadian city to understand the development and behavior of gambling, including seven females and six males. While the majority of these gamblers demonstrated minimal to moderate levels of problems, two were assessed as problem gamblers by the Canadian Problem Gambling Severity Index.

From the perspectives of lifelong development, human agency, cohort, timing, and linked lives, older gamblers reported varied pathways to recreational gambling or

problem gambling as results of intertwined familial, structural, and environmental factors. Traumatic childhood experience (mainly caused by wars and underdeveloped economics), stressful survival environments in young and mid-adulthood (particularly after migrating to Canada as an immigrant or refugee), conflicts and transitions within the family in mid- and late adulthood (as direct or indirect consequences of early life stress), along with the cultural norms and personal attitudes towards gambling, appear to influence gambling trajectories for these older Asian-Canadians. The presentation concludes with a critical discussion of the effectiveness of current intervention practice, as well as a proposal for a prevention-intervention-support model based on the strengths of life course perspectives, for helping professionals working with minority older adults.

ENVIRONMENTAL DESIGN AND QOL IN LONG-TERM CARE FACILITIES

S. Brennan¹, H. Osada¹, T. Doan², D. Yee-Melichar², 1. *J.F. Oberlin University, Tokyo, Japan*, 2. *San Francisco State University, San Francisco, California*

The current concept of long-term care (LTC) facilities has shifted from a homogenous health care institution, to that of individual person-centered care. The design characteristics of the physical environment is a particularly noteworthy aid in caring for elders with dementia. As such, this concept of person-centered care has been adapted and implemented by LTC facilities worldwide in slightly different manners. As dementia progresses, elders tend to find their quality of life (QOL) rooted in environment settings; therefore, a purposeful therapeutic environmental design can have a positive effect on the well-being and functionality for those with dementia. The purpose of this research was to examine the relationship between the environmental design in LTC facilities and its effect on elders with dementia's daily activity patterns and quality of life. The data for this research was collected at Assisted Living facilities in San Francisco and comparable level of care facilities in Japan. Environmental scales (TESS-NH/RC, EAT-HC, and PEAP) were used to assess the environmental design of the senior facilities. The residents with dementia were observed using the Dementia Care Mapping tool and then classified using the Quality of Life-Alzheimer's Disease assessment. The study hypothesized that facilities with higher scores in physical environment attributes would have a positive impact in the resident's quality of life. The findings of the research define the similarities and differences in quality of life for persons with dementia between American and Japanese facilities. The results of this study will be issued.

PERCEPTIONS AND EXPERIENCES OF WORKPLACE-BASED AGE DISCRIMINATION IN AUSTRALIA

K. O'Loughlin², H.L. Kendig¹, R. Hussain¹, L. Cannon¹, 1. *Research School for Population Health, Australian National University, Canberra, Australian Capital Territory, Australia*, 2. *The University of Sydney, Sydney, New South Wales, Australia*

The Australian Human Rights Commission in 2011 appointed an Age Discrimination Commissioner who has conducted widely publicized campaigns to improve attitudes to ageing and combat ageism. This paper examines perceptions and experiences of age discrimination in the workplace among

Australians aged 18+ years, with a focus on those aged 55+ years.

Data are from a representative national sample of adults in the Australian Attitudes to Ageing (AAA) study conducted as a component of the Australian Survey of Social Attitudes (AuSSA) in 2015–16 (n=1211).

Results show that overall 46% of people perceived age discrimination to be common in Australia. Participants believed that compared to younger workers, older workers (55+ years) were more likely to be made redundant (82%), less likely to be promoted (72%), and more likely to have difficulty adapting to change (59%). The majority disagreed that they were less productive than younger workers (74%).

In regards to experiencing age discrimination, younger people (18–24 years), were more likely to report age as a factor in being turned down for a position (23%), being treated with disrespect (53%) and being ignored (41%). Significant differences were found in terms of age and gender, for example, more women reported they had been ignored (31%) and treated with disrespect (30%).

The findings are interpreted in the context of Government policies, demonstration projects, and other interventions intended to maintain workforce participation and increase self-funded retirement as responses to population ageing.

GAMBLING AMONG CULTURAL MINORITY OLDER ADULTS: A MIXED METHODS SYSTEMATIC REVIEW

H. Luo, *university of Manitoba, Winnipeg, Manitoba, Canada*

Despite growing numbers of older gamblers, many of whom are cultural minority group members, there has been a lack of systematic reviews of gambling among this particular population. This is the first systematic review of empirical evidence in the literature on how gambling has been affecting older adults from cultural minorities. This review applied a mixed methods approach to examine both quantitative and qualitative studies published between 1996 and 2016. A thorough search of seven databases yielded 17 articles with a total sample of 9,044 older gamblers of cultural minority backgrounds. Eleven were quantitative studies and six were qualitative (including one mixed methods study). Nine studies (53%) focused or included Asian seniors, five (29%) on African-American older adults, four (24%) included indigenous populations, and one (6%) included a Hispanic sample.

Lifetime gambling prevalence rates range from 26.6% to 92%, while problem gambling rates from 2.2% to 17%. Onset ages vary from as early as 7 or 8 to 69. Causes of gambling include enabling (environmental) factors and motivational (personal) factors. Enabling factors are cultural acceptance, socializing/bonding power of gambling, social networks, accessibility (availability, transportation, and low entry barriers), and external stimuli. Motivational factors include intentions of reducing boredom, increasing socialization, enjoying freedom, reducing stress, and winning money. Both categories of factors can also act as buffers that hinder gambling behavior. Findings on consequences of gambling, personal coping strategies, and intervention practice are also synthesized. The review is concluded with a critical discussion of findings, gaps in research, and suggestions for future investigation.

SKILLED NURSING FACILITIES THAT DISPROPORTIONATELY SERVE MEDICARE BENEFICIARIES IN THE U.S.

M. Rivera-Hernandez, M. Rahman, V. Mor, A. Trivedi, *Brown University, Providence, Rhode Island*

With more than \$62 billion in annual spending, post-acute care (PAC) has become Medicare's fastest growing category of health care expenditures and a major source of regional variation in overall Medicare spending. Yet, studies have not evaluated care quality for minority patients who are discharged to skilled nursing facilities (SNFs) after acute care hospitalizations. The objective of this paper is to assess the concentration and quality of SNFs that care for black and Hispanic patients, including those in Medicare fee-for-service (FFS) and Medicare Advantage (MA). We used cross-sectional data of SNF performance measures and facility characteristics associated with quality of care from 2013. There were approximately 575,147 White, 65,562 African American and 33,354 Hispanic Medicare enrollees in FFS and MA aged 65 and older admitted to a SNF. Approximately 27% of SNFs accounted for 80% of all admissions for black patients. Care was even more concentrated for Hispanics, with 19% of all SNFs accounting for 80% of Hispanic patient care. SNFs with higher fraction of blacks (~30%) were more likely to have less direct care: Total RN hrs/day/resident (0.02), higher hospitalization rate (3.00%), and lower star ratings (0.63) compared to SNFs with no black patients. Differences remained the same after we stratified by whether patients were in MA. Only minor differences were found for SNFs with higher fraction of Hispanics. Racial and ethnic minorities in the Medicare program, particularly blacks, are concentrated within a small number of SNFs with worse measured performance and characteristics associated with lower quality.

PARTICIPATORY RESEARCH PROJECT FROM THE PERSPECTIVE OF ELDERLY MIGRANTS FROM THE FORMER SOVIET UNION

N. Schulz, *University of Cologne, Cologne, NRW, Germany*

In the context of increased urbanization and migration in the last century, public health research has evolved to explore the impact of urban environments on health. Especially community-based participatory research, that involves direct contact with migrant participants, can provide a more comprehensive understanding of complex health and social issues and aims for social change for example, by developing health interventions on behalf of people who are disadvantaged. Usually this approach is designed to enable migrant participants to take greater control over their lives by providing mechanisms through which they could define and solve their own problems rather than rely on outside "expert".

But what happens, if the direct access to the relevant migrant participants is difficult and specific barriers (e.g. mistrust, experience of discrimination, power imbalances,) cannot be overcome? By taking the example of my ethnographic research, I would like to show from the point of view of elderly migrants from the former Soviet Union, participated as a group in a health intervention program in Germany, how they construct insider-outsider-status of researcher, practitioners and policy-makers. Through observing, interacting with, participating in their activities, and analyzing data (fieldnotes, interviews), I found out the relevance of ethnicity,

age and gender among this group and the multiple lines of differentiation and the interplay of these categories within the group. Results of analysis clearly indicate that the group creates mechanisms of inclusion and exclusion in order to protect themselves from marginalization and to keep their group as a space of security and well-being.

OLDER ADULTS' GENDER IDENTITY AND SEXUAL ORIENTATION: THE IMPORTANCE FOR END-OF-LIFE CARE

K. Wilson¹, K. Kortés-Miller², A. Stinchcombe^{3,4,2}, 1. *Family Relations & Applied Nutrition, University of Guelph, Guelph, Ontario, Canada*, 2. *Lakehead University, Thunder Bay, Ontario, Canada*, 3. *International Longevity Centre (Canada), Ottawa, Ontario, Canada*, 4. *University of Ottawa, Ottawa, Ontario, Canada*

As Canada's population is aging, so too is the lesbian, gay, bisexual, and transgender (LGBT) community. Although the body of literature on LGBT aging is growing, very little of the research focused on end-of-life care originates from Canada. To begin to fill this gap, pilot research with LGBT older adults was conducted in three regions in Ontario. This presentation will feature findings from focus groups on the lived experience of twenty-three self-identified LGBT older adults. Despite commonalities pertaining to perceptions of end-of-life that apply generally to aging and older adulthood, through our analysis a key finding is that sexual orientation and gender identity have unique implications for end-of-life. Key themes include the need for autonomy and control and unique considerations around social connections and supports. A salient finding was related to the heteronormative assumptions of many health and social care providers and fears about need to 'return to the closet' to receive quality end-of-life care. Integrating the research literature and the lived experience of our participants, recommendations are proposed and will be presented as a 'Call to Action.' These recommendations encompass new directions for clinical practice, research, and law and policy, and taken together their implementation would lead to cultural competence in the area of LGBT aging across the health continuum, with the goal of improving end-of-life and quality death experiences.

TWO BERLIN RESEARCH PROJECTS: HOUSING PROJECTS AND LONG-TERM CARE FOR LGBT SENIORS

R. Lottmann¹, M. Castro Varela^{2,1}, I. Kollak¹, 1. *Alice Salomon University Berlin, Berlin, Germany*, 2. *Institute for Human Sciences, Vienna, Vienna, Austria*

GLEPA ("Gleichgeschlechtliche Lebensweisen und Pflege im Alter") analyzes discrimination practices against LGBT elders, who are in need of care. The study focuses on the special demands of LGBT elders in long-term care facilities and evaluates the chances of a Dutch care certificate ("The Pink Passkey"). GLEPA also examines the opportunities and risks of LGBT housing projects for the mentioned target group.

A first research was based on interviews with experts and tenants of the "Lebensort Vielfalt", a housing and care project that opened in 2012 in Berlin, organized by the gay and lesbian community and a gay counselling organization. Subsequently, GLEPA is based on narrative interviews with

LGBT elders, who are in need of care, professionals working in long-term care facilities as well as on discussions in focus groups of experts.

The research was able to isolate LGBT-related strategies and requirements to avoid heterosexism, homo- and transphobia and other forms of discrimination in the care of elderly LGBT people. In addition, GLEPA defined LGBT-specific needs and expectations a supportive (long-term) care should meet.

The results of the qualitative research provided a basis to outline new models of community care-based services, both within and outside the LGBT community. GLEPA renders visible the consequences of discrimination against elderly LGBTs as well as the potential of a biography-sensitive care service capable to offer a more individually tailored care-approach. Furthermore, the possibilities of a certificate for LGBT-sensitive care will be discussed.

USING EVIDENCE TO REVISE COLORADO ADULT PROTECTIVE SERVICES' ASSESSMENT PROCEDURES

L. Hasche¹, P. Rogers², 1. *Graduate School of Social Work, University of Denver, Denver, Colorado*, 2. *Colorado Adult Protective Services, Denver, Colorado*

In 2014, Colorado's Adult Protective Services implemented a statewide, electronic assessment tool that captures risk and safety data on older clients who are at risk of abuse, neglect, and exploitation. The assessment tool is designed to help guide service planning and monitor outcomes over time. This study aimed to validate the assessment procedures by analyzing retrospective assessment data for one year (n = 1,581 cases), surveying with case vignettes to determine reliability (n = 49 workers), and conducting focus groups on utility, feasibility, and areas for improvement (n = 42 workers). The assessment included 70 risk and safety factors across the areas of: physical functioning, environmental context, financial resources, mental health and cognition, medical issues, and support systems. Findings indicated ways revisions could minimize repetition, reflect better the scope of practice for adult protective service workers, and calculate valid total scores for monitoring changes over time. From the preliminary analysis, the scores tend to trend as expected with follow-up risk scores being lower than baseline risk scores. Similarly, follow-up safety scores are higher than baseline safety scores. Themes regarding areas for improvement include: (1) omitting risk factors that are not modifiable / not applicable from total score calculations; (2) including items regarding client refusal of services; (3) simplifying the mental health and cognition subscale; and (4) increasing training to decrease subjectivity. Implications from this study can highlight best practices in assessment procedures and how research-practice partnerships can be used to improve adult protective service response to elder maltreatment.

ADDRESSING ELDER ABUSE IN ETHNO-CULTURAL MINORITY COMMUNITIES IN BC: MAPPING THE KNOWLEDGE GAP

K.M. Kobayashi¹, K. James², 1. *Sociology, University of Victoria, Victoria, British Columbia, Canada*, 2. *University of British Columbia, Vancouver, British Columbia, Canada*

This project represents a collaborative effort between academic researchers, elder law practitioners, and not-for-profit multicultural service provider administrators

and staff. It addresses elder abuse in relationship to two other salient themes, the law and ethnicity, identified by the National Initiative for the Care of the Elderly as priority areas for research, networking, and knowledge transfer in improving the care of older adults. The project has three main objectives: (1) to explore the nature of elder abuse in the two largest ethnocultural minority communities in BC, the Chinese and South Asians; (2) to conduct a mapping exercise to determine what elder abuse tools – both digital and paper – currently exist for these communities; and (3) to present our assessment to a meta-focus group of key service provider representatives to solicit their feedback on our findings, and to create both a visual map of resources and an agenda for developing needed tools. Two key outcomes that have emerged from this leadership collaboration are: (1) a visual map of existing and needed resources that will be used to build awareness to prevent, recognize, and respond to elder abuse in these communities; and (2) the development of one awareness-building tool for each community – a poster – that fills an identified gap in the current resource pool. In the end, the project served to improve support for elder abuse response mechanisms by: (1) facilitating the sharing of resources across participant organizations and their affiliates; and (2) enhancing already-existing informal and formal networks of support across sectors.

TRADITIONAL CHINESE MEDICINE AND PHYSICIAN USE: FINDINGS FROM CHINESE AMERICANS IN THE PINES

D.D. Nguyen¹, J. Liu², A.C. Mui², X. Dong³, 1. *Temple University, Philadelphia, Pennsylvania*, 2. *Columbia University, New York, New York*, 3. *Rush University, Chicago, Illinois*

Background

Immigration from China accounts for the majority of the Asian American population. Despite a growing population, little is known about how Chinese immigrants use health care services. Particularly, the extent of traditional Chinese medicine use and its concurrent effects on health care service use is poorly understood. To address this knowledge gap, this study uses existing data to examine older Chinese immigrants, their use of traditional Chinese medicine (TCM), and physician contact.

Methods

This study analyzed data from the Population Study of Chinese Elderly in Chicago (PINE), a community-engaged, population-based epidemiological study of older Chinese adults living in the Greater Chicago area (N=3158). Negative binomial regression models were used to examine physician contacts.

Results

Eleven percent of the sample used acupuncture, and 12% used massage therapy. Over 90% of acupuncture users had physician contact. Negative binomial regression results showed that using acupuncture and massage was associated with increased frequency of physician visits. A moderating model was tested to isolate the effects of TCM use and chronic medical conditions, which showed an increase in the number of medical conditions among acupuncture users was associated with decreased frequency of physician visits.

Discussion

This study revealed the effects of culture and health on physician contact. The use of TCM did not reduce physician contacts. The moderating effects of the number of medical conditions implies a need for those suffering from the burden of diseases. Gerontological practice and policy should seek to integrate approaches to meet the needs of older adults.

RURAL AGING HEALTH RESEARCH: RECRUITMENT AND RETENTION STRATEGIES

B. Jeffery¹, S. Johnson¹, J. Bacsu², 1. *Faculty of Social Work, University of Regina, Prince Albert, Saskatchewan, Canada*, 2. *University of Saskatchewan, Saskatoon, Saskatchewan, Canada*

Recruitment and retention of older adults in research can be challenging, especially within the rural context. Drawing from three different rural aging studies in Saskatchewan, Canada, this presentation will discuss the challenges and range of strategies used to recruit and retain research participants in a rural setting. Specifically, this presentation will address: 1) unique challenges within the rural context; 2) a range of recruitment and retention approaches; 3) the strengths and barriers of using these methods; and 4) reflections and lessons learned to strengthen future research. The challenges spanned personal, structural, and societal contexts and included poor health, smaller population, distance, many living alone, distrust of outsiders, and limited access to health services. Two of the studies utilized a community based approach to recruitment with active involvement of community leaders and local partners in four rural communities. The third study involved service providers in the home care network and local community members within two regional health authorities. Our approaches highlight the importance of relationship building through regular researcher presence in the community and participation in local events to build trust before recruitment begins. Our strategies included: community advisory boards; local information sessions; flexible methodologies; in-person interaction; attending community events; trust and relationship-building; and using diverse forms of communication (e.g., newsletters and workshops) to share study updates and findings. We will reflect on the supports and barriers associated with these strategies and offer lessons learned to assist other researchers interested in aging research.

SESSION 3590 (POSTER)

DATABASES ON AGING

AGER (ACUTE GERIATRICS): A NEW DATABASE OF CLINICAL AND BIOLOGICAL DATA FROM ACUTE GERIATRICS WARDS

L. Zerah^{1,2,3}, H. Le Petitcorps^{2,3,4}, E. Bouvard^{3,5}, C. Thomas^{3,6}, E. Magny^{2,3,4}, C. Tourette³, E. Pautas^{2,3,4}, 1. *Department of Geriatrics, Unit of Peri-Operative Geriatric care, Groupe Hospitalier (GH) Pitié-Salpêtrière, APHP, Paris, France*, 2. *Sorbonne University, University Pierre and Marie Curie (UPMC) Paris 06, Paris, France*, 3. *University Hospital Department Fight Aging and Stress*

(DHU FAST), Paris, France, 4. Department of Geriatrics, GH Charles Foix, APHP, Ivry sur Seine, France, 5. Department of Geriatrics, GH Tenon, APHP, Paris, France, 6. Department of Geriatrics, GH Saint Antoine, APHP, Paris, France

Since October 2014, geriatricians of 5 geriatric wards in teaching hospitals within the FAST (Fight Ageing and STress) university department (Pierre et Marie Curie university, Paris, France), implement a common database named AGER (Acute GERiatrics). For each patient hospitalized for an acute pattern, 134 social, clinical, therapeutic, biological and evolutionary (collection at 1, 3, 6, 12 months) datas were collected systematically and prospectively. The aim was to include 1500 to 2000 patients per year.

Preliminary results of 1261 patients aged 75 years or older, mean age 86 ± 6 years, sex ratio female/male 2, median hospital stay 12 days [8–16], were obtained with the first extraction in May 2015 (will be complemented by a second extraction under 12 and 18 months from the beginning of inclusions). These patients, whose 75% of them were hospitalized from emergency departments, had several comorbidities (median Charlson score: 3 [1–4], 29% with dementia) and polymedication (median number of medications 6 [4–9]). The first reason for hospitalization was falls (23%), followed by impaired general condition (17%) and acute respiratory distress (12%). Delirium was present in 40% of hospitalizations. Patients' outcome at the end of hospitalizations were divided into: back to home (52%), rehabilitation (31%), transferred to an other ward (10%) and death (7%). At 6 months, 23% of patients had died and 9% were newly institutionalized.

AGER, with specific clinical data on complex geriatric patients, will allow the establishment of epidemiological studies and bio-clinical ancillary studies focusing on acute stress.

CLINICAL TRIALS NOVEL METHODOLOGIES AND BIG DATA FOR OLDER ADULTS

S. Del Signore^{1,2}, G. Zia¹, S. Del Signore¹, W. Diogh², 1. *Bluecompanion ltd, London, United Kingdom*, 2. *Biophytis, Paris, France*

Standard designed clinical trials like phase3 confirmatory studies may be inadequate for collecting good long-term clinical data in older adults. Concomitant chronic diseases and poly-therapy related exclusion criteria may prevent the trial to enrol a representative sample of the target population. Rigid scheduling of visits and investigations negatively affects compliance and retention rate while increasing the risk of biased results.

A novel approach, based on a permanent clinical trial infrastructure, e.g. patients and clinical investigators from a geographic area, could overcome these current limits. A permanent data platform integrates different source data: clinical data, imaging, physical activity recording, disease related biomarkers, and patient reported outcomes. Data can be accessed and re-purposed at the end of the initial study, e.g. to answer to secondary (not pre-specified) questions by regulators.

The implementation of such a clinical trial platform is enabled by the novel information and communication technologies (ICT) allowing informal communication with

patients and continuous data collection from home, minimizing travels to the investigational site.

SARA-OBS, a multi-centre study, aims to observe and capture 6-month changes in physical function and body composition from 300 older patients living in the community but at risk of mobility disability and physical dependency.

An adaptive data-warehouse infrastructure is the basis of this approach, and will be described. Body sensors and adapted, remotely administered questionnaires will empower the elderly participant by providing a simplified way for communicating with their physician and the staff. A dedicated website with relevant health information will identify SARA Clinical Data Platform entry point.

AGE-RELATED CHANGES IN HYPOTHALAMIC-PITUITARY-GONADAL AXIS AMONG AGING POPULATION

C. Wen^{1,5}, H. Lin², H. Chou^{3,4}, M. Lai^{3,2}, 1. *Department of Geriatrics and Gerontology, National Taiwan University Hospital, Taipei, Taiwan*, 2. *MJ Health Screening Center, Taipei, Taiwan*, 3. *Graduate Institute of Epidemiology and Preventive Medicine, College of Public Health, National Taiwan University, Taipei, Taiwan*, 4. *Clinical Research Outcome and Training Center, Big Data Center, China Medical University Hospital, Taichung, Taiwan*, 5. *Department of Family Medicine, National Taiwan University Hospital, Taipei, Taiwan*

Background: To evaluate age related changes of sex hormone in aging population.

Materials and Methods: A total 28529 participants, aged 20 to 89 were recruited from four MJ Health Screening Centers in Taiwan from 2012 to 2015. Sex hormone, sex hormone binding globulin (SHBG), follicle-stimulating hormone (FSH) and luteinizing hormone (LH) were measured. Age groups were divided into a 5-year interval for further analysis.

Results: In men, total testosterone (TT) decreased from 6.0ng/ml at age 20–25 years to 5.3 ng/ml at age over 80 years. Free testosterone (FT) decreased from 134.4 pg/ml at age 20–25 to 67.3 pg/ml at age over 80 ($\beta = -0.88$ pg/ml per age group, $p < .0001$). SHBG, FSH and LH increased with age. The values of these hormone in two age groups (20–25 and 80+ years) were as follows: SHBG, 29.3 and 68.6 nmol/L ($\beta = 0.52$, $p < .0001$); FSH, 2.8 and 17.5 mIU/ml ($\beta = 0.14$, $p < .0001$); LH, 3.2 and 11.0 mIU/ml ($\beta = 0.05$, $p < .0001$). In women, the values of TT and FT at age group 20–25 and 80+ years were: TT, 0.42 and 0.28 ng/ml ($\beta = -0.003$, $p < .0001$); FT, 6.1 and 3.2 pg/ml ($\beta = -0.05$, $p < .0001$). Interestingly, SHBG concentration reveals a cubic curve, the lowest and highest level were 59.9 nmol/L at age 55–60 and 80.2 nmol/L at age over 80, respectively. As expected, E2 declined sharply at age 51–55 ($\beta = -2.66$, $p < .0001$). In contrast, FSH and LH increased after menopause.

Conclusion: Age related changes in hypothalamic-pituitary-gonadal axis is sex-dependent. TT, FT and SHBG patterns were different among age groups compared with Western population.

ASSOCIATION OF SUPPORT ON THE MORTALITY OF OLDER ADULTS WITH DIFFERENT LIVING ARRANGEMENTS IN TAIWAN

M. Liao^{1,2}, C. Yeh³, S. Lee⁴, M. Lee^{1,2}, 1. *Taichung Hospital, Ministry of Health and Welfare, Taichung, Taiwan*, 2. *Institute of Medicine, Chung Shan Medical University, Taichung, Taiwan*, 3. *School of Public Health, Chung Shan Medical University, Taichung, Taiwan*, 4. *School of Nursing, Chung Shan Medical University, Taichung, Taiwan*

The present longitudinal investigation study evaluated the effects of support on the mortality of older adults with different living arrangements in Taiwan. The data were obtained from the Taiwan Longitudinal Study on Aging, 1996–2007, which included those aged ≥ 67 years, with 1492 males and 1177 females. Living arrangements were divided into four categories: living alone, living only with spouse, living with family and living with others. Support was divided into two categories: providing receiving social support. The effect of providing/receiving social support on the mortality of the elderly was determined using Cox regression analysis, according to various living arrangements. Participants who lived with family had lower educational levels (illiterate or elementary school) and more instrumental activities of daily living (IADL) and activities of daily living (ADL) disability; however, they provided more social support than those in other living arrangements. After adjusting for several potentially confounding variables, including IADL and ADL disability, the results showed that older adults living with family and providing social support can lower their mortality rate by 11 per cent (Hazard ratio = 0.89; 95 per cent confidence interval = 0.83–0.96; $p = 0.0018$).

In conclusion, when living with family, the lives of the elderly can be dramatically extended by providing social support.

TRENDS OF THE MAIN CAUSES OF HOSPITAL ADMISSION AMONG THE BRAZILIAN ELDERLY ACCORDING TO SEX

I. Rosset, C. Rossetto, L.M. Paskulin, E. de Moraes, N. da Rosa, *Nursing School, Federal University of Rio Grande do Sul - Brazil, Porto Alegre, Rio Grande do Sul, Brazil*

Considering the accelerated aging in Brazil and in the world, the causes of hospitalizations tend to change over time. This study aimed to evaluate the trends of the main causes of hospital admissions of Brazilian elderly in public institutions or private ones with contract agreement. This retrospective study used secondary data from the Hospital Information System of the Brazilian Ministry of Health. Data were collected for 2005 and 2015, and the five main causes of hospitalization among the elderly ≥ 60 years were included according to the chapters of ICD-10. In 2015, occurred 2,789,300 hospitalizations, while in 2005 occurred 2,224,147. The distribution was similar (about 50%) in both years for both sexes. In 2015, 24.1% of men's hospitalizations was by Diseases of the Circulatory System (DCS), 14.8% by Respiratory Diseases (RD), 11.4% by Neoplasia, 10.8% by Digestive Diseases (DD) and 8.1% by Diseases of the Genitourinary System. Among women, 23% of hospital admissions was by DCS, 15.1% by RD, 10.2% by Neoplasms, 9.6% by DD and 8.3% by Some Infectious and Parasitic Diseases (SIPD). The proportion of admissions by DCS and RD reduced, and by Neoplasia increased, in both sexes when compared to 2005. In 2005, while SIPD was the fifth leading cause of male admissions, it was the fourth among female. Although in different proportions, the four leading causes of hospitalizations were

the same for both sexes in 2015, differing in the fifth one. Therefore, it is important attempting to gender differences when approaching disease prevention among the elderly.

SESSION 3595 (POSTER)

DEPRESSION

THE PREVALENCE OF POST-STROKE DEPRESSION AND ITS PREDICTORS AMONG OLDER ADULTS IN KOREA

E. Oh, J. Lung, G. Hong, *nursing, Hanyang university, Seongdong-gu, Seoul, Korea (the Republic of)*

Depression is common after stroke and is associated with adverse health outcomes for older adults. The aim of this study was to explore the prevalence and predicting factors of post-stroke depression (PSD) among community-living older adults who diagnosed stroke in Korea. Secondary data analysis of the 2014 Korean National Elderly Living Conditions and Welfare Desire Survey was used ($N=10,451$). Logistic regression analysis was conducted to examine the predictors of PSD. Depression status was categorized if the score greater than 8/15 on the Geriatric Depression Scale-15 (GDS-15). The prevalence of PSD was 46.5% ($n = 349$) of older adults with medically diagnosed stroke ($n=750$) compared to 31.5% ($n = 3,055$) among those without stroke ($n=9,701$), which was significantly different between two groups ($t=-11.604$, $p<0.001$). In a logistic regression model, factors associated with an increased risk of PSD in older adults are having poor self-rated health (OR = 6.744, 95% CI = 2.829–16.078), limitation of activities of daily living (ADLs) and instrumental activities of daily living (IADLs) (OR = 2.696, 95% CI = 1.859–3.910), experience with falling (OR = 1.510, 95% CI = 1.068–2.135), trouble with vision (OR = 1.403, 95% CI = 1.005–1.958). The PSD prevalence was high and PSD showed a strong association with multidimensional factor among community-living older adults. Preventive intervention should be developed to decrease the PSD among Korean older adults.

MASKED DEPRESSION IN OLDER MEN: HYPERTENSION, SILENT CEREBROVASCULAR DISEASE, AND METABOLIC SYNDROME

R.B. Francoeur, *Adelphi University, Garden City, New York*

Addressing subthreshold and subsyndromal depression in cerebrovascular conditions, diabetes, and obesity may reduce morbidity and risk for major depression. However, depressive symptom profiles reflecting distress may not involve dysphoric mood, and those reflecting illness-related alexithymia limit emotional self-awareness. I used the first wave of population-weighted data of the New Haven Epidemiological Study of the Elderly (EPESE) to examine symptom profiles of subsyndromal, and subthreshold, depression in cerebrovascular conditions with co-occurring excess weight and diabetes. These data (2,812 non-institutionalized older adults) combined a stratified, systematic, clustered random sample from independent residences and a census of senior housing facilities. Physical conditions included progressive cerebrovascular disease (hypertension, silent cerebrovascular disease, stroke, vascular cognitive impairment) and

co-occurring excess weight and/or diabetes (without complications). These conditions and interactions (clusters) simultaneously predicted twenty depression items (CES-D scale) and a latent trait of depression in participants experiencing subthreshold or subsyndromal depression (CES-D > 10). I used the MLR estimator in Mplus and an innovation I recently created for estimating unbiased effects from Multiple Indicators-Multiple Causes (MIMIC) models with exhaustive specification. Robust findings ($p < .05$) were identified from models with and without adjustments for confounding factors and depression level. Symptom profiles reveal masked depression in older males, related to the metabolic syndrome (hypertension–overweight–diabetes; silent cerebrovascular disease–overweight; silent cerebrovascular disease–diabetes). Several clusters are equivocal regarding masked depression; one emphasizes dysphoric mood. Replicating findings could identify patient subgroups with the metabolic syndrome for targeted, cost-effective screening of subthreshold and subsyndromal depression.

MASKED DEPRESSION AFTER STROKE OR WITH VASCULAR COGNITIVE IMPAIRMENT: SEX, OBESITY, DIABETES STATUS

R.B. Francoeur, *School of Social Work, Adelphi University, Garden City, New York*

Addressing subthreshold and subsyndromal depression in cerebrovascular conditions, diabetes, and obesity may reduce morbidity and risk for major depression. However, vascular depression may be masked by low endorsement of dysphoric mood. I used the first wave of population-weighted data of the New Haven Epidemiological Study of the Elderly (EPESE) to examine symptom profiles of subsyndromal, and subthreshold, depression in cerebrovascular conditions with co-occurring excess weight and diabetes. These data (2,812 non-institutionalized older adults) combined a stratified, systematic, clustered random sample from independent residences and a census of senior housing facilities. Physical conditions included progressive cerebrovascular disease (hypertension, silent cerebrovascular disease, stroke, vascular cognitive impairment) and co-occurring excess weight and/or diabetes (without complications). These conditions and interactions (clusters) simultaneously predicted twenty depression items (CES-D scale) and a latent trait of depression in participants experiencing subthreshold or subsyndromal depression (CES-D > 10). I used the MLR estimator in Mplus and an innovation I recently created for estimating unbiased effects from Multiple Indicators-Multiple Causes (MIMIC) models with exhaustive specification. Robust findings ($p < .05$) were identified from models with and without adjustments for confounding factors and depression level. In both genders reporting a stroke, and in older women tested separately, depression was masked when excess weight, but not diabetes, was experienced. Masked depression was detected in the same context among older women with vascular cognitive impairment, and in both genders with vascular cognitive impairment when they were not overweight or diabetic. Replicating findings could identify subgroups for targeted, cost-effective screening of depression.

SLEEP PATTERNS IN OLDER PEOPLE WITH MOOD DISORDERS

G. Prada^{1,2}, R. Nacu^{1,2}, L. Lungu^{1,2}, A. Ilie³, A. Prada², I. Alexa³, A. Herghelegiu¹, *1. Clinical department, National Institute of Gerontology and Geriatrics “Ana Aslan”, Bucharest, Romania, 2. University of Medicine and Pharmacy “Carol Davila”, Bucharest, Romania, 3. “Gr.T. Popa” University of Medicine and Pharmacy, Bucharest, Romania*

Introduction: Sleep and mood disorders are frequently seen in elderly, with important consequences on morbidity and mortality. We analyzed sleep patterns in elderly with mood disorders.

Material and Methods: A transversal study performed on 840 randomly selected patients previously diagnosed with mood disorders, divided into 2 equal groups: adults (50–64 years), elderly (≥ 75 years), with equal number of women and men. Study based on a questionnaire regarding sleep patterns and quality.

Results: Majority of patients in both groups resided in urban area; 1/4 elderly lived alone as compared to only 17% adults. 1/3 of adults and only 22% elderly with higher education. Significantly higher prevalence of daytime sleeping amongst elderly ($p < 0.01$). Elderly sleep less hours. Almost no elderly eat before sleep, while over 1/3 of adults have a meal before going to bed. Significantly more elderly wake-up during night ($p < 0.01$), mainly due to pain and men due to reno-urinary disorders. Elderly take longer to fall asleep ($p < 0.05$), but have less nightmares. Risk factors for sleep disorders have been identified: smoking, toxic exposure, meals before bedtime. Sleep-apnea syndrome was more prevalent in elderly ($p < 0.05$). Mood disorders negatively impact on sleep quality in elderly with frequent interruptions and global reduction. Over 85 years influence of depression on sleep quality decreases significantly ($p < 0.01$). Sedentary life-style more prevalent in elderly and had a significant effect on quality of sleep and mood disorders ($p < 0.05$).

Conclusions: Elderly from urban areas have a poorer sleep quality and women are more prone to both mood and sleep disorders.

INTERNAL CONSISTENCY OF GERIATRIC DEPRESSION SCALE: CHALLENGE FOR NEW PROPOSALS

N. Rodriguez, C. Escudero, M. Castro, N. Medina, J. Santacruz, R. De La Espriella, C. Cano Gutierrez, *Universidad Javeriana, Bogota, Colombia*

High incidence of elderly depression motivates use of screening depression scales in aging; the most used scales by specialized and nonspecialized healthcare staff is Geriatric Depression Scale. Short version of this scale (15 items) was propose in 1982 whit a high effort in his construction and with no modification since there. The aim of this study was to determine the confiability of these 15 item-short version and ultrashort versions (5, 3, and 2 items). This study used information of the *Encuesta Salud Bienestar y Envejecimiento SABE* in Bogotá/Colombia (1957 registers). Statistical analysis showed a high variability in homogeneity items' Cronbach analysis (between 0,59 until 0,23). Factorial analysis showed 3 factors in the scale. This seems to be part of a need to contextualize the scale because the use of it since

1982 without changes and a dynamic depression concept through the years.

SESSION 3600 (POSTER)

EPIDEMIOLOGY I

PREDICTING RISK OF DIABETES-RELATED HOSPITALIZATION IN OLDER PATIENTS WITH TYPE 2 DIABETES

C. Lin², T. Li¹, C. Lin¹, C. Liu², W. Lin², 1. *China Medical University, Taichung, Taiwan*, 2. *China Medical University Hospital, Taichung, Taiwan*

Diabetes is an ambulatory care-sensitive condition (ACSCs), for which timely, effective, and efficient outpatient care can reduce hospitalization risks. The aim of the study is to develop a prediction model for diabetes-related hospitalization in patients with type 2 diabetes.

Methods: A retrospective cohort study was conducted among 27,498 older patients with type 2 diabetes aged 50–84 years during 2000–2003 from the database of Taiwan National Diabetes Care Management Program (NDCMP). We used the Cox proportional hazard regression model to derive risk scores. The receiver operating characteristic curves were used to evaluate the predictive accuracy. Calibration was assessed by the Hosmer-Lemeshow test.

Results: A total of 5,603 older diabetic patients had diabetes-related hospitalization during 7.39 years of follow-up. The final prediction model incorporated age, gender, smoking, age of diabetes onset, duration of type 2 diabetes, body mass index, HbA1c, variation of fasting plasma glucose, variation of HbA1c, eGFR, total cholesterol, LDL, triglyceride, hypertension, stroke, diabetic retinopathy, disease of peripheral circulatory disturbance, hypoglycemia, ketoacidosis, postural hypertension, anti-diabetes medication and cardiovascular medications. The AUCs of 1-, 3-, 5- and 10-year diabetes-related hospitalization risks were 0.76, 0.74, 0.74 and 0.72 in the validation set, respectively. The predicted and observed 1-, 3-, 5- and 10-year probabilities of diabetes-related hospitalization were similar in the validation set.

Conclusion: We have developed a model that estimates diabetes-related hospitalization risk in older patients with type 2 diabetes, which can serve as a screening tool to identify older diabetic patients who are at higher risk for hospitalization.

HIGH-SENSITIVITY C-REACTIVE PROTEIN AND RISKS OF ALL-CAUSE AND CAUSE-SPECIFIC MORTALITY IN JAPAN

H. Nisa¹, A. Hirata², M. Kohno², C. Kiyohara³, K. Ohnaka², 1. *Department of Public Health Faculty of Medicine and Health Sciences, Syarif Hidayatullah State Islamic University Jakarta, Tangerang Selatan, Banten, Indonesia*, 2. *Department of Geriatric Medicine Graduate School of Medical Sciences, Kyushu University, Fukuoka, Japan*, 3. *Department of Public Health, Graduate School of Medical Sciences, Kyushu University, Fukuoka, Japan*

Background: High-sensitivity C-reactive protein (hsCRP) levels are lower in Japanese compared with Western subjects.

Since it is uncertain whether hsCRP is a potent predictor of mortality at low CRP concentrations, the present study examined associations with all-cause and cause-specific mortality in a large population of Japanese.

Materials and Methods: Subjects were 4,737 men and 6,343 women aged 49–76 years participating in the baseline survey of an ongoing cohort study of lifestyle-related diseases between February 2004 and July 2006. Hazard ratios for all-cause and cause-specific mortality associated with hsCRP levels were estimated using Cox proportional hazards regression.

Results: A total of 436 all-cause deaths occurred during a median follow up of 8 years. The main cause of death was cancer. In men, hsCRP levels were positively associated with the risk of all-cause mortality as well as deaths from cancer and cardiovascular disease (CVD). All-cause mortality hazards for the 2nd (0.34–0.84 mg/L) and the 3rd (≥ 0.85 mg/L) tertiles of hsCRP were 1.27 (95% confidence interval [CI], 0.93–1.73) and 1.75 (1.30–2.37), respectively (p for trend=0.001). In women, increased risk of all cause and cause-specific mortality associated with elevated hsCRP levels was observed, but the associations were not statistically significant.

Conclusions: HsCRP may be an independent predictor of all-cause, cancer and CVD mortality in apparently healthy Japanese men, but not women. The differential effect of hsCRP in predicting mortality risk by sex warrants further investigation.

OPTIMISM AT AGE 90 AND 5-YEAR MORTALITY

J.M. Jacobs^{1,2}, J. Stessman^{1,2}, 1. *Hadassah-Hebrew University Hospital, Jerusalem, Israel*, 2. *The Jerusalem Institute of Aging Research, Jerusalem, Israel*

Little is known concerning optimism among the very old. We examined the association between optimism and 5-year mortality among non-depressed 90 year olds.

Subjects were drawn from the Jerusalem Longitudinal Study (1990–2016), an ongoing prospective study of a representative community-dwelling cohort, born 1920–21. Comprehensive assessment at 90 included a 7-question 14-point optimism score, for which quartiles were determined (Q1 lowest-Q4 highest optimism). Depressed subjects were identified using the Short Geriatric Depression Scale, and not included in the current analysis. Mortality data were collected from the Ministry of Interior. Cox proportional hazards ratios (HR) were determined, adjusting for gender, diabetes, ischemic heart disease, and hypertension.

A total of 231 non-depressed subjects were assessed at 90, among whom 11% had lowest optimism score (Q1), 22% medium score (Q2), 32% high optimism (Q3), and 36% very high (Q4). Subjects with highest optimism (Q4) were more likely to be better educated, have improved self-rated health, get out the house more frequently, with lower rates dependence in basic activities of daily living. Optimism was consistently associated with improved survival throughout follow-up from age 90–95: Kaplan-Meier survival analyses according to optimism quartiles (Q1,2,3,4) was 41%, 64%, 66%, 72% (log rank $p < 0.05$) respectively. Using the lowest optimism quartile (Q1) as a reference (HR =1), the adjusted HR's for mortality according to optimism were Q2 HR=0.45 (95%CI 0.22–0.91), Q3 HR=0.49 (95%CI 0.25–0.95), and Q4 HR=0.36 (95%CI 0.18–0.71).

Our findings show that optimism among the oldest old is significantly associated with subsequent survival.

REGIONAL DIFFERENCES IN DISABILITY AMONG COMMUNITY-DWELLING OLDER PEOPLE IN EUROPE

J. Jerez-Roig^{1,2}, M. Bosque-Prous^{1,3}, M. Gine-Garriga², C. Bagur-Calafat⁵, A. Espelt^{3,4}, 1. *Universitat Pompeu Fabra, Barcelona, Catalunya, Spain*, 2. *Facultat de Psicologia, Ciències de l'Educació i de l'Esport; Universitat Ramon Llull, Barcelona, Catalunya, Spain*, 3. *Agència de Salut Pública de Barcelona, Barcelona, Catalunya, Spain*, 4. *Facultat de Psicologia, Universitat Autònoma de Barcelona, Bellaterra, Catalunya, Spain*, 5. *Departament de Fisioteràpia, Universitat Internacional de Catalunya, Sant Cugat del Vallès, Catalunya, Spain*

The objective was to estimate the prevalence of disability among older people in 17 European countries. We also aimed to analyze differences in the profile of disabled individuals between European regions, regarding sociodemographic, lifestyle and health-related variables. This is a cross-sectional study based on the last data of the Survey of Health, Ageing and Retirement in Europe (SHARE project). Community-dwelling subjects aged 65 and over were included. Disability was defined as presenting at least one functional limitation in basic activities of daily living. The prevalence of disability was 9.2% (95%CI:8.5–9.9%), 15.3% (95%CI:14.7–16.0%), 19.2% (95%CI:18.4–19.9%) and 19.2% (95%CI:18.3–20.1%) in Northern, Central, Eastern and Southern European regions, respectively. The prevalence of disability by country was 8.2% (Netherlands), 8.9% (Sweden), 10.9% (Denmark), 13.2% (Slovenia), 14.0% (Germany), 14.5% (Austria), 14.6% (Luxembourg), 17.4% (Czech Republic), 17.5% (France), 18.2% (Italy), 18.5% (Spain), 18.6% (Hungary), 20.5% (Belgium), 22.3% (Estonia), 24.6% (Poland) and 25.1% (Portugal). In Southern Europe, disabled subjects were significantly older, predominantly women, with low education level, more physically inactive, took higher number of drug types, present lower mean memory score and higher prevalence of high blood cholesterol, diabetes, arthritis/rheumatism, dementia, depressive symptoms and affective/emotional disorders ($p < 0.001$). The highest proportions of poor self-rated health and obesity were identified in Eastern Europe, while the Northern region presented the highest prevalence of cancer, current/former smokers and alcohol consumption ($p < 0.001$). In conclusion, the prevalence of disability was higher in Eastern and Southern Europe and the latter region presented a disadvantaged sociodemographic and health-related profile for the majority of variables.

PREVALENCE OF DISABILITY AMONG COMMUNITY-DWELLING OLDER ADULTS IN EUROPE: A STUDY OF SHARE DATA

J. Jerez-Roig^{1,2}, M. Bosque-Prous^{1,3}, M. Gine-Garriga², C. Bagur-Calafat⁴, A. Espelt³, 1. *Universitat Pompeu Fabra, Barcelona, Catalunya, Spain*, 2. *Facultat de Psicologia, Ciències de l'Educació i de l'Esport Blanquerna; Universitat Ramon Llull, Barcelona, Catalunya, Spain*, 3. *Agència de Salut Pública de Barcelona, Barcelona, Catalunya, Spain*, 4.

Departament de Fisioteràpia, Universitat Internacional de Catalunya, Barcelona, Catalunya, Spain

The main objective was to estimate the prevalence of disability among older adults in Europe. Besides, we aimed to characterize the profile of disabled older adults, regarding sociodemographic, lifestyle and health-related variables. A cross-sectional study based on the latest data of the Survey of Health, Ageing and Retirement in Europe (SHARE) is presented. Community-dwelling subjects aged 65 and older were selected. Disability was defined as presenting at least one functional limitation in basic activities of daily living. The final sample was 36078, from which 5784 suffered from disability, representing a prevalence of disability of 16.0% (95%CI: 15.7–16.4%). Taking into consideration the subsample of disabled older people, the most affected activities were dressing (58.7%) and bathing (57.8%), followed by transferring (36.1%), toileting (24.9%), walking (22.9%) and eating (20.1%). Mean number of affected tasks was 2.3 (SD: 1.6) and mean age 77.8 (SD: 7.6) years. The majority of disabled older adults were women (60.2%), with partnership (56.1%), low education level (61.7%), physically inactive (52.8%), current/former smoker (80.1%), with fair/poor self-rated health (84.0%), bad satisfaction with life (61.8%), and depressive symptoms (60.5%). Furthermore, 27.0% were obese, 32.5% presented anxiety and took 3.1 drugs on average. The most frequent related diseases/conditions were hypertension (55.3%), arthritis/rheumatism (46.8%), high blood cholesterol (29.5%), heart attack (27.6%) and diabetes (24.5%). In conclusion, the prevalence of disability in European older adults was 16% and disabled subjects presented a disadvantaged sociodemographic profile, worse lifestyle and quality of life, as well as high prevalence of chronic diseases and psychological disorders.

HEALTH AND FUNCTIONAL STATUS OF NONAGENARIANS

M. Odden¹, W. Jen Hoe Koh², A. Arnold², B. Psaty², A. Newman³, 1. *Epidemiology, Oregon State University, Corvallis, Oregon*, 2. *University of Washington, Seattle, Washington*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania*

The U.S. population aged 90 years and older is growing rapidly and there are limited data on the health of this group. The Cardiovascular Health Study recruited 5,888 black and white adults ≥ 65 years in two waves (1989–90 and 1992–93) from Medicare eligibility lists in Forsyth County, North Carolina; Sacramento County, California; Washington County, Maryland; and Pittsburgh, Pennsylvania. Data on health status were collected from baseline to present. As of December 31st, 2015, 1,899 participants had achieved age 90 or older during the study follow-up and had available measures. Nearly three-fourths of women (72%) and men (74%) had one or more of the following chronic conditions by age 90: cardiovascular disease, cancer, chronic obstructive pulmonary disease, and dementia; and the mean number of prescription medications was 6 (SD 4). The majority of women (75%) and men (60%) reported difficulty on one or more instrumental activities of daily living; fewer reported difficulty on activities of daily living (50% of women and 37% of men). Modified Mini-Mental Status Exam scores indicated cognitive deficits in both women and men (mean=82;

SD=16.5 for both genders). The majority of women (59%) and men (62%) reported being in good or better health and without depressive symptoms (76% and 77%, respectively) at age 90. After age 90, medication burden, functional status, cognitive function, and depressive symptoms worsened with age similarly in women and men. Persons surviving to age 90 and older had a high burden of morbidity and disability, yet remained optimistic about their health status.

EXECUTIVE FUNCTION AND PHYSICAL DECLINE TRAJECTORIES IN COMMUNITY DWELLING NON-DEMENTED OLDER ADULTS

V. Del Panta, M. Colpo, G. Sini, B. Stefania, *Local Health Unit Tuscany Centre, Florence, Italy*

Purpose: There is strong evidence that older persons with cognitive impairment are often physically impaired. However, whether cognitive function predict future changes in mobility has not been evaluated. We tested the hypothesis that Trail Making Test A (TMTA) performance predicts rates of decline of Short Portable Physical Performance Score (SPPB) over a 9-year follow-up in 470 InCHIANTI participants (235M, 71.3±5.0ys, 235F, 72.5±5.8ys) 65 years or older with Mini Mental State Examination (MMSE) ≥26 at baseline.

Methods: Trajectories of SPPB changes with aging were estimated by Latent Class Growth Curve Models (LCGCM), separately in men and women. Predictors of SPPB rate of decline were identified by logistic regression models.

Results: Two longitudinal trajectories of physical functional decline (slow and fast) were identified in both for gender. The same significant predictors of SPPB decline were found for men and women: age (OR=1.13 and OR=1.17), TMTA>79seconds (OR=2.5 and OR=2.9) and number of diseases (OR=1.4 and OR=1.6).

Conclusion: Age, impaired executive function and multimorbidity predict accelerated decline of lower extremity function in both men and women. Simple cognitive screening could facilitate early recognition of changes in physical functioning.

EFFECTS OF APOE GENOTYPES ON COGNITIVE AGING IN THE MIDDLE-AGED AND ELDERLY: A15-YEAR FOLLOW-UP

Y. Nishita-Kodaira¹, C. Tange¹, M. Tomida^{1,2}, R. Otsuka¹, F. Ando^{3,1}, H. Shimokata^{4,1}, 1. *National Center for Geriatrics and Gerontology, Obu, Aichi, Japan*, 2. *Research Fellowship of the Japan Society for the Promotion of Science, Tokyo, Japan*, 3. *Aichi Shukutoku University, Aichi, Japan*, 4. *Graduate School of Nutritional Sciences, Nagoya University of Arts and Sciences, Nisshin, Japan*

Relationship between ApoE-ε4 allele and longitudinal changes of cognitive abilities were examined in middle-aged and elderly community-dwelling Japanese. The participants were 2088 men and women (age: 40–79, excluding history of dementia) who participated in the National Institute for Longevity Sciences- Longitudinal Study of Aging. They were tested in up to eight times, for approximately 15 years. Cognitive abilities including general knowledge and processing speed were assessed using Information and Digit Symbol Test, components of Wechsler Adult Intelligence Scale-Revised. Participants with 1 or 2 ApoE-ε4 allele were

considered ε4 carriers (n=406, 19.4%). General linear mixed models were comprised of fixed effects of ApoE-ε4 (carriers/non-carriers), baseline age, follow-up years, their interactions and covariates (sex, education, BMI, alcohol intake, marital status, occupation, current smoking, past and present illness and retest effect). Individual variance (intercept and slope) assigned as random effects. Results indicated that main effects of ApoE-ε4 were not significant for both test scores. However, the interaction terms, ApoE-ε4×age×follow-up years were significant for general knowledge and processing speed (p=.016; p=.004), suggesting the effect of ApoE-ε4 on cognitive changes differed depending on baseline age. Predicted trajectory substituting baseline age and ApoE-ε4 status indicated that differences in slopes between ApoE-ε4 carriers and non-carriers were significant after 55 years of age for general knowledge, and 57 years of age for processing speed, with rate of decline in ApoE-ε4 carriers being larger than that in non-carriers. In conclusion, APOE-ε4 might affect the decline in general knowledge and processing speed from the latter half of their 50s.

CHILDHOOD ADVERSITIES AND HOME ATMOSPHERE AS DETERMINANTS OF DISABILITY AND UNEMPLOYMENT PENSION

M. von Bonsdorff¹, K. Kokko¹, H. Kautiainen², M. Salonen³, M. von Bonsdorff¹, C. Osmond⁴, E. Kajantie³, J.G. Eriksson², 1. *University of Jyväskylä, Jyväskylä, Finland*, 2. *University of Helsinki and Unit of General Practice, Helsinki University Hospital, Helsinki, Finland*, 3. *National Institute for Health and Welfare, Helsinki, Finland*, 4. *University of Southampton, Southampton, United Kingdom*

Childhood adversities have been linked with adverse life events, but less is known about the long-term effects of childhood home atmosphere in terms of work career. We investigated whether childhood adversities and home atmosphere were associated with disability or unemployment pension. In the Helsinki Birth Cohort Study (born 1934–44), 2001 cohort members had data available on 9 childhood home atmosphere items e.g. whether it was supportive or warm (sum score 0–36, higher score indicating more favorable atmosphere), and 9 childhood adversities e.g. unemployment, parent's long-term illness or divorce (sum score 0–9, coded into no; one; and two or more) assessed in 2001–04. Of those, 1528 had data on type and time of retirement provided by the Finnish Centre for Pensions. Adjustments were made for childhood and adult socioeconomic status, adult lifestyle factors, and chronic diseases. Between 1971 and 2011, 21.0% transitioned into disability, 16.7% into unemployment, 20.2% into part-time, and 42.1% into old age pension. A higher home atmosphere score was associated with a lower hazard of disability pension, fully adjusted hazard ratio (HR) being 0.97, 95% confidence interval (CI) 0.96, 0.99 per one unit higher home atmosphere score. Those who had experienced two or more childhood adversities had a higher hazard of unemployment pension compared to those with no adversities, fully adjusted HR being 1.60, 95% CI 1.18, 2.19. Childhood adversities and home atmosphere might have long-term effects on the length of the work career and retirement.

MIDLIFE NEIGHBORHOOD SOCIOECONOMIC STATUS AND 20-YEAR CHANGE IN COGNITION: THE ARIC-NCS STUDY

A. Kucharska-Newton³, M. Patel², P. Palta³, T.H. Mosley¹, G. Heiss³, 1. *University of Mississippi, Jackson, Mississippi*, 2. *Symphony Health Solutions, Conshohocken, Pennsylvania*, 3. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Studies of the association between socioeconomic status (SES) and cognitive function have mostly focused on individual attributes to define SES (e.g. education, income), while few have examined the association of contextual SES characteristics with age-related change in cognitive function.

Using data from the biracial Atherosclerosis Risk in Communities Neurocognitive Study (ARIC-NCS), we examined the association of ZIP code-level median household income, assessed at mid-life, with 20-year change in cognition from mid-life through older adulthood. Cognition was assessed in 13,881 men and women at baseline (1990–1992; median age: 57.3 years, 44.3% men, 23.7% African American) and at two subsequent examinations (1996–1998 and 2011–2013) using the Delayed Word Recall Test, Digit Symbol Substitution Test, and the Word Fluency Test, standardized to the baseline scores. Standardized test scores were then averaged to yield a global cognition domain z score. Multiple imputation by chained equations was used to impute cognitive test scores missing due to attrition.

Using random effects mixed models, adjusted for age, gender, race, and individual-level educational attainment, we observed that the magnitude of the rate of change in global cognition during a median 20.8 years of follow-up was similar across distribution-based tertiles of median household income (high SES: $\beta = -0.99$ (95% CI -1.00, -0.99); middle SES: $\beta = -0.96$ (95% CI -0.97, -0.96); low SES $\beta = -0.96$ (95% CI -0.96, -0.95)). Our findings suggest that mid-life neighborhood SES is not associated with the rate of cognitive decline through older adulthood.

RELATIONSHIP OF GLOBAL CARDIOVASCULAR RISK AND MIDLIFE PHYSICAL PERFORMANCE IN A BI-RACIAL COHORT

B.D. Pollock¹, P. Stuchlik¹, J.M. Guralnik², J. Gustat¹, L.S. Webber¹, W. Chen¹, E.W. Harville¹, L. Bazzano¹, 1. *Epidemiology, Tulane University School of Public Health and Tropical Medicine, New Orleans, Louisiana*, 2. *University of Maryland School of Medicine, Baltimore, Maryland*

Evidence has suggested the existence of a bi-directional relationship between cardiovascular disease and physical performance in elderly adults, with several potential common mechanisms including chronic inflammation and sarcopenia. Yet, there remains little data on the relationship between CVD risk and physical performance in mid-life. The objective of this study was to determine if global cardiovascular risk measures were associated with score on the short physical performance battery (SPPB) in a mid-life cohort of African-American and white adults followed since childhood. Our study included 845 participants of the Bogalusa Heart Study cohort. We separately examined the relationships between both

10-year AtheroSclerotic CardioVascular Disease (ASCVD) and Framingham CHD risks and poor physical performance, defined as SPPB<10, in logistic regression models, controlling for educational attainment, as a surrogate of socioeconomic status, alcohol, and body mass index. Mean (SD) age was 48.4 (4.9); 63.2% of were women and 33.5% were African-American. A total of 173 (19.8%) participants demonstrated poor physical performance, with median (IQR) ASCVD 10-year risk and Framingham risks of 5.6% (2.3%-11.7%) and 2.5%(0.9%-6.4%), respectively versus 3.1% (1.3%-6.1%) and 1.3%(0.5%-4.8%) in those with good physical performance ($p < .0001$ and $p < .001$, respectively). These relationships both persisted ($p < .01$) after adjustment. These results indicate that global cardiovascular risk is strongly linked to physical performance measures, even in a relatively low-risk, mid-life population. Given this strong association, mid-life cardiovascular risk scores which are commonly calculated in primary care settings may aid in the early identification of individuals who may benefit from interventions designed to prevent frailty.

PRESCRIBED MEDICATION AND MALNOURISHMENT AT RISK OF MALNUTRITION

A. Maseda¹, A. Bujn¹, L. Lorenzo-López¹, R. López-López¹, V. Valdiglesias², B. Laffon², J. Millán-Calenti¹, 1. *Gerontology Research Group, Instituto de Investigación Biomédica de A Coruña (INIBIC), Complejo Hospitalario Universitario de A Coruña (CHUAC), SERGAS, Universidade da Coruña, A Coruña, Spain*, 2. *DICOMOSA Group, Department of Psychology, Area of Psychobiology, Universidade da Coruña, A Coruña, Spain*

Malnutrition is a common health problem in polymedicated older adults. This cross-sectional study investigates the relationship between the prescribed medication and malnourishment/risk of malnutrition. The research was conducted in a representative sample of 749 community-dwelling elders aged 65 years and over, showing a combined prevalence for the malnourished/ at risk of malnutrition group of 14.3% (assessed by the short form of the Mini Nutritional Assessment, MNA-SF). Each medication was categorized according to the Anatomical Therapeutic Chemical (ATC) classification. Low MNA-SF score group (≤ 11 points) consumed a higher number of medications (6.5 ± 3.5 vs. 4.5 ± 3.2 , $p < 0.001$) and presented higher polypharmacy (5 or more, 64.5% vs. 40.0%, $p < 0.001$). The most common drug classes in malnourished/at risk of malnutrition participants were cardiovascular (76.6%), alimentary tract and metabolism (70.1%) and nervous system (68.2%). Stepwise logistic regression analyses revealed that no consuming alimentary tract and metabolism (adjusted OR 1.61; 95% CI 1.01 to 2.56), blood and blood forming organs (adjusted OR 1.69; 95% CI 1.09 to 2.60) and nervous system (adjusted OR 2.16; 95% CI 1.38 to 3.38) drug classes was related to lower MNA-SF scores. Therefore, the consumption of these medications is associated with the presence/absence of malnutrition. These findings reveal the importance of a correct prescribed medication related to the most frequent health problems in older adults to avoid the presence of malnourishment/ risk of malnutrition and to propose appropriate intervention.

SERUM GDF15 PREDICTS ALL-CAUSE MORTALITY IN A GENERAL POPULATION OF JAPANESE ELDERLY

Y. Fujita, Y. Taniguchi, M. Tanaka, S. Shinkai, M. Ito,
Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan

Growth differentiation factor 15 (GDF15) is a member of the TGF- β superfamily, which has been implicated in aging and various age-related diseases. We and others have recently reported that the serum GDF15 level was increased in patients with mitochondrial diseases, suggesting its potential as a marker for mitochondrial dysfunction. The epidemiological relevance of GDF15 to adverse health outcomes of the elderly has not been well established. In the present study, we aimed to determine the relationship between GDF15 and all-cause mortality in a general population of Japanese elderly. 1,832 community-dwelling older adults aged 65 years or older participated in baseline surveys in the towns of Kusatsu and Hatoyama in Japan. The serum GDF15 concentration was determined by the AlphaLISA immunoassay. There occurred 134 deaths during a median follow-up of 4.7 years. We used the Cox proportional hazard model to assess the association of the serum GDF15 level with mortality, controlling for important confounders at baseline (sex, age, years of education, number of chronic diseases, diastolic blood pressure, red blood cell count, total cholesterol, eGFR, albumin, cognitive function, gait speed, higher-level competence, and inflammation markers). Participants in the highest quartile (GDF15 concentrations of >974 pg/mL) had a hazard ratio of 2.33 (95% confidence interval: 1.06–5.12) for all-cause mortality compared with those in the lowest quartile (GDF15 concentrations of < 562 pg/mL). These results suggest that serum GDF15 concentration independently predicts all-cause mortality in a general population of Japanese elderly.

SESSION 3605 (POSTER)

FAMILY CAREGIVING

GENDER DIFFERENCES IN TIME USE AND PERCEIVED TIME PRESSURE OF MIDDLE- AND OLD-AGED CAREGIVERS

J. Kang, *Human Development and Family Studies, The Pennsylvania State University, State College, Pennsylvania*

Recently in Korea, the academic and societal attentions are focusing on middle and old aged people as the asset providing caregiving to their grandchildren. However, the middle and the old aged people may face not only taking care of grandchildren but also diverse demands of caregiving, such as caregiving for spouse and parents; These caregiving demands are not limited to women. There should be differences in caregiving itself and the effects of caregiving on caregivers between man and woman, considering people act based on gender roles and gender norms. Therefore, we can expect that caregivers show the gender differences in time spent and perceived time pressure according to how they conduct their caregiver's role.

The sample was drawn from the 2014 Korean time diary data collected by the Korean National Statistical Office, including caregivers aged 50 and above. Caregivers are defined as people who reported that they did family caregiving

activities when the data was been collecting. Frequency, percent proportion, mean, t-test, and chi-square test were used.

The total number of people family caregivers aged 50 and above was 2885 and 68.8% of caregivers were woman. About 88.2% of caregivers taking care of grandchildren were female. About a half of male caregivers(53.7%) took care of their spouses and about 5% male caregivers provided caregiving to their parents suffered from dementia.

Male caregivers spent more time on studying($t=2.287$, $p<0.001$) but less time on family caregiving($t=-22.205$, $p<0.001$), household labor($t=-30.121$, $p<0.001$), personal care activities($t=-297$, $p<0.01$) and social participation($t=-8.15$, $p<0.001$) as compared to the female. Nevertheless, male caregivers perceived greater time shortage than female($\chi^2=32.096$, $df=3$, $p<0.001$).

The results of the study showed that male caregivers spent less time for caregiving, house chores and personal care. However, they replied higher level of time pressure. These findings imply that male caregivers felt more stressed due to their caregiver's role which is unfamiliar to them. Therefore future studies should focus more on male caregivers, and find out proper way of supporting them.

THE EFFECT OF INTERNET SUPPORT GROUPS ON CAREGIVER SOCIAL SUPPORT AND SELF-EFFICACY: A META ANALYSIS

D.P. Oliver¹, S. Patil¹, J.J. Benson¹, A. Gage², K. Washington¹, R. Kruse¹, G. Demiris³, 1. *University of Missouri - Columbia, Columbia, Missouri*, 2. *Central Missouri State University, Warrensburg, Missouri*, 3. *University of Washington, Seattle, Washington*

Research has shown that family caregivers often become socially isolated as they experience the burdens associated with caring for their loved one. The 24 hour nature of caregiving prohibits attendance at traditional support groups. Various small intervention studies across disease categories (Alzheimer's, cancer, stroke, etc.) have tested Internet based social support groups with caregivers. In an effort to examine the effect of these online groups on social support and self-efficacy we conducted a meta analysis. The sample was selected from a search of systematic reviews published since 2014. Studies included in the final sample from those reviews must have been conducted after 2000 with family caregivers of adults with chronic health problems (not mental health). The intervention had to include the Internet and three or more participants. Five online intervention studies measured social support with a total sample size of 222. Three online intervention studies measured self-efficacy with a total sample size of 132. In both cases there was no publication bias found. Results found that 59% of the effect size in social support was a true variance in effect. Likewise, 18% of the effect size in self-efficacy was a true variance in effect. Online technology can significantly improve caregiver's social support and self efficacy. Further high quality studies may reduce heterogeneity and lead to further robust findings.

EXPERIENCES OF OLDER CAREGIVERS FOR PERSONS WITH MAJOR PSYCHIATRIC DISORDERS

T. Labrum, *School of Social Policy & Practice, University of Pennsylvania, Salt Lake City, Utah*

Across developed nations, relatives often provide high levels of caregiving to persons with major psychiatric disorders (PD), with it being estimated that there are more than 8 million such caregivers in the U.S. Caregivers for persons with PD is an aging population and more than 40% of such caregivers are at least 60 years of age. Surprisingly, caregiving provided by older persons to persons with PD has received little attention from researchers and practitioners. Using a U.S. community recruited sample of 741 older (60+) caregivers for persons with PD, the present analysis describes the experiences and perceived impacts of caregiving by older persons. Caregivers provided caregiving for a median of 10 hours a week and had provided caregiving for a median of 10 years. 46% reported that as a caregiver they feel alone and 45% described caring for a person with PD as very emotionally stressful. 22% described their health as fair or poor, with an entire 56% reporting that caregiving worsened their health. Finally, 45% reported having difficulty talking to others about the recipient of care's mental health issues. Many older caregivers are not in contact with traditional mental health providers; aging professionals should assess and address the impacts of caregiving on said persons. Older caregivers experiencing emotional and physical strain may benefit from being referred to family psychoeducation and/or to treatment agencies that may be able to alleviate the burden of care. Socially isolated older caregivers or those perceiving stigmatization may benefit from attending social support services.

PERCEIVED BENEFITS OF A TRAINING PROGRAM FOR FAMILY CAREGIVERS OF PEOPLE WITH DEMENTIA IN CHILE

J. Gajardo¹, J.M. Aravena², M. Gálvez³, 1. *University of Chile, Santiago, Chile*, 2. *INTA, University of Chile, Santiago, Chile*, 3. *Kintun Center, Santiago, Chile*

In Chile most of care for persons with dementia is delivered by family relatives and research of interventions targeting caregivers of persons with dementia is very limited. This qualitative study explored perceived benefits of an education and training program for family caregivers of older persons with dementia. Setting was the Program Kintun for persons with dementia in the city of Santiago, Chile. Intervention was founded using the theoretical frame of readiness in family caregivers of persons with dementia by Gitlin et al (2014), based on a progressive cycle in the development of skills that allow caregivers to move towards higher levels of self-efficacy.

Participants were 65 family caregivers who attended a 4-session intervention between years 2014–2015, guided by one occupational therapist and one psychologist. Data were collected through 4 focus groups and field notes, and were analyzed through content analysis, with open coding to develop main themes. Three main themes were identified and these themes represent the global areas of benefits that participants perceived. Theme one “Being able to manage the unknown” which relates to self-efficacy as participants described their perceived capacity to face situations that were new and to which they had not previously developed a solution. Theme two was “Stop the fight”, which relates to learn about dementia and the acceptance of the disease. Third theme was “Meeting someone like me”, which relates to the

access to support by meeting others who are facing similar challenging situations and doubts.

GRANDPARENTS CARING FOR GRANDCHILDREN IN THE UNITED STATES AND CHINA

S. Wang, H. Wang, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

The United States and China have very different social norms and expectations regarding providing care to grandchildren. This study is interested in how providing grandchild care is shaped by these two cultures. Using data from the China Health and Retirement Longitudinal Study (wave 2013) and data from the Health and Retirement Study (Wave 2012), we compared the prevalence and characteristics of grandparents caring for grandchildren in the United States and China.

The sample comprises of 9,676 American grandparents (*Age* = 64) and 6,527 Chinese grandparents (*Age* = 60) aged 45 and over. Providing grandchild care is more prevalent in China (50%) than in the U.S. (31%). The US grandparent caregivers are disproportional females (78% versus 52% in China), whereas Chinese grandparent caregivers are disproportional married (78% versus 57% in the US).

The U.S. and China share some determinants in providing grandchild care, such as age, gender, education level, mobility, household size, and numbers of dependent children grandparents have. However, there are significant differences. The US grandparents who are married and healthier are more likely to provide care, whereas Chinese grandparents who are in better economic status and have fewer adult children are more likely to provide care.

Findings of this study suggest that grandparents' availability and abilities to provide care are two important aspects in determining care provision in both countries, although these two aspects may be manifested by different factors in each country. Future study may explore more characteristics of grandparent caregivers and differentiate types of grandchild care.

PERCEPTIONS OF LATINO CULTURAL VALUES RELATED TO CAREGIVING

I. Gouveia Marques¹, A.A. Gomez², M. Magallanes¹, M. Garcia¹, J.S. Rocha¹, D. Marquez¹, 1. *University of Illinois at Chicago, Chicago, Illinois*, 2. *Smith University, Northampton, Massachusetts*

Latinos have a tendency to age at home and are less likely to use formal care services. Familial caregiving is common for spouses or adult children. The purpose of this paper is to identify Latino cultural values that influence caregiving practices of relatives with Alzheimer's disease and related dementia. Interviews were conducted with sixteen Latino caregivers, 50 years and older, who were the primary caregiver of a relative with ADRD for a minimum of 4 hours daily, for the past 6 months. Interviews were conducted in English and Spanish, were recorded, transcribed, translated and coded according to directed content analysis. Latino cultural values identified were familismo, marianismo, machismo and fatalismo. Familismo was mainly mentioned regarding the preference to age at home and not use formal care services. Both men and women mentioned the value of familismo and the notion that if their loved ones are put in

homes then they will not receive love and proper care, and therefore, die faster. Marianismo was identified in caregiving actions, described as natural practices and obligations performed by women. Machismo was noted in descriptions of actions as men's duties to protect their family. Fatalismo was cited as ways to express gratitude for positive situations, and appreciation for avoidance of negative situations. Creating services or programs that provide information for Latino communities that acknowledge and incorporate cultural values into providing care can benefit the care recipient and also the familial Latino caregivers.

OLDER CAREGIVERS LIVING IN DIFFERENT CONTEXTS IN BRAZIL

B.M. Luchesi^{1,2}, A. Brigola¹, A.I. Ottaviani¹, É.N. Souza¹, E.S. Rossetti¹, M. Terassi¹, N.A. Oliveira¹, S. Pavarini¹, 1. *Gerontology, Federal University of São Carlos, São Carlos, SP, Brazil*, 2. *University of São Paulo, Ribeirão Preto, SP, Brazil*

The number of older people that provide care to another elderly individual is increasing in the world. The context that they live can influence the quality of the care. The aim was to compare the differences in sociodemographic, care and health variables of older caregivers living in urban, rural and poverty contexts. There were household interviews, with n=344 older caregivers that provided care to a dependent older adult in Brazil. We evaluated sociodemographic and care characteristics, and the health variables: activities of daily living (ADLs), self-reported pain, frailty, cognition, satisfaction with life, familiar functioning, burden, stress and hope. Regarding the care context, 55.1% were living in urban areas, 21.3% in poverty areas and 23.6% in rural areas. In all contexts, the majority of the caregivers was female, with an average age of 67 years and cared for the spouse. The poorer caregivers were less educated ($p \leq 0.05$) than the others. Older carers living in poverty areas received significantly less emotional and material help to provide care, were less satisfied with life, were more frail, had more cognitive deficits, had the worst family functioning level and the lower level of hope when compared to the ones living in urban and in rural contexts. However, caregivers of poverty areas were more independent to the ADLs. The other variables were not significantly different. The results showed important differences between contexts. The professionals working in primary health care centers should consider these differences when planning interventions that focus on help this specific group of caregivers.

COLLEGE STUDENTS' CAREGIVING CONSCIOUSNESS: EFFECTS OF THE IMAGE OF ELDERLY AND INTIMACY

S. Mo, S. Choi, *Kongju National University, Gongju, Korea (the Republic of)*

Influenced by the filial piety concept of Confucianism, most of the Korean family takes care of their parents even though not living with them. But the caregiving consciousness has lowered especially among the young people. This study examined how the image of elderly and intimacy impact on college students' caregiving consciousness. The data were collected by self-filled up survey among 353 college students

in Seoul and Chungnam during December of 2015. Based on literature reviews, a 16-item scale on caregiving consciousness, an 8-item scale on intimacy and a 12-item scale on image of elderly were used. College students' caregiving consciousness (3.96: economical>physical>emotional) and intimacy level(3.99) were higher than the average, while mean score of the image of elderly was a little lower(2.91: social>psychological>physical). Among the demographic variables, only sex and birth order were significantly related to economical caregiving consciousness. In multiple regression analysis, intimacy, the social image of elderly and living experience with grandparents were the significant predictors. College students, who had the intimate relationships with their parents, the positive social image of elderly, and living experience with grandparents, were more likely to have positive caregiving consciousness. In conclusion, intimacy was found as the most influential factor. Therefore, it is suggested to develop and implement the program making parent-child relationships steady. Also, it is necessary to improve the negative image of elderly and understand the elderly properly through aging experience program, intergenerational program, and voluntary activities for the elderly.

PROJECT ELDER IN FAMILY: MODEL OF PUBLIC POLICY OF FAMILY CARE IN RIO DE JANEIRO

C. Brasil¹, C. Chaves², F. Furtado², S. Pollo², A. Giannoutsos², H. Santiago², A. Brandão², H.L. Furtado^{3,1}, 1. *Commission of the Elderly, Chamber of Deputies - Brazil, Brasilia - DF, Brazil*, 2. *Government Secretariat of Active Ageing, Resilience and Care of the City of Rio de Janeiro, Rio de Janeiro, Brazil*, 3. *Castelo Branco University, Rio de Janeiro, Brazil*

Through the observation of demographic changes and oriented by The Madrid Plan, the Government Secretariat of Active Ageing, Resilience and Care of the City of Rio de Janeiro highlighted the need to develop public policies aimed at quality of life, rights and confrontation of social inequalities, and created, in 2006, the project Elder in Family to ensure the permanence of elders in their home and integrated in their community. The objective is to avoid institutionalization, reducing social vulnerability and making it possible to stay in residence, through financial support, referring to 45% of the minimum wage, and social assistance to those who are unable to provide subsistence or have it provided by family. Assessment for inclusion was done by technical team following criteria of age (60 and plus); dependence degree I, II and III; personal or family income of up to two minimum wages; social vulnerability; possession of valid documents; writs or judicial follow-up; waiting time for inclusion. Monitoring is accomplished through periodic technical visits, annual registration and quarterly meetings with family. Goals achieved were 382 elders assisted in 10 years, 172 (45%) dropped out, 210 elders (55%) remain assisted; main causes of exclusion are deaths (>70%), followed by nonattendance of inclusion criteria, change of municipality and temporary support programming. It was not identified any case of institutionalization and there are 200 elders awaiting to be registered. The result was obtained through a low cost project, easy implementation and maintenance, prioritizing intersectional actions of the Government.

HISTORICAL TRENDS IN DEMENTIA FAMILY-CARE: A NEW GENERATION OF CAREGIVERS

C. Lee¹, D. Perdomo¹, S.J. Czaja¹, R. Schulz², 1. *Psychiatry and Behavioral Sciences, University of Miami Miller School of Medicine, Miami, Florida*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*

Family caregivers' represent the backbone of support to older adults who have a chronic condition such as Alzheimer's Disease (AD). Given the changes in the health care environment and in family structures and dynamics, it is important to understand the current demands on caregivers and how these vary with the context of caregiving. This paper will present comparison data from the Miami site of the Resources for Enhancing Alzheimer's Caregiver Health (Reach) II trial and our on-going trial, Caring for the Caregiver Network. The trials were conducted with family caregivers of AD patients in the same geographic area two decades apart, had similar eligibility criteria and used similar recruitment strategies. We use baseline data for the two studies to compare and contrast caregivers who join an intervention trial separated by two decades, the nature of the caregiving challenges they confront, areas of need, and magnitude of stress and burden. We discuss secular changes in health, social service systems, and public awareness of AD and caregiving that might account for observed differences.

HOMICIDAL THOUGHTS IN FAMILY CAREGIVERS OF PEOPLE WITH DEMENTIA

S. O'Dwyer^{1,2}, W. Moyle², T. Taylor², J. Creese², M. Zimmer-Gembeck², 1. *Medical School, University of Exeter, Exeter, United Kingdom*, 2. *Griffith University, Brisbane, Queensland, Australia*

Family caregivers of people with dementia have higher than average rates of suicidal ideation, but there has been no research on homicidal ideation in this population. The aim of this study was to explore thoughts of homicide in family caregivers of people with dementia. Twenty-one in-depth interviews were conducted in Australia with people who were currently, or had previously been, caring for a family member with dementia. Transcripts were analysed thematically and seven themes were identified: active thoughts of homicide; understanding homicidal thoughts in others; passive thoughts of death; euthanasia; homicidal thoughts in other caregiving situations; abuse; and disclosing thoughts of harm. Two of the 21 caregivers had actively contemplated killing the person with dementia, four expressed a passive desire for the death of the person with dementia, and four reported physically or verbally abusing the person with dementia. Only one caregiver had previously disclosed these thoughts, but disclosing helped to normalise the experience and facilitated access to support. Caregivers who had not contemplated homicide said they understood why others had. This is the first study of homicidal ideation among family caregivers of people with dementia and the findings have immediate implications for health professionals and service providers. More research is required to determine the prevalence of homicidal ideation in the caregiving population and understand the relationship between thoughts of homicide and a preference for euthanasia. After this session, participants will be able to explain why some caregivers contemplate homicide and identify directions for research and clinical practice.

CAREGIVING WITH GRATEFULNESS: THE ROLE OF GRATITUDE IN COPING WITH DEMENTIA CAREGIVING

B. Lau, *University of Hong Kong, Hong Kong, Hong Kong*

Taking care of a family member with dementia takes a heavy toll on the psychological well-being of caregivers. Nonetheless, a growing body of research has begun to examine gains and growth among caregivers, as well as the factors sustaining their noble pursuit. Positive psychology may have much to offer in this line of inquiry. Gratitude is widely perceived as a key factor to psychological well-being by different cultures and religions. Gratitude intervention has also been found to be one of the most robust categories of positive psychological interventions, especially for older adults. Hence, this study set forth to examine the role of dispositional gratitude in dementia caregiving under the resources-coping model. Using the structural equation modelling approach, we investigated the associations among dispositional gratitude, coping strategies, psychological resources and psychological distress in the context of dementia caregiving. Findings with 101 Chinese familial caregivers of persons with dementia (mean age = 57.6, range = 40–76; 82% women) showed that gratitude was associated with the greater use of emotion-focused coping (positive reframing, acceptance, humour, emotional social support seeking, religious coping) and psychological resources (caregiving competence and social support). Psychological resources and emotion-focused coping in turn explained the relationship between gratitude and lower levels of psychological distress (caregiving burden and depressive symptoms). The present results indicate the beneficial role of gratitude on coping with caregiving distress and provide empirical foundation for incorporating gratitude in future psychological interventions for caregivers. The potential of applying positive psychological constructs in supporting dementia caregivers will be discussed.

MEANING IN STROKE FAMILY CAREGIVING: A PILOT PHENOMENOLOGICAL STUDY

J. Zhang, D. Lee, *The Chinese University of Hong Kong, Hong Kong, Hong Kong*

Meaning in caregiving has been identified as an important influence on stroke family caregivers' responses to caregiving and the consequences of caregiving. While the role of meaning plays in stroke caregiving has been recognized, the research foci are mostly on the western populations. Due to different cultural, economic and social backgrounds, caregivers from other populations, such as the Chinese population, may perceive caregiving differently and thus attribute different meanings to it. A hermeneutic phenomenological study was conducted to illuminate meaning in caregiving from the perspective of the Chinese stroke family caregivers. A total of five stroke family caregivers were included in this pilot study. Data were collected through unstructured interviews and analyzed by a three-step analysis method including naive reading, structural analysis, and comprehensive understanding. Meaning in caregiving was interpreted as a physical, psychological and social suffering, and an obligation came from social norms and the ethics of Confucius. Caregivers also perceived caregiving as an opportunity and a subjective choice to maintain love and hope, to gain personal growth, and to achieve harmony within the family. After caregiving

was normalized in daily life, it became a natural part of life. This study has identified important culturally relevant meanings among the Chinese stroke family caregivers. Findings of this study will empower health and social care professionals to develop culturally relevant interventions to support the Chinese stroke family caregivers and the stroke survivors.

CAREGIVING AND SERUM BIOMARKERS: COMPARING EFFECTS ACROSS POPULATION-BASED AND CONVENIENCE SAMPLES

D.L. Roth¹, W.E. Haley², N.S. Jenny³, M. Cushman³, O. Sheehan¹, J.D. Walston¹, 1. *Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland*, 2. *University of South Florida, Tampa, Florida*, 3. *University of Vermont, Colchester, Vermont*

Several previous studies have compared biomarker indicators of stress, inflammation, and immune system functioning between family caregivers and noncaregivers. Most studies have used small convenience samples of specific caregiving subgroups (e.g., spouses of persons with dementia) and used poorly described noncaregiving comparison groups. Published reviews have noted these limitations and also documented clear inconsistencies in the findings, but definite conclusions have, nonetheless, been offered, and dysfunctional biomarker effects of caregiving are typically characterized as established facts. In our presentation, we will report meta-analyses that objectively summarize the previous findings and report new findings from the national, population-based, Reasons for Geographic and Racial Differences in Stroke (REGARDS) study. REGARDS includes a diverse sample of 2468 caregivers who had measures of C-reactive protein (CRP) and white blood cell count (WBC) obtained from serum samples. A matched sample of 2468 noncaregivers was identified using propensity-score matching techniques that balanced the two groups on 15 demographic, health history, and health behavior variables. Caregivers in the REGARDS study did not differ significantly from matched noncaregivers on the natural logarithm of CRP or on WBC ($ps > .36$), but the caregivers who reported high caregiving strain (17% of all caregivers) had significantly higher logCRP ($M = 0.97$) and WBC ($M = 6.10$) levels than less strained caregivers ($Ms = 0.84$ & 5.88 , respectively; $ps < .03$). Differences between studies using convenience samples and those using population-based samples will be discussed, including the importance of using more rigorous methods to assemble suitable noncaregiving comparison groups.

CHANGES OVER TIME IN FAMILY CAREGIVING FOR DISABLED OLDER AMERICANS, 1982–2012

A.L. Janus¹, P.J. Doty², 1. *Sociology, University of Edinburgh, Evanston, Illinois*, 2. *Department of Health and Human Services, Washington, District of Columbia*

This paper examines trends in informal caregiving for community-dwelling disabled older Americans between 1982 and 2012. We decompose hours of care received from spouses and children according to changes in: (a) the number of *potential* spousal and child caregivers (“family

structure”), (b) the likelihood that existing spouses and children are caregivers (“the propensity to give care”), and (c) the amount of care provided by individual spousal and child caregivers (“caregiving intensity”). We use data from two nationally representative surveys, the National Long-Term Care Survey (1982 and waves every five years from 1984 through 2004) and the Health and Retirement Study (waves every two years from 2000 through 2012). Disabled older people reported having fewer informal caregivers in 2012 than they did 30 years earlier. Hours of care received from spouses, children, and other family members declined during the 1990’s but have remained fairly constant since then. With regard to the decompositions, existing spouses’ and children’s decreasing likelihood of being caregivers led to fewer spousal and child caregivers per disabled older person in 2012 than in 1982, but the amount of care provided by individual spousal and child caregivers has been similar across the thirty years. Because the intensity of care provided by individual family caregivers has remained fairly constant since the early 1980s, the needs of family caregivers who experience high stress and a high time burden continue to deserve our attention.

THE SHARE PROGRAM FOR EARLY-STAGE DEMENTIA CARE DYADS: PROMISING RESULTS FROM THE RCT

C.J. Whitlatch¹, S. Orsulic-Jeras¹, S. Zarit², A. Heid³, E.E. Femia⁴, 1. *Center for Research & Education, Benjamin Rose Institute on Aging, Cleveland, Ohio*, 2. *Penn State University, University Park, Pennsylvania*, 3. *Rowan University School of Osteopathic Medicine, Philadelphia, Pennsylvania*, 4. *Consultant, Falls Church, Virginia*

Receiving a diagnosis of Alzheimer’s disease brings with it many stressors and concerns for both the person receiving the diagnosis and his/her family caregiver. During this early stage of dementia it is possible to engage both care partners, the person living with dementia and the caregiver, in a psychosocial intervention that addresses future care. Yet, few programs actively engage both members of the care dyad in order to gain an understanding of each person’s preferences and for developing a plan targeting future care needs. This presentation describes the SHARE program (Support, Health, Activities, Resources, and Education), a six-session psychoeducational intervention for early-stage care dyads, and presents the feasibility and efficacy findings from a randomized controlled trial with 128 care dyads. Results indicate that compared to care partners in the control group, SHARE participants: 1) were able to construct a balanced care plan, 2) increased in their use of services ($p < .003$), 3) experienced improved dyadic relationship functioning (caregivers only, $p < .030$), and had higher program satisfaction especially for caregivers (p values ranging from $< .05$ to $< .001$). Although no differences were found between the control group and SHARE treatment group for mood or depression, it was encouraging that these potentially difficult discussions about the future course of dementia were not upsetting to either care partner, but rather helpful and productive. Results suggest that a prevention approach targeted for care dyads in the early stages of dementia holds great promise for improving outcomes and creating a manageable plan of care for the future.

SLEEP IN OLDER CAREGIVERS AND NON-CAREGIVERS: THE NATIONAL HEALTH AND AGING TRENDS STUDY

M. Tzuang¹, C. Holingue¹, A.P. Spira^{1,2}, 1. *Department of Mental Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 2. *Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland*

Studies of older caregivers of persons with dementia, Parkinson's disease or cancer in clinical samples indicate that caregivers have poorer subjective and objective sleep than non-caregiver controls. Less is known of older caregivers from population-based studies. We identified 948 community-dwelling participants who reported providing care for a spouse/partner, sibling, parent or other older relative, and 3,760 non-caregiver participants living in the community from the 2011 National Health and Aging Trends Study. Our sleep outcome measures were self-reported prior-month frequency of trouble falling asleep (i.e., sleep latency >30min), trouble returning to sleep when waking earlier than desired, and sleep medication use. Responses were on a 5-point scale (1 = every night, 5 = never). We selected responses of "some," "most," or "every night" to indicate a sleep problem; "rarely" or "never" indicated its absence. The prevalence of each sleep problem was similar in caregivers and non-caregivers. In a model adjusted for age, gender, marital status, education, self-reported health, depressive and anxiety symptoms, and heart attack or heart disease in the past year, we found that being female, having poor self-reported health, and greater levels of depressive and anxiety symptoms were associated with a greater odds of prolonged sleep latency, trouble falling asleep, and greater sleep medication use (adjusted odds ratios ranged from 1.06 to 1.69, all $p < 0.05$). Among caregivers, poor self-rated health and greater anxiety scores were associated with all three sleep problems. These findings may help target sleep interventions to subgroups of caregivers at higher risk of poor sleep.

SESSION 3610 (POSTER)

FAMILY CAREGIVING

FAMILY CAREGIVER CONFLICTS AND SUPPORT OF PEOPLE WITH DEMENTIA IN LONG-TERM FACILITIES

C. Fukui¹, M. Sakka¹, R.M. Amiya^{1,2}, I. Sato¹, K. Kamibeppu¹, 1. *Department of Family Nursing, Faculty of Medicine, Graduate School of Health Sciences and Nursing, The University of Tokyo, Bunkyo-ku, Tokyo, Japan*, 2. *TechWerks LLC, Silver Spring, Maryland*

Purpose: This study developed Family Conflict Scales for family caregivers for persons with dementia in long-term care facilities to explore the relationship between family conflicts and family support. **Design and Methods:** The scale was developed through forward- and back-translations, interviews of 12 staff members in long-term care facilities, and cognitive interviews of 12 family caregivers who met operational definitions in this study. The test was conducted with 334 family caregivers and a retest was conducted with 318 family caregivers who had indicated willingness to participate further. **Results:** The internal consistency was relatively high for all scales (Cronbach's

alpha > 0.87); sufficient retest reliability was demonstrated for all scales (intraclass correlation coefficient > 0.69). The confirmatory factor analysis supported a three-factor model. Convergent and discriminant validity for each Family Conflict Scale (in Japanese) subscale and Family APGAR were acceptable. Family caregivers who received no family assistance for caregiving perceived more conflict in their family than those receiving family assistance. **Implications:** The Japanese version of the Family Conflict Scale for family caregivers of persons with dementia in long-term care facilities was developed. The reliability and validity of the scale were verified. When providing support to family caregivers in long-term care facilities, it is necessary to consider the family from multiple viewpoints, including family conflicts and support conditions from other family members.

REVIEW OF FACILITATING AND CONSTRAINING INFLUENCES ON FAMILY CAREGIVING IN LONG-TERM CARE

J. Parmar, 1. *Department of Family Medicine, University of Alberta, Edmonton, Alberta, Canada*, 2. *Network of Excellence in Seniors' Health and Wellness, Covenant Health, Edmonton, Alberta, Canada*

Context: Family caregivers continue to be involved after the transition of the older relative into long-term care and the family caregiving is carried into the context of long-term care regardless of the caregiver burden prior to the transition. With family as context, this review examines the mutually influencing dynamics of older adults in long-term care, their family caregivers and their environment, including the facility and staff.

Purpose: The aim of this review is to study the facilitating and constraining influences on family caregiving in long-term care.

Method: This was a narrative literature review of studies from seven databases

Results: Four major themes emerged: The caregiving journey of families endures despite significant stress experienced by them before, during and after transitions of their older relative into long-term care. The changing nature of interpersonal relationships with entry of a relative to long-term care is an underpinning of the caregiver journey. The mismatch of role expectations of family caregivers and staff in long-term care is a challenge to family caregiving. Family caregiving appears to be sustained by being preservative in nature at the time of and after transition to long-term care.

Conclusion: A better understanding of the facilitating and constraining influences on the family caregiving journey in long-term care could be instrumental in the ways in which older people, family caregivers and staff can help to forge a community and clarify roles and expectations and support each others' well-being, and furthermore inform policy and practice.

RE-EVALUATING THE RELATIONSHIP BETWEEN CARER STRESS AND INSTITUTIONAL CARE UTILISATION

N. Donnelly¹, C.A. McGarrigle², A. Hickey¹, F. Doyle¹, 1. *Psychology, Royal College of Surgeons in Ireland, Dublin, Ireland*, 2. *Trinity College Dublin, the University of Dublin, Dublin, Ireland*

Background: Controversy exists in the literature about whether carer stress is a risk factor for institutional care use by care recipients, or just an epiphenomenon. We tested competing models of the contribution of carer stress to institutional care utilisation by community-dwelling older people.

Methods: Secondary analysis of The Irish Longitudinal Study on Aging (TILDA). A structural path analysis tested theoretically informed models of the relationship between carer stress and institutional care utilisation by community-dwelling older people.

Results: Two competing models were tested. One in which carer stress was found to be an independent predictor of institutional care utilisation by care recipients (OR: 1.47; 95% CI: 1.05–2.06; AIC: 2813.67 BIC: 2866.83) and one in which stress was an epiphenomenon of the process of institutional care utilisation (coefficient: 0.37; 95% CI: 0.06–0.68; AIC: 2860.56 BIC: 2913.73). Both models appear equally valid, suggesting a bi-directional relationship between carer stress and utilisation of institutional care by community-dwelling older people.

Conclusions: Results suggest the effects of institutional care utilisation on carer stress are as convincing as the effect of carer stress on institutional care utilisation, which has implications for current theories of the role of carer stress in institutional care utilisation.

COGNITIVE PROFILE AND FACTORS ASSOCIATED WITH THE COGNITION OF OLDER CAREGIVERS

S. Pavarini, A. Brigola, B.M. Luchesi, M. Terassi, N.A. Oliveira, T.d. Alexandre, K. Inouye, A.I. Ottaviani, *Federal University of São Carlos, São Carlos, SP, Brazil*

Cognitive impairment is prevalent in elderly individuals and can influence the performance of tasks, especially when these are related to the delivery of care. The objective was to identify the cognitive profiles and factors associated with the cognition of elderly caregivers of elderly Brazilian individuals from a primary healthcare service. A total of 350 individuals, 60 years old or older, who cared for an elderly individual dependent in regard to at least one daily living activity were interviewed in their homes. Cognition, assessed by *Addenbrooke's Cognitive Examination-Revised* (ACE-R), was the outcome of interest in the logistic regression model. The results show that older caregivers were mainly women (77.6%), aged between 60 and 69 years old (59.3%), married (90.1%), and with low income (70.8%). In regard to cognition, 144 (41%) older caregivers obtained scores below the median adjusted by education. Association between being a caregiver and obtaining a score below the median in the ACE-R was found for the following: being a woman (OR=2.10; 1.06–4.18); providing care to father- or mother-in-law (OR=9.40; 1.16–76.2); being frail (OR=2.60; 1.13–6.05); living with spouse and child (OR=2.71; 1.34–5.46); not having affective support (OR=1.81; 1.05–3.11), and being dependent in instrumental daily living activities (OR=0.82; 0.72–0.93). The percentage of older caregivers who scored below the median on the ACE-R is of concern. Loss of cognitive functions among older caregivers can be a complicating factor when it affects care provided to another elderly individual, not only because the quality of care provided may be affected, but also because it can become very costly for caregivers.

CHANGES IN SUBJECTIVE BODY PAIN OF FAMILY CAREGIVERS: A COMPARATIVE LONGITUDINAL STUDY

Y. Torimoto-Sasai¹, A. Igarashi², T. Wada³, M. Arakida¹, N. Yamamoto-Mitani², *1. School of Health Sciences at Odawara, International University of Health and Welfare, Odawara, Kanagawa, Japan, 2. Division of Health Sciences & Nursing, Graduate School of Medicine, the University of Tokyo, Bunkyo-ku, Tokyo, Japan, 3. The Jikei University School of Medicine, Minato-ku, Tokyo, Japan*

Many studies have examined caregiver burden, but limited research has been conducted on the changes in the health conditions of family caregivers over time. The changes in family caregivers' physical health during long-term caregiving should be explored and suggestions for supporting home caregiving should be proposed. This study tested the changes in subjective body pain of family caregiver's during long-term caregiving for the elderly, using a longitudinal, comparative research design.

Self-assessments of family caregivers and non-caregiver counterparts were repeated at baseline, six-month, and one-year intervals to test the change in subjective body pain over time. The collected data included demographics, health behaviors, and health conditions, and subjective body pain measured using the Margolis pain scale. A mixed model with a random intercept was applied to test the change in subjective body pain over time during long-term caregiving. We collected data from 95 family caregivers and 136 non-caregivers. Average age of caregivers and non-caregivers was 65 and 63 years, respectively. The subjective body pain varied among individuals (random intercept, $p < 0.05$). However, over time, average pain scores became significantly higher among caregivers than among non-caregivers, after controlling for sociodemographic characteristics and health-related variables. (Estimates of caregiving variable was 5.45 ($p < 0.05$)). It was suggested that long-term caregiving caused negative changes in family caregivers' subjective body pain. Comprehensive support is required to protect family caregivers' health.

INTERNET-BASED INTERVENTIONS FOR CAREGIVERS OF OLDER ADULTS: SYSTEMATIC REVIEW

C. Guay^{1,2}, C. Auger^{1,2}, D. Gélinas-Bronsard^{1,2}, L. Demers^{1,3}, B. Mortenson^{4,5}, S. Ahmed^{6,2}, B. Miller^{4,5}, J. Jutai^{7,8}, *1. Université de Montréal, Montreal, Quebec, Canada, 2. Center for Interdisciplinary Research in Rehabilitation of Greater Montreal (CRIR), Montreal, Quebec, Canada, 3. Institut universitaire de gériatrie de Montréal (IUGM), Montreal, Quebec, Canada, 4. University of British-Columbia, Vancouver, British Columbia, Canada, 5. GF Strong Rehabilitation Center, Vancouver, British Columbia, Canada, 6. McGill University, Montreal, Quebec, Canada, 7. University of Ottawa, Ottawa, Ontario, Canada, 8. Bruyère Research Institute, Ottawa, Ontario, Canada*

Internet-based interventions helping caregivers of older adults to cope with caregiving tasks can offer an efficient and accessible alternative to traditional face-to-face interventions. However, little is known about the existing links between intervention components and outcomes. A systematic review was conducted in databases with keywords

relevant to internet, caregivers and self-management interventions. Studies had to report on an intervention delivered mainly using the Internet and on caregiver specific outcomes, include at least one care recipient older than 50 years and score high level of evidence. A narrative synthesis of components (e.g. content, multimedia use, interactive online activities and provision of support), caregiver outcomes (e.g. on stressors, mediators and psychological health) and behavior change techniques was conducted. A total of 2338 articles were screened. 12 randomized controlled trials were included covering 10 internet-based interventions. 5 interventions led to statistically significant results on caregiver outcomes, mostly reporting impacts on depression or anxiety (n=4). From these interventions, 4 incorporated remote professional support with either synchronous (e.g. videoconference, n=1) or asynchronous (e.g. email, n=3) components and all were highly interactive with quizzes on educational content (n=3) or online questionnaires on health status (n=2). All 5 interventions provided instructions for behavior change, 4 provided social support and 3 used modeling techniques. In sum, internet-based interventions that are interactive, model appropriate behavior, incorporate professional support and provide instructions and social support can lead to better outcomes in caregivers. More studies isolating the specific effect of components are needed to better understand the underlying mechanism of action.

FAMILISMO, ACCULTURATION, CAREGIVING BURDEN WITH KNOWLEDGE OF AND CONFIDENCE IN HOME HEALTH SERVICES

J.D. Crist, A. Pasvogel, *College of Nursing, The University of Arizona, Tucson, Arizona*

Familismo (valuing family over individual needs including aging adult care) is often theoretically central to research about family caregivers of aging adults of Mexican descent and other allocentric cultures. *Familismo* has been shown to have strong protective outcomes, yet act as a barrier to use of supportive care, such as home health care services (HHCS). Acculturation (an individual's acceptance of dominant viewpoints, operationalized as "Anglo" or "Mexican" "orientation") varies in its associations with variables; e.g., *Familismo*. We explored family caregivers' associations among *Familismo* and Acculturation with Caregiving Burden, Knowledge of HHCS, and Confidence in HHCS, as part of a randomized control trial to increase Mexican-descent aging adults' use of HHCS. Some results were in the expected direction; e.g., *Familismo* positively associated with Mexican orientation ($r=.328$) and negatively with burden ($r= -.294$); Knowledge of HHCS associated with Anglo orientation ($r=.252$). However, Fear of HHCS, a subscale of Confidence (reverse coding), negatively associated with Mexican orientation ($r= -.304$); results varied by spouse/other and offspring caregivers. Spouse/other caregivers' Fear positively associated with English Language Preference subscale ($r=.383$); Offspring caregivers' Fear negatively associated with Spanish Language Preference subscale ($r= -.404$). Perhaps older, English-speaking caregivers had had more negative experiences with the healthcare system increasing fear; perhaps younger, non-English-speaking caregivers had been assigned more bilingual, culturally competent

providers, decreasing fear. Researchers, clinicians, and policymakers should standardize measures of *Familismo* and Acculturation, and address the complexity of differential cultural needs when designing interventions to improve families' access to services in the US and globally.

STATE OF THE ART OF FAMILY CAREGIVING FOR PATIENTS WITH HOME MECHANICAL VENTILATION: A LITERATURE REVIEW

M. Udchumpisai, K. Nilmanat, Q. Balthip, *Faculty of Nursing, Prince of Songkla University, Hat Yai, Thailand*

Patients with home mechanical ventilation (HMV) constitute a small but increasing population worldwide. A greater understanding of family caregivers of HMV-dependent patients is needed. This paper aims to present a literature review on family caregiving for patients with HMV. The databases searched were the Cumulative Index to Nursing and Allied Health Literature (CINAHL), Google Scholar, Science direct, ProQuest Nursing, and PubMed. The search included all English language literature published from 2008 to 2016. The synthesis method was used to identify and explore family caregiving in patients with HMV. The population eligible for inclusion consisted of family caregivers serving as main caregivers for patients depending on invasive mechanical ventilation at home. Studies were excluded if the research focused on non-invasive HMV or the patients' experience did not involve family caregiving. Thirty-four papers were identified as relevant to the topic of interest. Their data revealed that the state of the art in family caregiving for patients with HMV comprises five main aspects: (i) complexity of caregiving demands, (ii) ethical dilemma and legal issues related to HMV care, (iii) caregiving burden experienced by family members, (iv) family caregivers' adaptation, and (v) factors influencing the family caregiving experiences. The results of this review highlight the lack of knowledge in this field. Further research on the deeper exploration of family caregiving experiences for patients dependent on HMV in diverse cultural contexts is recommended.

SLEEP AND CAREGIVING AMONG ADULT DAY HEALTH CARE PROGRAM CAREGIVERS: A PILOT STUDY

Y. Song^{1,2}, J.M. Dzierzewski³, C. Fung^{1,2}, J.C. Rodriguez^{1,4}, S. Jouldjian¹, K. Josephson¹, C.A. Alessi^{1,2}, J.L. Martin^{1,2},
1. VA Greater Los Angeles Healthcare System, North Hills, California, 2. University of California, Los Angeles, David Geffen School of Medicine, Los Angeles, California, 3. Virginia Commonwealth University, Department of Psychology, Richmond, Virginia, 4. Pontificia Universidad Catolica, Santiago, Chile

Background: Older US veterans and their caregivers often report significant sleep disruption, but little is known about caregivers' attitudes towards sleep therapies. This study explored caregivers' attitudes toward therapies for managing veterans' sleep problems and their own sleep issues, and collected pilot data about caregivers' sleep and daytime function.

Methods: A focus group was conducted with caregivers (N=5) of US veterans at one adult day health care program. Participants completed a questionnaire including demographic

items, Pittsburgh Sleep Quality Index (PSQI), Insomnia Severity Index (ISI), Zarit Burden Interview (ZBI), Perceived Stress Scale (PSS) and Flinders Fatigue Scale (FSS), and a five-day sleep diary.

Results: Caregivers (100% female spouses of veterans; mean age=72) were primary caregivers for an average of 10 years (mean care hours per week=70). Four had PSQI>5 indicating poor sleep quality. The average ISI was 7.4 ± 4.7 with 3 having at least mild insomnia. The average ZBI was 28.1 ± 8.5 with 3 at risk for depression due to high caregiving burden. The average PSS was 13.6 ± 6.6 , indicating medium stress levels. Four experienced fatigue due to poor sleep. Two experienced nocturnal awakening due to caregiving. Four napped during the day. They reported sleep compression (gradually reducing time in bed to improve sleep quality), indoor physical activity, and outdoor light exposure were acceptable sleep interventions for themselves and veterans.

Conclusions: Caregivers experience poor sleep quality. They perceive the core elements of a behavioral sleep intervention targeting both members as acceptable. Potential benefits to patients and caregivers may be improved sleep and reduced stress.

THE MEDIATING ROLE OF SLEEP QUALITY ON WELL-BEING OF WORKING FAMILY CAREGIVERS

A. Honda¹, Y. Iwasaki², S. Honda¹, 1. Graduate School of Biomedical Sciences, Nagasaki University, Nagasaki, Japan, 2. Graduate School of Life Science and Systems Engineering, Kyushu Institute of Technology, Kitakyushu, Japan

It has been recognized that many caregivers of dementia patients have sleep problems, and that these sleep problems are often related to the nighttime behaviors of the care recipients. Recent studies have found that approximately two-thirds of caregivers suffer from sleep disturbances, and that poor quality of sleep of caregiver is linked not only to physical and psychological burdens but also to an increased risk of depression. This study aimed to investigate whether the well-being of caregivers is mediated by sleep quality and its relationship to behavioral and psychological symptoms in elderly relatives by using a mediational model. We studied 105 working family caregivers (49 men and 56 women, aged 21–64 years) in a cross-sectional design. We assessed well-being based on scores from the K10 scale, subjective self-rated health and satisfaction with daily life. Well-being of caregivers was impacted by the level of behavioral and psychological symptoms that elderly relatives were experiencing. Quality of sleep also affected well-being in working family caregivers, and that has role which controlling affect from behavioral and psychological symptoms in elderly relatives. In conclusion, maintaining quality of sleep in working family caregivers is important for reducing caregiver frustration and improving the balance between work and family life. If caregivers can maintain a high quality of sleep, caregiver burdens and the psychological distress are reduced; therefore, high quality of sleep not only promotes positive control of life and health but also improves overall well-being in caregivers.

WORLDHOOD OF ELDERLY BRAZILIAN CAREGIVERS AND THEIR OPENNESS TO THE WORLD OF CARE

L. Pedreira¹, G. Tadeu Reis da Silva¹, R. Maria de Oliveira Silva¹, A. Maria Cabral Ferreira², C. Marques Freitas¹, J. do

Amaral³, T. de Oliva Menezes³, 1. Universidade Federal da Bahia - Nursing School, Salvador, Brazil, 2. Universidade Federal da Bahia - Philosophy School, Salvador, Brazil, 3. Universidade Federal da Bahia, Salvador, Brazil

To understand how the worldhood of elderly caregivers, that delivery care to elderly people, is constituted. A Phenomenological research, conducted in the domicile of these persons, registered in a public program of home care. Recorded interviews with a guiding question and roadmap were used for characterization. The transcribed interviews were analyzed based on the philosophical hermeneutics and on the understanding of the hermeneutic circle. The units of meaning were discussed through the eyes of Heidegger's phenomenology. Six elderly main caregivers participated, with ages between 72 and 84 years. The following units of meaning formed: The daily life of being in the world as elderly person caring for another, and Historicity and its openness to the world of care. The worldhood constituted by these people is influenced by a hard routine, and it is overloaded and lonely, which make them vulnerable in the face of this routine and in the inherent weaknesses of their ageing process.

OLDER PEOPLE'S EXISTENTIAL LONELINESS FROM THE PERSPECTIVE OF BEING A NEXT OF KIN

H. Larsson, M. Råmgård, I. Bolmsjö, *Health and Society, Malmö University, Kristianstad, Sweden*

In the health care context, existential issues are important, in particular when death comes closer as among frail older people. The concept of existential loneliness has been described as a condition of life, an experience and a process of inner growth. However, how existential loneliness is perceived as a phenomenon remains unclear. Listening to the voices of next of kin's can be one way to reveal older persons' experience of existential loneliness. Hence, the aim of this study was to explore older persons' existential loneliness from the perspective of being a next of kin. The study was descriptive with a qualitative design and 16 interviews with next of kin's were carried out. The data was analyzed using qualitative content analysis. The findings showed that next of kin's perceived existential loneliness among their relative when mobility and space, were limited, were disconnected from others and were in a process of separation, meaning that they were leaving their lives behind. The findings also showed that next of kin's perceived that the older person's experience of existential loneliness could be reduced by social activities and when being cared for in an environment that supports contact with others.

KOREAN FAMILY CAREGIVERS' EDUCATIONAL NEEDS FOR MANAGING BPSD: THE SECOND YEAR STUDY

J. Park, H. Cheon, J. Kim, J. Song, *Korea University, Seoul, Korea (the Republic of)*

As a second series of the study titled "Let's read their minds", this study aimed to identify Korean family caregivers' educational needs for managing Behavioral and Psychological Symptoms of Dementia (BPSD). Data were collected by focus-group interviews with 8 family caregivers (7 women, mean age = 67.88 ± 9.75) who registered in a local dementia support centers located in Seoul. Five open-ended questions about managing BPSD were asked: What is the

most difficult symptom for you to manage?; What triggers the symptom?; How do you deal with the symptom when it occurs?; Why the symptom bothers?; and What education would be helpful for you? Among BPSD, agitation, aggressive behavior, and apathy were excluded from the interview topic because they were confirmed in the study conducted in 2013. Data were analyzed using content analysis. The difficult BPSD that family caregivers experienced were identified as suspicion, delusion, hallucination, wandering, depression, refusal to care, inappropriate elimination, and inappropriate eating. Most of respondents answered that they first scolded, hit, or argued with the patient when BPSD occurred and wanted to know how to effectively manage the patient's BPSD. The findings suggest that education is necessary for improving family caregivers' competencies to handle BPSD. The education should be comprehensive enough to make caregivers acquire general attitudes towards the persons with dementia as well as specific skills for managing BPSD.

This work was supported by the National Institute for Dementia Grant (2014-02). Correspondence to Jun-Ah Song (E-mail: jasong@korea.ac.kr).

PSYCHOLOGICAL DIMENSIONS AND SOC AMONG ELDERLY PRIMARY CAREGIVERS PROVIDING HOME CARE FOR ELDERLY

S. Ninomiya¹, T. Kobayashi², 1. *Ube Frontier University, Ube, Japan*, 2. *Hiroshima University, Hiroshima, Hiroshima, Japan*

Objective: The present study surveyed the elderly primary caregivers providing home-based care for elderly individuals in local regions of Japan in order to determine whether psychological dimensions and sense of coherence (SOC) differed according to age group.

Methods: The subjects were 67 pairs comprised of elderly individuals aged ≥ 65 years undergoing home care and their primary caregivers also aged ≥ 65 years. The survey items consisted of primary caregiver attributes, Barthel Index (BI), psychological dimensions (mental health; CES-D8), feeling of caregiving burden (J-ZBI), general self-efficacy (GSES), life satisfaction (LSI-K), and SOC (SOC13-5). For comparison, primary caregiver responses were scored and classified into two age groups: 65–74 years and ≥ 75 years. The survey was designed to avoid any potential ethical issues.

Results: SOC was significantly higher among primary caregivers aged ≥ 75 years than those aged 65–74 years. Positive correlations between GSES, LSI-K and SOC were recognized in both age groups. A negative correlation in the J-ZBI, CES-D8 and SOC scores was only seen among the primary caregivers aged ≥ 75 years.

Discussion: Primary caregivers who had a high SOC score exhibited a high level of general self-efficacy and life satisfaction. The results also suggested that primary caregivers aged ≥ 75 years who had a high SOC score had a low feeling of caregiving burden and a high level of mental health. Primary caregivers aged ≥ 75 years had a higher SOC than their 65–74 year-old counterparts, suggesting that a high level of SOC is important in continuing to provide care.

FACTORS RELATED TO MENTAL HEALTH OF ELDER FAMILY CAREGIVERS IN DEMENTIA CARE

Y. Okumura¹, J. Kuze², S. Tanimukai³, 1. *Department of Psychology, Tezukayama University, Nara, Nara, Japan*, 2. *Nihon Fukushi University, Handa, Aichi, Japan*, 3. *Ehime University, Toon, Ehime, Japan*

In dementia care, elder caregivers increase recently and it's necessary to consider support according to the age of the caregivers. In this study, the degree of mental health and factor were investigated to consider the appropriate support to the family caregivers. A questionnaire survey was conducted with family caregivers that are caregiving dementia persons at home. Analysis objectives were 81 persons (20 males, 61 females), and age average was 62.91 ± 10.66 years (range 33–88). In this study, the WHO-Five Well-being Index (WHO-5-J), The Erikson Psychosocial Stage Inventory (EPSI) and perceptions about the self of the participants were assessed. Among 81 caregivers, more than 65-years-old persons (elder group) were 32, and less than 65-years-old persons (younger group) were 49. The younger group scored the high points more than the elder group for the total score of WHO-5-J that is index of mental health ($t(79) = 2.26, p < .05$). In the elder group, when caregivers recognized of own as "I am I, myself" ($t(29) = 2.99, p < .01$), the total score of WHO-5-J and identity subscale score of EPSI ($t(29) = 2.19, p < .05$) were high points compared with the caregivers who are not recognized. The significant difference wasn't admitted for the younger group. The difference in the nursing environment wasn't admitted about the degree of mental health and own recognition. In dementia care, it is suggested that the support to maintain or promote the self-identity is needed for the elder family caregivers.

SESSION 3615 (POSTER)

FAMILY, INTERGENERATIONAL, AND CAREGIVING ISSUES

LIFE AFTER CARE: ROLE AND IDENTITY TRANSITION AND FAMILY CAREGIVING

C. Kelleher, *University College Cork, Cork, Ireland*

Framed by an idealist ontology and relational constructionist perspective (Blaikie 2010), this qualitative study explores how family carers experience role and identity transition as they progress from 'family member' to 'family carer', to 'post-carer', with the latter reflecting the cessation of the caring role as the individual being cared for moves to or dies in a care home or dies at home. Such transitions approximate cumulative rites of passage (Van Gennep 1960, Turner 1969) comprising identity rebuilding and present practical and emotional challenges for family carers. In line with Barnhart and Penaloza (2013), we characterize family caring as a dynamic and situated, socially constructed group phenomenon, where the assisting functions of family, friends, and paid service providers create a family caring ensemble (FCE). Depth interviews were conducted with eight family carers, four females and four males, who had experienced loss in relation to their family caregiving role. Emergent

themes relating to carers' experiences of role and identity transitions and losses were induced from participants' narratives (Spiggle 1994). We induced three phases of role and identity transition precipitated by multiple losses across the care giving life course, which we term reconfiguring, distancing and reconstituting. While the role and identity transition phases induced might suggest a linear transition from family member to family carer over time, they were in fact cumulative, multifaceted and overlapping. Each transition require carers to juggle multiple roles, which lead to chronic stress for the duration of the caregiving period and imply intensive identity re-building within and beyond family networks, while over time a sense of renewal and positive emerged as post carers refashioned identities within and beyond the family. We conclude with implications for carer organizations, service providers and policymakers.

THERE'S MORE TO GOOD CARE THAN JUST A GOOD SERVICE: RESULTS AND IMPLEMENTATION OF NATIONAL SURVEY

A. Ramovs^{1,2}, J. Ramovs¹, T. Mlakar¹, 1. Anton Trstenjak *Institute of Gerontology and Intergenerational Relations, Ljubljana, Slovenia*, 2. *University Medical Centre Ljubljana, Ljubljana, Slovenia*

With evidence that majority of the infirm elderly live at home and is taken care of by informal caregivers, staying home as long as possible and support of both, caretakers and caregivers, became focus of new European and American actions and policies.

According to SHARE and our survey data, 25.4 % of Slovenians are older than 60 years and 75% of those in need of care live at home (like in other central EU counties). In order to help professionals and governments to improve and assist with the informal care (also in form of different care services) it is essential to understand risk and protective factors for good care, i.e. what helps caregivers to care well for the elderly, what gives infirm elderly their human dignity even in their disability and what are pitfalls in the caregiver-caretaker relationship.

As an answer to these questions large-scale representative survey on the needs, potentials and standpoints of Slovene population aged 50+ was carried out in form of personal field interview by Anton Trstenjak Institute – National Institute of Gerontology. The qualitative analysis showed that 57% of people interviewed were able to list one or more good memories from the time of caregiving or caretaking. Good relationship, ethical fulfillment of human responsibility of the one who is strong against the weaker one and thankful acceptance of help are some of the most prominent answers. Together with the analysis of happiness and content, these results clearly indicate that quality of care becomes significantly higher with congruent relationship between caregiver and caretaker - moreover, if they are not taken into account, even first rate service will not bring content.

ADULT CHILDREN'S ATTITUDES, BEHAVIORS, AND WELL-BEING

L.M. Paskulin¹, M. Aires^{1,2}, F. Fengler¹, D. Mocellin¹, N. Oliveira¹, C. Bierhals¹, I. Rosset¹, E. Morais¹, 1. *School of Nursing, Federal University of Rio Grande do Sul, Porto Alegre, RS, Brazil*, 2. *URI, Frederico Westphalen, RS, Brazil*

Well-being can be defined as positive or negative personal feeling related with life as a whole. Filial responsibility might be protective or harmful for caregiving well-being. The purpose was to examine associations between filial responsibility attitudes/behaviors and caregiver well-being. A cross sectional study with an intentional sample of 100 children caregivers of older adults from two Primary Health Care Centres was conducted in the south of Brazil. Face to face interviews were developed in 2014 using the Filial Responsibility protocol validated in Brazilian Portuguese (AIRES et al, 2012). Filial responsibility attitudes were assessed through the Filial Expectancy Scale and the Measure of Filial Piety. Caregiving behaviors were assessed through assistance with basic and instrumental activities of daily living (ADL), companionship, financial and emotional support. Well-being was measured by the Caregiver Burden Inventory, the Life Satisfaction Scale, the Personal Well-Being Index and the Quality of Your Relationship Scale. Multiple regression analyses assessed the association between attitudes/ behaviors and well-being scales. It was found a higher frequency of caregiving daughters (74) with a mean age of 54.04 ± 10.17 years, married (42) with a mean of 13.96 ± 4.87 years of study. The children with higher scores of filial piety had significantly higher scores on Personal Well-Being Index (p=0.001). Financial support (p=0.005) and help in the ADLs (p<0.001) were associated with higher scores on the Caregiver Burden Inventory and influenced negatively caregiver well-being. Children caregivers who satisfied their parents companionship and visiting's needs had worse scores of life satisfaction (p=0.034).

EMPLOYMENT STATUS OF ADULT CHILDREN IN CHINA: EFFECTS ON CAREGIVING TIME AND DEPRESSIVE SYMPTOMS

Y. Liu¹, R. Fu², K.A. Roberto¹, J.S. Savla¹, 1. *Virginia Polytechnic Institute & State University, Blacksburg, Virginia*, 2. *Siena College, Albany, New York*

Objective: Involvement in paid employment can affect family members experience as caregivers for older relatives. Based on Pearlin's stress model, this study explores the potential moderating effect of employment status on caregiving time and depressive symptoms among adult children caregivers in mainland China.

Method: Participants included 660 adult children caregivers from a nationally representative sample of individuals aged 45+ (N=13,204) from the China Health and Retirement Longitudinal Study (CHARLS) Wave 2 (2013). Multiple linear regression was used to analyze the direct effect of time spent in the caregiver role and the moderating effect of employment status on symptoms of depression of caregivers.

Results: The direct effect of caregiving time and employment status on depressive symptoms varied by gender. Male adult children caregivers reported experiencing higher levels of depressive symptoms if they were currently working (B=5.428, p<0.05) or spent more hours per year providing care to their parents (or parents-in-law) (B=2.040, p<0.05). These patterns were not found among female adult children caregivers. Employment status had a moderating effect on the relationship between caregiving and depressive symptoms. Among males spending more time on caregiving, those who were employed experienced lower levels of depressive symptoms (B= -1.794, p<0.05).

Discussion: Working may buffer the effect of caregiving on depression among male adult children caregivers. Findings offer evidence that Pearlin's stress model is applicable to adult children providing care of elderly parents in mainland China and inform policies and programs addressing employment issues that could support adult children caregivers achieving better health.

SOCIAL DETERMINANTS OF HEALTH, HEALTH DISPARITIES, AND CAREGIVING FOR AGING PARENTS IN CHINA

Y. Liu, K.A. Roberto, J.S. Savla, *Virginia Polytechnic Institute & State University, Blacksburg, Virginia*

Purpose. This study explores the relationship between being a caregiver for aging parents in mainland China and social determinants of health (SDH) (age, gender, urban/rural residency, marital status, education, living arrangement), as well as mental and physical health outcomes and disparities between caregivers and non-caregivers.

Methods. A nationally representative sample of respondents aged 45+ (N=13,204) from the China Health and Retirement Longitudinal Study Wave 2 (CHARLS, 2013) was analyzed. Logistic regression was used to explore the relationship between SDH, health disparities, and family caregiving.

Results. Different aspects of SDH related to family caregiving. Adult children who were women (OR=1.60, $p<0.01$), urban residents (OR=1.73, $p<0.01$), younger adults (OR=0.92, $p<0.01$), married (OR=3.98, $p<0.01$), high school educated (OR=1.57, $p<0.01$) and above (OR=2.32, $p<0.01$), were more likely to be caregivers than non-caregivers. Caregivers were more likely to live with parents (OR=1.69, $p<0.01$) or live with multiple generations (OR=2.28, $p<0.01$). Health disparities were evident. Caregivers were more likely to report being in fair health (OR=1.51, $p<0.1$), having less difficulties with physical functions (OR=0.90, $p<0.1$), but having two or more chronic diseases (OR=1.57, $p<0.01$) compared to their counterparts.

Implications. Health disparities undermine the capacity of adult children in mainland China to engage in family caregiving. This study adds to the discussion about how to support Chinese adult children who will take care of their parents and can help shape and inform policies and programs for vulnerable populations and perhaps leverage opportunities to engage adult children caregivers in getting support with the goal of achieving health equity.

FACTORS THAT INFLUENCE POSITIVE ASPECTS OF CAREGIVING AMONG JAPANESE CAREGIVERS

Y. Sawada¹, K. Kageyama², M. Ono³, 1. *Nihon Fukushi University, Nagoya, Japan*, 2. *Tokyo University of Technology, Tokyo, Japan*, 3. *KANSAI UNIVERSITY of SOCIAL WELFARE, Ako, Japan*

Although caring for an elderly loved one at home can be physically and emotionally challenging, some caregivers see it as being a positive experience. This study was conducted to investigate factors behind the differences between caregivers who see it as a positive or negative experience. Participants were 64 family caregivers (78.1% female, $\text{Mage}=65.52 \pm 9.93$) who were asked to describe their emotions and experiences of providing care at home. Of those, 20

participants (31.25%) reported that they view caregiving as being a positive experience. The data obtained from those 20 participants ($\text{Mage}=65.58 \pm 7.87$) were analyzed, and compared with those who view caregiving as being a negative experience.

Results indicated that 85% of the participants who reported caregiving as a positive experience were female, 65% were children or in-laws, 30% were spouses, 30% had a sense of giving back to the person who has cared for them, 65% had either or both informal and formal support, and 95% were living with the loved one. Thirteen of the people participants have been caring for were female (65%) who require either a higher level of care (30%) or a lower level of care (25%).

Based on these results, it may be concluded that the factors behind the differences between caregivers who see it as a positive or negative experience are being female relatives, living with and having a good relationship with the loved one, and having someone who share the responsibility of caring for their loved one. A large-scale study is required to confirm these results.

INFORMAL CARERS IN THE CARE MARKETS

M. Zechner, *School of Health Care and Social Work, Seinäjoki University of Applied Sciences, Seinäjoki, Finland*

Care for the elderly in the Nordic welfare states, such as Finland, has been characterized by strong social rights for publicly provided care services. This, however, has been changing in decent decades due to economic harshness and ageing of the population with increasing demand for services. One of the attempts to solve this dilemma in Finland, has been to increase informal care given by family members and other close ones.

To support informal care, a benefit called informal care allowance, has been developed already at the end of the 1980's. It is a combination of a taxable cash benefit and public care services where the caregiver has pension rights and is entitled to a certain number of days off each month. The political aim is to increase the take-up of this benefit.

Simultaneously with the attempt to encourage informal care, also other changes in the care services have been taking place. Previously public bodies, namely municipalities, have been the main service providers while the provision of non-governmental organizations has covered certain service niches. During the past two decades, markets actors have been encouraged with success to become providers of publicly funded services.

This has changed the position of informal carers and those in need of care. Informal carers increasingly have to focus on, not only on care, but also on seeking, comparing and controlling the service providers that increasingly are market actors. This presentation focuses on informal carers as markets actors in the context of a Nordic welfare state.

THE IMPACT OF TIME SPENT CAREGIVING ON THE LIVES OF THE HIDDEN WORKFORCE OF UNPAID CAREGIVERS

P. Kelly, J. Heyman, L. White-Ryan, *Graduate School of Social Service, Fordham University, West Harrison, New York*

As the population continues to age, a growing number of people find themselves in the position of having to provide unpaid care to older adults, whether family members, friends, or neighbors. Studies have shown that caregiving for the elderly and chronically ill can be burdensome and stressful, and can contribute to high rates of depression among caregivers (Ramsay, Walker, Ramsay, Compton, & Thompson, 2012). The longer the hours spent in weekly caregiving, which may comprise activities of daily living, memory assistance, and dealing with behavioral issues, can also interact to increase caregiver stress and psychological well-being (Gaugler, Jarrott, Zarit, Stephens, Townsend, & Greene, 2003). The objective of this research is to better understand the factors associated with caregiver burden. The focus of this analysis was to explore the length of time spent in unpaid caregiving, whether the caregiver worked outside the home, and the number of hours per week devoted to caregiving. A cross-sectional, non-probability convenience sample was used to collect data from caregivers at an intergenerational program and community caregivers (N=183). Caregiver burden was measured using the Zarit Burden Interview (ZBI-12). Results indicated a moderate, positive correlation between hours spent caregiving and caregiver burden. In addition to questions on time, effort and activities related to caregiving, respondents were asked open-ended questions about how caregiving has impacted their lives, in either a negative or positive manner. Content analysis was performed to categorize responses. Some examples include: “appreciating moments more with her” and “created very overwhelming and stressful environment for me”.

RECONNECTION—AN EXPERIENCE OF INTERGENERATIONAL PRACTICES WITH YOUNGER AND ELDER GENERATIONS

S.A. Fuentes, F. Ludovici, *Pontificia Universidade Catolica, Sao Paulo, Sao Paulo, Brazil*

The contemporary world is marked by an increasing individualism, leading to an impoverishment of the human experience. One of the consequences is a disconnectedness across generations, where both younger and elder generations have to lose. The aim of this study was to connect these two generations, by empowering the younger generation to act as socio-cultural agents for the elderly, and determine well-being benefits from this interaction. We used planned interactive educational research, and developed strategies and activities to sensitize the young generation to think about old age and aging, to empower the young generation to actively work with the elderly segment, and to invite seniors to participate in the activities. The methodology provided a number of strategies and activities still to be trialed, reflected, evaluated and adapted to enhance their effectiveness. The theoretical framework validated the importance of social actions as agents of change among them: Foucault, Agamben, Arendt, Freire. The number of activities organized resulted in: (i) mobilization of the young generation to engage with the elderly; (ii) enhancement of the level of interest from the younger generation to engage with the elderly, both giving and absorbing value, in an outside of the activities; and (iii) creation of social and cultural opportunities for the elderly community to share their knowledge and expertise with younger generations. In summary, the intergenerational activities reduced elder inactivity,

enhanced elder sense of life purpose, provided greater feelings of function for both generations involved, which may prevent health deterioration amongst the elderly.

THE SELF-INTERACTIONAL GROUP THEORY (SIGT) TO EXPLAIN INTERGENERATIONAL RELATIONS

V. Roos, *North-West University, Potchefstroom, South Africa*

Researchers' attempts to focus attention on the importance of relationships to explain intergenerational relations, provide little insight to explain the relational nature of intergenerational relationships. This presentation sets out to demonstrate how data obtained from the Mmogo-method®, in combination with the Intergenerational Group Reflecting Technique, were used to develop SIGT. Drawing on the General Systems Theory and the interactional approach, SIGT explains the relational/interactional nature of intergenerational relations. Relationships are viewed as the reciprocal, continuous communicative interactions between members of different generations. Thus, from a pragmatic perspective, focus or punctuation enables observation and description of different units of the relational interactions, namely the intra-individual, inter-individual, and group units of analysis. The intra-individual unit of analysis encompasses individuals' subjective experiences (emotions/feelings), and the problems or meaningfulness associated with the interactions between people. The intra-individual unit of analysis gives an indication of what takes place in the inter-individual and group units of analysis. The inter-individual unit of analysis involves (1) the context in which the interactions take place; (2) the definition of the relationship; (3) relational qualities (observable behaviour); (4) the motivation (social goals/needs) for interactions between people; and the (5) interactional processes. The group unit of analysis describes intra- and intergroup group behaviour. These units of analysis, which occur simultaneously and reciprocally, are embedded in the broader social, cultural, political and economic environments which informed them. SIGT will be applied to intergenerational relations in a rural South African context.

PSYCHOLOGICAL OUTCOMES OF INTERACTION BETWEEN OLDER PEOPLE AND CHILDREN

D. Belostotckaia, 1. *Developmental psychology, Vienna University, Vienna, Austria*, 2. *Oxford University, Oxford, United Kingdom*

There is strong scientific evidence about positive psychological outcomes of intergenerational interaction both between the relatives, and between unrelated children and older people participating in intergenerational programs. However, it is not clear whether this positive effect is a result of interaction itself, or participating in particular activity, or there is an intergenerational effect. Presumably all these three components supplement each other, and if so, what is the role of intergenerational effect in the positive psychological outcomes of such programs? This research project aims to answer this question, which will help to better understand, evaluate and design intergenerational programs. Using a sample of children, older people and a middle generation (N=300) participating in the intergenerational program “Summer of Age” in Bristol, this study tests the hypothesis that intergenerational interaction leads to a higher level of

subjective well-being. Diversity of activities using in the "Summer of Age" program allows us to control for the type of activity when testing the effect of intergenerational interaction.

WHO SPENDS MORE LEISURE WITH A FAMILY IN LATER LIFE: DO ASSETS MATTER?

S. Hong¹, C. Han², S. Lee², 1. *Dongguk University in Korea, Seoul, Seoul, Korea (the Republic of)*, 2. *Sungkyunkwan Univ in Korea, Seoul, Seoul, Korea (the Republic of)*

This study aims to test the asset effect on family leisure activity in later life. Using a probability disproportionate stratified sampling method, 1,421 subjects were selected from the nationally representative sample of 10,000 aged 55 and above in Singapore. Of them, 1,086 subjects successfully completed average one-hour face to face interviews with a structured questionnaire for six months in 2012. The complexity of stratified clustering survey sampling required post-survey weightings which needed to be applied for all statistical analyses. Monthly household income, assets (financial and real), and debts were measured with categorical ranges. Latent class analysis estimated an empirical pattern, using the family leisure activity (FLA) profiles (Zabriskie & McCormick, 2001): High (19%), Moderate (63%), and Low (18%) FLA classes. Demographics (age, gender, ethnicity, marital status, education, employment, house type, & religion), family structure (family size, generation, & living arrangement), and health status (physical function, depression, & self-rated health) were controlled. While financial assets were positively associated with higher levels of FLA, real assets had no impact on FLA. Higher income positively influenced FLA, but the effect of debts were complicated. Higher debt increased the likelihood of being a High FLA class than a Moderate FLA class, but decreased the likelihood of being a Moderated FLA class than a Low FLA class. The study findings were partially confirmed the asset effect on FLA, which implies the importance of financial saving intervention such as asset-based programs for older adults' family life.

THE IMPACT OF SOCIAL RELATIONSHIPS ON QUALITY OF LIFE IN HYPERTENSION PATIENTS LIVING IN A SENIOR CLUB

Q. Xu, Z. Sheng, C. Liu, H. Zhou, J. Hu, Y. Chen, L. Dong, Y. Jin, *The Affiliated Hospital Of Ningbo University Medical College, Ningbo City, Zhejiang Province, China*

Objective: To explore the influence of different social relations on the quality of life of hypertension patients who lived in senior club.

Methods: 108 volunteers of hypertension patients in the senior club were researched by the scale of SF-36 and self-made questionnaire. Besides, interviews were conducted in 10 hypertension patients by purpose sampling methods. The interview data were analyzed by Colaizzi method.

Results: (1) There were significant difference in quality of life with different marital status, living state, frequency contact and social support from theirs families, social workers, neighbors, friends ($P < 0.05$). (2) The interviews reveal how the social relations affect the quality of life. The main effects are as follows: 1) Favorable family relationship is very important to improve the quality of life by the material and spiritual supports from families. 2) In the senior club the social workers can enrich their spiritual life. But the patients

worry about the health and medical conditions especially the EMS of the club staffs. 3) The harmonious social relationships with neighbors and friends have a positive influence on the quality of life, because of the increased social contact and the sharing of knowledge. However, the elders are inert to make Friends and always have small contradictions between each other.

Conclusions: The quality of life in hypertension patients was significantly affected by the social relationship. The club staffs should devote more energy to care the social relationship and provide personalized nursing measures for hypertension patients.

DETERMINANTS OF CAREGIVING BY CHILDREN TO THE FRAIL ELDERLY LIVING ALONE IN JAPAN, KOREA AND TAIWAN

K. Kojima¹, J. Kim², 1. *National Institute of Population and Social Security Research, Tokyo, Tokyo, Japan*, 2. *Tokyo University and Graduate School of Social Welfare, Isesaki, Gunma, Japan*

In East Asia, aging has been proceeding with increase of the elderly living alone. The long-term care policy has been important so that long-term care services are provided to the elderly living alone. But, the role of children in caregiving is still important for them. What are the determinants of caregiving to the elderly living alone by children? We have analyzed it with focus on Japan, Korea and Taiwan. The data we have used were 2013 survey of the elderly living alone in Japan, Korea and Taiwan conducted by our research team. The samples used for analysis were 151 in Japan, 145 in Korea and 151 in Taiwan. This survey was approved by the ethics committee of Tokyo University and Graduate School of Social Welfare. The model was logit model. The dependent variable was whether children and their spouses give care or not. The independent variables were socio-economic status of the elderly living alone, care service use, relationship with children as caregiver. There are significant independent variables at 5% level as follows, medical care service use (+, Korea), elderly income (-, Japan), keeping good relations with children (+, Japan and Korea). In East Asia, determinants of caregiving by children have diversity in East Asia. But, we can show that to keep good relations with children is an important factor in elderly care by family. For long-term care policy in East Asia, it is important to take into account the support to frail elderly living alone and family caregiver.

SESSION 3620 (POSTER)

FRAILITY

THE ASSOCIATION BETWEEN HEALTHY LIFESTYLE AND FRAILITY IN CHINESE COMMUNITY-DWELLING OLDER ADULTS

C. Wang¹, X. Qiao¹, X. Tian¹, N. Liu¹, L. Dong¹, R.L. Kane², 1. *Shandong University, Jinan, China*, 2. *University of Minnesota, Minneapolis, Minnesota*

The study aims to identify the association between healthy lifestyle and frailty in a community-dwelling population of Chinese older adults. A total of 917 community-dwelling people aged 60 years and older were recruited from

a Chinese city. Frailty was assessed using the FRAIL Scale. A healthy lifestyle accumulation index was constructed using measures on physical activity, daily living habits and social participation. Data on ADL, IADL, depression, cognition and socio-demographics were also collected. The prevalence of frailty was 3.9%, higher in women (4.7%) than in men (2.5%). Women adopted more healthy lifestyles (mean 9.8) than did men (mean 8.9). Increasing age, female, ADL and IADL impairments, and depression were associated with an incremental risk of frailty. Healthy lifestyle was an independent protective factor of frailty (OR = 0.89, 95% CI = 0.82 - 0.97) after adjusting for socio-demographics and general health status, significantly in men (OR = 0.84, 95% CI = 0.73 - 0.97), but not in women (OR = 0.91, 95% CI = 0.82-1.00). Healthy lifestyle accumulation attenuates the risk of frailty in Chinese community-dwelling older adults. This suggests that it is relevant for elders, especially for aged males, to adopt healthy lifestyle in order to prevent or delay the onset of frailty.

PHYSICAL FRAILTY AND ONE-YEAR READMISSIONS AMONG GERIATRIC TRAUMA PATIENTS

C. Maxwell¹, M.S. Dietrich¹, R.S. Miller², 1. *Vanderbilt University School Of Nursing, Nashville, Tennessee, 2. Vanderbilt University, Nashville, Tennessee*

Background: An understanding of acute care readmissions among older adults informs quality improvement efforts and guides policy initiatives. Among geriatric trauma patients (GTPs), studies examining one-year readmissions have been confined to retrospective analyses of trauma registry data and/or large state-wide discharge data. We conducted a prospective cohort study among GTPs who remained alive at four time points over one year, and examined all causes of readmissions, repeat readmissions, and pre-injury frailty status. We hypothesized that pre-injury physical frailty would predict readmissions among GTPs.

Methods: Sample: 188 adults \geq age 65 admitted to a level one trauma center over a six month period (Oct2013-Mar2014) with a primary injury. Pre-injury physical frailty measures were obtained on admission from surrogate respondents. Procedure: After hospitalization, home phone calls were made to patients or surrogates at 30, 90, 180 and 360 days. Data Analysis: Frequency distributions, logistic regression models.

Results: Over a 1-year period, 46 patients (25%) died and 55 patients (40%) still living at 4 time points experienced one or more readmissions, for a total of 125 readmissions. Seventeen patients (31%) had > 1 readmission prior to death or within 1-year. Reasons for readmission included: follow-up surgeries (30%), medical complications (28%), medical comorbidities (22%), and repeat falls (9%). After controlling for age, comorbidities, injury severity, pre-injury frailty and cognitive impairment, pre-injury frailty status was the only statistically significant predictor of at least 1 readmission \leq one-year post injury (O.R.=1.52, p=0.039).

Conclusion: Our findings extend our understanding of the influence of frailty on GTP outcomes, and highlight the importance of frailty screening upon hospital admission to facilitate patient-centered care and shared decision-making.

PATTERNS OF MULTIPLE HEALTH-RELATED BEHAVIORS IN NON-DISABLED OLDER ADULTS WITH FRAILTY

W. Chang, 1. *National Health Research Institutes, Taipei City, Taiwan, 2. Ministry of Health and Welfare, Taipei City, Taiwan*

Previous research has found the protective effects of health-related behaviors such as social engagement and using preventive services on the onset of disability for older adults with frailty. This study aimed to identify heterogeneous performance types based on multiple health-related behaviors, and to investigate the factors associated with the behavioral patterns. Data was drawn from the 2011 survey data of Taiwan Longitudinal Study on Aging (TLISA) with a sample of 1685 individuals aged 58 years or older who had prefrailty or frailty and no ADL disability. Health-related behaviors including smoking, harmful alcohol use, betel quid chewing, leisure-time physical activity, Qui-gong or transcendental meditation, preventive services utilization, and volunteering or community activity were analyzed to identify latent behavioral patterns by applying latent class analysis (LCA) with covariates using a multinomial logistic regression framework. Four behavioral patterns were identified: Healthy Life Style with High Social Engagement (prevalence of 25.4%), Physical Activity (19.0%), Inactive Life Style (37.7%), and Risky Life Style (17.9%). Younger age, being male, lower socioeconomic status (SES), lower number of chronic diseases, and being more frail increased the risk of being in the Inactive and Risky classes. Compared with the Healthy and Social Engagement class, the Physical Activity class tended to have lower SES. Intervention programs improving healthy behavioral patterns to prevent the development of disability for frail older adults could be designed according to the identified related factors. Policies on aging health should focus more on disadvantaged people and those who still have no or few chronic diseases.

FRAILTY TRAJECTORIES OF MEXICAN ORIGIN OLDER ADULTS

B.T. Howrey, S. Al Snih, K.J. Ottenbacher, *Family Medicine, University of Texas Medical Branch at Galveston, Galveston, Texas*

Progressive physical frailty in older adults is associated with increased risk of falls, disability, institutionalization and mortality; however, there is considerable heterogeneity in frailty trajectories over time. We identify heterogeneous frailty trajectory groups and examine the specific contribution of health conditions to frailty trajectories among older Mexican origin adults. We use a sample from the Hispanic Established Population for the Epidemiological Study of the Elderly (HEPESE) with a count of frailty criteria in 1995: slow gait, weak hand grip strength, exhaustion, and unexplained weight loss (n=2040). Using group based trajectory models we identified three frailty groups: low stable (n=96), moderate progressive (n=1456), and high progressive (n=488). The small stable group was significantly younger and had fewer baseline health conditions than either the moderate or high frailty groups, while the high frailty group had comparatively higher rates of stroke and hip fracture

at baseline than the other groups. Poisson regression models found that frailty counts increased with diabetes (IRR 1.19, 95% CI 1.09–1.29 and IRR 1.17, 95% CI 1.10–1.24 respectively) and pain (IRR 1.19, 95% CI 1.09–1.29 and IRR 1.18, 95% CI 1.16–1.41 respectively) and decreased with church attendance (IRR 0.88, 95% CI 0.82–0.95 and IRR 0.88, 95% CI respectively) in the moderate and high groups. Covariates were not associated with changes in frailty in the stable group. These results suggest that while frailty increases for the majority, it does so at different rates. The presence of a small, low frailty group over time warrants further study.

THE LINK BETWEEN DEPRESSION AND FRAILITY AMONG OLDER VETERANS FROM A VA GERIATRIC CLINIC

C.J. Burant^{2,1}, P.A. Higgins^{2,1}, H. Kim³, D.H. Canaday^{2,1}, T. Hornick^{2,1}, 1. *Case Western Reserve University, Bedford, Ohio*, 2. *Louis Stokes VA Medical Center, Cleveland, Ohio*, 3. *Mayo Clinic, Rochester, Minnesota*

Frailty is described as the vulnerability to declining health that could contribute to increased morbidity and mortality. Exhaustion and overall weakness are key components of frailty and may have links to depression. Depression and frailty in many ways may not be distinct from one another and may be bidirectional in nature. As older adults' health becomes compromised, patients may be at higher risk for frailty and depression. The purpose of this prospective pilot study of older veterans (n= 146) mean age = 83.7 (sd=6.1) was to identify the prevalence and associated factors with depression and two measures of frailty (Fried and Gill). In this study of a VA outpatient geriatric clinic, patients were screened for depression using the GDS-15 and for frailty using the Fried Frailty Criteria (weight loss, exhaustion, physical activity, walk time, grip strength) the Gill Frailty Instrument (walk time, sit to stand). In the current study, 25 (17.1%) patients reported some signs of depression (GDS 5 or greater). Regarding frailty, using the Fried criteria 77(52.7%) had some frailty, while 48 (32.9%) were frail. For the Gill criteria, 31 (21.2%) had some frailty and 49 (33.6%) were frail. Depression was correlated with Fried Frailty (r=.30) and its components including: difficulty in walking (r=.22); exhaustion [lack of effort (r=.33) and could not get going (r=.41)]. Depression was not related to Gill frailty, except for its component of difficulty in walking (r=.22). More in-depth studies are needed to fully understand the cyclical nature of the relationship between depression and frailty.

SESSION 3625 (POSTER)

GENDER ISSUES IN AGING

GENDER DIFFERENCES IN CARDIOVASCULAR DISEASE: COMORBID POST-TRAUMATIC STRESS DISORDER AND DIABETES

C.J. Gibson^{1,2}, Y. Li^{1,3}, S. Inslight^{1,2}, A.L. Byers^{1,2}, 1. *San Francisco VA Medical Center, San Francisco, California*, 2. *University of California, San Francisco, San Francisco, California*, 3. *NCIRE-The Veterans Health Research Institute, San Francisco, California*

Post-traumatic stress disorder (PTSD), an often chronic and debilitating condition with health impacts across the lifespan, is associated with increased risk for both diabetes mellitus and cardiovascular disease. Depression comorbid with diabetes is known to contribute more strongly to cardiovascular disease and mortality than either condition alone, and this risk may be particularly pronounced among women. Similar patterns linking comorbid PTSD and diabetes with cardiovascular risk may be expected, but have not been established. These associations were examined in the Department of Veterans Affairs National Patient Care Database (n=163,184, 4% female), a retrospective cohort study of Veterans 55 years and older. PTSD and diabetes mellitus at baseline (2000–2003) were related to risk for incident cardiovascular disease (myocardial infarction, stroke, or transient ischemic attack) over a 10 year follow-up period (2004–2014) using Cox proportional hazard models. After adjusting for demographic variables, medical conditions, and psychiatric diagnoses, there was a significant three-way interaction between gender, diabetes, and PTSD predicting incident cardiovascular disease (p=0.03). Risk for incident cardiovascular disease was over three times higher for women Veterans with comorbid diabetes and PTSD compared to PTSD alone (HR 3.18, 95% CI 1.10–9.24), but comorbid diabetes did not increase risk for male Veterans with late-life PTSD (HR 0.96, 95% CI 0.86–1.07). These findings highlight the need for research to identify mechanisms contributing to increased risk for morbidity and mortality among women affected by these commonly co-occurring conditions, and the importance of examining gender differences in PTSD and its health-related comorbidities.

MEN AND AGING: NEGOTIATING MASCULINITY

M. Charpentier, 1. *Social Work, UQAM-University of Quebec in Montreal, Montreal, Quebec, Canada*, 2. *Research chair on Aging and Citizen Diversity, Montréal, Quebec, Canada*

This poster presents the findings of a qualitative study on men's experience of aging that was conducted in Québec with 24 men aged 65 to 92. Their experience was examined from a subjective and reflexive (relationship to the self, body, others) point of view and based on the conduct of actors in their daily environment and the public arena (Dubet 1994). We will show that older men experience grief associated with aging, especially losses linked to the body in terms of physical aptitudes/performance, sexuality and sex appeal. They see themselves as increasingly unable to meet expectations associated with the hegemonic model of masculinity, in other words, the dominant standards and values concerning masculinity (Thompson and Worthy 2004), which can be translated into the traditionally male qualities of emotional control, strength, and competitiveness (Roy 2008). Paradoxically, their susceptibility to the hegemonic standards of masculinity, which causes them to experience aging in terms of loss, is also what inspires these men to (re)act, and exercise what could be called their power to act. Faced with the loss of power over their body, older men develop various strategies, which change over time, to negotiate the effects of aging. Of these, the principal ones are: recreating a significant

social network: volunteer work or taking on short-term jobs
2) changing reference group: comparing themselves favourably to men of their age instead of to younger men as they did before; 3) redefining the notion of age – physical age does not correspond to their mental age.

INTERPERSONAL VIOLENCE AND POST-TRAUMATIC STRESS DISORDER AMONG COMMUNITY-DWELLING OLDER WOMEN

C.J. Gibson^{1,2}, A. Huang², B. McCaw³, J. Shan³, L. Subak², S.K. Van Den Eeden³, 1. *San Francisco VA Medical Center, San Francisco, California*, 2. *University of California, San Francisco, San Francisco, California*, 3. *Kaiser Permanente Division of Research, San Francisco, California*

Because prior research on interpersonal violence (IPV) and sexual violence has largely focused on younger women, little is known about the risk and impact of these experiences among older women. To address that gap, the prevalence of physical and emotional IPV from an intimate partner, lifetime sexual violence, and post-traumatic stress disorder (PTSD) symptoms were examined in a multi-ethnic sample of community-dwelling midlife and older women (mean age 60.5, range 41–81). Data were drawn from the Reproductive Risk of Incontinence Study in Kaiser (RRISK), an observational cohort study (n=2,106) of long-term enrollees in the Kaiser Permanente Northern California health care system, with home-based assessment using standardized instruments. In this multi-ethnic sample (40% non-Latina White, 20% Latina White, 20% Black, and 20% Asian), 16% of participants reported ever having experienced physical IPV, and 4% reported physical IPV within the past year. A history of emotional IPV was reported by 21% of participants, and 14% reported emotional IPV within the past year. Lifetime sexual violence, including being groped, fondled, or raped, was reported by 19% of the sample. Over 22% of the sample reported symptomatology indicative of clinically significant PTSD, although the incident trauma exposure related to these symptoms was not assessed. The high rates of reported violence and PTSD symptoms in this ethnically diverse sample highlight the importance of systematic screening and early intervention among midlife and older women, which may contribute to otherwise unidentified mental and physical health care needs in this population.

GENDER-RELATED DIFFERENCES IN THE EFFECT OF SOCIAL DETERMINANTS ON QUALITY OF LIFE IN OLDER AGE

B. Tobiasz-Adamczyk¹, A. Galas², K. Zawisza¹, S. Chatterji³, J. Haro⁴, J. Ayuso-Mateos⁵, S. Koskinen⁶, M. Leonardi⁷, 1. *Department of Medical Sociology, Chair of Epidemiology and Preventive Medicine, Jagiellonian University Medical College, Krakow, Poland*, 2. *Department of Epidemiology, Chair of Epidemiology and Preventive Medicine, Jagiellonian University Medical College, Krakow, Poland*, 3. *Department of Health Statistics and Information Systems, World Health Organization, Geneva, Switzerland*, 4. *Instituto de Salud Carlos III, Centro de Investigación en Red de Salud Mental. CIBERSAM; Parc Sanitari Sant Joan de Déu, CIBERSAM, Universitat de Barcelona, Barcelona,*

Spain, 5. *Department of Psychiatry, Hospital Universitario de La Princesa, Instituto de Investigación Sanitaria Princesa, Madrid, Spain*, 6. *National Institute for Health and Welfare, Helsinki, Finland*, 7. *Fondazione IRCCS, Neurological Institute Carlo Besta, Milano, Italy*

Gender-related differences in the process of aging have been well documented in relation to life expectancy, prevalence of chronic conditions, and level of disability but still the explanation of the role of social determinants in quality of life, which can play different role in men and women, has remained unclear. The investigation aims to reveal gender-related differences in social determinants on quality of life assessed by a multi-pathway model considering health, social, demographic and living place characteristics.

The sample for the analysis consists of 5099 participants aged 50+ years from general Finnish, Polish and Spanish populations being a part of cross-sectional COURAGE in EUROPE study. The quality of life was measured by WHOQOL-AGE scale. Social determinants were measured by the COURAGE Social Network Index, the OSLO-3 Social Support Scale, the Three-item UCLA Loneliness Scale, participation and trust scales were used. The path model was used to verify relations between different determinants of quality of life by multi-pathway modelling what enabled adjustment for several covariates.

The results showed that the effects of social networks, participation, trust and loneliness on quality of life in elderly (aged 50–64) men and women; which were similar in both gender groups. Gender-related differences in the role of social support, participation and trust in quality of life were observed among older (aged 65–79) individuals, males benefited more from social support, females more from social participation and trust. In the oldest (80+) group gender-related differences were noticed only in the role of social support in quality of life.

FUNCTIONAL STATUS, COGNITION, AND SOCIAL RELATIONSHIPS IN DYADIC PERSPECTIVE

J. Wong¹, N. Hsieh², 1. *University of Chicago, Chicago, Illinois*, 2. *Michigan State University, East Lansing, Michigan*

Health declines can change older adults' social participation and social relationships. Yet, researchers rarely examine how the health and disability of *one's spouse* might affect *one's* engagement with the social world, even though stressors and life strains are often experienced as a couple or as a family. Using the partner data from Wave II (2010–11) of the National Social Life, Health, and Aging Project (N=953 heterosexual couples), we model the relationship between cognitive and functional limitations in one spouse and reports of social participation and relationship quality in the other. We find that one spouse's functional health is associated with the other's reports of relationship quality (partner effects) but that cognitive health is mostly associated with one's own reports of relationship quality and social participation only (actor effects). These associations vary by gender and by type of social relationship. For example, wives report lower support and higher strain from spouses when husbands have ADLs, but husbands' marital quality is not associated with

wives' functional limitations. Also, husbands report less strain from family and friends when wives have IADLs, but wives do not experience similar "social benefits" when husbands have functional limitations. These findings underscore the importance of gender and both partners' health in shaping social life at older ages.

EXAMINING PREDICTORS OF SELF-RATED HEALTH AMONG MIDDLE-AGED AND OLDER AFRICAN AMERICAN MEN

R. Turner, *Duke University, Durham, North Carolina*

An expanding body of literature exists that depict the poor health status of African-American men. Given the broad scope of poorer health among African-American men in the U.S., little is known about the psychosocial factors that influence their perceptions of health. In this study, we extend previous work by examining the influences of sociodemographic (education, income, marital status), physical health (disability status, disease history), and psychosocial indicators (stress, social support) on self-related health among middle-aged and older African-American men. Data was drawn from the National Survey of American Life to examine perceptions of self-rated health among 1,277 African-American middle age and older men. Our findings demonstrate that physical health and emotional social support play important roles in determining how African-American men view their health. This work underscores the importance of targeting both physical health and psychosocial factors when developing interventions design to improve the health of adult African-American men.

A COMPARATIVE ANALYSIS OF RESILIENCE IN TWO COHORTS OF OLDER, SINGLE WOMEN IN RURAL AUSTRALIA

P.M. Irwin, *Independent scholar, Courtenay, British Columbia, Canada*

Australian rural women are stereotypically perceived as stoic, self-reliant, and used to handling adversity. An ethnographic study conducted in rural Australia identified the developmental trajectories, responses, and profiles of resilience in two cohorts of older, single women living independently in the community: older old widows (aged 80 years and above) who were long-term 'locals'; and newcomers—late middle-aged (55 to 65 years of age) divorcees relocating from the city.

The older old women portrayed a predominantly passive reaction to crises and adversity throughout their adulthood, focused on bouncing back to regain equilibrium. By contrast, the late middle-aged women's response to personal and social disruptions was actively reactive, until they elected to restart their lives in the town. Moving to the town triggered a shift in the resilience responses of both groups of women: over time, the older old women pragmatically adjusted to their changed circumstances, whereas the late middle-aged women were isolated by an unfamiliar and unwelcoming local culture, and ultimately withdrew. For the majority of the older old women, the town's sociocultural norms and expectations limited their personal and social choices, and boxed them in. For them, resilience in later life is acquiescence. Concomitantly, the

late middle-aged women were systematically excluded from fully participating and contributing to the community, and thus boxed out by these constraints. For these women, resilience equates to endurance.

This finding contradicts the almost universal conception of resilience as a proactive, agentic, and positive construct in the literature.

DOING LAT: REDOING GENDER AND FAMILY IN LIVING APART TOGETHER RELATIONSHIPS IN LATER LIFE

D. Brothers, *Madonna University, Livonia, Michigan*

Gender relations in later life relationships have historically been studied within long-term marital relationships. This research shows patterns of high gender conformance earlier in family life, especially when young children are present, and less so later in life. Demographic and socio-cultural changes are giving rise to different partnership forms including cohabitation, divorce, remarriage, and living apart together (LAT), an intimate relationship in which the couple maintains separate residences. Using a life course framework the researcher examines how gender is manifested in the formation and maintenance of LAT relationships in later life using social constructivism and the theory of gender as social structure. A grounded theory qualitative study in the United States with 13 women and 7 men age 59 to 89 reveals patterns of "doing" gender as well as "doing" family earlier in life. LAT relationships in later life appear to be an opportunity to "redo" family in an individualized way, with the men and women both valuing and maintaining the autonomy and freedom that comes in a life stage with lessening work and family responsibilities. Additionally, LAT allows the women in the study to "redo" gender by actively resisting "doing" gender in ways such as being submissive to men, catering to men's needs and wants, and taking on caregiving duties. This study demonstrates how LAT meets the individualistic needs of both men and women in later life, while providing the opportunity to exercise agency to act outside of gender norms and expectations present in earlier life, especially for women.

GENDER DIFFERENCES IN SENIOR TRAVEL CHARACTERISTICS AND WILLINGNESS TO USE A DEMAND-RESPONSIVE BUS

C. Wan Hui¹, S. Chang¹, P. Tseng², 1. *Tamkang University, New Taipei City, Taiwan*, 2. *Central Police University, Taoyuan City, Taiwan*

As with many other countries, Taiwanese society has become an aging society. Maintaining or enhancing senior mobility is a therefore very important issue in promoting an active aging society. Due to social and economic differences (e.g. there are fewer female motorcycle riders than males) and/or activity features influenced by the Chinese culture and tradition, the travel characteristics of elderly females and males are very likely different. Their considerations for transportation services could be different as well. This study investigates gender differences in the travel characteristics of the elderly using a questionnaire survey. In total, 1137 valid questionnaires were collected. Survey analysis reveals that for non-walking trips, the female

elderly subjects are more limited in mobility than male elderly subjects due to limited usage of a cars and motorcycles. Results also show that bus service with a frequent schedule could increase elderly people's activity levels for longer distance activities. However, many of the elderly live in areas where bus service is infrequent. A demand responsive service (DRS) bus could be an alternative means of transportation. This study builds two logistic regression models separately to explore the factors affecting the willingness of male and female elderly people to use a DRS bus for their medical trips. The greatest differences between male and female subjects appear in the factors of age and most frequent transportation mode for a medical trip. The gender differences in the willingness to use a demand responsive service bus are discussed in this study.

SESSION 3630 (POSTER)

GENETICS

ASSOCIATION OF GENETIC VARIATION OF TOMM40 WITH COGNITIVE DECLINE IN OLDER ADULTS: THE SONIC STUDY

H. Ryuno¹, K. Kamide^{1,2}, M. Kabayama¹, K. Sugimoto², T. Ishizaki³, Y. Arai⁴, Y. Gondo⁵, H. Rakugi², 1. *Division of Health Science Osaka University Graduate School of Medicine, Suita, Japan*, 2. *Department of Geriatric & General Medicine Osaka University Graduate School of Medicine, Suita, Japan*, 3. *Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Japan*, 4. *Division of Geriatric Medicine Keio University School of Medicine, Shinjuku-ku, Japan*, 5. *Department of Human Sciences Osaka University Graduate School, Suita, Japan*

Background: It is reported that single nucleotide polymorphism (SNP) of the Translocase of outer mitochondrial membrane 40 homolog (TOMM40) gene is significantly associated with late-onset Alzheimer's disease and cognitive decline in various ethnic groups. The aim of this study is to clarify the association of rs2075650 in TOMM40 with cognitive function among 70- and 80-year-old Japanese general population.

Methods: Participants in age 70±1 and 80±1 years (n=550, 517 respectively) were randomly recruited from general population participating in the study of Septuagenarians, Octogenarians and Nonagenarians Investigation with Centenarians (SONIC) study, and part of them received follow-up investigation after 3 years. Written informed consent for genetic analysis was obtained from study participants. Rs2075650 in DNA extracted from blood samples was genotyped by TaqMan PCR method. Cognitive function was measured by the Montreal Cognitive Assessment (MoCA-J). Association of SNP with cognitive function is analyzed by the multiple regression models adjusting potential confounding factors.

Results: There were no significant differences of MoCA-J total score at baseline among each allele in rs2075650 both in 70 and 80 years participants. However, in 80 years participants, there was significant differences in MoCA-J total score among alleles in rs2075650 (AA, GA, GG; 22.0, 21.2, 18.3, respectively; p=0.008) at follow-up examination. In addition,

the TOMM40 (G allele) was significantly associated with a greater decline in MoCA-J total score at follow-up ($\beta=0.14$; p=0.002), and the effect appeared to be greater in females ($\beta=-0.21$; p=0.001), but not in males and in 70 years participants.

Conclusions: TOMM40 rs2075650 is an independent associated factor of cognitive function in Japanese females aged around 80.

CORRELATION BETWEEN IGF2R RS9456497 AND CARDIOVASCULAR RISKS IN LONG-LIVED CHINESE

S. Pan, *Pathophysiology, Guangxi Medical University, Nanning, China*

IGF2R rs9456497 was genotyped by iMLDR for 496 Zhuang long-lived Chinese (90–107 y/o) and their offspring (n = 723, 60–75 y/o) and matched healthy subjects (n = 611, 60–75 y/o). Association analyses were then conducted among genotypes and cardiovascular risks. No significantly different risk was detected among genotypes in each group except that the mutant genotype (GA/GG) tended to reduce the systolic blood pressure (SBP) and diastolic blood pressure (DBP) levels in longevity group. However, after sex stratification, total cholesterol (TC) level of each genotype in offspring males was elevated versus relevant genotype in longevity and control group; the triglyceride (TG), fasting plasma glucose (FPG) and BMI levels of each genotype in longevity group were lower while SBP and DBP levels were higher than that of the relevant genotype in offspring and controls. Long-lived females tended to display lower TG, FPG and BMI but higher SBP and DBP levels than offspring and controls; intragroup comparison showed that the FPG level of GG/GA genotype was lower than that of AA genotype in controls while other parameters did not differ across genotypes in each group. After stratified by lipid status, the frequency of G allele was markedly increased in the dyslipidemic subgroup in the combined population and controls. Linear regressive analyses showed that HDL was positively correlated to IGF2R rs9456497 GA genotype while BMI was negatively correlated to AA genotype in offspring group. These results suggest that IGF2R rs9456497 polymorphism is correlated to the cardiovascular risks in a sex and lipid status pattern.

G-395A POLYMORPHISM IN THE KLOTHO GENE ASSOCIATES WITH FRAILTY AMONG OLDEST-OLD PEOPLE

Q. Hao, M. Yang, B. Dong, *The Center of Gerontology and Geriatrics, West China Hospital, Chengdu, Sichuan, China*

Background: Frailty characterized as declined physiological reserve and increased vulnerability. It is still on a starting stage of studies on genetic factors of frailty. Previous studies found KLOTHO plays a protective role on several age-related diseases. We proposed a hypothesis of a probable protective effect of KLOTHO on frailty in old people. Thus, we use a very old Chinese cohort to detect it. **Methods:** This is a secondary analysis of the Project of Longevity and Aging in Dujiangyan (PLAD) study, which conducted in Southwest China. Community-dwelling Chinese people aged 90 years or more were included. Frailty was assessed with a revised FRAIL scale proposed by the International Association of Nutrition and Aging.

G-395A (rs1207568) genotyping in the promoter region of the KLOTHO gene was performed using the TaqMan allelic discrimination assay. **Results:** A total of 632 participants (68.4% female; mean age: 93.5 ± 3.2 years) were included. KLOTHO G-395A polymorphism genotype frequencies for the whole sample were 1.7% AA, 25.6% GA, and 72.6% GG. GG genotype frequencies for the frailty and control groups were 83.6% and 71.2%, respectively. Frailty prevalence was significantly lower in the GA+AA group than GG genotype group (6.9% vs. 13.3%, $p=0.026$). GA+AA genotype subjects had significantly lower risk of frailty (OR: 0.50, 95% CI 0.26 to 0.98) than GG genotype after adjusting for age, gender, education levels, previous occupation, cognitive impairment, metabolic syndrome, habits of smoking, alcohol consumption and exercise. **Conclusions:** KLOTHO G-395A polymorphism associates with less frailty in a sample of Chinese nonagenarians and centenarians.

ASSOCIATION OF APOE WITH COGNITIVE CHANGE IN COMMUNITY-DWELLING ADULTS: THE RANCHO BERNARDO STUDY

E.T. Reas², G.A. Laughlin¹, J. Bergstrom¹, D. Kritz-Silverstein¹, E. Barrett-Connor¹, L.K. McEvoy^{2,1}, 1. *Department of Family Medicine and Public Health, University of California, San Diego, La Jolla, California,* 2. *Department of Radiology, University of California, San Diego, La Jolla, California*

The E4 allele of the Apolipoprotein E (ApoE) gene increases risk for sporadic Alzheimer's disease, yet it is unclear whether E4 accelerates cognitive decline in normal aging. This study examined the association between ApoE genotype and trajectories of cognitive change in community-dwelling older adults from the Rancho Bernardo Study, and assessed whether E4 effects were modulated by sex, education and lifestyle. Between 1988–2016, 1393 adults (1087 E4-; 306 E4+), aged 44–99 years at their initial cognitive assessment, completed a neuropsychological test battery including tests of global cognitive function, executive function, verbal fluency and episodic memory. Participants were tested up to seven times over a maximum follow-up of 27 years. Linear mixed effects models examined age-related trajectories of cognitive change, assessing the influence of ApoE genotype, sex, education, physical activity, alcohol consumption and smoking. No main effects of ApoE on cognitive function were observed. However, E4 carriers showed greater age-related decline than non-carriers on executive function and verbal fluency. Men, but not women, carrying an E4 allele demonstrated greater age-related decline in global cognitive function than non-carriers. Verbal fluency declined more rapidly for those without a college education, but only for E4 carriers. Alcohol consumption interacted with ApoE genotype on age-related decline in global cognitive function and memory, but neither smoking nor physical activity interacted with ApoE status. These findings indicate that the E4 allele may increase risk for cognitive decline with advancing age. This risk differs between men and women, and may be modulated by education and alcohol consumption.

VASCULAR DEPRESSION FUNCTIONS INDEPENDENTLY OF APOE GENOTYPE: THE WISCONSIN LONGITUDINAL STUDY

R. Scott, D. Paulson, *Department of Psychology, University of Central Florida, Orlando, Florida*

Studies evaluating the effect of Apolipoprotein E (ApoE) on vascular depression are sparse, employ heterogeneous methods, and yield inconsistent results. One possibility is that ApoE is a moderator of another predictor such as cerebrovascular burden (CVB). This longitudinal study examines the relationships between ApoE, CVB, and depressive symptomatology in a large cohort sample from mid-life to later-life. Data include 3,203 participants across 18 years from the Wisconsin Longitudinal Study (baseline mean age=53). Depressive symptomatology was measured using the CES-D. CVB was operationalized as hypertension, high blood sugar, diabetes, and other heart problems. ApoE genotyping was completed using saliva samples. Hypotheses were examined via repeated-measures ANOVA and a moderated path model. RM-ANOVA results indicated no significant within-subjects effect of time, time×CVB interaction, or time×ApoE-carriage interaction on depressive symptomatology. Between-subjects effects yielded CVB as a significant predictor of depressive symptomatology ($F(1, 2327)=16.274, p<.001, \eta_p^2=.007$); this effect was not evident for ApoE-carriage. Results supported the hypothesized path model (RMSEA=0.041; CFI=0.959), however ApoE-carriage was not a significant moderator of the 2004 or 2011 vascular depression effect. The present findings do not implicate ApoE as a predictor of depressive symptomatology, or as a moderator of the vascular depression effect, in a large sample of adults spanning 18 years. Results are consistent with some past findings and inconsistent with others. Some work suggests genetics research is vulnerable to type-1 errors, though file-drawer effects remain difficult to quantify. Findings suggest ApoE carriage may not influence expression of depressive symptoms among older adults.

SESSION 3635 (POSTER)

GERONTOLOGY AND GERIATRICS EDUCATION

GEOMAPPING: EFFECTIVENESS OF REACHING RURAL HEALTHCARE WORKERS WITH GERIATRIC EDUCATION?

R. McAtee, R. Chernoff, K. Krell, *Geriatrics, University of Arkansas, Little Rock, Arkansas*

According to the U.S. Census Bureau, 15.7% of people living in Arkansas in 2014 were over the age of 65 and by 2030, that number is expected to increase to at least 25%. In addition, 44% of the state's population is considered rural compared to the national average of 19%. Further complicating these data is that only 64.5 primary care practitioners (PCPs) per 100,000 people serve rural Arkansas areas compared to 139 PCPs per 100,000 people in urban Arkansas areas (Rural Profile of Arkansas, 2015). In Arkansas there are 76 Rural Health Clinics, 401 long term nursing facilities (188 in HRSA-designated Rural Areas), and 106 hospitals (29 are Critical Access). Therefore health care practitioners

working in these rural areas need frequent and current information regarding best practices in caring for this growing population.

A study was completed to determine if education from the Arkansas Geriatric Education Collaborative (a HRSA Geriatric Workforce Enhancement Program) was reaching the workers who staff these rural healthcare entities. Geographic patterns of healthcare staff that attended geriatric-focused educational events were analyzed using powerful graphical imagery. Data points have been layered using size, thickness, color and opacity to develop a multifaceted geo map that makes it easy to see and understand the relationships between the data and geography. Older adult poverty levels, education levels, census tracts, ethnicity, healthcare worker geriatric education, and other data points were analyzed and are presented in a visually enhanced format that quickly illustrates trends and hidden stories.

PROVIDING DEMENTIA EDUCATION TO RURAL FIRST RESPONDERS: OUTCOMES IN ARKANSAS

R. McAtee, R. Chernoff, *Geriatrics, University of Arkansas, Little Rock, Arkansas*

As the incidence of Alzheimer's disease and other related dementia diagnoses continue to rise and plague our country's older adults, it is imperative that care for these individuals be addressed on every level. Nationally it is estimated that over 5 million seniors are living with Alzheimer's disease today and, by 2050, it is expected that almost 14 million will have the disease. 54,000 of those are living in Arkansas today with an estimate of 67,000 by 2025 (Alzheimer's Association, 2016). Since 44% of Arkansas' population live in rural areas and 19% percent of Arkansas' older adults reside there, reaching and educating these first responders is a priority, yet has been a challenge.

In 2015, it was ascertained that virtually no dementia-related training for first responders was occurring in Arkansas. The Arkansas Geriatric Education Collaborative educators (a Geriatric Workforce Enhancement Program) have taken the Certified Alzheimer's Disease and Dementia Care Training and the Certified First Responder Dementia Training from the National Council of Certified Dementia Practitioners and developed a three hour program and mobilized it to multiple first responder groups. These included the Arkansas State Police Academy, multiple city and county paramedics' organizations, emergency medical technicians, police officers and fire fighters. This presentation will outline the content and method of training, demographics of first responder' groups, pre and post test results, and follow-up qualitative interview findings from first responders who have put their training into action in the field.

DRUG EDUCATION PROGRAM (DEP) FOR COMMUNITY-DWELLING ELDERLY

C. Lee, M. Tse, *The Hong Kong Polytechnic University, Hong Kong, Hong Kong*

Good chronic disease control requires satisfactory medication adherence. Unfortunately, omission of doses is common among elderly due to complicated regimen and

self-perceived adverse drug effects. A 4-week Drug Education Program (DEP) based on Health Belief Model was designed to improve the drug knowledge and hence tackle the drug adherence problem. It was an experimental pre and posttest control group design.

Elderly community centers were approached and randomized into experimental and control group according to a computer-generated list. 108 community-dwelling elderly from 4 centers joined the study. 55 in the experimental group received the DEP once a week for 4 week, while 53 in the control group received social gathering and news sharing for the same duration. There were 30 male and 78 female; with the mean age of 77; the majority of them suffered from hypertension, diabetes and congestive heart failure which required regular follow up and had to take 1-2 drugs daily.

The content of the DEP includes drug knowledge on hypertension, diabetes, pain and constipation. Interactive teaching methods were used to arouse participants' interest, while true-and-false questions to assess the retention of memory at the end of each lesson. A set of questionnaire was used to assess the drug knowledge gain. Upon completion of the DEP, there was significant increase in the drug knowledge (from 9.48 to 12.63; $p < 0.05$) for the experimental group and not the control group. Also, general feedback from the participants has been very positive.

EFFECTS OF UNDERGRADUATES AND OLDER ADULTS CO-LEARNING ABOUT HEALTHY AGING

S.Y. Chen, *Graduate Institute of Elder Education, National Chung Cheng University, Chia-yi, Taiwan*

This study investigated the effects of integrating intergenerational learning into an elderly health promotion curriculum. A nonequivalent quasiexperimental research design, which involved combining qualitative and quantitative methods, was adopted, with qualitative data used to explore the impact of older adults on undergraduate learning about healthy aging. Ninety-one participants were included in this study. Ten older adults studied together freely with 48 students in the experimental group for 18 weeks. In addition to learning healthy aging theory, the students needed to implement a healthy lifestyle project at the last five weeks. The control group comprised students in a health-unrelated gerontology course that did not involve the addition of any older adults. The evaluation indicators included aging knowledge, attitude toward older adults, the students' self-assessed health, and the students' healthy lifestyle behaviors. The quantitative results revealed that the experimental group performed significantly more favorably than did the control group in the healthy lifestyle behaviors, including regular exercise, sufficient sleep, and late-night snacking. Eighty nine percent of students believed that learning together with older adults can enhance the understanding of healthy aging. Analyzing the students' reflective reports showed that, through the intergenerational interaction, the active older adults served as a healthy aging model, enhancing the students' care about elderly health issues, attention to their own health, and practice of healthy lifestyle behaviors. Students suggested that more time should be allocated for them to

perform the healthy lifestyle project, and that more opportunities should be provided for them to interact with older adults.

LEVELING AND ADAPTING GERONTOLOGY COMPETENCIES: EXAMPLES FROM CANADA AND THE U.S.

D.E. Schafer¹, B. Pianosi², A. Pelham³, P. Perdue⁴, 1. *National Ass. for Professional Gerontologists, Healdsburg, California*, 2. *Huntington University, Sudbury, Ontario, Canada*, 3. *San Francisco State University, San Francisco, California*, 4. *Bridge Valley Community and Technical College, South Charleston, West Virginia*

Background: AGHE recently published *Gerontology Competencies for Undergraduate and Graduate Education* (2014) that represents the most comprehensive effort to date to identify gerontology competencies. The challenge for educators is to integrate competencies into gerontological curricula and to use them in measuring the skills of gerontology program graduates. This presentation reports on two such attempts, with particular emphasis on “leveling” competencies.

Developing an Introductory Course in Canada: A group of faculty affiliated with the Council of Ontario Universities is leading the development of an introductory gerontology course in seven modules based on the AGHE foundational competencies. Since it is anticipated that the course would be useful both for students and practitioners, the developers share their perspectives on adapting the competencies for various levels.

Measuring the Skills of Gerontology Program Graduates in West Virginia: The National Association for Professional Gerontologists (NAPG), in cooperation with the Gerontology Master of Arts Program at San Francisco State University, measured gerontology competencies by operationalizing 18 skill outcomes. Forty-nine master’s students wrote 400 essay answers that were tested for inter-rater agreement using one-way analysis of variance. The fact that there was no significant difference among three raters ($f = .28, p = .76$) in scoring essay responses indicates reliability. This method of measuring competencies developed with master’s students has been used as an exit exam for graduates of the Gerontology Associate Arts Program at Bridge Valley Community and Technical College in South Charleston, West Virginia. Researchers discuss the adaptation of competency testing at these two educational levels.

FEAR OF DYING AND DEATH IN SELF AND OTHERS

C.C. Merz, M. McDarby, B.D. Carpenter, *Psychological & Brain Sciences, Washington University in St. Louis, St. Louis, Missouri*

People delay advanced care planning for the end of life for many reasons, including anxiety about dying and death. Undergraduate courses on dying and death may, as one objective, address students’ anxiety. The purpose of this study was to examine changes in anxiety about dying and death among undergraduates in an advanced course on those topics. Thirty-two students completed the Collett-Lester Fear of Death Scale (FDS) at the beginning and end of the semester. Paired-samples *t* tests revealed several significant changes. After taking the course, students reported less

anxiety about their own death ($t(31) = 2.97, p < .01$) but no change in anxiety regarding their own dying ($t(31) = 1.60, p = .12$). With regard to fear for others, students reported less anxiety about both the death ($t(31) = 2.83, p < .01$) and dying of others ($t(31) = 2.49, p < .05$). Students felt more prepared at the end of the semester to handle their own death ($t(30) = 2.92, p < .01$) and the death of others ($t(29) = 2.25, p < .05$). However, the association between preparation for one’s own death and the death of others was far from perfect ($r = .39$), suggesting, for some people, divergent beliefs about preparation. This study offers evidence that a one-semester course on death and dying with undergraduate students can leave them feeling less anxious and more prepared for dying and death. Potentially influential components of the course are described.

INDIGENOUS ELDERS IN RESIDENCE: GROWING RELATIONSHIPS THE ELDERS’ WAY

J.P. Lewis, *WWAMI School of Medical Education, University of Alaska Anchorage, Anchorage, Alaska*

Traditionally, Indigenous Elders were the original teachers and leaders in tribal societies. Their role was to improve the overall health and wellbeing of their families through teaching and mentorship. Due to the encroachment of western methods of teaching and learning into tribal communities, the oral traditions and other methods of indigenous learning have been pushed to the wayside. From January through March of 2015, the Indigenous Elders in Residence Program hosted 10 Indigenous Elders who visited classes in the University of Washington School of Social Work, School of Medicine, and American Indian Studies Department. Throughout the program, a total of 36 students completed survey evaluations of the program including demographic measurements, multiple choice questions, and open-ended questions. This study draws primarily on the survey results to describe the demographic characteristics of students, student ratings of the most successful aspects of the program, and a thematic analysis of the students’ comments and reflections on the program. Lunch meetings, workshops, class sessions led by the Elders, and one-on-one mentoring were rated by participants as the most effective and engaging aspects of the program. Primary themes from the students’ reflections include storytelling as pedagogy and community-building through storytelling. Students described storytelling as a meaningful form of pedagogy not previously experienced in the classroom setting. Stories also impressed upon students the importance of community, being “a part of something,” and how their own strengths and prior experiences shape their contributions to community. The success of this pilot program illustrates a promising step toward indigenizing the academic institution and teaching through traditional pedagogies.

BUILDING A LEARNING CULTURE THROUGH AN ENHANCED LEARNING PARTNERSHIP IN CONTINUING CARE

H. Moquin¹, L. Venturato¹, C. Seneviratne¹, D. Hycha², D. Wilson², 1. *University of Calgary, Calgary, Alberta, Canada*, 2. *Covenant Care, Calgary, Alberta, Canada*

Continuing and long-term aged care environments provide important health and social support services to older

adults, but are rarely seen as optimum sites for student learning, or as vibrant spaces for personal and professional growth for staff or residents. Creating a supported learning environment within these care settings is vital to enhance quality of care and quality of life for residents, their families and staff, and to promote effective learning experiences for students.

The Faculty of Nursing at the University of Calgary is working with Covenant Care, a non-profit care provider organization, on an innovative partnership aimed at developing a learning culture within a complex care environment in Calgary, Alberta. This enhanced learning partnership is comprised of three core elements: 1) an undergraduate nursing positive placement program (+PPP); 2) research and advanced practice learning opportunities for graduate students; and 3) learning opportunities and workforce development for residents, families and staff. This participatory action research study is exploring and developing a person-centered care and learning culture within a supportive living and hospice setting.

This presentation will detail our developing understanding of the core components of a learning culture within long-term care settings, as well as aspects of culture change, including barriers and facilitators, culture change process, and challenges associated with evaluation and sustainability.

ALIGNING TEACHING IN GERIATRICS WITH CORE ENTRUSTABLE PROFESSIONAL ACTIVITIES FOR ENTERING RESIDENCY

H.Y. Cheng, M. Gusic, *Medicine, UVA, CHARLOTTESVILLE, Virginia*

The Core Entrustable Professional Activities (EPAs) for Entering Residency¹ define behaviors that medical students should be able to do to ensure readiness for residency. Each is mapped to the Physician Competency Reference Set² but mapping to the Minimum Geriatrics Competencies (MGC) for Graduating Medical Students³ has not been reported.

Based on MGC, the author created workshops on 1) identifying and reducing hidden harms of drug therapy, 2) practicing value- and preference-based prescribing/deprescribing, 3) prescribing opioids and 4) writing admission orders. These workshops address the competencies critical to entrustment for EPA 4 through addressing key functions¹ associated with the task.

The following illustrates how teaching and assessment of MGC can be used to meet curricular goals and provide assessment data about student performance of EPAs. A workshop designed to facilitate students' ability to "accurately identify clinical situations where...patient preference, or goals of care should override standard recommendations for treatment in older adults" (MGC 16) addresses the key function, "demonstrate an understanding of the patient's current condition and preferences that will underpin the orders being provided" and critical competency, "make informed decisions about diagnostic and therapeutic interventions based on patient information and preferences, up-to-date scientific evidence, and clinical judgment" linked to EPA 4 (ability to enter and discuss orders and prescriptions). Assessment of student performance is done through pre- and post-tests and clinical observations. Data from the assessments are used in the summative evaluation for the clerkship.

LIVE-IN STRANGERS: AN EXPERIENTIAL ACCOUNT OF GERONTOLOGY EDUCATIONAL IMMERSION IN SENIOR HOUSING

R. Kilaberia, E. Ratner, *School of Social Work, University of Minnesota, Minneapolis, Minnesota*

Gerontology education programs that combine elements of experiential service-learning, community participation, and residential immersion have been emerging in the United States and internationally. Combining fieldwork, interviews, and immersion methods, this study draws on qualitative ethnographic and phenomenologic design, whereby a student lived in senior housing for 3.5 years. The study is among the longest and most intensive gerontological field experiences ever reported. It is based on more than 2,000 hours of observations and conversational interviews with 14 residents. Major patterns based on observational data show the importance of shared history, support for one another, negotiating environmental tensions, and demand for attention on the part of residents. Major themes derived from interviews elaborate on family conflict, conflict between residents, and life decisions. Results show that a unique combination of physical and social proximity in an intergenerational alliance enables both life enhancement for older adults and learning opportunities for students. A recommendation is made to implement a live-in role more formally.

AN INTERPROFESSIONAL GERIATRIC TRAINING AND OUTREACH PROGRAM: STUDENT, PATIENT, AND PROVIDER OUTCOMES

J.M. Shellman¹, M. Malcolm¹, A. LeClaire¹, J. Cave¹, C. Rees², 1. *University of Connecticut, Storrs, Connecticut*, 2. *Middlesex Hospital, Middletown, Connecticut*

The need for older adults to access high quality care can only be fully addressed with a workforce well-trained in the specialty of geriatrics. Geriatric Outreach and Training with Care (Got Care!) is an innovative, interprofessional geriatric training and practice model designed to develop a cadre of healthcare providers skilled in interprofessional, geriatric care. This academic-community partnership includes an interdisciplinary faculty team of geriatric experts from nursing, medicine, dental medicine, pharmacy, physical therapy, social work, and public health. Unique hands-on opportunities are provided for interprofessional students to learn together in the didactic arena and then reach out with geriatric expert faculty to conduct interprofessional home visits to older adults with multiple chronic conditions and high emergency department (ED) use. The purpose of this study was to evaluate the impact of the GOT! Care Program on student (N=177) collaborative practice skills, patient outcomes (N=38), and primary care provider (N=12) satisfaction. Statistically significant improvement was found in student levels of collaborative practice skills in 7 of 8 subscales of the Collaborative Practice Assessment Tool. Improvements in patient experience with care were noted including increases in quality and satisfaction as measured by HEDIS, an increase in referrals to community services such as mental health, social work, and palliative care services, and a decrease in ED use in the sample. Primary care providers report high satisfaction with the program citing GOT! Care, "a more cohesive approach"

to caring for their patients. Implications for interprofessional geriatric education, practice, and research will be presented.

REDUCING AGEISM THROUGH INTERGENERATIONAL SERVICE LEARNING

J.A. Sugar, H. Haslem, T. Skaar, T. Brancamp, S.G. Harris, *School of Community Health Sciences, University of Nevada: Reno, Reno, Nevada*

Ageism is insidious and ubiquitous. It negatively impacts older adults' stress response, work environment, memory performance, and health care; contributes to elder abuse; and curtails opportunities for older adults to engage in their community's social and cultural life. Ageism also diminishes students' interest in pursuing education and careers in aging-related fields, leading to shortages in the gerontology and geriatrics workforce. Education, combined with service-learning experiences, provides an opportunity for intergenerational interaction, leading to a reduction in ageism. But what aspects of service learning affect ageism? Is education without service learning equally effective in reducing ageism?

Our study comprised three groups of college students who: (1) were enrolled in an aging course with a service-learning project (N = 166), (2) were enrolled in an aging course with no service learning (N = 170), and (3) had not taken an aging course (N = 170); and a group of older adults who were participating in a service-learning project (N = 62). Basic demographic data, educational and personal experiences with seniors, and career interests were collected. Ageism was measured with the Fraboni Scale of Ageism at the beginning and at the end of a semester. Surveys and journal entries were used to assess participants' experiences. Quantitative and qualitative analyses were conducted. Intergenerational interaction has been shown to lessen ageism. Our results confirmed that service learning is a successful way to promote these interactions. We also demonstrated the benefit of an interdisciplinary approach to foster social change within our community.

WEBINARS AS A TOOL FOR GERIATRIC EDUCATION: OUTCOMES OF A WEBINAR SERIES ON DEMENTIA CARE

M. Tzuang^{1,2}, J. Downey², G. Yeo², K.M. Mehta^{5,2}, M.R. McBride², M.R. Grudzen², D. Gallagher-Thompson^{2,3,4}, 1. *Department of Mental Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 2. *Stanford Geriatric Education Center, Stanford, California*, 3. *Department of Psychiatry & Behavioral Sciences, Stanford University School of Medicine, Stanford, California*, 4. *Stanford Alzheimer's Disease Research Center, Stanford, California*, 5. *Department of Epidemiology and Biostatistics, University of California San Francisco, San Francisco, California*

Stanford Geriatric Education Center (SGEC) offered a series of 15 webinars (short for web-based seminar) titled "State of the Science: Dementia Evaluation and Management Among Diverse Older Adults and Their Families" in 2013. Stellar speakers from neurology, psychiatry, psychology and family medicine covered a range of topics in dementia care. Targeting providers working with diverse elders and their families, SGEC was able to present the contents interactively and in real time, and extend the 'reach' of this training to more new and diverse audiences.

A total of 1,163 participants from 29 U.S. states and representing 28 disciplines participated in the webinars. 30% of participants indicated that they work in Medically Underserved Communities, 17% works in a rural area, 70% works with ethnic minority patients and around 40% works with non-English speaking patients on a daily basis. Post webinar survey results show that over 90% of respondents reported increase in their knowledge and skills in the training topic. In addition, 98% of participants in each webinar indicated that they plan to either apply the information or skills learned in their work setting or, implement or advocate at least one patient/service improvement. Each webinar has since been archived and made available on the SGEC YouTube channel and has received 38,757 views from 159 countries as of May 2016. In conclusion, this was a successful geriatric education program, evidenced by its broad reach and endurance of the webinar presentations. The challenge lies in improving the response rate for post webinar surveys.

EDUCATIONAL TECHNOLOGIES IN GERONTOLOGY AMONG YOUTH

K. Prashchayeu, A. Ilnitski, *Belarusian republican gerontological public association, Navapolatsk, Belarus*

The aim of study is to implement the best educational practices among youth in gerontology to achieve clear understanding of healthy aging and improve knowledge's in communication with seniors.

Material and methods: Few educational technologies were implemented: interactive games with using of simulators of geriatric syndromes; education in physical training by using of special exercises for cognitive support (intelligent gym); education in field of local folk and language traditions which can be used in supporting of physical and cognitive functions. The average age of the youth group was 21,2±1,5 years, participants were students of different senior schools, total number of participants of educational programs was 346. For estimation of effects of training programs special original questionnaires were used.

Results: During educational programs the level of knowledge in preventive and healthy behavior increased on 35,5%, the number of healthy habits on 15,5%, understanding of healthy aging on 52,0%, understanding of health and social problems of elders on 70,0%, the level of ageism decreased on 30,0%. 70,0% of participants of education trainers noticed the increased level of understanding of problems of their old relatives and neighbours, 82,5% expressed interest in training because all topics were in fashion in the society.

Conclusion: Achievement of long and healthy lifespan by paying attention to the health status, behavior, habits of younger generation is possible by using of untraditional interactive forms of education of youth in sphere of healthy ageing.

SESSION 3640 (POSTER)

HEALTH AND SOCIAL SERVICE INTERVENTIONS

QUALITY OF LIFE OF USERS OF GERMAN REGIONAL DEMENTIA CARE NETWORKS—RESULTS OF THE DEMNET-D STUDY

J. Graeske¹, A. Schmidt², S. Schäfer-Walkmann³, R. Thyrian⁴, B. Holle⁵, K. Wolf-Ostermann², 1. *htw saar, Faculty of Social Sciences, Saarbrück, Germany*,

2. University of Bremen, Bremen, Germany, 3. ifas, Stuttgart, Germany, 4. DZNE Rostock/Greifswald, Greifswald, Germany, 5. DZNE Witten, Witten, Germany

Worldwide the support of people with dementia (PwD) in their own living arrangements is becoming more important. In the last decade 4 different types (stakeholder, organization, hybrid, order-related) of local dementia care networks (DCN) evolved in Germany, offering multiprofessional care and support (by medical doctors, health care services, therapists, volunteers, ...) for PwD. Empirical findings of long-term health outcomes of PwD supported by DCN are lacking yet. The one-year follow-up DemNet-D study was conducted to investigate long-term health related outcomes of PwD supported by 13 DCN all over Germany. Main outcomes were quality of life (proxy QoL-AD) and remaining in own domesticity. Further characteristics were challenging behavior (CMAI), functional abilities (IADL) and depression (GDS). 560 PwD (mean age 80 years, 58% female) were included in the study. Participants reported a moderate quality of life (QoL-AD: 29.1) at baseline. Quality of life remained almost unchanged at follow-up (QoL-AD: 28.1). 78 PwD moved into another living arrangement. Multi-level analysis showed no significant association for all primary outcomes with different types of DCN ($p > 0.05$). Improved QoL-AD scores depended on lower QoL-AD scores at baseline. In general we observed better QoL when PwD showed less challenging behavior and lived together with relatives. The stable quality of life over time and the low number of PwD moving into another living arrangement indicate, DCN are a sufficient way to provide adequate support to PwD.

THE HEALTHY LIVING PROJECT: AN INTERDISCIPLINARY WELLNESS PROGRAM FOR OLDER ADULTS

J. Molden, E. Plys, K. Williams, C. Nichols, A. Eades, L. Engleman, S.H. Qualls, D.L. Segal, *University of Colorado Colorado Springs, Colorado Springs, Colorado*

Improving older adults' well-being requires recognizing the importance (and interdependence) of physical and mental health. This study describes initial data from the Healthy Living Project, a unique interdisciplinary program combining behavioral/mental health services, dietary guidance, and physical activity interventions specialized for older adults with the goal of improving physical and mental health. Thirty-eight participants (M age = 66.5 years, range = 60 to 83 years; 76% Caucasian; 87% women) completed baseline assessments. Commonly endorsed goals of participation included weight loss (92.1%), healthier eating (63.2%), and strength gains (60.5%); fewer participants endorsed goals of reducing life stress (31.6%) and improving mental health (5.3%). On the PROMIS Global Health Scale, self-reported mental health ($M = 10.8$) and physical health ($M = 11.2$) were comparable but somewhat low. Baseline stages of change ratings placed the majority (59.5%) in the Contemplation stage. Initial dietician assessments suggested the sample was moderately obese (BMI $M = 34.3$) with high body fat percentages ($M = 42.8\%$). Physical activity assessments including Timed Up and Go ($M = 7.3$ seconds) and 30-second chair stand ($M = 8.3$ reps) suggested some functional disability risk. Moreover, 26.3% were classified as a moderate or high fall risk. Qualitative data from a subset of program completers

revealed significant and meaningful improvements in stamina, strength, energy, fall risk, perceived barriers, and self-efficacy, which is impressive given participants' complex, intertwined mental and physical health needs. The interventions, successes, and challenges of this interdisciplinary and integrated treatment approach in community mental health will be described.

BINGOCIZE: AN INTERVENTION FOR OLDER ADULTS' COGNITION, FUNCTIONAL PERFORMANCE, AND HEALTH KNOWLEDGE

M. Shake¹, J. Crandall¹, R. Mathews¹, M. Snyder², C. Richardson¹, K. Nunez¹, M. Zierter¹, 1. *Psychological Sciences, Western Kentucky University, Bowling Green, Kentucky*, 2. *Missouri Western State University, St. Joseph, Missouri*

Exercise interventions and health promotion programs can help maintain or improve quality of life for older adults. However, the majority of older adults in the United States do not adhere to such programs. We designed a novel technological app (for tablets, computers, and phones) that combines Bingo, Exercise, and Health Education, which can be used at older adult facilities remotely. We recruited older adults ($N=38$) from nearby independent living senior communities and randomly assigned them to either a Bingocize group (Exercise+Bingo+Health Education) or a non-exercise Control group (Bingo+Health Education only); both groups used the app twice weekly for ten weeks so we could assess the efficacy of using the program. We collected pre- and post-intervention data on fluid cognition, functional performance, and physical health. The Bingocize group did not show differential improvement (i.e., a Group x Pre/Post interaction) on any of our cognitive executive function tasks, which examined inhibition, shifting, updating, and fluency, all $F(1,35)$, $p > .05$. However, they did differentially improve in some aspects of health and functional performance; for example, they improved in arm curl repetitions, $F(1,35)=4.38$, $p < .05$, $\eta_p^2=.10$. Additionally, both groups improved in their knowledge of the health topics (osteoarthritis and fall risk reduction), $F(1,36)=107.62$, $p < .01$, $\eta_p^2=0.75$, suggesting the program can be used to teach health topics to older adults. Finally, participants in both groups increased health activation, suggesting their perspective on health-promoting behaviors had improved, $F(1,36)=6.30$, $p < .05$, $\eta_p^2=.15$. Overall, the app was well-received by older participants and may be useful in improving adherence to health-promoting programs.

USING ENVIRONMENTAL LIGHT THERAPY TO IMPROVE SLEEP AND NEUROPSYCHIATRIC SYMPTOMS IN DEMENTIA

S. Gouffier^{2,1}, S. Al Rifai³, L. Benattar³, G. Sacco^{2,1}, O. Guerin^{2,1}, 1. *gerontology, University hospital of Nice, Nice, France*, 2. *CIU Santé, Nice, France*, 3. *ORPEA Group, Puteaux, France*

Introduction: Alzheimer's disease and related syndromes (AD) is a disease affecting memory but also the relationship with the environment and empower people. No study has shown proven efficacy on the behavior of patients with AD. The main objective of the study was to assess the influence of environmental light therapy on sleep. Secondary objectives

were the study of, anxiety by the COVI scale and behavioral disorders by the NPI scale.

Material and Method: 12 residents of a nursing home with an integrated light therapy in common areas were studied., residents was equipped with a actimeter wrist or ankle for 42 days divided into three periods of 14 days with a standard lightin period 1 and 3 and light therapy on period 2. Sleep time was estimated by two algorithms.

Results: Average age was 84.2 (SD 6.5).Total sleep time during period 2 was significantly increased with 55.1 minutes compared to the period 1 without significant difference between period 2 and 3. For the COVI scale there was a significant decrease of 0,7 point and the NPI scale decrease of 4.7 points significantly between period 1 and 2. For the 2 scales there were no difference between the period 2 and 3.

Conclusion: The originality of this work was not to use a light intensity variation but a color light variation. We reached to show a improvement on sleep and behaviour.

A FAMILY-BASED DIABETES SELF-MANAGEMENT INTERVENTION FOR OLDER CHINESE ADULTS IN CHINA

C. Cai², J. Hu¹, 1. *College of Nursing, Ohio State University, Columbus, Ohio*, 2. *Wuhan University HOPE School of Nursing, Wuhan, Hubei, China*

Purpose: This study explored the effects of a family-based self-management educational intervention on self-management in older adults with type 2 diabetes in Wuhan, China.

Methods: A quasi-experimental design with repeated measures was employed. Older Chinese patients with type 2 diabetes (N=57) and their family members were assigned to two groups. The intervention group (n₁=29) received a tailored 7 sessions educational intervention and the control group (n₂=28) received routine care in the community. Participants were recruited in the community health center in Wuhan, China. Data were collected at pre- and post-intervention, and at the end of 3-month follow-up. Descriptive analysis and repeated measures analysis of variance were used to analyze the data.

Results: Participants with type 2 diabetes in the intervention group showed significance in greater reductions in A1C, body mass index and waist circumference; and significant improvement in diabetes knowledge, diabetes self-efficacy, self-care activities, and health-related quality of life than those in the control group. Family members in the intervention group had significant improvements in diabetes knowledge and health-related quality of life.

Conclusions: The findings demonstrate that family-based diabetes self-management intervention incorporated self-efficacy theory may help family members support older Chinese adults with type 2 diabetes, modify their lifestyle, and perform self-care activities to improve A1C management.

DYADIC RELATIONSHIP IN HEALTH INTERVENTIONS: PERSPECTIVES OF HOME CARE AIDES AND THEIR OLDER CLIENTS

L. Yin, N. Muramatsu, *University of Illinois at Chicago, Arlington Heights, Illinois*

Positive social relationships benefit the health of older adults. However, little is known about whether and how

dyadic relationship between the provider and the recipient of an intervention program influences health outcomes. To address this knowledge gap, this study examined whether physical activity intervention outcomes depend on the social relationship between older adults and their home care aides (HCAs) who implemented an in-home physical activity intervention for their older clients in a Medicaid-funded home care program. A total of 50 HCA-client pairs participated in the 4-month intervention in a metropolitan area in the United States. The intervention's primary outcome was clients' function, measured in difficulties and dependence in daily activities. Baseline dyad relationship was measured by 3 negatively phrased items: The client or HCA "Makes me feel frustrated", "Makes me feel angry or provoked", and "Is rude or insulting to me". Clients and HCAs rated each other separately. The relationship was positively rated by both parties in 70 percent of HCA-client pairs, and rated negatively by one or both of the parties in 30 percent of pairs. Mixed-effects analysis indicated that client outcomes significantly improved after the intervention (p<.001), controlling for clients' age, gender, education, marital status, living arrangement and health conditions. Dyadic relationship significantly moderated the rate of outcome improvement (p<.0.05), indicating improvement was observed only among HCA-client pairs whose baseline relationship was rated positively by both parties. Health interventions for older adults should pay attention to the role of dyadic relationship between intervention providers and recipients.

A MULTIFACTORIAL INTERVENTION FOR HIP FRACTURE PATIENTS WITH COGNITIVE IMPAIRMENT: PROTOCOL OF A RCT

K. Pfeiffer¹, S. Martina², A. Dautel¹, C. Becker¹, K. Hauer³, 1. *Clinic of Geriatric Rehabilitation, Robert-Bosch Hospital, Stuttgart, Germany*, 2. *University of Applied Sciences Mannheim, Mannheim, Germany*, 3. *AGAPLESION Bethanien Hospital, Geriatric Center at the University of Heidelberg, Heidelberg, Germany*

Fall related hip and pelvic fractures are among the injuries with the most serious consequences for the elderly population. The prognosis for functional recovery markedly worsens in the large subgroup of patients with cognitive impairment. So far, only a small number of clinical trials could show that cognitive impaired hip fracture patients can benefit in some extent from multidisciplinary rehabilitation programs by applying subgroup analyses. However, no specific home-based interventional approach has been designed for this specific target group so far. In the presented ongoing study (2015–2019; ISRCTN 69957256) we are evaluating a multifactorial intervention for hip or pelvic fracture patients with mild to moderate cognitive impairment and their family caregivers (if existing). The 4-month home-based intervention after geriatric rehabilitation comprises two components: (A) a supervised physical exercise training program and goal-setting on physical activity delivered by professionals and lay instructors, and (B) information about the care system, structured problem-solving, and case management are offered by a social worker for patients and their main caregivers. Primary outcomes of this randomized controlled trial are physical

activity and physical performance. Secondary outcomes are falls, fear of falling, depressive symptoms and quality of life. Endpoints are measured before discharge from rehabilitation, before intervention, post-intervention, and at 3-month follow-up. The intervention protocol and first experiences in implementing the study are presented and illustrated with case examples.

TRAINING WITH VIDEO GAMES: EFFECTS ON COGNITIVE AND NEURAL MEASURES OF ATTENTION AND MEMORY

S. Ballesteros^{2,1}, J. Mayas^{2,1}, A. Prieto^{2,1}, E. Ruiz^{2,1}, P. Toril^{3,1}, L. Ponce de León^{4,1}, J. Reales^{5,1}, 1. *Consolidated Research Group Studies on Aging and Neurodegenerative Diseases, Madrid, Spain*, 2. *Facultad de Psicología (UNED), Madrid, Spain*, 3. *Associated Center of madrid (UNED), Madrid, Spain*, 4. *Facultad de Derecho (UNED), Madrid, Spain*, 5. *Department of Methodology (UNED), Madrid, Spain*

A major goal of aging research is to find out methods that help to maintaining cognitive and brain health in older adults. Cognitive training with non-action video games seems promising to maintaining and/or improving some cognitive functions. Previous longitudinal studies from our laboratory with trained and passive control participants suggest that the aging brain retains some plasticity and that non-action video training might be an effective intervention tool to improve some cognitive abilities, including processing speed, attention and memory. The current randomized controlled (RCT) study (ClinicalTrials.gov ID: NCT02796508) was designed to overcome some limitations of previous training studies by including an active control group and training expectancy and engagement evaluations. The objectives of this RCT were: (1) to investigate the behavioural and neural effects of training in tasks designed to assess attentional and working memory functions; and (2) to examine the durability of the possible transfer effects after 6 month non-contact period. Seventy-five older adults completed 16 forty-min training sessions over 10–12 weeks. Thirty participants (experimental group) played 10 selected games from *Lumosity* and 25 (active control group) played *The Sims*. Behavioral results showed that after training, both groups improved performance in visual n-back and spatial Corsi blocks working memory tasks and were less distracted in a cross-modal odd-ball task. In summary, these findings suggest certain behavioural improvements after training in both groups. Further analyses of the electrophysiological recordings will unveil possible changes in brain activity associated with changes in task performance after training.

THE COMPASS OF OLDER PEOPLE LEARNING: A MIXED METHODS STUDY OF HEALTH PROMOTION FOR OLDER PEOPLE

T. Keinwong^{2,1}, S. Hunter¹, J. Lyneham¹, 1. *School of Nursing and Midwifery, Newcastle, New South Wales, Australia*, 2. *Suan Dusit University, Faculty of Nursing, Bangkok, Thailand*

Aim

To explore and better understand the current health promotion activities for Thai older people in relation to hypertension, and to provide the strategies and guidelines for the most effective health promotion for Thai older people.

Methods

The mixed methods research was conducted at the Primary Care Unit, Thailand and was comprised of a quantitative and qualitative study. The quantitative part involved document analysis of the available health education materials. The qualitative part examined the health care providers (HCPs)' perceptions of health promotion and the older people's learning experiences with hypertensive health education. The data for each part was collected in parallel and then analysed separately. The findings were merged to analyse the findings.

Results

The failure of health promotion for Thai elderly was obvious. The findings uncovered that the education provided to Thai elderly was not supportive of their learning capabilities, revealing a gap between the educational activities of HCPs and the elderly's learning outcomes. "The compass of older people learning" model is designed to guide the older people learning and to ensure effective health promotion. The four directions of the compass are: the practicalities, learning methods, facilitators and inhibitors of learning to optimise the health in Thai older people.

Conclusion

Effective health promotion guidelines for Thai older people need to be promoted because of their unique style of learning relating to ageing changes, and their learning culture.

EMPOWERING OLDER ADULTS WITH CHRONIC DISEASES: THE MHEALTH PROTOCOL AND FEASIBILITY TEST

H. Kim^{1,2}, S. Hong¹, B. Woo¹, S. Lee¹, S. Kwon¹, Y. You¹, 1. *College of Nursing, Yonsei University, Seoul, Korea (the Republic of)*, 2. *Mo-Im Kim Nursing Research Institute, Seoul, Korea (the Republic of)*

Although 89% of older Korean adults have at least one chronic disease, most self-management interventions are clinic-based, delivered through face-to-face education, and highly focused on disease information. This pilot study developed and tested a mHealth protocol to empower older adults to manage their chronic diseases at home.

Our mHealth protocol of health empowerment includes Phase 1: standardized mobile tablet training with guidebooks, demonstrations, and guided practice, Phase 2: standardized information for disease management retrieved from the Korean Center for Disease Control about a healthy diet, exercise, and individual diseases, Phase 3: training to use the high-quality mHealth apps for individual conditions, such as a blood pressure measuring tool, a glucose monitoring, and tracking logs, and Phase 4: encouragement to self-select mHealth apps based their individual needs.

A feasibility test was completed with 10 older adults living with one or more of the following diseases: cerebrovascular disease (2/10), ischemic heart disease (3/10), diabetes (5/10), and hypertension (6/10). Gender, educational level, and experience using smartphones influenced learning speed, confidence, and competence. The men required little or no time for Phase 1 while the women who preferred to continue Phase 3 were dependent on the interventionists. The attrition rate was only 20% due to time conflicts, emotional distress, and family discouragement. However, the

health empowerment score improved from 24 to 36 after the intervention ($p < 0.03$). At least 4 weeks with weekly meetings were required. A highly person-centered approach is required to meet individual needs for various types of multiple chronic-disease management.

ORAL HEALTH AND CANCER SCREENING IN NURSING HOMES: MOTIVATION AND OPPORTUNITY AS INTERVENTION TARGETS

S. Burke³, T. Cadet^{1,2}, M. Lecloux⁴, E. White⁵, P. Maramaldi^{1,2,6}, E. Kalenderian⁷, T. Kinnunen⁸, 1. *School of Social Work, Simmons College, Boston, Massachusetts, 2. Harvard School of Dental Medicine, Boston, Massachusetts, 3. Florida International University, Miami, Florida, 4. West Virginia University, Morgantown, West Virginia, 5. Boston Children's Hospital, Boston, Massachusetts, 6. Harvard T. H. Chan School of Public Health, Boston, Massachusetts, 7. University of California, San Francisco School of Dentistry, San Francisco, California, 8. University of Helsinki, Helsinki, Finland*

Background: Improving the oral health in the older adult population is a priority of the Healthy People 2020. Poor oral health is a risk factor for many diseases including oral cancer, which disproportionately affects older populations. An estimated 48,330 Americans will be newly diagnosed while 9,570 of all oral cancer patients will die in 2016. Paradoxically, nursing home populations are at the highest risk, yet least likely to receive relatively simple and low cost oral cancer screening procedures. **Methods:** The purpose of this NIDCR-funded pilot study was to use empirical methods to identify interventions that could eliminate barriers to oral hygiene and cancer screening in nursing homes. The Health Belief and COM-B Model provided the conceptual framework. A rigorous recruitment protocol yielded a purposive sample of nursing home administrators and directors who participated in nine discrete focus groups ($n = 34$). Qualitative analysis (NVivo) was used to identify conceptual themes related to potential intervention targets. **Findings:** Participants identified several impediments to oral hygiene and cancer screening. High barriers, low opportunities, and low motivation were themes identified as potential targets for intervention. Framed in the conceptual model, findings indicated that intervention strategies should target increasing oral health awareness to increase levels of perceived seriousness. **Conclusions and Implications:** Our findings provide formative data to support the development and testing of low-cost interventions using established behavior change theories. Interventions that increase awareness should target all nursing home staff involved in the oral health care of older adults.

HEALTH LITERACY SCREENING IN GERIATRIC PRIMARY CARE

A. Albright, L. Mieskowski, A. Halli, D. Carroll, F.R. Scogin, R.S. Allen, *University of Alabama, Tuscaloosa, Alabama*

Health literacy is vital to understanding medical information and making subsequent decisions based on this information. Knowledge of patient health literacy may be particularly

important for care providers, as it can provide guidance on how to best communicate with the patient (Nouri & Rudd, 2015). Approximately 100 patients (mean age = 78; 72% female; 14% African American) attending an interdisciplinary geriatrics clinic in West Alabama have been recruited to take part in a variety of behavioral health screenings, such as evaluation of cognitive status and depression. One of the aims of this process was to provide more comprehensive health care to elderly adults by assessing both physical and mental health. It may be particularly important to monitor health literacy within this population, as several studies (eg, Kobayashi et al., 2015) have shown that health literacy decreases in older adults with mild cognitive impairment. In addition, low health literacy has previously been linked with both lower recognition of symptoms of depression and lower likelihood to seek mental health treatment in young adults (Kim et al., 2015). The current study assessed health literacy using a selection of eight questions developed by Chew, Bradley, and Boyko (2004). Health literacy was found to be significantly associated with cognitive status ($r = .34, p < .001$), depression ($r = -.26, p < .05$), and psychological inflexibility ($r = -.34, p < .05$). Based on these findings, knowledge of patient health literacy levels may have important mental and physical healthcare implications in elderly adults.

RESILIENCE BUILDING AND ENVIRONMENTAL MASTERY AMONG OLDER ADULTS WITH VISION LOSS

S. Sorensen, *Warner School for Education and Human Development, University of Rochester, Rochester, New York*

Older adults with vision impairment tend to experience losses in Environmental Mastery (EM), a vital component of psychological well-being. Poorly informed about their eye condition and the services and devices that help maintain functioning, they slowly lose the ability to control their activities and environment. We tested the effects a Resilience Building Program (RBP) aimed at increasing concrete planning (CP) for future care needs among older adults with vision loss due to Age-Related Macular Degeneration. Participants aged 60–96 ($N=180$, 63% female, 96% White) were randomized to RBP or control. Both groups attended vision education classes and received large print resource binders. RBP participants received 4 weeks of in-home basic problem-solving and 4 weeks of future-oriented problem-solving training. Controls received a friendly visitor. CP and EM were measured at: baseline, after classes, after 4 weeks of in-home visits, after conclusion of the program, after 6 months, and after 12 months.

In multi-level models, a linear and quadratic increase in CP and a linear, quadratic, and cubic curve for EM were detected. Controlling for gender and age, results suggested that the shape of the curve was different for the two treatment groups (GroupXquadtime and GroupXcubetime $p < .05$), but that the groups did not differ significantly in EM at 12 month followup. Adding concrete planning for future care as a time-varying covariate, however, showed that the increase in CP was positively associated with greater EM and improved the model fit ($\Delta\text{Chi-square} = 13.1, df=1$). Future analyses will directly test whether increases in concrete planning mediate maintenance of EM.

SESSION 3645 (POSTER)

HEALTH CARE AND HEALTH PROMOTION

THE FREQUENCY OF GOING OUTDOORS, PHYSICAL PERFORMANCE, AND HRQOL AMONG COMMUNITY-DWELLING ELDERLY

Y. Inaba¹, N. Kamide², 1. *Showa University, Yokohama, Japan*, 2. *Kitasato University, Sagami, Japan*

The purpose of this study was to evaluate the differences in physical performance and health-related quality of life (HRQOL) between the frequency of going outdoors among community-dwelling older adults.

A cross-section of 139 community-dwelling people aged 65 and over was recruited to the study. Physical performance, HRQOL were compared among three groups defined by the frequency of going outdoors in a week: (1) almost once a day, (2) about once per 3–4 days, (3) about once a week. The measurements of physical performance included static and dynamic balance, maximum gait speed, strength. HRQOL was assessed using the SF-36 Health Status Survey. To examine the differences between the frequency of going outdoors and these factors, we used one-way ANOVA.

Firstly, compared with results between the groups, the lowest frequency of going outdoors was significantly lowered physical performance measures; one-leg standing time with eyes open ($p < .01$), timed up and go ($p < .01$), maximum gait speed ($p < .01$), grip strength ($p < .01$), and lower extremity muscle strength ($p < .05$). Secondly, in all the eight dimension of SF-36, the scores were significantly low in the lowest frequency of going outdoors, respectively ($p < .01$). There were no significant age and gender differences between three groups.

These results suggest that the frequency of going outdoors may be a useful indicator for frailty for physical function and HRQOL among community-dwelling older adults.

INTERGENERATIONAL COMMUNICATION ABOUT FAMILY HEALTH HISTORY: DIAGNOSES, CAUSES OF DEATH, AND RISK

J. Lin¹, L. Koehly¹, M. Myers², C. Marcum¹, 1. *National Institutes of Health, Bethesda, Maryland*, 2. *Cincinnati Children's Hospital Medical Center, Cincinnati, Ohio*

Family health history (FHH) provides health information that is essential for individual risk assessment and preventive care. Members of one generation confer both genetic and shared environmental risk to members of another generation. Diseases affecting grandparents, for instance, can influence risk of disease in their children (second generation) and grandchildren (third generation). However, collection of FHH by the younger generation from the older generation is often infrequent and incomplete. In this paper, we evaluate the extent to which FHH knowledge flows along communication ties in the family network. Specifically, we look at intergenerational consensus on the health status and cause-of-death of grandparents in 35 three-generation families ($n = 177$). We find that 30% of adult grandchildren indicate that they do not know their grandparent's health status with respect to diabetes and heart disease diagnoses, compared with only 11% of second generation members (parent). This pattern is however not explained by established pathways of

communication between generations. In contrast, both the parents and the adult grandchildren are more knowledgeable about deceased grandparents' cause of death (15% and 3% "don't know" responses, respectively). Similarly, we found a low level of consensus between parents and their children about grandparental health diagnoses (21%) and a relatively high level of consensus about cause-of-death of deceased grandparents (44%), likely reflecting the saliency of the loss of a grandparent. Our results suggest that salient family events may represent opportunities to activate intergenerational exchange of family health information.

ROLES OF NEIGHBORHOOD COHESION, DISCRIMINATION, AND OUTLOOK ON LIFE IN PREVENTATIVE HEALTHCARE

T. Cadet^{1,2}, J. Mitchell³, S. Burke⁴, L. Bakk^{5,6}, O. Rostant⁷, 1. *School of Social Work, Simmons College, Boston, Massachusetts*, 2. *Harvard School of Dental Medicine, Boston, Massachusetts*, 3. *University of Michigan School of Social Work, Ann Arbor, Michigan*, 4. *Florida International University, Miami, Florida*, 5. *University of Buffalo School of Social Work, Buffalo, New York*, 6. *Institute on Innovative Aging Policy and Practice, Buffalo, New York*, 7. *National Institute on Aging, Baltimore, Maryland*

Background: Contextual differences impacting African American (AA) and White older adults are critical to promote healthy aging. **Methods:** A secondary analysis of the Health and Retirement Study (2008–2014; $n = 2390$; 215 AAs and 2175 Whites) examined relationships between neighborhood factors, personal experiences, and preventative health service utilization (breast, cervical, and prostate cancer, cholesterol screening, flu shots). **Results:** Multivariate analyses indicated that AAs were less likely than Whites to report a completed breast (OR=1.79), cervical (OR=1.70) or prostate cancer (OR=1.67) preventative health screening in 2012. Among all women, worse treatment from physicians in 2008 predicted lower cancer screening utilization in 2012 (OR=1.25), while women reporting greater life satisfaction in 2008 were more likely to complete cancer screenings in 2012 (OR=1.10). Men were less likely to report completing a prostate cancer screening if they perceived poorer treatment from physicians in 2008 (OR=1.04) or were stopped unfairly by police (OR=1.52). Race differentiated men with regard to police contact. Police stops also predicted the odds of all participants eschewing cholesterol screening (OR=1.71). At baseline, all older adults were less likely to report: receiving flu shots (OR=1.10); feeling that someone would help them if in trouble (OR=1.11); receiving poorer service than others (OR=1.10); having important things to look forward to in life (OR=1.17); or enjoying making plans for the future (OR=1.10). **Conclusions:** Given the diversity of responses, the importance of viewing all older adults through multiple lenses is critical to health promotion programming.

THE VITALITYNAVIGATOR: A SELF-ASSESSMENT AND SELF-MANAGEMENT TOOL DESIGNED FOR OLDER PEOPLE

K. Spanjers, S.E. de Rooij, *Geriatric Medicine, University Medical Centre Groningen, Groningen, Groningen, Netherlands*

The VitalityNavigator enables older people to assess their vitality and the presence of common (geriatric) health problems. The VitalityNavigator has therefore more modalities: it acts as a self-test for older people to test how fit they are compared to age and sex matched controls and provides a personalised set of factsheets with reliable information on their specific problems and health conditions. The VitalityNavigator is available as online self-test [www.ouder-enacademie.nl], and as free smartphone application. In total, 952 people completed the online self-test VitalityNavigator voluntarily, only by providing the tool on the website. A total of 321 participants (34%) were 70 years or older. Most common self-reported (geriatric) health problems by these older persons (70 years or older) were pain (48%), some trouble with walking (42%), memory complaints (28%), and limited acquaintances (18%). Response rate was higher at the beginning of the self-test (90–100%) compared to last questions (80–85%), this also corresponds with open text fields in which respondents valued the self-test as too long. The smartphone application of the VitalityNavigator is therefore already shortened. As results correspond with Dutch data of the older population, it seems the VitalityNavigator is a suited tool to assess self-reported common geriatric health conditions among older people. Further research will investigate how the VitalityNavigator and its information is used by older people and to what extent it influences the contact with healthcare professionals.

EARLY OUTCOMES OF FIT & STRONG! PLUS: NEW EXERCISE AND WEIGHT LOSS PROGRAM FOR OSTEOARTHRITIS

S.L. Hughes, A. DeMott, *Center for Research on Health and Aging, UIC, Chicago, Illinois*

Overweight older adults with osteoarthritis (OA) face high risk for disability; however, no evidence-based programs target PA and weight simultaneously. Fit & Strong! (F&S!) is an evidence-based PA program for persons with OA that improves lower extremity (LE) strength and mobility out to 18 months. We present findings from a trial of the new *FS! Plus* program that addresses *PA and weight loss*.

This comparative effectiveness trial is enrolling 400 participants (200 in F&S! and 200 in F&S! Plus). To date, enrollees (n=394) are 86% female, 92% African-American, obese (BMI=34.6), with a mean age of 67.9. Mean LE pain and stiffness scores are 5.9 and 3.2, mean Chair-Stands is 8.3 and mean 6-Minute Distance Walk is 1167 feet. The F&S! Plus group had fewer chronic conditions at baseline, but prevalence of common conditions by group was similar.

Preliminary findings on 292 participants with 2-, and 6-month outcomes revealed significant differences in change in BMI ($p<.001$), weight ($p<.001$), waist circumference ($p=.001$), LE pain ($p=.04$), LE stiffness ($p=.004$), LE physical function ($p=.002$), and 6-Minute Distance Walk ($p<.001$), all favoring FS! Plus at 2 months. At 6-months change in BMI ($p=.005$), weight ($p=.006$), waist circumference ($p=.004$), and LE physical function ($p=.02$) remained significant, favoring the treatment group. FFQ diet data show significant changes in total ($p=.006$), dark green ($p=.02$), and orange vegetable consumption ($p=.02$) at 2-months and total ($p=.002$) and dark green vegetables ($p=.002$) at 6-months, favoring F&S! Plus.

This presentation will review the trial design and baseline, 2, 6, and 12-month outcomes.

OLDER PEOPLE'S UNDERSTANDING OF AND RECEPTIVENESS TO ACTIVITIES TO PREVENT COGNITIVE DECLINE

S. Pettigrew¹, M.I. Jongenelis¹, N. Biagioni¹, Z. Talati¹, R. Newton², J. Warburton³, B. Jackson⁴, C. Worrall¹, 1. *Psychology, Curtin University, Perth, Western Australia, Australia*, 2. *Edith Cowan University, Perth, Western Australia, Australia*, 3. *La Trobe University, Perth, Western Australia, Australia*, 4. *University of Western Australia, Perth, Western Australia, Australia*

It is important for older people to engage in evidence-based behaviours to protect their cognitive function. Such behaviours include stimulating cognitive, physical, and social activity. This study assessed older Australians' understanding of the types of activities that are beneficial in the prevention of cognitive decline to inform future efforts to encourage appropriate prevention behaviours among seniors. The specific study objectives were to (1) gauge current levels of awareness of protective behaviours and (2) assess older people's motivation to participate in protective behaviours. As part of a larger research project on healthy ageing, interviews were conducted with more than 250 Australians aged 60+ years. Topics covered in the interviews included current participation in activities perceived to be protective of cognitive health and attitudes to a range of protective activities. Interviews were digitally audio-recorded, with the transcriptions subsequently imported into NVivo11 for coding and analysis. The interviewees were strongly motivated to protect their cognitive health but had limited understanding of effective activities. Most responses were limited to activities such as completing crosswords and playing Sudoku, card games, and other solitary brain exercises. These activities were generally perceived to be enjoyable, unlike physical activity that was often viewed as unpleasant. There was very little awareness of the protective benefits of physical activity and social interaction. The results indicate there is enormous potential to improve seniors' understanding of effective strategies to prevent cognitive decline. The interviewees favoured guidance from doctors and articles in newspapers as the most effective methods of conveying this information.

USING A STATE AGING SERVICES INFRASTRUCTURE TO PROMOTE PREVENTION GUIDELINES

S.M. Albert, J. King, J. Jones, Y. Park, A. Newman, *Behavioral and Community Health Sciences, University of Pittsburgh, Pittsburgh, Pennsylvania*

Supporting prevention behavior among older adults can be challenging because of conflicting media messages and the treatment focus of primary care. State aging services infrastructure can provide an innovative platform for supporting prevention and reaching large numbers of older adults. The University of Pittsburgh CDC Prevention Research Center partnered with the Pennsylvania APPRISE program to deliver the "10 Keys" to Healthy Aging™. APPRISE is a Medicare counseling program offered at senior centers; the "10 Keys" is a series of behavior activation workshops for adults aged 50+ that cover USPSTF and evidence-based recommendations for health promotion.

In 2013–16, 406 older adults (mean [sd] age 75.1 [8.7], 89% female, 5% non-White) completed the “10 Keys” and a pre- and post-test assessment of prevention knowledge. On a 14-point test, respondents’ knowledge increased from a mean of 8.1 [2.3] to 10.0 [2.3] correct ($p < .001$) after a mean interval of 30 days. Improvements in knowledge were seen in every domain except mammography. Participants who reported prevention behaviors (mammography, exercise, bone density tests) scored higher in prevention knowledge at baseline ($p < .01$), suggesting an association between knowledge and active prevention behavior.

In 2016–17 we are following APPRISE/”10 Keys” participants with repeated telephone assessments to determine if participation in the “10 Keys” program increases actionable prevention behavior.

THE RELATION BETWEEN PURPOSE IN LIFE, COGNITION, AND EXERCISE

S. Bardach¹, S.D. Holmes², R.R. Murphy¹, Y. Liu¹, T. Hammond¹, G. Jicha¹, 1. *University of Kentucky, Lexington, Kentucky*, 2. *University of Maryland, Baltimore, Maryland*

Maintaining a strong sense of purpose in life has been shown to decrease mortality and reduce the risk for disease. Greater purpose in life is also associated with a reduced risk of Alzheimer’s disease. It is unclear, however, if attitudes toward purpose in life are related to health behavior choices. To explore the relationship between purpose in life and health behavior choices, participants in the University of Kentucky Alzheimer’s Disease Center cohort (N=492), spanning the age and cognitive continuum, completed a ten-item Purpose in Life scale and questions about physical activity. We explored differences in purpose in life between those who were cognitively normal (N=357) and those who were impaired (n=135). Within each group, we explored whether purpose in life was associated with engagement in physical activity using standard descriptive and comparative statistics. Purpose in life scores were significantly higher in participants with normal cognition compared to participants who were cognitively impaired (mean 39.2 vs. 35.8, $p < .001$). Greater purpose in life was associated with more engagement in physical activity for both cognitively normal ($r = .193$, $p < .001$) and cognitively impaired individuals ($r = .244$, $p = .007$). These relationships remained significant even after including age in the analysis. The findings that purpose in life was associated with engagement in physical activity among both cognitively normal and cognitively impaired individuals, suggests that maintaining a sense of direction and goal directedness may not only play a role in psychological well-being, but may also influence health behavior and physical health as well.

RESILIENCE—WHAT IS IT? THE PERSPECTIVES OF RURAL THAI COMMUNITY NURSES TOWARD ELDERLY RESILIENCE

W. Pathike, *Newcastle University, Newcastle, New South Wales, Australia*

This Ethnographic research study describes an understanding of the concept of ‘elderly resilience’ from the perspective of rural Thai community nurses. **Findings:** There was a distinct lack of understanding and hence promotion

of ‘Elderly resilience’ in the rural Thai communities where the data was collected. The perceptions of elderly resilience were therefore described indirectly through four positive responses elicited following adverse situations; the ability to live on their own legs, an ability to express their feelings, to value themselves and possessing religious beliefs. **Conclusion:** Knowledge of resilience as a concept is currently limited. A better understanding of elderly resilience is essential to improve the quality of care for the ageing.

THE BENEFITS OF RETAIL HEALTH CLINICS FOR AGING POPULATIONS

S. DiMeo¹, D. McCaughey², C. Baumgardner¹, 1. *The Pennsylvania State University, State College, Pennsylvania*, 2. *The University of Alabama at Birmingham, Birmingham, Alabama*

Retail health clinics (RHC) offer a scope of services pertaining to minor acute conditions and preventive screenings. This emerging phenomenon advertises quick, convenient, and affordable care; therefore, the retail clinic industry has garnered considerable interest among stakeholders in the healthcare industry. This study presents a framework for understanding the RHC industry, its impact on the care continuum and emergency department (ED) overcrowding, and its value for elderly populations.

A systematic literature review was conducted using the online databases *ProQuest* and *PubMed*. Articles (n = 38) were retrieved that examined varying facets of the RHC industry.

Our study revealed that there is a rising affinity for RHC services among elderly populations. According to our findings, convenience and proximity to RHCs have been identified as leading factors of clinic use. Additionally, RHCs have received relatively high consumer satisfaction scores, and the quality of care in RHCs is comparable to alternative care settings.

The use of RHCs is increasing among elderly individuals, and this care model has the potential to act as a safety net for aging populations through their transitions of care. Moreover, RHCs may prevent unnecessary ED overcrowding by providing timely care for minor health conditions at low costs. Our findings identify the importance of RHC use and its potential to increase access to care for elderly individuals at lower costs, without compromising quality. RHC use is particularly important among community dwelling elders, family care providers, and healthier aging individuals who are seeking preventive care or treatment for minor illnesses.

THE IMPACT OF HEALTH LITERACY ON HEALTH OUTCOMES AMONG OLDER ADULTS

S. MacLeod¹, S. Musich¹, S. Gulyas¹, Y. Cheng¹, R. Tkatch¹, D. Cempellin², G.R. Bhattarai¹, K. Hawkins¹, 1. *Optum, Ann Arbor*, 2. *UnitedHealthcare, Minneapolis, Minnesota*

Health literacy refers to the ability to obtain, process, and understand basic health information to make health decisions. The objectives of this study were to estimate the prevalence of low health literacy in an older adult population, identify characteristics associated with low HL, and describe the impact of low HL on healthcare utilization, expenditures, and satisfaction with care. Healthcare claims,

membership, and a modified version of the Consumer Assessment of Health Plan Survey (CAHPS) were used for Medicare beneficiaries with AARP® Medicare Supplement Insurance plans insured by UnitedHealthcare (for New York residents, UnitedHealthcare Insurance Company of New York). Descriptive statistics and multivariate modeling were used to evaluate those with adequate versus low HL. Sixty-four percent of those surveyed responded; among these, 16.8% indicated low HL. Lower HL was predicted by male gender, older age, more comorbidities, rural residence, and lower education. Low HL was also associated with poorer outcomes including more emergency room visits, inpatient hospitalizations, fewer flu vaccines, reduced satisfaction with providers, health plans, and overall health care, and lower compliance with evidence-based measures (EBMs). Those with low HL incurred \$3,892 more in annual health expenditures than those demonstrating adequate HL. Low HL is common among older adults, increases healthcare utilization and expenditures, and negatively impacts satisfaction and compliance with EBMs.

SIMULATION: COMPANION CLINICAL PRACTICE FOR BACHELOR OF NURSING STUDENT LEARNING IN RESIDENTIAL CARE

C. Seneviratne, C. Mannion, S. Hirst, *Faculty of Nursing, University of Calgary, Calgary, Alberta, Canada*

Nursing students learn in a variety of clinical settings including residential care. Faculties of Nursing administrators and educators understand the need for face to face student learning with older adults, and recognize potential consequences such as development or reinforcement of negative perceptions related to older adults. One strategy we intend to implement in the second year of the Bachelor of Nursing program at the Faculty of Nursing University of Calgary Canada is the use of simulation to improve student learning and attitudes toward older adults. We conducted a literature review to introduce simulation as a companion learning strategy to face to face practice in residential care settings. The purpose of the review was to identify what is known regarding the use of simulation to counter ageism that may be held by nursing students regarding older adults living in residential care. Our CINAHL, Medline (Ovid), and Google Scholar search using key words: 'Nursing Education', 'Simulation', and 'Older Adult' produced 26 articles. Five of the 26 met our inclusion criteria. Our analysis revealed: 1) undergraduate nursing students regard clinical simulation as a positive way to enhance their clinical experiences with older adults; and 2) due to limited evidence more research is required to understand if using simulation will improve student perceptions of older adults when learning and working in residential care. The presentation will outline findings from the literature review and include recommendations related to use of simulation in bachelor of nursing programs with a specific focus on caring for older adults.

SUBJECTIVE MEMORY, MUSCLE STRENGTH, AND SELF-PERCEIVED HEALTH AMONG COMMUNITY-DWELLING OLDER ADULTS

Y. Lim, *Yonsei University Wonju College of Medicine, Wonju, Korea (the Republic of)*

Although there are many studies on the relationship between physical fitness and self-perceived health among older adults, few studies have identified whether physical fitness affects self-perceived health through subjective perception of memory (whether a mediation exists), and whether the relationship between physical fitness and self-perceived health depends on regular exercise (whether it is moderated by exercise). The purpose of this study was to explore the mediating effects of subjective memory perception and moderating effect of regular exercise on the relationship between physical fitness and self-perceived health among community-dwelling older adults. A cross-sectional, correlational design was used and participants were 236 community-dwelling older adults. The instruments were Hand Grip Strength Test, Subjective Memory Perception Scale, and Self-Perceived Health Status. Results showed that there was evidence of a significant mediating effect of subjective perception of memory on the relationship between muscle strength and self-perceived health (effect= .0003, $p < .05$), indicating that there was a significant indirect effect of physical fitness on perceived health through subjective memory perception. Findings, also, showed that regular exercise did moderate the relationship between muscle strength and self-perceived health for older adults, denoting that there was a significant positive relationship between muscle strength and perceived health, when regular exercise is performed. The findings have implications for intervention strategies for older adults, and suggest the need to develop cognitive strategies and cognitive context for keeping regular exercise and better self-perceived health.

SESSION 3650 (POSTER)

HIV

FRENCH NURSING HOMES: IS THERE PLACE FOR THE AGING HIV POPULATION?

F. Delamarre-Damier^{3,2}, S. Henni^{4,2}, G. Veyrac^{1,2}, A. Ruellan¹, C. Joyau^{1,2}, C. Bernaud⁵, C. Allavena⁵, 1. *Department of Clinical Pharmacology, Institute of Biology, University Hospital, Nantes, France*, 2. *French Nursing Home Research Organization (AGREE), Chateau Thébault, Nantes, France*, 3. *Geriatric Department University Hospital, Angers, France*, 4. *University Hospital Center of Angers, Angers, France*, 5. *Department of tropical and infectious diseases, University Hospital, Nantes, France*

Introduction: Since availability of potent antiretroviral therapy, number of people ageing with HIV is increasing. They are expected to have close to normal lifespans and about half of these subjects are over 50 in 2015.

Objective: The aim of this study is to determine if French nursing homes have planned to receive this emergent HIV population and have an adequate information on HIV infection, the treatment and specific care.

Methods: A survey focusing on reasons of acceptance/ non acceptance of HIV patients and level of knowledge of HIV infection management and treatment was sent to nursing homes located in the Pays de La Loire area. This survey was followed by a phone call of administrative director, in charge of agreement for resident admission following or not medical director advice.

Results: Among the 25 participating nursing homes, only 1 center (4%) was prepared for HIV resident admission. Public nursing homes were more likely to accept HIV residents, and one public nursing home who had already accepted one resident agreed to accept more HIV residents. The main reasons to refuse admission were the risk of contamination, a poor knowledge of the HIV infection, its management and its treatment and costs of antiretrovirals.

Conclusion: In France nursing homes are not yet prepared to welcome the rising aging HIV population. Nursing home staff as well as nursing home physicians must be quickly informed and trained on care, management of specific medical conditions and antiretroviral treatments. Furthermore financial constraints remain a major issue.

A QUALITATIVE ANALYSIS OF INPATIENT GERIATRIC CONSULTS IN THE AGING HIV POPULATION

T. del Carmen, R. Freeman, E.L. Siegler, H. Singh, *Weill Cornell Medical College, New York, New York*

In the United States, adults over age fifty comprise half of the entire HIV population. They have significantly higher rates of co-morbidities and experience ART-related side effects. We piloted an inpatient geriatric consult service to address geriatric syndromes in hospitalized older HIV patients.

Methods: Inclusion criteria – patients fifty-five years old and above with HIV admitted to an urban academic medical center. A geriatric assessment was performed by a board certified geriatrician. Validated screening tools were used to assess geriatric syndromes. Open ended questions were asked to allow patients to express any concerns.

Results: Nine patients were identified with a mean age of sixty-five. All patients were agreeable to a geriatric evaluation. Three patients were admitted for neurological disorders, two were admitted for metabolic disturbances, two were admitted for acute pain syndromes, one was admitted for an endocrine disorder and one was admitted for a gastrointestinal disorder. Seven out of nine patients (78%) expressed a decrease in functional status and weakness, six out of nine (67%) were found to have cognitive impairment. Three out of nine (33%) addressed goals of care, three out of nine (33%) had uncontrolled pain and three out of nine (33%) wanted to discuss community services upon discharge.

Conclusion: Our study suggests older HIV patients are receptive to an inpatient geriatric assessment. Major concerns included functional decline and cognitive impairment. Further research is needed to better explore geriatric syndromes, themes of concern and attitudes on aging amongst older HIV patients in an acute care setting.

POLYPHARMACY AND ANTIRETROVIRAL THERAPY IN THE AGING HIV-INFECTED POPULATION: A NEW CHALLENGE

A. Ruellan¹, C. Joyau^{1,2}, G. Veyrac^{1,2}, C. Allavena³, C. Bernaud³, F. Delamarre-Damier^{4,2}, P. Jolliet^{1,5}, 1. *Department of Clinical Pharmacology, Institute of Biology, University Hospital, Nantes, France*, 2. *French Nursing Home Research Organization (AGREE), Chateau Thebault, France*, 3. *Department of tropical and infectious diseases, University Hospital, Nantes, France*, 4.

Geriatric Department University Hospital, Nantes, France, 5. *EA4275 «Biostatistics, Pharmacoepidemiology and Subjective Health Measures», Medicine University, Nantes, France*

Introduction: Potent and well tolerated highly active antiretroviral therapies (HAART) have increased life expectancy of HIV population with 50% of the patients over 50 years in 2015. Comorbidities and polypharmacy have been associated with increasing age, increasing risk of adverse drug reactions (ADR), increased hospitalization rates, adherence issues, misuse and drug-drug interactions.

Objective: To evaluate and describe the toxicity associated with HAART in the elderly population.

Methods: All ADR associated with a suspected HAART in the elderly population (65- year-old patients or over) were collected on the French Pharmacovigilance Database from 01/01/2005 to 12/31/2015. After sorting the data according to System Organ Class, the rate of ADR was calculated. Severity, outcome, patient characteristics and comorbidities were also collected.

Results: 319 notifications with ADR were reviewed, among them 159 were serious. The median age was 68 years (range 65–107) with 26% women. Most frequent clinical side effects were skin and subcutaneous tissue disorders (n=77-15.3%), renal and urinary disorders (n=77-15.3%) and gastrointestinal disorders (n=56-11.1%). Nucleoside (or nucleotidic) Reverse Transcriptase Inhibitor- and Protease Inhibitor-including regimens were the most frequent suspected regimens associated with ADRs. Opportunistic infections and comorbidities such as hypertension, diabetes, hyperlipidemia were mainly identified, with 6 or more concomitant medications notified in this context.

Conclusion: This investigation provides a background for subsequent management and understanding of how to optimize the care of these patients that have an increased risk of polypharmacy with medical treatments associated with chronic diseases added to HAART.

POLYPHARMACY AMONG OUTPATIENT HIV-POSITIVE OLDER ADULTS ON ANTI-RETROVIRAL THERAPY IN UGANDA

M. Ssonko¹, F. Stanaway⁴, H.K. Mayanja², T. Namuleme¹, R. Cumming⁴, B. Mukasa¹, Y. Karamagi¹, V. Naganathan^{3,5}, 1. *Mildmay Uganda, Kampala, Uganda*, 2. *Makerere University College of Health Sciences, Kampala, Uganda*, 3. *Centre for Education and Research on Ageing, Sydney Medical School, University of Sydney, Sydney, New South Wales, Australia*, 4. *Sydney School of Public Health, Sydney Medical School, University of Sydney, Sydney, New South Wales, Australia*, 5. *Ageing and Alzheimers Institute, Concord Hospital, Sydney, New South Wales, Australia*

Polypharmacy is common among HIV positive older adults on combination Anti-retroviral therapy (cART) compared to younger people in developed countries. The aim of this study was to determine the prevalence, risk factors and adverse effects associated with polypharmacy among the ambulatory older adults on cART in an urban HIV clinic in Uganda. A cross-sectional study was conducted for 5 months in 2015. Systematic random sampling was used to enroll 411 participants aged ≥ 50 years on cART. Polypharmacy was defined as taking ≥ 4 different non HIV drugs. Data was

collected on socio-demographics (age, sex, household, level of education, BMI, marital status and source of income), previous hospitalisations, prescribing cadre, comorbidities, mini-mental status exam, Karnofsky performance status, frailty index, and potential adverse events of medications (falls, medication side effects). Prevalence of polypharmacy was 15.3%. In multivariate logistic regression analysis, significant correlates of polypharmacy were age ≥ 65 years (OR 2.7 (95% C.I. 1.2, 5.9) and frailty index score of ≥ 5 (OR 9.7 (95% C.I. 1.3-, 76). Participants with rented residences were less likely to have polypharmacy (OR 0.3 (95% C.I. 0.1, 0.97). Falls in past one year were more frequent in the polypharmacy group (21% vs 13%, $p = 0.09$). Potential drug related adverse effects were more common in the Polypharmacy group (25% vs 11% $p < 0.05$). Polypharmacy is common among an older ambulatory HIV positive clinic population in Uganda. More research is required to determine the benefit or harms of polypharmacy in sub-Saharan Africa among HIV positive older adults.

FRAILITY IN OLDER ADULTS (>50 YEARS) LIVING WITH HUMAN IMMUNODEFICIENCY VIRUS (HIV). A CARE PROPOSAL

J.M. McMillan^{1,2}, D.B. Hogan^{1,2}, M.J. Gill^{1,2}, H. Krentz^{1,2}, 1. *University of Calgary, Calgary, Alberta, Canada*, 2. *Alberta Health Services, Calgary, Alberta, Canada*

The aim of the proposed study is to estimate the period prevalence of frailty using two different approaches in a cohort of HIV patients engaged in care at the Southern Alberta Clinic. This population differs from previous studies of frailty in HIV by the inclusion of a broad and heterogeneous patient population. Another novel element will be the use of a second frailty measure, the Clinical Frailty Scale, which is widely used in care settings. Patients will be grouped by sex and age intervals (50–54, 55–59, 60–64, 65–69 and over 70 years) in order to determine the age-related period prevalence of frailty within the clinic population and to identify potential predictive variables for the development of frailty in PLWHA, such as age, sex, duration of known HIV infection, presence or absence of AIDS, specific age-related co-morbidity, multi-morbidity (defined as 2 or more of these co morbidities), nadir CD4 count, duration of unsuppressed viremia and exposure to both antiviral therapy (ART) and individual agents. This data is routinely collected as part of care and is readily available through the SAC database. The period prevalence of frailty in the study population will be compared to published data on similarly aged populations as well as in older populations (e.g., older adults in the Canadian Study of Health and Aging).

By the time of the International Association of Gerontology and Geriatrics 21st World Congress, in 2017, our study group anticipates having preliminary results from our study, including period prevalence of frailty, using two different frailty scales, as well as preliminary evaluation of potential risk factors for frailty,

Potential long-term implications of this research project range from better care of aging PLWHA to improved planning for future clinic and societal resources to deal with the needs of HIV-infected patients.

SESSION 3655 (POSTER)

INTERGENERATIONAL PROCESSES

OFFSPRINGS' OBLIGATION AND APPRAISALS OF SUPPORT TO PARENTS: IMPLICATIONS FOR PARENTAL DEPRESSION

Y. Cheng, *The University of Texas at Austin, Austin, Texas*

Adult offspring is the main source of support for their older parents. Offspring may feel obligated to help their parents, and a sense of obligation further triggers another feeling regarding helping parents (e.g., stress, rewards). Literature has focused on offspring's support to their older parents (actual support and the appraisals) and the impact on their own well-being. However, whether offspring's support and the appraisals are associated with parental well-being is less frequently discussed. This study examined offspring's sense of obligation, support to older parents, feelings of stress and reward, and parental depression. Middle-aged offspring ($n = 190$; 60% women; mean age = 54.68) and their older parents ($n = 221$; 72% women; mean age = 80.17) were included from the Family Exchanges Study 2 (FES2). Path models through structural equation modeling indicated that adult offspring's stronger sense of obligation was associated with less stressful and more rewarding feelings in helping older parents. Furthermore, offspring's lower stress was associated with less parental depression. Consistent with other interpersonal contexts, the manner in which the support is delivered appeared to be crucial to support receivers' outcomes. Adult offspring's feelings of stress and reward when helping their parents not only impacted their own health, but also were associated with their parents' well-being.

LOOK AT ME: MEETING OF GENERATIONS MEDIATED BY WRITING LETTERS

D.F. Santos¹, C. Cerveny², R.P. Teixeira³, 1. *Centro Universitário Módulo, Caraguatatuba, SP, Brazil*, 2. *Pontifícia Universidade Católica de São Paulo (PUC-SP), São Paulo, SP, Brazil*, 3. *Instituto Federal de São Paulo (IFSP), Cubatão, SP, Brazil*

This study analyzed the benefits of an exchange of letters between different generations, investigating how the act of writing about events of everyday life may be associated with a better self perception of the participants. The research analyzed the participation of eight pairs, each one consisting of a student from the 4th or 5th year of a Primary School aged between 9 and 11 years, and an elderly, over 60 years of age, in 2011 and 2012. A qualitative research was made with letters and questionnaires used as instruments and considered from the perspective of content analysis focused on meanings, and this strategy was methodologically complemented by participant observation. This experience produced positive psychological effects for its participants, both immediate and remote, by contributing to the expansion of the view about the world and themselves. For the elderly, expanding the memory of significant experiences, associated with written records and the possibility of using them in moments of weakness, produced psychological benefits that were observed by the researchers. The experience of living positive emotions brought comfort to the aging process because

it attenuated the perception of social exclusion and loneliness, by reviving the feeling of usefulness and social inclusion, by providing a real life experience and by meeting the needs of this phase of life. The possibility of self-expression also favored the maturation and psychosocial development of children, as the correspondence produced an interlocutor that listened carefully and sought to understand the demands that are specific to childhood.

EXPANDING THE VIEW OF MUTUAL BENEFIT TO SUSTAIN INTERGENERATIONAL PROGRAMS

R.H. Weaver², J. Naar², S.E. Jarrott¹, 1. *College of Social Work, The Ohio State University, Columbus, Ohio*, 2. *Virginia Tech, Blacksburg, Virginia*

Using content analysis, we identified themes in data collected via small focus groups and individual interviews with staff and administrators (N=30) from six sites where child-care centers partnered with adult day services, senior center, and elder volunteer programs. As a USDA CYFAR Sustainable Community Project, emergent themes addressed the impact of intergenerational programming on children, elders, families, and staff as well as issues of sustainability. Resources provided by the project, primarily training on best intergenerational practices, were evaluated as contributing to sustainability. Collaborative partnerships that included Extension Educators, also contributed to sustainability. Sites identified different barriers to intergenerational programming, reflecting their financial resources, diverse partners, and buy-in of program stakeholders. Investigators interpret interviewees' responses, conducted over the 5-year project, as reflecting the unique contexts of each program. For example, the longest running intergenerational program was challenged by staff buy-in, which evidenced itself in observations of participants and staff. In contrast, the newest program achieved early buy-in and had AAA and Head Start resources to support their efforts. Findings bolster previous research indicating that effective intergenerational programs must benefit all stakeholders - not just the youth and elder participants. Taking a participatory approach that involves staff, administrators, and participants promotes mutual benefit with program nimbleness. Support from Extension professionals facilitates stronger, denser network connections for partners to draw upon.

GENDERED ALLOCATION OF SUPPORT FOR AGING PARENTS AND PARENTS-IN-LAW IN TAIWAN

Y. Cheng², H. Ko¹, 1. *Central Michigan University, Mt. Pleasant, Michigan*, 2. *New graduate, Sunnyvale, California*

Adult offspring is the main source of support for their older parents. With the aging population increasing worldwide, how married adults allocate their limited resources to their parents and parents-in-law is becoming a major challenge. Based on the U.S. literature, married women tend to provide more support to their own parents than to their parents-in-law. Men follow their wives and help parents-in-law more than their own parents. In contrast, in the Taiwanese traditional culture, married women should allocate resources to parents-in-law rather than to their own parents; married men are not responsible for helping parents-in-law. However, little is known about whether married adults in Taiwan actually follow the traditional support allocation. This study examined married adult offspring's allocation of financial and practical support based on the 2011

Taiwan Social Change Survey. Married adults with at least one parent and parent-in-law living were included ($n = 535$; 48% women; mean age = 47.25). Multilevel models indicated that women allocated more frequent practical support for parents-in-law than for their parents, and gave the same level of financial support to both parents and parents-in-law. Men gave both practical and financial support more frequently to their parents than to parents-in-law. In general, these findings fitted the Taiwanese traditional expectation of support allocation, especially for men. Although women still fulfill their obligation to help parents-in-law, they may be more inclined to help their own parents due to their increased participation in the labor force. Implications on policy and gender roles in Taiwan are also discussed.

GRANDPARENTS RAISING GRANDCHILDREN SELF-CARE PRACTICES: THE GRANDCARES PROJECT

C.A. Fruhauf¹, L. Yancura², H. Greenwood², A.N. Mendoza¹, 1. *Human Development & Family Studies, Colorado State University, Fort Collins, Colorado*, 2. *University of Hawaii at Manoa, Manoa, Hawaii*

Globally, it is well known that grandparents often serve their families by providing instrumental and emotional support. Grandparents may also assume the role of "surrogate parent" or raise grandchildren when the middle generation is unavailable. When grandparents assume the primary caregiving role of their grandchildren, they often experience decreases in their physical and mental health. One aspect of health and well-being that is critical to maintaining and improving optimal health in later life is self-care. Self-care focuses on personal health maintenance and includes positive lifestyle practices. Despite the self-care literature being rooted in the medical field with more than 25,000 articles on the topic, empirical research addressing grandparents' raising grandchildren self-care practices, however, is minimal. Furthermore, although chronic disease self-management interventions are well known, until recently, no program directly targets self-care practices of grandparents. As a result, we utilized methods in community-based participatory research (CBPR), which is often used to identify and meet the needs of at-risk populations, to develop and implement The GRANDcares Project. This presentation will extend the literature on CBPR principles by describing our collaborative working relationships with local and state agencies, including two statewide Extension systems, serving grandparent caregivers. We also will address our research objectives and outcomes related to improving grandparents' self-care. Finally, we will address the theoretical background of CBPR, the challenges and benefits of using CBPR as a recruitment and retention strategy, and suggest guidelines for using this method to support self-care practices of grandparent caregivers in both the United States and abroad.

APPLICATION OF INTERGROUP CONTACT THEORY TO MANAGING AGE-DIVERSE TEAMS

M. Choi¹, S.E. Jarrott¹, J. Naar², 1. *Social Work, The Ohio State University, Columbus, Ohio*, 2. *Virginia Tech, Blacksburg, Virginia*

The outcomes of different generations working together can be mixed. Previous literature has taken a pessimistic view, addressing conflict and social categorization among

generations. Alternatively, we consider an optimistic view, using contact theory to explore employees' perspective on the different career stages as they relate to team effectiveness. Allport identified necessary conditions for positive intergroup contact. Data from the Age and Generations Study were analyzed using Hayes' indirect macro analysis technique, which enables researchers to test multiple mediators in the same model. We examined the mediating effect of attitudes toward different career stages on the direct relationship between supervisor support and team effectiveness and between team inclusion and team effectiveness. Of 1,572 participants, 60.4% were female and the mean age was 50.30 years ($SD=12.10$). Results achieved significant mediation models with supervisor support and team inclusion accounting for respectively, 44.3% and 52.7% of the adjusted variance. The total and direct effects of supervisor support on team effectiveness are 0.50, $p < .001$, and 0.43, $p < .001$, respectively. Additionally, the total and direct effects of team inclusion on team effectiveness are 0.55, $p < .001$, and 0.50, $p < .001$, respectively. Our findings reflect the value of contact theory tenets of authority support and cooperation towards a common goal in supporting successful outcomes of diverse team. Future efforts should explore strategies to optimize supervisor support and enhance team engagement. Improving attitudes toward the out group in age-diverse teams may be key to reducing potential conflict in age-diverse workplaces.

THE EFFECTS OF AN INTERGENERATIONAL SERVICE LEARNING EXPERIENCE ON AGEIST ATTITUDES

K. Ivey^{1,2}, D.C. Potts^{1,2,3}, S. Gately^{1,2}, J. Westmoreland^{1,2}, H. Henkin^{1,2}, E. Mayer^{1,2}, A. Halli-Tierney^{1,2}, R.S. Allen^{1,2},
1. *Psychology, University of Alabama, Tuscaloosa, Alabama*,
2. *Alabama Research Institute on Aging, Tuscaloosa, Alabama*,
3. *Cognitive Dynamics, Tuscaloosa, Alabama*

Intergenerational service learning programs address ageist attitudes by bolstering empathetic intergenerational relationships, creating a comprehensive, realistic view of aging, and fostering positive attitudes towards older adults. We examined learning outcomes for undergraduate students enrolled in: 1) an experiential, 2) didactic aging content, and 3) introductory psychology courses. Students completed pre- and post- surveys measuring empathy and attitudes toward older adults and persons with dementia (PWD) and community service. Students enrolled in the experiential course exhibited improved attitudes towards PWD, Wilks' $\lambda = 0.952$, $F(2,355) = 8.98$, $p < .0001$ ($M = 14.25$, $SD = .36$) relative to students in psychology of aging ($M = 12.59$, $SD = .17$) or PY 101 ($M = 11.87$, $SD = .12$). Moreover, attitudes towards community service were improved for students enrolled in the experiential course, Wilks' $\lambda = .502$, $F(2, 356) = 176.436$, $p = .000$ ($M = 27.71$, $SD = .41$) relative to students in psychology of aging ($M = 25.29$, $SD = .19$) or PY 101 ($M = 22.160$, $SD = .13$). Finally, students in the experiential course showed greater increases in empathy, Wilks' $\lambda = .856$, $F(2, 345) = 29.058$, $p = .000$ ($M = 47.52$, $SD = .75$) relative to students in psychology of aging ($M = 44.10$, $SD = .34$) or PY 101 ($M = 41.52$, $SD = .22$). Intergenerational service learning courses may offer a sustainable avenue for delivery of interventions to PWD in the community and facilitate entry of students into professions in geriatrics and gerontology.

WE WILL NOT BE MOVED: ELDERLY PERSONS' RESILIENCE IN FRONTIER LOCATIONS IN OPERATION PROTECTIVE EDGE

I. Regev, O. Nuttman-Shwartz, *Sapir academic college, Sderot, Israel*

The unique ways of coping of elderly people during times of threat are examined here. The population were elderly Israelis who chose to remain in their frontier-location homes during Operation Protective Edge in the summer of 2014. Three semi-structured focus groups were held in three different locations, in September and October, 2014. Each three-hour group discussion included introductions and a conversation about the war and coping with it. An open question invited participants to tell their personal story of the operation. Content-categorical analysis of the transcripts yielded four main themes: (1) Together – ethical theme: individual vs. collective, worry about oneself vs. worrying about others; (2) I'm not afraid – emotional theme: expressing emotions that vacillated between lack of fear to fear, loneliness, failure, desertion vs. courage, uncertainty, anger and disappointment with the state and the army, pain, and bad conscious; (3) Glad the kids left – intergenerational theme: different generational perspectives of the operation and means of coping, and issues of continuity and faith in the ways of the kibbutz/community vs. the possibility of leaving; (4) We will not be moved – personal and communal resilience theme, personal vs. communal responsibility. The many elderly residents who remained at home during the operation raised personal, familial, ethical, and communal issues and dilemmas, which can be explained by (1) the developmental stage of the elderly people, (2) processes of change in the kibbutz/community, and (3) different coping patterns resulting from generational differences.

THE ACTUAL AND EXPECTED AVAILABILITY OF INFORMAL CARE: CHILDLESS ELDERLY PEOPLE AND PARENTS

M. Kohli¹, M. Albertini², 1. *SPS, European University Institute, Berlin, Germany*, 2. *University of Bologna, Bologna, Italy*

As people get older, they face the question of who will provide them with care if they ever need it. Current estimates indicate that approximately 87% of Americans who receive long-term care receive it from informal caregivers. However, the supply of family caregivers is unlikely to keep pace with future demand, and increasing childlessness rates represent an additional challenge. Using data from the HRS, the present study analyzes how childlessness affects the probability that disabled individuals receive informal care, and nondisabled individuals anticipate future informal care. In contrast to most previous research, the childless are not treated as an homogeneous group; different types of and pathways to childlessness are distinguished. In general, the results do not hold up the claim that in the US non-parents face significant support deficits in old age. The probability of receiving support is substantially lower only for those who survived their children, whereas the weak negative effect observed for those who never had natural nor step-children is not statistically significant. Compared to natural parents, step-parents receive more support from their partners but get less help from their children. The analysis of support expectations

reveals that parents as well as childless people tend to overestimate the availability of informal care in case of need.

INTERGENERATIONAL KNOWLEDGE TRANSFER: ANTECEDENTS OF A DYADIC PROCESS

A. Burmeister¹, J. Deller², 1. *Bern University, Work and Organizational Psychology, Bern, Switzerland*, 2. *Leuphana University of Lüneburg, Lüneburg, Germany*

The aging of skilled workforces is a major challenge for organizations. In light of the massive wave of retirements of members of the baby boomer generation, the retention of valuable organizational knowledge from older and retiring workers has been identified as an urgent need. In this study, we integrate socio-emotional selectivity theory and the theory of psychosocial development to explain how individual characteristics of older and younger employees influence the intergenerational knowledge transfer process. We propose a moderated mediation model: First, we hypothesize that older employees' focus on generativity and younger employees' focus on extrinsic growth values predict their knowledge sharing and receiving behavior. Second, we propose that the effects of work values on knowledge sharing and receiving behavior are mediated by employees' willingness to engage in intergenerational knowledge transfer. Third, we argue that the indirect effects of work values on knowledge sharing and receiving behavior are moderated by age-diversity climate, such that if age-diversity climate is more pronounced, the proposed relationships are stronger. We collected multi-source, time-lagged data from 80 intergenerational knowledge transfer dyads (i.e., older and younger employees), who were based in four German companies that operate in the financial services industry. We found support for most of our propositions. The study contributes to research on aging workforces and intergenerational interactions at the workplace by showing that the individual characteristics of both older and younger employees influence knowledge retention. Further, the study shows that contextual variables can influence intergenerational knowledge transfer processes.

DOES CHINA'S NEW RURAL PENSION SCHEME CROWD OUT PRIVATE TRANSFERS? EVIDENCE FROM CHARLS

T. Chen, *Renmin University of China, Beijing, China*

Objectives. China has recently started a major effort to bring old-age pension coverage to rural China. If private transfers are crowded out by public transfers, expansions in public social security will be less effective in terms of improving older people's economic well-being. This study investigated the relationship between pension and intergenerational monetary transfers older parents received in rural China.

Methods. Data for this investigation derived from the China Health and Retirement Longitudinal Study (CHARLS) national followup conducted in 2013. The total sample size was 17,705 individuals in 10,257 households. To see if nonlinear effects occur, a semiparametric method was applied to identify the nonparametric responsiveness of intergenerational transfers to recipients' pension income while still taking account of the (linear) covariates affects such responsiveness.

Results. Crowding-out was not an important feature of transfer behavior in rural China, but crowding-in was. We

found there was initially a negligible negative relationship between transfer received and pension for elderly at low pension income level. The correlation became significantly positive for older parents at median and high pension income level.

Discussion. The results suggest that expansions in public transfers appear not to shrink private transfers, and, in rural China, may actually strengthen intergenerational transfers for older adults. This finding is consistent with an exchange-based motive for transfers. At the same time, it does not necessarily deny altruism among children and may imply a complementary effect upon children's transfers.

THE ROLE OF SOCIAL SUPPORT IN CUSTODIAL GRANDPARENTS' DEPRESSION

Y. Lee, *SUNY-Binghamton University, Binghamton, New York*

Grandparents raising grandchildren struggle with high caregiving stress that negatively influences the older adults' well-being. Surveys with 70 custodial grandparents were conducted in 2015–16 focusing on understanding needs of grandparent-headed families and factors related to grandparents' mental health status. Majority of the sample (73%) was non-Hispanic white and the mean age was 63 years old (range: 45–79). Sixty seven percent of the grandparents reported a household income below \$40,000 and 38% of them were raising more than one grandchild. The mean length of the caregiving was 6.7 years. Almost half of the grandparents rated their health as poor or fair, and one third of the grandparents reported a risk of clinical depression. Half of the grandparents reported five or more concerns in raising the child (i.e., finance and legal issues, health of a grandparent and a grandchild, and a grandchild(ren)'s education, etc.). Half of the grandparents disclosed some challenges in working with their grandchild(ren)'s school. Multiple regression analysis was ran to examine the contributions of age, ethnicity, income, number of grandchildren, duration of care, needs related to caregiving and grandchild's school, and social support in accounting for grandparents' depression. With all predictors in the equation, the model accounted for 28.8% of the variance in the grandparents' depression ($R^2=.288$; adjusted $R^2=.182$). Among the predictors, social support was the only significant predictor of the grandparents' depression ($\beta=-.354$, $p=.008$). The result suggests the importance of development of programs strengthening grandparents' social support systems to promote the caregivers' well-being.

SESSION 3660 (POSTER)

INTERVENTIONS, POLICY, FINANCING AND POLITICAL ISSUES

BUILDING CONNECTIONS BETWEEN ELDER LAW AND GERONTOLOGY

N.A. Kohn¹, I. Doron², M.T. Brown¹, 1. *Syracuse University, Syracuse, New York*, 2. *University of Haifa, Haifa, Israel*

Over the past several decades, elder law has emerged as an important legal specialty. Lawyers, clients, and, law schools are increasingly recognizing the value of the field and its practical and intellectual rigor. Despite this development,

however, elder law remains at the periphery of the study of aging and has yet to be meaningfully integrated into the larger field of gerontology.

This lack of integration is unfortunate for two primary reasons. First, elder law practice would benefit from being informed by the larger study of aging. Second, an understanding of elder law is integral to understanding of the experience of growing older.

To investigate the current relationship between elder law and gerontology and opportunities for (and barriers to) connecting the fields, we conducted structured interviews with 27 leading professors of gerontology and elder law in the United States, Canada, and the United Kingdom. Interviews were designed to: 1) identify existing attitudes toward elder law among those working in the field of gerontology, and existing attitudes toward gerontology among those working in the field of elder law; 2) identify opportunities for, and barriers to, connecting teaching and scholarship in the two fields.

In this session, we will present our findings related to existing and potential connections between the fields of gerontology and elder law in scholarship and participant suggestions for improving the connection between the fields. Based on these findings, we will then help participants identify steps they might take to connect and integrate the two fields in their scholarship and teaching.

HUMAN RIGHTS AND DEMENTIA: ARE FAMILY CAREGIVERS LIABLE FOR DAMAGES?

K. Murayama, *Advanced Research Center for Human Sciences, Waseda University, Tokorozawa, Saitama, Japan*

This report analyzes a 2016 Japanese Supreme Court case involving family caregivers' liability for damages caused by a dementia sufferer who found his way into a railway and died. This analysis is important because it considers the right of persons with disabilities to live in the community, as stated in Article 19 of the Convention on the Rights of Persons with Disabilities. The Court absolved the wife and son of the deceased, who needed long-term care, of liability, and defined four criteria for finding someone liable for damages: (a) caregivers' living, mental, and physical conditions; (b) the actual condition of caregivers' involvement with persons with mental disabilities; (c) the nature and incidence of the problematic behaviors of persons with mental disabilities; and (d) the actual situation of supervision and care. Criterion (b) can cause families to give up home care, leading to early institutionalization and often making care facilities liable for damages. Consequently, care facilities might limit such patients' freedom of movement and supervise them strictly. Furthermore, there have been many mentions of judges having little awareness of the human rights of persons with dementia and how they are actually cared for. Although the judgment focused only on caregivers' liability, it should have also pursued the railway company's failure to ensure public safety. The Court did, however, present its views on social health care and took the family into account: if these criteria are applied appropriately, the human rights of both dementia sufferers and their families will be protected.

ELDERLY WELL CARE PROJECT: AN INTEGRATIVE CARE MODEL AND POLICY IN BRAZIL

D.P. Silveira^{1,2}, M. Oliveira¹, 1. *BRAZILIAN FEDERAL AGENCY FOR HEALTH PLANS AND INSURANCE, RIO DE JANEIRO, RIO DE JANEIRO, Brazil*, 2. *FUNDAÇÃO OSWALDO CRUZ - FIOCRUZ, RIO DE JANEIRO, RIO DE JANEIRO, Brazil*

Living longer is a reality in Brazil - and will be even more in the coming years. The increase in life expectancy must go hand-in-hand with autonomy and good health. This is a burning issue: today, older people represents 11% of Brazilians and it is expected to reach 30% by 2050. The country needs to come to the fore on providing a higher quality medical care and a safer health care environment for the elderly. Brazilian Federal Regulatory Agency for Health Insurance (ANS) initiated the Project Elderly Well Care, which proposes redesign healthcare delivery, with new arrangements in financing and alternative reimbursement models. The model is patient-centered and the two pillars are: (a) improving the quality and coordination of care along all the healthcare chain, and b) avoiding redundancy tests and prescriptions, as well interruptions in the patient path. In this model, the hospital and the emergency take on new places in the health network, being reserved for times of acuteness of chronic diseases or playing a role of care organizers. The integration of care is enhanced through the figure of the "navigator". With regard to healthcare payments models, the Project encourages alternative models based mostly on fixed payments and financial incentive according to providers performance, inspired by the American model of Accountable Care Organizations. The Project has now 75 participants in the implementation phase, hospitals, clinics, emergencies and other providers that are trying to change how they deliver healthcare for older people in private health insurance marketplace in Brazil.

WHAT IS AN ERROR IN NURSING CARE? NEGATIVE KNOWLEDGE IN NURSES' PERCEPTIONS

M. Habermann¹, H. Cramer², 1. *Centre for Nursing Research and Counselling, Hochschule Bremen, Bremen, Bremen, Germany*, 2. *Alters-Institut, Dortmund, Nordrhein-Westfalen, Germany*

Globally, the prevention of errors constitutes a framework of growing importance for analyzing and optimizing the work of health professionals. Nurses working close to persons dependent on care and therapy hold major potentials to discover errors in treatment and care, to prevent harm, but also to cause errors. Medication errors have dominated the research. In addition, reporting systems and the observation of underreporting have also been the subject of research. Very little research has been done to explore definitions and concepts of nursing errors in nurses' perceptions. Such "negative knowledge" represents the flip side of professional knowledge. The analysis of definitions and concepts of nursing errors (1) promotes a better understanding of professional attitudes, beliefs and knowledge of nurses. It (2) supports the compilation of nurse-sensitive questionnaires and (3) should be taken into consideration when introducing reporting systems and other organizational innovations in order to prevent errors.

Against this background, examples of errors and classifications of errors will be presented in this contribution on the basis of in-depth, ethnographic interviews with nurses (n=8) working in nursing homes. The results will be contrasted with narratives of nurses working in hospitals and their evaluation of errors (n=10) in order to explore field-specific concepts. The interviews were audiotaped and analyzed with Atlas.ti by a research team. Eight code families had been obtained representing error classifications.

The results indicate that it might be beneficial to put more emphasis on nurses' perceptions when it comes to organizational innovations aiming for residents' safety.

THE STRUCTURE OF THE TRANSDISCIPLINARY APPROACHES BY CARE MANAGERS IN JAPAN

T. Ayabe, *BAIKA Women's University, OSAKA, Japan*

In Japan's Long-term Care Insurance System, importance is given to medical and care team approaches as part of care management.

This study aimed to clarify the structure of Transdisciplinary approaches (TA) coordinated by care managers (CM), and performed through collaboration among team members, including home care service coordinators (HC) belonging to home-visit care aging and home-visiting nursing (HN) in long-term care insurance system in Japan.

Using the database Wamnet, 800 CM registered with this system and located in randomly selected prefectures were targeted as potential study facilities. A mail questionnaire survey was conducted, involving an CM of each potential study facility within the period between March 20 and April 20, 2015. Excluding missing values, responses from 202 (valid response rate: 25.2%) were analyzed. For 45 TA-related items, The research design factor analysis was the exploratory and confirmatory factor analysis about TA. The reliability of each item was examined using Cronbach's alpha.

Through the exploratory analysis, the following 3 factors were extracted: 1: approaches that support and strengthen of role ($\alpha=0.950$), 2: approaches for role relief within a team ($\alpha=0.875$), 3: that contribute to expansion of role ($\alpha=0.933$). Result of the exploratory and confirmatory factor analysis, It showed a fit index of GFI=0.836, AGFI=0.802, CFI=0.933, RMSEA=0.071, suggesting the model is within the accepted range.

CM was practicing 3 keywords ("support and role strengthen", "role expansion", "role relief") of TA.

THE IMPACT OF NURSE PRACTITIONERS AND PHYSICIAN ASSISTANTS ON NURSING HOME QUALITY

R. Pradhan¹, R. Weech-Maldonado², S. Gupta³, N. Dayama¹, 1. *Health Policy & Management, University of Arkansas for Medical Sciences, Little Rock, Arkansas*, 2. *University of Alabama at Birmingham, Birmingham, Alabama*, 3. *Saint Louis University, Kansas City, Missouri*

With an aging population and rise in alternatives, nursing home (NH) population is frailer and medically complex. Prior research suggests that physicians play an important role in improving NH quality but there is an acute shortage of experienced physicians willing to work in NHs. Nurse Practitioners/Physician assistants (NPs/PAs) are specially trained in primary care and other basic medical services

present an attractive alternative. Using the Donabedian Structure-Process-Outcome (SPO) model, this study examines the impact of NPs/PAs on physician sensitive measures of NH quality. The study sample includes all Medicare certified NHs for the study period 2000–2013 with a total sample size of approximately 200000 observations. We use panel data regression with year and facility level fixed effects. The variable of interest is the presence of NPs/PAs (0 for No and 1 for yes) and we use the following quality variables derived from both Long-term care Focus as well as the Minimum Data Set (MDS): restraints, pain, pressure sore prevention (a facility composite score (0–4) of pressure sore prevention processes derived from four MDS dichotomous items), restorative ambulation (A facility level continuous variable that measures the facility's average number of days in a week that residents are walked using restorative nursing aides), 30 day SNF rehospitalizations, hospitalizations per resident year, ADL decline and pressure ulcer. Results present a mixed picture with NHs with NPs/PAs reporting significantly lower restraint use and ADL decline but with no impact on rehospitalizations or hospitalizations. Policy and managerial implications are discussed.

THE CONCEPT OF INTERCULTURAL OPENING OF CARE ORGANIZATIONS IN GERMANY: ASSESSING IMPLEMENTATION

M. Habermann¹, M. Stagge², 1. *Centre for Nursing Research and Counselling, Hochschule Bremen, Bremen, Bremen, Germany*, 2. *F+U, Heidelberg, Baden-Württemberg, Germany*

After decades of disputing that it is a country of immigration, Germany has developed new policy approaches towards immigration in this century, acknowledging the fact that one fifth of the population has a migrant background. On average, the immigrant population and their descendants are younger than the German population. However, immigrants over 65 years of age constitute a quickly growing population group in Germany which will nearly double in number by 2030 (from 1.5 million to 2.8 million) as estimated by the Germany Federal Statistics Office. This creates a challenge for long-term care organizations. Access to services has to be facilitated and socioculturally adapted care established. The concept of "intercultural opening" is one approach for responding to these challenges. It involves change processes in long-term care organization affecting structures, processes and outcomes. No data exists on the current state of the concept's implementation in long-term care organizations since appropriate assessment tools have not yet been defined.

Against this background, this contribution will present (1) an outline of the concept of "intercultural opening" and (2) three current approaches to developing assessment tools. The findings are based on an extensive literature research and publications of municipal model projects (Munich, Frankfurt, Bremen).

SURVIVAL OF NON-PROFIT AND FOR-PROFIT LONG-TERM CARE INSTITUTIONS IN TAIPEI AND NEW TAIPEI CITIES

C. Chen¹, C. Wang², 1. *Chinese Culture University, Taipei, Taipei, Taiwan*, 2. *Department of Mathematics, Tamkang University, Taipei, Taiwan*

It is well established that various factors influence the survival of care facilities. Due to Taiwan allowing for-profit care facilities in 1997, it is important to investigate how both non- and for-profit institutions survive. This study uses data on 199 care institutions in Taipei and New Taipei cities, examining how facility size, evaluation score, whether non- or for-profit, location, and institution type affect survival. The results show that institutions in a large metropolis have a lower survival rate (75.7%) than those in suburban areas (90.0%), and that ecological dynamics and institutional changes have a stronger influence on small and for-profit care institutions than on nonprofit care institutions. Effective policies for encouraging the establishment and survival of urban care facilities should therefore be a major focus for long-term care policymakers.

THE POLITICS OF AGING IN A DIVERSE SOCIETY

F. Torres-Gil, A. Hahm, C. Demko, *University of California Los Angeles, Los Angeles, California*

This paper will present a case study of the politics of aging in a diverse society. With much of the world facing aging and growing numbers of older persons, they can expect that the elderly will engage in the political and governmental processes of their country. In addition, however, nations are beginning to also face issues of foreign workers, immigration and migrants and a more diverse society. What happens when aging and diversity come together? What are the policy and political implications of a politics of aging coupled with the pressures of immigration and diversity? This presentation uses the United States of America as a case study of a society becoming older while it becomes majority-minority and faces ongoing immigration pressures. The USA by 2030 will have a doubling of its 65 years and over population but by 2050 will find that Asians, Hispanics, Blacks and Immigrants will constitute a majority of its population; and this while facing the ongoing controversies of immigration and refugee politics. This presentation will present a historical and policy analysis of the nexus of aging, diversity and immigration and provide implications and lessons for others—e.g. Korea, Japan, European Union, Israel, Australia—facing similar pressures. After attending this presentation, participants will have an analytical understanding of demographic forces reshaping society and will be able to apply this case study to their host countries.

MEDICARE ADVANTAGE MARKET DYNAMICS AND QUALITY: HISTORICAL CONTEXT AND CURRENT IMPLICATIONS

T.D. McBride, L. Kemper, A. Barker, L. Wilbers, *Brown School, Washington University in St. Louis, St. Louis, Missouri*

In this presentation, we assess variation in Medicare's star quality ratings of Medicare Advantage (MA) plans that are available across geographic areas. Evidence from the recent Centers for Medicare & Medicaid Services (CMS) quality demonstration suggests that market dynamics, i.e., firms entering and exiting the MA marketplace, play a role in quality improvement. Therefore, we also discuss how market dynamics may impact the smaller and less wealthy populations that are characteristic of rural places, raising concerns about equity and access to quality plans.

Highly rated MA plans are more likely to be health maintenance organizations (HMOs) and local preferred provider organizations (PPOs), as opposed to regional PPOs. HMOs and local PPOs may be better able to improve their quality scores strategically in response to the bonus payment incentive. MA plans have lower quality ratings in rural areas on average. However, the rural enrollment rate is higher in plans with lower quality scores than in plans with high quality scores. This differential is likely due, in part, to lack of availability of highly rated plans in rural areas: 17.8 percent of rural counties lacked access to a plan with four or more (out of five) stars, while just 3.7 percent of urban counties lacked such access. MA plans with high quality scores have been operating longer, on average, and have a lower percentage of rural counties within their contract service areas than plans with lower quality scores. In 2015, 59.3 percent of rural MA beneficiaries were enrolled in a plan with at least four stars, compared to 71.1 percent of urban enrollees.

This analysis is completed using a unique data set containing all MA plans across the U.S. For each MA plan, the quality scores are explored to explore the geographic variation of plans that offered.

ADDRESSING FOOD DISPARITIES FOR OLDER ADULTS IN WATTS: A CASE STUDY

B. Gomez, *University of La Verne, Rancho Cucamonga, California*

Research has shown that access to healthy foods as a means to mediate the impact of chronic diseases amongst low-income, minority older adults is critical. There have been a myriad of government-funded programs that promote healthy behaviors for Americans in the United States like the *Healthy People Initiative* proposal of 2010; but very little has been done to provide accessibility to healthy foods for some of the most vulnerable including low-income, older minorities. While the *Healthy People Initiative* is revised every ten years, there remains a constant challenge of addressing the disparities in access to preventive care and access to healthy food for minorities. In an effort to gain more understanding of the availability and accessibility to healthy foods in a densely populated community in South Los Angeles, the author found that in Watts, a 2.12 square mile city, where residents are predominantly Latino and African-American, there was one grocery store with limited access to fresh food. What there was access to were six liquor stores and ten fast food restaurants. The implications of having more liquor stores in poor neighborhoods suggests that many of its residents have more access to alcohol and fast food than fresh, healthy food. This suggests that making choices about proper nutrition, especially, in areas where the residents are living on a fixed income and may lack access to transportation, is extremely challenging. Based on these findings, it is imperative to provide equitable accessibility to healthy foods in low-income communities. It has been reported that many grocery store owners are hesitant to bring business to neighborhoods like Watts because of the high crime rates and insurance premiums (within a six-month period, there were 565 property crimes). However, making the decision to prioritize policies that incentivize far outweigh the costs to treat chronic illness amongst low-income communities.

HEALTH AND HEALTH CARE AS HUMAN RIGHTS

C. Cox¹, P.J. Kolb², 1. *Graduate School of Social Service, Fordham University, New York, New York*, 2. *Lehman College, New York, New York*

The rights to health and health care in the event of illness, disability, or old age are detailed in Article 25 of the Universal Declaration of Human Rights. These rights are fundamental to the well-being of older adults as demands for health care are closely related to the increase in chronic conditions that commonly occur with aging. Without adequate and accessible health care, rights are seriously impeded and the quality of life diminished. This paper discusses the two major health care policies in the USA, Medicare and Medicaid, affecting older adults and the ways in which the programs relate to human rights. Medicare, a federal health insurance program focusing on older adults was created in the 1960s and is composed of several parts. Part A covers in-hospital care while Part B, which is paid for through monthly premiums covers out-patient care. Prescription drugs are covered through a separate plan. Medicaid, also developed in the 1960's provides health care is a means-tested, needs based program with eligibility dependent on income and assets. It is also the largest payor of long term nursing home care in the country. This paper focuses on the ways in which these two health programs relate and respond to human rights of older adults. Particular attention is given to the accessibility of services areas that are fundamental to the realization of human rights and well-being. Recommendations for making programs rights rather than needs based are given with examples of rights based health policies in other countries.

HIP FRACTURES AND DECLINING DXA TESTING: AT A BREAKING POINT?

D. Zeldow, E. Lewiecki, R. Adler, *National Bone Health Alliance (NBHA), Arlington, Virginia*

Background. Hip fracture incidence rates have generally decreased over the last 15 years in the U.S. and other developed countries. The dramatic decline has been ascribed to improvements in osteoporosis evaluation and fracture prediction via DXA and the advent of generally safe and effective drugs, starting with oral bisphosphonates in 1995. We sought to examine the latest national trends in hip fracture rates.

SOCIAL NETWORK, INFORMATION SEEKING AND OLDER ASIAN IMMIGRANTS' FINANCIAL CAPABILITY

Y. Nam¹, J. Huang², E. Lee³, M. Sherraden⁴, 1. *University at Buffalo, State University of New York, Buffalo, New York*, 2. *Saint Louis University, Saint Louis, Missouri*, 3. *National Asian Pacific Center on Aging, Seattle, Washington*, 4. *University of Missouri–St. Louis, St. Louis, Missouri*

Introduction: Understanding the financial capability (i.e., knowledge and access to financial services) of older Asian immigrants in the U.S. is low. This study aims to identify facilitators and barriers of financial capability in older Asian immigrants over their lifetimes, an understudied area of research.

Method: We conducted semi-structured in-depth interviews in Cantonese, English, Korean, or Mandarin in 2016 with 13 low-income older Asian immigrants in an

employment program in Los Angeles. Qualitative data were analyzed to identify emerging themes and patterns.

Results: Analyses indicate that social network (kinship network and friendship) and information seeking are strongly associated with financial success. Social networks have both positive and negative aspects (“My husband co-signed his brother’s loan and we lost everything I had because he was bankrupt;” “[My house] is still underwater. It is under my name but my wife and everybody else is putting money in because I cannot pay.”). Banks rarely provide information unless interviewees ask specific questions; however, only a few do because they report they do not know what questions to ask. The few who ask questions are able to acquire helpful financial knowledge. (“I learned about a down payment assistance program on newspaper.... At the beginning, I could not understand the program at all... I went to the person in charge several times and asked questions over and over.”).

Conclusions: Results suggest financial institutions’ and community organizations’ active interventions to enhance older Asian immigrants’ financial capability.

SESSION 3665 (POSTER)**LIFE COURSE AND DEVELOPMENTAL CHANGE****CAN EDUCATION OVERCOME LIFE COURSE EFFECTS OF CHILDHOOD ADVERSITY IN THE UNITED STATES?**

S.B. Laditka, J.N. Laditka, *University of North Carolina at Charlotte, Charlotte, North Carolina*

Childhood experiences can affect health throughout life. More education may moderate the effects of adverse circumstances during childhood on health during adulthood. We examined associations of childhood adversity with life expectancy and the percentage of life with disability. We studied an index representing four indicators of childhood adversity for African American and white women and men: fair/poor childhood health, having a single parent, having a father with low education (\leq grade 8), or growing up in poverty, using data from the Panel Study of Income Dynamics (12 waves 1992–2013; ages 40+; $n=7,977$; 47,674 functional status and death transitions; 1,008 deaths). Multinomial logistic Markov models estimated monthly probabilities of disability in activities of daily living, and death, adjusted for age, sex, and race/ethnicity. Microsimulation used the probabilities to create large populations to identify outcomes, with bootstrap confidence intervals. We examined results separately for individuals with high (college graduate) and low (\leq grade 8) education. African American men from age 40 illustrate results (all $p<0.05$): with low education, those with no childhood risk factors lived 5.8 more years than those with all four. The percentage of remaining life with disability was 12.4% for those with no risks, 34.1% with all four risks. Parallel results for African American men with high education were 8.1 more years, 9.6% and 29.0%. Results were similar for women and white men. Childhood adversity may increase disability in later life and reduce life expectancy. Education may moderate the negative association of childhood adversity with disability and mortality.

THE PERSISTENT LEGACY OF CHILDHOOD ADVERSITY: EARLIER AND MORE DISABILITY, IMPAIRED ABILITY TO WORK

J.N. Laditka, S.B. Laditka, *University of North Carolina at Charlotte, Charlotte, North Carolina*

Adverse circumstances during childhood (“childhood adversity”) have been associated with poor adult health. We studied associations of an index representing nine types of childhood adversity with life course reports of difficulty working due to physical or nervous health conditions (“work disability”) using data from the Panel Study of Income Dynamics (PSID) and the 2014 PSID Childhood Retrospective Circumstances Study (1992–2013; $n=6,289$; 85,208 transitions). Reporting four or more adversities defined a high level. Multinomial logistic Markov models estimated annual probabilities of transitioning among levels of work disability (none, moderate, severe), adjusted for age, sex, race/ethnicity, and education. Using the probabilities we created large populations with microsimulation, measuring annual disability status for each individual, age 20 through death, with bootstrap standard errors. High adversity was associated with more disability at all ages (all results $p<0.05$), illustrated by African American women: at age 50 with high school education and no reported adversities, population rates of moderate and severe work disability were 4.5% and 5.5%, respectively, compared with 10.4% and 11.3% with high adversity. Childhood adversity was associated with first becoming work disabled at younger ages: 39.5 compared with 47.4 for moderate disability, 45.0 compared with 53.6 for severe. The disadvantage continued throughout life; at age 70, 19.3% of those with no reported adversity had severe work disability, compared with 30.6% with high adversity. Results for white women, and African American and white men, showed similar patterns. Childhood adversity may increase disability throughout adult life and substantially impair the ability to work.

PARENTAL EDUCATION, RESPONDENTS' EDUCATION, AND SELF-RATED HEALTH IN THE U.S. AND KOREA

J. Lyu⁴, S. Lee², K.J. Johnson³, 2. *University of Massachusetts Boston, Boston, Massachusetts*, 3. *Indiana University, Richmond, Indiana*, 4. *Institute of Aging, Hallym University, Chuncheon, Korea (the Republic of)*

Parental education is an important early-life socioeconomic indicator and may have an influence on health in later life. However, due to distinct cultural and social contexts, this association may be different for midlife and older adults in Western (U.S.) and Eastern (Korea) countries. The purpose of this cross-national study is to investigate the association between parental education and self-rated health (SRH) among American and Korean adults over 50. In addition, the respondent's own education is examined as a mediating factor in the association between both paternal and maternal education and respondent's SRH. The study sample is drawn from nationally representative data: the 2012 Health and Retirement Study (HRS) and the 2012 Korean Longitudinal Study of Ageing (KLoSA). The final sample consists of 14,435 HRS and 7,009 KLoSA respondents age 51 or older. Separate multivariate logistic regression models are used to examine the association between paternal and maternal education

and SRH. Regression results show that low paternal education is significantly associated with poor SRH, and this association is fully mediated by respondent's education in both countries. However, low maternal education is associated with poor SRH only among U.S. adults, and this association is partially mediated by respondent's education. The disparity found in maternal education may be due to the cultural differences in the patriarchy and the rate of change in gender expectations and economic development. The findings suggest existing similarities and differences in the relationship between parental education and SRH for midlife and older adults in the U.S. and Korea.

GENDER DIFFERENCES IN THE EFFECTS OF SOCIOECONOMIC STATUS AND LIFE TRANSITIONS ON DEPRESSION

H. Lee¹, S. Park², 1. *Social Welfare, Daegu University, Gyeongsan-si, Gyeongsangbuk-do, Korea (the Republic of)*, 2. *Washington University in St. Louis, Saint Louis, Missouri*

From a life-course perspective, changes in labor market participation and/or social networks in old age constitute critical transitions which may shape and be shaped by gender other socio-cultural forces. Research on socioeconomic disparity in depression in old age is well-established. However, much less is known about how major transitions and turning points affect SES disparity in depression, and whether the association may vary by gender. This study aims to examine the effects of socioeconomic status on different life course stages and changes in employment status and social relations on depression among older adults over time and differential association varies by gender.

Data came from ten waves of the Korean Welfare Panel Study (2006–2015). The sample was restricted to older individuals aged 51–55 years at baseline ($N=993$). Multi-group analysis using latent growth curve modeling was used.

Among older men, transitions in labor market status were significantly associated with depression, but SES in middle age has no effect. Among older women, changes in social relationships in middle age were significantly associated with later year depression over time, but transitions in labor market participation had no effects.

This study demonstrated (1) the life course pathways linking childhood SES, middle age, and old age affect later year depression overtime and vary by gender, (2) changes in employment status and social relations differentially affect older men and women's mental health. These findings provide important empirical information to develop gender-based clinical programs and policy development to decrease later year depression.

THE ROLE OF RECOLLECTED PAST LIFE SATISFACTION ON PSYCHOLOGICAL WELL-BEING: AGE DIFFERENCES IN JAPAN

J. Hong, S.T. Charles, *University of California, Irvine, Irvine, California*

The current study examined how the association between under or overestimation of past life satisfaction relates to well-being, and how this association varies by age. Participants from Survey of Midlife Development in Japan (MIDJA; $N=1027$) who ranged in age from 30 to 79 years-old completed two questionnaires, five years apart. They

rated their current life satisfaction at time 1. At time 2, they were asked to remember their level of life satisfaction five years ago. Psychological well-being was measured with composite measures of eudaimonic well-being. Across the sample, accurately remembering past life satisfaction was related to higher levels of well-being. Overestimating past life satisfaction (perceiving past life satisfaction as better than it actually was) was related to lower levels of well-being for younger adults compared to their more accurate responders, but unrelated to differences in psychological well-being among older adults. Conversely, underestimating past life satisfaction was related to lower levels of well-being for older adults, but to higher levels of well-being for younger adults. Findings are discussed in relation to the importance of past and future time perspectives on the well-being of different age groups.

FEELING BETTER . . . AT THIS AGE? INVESTIGATING EXPLANATIONS FOR HEALTH IMPROVEMENTS AMONG THE OLDEST-OLD

E. Vogelsang, *California State University-San Bernardino, CA, California*

Individuals in their 80s or 90s are generally not thought of as experiencing improving health, but a significant portion of this age group either (a) subjectively assess their health as having recently improved; or (b) demonstrate recent health improvements; when comparing consecutive health surveys. Although there have been a number of studies examining possible causes of health decline at older ages; the determinants of health improvements are much less understood. Using 21,155 observations from eight waves of the Asset and Health Dynamics survey (the oldest-old portion of the Health and Retirement Study), I test three hypotheses that may explain why oldest-old individuals report or demonstrate health improvements: (1) normalizing long-term health conditions, (2) recovery from recent negative health events, and (3) making positive lifestyle changes. I find that health improvements computed by comparing consecutive surveys were largely attributable to recovery from recent negative health diagnoses; while retrospectively reported health improvements were primarily associated with normalizing morbidity. I also find that taking up exercise was positively associated with health improvements, but stopping negative health behaviors (i.e., drinking and smoking) were not. These findings suggest some ways in which the interpretation and implications of health “improvements” may be unique for oldest-old adults, when compared to other age groups.

INDIVIDUAL AND SOCIAL RESOURCES TO COPE WITH HEALTH EVENTS IN MIDDLE AGE AND OLD AGE

S. Pin, 1. *University of Lausanne, Lausanne, Switzerland*,
2. *Institute of Social and Preventive Medicine, Lausanne, Switzerland*

Previous research showed that psychological strengths and social support are effective resources for coping with stressful life events in the aging. At the same time, a wide range of studies highlighted the increased frequency during ageing of health events. However, little is known about the adaptation process to such events. This paper aims to

examine the individual and social factors associated with self-rated health trajectories among middle-aged and older people victims of at least one health event.

Data came from the first four waves of the Survey of Health, Ageing and Retirement in Europe (SHARE). The sample included 2 371 people aged 50 to 95 and victims of at least health event (falls/fractures, cardiac events, hospitalizations or surgical interventions) at wave 2. Growth curve analyses were performed for examining the sociodemographic, behavioral (physical activity), psychosocial (mastery and optimism) and social (social participation, social support) predictors of self-rated health among victims.

The decline of self-rated health during the 8-years follow-up occurred more likely after a cardiac event or a hospitalization. Men more than women were more vulnerable. Optimism significantly improved self-rated health after a surgical intervention. Whatever the kind of health event, physical activity has a positive and independent effect on self-rated health.

These results highlighted the specificity of adaptation to health events in the middle age and old age. In the long-term, this gendered process seems more sensitive to behavioral strategies than to social resources.

WHAT EQUALITY? LIFE COURSE DIVERSITY AND INEQUALITY IN LATER LIFE IN CHANGING SWEDEN

A. Motel-Klingebiel, S. Kelfve, *National Institute for the Study of Ageing and Later Life, Department for Social and Welfare Studies, Linköping University, Norrköping, Sweden*

This paper discusses shifts in inequality over time in Sweden, which serves as a case example of a quickly changing welfare society. Its 60+ population of today faced the golden age of capitalism, prosperity and welfare but also crises, new uncertainties, erosions and shifts in social norms and organisation of labour. These changes add to life course inhomogeneity, generate asynchronies, and create winners and losers regarding life chances and inclusion. Transformations in life courses and social institutions exacerbate the cumulation of (dis)advantage and have crucial impacts on employment, retirement transitions and later life. Aspects like gender, cohort, education, ethnicity and others moderate these dynamics. Increasing disparities between societies give rise to migration and contribute in turn to differences within countries.

This study deals with changing population compositions, patterns and later-life consequences of life courses in Sweden focusing on inter- and intra-cohort disparities. By taking an international comparative perspective, Swedish trends are contrasted with those in other European societies. Based on extensive Swedish registry information and European survey data from EU-SILC, this study assesses changes in trajectories and distributions in a cohort-sequential perspective.

Results of this ongoing study find significant shifts in life course patterns that are fortified by variations in population compositions, with disadvantaged groups as forerunners in overall relative declines in later-life economic positions, and increasing intra-cohort inequalities corresponding with unexpected drawbacks for many as well as new possibilities for others.

SIX FACTORS TO TRIGGER COGNITIVE DEVELOPMENT ACROSS THE LIFESPAN: A NEW THEORETICAL FRAMEWORK

R. Wu¹, G. Rebok², F.V. Lin³, 1. *Psychology, UC Riverside, Riverside, California*, 2. *Johns Hopkins University, Baltimore, Maryland*, 3. *University of Rochester Medical Center, Rochester, New York*

We present a novel theoretical life course framework (CALLA – Cognitive Agility across the Lifespan via Learning and Attention) that uses research from cognitive development (with infants and children) to inform cognitive aging. This framework posits that an increase in cognitive abilities (e.g., memory, attention, inhibition) during infancy and childhood is partially an outcome of a specific type of learning approach, which may be triggered by 6 critical factors (e.g., open-minded learning, scaffolding, growth mindset). Our framework suggests that one cause of healthy age-related cognitive decline (besides known causes, such as neurodegeneration) may be a decrease in these 6 factors. We hypothesize that these factors remain important throughout adulthood and can mitigate age-related cognitive decline in healthy adults. Our framework differs from current dominant frameworks that argue that cognitive abilities are separate “modules” that can be isolated and trained. Infant and child development research suggests that an outcome of acquiring new skills and knowledge is the development of cognitive abilities. Future studies will determine whether this is also the case in aging adulthood. This framework pushes the limits of current estimates of neuroplasticity and cognitive functioning in aging adults. By providing learners with maximally supportive environments we can expand cognitive performance beyond currently known limits.

AGE DIFFERENCES IN AFFECTIVE AND BIOLOGICAL CORRELATES OF MOMENTARY SOLITUDE

T. Pauly¹, J.C. Lay¹, U. Nater², S.B. Scott³, C.A. Hoppmann¹, 1. *University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Philipps-Universität Marburg, Marburg, Germany*, 3. *Stony Brook University, Stony Brook, New York*

Spending time alone constitutes a ubiquitous part of our everyday lives. As we get older, alone time increases. However, not much is known about age differences in the experience of spending time alone (momentary solitude). We examined relationships between momentary solitude, affect quality, and two hypothalamic-pituitary-adrenal axis activity markers (salivary cortisol; dehydroepiandrosterone sulfate [DHEAs]) to better understand the affective and biological correlates of momentary solitude across the adult lifespan. For this purpose, 185 adults aged 20 to 81 years (M age = 49 years, 51% female, 74% Caucasian) completed questionnaires on momentary solitude (alone vs. not alone) and current affect on a handheld device and provided concurrent saliva samples up to seven times a day for 10 consecutive days. Multilevel model results showed that, compared to being with others, momentary solitude was concurrently associated with reduced high arousal positive affect, increased low arousal positive affect, and increased low arousal negative affect. Age by solitude interactions indicate that greater age was associated with increased high arousal positive affect and reduced low arousal negative affect during

momentary solitude. Furthermore, momentary solitude was associated with increased cortisol and DHEAs. With greater age, the association between momentary solitude and cortisol weakened and was not significant in adults aged 52 years and older. Findings suggest that momentary solitude can be a double-edged sword as evidenced by both positive and negative well-being implications. Importantly, greater age is linked to more favorable affective and biological correlates of momentary solitude.

SOCIOECONOMIC STATUS AND LONGITUDINAL AGING PATTERNS ACROSS DOMAINS

C. Zavala¹, C. Lundholm¹, C.A. Reynolds², N.L. Pedersen^{1,3}, 1. *Karolinska Institutet, Stockholm, Sweden*, 2. *University of California, Riverside, Riverside, California*, 3. *University of Southern California, Los Angeles, California*

Socioeconomic status (SES) is associated with individual differences in physical, emotional, and cognitive functioning across the lifespan. Additionally, self-reported financial strain is associated with these outcomes above and beyond commonly used SES indicators based on education and occupation. To further understand the association of SES with individual aging patterns across multiple domains, the current study considered longitudinal change for physical, emotional, and cognitive functioning. The sample included 857 individuals between 50 and 87 years of age at baseline assessment from a Swedish aging cohort. Individual growth curve estimates with up to 27 years follow-up were used as indicators in a latent class analysis. Meaningful classes distinguished individuals based on level of functioning and change across age among physical, emotional, and cognitive traits. Notable aging classes included one with high functioning coupled with low depressive symptom patterns and a class characterized by low functioning coupled with high depressive symptom patterns. Compared to the high functioning class, the low functioning class had accelerated declines on verbal ability before age 75 and slower declines on spatial reasoning and grip strength after age 75. The effect of level of education, socioeconomic index (SEI; based on highest household occupation), and a measure of financial strain on individuals' aging class membership was tested. Results indicate that a higher SEI and lower financial strain are associated with healthier, high functioning aging patterns across domains controlling for the effects of education. Socioeconomic factors may be acting as buffers against aging patterns characterized by low functioning in multiple domains.

EXPLORATORY SEARCH FOR HETEROGENEITY IN CHANGE ACROSS OLD AGE USING STRUCTURAL EQUATION MODEL TREES

R. Jacobucci, E.M. Zelinski, *University of Southern California, Los Angeles, California*

As previously examined using dynamic longitudinal models (Jacobucci, Grimm, & Zelinski, in preparation) to study the trajectory of both cognition and health in the Health and Retirement Study, change often takes on a nonlinear form. Studying change using structural equation models allows for individual differences in both intercepts and slopes, however, the assumption is made that the trajectory form is the same for everyone in the sample. Including demographic

variables as covariates only allows for the identification of mean differences, not allowing for the identification in different degrees of non-linearity of this change. To overcome this limitation, we used structural equation model trees (SEM Trees; Brandmaier et al., 2012) to identify heterogeneous subgroups that demonstrate discrepant trajectories of change in both health and cognition in older age.

We fit latent growth curve models to the mental status, total recall, and a composite health scale that was comprised of self-reported health and other indicator items of various health conditions. We searched for subgroups with SEM Trees using the covariates of years of education, race, Hispanic, and gender. Results for each of the scales included identifying different subgroups, with consistent groups comprised of splits on education (between 11 and 12 years of education), and between black and white race identification. Results include identification of subgroups, based on covariate main effects and interactions, that show delayed declines in cognition and health as well as subgroups that demonstrate highly non-linear changes in comparison to groups that are nearly linear in their decline.

SESSION 3670 (POSTER)

LONG-TERM CARE AND ASSISTED LIVING II

THE MEANING OF A VISUAL ARTS PROGRAM FOR OLDER ADULTS IN LONG-TERM CARE

L. Rodrigues^{1,2}, D. Sheets¹, A. Smith¹, J. Hemond², 1. *Social Dimensions of Health, University of Victoria, Victoria, British Columbia, Canada*, 2. *Island Health, Victoria, British Columbia, Canada*

This research explores the experiences of older adults participating in an innovative visual arts program at a long-term care facility in Victoria, British Columbia, Canada. The program offers participants an opportunity to explore their creativity and identity as artists. Conceptually, the study draws from Tornstam's gerotranscendence framework (Tornstam, 2005) and the theory of meaning (Frankl, 1963). A narrative inquiry approach was used with data collected through face-to-face interviews and observations of 10 residents and three staff involved in the visual arts program. Findings indicate that the program fostered a sense of community among participants and enhanced their quality of life. The public exhibition of their art work at a community-based art exhibit, validated the merit of their work and gave meaning and purpose to their participation in the program. Findings contribute to a greater understanding of the importance of arts programs that foster creativity in later life and resonate with Tornstam's (2005) argument that older people living in institutions can experience multiple dimensions of the self through individualized forms of expression. This study concludes by highlighting the need to increase access to arts programs for older people living in residential care.

COMPARISON OF PUREED AND REGULAR MENUS IN CANADIAN LONG-TERM CARE HOMES

V. Vucea¹, A.M. Duncan^{2,3}, L. Duizer^{2,3}, J. Morrison¹, H.H. Keller^{3,1}, 1. *University of Waterloo, Waterloo, Ontario, Canada*, 2. *University of Guelph, Guelph, Ontario, Canada*,

3. *Schlegel-University of Waterloo, Research Institute for Aging, Waterloo, Ontario, Canada*

Long term care (LTC) pureed menus are hypothesized to contain less nutritional quality as compared to regular texture menus due to processes required to modify textures. Making the Most of Mealtimes (M3) is a cross-sectional multi-site study that collected data in 32 LTC homes in four Canadian provinces (AB, MB, NB, ON). This secondary data analysis examined if the planned pureed menus were significantly different in energy, macronutrients, micronutrients, and fibre as compared to the regular texture menus. A nutrient analysis for the first week of the menu cycle was completed using ESHA Food Processor software, based on home recipes and portion sizes. Analysis of variance compared menus across and within provinces using the Dietary Reference Intake (DRI) standard for those 70+ years. Using the average across provinces, pureed menus offered a nonsignificant lower amount for the majority of nutrients as compared to the regular menu. However, there were significant province and diet texture interactions for energy, protein, carbohydrates, fibre, and 11 of 22 micronutrients analyzed ($p < 0.01$), with NB and AB having lower nutrient content for both menus. Fibre and nine micronutrients were below DRI recommendations for both menus across the provinces. Within each province, similar trends were observed; some homes had significantly lower nutrient content for pureed diets, while others did not. This study demonstrates the variability in menu planning in Canadian LTC and the need for improved menu planning protocols to ensure planned diets meet nutrient requirements regardless of texture. (Supported by Canadian Institutes of Health Research).

QUALITY ASSURANCE PERFORMANCE IMPROVEMENT COLLABORATIVES: A NOVEL APPROACH TO NURSING HOME QUALITY

E. Burton, K. Allen, L. Dubicki, E.W. Miller, *Center for Aging & Community, University of Indianapolis, Indianapolis, Indiana*

The Centers for Medicare and Medicaid introduced the Quality Assurance Performance Improvement (QAPI) program to improve quality of care and resident outcomes in nursing facilities, but is not currently used broadly or consistently. QAPI integrates tenets of the Quality Assurance, Performance Improvement, and Lean Six Sigma approaches to quality to create a data-based process for systems change. Under the direction of the Indiana State Department of Health, seven regional collaboratives were formed across Indiana as a pilot to implement the QAPI approach in their regions. Collaboratives included a leadership team and membership of at least 20 skilled nursing facilities and community and regional partners. The University of Indianapolis Center for Aging & Community provided training, technical assistance, guidance, and overall program management. Goals included building the collaborative, educating members on the QAPI process, and completing two Process Improvement Projects (PIPs) in each region. Project topics included reducing rates of UTIs, hospitalizations, pneumonia, falls, staffing retention, and inappropriate antipsychotic use. Improving staff retention, particularly for certified nursing assistants was also targeted. Collaborative leadership and members

were surveyed about their experiences and attitudes about the collaborative process.

Initial results show overall positive impact of the pilot program. Project one outcomes included reductions by 16% for pneumonia incidence, 29% for falls, 38% for hospitalizations, 40% (average) for UTIs. Savings of more than \$289,343 were identified in six months. Collaborative members reported improved utilization of the QAPI model and positive attitudes toward the collaborative approach. Discussion will include additional outcomes and implications for expansion of the pilot.

INFLUENCE OF ORGANIZATIONAL CONTEXT ON NURSING HOME RESIDENTS' SOCIAL ENGAGEMENT

S.A. Chamberlain, C. Berendonk, M. Hoben, C.A. Estabrooks, *Nursing, University of Alberta, Edmonton, Alberta, Canada*

Unregulated care providers (health care aides) provide the majority of hands-on care to nursing home residents. The work environment (organizational context) of these direct care providers is increasingly recognized as having an effect on resident outcomes (e.g., pressure ulcers, pain, social engagement). Social engagement is a crucial component of resident health as lower levels are associated with increased risk of depression and mortality. The purpose of this presentation is to examine how individual resident factors and modifiable elements of the organizational context (e.g. leadership, culture) influence the social engagement of residents. We used data collected in 91 Western Canadian nursing homes in the Translating Research in Elder Care (TREC) program of research: 4,056 health care aide surveys and 87,423 Resident Assessment Instrument-Minimum Data Set (RAI-MDS 2.0) records. Health care aide surveys provide information on staff demographics and organizational context. RAI data is routinely collected in the nursing homes and collects information such as resident characteristics, health conditions, and medications, to assist in care planning and monitoring quality of care. Using mixed-models we assessed the effect of resident, staff, and facility factors on residents' social engagement. We found that residents' cognitive impairment and sensory impairment were associated with reduced social engagement. Quality of organizational context and quality of staff work life were positively related to resident social engagement. Organizational context in nursing homes is modifiable. Understanding the effect of organizational context on resident social engagement helps to identify tangible features of nursing homes to improve resident health and quality of life.

UNDERSTANDING GLOBAL INFLUENCERS OF GENERIC DRUG USE AMONG OLDER ADULTS

J. Howard¹, I. Harris¹, G. Frank¹, Z. Kiptanui¹, J. Qian², R. Hansen², *1. IMPAQ International, Columbia, Maryland, 2. Auburn University, Auburn, Alabama*

With an increase in prescription drug spending and rising drug costs there is a need to encourage the use of generic prescription drugs. Generic drugs were responsible saving \$1.2 trillion in the United States over the past decade; Medicare realized over \$75 billion in savings in 2014. Generic drug use

accounts for >80% of the prescriptions filled in the United States, yet only 30% to 60% of prescriptions filled globally. To better understand economic, patient, practice and policy factors that influence generic drug use among older adults across the globe, a systematic review was conducted. Using key words to search across six databases, 141 articles were identified for review. Articles were included for review if they met the inclusion criteria; publication date after 2005, published as an empirical study, and relevance. Findings from the review show that several factors influence generic drug utilization among older adults in the US and internationally. Examples include federal and healthcare policies, promotional activities, such as by drug companies on the prescribing habits of hospital-based physicians, and physicians' and patients' perceptions. This presentation will expand on these and other findings related to factors that influence generic drug utilization among older adults. This presentation also will describe differences in approaches to encourage generic drug use among older adults in the US and internationally and how results from the systematic review may be utilized in the promotion of policies and practices targeting generic drug use among older adults to ultimately improve generic drug promotion among this population.

FACILITATING CONSUMER-DIRECTED DECISION MAKING IN LONG-TERM CARE: RESULTS FROM A CITIZENS' JURY

M. Cations^{2,1}, K. Laver², C. Whitehead², J. Ratcliffe², S. Kurrle³, W. Shulver², M. Crotty², *1. UNSW Australia, Sydney, South Australia, Australia, 2. Flinders University, Adelaide, South Australia, Australia, 3. University of Sydney, Sydney, South Australia, Australia*

People with dementia are increasingly vocal about their right to make decisions regarding their own care. Enabling informed choice is a challenge in long term care where many residents are in the later stages of dementia. Care facilities are bound by both financial and legal responsibilities and task-centred care can be rooted in staff culture. A Citizen's Jury is an emerging method of community engagement that solicits the judgement of lay-people on complex policy issues. The aim of this Citizen's Jury was to guide implementation of consumer directed care into long term care practice.

A group of 14 'jurors', unrelated members of the public, were upskilled in the concepts of residential care, cognitive impairment and informed decision making by a panel of experts. They were charged with making a judgement about (1) what day-to-day matters should be left to consumer choice; (2) who should be responsible for eliciting preferences, and; (3) what regulations should be in place to ensure choice is honoured.

Jurors were in favour of informed decision making in aged care but could acknowledge the barriers inherent to the current system. Jurors identified many aspects of day-to-day life that could and should be amended to consider resident preferences. They agreed that systems are needed to provide transparency and monitoring of consumer-directed care, and that existing bodies were well placed to provide these. Overall jurors believed that the onus of facilitating resident decision making rested with care facilities and that amendments to improve care flexibility were overdue.

MAKING THE TRANSITION FROM RESIDENTIAL LONG-TERM CARE (RLTC) BACK TO THE COMMUNITY

G. Puurveen¹, R. Kelly², 1. *School of Nursing, University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Fraserhealth Authority, Vancouver, British Columbia, Canada*

The objective of this research is to examine clinical (e.g., older adult's physical wellbeing) and system-level (e.g., use of community-based services) outcomes related to older adults' transition from RLTC back to the community. This study is a longitudinal design and uses data from the RAI MDS 2.0 from a cohort of older adults residing in RLTC in one health region in British Columbia, Canada.

The purpose of this presentation is to report findings on the application of an algorithm designed to identify older RLTC residents who might be candidates for a transition back to the community. The algorithm was evaluated on a cohort of older adults who had been discharged from RLTC (N=3,859) between the years 2010 and 2014. A small percentage of these residents (n = 102) had been transitioned back to the community, whereas non-transitioning residents (n = 3,757) either moved to another RLTC or died. Statistically significant differences were observed across several variables; compared to non-transitioners, transitioners were younger, had been in RLTC for shorter durations, and were more likely to express a preference to return to the community and to have a support person who was positive about the transition. An ROC analysis of the algorithm disclosed a significant area under the curve ($c = .767, p < .001$).

These findings suggest that a small portion of older adults could transition back to the community. This has important implications for the development of policies that ensure appropriate and accessible health services in the community.

SUPPORT RESIDENTS' WALKING IN SENIOR-LIVING FACILITIES THROUGH ENVIRONMENTAL DESIGN

Z. Wang¹, H. Cai², 1. *Henan University, Kaifeng, China*, 2. *University of Kansas, Lawrence, Missouri*

Background: Healthy living in senior-living facilities is an important focus for the residents, their families, and senior-living service providers. Appropriate physical activities such as walking benefit seniors' health and the built environment in facilities is one obvious mechanism for promoting physical activities. But we lack research on environmental factors significant to physical activities in senior-living facilities. Previous studies focused on the larger facility-level conditions, overlooking the detailed room-level characteristics, which may have a more direct impact on residents' physical activities.

Aim: Focusing on walking, this research investigates both facility-level and room-level correlates of residents' physical activities in senior-living facilities.

Methods: Data of independent and/or assisted-living facilities are collected in California and Missouri through GIS, surveys, and on-site observations. Survey questions and observation tools are adopted from previously validated research. Focusing on residents' daily walking, survey responses are collected from the residents and their care givers. Key attributes of environmental design are summarized and measured at the site, building, and room levels. Bivariate

tests and multivariate analyses are conducted to identify environmental factors significant to the frequency of walking and the duration per occurrence.

Findings: Confirming findings from previous research, expected environmental correlates of residents' walking in senior-living facilities include indoor sunshine, window view, indoor-outdoor connections, transitional areas, green areas, walking-route choices, and destinations for walking on the property. Findings are discussed through the eyes of designers and academic researchers working together to examine what it means to design for residents' walking in senior-living facilities.

INCREASING PREVALENCE OF ASSISTED LIVING AS A SUBSTITUTE FOR PRIVATE-PAY LONG-TERM NURSING CARE

B. Silver, K. Thomas, P. Gozalo, *Health Services, Policy, and Practice, Brown University School of Public Health, Providence, Rhode Island*

Over the past two decades, assisted living (AL) has rapidly emerged as a viable housing and long-term care (LTC) option for older Americans and in many cases, an alternative to nursing home (NH) care. Drawing on the standard economic model of long-term care decision-making, we theorize that with the introduction of AL in a market, individuals who can no longer live at home and otherwise would have entered a NH—particularly those less disabled and wealthier individuals—are more likely to enter AL. As such, we hypothesize that an increase in the local supply of AL will be associated with fewer private-pay resident days in NHs. Data come from a national list of U.S. AL communities in 2007 and 2014, NH survey data, and the Residential History File of NH residents. We estimated the relationship between county level capacity of AL beds and the number of private pay NH resident days using ordinary least squares with state and year fixed effects. Our results suggest that within each county, one additional ALF bed was associated with a reduction of 2.71 private pay NH days ($p < 0.001$). Our sensitivity analysis examining Florida counties, which identify private pay AL beds, showed that an increase in one private pay AL bed resulted in a reduction of 11.47 private pay NH days ($p < 0.001$). Our results indicate a significant relationship between private pay NH residence and increases in ALF capacity.

SPATIAL DISPARITY: THE STRATIFICATION OF FLORIDA'S ASSISTED LIVING FACILITY MARKET

J. Nazareno, B. Silver, K. Thomas, *Brown University, Providence, Rhode Island*

As states work toward rebalancing their long-term care (LTC) systems to provide services in non-institutional settings, it is important to understand the market for Assisted Living Facility (ALF) services. We obtained records of all licensed Florida ALFs for 2003–2014. We also obtained the socioeconomic and demographic information for each county from the U.S. Census Bureau and the median household income for each county from the Bureau of Labor Statistics. In our study we describe changes in Florida's ALF market during the observation period. We estimated changes in the prevalence of ALFs at the county-level and over time, by facility size, and compared this with changes in the demographic and

socioeconomic makeup of those counties. We also examined the relationship between facility-size and licensure types. Small, 6–12 bed ALFs were the most prevalent and exhibited greatest growth during 2003–2014. Smaller facilities operated in lower income, densely populated areas with a higher proportion of African American and Hispanic individuals. These facilities were more likely to be licensed to provide limited mental health (LMH) services, and had a significantly higher proportion of beds licensed for Optional State Supplementation (OSS) payment. Larger facilities (101+) tended to operate in higher income areas with the highest proportion of individuals over 65 and 85 years of age, and a smaller proportion of racial/ethnic minority populations. Our findings offer insight into the increasing segregation of care found within the ALF market in Florida.

A STUDY OF CHRONIC DISEASES' INFLUENCE ON ADL CAPABILITIES IN CHINESE OLDER ADULTS

H. Zhou, *Renmin University of China, Beijing, China*

This study examines the associations between chronic diseases and ADL capabilities with Chinese older adults. Data set was derived from a national sample of China Longitudinal Aging Social Survey 2014. Logistic regression was applied to analyze the relationships between the total score of ADL and chronic diseases condition (0=healthy, 1= have at least one chronic disease) while controlling for sociodemographic characteristics. Then, six logistic models were applied to examine the associations between five specific diseases and each daily life ability, respectively.

The study found that chronic disease condition in general is negatively associated with older people's ADL ability. Furthermore, different chronic diseases' impacts are differing with regard to clothe wearing, bathing, eating, toileting, bed transferring and indoor mobility. Among the five diseases, cerebrovascular disease and dementia have the greatest impacts on all abilities. These findings have important implications for practitioners and policy makers in terms of long-term care services.

THE DIFFERENCE BETWEEN IDEAL AND REALITY OF WORK PERCEIVED BY SOCIAL WORKERS AT NURSING HOMES

M. Shirasawa¹, H. Ishida², 1. J. F. Oberlin University, *Shibuya-ku, Tokyo, Japan*, 2. *Hiroshimaken Saiseikai Social Welfare Center, Age-gun, Hiroshima-ken, Japan*

The aim of this study is to clarify the ideal scope of work and the reality perceived by residential social workers working at nursing homes, and to identify the differences between the ideal and the reality by the social workers' attributes. A questionnaire survey was sent to 400 residential social workers by post on March 2014 and 107 valid responses were obtained. A factor analysis yielded eight factors for the ideal scope of work: 'operation management', 'rights advocate', 'admission support', 'care plan making', 'welfare education center related', 'everyday life support', 'assessment' and 'coordination with external organizations' tasks. For each factor, the difference between the reality and the ideal was t-tested by the attributes of the respondents. Significant differences were found by 'age', 'years of experience as a social worker' and 'educational qualifications' in the 'operation management' task, by 'educational qualification' in the

'rights advocate' task, by 'years of experience at current workplace' and 'years of experience as a social worker' in the 'admission support' task, and by 'doubling as the care manager' and 'years of experience as a social worker' in the 'care plan making' and 'assessment' tasks. The study revealed that the more years of experience the social worker had and the older they were, the closer they were to the ideal situation. It also clarifies that doubling as care manager facilitates the work in the residential social work area of tasks, since the assessments and making of care plans for residences are cited as their ideal tasks.

FACTORS ASSOCIATED WITH TURNOVER OF PERSONAL CARE AIDES IN RESIDENTIAL CARE FACILITIES IN THE U.S.

A.L. Temple, *Health Sciences, James Madison University, Harrisonburg, Virginia*

Turnover of personal care aides (PCAs) represents a major challenge to the provision of quality care in residential care facilities (RCFs). The purpose of this study was to explore the role of organizational and job characteristics in relation to turnover of PCAs. Using data derived from the 2010 National Survey of Residential Care Facilities (n = 2,170), weighted logistic regression analysis was used to examine organizational and job characteristics associated with facilities that reported turnover of PCAs. Results indicate that 64% of RCFs nationwide experienced PCA turnover. Among the organizational characteristics, smaller facility size, lower occupancy rate, and lower staffing levels of RNs and PCAs reduced the odds of turnover whereas for-profit ownership and shorter tenure of the administrator increased the odds of PCA turnover. Job characteristics including less than 75 hours of formal training and the availability of health insurance also increased the odds of facilities experiencing PCA turnover. These findings suggest that larger RCFs with higher nurse staffing levels, possibly reflecting a greater acuity of residents, are more likely to have turnover of PCAs. Results also highlight the importance of increased training and longer tenure of administrators as important factors related to PCA turnover. Given these differential findings compared to other long-term care settings, study implications include the need to tailor policy and practice interventions to recruit and retain PCAs in residential care.

ATTITUDES TOWARD OLDER ADULTS AND LONG-TERM CARE: INSURANCE AGENTS AND THE INSURED IN TAIWAN

T. Kuo¹, Y. Lin², A. Lai², 1. *Medical Sociology and Social Work, Chung Shan Medical University, Beverly Hills, California*, 2. *Hsiang Shang Culture and Education Foundation, Taichung City, Taiwan*

Background: Taiwan is becoming the fastest aging countries in the world and both public and private long-term care insurance are being discussed.

Purpose: The paper was to examine how private long-term care insurance agents and the insured view their long-term care needs and attitudes toward older adults.

Methodology: A survey was conducted in 2015 from 415 people participated in the survey consisted of questions on demographic characteristics, long-term care needs and views, and attitude toward older adults.

Results: The participants were mostly female (79.8%), middle-age of 45 to 64 years old (63.6%), married (70.5%), and with at least high school education (86.9%). While most participants had no caregiving experiences (60.5%), they were starting to prepare about long-term care by gathering information (80.6%). A correlation analysis revealed that long-term care preparation was positively related with education, monthly living expenses and with caregiving experiences.

Discussion and Conclusion: Those who started to prepare for long-term care were more educated, with higher living expenses and had prior caregiving experiences. Most participants thought older adults had excessive demands for love, had shabby home, and unable to change. Positive attitudes were the older adults were different from one another, preferred to work as long as they can, and neighborhoods were nice when integrated with the older adults. This paper suggests that people view attitudes toward older adults and preparation for long-term care may come with stereotypes or prior experiences.

A STUDY ON HUMAN RIGHTS BEHAVIOR OF KOREAN CARE WORKERS IN LONG-TERM CARE FACILITIES

M. Kim, *Ewha Womans University, Seoul, Korea (the Republic of)*

As the provision of long-term care policy takes root and with a gradual increase in elderly population, the use of elderly care service has become a growing norm. More than ever, there exists an urgent need for a paradigm shift in the building of an institutional basis for the improvement of care service, from the prevalent practice of 'need based service' toward the concept of 'human rights based service'. A great focus is being shed on care-workers, at the 'front line' of advocating human rights, as their human rights advocacy behaviour is seen as a key variable in providing high quality care service for elders. This study aims to examine how care-workers' individual human rights awareness levels, and the influence of their respective organizations, as an environmental factor, affect their human rights advocacy behaviour. The study includes a comprehensive analysis of the interactions between the regulatory effect of environmental factors (service orientation?) on an organizational level, human rights awareness (individual level) and the service environment (organizational). The analysis sample consisted of 782 registered non-profit corporation of long-term care facilities all over the country in 2014. The findings of the thesis suggest that human rights awareness at individual levels has a significant influence on human rights advocacy behavior. The interaction of human resources management in service orientations was also found to influence human rights advocacy on a significant level. Both human rights awareness at individual level and service orientations at organizational level were thus determined as key variables for improving the human rights awareness of care worker in long-term care facilities in Korea.

SESSION 3675 (POSTER)

LONG-TERM CARE: INSTITUTIONS AND IN-HOME SERVICES I

SUCCESSFUL IMPLEMENTATION OF CONSISTENT STAFF ASSIGNMENT IN LONG-TERM CARE SETTINGS

P. Brennan¹, S. Lemke², K. Schutte², S. SooHoo², *1. Institute for Health and Aging, University of California, San Francisco, San Francisco, California, 2. VA Palo Alto Health Care System, Palo Alto, California*

Consistent staff assignment is a cornerstone of culture transformation in long-term care settings. By minimizing the number of different staff who provide care during a resident's stay, consistent staff assignment promotes more resident-centered care and is thought to result in improved resident functioning and quality of life. This study assessed the extent and stability of consistent staff assignment in 199 of the 335 organizational units that comprise the Veterans Health Administration national network of nursing homes (called Community Living Centers or CLCs). A survey completed by staff schedulers in each of these CLC units retrospectively assessed levels of consistent staff assignment over a one-year period and unit characteristics that have been hypothesized to facilitate successful implementation of consistent staff assignment in long-term care settings. Over a one-year period, 38% of CLC units had stable high, 29% had stable low, and 33% had variable levels of consistent staff assignment. Characteristics that distinguished the units with stable high consistent staff assignment were use of fixed care teams and greater staff input for care assignments. Schedulers in these units reported more positive experiences linked with consistent staff assignment and better unit functioning in terms of staff absences, workload complaints, and scheduling problem resolution. Contrary to expectation, implementation of consistent staff assignment was not related to unit size, staffing level, or unit care specialization (e.g., dementia, geropsychiatric care). Findings from this study may be helpful to long-term care providers planning, or having difficulty sustaining, successful implementation of consistent staff assignment in their care settings.

VARIATIONS IN SERVICE USE PATTERNS BY JAPANESE IN HAWAII: RESULTS AND GLOBAL IMPLICATIONS

Y. Yamazaki¹, V. Yontz², C.T. Hayashida³, *1. Medical Education, Tokyo Medical University, Tokyo, Japan, 2. University of Hawaii at Manoa, Honolulu, Hawaii, 3. St. Francis Healthcare System of Hawaii, Honolulu, Hawaii*

It is easy to assume that most frail elders would have similar service utilization patterns based on disability levels regardless of ethnicity. Previous studies in Western Countries however have identified relations between ethnicity and certain types of eldercare service. This study attempts to duplicate this association and discuss its implications. This research question was tested in Hawaii which is a fast-aging, multi-ethnic state in the U.S. This study sought to substantiate variations in service utilization by investigating the use of a Personal Emergency Response System (PERS) service among elderly ethnic Japanese in Hawaii.

Questionnaires were mailed to 585 elderly subscribers of a company providing personal emergency response system services in Hawaii in 2014. Compared with non-Japanese elders, ethnic Japanese elders had a significantly higher propensity to use the personal emergency response system services, were older, used fewer prescribed medications, and were more likely to have these services paid for by family members or to pay themselves.

Japanese culture in Hawaii beyond the immigrant population has had an effect on increasing the use of PERS services. This result suggests that other ethnic groups may also have unique service utilization patterns for long-term care services. While it is not possible to fully predict what the ethnic preference for aging services will always be, it behooves professional healthcare workers and care managers to remain culturally sensitive and not just assume that what is needed is based on disability levels of their clients.

ALL TOGETHER NOW: MULTIPLE STAKEHOLDER INSIGHTS ON INTEGRATING QUALITY IMPROVEMENT IN A LARGE SYSTEM

C.W. Hartmann^{1,2}, L. Minor³, S.R. Terkildsen³, J. Barber³, M. Shaughnessy⁴, 1. *Center for Healthcare Organization and Implementation Research, Bedford VA Medical Center, Bedford, Massachusetts*, 2. *Boston University School of Public Health, Boston, Massachusetts*, 3. *Geriatrics and Extended Care Operations, Washington, District of Columbia*, 4. *Office of Geriatrics and Extended Care Policy, Washington, District of Columbia*

Change presents challenges and opportunities. How change happens determines success. Using evidence-based approaches can make quality improvement (QI) changes easier and more likely to achieve their full potential. How theoretically-grounded QI can be integrated into day-to-day CLC activities depends on the improvement project, the environment into which it is to be integrated, the mechanisms by which it is introduced, and how its implementation is facilitated. The Veterans Health Administration (VHA) is one of the largest healthcare providers in the U.S., with 135 nursing homes (called Community Living Centers—CLCs). Recent VHA QI initiatives in CLCs have been grounded in the “COM-B” model of behavior change. The COM-B model describes a cyclical process in which human behavior (B) is generated by three components—capability, motivation, and opportunity (COM)—which in turn affect behavior (B) in a cycle. We describe three specific QI projects grounded in COM-B: (a) VHA’s Central office leadership implementing a national CLC rollout of a quality dashboard, (b) health services researchers implementing a CLC QI project to improve CLC resident and staff interactions as part of a larger research study, and (c) CLC management and staff implementing unit-based QI programs focused on increasing CLC resident engagement in life. Each of these stakeholders will discuss the unique perspectives, challenges, and opportunities of their implementation experience, aligning them through the lens of the COM-B model and sharing successful, practical lessons applicable to nursing home frontline staff, mid-level management, and systems-level leadership.

ASSOCIATION BETWEEN HEALTH STATUS AND LONG-TERM CARE NEEDS: A COHORT STUDY OF JAPANESE ELDERLY

F. Kong¹, T. Hoshi², S. Li¹, L. Xu¹, B. Ai³, Z. Yan⁴, G. Ding¹, M. Si¹, 1. *Department of Social Medicine and Health Services Management, Shandong University, Jinan, Shandong, China*, 2. *Tokyo Metropolitan University, Tokyo, Japan*, 3. *Minzu University of China, Beijing, China*, 4. *CDC of Zibo City, Zibo, China*

Introduction: WHO defines health as a complete state of mental, physical and social wellbeing. However, there have been limited detailed evidences that objectively and systematically assessed the chronological relationships between these three health aspects and long-term care (LTC) needs. This study was conducted to explore such issue.

Method: Among the urban dwelling elderly aged 65 years and over, data were collected through self-reported questionnaire in 2001 and 2004 in Tokyo. Ultimately, 8,126 (3,851 men, 4,311 women) respondents were included in the analysis. Three health-related latent factors were identified by determinant factor analysis. A structural equation model (SEM) method was used to analyse the causal effect relationship between mental, physical, social health and LTC needs.

Results: By using determinant factor analysis, 3 factors, named ‘mental health’, ‘physical health’, ‘social health’, were defined as latent variables, respectively. The SEM analysis indicated significant direct but negative correlations between ‘physical health 2001’ and ‘LTC needs 2004’, which meant the three-year earlier physical health significantly affected on the current LTC needs (standardized direct coefficient=-0.73). In contrast, ‘mental health 2001’ and ‘social health 2001’ had little direct effects on ‘LTC needs 2004’ (0.04 and 0.05 respectively). Meanwhile, we also observed an indirect effects of ‘mental health 2001’ on ‘LTC needs 2004’ through ‘physical health 2001’ (standardized indirect coefficient=-0.35).

Conclusions: This study illustrates that the LTC needs is mainly confirmed by physical health, followed by mental and social health.

PERSON-CENTERED CARE (PCC) PRACTICES AND EATING ASSISTANCE IN CANADIAN LONG-TERM CARE FACILITIES

S. Wu¹, S. Slaughter², J. Morrison¹, H.H. Keller¹, 1. *Kinesiology, University of Waterloo, Waterloo, Ontario, Canada*, 2. *University of Alberta, Edmonton, Alberta, Canada*

Introduction: PCC can improve the mealtime experience for residents, yet practices specific to mealtimes are poorly understood. The Relational/Person-Centered Care in Dining checklist (RPCC) is a face valid and reliable instrument for assessing these interactions.

Objectives: It was hypothesized that residents who require eating assistance would receive fewer positive mealtime interactions and care practices than those who do not require assistance.

Methods: M3 is a cross-sectional study based in 32 long-term care homes across four Canadian provinces. Mealtime practices were observed by one of eight trained assessors for 637 randomly selected residents at three meals on non-consecutive days. Observation ratings were averaged across the three meals. An Edinburgh Feeding Evaluation in Dementia Questionnaire item determined if assistance was required (‘never/rarely’, ‘sometimes’, ‘often’). A summary score from RPCC was calculated based on the ratio of positive to negative mealtime specific interactions, with higher scores indicating more positive interactions. ANOVA determined if frequency of physical eating assistance a resident received was associated with the ratio of positive-to-negative RPCC interactions.

Results: Almost one-quarter (23%) of residents required some level of assistance (11% sometimes; 12% often). Frequency of eating assistance was negatively associated with the ratio of positive to negative mealtime interactions [$F(2, 632)=34.72, p<.001$; never/rarely=2.3, sometimes=1.6, often=1.5].

Conclusions: Residents requiring more physical eating assistance received fewer positive interactions with staff compared to those requiring no assistance. Further work will examine the independence of this association and if it influences food intake. (Funding from Canadian Institutes of Health Research)

INDIVIDUALIZED MUSIC FOR NURSING HOME RESIDENTS WITH DEMENTIA: A RESEARCH-CLINICAL COLLABORATION

N. Andrew, R. Smith, S. Meeks, *University of Louisville, Louisville, Kentucky*

This poster will describe a collaboration between nursing facility staff and university researchers to establish individualized music interventions to improve targeted behavioral outcomes for nursing home residents with dementia. We used single-case design to assess intervention effectiveness for each resident. We will present data from 4–5 patients to illustrate how this type of design can be used to inform intervention targeting. We used independent sample t-tests to compare mean percentages of observed affect and behaviors from the Philadelphia Geriatric Center Affect Rating Scale and a modified Passivity in Dementia Scale before and during the music intervention and with a control period of attention only. Preliminary analyses show that for one resident, the music intervention did not produce significant differences in affect or behavior, but for a second resident positive affect ($t(21) = -3.784, p = .001$) was significantly higher during the intervention, and negative affect ($t(19.674) = 2.595, p = .017$) and negative behaviors ($t(15.453) = 3.242, p = .005$) were significantly lower during the intervention. We illustrate how reports from these simple analyses can be used to inform nursing home staff about how to use individualized music with residents who will most benefit from the intervention.

HOW DO FAMILY MEMBERS DEAL WITH CONFLICT IN LONG-TERM CARE? APPLICATION OF CONFLICT THEORY

A. Petrovic, C.A. Konnert, *Psychology, University of Calgary, Calgary, Alberta, Canada*

Conflict between families and staff in long term care (LTC) is a daily reality that has adverse outcomes for residents, staff and families. However, to date it has not been empirically evaluated. Multiple barriers exist in examining conflict, including its sensitive nature, which may have precluded such study, as well as lack of theoretical integration. In order to examine family-staff conflict and its management in LTC, this study has merged two independent bodies of literature, that of family caregiving in LTC and organizational behaviour literature on conflict. This study presents the argument that two prominent theories from the conflict literature, namely the *theory of cooperation and competition* (Deutsch, 1973) and the *dual concern theory* (Pruitt & Rubin, 1986) can be applied in LTC. This mixed-methods study examined family-staff conflict and conflict

management in a sample of 107 family caregivers, with data showing preliminary support for the model. Results indicate that family caregivers engage in a variety of conflict resolution strategies to manage family-staff conflicts and indicate a significant role for trust, power and communication between family and staff on the frequency of conflict as well as use of cooperative and competitive conflict management. The implications of the conflict resolution strategies endorsed by family caregivers on key caregiver outcomes (i.e., family satisfaction with care and caregiver burden), theoretical fit, and evidence-based strategies for effective intervention in family-staff conflicts will be discussed.

THE FINAL WORD: CT MFP PARTICIPANTS' QUALITATIVE FEEDBACK ON PROGRAM EXPERIENCES

K.G. Kellett, K. Ligus, J.T. Robison, *UConn Health, Farmington, Connecticut*

The Money Follows the Person Rebalancing Demonstration (MFP) is a federal initiative to help states transition people needing long-term services and supports from institutional settings to the community in an effort to enhance individual preferences and rebalance Medicaid expenditures. This qualitative study explored Connecticut (CT) MFP consumers' post-transition experiences. Participants provided feedback about perceived effectiveness of the program and identified barriers to successful program implementation. Data were collected from 1,197 consumers who answered an open-ended question in the Quality of Life Survey conducted from 2008–2015 at baseline, 6, 12 and 24 months after transition. ATLAS.ti software was used to identify and organize themes. Findings show that while consumers appreciated the program and offered positive feedback, many also reported barriers and challenges. Of the 1,902 comments, the most frequently reported theme was lack of support for physiological needs, such as additional personal assistance and assistive technology (40%, n=764). The second most common theme was shortages in supplemental supports, such as housing, transportation and finances (25%, n=484). A third theme referred to social needs including choice and control, and social supports (18%, n=311). While MFP consumers generally report high quality of life, both in the CT program and nationally, this study suggests that some participants would benefit from more community services and supports to fully meet their needs. Findings have the potential to deepen stakeholders' understanding of consumer needs and facilitate planning to improve services and supports for older adults and people with disabilities living in the community.

NON-PHARMACOLOGICAL MANAGEMENT OF DISTRESS AMONG COMMUNITY LIVING CENTER RESIDENTS USING TECHNOLOGY

J. Sills¹, J. Mazzone¹, M. Atallah¹, J. Teraoka¹, O. Harris^{1,2},
1. *VA Palo Alto Health Care System, Palo Alto, California*,
2. *Stanford University, Stanford, California*

While non-pharmacological management of distress in long-term care facilities is of critical importance, traditional psychotherapy interventions pose challenges of scale. To bolster non-pharmacological management of acute distress among a geropsychiatric cohort of community living center residents, assistive technology services were added.

Traditional psychotherapy interventions including reminiscence, behavioral activation, and relaxation exercises were modified such that they could be delivered on a digital platform. A paired-samples t-test was conducted to compare resident's subjective distress ratings immediately before assistive technology intervention and subjective distress ratings immediately after assistive technology intervention. There was a significant difference in the mean scores for pre-assistive technology intervention ($M=4.09$, $SD=2.50$) and post assistive technology intervention ($M=2.29$, $SD=1.98$) conditions; $t(13)= 5.29$, $p = 0.000$. These results suggest that our assistive technology interventions have helped to provide residents with a corrective emotional experience and justify future programmatic development of such non-pharmacological interventions.

REGULATORY RELATIONSHIPS IN NURSING HOMES—US AND THEM, ME AND YOU, WE

E. Roddy¹, B. Dewar¹, J. Meyer², 1. *University of the West of Scotland, Hamilton, United Kingdom*, 2. *City University London, London, United Kingdom*

Effective collaboration between regulatory staff and those they inspect has been recognised as a key component in furthering the improvement agenda within nursing homes. This presentation will discuss a study which is using appreciative inquiry to bring together all those who participate in nursing home inspection (inspectors, inspection volunteers, care home managers and staff, residents and relatives), where the focus is on the shared capacity of all involved to enhance the experience of inspection. Drawing on relationship-centred care and complex responsive processes theoretical frameworks this study explores the relational processes at play in inspection with particular attention to those which help to build collaboration. Knowledge of these positive relational practices is used by the research participants to inform experimentation with new initiatives to develop these relationships further.

Principle methods used in this study are group discussions, interviews and observation of inspection visits. Representatives from each of the inspection stakeholder groups are involved in these data collection methods. A key principle within appreciative inquiry is that of 'inquiry as intervention', and so the coming together of the various stakeholders for group discussions has in itself an influence on relationships among the stakeholders.

Broad themes for enhancing relationships in the nursing home inspection setting include: Shared ownership of inspection process and outcomes and Shared humanness- deepening our understanding of each other's perspectives. The ways in which these themes can be brought to life in nursing homes will be outlined in this presentation.

RESIDENT CHOICE: NURSING HOME STAFF PERSPECTIVES ON CHALLENGES AND RESOLUTIONS

J. Palmer^{1,2}, V.A. Parker^{1,2}, D.R. Berlowitz^{1,2}, L. Snow^{3,4}, C.W. Hartmann^{1,2}, 1. *Bedford, MA VA Medical Center, Bedford, Massachusetts*, 2. *Boston University, Boston, Massachusetts*, 3. *Tuscaloosa, AL VA Medical Center, Tuscaloosa, Alabama*, 4. *University of Alabama, Tuscaloosa, Alabama*

Culture change implementation in nursing homes has made notable strides over the past two decades but faces remaining obstacles. Obstacles to a central component of culture change, resident choice in daily life, have been researched little internationally and even less in the U.S. This study explored U.S. nursing home staff members' perceptions of challenges to realizing resident choice in daily life and of possible resolutions to overcome these challenges. Semi-structured interviews were conducted at two purposively sampled Veterans Health Administration (VHA) Community Living Centers (i.e., nursing homes). Participants constituted twenty-six staff members, with positions varying in discipline and in hierarchical level. A modified grounded theory approach guided data analysis. Data analysis surfaced key challenges at the following three levels: intra-personal (e.g., resident personal characteristics, staff work demands), inter-personal (e.g., staff-resident power dynamics), and organizational (e.g., organizational policies). The most salient results were found at the staff intra-personal level; staff mental models of care often lacked clarity on how to promote resident choice when faced with challenges such as balancing the competing goals of resident choice and resident medical and safety needs. Findings also included staff-employed resolutions to resident choice-related challenges, i.e., preventive practices, staff and resident education, staff reinforcement, staff deliberation, stakeholder collaboration, and supportive leadership. This study pinpoints a comprehensive set of challenges and resolutions to challenges particular to nursing home staff promotion of resident choice. It offers specific and concrete insights on how this central component of culture change, and thus resident quality of life, can be advanced.

HOPE IN THE NURSING HOME: RELATION WITH QUALITY OF LIFE, FUNCTION, PAIN, SOCIAL SUPPORT, RELIGIOSITY

E. Marcus^{1,2}, A. Turchinsky², A. Naydich², P. Cohen-Goichman², E. Adler², 1. *Herzog Hospital, Jerusalem, Israel*, 2. *Hadassah-Hebrew University School of Nursing, Jerusalem, Israel*

Hope is an important factor influencing the quality and quantity of life in patients with chronic diseases. We aimed to assess the association between hope and quality of life, physical function, pain, social support, and religiosity among nursing home residents. Residents in four homes for the aged in Jerusalem were included in the study. IRB approval and informed consent were obtained. Level of hope was assessed by the Herth Hope Index (score range 12–48); quality of life by the WHO Quality of Life-BREF instrument (physical health, psychological, social relationships, and environment domains); physical function by the Barthel Index; pain by the Short Form McGill Pain Questionnaire; and social support by the Social Support Questionnaire for Transactions (SSQT) and Social Support Questionnaire for Satisfaction (SSQS). Residents defined their religiosity as secular, traditional, or religious. There were 100 participants (63 females, 37 males; mean age 80.9 years); 25 secular, 37 traditional, and 38 religious. The mean Herth Hope Index score was 33 ± 4 . Level of hope was correlated with the physical ($r=0.479$, $p<0.001$), psychological ($r=0.759$, $p<0.001$), social ($r=0.567$, $p<0.001$), and environment ($r=0.532$, $p<0.001$) domains of quality of life. Hope correlated positively with level of physical

function ($r=0.205$, $p=0.04$), inversely with pain intensity ($r=-0.215$, $p=0.032$), positively with social support ($p<0.001$) and positively with level of religiosity ($r=0.266$, $p=0.008$). In this population, higher quality of life and physical function, lower pain intensity, better social support, and greater religiosity were associated with higher levels of hope, emphasizing the importance of interventions to foster hope.

PREDICTORS OF FAMILY MEMBER INVOLVEMENT IN NURSING HOMES

A.R. Roberts^{1,4}, K.J. Ishler², K. Betts Adams³, 1. *Family Science & Social Work, Miami University, Oxford, Ohio*, 2. *Case Western Reserve University, Cleveland, Ohio*, 3. *Independent Gerontology Consultant, Farmington, Connecticut*, 4. *Scripps Gerontology Center, Oxford, Ohio*

Families often remain involved in the care of loved ones after nursing home (NH) placement. This study examines the predictors of three family involvement outcomes: visiting, providing direct care, and communicating with staff. The primary family contact of a census-proportionate, random sample of NH residents was surveyed in a 2012 biennial, state-mandated survey of family satisfaction with care. Multilevel models examined resident, family member, and facility predictors for each family involvement outcome ($N = 14,979$ individuals; 839 facilities).

Findings suggest that the perceptions family members have of the NH staff and living environment influence their involvement. Families visited less frequently and provided lower levels of personal care when they liked the facility overall, felt that residents looked well-groomed and cared for, received adequate medical information from staff, and viewed staff as friendly. On the other hand, increased frequency of visiting was associated with receiving adequate information at admission and the perceived availability of administration to talk, factors that also contributed to more communication with staff. In addition, family members communicated more with staff when they perceived the staff as friendly and residents appeared well-groomed and cared for. Other predictors of increased family involvement included family relationship (e.g., spouses), lower physical functioning of residents, expected short-term stay, and urban location. All findings were significant at $p<0.05$. Prior research has linked family involvement to resident quality of life and family satisfaction with care. These findings can inform interventions to promote increased meaningful family involvement in NHs.

EXPLORING STAFF PERCEPTIONS OF PEOPLE WITH DEMENTIA AT ADULT DAY SERVICES (ADS) IN TAIWAN

C. Liou, *Kent State University, North Canton, Ohio*

One important aspect of quality of care at long-term care services is staff-client relationships. Staff's perception of clients has huge impact on building relationships with their clients. Studies have shown that staff in nursing homes perceive dementia residents more negatively than positively, and that negative attitudes were associated with less strain and less satisfaction with the caregiving work (Brodsky, Draper, & Low, 2003; Norbergh, Helin, Dahl, Hellzen, & Asplund, 2006). Although there is a wide range of studies about attitudes towards people with dementia, few have been done

in ADS settings. This study aims to explore staff perception of their clients with dementia in five ADS centers in Taiwan through interviews and field observations. Fifty-four individual interviews were conducted at centers in 2011 and 2014 with nurse's aides, nurses, social workers, housekeepers, volunteers, bus drivers and centers' directors. The field observations consisted of 120 hours at each center for a total of 600 hours. The findings revealed two themes reflecting ADS staff's attitudes towards clients: (1) labeling the clients as "old" or "sick" to distance themselves from the clients and (2) viewing the clients as their aging relatives and over-helping them. Both attitudes not only affected staff-client relationships but also influenced how clients viewed themselves by inducing self-labeling of incompetent and dependent. More education training is needed for staff at ADS centers in Taiwan to change their attitudes and behavior toward clients with dementia. With a more positive attitude of people with dementia, the prerequisites for person-centered care will improve.

LOW-INCOME OLDER POPULATIONS OF CALIFORNIA AND TEXAS: GROWING CHALLENGES FOR STATE HEALTH POLICIES

J.L. Angel, R.J. Angel, S. Caldera, *LBJ School of Public Affairs, University of Texas at Austin, Austin, Texas*

States face serious challenges in financing long-term services and supports (LTSS) for growing populations of Medicaid-eligible older citizens. As in other areas of health and social support, a shift from fee-for-service to managed care financing holds great potential for controlling costs while providing program participants high quality care. In this study, we compare managed care community-based LTSS capitation models for dual-eligible older individuals in California and Texas. We compare the ways in which the two states employ two major federal Medicaid waivers, in addition to the Program of All Inclusive-Care of the Elderly (PACE), a federally mandated option within Medicare. While Texas has focused on the consolidation of most of its waiver programs into a single statewide capitated managed care program, California continues to experiment with a more diverse set of local programs. Results suggest that PACE may be the more cost-effective option in both states. However, our analysis suggests that low capitation rates may be stifling expansion of PACE in Texas. As with Texas, detailed analysis of capitation rates in California suggests that PACE may be less expensive option than institutional care for the frailest dual-eligible residents. A major question that arises relates to the extent to which local waiver experiments can be brought up to scale statewide, and whether California and other states will make the expansion of managed LTSS a priority in response to rapidly growing Medicaid expenditures.

PSYCHOSOCIAL PREDICTORS OF SURVIVAL IN TWO OLD AGE COHORTS

J. Despot Lucanin², D. Lucanin¹, 1. *Department of Health Psychology, University of Applied Health Sciences, Zagreb, Croatia*, 2. *Centre for Croatian Studies, University of Zagreb, Zagreb, Croatia*

Increased life expectancy seems to result in disability postponement and increase in care services needs at older age. Existing models of the psychosocial factors' associations

with health and survival in older adults show inconsistencies regarding the significance of these associations. Few of these models regarded the cohort effects, which may be important in the planning of care for old persons.

The aims of this research were to check the differences in survival and in psychosocial characteristics between two cohorts of older adults and to compare psychosocial predictors of survival in two different cohorts of retirement homes' residents.

Participants were two cohorts of old persons, older than 60 years, from Croatia. The cohort interviewed in 1994 consisted of 186 participants (144 women). The cohort interviewed in 2008 consisted of 277 participants (182 women). Both cohorts lived in retirement homes. The inclusion criterion for this research was reliable information on the participants being deceased in the meanwhile, by 2015.

Variables measured: Sociodemographic, self-rated health, functional ability, social support, depression.

Data were collected by specifically constructed questionnaire, administered individually in the form of structured interview, by the trained interviewer. Participants' survival was followed by 2015.

Significant gender differences in survival were found, with continuing trend of women surviving longer in both cohorts. Better self-rated health and functional ability were found in younger cohort. Combinations of multivariate analyses confirmed significant contribution of psychosocial variables to survival prediction.

Implications are in the planning and adjustment of psychosocial care for future cohorts of retirement homes' residents.

IT HAS GIVEN ME A NEW LIFE: PEER MENTORING IN RESIDENTIAL CARE

K. Theurer¹, S. Brown², B. Mortenson^{1,3}, M. Suto¹, R.I. Stone⁴, V. Timonen⁵, 1. *Rehabilitation Sciences, University of British Columbia, Toronto, Ontario, Canada*, 2. *Schlegel-UW Research Institute for Aging, Waterloo, Ontario, Canada*, 3. *GF Strong Rehabilitation Research Program, Vancouver, British Columbia, Canada*, 4. *LeadingAge Center for Applied Research, Washington, District of Columbia*, 5. *Trinity College Dublin, Dublin 2, Ireland*

Most residents within residential care lack a sense of purpose. This has been associated with loneliness and depression, which are wide-spread across long-term care, assisted and retirement living. There is evidence that individuals engaged in peer support groups experience significant benefits, but this type of program is rare within these settings. To address this gap we developed an innovative peer support program called the Java Mentorship Program, in which volunteers, family and residents (mentors) form a supportive team, receive education and provide mentorship and visitation in pairs to residents (visitees) that are lonely or socially isolated. We conducted a mixed-methods pre-post study to explore the outcomes of and participants' experiences with the introduction of this program in 10 residential care settings. Over a six-month period, qualitative data were collected using a combination of observations, individual interviews and staff focus groups and quantitative data were collected using standardized measures of sense of purpose, loneliness and depression. A total of 105 mentors, 86

visitees and 24 staff enrolled in this study. Qualitative analysis identified three themes: 1) "Mutually Beneficial" described how both mentors and visitees benefitted; 2) "Recruitment and Pairing Challenges" identified issues encountered by some staff; and, 3) "Transformative Team Meetings and Education" described the program's positive impact on staff, mentors, and visitees. Preliminary results are promising. The quantitative data analysis underway will also be presented. Positive results will support further experimental research to determine if this intervention is efficacious at decreasing depression and loneliness and enhancing purpose within residential care.

SESSION 3680 (POSTER)

LONGEVITY AND HEALTHSPAN

EFFECTS OF PHARMACOLOGICAL INHIBITION OF AGING-ASSOCIATED PATHWAYS OF DROSOPHILA LIFESPAN

A. Moskalev^{1,2,3}, M. Shaposhnikov², N. Zemskaya², K. Proshkina², K. Lashmanova¹, 1. *Medical physics, Moscow Institute of Physics and Technology, Syktyvkar, Russian Federation*, 2. *Institute of biology of RAS, Syktyvkar, Russian Federation*, 3. *Engelhardt Institute of Molecular Biology, Moscow, Russian Federation*

Mutations of the PI3K, TOR, iNOS, and NF- κ B genes increase lifespan of model organisms and reduce the risk of some aging-associated diseases. We studied the effects of inhibitors of PI3K (wortmannin), TOR (rapamycin), iNOS (1400W), NF- κ B (pyrrolidin dithiocarbamate and QNZ), and the combined effects of inhibitors: PI3K (wortmannin) and TOR (rapamycin), NF- κ B (pyrrolidin dithiocarbamates) and PI3K (wortmannin), NF- κ B (pyrrolidine dithiocarbamates) and TOR (rapamycin) on *Drosophila melanogaster* lifespan and quality of life (locomotor activity and fertility). Our data demonstrate that pharmacological inhibition of PI3K, TOR, NF- κ B, and iNOS increases lifespan of *Drosophila* without decreasing quality of life. The greatest lifespan expanding effect was achieved by a combination of rapamycin (5 μ M) and wortmannin (5 μ M) (by 23.4%). The treatment of *Drosophila melanogaster* with 10 non-steroidal anti-inflammatory drugs (NSAIDs: CAY10404, aspirin, APHS, SC-560, NS-398, SC-58125, valeroyl salicylate, trans-resveratrol, valdecoxib, licofelone) leads to extension of lifespan, delays age-dependent decline of locomotor activity and increases stress resistance. The lifespan extending effects of APHS, SC-58125, valeroyl salicylate, trans-resveratrol, valdecoxib, and licofelone were more pronounced in males, valdecoxib and aspirin - in females. We demonstrated that lifespan extension effect of NSAIDs was abolished in flies with defective genes involved in Pkh2-ypk1-lem3-tat2 pathway.

DECREASED CONSUMPTION OF SPECIFIC MACRONUTRIENTS PROMOTES METABOLIC HEALTH AND LONGEVITY

N. Cummings^{1,2}, A. Radcliff^{1,2}, E. Konon^{1,2}, E. Hebda^{1,2}, S.I. Arriola Apelo^{1,2}, M. Barnes^{1,2}, J. Wu^{1,2}, D. Lamming^{1,2}, 1. *Medicine, University of Wisconsin-Madison, Madison, Wisconsin*, 2. *William S. Middleton Memorial VA Hospital, Madison, Wisconsin*

Low protein, high carbohydrate diets can increase lifespan and improve metabolic health in both rodents and humans, but the specific aspects of a low protein diet that promote health and longevity have not been identified. Here, we demonstrate that a specific reduction in dietary branched chain amino acids (BCAAs) is sufficient to improve metabolic health, improving glucose tolerance and decreasing adiposity in both young and middle-aged mice, and promoting leanness and insulin sensitivity in mouse models of diet-induced obesity. Further, we find that diets with decreased protein or BCAA content can promote the longevity of progeroid mice. Reduced consumption of BCAAs does not induce the production of FGF21, a reputed endocrine signal of protein restriction and fasting, but does result in specific inhibition of the mechanistic Target Of Rapamycin Complex 1 (mTORC1). Our results suggest that a reduction in dietary branched chain amino acids promotes metabolic health and longevity, and may represent a highly translatable option for the treatment of diabetes and other age-related diseases.

METHIONINE RESTRICTION ALTERS HEPATIC MIRNAS INVOLVED IN METABOLISM IN YOUNG, OBESE, AND AGED MICE

M. Park, D. Cooke, J. Plummer, G. Ables, J.R. Hens, *Orentreich Foundation for the Advancement of Science (OFAS), Cold Spring, New York*

Age-associated disorders, such as Type II diabetes and nonalcoholic fatty liver disease, can be regulated by micro-RNAs. Dietary methionine restriction (MR) in young mice reduces adiposity and increases glucose sensitivity. The aim of this study was to determine whether previously identified miRNAs altered by MR in livers of young mice were similarly regulated in diet-induced obese (DIO) mice and aged mice. Young and aged male (8-week-old and 18-month-old, respectively) C57BL/6J mice were fed either a control (0.86% methionine; CF) or MR (0.12% methionine) diet; DIO mice (12-weeks-old; 40 grams) were fed a high-fat (60%) CF or MR diet for 12 weeks. MR repressed hepatic expression of several miRNAs (miR-455-5p, miR-33-5p, miR-99a-5p, and let-7g-5p) and increased the expression of mRNAs (Scarb1, Abcb11, Irs2, Insr, mTor, and Hadhb) that regulate the synthesis and transport of cholesterol, bile acids, fatty acids, and insulin in both young and DIO mice. However, in aged mice, miR-33-5p and miR-99a-5p, which regulate bile acid transport and mTOR signaling, respectively, were not affected by MR, while let-7g-5p, which regulates insulin signaling, was increased. MiR-455-5p, which can target Scarb1 and regulate cholesterol synthesis, remained repressed by MR. These findings suggest that the benefits of MR on liver function in young and DIO mice appear to be achieved through multiple mechanisms to attenuate a fatty liver condition, and that only some of these mechanisms are still effective in old mice.

3-HYDROXYANTHRANILIC ACID—A NOVEL MOLECULAR TARGET FOR LIFESPAN EXTENSION IN THE KYNURENINE PATHWAY

G.L. Sutphin, R. Korstanje, *The Jackson Laboratory, Bar Harbor, Maine*

Identifying novel genetic factors that can be targeted to beneficially influence longevity, healthspan, and age-associated disease is an ongoing area of focus in aging science.

In a recent study, we selected 82 *Caenorhabditis elegans* genes based on orthology to 125 human genes differentially expressed with age and conducted an RNAi lifespan screen. The clear outlier was *kynu-1*, encoding the kynurenine pathway enzyme kynureninase. RNAi knockdown of *kynu-1* extended lifespan by >20%. Kynurenine pathway gene expression and metabolite abundance is perturbed in individuals with a number of age-associated diseases, including neurodegenerative disease. Many intermediate kynurenine pathway metabolites have neuroactive or antioxidant properties, and pharmacological interventions targeting kynurenine pathway enzymes are being pursued for Huntington's disease in particular. In an expanded survey of the kynurenine pathway, we identified two additional genes for which knockdown results in a similar degree of lifespan extension to *kynu-1(RNAi)*—*haao-1* and *tdo-2*. Knockdown of *kynu-1*, *haao-1*, or *tdo-2* extended healthspan and delayed pathology in *C. elegans* models of Alzheimer's and Huntington's disease. Knockdown of *haao-1* alone achieved these benefits without impairing reproduction or development. HAAO-1 encodes the enzyme 3-hydroxyanthranilate 3,4-dioxygenase, which converts the metabolite 3-Hydroxyanthranilic Acid (3HAA) into 2-amino-3-carboxymuconate semialdehyde. Worms lacking *haao-1* have highly elevated 3HAA, which is thought to have both direct and indirect antioxidant properties. In ongoing work, we find that treatment of worms with 3HAA phenocopies reduced *haao-1* in the context of aging and neurodegenerative pathology in *C. elegans*, suggesting that it may represent a potent metabolic target for treating age-associated cognitive disease.

STRESS AND LONGEVITY PATHWAYS CONVERGE ON FMO-2

S. Leiser, *Molecular & Integrative Physiology, University of Michigan, Ann Arbor, Michigan*

Research in model organisms including *Caenorhabditis elegans* has led to the discovery of a number of genetic longevity pathways that are conserved in multiple organisms. Unfortunately, many or all of these pathways have pleiotropic effects including decreased fertility, developmental defects and other side effects undesirable for human translation. Our research focuses on identifying genes downstream of the transcriptional pathways that play important roles in the promotion of longevity with a goal of increasing lifespan with minimal side effects. Our recent data focusing on the effectors downstream of the hypoxic response led to a discovery that a single enzyme is both necessary and sufficient to improve stress resistance and longevity downstream of multiple stress response pathways. This protein, flavin-containing monooxygenase-2 (FMO-2), improves multiple measures of health in addition to longevity and is part of a well-conserved family of proteins. Our current studies focus on the molecular mechanisms, signaling pathways, and stress response programs that utilize FMO proteins in *C. elegans*, while testing similar hypotheses in mammalian systems. We also focus on developing small molecules (drugs) that may be useful in modifying the expression or activity of these proteins in humans. Our results suggest that FMOs are conserved modulators of metabolism, stress response and perhaps longevity in multiple organisms. We conclude that flavin-containing monooxygenases have evolved as

regulators of metabolism and stress response and that better understanding their molecular mechanisms will suggest ways in which they may be modulated to benefit health and longevity.

SERUM BIOMARKERS PREDICTING INSULIN RESISTANCE IN COMMUNITY-DWELLING OLDER ADULTS OF THE NUAGE STUDY

J. Matta², P. Gaudreau³, T. Fülöp⁴, I.J. Dionne⁴, D. Tessier⁴, B. Shatenstein³, H. Payette⁴, J.A. Morais¹, 1. *Medicine, McGill University, Montreal, Quebec, Canada*, 2. *Holy Spirit University, Beirut, Lebanon*, 3. *University of Montreal, Montreal, Quebec, Canada*, 4. *University of Sherbrooke, Sherbrooke, Quebec, Canada*

We aimed to identify predictors of insulin resistance in community-dwelling participants of the Quebec Longitudinal Study on Nutrition and Successful Aging (NuAge). A total of 288 subjects (75.3 ± 4 years) with complete datasets were identified as insulin-resistant (n=96) and insulin-sensitive (n=192) over a 3-year period by trajectory analyses of the HOMA-IR score. Biomarkers included adiponectin, leptin, C-reactive protein (CRP), tumor necrosis factor- α (TNF- α), interleukin-6 (IL-6), IL-10, triglycerides, HDL and LDL-cholesterol, total insulin-like growth factor-1 (IGF-1) and its binding protein-3 (IGFBP-3). Muscle mass index (MMI; kg/height in m²) and % body fat were derived from DXA or bioimpedance. Physical activity was assessed by the PASE questionnaire. Factors found to correlate with HOMA-IR score by simple regression were included in a logistic regression analysis to determine baseline variables that affected insulin status of participants over time. All analyses were stratified for age and sex and adjusted for number of chronic conditions, cigarette smoking and physical activity. Significant differences were observed between groups with regard to body composition, physical activity, leptin, CRP, triglycerides, HDL and LDL-cholesterol as well as TNF- α and IL-6. TNF- α [OR (95% CI): 1.12 (1.00–1.23)]; leptin [2.92 (1.29–6.64)] and adiponectin [OR (95% CI): 0.58 (0.35–0.95)] were significant independent predictors of insulin resistance. Conclusion: higher levels of TNF- α and leptin contribute to higher odds of insulin resistance with aging in both men and women. A negative association with adiponectin and insulin resistance was observed. These findings could serve to define interventions targeting these biomarkers to minimize the risk of developing insulin resistance.

INDY REDUCTION PRESERVES FLY HEALTH AND HOMEOSTASIS

B. Rogina¹, R.P. Rogers², J.K. Woods¹, M.S. Chung¹, 1. *Genetics & Genome Sciences, School of Medicine, University of Connecticut Health, Farmington, Connecticut*, 2. *Wentworth Institute of Technology, Boston, Massachusetts*

Indy (*I'm not dead yet*) encodes the fly homolog of a mammalian *mIndy* (SLC13A5) plasma membrane citrate transporter. Reduction of *Indy* gene activity in flies, or its homolog in worm extends longevity. Decreased expression of INDY in flies, worms, rats, and mice has beneficial effects on energy balance because the levels of cytoplasmic citrate play a central role in metabolism. INDY is predominantly expressed in the midgut, fat body and oenocytes, all tissues

with a key role in metabolism. Our first goal was to determine which tissue is the most important for INDY-mediated benefits. We used *Indy* RNAi-mediated silencing and tissue-specific Gene-switch drivers. We found that reduction of *Indy* mRNA levels in female fly gut and fat body increases stress resistance and longevity but not to extend found in original *Indy* flies suggesting synergistic contribution of each of the tissues. Down-regulation of the *Indy* gene in flies preserves intestinal stem cell homeostasis (ISC) and midgut integrity. ISC homeostasis is crucial for midgut homeostasis and contributes to health and longevity in a variety of species. The Insulin/Insulin-like signaling (IIS) is a key nutrient sensing pathway, which regulates growth, metabolism and longevity. *Indy* reduction is associated with decreased IIS activity as illustrated by decreased *dilps* levels in heads and thoraces of *Indy* flies. Our second goal was to examine the role of IIS in *Indy* mediated changes in ISC homeostasis and health. We found that at least some of INDY's beneficial effects on fly health are mediated by the IIS.

MITOCHONDRIAL DNA HETEROPLASMY LEADS TO AGE-RELATED FUNCTIONAL DECLINE AND INCREASED MORTALITY RISK

G.J. Tranah¹, S. Katzman², S.R. Cummings¹, 1. *California Pacific Medical Center, San Francisco, California*, 2. *LA Eye Center and Clinic, Los Angeles, California*

Mitochondrial DNA (mtDNA) heteroplasmy is a measure of relative levels of mutated and normal mtDNA molecules in a cell. High levels of heteroplasmy at specific mtDNA sites causes inherited mitochondrial diseases with neurological, sensory, metabolic, cardiovascular, and movement impairments. Here we test the hypothesis that elevated heteroplasmy levels at known disease causing sites are associated with impaired function resembling mild forms of mitochondrial disease.

We sequenced the entire mtDNA from blood and examined heteroplasmy at twenty disease-causing sites to identify associations with physical, cognitive, neurosensory, cardiovascular, and metabolic function, and 12 year mortality among 789 elderly participants from the community-based Health, Aging, and Body Composition Study.

Elevated mtDNA heteroplasmy at four mtDNA sites was associated with reduced cognition, vision, hearing, and mobility: m.10158T>C with MMSE score (p=0.009); m.11778G>A with contrast sensitivity (p=0.02); m.7445A>G with high frequency hearing (p=0.047); m.5703G>A with 400m walking speed (p=0.007). Elevated mtDNA m.3243A>G heteroplasmy exhibited pleiotropic effects and was associated with impaired strength, cognition, metabolic, and cardiovascular function: grip strength (p=0.027); DSST score (p=0.009); fasting insulin (p=0.006); pulse wave velocity (p=0.032). Increased total mortality risk (HR=1.25, 95%CI=1.01–1.56, p=0.046), including dementia-related (HR=1.96, 95%CI=1.11–3.44, p=0.02) and stroke-related (HR=2.43, 95%CI=1.00–5.97, p=0.05) mortality were observed for those in the highest tertile of m.3243A>G heteroplasmy (6–19%) when compared with the lowest tertile (0–4%).

These results indicate that increased mtDNA heteroplasmy is associated with impaired functioning and increased risk of mortality. We propose the novel use of mtDNA heteroplasmy

as a simple, non-invasive predictor of age-related physiological impairment and mortality.

CENTENARIANS TRANSCRIPTOME IS UNIQUE AND REVEALS A ROLE OF BCL-XL IN SUCCESSFUL AGING

C. Borrás, M. Ingles, C. Mas, J. Viña, *University of Valencia, Valencia, Spain*

Centenarians not only enjoy an extraordinary aging, but also show a compression of morbidity. We identified 1721 mRNAs differentially expressed by PMBCs from centenarians when compared with septuagenarians and young people. Sub-network analysis led us to identify Bcl-xL as an important gene up-regulated in centenarians. We found that centenarians display lower plasma cytochrome C levels, higher mitochondrial membrane potential and also less cellular damage accumulation. Immune function is significantly impaired in septuagenarians compared with young people whereas centenarians maintain it. To further ascertain the functional role of Bcl-xL in cellular aging, we found in transduced lymphocytes from septuagenarians with Bcl-xL a reduction in senescent-related markers. Finally, *C. elegans* bearing a gain of function mutation in the Bcl-xL ortholog *ced-9* showed a significant increase in mean and maximal life span. These results show that mRNA expression in centenarians is unique and reveals that Bcl-xL plays an important role in successful aging.

FEMALE SEX HORMONES ALTER THE METABOLIC IMPACT OF HEPATIC RICTOR DELETION

S.I. Arriola Apelo¹, C.P. Pumper¹, N. Cummings¹, A. Lin¹, E.L. Baar², D. Lamming¹, *1. University of Wisconsin-Madison, Madison, Wisconsin, 2. Northwestern University, Chicago, Illinois*

Rapamycin is an immunosuppressant and anticancer drug that extends lifespan in model organisms including mice, but side effects including metabolic disruption may limit its wide-scale use for diseases of aging. We have previously found that many side effects of rapamycin may be mediated by “off-target” disruption of the mechanistic target of rapamycin complex 2 (mTORC2), and that deletion of *Rictor*, an essential protein component of mTORC2, specifically in the liver results in hepatic insulin resistance, disrupted glucose homeostasis and decreased male, but not female, lifespan. Here, we investigated the interaction of sex hormones and hepatic mTORC2 with respect to metabolic health and lifespan. We gonadectomized pre-pubertal male and female mice in which *Rictor* is specifically deleted in the liver and their wild-type littermates. Ovariectomy impaired glucose and pyruvate tolerance, while castration had no effect on glucose homeostasis. Deletion of *Rictor* strongly impaired glucose and pyruvate tolerance in male mice, regardless of surgery treatment. Intriguingly, *Rictor* deletion impaired glucose and pyruvate tolerance in female mice undergoing sham surgery, but had no further effect on ovariectomized mice. These results suggest that female, but not male, sex hormones are required for mTORC2 modulation of hepatic insulin signaling and glucose homeostasis. We will also present the results of our ongoing lifespan study investigating the interaction of sex hormones and hepatic *Rictor* expression on longevity.

MATERNAL OBESITY PROGRAMS EARLY AGING OF MALE RAT OFFSPRING (F1) LIVER METABOLISM AND TRANSCRIPTOME

C. Lomas-Soria¹, C.J. Bautista¹, L.A. Reyes-Castro¹, C. Ibañez-Chavez¹, G.L. Rodríguez-González¹, L. Cox², P. Nathanielsz^{3,2}, E. Zambrano¹, *1. Instituto Nacional de Ciencias Médicas y Nutrición SZ, Mexico City, Mexico, 2. Texas Biomedical Research Institute, San Antonio, Texas, 3. University of Wyoming, Laramie, Wyoming*

Maternal obesity (MO) predisposes F1 offspring to chronic disorders including non-alcoholic fatty liver disease (NAFLD). With aging, the liver undergoes structural and functional changes associated with metabolic impairment. Mechanism(s) whereby MO and/or aging cause NAFLD are unknown. F0 female rats ate control (C) or obesogenic diet (MO) from weaning through lactation. After weaning F1 males ate C diet. At postnatal day (PND) 110 and 650 F1 serum and liver OS measures, liver histology, immunohistochemistry (IHC), and transcriptomics (RNA-seq) were evaluated. Data M ± SE. 110d MO F1 show impaired hepatic lipid function, increased NAFLD and OS markers; liver fat (C110, 2.7 ± 0.8; MO110 11.0 ± 0.7; C650 6.0 ± 0.9; MO650 29.0 ± 2.0 % area stained), lipoperoxidation (C110, 24.4 ± 3.4; MO110 36.1 ± 3.0; C650 35.9 ± 1.6; MO650 50.6 ± 2.2 nMol/mg protein). MO antioxidant enzymes decreased earlier than C F1, exacerbated in MO650 vs. C650. RNA-seq demonstrated differentially expressed genes (DEG) down regulated by age (C 110 vs C 650, 97%) and diet (C110 vs MO110, 95%). All five oxidative phosphorylation complexes showed decrease gene expression in MO F1 110d, e.g. mRNA *Nduf10* (C110, 6.2 ± 0.09; MO110 5.6 ± 0.12; C650 5.4 ± 0.30; MO650 5.52 ± 0.18 A.U.), also *SIRT-2* mRNA and protein (C110, 15.3 ± 1; MO110 9.8 ± 0.5; C650 12.1 ± 0.5; MO650 9.9 ± 0.5 % of area) were decreased to C650 levels indicating premature aging. We conclude MO programs metabolic dysfunction and down regulation of oxidative phosphorylation genes, especially complex 1 the major site of ROS production, leading to NAFLD accelerating metabolic dysfunction, predisposing F1 to premature aging.

MATERNAL PROTEIN RESTRICTION IN PREGNANCY ACCELERATES SPERM AGING IN RAT OFFSPRING (F1)

G.L. Rodríguez-González¹, L.A. Reyes-Castro¹, C. Vega¹, L. Boeck¹, C. Ibañez-Chavez¹, P. Nathanielsz^{2,3}, F. Larrea¹, E. Zambrano¹, *1. Instituto Nacional de Ciencias Médicas y Nutrición SZ, Mexico City, Mexico, 2. University of Wyoming, Laramie, Wyoming, 3. Southwest National Primate Research Center, San Antonio, Texas*

Maternal protein restriction (MPR) during pregnancy leads to premature male reproductive aging. Poor nutrition during development increases oxidative stress (OS), a mechanism implicated in male infertility and aging. We hypothesized MPR in pregnancy accelerates sperm aging and involves OS. Mothers ate control (C) (20% casein) or a restricted (R) (10% casein) isocaloric diet during pregnancy. After birth all rats ate C. At postnatal day (PND) 110, 450, and 850 male F1 were euthanized and epididymal tail and

vas deferens sperm obtained to measure: 1) reactive oxygen species ROS, 2) sperm concentration, viability and motility. Data $M \pm SEM$; two-way ANOVA analysis; $n=6$, $p<0.05$. At all ages ROS was higher in R vs C (110 PND C: 3 ± 0.2 , R: 9 ± 1 ; 450 PND C: 3 ± 0.1 , R: 7 ± 1 ; 850 PND C: 3 ± 0.1 , R: 7 ± 0.4 ; $p<0.05$) and sperm quality was reduced. In both groups, ROS did not change with age. Sperm concentration decreased at PND 450 with no further changes (110 PND C: 319 ± 9 , R: 271 ± 7 ; 450 PND C: 252 ± 16 , R: 216 ± 14 ; 850 PND C: 227 ± 13 , R: 190 ± 11 ; $p<0.05$). For both groups sperm viability decreased at PND 450, but in R sperm viability declined further by PND 850 (110 PND C: 87 ± 1 , R: 79 ± 2 ; 450 PND C: 77 ± 1 , R: 68 ± 1 ; 850 PND C: 78 ± 2 , R: 56 ± 4 ; $p<0.05$). MPR increases sperm ROS potentially playing an important role in sperm aging trajectory. The increase of sperm ROS of young adults may lead to the programming in F2 via the male germ line.

INTRAUTERINE GROWTH RESTRICTION (IUGR) ACCELERATES PRIMATE CARDIAC AGING: A FUNCTIONAL MRI STUDY

A. Kuo¹, H.F. Huber², C. Li², P. Nathanielsz², G. Clarke¹, 1. *Radiology, University of Texas Health Science Center at San Antonio, San Antonio, Texas*, 2. *University of Wyoming, Laramie, Wyoming*

Epidemiological studies show IUGR predisposes offspring to adult cardiovascular diseases. However, it is not known whether cardiac function is affected in young adulthood. Using cardiac MRI, we compare left ventricular systolic function among young adult baboons (YNG), age matched IUGR baboons (IUGR), and more elderly baboons (OLD).

From 0.16 gestation to end of lactation pregnant baboons were fed *ad lib* vs 70% *ad lib* diets that result in IUGR. Baboons studied were IUGR (N=16, 8M, 5.7yr), young controls (YNG, N=16, 8M, 5.6yr), and elderly baboons (OLD, N=12, 6M, 16yr). Cardiac MRI was performed to evaluate systolic function and cardiac motion to include steady-state free precession and tissue tagging sequences. Data analysis was performed with CMR42 Circle and Harmonic Phase Flow. Statistical analysis was done by ANOVA and non-linear curve fitting, significant deemed at $p < 0.05$.

Reduced left ventricular systolic ejection fraction was present in IUGR and OLD groups of both sexes (YNG $58 \pm 3\%$, IUGR $45 \pm 2\%$, OLD $50 \pm 3\%$, $p<0.05$). Altered midventricular and basal rotation was observed in male IUGR and OLD groups during the latter half of systole ($p < 0.05$). A similar trend of rotational alteration was seen in the apical segment in the male IUGR and OLD groups, NS. No significant difference in rotation is noted in the females.

Left ventricular function decline is seen in the IUGR group, similar to OLD, raising concern for accelerated aging phenotype with IUGR. Lack of significant rotational changes in the IUGR and OLD females suggests sex-divergent response to antenatal stress and aging.

PLEIOTROPIC EFFECTS OF GENETIC VARIANTS ON MAJOR HUMAN AGE-RELATED DISEASE TRAITS AND LIFESPAN

A. Kulminski, Y. Kernogitski, L. He, Y. Loika, K. Arbeev, S.V. Ukraintseva, A.I. Yashin, I. Culminkaya, *Duke University, Durham, North Carolina*

Biomedical research is traditionally focused on individual health conditions in order to postpone, ameliorate, or prevent the accumulation of morbidities in late life. An attractive idea in geroscience is to find factors, which could reduce burden of a major subset of diseases to efficiently extend health span. Genome-wide association studies raised enthusiasm for discovering genes influencing age-related disease traits and lifespan. The problem, however, is not straightforward due to the elusive role of evolution in these age-related phenotypes which implies a special type of genetic heterogeneity reflecting sensitivity of genetic associations to the life course of individuals in different environments. This elusive role can complicate discovering genetic predisposition to specific age-related phenotypes but can also facilitate discovering genes influencing seemingly unrelated ones. We examined pleiotropic genetic predisposition to major human age-related disease traits and lifespan in five large-scale studies (the Atherosclerosis Risk in Communities Study, the Framingham Heart Study, the Multi-Ethnic Study of Atherosclerosis, the Cardiovascular Health Study, and the Health and Retirement Study). These traits included biomarkers (lipids, blood pressure, blood glucose, body mass index, creatinine, lung function, hematocrit, C-reactive protein, heart rate), diseases (diseases of heart, Alzheimer disease, stroke, diabetes, cancer), and death. Our preliminary analyses highlighted 24 novel independent loci showing pleiotropic associations at genome-wide level. The analysis shows that the same loci were associated not only with causally-related age-related phenotypes but also with those which were seemingly unrelated. These findings suggest promising loci for disease-specific and systemic, age-related mechanisms of a major subset of age-related phenotypes.

INTERPLAY BETWEEN CIRCULATING NITRIC OXIDE (NOX) AND INTERLEUKIN-17 IN ELDERLY OUTPATIENTS

G.G. Avelar¹, W. MachadodaSilva¹, C. Moraes², J.A. Almeida², C. Cordova², O.T. Nobrega¹, 1. *Faculdade de Ceilândia, Universidade de Brasília, Taguatinga Sul, Brasília, Brazil*, 2. *Universidade Católica de Brasília, Brasília, Brazil*

Objective

This study investigated the possible association of clinical, biochemical and inflammatory variables of elderly patients with circulating levels of nitric oxide (NOx) as well as with genotypes of endothelial nitric oxide synthase (eNOS).

Method

Clinical (demographics, anthropometry, current and previous diseases, and lifestyle) and biochemical characteristics (lipemic, glycemic and hormonal profiles) were assessed from 168 geriatrics outpatients eligible for primary care for age-related disorders. Furthermore, total serum levels nitric oxide (NOx) and genotypes produced by the eNOS G894T polymorphism were determined. Circulating levels of 10 inflammatory mediators were measured. The Student's t test analyzed continuous variables across genotypes while the Spearman or the Pearson correlation tests analyzed categorical or continuous traits (respectively) according to serum NOx. $P < 0.005$ was the significance threshold following Bonferroni's convention.

Results

No association was found between the allelic variants of eNOS with any of the clinical or laboratory profiles, nor

did NOx associated with clinical or biochemical data. There was a negative correlation between plasma concentrations of NOx and levels of the immune mediator IL17.

Conclusion

Evidence for a positive correlation between circulating NOx and IL17 is already present in the literature. But the negative correlation observed herein diverges from investigations described so far, mostly conducted under inflammatory conditions. Our assumption is that, in non-inflammatory conditions, basal IL17 may not display positive modulatory properties on NOx, due to either a biphasic effect or no effect at all of IL17. Our results do not support functional properties of the classic genotypes studied herein.

SESSION 3685 (POSTER)

MENTAL HEALTH AND SUBJECTIVE WELL-BEING

THE ROLE OF RELIGIOSITY AS A PROTECTIVE FACTOR OF SUICIDE ATTEMPTS IN ELDERLY BRAZILIANS

S. Mesquita de Oliveira Teixeira², L. Maia², L. Cunha de Souza², L.F. Araujo¹, F. Cavalcante¹, A. Sousa Cavalcante³, 1. *PSYCHOLOGY, UNIVERSIDADE FEDERAL DO PIAUÍ, PARNAIBA, PIAUI, Brazil*, 2. *Universidade de Fortaleza - UNIFOR, Fortaleza, Brazil*, 3. *Universidade Estadual do Piauí, Teresina, Piauí, Brazil*

Religion appears to bolster the subject in your search for meaning, assuming the function of giving meaning to human life, through the spread of convictions that are on the path toward meeting this sense to exist. This study aims to understand how religion can contribute to curb suicide attempts in elderly people. This work explores a multicentric research part entitled study on suicide attempts in the elderly from the perspective of public health, held from 2012 to 2015 with the support of the Conselho Nacional de Desenvolvimento Científico e Tecnológico (CNPq). This study was approved by the Research Ethics Committee of the National School of public health (ENSP) of Fundação Oswaldo Cruz (FIOCRUZ). 57 interviews were analyzed with seniors who tried suicide in the five Brazilian regions. The instruments are: personal and social identification form of the elderly; semi-structured interview. For analysis, we use the method-hermeneutical dialectic. The results showed that religion exerts an integrative function, promoting the construction of a path enabler for that subject encounter a significant universe and feel part of society. Such protective function didn't report pegged only to the fact of being associated with any institution of religious slant, but the role that religion has played, and to directions that assigned to the life of the respondents. It was noted that religious practices linked to careful with the inner life and the meeting with directions for maintenance of life can collaborate on the prevention of suicide.

CAREGIVER STRESSORS AND DEPRESSIVE SYMPTOMS AMONG OLDER HUSBANDS AND WIVES IN THE UNITED STATES

M. Kim¹, R.E. Dunkle¹, A.J. Lehning², H. Shen³, S. Feld¹, A. Perone¹, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *University of Maryland, Baltimore, Maryland*, 3. *University of Missouri- St. Louis, St. Louis, Missouri*

Framed by Pearlin's Stress Process Model, this study prospectively examined the effects of three primary stress factors reflecting the duration, amount, and type of care (ADL, IADL, both) on the depressive symptoms of spousal caregivers over a two-year period. This study also measured whether the effects of these stressors differ between husbands and wives. We analyzed data from the 2004 and 2006 waves of the Health and Retirement Study, a nationally-representative sample of adults ages 50 and over in the U.S. The analytic sample included 774 community-dwelling respondents who were married/partnered and providing help to their spouses for Activities of Daily Living (ADLs) and/or Instrumental Activities of Daily Living (IADLs). We used multivariate regression models to examine the direct effects of primary stressors on depressive symptoms among the total sample and for husbands and wives. We found that none of the primary stressors were associated with depressive symptoms within the total sample. However, when examining these issues for husbands and wives, wives providing only personal care (ADLs) had significantly more depressive symptoms than wives providing only instrumental care, while husbands providing different types of care showed no significant differences in depressive symptoms. We conclude that wife caregivers' increased vulnerability to depressive symptoms when providing personal care may reflect different gender roles in caregiving. Future studies that directly address couples' relational dynamics and gendered experiences in personal care, including emotion work, may further illuminate strategies for reducing depressive symptoms experienced by wife caregivers engaged in personal care assistance.

THE EFFECTS OF PHYSICAL LIMIT AND NEIGHBORHOOD COMPOSITION ON DEPRESSIVE SYMPTOMS IN LATER LIFE

S. Joo, H. Jun, C. Bomi, *Dept. of Child and Family Studies, Yonsei, Seoul, Korea (the Republic of)*

As people age, they are more likely to have physical and functional limitations, so that the influence of the living area become greater in later life. Therefore, the present study examined the interaction effects between activities of daily living (ADL) and the rate of a low income household on depressive symptoms. Data from the Korean Longitudinal Study of Aging in 2012 and Household Data from the Department of Statistics in Korea in 2012 were used. The sample was 2,386 individuals over 65-years-old. Data was analyzed by using hierarchical linear multivariate (multilevel) analysis. Results showed that ICC was 2.75. This means that the variance of the neighborhood accounted for the 2.75% of total variance of depressive symptoms. The interaction effect between ADL and the rate of a low income household was significant. The influence of ADL was smaller in regions where the rate of low income households was higher than in regions where the rate was lower. In addition, the main effect of ADL on depressive symptoms was significant but the main effect of the rate of a low income household was not. These results highlight that the effects of ADL on depressive symptoms may differ depending on neighborhood composition. They imply there are contextual aspects embedded in depressive symptoms beyond individual characteristics. Implications and directions for future research are discussed.

STRESSFUL LIFE-EVENTS AND COPING STRATEGIES IN OLD AGE: A COMPARISON BETWEEN SPAIN AND PUERTO RICO

L. Rubio¹, H.A. Vera², C.G. Dumitrache³, I. Rosario², 1. *University of Jaen, Jaen, Spain*, 2. *Pontificia Universidad Católica de Puerto Rico, Ponce, Puerto Rico*, 3. *University of Granada, Granada, Spain*

The aim of this study was to analyze life-events that elderly Spanish and Porto Rican adults consider stressful and the coping strategies they use to face them. The Spanish sample comprised 243 people, 33.3% men and 66.7% women. The Porto Rican sample comprised 195 people, 32.3% men and 67.7% women. The CSI Coping Strategies Inventory was used and MANOVAS analyses were carried out to test the interaction between cultural context, gender and stressful situation. It was found that 44.9 % of the Spanish sample and 43.1% of the Porto Rican sample mentioned health problems or the death of loved ones as their most stressful event. Meanwhile, for 35.8% of the Spanish participants and for 25.1% of the Porto Rican participants family conflicts constituted their main stressful circumstance. For 19.3% of the Spanish sample and for 31.7% of the Porto Rican sample other problems were cited as the most stressful event. The most frequently used coping strategy among Porto Rican older adults was problem solving, while Spanish older adults used wishful thinking most frequently. The MANOVA analysis showed a main effect of gender, stressful life-events and cultural context on the type of coping strategy used by participants. Similarly, an interaction effect was found between stressful life-events and cultural context. No interaction of gender and cultural setting was found. Therefore, the way in which different stressful life-events are coped with might be influenced by cultural aspects, meanwhile women and men from different cultural settings use similar strategies to face stressful situations.

ASSOCIATION BETWEEN MENTAL HEALTH AND PHYSICAL, COGNITIVE, SOCIAL FACTORS IN ELDERLY

H. Inagaki¹, M. Sugiyama¹, C. Ura¹, F. Miyamae¹, A. Edahiro¹, K. Motokawa¹, H. Murayama², S. Awata¹, 1. *Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan*, 2. *Institute of Gerontology the University of Tokyo, Bunkyo-ku, Tokyo, Japan*

Purpose: In Japan, which will become to super-aged society in nearly future, it is very important to maintain or improve mental health in elderly. We examined the association between subjective mental health and physical, cognitive, social and economic factors of community-dwelling elderly, using large mail-survey data in Tokyo urban area.

Methods: We mailed a self-administered questionnaire to 132,005 subjects aged 65 years or older living in urban area of Tokyo in a community-based, cross-sectional study, and collected 78,917 responses (59.8%). Mental health was assessed using the Simplified WHO-5 Japanese version (S-WHO-5-J). It is consisted of 5 items with four-level Likert scale, and score-range is 0–15. Furthermore, we measured demographics (sex, age, person living together, education), physical factors (self-rated health, motor function, diseases (cerebral stroke, cardiac disease, diabetes, cancer)), cognitive factors (subjective memory complaints, self-administered

dementia checklist), basic ADL and I-ADL, social factors (social support, direct interaction to others, social activities, frequency of going-out), and self-rated economic conditions in now and their childhood.

Results: Correlations (Pearson) between S-WHO-5-J and other all variables were significant ($p < 0.001$). Multiple regression analysis showed S-WHO-5-J significantly associated with all variables except a cancer; especially, standard partial regression coefficients of self-rated health ($\beta = -0.211$), self-administered dementia checklist (-0.167), and social support (-0.131) were greater than other variables relatively.

Conclusion: Among the relevant factors of mental health, physical health, cognitive function, and social support were associated with mental health strongly. This result is similar to the previous studies conducted in other regions, were considered to be highly reproducible results.

THE ROLE OF EDUCATION AND RESILIENCE IN MENTAL HEALTH TRAJECTORIES OF AGING VETERANS

S. Urena, M.G. Taylor, D. Carr, *Sociology, Florida State University, Tallahassee, Florida*

Military veterans face negative and positive exposures uniquely related to service, including trauma from combat, increased educational opportunities and resilience from service experience. The literature provides mixed findings on whether veterans have better or worse mental well-being in later life compared to civilians, partially because these exposures are often unmeasured. Increased education and resilience among veterans are theorized to be unique pathways through which military service benefits long term well-being, but little empirical work addresses these mechanisms. We examine the roles education and resilience play in mental health among aging U.S. veterans, controlling for early life and service related exposures while accounting for selection into service. Using the Health and Retirement Survey (HRS) 2013 Veterans Mail Survey and a matched civilian comparison sample, we examine depressive symptom trajectories of older veterans and civilians. First, we find significantly higher levels of education, resilience, and well-being among older veterans compared to civilians, net of early life and service related exposures. We find that education and resilience independently mediate a substantial portion of increased well-being among veterans. The relevance of these findings for veterans and nonveterans in both early and late older adulthood will be discussed, along with implications for more recent cohorts.

SOCIOECONOMIC AND SOCIOBEHAVIOURAL INFLUENCES ON RESILIENCE AND VULNERABILITY

T.D. Cosco^{1,2}, M. Stafford¹, D. Kuh¹, R. Cooper¹, 1. *MRC Unit for Lifelong Health and Ageing, London, United Kingdom*, 2. *University of Oxford, Oxford, United Kingdom*

When presented with challenges that accompany ageing, such as reduced physical capability, some individuals respond more positively than others, maintaining higher levels of wellbeing than expected, i.e. they are resilient. Although socioeconomic advantage is positively associated with individual (internal) and external resources that promote resilience in some contexts, the relationship between

socioeconomic position (SEP) and resilience as defined above is not known. We sought to examine the relationships of SEP, assessed by participants' occupational class, and sociobehavioral factors with mental wellbeing for a given physical capability. Participant data at age 60–64 came from the MRC National Survey of Health and Development, a nationally representative British birth cohort study ($n=1756$). Resilience was operationalised as having a greater than expected level of wellbeing, captured by the Warwick-Edinburgh Mental Well-being Scale (WEMWBS), for a given level of performance-based physical capability, assessed using grip strength, chair rise, standing balance, and timed-up-and-go tests. The degree of resilience or vulnerability was quantified as the difference between observed and expected WEMWBS scores, i.e. residual values, for physical capability using linear regression; positive residual scores indicated resilience and negative residual scores indicated vulnerability. The relationship between SEP, physical activity and social support, and the resilience-vulnerability score was examined in sex-adjusted linear regression models. Individuals with higher occupational class, physical activity and social support had higher scores on the resilience-vulnerability scale. These relationships need to be considered when identifying targets for interventions promoting wellbeing in populations experiencing age-related functional decline.

PSYCHO-SOCIAL MODERATORS OF THE COUPLING OF STRESS AND NEGATIVE AFFECT: A MICRO-LONGITUDINAL STUDY

V. Allen, T. Windsor, *Flinders University, Bedford Park, South Australia, Australia*

Socio-emotional theories suggest that with age, hedonic goals are increasingly prioritised, with changes in social motivation and emotion regulation (ER) strategies proposed as mechanisms facilitating pursuit of such goals. Supportive relationships and ER strategies such as reappraisal are thought to buffer against the negative affective consequences of stress. Personality traits such as neuroticism and extraversion also affect stress and negative affect. Few studies have used intensive longitudinal data to examine the role of psycho-social variables as moderators of associations of stress and negative affect and how these relationships differ with age. To bridge this gap in existing research, a micro-longitudinal design was employed in which 38 younger (aged 17–28) and 44 older (aged 62 and over) adults completed measures of personality, positive and negative social exchanges, and habitual ER (i.e., reappraisal and suppression) at baseline assessment, and measures concerned with daily experiences of stress and negative affect over 20 consecutive days. Analysis of between-person associations indicated that those with higher levels of reappraisal and positive social exchanges showed a weaker association between levels of stress exposure and negative affect. Higher extraversion buffered the association of stress and negative affect, while higher levels of neuroticism and more frequent negative social exchanges amplified between-person stress-negative affect associations among older adults. Higher reappraisal and lower neuroticism were each associated with reduced reactivity to stress at the within-person level for older adults. The results highlight age differences in the significance of psycho-social resources for protecting against deleterious effects of daily stress exposure.

EXPERIENCED SUBJECTIVE WELL-BEING DURING LEISURE-TIME ACTIVITIES AMONG OLDER ADULTS

T. Yamashita¹, A.R. Bardo², D. Liu¹, 1. *University of Nevada, Las Vegas, Las Vegas, Nevada*, 2. *Duke University, Durham, North Carolina*

Understanding how older adults instantly evaluate their leisure time activities is critical to enhance quality of life. However, such experienced subjective well-being (SWB) during specific leisure time activities in later life is certainly understudied. The purpose of this study was to examine older adults' SWB during active (e.g., physical activities) and inactive (e.g., watching TV, doing nothing) leisure time activities. Data were obtained from the 2012 and 2013 American Time Use Survey Well-being Module (ATUS-WB). ATUS-WB assessed experienced SWB (i.e., happiness and meaningfulness) during specific activities over a 24-hour period among a nationally representative sample of American adults. SWB indicators were recorded using a 7-point Likert scale with the higher value indicating more positive SWB. Propensity score matching, which adjusted for demographic, socioeconomic, and health characteristics, was used to create matched samples of adults aged 60 years and older by active and inactive leisure time activities. The matched samples ($n = 282$ in each group) were equivalent in all characteristics. Subsequently, a series of independent t-tests were used to examine group differences in SWB. Results showed that older adults who engaged in active leisure time activities experienced significantly greater happiness (mean = 5.93; $t = 4.53$, $p < 0.001$) and meaningfulness (mean = 6.24; $t = 8.80$; $p < 0.001$) than those who engaged in inactive leisure time activities (means = 5.31, and 5.00, respectively). Given the identified positive association between active leisure time activities and SWB, suggestions for leisure time use in later life and policy implications were evaluated.

URBAN-RURAL DIFFERENCES IN SOCIAL CAPITAL IN RELATION TO SUBJECTIVE WELL-BEING IN OLDER RESIDENTS

K. Zawisza, B. Tobiasz-Adamczyk, *Jagiellonian University Medical College, Krakow, Poland*

The aim of the study was to assess the differences between rural and urban areas as regards the role of social capital and its effect on self-rated health and subjective well-being among older people in Poland.

The cross-sectional study the *COURAGE in Europe* conducted in 2009–2012. The sample was selected on the basis of multi-stage clustered design from the non-institutionalized adult population. The analysis was based on 1299 of older people aged 65 and over from general Polish population.

As an indicator of social capital the *COURAGE* Social Network Index, the OSLO-3 Social Support Scale, the three item UCLA Loneliness scale were used as well as social participation and trust was assessed. Self-rated health (SRH) was measured by WHO-Europe recommended version (ranging from "very good" to "very bad"). Well-being was assessed by the Day Reconstruction Method.

The results showed that in urban areas, social network and social participation supported positive self-rated health; in rural older residents number of years of education and social support play the same role, while self-rated health decreased with increasing level of loneliness. Self-rated

health decreased in both groups of older people with growing number of diseases.

Multivariate linear regression model of predictors of well-being in older age also confirmed differences between urban and rural older residents. In rural residents subjective well-being significantly increased with positive effect of social network. Whereas, both in urban and rural areas poor assessment of subjective well-being increased with higher level of loneliness and growing number of chronic diseases.

THE LONGITUDINAL RELATIONSHIP BETWEEN WILL TO LIVE AND DEPRESSION IN LATE LIFE

S. Carmel¹, H. Tovel¹, V.H. Raveis², 1. *Public Health, Ben-Gurion University, Beer-Sheva, P.O.Box 653, Israel*, 2. *NYU, New York, New York*

Depression is widely prevalent in late life. Will-to-live (WTL) declines with age and is a significant predictor of survival. WTL and depression are both important indicators of subjective well-being and are interrelated. The motivation to continue living embedded in the WTL lead us to examine the direction of long-term influence of Depression and WTL on one another. At baseline, 1,216 randomly selected elderly persons (75+) were interviewed at home (T1), and 892 of them were interviewed again two years later (T2). Cross-Lagged SEM analysis (using AMOS 18) was performed to assess direction of influence from Depression (15-item GDS scale Zalsman et al., 1998 - higher scores reflect lower Depression levels) to WTL (5-item Carmel's scale, 2015 - higher scores reflect stronger WTL) and vice versa. The research model yielded good fit indices with Chi-square/DF=3.17, CFI=.969, NFI=.955, TLI=.956, RAMSEA=.049 (CI=.043-.056) and SRMR=.038. The correlation between WTL-T1 and Depression-T1 was $r=-.44$ ($p<.001$), and $r=.40$ ($p<.001$) between WTL-T2 and Depression-T2. Analysis reveals significant positive effects of Depression-T1 on WTL-T2 (Beta=.098, $p=.006$), and of WTL-T1 on Depression-T2 (Beta=.171, $p<.001$). However, the long-term influence of WTL on Depression is significantly stronger than the influence of Depression on WTL (Chi-square=22.21, $df=1$, $p<.001$). Our results indicate the existence of a longitudinal reciprocal relationship between WTL and Depression with a stronger influence of WTL on Depression than the influence of Depression on WTL. Interventions for older persons to maintain and promote WTL for as long as possible have the potential to prolong life and maintain quality of life

THE MEANING OF AGING FOR PEOPLE WITH MENTAL ILLNESS: IMPLICATIONS FOR PROMOTING HEALTHY AGING

D.W. Lai¹, K. Chan², S. Yau³, 1. *The Hong Kong Polytechnic University, Hong Kong, Hong Kong*, 2. *The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 3. *The New Life Psychiatric Rehabilitation Association, Hong Kong, Hong Kong*

Growing research evidence describes disparities and barriers associated with mental illness, which makes it difficult for individuals with mental illness to maintain physical, mental and social health during the aging process. This study examines the meaning of aging from the perspective of older individuals with mental illness, exploring their motivations and challenges to adopting healthy aging lifestyles and practices.

Narrative interviews were conducted with 61 adults with mental illness aged 50 and older in community and institutional settings in Hong Kong. Thematic analysis of interview data indicated that: 1) Participants expressed uncertain and worry about their daily life and health condition when aging, 2) Participants wanted to adopt healthy lifestyles and behaviors, but their mental illness symptoms and medication side effects made it difficult to learn and adopt new skills and knowledge, 3) Participants preferred to receive help and support from family members or friends, and indicated that needed and necessary community supports and care was not available to them, and 4) Participants wanted more understanding and acceptance of their mental health and life conditions from other individuals and wider society. These findings suggest that social and health services should be better tailored to support individuals with mental illness and their families during the aging process, responding to their perceived needs. Educational initiatives on mental illness and healthy aging should be provided to both individuals with mental illness and the general public.

RELIGION AND HOPELESSNESS AMONG KOREAN OLDER ADULTS

J. Kim¹, S. Han¹, Y. Lee¹, E. Park², 1. *Sungkyunkwan University, Seoul, Korea (the Republic of)*, 2. *Daejeon-Sejong Regional Council, Daejeon, Korea (the Republic of)*

Few studies have examined how both religion and importance of religion are associated with hopelessness in older adults. Using the 2011 survey of living conditions and welfare needs of Korean older adults (N=10,890), we studied whether the interaction of religious groups and the importance of religion influence hopelessness in Korea, where a substantial number of people believe in Buddhism, Protestantism, and Catholicism, and half of population is religious "nones". Based on the question about religious group identification and the question about the importance of religion in their lives, we have created seven religious group categories: strong Buddhists, weak Buddhists, strong Protestants, weak Protestants, strong Catholics, weak Catholics, and religious "nones". Our results showed that about 36% of Korean older adults said they feel hopeless. Controlling socio-demographic factors and health status, we found that regardless of religious group, those who said religion is important in their lives are less likely to be hopeless, but those who said religion is not important do not feel significantly more or less hopeless than religious "nones". Our findings suggest that the importance of religion in their lives plays a major role in hopelessness in older adults, and that both religious group and religiosity should be considered at the same time to understand elderly hopelessness.

HOME-BASED EXERCISE FOR DEPRESSIVE SYMPTOMS AMONG CARERS OF PERSONS WITH DEMENTIA: INTERIM FINDINGS

W. Chan¹, N.T. Lautenschlager², B. Dow³, S. Ma⁴, C.S. Wong¹, L. Lam⁴, 1. *The University of Hong Kong, Hong Kong, Hong Kong*, 2. *The University of Melbourne, Melbourne, Victoria, Australia*, 3. *National Ageing Research Institute, Melbourne, Victoria, Australia*, 4. *The Chinese University of Hong Kong, Hong Kong, Hong Kong*

We report the interim findings of a randomised controlled trial that assessed the efficacy of a home-based exercise programme in alleviating depression among caregivers of persons with dementia. In this single-blind trial, participants were randomly assigned to receive eight sessions of home-based 12-step sitting Tai Chi or a standard non-exercise social contact control, which spanned over 12 weeks. Clinical response was evaluated with Hamilton Rating Scale for Depression (HAM-D-17), Zarit Carer Burden Interview (ZBI), and cognitive assessment. A total of 138 primary caregivers of persons with dementia have been recruited. Sixty-nine caregivers were randomised to the Tai Chi group whereas 69 to the control group. To date, 86 caregivers have completed the study. Using linear mixed models, HAM-D-17 scores were found to decline significantly among Tai Chi participants at both week 6 and 12 ($p < 0.05$). In addition, delayed recall also improved in the intervention group at week 12 ($p < 0.05$). ZBI and other cognitive test scores did not change significantly. Our interim results suggested that Tai Chi was well tolerated and associated with reductions in the severity of depressive symptoms in caregivers.

SESSION 3690 (POSTER)

NEURODEGENERATIVE CONDITIONS: APPROACHES TO IDENTIFICATION

IDENTIFYING SPECIFIC SYMPTOMS OF LATE ONSET FRONTOTEMPORAL DEMENTIA FROM A FTD COLOMBIAN COHORT

C. Triviño Martínez^{1,2}, D.L. Matallana¹, C. Cano¹, 1. Pontificia Universidad Javeriana, Bogotá, Colombia, 2. Universidad Nacional de Colombia, Bogotá, Bogotá, Colombia

Recent studies have reported cases of late-onset frontotemporal dementia (LO-FTD), a relatively rare disease since clinical symptoms of FTD have mainly an Early Onset (EO). The aim of this study is to illustrate the complexity of the diagnostic process investigating LO-FTD as well as the main considerations of aging effects of different variants: 2 cases with behavioral FTD (bvFTD) and two additional ones with non-fluent aphasia (PNFA) from a Colombian cohort of 100 FTD patients, will be presented. It seems that, for instance, LO-FTD was more common than previously thought and age onset of these 4 cases ranges from 80 to 92 years old. All 4 patients did not have Alzheimer's disease neither vascular factors that followed an atypical course according to a clinical consensus diagnostic experts or MRI study, among others. Conclusion: Our study suggested that FTD is heterogeneous with respect the age of symptom onset. After controlling for the effects of chronological aging, EO-FTD a qualitative analysis suggests a great risk of misdiagnosis since even though they are similar to an atypical Alzheimer profiles (frontal variant of Alzheimer disease) clinical features are clearly different from other type of dementia.

HIPPOCAMPAL SUBFIELDS ATROPHY IN ALZHEIMER'S DISEASE AND SEMANTIC DEMENTIA: A CROSS-SECTIONAL STUDY

M. Chapleau^{1,2}, M. Montembeault^{1,2}, M. Boukadi^{1,2}, S. Lacoste¹, I. Rouleau³, R. J. Laforce, M.A. Wilson⁵, S. Brambati^{1,2}, 1. Psychology, University of Montreal,

Montreal, Quebec, Canada, 2. Centre de recherche de l'Institut universitaire de gériatrie de Montréal, Montreal, Quebec, Canada, 3. Université du Québec à Montréal, Montreal, Quebec, Canada, 4. Centre de recherche du CHU de Québec, Québec, Québec, Canada, 5. Université Laval, Montreal, Quebec, Canada

Hippocampal atrophy is one of the anatomical hallmarks in Alzheimer's disease (AD) patients and the substrate of their episodic memory deficits. However, its specificity has been questioned since semantic dementia (SD) patients also display an atrophy of the hippocampus, but the cognitive symptoms do not include episodic memory impairments, and these patients rather manifest semantic memory deficits due to a deterioration of the anterior temporal lobes. Based on our previous finding (Chapleau et al., 2016), our hypothesis is that the posterior portion of the hippocampus is atrophied in AD patients only, and therefore explains the absence of episodic memory deficits in SD subjects. We conducted a cross-sectional study to quantify sub-hippocampal volumes in 9 SD patients, 11 AD patients and 12 controls, using the recent version of the automated segmentation software Free Surfer 6.0. The results showed that SD and AD subjects presented significant and bilateral volume differences, when compared to CTRLs, regarding whole hippocampi volumes and most sub-regions. In terms of the antero-posterior axis, the posterior regions were more atrophied in AD vs SD subjects. The hippocampal tails were bilaterally atrophied in AD compared to CTRLs, but only the left in SD, and the right fimbria was significantly smaller in AD vs CTRLs, but no difference was found in SD. While the sub-cortical results seem to confirm the pattern that has been observed in previous structural imaging studies, the results from an antero-posterior perspective seem to provide important new information.

ADVERSE EVENT REPORTS IN PD PATIENTS RECEIVING EXTENDED-RELEASE CARBIDOPA-LEVODOPA: EFFECTS OF AGE

S. Kell, S. Khanna, N. Rustay, S. Gupta, Impax Laboratories, Inc., Hayward, California

Introduction: Carbidopa-levodopa extended-release capsules (ER CD-LD, IPX066) significantly improve motor symptoms and activities of daily living in early and advanced Parkinson's disease (PD). ER CD-LD produces an initial peak in plasma levodopa concentrations at about one hour, which are maintained for about 4–5 hours before declining.

Methods: ER CD-LD was studied in three Phase 3 controlled trials, one in early PD vs. placebo and two in advanced PD: one vs. immediate-release (IR) CD-LD and one vs. IR CD-LD+entacapone (CLE). For each study, adverse events (AEs) were collected at each visit and comparative summaries were examined in patients categorized by age groups of <65, 65–74, and ≥75 years old.

Results: Of the 849 patients treated with ER CD-LD in controlled trials, 431 (50.8%) were of age <65, 310 (36.5%) were 65–74, and 108 (12.7%) were ≥75 years old. The percent of patients reporting ≥1 AE in each age group (<65, 65–74, ≥75 years) were 54.1%, 60.0%, and 64.8%, respectively. AEs reported by ≥5% in any age group (<65, 65–74, ≥75 years) were nausea (9.7%, 11.0%, 11.1%), headache (7.9%, 7.1%, 3.7%), dizziness (6.0%, 9.4%, 8.3%),

dyskinesia (5.8%, 4.8%, 5.6%), insomnia (5.3%, 3.5%, 3.7%), and constipation (2.3%, 1.6%, 7.4%).

Conclusions: In this population of PD patients treated with ER CD-LD in the Phase 3 clinical studies, the number of patients reporting ≥ 1 AE increased with increasing age. Of the most frequent AEs, headache decreased with increasing age, but no clear pattern of AE frequency emerged for nausea, dizziness, dyskinesia, insomnia or constipation.

DISORDERS OF VISUAL PERCEPTION FOR THE ELDERLY WITH BEGINNING COGNITIVE IMPAIRMENTS: REEVALUATION

L. Dourthe¹, C. Sagot¹, P. Mélissa¹, B. Dieudonné¹, S. Greffard¹, Z. Barrou¹, M. Verny^{1,2}, 1. *Pitié Salpêtrière, Paris, France*, 2. *Pierre et Marie Curie University, Paris, France*

CONTEXT: Visuo perceptual deficits (VPD) not widely studied on the elderly, are common in dementia with Lewy bodies (DLB). The NEVIP test (Newcastle visuo-perception battery) is a simple, rapid and standardized computerized test, designed to explore different angles of visual perception. The aim of this study is to identify the progression of the NEVIP score after 1 year on the elderly with mild cognitive impairment (MCI) and beginning dementias, and also to assess the predictability of developing a DLB by the MCI population with a pathological NEVIP test. **MATERIEL ET METHOD:** Preliminary prospective cohort study conducted from November 2014 to February 2015 (by geriatrics, Pitié-Salpêtrière Hospital, Paris). Inclusion criteria were: 70 years and older patients with memory complaints, MMS > 18/30, recent cerebral imaging. **RESULTS:** Among the 30 patients included, only 16 were seen again after 1 year. At the initial analysis 57% had a pathological NEVIP, and after one year just 44%. After 1 year, the NEVIP test is pathological for 100% of the patients with a possible DLB. 3 patients had a deficit score at T0, which became normal after 1 year: 2 of these patients developed an Alzheimer disease, one a mixed dementia. One patient with a normal NEVIP which became pathological developed a DLB. **CONCLUSION:** This preliminary study opens perspectives for the analysis of VPD on the elderly. Identifying this deficit simply and early could help diagnose atypical presentations.

ASSOCIATION OF CIRCADIAN REST AND ACTIVITY RHYTHMS WITH BRAIN VOLUMES IN COGNITIVELY NORMAL OLDER ADULTS

A.P. Spira^{1,2,3}, V. Zipunnikov¹, M.N. Wu², D. Dey⁴, E.M. Simonsick⁵, L. Ferrucci⁵, C. Davatzikos⁶, S. Resnick⁵, 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 2. *Johns Hopkins School of Medicine, Baltimore, Maryland*, 3. *Johns Hopkins Center on Aging and Health, Baltimore, Maryland*, 4. *Indian Statistical Institute, Kolkata, India*, 5. *National Institute on Aging Intramural Research Program, Baltimore, Maryland*, 6. *University of Pennsylvania, Philadelphia, Pennsylvania*

Disturbed circadian rest/activity rhythms have been linked to cognitive decline, but little is known about their association with neuroimaging-derived brain volumes. We studied 176 cognitively normal participants in the Baltimore Longitudinal Study of Aging aged 74.8 ± 8.9 years (58%

women, 29% non-White), who were instructed to wear wrist actigraphs for seven consecutive 24-hour periods and underwent 3T magnetic resonance imaging scans, with total gray and white matter, ventricular volume, and hippocampal volume quantified using a multi-atlas segmentation approach (MUSE software). We used function-on-scalar regression models, a data-driven approach, to quantify links between timing of actigraphic activity counts and brain volumes, adjusting for age, sex, education, CES-D score, MMSE score, and intracranial volume. Gray matter, white matter, ventricular, and hippocampal volumes were considered in separate models and time intervals rounded to the nearest 30 minutes. On average, lower gray matter volume was associated with higher activity levels between 2:30 AM and 12:30 PM and between 4:30 PM and 11:30 PM, lower white matter volume was associated with greater activity between 12:00 AM and 11:00 AM, and larger ventricles were associated with lower activity between 3:00 AM and 6:00 AM and higher activity between 6:30 PM and 12:00 AM (all $p < .05$). Lower hippocampal volume was associated with lower activity between 9:30 AM and 4:30 PM ($p < .05$). Results suggest that rest/activity patterns may be differentially associated with brain gray and white matter, and hippocampal volume. Longitudinal studies are needed to evaluate whether particular rhythms precede and perhaps promote neuronal loss, and vice versa.

DEMENTIA IN THE ICU: THE VALIDITY OF THE AD8 IN CRITICALLY ILL ADULTS

M.C. Duggan¹, M.E. Morrell¹, K. Frimpong¹, D.R. Nair¹, T. Girard^{1,2}, P.P. Pandharipande^{1,2}, W. Ely^{1,2}, J.C. Jackson^{1,2}, 1. *Medicine, Vanderbilt University, Nashville, Tennessee*, 2. *Department of Veteran Affairs, Nashville, Tennessee*

Dementia is under-recognized in the intensive care unit (ICU). There is a paucity of data on brief, informant-based questionnaires, such as the AD8, to detect dementia in critically ill adults. The AD8, which has been validated in non-ICU settings, could be very helpful for busy ICU clinical teams who commonly care for patients with dementia. This investigation was planned *a priori* as a substudy within the BRAIN-ICU prospective cohort study (NEJM 2013), which enrolled patients with respiratory failure or shock. Qualifying surrogates of the ICU patients (N=75) were administered both AD8 (2–3 minute tool) and Clinical Dementia Rating scale (CDR, 30–45 minute tool). Using CDR cutoffs of ≥ 1 for mild dementia and > 0.5 for very mild dementia, we used a standard AD8 cutoff of ≥ 2 to calculate sensitivity, specificity, positive and negative predictive values (PPV and NPV), and AUC. By CDR, 4 patients had no dementia, 34 very mild dementia, and 37 at least mild dementia. For diagnosing mild dementia, the AD8 had sensitivity of 97% (95% CI 86%–100%), specificity 16% (6–31), PPV 53% (40–65), NPV 86% (42–100), and AUC 0.738 (0.626–0.850). For diagnosing very mild dementia, the AD8 had sensitivity of 92% (83–97), specificity 25% (1–81), PPV 96% (88–99), NPV 14% (0.5–58), and AUC 0.734 (0.538–0.930). **Conclusion:** Considering that it can be completed in several minutes, the AD8 at its standard cutoff of ≥ 2 is highly sensitive (97%) for detecting mild dementia in general medical and surgical ICU patients.

LINKS OF 24-HOUR REST AND ACTIVITY RHYTHMS TO DEPRESSIVE SYMPTOMS AND COGNITION IN THE MEMORY IMPAIRED

A.P. Spira^{1,2,3}, V. Zipunnikov¹, J. Urbanek¹, M.N. Wu², P. Rosenberg², L.F. Friedman^{4,5}, J.A. Yesavage^{4,5}, J.M. Zeitzer^{4,5}, 1. Department of Mental Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. Johns Hopkins School of Medicine, Baltimore, Maryland, 3. Johns Hopkins Center on Aging and Health, Baltimore, Maryland, 4. VA Palo Alto Health Care System, Palo Alto, California, 5. Stanford University School of Medicine, Stanford, California

Altered rest/activity rhythms are common in individuals with memory disorders, and are often conceptualized as a neuropsychiatric symptom. However, altered circadian rhythms may also drive other neuropsychiatric symptoms (NPS), such as depressive symptomatology, and disrupt cognitive function. Thus, we examined the association of 24-hour rest/activity rhythms with both depressive symptoms and cognitive performance in 54 adults with memory impairment (mean age = 77.8 ± 8.1; 43% women). Participants wore wrist actigraphs for approximately one week and completed the Mini-Mental State Examination (MMSE) in the baseline phase of a randomized trial. Beck Depression Inventory-II (BDI-II) scores were obtained for memory-impaired participants based primarily on caregiver input. We fit a function-on-scalar regression (FOSR) model to characterize links of clinical variables with rest/activity patterns. BDI-II and MMSE scores were the primary predictors; age, gender, and education were covariates. The 24-hour actigraphy profiles were the outcomes. BDI-II and MMSE scores both had statistically significant effects in the FOSR model. Greater depressive symptomatology was associated with significantly higher levels of activity, primarily between approximately 12AM and 12PM ($p < 0.05$). Better performance on the MMSE was associated with significantly higher levels of activity between approximately 10AM and 1PM and approximately 4PM and 7PM ($p < 0.05$). These results suggest that 24-hour rest/activity disturbances are linked to both neuropsychiatric (i.e., depressive) symptoms and cognitive performance, and that circadian disruption may therefore affect these clinically important outcomes. Further research is needed to investigate whether treatment of circadian disruption reduces neuropsychiatric symptoms and improves cognition in the memory impaired.

COGNITIVE RESERVE INFLUENCES LONGITUDINAL DECLINE IN YOUNG-ONSET DEMENTIA

L. Massimo¹, C. McMillian², S. Xie², L. Renner², K. Rascovsky², A.M. Kolanowski¹, M. Grossman², 1. The Pennsylvania State University, University Park, Pennsylvania, 2. University of Pennsylvania, Frontotemporal Degeneration Center, Philadelphia, Pennsylvania

Objective: To examine the effect of cognitive reserve (CR) on longitudinal cognitive decline and gray matter (GM) atrophy in young-onset dementia.

Methods: Forty-seven patients with behavioral variant Frontotemporal Degeneration (bvFTD) were studied longitudinally on neuropsychological measures of executive function (verbal fluency) and language (confrontation

naming). Neuroimaging data were available for a subset of these subjects. Each patient's primary occupation was classified as professional or non-professional. Level of education was recorded in years and dichotomized into high and low groups. Linear mixed-effects models evaluated the interaction of neuropsychological performance change with professional and educational status. Regression analyses were used to relate longitudinal change in performance on neuropsychological measures to GM.

Results: There were significant occupation by time interactions for declining performance on measures of executive function, including letter-guided (FAS: $t=-2.51$; $p=0.01$; animals: $t=3.05$; $p=0.003$). Professional status did not affect the rate of decline on language measures. We found similar interaction effects for executive measures for education (FAS: $t=2.01$; $p=0.04$; animals: $t=3.09$; $p=0.002$). Furthermore, longitudinal decline in executive performance was associated with baseline GM volume in the dorsolateral prefrontal cortex.

Conclusions: bvFTD individuals with higher CR demonstrate more rapid decline on measures of executive function. This may be related to early disease in the frontal lobe which limits professionals' ability to utilize executive resources to "compensate" for declining cognition. The identification of individual factors associated with rate of clinical progression is important for estimates of prognosis and the design of treatment trial studies.

EFFICACY OF EXTENDED-RELEASE CARBIDOPA-LEVODOPA WITH OR WITHOUT THE USE OF OTHER PD MEDICATIONS

S. Gupta, S. Khanna, N. Rustay, S. Kell, R. Rubens, Impax Laboratories, Inc., Hayward, California

Introduction: Carbidopa-levodopa extended-release capsules (ER CD-LD, IPX066) significantly improves motor symptoms and activities of daily living in early and advanced Parkinson's disease (PD). ER CD-LD produces an initial peak in plasma levodopa concentrations at about one hour, which are maintained for about 4–5 hours before declining.

Methods: The safety and efficacy of ER CD-LD vs. immediate-release (IR) CD-LD was examined in a randomized, double-blind, active-controlled, Phase 3 study. Efficacy measures (PD diary and Unified PD Rating Scale [UPDRS] Parts II [activities of daily living] + III [motor score]) were analyzed to evaluate the effect of concomitant use or non-use of dopamine agonists (DA), monoamine oxidase-B (MAO-B) inhibitors, or amantadine on the response to ER CD-LD.

Results: In the overall study (N=393), ER CD-LD improved "off" time ($P<.0001$), "on" time without troublesome dyskinesia ($P=.0002$), and UPDRS Parts II+III scores ($P<.0001$) vs. IR CD-LD. Numerical improvements from baseline in PD diary measures and UPDRS Parts II+III were seen with ER CD-LD vs. IR CD-LD in each subgroup. Improvements in "off" time and "on" time without troublesome dyskinesia were significant ($P<.05$) for ER CD-LD vs. IR in each subgroup, except for the group using concomitant amantadine ($P>.50$). ER CD-LD did not significantly worsen "on" time with troublesome dyskinesia vs. IR in any subgroup ($P>.11$). The most frequent adverse events were similarly reported across subgroups.

Conclusions: The concomitant use or non-use of adjunctive PD medications did not affect the efficacy or degree of troublesome dyskinesias when ER CD-LD was compared to IR CD-LD.

DEFAULT MODE NETWORK CONNECTIVITY, EPISODIC MEMORY AND HEARING AND VISION LOSS IN OLDER ADULTS

X. Zuo^{1,5}, J. Zhuang³, N. Chen³, S. Cousins², E. Lad², D.J. Madden³, G. Potter⁴, H. Whitson^{5,3,6}, 1. *Duke-NUS Medical School, Singapore, Singapore, Singapore*, 2. *Department of Ophthalmology, Duke University Medical Center, Durham, North Carolina*, 3. *Brain Imaging and Analysis Center, Duke University Medical Center, Durham, North Carolina*, 4. *Department of Psychiatry and Behavioral Sciences, Duke University School of Medicine, Durham, North Carolina*, 5. *Center for the Study of Aging and Human Development, Duke University Medical Center, Durham, North Carolina*, 6. *Department of Ophthalmology and Department of Medicine, Duke University Medical Center, Durham, North Carolina*

Introduction: Functional MRI (fMRI) studies are useful in revealing patterns of neuronal network activity in brains in older adults. The default mode network (DMN) is a well-described functional brain network likely related to introspection and is most active when the brain is not engaged in a specific cognitive task. Our objective was to describe how DMN connectivity relates to memory and sensory status in a sample of older adults with well-characterized vision and hearing and mild or no changes in cognition.

Methods: We collected resting state fMRI of the brain, vision and audiometry results from 41 older adults with age-related macular degeneration (AMD) and 37 age matched controls with healthy eyes. fMRI data were used to quantify the strength of intrinsic functional connectivity between regions of the brain that comprise the DMN. Memory was assessed by a standardized word recall test. Participants with moderate to severe dementia were excluded.

Results: Controlling for age, the preliminary results demonstrate significant positive correlation between DMN connectivity and episodic memory ($r=0.24$, $p=0.04$). Vision and hearing impairment were not related to overall DMN connectivity, nor was there any interaction between sensory impairment and memory with respect to connectivity. Further analysis will explore whether connectivity between specific hubs within the DMN relates to vision/hearing impairment.

Conclusion: The study demonstrated that DMN connectivity is positively correlated with episodic memory. In this population DMN connectivity did not differ depending on sensory input. DMN connectivity may serve as a useful and specific marker of memory loss that may signify early dementia.

SESSION 3695 (POSTER)

PAIN MANAGEMENT

THE ROLE OF PAIN MANAGEMENT AMONG HOSPITALIZED OLDER ADULTS WITH DELIRIUM

L. Deng, C.S. Ritchie, I. Maravilla, S. Schear, S. Garrigues, N. Thompson, C. Miaskowski, K. Patel, *Division of Geriatrics, University of California, San Francisco, San Francisco, California*

Inadequate treatment of pain is a known risk factor for delirium among older adults. However, little is known about pain management among hospitalized older adults with delirium. We sought to investigate the role of pain and pain management in the development of delirium among older adults with moderate to severe pain admitted to the medicine service. Medical record review was conducted on adults ≥ 65 years admitted to the medicine service at an urban hospital between November 2014 and May 2015 with moderate to severe pain defined by the Numerical Pain Rating Scale score: 4 – 10. Of 254 patients with moderate to severe pain on admission, 41 (16%) were diagnosed with delirium during their hospitalization. Compared to patients without delirium, those with delirium were more likely to be age ≥ 75 years (59% vs. 42%, $p=0.05$), have a history of dementia (29% vs. 7%, $p<0.0001$), experience longer length of hospitalization (8 days vs. 5 days, $p=0.03$), and receive a palliative care consult (32% vs. 10%, $p=0.0002$). During hospitalization, patients received opioids (76%), acetaminophen (68%), adjuvant analgesics (34%), and nonsteroidal anti-inflammatory drugs (5%). There was no difference in pain severity or frequency of analgesic administration in patients with and without delirium. However, prior to admission, patients with delirium were more likely to be prescribed adjuvant analgesics (39% vs. 22%, $p=0.02$). In conclusion, pain management among hospitalized older adults was similar for those with and without delirium. Further research is needed to understand the role of adjuvant analgesics in older adults with delirium.

REVIEW OF PAIN ASSESSMENT INSTRUMENTS AVAILABLE FOR OLDER ADULTS

Y. Kang, G. Demiris, *University of Washington, SEATTLE, Washington*

Pain is common among older adults, and is often under-reported because it is considered as part of the normal physiological changes that come with aging. Since self-report of pain is the gold standard in research and practice, it is important to use the appropriate pain assessment tools to facilitate self-report. Little is known which self-report pain assessment tools are most appropriate to use in cognitively intact older adults. Thus, the purpose of this review is to identify which tools have been recognized as appropriate tools for this population. A systematic search was conducted through indexed databases from January 1990 to December 2015. Two raters independently evaluated 35% of abstracts based on inclusion/exclusion criteria. A final set of 43 full articles was reviewed. There were 23 self-reported pain assessment tools including non-dimensional, unidimensional, and multidimensional tools. In this review, the Iowa Pain Thermometer, the 6-point Verbal Descriptor Scale, and the 11-point Verbal Numeric Rating Scale, the short form Brief Pain Inventory and the Geriatric Pain Measure were recognized as more suitable tools than any other tools in cognitively intact older adults across different settings. Only the Geriatric Painful Event Inventory and the Geriatric Pain Measure were developed specifically for older adults. Since 80% of older adults have at least one chronic disease, multidimensional tools such as the Geriatric Pain Measure may be more appropriate. More studies are needed to evaluate the psychometric tests of the Geriatric Pain Measure in different settings, racially diverse populations and diseases or clinical conditions.

SEX DIFFERENCES IN ASSOCIATIONS OF COGNITIVE FUNCTION WITH PERCEPTIONS OF PAIN IN OLDER ADULTS

R.R. Romano^{2,1}, S.A. Atalla², J.C. Gore², M.S. Dietrich², R.L. Cowan², T. Monroe², 1. *Department of Veterans Affairs, Nashville, Tennessee*, 2. *Vanderbilt University, Nashville, Tennessee*

Sex-differences in pain have been shown to exist in older adults with normal cognition. It is not known if sex-differences extend throughout a range of cognitive impairment in Alzheimer's disease. We conducted a secondary analysis on data from a cross-sectional parent study of sex differences in the associations of cognitive function (MMSE) with sensory perception. Median age of males (N=38) and females (N=38) was 73 (IQR: 68–80) with similar distributions of MMSE scores (medians 27,28, ranges 11–30). Specific perceptual responses were to heat thresholds of warmth, mild pain, and moderate pain and self-reported unpleasantness of each respective percept. Similar patterns of associations of MMSE scores with perceptions of heat thresholds (temperatures) were observed for both groups. We found inverse statistically significant associations at the threshold of warmth (females: $r_s = -0.39, p = 0.015$; males: $r_s = -0.47, p = 0.003$) with weakening and not statistically significant associations for mild and moderate pain thresholds. Conversely, increasingly divergent patterns of MMSE with unpleasantness ratings were observed. Females demonstrated none/positive associations (weak pain: $r_s = 0.09, p = 0.597$; moderate pain: $r_s = 0.26, p = 0.109$) while males demonstrate increasing inverse associations (weak pain: $r_s = -0.29, p = 0.075$; moderate pain: males: $r_s = -0.22, p = 0.190$). The difference between males and females at the moderate pain threshold was statistically significant ($z = 2.05, p = 0.040$). Between group findings suggest that with worsening cognition, patterns of responses to thermal stimulus intensity may differ between males and females. These findings may help to explain the decreased frequency of pain reports in people with AD and consequently a lower administration of analgesics.

A RETROSPECTIVE AUDIT OF PAIN MANAGEMENT IN PATIENTS PRESENTING WITH HIP FRACTURE

H. Gillespie, A.C. Kwok, V. Raves, A. Bari, F. Mestrov, T. Rees, L. Harris, B. Payne, *Northern Sydney Local Health District, Mona Vale, New South Wales, Australia*

The Agency of Clinical Innovation (ACI) developed seven minimum standards for the management of Hip Fracture across all public NSW hospital departments. Standard two relates to Pain management. The standards were implemented in the Northern Sydney Health District Service [NSLHD] with a population of 887,000 and five public hospitals in 2014. This retrospective case control study reviewed the medical notes of 34 patients with hip fracture admitted to MonaVale Hospital, a metropolitan hospital in Sydney, to identify gaps in Standard Two implementation. ACI data will inform the new Australian and New Zealand Hip Fracture Registry.

This 2015 audit assessed pain management in the Emergency department, Peri-operative setting and Rehabilitation. The audit confirmed the elderly population (mean age 86), appropriate assessment of pain scores (hourly upon presentation in 82% of patients). Analgesia prescribing

varied across the cohort. Local nerve blocks were used in 35% of patients in Emergency department. Post op analgesia was determined to be reasonable with only 18% of patients reporting severe pain, which may reflect under utilisation of neuropathic analgesia (14%). Inappropriate use of NSAIDs were found in 10% of patients. In response to the audit findings the team are developing a standardised pain pathway during the hospital journey for the patient.

AN ALGORITHM TO OPTIMIZE PAIN DETECTION AND MANAGEMENT IN OLDER PATIENTS UNABLE TO COMMUNICATE PROPERLY

S. Bonin-Guillaume^{1,2}, E. Jouve^{2,1}, P. Rat², 1. *AIX MARSEILLE UNIVERSITY, MARSEILLE, France*, 2. *ASSISTANCE PUBLIQUE HOPITAUX DE MARSEILLE, MARSEILLE, France*

Although there are a lot of scales existing to assess pain in older patients, pain remains under diagnosed in those with inability to communicate verbally (ICV), i.e. patients with dementia, aphasia, delirium and/or not understanding the local language (1).

This is even more challenging when those patients suffer from acute pain and/or when visiting emergency department (ED).

We developed an algorithm aiming at helping medical and nurses staffs from different kind of settings to optimize pain detection and management in those patients.

Briefly, first use the verbal self-rating scale (1). If the scoring is uninformative according to the nurse, then consider the Algoplus behavioral scale assessment as a second step. The Algoplus scale has been specifically developed for acute pain assessment in ICV old patients (2) and validated in patients with and/or without Depression and/or dementia (3).

It has been successfully tested in different care settings. It is an easy and quick to use scale (less than 1 minute for scoring) and has been implemented in lots of the acute care settings in France. A cut off score of 2 allowed pain management. If the algoplus scores 3 or higher, then opioid treatment can be considered as a pain treatment option, even in older patients in ED (4).

ACTIVITY-RELATED PAIN AND METABOLIC COST DURING DAILY TASKS IN YOUNGER, MIDDLE, AND OLDER ADULTS

D. Corbett, A. Wanigatunga, N. Wawryzniak, E.M. Handberg, V. Valiani, C. Janelle, T.M. Manini, *University Florida, Gainesville, Florida*

Background: Aging is associated with an increased risk for chronic pain and pain related disability. Minimal research exists on how activity-related pain is associated with the metabolic cost of movement and how this association varies in younger and older adults. The purpose of this study was to examine the relationship between pain and the metabolic cost of common daily activities in younger, middle, and older aged adults.

Methods: 70 individuals (16 younger-aged, 31.3 ± 9.2 yrs; 29 middle-aged, 55.7 ± 5.2 yrs; 25 older-aged, 72.0 ± 5.7

years) performed 28 self-paced daily activities (leisure walking, washing dishes, ascending stairs, etc.). Oxygen consumption (VO₂) was measured for approximately 8 minutes during each task using a portable metabolic system (Cosmed K4b2). Values were expressed as metabolic equivalents (METs; O₂ uptake relative to 3.5 ml/kg/min). A 10-point Likert scale was used to assess ratings of perceived pain. Activity-related pain was calculated by subtracting pain scores rated immediately prior to task start from pain scores rated upon task completion.

Results: There was a significant interaction between METs and pain by age category ($p < 0.001$, $R^2 = 0.040$). Both younger and middle-aged adults showed a significant association between METs and activity-related pain ($\beta = 0.106$, $p < 0.001$; $\beta = 0.083$, $p = 0.001$; respectively). However, there was no relationship observed among older adults ($\beta = 0.029$, $p = 0.467$).

Conclusion: Higher activity-related pain is associated with a higher metabolic cost of performing daily activities. This effect appears stronger in younger and middle-aged adults than older adults.

OXIDATIVE STRESS MARKERS IN ELDERLY PATIENTS TREATED WITH ACUPUNCTURE

Y.M. Garcia, A.C. Seguro, M.H. Shimizu, M.G. Tibo, E.P. Vilela, M. Rebêlo, E.L. Thenquini, W.T. Hsing, *Clinical Medicine, São Paulo University Medical School, São Paulo, São Paulo, Brazil*

Acupuncture is an interesting strategy to control symptoms in elderly patients. A group of 24 aged patients, who attend to the Geriatrics Ambulatory of Hospital das Clínicas of São Paulo Medical School was studied. They had pain complaints and were referred to treatment with acupuncture. Their levels of TBARS (a marker of oxidative stress) and GSH (an anti-oxidant enzyme) were determined before treatment, and after 10 and 20 weekly acupuncture sessions. Results were classified in high, normal or low and compared by ANOVA and Chi squared test. Four patients did not undergo the second evaluation and nine the third one. The mean GSH level was 1,67 before, 1,83 after 10 weeks and 2,04 after 20 weeks of treatment (ANOVA $p=0,211$, t paired test $p=0,077$). The mean TBARS level was 1,24 before, 0,55 after 10 weeks and 1,03 after 20 weeks of treatment (ANOVA $p=0,327$, t paired test $p=0,629$). No other comparison was statistically significant. The power of the sample for ANOVA was 0,219. The authors conclude that elderly patients treated by acupuncture possibly had their capacity of protection against oxidative stress by GSH enhanced during treatment, but not their oxidant activity marked by TBARS. Due to the small power of the sample, a definite statement needs a larger number of patients.

PAIN ASSESSMENT IN PEOPLE WITH SEVERE COGNITIVE IMPAIRMENTS—DO NURSES USE OBSERVATIONAL INSTRUMENTS?

R. Palm^{1,2}, E. Sirsch³, S. Bartholomeyczik², B. Holle^{1,2}, 1. *Site Witten, German Center for Neurodegenerative Diseases, Witten, Germany*, 2. *Witten/Herdecke University (UWH), Faculty of Health, School of Nursing Science, Witten, Germany*, 3. *Catholic University Vallendar, Vallendar, Germany*

Many nursing home residents with cognitive impairments (CI) suffer from chronic pain, which is also discussed as a reason for challenging behavior. Because of their impaired communication abilities it is recommended to use an observational pain-instrument for the assessment. It is not known, if in German nursing homes the pain assessment for residents with severe CI is performed with the help of observational instruments or if also self-rating instruments are used. We assumed that in Dementia Care Units (DCU) observational pain instruments should be used more often than in Traditional Care Units (TCU). To find this out, we analyzed cross-sectional data from $n=1397$ residents living in $n=75$ care units ($n=30$ DCUs and $n=45$ TCUs). Descriptive statistics showed that in DCUs 82% of their residents with severe CI were assessed with an observational instrument; in TCUs this applied to only 42%. The differences were statistically significant ($p<.001$); a mixed model that adjusts for the nested data structure confirmed this result. We conclude that the use of observational instruments to assess pain in residents with severe cognitive impairments is not the standard in TCUs in German nursing homes. There is an urgent need to improve the knowledge about pain assessment in residents with severe cognitive impairments in TCUs to enhance the choice of the most suitable instrument.

PATTERNS OF PAIN MANAGEMENT AMONG ETHNICALLY DIVERSE OLDER ADULTS

L. Chiang-Hanisko, *Florida Atlantic University, Boca Raton, Florida*

Aging is strongly associated with pain due to increased prevalence of frailty, chronic conditions and end-of-life issues. Multiple co-morbidities in older adults often complicate pain management efforts and increase the possibility of polypharmacy. Ethnically diverse older adult populations are at a higher risk of experiencing severe pain and adverse reactions from pharmacological agents due to cultural factors and access to medications and services to manage pain. The purpose of this study is to explore pharmacological pain management associated with polypharmacy among four ethnically diverse older adult populations. The study consisted of 40 purposive samples age 60 and older from community settings in south Florida representing four cultural groups (African American, Afro-Caribbean, European American and Hispanic American). Q-methodology was used to identify the older adults' common attitudes, perceptions and practices regarding pharmacological pain management with the intent to develop typologies that predict polypharmacy. Subjects' average age was 76.69 ranging from 60 to 97 with 87% females. Average chronic illness was 4.38, average medication used was 10.55 with average pain medication used 2.05. The Q-sort of 34 statements, using PQ method factor analysis, resulted in the emergence of six viewpoints as typologies, including: Bearing with pain; using alternatives, self-management with external resources; self-medicated; compliance and fear of addiction. Each typology was named based on its distinguishing statements indicating how older adults manage chronic pain. Knowledge of these typologies can alert practicing healthcare professionals to medication patterns that distinguish older adults but also uniquely predispose them to polypharmacy.

SESSION 3700 (POSTER)

PAIN MANAGEMENT AND REHABILITATIVE CARE

GENDER DIFFERENCES IN ASSOCIATION OF PAIN AND PHYSICAL PERFORMANCE WITH FEAR OF FALLING

S. Thapa³, S.G. Leveille³, J.F. Bean¹, R. McLean², T. You³, 1. *Spaulding Center for Lifelong Health and Fitness, Partners Health Care, Boston, Massachusetts*, 2. *Hebrew Senior Life Institute for Aging Research, Boston, Massachusetts*, 3. *University of Massachusetts Boston, Boston, Massachusetts*

Fear of falling (FOF) can contribute to avoidance of physical activity and subsequent adverse health effects, reducing quality of life in older adults. An understanding of potential gender differences in factors such as pain and physical performance as contributors to FOF may lead to better fall prevention in women and men. We studied 765 adults aged 70 and older living in Boston area communities, participants in the population-based MOBILIZE Boston study. Pain severity was assessed using the Brief Pain Inventory pain severity subscale and musculoskeletal pain was classified as multisite, single site, or no pain. Fear of falling was measured using the Falls Efficacy Scale (FES). Physical performance was assessed using the Short Physical Performance Battery (SPPB). We used multivariable linear regression to examine the relation between pain and SPPB with FES score, separately in women and men. Slight differences between women and men in FES scores were not statistically significant (women mean = 95.19 ± 9.58; men mean = 96.33 ± 8.60, *p*-value = 0.10). In separate multivariable models (adjusted for age, education, low vision, frailty, sppb, arthritis, and depression), pain severity and multisite pain were associated with lower FES scores in women (*p*-values = 0.02 and 0.03, respectively), but not in men (*p*-values = 0.21 and 0.57, respectively). In both women and men, low SPPB scores were strongly associated with FOF (*p*-value < 0.001 for both). Further adjustment for history of falls had little impact on the findings. Future research is needed to determine the possible effects of the observed gender differences in FOF on fall risk and other adverse health outcomes.

VALIDATION OF PAIN CATASTROPHIZING SCALE THAI VERSION IN OLDER ADULTS WITH KNEE OSTEOARTHRITIS

P. Youngcharoen¹, S. Aree-Ue¹, Y. Saraboon², 1. *Ramathibodi School of Nursing, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Bangkok, Thailand*, 2. *College of Nursing, Nakhon Phanom University, Nakhon Phanom, Thailand*

Pain catastrophizing is defined as individuals' exaggeration of pain perceptions that results in negatively evaluating their ability to deal with pain. The pain catastrophizing scale (PCS) has been developed in English for use to measure how catastrophizing impact on pain experience. Older adults with knee osteoarthritis suffer from pain and joint stiffness, which could limit their functional ability. Assessing patients' pain catastrophizing will be helpful to understand their perceptions on catastrophizing and how its influence pain and

disability. The purpose of this study was to translate the PCS into Thai and assess its psychometric properties with Thai older adults with knee osteoarthritis. The PCS was translated from English to Thai using committee approach. Five Thai experts were asked to assess content validity of PCS Thai version (PCS-Thai). Cognitive interviews were conducted with 10 older adults with knee osteoarthritis to confirm their accuracy. Thirty older adults with knee osteoarthritis with a mean age of 69.07 ± 6.62 years were recruited into a study investigating reliability. The I-CVI for each item and the S-CVI of the PCS-Thai were 1, which confirmed its content validity. The PCS-Thai indicated a good internal consistency reliability. Cronbach's alpha coefficients for the total PCS and for rumination, magnification, and helplessness subscales were 0.93, 0.84, 0.74, and 0.85, respectively. The PCS-Thai will be validated with larger sample size to confirm reliability and validity. This research can contribute to develop valid and reliable measure for future research of factors influencing of pain and disability in older adults with knee osteoarthritis.

PAIN CHARACTERISTICS AND PAIN CATASTROPHIZING IN COMMUNITY-LIVING OLDER ADULTS

A. Nawai¹, S.G. Leveille^{1,2,3}, J.B. Foust¹, L. Shi¹, T. You¹, 1. *Nursing, University of Massachusetts Boston, Quincy, Massachusetts*, 2. *Department of Medicine, Beth Israel Deaconess Medical Center, Boston, Massachusetts*, 3. *Harvard Medical School, Boston, Massachusetts*

Chronic pain often leads to psychological symptoms and physical disability, affecting the lives of many older adults. Pain catastrophizing, potentially treatable, may have an important role on the pathway from chronic pain to its disabling consequences. This secondary analysis examines cross-sectional associations between pain characteristics and pain catastrophizing in older adults. The MOBILIZE Boston Study II included 354 adults aged 71 to 101 years (mean = 84.5y; 65.8% female), living in the Boston area, enrolled from the original population-based cohort of the MOBILIZE Boston Study. Pain characteristics included the Brief Pain Inventory severity and interference subscales (scored 0–10, grouped into quartiles). Joint pain distribution was classified as none, single site, multisite, and widespread pain. The Pain Catastrophizing Scale (PCS), a 13-item scale, yielded scores ranging from 13–65. Multivariable linear regression models were used to examine the associations between pain characteristics and pain catastrophizing. Older age and chronic conditions, including osteoarthritis, depression, and anxiety, were associated with pain catastrophizing (*p* < 0.05). PCS was higher in older adults with moderate-severe pain compared to those with very mild pain or without pain (means = 25.8, 23.2, 21.8, respectively, *p*-value = 0.01). Results were similar for pain interference (*p*-value = 0.004) and pain distribution (*p*-value = 0.03). The associations between pain characteristics and pain catastrophizing persisted after multivariable adjustment for sociodemographic characteristics and chronic conditions. Therefore, pain severity, pain distribution, and pain interference are independently associated with pain catastrophizing in older adults. Longitudinal studies are needed to understand how pain catastrophizing may contribute to pain-related physical disability and falls in this population.

AGING AND CHRONIC PAIN: WOMEN WITH FIBROMYALGIA

M.S. Hayar, *Estudos Pós-graduados em psicogerontologia, UNIP-Universidade Paulista, SAO PAULO, Brazil*

This study investigates the process of aging in women who are affected by fibromyalgia, as well as the physical, personal, and social impacts of this disease. It is a descriptive, prospective and retrospective, quantitative, and qualitative research. The study included 66 women diagnosed with fibromyalgia aged between 30 and 68 years living in São Paulo/SP, Brazil. For qualitative research, a group of 15 women from the 66 was selected. The instrument sought to encourage themes for reflection to access the social representations of pain, disease, and aging with chronic pain. The Collective Subject Discourse technique was used as the methodology to process the data of the qualitative research. The results indicated a higher incidence of fibromyalgia in older women; however, the impact on quality of life, measured by the Fibromyalgia Impact Questionnaire FIQ[Editor1], was higher among the middle-aged group (50–59 years). There was a higher prevalence of the disease among women with low education but its impact was found to be more significant for women with higher education. The presence of religiosity was clear in this group of individuals. The doctor–patient relationship was highlighted as an important factor for facing the adversities caused by the disease because of the need for social legitimization of the disease. Primary attention care requires an appropriate approach for a person with a chronic illness as peculiar as fibromyalgia.

RESISTANCE TRAINING IMPROVES SYSTEMIC AND TISSUE INFLAMMATORY PROFILES IN BREAST CANCER SURVIVORS

M.C. Serra^{1,2}, A.P. Goldberg^{1,2}, H.K. Ortmeier^{1,2}, A.S. Ryan^{1,2}, 1. *University of Maryland School of Medicine, Baltimore, Maryland*, 2. *Baltimore VA Geriatric Research, Education and Clinical Center, Baltimore, Maryland*

Evidence supports resistance training (RT) as a non-pharmacological therapy to improve quality of life (QOL), fatigue, and physical function in breast cancer survivors (BCS). Less is known about the effects of RT on metabolism and systemic and tissue inflammation. The aim of this study was to determine the effects of RT on inflammation and whether these changes relate to favorable effects on metabolic, physical function, and subjective outcomes in postmenopausal BCS. Eleven BCS (48–75 years old; 2–34 years cancer latency; BMI: 30 ± 4 kg/m²; mean \pm SD) underwent QOL (SF-36), fatigue (Piper fatigue scale), and function (6 min walk distance [6MWD] and 5 chair stand time) measurements before and after 16 weeks of whole-body RT. Blood pressure and lipid assessments, a 75 g OGTT, and skeletal muscle and adipose tissue biopsies also were performed. Plasma and skeletal tissue and adipose secretions were examined for IL-1 β , IL-6, IL-6SR, IL-8, SAA, and TNF- α protein content. RT improved strength 25–30%, QOL 10%, fatigue -58%, 6MWD 4%, chair stand time -15%, fasting insulin -18%, and systolic blood pressure -5% (P 's < 0.05). The protein content of IL-6SR, SAA, and TNF- α in plasma tissue and adipose secretions decreased ~25–35% (P 's < 0.05). There was a 75% increase in muscle protein content of IL-8 (P 's < 0.05). Changes in strength and inflammatory markers

were not associated with subjective, functional or metabolic outcomes, except chair stand time, which decreased with increasing leg press strength ($r=0.65$, $P<0.05$). The results support RT as a viable rehabilitation technique to improve subjective outcomes, physical function, metabolism, and inflammation in BCS.

THE GERIATRIC SUBSTANCE ABUSE RECOVERY PROGRAM (GSARP): SOLUTIONS IN POSTACUTE REHABILITATION

O. Burack, V.R. Cimarolli, G. Poole-Dayana, S. Samaroo, M. Bondy, I. Liu, *The New Jewish Home, New York, New York*

The Geriatric Substance Abuse Recovery Program (GSARP) set within a skilled nursing facility is the first medical rehabilitation initiative for elders integrating substance abuse (SA) recovery into post-acute care. Program goals are to improve psychological functioning and clinical outcomes (e.g. recovery plan adherence). An eight month pilot was conducted to examine program efficacy.

GSARP program components included identification of rehabilitation patients requiring SA services, assessment of patients' addiction and support needs; development of comprehensive individualized care plans to meet patients' inhouse needs (SA counseling, group and individual therapy, AA), involving caregivers, and linking patients with community services before discharge. To monitor recovery and track outcomes following discharge: patients were called within 48 hours, a home visit was conducted after two weeks, and phone interviews ($N=29$) were completed after 30 days.

Ninety nine patients participated in the intervention (Mean age = 65 years; 67% male; over 50% were minorities; 94% had early-onset addiction). Alcohol SA was most prevalent (91%), followed by illicit drugs (23%), and prescription drugs (9%). One-month after discharge: 69% with alcohol and 64% with drug abuse issues reported not having relapsed, 73% of respondents reported not having difficulty following their discharge plan, and 50%, reported continuing AA/ therapy. Additionally, 70% rated their program satisfaction as "excellent" or "good." No differences in depression were found from admission to 1-month post discharge. GSARP participants were more likely to be discharged home (74% vs. 47%) than patients who were referred to the program but refused participation ($N=25$).

DEVELOPMENT OF THE SIMPLIFIED PILATES EXERCISE PROGRAMME FOR PREVENTION OF FALLS IN OLDER ADULTS

T. Wong, Y. Chen, *The University of Hong Kong, Hong Kong, Hong Kong*

Traditional Pilates exercise programme may be too demanding for some older adults that may adversely affect their exercise compliance. Therefore, a two-stage pilot study was conducted to investigate the effectiveness of an expert-designed simplified Pilates programme comparing to the traditional Pilates programme. In stage one, four healthcare providers with more than 10-year of experience in exercise prescription were recruited to participate in a focus group aiming to develop an expert-designed simplified Pilates programme (eight Pilates exercises). In stage two, sixteen older community-dwelling adults (mean age = 79 ± 5.4 years) were

randomly recruited from two elderly community centres in Hong Kong and were randomly allocated to simplified Pilates training group or traditional Pilates training group. Each participant completed a 4-week (total 8 sessions) training programme and each session lasted for 60 minutes. All participants were required to complete a battery of physical and psychological assessments before (T0) and after completion of the training programme (T1). Muscle strength, flexibility, functional mobility, balance, depression, self-efficacy, fear of falling and anxiety level were measured. Results showed significant improvements after training in both simplified and traditional Pilates training groups ($p < 0.05$) on various physical outcomes, such as scores of Berg Balance Scale, Timed Up & Go test, Sit & Reach test and average peak force (e.g., left knee flexors, left hip abductors and left hip extensors). Additionally, participants who completed the simplified Pilates training improved significantly better than participants in the traditional Pilates training group in the scores of Berg Balance Scale and Geriatric Depression Scale.

GREAT TRIAL: PERSONALISED COGNITIVE REHABILITATION GOALS OF PEOPLE WITH EARLY-STAGE DEMENTIA

A. Kudlicka¹, S. Evans², J. Pool⁴, J.R. Oyebode³, B. Woods², L. Clare¹, 1. *Psychology, University of Exeter, Exeter, United Kingdom*, 2. *Bangor University, Bangor, United Kingdom*, 3. *Bradford University, Bradford, United Kingdom*, 4. *Dementia Pal Ltd, London, United Kingdom*

The use of individual goals in psychosocial interventions ensures that these interventions are aligned with patient's values and address their vital needs. There is preliminary evidence from small-scale studies that people with early stage dementia (PwD) can identify personally-meaningful therapy goals. Here we present evidence of successful goal-setting in a large multicentre RCT of cognitive rehabilitation for PwD.

The Bangor Goal Setting Interview was used to elicit therapy goals related to everyday functioning for 473 people with early stage AD, vascular, or mixed dementia as part of the baseline assessment in the GREAT trial. Researchers and PwD worked together to identify up to three specific, measurable, achievable, personally relevant and time-bound therapy goals. Identified goals were analysed thematically to reveal common therapy needs.

Over 1500 therapy goals were identified by 473 PwD. Goals were driven by the motivation to reduce dependence, improve safety and increase engagement in pleasurable activities. They related to better management of everyday life through improving orientation, contributing to household chores, managing medication, and locating lost items. There was also an emphasis on increase activity levels, with goals around participation in meaningful activities, socialisation, remembering names, exercising, and using new technology.

The overwhelming majority of PwD in the GREAT trial were able to identify meaningful therapy objectives. These findings have implications for research, clinical practice, and policy. An understanding of the areas where PwD most want support can be used to develop genuinely person-centred care and provide targeted support where and when it is needed most.

SESSION 3705 (POSTER)

PRIMARY CARE

WHAT GP AND PRACTICE CHARACTERISTICS MAKE A DIFFERENCE TO OUTCOMES IN LATER LIFE?

L. Palapar, L. Wilkinson-Meyers, T. Lumley, N. Kerse, *University of Auckland, Auckland, New Zealand*

This paper aims to identify physician and practice characteristics associated with better health outcomes of older people. We performed a secondary analysis of data from a cluster randomised controlled trial involving 3,893 community-dwelling patients aged 75+ enrolled in 60 randomly selected general practices in three urban regions in New Zealand (response rates were 52% practice-, 36% GP-, and 47% patient-levels). After controlling for patient-level predictors of health status, we examined the association between 25 GP- and practice-level characteristics and enrolled older patients' 36-month outcomes: functional ability, assessed by the Nottingham Extended Activities of Daily Living; ratings of quality of life domains, obtained using the WHOQOL-BREF; and rates of ambulatory sensitive hospitalisations from the national dataset of hospital events. The largest significant differences in 36-month outcomes are as follows: lower function in practices that followed-up missed appointments ($b = -0.44$, $p = 0.006$); higher function in practices with greater proportion of older patients ($b = 0.19$, $p = 0.004$); lower QOL ratings in practices that followed-up missed appointments ($b = -1.77$, $p = 0.018$); higher ratings in GPs attending more clinical sessions ($b = 1.90$, $p = 0.014$); 8% lower admission rates for each 10% increase in locum physicians ($p = 0.018$); and 113% higher rates in main urban centre practices ($p = 0.008$). The large differences in rates of ambulatory sensitive hospitalisations highlight potential benefits of investing in physician- and practice-focused interventions.

THE PATIENT-CENTERED MEDICAL HOME FOR THE OLDER ADULT: WHAT NEEDS TO BE DIFFERENT?

R.J. Schreiber^{1,2}, A.M. Bowman³, R.L. Golden⁴, D. Dorr⁵, 1. *Hebrew Senior Life, Boston, Massachusetts*, 2. *Harvard Medical School, Boston, Massachusetts*, 3. *Gerontological Society of America, Washington, District of Columbia*, 4. *Rush University, Chicago, Illinois*, 5. *Oregon Health and Science University, Portland, Massachusetts*

The purpose of the Patient-Centered Medical Home (PCMH) in the United States is to position the primary care system to provide better health care, better health, and lower cost per capita coupled with high-quality, accessible, and efficient care for all Americans. The PCMH is a promising model for transforming the organization and delivery of primary care. This presentation highlights the published White Paper entitled "Patient-Centered Medical Homes and the Care of Older Adults" in the fall of 2016. It provides a roadmap for the PCMH to continue the transformation of primary care delivery of care to the spectrum of older patients and/or their caregivers. The presentation will discuss the approach needed to recognize, facilitate, and encourage improved care for older adults in a PCMH setting by providing person-oriented

and patient-goal directed health care that is inclusive of connections to community-based organizations.

FACTORS ASSOCIATED WITH OTOTOXIC MEDICATION USE AMONG OLDER ADULTS

Y. Joo¹, K. Cruickshanks², B. Klein², R. Klein², M.I. Wallhagen¹, 1. *University of California, San Francisco, San Francisco, California*, 2. *University of Wisconsin, Madison, Madison, Wisconsin*

Drug related ototoxicity may exacerbate age-related hearing loss, yet older adults are often on multiple medications for concurrent chronic illnesses. The purpose of this study was to explore factors associated with ototoxic medication use among older adults in Beaver Dam, Wisconsin. Cross-sectional analyses were conducted using the large Epidemiology of Hearing Loss Study database. Trained interviewers administered a questionnaire at baseline and at a 10-yr follow-up examination that included questions on medications that participants were taking at least once per week and on their health history. The assessments included an additional evaluation of actual medications currently used to assure accuracy.

Participants with hearing loss were taking a greater number of ototoxic medications than those without hearing loss at both baseline and 10-year follow-up. Hypertension, diabetes, cardiovascular diseases (CVD) and history of smoking were associated with ototoxic medication use at baseline, while only CVD and hypertension were associated at 10-year follow-up. Age and hypertension were associated with change in ototoxic medication use over 10 years among participants who were not taking any ototoxic medication at baseline. Hypertension, diabetes, and CVD may add significant risk for hearing loss among ototoxic medication users because these diseases themselves are risk factors for age-related hearing loss. Therefore, health providers need to consider the benefits vs. harms of adding potential ototoxic medications to people who have diabetes, hypertension, or CVD. Epidemiological studies are needed to refine our understanding of the relationship between potentially ototoxic medications, age-related hearing loss, and healthy aging.

ASYMPTOMATIC PERSISTENT EOSINOPHILIA IN AN ELDERLY PATIENT WITH SURGICAL MESH

R. Haque¹, A. Umar², Z. Alavi¹, 1. *Division of Geriatrics, Michigan State University, East Lansing, Michigan*, 2. *Dow Medical University, Karachi, Pakistan*

69 years old female, presented with asymptomatic, incidental finding of eosinophilia, on her first office visit. Medical history of HTN and surgical history abdominal hernia repair with mesh, 5 years ago. She has no pets, no foreign travel, nonsmoker, with no alcohol or substance use. No drug allergies and no family history of malignancy or immune disorder. Her mammogram and screening colonoscopy was normal. She takes the following for the last 10 years; Aspirin, Amlodipine; supplements include Fe, folic acid and multivitamins.

Review of systems was unremarkable except for mild occasional itching at her surgical site. Physical exam was unremarkable, except for the hernia repair scars on her

abdomen. Cell count and differential, revealed an elevated eosinophil count (11.8 /cc mm); a persistent eosinophilia for the last 3 years, since her hernia surgery, was noted. Comprehensive metabolic panel was normal.

Results

Based on the temporal relationship of her medications to the development of eosinophilia, we concluded, that the persistent eosinophilia was indicative of possible subclinical, graft vs host reaction GVHD. She was advised periodic follow up and observation.

Discussion:

Surgical mesh has been associated with a robust GVHD and immune complications but there is a paucity of literature with respect to the elderly patients. Further studies are warranted about the impact of surgical implants in elders.

Conclusion:

Subclinical GVHD reactions, should be included in the differential diagnosis of Eosinophilia, in the elderly patient with surgical mesh. Late GVHD presenting asymptomatic eosinophilia, in the elderly, merits close monitoring and follow up

THE MEDICARE WELLNESS VISIT: AN UNDERUTILIZED PATH TO EXCELLENCE IN GERIATRIC PRIMARY CARE

D. Bluestein¹, R. Diduk-Smith¹, T.B. Hughes², M. Early¹, L. Mazzurco¹, 1. *Department of Family and Community Medicine, Eastern Virginia Medical School, Norfolk, Virginia*, 2. *Department of Pharmacy Practice, Hampton University School of Pharmacy, Hampton, Virginia*

Primary care faces a demographic imperative to serve older adults. However, primary care of seniors occurs in short visits that preclude systematic assessment and management of complex needs. Quality of care often suffers as a result. The Affordable Care Act has afforded Medicare recipients the benefit of an annual hour long wellness visit. However, nationally, only 10% of eligible people receive a Medicare Wellness Visit (MWV), a proportion that was mirrored in a community-based family medicine clinic in Southeastern Virginia (10.3%). In an effort to improve MWV rates of utilization, a 10 item survey was designed to ascertain among patients the extent to which the decision to utilize the MWV was influenced by their primary care clinician, their awareness of and satisfaction with the MWV. We sought to determine whether patients were aware of the MWV, if their primary care clinician had recommended one, and if there were attitudinal barriers towards having a MWV done. Emergent findings revealed: 1) recommendation by primary care clinicians was the strongest predictor of getting an MWV, 2) MWV recipients were highly satisfied with their experience, 3) attitudinal barriers such as "death panels", and concerns about costs, however, an aversion to various preventive services was not a barrier, and 4) the overwhelming majority of persons who had not had a MWV had never heard of the MWV. Findings led to patient education and the completion of 129 MWVs between April and July of 2016. Annualized, 384 MWVs represented an increased utilization rate of 74%.

AGING AND THE FREQUENCY OF NSAID-RELEVANT COEXISTING MEDICAL CONDITIONS IN THE PRIMARY CARE SETTING

L. Bloom¹, M. Blacketer², K. Boyle^{3,1}, A. Myers¹, R. Weinstein², 1. *Johnson & Johnson Consumer Products US, McNeil Consumer Healthcare Division, Fort Washington, Pennsylvania*, 2. *Janssen Research & Development, LLC, Titusville, New Jersey*, 3. *KE Boyle Consultants, LLC, Exton, Pennsylvania*

The second most common reason adults seek care from primary care providers (PCP) is musculoskeletal and connective tissue conditions; the most common medicines discussed at these visits are analgesics. Primary care providers can help promote the safe use of over-the-counter (OTC) analgesics, especially in the aging population, by identifying all coexisting medical conditions including those that increase the risk of NSAID associated complications. Data from 3 large healthcare claims databases (Truven Health) were analyzed to identify NSAID-relevant coexisting medical conditions of interest among adults ≥ 18 years with a PCP visit in 2013 and with at least one year of enrollment prior to their first PCP visit. The databases were representative of privately insured, Medicaid, and employer-based supplemental Medicare insurance populations. For this analysis, NSAID-relevant coexisting medical conditions of interest were asthma, CV risk (e.g., prior MI, coronary artery disease, congestive heart failure, hypertension, stroke), GI risk (e.g., history of gastrointestinal bleed, peptic ulcer disease, alcohol use, exposure to anticoagulants or steroids), and renal insufficiency. Hepatic cirrhosis was not included. At least 50% of all patients and at least 60% of patients diagnosed with a musculoskeletal disorder had at least one NSAID-relevant coexisting medical conditions. This frequency of at least one NSAID-relevant coexisting medical conditions increased with age in each population. These data reinforce the critical role PCPs can play in identifying aging patients with NSAID-relevant coexisting medical conditions and in turn providing them guidance on appropriate choice and use of OTC analgesics.

ATTITUDES TOWARDS DEMENTIA EXPRESSED BY MEDICAL STUDENTS AND RESIDENTS IN BRAZIL

A.F. Jacinto¹, A. Raza Leite³, V. Citero², P.J. Villas Boas¹, 1. *Faculty of Medicine of Botucatu - São Paulo State University, Botucatu, São Paulo, Brazil*, 2. *Federal University of São Paulo, São Paulo, Brazil*, 3. *Faculdade de Medicina de Botucatu - UNESP, São Paulo, Brazil*

The present study describes the attitudes towards demented patients in three different phases of medical education: the end of the last semester of medical school, the beginning and end of three residence programs. A questionnaire on attitudes towards dementia was applied to 338 subjects. The subjects answered that (a) the quality of life of the patients with dementia can be improved; (b) it is the physician's role to inform the family about the diagnosis of dementia without using euphemisms; (c) it is fair to refer the families to specialized services; (d) the General Practitioner has a major role in caring for these patients; (e) caring for the patients with dementia is more rewarding than frustrating. Four statements showed an evolutionary pattern with statistically significant differences ($p < 0.05$): (1) the residents in the final period of their training agreed less than the

resident in the beginning and less than the medical students that "much can be done to improve the quality of life of the caregiver"; (2) only the residents in the first period of their training agreed more than the medical students that "it is more useful than harmful to provide diagnosis" and (3) that "dementia is better diagnosed in specialized services"; (4) residents in the last period of their training agreed less than the less advanced medical student that "primary care has limited role in the management of patients." The results show that some attitudes change as the subjects turn from students to more mature doctors.

RISK EVALUATION OF SUPER-ELDERLIED IN JAPAN BASED ON POTENTIALLY INAPPROPRIATE MEDICATIONS

A. Nagakawa^{3,2}, M. Honda³, S. Bito³, 2. *Tokai University School of Medicine, Isehara city, Japan*, 3. *National Hospital Organization Tokyo Medical Center, Tokyo, Japan*

Older adults are considered to be at risk of developing multiple chronic diseases and polypharmacy. We conducted a study to clarify actual states of the prescriptions for the super-elderly patients aged 90 years and over in Tokyo, Japan. This study was done at an urban tertiary medical center in Tokyo Japan, and 203 patients age over 90 admitted from June 1 2009 to May 31 2012 were enrolled.

The demographics of the study were patients aged 90–104 years with the mean age of 93.62 (± 3.14), 74.4% female. The mean number of prescription drug was 5.2 (± 3.4) kinds and the mean daily cost of medications was 420.48 JPY. Of all patients, 54.2% received 5 or more medications, 16.7% received 9 or more. Furthermore, 35.0% received medications specified in Beers Criteria List as potentially inappropriate. In substudy, patients were classified into two groups based on the level of care need. The comparison of the number of drugs taken daily, pill counts, drug costs, and the use of potentially inappropriate medications in the Beers criteria was performed. There was no significant difference between the patients with the high care need and the low care need. As the conclusion, the super-elderlies aged 90 and over received multiple drugs, including potentially inappropriate medications. No differences were observed among the levels of the care need. Adequate medication reviews for this age group is critically needed.

COMPARISON OF ERADICATION RATE OF H. PYLORI WITH SEQUENTIAL REGIMEN BETWEEN ELDERLY AND YOUNG PEOPLE

J. Kang, D. Lee, *Division of Gastroenterology, Seoul National University Bundang Hospital, Seongnam, Gyeonggi, Korea (the Republic of)*

Background

The possibility of exposure to specific antibiotics is increased with aging. Especially, if the patient is used specific antibiotics commonly used in the eradication of *Helicobacter pylori* (H.P.) to treatment other disease. Therefore, the treatment of H.P. in the elderly could be cautious about drug resistant compared to the young.

Aim

This study aims to find out the difference of H.P. treatment resistance according to age.

Methods

The 231 patients were enrolled who were diagnosed H.P. and treated with sequential therapy (Rabeprazole, amoxicillin followed by metronidazole, clarithromycin or moxifloxacin) at the Seoul national university Bundang hospital, Korea, from January 1, 2013 to December 31, 2015. We classified patients older than 60 years old group (Group A), and between 20 to 59 years old group (Group B). And the difference in eradication rate of patients who underwent sequential therapy as a primary eradication therapy were compared in the two groups.

Results

The 184 patients were successfully treated to sequential therapy (79.6%). The 116 patients were group A and 86 patients were on treatment success (74.1%). The 115 patients were group B and 98 patients were on treatment success (85.2%). Eradication rate differences between these two groups was statistically significant with P value of 0.036 (Pearson's chi-square test).

Conclusion

The group B is significantly higher eradication rates (85.2%) compared with the group A (74.1%). Antibiotic resistance maybe one of the possible cause of low eradication rate in the elderly patients. Further studies are needed to clarify the difference between two groups.

REDUCING POLYPHARMACY AND IMPROVING MEDICATION RECONCILIATION IN A FAMILY MEDICINE CLINIC

C. Masuda, L. Aggarwal, M.Y. Cheung Katz, *Family Medicine Residency, University of Hawaii, JABSOM, Honolulu, Hawaii*

Polypharmacy can adversely impact patient safety and healthcare systems. We designed a pilot, randomized non-blinded IRB approved study (CHS23290) to identify and address potential polypharmacy in adults 18 years and older with 4 medications or more using a team of physicians, pharmacist, and pharmacy students. Recruitment is ongoing with goal n=50 control, n= 50 intervention. To date, 12 patients are enrolled. Pharmacist/students chart review electronic medical records and select per above criteria and call prior to appointment, to obtain verbal consent for study participation, conduct medication reconciliation, and identify patient concerns. Medications are reviewed for appropriateness including drug-drug interactions, therapeutic appropriateness, and duration of drug treatment. Discrepancies and recommendations are addressed on day of visit with physician followed by post-visit surveys. Examples of interventions: discontinuing medication for side effect or lack of efficacy; adding, removing, or changing dose to reflect accurate medication profile; changing administration route for ease of use; adding medications to better control condition. Primary outcomes to date for 8 intervention patients at time of abstract submission – 12% of medications were decreased, and 100% of patient's medications were changed. Secondary outcome – 2 potentially harmful medications eliminated. Post-survey, 87.5% of patients felt they had more time with physicians during the clinic visit. Preliminary results indicate that interdisciplinary medication reconciliation prior to and during office visits can help to reduce the number of medications used.

Polypharmacy is a significant patient safety concern especially in geriatric populations; interdisciplinary medication reconciliation is key in addressing this issue.

DIFFERENT MEANINGS OF HEALTHY AGING FROM MULTIPLE PERSPECTIVES AND THE PROMOTION OF HEALTHY AGING

P. Manasatchakun^{1,2}, Å. Roxberg³, M. Asp¹, *1. School of Healthcare and Social Welfare, Mälardalen University, Eskilstuna, DRONTNINGGATAN 16 A, Sweden, 2. Boromarajonani College of Nursing Udon Thani, Muang, Udon Thani, Thailand, 3. School of Health and Welfare, Halmstad University, Halmstad, Sweden*

In Thailand, the number of older population rises more significantly than other countries and the second fastest in South-East Asia, next to Singapore. In the northeastern country has high proportion of old people and the figure keeps increasing. Although healthy ageing is the goal in promotion of older people's health, however there is a lack of studying regarding this concept in this region. A qualitative approach has been conducted. Participants involve 17 older persons, 14 relatives who are responsible for taking care of older people and 36 community nurses who worked with those people. In depth interviews with open-ended questions were used to gain a variation of conceptions of healthy ageing from older persons and relatives' perspectives. Focus group discussions were used to engage the community nurses in discussions about the meaning of and promotion of healthy aging. Phenomenographic analyzing method was used to analyze the data from older people and their relatives. A latent content analysis was conducted to analyze the data from focus groups discussion. The findings reveal variations of healthy aging meaning through the three descriptions; "being interconnection", "the ability to do something well and feeling valued" and "thinking beyond capacity and function of body and mind". Promoting of healthy aging was described as "providing health assessment", "sharing knowledge" and "having limited resources". These findings shed some light upon the importance of holistic approach when promoting of healthy aging. The knowledge gained from the study may be helpful for improving healthy aging strategies in Thailand.

SESSION 3710 (POSTER)

QUALITY OF LIFE AND SUBJECTIVE-WELL BEING IN LATER LIFE I

QUALITATIVE MEASURES OF HEALTH-RELATED QUALITY OF LIFE IN AN OLDER ADULT POPULATION

N. Romanowski, A.R. Eisenstein, *Research, CJE SeniorLife, Chicago, Illinois*

This study aimed to explore domains that are important to vulnerable older adults in relation to their Health-Related Quality-of-Life (HR-QOL) through a qualitative assessment. We then compared qualitative findings to a standard QOL measure. This was a secondary data analysis from a project funded by the Michael Reese Health Trust, designed to assess

the health of older adults ($n=232$) in the Chicagoland area receiving services from CJE SeniorLife, a non-profit community based organization. HR-QOL is a concept being used nationally to assess how health status impacts quality of life. HR-QOL is defined to include several domains of health, including physical and mental health, social functioning, and emotional well-being. Analysis from this study found that when directly asked about HR-QOL, older adults brought up some topics that were not included in traditional HR-QOL measures. When asked to consider anything and everything related to their HR-QOL, 62% of responses included issues related to mobility, 53% included themes related to medical issues, and 49% included themes related to general health. Qualitative themes were then compared to quantitative findings. Those who rated their QOL as very good or excellent were more likely to define HRQOL as being related to mobility (68%), those who ranked their QOL as poor/fair were more likely to define HRQOL related to access to medical care (57%). HRQOL is an important concept, but we must understand what it means for older adults, and which domains of health are most salient to them.

IMPACT OF PRESENT-ORIENTED SAVORING ON OLDER ADULTS' PSYCHOLOGICAL WELL-BEING

J.L. Smith, *Institute on Aging, Mather LifeWays, Evanston, Illinois*

Savoring is the use of positive emotion regulation strategies to increase awareness, enjoyment, and appreciation of positive experiences. Savoring can encompass past (positive reminiscence), present (savoring the moment), or future (positive anticipation) positive experiences. According to socioemotional selectivity theory, older adults tend to prioritize emotional goals in the present moment. The current study examined whether the ability to savor the moment may be more strongly associated with measures of well-being in older adults compared to the ability to savor past or future experiences. Participants ($n = 266$, mean age = 73.4 years, 81% female, 74% White) completed a survey that measured past-, present-, and future-oriented savoring ability, happiness, depression, and resilience. Multiple regression analyses were conducted with past, present, and future savoring ability predicting psychological well-being (i.e., happiness, depression, or resilience). Higher levels of present-oriented savoring were significantly related to greater happiness, lower depression, and higher resilience, $b = .65$, $\beta = .57$, $p < .001$, $b = -.23$, $\beta = -.45$, $p < .001$, and $b = .51$, $\beta = .43$, $p < .001$, respectively. Past- and future-oriented savoring were not significant predictors after accounting for present-oriented savoring. These findings suggest that the ability to savor the moment contributes to greater psychological well-being in older adults. Interventions designed to enhance older adults' savoring the moment may be more beneficial for enhancing psychological well-being than interventions focused on positive reminiscence or positive anticipation.

COMMUNITY COHESION AND PSYCHOLOGICAL WELL-BEING AMONG ELDERS WITH AND WITHOUT DEMENTIA

S. Kim, R. Blieszner, *Virginia Tech, Blacksburg, Virginia*

Community cohesion, feelings of trust and belonging in physical living places, may encourage elders' participation in

social activities and enhance psychological well-being. Using two waves (R1, R2) of the National Health and Aging Trend Study, we examined the direct effect of community cohesion on psychological well-being and the indirect effect of social activity participation among elders living in the community. Both the dementia ($n=806$) and the no dementia ($n=3754$) groups rated community cohesion (R1) and psychological well-being (R2; quality of life, positive and negative affect). Elders also reported the number of social activities in the last month (visiting others, religious services, clubs/classes, going out for enjoyment) at R2. Stratified structural equation models were estimated for elders with and without dementia. For the dementia group, community cohesion had direct effects on quality of life ($\beta=0.195$, $p<.001$) and positive affect ($\beta=0.19$, $p<.001$), but not negative affect. For the no dementia group, community cohesion was directly associated with quality of life ($\beta=0.175$, $p<.001$), positive affect ($\beta=0.15$, $p<.001$), and negative affect ($\beta=-0.14$, $p<.001$). Indirect effects of social activity participation were found with quality of life (dementia group: $\beta=0.05$, $p<.001$; no dementia group: $\beta=0.04$, $p<.001$), positive affect ($\beta=0.04$, $p<.001$; $\beta=0.04$, $p<.001$), and negative affect ($\beta=-0.04$, $p<.001$; $\beta=-0.03$, $p<.001$) in elders with and without dementia, respectively. Better psychological well-being among elders with high levels of community cohesion was associated with increasing participation in social activities. These findings demonstrate the importance of developing and maintaining community-level social cohesion for sustaining well-being among elders regardless of dementia status.

COGNITIVE RESERVE IS ASSOCIATED WITH QUALITY OF LIFE, SELF-ESTEEM, AND SELF-EFFICACY IN LATER LIFE

C. Opdebeeck^{1,2}, A. Kudlicka⁴, S. Nelis³, C. Quinn³, L. Clare³, 1. *Lancaster University, Lancaster, Lancashire, United Kingdom*, 2. *University of Manchester, Manchester, United Kingdom*, 3. *University of Exeter, Exeter, United Kingdom*, 4. *Manchester Metropolitan University, Manchester, United Kingdom*

With the growing older population worldwide there is increasing emphasis on helping this population age well. Cognitive reserve may provide a pathway to maintaining both cognitive and emotional health in later life. Previous research has shown that higher levels of cognitive reserve are associated with better cognitive function, reduced risk of dementia and lower levels of depressive symptoms. This study of 236 community-dwelling people aged 60+ sought to assess whether cognitive reserve is also associated with greater self-perceived quality of life, self-esteem and self-efficacy. Cognitive reserve was assessed with the Lifetime of Experiences Questionnaire, which assesses a combination of education, occupational complexity, and lifetime engagement in cognitive and social activity. Higher levels of cognitive reserve were associated with significantly higher levels of self-reported quality of life, self-esteem, and self-efficacy. Comparing the individual constituent elements of the cognitive reserve measure, education was the factor most strongly associated with self-efficacy, while engagement in cognitive and social activity in later life was the factor most strongly associated with quality of life and self-esteem. Occupational complexity was not associated with any of the dependent

variables, suggesting the results were not attributable solely to socioeconomic status. Encouraging people to continue to engage in the cognitive and social activities associated with higher cognitive reserve may increase well-being in later life in terms of quality of life, self-esteem and self-efficacy as well as helping to maintain cognitive function.

WELL-BEING OVER THE LIFE COURSE: CHANGES AND ADAPTATIONS

C.A. Heaney¹, T. Rich¹, J. Evered², S.J. Winter¹, E. Avery¹, 1. *Stanford Prevention Research Center, Stanford University, Stanford, California*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*

Scholars have been trying to understand the concept of well-being for hundreds of years. Many experts from multiple disciplines have weighed in on the topic. Our research takes a phenomenological approach, conducting a mixed methods study to explore how people think about and experience well-being. We conducted over 100 semi-structured interviews with people from 18 to 82 years of age. During these interviews, people were asked to describe times in their lives when they experienced particularly high and low well-being. In addition, we collected survey data from 222 individuals (27 to 84 years old), assessing the various domains of well-being culled from rigorous analysis of the interviews. Results indicate that well-being is a multi-faceted concept that includes various domains: how people feel physically (e.g., pain experienced, vitality, ability to resist illness), emotional health, social connectedness, stress and resilience, finding purpose and meaning in daily life, taking care of oneself through healthy lifestyles, and several other domains. Older participants (age 60 and older) and younger participants reported similar levels of well-being, in spite of the fact that the older group was more likely to have one or more chronic illnesses. Different domains of well-being were more strongly associated with global ratings of well-being between the groups. For example, being resilient when facing setbacks was more strongly associated with well-being among the older group while physical functioning was more strongly associated among the younger group. The qualitative data illustrates how and why people change their weighting of the domains as they age.

NAPPING FREQUENCY, PLANNED VS. UNINTENTIONAL NAPS, AND DAYTIME FUNCTIONING IN OLDER ADULTS

J.T. Owusu¹, C. Ramsey^{2,3}, M. Tzuang¹, C. Kaufmann⁴, J.M. Parisi¹, J.D. Kasper¹, A.P. Spira¹, 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 2. *Veteran Affairs Connecticut Healthcare System, West Haven, Connecticut*, 3. *Yale School of Medicine, New Haven, Connecticut*, 4. *University of California San Diego School of Medicine, San Diego, California*

It is unclear whether napping is positively or negatively associated with activity participation among older adults, and less is known about whether planned vs. unintentional napping affects this association. We studied 2,852 community-dwelling adults aged ≥ 65 from Rounds 3 or 4 (2013–2014) of the National Health and Aging Trends Study. Participants reported napping frequency (never, rarely, some days, most days, every day), whether naps were planned vs.

unintentional, and whether health or functioning restricted their activity participation (e.g., socializing, volunteering). We categorized participants reporting rarely/never napping as non-nappers and remaining participants as either planned or unintentional nappers. In further analyses excluding non-nappers, participants were categorized as napping some days or most days/every day. We fit logistic regression models with activity restrictions as the outcomes and napping variables as primary predictors, with adjustment for age, sex, race, education, body mass index, anxiety and depressive symptoms, and self-rated health. Overall, 23.3% of participants reported planned naps and 29.7% unintentional naps; 47.0% were non-nappers. Among nappers, 51.9% reported napping some days. After adjustment, compared to non-nappers, planned and unintentional nappers had a greater odds of activity restrictions (Planned OR=1.48, 95% CI 1.14–1.92; Unintentional OR=1.50, 95% CI 1.14–1.96). Compared to those napping some days, those napping most days/every day had a greater odds of activity restrictions (OR=1.70, 95% CI 1.29–2.23). Among older adults, frequent, planned and unintentional naps are associated with a greater odds of activity restrictions. Longitudinal studies with objective napping measures are needed to further investigate links between napping and activity restrictions.

EDUCATIONAL INEQUALITIES IN LATE-LIFE DEPRESSION ACROSS EUROPE

T. Hansen, *NOVA, HIOA, Oslo, Norway*

This study explores country- and gender stratified absolute and relative educational differences in depression among older adults from 10 European countries. We also examine whether the social gradients in depression are explained by differential exposure to adverse circumstances. We use cross-sectional, nationally representative data from the Generations and Gender Survey. The analysis comprises 27,331 Europeans aged 60–80. Depression is measured with a seven-item version of the Center for Epidemiologic Studies Depression (CES-D) scale. Findings show considerable between-country heterogeneity in late-life depression. An East-West gradient is evident, with rates of depression up to threefold higher in Eastern European than in Scandinavian countries. Rates are about twice as high among women than men in all countries. Findings reveal marked educational gaps (prevalence differences) in depression in all countries, yet the gaps are larger in weaker welfare states. This pattern is less pronounced for the relative inequalities (odds ratios). Some countries observe similar relative inequalities but vastly different absolute inequalities. We argue that the absolute differences are more important. Educational gradients in depression are strongly mediated by individual-level health and financial variables. Socioeconomic variation in late-life depression are larger in countries with poorer economic development and welfare programs.

DAILY MINDFULNESS AS A MEDIATOR OF DAILY STRESSORS AND PHYSICAL AND MENTAL HEALTH IN OLDER ADULTS

S.D. Neupert, J.A. Bellingtier, E.J. Lefebvre, L. Zhang, *Psychology, North Carolina State University, Raleigh, North Carolina*

Daily stressors are associated with increased physical symptoms and negative affect in older adults, but mindfulness may be a very promising tool in the fight against stressors and their response. Mindfulness is characterized by focusing on the present and is a naturally occurring characteristic that differs between and within individuals. Mindfulness may facilitate well-being through self-regulated activity and fulfilment of basic psychological needs (i.e., autonomy, competence, and relatedness). We examined daily mindfulness as a mediator of the relationships between daily stressors and physical symptoms as well as negative affect in a sample of older adults. Participants ($n = 116$, ranging in age from 60–90) were recruited via mTurk (Amazon's crowdsourcing platform) and completed a 9-day daily diary study online. Using multilevel models for our analyses, we found evidence for trait as well as state variation in mindfulness; 68% of the variance in daily mindfulness was between-person and 32% of the variance was within-person. We did not find evidence for mediation of daily mindfulness when examining negative affect, but we did find evidence for mediation of daily mindfulness when examining physical symptoms. Specifically, days with increases in daily stressors were associated with decreases in mindfulness which was then associated with increases in physical health symptoms. These results suggest that efforts to increase daily mindfulness may be useful in reducing physical reactivity to daily stressors in older adults.

ART FOR AGES: THE BENEFITS OF MUSICAL EXPERIENCE ON THE HEALTH AND WELL-BEING IN NURSING HOMES

C. Pedrazzani¹, S. Cavalli¹, P. Di Giulio¹, H. Eiholzer², P. Paolantonio², D. Fancourt³, A. Williamon^{3,2}, 1. *Centre of Competence on Aging, University of Applied Sciences and Arts of Southern Switzerland (SUPSI), Manno, Switzerland*, 2. *Conservatorio della Svizzera italiana/University School of Music, Lugano, Switzerland*, 3. *Centre for Performance Science, Royal College of Music, London, United Kingdom*

Listening to music has been shown to play a significant role in many older adults' lives and the health benefits of making music for elders have also been demonstrated in recent studies. However, the field remains under-researched.

This communication reports a not randomized clinical trial conducted in four Swiss nursing homes (NH). Residents aged of 65 years old and more, willing to take part in music activities, participated to 10 music sessions: one group focused on singing ($n=40$) and the other on rhythm ($n=40$). Participants involved in other not-music activities of the NH acted as controls ($n=40$).

The music sessions were held – with live singing and playing simple instruments but also sticks, cups or graters – by the master's students and musicians of the Conservatorio della Svizzera italiana/University School of Music. They were well attended by the residents with minimum drop out.

A music questionnaire together with measurements of quality of life (SF12), depression (GDS scale) and loneliness (De Jong Gierveld Loneliness Scale) scales were administered at baseline and after the last session. Before and after one music session, saliva samples were collected to measure levels of stress hormones. Psychological data are compared using repeated measures analysis of variance (ANOVA) across time and between groups, biological data are analyzed using

saliva multiplex assays. Data show an increase in the importance conferred to music by residents taking part in music activities and an improvement in their perceived health status and in some dimensions of quality of life and well-being.

RESILIENCE MEDIATED THE BENEFICIAL EFFECT OF MALLEABLE MINDSET ON OLDER ADULTS' COGNITIVE WELL-BEING

T. Li, *Education University of Hong Kong, Hong Kong, China*

Implicit beliefs regarding whether people's personal characteristics attributes (e.g. intellectual ability, personality, moral character, and shyness) are changeable (the malleable mindset) or static (the fixed mindset) are shown to be related to a lot of important outcomes, including better academic achievement, higher level of resilience, more efficient self-regulation, and less negative reaction to social exclusion. However, most previous studies about implicit theory were about adolescents and young adults. Only very few studies have tested the effect of implicit theory in older adults. Older adults frequently encounter major or minor changes in their lives, such as retirement, loss of loved ones, or change of residence. Believing that one's intelligence is malleable after putting in effort may lead older adults to be more willing to try relatively novel and difficult tasks in life, and be more resilient when facing adversities. To test the important role of implicit theory in later adulthood, the current study recruited 112 older adults aged 60 to 92 years old and measured their implicit theory of intelligence, resilience, and cognitive difficulty in everyday tasks by questionnaires. Results revealed that malleable mindset was significantly related to higher level of resilience and less difficulty in everyday cognition. Furthermore, resilience fully mediated the beneficial effect of malleable mindset on everyday cognition. The findings support that implicit mindset is important for older adults' well-being. More studies can be conducted to thoroughly investigate the benefits of holding a malleable mindset in later adulthood.

GENDER DIFFERENCES IN QUALITY OF LIFE OF URBAN ELDERS IN ETHIOPIA

M. Kotecho², M.E. Adamek¹, 1. *Indiana University, Indianapolis, Indiana*, 2. *Addis Ababa University, Addis Ababa, Ethiopia*

According to WHO, two-thirds of the world's older adults live in developing nations. This proportion is expected to increase to 80% by 2050. Sweeping social and demographic changes in developing countries such as Ethiopia raise many questions regarding the quality of life of older adults, particularly women. In the absence of public pensions and with family supports waning due to migration and poverty, the well-being of an alarming number of elders is at-risk. This study examined gender differences in the quality of life of urban older adults aged 60 and over in Addis Ababa, the capital city of Ethiopia. Data were collected by face-to-face interviews in 2014 from 384 older adults (208 women, 176 men). The WHOQOL-BREF was used to assess quality of life in 4 domains (physical, psychological, social, environmental). Over half of respondents had incomes of less than \$25 a month, with women faring worse than men. Only 10% of respondents rated their health as excellent. Not surprisingly,

over one-third (37%) of elders rated their QOL as poor or very poor and another third were undecided. Women, the old-old, those lacking formal education, and those with lower incomes reported significantly lower QOL in the physical, psychological and social domains. Physical functioning, social support and perceived economic status had a direct effect on all four domains of quality of life. These findings can be useful in advocating for policy changes and in designing intervention strategies to promote QOL in older adults in developing nations.

FACTORS RELATED TO WELL-BEING IN CHILEAN CAREGIVERS OF OLDER PERSONS WITH DEMENTIA

J.M. Aravena², C. Albala², J. Gajardo³, 2. *INTA University of Chile, Santiago, Chile*, 3. *University of Chile, Santiago, Chile*

Well-being related to care for person with dementia (PwD) is an important health measure as it involves both negative and positive implications of caregiving. To learn about factors related to caregiver's well-being perception, a cross-sectional study was conducted in family caregivers of older persons with mild and moderate dementia, who assisted a daycare center for dementia in Santiago, Chile, from March to July 2016. Data were collected using the following assessments: PCI (perceived wellbeing), ZBI-6 (caregiver burden), EQ-5D (health perception), GDS-Reisberg (dementia severity), NPI-Q (neuro-psychiatric behaviors and distress) and ADCS-ADL (activities of daily living). The relationship between perceived well-being and other factors was evaluated through correlations (r,s) and logistic regression models (OR). In 86 subjects, significant correlations were observed ($p<0,05$) for perceived well-being and caregiver burden ($r=-0,53$), health perception ($s=0,39$), depressive symptoms ($s=-0,44$), activities of daily living ($r=0,21$), neuro-psychiatric behaviors ($r=-0,43$) and distress ($r=-0,54$). Perceived well-being and its dimensions were associated negatively to neuro-psychiatric behaviors (OR=1,07; 95%CI=1,03-1,15), caregiver burden (OR=1,48; 95%CI=1,18-1,86), and positively associated to activities of daily living (OR=0,95; 95%CI=0,91-0,99). Caregivers of PwD perceived well-being does not relate solely to burden sensation, but also to health situations and PwD symptoms. Interventions targeting caregivers should not only consider the negative implications of care (as burden) but also the positive elements that could be useful to improve well-being.

SOCIAL CAPITAL, HEALTH, AND SUBJECTIVE WELL-BEING IN THE VERY OLD: THE K2 STUDY

M. Takayama¹, Y. Ishioka¹, I. Sugawara², Y. Masui³, M. Saganuma⁴, M. Ogawa³, 1. *Keio University, Yokohama, Kanagawa, Japan*, 2. *Tokyo University, Tokyo, Japan*, 3. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 4. *Tokai University, Isehara, Japan*

Aging populations are becoming a worldwide phenomenon that has turned the attention of researchers and politicians towards strategies tackling not only financial but also societal issues relevant to healthy ageing. Regarding social issues relevant to aging, social capital resources and sense of community have found to be important for understanding health and well-being. However, if and how social capital and psychosocial factors effect on health and well-being in

the very old yet to be elucidated. The purpose of this study is to investigate the effects of structural and cognitive aspects of social capital, and sense of community on self-rated health and subjective well-being among older adults aged 75+ years, living in Japan. The participants were 873 Japanese older adults aged 75, 80, or 85 years. Concerning social capital, we assessed informal social networks, general trust, norms of reciprocity (mutual aid), and feeling of safety. Sense of community was measured by attachment, membership, and cohesion. Subjective Well-being was assessed by evaluative well-being (life satisfaction), hedonic well-being (positive affect), and isolation. Hierarchical regressions showed that social capital and sense of community were not associated with hedonic well-being significantly, whereas these factors were associated with higher self-reported health and higher evaluative well-being, and lower isolation beyond the effects of sociodemographic factors and physical functional limitations. Moreover, the results showed that social capital and sense of community were more strongly associated with higher life satisfaction and lower isolation among older adults aged 80 and over than those aged 75 years.

LESSONS LEARNED FROM TEACHING THE ART OF HAPPINESS TO OLDER ADULTS

E. Orsega-Smith, S. Goodwin, K. Greenawalt, J. Turner, E. Rathie, *Behavioral Health & Nutrition, University of Delaware, Newark, Delaware*

As the US population ages, late life depression becomes more of a public health problem. Depression is associated with increased mortality and decreased physical, cognitive, and social functioning, which can impact the ability to maintain independence. The Art of Happiness is an 8-week intervention based on the teachings of the Dalai Lama with the goals of enhancing happiness levels and overall mental wellbeing in older adults. This pilot program conducted at a senior center consisted of 90 minute classes that examined several topics including: (1) defining happiness, (2) stress management, (3) reflecting on happiness, (4) compassion/human connection, (5) forgiveness, (6) transforming suffering, (7) mindfulness, and (8) humor. 20 participants who completed the course were mostly married (42.1%), female (80%) and Caucasian (90%) with an age range of 56–84 years of age (mean age= 72.26 ± 7.38). Participants' levels of gratitude, life satisfaction, depression, mindfulness, arousal states, and subjective happiness were assessed pre and post program. Paired t-tests showed significant improvements in participant subjective happiness ($p<.01$), mindful awareness ($p<.05$), PHQ9 depression scores ($p<.01$), and the AD/ACL- subscore of tension ($p<.0001$). Results also showed a trend of improvements in gratitude levels, satisfaction with life, and perceived stress, however these changes were not significant. These results suggest that older adults may benefit from participating in programs that emphasize positive outlook and mindful awareness. Future studies will investigate how to implement programs in other older adult settings, including continuing care retirement communities.

RELIGIOUS MEANING AND PSYCHOSOCIAL DEVELOPMENT IN LATE LIFE

R.O. Castellanos¹, N.M. Mendoza Ruvalcaba², E. Arias-Merino², 1. *INSTITUTO DE CIENCIAS BIOMÉDICAS,*

UNIVERSIDAD AUTÓNOMA DE CIUDAD JUÁREZ,
CIUDAD JUÁREZ, CHIHUAHUA, Mexico, 2.
UNIVERSIDAD DE GUADALAJARA, GUADALAJARA,
JALISCO, Mexico

Religious meaning is the process of turning to religion in an effort to find a sense of purpose and direction in life and a sense that there is a reason for self existence throughout the life span and development. The aim of this study is to examine the relationship between religious meaning and the psychosocial development (generativity and integrity), and life satisfaction in older adults.

Cross-sectional study, n=393 community-dwelling older persons 60+years, Jalisco Mexico. Mean age of participants was 70.74 (SD=8.35). The assessment included Religion Meaning Scale, Loyola Generativity Scale, Integrity scale, Satisfaction With Life Scale, and socio-demographics. Data were analysed in SPSS-18, chi-square and Pearson correlation coefficient was calculated.

Most of the participants strongly believed that God put them in this life for a purpose (83.5%), God has a specific plan for their lives (80.2%), God has a reason for everything (83.3%), their Faith gives them a sense of direction in life (84.5%), helps to better understand themselves (83.7%) and other people (82.2%).

In general, religious meaning was positive related to generativity, integrity and life satisfaction.

Specifically, there were found differences in associations between Faith or God component of the religious meaning and psychosocial development.

It was found a stronger significant positive Faith – generativity relationship, integrity (transcendence), and satisfaction with life ($p < .05$).

It was found a positive relationship between religious meaning and the psychosocial development, and life satisfaction in older adults. Religion may have the potential to capture the core issues involved in the psychosocial development in the aging.

SESSION 3715 (POSTER)

SUCCESSFUL AGING: QUALITY OF LIFE, WELL-BEING, AND SOCIAL INCLUSION AND NETWORKS

VARIATION BY GENDER AND AGE IN THE HEALTH EFFECTS OF ECONOMIC STRESSORS

R.L. Brown¹, J.A. Richman², K.M. Rospenda², 1. *Sociology, University of Kentucky, Lexington, Kentucky*, 2. *University of Illinois-Chicago, Chicago, Illinois*

Research in the wake of the recent recession has shown differences by gender and age cohort in the effects of economic stress on indices of psychological and behavioral health. To improve our understanding of these differences, we conduct a series of recursive structural equation models using data from a national survey conducted in 2009. We first consider variation by age and gender in a wide array of economic stressors, including home ownership problems, undesirable living situation, problematic employment situation, unemployment or underemployment, inadequate health insurance, social role constraints, and inadequate sick time. We next explored the possibility that the associations between the economic stressors examined and psychological

distress, past-month drinking and problematic drinking may vary within gender by age cohort. The results indicate clear differences in how one's age cohort influences the effects of economic stressor exposure across health outcomes, and in ways that appear gendered. Among women, for example, there is a clear pattern that employment-related stressors are of greater relevance for women of younger age cohorts, whereas non-work-related stressors appear to be of greater relevance for older women. In contrast, among men, work-related stressors appear to be most salient for psychological well-being and alcohol consumption among older men. These findings indicate that prevention or intervention strategies aimed at reducing psychological and behavioral health issues may be more efficacious if they address age and gender variation in how an economic downturn is experienced.

“WITHOUT WALLS” SENIOR CENTER PROGRAMMING AS A STRATEGY FOR RURAL SOCIAL ENGAGEMENT

D. Wihry¹, L.W. Kaye¹, J. Crittenden¹, A. Davidoff², 1. *Center on Aging, University of Maine, Bangor, Maine*, 2. *Gateway Seniors Without Walls, Orono, Maine*

Limited transit options and long travel distances heighten the risk of isolation of older adults in rural regions. These challenges, as well as limited funding for fixed physical infrastructure and paid program staff in rural areas, necessitate consideration of adaptive, nontraditional, senior center models. This poster examines facilitating factors and challenges in the development of Gateway Seniors Without Walls, an older adult-led virtual senior center operating without a standing facility in a rural US region providing social, and health promotion programming at partnering community sites as well as serving as a connector to formal health, social service, and business resources. In 2015, Gateway partnered to provide approximately 30 activities monthly representing 1,162 hours of programming. In 2013, ten community member focus groups were convened to inform the design of Gateway. Dominant themes included: 1) concerns about transportation as a barrier to accessing senior center programming; 2) a desire for programming that extended beyond entertainment and social activities to include information and resources for healthcare, education on aging, and legal services; and 3) a desire for diverse single session activities to compliment regular programming. Methods for this qualitative study included a review of focus group and meeting notes, and information provided by key informants associated with Gateway. Key challenges identified include: identifying volunteer older adult leadership in formulating programming; collecting participation and demographic data from attendees at diverse sites; and successfully marketing health and wellbeing-focused programs to potential participants. Best practices for program replication in other rural locations will be provided.

DEVELOPING CRITICAL FACTORS ASSOCIATED WITH POSITIVE OUTCOMES FOR INFORMAL CAREGIVERS

T. Dalton, M. Parsons, N. Sheridan, *University of Auckland, Auckland, New Zealand*

Informal caregivers are the backbone to the health system and need support in their role as caregivers through

policy and practice. Since the neoliberal reforms of the 1980s, the onus of care has increasingly been placed upon friends and families. Societal changes, including ageing in place has resulted in greater pressure on informal caregivers. This research reveals critical success factors that can lead to positive health outcomes for informal caregivers and care recipients who are older adults, people with disabilities and people suffering chronic illnesses. This research employed a mixed methods approach. Data from qualitative interviews informed the development of a New Zealand-wide survey that was conducted in 2013 over 12 months. Six hundred and seventy responses were received from caregivers about 'best practices' that would support their provision of care. Caregivers reported on the factors that improved their quality of life that positively affected the people they cared for. The significant factors influencing quality of life included finances, consideration of the positive and negative aspects of caring and practical caregiving support. Measuring quality of life is important as the success of outcomes for care recipients are dependent upon the caregiver's well being. This research will inform policy and practice that supports informal caregivers and those that are cared for. There is an urgent need to develop best practices associated with positive health outcomes for caregivers that may also improve sustainability of quality care.

EXPLORING PROGRAMS FOR REDUCING SOCIAL ISOLATION AND DEPRESSION IN RURAL AGED CARE CLIENTS

L. Parkinson¹, M. McAllister¹, N. Molyneux¹, L. Franck¹, D. Jeffrey², 1. CQUniversity, Rockhampton, Queensland, Australia, 2. PresCare, Brisbane, Queensland, Australia

The link between social isolation and poor health is well established. However, effective interventions to reduce social isolation in older people, and how to implement these in aged care is less clear. This project, a collaboration between CQUniversity Australia and PresCare aged care, used literature reviews and environmental scans to meet the overall objective of describing how social isolation and depression impact on health and wellbeing of older people living in regional areas, and how to reduce these effects for this group.

There is a lack of evidence for effective interventions to reduce the effects of social isolation and depression in older clients, particularly in regional areas, but a plethora of past projects. The main success factors for successful interventions were enhancing group membership and identification through socialization, providing meaningful activities that enhanced sense of belonging, and using a social identity approach to tailor activities to the client characteristics.

There is a wide range of possible programs and activities to choose from in aged care settings; format and type of activity or program will depend upon the needs, personality and capacities of the individual, the setting, and resources available. Management support is critical, including providing adequate resources of staff, time and funding.

The most mentioned barriers to success were: lack of adequate continuing funding; lack of appropriate transport; lack of adequate time; lack of fundamental management support; lack of willing staff, family and volunteers; the poor health and disability of the clients; and the negative attitudes of the clients themselves.

MAPPING TYPOLOGIES OF SOCIAL PARTICIPATION TO PROGRAMMING FOR ELDERERS IN THE CHANGING ASIAN CONTEXTS

S. Aw¹, Y. Oh², G.C. Koh¹, H.J. Vrijhoef¹, S. Harding³, Z.J. Hildon⁴, 1. Saw Swee Hock School of Public Health, Singapore, Singapore, 2. Hallym University, Chuncheon, Korea (the Republic of), 3. Tsao Foundation, Singapore, Singapore, 4. John Hopkins University, Baltimore, Maryland

This study, informed by the social ecological perspective, seeks to unpack (1) social isolation and related vulnerabilities and (2) social inclusion, and better participation in 'successful ageing' program activities, in a multi-ethnic Singapore elder population, over 55 years old. We synthesised qualitative data from 8 focus groups; 4 photovoice sessions; and 6 walk-along interviews. We identified isolated elders living on the margins, for whom subsidies were not working – often because before claims could be made, family needed to be shown legally to not offer support. Elders fallen on hard times wanted to be self-sufficient, doing odd jobs, collecting cardboards, keeping them out of mainstream activities. 'Closed doors', characterised mistrust, cited as advised during the cultural shift to an urbanised Singapore; other barriers included hostility, soured relationships. 'Comfort-zoning' alone with sedentary routines was common, sometimes explained by traditional norms defining social activities as wasteful. Among more socially included were the very active, repeat attendees to organized activities, and volunteers. More occasional participators sought out 'safe' routines within known inner circles. Ethnic minorities were under-represented in mainstream activities, pointing to structural barriers and preference for cultural groupings. At the macro-level subsidies need to be recast as means-tested on elders' instead of families' income and assets; the benefits of social contact explicitly taught; and cultural precepts of wasteful activities counteracted. At the meso-level religious institutions can be leveraged to run programs, encouraging natural grouping within them to carry through amidst community activities; while breaking lone routines by trust-building and befriending from the active.

RELATIONSHIP BETWEEN SOCIAL ISOLATION AND SUPPORT EXPECTATION IN THE MARGINAL COMMUNITY

Y. Watanabe, Human Science, Musashino University, Nishitokyo, Tokyo, Japan

Purpose: A marginal community is defined as a community in which over 50% of the population is over 65 years old and facing difficulty maintaining adequate function for their daily lives. Difficulties facing the marginal community can include unemployment, shopping for daily necessities, and others. This situation occurs not only in Japan, but also worldwide, especially in developed countries. This research aims to reveal the relationship between social isolation and support expectation in the marginal community.

Method: Cross-sectional research was conducted in 2015 through questionnaire. The questionnaire was administered to people over 20 years old through visiting all the houses in marginal community. Only the elderly (65+) respondents' data were used for analysis. The data were analyzed using a t-test. Social isolation was measured by "How many times

do you have a number of involvements with someone?”. Support expectation was measured by “Can you expect to get a support by each of families or relatives, friends, and formal services?”.

Results: Statistically significant differences were found between social isolation and support expectation. When the support could be expected from “families and relatives”, “friends” who live inside or outside of the community, a number of involvements were found significantly higher average ($P < .05$). Between the expectation for formal services and a number of involvements were not found a significant difference.

Conclusion: These results are suggested that support expectations for daily lives are given up by social isolation in the elderly. Social isolation can be a risk of life continuation in the marginal community.

WALKING SPEED OF OLDER PEOPLE AND PEDESTRIAN CROSSING TIME

E. Duim¹, M. Lebrao¹, Y. Duarte², J.F. Antunes¹, 1. *Public Health School, University of Sao Paulo, Sao Paulo, Brazil*, 2. *Nursing School, University of Sao Paulo, Sao Paulo, Brazil*

Decreased gait speed in older people may put them at risk of injury and social seclusion for being unable to cross streets at safe. Traffic lights consider the walking speed of 1.1 meters per second (m/s) to regulate the time for pedestrian crossing in Sao Paulo, Brazil as in New York City. However, this regulation does not consider walking speed changes across time.

The objective was to assess walking speed of older people, and to compare these results with international standards for pedestrian crossing. In this cross-sectional study, the probabilistic sample of 1,191 individuals aged 60 or more years, in the city of Sao Paulo, Brazil, in 2010. Walking speed was directly assessed by a physical test, and dichotomously classified using two cut-off points: 1.1 and 0.9 m/s. Interviews informed socio-demographic and health status characteristics. A preponderant proportion (95.7%) of older adults walks at a slower pace than is currently demanded pedestrian lights (1.1 m/s). Reducing the reference speed to 0.9 m/s would allow decreasing this proportion to 69.7%. Women, brown individuals, those less schooled and those reporting poorer health status had higher odds of walking at a slower pace than would be required by traffic lights to cross streets in the city. Most older adults cannot cross streets at their own walking speed in São Paulo. These results reinforce the need of interventions targeting the whole traffic environment, to prevent accidents with older people and to promote urban mobility.

RESIDENTS' CHANGE IN SOCIALIZATION AND LONELINESS SINCE MOVING TO SENIOR HOUSING

H. Taylor, S. Herbers, N.L. Morrow-Howell, *Washington University in St. Louis, St. Louis, Missouri*

It is frequently assumed older adults who move to senior housing communities (SHCs) will socialize more and be less lonely. The purpose of this study is to describe changes in residents' frequency of socialization and loneliness since moving into senior housing, and to determine factors associated with these changes. Ninety-six older adults living in two SHCs completed cross-sectional surveys with items regarding changes in socialization and loneliness since moving into a SHC, age, education, depressive symptoms, anxiety symptoms, years lived

in the SHC, and distance to previous residence. Analyses for the current study include descriptive statistics and multinomial logistic regression models. Since moving into a SHC, twenty-five percent of residents had decreases in socializing with family, 20% had decreases in socializing with friends, 19% had decreases in level of companionship, 21% felt more left out, and 14% felt more isolated. Age, education, anxiety symptoms, and years living in the SHC were related to changes in socialization and loneliness in the multinomial logistic models. These analyses suggest a significant portion of older adults living in senior housing may socialize with friends and family less and feel lonelier after moving to senior housing. It is important to understand the reasons for decreasing social interactions and increasing loneliness after older residents move to senior housing, and how to intervene upon their behalf. Additional studies are needed to determine if these findings are consistent, and interventions should be developed to increase socializing and decrease loneliness among residents living in senior housing.

THE SIGNIFICANCE OF INTIMACY AND INTIMATE RELATIONSHIPS IN ASSISTED LIVING

A. Fitzroy, C.L. Kemp, E.O. Burgess, *Georgia State University, Atlanta, Georgia*

Intimate relationships are rarely studied in the context of older adults' care arrangements, particularly in long-term care settings. Consequently, little is known about the availability and effects of intimacy in the lives of long-term care residents. Addressing this gap, this paper focuses on the intimacy experiences of older adults residing in 8 diverse assisted living (AL) communities. We analyze data drawn from a five-year NIA-funded qualitative study (R01AG044368) guided by the “Convoys of Care” model. Previous analysis of study data shows that most residents experience some form of intimacy in their day-to-day lives. Yet, a range of multilevel factors influences intimacy and many have unmet intimacy needs in these settings. Building on this work, our aim is to understand how the presence and absence of intimacy influences residents' lives, relationships, and care experiences in AL. Findings show that some AL residents sought out, created, and maintained intimacy through a variety of interaction and relationships and with other residents, family, and care staff. Residents who had companionship, particularly involving physical interactions, felt it enhanced their quality of life and care. In some instances, such companionship created conflict within care networks. Mostly, however, formal and informal caregivers experienced relief and satisfaction when residents established intimate connections, including friendships. Many residents desired, but lacked outlets for intimacy, which frequently led to feelings of loneliness, isolation, and sadness. This outcomes was particularly prevalent among men. Our findings imply the need for a holistic model of care that takes into account and addresses intimacy needs.

SYNERGISTIC IMPACTS OF PRE-HOMEBOUND AND SOCIAL ISOLATION ON MORTALITY AMONG THE OLDER IN JAPAN

M. Yasunaga¹, M. Nishi¹, M. Hasebe², K. Nonaka¹, T. Koike³, H. Suzuki¹, Y. Murayama¹, Y. Fujiwara¹, 1. *Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan*, 2. *Sei-Gakuin University, Saitama, Japan*, 3. *Kyushu Sangyo University, Fukuoka, Fukuoka, Japan*

Aim: The object of the study is to clarify whether synergistic impacts of low frequency of going outdoors and social isolation on mortality among the community dwelling older adults in Japan.

Methods: We examined a prospective cohort of 1,162 community-dwelling persons, aged 65 years or older, who completely responded to both the baseline mail survey in 2008 (T1) and follow-up survey in 2010 (T2) in Wako City, Saitama prefecture, Japan. Participants were asked about frequency of going outdoors, social isolation status (having contact < once a week with anyone outside household), functional capacity (TMIG-IC), age, gender, annual income, years of schooling, self-rated health, depressive mood, medical history, and mortality.

Results: The mean age of participants was 72.8 years (SD=6.0), and 58.3% were women. We defined the groups as follows. Group 1: not isolated and going outside the home every day (n=647), Group 2: not isolated and going outside the home < every day (n=234), Group 3: isolated and going outside the home every day (n=163), Group 4: isolated and going outside the home < every day (n=118). Cox regression analyses demonstrated that the variables identifying Group 4 with reference to Group 1 were predictors of subsequent all-cause mortality even after adjustment for confounders (Odds ratios =2.03, 95% CI: 1.14–3.63).

Conclusion: Synergistic impacts of low frequency of going outdoors and social isolation among the older predicted all-cause mortality.

DRIVER LICENSING DECISIONS FOR MEDICALLY AT RISK, OCCUPATIONAL THERAPY, AND LOCAL PROVIDER NETWORKS

E. Davis, *American Occupation Therapy Association, Bethesda, Maryland*

In North America, the motor vehicle is the main mode of transportation, especially for rural and suburban communities. Importantly, older adults value driving as a “key” to their independence. Decisions to cancel a license have serious implications. The process to determine a driver’s fitness to retain their license is complex. There is an implicit duty to ensure evaluations consider each unique individual’s problems and potential. For individuals with medical conditions, the criterion to make licensing decisions requires the skills, knowledge and understanding of the medical condition challenging driving competence. Unfortunately, this is too often not the case. Several programs serve drivers but are not trained to evaluate medical risk, and we caution if these skill sets are interchanged. A driving instructor, who excels at evaluating driving knowledge and skills, may see errors in driving through the lens of educational needs not capacity to learn. It is unfair to drivers and the professionals that serve them if we misalign programs. This session will present the strengths, weaknesses, and opportunities of driving evaluation and the varied professionals that offer services under this umbrella term. The presenters will describe how driving schools and driving rehabilitation differ, each offering a distinct value to the aging driver. Occupational therapy practice is dedicated to improving instrumental tasks of daily living, which includes driving and general practice OTs work with a small number of specialists to offer a networked service.

Participants in the audience will receive multiple resources for referral, practice and treatment.

UNDERSTANDING THE USE OF COMPENSATORY STRATEGIES TO ENHANCE OLDER DRIVERS’ MOBILITY

M. Levasseur¹, J. Coallier¹, C. Gabaude², M. Beaudry¹, M. Bedard³, C. St-Pierre¹, 1. *Université de Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *Institut français des sciences et technologies des transports, de l’aménagement et des réseaux, Bron, France*, 3. *Lakehead University, Tunderbay, Ontario, Canada*

Rationale: Use of compensatory strategies, i.e., means used to adjust for diminished abilities, can optimize the community mobility of older drivers. However, although several investigations have been carried out on compensatory strategies, facilitators and barriers to the use of these strategies are mostly unknown. This study aimed to explore facilitators, barriers and needs for the use of adaptive driving strategies which can optimize the community mobility of older drivers.

Method: An exploratory qualitative clinical research design was conducted with 11 older drivers, 7 relatives and 14 driving professionals.

Results: Facilitators for the use of adaptive driving strategies were: being a woman; perceiving dangers; recognizing the usefulness of strategies and abilities as diminished; having disabilities or discomfort when driving; experiencing complex driving situations; receiving help of relatives and services of professionals; and having other transportation options. Barriers were: not knowing strategies; being proud; lack of self-criticism; unwillingness of relatives and physicians to intervene; having costs to the use of adaptive strategies; recognizing driving as important; perceiving the complexity of using other transportation options; and lack of proximity to facilities and services. To foster the use of adaptive strategies, TV, radio, newspapers and information sessions need increasing older drivers’ awareness about the age-related changes, the community resources, and the strategies themselves, including their importance in safe driving. Furthermore, to support older drivers in changing their driving habits and using adaptive strategies, results demonstrated that it is important to involve their relatives and professionals.

Conclusion: While promoting safe driving and the prevention of collisions and injuries on the road, knowledge about facilitators, barriers and needs for the use of adaptive driving strategies could ultimately allow seniors to optimize their community mobility.

PRODUCTIVE AGING, FAMILY CAREGIVING, AND SUBJECTIVE WELL-BEING OF OLDER ADULTS IN CANADA

L. Li¹, D.W. Lai², H.L. Tong³, 1. *Faculty of social work, University of Calgary, Edmonton, Alberta, Canada*, 2. *Hong Kong Polytech University, Hong Kong, Hong Kong*, 3. *MacEwan university, Edmonton, Alberta, Canada*

Productive aging is a significant topic in the gerontological study, which is closely and positively associated with older people’s subjective wellbeing. However, family caregiving as a key aspect of productive aging may play a different role in this scenario. Current study intends to explore the relationship between older adults’ engagement in different productive activities and their subjective wellbeing in Canadian context. Using the secondary data from General Social Survey (Cycle

22)-Social Network, analyses are conducted to explore the relationship between productive activities include employment, volunteering, family caregiving (for children or senior) and housework, and subjective wellbeing includes life satisfaction, happiness and perceived mental health. Analyses based on general aging population indicate that older adults actively engaging in employment, voluntarism, and housework would report better subjective wellbeing, but family caregiving for seniors is negatively associated with subjective wellbeing. Analysis is further conducted within different groups of aging population. As a result, involve in voluntarism and housework activities are positively related to their life satisfaction among aging people from ethno-cultural or immigration communities. Also, a positive relationship between volunteering activities and subjective wellbeing, and negative relationship between caregiving for senior and life satisfaction/perceived mental health are identified among Canadian born aging people. The findings reveal the different role of family caregiving in later life regarding to subjective wellbeing. Also, with the increasing aging and diversified population in Canada, the findings emphasize the importance of providing better-tailored service to support aging people from varying demographic background.

HAS CONSUMER-DIRECTED CARE IN COMMUNITY AGED CARE IMPROVED QUALITY OF LIFE FOR OLDER AUSTRALIANS?

J. Ratcliffe¹, N. Bulamu¹, E. Lancsar², G. Liz³, I. Cameron³, M. Corlis⁴, B. Kaambwa¹, 1. *Health Economics, Flinders University, Adelaide, South Australia, Australia*, 2. *Monash University, Melbourne, Victoria, Australia*, 3. *University of Sydney, Sydney, New South Wales, Australia*, 4. *Helping Hand, Adelaide, South Australia, Australia*

The Australian Government has recently committed to major policy reform in aged care, with the widespread introduction of consumer directed care (CDC) in community care. The main aims of this study were to assess the impact of CDC on the quality of life of older Australians. Quality of life was assessed using the EuroQoL 5 dimensions 5 level (EQ-5D-5L) and the older people-specific capability index (ICECAP-O). The relationships between quality of life, length of time receiving CDC and socio-demographic characteristics were examined using descriptive statistical and multivariate regression analyses. 484 older people were approached of whom 150 (31%) consented to participate. Mean quality of life scores were 0.56 (sd=0.26) and 0.76 (sd=0.17) according to the EQ-5D-5L and the ICECAP-O respectively. Sub-group analysis revealed slightly higher quality of life scores for both instruments for those in receipt of CDC for ≤12 months [0.57 (0.25) and 0.78 (0.15)] compared to >12 months [0.54 (0.25) and 0.72 (0.18)]. However these differences were not found to be statistically significant. Although little variation was found overall in quality of life outcomes according to the length of exposure to CDC for either the EQ-5D-5L or ICECAP-O, analysis at the dimension level suggested that those with a longer period of exposure had stronger capability in being able to do things that made them feel valued. These cross-sectional results should be interpreted with caution and longitudinal follow up is needed to facilitate a detailed examination of the relationship between CDC and its longer-term influences on quality of life.

ASSESSMENT OF THE EFFECTIVENESS OF A COMPREHENSIVE DRIVING TRAINING PROGRAM FOR OLDER ADULT DRIVERS

S. Gagnon¹, A. Stinchcombe^{2,1}, M. Curtis¹, M. Kateb¹, R. Aljied¹, J. Polgar³, M.M. Porter⁴, M. Bedard², 1. *Psychology, University of Ottawa, Ottawa, Ontario, Canada*, 2. *Lakehead University, Thunderbay, Ontario, Canada*, 3. *University of Western, London, Ontario, Canada*, 4. *University of Manitoba, Winnipeg, Manitoba, Canada*

Several driving retraining programs have been developed to improve older drivers' driving skills and researchers have been interested in assessing their effectiveness. This study was designed as a replication of a previous study done by our team (Sawula et al. submitted). The objective of both studies was to determine if a compressive training program combining 1) basic in-class training (BT); 2) on-road training with individualized feedback (OR); and 3) on-road training with individualized feed-back plus training on a driving simulator (ORS) would lead to improvements in older drivers' on-road driving evaluations. Using a randomized controlled trial (RCT) study design, 43 older drivers (mean age=71.7 years, SD = 4.91) were randomly assigned to one of three groups (BT, BT+OR, or BT+ORS). All participants completed a pre- and post-intervention on-road driving evaluation on a standardized route. The driving evaluations were recorded using video and GPS equipment and were scored by a blind assessor. The results of this study demonstrated that post-intervention driving evaluation scores for the BT+OR and BT+ORS groups when compared to the BT group were significantly different. While unsafe driving errors showed a 6% reduction in the BT group, BT+OR and BT +ORS group reduced their errors per 23% and 34% respectively. There were no differences between BT+OR and BT+ORS group, thus further research is required to determine the contribution of simulator training on its own.

AGING IN LOW-DENSITY URBAN ENVIRONMENTS: TRANSIT MOBILITY AS A SOCIAL JUSTICE ISSUE

G. Adorno¹, N. Fields¹, R. Parekh¹, K. Magruder², 1. *Social Work, University of Texas Arlington, Arlington, Texas*, 2. *The Senior Source, Dallas, Texas*

Around the world, particularly in North America and Australia, urban sprawl in low-density urban and suburban cities has contributed to transit mobility barriers for persons who do not drive. Consequently, older nondrivers may experience limited access to health care and find themselves isolated from familiar lifestyle habits, social networks, and obtaining goods and services. Such social exclusion can undermine quality of life, diminish intellectual stimulation, and accelerate declines in personal health, leading to difficulties in independent living. As part of a community-based participatory research (CBPR) study of the age-friendly domains of an ethnically diverse metropolitan U.S. city, we explored the experiences of adults age 55 and older about their transit mobility needs and its impact with respect to 'aging well.' Using inductive and deductive methods and Atlas.ti software, we analyzed qualitative data collected (N = 60) from six ethnically diverse focus groups and individual interviews of homebound older adults. Four themes emerged specific to the influence of contextual factors on transit mobility barriers

among older drivers and nondrivers. Findings suggest that local historical, political, and cultural attitudes combine with the 'built' environment to further marginalize older adults' access to adequate, affordable transportation options. The reciprocal fit between transit mobility needs and the environment is critical to freedom, independence, and healthy aging for older adults in settings of urban sprawl. Research at the intersection of aging and transit mobility requires equal grounding in a range of justice principles (environmental, social, economic) in the pursuit of sustainable transit options for aging populations.

LEISURE ACTIVITIES AND SUBJECTIVE WELL-BEING OF OLDER ADULTS IN RESIDENTIAL CARE CENTRES

M. Panthi, *University of Otago, Dunedin, New Zealand*

Older adults are at the risk of loneliness, depression, and isolation when they move to the residential care centres due to their cognitive and physical disabilities; however, little has been done to explore their leisure activities. Quantitative studies have established a correlation between leisure activities and well-being, but they cannot establish causality or provide insights into the perceptions of residents themselves.

The main aim of this research is to explore the meaning, perception and experiences of leisure and the perceived relationship between leisure activities and well-being through a qualitative approach.

Triangulation was used in data collection, which involved three components: participant observation, key informant interviews with professionals, and in-depth interviews with residents. Semi-structured interviews were conducted with a purposive sample of Twenty-Four residents chosen on the basis of their abilities, including cognitive impairment. The second set of interviews were conducted with six key informants. Finally, one-day observations were made in each of the six residential care sampled.

The results provide insights into the best practices for engaging people with various abilities in activities and emphasize the importance of leisure activities, particularly those that involve families, social ties, and companionship. They also highlight the problems of non-participation by physically and cognitively impaired residents.

This session will provide guidance to policymakers, as well as the staff and managers of residential care facilities on developing new strategies, plans, and programs to increase the active participation of older adults in a variety of activities.

TRANSNATIONAL SUPPORT EXCHANGE AND QUALITY OF LIFE: THE INTERNET USE OF OLDER CHINESE IMMIGRANTS

J. Zhang, *Sociology, Southeast University, Nanjing, Jiangsu, China*

This paper aims to explore how the internet use facilitates transnational support exchanges among older Chinese immigrants in New Zealand. Although transnationalism has become the major theoretical trend in international migration studies for more than a decade, little attention has been directed to the transnational life and practices of older immigrants. Even less academic effort has been made to investigate the role that the internet plays in older immigrants' transnational activities, due to the widely assumed notion

that the elderly are in general on the disadvantaged side of the digital divide. This current research is based on the data derived from 35 qualitative interviews with older Chinese immigrants living in New Zealand. Findings show that the internet has been used by the participants as a tool to maintain connections with their families and friends who are in China or in other host countries. This is found to facilitate the process of exchanging practical and emotional support, which helps the older Chinese immigrants to cope with their day-to-day lives in New Zealand. More importantly, the support exchanges enable them to develop a transnational perspective regarding their quality of life and ageing experiences. By exploring the relations between internet use and transnational support exchanges, this paper provides insights into our understanding of transnational lifestyles of older Chinese immigrants.

SOCIAL SUPPORT, STRESS, AND LIFE SATISFACTION AMONG RETIRED OLDER ADULTS IN SOUTH KOREA

H. Kang^{3,1}, R.K. Chapin^{3,1}, H. Kim², 1. *Center for Research on Aging and Disability Options, University of Kansas, Lawrence, Kansas*, 2. *Gerontology, University of Kansas, Lawrence, Kansas*, 3. *School of Social Welfare, University of Kansas, Lawrence, Kansas*

This study tested the relationship between stress and life satisfaction of retired older adults in South Korea as moderated by social support. The 2013 and 2014 Korean Retirement and Income Study (KReIS), nationally representative longitudinal datasets, were used to analyze 2,449 retired older adults (65+). Stress was measured in five dimensions: family, finance, health, housing-environment, and sense of loss. Social support was measured in four dimensions: emotional, informational, material, and appraisal support. Life satisfaction was composed of five items that solely focus on general satisfaction of daily life. Life satisfaction as a dependent variable was regressed on stress while controlling for age, education, cost-of-living allowance, and self-reported health. A moderating effect of social support was examined using hierarchical multiple regression analyses. To examine the significance of a moderating effect, we made an interaction term between stress and social support.

Our results pointed to the ability of social support to moderate the relationship between stress and life satisfaction. A statistically significant increase in R-squared and the vanished effect of stress on life satisfaction after adding the interaction indicated the moderating effect of social support. Additionally, lower levels of stress and greater perceived social support were directly associated with higher levels of life satisfaction. Greater age, more education, better health, and financial security also had positive associations with life satisfaction. Policy implications of these findings for future generations of retired older adults who will be more likely to expect lower levels of social support due to demographic and economic changes are discussed.

AUTONOMY AND SOCIAL PARTICIPATION OF NURSING HOME RESIDENTS: NURSES' PERSPECTIVES

P. Marijic, A. Buss, S. Strupeit, *Nursing Science, Munich University of Applied Sciences, Munich, Germany*

The aim of this study was to examine organizational structures in nursing homes and nurses' autonomy and participation in decision making. Additionally, nurses' influence on the residents' autonomy and social participation was examined.

Twelve qualitative Interviews with nurses working in four different nursing homes were conducted. The participants were interviewed using a previously developed semi-standardized interview guide. Interviews were audio-recorded and transcribed verbatim. All transcripts were thematically analyzed using content analysis approach.

The participants described a structured daily routine in the nursing homes, including basic care or meal times. Within these structures nurses are able to determine individual schedules and, in exceptional cases, to vary from daily routine. However, autonomous decision making was seen as a form of enhanced responsibility and therefore rejected, whereas more responsibility was associated with wanting higher salary and changes of existing structures. Nurses' reported that they have a big influence on residents' autonomy and social participation and great responsibility as to that matter.

Nurses' autonomy and participation in decision making may be limited by institutional structures and, moreover, nurses' decision making is lacking autonomy and participation because they cannot or do not want to accept responsibility. Thus, the residents' autonomy and social participation could be restricted because nursing home residents are influenced by nurses' acting.

EXPLORING PROCESSES OF ADAPTATION FOR SUCCESSFUL AGING: LIVED EXPERIENCES OF OLDER SINGAPOREAN ADULTS

F. Shiraz¹, S. Aw¹, G.C. Koh¹, M. Wong¹, H.J. Vrijhoef^{1,3,4}, S. Harding², Y. Yu⁵, Z.J. Hildon^{1,6}, 1. *National University of Singapore, Singapore, Singapore*, 2. *Tsao Foundation, Singapore, Singapore*, 3. *Maastricht University Medical Centre, Maastricht, Netherlands*, 4. *Vrije Universiteit, Brussels, Belgium*, 5. *Hallym University, Korea (the Republic of)*, 6. *London School of Hygiene and Tropical Medicine, London, United Kingdom*

Defining successful aging is a critical research and policy question. The overall purpose of this study is to present theoretical and pragmatic recommendations to improve holistic interventions for elders; as such we explored views of Singaporeans over 55 years of age on: What is protective in preserving elders' health and adapting to inevitable changes; And, related programmes. Semi-structured interviews (n=40) explored Biophysical (B) health, Psycho-emotional (P) wellbeing, and Social (S) relationships. Focus groups (8 groups, n= 83) asked about improving: B-health lifestyle / disease-management programmes; P-wellbeing guided therapeutic autobiography; S-relationship building activities. Interviews showed that B-health was characterised by 'keeping on keeping on' attitude, wanting to keep moving and learning; exercise was most highly valued. This theme was notably linked to self-determination to overcome age-related decline, carrying through to P-wellbeing. Itself defined by: 'doing right' – helping others, the power of prayer, and being able to reflect and talk about changes, as part of one's identity. Therefore S-relationships were also important here – we identified a taxonomy explaining quality of relationships, dependant on

'inter-connectedness' of practical 'sharing' and close, confident 'caring' support; sharing was sometimes seen to substitute caring. Protective themes overlapped, demonstrably lifting elders toward better functioning; focus groups suggested how Interventions could be improved to leverage these. E.g. by emphasising 'doing' healthy lifestyles rather than 'knowing' them; addressing confidentiality in community settings; and offering non-technical inclusive 'emotionally safe' activities that allow caring relationships to develop.

SOCIAL VERSUS POLITICAL: VIEWS OF ELDERLY IN RUSSIA

I.L. Pervova, *Theory and Practice of Social Work, Saint-Petersburg State University, Saint-Petersburg, Russian Federation*

T. Marshall (1965) noted that social rights are more familiar to and important for citizens than political ones. Current research focused on the comparison(s) of the views of elderly persons and young individuals in areas of social and political rights. Procedures involved structured phone interviews (CATI system; Saint-Petersburg) with random sample subject groups of 450 respondents 60 and older (E) and 530 18-29 years old (Y).

Data suggests 45% of the elderly and 35.5% of youth couldn't name any of political rights, while the majority (E-81.4%, Y-64.1%) was checking political news via mass media on daily bases. Suffrage was named as the main political right by approximately half of the sample (E-42.2%, Y-50.4%). Freedom of thought was identified as a political right by (E-12.8%, Y-20.3%) with equivalent rating of the right to freely receive and disseminate information legally (E-11.6%, Y-8.5%). The right to assemble peacefully and without weapons was noted by (E-8.5%, Y-5.9%).

Social rights appear more familiar to elderly citizens than political ones, e.g. the right for labour (E-33.7%, Y-28.4%), education (E-33.7%, Y-47.0%), medical help (E-42.6%, Y-40.3%), and social care (E-33.7%, Y-17.8%). The majority of respondents (E-62.0%, Y-78.0%) consider social rights as more important than political ones; some (E-21.7%, Y-8.9%) consider both of equal merit; with some (E-9.1%, Y-6.4%) preferring political rights. Summary data support the major premises of T. Marshall: with the elderly attaching more importance to political rights than youth and appear to be better informed regarding both political and social rights.

THE INFLUENCE OF KOREAN ELDERLY'S PARTICIPATION IN SOCIAL ACTIVITIES ON THEIR LIFE SATISFACTION

Y. Song, K. Ryu, B. Shin, S. Choi, Y. Choi, *Pusan national university, Busan, Korea (the Republic of)*

Korea shows the faster growth in aging than any other country, as it has the fastest growing rate in the population of older people. The problems caused by the aging society are beyond personal level, instead, require the national level approaches.

Though continued participation in social activities are believed to be important for successful aging, older people's participation is poor in Korea. While participating in social activities, the elderly participants can play roles of service providers, in which they may have satisfaction as contributing to their communities. Using their own experiences, knowledge,

skills, and abilities for their communities enables them to feel productive, thus, becoming active and vibrant, which will eventually influence their life satisfaction positively.

Therefore, this research will study on the effect of older people's social activities on their life satisfaction and draw implications for Korean social welfare.

This study conducted a survey of 438 elderlies at age of 65 and over, statutory age as old people in Korean Welfare of the Aged Act. IBM SPSS Statistics 18.0 was used to analyse the survey results. As a result, participation in social activities is significantly correlated with positive effect on life satisfaction by 52.3%. Based on the results, it will make suggestions for welfare for the aged and future studies.

SESSION LB3720 (POSTER)

LATE BREAKER POSTER SESSION 4

IMPACT OF AN EDUCATIONAL BRAIN FITNESS INTERVENTION ON BEHAVIOR AND KNOWLEDGE CHANGE IN SENIOR LIVING

R.F. Nicholson, 1. *Mather LifeWays Institute on Aging, Evanston, Illinois*, 2. *University of Chicago, Chicago, Illinois*

With a growing interest in brain fitness, there is growing interest in brain fitness programming for older adults. One approach to providing brain fitness content is through educational interventions, where behavior change would take place outside the classroom. But evidence is needed to show that such educational interventions can produce behavior change. One potential additional obstacle for such interventions is that program staff lacks the expertise to provide detailed brain fitness content, particularly if older adults are interested in the science behind brain fitness lifestyle recommendations (which our prior research suggests is often the case). This random assignment wait-list control intervention study examined an implementation of the multi-dimensional educational Boost Your Brain & Memory cognitive fitness intervention in 12 senior living organizations. This program employed a train-the-trainer model to facilitate wider potential distribution and to enable non-experts to deliver the program content as instructors. The impact of this program on knowledge and behavior was examined comparing pre- and post-results of the intervention group and waitlisted controls. Older adult participants (n=166) completed measures of: brain health knowledge, use of memory techniques, physical and intellectual activity, and mindfulness, at baseline and after the intervention group's completion of the course. Changes in knowledge scores and in self-reported physical and intellectual activity increased significantly more for intervention participants than for waitlist controls at the conclusion of the course. There were no significant changes between the groups in mindfulness or use of memory techniques.

THE ASSOCIATION BETWEEN SOCIAL ENGAGEMENT AND RISK FOR ELDER ABUSE AMONG CHINESE OLDER ADULTS

X. Dong, K. Li, *Rush Institute for Healthy Aging, Rush University Medical Center, Chicago, Illinois*

Elder abuse is a pervasive public health issue among aging population. However, limited research explored whether social engagement is associated with the risk of elder abuse among Chinese older adults. Data collected from 3,157 Chinese older adults aged 60 and above through the Population Study of Chinese Elderly in Chicago (PINE study), were used to examine the association between social engagement and elder abuse. Social engagement was measured by a list of 16 questions regarding social activities and cognitive activities. Elder abuse was measured by modified H-S/EAST and VASS, modified CTS, and unmet needs assessment. After adjusting for the confounding variables, social engagement was significantly associated with lower risk of caregiver neglect (OR, 0.96 (0.94, 0.97)). In contrast, older adults who had cognitive activities were more likely to have the risk of elder abuse (OR, 1.02 (1.00, 1.04)). There was also significant association between social engagement and higher risk of financial exploitation (OR, 1.03 (1.01, 1.04)). The protective role of social engagement was well documented in literature. However, our study showed social engagement may also be associated with the higher risk of elder abuse, financial exploitation in particular. It is probably because social engagement increases the exposure of older adults to society and they are more likely to encounter with negative financial related issues. Future research is in need to understand the different roles of social engagement on elder abuse.

A PSYCHOEDUCATIONAL PROGRAM FOR FAMILY CAREGIVERS OF DEMENTIA PATIENTS: EFFECTS AND REPLICABILITY

C.R. Ferreira, E.J. Barham, *Federal University of Brazil - São Carlos, Sao Carlos, Brazil*

Caregivers of family members with Alzheimer's disease frequently report moderate to severe perceptions of burden, increasing the probability that they will develop stress-related health problems. Psychoeducational intervention programs have focussed on: (a) teaching about dementia, (b) stress management, and (c) ways to deal with problematic behaviors. The "Three Cs Program" (comprehend, cope, and collaborate) builds on earlier work, but also helps caregivers include the dementia patient in everyday situations, and to establish more positive interactions with others. Our objectives were to evaluate: (a) the effectiveness of the program, and (b) the replicability of these results. In Study 1, one healthcare worker met individually with 14 caregivers in a city in MG, Brazil. In Study 2, nine other healthcare workers who were trained to use the program met individually with a further 15 caregivers, in a city in SP, Brazil. Among other measures, the caregivers completed the Zarit Burden Inventory prior to and following the intervention program. On average, we observed a nine point reduction in perceptions of burden, in Study 1 ($t(13) = -3.109, p = 0.008$), indicating program effectiveness, and also in Study 2 ($t(14) = -3.943, p = 0.001$), indicating replicability of the results when other healthcare workers delivered the program. In future studies, healthcare worker and caregiver variables that moderate program effectiveness should be identified. A follow-up study is also needed, to determine whether caregivers continue to use the strategies they adopted during the intervention, and the longer-term effects of the program on the caregivers' wellbeing.

AGEISM: COMBATING NEGATIVE PERCEPTIONS OF AGING THROUGH EXPERIENTIAL LEARNING

A. Binns, M. Gray, O. Orsak, A. Heimer, *Health, Human Performance and Recreation, University of Arkansas, Fayetteville, Arkansas*

An influential social construct, ageism is best defined as a set of discriminatory/prejudicial beliefs against people that are “old”. Ageism is more pervasive than sexism or racism and largely understudied. Therefore, the present study aim was to reduce ageism through aging simulation. Adults ($n=63$; 29.5 ± 12.0 years) were assessed on two occasions, once to perform measures without the aging suit and again at least seven days later in the GERT aging suit (GERontologic test suit). Before and after performing functional fitness measures, participants completed the Aging Semantic Differential Scale (ASD) to determine attitudes toward older adults and assess ageism. ASD composite score represented perspectives on aging; larger composite scores indicating more negative perceptions of aging. Perceptions of older adults were negative before task performance with or without the GERT aging suit, indicated by preliminary ASD scores (77.5 ± 14.9 and 81.2 ± 13.6 , respectively). Following functional task performance without the GERT suit, the ASD score slightly decreased (2.2%); however, the change in score was not significant ($p=.08$). Following older adult task performance in the GERT suit, aging perspectives became significantly more negative (8.5%; $p=.01$). Results from this study indicate that aging simulation via GERT suit had a significant impact on attitudes toward older adults. Contrary to our hypothesis, aging simulation resulted in greater negative perceptions of older adults. This finding is postulated to be due to the self-reported increased difficulty in functionality when wearing the GERT suit. Therefore, future investigations should incorporate additional psychometric analyses (i.e., empathy) as it relates to ageism following aging simulation.

VALIDATION OF THE PERCEPTIONS OF AGING AND HEALTHY AGING FOR CHRONIC DISEASE OLDER PERSONS

Y. Wang^{1,2}, C. Chen¹, 1. *Institute of Allied Health Science, College of Medicine, National Cheng Kung University, Tainan city, 701, Taiwan*, 2. *Chi Mei Medical Center, Liouying, Tainan city, 710, Taiwan*

Background: The percentage of older persons aged 60 and above has reached 19.13% in Taiwan. Up to 88% of older persons in Taiwan report at least one type of chronic disease. However, no reliable and validated instrument is currently available in Taiwan to measure the perceptions of aging and healthy aging of chronic disease in older persons. **Aim:** The purpose of this study was to validate the Chinese version of the perception of aging and healthy aging for chronic disease older persons. **Method:**

The participants were recruited chronic disease older persons from outpatient department and community medical service in Southern Taiwan. We had developed questionnaires supporting the perception of aging (APQ), healthy aging (HAQ) for future study. The APQ was to translate the Barker et al.(2007) questionnaires; HAQ based on literature and Ryff & Singer (2009) healthy aging theory. The mean content validity index were 80–100% from 10 experts. From January to December 2016, 415 valid questionnaires were

returned. Exploratory factor analysis and Cronbach's Alpha were applied to examine the validity and reliability of the questionnaire. **Result:** The results of this study showed the APQ and HAQ in Chinese version accounted for variance of 69.77% and 65.91% were explained by the factor, the Cronbach's Alpha is 0.87 and 0.81, subscales from 0.83 to 0.91 and 0.65–0.89. **Conclusion:**

The Chinese Version APQ and HAQ showed good validity and reliability when applied to Taiwanese chronic disease older persons.

EXAMINING THE WITHIN-PERSON COUPLING OF CONTROL BELIEFS AND COGNITION IN OLDER ADULTS

S. Zhang¹, A. Gamaldo², J. Allaire¹, 1. *North Carolina State University, Raleigh, North Carolina*, 2. *Pennsylvania State University, State College, Pennsylvania*

The current study examined the within-person relationship (e.g., coupling) between control beliefs and cognition in a heterogeneous sample of older adults and whether race moderated this relationship.

The sample consisted of 206 community-dwelling elders ranging in age from 60 to 94 ($M = 73$, $SD = 7.00$), of which 22 were African American (AA). Participants completed a computerized cognitive battery and Daily Control Belief Questionnaire over eight testing occasions over a 2–3 week period. Daily Control Belief Questionnaire included two subscales: locus-of-control scale (higher scores reflected more internal control) and perceived competence scale (higher scores were indicative of greater self-perceived competence). Multilevel modeling suggested that on days when older adults reported higher internal locus of control, simple and complex reaction time was faster. Moreover, older adults, who typically demonstrated low levels of locus of control across the study, exhibited faster simple reaction times on those occasions when their internal locus of control was higher than their usual levels.

Models with race as a moderator suggested that European Americans (EAs) experienced an increase in performance on the Digit Symbol Substitution Task (DSST) on occasions when their daily competence was high. A similar coupling relationship was not observed for AAs. In addition, EAs with low locus of control over the course of the study had faster complex reaction time when their daily locus of control was high. Discussion will focus on the possible mechanisms underlying the association between controls beliefs and cognition and differences in these coupling associated with race.

ASSOCIATION BETWEEN DEPRESSION SYMPTOMS AND ELDER SELF-NEGLECT AMONG U.S. CHINESE OLDER ADULTS

Y. Xu, X. Dong, *Rush Institute for Healthy Aging, Chicago, Illinois*

Background: Elder Self-neglect is an imperative public health issue. However, little is known about the association between depressive symptoms and elder self-neglect among Chinese community-dwelling populations. This study aimed to examine the association of depressive symptoms with elder self-neglect and its phenotypes. **Method:** Data were from the Population Study of Chinese Elderly in Chicago (PINE) study, a population-based survey of U.S. Chinese

older adults aged 60 years and above. Depressive symptoms in past 2 weeks were examined by the Patient Health Questionnaire (PHQ-9). Self-neglect was assessed with 27 items including hoarding, personal hygiene, unsanitary conditions, house needs repair and lack of utilities. Logistic regression was applied. Result: Of the 3,157 community-dwelling Chinese older adults, 853 (27.0%) were found have self-neglect. Among them, 531 (62.3%) reported having depressive symptoms. After controlling demographic variables, years in U.S., and years in the neighborhood, language preference, medical comorbidities, and cognitive functions, having depressive symptoms was associated with increased risk of having self-neglect (OR:1.50 (1.26–1.79)). Compare with those without depressive symptoms, older adults with mild (OR: 1.31 (1.08–1.58)) and moderate/severe (OR: 2.07 (1.62–2.63)) level of depressive symptoms were more likely to have self-neglect. The results in five phenotypes were consistent with overall self-neglect. The results in five phenotypes were consistent with overall self-neglect. Conclusion: This study advanced the knowledge of the association between depressive symptoms and depressive symptoms among U.S. Chinese elderly population. Community health care providers and other professionals should consider screening elder self-neglect while treating those with depressive symptoms.

COMPARISON OF THE ASSOCIATION BETWEEN MARITAL TRANSITION AND BIOLOGICAL RISKS BY GENDER

H.N. Trinh, L.E. Cofie, A.B. Berenson, K.S. Markides, *OBGYN, University of Texas Medical Branch, Galveston, Texas*

This study examined gender differences in the association between marital transition and biological risks at old age. Data on adults age 57 years and older (N=2,261) were drawn from the United States National Social Life and Aging Projects, Waves 1 (2005–2006) and 2 (2010–2011). Marital transition was measured as cross-wave changes in marital status and quality of marriage (spousal support and strain). Biological risks examined were dysfunctions of cardiovascular-, metabolic-, inflammatory-, and hypothalamic-pituitary-adrenal (HPA) activities measured at Wave 2. A series of Poisson and logistic regression were used to analyze the total sample and gender-stratified sample. Results show that being continuously married compared to being unmarried was significantly associated with reduced cardiovascular and metabolic-risks, and the effects were more salient among women. Adversely, being continuously married was associated with higher risk of low HPA functioning among older men. Among older women, the transition from being married in wave 1 to unmarried in wave 2 was linked to lower cardiovascular risks, but the effect was marginally significant. Sensitivity analyses of the married participants in wave 2 indicated that spousal support was significantly associated with lower cardiovascular risks for both sexes, while spousal strain was only associated with reduced cardiovascular risks among women. Changes in marital status and quality did not associate with measures of chronic inflammation and HPA activities. The findings suggested that a longer and more supportive marriage was beneficial for socially disadvantaged older adults' physiological functions, especially among women.

PAIN COMMUNICATION IN OSTEOARTHRITIS PATIENTS AND THEIR SPOUSES

A. Stanford, L.M. Martire, *Human Development and Family Studies, Penn State University, University Park, Pennsylvania*

Osteoarthritis (OA) patients who tend to hold back disclosing pain or other arthritis-related concerns to their spouse report poorer illness adjustment (Porter et al., 2008). Greater self-efficacy for communicating breast cancer symptoms is related to less holding back (Edmond et al., 2013); however, it is not known if patients' self-efficacy for communicating pain is associated with more pain disclosure. Additionally, patients tend to report that their pain is not well understood by spouses (Herbette & Rimé, 2004) which may discourage disclosure or cause difficulties adjusting to chronic pain (Flor, Turk, & Scholz, 1987). The current study sought to examine the effects of self-efficacy for pain communication and perceptions of spouse understanding on rates of disclosure to one's spouse. This study involved knee OA patients (N = 152) and examined self-efficacy, pain disclosure, and perceptions of spouse understanding across 3 time points of data collection spanning 18 months (T1, T2, T3). Consistent with hypotheses, regression analysis of T1 data showed that self-efficacy for pain communication predicted higher rates of patient pain disclosure, beyond the effects of marital satisfaction, patient sex, and OA severity ($p < .05$). The same effect was found for greater spouse understanding at T1 ($p < .05$). Contrary to hypotheses, we found no longitudinal effects of self-efficacy (T1-T2: $p = .24$; T2-T3: $p = .93$) or understanding (T1-T2: $p = .81$, T2-T3: $p = .17$) on pain disclosure. Findings suggest that patient and spouse factors are influential in patients' concurrent level of pain disclosure.

SOCIAL SUPPORT PREDICTS ILLNESS BEHAVIOR TRAJECTORIES IN THE SWEDISH ADOPTION/TWIN STUDY OF AGING

B.L. Bannon¹, A.K. Dahl-Aslan³, N.L. Pedersen², C.A. Reynolds¹, *1. University of California, Riverside, Riverside, California, 2. Karolinska Institutet, Stockholm, Sweden, 3. Jönköping University, Jönköping, Sweden*

Social circumstances (e.g., stress, loneliness, support) predict illness behaviors, i.e., responses to symptoms of illness, but little is known about social influences on trajectories of illness behavior in late-life. We examined the predictive value of social support on illness behavior trajectories in SATSA. Participants were 1,314 twins (Mean age at baseline=60.26; SD=13.20; 58% female). Illness behavior was a single factor score calculated from four indicators across four surveys between 1987–2003 (i.e., somatic complaints, over-the-counter medication use, activity limitations due to pain, and perceived illness complications). Higher scores indicated greater likelihood of treatment seeking. Baseline social support measures indexed perceived availability of support from family and friends. Covariates were baseline comorbidity, gender, SES, marital status, and age (centered at 70 years). Illness behavior increased annually (B=.16, SE=.02, $p < .0001$). People with more comorbidity (B=2.50, SE=.14, $p < .0001$) and females (B=2.63, SE=.46, $p < .0001$) reported higher illness behavior levels, whereas friend support (B= -.17, SE=.04, $p < .0001$) and age (B= -.20, SE=.02, $p < .0001$) negatively predicted illness behaviors. Further, age (B=.004, SE=.001, $p < .0001$) and

comorbidity ($B=.02$, $SE=.01$, $p=.02$) predicted faster increases in illness behavior. While multi-morbidity predicts increases in illness behavior level and change, friend support, but not family support, predicts reduced levels. Hence, friend support might be a useful target for reducing overutilization of health-care in older adults.

VALIDATING GEROTRASCENDENCE FOR AN UNMARRIED OLDER POPULATION

A. Jasper¹, P. Martin¹, A.J. Bishop², 1. *Iowa State University, Ames, Iowa*, 2. *Oklahoma State University, Stillwater, Oklahoma*

Gerotranscendence is a rapidly growing theory of psychological development in older adulthood that is implicated in well-being and life satisfaction during later life. The purpose of this study was to assess the structural validity of Tornstam's 10-item gerotranscendence scale in a population of unmarried older adults. A total of 227 older adults ($n = 65$ never-married, $n = 93$ widowed, and $n = 69$ divorced) from the Iowa Unmarried Survivors Study participated (71% female, 92% Caucasian), ranging in age from 65 to 94 years old. A confirmatory factor analysis (CFA) using Mplus was computed with the gerotranscendence scale's traditional three factor structure; however, this resulted in no convergence of the data. An exploratory factor analysis (EFA) was completed to identify a better fitting model, which indicated a four factor structure fit the data more optimally. However, due to insufficient factor loadings, one factor was dropped from further analysis. The adjusted gerotranscendence scale CFA was computed with the modified factor structure. Results indicated an acceptable model fit to the data, χ^2 ($df = 11$) = 25.53, $p = .01$; CFI = .95; RMSEA = .08, using the modified gerotranscendence scale. Factor loadings were also acceptable, ranging from .61 to .93, with one item loading at .41. Results suggest that a modified version of Tornstam's gerotranscendence scale with revised dimension factors may be more appropriate for assessing gerotranscendence in a population of unmarried older adults.

VALIDATION OF THE SOCIAL APPEARANCE ANXIETY SCALE WITH OLDER HETEROSEXUAL AND SEXUAL MINORITY MEN

E. Elmer, *Sociology, Vrije Universiteit Amsterdam, Vancouver, British Columbia, Canada*

Social appearance anxiety (SAA) refers to anxiety about being negatively evaluated by others due to one's overall appearance. It is associated with several mental health problems, including body dissatisfaction, disordered eating, depression, and social anxiety. Due to a lack of psychometrically valid instrumentation, there has been little research on SAA in older adult populations, including older sexual minority men, who may be at particular risk for SAA. The current study examined the psychometric properties of the 21-item Social Appearance Anxiety Scale (SAAS; Hart et al., 2008) in a global, demographically diverse sample of heterosexual and gay/bisexual men aged 50–88 ($N=1,275$). For both sexual orientation groups, the SAAS demonstrated a one-factor structure and high internal consistency reliability. In both groups, the SAAS also demonstrated good construct validity: it was positively and moderately associated with depression and loneliness, as well as two personality traits:

social inhibition and general rejection sensitivity. It was also negatively and moderately associated with self-esteem, self-perceived attractiveness, and overall mental well-being. Although both groups reported lower levels of social appearance anxiety with increasing age, overall mean levels were higher for sexual minority men. Moreover, the relationship between SAA and both self-esteem and self-rated attractiveness was stronger for sexual minority than heterosexual men. This study suggests that the SAAS is a psychometrically valid instrument to assess SAA in both groups of men. It also suggests important sexual orientation disparities in SAA that warrant further study.

INCOME DROPS AND PERMANENT INCOME OVER 29 YEARS OF ADULT LIFE AND INFLAMMATION IN LATER LIFE

J. Pedersen^{1,2}, E. Lykke Mortensen^{1,2}, E. Foverskov^{1,2}, G. Petersen^{1,2}, R. Lund^{1,2}, 1. *Copenhagen University, Copenhagen, Denmark*, 2. *Center for Healthy Ageing, Copenhagen, Denmark*

Inflammatory processes have been implemented in a host of age related diseases, and are a likely mechanism linking low income with cardiovascular disease. In much of the existing scholarship income is treated as a static factor. The current study aims to address if annual income drops and permanent income across 29 years in adulthood are associated with later inflammation. To our knowledge this is the first study to use high resolution repeat measures of income to address this association. The study is based on participants from the Copenhagen Aging and Midlife Biobank ($n=5,460$) with annual measures of personal income from Danish national registers. Income drops were defined as a 20% drop in income over a one year period and permanent income was defined as mean income over 29 years. The associations were estimated using ordinary least squares regression, controlling for age, sex, cohort, and education. Inflammation marked by C-Reactive protein (CRP) and Interleukin-6 (IL-6) was measured at mean age 54 years. We found that 42% of the population experienced at least four income drops of more than 20% over the 29 year period and the average annual permanent income was 58,900 USD. Each additional drop in income was associated with a 1% higher level of CRP and IL-6. Each 20% increase in permanent income was associated with a 3% decrease in CRP and 2% decrease in IL-6. The results suggest that income instability over adult life may be associated with higher levels of inflammation in later life.

WHITE MATTER LESIONS ARE DIFFERENTIALLY LINKED TO CARDIOVASCULAR RISK AND PROCESSING SPEED DECLINES

S. Aichele¹, P. Ghisletta¹, P. Rabbitt², 1. *University of Geneva, Geneva, Switzerland*, 2. *University of Oxford, Oxford, United Kingdom*

Cerebral white matter hyperintensities (WMH), present in the majority of older adults, are consistently associated with cerebrovascular disease (CVD) and with cognitive declines in processing speed and executive function. Here we more comprehensively evaluate associations between WMH burden and longitudinal measures of health, lifestyle, and multiple cognitive indices. In a longitudinal study of 112 community-dwelling adults (age range 50–71 years at initial

assessment), we used an advanced data mining approach to evaluate the relative strength of 52 variables (including socio-demographic, lifestyle, health, and multiple cognitive measures) in association with cerebral WMH burden (total and regional). Greater chronological age, elevated symptoms of cardiovascular disease, and processing speed declines were most strongly (and consistently) linked to elevated WMH burden (jointly accounting for ~49% of total WMH variability). Frontal lobe WMH counts were significantly associated both with elevated cardiovascular symptoms (+17% WMH / +1SD, 95%CI [8%, 27%]) and with negative change in processing speed (+13% WMH / -1SD, 95%CI [6%, 20%]), whereas temporal lobe WMH counts were only significantly associated with negative change in processing speed (+37% WMH / -1SD, 95%CI [14%, 54%]). Outcomes generally support the vascular hypothesis of cognitive aging; however, WMH-cognition associations in temporal regions may be etiologically distinct from those related to cardiovascular illnesses.

FINDING THE MEANING IN LIFE PROGRAM FOR OLDER ADULTS: THE PATHWAY TO WONDERFUL AGING

N. Kusaka¹, N. Tsuchida², J. Narumoto³, K. Masuda⁴, A. Shiomura⁷, M. Ishikawa⁵, K. Katsura⁶, 1. *Department of Contemporary Social Studies, Doshisha Women's College of Liberal Arts, Kyotanabe, Kyoto, Japan*, 2. *College of Comprehensive Psychology, Ritsumeikan University, Kyoto, Japan*, 3. *Department of Psychiatry, Graduate School of Medical Science, Kyoto Prefectural University of Medicine, Kyoto, Japan*, 4. *Counseling Center, International Buddhist University, Osaka, Japan*, 5. *Institute of Human Sciences, Ritsumeikan University, Kyoto, Japan*, 6. *Osaka Mentalhealth Care Institute, Osaka, Japan*, 7. *Okatani Medical Foundation, Nara, Japan*

A sense of the meaning in life has been highlighted as an important factor in the mental and physical health in the elderly. As psychological programs designed to improve the well-being for older adults living in the community were scarce, a Finding the Meaning in Life Program, consisting of nine 90-minute weekly group sessions, has been developed as a way to realize the personal strengths and pursue meaning in later life. This program was conducted for three consecutive years using four separate groups.

The purpose of this study was to evaluate the effectiveness of this program in subjective well-being and cognitive functions, as well as to investigate possible moderators of these outcomes.

A randomized waitlist-controlled trial was conducted. The trial included 66 participants aged 58 - 81 years ($M=70.74$, $SD=5.04$). Participants were randomly assigned to the intervention group ($N = 40$, $M = 71.53$, $SD=5.11$) or to the waitlist control group ($N = 26$, $M=69.52$, $SD=4.78$).

Participants completed questionnaires on various measures of subjective well-being and the cognitive functions at baseline, nine weeks post-baseline, and six months after the intervention. To evaluate the potential effects of the program, a multilevel modeling with a repeated-measures design was applied.

Participants in the intervention group reported that the scores of will, hope ($p < .001$), a sense of personal growth

($p < .01$), autonomy and life satisfaction ($p < .05$) improved nine weeks post-baseline when compared with participants in the control group. The improvement was maintained six months later. This program could be an innovative approach to promote subjective well-being in later life.

PAIN INTENSITY, DISABILITY, AND WELL-BEING IN PATIENTS WITH CHRONIC BACK PAIN: DOES AGE MATTER?

M. Wettstein, J. Tesarz, W. Eich, *Department of General Internal Medicine and Psychosomatics, Medical Hospital, Heidelberg University, Heidelberg, Germany*

Chronic back pain is a frequent medical condition among middle-aged and older adults. Its detrimental impact on patients' functional ability and well-being are well-known. However, less is known about the role of age: Older patients may, on the one hand, feel less impaired and report higher well-being because pain may be better anticipated and regarded as more "normative" in old age. On the other hand, coping with pain may get more difficult with advancing age because of additional age-associated declines in physical, sensory and other resources, resulting in higher disability and lower well-being among older patients. In this study we compared four age groups (40–50 years: $n = 59$; 51–60 years: $n = 71$; 61–70 years: $n = 59$; 71–83 years: $n = 39$) of 228 patients with chronic back pain regarding multiple indicators of pain intensity, pain disability (as assessed by subjective, self-reported activity restrictions and objective, performance-based tests), and well-being (SF-12 physical and mental health, anxiety, depression, perceived control over life, affective distress). We found no significant age group differences regarding pain intensity. Although the older age groups revealed significantly higher performance-based disability and reported more activity restrictions, they scored higher on most well-being measures than the younger groups. Our findings may thus be seen in line with the "well-being paradox", suggesting that although disability in patients with chronic back pain increases with advancing age, quality of life was generally higher in older patients.

WHO BENEFITS FROM MORE CHOICE IN ELDERCARE: INVESTIGATING PREDICTORS OF CHOICE OVERLOAD

P. Bjalkebring^{2,1}, A. Dunr¹, B. Johansson¹, 1. *University of Gothenburg, Gothenburg, Sweden*, 2. *The Ohio State University, Columbus, Ohio*

Economic theory predicts that more choice is beneficial for both individuals and society. However, research suggests that too many options can lead to "choice overload", a phenomenon where individuals feel overwhelmed, potentially leading to lower choice satisfaction, and making poorer decisions (Schwartz, 2004). Although not as universal as initially believed, research suggests that certain circumstances tend to induce choice overload (Scheibehenne, Greifeneder & Todd, 2010). We investigated if the number of alternatives in choosing eldercare provider influenced satisfaction with eldercare decisions.

Two samples of adults were used: one Swedish ($n=176$, age; range=19–86, $m=47$, $sd=19$, 38% men) and one from the U.S. ($n= 156$, age; range 24–75, $m=47$, $sd=14$, 55% men). We measured cognitive functioning (numeracy and memory),

as well as self-rated health. We presented participants with information about 4, 8, or 12 different eldercare facilities and asked them to choose one. After completing the task, we measured participant satisfaction on a seven-point scale.

More alternatives were not related to less satisfaction overall, however, more options had a negative impact on satisfaction among participants with low self-rated health. We found no effects of age or cognitive ability on choice overload. However, we found an age-related positivity-bias indicating that older adults rated their choices as overall more positive compared to younger participants.

The finding that more alternatives were related to less satisfaction in participants with lower self-rated health is of importance in eldercare settings where the majority needs to make these decisions because of compromised health and functioning.

AGING AND SACCADIC EYE MOVEMENTS DURING COGNITIVE ACTIVITY

S. Noh^{1,2}, J. Choe⁴, Y. So¹, K. Kim³, 1. *Psychology, Chungnam National University, Korea, Daejeon, Korea (the Republic of)*, 2. *Platinum Aging Center, Seoul, Korea (the Republic of)*, 3. *Department of Neuropsychiatry, Seoul National University Bundang Hospital, SungNam, Korea (the Republic of)*, 4. *Department of Brain and Cognitive Sciences, Seoul National University College of Natural Sciences, Seoul, Korea (the Republic of)*

Gaze aversion (GA) is a phenomenon in which people turn their gaze away from the faces of other people or from other visual stimuli in order to concentrate on a train of thought. Previous studies have shown that these GA behaviors are associated with cognitive activity, and such behavior may be developed in early stages of life so that it can be utilized as a cognitive strategy. In this study, eye movement was measured in real time during the cognitive task using an eye tracker to objectively evaluate the GA phenomenon. Thirty six younger adults and 36 older adults performed verbal fluency and mental calculation tasks under two conditions: fixing their gaze to the center of the screen or gazing freely according to the gaze condition (gaze fix vs gaze free condition). We found that GA behaviors (the number of saccade and fixation per second) occurred during cognitive activities and the GA phenomenon was observed more frequently in the fluency task than in the mental calculation task. Moreover, GA increased as the difficulty level of mental calculation task increased and this aspect was more pronounced among young adults. Regarding the direction of saccade, vertical movement was observed remarkably in the young, while horizontal movement was observed in the elderly. It is suggested that the decreased GA behavior in the elderly is related to aging and further research on whether they reflect pathological aging and function deterioration is needed.

TRAJECTORIES OF COGNITION FROM ACUTE HOSPITALIZATION TO THREE MONTHS POST-DISCHARGE IN OLDER PERSONS

L. Reichardt¹, R. van Seben¹, J. Aarden^{2,1}, R. Engelbert^{2,1}, J. Bosch^{3,1}, B. Buurman¹, 1. *Academic Medical Center, Amsterdam, Netherlands*, 2. *Amsterdam University of Applied Sciences, Amsterdam, Netherlands*, 3. *University of Amsterdam, Amsterdam, Netherlands*

Acute hospitalization often initiates events leading to changes in cognitive functioning. The majority of studies that investigated cognitive trajectories over time focused on specific patient-populations such as patients who suffered a hip fracture, stroke, or delirium. Moreover, previous studies have had only long-term follow ups. Trajectories of cognitive changes within the short critical three months post-discharge are hence unknown. Therefore, the aim of this study was to identify distinct trajectories of cognitive functioning from acute hospitalization up to three months post-discharge and to study the incidence of functional decline and mortality. We conducted a multicenter prospective cohort study, the Hospital-Associated Disability and impact on daily Life (Hospital-ADL) study, including 400 acutely hospitalized patients of 70 years and older, who had a minimal MMSE-score of 15 at admission. Data were collected in six hospitals in the Netherlands. We identified three cognitive trajectories: 1] consistently high level of cognitive functioning (69%), 2] moderate cognitive functioning and improvement (22%), and 3] consistently minimal cognitive functioning (9%). In the group with a consistently high level of cognitive functioning, 14% had functional decline and the mortality rate was 11% at three months post-discharge. Of the participants with moderate cognitive functioning and improvement, 24% experienced functional decline and the mortality rate was 6.5%. Finally, of the participants with consistently low cognitive functioning, 41% had functional decline and 14% died within three months post-discharge. These distinct trajectory groups of cognitive functioning provide information about the possible prognosis of cognition and functional recovery after an acute hospitalization.

SUBJECTIVE WELL-BEING AND HEALTH: UNIQUE EFFECTS OF GLOBAL AND SINGLE DAY ASSESSMENTS

L.H. Ryan, M. Larkina, J.E. Smith, *The University of Michigan, Ann Arbor, Michigan*

A growing area of research concerns associations of non-clinical emotional indicators (i.e., rather than mental illness/depression) with health. Positive (e.g. happy, interested, content) and negative (e.g. frustrated, sad, angry) affect are distinct but related constructs that assess subjective well-being from global/trait to momentary levels. Little is known about whether varying levels of affective granularity are uniquely associated with health. Self-rated health can also be considered across different levels (global or in-a-day), such as single item global self-reports down to how an individual rates health in a single day. The current study leverages underutilized data from the Health and Retirement Study (N = 5650; mean age = 68, SD = 10, Range 51 - 99) to investigate associations of positive and negative affect with self-rated health. Global ("Would you say your health is...") and in-a-day ("How was your health yesterday...") health are the outcome measures. Positive and negative affect were also assessed globally (PANAS) and in-a-day (Yesterday: overall, within activities). A series of linear regression models independently assessed associations of positive and negative affect on self-rated health. All models controlled for age, gender, race/ethnicity, education, wealth, work status, and marital status. All levels of positive affect and all levels of negative affect, aside from that linked to activities yesterday, were significantly

associated with self-rated health (global and in-a-day) in expected directions. The current study finds that over and above known demographic correlates of health, global and in-a-day positive and negative affect have unique effects. Potential mechanisms are discussed.

THE PSYCHOMETRICS OF THE SUBJECTIVE HAPPINESS SCALE AMONG BLACKS AND WHITES

G. McCaskill^{2,1,3}, M. Miller⁴, R. Weech-Maldonado³, 1. Birmingham VAMC, Birmingham, Alabama, 2. Alabama A&M University, Normal, Alabama, 3. University of Alabama at Birmingham, Birmingham, Alabama, 4. Texas A&M University, College Station, Texas

Subjective well-being is difficult to measure. Most subjective well-being instruments have been developed and assessed on mostly White middle age adults, which suggests a need for a valid and reliable subjective well-being instrument for non-Whites. The objectives of this study were to examine the psychometric properties of the Subjective Happiness Scale (SHS) in a sample of Black and White community-dwelling adults in Alabama (N = 604) and to assess the scale's construct validity across both racial groups. Exploratory factor analysis (EFA) and confirmatory factor analysis (CFA) were performed using the 4-item SHS. Additionally, we evaluated the internal consistency reliability for the overall sample and separately by race. The initial EFA models analyzed the factor structure for the overall sample and for each racial group separately. EFA results support a one-factor structure for the SHS for the overall sample and for each racial group separately. CFA models determined the goodness of fit of the scale for each racial group separately. The four-item scale demonstrated a significantly good fit among Blacks ($\chi^2 = 0.11$; $p < 0.9$; RMSEA= 0.0; CFI= 1.0; TLI= 1.0), but not Whites ($\chi^2 = 17.8$, p -value = 0.001; RMSEA= 0.15; CFI= 0.98; TLI= 0.95). The four-item scale also demonstrated adequate internal consistency for the overall sample ($\alpha = 0.89$) and separately for Blacks ($\alpha = 0.89$) and Whites ($\alpha = 0.89$). Findings indicate that the SHS is appropriate for measuring subjective well-being among Blacks. Additional work to improve the scale's psychometrics across both racial groups is currently underway.

MEANINGS OF HOMES FOR LIFELONG CAREGIVERS OF ADULT CHILDREN WITH AUTISM SPECTRUM DISORDER

C. Marsack¹, T.E. Perry², 1. Social Work, Eastern Michigan University, Troy, 2. Wayne State University, Detroit, Michigan

Homes are seen as markers of identity, histories, and relationships. For many older adults, they may experience their residence as an "empty nest" where the raising of children is self-defined and normatively-defined as a completed social role. However, for some, the raising of children under one's roof continues into older adulthood. This study explores the experiences of older adults caring for adult children diagnosed with Autism Spectrum Disorder (ASD) and how their caregiving relationships are intertwined with their relationship with their homes. As a follow up to a U.S. quantitative study, 51 semi-structured interviews were conducted among older parents, age 50 and over, of adult children with ASD. Transcribed qualitative interviews were analyzed using Atlas

ti 7 software, using a grounded theory approach and line-by-line analysis. Parents indicated a number of challenges regarding their homes and living arrangements. Many parents with co-residing adult children reported (1) a sense of being on duty, (2) sacrifices that are non-normative to their peers, and (3) wanting a different living arrangement. Parents also experienced (4) a lack of privacy, and (5) an unpredictable (e.g. unsafe) home environment. In considering the complexity of lifelong caregiving, meanings of the home as a primary site of this caregiving relationship must be considered. Older adults may need help coming to terms with how their residential setting reflects their lifelong caregiving obligations. Practitioners should address this aspect of later life caregiving, with attention to the meanings of home in terms of privacy, identity and safety in supporting these families.

ASSOCIATIONS OF PERSONALITY TRAITS WITH INFORMANT SCREENING SCORES OF COGNITIVE DECLINE

P. Hill, M.J. Boudreaux, P.J. Cruitt, T.F. Oltmanns, Washington University in St. Louis, St. Louis, Missouri

Consistent evidence suggests that personality traits are associated with risk for cognitive decline, with research typically focusing on the role of the Big Five personality traits (extraversion, agreeableness, conscientiousness, neuroticism, and openness to experience). Although this work has demonstrated the importance of personality traits for concurrent and longitudinal prediction of cognitive decline, evidenced associations typically have been modest in magnitude. The nature and extent of these results may have been limited by the use of self-report personality scales and reliance on broad, domain level Big Five measures.

The current study examined associations between Big Five facets (both self- and informant-rated), assessed using the NEO PI-R, and informant-reports of dementia symptoms, using the AD-8 measure, in a representative, community-based sample of 838 middle-to-older adults (mean age: 66.6 years) participating in the St. Louis Personality and Aging Network (SPAN) study. At the domain level, findings replicated past work as self-reported neuroticism ($r = .20$) and conscientiousness ($-.15$) were associated with AD8 scores. At the more narrow, facet level, research found that while the neuroticism associations held across most facets, the findings for conscientiousness were significant only for some facets (competence, dutifulness, and self-discipline). Moreover, results found that higher scores on activity and positive emotions (aspects of extraversion), and on trust (a facet of agreeableness) were associated with lower AD8 scores. With respect to informant-rated personality, almost all Big Five facets were associated with AD8 scores in the form of socially desirable traits being related to better cognition.

HIV AND AGING: ASSOCIATIONS BETWEEN INFORMATION SOURCES AND HIV KNOWLEDGE AMONG PEOPLE AGE 50+

E. Robinson¹, S. Ashida², 1. University of Missouri, Columbia, Missouri, 2. The University of Iowa, Iowa City, Iowa

Older adults account for 50% of people living with HIV and 20% of new HIV infections in the U.S. This may be partly attributed to limited knowledge of personal risk

factors. Currently, little is known about where older adults receive HIV information and implications of the information sources on their HIV knowledge. Adults 50–84 years of age in a Midwestern city completed one-time web-based surveys to indicate where they receive HIV information from and complete the HIV Knowledge Questionnaire-18. Multiple linear regression analysis was conducted to determine the relationships between information sources and HIV knowledge controlling for covariates. Participants ($n=427$) were predominantly white (94%) and female (73%), and reported a mean of 5.7 ($R=0-13$, $SD=3.0$) sources of HIV information. The listed sources of HIV information include the television (82%), Internet (79%), newspaper (76%), radio (61%), family/friends (54%), healthcare provider (38%), local health department (37%), and library (29%). Receiving HIV information from a healthcare provider ($\beta=.64$, $p<.05$), a local health department ($\beta=.52$, $p<.05$), the Internet ($\beta=1.19$, $p<.001$), and the library ($\beta=.63$, $p<.05$) were associated with higher HIV knowledge, controlling for age, gender, income, education, race, and prior employment in healthcare. Higher number of information sources ($\beta=.12$, $p<.001$) was also associated with higher HIV knowledge. Although healthcare providers and local health departments are not the main sources of HIV information, they may be important in facilitating greater HIV knowledge amongst this age group. Health professionals can also guide and assist them to seek information from multiple credible sources.

PREDICTORS OF SATISFACTION WITH AGING IN PLACE: THE ROLE OF HOME- AND COMMUNITY-BASED SERVICES

F. Wen¹, C. Stewart², G. Armstrong¹, G. Burke³, L. Land⁴, C. Miller⁵, B. Clifton⁶, 1. *Family and Community Medicine, OU-TU School of Community Medicine, Tulsa, Oklahoma*, 2. *College of Nursing, University of Oklahoma Health Sciences Center, Tulsa, Oklahoma*, 3. *Morton Comprehensive Health Services, Tulsa, Oklahoma*, 4. *LIFE Senior Services, Tulsa, Oklahoma*, 5. *INCOG Area Agency on Aging, Tulsa, Oklahoma*, 6. *Carver Senior Center, Tulsa, Oklahoma*

Home- and community-based services (HCBS) are critical to helping older adults age in place (AIP). Few studies have examined the association between older adults' satisfaction with AIP and HCBS utilization, particularly in the context of the Andersen behavioral model of health services use. The purpose of the study is to examine how predisposing, enabling, and need characteristics combine with HCBS utilization to predict satisfaction with AIP. A survey was administered to 229 adults aged ≥ 65 years. The survey assessed individual predisposing (age, gender, race, marital status, education), enabling (income, activity satisfaction, informal caregiving availability, HCBS costliness), need (health status change), and contextual enabling (neighborhood resources, neighborhood accessibility, HCBS availability) characteristics. Use of nine HCBS was assessed (i.e., nursing, physical/occupational therapy, personal care, counseling, home-delivered meals, prescription delivery, home maintenance, transportation, and yard maintenance). Among those in need of HCBS ($n=166$), 29% were satisfied with AIP, and 71% were not satisfied; 20% did not use HCBS and 80% used at least 1 service. Satisfaction with AIP was significantly

correlated ($p<.05$) with HCBS use ($\rho=-.16$), activity satisfaction ($\rho=.26$), HCBS costliness ($\rho=-.43$), health status change ($\rho=.20$), and neighborhood accessibility ($\rho=.19$). In a multivariate logistic regression model, satisfaction with AIP increased with health status improvement [$\text{Exp}(B)=3.45$, $p<.05$] and neighborhood accessibility [$\text{Exp}(B)=1.49$, $p<.05$], but decreased with HCBS costliness [$\text{Exp}(B)=0.67$, $p<.05$]. HCBS use decreased satisfaction with AIP [$\text{Exp}(B)=0.18$, $p<.05$], possibly as a result of the overall decline in ability and activities signified by the need for and use of HCBS. Further research is needed.

DETECTION OF CYTOMEGALOVIRUS DNA IN MONOCYTES, CMV-SPECIFIC T CELLS, AND IL-6 LEVELS IN OLDER ADULTS

Y. Chen^{1,2}, H. Li², L. Ferrucci⁴, S.X. Leng^{2,3}, 1. *Geriatrics, The Second Xiangya Hospital of Central South University, Changsha, Hunan, China*, 2. *Johns Hopkins University School of Medicine, BALTIMORE, Maryland*, 3. *The Milstein Medical Asian American Partnership (MMAAP) Foundation, New York, New York*, 4. *National Institute on Aging, Baltimore, Maryland*

Chronic cytomegalovirus (CMV) infection is believed to significantly contribute to T-cell immunosenescence and adverse health in older adults. A major barrier to advancement in this field has been that chronic CMV infection is diagnosed by anti-CMV IgG serology, a crude measure that merely indicates prior exposure to the virus and does not distinguish between past (resolved) or chronic (persistent) infections. We have optimized a nested PCR-based assay for qualitative detection of CMV DNA in the peripheral blood mononuclear cells (PBMCs). In this study, we evaluated 89 men and women InCHIANTI study participants (mean age=79, 65–96 years old). Among them, 36 were HLA-A2+ for whom CMV pp65-specific CD8+ T-cell frequencies were measured through class I tetramer analysis. The results showed that 56 of 89 participants (63%) had detectable monocytic CMV DNA while almost all (99%) were CMV seropositive. Those with detectable monocytic CMV DNA had significantly higher serum IL-6 levels than those without ($1.81+1.5$ vs $1.19+0.91$ pg/ml, respectively, $P=.01$), regardless of anti-CMV IgG titers. Among 36 HLA-A2+ participants, those with detectable monocytic CMV DNA ($n=20$) had significantly higher CMV pp65-specific CD8+ T-cell frequency than those without ($n=16$, $3.65 \pm 3.6\%$ vs $0.86 \pm 0.67\%$, respectively, $P=.003$). Taken together, these results suggest that detection of human CMV viral DNA in the PBMCs may be a better indicator than CMV seropositivity for increased IL-6 levels and CMV pp65-specific CD8+ T-cell expansion in older adults. Research is needed to further evaluate detection of monocytic CMV DNA as a valuable diagnostic tool of chronic CMV infection in older adults.

CHILDHOOD PERSONALITY AS A PREDICTOR OF COGNITIVE ABILITY AND COGNITIVE IMPAIRMENTS IN ADULTHOOD

G. Edmonds¹, P. Hill², S. Hampson¹, 1. *Oregon Research Institute, Eugene, Oregon*, 2. *Washington University in St. Louis, St. Louis, Missouri*

Using data from the Hawaii Personality and Health Study, we tested Big Five personality traits assessed in childhood as

predictors of performance on a proxy version of the Mini-cog, a screening tool for cognitive impairment, assessed at age 60. We additionally tested general cognitive ability assessed at age 50 as a potential mediator of associations between childhood personality and Mini-cog scores. These are some of the first data available to test associations between personality in childhood and cognitive outcomes decades later in adulthood. The sample was comprised of 330 participants (52% women) who completed half day clinic exams at average age 50 and again at age 60. Childhood personality traits were assessed at average age 10 using teacher ratings of personality. General cognitive ability was measured at average age 50 using the Woodcock-Johnson Brief Abilities Inventory (BIA). At age 60, participants completed a clock drawing task and the Hopkins Verbal Learning Task (HVLTR). These were used to construct a proxy Mini-cog. Partial correlations controlling for age and gender showed that childhood Conscientiousness ($r = -.13$), Intellect/Openness ($r = -.12$), and Agreeableness ($r = .12$) were associated with Mini-cog scores. In path analyses testing age 50 cognitive ability as a mediator of these effects, both childhood Intellect/Openness and Conscientiousness showed indirect effects through age 50 cognitive ability on Mini-cog performance at age 60. Childhood Agreeableness maintained an independent association with Mini-cog scores, not mediated by adult cognitive ability. We discuss possible mechanisms that may account for the observed associations.

SENESCENCE AND APOPTOSIS IN AGING SKELETAL MUSCLE

D. Kwak¹, C.W. Baumann², L.V. Thompson¹, 1. *Physical Therapy and Athletic Training, Boston University, Boston, Massachusetts*, 2. *University of Minnesota, Minneapolis, Minnesota*

In mitotic cells, senescence and apoptosis occur in response to certain stressors (e.g., aging). However, in post-mitotic cells, such as multinucleated skeletal muscle myofibers the extent to which cellular senescence and apoptosis occurs is largely unknown. Therefore, the purpose of this study was to explore the role of senescence and apoptosis as drivers of age-associated sarcopenia. We hypothesized that biomarkers of senescence and apoptosis would increase in aging skeletal myofibers and that these changes would be associated with sarcopenia. To identify biomarkers of senescence and apoptosis, the extensor digitorum longus (EDL) and tibialis anterior (TA) muscles were examined from adult (<12 months, N=11) and elderly (>28 months, N=11) male C57BL/6 mice. The EDL was used to assess *ex vivo* whole muscle physiology while the TA was used to determine protein content (p53, p21, p16, caspase 3, and IL-6) and presence of SA β -gal and Tunnel via histological staining. Muscle wet weight and absolute force production were significantly reduced in the elderly mice. Aging significantly increased p21, IL-6, and caspase 3 content; however, did not appear to impact p53 nor p16 expression. Myofibers of elderly mice had an increase of apoptotic myonuclei, but only presented a small percentage of SA β -gal. Taken together, biomarkers of cellular senescence and apoptosis are present in muscle of elderly mice. Because p21, IL-6, caspase 3, and apoptotic cells were increased in the elderly muscle it is possible that these pathways contribute to sarcopenia.

NEW EVIDENCE THAT PROTECTIVE EFFECTS OF FAMILIAL LONGEVITY EXPIRE AT OLDER AGES

L.A. Gavrilov¹, N.S. Gavrilova^{1,2}, V.N. Krut'ko², 1. *NORC at the University of Chicago, Chicago, Illinois*, 2. *Federal Research Center "Computer Science and Control" of Russian Academy of Sciences, Moscow, Russian Federation*

This study presents new findings that challenge a common belief in sustained protective effects of familial longevity during the human life course. We found that the survival advantage of biological relatives of long-living individuals vanishes at older ages, suggesting that protective effects of longevity-assurance genes disappear at age 95–100 years. We compared survival patterns of 3,664 siblings of U.S. centenarians with survival of a control group of 4,078 siblings of shorter-lived individuals (died at age 65 years). Survival analysis after age 40 years was conducted separately for 4,201 male and 3,541 female siblings born in 1886–1896. Although siblings of long-lived individuals have lower mortality at younger ages compared to siblings of shorter-lived individuals, their actuarial aging rate (rate of mortality growth with age) is consistently higher, so that their survival advantage practically disappears at older ages. To validate these findings, we analyzed data on survival of 3,408 U.S. centenarians born in 1890–97 with known information on maternal and paternal lifespan. We found that indeed both maternal and paternal longevity (lifespan 90+ years) have no protective effect on survival after age 100 years. These findings challenge predictions of the mutation accumulation theory of aging about higher survival advantage at older ages associated with familial longevity due to lower load of late-acting deleterious mutations. Our findings are compatible with predictions of the reliability theory of aging suggesting higher initial levels of system redundancy (reserves) in individuals with protective familial/genetic background. Supported by the National Institute on Aging (R01 AG028620 to L.G.).

EFFECT OF CHRONIC POLYPHARMACY AND THE DRUG BURDEN INDEX (DBI) ON PHYSICAL FUNCTION IN AGED MICE

J. Mach^{1,2,3}, C. Logan^{1,2}, G. Gemikonakli^{1,2}, A.E. Kane^{4,2}, S.E. Howlett⁴, R. de Cabo⁵, D.G. Le Couteur^{2,6}, S.N. Hilmer^{1,2,3}, 1. *Kolling Institute, Sydney, New South Wales, Australia*, 2. *University of Sydney, Sydney, New South Wales, Australia*, 3. *Royal North Shore Hospital, Sydney, New South Wales, Australia*, 4. *Dalhousie University, Halifax, Nova Scotia, Canada*, 5. *National Institute on Aging, Baltimore, Maryland*, 6. *Concord Hospital, Sydney, New South Wales, Australia*

Increasing DBI (measure of patient's total exposure to anticholinergics and sedatives) is associated with impaired physical function in observational studies of older adults. We aim to determine the effect of polypharmacy (use of ≥ 5 drugs) and increasing DBI on functional outcomes in aged mice. From 12 to 21 months of age male C57BL/6 mice are fed control diet or treated feed/water containing therapeutic doses of five drugs with Zero DBI (simvastatin, metoprolol, omeprazole, paracetamol, irbesartan), Low DBI (simvastatin, metoprolol, omeprazole, paracetamol, citalopram), High DBI (simvastatin, metoprolol, oxybutynin, oxycodone, citalopram), or single drug (simvastatin, metoprolol, oxybutynin, oxycodone or citalopram). A panel of functional tests

was performed every 3 months. Results to date at 15 months of age, compared to control diet, have found that openfield locomotor activity and midzone entries significantly declined in Low DBI, High DBI and citalopram groups ($n=10-13$, $p<0.05$). At 15 months, compared to control diet, nesting scores were lower with Low DBI, High DBI, citalopram, simvastatin and metoprolol ($n=20-29$, $p<0.05$). No significant difference was observed between treatment groups with grip strength (wire hang impulse) or muscle endurance (rotor rod latency). Our results show for the first time in a preclinical model that chronic polypharmacy with increasing DBI or individual sedative or anticholinergic drugs cause negative functional outcomes. Future research will continue the study through old age to determine the causation and mechanism of the adverse effects of polypharmacy observed in older adults.

GENE THERAPY EFFECTS ON STRUCTURAL CHANGES IN VARIOUS ORGANS OF YOUNG AND OLD MICE WITH DIABETES

V. Bezrukov¹, T. Kvitnitskaya-Ryzhova¹, S. Mikhalskiy¹, S. Lugovskoy¹, P. Klymenko¹, O. Toporova², I. D.F. Chebotarev Institute of Gerontology NAMS Ukraine, Kiev, Ukraine, 2. Institute of Molecular Biology and Genetics National Academy of Sciences of Ukraine, Kiev, Ukraine

The aim was to study structural, ultrastructural and histochemical changes (light, electron microscopy and morphometry) of the murine pancreatic gland (PG), heart, kidney, liver, spleen and brain and apoptosis in these organs (TUNEL-method) at experimental diabetes mellitus (DM) and its correction with gene therapy (GT) in young (3–5 mos) and old (20 mos) C57BL/6j mice.

DM was modeled by injecting Streptozotocin (40 mg/kg) during 5 days. Four weeks after the development of stable hyperglycemia, the plasmid vector of human preproinsulin (PEI-pDNA complex) was injected into animal livers. The animals were sacrificed in 30 days after plasmid injection.

After the GT the young animals displayed some normalization of PG and internal organs structure (development of compensatory-adaptive processes in them). We observed the increase of the pancreatic islets quantity, their specific volume in the PG tissue and higher functional activity of beta-cells along with the decrease of the apoptosis level, being combined with a definite normalization of blood glucose. The old animals displayed a significant worsening of study parameters, leading to the destructive and dystrophic changes and development of pathological processes (insulinitis) as well as to greater intensity of apoptosis. The effectiveness of GT at experimental DM appeared to be age-dependant. Hence age factor should be taken into consideration in developing DM therapy strategy.

CHANGES IN COPING STRATEGY WITH AGE

S. Maeng, H. Oh, M. Song, Y. Kim, S. Cha, J. Bae, J. Shin, N. Sohn, Gerontology, Kyung Hee University, College of East-West Medical science, Yongin, Korea (the Republic of)

Coping is a strategic approach about how to deal with stressful situations. Those who use proactive coping strategies have a tendency to accept changes and act before changes are expected. In contrast, reactive coping is more inflexible, preservative and more likely act in response to changes. There are a variety of explanations for why people

become conservatively as they age, but changes in the coping style may also be relevant. However, there is not much research on coping style changes with age. Therefore, this study investigated the changes in coping behaviors at 2, 12, and 23 months old mice with its underlying hormonal and biochemical characteristics.

Behavioral measurements in the active avoidance test and shock prod test have shown an age-related increase in reactive style of coping. Also, aged mice showed a tendency of inflexible or even did not attempt to cope in forced swim, fear conditioning and active avoidance test. The circadian and peak concentration of serum corticosterone in resting state was higher. However, the increase in stress hormone was less in response to stress. In this regard, the expression level of GR was lower in the hippocampus in aged animals.

According to these results, aging is related with 1) the rate of selecting a reactive coping strategy increases, 2) stress reactivity decreases 3) which are associated with the change in glucocorticoid receptor numbers in critical brain circuits. These age-related strategic changes may explain why the elderly becomes more conservative.

COMPARISON OF BIOLOGICAL AGE ESTIMATES IN HEALTHY INDIVIDUALS: TOWARD PLASMA-BASED QUANTIFICATION

F. de Wolf, E. Brinkman, G. Weverling, P. Klatser, S. Kostense, F. Schmitz, W. Koudstaal, J. Goudsmit, Janssen Prevention Center, Leiden, Netherlands

Biological Age (BA) assesses a person's deviation from chronological age and is an estimate of the individual's health status. Through quantification of multiple biomarkers one can predict the individual's aging process and mortality risk better than by chronological age alone. Several methods have been developed to compute a person's BA (1–4). Here we compare an BA estimate relying on biochemical and functional parameters (measured in different matrixes)- referred to as ClinicalAge (1) and three BA estimates based on methylation levels of specific DNA CpG sites obtained from PBMCs- termed DNAmAge (2–4) from the same cohort. All measurements were obtained from 60 healthy individuals subdivided in a young (mean 23.9; range 20–30 yrs), middle (45.8; 40–50) and older (65.3; 60–70) age group. Correlations among ClinicalAge and DNAmAge were low, whereas the three DNAmAge estimates strongly correlated with each other. Validation of any BA estimate with respect to its predictive power for mortality and ultimately all-cause morbidity requires large diverse cohort studies with longitudinal follow-up. Previously described BA surrogates were determined by various biomarkers quantified in distinct matrixes of body fluids, which are not all available on large scale in cohort studies. Therefore we aim to investigate the feasibility to measure BA in plasma only. Here we demonstrate that a unique set of epigenetic markers can be quantified in plasma and strongly correlated with chronological age. Ultimately, we established strategies to develop a BA estimate using plasma biomarkers, which subsequently needs to be derived and validated in longitudinal cohort studies.

AGING AND FRAILTY IN SILICO: THE PROPAGATION OF LOCAL DAMAGE THROUGH COMPLEX NETWORKS

A.B. Mitnitski, A.D. Rutenberg, S. Farrell, K. Rockwood, *Dalhousie University, Halifax, Nova Scotia, Canada*

Background: The relationships between aging, frailty and mortality are well documented but remain mainly empirical. We present a dynamical network model that explains the patterns of mortality and frailty.

Methods: We developed a computational model of human organism as a complex dynamical network of interacting nodes. Each individual is represented by a distinct network with 10,000 nodes- representing potential health deficits that can be in one of two states for every individual: either healthy, or damaged. Some have more connections than others, and each has a local environment defined by the damage state of its connected nodes. The local damage affects the nodes connected with that one (e.g. enhances the damage rate and reduces the repair rate of these nodes). Using Shannon entropy, we calculated how much information frailty adds to assessing the risk of death and how much information individual deficits add.

Results: Transitions between damaged and non-damaged states are governed by their stochastic environment. Our model shows how age-dependent acceleration of the frailty index and the Gompertz law of mortality emerge, without specifying an age-damage relationship. The mortality prediction information added by specific deficits increases with deficit degree, i.e. with the number of connections with other deficits: the most connected deficits (e.g. disabilities) become damaged later in life, in contrast to the least connected deficits.

Conclusions: Our model supports the idea that aging occurs as an emergent phenomenon, and not as the result of age-specific genetic programming. Instead, aging reflects how damage propagates through a complex network of interconnected elements.

RELATIONSHIP BETWEEN CHRONIC INFLAMMATION AND OBJECTIVELY MEASURED PHYSICAL ACTIVITY IN OLDER ADULTS

N.D. Knuth¹, S.R. Caro¹, M. Walter², J. Schrack³, 1. *Towson University, Towson, Maryland*, 2. *National Institute of Diabetes and Digestive and Kidney Diseases, Bethesda, Maryland*, 3. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

It is well established that physical activity decreases with age, and that lower levels of physical activity contribute to increased risk of functional decline with aging. Aging is also linked with an increased pro-inflammatory state; however, the association between objectively measured physical activity and inflammatory burden in older adults is not well defined. Therefore, physical activity (PA) was measured using wrist-worn ActiGraph Link accelerometers continuously over 7 days in 60 older participants (28 women, aged 69 ± 10 yrs) of the Longitudinal Aging Study at Towson (LAST). Accelerometer data was downloaded in 60-second epochs and expressed as the log-transformed average counts per day across the three axes. Blood samples were collected after an overnight fast, processed, and stored at -80°C until analysis. Plasma interleukin-6 (IL-6) and tumor necrosis factor alpha

(TNFα) concentrations were measured by bead-based multiplex assay, and C-reactive protein (CRP) was measured by enzyme-linked immunosorbent assay. Tertiles of each inflammatory factor were created and the association between the mean of the log-transformed activity counts and inflammatory tertiles was modeled using linear regression models, adjusting for age, sex, and BMI. In separate models, IL-6 was negatively associated with total daily PA, independent of age ($\beta = -0.11$, $p = 0.01$); however TNFα ($\beta = -0.03$, $p = 0.49$) and CRP ($\beta = -0.06$, $p = 0.18$) were not related to total daily PA. The independent, negative association between IL-6 and total daily PA highlights potential underlying pathways contributing to the age-related decline in PA, and subsequent physical function.

SIRTIIN-2 IS REGULATED BY SERUM RESPONSE FACTOR AND P49/STRAP GENES

X. Zhang, G. Azhar, J.Y. Wei, *University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Introduction: Serum response factor (SRF) has been implicated in the regulation of cell growth, proliferation and senescence. SRF regulates its target genes by binding to the serum response element (SRE or CArG-box) with “CC(A/T)6GG” sequence. SRF interacts with SRF-binding protein(s), including p49/STRAP (SRFBP1), to co-regulate SRF-target genes.

Hypothesis: The CArG-sequence exists not only in cytoskeletal genes but also in other genes. Since p49/STRAP, an SRF-binding protein, alters NAD/NADH ratio and affects histone protein deacetylation, we hypothesized that the CArG-sequence may exist in the promoter of sirtuin genes, and that SIRT2 may be regulated by SRF and p49/STRAP.

Methods and Results: Using bioinformatic analysis, we found a classic CArG-box sequence in the promoter of SIRT2 gene (accession no. AC011455). Sequencing analysis of five human DNA samples confirmed that all DNA samples had the same CArG-box sequence. Electrophoretic mobility shift assay showed that SRF protein indeed bound to P32-labeled SIRT2 promoter probe. A luciferase vector containing the SIRT2 promoter was constructed and used for transfection assays. The SIRT2 gene promoter was activated by SRF and myocardin, but repressed by p49/STRAP. Serum starvation also changed SIRT2 mRNA levels.

Conclusion: The SRF protein binds to the SIRT2 gene promoter and regulates SIRT2 gene expression, thus the SIRT2 gene is a SRF-target gene. SIRT2 gene is modulated by p49/STRAP and myocardin through interactions with SRF. The age-associated increases in cardiac SRF and p49/STRAP protein levels likely affect SIRT2 gene expression and induce histone protein deacetylation, thereby contributing to SIRT2-mediated aging in the heart.

MYOSTATIN, STRENGTH, AND POWER AMONG OLDER ADULTS FOLLOWING A 20-WEEK, RESISTANCE TRAINING PROGRAM

M. Gray, A. Binns, J. Glenn, *University of Arkansas, Fayetteville, Arkansas*

Among older adults (>65 y), 20% suffer from at least one mobility disability. While factors leading to mobility disability are multifactorial, declines in lean muscle mass leading to reductions in parameters of muscle function (i.e. muscular strength and power) are primary determinants of the

disablement pathway. Myostatin, a potent inhibitor of lean mass accretion, increases with age and is postulated to be a primary factor in lean mass loss throughout the lifespan. The purpose of this study was to examine serum myostatin, muscular strength, muscular power, and lean-tissue mass (LTM) changes following a high-velocity resistance training (HVRT) intervention among older adults. Forty-eight participants (77.2 ± 6.2 years; 74% female) were randomly assigned to HVRT or a control exercise group (CON). HVRT performed eight exercises at 70% 1-repetition maximum and CON participated in the same exercises with no external resistance. Participants attended supervised exercise classes two days per week for 20 weeks. There were no group by time interactions in the response to the exercise intervention for strength, power, or myostatin. There was a significant effect of time for muscular strength and power, increasing 28% and 23%, respectively ($p < .001$). A trend for a 9% reduction in serum myostatin ($p = .08$) existed for both groups; however, LTM remained unchanged. HVRT, with or without external resistance, is beneficial for increasing muscular strength and power among older adults. Therefore, HVRT is optimal training modality for increasing muscular strength and power among older adults, potentially minimizing mobility disability with age.

ALEXANDER TECHNIQUE PRACTITIONERS: IMPROVED POSTURAL CONTROL COMPARED TO AGE-MATCHED OLDER ADULTS

C. Ketcham, D. Anderson, K.A. Hamel, *San Francisco State University, San Francisco, California*

The Alexander Technique (AT) is a movement re-education technique that may have significant potential for improving balance and gait and reducing fall risk in older adults. AT practitioners use conscious control to identify, inhibit, and then replace maladaptive movement patterns. Like many complementary and integrative medicine practices, the AT has received limited scrutiny as an intervention for balance and mobility deficits in older adults, however, recent research has found significant differences in the gait biomechanics of older AT practitioners (ATP) compared to age-matched controls. AT training in older adults has also been suggested to improve balance, yet, to date, no studies have examined the biomechanics of balance control, such as the control of the whole body center of mass (COM). The purpose of this study was to compare COM velocities of older adult ATP to those of healthy controls without AT training on four balance tasks (eyes open firm surface, eyes closed firm surface, eyes open unstable surface, eyes closed unstable surface). Participants included six licensed ATP ($ATP = 65.8 \pm 5.2$ years), seven healthy age-matched and activity-matched controls ($OA = 66.6 \pm 4.2$ years), and five younger adults ($YA = 28.2 \pm 3.1$ years). The ATP group swayed with significantly slower velocities than the OA group on the eyes closed unstable balance task ($p = 0.008$) and with a trend toward slower velocities on the eyes closed firm surface task ($p = 0.08$). Sway velocities were similar between the ATP and YA groups for all tasks. These findings suggest that the AT could mitigate the deleterious effects of aging on postural control.

PREDICTING FUNCTIONAL DECLINE IN COMMUNITY-LIVING OLDER PEOPLE WITH A LOW SOCIOECONOMIC STATUS

J. Veldhuizen², M. Schuurmans^{1,2}, N. Bleijenberg^{1,2}, 1. *Nursing Science, University Medical Center Utrecht - Julius Center For Health Sciences and Primary Care, Utrecht, Netherlands*, 2. *University of Applied Sciences Utrecht, Institute of Nursing Studies, Utrecht, Netherlands*

Maintaining independence is the most important goal of the majority of older people. The onset of disability in activities of daily living is one of the greatest threats to the ability of older people to live independently. Older people with a low socioeconomic status (SES) are at high risk of functional decline. It is unclear what predicts functional decline in older people with a low SES. The aim of this study was to determine predictors of 12-month functional decline in community-living older people with low SES in the Netherlands. Functional decline was defined as the inability to perform (instrumental) activities of daily living. A prognostic multicentre study was conducted, using data from The Dutch Older Persons and Informal Caregivers Survey Minimum DataSet. A multivariable logistic regression model was fitted, using a stepwise backward selection process. Performance of the model was expressed by discrimination, calibration and accuracy. A total of 4,370 participants were included. The mean age of the participants was 80 years and 58.9% were female. Functional decline was present in 1,486 participants (34.0%). Ten predictors were independently associated with the outcome. Dementia was the strongest predictor (OR 1.83, 95% CI 1.04–3.23). Other predictors were age, education, poor health, quality of life rate, arthritis/arthritis, hearing problems, anxiety/panic disorder, pain and less social activities. The final model showed an acceptable discrimination (C-statistic 0.69, 95% CI 0.67–0.70), calibration (Hosmer-Lemeshow p-value 0.33) and accuracy (Brier score 0.20). Further research is needed to examine how functional decline can be ameliorated in this population.

MAKING THE MOST OF MEALTIMES: MALNUTRITION AND MODIFIED TEXTURE FOOD IN CANADIAN LONG-TERM CARE

V. Vucea¹, H.H. Keller^{1,2}, J.M. Morrison¹, L. Duizer^{3,2}, A.M. Duncan^{3,2}, S. Slaughter⁴, C. Lengyel⁵, N. Carrier⁶, 1. *University of Waterloo, Waterloo, Ontario, Canada*, 2. *Schlegel-University of Waterloo, Research Institute for Aging, Waterloo, Ontario, Canada*, 3. *University of Guelph, Guelph, Ontario, Canada*, 4. *University of Alberta, Edmonton, Alberta, Canada*, 5. *University of Manitoba, Winnipeg, Manitoba, Canada*, 6. *Université de Moncton, Moncton, New Brunswick, Canada*

Modified texture foods (MTFs) are associated with a high prevalence of malnutrition (40–80%) among older adults in LTC, yet research to demonstrate the independent effect of MTFs is lacking. Making the Most of Mealtimes (M3) is a cross-sectional multi-site study that collected data in 32 LTC homes in four Canadian provinces (AB, MB, NB, ON). This secondary data analysis examined if prescription of MTFs as compared to a regular texture diet was associated with the risk of malnutrition in residents of LTC homes when diverse relevant covariates were considered. The Mini Nutritional

Assessment Short-Form (MNA-SF) score was used to determine malnutrition. Use of MTFs, and resident and site characteristics were identified from health records, observations, and standardized assessments. Hierarchical linear regression analysis, accounting for clustering, was performed. A minced diet ($F(1, 382)=5.01, p=0.03$), as well as a pureed diet ($F(1, 279)=4.95, p=0.03$), were both significantly associated with risk of malnutrition among residents. After adjusting for age and gender, other significant covariates were: use of oral nutritional supplementation, cognitive impairment, eating challenges, and poor oral health. Given the significant association between consumption of MTFs and risk of malnutrition, MTFs need further consideration in regard to improving nutrient density and sensory appeal. These improvements could support food intake and quality of life and thus prevent malnutrition and other negative outcomes (e.g., depression, hospitalization). (Funded by Canadian Institutes of Health Research).

CARE COMPLEXITY AND MEDICATION USE AMONG OLDER SINGAPOREANS

Y. Guo^{1,2}, H. Whitson¹, T. Ostbye¹, A. Luciano¹, R. Malhotra², 1. *Duke University, Durham, North Carolina*, 2. *Duke-NUS Medical School, Singapore, Singapore*

The aim of this study was to investigate whether medical complexity (multiple providers or more healthcare visits) was associated with lower levels of confidence in medication use and adherence. Data on socio-demographics, health encounters, health status, and health attitudes and behaviors from a nationally representative survey of older Singaporean adults were utilized. Participants who responded to questions pertaining to prescription medication use were selected for analysis ($N = 1,572$). The association of medical complexity factors with self-reported medication confidence and adherence was analyzed using logistic regression analysis controlling for age, gender, ethnicity, education, and number of health conditions. The mean age of participants was 71, and 41% were male. We found no significant association between number of visits and either confidence about usage ($OR = 1.06, 95\% CI 0.95-1.20$) or medication adherence ($OR=1.01, 95\% CI 0.90-1.13$). We similarly found no significant association between number of providers and either confidence about usage ($OR=1.03, 95\% CI 0.90-1.18$) or medication adherence ($OR=1.05, 95\% CI 0.92-1.19$). Confidence about medication use was more likely among males, those with \geq secondary education, and more comorbidities. Lower confidence was likely with increasing age. Adherence was less likely among Indian participants and those with more comorbidities. Having more healthcare visits or providers were not independent correlates of lower medication confidence or adherence. Seniors with less education may be at risk for lower confidence or uncertainty in medication usage. The role of other potential contributors to nonadherence in complex patients (e.g., cost and access, patient preference, competing demands) should be evaluated next.

ANTIDEMENTIA MEDICATION USE IS ASSOCIATED WITH DECREASED INFORMAL COSTS IN MILD DEMENTIA

S. Behrens¹, R.B. Gail², S. De Berard¹, S. Schwartz¹, J. Matyi¹, C. Sanders¹, J. Tschanz¹, 1. *Utah State University, Logan, Utah*, 2. *Binghamton University, Binghamton, New York*

Antidementia medication use (ADMU) is associated with a delay in the progression of dementia symptoms, but their association with informal costs of dementia care has not been well-studied. Using the Cache County Dementia Progression Study, a population-based sample of persons with dementia (PWD), we examined daily caregiving hours for 219 PWD (46.9% female, mean (SD) age = 85.8 (5.0) years), which were estimated from the Caregiver Activity Survey. Informal costs were then calculated using the replacement cost method by multiplying hours of care by Utah median wages in the visit year. Cost was adjusted for inflation using the Medical Consumer Price Index and expressed in 2015 dollars. ADMU was based on inspection of each participant's medications and interview. Linear mixed models, with gamma log-link function, tested the association between antidementia medications and informal costs. Covariates included: psychotropic and anticholinergic medication use, participant's health status, gender, and dementia severity (measured by the Clinical Dementia Rating Scale-Sum of Boxes). ADMU was 30.7% at baseline and median informal costs were \$9.95/day. Overall, ADMU was not associated with informal costs ($\text{exp}\beta = .79, p = .090$) in the entire sample. In analyses restricted to participants with mild dementia severity at baseline, ADMU was associated with 28% lower costs ($\text{exp}\beta = .72, p = .039$). Among covariates, only dementia severity (time-varying) was significantly associated with informal costs. These results suggest that ADMU is associated with lower informal costs, particularly among PWD using these medications while in mild stages of dementia severity.

FRAILTY AND COGNITIVE CHANGE AMONG KIDNEY TRANSPLANT RECIPIENTS

N.M. Chu, A. Gross, Q. Xue, K.J. Bandeen-Roche, A. Sharrett, M.C. Carlson, D. Segev, M. McAdams De Marco, *Epidemiology, Johns Hopkins Bloomberg School of Public Health, Bethesda, Maryland*

With restoration of kidney function, kidney transplant (KT) recipients may experience preserved or improved cognitive function. However, KT recipients have a higher burden of frailty at the time of KT, and frail recipients may not experience this potential benefit. The goal of this prospective study was to assess post-KT cognitive trajectories by frailty status (12/2008 – 12/2015). Participants completed a physical frailty exam (five Fried criteria) and global cognitive testing (3MS) at time of KT-admission, as well as at least one cognitive follow-up during post-KT. We used a mixed effects model including follow-up time, age, sex, race, donor type, and 3MS score at time of KT as predictors, with a random slope (time) and intercept (person), to describe multiple 3MS scores post-KT by frailty status. Of 625 KT recipients (mean age 53 years) followed for a median of 2.0 years (mean of 3.9 visits), 15.7% were frail with a mean 3MS score of 90.3 at time of KT. In the first month post-KT, non-frail recipients experienced a statistically significant cognitive improvement (0.077 points-per-day, 95% CI: 0.047, 0.11), however there was no evidence of such an improvement among frail recipients (0.017 points-per-day, 95% CI: -0.056, 0.089). In the first three months post-KT, analogous trajectories were observed (non-frail: 1.4 points per month, 95% CI: 0.74, 2.1; frail: 0.66 points-per-month, 95% CI: -1.1, 2.5). In conclusion, frailty is associated with mitigated improvement in

global cognition post-KT. Frail recipients may benefit from interventions to improve post-KT cognitive function.

COMPARING VIDEO-BASED AND USUAL CARE INTERVENTIONS FOR IN-HOME DEMENTIA CAREGIVERS

C. Shaw¹, S. Kim¹, K.N. Williams², 1. *University of Iowa College of Nursing, Iowa City, Iowa*, 2. *University of Kansas School of Nursing, Kansas City, Kansas*

Approximately 90% of persons with dementia (PWD) develop behaviors and challenging care situations that are linked to caregiver burden, negative health outcomes, and nursing home placement (Bhur et al., 2006; Metlife, 2011). As part of the ongoing FamTechCare randomized controlled trial—where caregivers and PWD dyads are randomized to receive care feedback using in-home video monitoring or standard-of-care telephone conversations—telehealth team and healthcare provider suggested interventions were analyzed. This analysis compared frequencies of suggested intervention counts between the video-monitoring experimental (N=24) and standard-of-care control (N=24) groups. The Schulz & Martire (2004) Stress/Health Model for Caregiving was adapted for thematic analysis to identify emergent intervention themes. A total of 570 interventions were suggested over the 12-week study period and categorized post-hoc into 10 themes. No significant difference was found in the number of interventions provided between groups ($p=0.54$). Interventions focusing on education and skills for behavioral and psychological symptoms of dementia was the most suggested intervention theme in both groups (experimental: $n=51$; control: $n=53$; $p=0.32$). Despite the small sample size, two trends were identified for differences in suggested intervention themes between groups. The experimental group was more likely to receive suggestions regarding education and skills for safety/environmental modifications (experimental: $n=36$; control: $n=15$; $p=0.09$) and the control group was more likely to receive positive reinforcement (experimental: $n=17$; control: $n=36$; $p=0.08$). These differences demonstrate that suggested interventions from healthcare providers to in-home caregivers may differ when video data is observed and analyzed.

STATIN USE AND THE RISK OF HEPATOCELLULAR CARCINOMA: A POPULATION-BASED PROSPECTIVE COHORT STUDY

S. Kim^{2,1}, J. Chang², K. Kim², I. Hwang³, S. Park^{2,1}, 1. *Family Medicine, Seoul National University Hospital, Seoul, Korea (the Republic of)*, 2. *Seoul National University College of Medicine, Seoul, Korea (the Republic of)*, 3. *Gachon University Gil Medical Center, Incheon, Korea (the Republic of)*

Although statin is one of the most widely used drugs worldwide, the association between statin use and hepatocellular carcinoma (HCC) risk remains controversial. This study aims to investigate the association between statin use and risk of HCC in a large scale population-based prospective cohort. We selected participants aged >40 years in 2002 whose health examination data were available from the Korean National Health Insurance Service-National Sample Cohort (NHIS-NSC) database. We collected statin exposure data and medical information of the population in the database over 5 years (2002–2006), and followed up eligible participants for HCC

development over the next 7 years (2007–2013). We used Cox proportional hazard regression models to calculate the hazard ratios of statin use and HCC risk, after adjusting for sex, age, incoming status, disability, body mass index, smoking status, alcohol consumption, physical activity, comorbidity, underlying liver disease, and medication use. Overall, 443,239 participants were included in the analysis, including 3,147 cases of HCC during the observation period. The adjusted hazard ratio for HCC in statin users was 0.66 (95% confidence interval [CI], 0.56–0.77), indicating a 34% risk reduction in a dose-response manner (P for trend < 0.001). Sensitivity analysis showed a reduced risk of HCC in statin users in all subgroups, in terms of age and sex, as well as a stronger risk reduction in patients with underlying liver disease. In conclusion, statin use is associated with a reduced risk of HCC in a dose-response manner.

A PERTURBATION-BASED INTERVENTION IMPROVES GAIT STABILITY AND COGNITIVE PERFORMANCE IN OLDER ADULTS

D. Martelli, U.M. Staudinger, S. Agrawal, *Columbia University, New York, New York*

Normal aging is associated with decline in both physical and cognitive functions. This contributes to an increased risk for falls, one of the most common and serious problem in late life. Physical exercise can marginally improve balance, gait and cognitive functions. In order to specifically target the neuromuscular skills required for fall prevention, new training paradigms that strengthen the control of compensatory responses after balance perturbations are required. To date, it is unknown if these training paradigms are also able to improve the cognitive functioning.

We have developed a novel cable-driven robot that can apply multidirectional waist-pull perturbations while walking. A case-control study was performed on sixteen older adults to test the hypothesis that a single perturbation-based balance training session would be more effective than normal walking alone to improve (i) balance reactions to perturbations not experienced during the training; (ii) gait stability during unperturbed walking; and (iii) cognitive performance in terms of speed and executive functioning. Results confirmed that only participants trained with repeated perturbations showed acute effects of increases stability, both during walking and while reacting to novel perturbations, and superior performance in the Symbol Digit Modalities Test.

Attention may have been primed through the perturbations or were linked with stability improvements. Even though we are unable to describe the underlying mechanisms mediating the cognitive and physical impairment, we envision to implement a task-oriented balance training program aimed at improving human aging trajectories in terms of balance, gait and cognitive functioning, thus reducing older adults' risk of falling.

LATE-LIFE SUICIDE IN TERMINAL CANCER: A RATIONAL ACT OR UNDER-DIAGNOSED DEPRESSION?

G. Cheung¹, G. Douwes², F. Sundram¹, 1. *University of Auckland, Auckland, New Zealand*, 2. *University of Groningen, Groningen, Netherlands*

Context: Previous studies have reported significantly elevated standardised mortality rates in older people with cancer. Terminally ill people represent a unique group where suicide may be considered as rational.

Objectives: The aims of this study are to (i) compare the socio-demographic and clinical characteristics of older people with and without terminal cancer who died by suicide, and (ii) analyze the suicide motives of those with terminal cancer to determine whether they represent rational suicide.

Methods: The New Zealand Coronial Services provided records of all older people (age \geq 65) who died by suicide between July 2007 and December 2012. Socio-demographic and clinical data were extracted from the records. Using the characteristics for defining rational suicide, we determined whether the motives in terminal cancer cases represented rational suicide.

Results: Of the 214 suicide cases, 23 (10.7%) older people were diagnosed with a terminal cancer. Univariate analysis found older people with terminal cancer who died by suicide were less likely to have a diagnosis of depression (8.7% versus 46.6%, $p=0.001$) or previous contact with mental health services (4.5% versus 35.0%, $p=0.004$) than those without terminal cancer. 82.6% of the terminal cancer cases had a motivational basis that would be understandable to uninvolved observers.

Conclusions: A high proportion of those with terminal cancer had motives suggestive of rational suicide. Future studies are needed to clarify whether the low rate of depression is secondary to under-diagnosis of depression or people with terminal cancer choosing to end their life as a rational act to alleviate suffering.

COST OF DIAGNOSED HERPES ZOSTER COMPLICATIONS IN PATIENTS AGE \geq 50 YEARS: A U.S. CLAIMS DATA ANALYSIS

D.A. Rausch³, M. Levin², J. Meyers¹, S. Candrilli¹, S. Yan⁴, G. Krishnarajah⁴, B. Patterson³, 1. *Health Economics, RTI Health Solutions, Research Triangle Park, North Carolina*, 2. *University of Colorado Anschutz Medical Campus, Aurora, Colorado*, 3. *GSK, Philadelphia, Pennsylvania*, 4. *CSL Behring, King of Prussia, Pennsylvania*

Objective: This analysis (GSK study identifier: HO-15-15772) assessed costs associated with diagnosed herpes zoster (HZ)-related complications using a US insurance claims database.

Methods: Patients with a diagnosis of HZ (ICD-9-CM diagnosis code 053.xx) between 04/01/2008 and 03/31/2013 were selected from the Truven Health MarketScan Research Database (the date of the first observed HZ diagnosis was designated as the index date). Patients were required to be \geq 50 years and to have continuous health plan enrollment 6 months pre- through 12 months post-index date. Cutaneous, neurologic (excluding post-herpetic neuralgia), and ophthalmic HZ-related complications were identified using ICD-9-CM codes. Patients with immunodeficiency diagnoses or who received an HZ vaccine pre-index date were excluded. Healthcare costs were assessed in the 1-year time-frame post-index date; post-hoc multivariable regression models using a tightened definition of ophthalmic complications (neurologic and cutaneous definitions remained unchanged) controlled for demographics, pre-index date costs, and comorbidities.

Results: Of 248,275 patients with HZ, 9.7% had a complication (5,452 cutaneous, 1,076 neurologic, 17,289 ophthalmic). Patients with a complication accrued \$4,716

more in unadjusted all-cause total healthcare costs, on average, versus patients without complications (range: \$2,173 ophthalmic to \$18,323 neurologic). Costs associated with a complication tended to increase with age (range: \$2,925 ages 50–59 to \$5,923 ages 70–79). Multivariable models demonstrated that patients with a cutaneous complication accrued \$5,491, patients with a neurological complication accrued \$10,866, and patients with an ophthalmic complication accrued \$784 greater costs versus patients without complications.

Conclusions: Costs associated with diagnosed HZ-related complications are substantial and tend to increase with age.

CAN WE MODIFY THE COGNITIVE TRAJECTORY IN A HOSPITAL WITH EXERCISE? A RANDOMIZED CLINICAL TRIAL

N. Martinez-Velilla, A. Casas Herrero, M. López-Sáez de Asteasu, F. Zambom Ferraresi, F. Alonso Renedo, B. Gonzalez Glaría, M. Izquierdo, *Universidad Publica de Navarra, Pamplona, Navarra, Spain*

Frail older adults have reduced functional and physiological reserves, rendering them more vulnerable to the effects of hospitalization, especially during the acute phase of hospitalization. Despite the theoretical support for the idea that exercise can improve cognition this idea has not been fully translated into clinical practice, especially during the acute phase of hospitalization.

We are conducting a randomized clinical trial in 193 patients admitted to Hospital. Hospitalized patients who meet inclusion criteria are randomly assigned to the intervention (IG) or control group (CG). The intervention consisted of a multicomponent exercise training programme, composed of supervised progressive resistance exercise training at low-moderate intensities, balance-training, and walking for 5–7 consecutive days. Evaluations of cognition (MMSE, TMT-A, Isaacs test), depression (GDS Yesavage 15) and quality of life (EQ-5D) have been conducted at admission and previous to discharge in the control and intervention group. 193 patients have completed pre/post evaluations (control group (CG) $n=83$, intervention group (IG) $n=81$). Dropout has been 29 due to different medical reasons. Mean age was 87.10, mean BMI 27.16, mean CIRS-G 12,04, mean MNA 23.41. In the IG, significant improvements were observed after the intervention in cognition (MMSE (22,29 pre-24,81 post), $p<0.001$; TMT-A (141,8 pre-112,75 post) $p<0.001$; Isaacs test (6,14 pre-8,23 post) $p<0.001$), depression (GDS Yesavage $p<0.05$) and quality of life (EQ-5D $p<0.0001$). The CG had no significant improvements in any of the cognitive, mood or quality of life parameters studied.

GERIATRIC SYNDROMES FROM ADMISSION TO 3 MONTHS POST-DISCHARGE AND THEIR ASSOCIATION WITH RECOVERY

R. van Seben¹, L.A. Reichardt¹, J. Aarden^{3,4}, M. van der Schaaf^{3,4}, R. Engelbert^{3,4}, J. Bosch², B. Buurman^{1,3}, 1. *Department of Internal Medicine, Section of Geriatric Medicine, Academic Medical Center, Amsterdam, North Holland, Netherlands*, 2. *Department of Clinical Psychology, University of Amsterdam, Amsterdam, Netherlands*, 3. *Amsterdam Center for Innovative Health Practice (ACHIEVE), Faculty of Health, Amsterdam*

University of Applied Sciences, Amsterdam, Netherlands,
4. Department of Rehabilitation, Academic Medical Center,
Amsterdam, Netherlands

Studies have addressed the prevalence of geriatric syndromes during hospitalization and showed their association with adverse outcomes. However, data on their course post-discharge and association with recovery are scarce. This study assessed the course of geriatric syndromes from admission until discharge and then monthly until three months post-discharge and their impact on functional decline, readmission, and mortality. A multi-center cohort study, the Hospital-Associated Disability and Impact on Daily Life (Hopital-ADL) study, was conducted, including 400 acutely hospitalized patients aged ≥ 70 years admitted to an internal, cardiology or geriatric ward from 6 Dutch hospitals. Geriatric syndromes that were assessed included: fatigue; malnutrition; fall risk; fear of falling; shortness of breath; incontinence; pain; dizziness; depressive symptoms; cognitive impairment. 80% of patients experienced fatigue at admission, which remained present among 50% up to three months post-discharge. 40% were malnourished at admission, and still 20–30% in the first three months post-discharge. Almost 40% experienced a fall six months prior-hospitalization, and 11–12% had a fall in the first, second and third month respectively. 40% were afraid to fall at admission, 30% in the first months post-discharge. 15–35% experienced shortness of breath, incontinence, pain and dizziness during and post-hospitalization. 22% experienced depressive symptoms at admission, 11% post-discharge. 20% was cognitively impaired at admission, which decreased to 11% post-discharge. At hospital admission and post-discharge, depressive symptoms, malnutrition, fear of falling, shortness of breath and pain were associated with functional decline, readmissions and mortality. Hence, our study underpins the importance of addressing geriatric syndromes in transitional care interventions.

DEVELOPMENT OF A MEDICATION ADHERENCE SCALE FOR ELDERLY PATIENTS WITH CHRONIC DISEASE

J. Kim, S. Kang, *Colege of Nursing, Chonnam National University, Gwangju, Korea (the Republic of)*

Objectives: This study was to develop a scale to evaluate medication adherence in elderly patients with chronic disease and to examine validity and reliability of the scale. Methods: The development process for the preliminary scale included construction of a conceptual framework by concept analysis and initial items, verification of content analysis, sentence correction, and pilot study. This study was conducted using a questionnaire survey with one-to-one interviews during October, 2016. Participants were 345 elderly patients with chronic disease. Data were analyzed using item analysis, factor analysis, criterion related validity, internal consistency, and test-retest. Results: The developed scale consisted of 18 items and 4 factors - remember of taking medication (2 items), expectations for drug effects (5 items), practice taking medication according to instructions (8 items), communicating with health professionals (3 items), and explained 69.7% of total variance. The scale had significantly positive correlation ($r = .717$, $p < .001$) with the Morisky Medication Adherence Scale (MMAS-8) of Morisky, Ang, Krousel-Wood

and Ward (2008). Cronbach's alpha was .91, Guttman split half coefficient was .80, and test-retest reliability was .912. Conclusion: Results indicate that the Medication Adherence Scale for elderly patients with chronic disease has validity and reliability, and is a suitable scale in health care settings to assess the status of medication adherence in elderly patients with chronic disease.

PERSISTENT USE OF PSYCHOTROPIC DRUGS IN RESIDENTS RECEIVING LONG-TERM CARE IN NORWAY

A. Helvik^{1,2}, J. Saltyte Benth^{3,5}, B. Wu⁴, K. Engedal¹, G. Selbaek¹, 1. *Norwegian national advisory unit for aging and health, Oslo, Norway*, 2. *Norwegian University of Science and Technology, Trondheim, Norway*, 3. *University of Oslo, Oslo, Norway*, 4. *New York University, New York, New York*, 5. *Akershus University Hospital, Oslo, Norway*

The prevalence of psychotropic drug (PTD) use in residents receiving long-term care (nursing home, NH) is high, but few have explored persistency in PTD use in NH residents and factors associated with persistency. This at the same time as we know that risk of side events may be higher with long-term use in older adults. Thus, the aim of this study was to describe the prevalence and persistence in use of PTD and to explore factors associated with persistency in PTD use at two consecutive time points in NH residents. Methods: We included 1163 NH residents in a 72-month longitudinal study with five assessments. Use of PTD, neuropsychiatric symptoms (NPS), severity of dementia and physical health were assessed each time. Results: The prevalence over time and persistent use of antipsychotic drugs, antidepressants, anxiolytics and sedatives at two consecutive time points were high (50–100 %) in residents with and without dementia. There was an association between greater NPS at the first time point, and persistent use of these drugs, but changes in NPS between time points, did not explain such use. A longer NH stay increased the odds for persistent use of antipsychotics. Conclusion: Psychotropic drugs are frequently used as a long-term treatment among NH residents and are associated with severity of neuropsychiatric symptoms, but not with severity of dementia. Closer attention should be paid to follow-up of psychotropic drug treatment, and especially for long-term use of antipsychotics, since the duration of such treatment should be as short as possible.

OMIC SIGNATURES IN FRAILTY AND FRAILTY DIAGNOSIS

D. Gomez-Cabrero^{1,2,4}, S. Walter^{3,4}, I. Abugessaisa^{1,4}, L. Rodríguez-Mañas^{3,4}, J. Tegner^{1,4}, 1. *Karolinska Institutet, Stockholm, Sweden*, 2. *King's College London, London, United Kingdom*, 3. *Geriatric Department, Hospital Universitario de Getafe, Madrid, Spain*, 4. *On behalf of FRAILOMIC Initiative, Madrid, Spain*

The forecasted increase in the number of older people for this century will be accompanied by an increase of those with disabilities. Disability is usually preceded by a condition named frailty which is still a non-reversible condition when compared with disability. Recent studies stress the relevance of testing the clinical utility of the existing definition of frailty by using combinations of clinical criteria (current definition) and lab Biomarkers (BMs).

In Frailomic we aimed to characterize, both biologically and clinically, frailty by profiling more than 30000 blood and urine derived -Omic signatures in four different European cohorts. In all cohorts, we combined the omic information with existing clinical data that included existing relevant markers such as disability, co-morbidity or depression among others.

The analysis was conducted as a three-stage workflow. In a first stage, we identified those signatures per omic type and per cohort type that were significantly associated with frailty, using a non-parametric approach that included as covariates known frailty covariates such as age or depression among others. In a second stage, we identified using Machine Learning techniques and per cohort, the minimal models of omic and non-omic signatures that better predicted frailty diagnosis. In a third stage, we investigated the robustness of the minimal models and the possible use in combination with existing clinical classifications of frailty.

As a result, we quantified the value of -omic improving the clinical definition of frailty, but also gained frailty-related functional information at the level of blood and urine metabolites and non-coding RNAs.

TRAJECTORIES OF DEPRESSIVE SYMPTOMS AND APATHY FROM HOSPITALIZATION TO THREE MONTHS POST-DISCHARGE

L. Reichardt¹, R. van Seben¹, J. Aarden^{2,1}, M. Haakman¹, R. Engelbert^{2,1}, J. Bosch^{3,1}, B. Buurman¹, 1. *Academic Medical Center, Amsterdam, Netherlands*, 2. *Amsterdam University of applied sciences, Amsterdam, Netherlands*, 3. *University of Amsterdam, Amsterdam, Netherlands*

Depressive symptoms and apathy are both causes for and a consequences of hospitalization among older persons. Depressive symptoms and apathy are highly heterogeneous in its course, and psychological or physical recovery may be related to distinct trajectories. These trajectories are unknown in the context of acute hospitalization and possibly important for post-hospital recovery. Therefore, the aim of this study was to identify distinct trajectories of depressive symptoms and apathy from acute hospitalization until three months post-discharge and to study the incidence of functional decline and mortality three months post-discharge in these trajectories. We conducted a multicenter prospective cohort study, the Hospital-Associated Disability and impact on daily Life (Hospital-ADL) study, including 400 acutely hospitalized patients of 70 years and above. Data were collected in six Dutch hospitals. We identified three depressive symptoms consistently trajectories among acutely hospitalized patients: 1]high level of depressive symptoms (10%), 2] moderate level of symptoms (28%), and 3]minimal symptoms (62%). Percentages of functional decline in the first, second and third group were 32%, 31%, and 12%, respectively. Mortality rates per group were 25%, 17%, and 5%, respectively. We identified three apathy trajectories: 1]consistently high level of symptoms (19%), 2]), 2]consistently moderate level (23%), and 3]moderate level of symptoms and decreasing post-discharge (15%). Percentages of functional decline were 23%, 7%, and 15% respectively. Mortality rates per group were 14%, 3%, and 0% respectively. These distinct trajectory groups of depressive symptoms and apathy provide information about the possible prognosis of these symptoms and functional recovery after an acute hospitalization.

ASSOCIATION OF OBESITY AND FRAILITY IN OLDER ADULTS: NHANES 1999–2004

R.S. Crow, M. Lohman, M.L. Bruce, A.J. Titus, T.A. Mackenzie, S. Bartels, J.A. Batsis, *Internal Medicine, Dartmouth-Hitchcock, Lebanon, New Hampshire*

Body composition changes with aging can impact function in older adults leading to frailty. Measuring adiposity using body fat or central adiposity using waist circumference (WC) have greater diagnostic accuracy than traditional measures such as body mass index (BMI).

We identified individuals ≥ 60 years old using the 1999–2004 cross-sectional National Health and Nutrition Survey (NHANES). Body fat percent was assessed using dual energy x-ray absorptiometry and WC was objectively measured. Frailty was defined using an adapted version of Fried's criteria: (low BMI $< 18.5 \text{ kg/m}^2$; slow walking speed [$< 0.8 \text{ m/s}$]; weakness [unable to lift 10lbs]; exhaustion [difficulty walking between rooms on same floor] and low physical activity [compared to others]). Robust, pre-frailty and frailty persons met zero, 1 or 2, and ≥ 3 criteria, respectively. The primary outcome evaluated the association between frailty and body fat or WC. Frailty was the primary predictor (robust=referent) and body fat and WC were considered continuous outcomes. Multiple imputation analyses accounted for missing characteristics.

Of the 4,984 participants, mean age was 71.1 ± 0.2 (SE) years (56.5% females). We classified 2,246 (50.4%), 2,195 (40.3%), and 541 (9.2%) individuals as robust, pre-frail and frail, respectively. Mean body fat and WC was 35.9% and 99.5cm in the robust, 38.3% and 100.1cm in pre-frail, and 40.0% and 104.7cm in frail individuals. After adjustment, pre-frailty and frailty were associated with a $\beta = 0.37 \pm 0.27, p = 0.18$, and $\beta = 0.97 \pm 0.43, p = 0.03$ for body fat and $\beta = 2.18 \pm 0.64, p = 0.002$, and $\beta = 4.80 \pm 1.1, p < 0.001$ for WC.

Geriatric obesity defined by higher body fat and high WC are associated with increasing rates of frailty when compared to robust patients.

SSRI/SNRI ANTI-DEPRESSANT INDUCED INTERSTITIAL LUNG DISEASE: A CASE SERIES AND CASE- CONTROL STUDY

T. Rosenberg¹, P. Montgomery¹, C. Wiens¹, F. Manning¹, L. Levy², 1. *Family Practice, University of British Columbia, Victoria, British Columbia, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*

SSRI and SNRI anti-depressants are widely prescribed in the elderly population. For unknown reasons, the incidence of interstitial lung disease (ILD) is increasing in western populations. There are published case reports and references on the Pneumotox web site (www.pneumotox.com) linking SSRIs/SNRIs to development of ILD and/or airway involvement (ILD/AWI). A case of venlafaxine induced ILD/AWI led us to explore this association in more detail. We report a series of 5 cases and a case control study examining the association between SSRI/SNRI usage and presence of ILD/AWI in an elderly population. Participants were all 296 elderly people followed in a primary care geriatric practice. A chart audit of the electronic medical record was done to identify cases and controls. The case definition included chronic respiratory symptoms and presence of ILD/AWI on CT or CXR.

SSRI/SNRI usage was standardized to 10mg of citalopram and person-month (p-m) exposure was calculated. There were 24 cases identified and 272 controls. Their mean ages were 90.5 and 88.6 (ns) respectively. There were 16/24 cases exposed to SSRI/SNRI and 97/175 controls. The Odds Ratio was 3.61, 95% CI 1.49–8.74, $p < 0.007$. The mean p-m exposure to SSRI/SNRI was 129.3 months for cases and 27.1 for controls ($P < 0.001$). We conclude that SSRIs and SNRIs were significantly associated with the risk of ILD/AWI. Because of their wide spread usage, further studies should be done to validate these findings. Prescribers should be cautious to monitor for development of insidious pulmonary symptoms and signs when these drugs are prescribed.

HOME-BASED REHABILITATION AND REABLEMENT: EVALUATING A PATIENT CENTERED, INTEGRATED MODEL OF CARE

D. Arbeau¹, J. Bustard², J. Elliott², M. Williams², A. Josselyn², A. Gaudet³, P.G. Jarrett², 1. *Community Services, Horizon Health Network, Bulls Creek, New Brunswick, Canada*, 2. *New Brunswick Department of Health, Fredericton, New Brunswick, Canada*, 3. *New Brunswick Department of Social Development, Fredericton, New Brunswick, Canada*

Rehabilitation and Reablement is a patient centered, integrated model of care delivered in the senior's home. It is enhanced, rapid in nature, promotes self-management and independence so that seniors can remain at home. This innovative approach to care was implemented in 2015–16 in a Regional Health Authority in New Brunswick (NB), Canada. This was delivered by NB's publically funded home health care service (Extra-Mural Program) and Social Care Services (Department of Social Development). Eligibility included age 65 and older, with specific targeted diagnoses, were hospitalized or at home and expected to improve within 9 weeks. Care was provided by an interdisciplinary health care team including up to 6 hours per day of personal support. To support a patient centered approach, an evidence based care planning tool was used to inform the focus of care. Out of 348 patients screened, 131 (38%) received this service. Average age was 80.3 years. The average Clinical Frailty Scale was 5.31 (Moderate Frailty). The majority (77.8%) were in hospital with the most common diagnosis being fracture (45%). Eighty percent of patients successfully remained at home. Standardized measures of frailty ($p < 0.0001$), mobility ($p < 0.0001$), basic activities of daily living ($p < 0.0001$) and instrumental activities of daily living ($p < 0.0001$) all showed statistically significant improvements. Although caregiver burden decreased, it was not a statistically significant finding ($p = 0.063$). Patient satisfaction exceeded 80% being satisfied or strongly satisfied. This patient centered, integrated approach to care demonstrates improvement in overall mobility and function facilitating senior's independence so that they can remain home.

QUALITY OF PHARMACEUTICAL CARE IN DEMENTIA PATIENTS

H. Mehta¹, S.D. Sura², M. Raji¹, H. Holmes³, Y. Kuo¹, R. Aparasu², J.S. Goodwin¹, 1. *University of Texas Medical Branch, Galveston, Texas*, 2. *University of Houston,*

Houston, Texas, 3. *University of Texas Health Science Center at Houston, Houston, Texas*

OBJECTIVES: Use of potentially inappropriate medications (PIM) in dementia patients reflect poor quality of care. The goal of this study was to evaluate quality of pharmaceutical care in dementia patients using the most recent 2015 American Geriatric Society (AGS) Beers criteria.

METHODS: This cohort study used the 5% national Medicare data from 2011–2012. The cohort included elderly patients diagnosed with dementia in the baseline year, i.e. 2011. Quality of care, i.e., use of PIMs, was defined in 2012 using the AGS Beers criteria. Predictors were identified in the baseline year based on the Andersen Behavioral Model: predisposing (sociodemographic), enabling (dual eligibility) and need factors (Elixhauser comorbidities, medication use and healthcare utilization). Descriptive statistics was used to determine the prevalence of PIMs. Multivariable logistic regression analysis was used to determine predictors of PIMs in dementia patients.

RESULTS: The cohort included 57,469 elderly dementia patients, with mean age of 85 ± 8 years. Overall, 53.1% of dementia patients received PIMs. The prevalence of top seven drugs classes were as follows: antipsychotics (31.3%), H2-receptor antagonists (11.3%), antihistamines (10.3%), antimuscarinic urinary incontinence (9.1%), antiemetics (6.7%), nonbenzodiazepine receptor agonist hypnotics (6.1%), tricyclic antidepressants (5.7%). Multivariable logistic regression found that females (odds ratio [OR], 1.16), Blacks (OR, 1.18), patients with Elixhauser comorbidities (twelve conditions), emergency room visit (OR, 1.1) and more than five prescription medications (OR, 3.0) were associated with higher likelihood of receiving PIMs.

CONCLUSIONS: One out of two dementia patients received at least one PIMs reflecting poor quality of pharmaceutical care in this vulnerable patient population.

TRENDS AND PREDICTORS OF 2-YEAR ACTIVITY PARTICIPATION IN COMMUNITY DWELLING OLDER ADULTS

A. Yeo¹, M. Chong^{1,2}, L. Tay^{1,3}, S.P. Yew¹, C. Tan¹, N. Ismail⁴, W. Lim^{1,5}, 1. *Institute of Geriatrics and Active Ageing, Tan Tock Seng Hospital, Singapore, Singapore*, 2. *Geriatric and Education Research Institute, MOH, Singapore, Singapore*, 3. *Sengkang health, Singapore, Singapore*, 4. *Continuing and Community Care, TTSH, Singapore, Singapore*, 5. *Department of Geriatric Medicine, Tan Tock Seng Hospital, Singapore, Singapore*

Background: Decline in activity level portends subsequent decline in physical function, cognitive status and quality of life. The Frenchay Activities Index (FAI) measures activity participation corresponding to a 2x2 framework of indoor/outdoor and work/leisure activities. This prospective cohort study aims to explore baseline factors that predict changes in FAI amongst community-dwelling older adults in the GERILABS study.

Methods: We studied 144 community-dwelling older adults over 2 years. Baseline data on demographics, vascular risk factors (VRFs), mood, physical function and Short Physical Performance Battery (SPPB) were collected. We compared between baseline and 2-year FAI status which were derived using quartile-cutoffs of total FAI scores.

High-performance were defined from the low-performance by improved FAI status or remaining within the upper most two quartiles. Significant variables in univariate analysis were further analyzed using logistic regression to ascertain predictors of improved FAI status.

Results: At 2-year, there were 57(39%) high and 89(61%) low performance (FAI: 2.49 ± 3.39 vs -3.62 ± 4.41 , $p < 0.01$). High-performance maintained outdoor/indoor work ($p < 0.01$) and indoor leisure ($p = 0.198$) activities. High-performance declined in outdoor leisure activities, although of lesser degree than low-performance (-2.23 ± 2.24 vs -4.53 ± 2.45 , $p < 0.01$). Using logistic regression adjusted for gender, VRFs, SPPB and mood, living alone [OR=4.02, 95% CI:1.40–11.50] and younger age [OR=0.937, 95% CI:0.89–0.99] were predictors of improved FAI status.

Conclusion: About two-fifths of community-dwelling older adults, typically those younger and living alone, maintained good activity participation at 2 years. While work activities were maintained, outdoor leisure participation notably declined. Further studies are needed to ascertain how living alone promotes maintenance of activity participation.

FUNCTIONAL STATUS OF NON-DEMENTED COMMUNITY-DWELLING OLDER ADULTS WITH PRIOR TRAUMATIC BRAIN INJURY

R.C. Gardner^{1,2}, K.M. Langa³, K. Yaffe^{1,2}, 1. UCSF, San Francisco, California, 2. San Francisco VA Medical Center, San Francisco, California, 3. University of Michigan, Ann Arbor, Michigan

Traumatic brain injury (TBI) is common and associated with heightened dementia risk, but functional implications of prior TBI among non-demented community-dwelling older adults are unclear. We sought to describe functional status associated with prior TBI in the Health and Retirement Study (HRS) - a population-based cohort study of community-dwelling older adults. We studied 984 older adults without dementia randomly selected from HRS 2014 respondents to complete a TBI survey and who reported no prior TBI ($n=737$) or prior symptomatic TBI requiring medical attention ($n=247$). Mean time since first TBI was 38 ± 19 years. Functional impairment was defined as self-reported difficulty on ≥ 1 of 6 instrumental activities of daily living (IADL): using a map, hot meal preparation, grocery shopping, making phone calls, taking medications, and managing money. Covariates assessed included demographics, medical comorbidities, depression, global cognition, and gait speed. We compared functional impairment across TBI groups using regression models adjusted for covariates that significantly differed between groups. Respondents with TBI were younger, less likely to be female, had higher prevalence of medical comorbidities and depression, but did not differ on global cognition or gait speed compared to respondents without TBI. Respondents with TBI were significantly more likely to report impairment on ≥ 1 IADL compared to those without TBI (30.0% vs. 20.4%, adjusted risk ratio [95% CI]: 1.31 [1.02–1.66]). In this population-based study of community dwelling older adults without dementia, those with prior TBI had 31% increased risk of IADL impairment even after accounting for higher prevalence of medical comorbidities and depression.

LONGEVITY KLOTHO GENE POLYMORPHISM AND THE RISK OF DEMENTIA IN OLDER MEN

L. Flicker¹, B. Morar³, G. Hankey³, B. Yeap³, J. Golledge², A. Jablensky³, O. Almeida¹, 1. Western Australian Centre for Health & Ageing, University of Western Australia, Perth, Western Australia, Australia, 2. James Cook University, Townsville, Queensland, Australia, 3. University of Western Australia, Perth, Western Australia, Australia

In mice the Klotho gene encodes a membrane protein that seems to suppress certain physiological aspects associated with the ageing phenotype including reduced lifespan and atherosclerosis. In humans Klotho variants (KL-VS) have been associated with increased longevity and better cognitive function. It is unclear whether they modulate dementia risk.

Using an existing cohort of older men, we recruited 527 individuals aged 71–87 years who were free of cognitive impairment. We used data linkage to track the onset of dementia over 10 years. KL-VS genotyping (rs9527025 T/G) followed standard procedures.

In these men, 370 (70.2%), 145 (27.5%) and 12 (2.3%) had the TT, TG and GG genotypes of KL-VS polymorphism. The Hardy-Weinberg test showed that this allelic distribution was in equilibrium. Overall the age adjusted annual rate of dementia was 17.2‰ (95%CI=14.0–21.1; total = 5053 person-years). The rates were 14.0‰ (95%CI=10.6–18.4; 3582 person-years), 23.5‰ (95%CI=16.6–33.2; 1363 person-years) and 46.4‰ (95%CI=19.3–111.5; 108 person-years) for men with the TT, TG and GG genotypes. Compared with the TT genotype, the sub-hazard ratios of dementia associated with the TG and GG genotypes were 1.6 (95%CI=1.0, 2.5; $p=0.030$) and 3.5 (95%CI=1.3, 9.1; $p=0.011$).

The Klotho KL-VS variant is associated with an increase in the incidence of dementia in older men in a dose-dependent fashion (intermediate for heterozygosis and highest for homozygosis). If these findings can be replicated then the risk of dementia may be able to be modulated by exploiting this metabolic pathway.

ARE ACUTE GERIATRIC UNITS MORE EFFECTIVE FOR HOSPITALIZED SENIORS WITH FRAILTY AND ADVANCED AGE?

Y. Ding, 1. Tan Tock Seng Hospital/National Healthcare Group, Singapore, Singapore, 2. Health Services & Outcomes Research, National Healthcare Group, Singapore, Singapore, 3. Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore, Singapore

Although acute geriatric units (AGU) are effective in care of hospitalized seniors, it is unclear who among them accrue greater benefit. Therefore, this study seeks to evaluate frailty and advanced age as predictors of benefit from AGU care compared with usual care for short-term outcomes. In a retrospective cohort study, we merged chart and administrative data of seniors aged 65 years and older hospitalized with pneumonia at three acute care hospitals over one year. Frailty is defined as Frailty Index of at least 0.25, while advanced age is 80 years and older. Thirty-day mortality, hospital length of stay (LOS), and episode cost are regressed in turn on AGU care, while controlling for frailty, advanced age, gender, severity of illness, recent hospitalization, and nursing

home residence. Interactions of AGU care with frailty and advanced age are examined. Among 2,905 seniors, odds ratios of 30-day mortality for AGU care compared with usual care are 0.54 vs. 1.04 for those with and without frailty respectively, and 0.69 vs. 1.31 for those with and without advanced age respectively (p-values for both differences <0.05). Corresponding comparisons of LOS differences are +1.68 vs. +2.88 days, and +2.87 vs. +1.33 days (p-values for both differences >0.05), while cost differences are -\$746 vs. -\$151, and -\$215 vs. -\$770 (p-values for both differences >0.05). Thus, seniors with frailty and advanced age obtain greater benefit from AGU care where short-term survival is concerned. Trade-offs with respect to LOS and cost may also favour those with frailty, but not advanced age.

ASSOCIATED RISK FACTORS OF RESTRAINT USE IN OLDER ADULTS WITH HOME CARE

K. Scheepmans^{3,1}, B. Dierckx de Casterlé¹, K. Vanbrabant⁴, L. Paquay³, H. Van Gansbeke³, K. Milisen^{1,2}, 1. *Department of Public Health and Primary Care, KU Leuven - University of Leuven, Leuven, Belgium*, 2. *Division of Geriatric Medicine, Department of Internal Medicine, Leuven University Hospitals, Leuven, Belgium*, 3. *Wit-Gele Kruis van Vlaanderen, Brussel, Belgium*, 4. *Interuniversity Institute for Biostatistics and Statistical Bioinformatics, KU Leuven, Leuven, Belgium*

The aim of the study was to gain insight into the associated risk factors for restraint use in older adults with home care. A cross-sectional survey of restraint use was conducted in a randomized sample of older adult home care patients completed by the patients' primary care nurses. A binary logistic regression model with generalized estimating equations was used to evaluate associations with the presence of restraints. Of the 8000 questionnaires, 6397 could be used for further analysis. Patients had a mean age of 80.6 years, 66.8% were females and 46.4% lived alone. 24.7% was restrained. Multivariate regression indicates that restraint use was associated with supervision [OR = 2.433, 95% CI = 1.948 - 3.038]; dependency in ADL-activities (i.e. eating [OR= 2.181, 95%, CI= 1.212 - 3.925], difficulties in transfer [OR= 2.131, 95%, CI= 1.191-3.812] and continence [OR= 1.436, 95%, CI= 0.925 - 2.231]); perceived risk of falls by nurses' clinical judgement [OR= 1.994, 95%, CI= 1.710 - 2.324], daily [OR 1.935, 95%, 1.316-2.846] and less than daily [OR= 1.446, 95%, CI= 1.048-1.995] behavioral problems; decreased well-being of the informal caregiver [OR= 1.472, 95% CI= 1.126 - 1.925]), the informal caregiver's dissatisfaction with the support of family [OR= 1.339, 95% CI= 1.003 - 1.788]; cognitive impairment [OR= 1.398, 95% CI= 1.290 - 1.515], and polypharmacy [OR= 1.415, 95% CI= 1.219 - 1.641]. Restraint use in home care is very common. The results may support the development of interventions to reduce restraint use in home care.

INSULIN GLARGINE 300 U/ML VS. 100 U/ML IN OLDER PEOPLE WITH T2DM: RESULTS FROM A RANDOMIZED TRIAL

R. Ritzel¹, M. Espinasse², I. Muehlen-Bartmer³, N. Zhang⁴, M. Munshi⁵, 1. *Klinikum Schwabing and Klinikum Bogenhausen, Städtisches Klinikum München GmbH, Munich, Germany*, 2. *Sanofi, Paris, France*, 3. *Sanofi-Aventis*

Deutschland GmbH, Frankfurt am Main, Germany, 4. *Sanofi R&D China, Beijing, China*, 5. *Joslin Diabetes Center, Boston, Massachusetts*

SENIOR was a phase 3b, randomized, open-label, 2-arm, parallel-group, multicenter, 30-week trial. Randomization was stratified by screening HbA_{1c} (<8.0 vs ≥8.0 %), previous insulin use (Yes/No), and sulfonylurea or meglitinide use at screening (Yes/No). Insulin was titrated to the ADA-recommended glycemic target for healthy elderly individuals (fasting SMPG: 90–130 mg/dL [5.0–7.2 mmol/L]), a higher glycemic target than utilized previously in randomized controlled trials of insulin glargine 300 U/mL (Gla-300) versus 100 U/mL (Gla-100) in adults. The aim of the SENIOR trial was to compare the efficacy and safety of Gla-300 with Gla-100.

In total, 1014 individuals (≥65 years) with T2DM were included in the trial, of whom 241 were ≥75 years old. The primary endpoint of non-inferiority of mean change in HbA_{1c} for Gla-300 versus Gla-100 was achieved (least squares mean difference [95% CI]: 0.02, [-0.092 to 0.129] %). Similar percentages of participants in both groups reported confirmed (≤70 mg/dL [≤3.9 mmol/L]) or severe hypoglycemia. The annualized rates of documented symptomatic (≤70 mg/dL [≤3.9 mmol/L]) hypoglycemia were lower with Gla-300 versus Gla-100, both in the overall study population (1.85 vs 2.56 events/participant-year; rate ratio [RR] 0.74 [0.56 to 0.96]) and in the ≥75 years subpopulation (1.12 vs 2.71 events/participant-year; RR 0.45 [0.25 to 0.83]). Frequency of adverse events, including cardiovascular events, falls and fractures was similar between treatments.

These results indicate that Gla-300 was effective in older people with T2DM, with a good safety profile, resulting in comparable reductions in HbA_{1c} and lower rates of documented symptomatic hypoglycemia versus Gla-100.

Supported By: Sanofi (clinicaltrials.gov NCT02320721)

MEASUREMENT PROPERTIES OF THE COMMUNITY BALANCE AND MOBILITY SCALE IN YOUNG-OLDER ADULTS

M. Weber¹, J. van Ancum², R. Bergquist³, K. Taraldsen³, A.B. Maier^{4,2}, J. Helbostad³, C. Becker⁵, M. Schwenk^{5,1}, 1. *Network Aging Research, Heidelberg University, Heidelberg, Baden-Württemberg, Germany*, 2. *VU University, Amsterdam, Netherlands*, 3. *Norwegian University of Science and Technology, Trondheim, Norway*, 4. *University of Melbourne, Melbourne, South Australia, Australia*, 5. *Robert-Bosch hospital, Stuttgart, Germany*

With the growing number of young-older adults, there is a need for balance and mobility assessment tools specifically validated in this population. This study aimed to evaluate the reliability, validity, responsiveness, internal consistency, and ceiling effects of a challenging balance and mobility scale (Community Balance and Mobility Scale, CBMS) in young-older adults. Fifty-one participants (66.4 ± 2.7 years) underwent CBMS assessment. The Fullerton Advanced Balance scale (FAB), Timed-Up-and-Go (TUG), 8-level balance scale, 3-meter tandem walk (3MTW), and gait speed were used for estimating concurrent validity. Reliability was calculated as Intra-class-correlations (ICC) and internal consistency by Cronbach alpha. Standardized response means (SRM) were used to assess responsiveness in detecting balance and

mobility changes after a 4-weeks exercise intervention. The CBMS correlated high with the FAB ($\rho = 0.74$; $p < .001$); good with the 3MTW ($\rho = 0.61$; $p < .001$); and moderate with TUG, gait speed, and 8-level balance scale ($\rho = 0.31-0.52$, $p < .05$). Reliability (ICC $> .95$), internal consistency ($\alpha = .74$) and responsiveness (SRM = 0.75, $p < .001$) were good. In contrast to FAB and 8-level balance scale, the CBMS had no ceiling effects. Measurement properties of the CBMS are good to excellent in young-older adults. The scale can be recommended to identify balance and mobility deficits and intervention-related changes over time. Results suggest that the CBMS is particularly relevant for detecting and monitoring early age-related changes in balance and mobility, which might be masked by other balance scales used in the geriatric field.

GAIT IMPAIRMENTS DURING SELF-PACED TREADMILL WALKING IN OLDER ADULTS WITH MULTIPLE SCLEROSIS

M. Hernandez¹, G. Chaparro¹, R. Mot², 1. *University of Illinois at Urbana-Champaign, Champaign-Urbana, Illinois*, 2. *University of Alabama at Birmingham, Birmingham, Alabama*

Gait impairments are common in persons with multiple sclerosis and normal aging, and would be expected to worsen with the combined effects of aging and this neurological condition. The present study used an instrumented treadmill to evaluate gait impairments in older adults with multiple sclerosis (MS) in comparison to healthy older adults (HOA) during self-paced gait in normal walking (NW) and divided-attention walking (Walking While Talking; WWT) tasks. We hypothesized that older adults with MS would exhibit increased gait impairment during WWT compared to NW tasks on a self-paced instrumented treadmill, when compared to HOA. Twenty older adults with MS (Mean (SD) age = 61 (6) years, 15 female, Expanded disability status scale (EDSS) score of 3.7 (1.6)) and twenty HOA (61 (7) years, 15 female) were recruited from the local community. Spatiotemporal gait parameters were obtained using the C-Mill instrumented treadmill, which allowed for self-paced gait, similar to over ground walking. The MS group demonstrated reduced single support time, anteroposterior symmetry; and increased stride time, step width, and double support time compared to HOA group, particularly during WWT tasks. These findings suggest that divided-attention tasks during self-paced gait on an instrumented treadmill may provide an effective tool in assessing changes in gait function in older adults with MS.

HIGH INTENSITY EXERCISE DOES NOT DELAY COGNITIVE DECLINE IN MILD TO MODERATE DEMENTIA: RCT

S.E. Lamb^{1,2}, D. Mistry², R. Lall², I. Khan², S. Dosanjh², S. Petrou², B. Sheehan³, 1. *University of Oxford, Oxford, United Kingdom*, 2. *University of Warwick, Coventry, United Kingdom*, 3. *Oxford University Hospitals NHS Foundation Trust, Oxford, United Kingdom*

Several small trials suggest exercise may delay cognitive decline in people with Alzheimer's, Vascular or Mixed dementia.

In a multicentre trial (registration ISRCTN10416500,15 centres), we randomly assigned 494 people with mild or moderate dementia to either a 4-month supervised high intensity exercise training regime and on-going supported physical activity programme or usual care. All participants had a standardised Mini-Mental State Examination (sMMSE) score greater than 10. The primary outcome was the Alzheimer's Disease Assessment Scale-cognitive (ADAS-cog) score at 12 months. Secondary outcomes were physical fitness, ADLs, neuropsychiatric symptoms, quality of life and health service resource use. We undertook pre-specified subgroup analyses and investigated impact on carers

Baseline sample means were ADAS-cog 21 (SD 8.2); age 77 (SD 7.7) and 60% were men. Compliance with exercise classes was high and physical fitness improved. By 12 months, mean ADAS-cog was 25 (SD12.3) in the exercise group and 24 (SD 10.4) in the usual care group (adjusted between group difference -1.4 (95% CI -2.62,-0.17, $p = 0.026$ higher score indicates worse cognition). Pre-randomisation disease type, sMMSE, physical status and gender were not significant sub-group factors. There were no significant differences in secondary or carer outcomes between groups. The exercise intervention was not cost effective.

In this large, well conducted trial, high intensity exercise training did not reduce decline in cognition in mild to moderate dementia. Although physical fitness improved, the impacts on other important clinical outcomes was null and the intervention was not cost effective from a UK Health care perspective.

SHORTHAND AND COGNITION—RESULTS OF A 5 YEAR PILOT STUDY

M. Gogol, *Department of Geriatrics, Lindenbrunn Hospital, Coppenbruegge, Germany*

Background: Cognitive decline is common in the elderly. In a pilot study we test the hypothesis that learning shorthand will preserve cognitive abilities. Shorthand is a special method of writing in short cuts and consist of learning a new "language" and writing speed training.

Setting: Ambulatory healthy women from Minden, North Rhine-Westfalia, Germany, independent in all ADLs and IADLs.

Methods: We studied a group of 17 right-handed females, mean age 71.8 ± 4.9 years in 2012. A geriatric, extended neuropsychological and clinical assessment was done yearly until January 2017. Training sessions comprise 2 sessions per week in year 1 and 2 followed by 1 session in year 3 to 5. During the study 5 women (2 depression, 1 malignancy, 1 rheumatic disease, 1 move to another city) left the study.

Results: Compared to 2012 the assessments in 2016 showed significant improvements in Rey Complex Figure Test (CFM: 76.9 vs 95.1, $p=0.0151$, and CFQ: 66.1 vs 91.3, $p=0.0018$) or remained stable without any decline, e.g. MMSE (27.6 vs. 28.6, $p=0.053$) and others (BAS ($p=0.42$), SBT ($p=0.83$), TMT A ($p=0.96$) + B ($p=0.36$), Wechsler Memory Scale, Regensburg Word Fluency Test, Test of Attentional Performance).

Discussion: Comparing to baseline we found a stable cognitive performance in all participants over 5 years indicating

that shorthand learning and training maybe beneficial for preserving cognitive abilities with aging.

POSTURAL MUSCLES WEAKNESS IN OLDER ADULTS WITH FALL HISTORY: A NEURAL OR A MECHANICAL DEFICIT?

T. Cattagni¹, J. Harnie¹, M. Jubeau¹, C. Couturier², G. Berrut^{2,1}, C. Cornu¹, 1. *Laboratory "Movement, Interactions, Performance" EA 4334, University of Nantes, NANTES, France*, 2. *University hospital of Nantes, Nantes, France*

The decline in torque production of postural muscles during aging is considered as a key factor in the risk of falling. Recent works showed that the maximal torque of plantar flexor muscles (PF) was lower in older adults with recent fall history (OF) than in older non-fallers (ONF). The present study aimed to investigate the neural and mechanical factors associated with the lower maximal PF torque production in OF. Fifteen young adults (YA) (22 ± 4 years), 15 OF (84 ± 4 years) and 15 ONF (83 ± 4 years) were included in this study. Torque and electromyographic activity of soleus, gastrocnemii and tibialis anterior (TA coactivation) muscles were recorded during maximal voluntary contractions of the PF. Electrical nerve stimulation was used to assess the voluntary activation level (neural factor) during maximal plantar flexion and the muscle contractile properties (mechanical factor). The results showed that the maximal PF torque was significantly lower ($P < 0.05$) for OF (51 ± 12 Nm) than ONF (70 ± 15 Nm) and YA (119 ± 40 Nm). The voluntary activation level was lower ($P < 0.05$) for OF ($73 \pm 18\%$) than ONF ($82 \pm 19\%$) and YA ($90 \pm 14\%$). A similar trend was observed for the maximal PF electromyographic activity. No difference in TA coactivation was reported among the three groups. While age affected the mechanical properties of ankle muscles ($P < 0.001$), no difference was observed between ONF (13 ± 3 Nm) and OF (12 ± 3 Nm).

These results suggest that the alteration of muscle force production observed in OF could be mainly related to a deficit in muscle activation capability rather than reduced muscle contractile properties.

RATE OF FORCE DEVELOPMENT PREDICTS PHYSICAL FUNCTION INDEPENDENT OF PEAK TORQUE IN MEN BUT NOT WOMEN

Y. Osawa, L. Ferrucci, S. Studenski, *Translational Gerontology Branch, National Institute on Aging, NIH, Baltimore, Maryland*

While isokinetic peak torque (PT) is associated with lower extremity performance (LEP), it requires expensive equipment not available in clinical settings. The rate of force development (RFD), well known in sports, captures speed during an isometric contraction and may be useful in studies of aging. We assessed whether RFD is associated with LEP independent of PT. Data from 1092 adults (age 26 to 96 years) enrolled in the Baltimore Longitudinal Study of Aging include demographics, body composition by DXA, LEP, PT and peak RFD. Peak RFD was obtained during 3-sec isometric knee extension at 120 degrees and PT from a test of 30 deg/sec concentric knee extension. LEP was assessed as time to complete a 6m walk at usual and fast pace (6m-usual and fast), a 400m walk at fast pace (400m), and distance

covered in a 2.5min walk at normal pace (2.5min) and global LEP by the Health ABC physical performance battery (HABCPB). Analyses used sex-stratified generalized linear regression models adjusted for age, race, height, fat-free mass, fat mass, and PT as covariates. In men, independent of PT, RFD was a significant ($p < 0.05$) predictor of all LEP except the 400m and the 2.5min long walks. In women, independent of PT, RFD was only a significant correlate of the 6m-fast walk ($p = 0.02$). In conclusion, RFD independently contributes to physical functions in men but less in women. RFD may help capture speed-related effects without isokinetic testing, but the sex difference requires further research.

ARE PROTOCOLS FOR MEDICATION HOLDS SUFFICIENT FOR SKIN PRICK TESTING FOR OLDER ADULTS WITH ASTHMA?

D. Antimisiaris¹, B. Polivka¹, R. Folz², J. Myers¹, R.J. Gopalraj¹, 1. *University of Louisville, Louisville, Kentucky*, 2. *Case Western Reserve University, Cleveland, Ohio*

Allergy skin prick testing (SPT) is commonly performed during the work-up of allergic asthma. We examined a cohort of older asthmatics who underwent allergy SPT following a standardized medication hold protocol in use at the University of Louisville. The protocol attempts to address the impact concurrent medication use has on skin prick test outcomes and are aimed at medications with anti-histaminic or anti-inflammatory activity. It is well documented that immune-senescence is common with advanced age. We were surprised to find a disproportionately low number of subjects with positive skin prick tests in our older aged asthmatics. This led us to explore the idea that additional medications which were not withheld by protocol (e.g., not typically recognized as suppressing immune function or allergy reactions) may effect skin prick interpretations. In one case, for example, a muscle relaxant related to amitriptyline was not held, although amitriptyline itself is typically withheld for 5 days prior to testing. Also, opioids and benzodiazepines have some immunosuppressive activity, yet are not singled out for withholding per SPT protocol. Given that older adults tend to have higher rates of both intra and inter-class polypharmacy that aim to treat comorbid conditions outside of asthma and allergy, we have looked at the potential role these medications play with this surprisingly low rate of negative allergy testing results. Our findings suggest that additional studies are needed to further understand the potential role additional classes of medications commonly used in older adults may play with interfering with skin prick testing protocols.

EFFECTS OF NEUROMUSCULAR ATTRIBUTES IN THE RELATIONSHIP OF MILD COGNITIVE IMPAIRMENT WITH MOBILITY

R. Ward^{2,3,1}, L. Quach^{2,1}, E. Leritz^{2,3}, S.G. Leveille^{4,3}, T. Trivison⁵, M.M. Pedersen⁶, J. Bean^{2,3,1}, 1. *Partners HealthCare, Boston, Massachusetts*, 2. *VA Boston Healthcare System, Boston, Massachusetts*, 3. *Harvard Medical School, Boston, Massachusetts*, 4. *College of Nursing and Health Sciences, University of Massachusetts Boston, Boston, Massachusetts*, 5. *Institute for Aging Research, Hebrew SeniorLife, Boston, Massachusetts*, 6. *Clinical Research Centre, Copenhagen University Hospital, Hvidovre, Denmark*

It is commonly understood that cognition and mobility are in dynamic feedback, but the role of specific aspects of neuromuscular functioning in driving this association has gone unexplored. We used data from Boston RISE ($n=422$; age= 76.5 ± 7.0 ; 68.3% female; 17.3% non-white; SPPB score= 8.7 ± 2.3) to evaluate the contribution of four neuromuscular attributes (leg strength, velocity, knee flexion range of motion [ROM], trunk extensor endurance [TEE]). To quantify the total effect of cognition on mobility, we showed via linear regression that amnesic, non-amnesic, and mixed MCI were associated with reduced SPPB scores in comparison to the no-MCI referent category [mean (95% CI) difference $-0.94(-1.49, -0.38)$; $-1.97(-3.09, -0.85)$; $-1.66(-2.19, -1.34)$, respectively, after adjustment for relevant covariates]. Each MCI category was similarly associated with clinically significant decreases in gait speed. We then re-estimated these models including the neuromuscular measures as covariates; with control for these factors, the apparent effects of MCI on mobility were attenuated by between 21 and 49%. Notably, these models also implied that neuromuscular attributes are independently associated with SPPB scores [strength: $0.52(0.30, 0.75)$; velocity: $0.38(0.15, 0.60)$; TEE: $0.57(0.37, 0.76)$] and gait speed. We observed little evidence of interaction between MCI and neuromuscular function in predicting mobility. Though derived from cross-sectional data, these results suggest that specific neuromuscular abilities are partial mediators of the influence of cognition on mobility, but also that they express the influence of other factors. They therefore may offer promising targets for interventions to either modulate or compensate for the deleterious effects of cognitive impairment on physical function.

RELATIONSHIP BETWEEN PERSON-CENTERED PRACTICES AND STAFF'S OUTCOMES IN KOREAN LONG-TERM CARE

S. Bae¹, D. Kim¹, J. Choi², J. Yoon¹, 1. *College of Nursing, Seoul National University, Seoul, Korea (the Republic of)*, 2. *College of Nursing Science, Kyung hee University, Seoul, Korea (the Republic of)*

Providing person-centered care is a guiding principle in overall healthcare as well as long-term care settings. Rapid aging in recent years makes it a priority to many countries, as they have to find a way of taking good care of older adults. This study examined the relationship between person-centered practices and staff outcome including job satisfaction and turnover intention in Korean long-term care facilities. A total of 299 staff from 13 long-term care facilities in Korea were recruited and completed survey questionnaires including Person-centered Practices in Assisted Living (PC-PAL), job satisfaction and turnover intention. Linear and logistic regression analyses were performed controlling for individual-level covariates (e.g., age, gender, education, marital status, workforce type, tenure, working shift, staff-patient ratio, and salary) and organizational-level covariates (e.g., facility type, ownership, grade, size, and staffing levels). The major study findings showed that the staff who provide more person centered care indicate higher staff job satisfaction scores ($\beta = 0.46$, p -value $< .001$). Specifically, among the five sub-domains of PC-PAL, the workplace practices area indicated the highest relationships with job satisfaction than the other areas ($\beta = 0.341$, p -value $< .001$). However, there was no

statistically significant relationship between person-centered practices and turnover intention in this study. Literature shows that person-centered practices have a significant impact on staff outcomes, care quality, and ultimately residents' outcomes in many countries. This study contributes to the body of knowledge on person-centered care by providing significant impacts of person-centered practices on staff outcomes in Korean long-term care facilities.

HEALING TOUCH AS SELF-CARE FOR VETERANS WITH HYPERTENSION

A. Schloss^{1,2}, D. Woods¹, A.M. Oconnell¹, 1. *Nursing, Azusa Pacific University, Los Angeles, California*, 2. *Greater Los Angeles VA Hospital, Los Angeles, California*

Seventy-eight million Americans suffer from hypertension, a key factor of cardiovascular diseases nationally and worldwide. Stress has been implicated as one of the contributors to hypertension (HTN). One out of every three veterans are diagnosed with high blood pressure. Roger's Theory of Science of Unitary Human Beings and Lazarus' Transactional Theory of stress were used to guide this study. The purpose of this pilot study was to examine whether the use of self-care healing touch, can reduce stress and anxiety in veterans 60 and older, diagnosed with hypertension. In this a pre-intervention, post-intervention randomized two-group experimental pilot study, 24 veterans, 10 African American, 9 Caucasians, 6 other, were recruited from Los Angeles County. Participants were randomized into 2 groups (intervention and control) for this 4 week study. Outcome measures included changes in blood pressure, self-reported stress using the Daily Stress Inventory (DSI) and anxiety measured using the Geriatric Anxiety Inventory (GAI).

Results showed a significant difference in the systolic blood pressure in the intervention group compared to the control group at Week 4. There was a marginal significance found in the heart rate, but no statistical significance seen in the stress or anxiety results on this minimal sampling study.

THE RELATIONSHIP BETWEEN SOCIAL CARE ACCESS AND HEALTHCARE USE BY OLDER ADULTS: A SYSTEMATIC REVIEW

G.F. Spiers, B. Hanratty, S. Moffatt, F. Matthews, A. Kingston, R. Barker, H. Jarvis, *Newcastle University, Newcastle upon Tyne, United Kingdom*

Adult social care is facing substantial pressures in sustainability and accessibility, with consequences for the health sector. A systematic review was undertaken to synthesise evidence on the relationship between access to social care and healthcare utilisation outcomes for older adults. Social care access was defined using Gulliford et al.'s (2002) four domains: availability and supply, utilisation, quality and relevance, and equity. Systematic searches of published and grey literature were conducted, resulting in 11538 records. Titles and abstracts were screened for potential relevance, and full texts of selected studies assessed for inclusion against review criteria. Studies must have reported evidence about the relationship between social care access and healthcare utilisation specifically for older adults, and be published after 2000. A total of 45 studies were included in the review. Evidence was concentrated on the influence of two accessibility domains: social care availability and supply, and social care

utilisation. No studies reporting evidence about the influence of social care quality or equity were identified. Evidence indicates that lower availability and supply of social care is associated with increased use of hospital care, particularly in UK studies. There is some indication that nursing home and residential care may have more influence than home based social care on healthcare utilisation. Evidence typically reflected secondary health care outcomes, with clear gaps regarding primary care use outcomes.

This review offers a clear and timely picture of how access to social care influences healthcare use for older adults.

BESTEST, MINI-BEST, BRIEF-BEST, AND BBS: ABILITY TO IDENTIFY FALLS STATUS, INSTITUTIONALIZED ELDERLY

L. Viveiro¹, G. Gomes¹, J.R. Bacha¹, N. Carvas Junior², W. Jacob-Filho³, J. Pompeu¹, 1. *Department of Physiotherapy, Speech Therapy and Occupational Therapy, Faculty of Medicine, University of Sao Paulo, Sao Paulo, Brazil*, 2. *Institute of Medical Assistance to the State Public Servant (IAMSPE), Sao Paulo, Brazil*, 3. *Department of Geriatrics, Clinics Hospital, Faculty of Medicine, University of Sao Paulo, Sao Paulo, Brazil*

Objectives: To verify the ability of the Balance Evaluation Systems Test (BESTest), Mini-BESTest, Brief-BESTest and Berg Balance Scale (BBS) to identify institutionalized elderly falling. **Methods:** This is a retrospective cohort study. Institutionalized elderly (n=39; aged 62–90 years; mean=78.26 [7.3] years) were recruited from a philanthropic nursing home of Sao Paulo City (Brazil). All participants were tested with BESTest, Mini-BESTest, Brief-BESTest, and BBS and the history of falls from a year ago was collected by the medical records. For the analysis, a falls status indicator was used and the sample was dichotomized in “Non-Faller” (participants who had no fall in the last year) and “Faller” (participants who had a fall or more in the last year). The sensitivity and specificity between the total score of the BESTest, Mini-BESTest, Brief-BESTest, and BBS was calculated based on the fall hazard indicator. The cut-off points were determined using the Receiver Operating Characteristic (ROC) curves. The statistical significance of each analysis was verified by the area under the ROC curve (AUC) and by their respective 95% confidence intervals (95% CI). **Results:** All balance tests were able to identify falls status (AUC=0.63; 0.70; 0.78 and 0.75, BESTest, Mini-BESTest, Brief-BESTest, and BBS, respectively), the Brief-BESTest (sensitivity=94%, specificity=61%) and the BBS (sensitivity=94%, specificity=56%) had the higher ability. **Conclusions:** All balance tests are valuable to identify fall status in institutionalized elderly. The Brief-BESTest presented slightly higher ability to identify falls status in our sample.

THE SUSTAINABILITY OF CHAIR YOGA PRACTICE IN OLDER ADULTS WITH LOWER EXTREMITY OSTEOARTHRITIS

J. Park¹, R. McCaffrey², D.L. Newman¹, 1. *Florida Atlantic University, Boca Raton, Florida*, 2. *Mercer University, Atlanta, Georgia*

Chair yoga is relatively gentle and easy-to-learn form of yoga and is well suited to older adults with osteoarthritis (OA) who cannot participate in standing exercises. The purpose of this study was to determine whether chair yoga practice could be sustained during and three months after an 8-week chair yoga intervention for older adults with lower extremity OA. A two-arm randomized controlled trial was conducted with twice-weekly 45-minute sessions (16 sessions) of chair yoga or Health Education Program (HEP; attentional control group). Pain, pain interference, balance, gait speed, fatigue, and functional ability were measured at baseline, during intervention (4 and 8 weeks) and post-intervention (1 and 3 months). Hierarchical Linear Modeling was conducted to measure changes across time within and between groups and measure sustainability of the effect of chair yoga compared to HEP from Week 9 to Week 21 (1 month and 3 month follow-ups). One hundred twelve participants completed the intervention and data collection; 106 completed at least 12 of 16 sessions (retention rate = 95%). There was no other statistically significant sustained effect of chair yoga at the 3-month post intervention for any other variables except pain interference ($p = .012$). In terms of compliance with home practice after the intervention, only less than 50% of the yoga participants continued yoga practice at home using the guide book. The findings of this study were that older adults do not enjoy doing these types of activities at home alone and prefer to do programs in groups with support from an instructor.

ONE-YEAR MORTALITY AFTER HIP FRACTURE IN OLD AND VERY OLD PATIENTS

J. Benchimol, B. Boietti, C. Elizondo, D. Giunta, S. Barrientos, L. Camera, G. Waisman, *Internal Medicine, Hospital Italiano de Buenos Aires (Argentina), Ciudad de Buenos Aires, Argentina*

Prospective cohort of patients included in the Institutional Registry of elderly patients with Hip fracture between June 2014 and December 2016. We excluded pathologic, periprosthetic, subtrochanteric or secondary to polytrauma fractures. We classified patients as: old patients (OP) ≥ 65 and < 85 years and very old patients (VOP) ≥ 85 years. We used Kaplan Meier method to estimate one year survival. We used a Cox model to estimate OP Hazard Ratios with 95% confidence intervals (95%CI).

We included 759 patients, 43% were OP and 57% were VOP. Proportion of women was 83% and 85% respectively, $p=0.45$. They had similar frequency of polypharmacy (46% and 47%, $p=0.78$) and proportion of people having two or more Charlson score (28% and 32%, $p=0.26$). VOP were more dependent by Barthel score (36% and 65%, $p<0.01$) and more fail Edmonton score (34% and 67%, $p<0.01$). One year survival was 96% (95%CI 93–98) in OP and 84% (95%CI 79–88) in VOP. Complications were more frequent in VOP, 26% and 34% $p=0.02$. Readmission were 30% and 41%, $p<0.01$. Age is an independent risk factor for one year mortality with a crude HR 4.59 (IC95% 2.16–9.73, $p<0.01$), adjusted for frailty, functionality, ASA score, Charlson, polypharmacy and nutrition HR 3.52 (95%CI 1.63–7.6, $p<0.01$).

CAREGIVING FOR A RELATIVE WITH LUNG CANCER: HOW DO SENIORS COMPARE TO YOUNGER CAREGIVERS?

M. Aubin^{1,2,3}, L. Vezina^{4,2}, R. Verreault^{1,3}, S. Simard^{2,1}, D. Jean-François¹, S. Dumont¹, J. Dogba¹, P. Gagnon¹,
1. *Family Medicine and Emergency Medicine, Laval University, Quebec, Quebec, Canada*, 2. *IUCPO Research Centre, Quebec, Quebec, Canada*, 3. *Quebec Center of Excellence on Aging, Quebec, Quebec, Canada*, 4. *Laval Family Medicine Centre, Quebec, Quebec, Canada*

Lung cancer is the most frequent type of cancer diagnosed. With a 5-year survival of 17%, such diagnosis is emotionally threatening not only for patients but also for their family caregivers (FC). Studies have reported even higher distress for FC. However, few researchers have focused on this population, particularly in longitudinal surveys. This study compares, for different age groups, distress and quality of life (QoL) among FC of lung cancer patients. Participants completed every 3 months, up to 9 months, validated questionnaires on distress and QoL. Univariate, bivariate analyses and mixed models with repeated measurements were conducted. A total of 105 FC participated to the survey (N=43 aged < 60, N=32 aged 60–69 and N=30 aged ≥ 70). In all groups, FC were predominantly women. Older FC had more frequently health problems. However, at baseline, distress was significantly lower among seniors (IDPESQ score 33.7 in < 60; 27.7 in 60–69; 22.8 in ≥ 70 (score range 0–100); p=0.04). Also, they experienced significantly better global QoL (p=0.008), physical (p=0.01) and psychological (p=0.003) well-being, as well as less social preoccupations (p=0.008) than their younger counterparts. These differences remained after 3, 6 and 9 months. These results suggest that seniors better manage caregiving than younger FC. However, with the expected increase in the prevalence of cancer, the aging of the population and the growing number of frail seniors, more research is necessary in this field, to better document FC experience in order to adapt services to their needs, especially for the very old.

IS A HIGH SODIUM INTAKE ASSOCIATED WITH ARTERIAL STIFFNESS IN THE VERY OLD?

C.M. Freitas, R.D. Miranda, D.B. Xavier, J.D. Junior, J.C. Toledo, E. Quadrado, *UNIFESP, São Paulo, SP, Brazil*

A high sodium intake and arterial stiffness is associated with an increased cardiovascular risk (CVR).

This study aimed to evaluate the association between sodium intake, estimated from urinary excretion, and arterial stiffness, noninvasively measured, in independent octogenarians.

We included elderly individuals of both sexes, aged ≥80 years and who were physically and cognitively independent. Arterial stiffness was evaluated by pulse pressure amplification index (PPAi), assessed by a noninvasive procedure using the Mobil-O-Graph™ equipment (PPAi=100x((PPb-PPc)/PPc), PP: pulse pressure, b: braquial, c: central). Furthermore, the Tanaka formula was used to estimate 24-h urinary sodium excretion using isolated urine samples, and these estimates were used as a surrogate for intake.

In total, 113 elderly individuals with a mean age of 87.6 ± 4.2 years were evaluated. Women (78.8%) accounted

for majority of the examined individuals. We categorized into two groups on the basis of sodium intakes of <3.0 and ≥3.0 g/day. PPAi was 30.8% and 25.2%, respectively (p = 0.008*).

In conclusion, octogenarians with a sodium intake of ≥3.0g/day had lower PPAi that means a higher arterial stiffness. Low PPAi strongly predicts mortality and adverse effects in very old. Therefore, these data suggested that the sodium intake-related increase in CVR may be attributed to higher arterial stiffness. Thus, recommendations for controlling salt intake should be emphasized.

PREDICTING HOSPITALISATIONS: COMPARING EIGHT RISK SCORES IN CARE-DEPENDENT ELDERLY FROM SIX COUNTRIES

H. van Hout^{1,2}, H.G. van der Roest^{1,2}, 1. *General Practice & Elderly Care Medicine, VU University medical center Amsterdam, Amsterdam, Netherlands*, 2. *Amsterdam Public Health Research Institute, Amsterdam, Netherlands*

Better prediction of hospitalisations may allow preventive interventions directed to appropriate target groups. We compared the predictive accuracy of eight existing risk scores to hospitalisations among older care dependent home dwelling adults across six countries from the IBenC study.

We assessed 2884 persons aged 65 or older, who received professional homecare in six different countries in Europe and followed them for 6 months. Eight existing index risk scores were computed with baseline data: (1) The Changes in Health, End-stage Disease, Signs, and Symptoms Scale (CHESS); (2) Detection of Indicators and Vulnerabilities for Emergency Room Trips (DIVERT); (3); (4) Identification Seniors At Risk Primary Care (ISAR PC); (5) Emergency admission risk likelihood index (EARLI); (6) Sherbrooke Postal Questionnaire (SPQ); (7) the Elders Risk Assessment (ERA), and (8) Community Assessment Risk Screen (CARS). Their accuracy to predict one or more reported hospitalisations or Emergency Department visits was expressed in the area under the ROC curve (AUC).

194 older adults were admitted at the ED and/or hospital ward during the six-month study period. The highest AUC value was found for the EARLI AUC=0.75, followed by DIVERT (AUC =0.69), CHESS (AUC =0.66), CARS (AUC =0.64), ERA (AUC=0.60), ISAR-PC (AUC =0.47) and SPQ (AUC =0.41). Significantly better AUC value were found in persons without a recent admission at baseline for DIVERT, EARLI and CARS risk scores.

Our results reveal two promising risk scores: EARLI, and DIVERT. Identification by these risk scores may help to target preventive intervention in high-risk groups.

DEMENTIA PREDICTED ONE-YEAR MORTALITY FOR HIP FRACTURE PATIENTS: A POPULATION-BASED STUDY

H. Chiu^{1,2}, T. Su², C. Chen^{2,3}, C. Chen¹, C. Hsieh¹, C. Liu¹,
1. *Christian Changhua Hospital, Changhua, Taiwan*, 2. *Kaohsiung Medical University, Kaohsiung, Taiwan*, 3. *Kaohsiung Municipal Ta-Tung Hospital, Kaohsiung, Taiwan*

Objective: We aimed to examine 1-month, 3-month, and 12-month mortality rates in elderly patients with repaired hip fractures. We further explored relative risks of dementia, Parkinson, and medical illness in predicting death following fracture treatment.

Methods: This retrospective observational cohort study analyzed 6,315 older persons with hip fractures, 2000–2012, identified from the 2005 Longitudinal Health Insurance Database. We used outpatient and carrier claims to identify individuals with dementia and Parkinson, traced back 2 years before the hip fracture dates. We used Cox proportional hazards models to estimate the risk of death associated with variables of interest with adjustment for demographic, clinical, treatment, and provider factors.

Results: Among 6,315 hip fracture patients, 10.82%, 5.89%, and 2.82% had dementia, Parkinson, and dementia plus Parkinson, respectively. One-year mortality rates were 15.49% for patients with dementia, 11.68% for those with Parkinson, 15.82 for those with dementia/Parkinson, and 9.78% for those without neurological illness. After covariate adjustment, the hazard ratio for 1-year mortality was 1.41 (95% CI: 1.14–1.74) for dementia patients compared with non-dementia patients. The hazard ratio was substantially elevated for patients with dementia/Parkinson (HR: 1.52, 95% CI: 1.03–2.22) compared with the reference group. There was no significant association with death for patients with Parkinson alone.

Conclusion: Our data show that hip fracture patients with preexisting dementia appear to be at greater risk of death than those without dementia. Parkinson did not predict death in 1, 3, or 12 months. Better follow-up management programs are suggested to reduce the death risk for elderly hip fracture patients, especially those with dementia.

WORTH THE WALK: A CULTURALLY-TAILORED INTERVENTION TO REDUCE STROKE RISK IN MINORITY OLDER ADULTS

C.A. Sarkisian¹, S. Song², C. Reyes¹, C.A. Carrillo¹, E. Jimenez³, S. Ma⁴, L. Trejo⁵, 1. *UCLA School of Medicine, Los Angeles, California*, 2. *Rush University, Chicago, Illinois*, 3. *Mexican American Opportunity Foundation, Los Angeles, California*, 4. *Chinatown Service Center, Los Angeles, California*, 5. *City of Los Angeles Department of Aging, Los Angeles, California*

Stroke is devastating disease that disproportionately kills and disables ethnic/racial minority older adults. Over 30% of stroke risk is attributed to sedentary lifestyle, but most older adults are physically inactive. With a goal of decreasing stroke disparities, our interdisciplinary team developed, implemented and tested a behavioral intervention to increase walking among Korean-American (KA), Chinese-American (CA), African-American (AA) and Latino (LT) older adults. We used community-partnered research methods to culturally tailor a 4-week, 2-hour per week curriculum based in social cognitive and attribution theory. We trained in-house senior center staff at 4 community senior centers to implement the intervention; we then measured the intervention's effectiveness using a single-blind randomized waitlist controlled trial. We recruited subjects (age >60 years, able to walk) at senior centers and randomized them into either immediate 4-week intervention or 3-month wait-list control. Measures were assessed by trained staff at baseline (prior to randomization), 1-month, and 3-months in both groups; wait list control subjects received the intervention after all data collection was completed. The primary outcome was mean steps/day over 1 week (measured with pedometers). We

enrolled 233 participants (mean age 74 years; 69% female). Mean baseline steps/day were 4744; after 1 month, control subjects decreased and intervention subjects increased with mean difference 750 steps/day ($p < 0.005$). The intervention increase was not sustained at 3-months. The intervention increased 3-month stroke knowledge and self-efficacy for exercise ($p < 0.05$ for both). We conclude that this initially encouraging community-partnered culturally tailored intervention failed to produce sustained improvements in walking among minority older adults.

IMPACTS OF THE FRENCH LIFESTYLE REDESIGN®, A PREVENTIVE OCCUPATIONAL THERAPY INTERVENTION

M. Levasseur^{1,2}, M. Lévesque^{1,2}, M. Beaudry², N. Larivière¹, J. Filiatrault³, M. Parisien⁴, Y. Couturier^{1,2}, N. Champoux³, 1. *Université de Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *Research centre on aging, Sherbrooke, Quebec, Canada*, 3. *Université de Montréal, Montréal, Quebec, Canada*, 4. *Centre de réadaptation en déficience physique-Institut universitaire, Montréal, Quebec, Canada*

Rationale: Developed in California to enable community-dwelling older adults to integrate meaningful, healthy and sustainable activities, the Lifestyle Redesign® is a well-known cost effective occupational therapy intervention. Recently adapted to French by our team, the impacts of this new version are unknown. This study thus aimed to explore the impacts of this version of Lifestyle Redesign® on French-speaking older adults.

Method: A mixed-method design including a pre-experimental component was conducted with 16 participants (10 women), aged 66–91 (79.4 ± 8.7), 10 without and 6 with disabilities. They completed social participation, health, leisure, engagement in meaningful activities and life balance questionnaires at 0, 6 (immediately after), 9 and 12 months, and semi-structured interviews.

Results: Lifestyle Redesign® increased older adults' mental health ($p = 0.02$), life balance ($p = 0.04$) and interest toward leisure ($p = 0.02$). Results have also shown improvement in engagement in meaningful activities of participants without disability ($p = 0.03$) and in social participation of older adults with disabilities ($p = 0.03$). The majority of participants recommended the intervention to other seniors. Moreover, participants reported several positive impacts of the intervention, both on their personal and environmental factors, and, more specifically, for their social participation. This influence on social participation was seen in several activities, occupational routines and the frequency and quality of their contacts with others.

Conclusion: The French version of Lifestyle Redesign® is a promising occupational therapy intervention for older adults living in the community.

Funding: This work was supported by the Canadian Institutes of Health Research (CIHR)'s [grant #126315].

SURVEY ON SAFETY MEDICATION IN ELDERLY IN THE COMMUNITY

R. Yang, *Nursing Department, Xi'an Peihua college, Xi'an, Shaanxi, China*

Objective: To investigate the knowledge of drug safety in the elderly in community, and provide research data for

strengthening supervision on drug application. Methods: A total of 481 elders aged from 60–85 years in the community was investigated with an individually designed questionnaire, which included the knowledge and behavior of drug safety.

Results: 83.6% of the elders were using medicine and the average number of drugs was 5. Most of them lacked knowledge about safe medication. "It would induce untoward effect if many kinds of drug are used together" (41.6%); "They should

have been diagnosed clearly before they use drug" (42.3%); "Observe the patient's condition and reaction closely after they have drug" (33.2%); "Stop taking drug to see doctors after abnormal appears" (21.8%) and "characteristic of medication for the elderly" (6.2%). Their compliance of medication was bad. They changed the time and interval of medication frequently or even forgot to take drug (63.4%); They used the prescription drug and nonprescription drug together (60.5%); They stopped taking medicine too fast or without orders (56.7%) and bought drug without doctor's diagnosis or prescription (53.3%).

Conclusion: The knowledge about safety medication in elderly in community needs to be improved. Various kinds of relevant continuing education should be strengthened.

MUSCLE MORPHOLOGY MEASURES FROM QUANTITATIVE ULTRASOUND ARE ASSOCIATED WITH KNEE ARTHRITIS STATUS

M. Harris-Love, H.J. Hernandez, T. Gonzales, B.A. Seamon, D. Pennington, V. McIntosh, M.R. Blackman, *Clinical Research Center, Washington DC VA Medical Center, Washington, District of Columbia*

Knee osteoarthritis (OA) is a complex condition involving articular cartilage, connective tissue, and skeletal muscle. Diagnostic ultrasound (US) has been proposed as an approach to characterize muscle changes in those with chronic conditions. The purpose of this study was to determine if quantitative US muscle morphology and morphometry measures are associated with clinical markers of knee OA. Male Veterans with knee OA ($n=36$; age = 62.2 ± 5.7 yr; BMI = 31.2 ± 6.5) participated in the study. Self-reported symptoms and physical function were evaluated using the Knee injury and Osteoarthritis Outcome Score (KOOS). Knee OA asymmetry was determined by the Kellgren–Lawrence grade and self-reported pain. B-mode quantitative US with a 13–6 MHz linear array transducer was used to obtain tissue echogenicity and muscle thickness values. The primary scanning site was the rectus femoris. Additional sites at the trapezius, deltoid, pectoralis major, and brachioradialis were used as proxy measures of lean body mass (LBM). Lower echogenicity ($\Delta -3.04$ grayscale levels, $t=2.70$, $p=.01$) and greater muscle thickness ($\Delta .17$ cm, $t=2.21$, $p=.03$) of the rectus femoris were identified in the less involved limb. Additionally, the summed US muscle thickness values were associated with the Symptom and Sports/Recreation KOOS subscales ($r=.37-.39$, $p=.02-.03$), and the deltoid was the only muscle group associated with all 5 KOOS subscales ($r=.36-.45$, $p=.01-.04$). In summary, US-derived muscle morphology and morphometry measures identified knee OA asymmetries in Veteran men. Key upper extremity muscle groups and proxy estimates of LBM should not be overlooked as factors that affect the KOOS score.

PRESCRIPTION AND OVER-THE-COUNTER MEDICATION USE IN THE OLDEST OLD IN THE SOUTH-CENTRAL UNITED STATES

G. Azhar¹, J. Hawthorne¹, L. Warford^{1,2}, L. Hutchison¹, J.Y. Wei¹, 1. *University of Arkansas for Medical Sciences, Little Rock, Arkansas*, 2. *CAVHS, Little Rock, Arkansas*

The objective of the study was to evaluate medication usage in individuals aged 95 and above residing in South-Central Arkansas. Electronic medical records of individuals treated at a University of Arkansas for Medical Sciences were reviewed. Of the 121 individuals studied, 13.2 % ($n=16$) were not on any prescription or over-the-counter (OTC) medications. The remaining 105 patients consumed a mean of 4.8 ± 2.7 prescription medications and 3.3 ± 2.2 OTC pills daily. Cardiovascular prescription medications were most commonly used with 76% of the elderly taking at least 1 anti-hypertensive daily (ranging from 1–5 daily). Approximately 46% were on diuretics, and about 11% were prescribed an HMG-CoA reductase inhibitor. Medications for endocrine disorders, diabetes mellitus and hypothyroidism were taken by 27% of subjects. Other commonly prescribed medications included anti-depressants and opioids; being 47% and 29 % respectively. Subjects were infrequently on medications for dementia and Parkinson's (~22%). There were limited prescriptions for insulin (2.6%), metformin (1.7%), and levothyroxine (7.8%). Aspirin was the most commonly used OTC medication at 43.8%, followed by acetaminophen. Other OTCs included laxatives (34%) and stool softeners (22%). The subjects on zero medications appeared to have a healthier hemoglobin and lipid profile compared to those who were on medications of any type (Hb = 12.6 ± 1.6 g/dL and TG = 106 ± 40.9 mg/dL versus Hb = 11.7 ± 1.7 g/dL and TG = 121 ± 82.7 mg/dL respectively). The oldest old still suffer from polypharmacy but the fact that these individuals survived beyond the ninth decade speaks to their resilience and better hematological and metabolic health.

HOW TO SCREEN POST-MENOPAUSAL FEMALES WITH CERVICAL CARCINOMA? A DISCUSSION ON THE METHODS

W. Zhao, P. Geng, L. Lei, H. Awad, Y. Li, X. Wei, Z. Zhu, J. Cheng, *Shanghai East hospital, Shanghai, China*

Introduction: The cervical cancer screening guideline suggests that females aged 30 to 65 take a combined cytologic and HPV test every 5 years, or a cytologic test alone every 3 years to screen HSIL. Nevertheless, our clinical data indicate incidence of false negative in part of the post-menopausal females' cytologic test. It is necessary to choose a more appropriate screening scheme for post-menopausal females. Methods: We conducted combined Thinprep cytologic test (TCT) and Cobas4800 HPV-DNA test to a cohort of 1489 female patients. Colposcopy and biopsy were conducted to the patients who showed LSIL or above, positive HPV-16 type or HPV-18 type, or ASCUS accompanied by positive HPV-other type in cytologic tests and HPV tests. Results: Among the 1489 females under combined tests, 321 were menopausal, 1168 were non-menopausal. The proportion of HPV infection were 15.89% (51/321) and 13.96% (163/1168) respectively. There was no significant difference between the two groups ($\chi^2 = 0.764$, $p = 0.382$). Verified by cervical biopsy, 12 post-menopausal females

and 18 non-menopausal females had HSIL.8 and 18 among post-menopausal and non-menopausal females with HSIL, respectively, had concordant TCT results as the final diagnosis. cytologic tests led to 4 missed diagnosis among the post-menopausal females with HSIL (2 presented normal cytologic results, 2 presented ASCUS which can be repeated in 6 months without further test), giving a missed diagnosis rate as 33.33%, which is statistically significant ($p = 0.018$). Conclusions : post-menopausal females suffer higher missed diagnosis rate from cytologic test alone than HPV test alone. It serves post-menopausal females better to take preliminary HPV screening than cytologic screening.

RENAL IMPAIRMENT AND ANAEMIA IN HOSPITALISED OLDER PATIENTS: IMPACT ON SHORT-TERM OUTCOMES

N. Soerjadi¹, B. Lau¹, W. Srikusalanukul¹, A. Fisher^{1,2}, 1. *Department of Geriatric Medicine, The Canberra Hospital, Canberra, Australian Capital Territory, Australia*, 2. *Medical School, Australian National University, Canberra, Australian Capital Territory, Australia*

Background: Current risk stratification for predicting outcomes in hospitalised elderly is suboptimal.

Aim: To investigate the impact of chronic kidney disease (CKD) and anaemia on admission on clinical outcomes in hospitalised elderly patients (≥ 60 years).

Methods: In 587 consecutive patients (mean age 85.8 ± 6.9 years, 63.7% females), characteristics and outcomes were analysed. CKD was defined as glomerular filtration rate $< 60 \text{ ml/min/1.73m}^2$. WHO criteria for anaemia were used: haemoglobin (Hb) $< 120 \text{ g/L}$ for females, Hb $< 130 \text{ g/L}$ for males; severe anaemia was defined as Hb $< 100 \text{ g/L}$ and iron deficiency as transferrin saturation $< 18\%$.

Results: Prevalence of CKD, anaemia, severe anaemia and iron deficiency on admission was 56.1%, 49.1%, 12.3% and 68.0%, respectively. There were 112 (19.1%) patients with prolonged hospital stay (> 10 days) and 86 (14.7%) died within 3 months. Significant risk factors (after adjustment for age and gender) for prolonged hospital stay were severe anaemia (OR 2.15, 95%CI 1.19–3.89, $p=0.011$) and iron deficiency (OR 1.98, 95%CI 1.08–3.62, $p=0.027$), while presence of CKD (OR 2.27, 95%CI 1.14–4.54, $p=0.020$) and/or severe anaemia (OR 2.02, 95%CI 1.03–3.94, $p=0.040$) were significantly and independently associated with mortality. The predictive values of these parameters were mild-moderate (area under the ROC curve 0.575–0.693) but severe anaemia demonstrated reasonable specificity (82.8%–83.3%), iron deficiency and CKD were relatively sensitive (77.6% and 71.8%, respectively) and the negative predictive values were high (84.3%–90.7%).

Conclusion: In older hospitalised patients severe anaemia, iron deficiency and/or CKD on admission increases the risk for prolonged hospital stay and 3-month mortality by twofold. This prognostic information might help in planning adequate individualised management.

COST-EFFECTIVENESS OF MINI-LAPAROTOMY FOR COLORECTAL CANCERS IN ELDERLY PATIENTS

C. Wan¹, H. Chiu^{1,2}, H. Hsieh², H. Tsai³, Y. Lin⁴, J. Wang^{2,3}, 1. *Christian Changhua Hospital, Changhua, Taiwan*, 2. *Kaohsiung Medical University, Kaohsiung, Taiwan*,

3. *Kaohsiung Medical University Hospital, Kaohsiung, Taiwan*, 4. *National Taiwan University, Taipei, Taiwan*

Objective: The purpose of this study was to apply cost-effectiveness methods to investigate the cost effectiveness of adopting mini-laparotomy surgery (MLS) compared with conventional surgery 1 year following resection in elderly colorectal cancer patients aged 65 years or older.

Methods: We used a prospective longitudinal study design. MLS patients were treated as the process innovation group and conventional surgery patients as the comparison group. Data were obtained from a chart reviewed of patients who underwent colorectal cancer resection during 2007 to 2012 in a medical center of south Taiwan. A total of 125 patients who received elective MLS and 179 who received conventional surgery were included. Cost measures were hospital-index cost and outpatient and inpatient costs within 1 year after discharge. Effectiveness measures were life-years (LYs) saved and (QALYs) saved.

Result: Patients in the MLS group demonstrated shorter post-surgical lengths of stay, but no significant differences were found in blood transfusions, complication rates or admitted to ICU room between two groups. The cost effectiveness analysis found that the health outcomes (LY and QALY gains) for the MLS group were statistically significantly better than the conventional surgery group, as were cost savings for per QALYs saved TWD\$550,967(USD\$18,365) in overall medical costs within one year.

Conclusion: We confirmed that the less invasive surgical process not only saved medical costs, but also increased QALYs for elderly CRC patients.

ASIAN AMERICAN ADULT CHILDREN AS CAREGIVERS FOR THEIR AGING PARENTS: A PUBLIC HEALTH PERSPECTIVE

J. Lee, *Gerontology, San Francisco State University, San Francisco, California*

This session is focused on adult children, particularly those with Asian ethnic backgrounds, who are caregivers for their aging parents. Specifically, this session will investigate how ethnic background affects caregiving roles and attitudes, positively or negatively. Studies show, for example, that those from Asian ethnic backgrounds often feel a greater obligation to take care of their older parents—often framed as filial piety. The expectations, roles, and consequent stress levels associated with these cultural caregiving values are of particular interest in this session. Identifying the differences in immigration history, acculturation, generational differences, and cultural values and norms within each Asian American sub-population is important in understanding these caregiver roles and expectations. The session draws from scholarly gerontology literature and adopts a Public Health perspective to organize existing studies and suggest appropriate support and interventions for Asian American adult children caregivers.

WHAT IS SUCCESSFUL AGING? COMPARING FRAMEWORKS FOR SUCCESSFUL AGING WITH CULTURAL PERSPECTIVES

A. Jensen, M.T. Dungan, M.C. Goates, E.L. Thacker, *Life Sciences, Brigham Young University, New Braunfels, Texas*

“Successful aging” has different meanings in different cultures. Our purpose was to examine whether published

frameworks for successful aging would align with the values and perspectives of older adults across cultures. We identified studies on elderly populations published from 1997 to 2016 that addressed older adult perspectives on successful aging, or that applied the 1997 Rowe and Kahn framework for successful aging to older adult cohorts. Additionally, we compared findings from these studies with framework found in the 2015 WHO World Report On Ageing and Health. We identified studies from a variety of cultures, including peoples from China, Japan, the Netherlands, the United States, and Nigeria. Key concepts identified from lay perspectives were much broader in scope than the three key criteria in the Rowe and Kahn framework: absence of disease, high physical and cognitive functioning, and engagement. Further concepts we identified included coping, financial security, spirituality, well-being, longevity, and life satisfaction. While published frameworks and cultural values overlapped, key concepts varied in importance from culture to culture. Based on our findings, we propose a framework that includes a comprehensive set of key concepts drawn from multiple cultures, and that allows healthcare workers and policy makers to weigh these concepts differently according to needs and views of each society. For example, Alaska Natives more highly valued well-being and spirituality, whereas Japanese-American men more highly valued financial security. A flexible framework that allows key concepts to be weighted differently depending on culture may be beneficial for defining and understanding successful aging.

RESIDENT AND FACILITY FACTORS ASSOCIATED WITH CARE LEVEL DETERIORATION IN NURSING HOMES IN JAPAN

X. Jin¹, N. Tamiya¹, B. Jeon¹, A. Kawamura¹, H. Takahashi², F. Sandoval Garrido¹, H. Noguchi³, 1. *Health service research, University of Tsukuba, Tsukuba, Ibaraki, Japan*, 2. *Fukushima Medical University, Fukushima, Japan*, 3. *Waseda University, Tokyo, Japan*

The purpose of this study is to determine the resident and facility characteristics associated with the care-need level deterioration of residents in Long term care health facilities for the elderly in Japan. Resident level of long-term care insurance claim data were merged with facility level data from the Survey of institutions and establishments for long-term care for the period from October 2012 to April 2014. The study consisted of 177,048 residents who were admitted into 1502 facilities during October 2012 to September 2013. We divided care-need level deterioration into two categories: deteriorated and not deteriorated. Multilevel logistic regression was used to analyze the facility and resident characteristics that were thought to be associated with care-need level deterioration. Result of multilevel regression showed that at resident level, older age group (OR=1.52, 95% CI, 1.42–1.62) were more likely to experience care-need level deterioration. However, higher care-need level (OR=0.26, 95% CI, 0.25–0.27) were less likely to experience care-need level deterioration. At the facility level, higher proportion of private room (OR=0.86, 95% CI, 0.78–0.95) and being located in a metropolitan area (OR=0.88, 95% CI, 0.83–0.93) were less likely to be care-need level deteriorated. By contrast, higher number of doctor per 100 users (OR=1.05, 95% CI 1.02–1.09) were

more likely to experience care-need level deterioration. We conclude as implication that both resident and facility level characteristics could affect care-need level deterioration. Investigating factors related with care-need level deterioration is important to improve provider performance and enhance competitiveness in the market.

INJURY PREVENTION IN SENIORS: A PUBLIC HEALTH APPROACH TO COMMUNITY MOBILIZATION: A SCOPING REVIEW

A. Crizzle^{1,5}, C. Dykeman², A. Andrews³, F. Brunet⁴, S. Laberge⁵, A. MacLeod⁶, 1. *School of Public Health, University of Saskatchewan, Saskatoon, Saskatchewan, Canada*, 2. *Public Health Ontario, Toronto, Ontario, Canada*, 3. *Public Health Ontario, Haliburton, Ontario, Canada*, 4. *Public Health Ontario, Alexandria, Ontario, Canada*, 5. *University of Waterloo, Waterloo, Ontario, Canada*, 6. *Trent University, Peterborough, Ontario, Canada*

Reducing injuries (e.g. falls) among seniors requires an expanded public health effort to work with stakeholders at multiple levels. To achieve this goal, local public health professionals need to effectively bring together, facilitate, and support community partners to initiate evidence based efforts. However, to date, there has been no formal review of the literature to inform how these professionals can best work together with community partners to address injury prevention among seniors. Thus, this scoping review aims to identify theories, models or frameworks that are applicable to community-based injury prevention initiatives. Six databases (i.e., OVID, PubMed, PsycINFO, CINAHL, Proquest, EBSCO) as well as the grey literature and hand searches were used to identify relevant literature published in the English language, between 2000 and 2016, within a North American context. The search strategy included those items (1) identifying a theory, framework or model related to mobilizing partners; and (2) referring to community-based injury prevention. After reviewing 13,756 abstracts, ten items were included. Findings show that a theory, and various conceptual models or frameworks exist for developing and sustaining partnerships, however, few evaluations are reported, explicit involvement of local public health practitioners is rare and applications to senior community-based injury prevention programs are undocumented. Successful injury prevention initiatives for seniors will require filling these gaps, and translating and evaluating how theories, models and frameworks are applicable to local public health professional practices. Additional models may be needed to specifically guide how public health can work locally with community partners.

PATIENT-CENTERED MEDICAL HOME, HEALTHCARE UTILIZATION, AND EXPENDITURES FOR OLDER CANCER SURVIVORS

J. Xu, *Gerontology, University of Maryland, Ellicott City, Maryland*

Purpose: The Patient-Centered Medical Home (PCMH) model has been proposed to improve healthcare delivery and decrease costs. This study examined the associations between receipt of care consistent with a PCMH and the healthcare utilization and expenditures among older cancer survivors.

Design and Methods: Secondary data analysis was conducted using data from the Medical Expenditure Panel Survey (MEPS). The study sample included adults aged 65 and over who had ever been diagnosed with cancer. The analytical datasets were constructed in two ways: a cross-sectional sample of MEPS 2008 to 2013, and a panel sample of MEPS Panels 13 to 17. Multivariable analyses were performed to examine the effects of the PCMH on healthcare utilization and expenditures.

Results: The PCMH was significantly associated with higher likelihood of having ED visits and outpatient visits. Among the PCMH domains, comprehensive care and compassionate care was significantly associated with more outpatient visits, having a usual source of care was associated with more office based visits, and accessibility was significantly associated with less total expenditures and less Medicare expenditures.

Implications: Future payment reform could consider incentivizing medical practices that adopt part of the cost-saving PCMH features and facilitate the progression of the implementation of a full PCMH model. Since the PCMH model is expected to adapt to a Medicare payment system that values the quality of care, aligns performance measures and incorporates value-based reimbursement, findings of this study inform the Medicare reform regarding the effects of the PCMH and its components on healthcare utilization and expenditures.

SUBSTANCE USE AMONG OLDER AND YOUNGER ADULTS EXPERIENCING CHRONIC HOMELESSNESS

L. Thomas, J.T. Lane, J. Hutchison, C. Vercryusse,
University of North Carolina at Charlotte, Charlotte, North Carolina

Few homeless services are tailored for older adults despite increased recognition of health and mental health challenges that differ from those of younger homeless adults and despite the overall aging of single homeless adults, the largest segment of the homeless population in the United States. In the last three decades, the median age of single homeless adults rose from 35 to 50 and projections indicate that the number of older homeless adults will double by 2050. This study examined the substance use patterns of older (≥ 50 years; $n=111$) and younger (< 50 years; $n=109$) adults on a chronic homeless registry in a large city in the southeastern United States. Participants reported using alcohol and cocaine at similar rates. However, older adults reported drinking until intoxicated fewer days in the last month ($m=4.95$, $sd=9.21$) than did younger adults ($m=8.73$, $sd=11.85$), $t=2.64$ (203.7) $p<.01$ and they reported using marijuana fewer days ($m=2.8$, $sd=6.88$) than younger adults ($m=8.3$, $sd = 11.82$), $t=4.22$ (173) $p<.0001$. They also reported significantly fewer days using multiple drugs, $t=3.03$ (175) $p<.01$. These behaviors suggest that while substance use services remain relevant, the needs associated with substance use may differ for older and younger adults experiencing chronic homelessness. Interventions should be adapted to better serve both groups. Findings are discussed in light of key interventions in federal initiatives to end chronic homelessness and in light of local and regional challenges to address homelessness.

THE STRENGTHS OF VETERANS: A COMPARISON OF TAIWANESE CENTENARIANS AMONG VETERANS AND NON-VETERANS

P. Yang, *Social Work, National Taiwan University, Taipei, Taiwan, Taiwan*

In general, women are longer lived than men in the general population. Yet, a previous study of Taiwanese centenarians (Yang, 2012) found that there were an over representation of male centenarians who were Second World War veterans. To further explore the characteristics of veteran centenarians, this study completed a cross-sectional population survey in Taiwan in the year of 2015. The inclusion criteria of centenarians was those born before December, 31st of 1914. The final sample comprised of a total of 157 Taiwanese centenarians, with 62 males and 95 females. Among them, there were 31 veteran centenarians. Descriptive and referential statistics were performed to compare the general centenarians and the veteran centenarians. Results showed that veteran centenarians were significantly different from the general centenarians in their ADL and IADL scores; i.e., the veteran centenarians were significantly more independent in their daily functioning. Also, many veterans married quite late in their late middle age or old age, so a much higher percentage of 32% still had living spouses who were much younger, compared to only 10% of general centenarians with spouses. There were also a higher percentage of veteran centenarians who were never married and had no children. Therefore, unlike the traditional family support culture dictates, veteran centenarians relied primarily on government pensions for their retirement income. In sum, the survivors of WWII veterans had distinct characteristics and a lot of strengths to sustain them to the super old age. Benefits of early strenuous physical training and life-long independent living were discussed as a lesson learned from the veteran centenarians.

THE SHAPING OF A DEMENTIA-FRIENDLY CINEMA

K. Brittain², C. Degnen¹, K. Morrissey¹, A. Dow¹, P. Wright¹,
1. Newcastle University, Newcastle upon Tyne, United Kingdom, 2. Northumbria University, Newcastle upon Tyne, United Kingdom

There is an increased focus on the challenges of including people with dementia in everyday life, which in Britain for instance can be seen in The Prime Minister's challenge, supported by the Alzheimer's Society, of creating dementia friendly communities. The vision is to tackle exclusion that people living with dementia experience; and yet, what actually constitutes a dementia friendly community is still difficult to determine. In this poster, we explore what makes a public space dementia friendly. We draw on qualitative research from a follow-on evaluation of a dementia friendly cinema pilot within the North East of England to report results from this scheme. Part of this was to explore, and devise an effective method, of gathering feedback from people with dementia and their carers. We introduced 'ThoughtCloud', a digital feedback tool for events, inviting cinema goers to express their thoughts and feelings about the scheme. The motivation of the design was to enable people with disabilities to provide feedback about care services, and this was the first time it was used with a group of people with dementia.

The main strength of using ThoughtCloud was in capturing ‘snippets’ of feedback straight after the films were shown. Key findings highlight how although the physical aspects of the cinema were important, the ambience and role of staff in meeting care needs were also seen as crucial to the success of the scheme.

THIRD REVIEW AND APPRAISAL OF IMPLEMENTING MIPAA: FINDINGS FROM THE UNECE COUNTRY REPORTS

V. Gaucaite Wittich, L. Warth, *Population Unit, UN Economic Commission for Europe, Geneva, Switzerland*

Every five years, countries of the UNECE region undertake an analysis of the current state of implementation of the Madrid International Plan of Action on Ageing and its Regional Implementation Strategy (MIPAA/RIS, adopted in 2002) and highlight the actions required to make further progress. The UNECE Working Group on Ageing – an intergovernmental body including 56 member States from Europe, North America, Caucasus and Central Asia – facilitates this process and the UNECE Secretariat compiles and synthesises the findings from all country reports.

The 3rd review and appraisal cycle of MIPAA/RIS (2012–2017) will be completed at the UNECE Ministerial Conference on Ageing in Lisbon, on 21–22 September 2017 with a launch of a Synthesis Report and adoption of political declaration.

This poster will provide a preview of findings from the Synthesis Report and will indicate the main areas of focus for the next cycle of MIPAA/RIS implementation in the UNECE region.

EMOTIONAL CONNECTEDNESS: GHANAIAN IMMIGRANTS AND THEIR NON-MIGRANT OLDER ADULTS RELATIVES

Y. Nyameazea, *University of North Carolina at Pembroke, Pembroke, North Carolina*

International migration often involves years of separation of nuclear and extended families. The literature shows that Ghanaian immigrants in the United States stay connected with non-migrant relatives in Ghana. The type and frequency of connectedness are found to be associated with certain demographic and socioeconomic circumstances of both the immigrants and non-migrant relatives. Using a survey data from 124 participants, this study assessed the factors underlying the reasons Ghanaian immigrants in the United States maintained emotional connection with their non-migrant older adult relatives.

The study results showed that the frequency of contacts initiated by Ghanaian immigrants is significantly influenced by perceived social disapproval by their peers and non-migrant family members. Specifically, perceived social disapproval contributed 7.7% of the explanation of the variance in phone contacts. We infer that Ghanaian immigrants’ uneasiness about negative opinions of their family and friends led to high level of phone and other telecommunication contacts with non-migrant older adult relatives.

We deduced that Ghanaian immigrants initiated telecommunication contacts within the broader context of societal and family expectation of mutual support and connectedness. Although at the geographic distance, they self-identify

with the Ghanaian ethics of shame and honor associated with elder care and elder respect. Through telecommunication contacts, they receive information about the life situations of their non-migrant older adult relatives and provide emotional support and care. This helps Ghanaian immigrants to preserve their honor and social status among their non-migrant relatives and members of the Ghanaian immigrant community.

PRO HEALTH 65+ HEALTH PROMOTION AND PREVENTION OF RISK—ACTION FOR SENIORS

S. Golinowska, M. Tambor, *Institute of Public Health, Faculty of Health Science, Jagiellonian University Medical College, Cracow, Poland*

The ageing of populations leads to an increased attention to health promotion among the elderly. The potential of health promotion to delay health deterioration and enable senior citizens to live relatively healthy and independent lives, serves as a base for the EU healthy ageing strategy and consequent European countries’ activities in health promotion and disease prevention.

We present the results of an international research project Pro-Health 65+ (2014–2017), which aimed at identifying effective methods of health promotion and disease prevention for older people, and gathering knowledge on funding, organization and good practices in this area in selected European countries.

Various research methods were applied to meet the objectives. To identify the most effective health promotion interventions, systematic literature reviews were performed. The country analysis relied on a review of available literature and primary data collected among national experts. Three groups of European countries, which represent different levels of economic development and population health status, were included: 1) Germany, Netherlands; 2) Italy, Portugal, Greece; 3) Poland, Czech Republic, Hungary, Bulgaria and Lithuania.

The results indicate that population ageing spurs European countries’ efforts to activate older people and to maintain their health. In wealthy countries, community-oriented initiatives focused on physical activity and social involvement prove to work well. In less affluent countries, the attention is on health risks, such as smoking and excessive drinking. Nevertheless, health promotion for older people does not constitute a priority in the countries’ health policies and the activities are frequently initiated by NGOs and via social networking.

CARE PLANNING IN U.S. NURSING HOMES, A FRAMEWORK FOR PERSON-DIRECTED CARE PLANNING (PDCP)

K. Porter¹, M. Lepore¹, K. Scales^{2,3}, K.N. Corazzini^{2,3}, E.S. McConnell^{2,3,4}, T. Thach¹, Y. Song², R.A. Anderson⁵, 1. *RTI International, Research Triangle Park, North Carolina*, 2. *Duke University School of Nursing, Durham, North Carolina*, 3. *Center for the Study of Aging and Human Development, Duke University, Durham, North Carolina*, 4. *Department of Veterans Affairs Medical Center, Durham, North Carolina*, 5. *University of North Carolina School of Nursing, Chapel Hill, North Carolina*

Nursing home (NH) residents leading their own care planning is a key feature of the emerging person-directed culture of long-term care. The U.S.—like some European, Scandinavian, and Pacific Rim nations—supports NH residents to direct their own care through policy, specifically identifying residents “as the locus of control” in care planning and delivery. In alignment with this shift toward a person-directed culture of care, we sought to understand how NH residents can become the leaders of their own care planning. Using the Complexity Theory-based Adaptive Leadership Framework as a conceptual guide, we conducted a two-part study of PDCP: (1) a scoping review of the literature on individuals’ involvement in care planning, widely inclusive of different demographic populations and care settings; and (2) a two-part series of exploratory and confirmatory engagement sessions about care planning with residents, families, and staff (24 sessions, 67 unique participants) in two North Carolina NHs. Using a coding scheme informed by the Adaptive Leadership Framework, our multidisciplinary team systematically analyzed the literature and engagement session transcripts, identifying two separate sets of themes. We have now cross-validated and integrated these into one set of themes. The integrated themes highlight key aspects of engaging individuals in their own care planning, as well as adaptive and technical challenges to such engagement. Engagement session findings expanded upon some findings from the scoping review. The following themes were identified and substantiated: essential elements of PDCP, engagement across multiple levels, formal/informal PDCP, follow-through, and barriers and outcomes of PDCP.

BUILDING AN AGE-FRIENDLY COMMUNITY FOR OLDER ADULTS IN A LARGE URBAN JURISDICTION

T. Kuo^{2,1}, N. Barragan^{2,1}, 1. *University of California, Los Angeles, Los Angeles, California*, 2. *Los Angeles County Department of Public Health, Los Angeles, California*

Expected changes in the U.S. healthcare and social services delivery systems will likely require innovations from non-health sectors to address the health and social services needs of older adults in the community, especially as they age in place. This project describes a regional initiative that unites public and private leadership, resources, and strategies to help create an age-friendly community in the Los Angeles region. The initiative brings together the County and City governments and their partners to join the AARP and the World Health Organization’s networks of age-friendly cities and communities. Backed by a local Board motion and a five-year commitment from its partners, the effort is expected to improve the region’s age-friendliness, which will include the development and implementation of a regional age-friendly action plan. The initiative will begin work on nine focus areas: livability (e.g., transportation, emergency preparedness and resilience), social participation, outdoor spaces and buildings, community and health services, communication and information, housing, civic participation and employment, respect, and social inclusion. The two local area agencies on aging are the co-leads of this initiative. This presentation describes the ongoing process and the barriers and facilitators that are anticipated as this multi-sector, regional initiative moves forward in Los Angeles. Progress made and lessons learned from this effort will have health policy

implications and can be used to further guide age-friendly practices in the region.

EVALUATION OF THE VETERANS’ HEALTH ADMINISTRATION’S COMPREHENSIVE END-OF-LIFE INITIATIVE

O. Intrator^{2,1}, S.C. Miller^{2,5}, W. Scott⁴, S. Shreve^{9,10}, C. Phibbs^{4,6}, B. Kinosian^{7,8}, T.E. Edes³, R. Allman¹⁰, 1. *University of Rochester, Rochester, New York*, 2. *GECDAC Canandaigua VA Medical Center, Canandaigua, New York*, 3. *VHA Geriatrics & Extended Care (10NC4), Washington, District of Columbia*, 4. *GECDAC Palo Alto VA Medical Center, Palo Alto, California*, 5. *Brown University, Providence, Rhode Island*, 6. *Stanford University, Palo Alto, California*, 7. *GECDAC Philadelphia VA Medical Center, Philadelphia, Pennsylvania*, 8. *University of Pennsylvania, Philadelphia, Pennsylvania*, 9. *Lebanon VA Medical Center, Lebanon, Pennsylvania*, 10. *VHA Geriatrics & Extended Care (10P4G), Washington, District of Columbia*

This study evaluated the impact of the Veterans’ Health Administrations’ (VHA) Comprehensive End of Life Initiative (CELICI) enacted in 2009, which financed VA medical center-affiliated hospice units and hospice and palliative care staffing, training, quality monitoring and community outreach. Data from VHA utilization, vital status and enrollment files and Medicare 5% sample enrollment and utilization files were used to identify male decedents and to track hospice use in the last year of life. Veterans and Medicare beneficiaries’ age, race, U.S. region of residence and urban rural residence, major diagnosis categories (cancer, COPD, health and neurological conditions, debility and failure to thrive) and nursing home use in the last 3 months of life were used to control for population differences. A difference-in-difference model compared hospice use among Veterans decedents to Medicare non-Veteran decedents in the pre-CELICI period (2007–2008) to the post-CELICI period (2010–2013). Veteran decedents were grouped to VHA-only users enrolled in Medicare, VHA users not enrolled in Medicare, VHA and Medicare users, and Medicare only users. Adjusting for Veteran factors, findings suggest hospice use by enrolled-Veterans increased subsequent to CELICI at a rate that surpassed increases in hospice use by non-Veteran Medicare decedents (RRR=1.17–1.39). The subgroup of Veterans arguably the most dependent on the VA (non-Medicare enrolled VHA users) had the greatest differential pre/post increase in hospice use (RRR=1.39). These finding likely reflect improvements in the quality of Veterans’ end-of-life care. With the discontinuation of the targeted financial investments, the challenge is to balance maintaining momentum with new competing priorities.

PEER BULLYING AND OTHER ANTAGONISTIC BEHAVIORS AMONG OLDER ADULTS IN INDEPENDENT LOW-INCOME HOUSING

R.P. Bonifas, M. Casalean, *Arizona State University, Phoenix, Arizona*

Peer bullying and other antagonistic behaviors are commonly associated with youth, yet such problematic social interaction patterns also occur between older adults. This poster presentation shares findings from a recent study of negative social interactions among older adults in independent

low-income housing ($n = 44$). Tenants completed a 19-item measure designed to capture the frequency of negative interaction patterns across a continuum of behaviors experienced over the previous year. Example behaviors include gossiping, exclusion, shunning, racial slurs, and threatening comments. Items were measured on a 5-point frequency scale ranging from never to several times per day. Results indicate that 86.4 percent sampled experienced some type of antagonistic behavior within the past year. The most common behaviors included being purposefully ignored (68.2 percent), being the subject of gossip (52.3 percent), being shunned (36.6 percent), purposefully avoided (31.8 percent), teased in a hurtful way (29.5 percent), and being made fun of (31.8 percent). These common behaviors occurred every few months to several times per month; the least common behavior was physical aggression (2.3 - 2.5 percent). Other tenant characteristics measured included health status via the SF-36 and sense of community via the Sense of Community Index II. Individuals who experienced higher levels of negative social interactions tended to have lower emotional well-being, lower physical functioning, and a lower sense of community integration, especially related to lacking a sense of shared emotional connection with their peers. Findings suggest the need for interventions to minimize bullying and other antagonistic behaviors in low-income housing.

RACIAL AND ETHNIC DIFFERENCES IN DISABILITY TRANSITIONS AMONG OLDER ADULTS IN THE UNITED STATES

L. Dong¹, V.A. Freedman², B.N. Sánchez¹, C.F. Mendes de Leon¹, 1. *Epidemiology, University of Michigan School of Public Health, Ann Arbor, Michigan*, 2. *University of Michigan Institute for Social Research, Ann Arbor, Michigan*

Background: Despite the increase in overall longevity over the past decades, racial/ethnic gaps in late-life disability persist. This study examined racial/ethnic disparities in patterns of disability transitions in a nationally representative sample of older adults, using a new disability spectrum that incorporates successful accommodation with devices in response to capacity limitations to prolong independence as an early stage in the disablement process.

Methods: The study sample consisted of 6201 Medicare beneficiaries aged 65 and above who had participated in the National Health and Aging Trends Study (NHATS) since 2011 and completed at least two consecutive annual-interviews during a five-year period. First-order Markov transition models were used to determine racial/ethnic differences in disability transitions between three disability stages (fully able, successful accommodation, difficulty/assistance in self-care activities and mobility) or to death.

Results: At baseline, older Blacks or Hispanics were less likely to report successful accommodation and more likely to report difficulty/assistance than Whites. After adjustment for demographic characteristics, living arrangement and health status, significant differences in disability transitions were found across racial/ethnic groups ($p=0.013$). Compared with Whites, Blacks and Hispanics had lower probabilities of remaining in successful accommodation (Black:52%; Hispanic:46%; White:63%), and higher probabilities of

transitioning from successful accommodation to difficulty/assistance (Black:29%; Hispanic:39%; White:23%).

Conclusions: Minority elders, especially Hispanics, appear less likely to report successful use of adaptations to postpone difficulties and dependence in self-care activities and mobility. Successful accommodation may provide possibilities for implementing interventions to fortify older adults' capacities and reducing the racial/ethnic gaps in disability.

PROTEOMIC SIGNATURE OF AGE IN HEALTHY HUMANS

T. Tanaka¹, A. Biancotto², C. Foo², J. Candia², Y. Kotlariov², R.D. Semba³, L. Ferrucci¹, 1. *National Institute on Aging, Baltimore, Maryland*, 2. *National Institute of Health, Bethesda, District of Columbia*, 3. *John Hopkins University, Baltimore, Maryland*

Identifying biological signatures of aging in order to gain insight into molecular pathways involved in healthy aging. To identify proteomic signatures of age, we measured 1306 proteins in plasma samples of 260 healthy men and women, aged 22–93 years, from the Baltimore Longitudinal study of Aging (BLSA) and the Genetic and Epigenetic Signatures of Translational Aging Laboratory Testing (GESTALT) study using an aptamer based assay (SOMAscan assay, SomaLogic, Boulder, CO). Linear regression adjusting for sex, study (BLSA or GESTALT), race, and technical covariates found 199 proteins that were significantly associated with chronological age ($P < 3.78 \times 10^{-5}$). Ten previously confirmed age-associated proteins (CHRDL1, CCDC80, PTN, FSTL3, TIMP1, MMP12, CST3, IGFBP6, ROR1, THBS4) were among the significant proteins. Some of the novel, differentially abundant proteins include growth/differentiation factor 15 (GDF15; $P = 2.06 \times 10^{-56}$), sclerostin (SOST; $P = 6.84 \times 10^{-33}$), interleukin-18 binding protein (IL18BP; $P = 6.65 \times 10^{-20}$), and tumor necrosis factor receptor superfamily member 1A (TNFRSF1A; $P = 1.65 \times 10^{-19}$). The most significant protein, GDF15, is a member of the transforming growth factor- β (TGF β) superfamily that is implicated in mitochondrial dysfunction and linked with key age-related diseases. Functional enrichment analysis of the significant proteins indicates that genes in the cytokine-cytokine receptor interaction (22 proteins; $P = 1.9 \times 10^{-8}$), complement and coagulation cascade (12 proteins; $P = 1 \times 10^{-6}$), and the axon guidance (14 proteins; $P = 7.5 \times 10^{-6}$) KEGG pathways are significantly enriched. The study of circulating proteins in blood enhances our knowledge of the molecular changes that occur with age and will help generate new hypotheses about the biology of aging. Additional research to replicate these findings is warranted.

IMPACT OF NOSTALGIA ON EMOTION AROUSAL AND AUTOMATIC PHYSIOLOGICAL RESPONSES

J. Wu^{1,2}, L. Chang^{1,2}, 1. *Academy of Psychology and Behavior, Tianjin Normal University, Tianjin, China*, 2. *Center of Cooperative Innovation for Assessment and Promotion of National Mental Health, Tianjin, China*

Nostalgia is a kind of sentimental longing for the past, which has been widely concerned by researchers in recent years. As a common emotional experience of the elderly, Nostalgia is believed closely related to their physical and

mental health. The aim of the present investigation was to examine the impact of nostalgia experiences on subjective feeling and automatic physiological responses (including HR, finger temperature, GSR, finger pulse rate, SpO₂, and respiration rate). This was investigated by a psycho-physiological methodology which used the autobiographical narratives. The study randomly assigned 40 Chinese older adults to a nostalgia or ordinary event condition. In the nostalgia condition, we provided participants with the definition of nostalgia and instructed them to recollect a positive nostalgic autobiographical event. In the ordinary condition, participants were instructed to think about an ordinary event taking place in the last week. The results showed that: 1) autobiographical narratives can be effectively induced nostalgia experiences; 2) nostalgia experiences induced in a controlled laboratory environment can be maintained at least for 4 minutes, 3) in the nostalgia condition, the SCRs and SpO₂ were significantly higher than the ordinary condition. LF and HF within the nostalgia group were much lower than those in the control group. Heart rates did not show significant differences between the groups. The autonomic nervous response patterns of positive nostalgia experiences showed a common pattern of inhibition.

SESSION 3725 (SYMPOSIUM)

UNIVERSITY OF CALIFORNIA SAN FRANCISCO: A LEADER IN AGING RESEARCH, CLINICAL CARE, AND POLICY WORK

Chair: W.B. Max, *San Francisco, California*

This session will present an overview of the breadth and depth of work related to aging being conducted at the University of California, San Francisco. Our work includes research in the basic biology of aging, population science and epidemiology, provision of clinical care, applications of technology and work with industry partners, and social science and policy work on health disparities in aging at the local, national, and international level. Presentations will highlight some of the most exciting work being done and will be presented by leaders on the campus working to improve the lives of older adults. This session will set the context for the 3 sessions to follow, which will provide more detailed presentations of specific programs of research and care.

BRINGING THE BIOLOGY OF AGING TO THE BEDSIDE

J.C. Newman, 1. *University of California, San Francisco, San Francisco, California*, 2. *Buck Institute for Research on Aging, Novato, California*

Study of the basic biology of aging has revealed many of the cellular and molecular pathways that drive the biological changes we describe as aging. Often these pathways are highly conserved across evolution, and can be manipulated in the laboratory by genetic or pharmacological means to extend the healthy lifespan of organisms. Scientists and clinicians are now turning their attention to translating these discoveries to clinical use. Several FDA-approved drugs appear to broadly regulate aging through conserved pathways, and novel compounds are being developed to target other pathways. Therapies that target mechanisms of aging may have

a transformative effect on the treatment of common diseases for which aging is the dominant risk factor, such as dementia or cardiovascular disease, as well as on complex, multisystem syndromes of aging with grave clinical import such as multimorbidity, frailty, and functional decline.

EPIDEMIOLOGY OF AGING: PREVENTION OF DECLINE AND DISEASES IN AGING

M.N. Haan, J. Torres, *University of California, San Francisco, San Francisco, California*

Aging is linked in many cases, to inexorable declines in function, and cognition, and increases in clinical events and death. These processes accelerate the use of costly and largely unsubsidized clinical services and long term care. Prevention of these outcomes in older populations requires the early identification of modifiable risk factors. The stated goal of primary prevention is absence of disease and may be preceded by primordial prevention, achieving the absence of a disease risk factor. Such an approach requires a 'life span' view that is longitudinal, beginning in early life. The certainty of these causal chains of risk factors is far from robust. Therefore, primary prevention in older populations may be most effective if the goal is to mitigate functional decline.

THE FUTURE OF THE AGE-FRIENDLY HEALTH SYSTEM AT UCSF

L. Walter, 1. *University of California, San Francisco, San Francisco, California*, 2. *San Francisco VA Medical Center, San Francisco, California*

San Francisco is the 17th most rapidly aging city in the U.S. and 19% of our seniors live alone. Many seniors become homebound in San Francisco due to the many hills and stairs. To address these challenges the UCSF Division of Geriatrics has developed innovative, multidisciplinary clinical programs to provide high quality care for frail, seriously ill older adults in our community. Results of our clinical programs (e.g., decreased ED visits, decreased hospitalizations, improved patient satisfaction, decreased costs) will be discussed as we shift from costly hospital-centric care to value-based population health with a focus on improving geriatric care for our rapidly expanding older population.

ROLE OF TECHNOLOGY AND INDUSTRY PARTNERSHIPS

A. Gazzaley, *University of California, San Francisco, San Francisco, California*

A fundamental challenge of modern society is the development of effective approaches to enhance brain function and cognition in both the healthy and impaired. For the healthy, this should be a core mission of our educational system and for the cognitively impaired this is the primary goal of our medical system. Unfortunately, neither of these systems have effectively met this challenge. I will describe a novel approach out of our lab that uses custom-designed video games to achieve meaningful and sustainable cognitive enhancement via personalized closed-loop systems (Nature 2013; Neuron 4014). I will also share with you the next stage of our research program, which integrates our video games with the latest technological innovations in software (e.g., brain computer interface algorithms, GPU computing, cloudbased analytics) and hardware (e.g., virtual reality,

mobile EEG, motion capture, physiological recording devices (watches), transcranial brain stimulation) to further enhance our brain's information processing systems with the ultimate aim of improving quality of life.

THE SOCIAL IMPLICATIONS OF GLOBAL HEALTH DISPARITIES IN AGING

H. Pinderhughes, *University of California, San Francisco, San Francisco, California*

The World Health Organization has reported that the world is facing a situation without precedent: We soon will have more older people than children and more people at extreme old age than ever before. As both the proportion of older people and the length of life increase throughout the world, what are the implications of major environmental, social and demographic changes for Global Health Disparities in Aging? Climate change, global conflicts and violence, changes in social relationships and social organization all are having profound impacts on global inequalities in health. The talk will examine the implications of these major global issues for health inequity among older and aging populations globally.

SESSION 3730 (SYMPOSIUM)

INTEGRATED ASSESSMENT ACROSS THE HOSPITAL CONTINUUM: THE INTERRAI HOSPITAL SYSTEMS

Chair: L.C. Gray, *The University of Queensland, Brisbane, Queensland, Australia*

Co-Chair: S. Sinha, *Mt Sinai Hospital, Toronto, Ontario, Canada*

Many frail or vulnerable adults encounter a complex pathway of care when admitted to hospital. Safe, effective and efficient care demands identification of vulnerable individuals and careful assessment as the patient proceeds across the hospital continuum, from entry to the emergency department, through the acute care system, and often into a rehabilitation or other form of post-acute care.

Hospitals usually develop documentation to support assessment using combinations of validated screeners and home grown observations. Such "systems" are often burdensome, inefficient and incompatible across each phase of care.

The interRAI research collaborative has developed a fully integrated comprehensive assessment system which incorporates screening for vulnerable patients, diagnostic and risk screening, quality indicators and comprehensive assessment for complex cases. It is applied to all adult patients, with comprehensive assessment reserved for patients with complex needs. Sub-systems include the interRAI ED Screener and Contact Assessment, the interRAI Acute Care, the interRAI Acute Care for Comprehensive Geriatric Assessment, the interRAI Mental Health and the interRAI Post-Acute Care and Rehabilitation.

This system required 10 years of research and development across many nations, and was released for application in 2016. In this seminar, the system will be described, including detailed accounts of its clinimetric properties, and opportunities for implementation.

OVERVIEW OF THE INTERRAI HOSPITAL SYSTEMS

L.C. Gray, *Centre for Research in Geriatric Medicine, The University of Queensland, Brisbane, Queensland, Australia*

The interRAI Hospital Systems are designed to support case finding and assessment across the entire hospital continuum. Some (general) systems are applied to all adult patients (the interRAI ED Screener and the interRAI Acute Care) while others (specialised) support in depth assessment of patients with complex care requirements (interRAI AC for Comprehensive Geriatric Assessment, interRAI Mental Health and interRAI Post Acute Care and Rehabilitation). The general systems perform preliminary diagnostic and risk assessments, and identify patients who require more complex assessments. These systems are brief and concise. The specialised systems are more extensive.

Each system contains a shared core set of clinical observations, and a set of scalar measures that enable monitoring of progress from the pre-morbid period to discharge. Each system has undergone extensive field testing to determine an extensive range of clinimetric properties, ensuring preservation of fidelity and enhanced efficiency when compared to traditional "mix and match" approaches.

SCREENING AND ASSESSMENT IN THE EMERGENCY DEPARTMENT

A.P. Costa, *Dept. of Clinical Epidemiology & Biostatistics, McMaster University, Hamilton, Ontario, Canada*

Guidelines suggest that older patients presenting to the emergency department (ED) should be screened to identify geriatric complexity and prioritize specialized geriatric resources. Screening and assessment tools have been developed, but few have been compared from a multinational context. interRAI has developed an integrated assessment system for geriatric care in the ED. It includes two companion tools – the ED Screener and the ED Contact Assessment.

We conducted two prospective studies with over 4,000 older ED patients from Australia, Belgium, Canada, Czech Republic, Germany, Iceland, India, Italy, Spain, and Sweden. Patients were assessed at ED admission with a standardized screening or assessment. Outcomes were examined for admitted patients and those discharged home.

The probability of negative patient outcomes was detectable at the multinational level with moderate accuracy. Agreement with independent ratings by geriatricians was high. Results demonstrate the utility of incorporating standardized geriatric instruments in routine clinical examination across contexts.

UNIVERSAL ASSESSMENT AND SCREENING IN THE ACUTE CARE SETTING

N.M. Peel, *Centre for Research in Geriatric Medicine, The University of Queensland, Brisbane, Queensland, Australia*

The interRAI Acute Care is a nurse administered rapid assessment system for all adult patients, that records and interprets functional and psychosocial information, including diagnostic and risk assessments for common geriatric syndromes. It aspires to replace the current compilation of assessment tools used in most hospitals world-wide (often extending to several hundred items), without loss of fidelity but with gains in efficiency.

The system was developed by expert panels internationally through the interRAI research collaborative. Field testing for face and content validity, item frequency distributions, inter-rater reliability, and resource requirement was conducted in 4 Australian hospitals in 2016.

The system is highly acceptable to nursing experts and clinicians. Time to completion is acceptable (median 15 minutes), and less than for most existing schedules. Diagnostic (e.g., delirium, dementia) and risk (e.g., pressure ulcer, falls) screeners have predictive validity at least similar to best of breed standalone tools (e.g., CAM, MMSE, Braden).

DEVELOPMENT OF QUALITY INDICATORS ACROSS THE CONTINUUM

M. Martin-Khan, *The University of Queensland, Brisbane, Queensland, Australia*

Quality assurance activities are complex and multifactorial. Despite this, it is important that patient outcomes are measured, and that improvements in clinical practice are made with a view to changing patient outcomes. Quality indicators (QI) for the interRAI Acute Care Assessment system have been developed through a process of literature review, expert panel advice, and field testing.

The interRAI QIs are derived from clinical data collected during patient assessment. The QIs are designed to support services to evaluate their performance over time. They are also used by hospitals that wish to use them to compare performance (i.e., benchmarking) as a quality improvement process.

A set of ten outcome QIs are derived from the interRAI AC. Work is being finalized on Post-Acute QIs. An additional set of QIs are currently being tested for the interRAI ED Contact assessment.

OPPORTUNITIES AND CHALLENGES IN IMPLEMENTATION

S. Sinha, *Mt Sinai Hospital, Toronto, Ontario, Canada*

Opportunities and Challenges in Implementation

The value of the interRAI hospital systems with their case-finding tools and “targeted” assessment systems at each stage of care supported by a core nurse-administered assessment suitable for all adult patients is now becoming recognized by hospital administrators and clinicians around the world.

It will enable better identification, diagnosis and treatment and even risk-avoidance of geriatric syndromes as well as the reduction in the efficiency and redundancy of current clinical care systems and processes is where the greater opportunity of this suite exists.

Implementing new systems that are not aligned with deeply engrained thinking and ways of working creates potential serious challenges. This presentation will assist clinicians and administrators to understand and appreciate the opportunities that the implementation of the interRAI suite could provide their environments and how to recognize and effectively address common challenges that may arise in advancing its implementation.

SESSION 3735 (SYMPOSIUM)

GSA JOSEPH T. FREEMAN AWARD LECTURE AND EXCELLENCE IN REHABILITATION OF AGING PERSONS AWARD LECTURE

Chair: T.T. Perls, *Boston University Medical Campus, Boston, Massachusetts*

S.L. Wolf, *Emory University School of Medicine*

The Joseph T. Freeman Award Lecture will feature an address by the 2016 Freeman Award recipient, Thomas T. Perls, MD, of Boston University Medical Campus. The session will also include the presentation of the 2017 Freeman Award. The Joseph T. Freeman Award is a lectureship in geriatrics and is awarded to a prominent physician in the field of aging, both in research and practice. The award was established in 1977 through a bequest from a patient's estate as a tribute to Dr. Joseph T. Freeman.

The Excellence in Rehabilitation of Aging Persons Award Lecture will feature an address by the 2016 Excellence in Rehabilitation Award recipient, Steven L. Wolf, PhD, of Emory University School of Medicine. The session also includes the presentation of the 2017 Excellence in Rehabilitation Award. The Excellence in Rehabilitation of Aging Persons Award is designed to acknowledge outstanding contributions in the field of rehabilitation of aging individuals.

THE LONGEVITY MARATHON AND HOW MEN AND WOMEN RUN DIFFERENT RACES

T.T. Perls, *Medicine, Boston University Medical Campus, Boston, Massachusetts*

Perhaps nowhere in the field of human ageing is the difference between men and women more lopsided than survival to extreme age. 85% of centenarians are women and just 15% are men. Though far fewer, men appear to be more functionally fit compared to women. This apparent paradox is likely due to men having substantially higher mortality risk associated with age-related diseases so that those who survive to very old ages do so because they are a cohort of select survivors, especially relative to women. Numerous hypotheses have been proposed for underlying systemic and cellular mechanisms for why women age so differently from men, but thus far there are no clear answers. Findings from the New England Centenarian Study and studies supporting the grandmother hypothesis suggest that women are responsible for the evolution of longevity-associated genes which enable us to live 30–40 years beyond the cessation of reproduction.

MOVE, MOVE, MOVE: MIND AND BODY—AN EXERCISE IN FERTILITY OR FUTILITY?

S.L. Wolf, *Emory University School of Medicine, Atlanta, Georgia*

As our aging population continues to increase, factors designed to maximize quality of life become an imperative. Based upon over 40 years of clinical and research experience with aging populations, many of whom have sustained neurological deficits such as stroke, this presentation reviews some contributions that have helped to foster novel interventions to confront this imperative. Whether discussing the introduction and systematic assessment of Tai Chi as an approach to delay the onset of falls or procedures to improve limb function following stroke, common threads become intertwined in the fabric of brain plasticity sewn by fundamental percepts of problem solving and proactive engagement. Conclusions derived from a review of some of this work would encourage more group based activities throughout the aging process that are directed by peers and supported by family members.

SESSION 3740 (SYMPOSIUM)

DEVELOPING SENSITIVITY ABOUT TRANSITIONAL CARE AND COGNITIVE IMPAIRMENT

Chair: G. Guo, *Peking University School of Nursing, Beijing, China*

Co-Chair: L. Phillips, *University of California, Los Angeles*

Frail elders frequently use multiple health care settings for their health conditions. Smooth transitions between care settings are essential for safety. As populations age, physical and cognitive declines are common, and declines are even faster among individuals with mild cognitive impairment (MCI), a risk factor for dementia. The prevalence of MCI varies by region in China between 5.4% and 25.0%. The dementia population in China constitutes 40% of the dementia population in the Asia-Pacific region and 25% of the dementia population worldwide. This situation brings great challenges in providing optimal care for older adults. In China, family care for elders at home is common. The China Social Endowment Service System Construction Plan (2011–2015) indicated that home-based care with support from community and institution is the main caring option for Chinese elders. Due to the complexity of cognitive impairment, nursing care of elders across different caring settings includes educating, counseling, and supporting family members. Optimal care also requires successful transition models. This symposium will focus on the ways that cognitive impairment complicates care transitions. A model for ED-to-home transitions for frail elders will be introduced. We will share our research on cognitive function and depressive disorders among community dwelling elders, cognitive function and falling in elders living at home, the effects of a group-based interactive intervention on mood and quality of life of aged care facility residents, and nurses' awareness of dementia. Sensitivity to the complexity of care transitions given the challenges of cognitive impairment will be central to our discussion.

CREATING PERFECT EMERGENCY DEPARTMENT (ED) TO HOME TRANSITIONS FOR FRAIL ELDERLY

L. Phillips, M. Cadogan, *University of California School of Nursing, Los Angeles, California*

In the U.S., frail older adults frequently use EDs and more than half are discharged to home. Several models have been success in reducing the human and economic costs of hospital-to-home transitions, but successful models for ED-to-home transitions are few. The purpose of this paper is to describe, from the perspective of ED care providers, those factors required to improve ED to home transitions. Nine focus group interviews were conducted to elicit data from ED health care staff. Data were analyzed using latent content analysis. Among the major themes were: Improving the transfer information about health and social history to and from the ED; Staffing and educational materials designed to accommodate the learning needs of older adults; and Designing system connections to assure follow-up and follow-through. Creating successful models for perfect ED to home transitions requires listening to the voices of the care providers on the front-line.

MILD COGNITIVE IMPAIRMENT AND DEPRESSION AMONG COMMUNITY DWELLING ELDERLY IN CHINA

H. Zou¹, Z. Li¹, L. Wang², S. Liu¹, F. Zhang¹, 1. *Peking Union Medical College School of Nursing, Beijing, China*, 2. *Desheng Community Health Service Center, Beijing, China*

Mild cognitive impairment (MCI) is a very early phase of Alzheimer disease (AD) which is a topic of continuing investigation, while depression may play an important impact on MCI's progression to AD which is continuously debated. This study aimed to examine cognitive function and depressive disorder in a community elderly sample in Beijing. 451 elderly people aging 60 and older were administered the Montreal Cognitive Assessment (MoCA-PUMC) and Geriatric Depression Scale (GDS). Of the overall sample, 234 (51.9%) were deemed to have MCI, 61(13.3%) and 21(4.7%) had mild and severe depression respectively. The incidences of depression between MCI and normal cognition group were significantly different. Logistic analysis demonstrated that older age, lower educational level and depression ($P < 0.001$) were risk factors for MCI in the elderly. The current findings may help health professionals to provide targeted cognitive screening and monitoring for this high-risk group.

THE RELATIONSHIP BETWEEN COGNITIVE FUNCTION AND FALLING AMONG OLDER ADULTS LIVING AT HOME

L. Jiang¹, Q. Qin², 1. *Xinhua Hospital Affiliated to Shanghai Jiaotong University School of Medicine., Shanghai, China*, 2. *School of Nursing, Wenzhou Medical University, Beijing, China*

The falls incidence among the elderly is important and frequency risk factors. The consequences of falls are broad and contribute to immobility and premature institutionalization. To investigate the association between cognitive function and falling in the elderly living at home we designed a case-control study. 1,576 elderly adults in this study completed interviews, and 274 of them who had falls last year were screened out as the case group. The results showed that mild cognitive impairment was associated with fall in the elderly living at home. After adjustment for marital status, level of education, the number of co-morbid conditions and living situation, the relationship was still significant ($OR = 1.747$, 95%CI [1.099, 2.777]). Multivariate logistic regression revealed that orientation and recall impairment, memory and calculation impairment were independently associated with higher rates of falling in the elderly. For elderly, orientation and recall impairment could predict falling in elderly living at home.

EFFECTS OF GROUP INTERACTIVE INTERVENTION FOR RESIDENTS WITH DEMENTIA IN THE AGED CARE FACILITY

J. Wang¹, X. Lin¹, S. Jia¹, X. Cao², Z. Shen¹, 1. *Fudan University, School of Nursing, Shanghai, China*, 2. *Shanghai Mental Health Center, Shanghai, China*

Group intervention is increasingly used to maintain the holistic function of persons with dementia. However, little

attention is paid to patients' interaction during intervention. This study explored the effects of group-based interactive intervention for residents with dementia in aged care facilities. 71 residents with dementia in two aged care facilities were recruited and randomly assigned into intervention group (35) and control group (36). The intervention group received six-month group-based interactive intervention, while the control group received routine care only. Mixed effects model analyses for repeated measurement data showed that daily activities, mood, and cognition level of intervention group residents were obviously better than that of control group residents. Quality of life of intervention group residents was also improved significantly. Therefore, group-based interactive intervention is effective for residents with dementia, which also provide strategies for caring for dementia persons in hospitals or homes when they depart from facilities.

AWARENESS OF ALZHEIMER'S DISEASE AMONG NURSES WORKING IN GENERAL HOSPITAL IN BEIJING, CHINA

Y. Liu¹, W. Bao², 1. *School of Nursing, Peking University, Beijing, China*, 2. *Beijing Hospital, Beijing, China*

More dementia patients are administered to hospitals from home or long-term care facilities at some stages of the disease. Adequate awareness about dementia among nurses in hospitals is essential to quality of the transitional care. This paper assessed the awareness of nurses on AD in a general hospital of Beijing China, and provide concrete information to further continuing education for nurses. 150 convenient samples were recruited from 5 geriatric wards. Awareness of AD was evaluated by ADKS. The overall correct rate was 65%. 'caregiving' (48% correct), 'risk factors' (59% correct) and 'symptoms' (59% correct) were the lowest domain of knowledge. Nurses with longer working years had significant lower scores on domains of risk factors, caregiving, and assessment and diagnosis. Further training on AD should include both medical-oriented and caring-oriented aspects. Well preparation of nurses on caring AD patients is essential for better transitional care.

SESSION 3745 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: THE IMPACT OF FALLS AND FEAR OF FALLING ON OLDER ADULTS' MOBILITY: AN INTERNATIONAL PERSPECTIVE

Chair: M. Auais, *Queen's University, Kingston, Ontario, Canada*

Discussant: J.M. Guralnik, *University of Maryland at Baltimore, Chevy Chase, Maryland*

Falls and Fear of falling (FOF) are common in old age. Although the adverse consequences of falls and FOF were studied extensively, most studies were either cross-sectional, focused on one context, or varied widely in definitions and outcome measures used, which prevented researchers from conducting meaningful comparisons between different nations. The International Mobility in Aging Study (IMIAS) is a population-based, cohort study (2012–2016) on community-dwelling older adults in five sites: Canada (Kingston, Saint-Hyacinthe), Albania (Tirana), Colombia

(Manizales) and Brazil (Natal). Drawing on longitudinal data from IMIAS and using validated and standardized tools in all study sites, presenters in this symposium will provide an overview of their recent research to improve our understanding of factors associated with falls and FOF at an old age in diverse locations, and investigate if FOF can independently lead to disability over time. Ms. Hwang, University of Hawaii, USA will share results from her study to test whether FOF is independently associated with average minutes walking per day among older adults. Dr. Auais from Queen's University, Canada will discuss whether FOF could independently lead to functional disabilities after a 2-year period. Dr. Vafaei from the Queen's University, Canada will explore potential mediators that could explain the longitudinal relationship between FOF and incident disability. Finally, Dr. Gomez, University of Caldas, Colombia will present his findings after testing a simple algorithm to predict falls over time and possible implications. This work has clinical and policy implications and could improve older adults' mobility and, ultimately, their integration in local communities.

THE RELATIONSHIP BETWEEN FEAR OF FALLING AND WALKING

P.W. Hwang¹, N. Rosendaal¹, C.M. Pirkle¹, M. Auais², 1. *University of Hawaii at Manoa, Honolulu, Hawaii*, 2. *School of Rehabilitation Therapy, Ontario, Ontario, Canada*

Fear of falling (FOF) is highly prevalent among older adults. We examine the relationship between fear of falling and average minutes walking per day among community dwelling older adults. Statistically significant differences in walking were observed between site locations, sex, age, educational attainment, functional fitness levels, fall history, and FOF. Participants with low functional fitness walk less on average compared to high functional fitness (β : -9.49, 95% CI: -14.74, -4.23). Participants with high FOF walk less on average compared to low FOF (β : -10.11, 95% CI: -15.13, -5.10). Fall history is not associated with walking in multivariate analyses. When stratified by functional fitness, among those with high functional fitness, those with high FOF walk less than those with low FOF (β : -10.90, 95% CI: -16.67, -5.14). The relationship is not observed among those with low functional fitness. FOF may be a barrier to walking for those with high functional fitness.

FEAR OF FALLING PREDICTS INCIDENCE OF FUNCTIONAL LIMITATION TWO YEARS LATER

M. Auais¹, B. Alvarado¹, E. Belanger³, C.L. Curcio⁴, J.M. Guralnik², 1. *School of Rehabilitation, Queen's University, Kingston, Ontario, Canada*, 2. *University of Maryland at Baltimore, Baltimore, Maryland*, 3. *University of Montreal, Montreal, Quebec, Canada*, 4. *University of Caldas, Manizales, Colombia*

We examined if fear of falling (FOF) predicts incident functional limitation over a 2-year period in older adults using self-reported and performance-based measures. In 2012, 1,601 participants were recruited from Canada, Colombia, and Brazil, and were re-assessed in 2014. We quantified FoF using the Falls Efficacy Scale-International (FES-I). Functional limitation measures were (1) self-reported mobility limitation, and (2) physical performance limitation,

score < 9 on the Short Physical Performance Battery (SPPB limitation). We entered in the analysis only those without functional limitation at baseline.

In 2014, 131 (14.3%) and 166 (15.4%) participants reported incident mobility and SPPB limitation, respectively. After adjusting for age, sex, socioeconomic, and health covariates in logistic regression models, one-point increase in FES-I (range: 116–64) at baseline predicted a 6% increase in the chance of reporting mobility limitation (95%CI: 1.04–1.09) and a 5% increase in the chance of having SPPB limitation in 2014 (95%CI: 1.02–1.07).

It is increasingly important to study FOF's effect on functional limitation and to take necessary measures that prevent the transition to end-stage disability.

PATHWAYS LINKING FEAR OF FALLING (FOF) AND INCIDENCE OF FUNCTIONAL LIMITATION IN OLDER ADULTS

B. Alvarado¹, A. Vafaei¹, M. Auais¹, C.M. Pirkle², C.L. Curcio³, 1. *Queen's University, Kingston, Ontario, Canada*, 2. *University of Hawai'i, Manoa, Hawaii*, 3. *University of Caldas, Manizales, Colombia*

We used longitudinal data from the International Mobility in Aging Study (n=1,355) to explore pathways between FOF measured by the Falls Efficacy Scale-International and incidence of functional limitation in old age.

Outcomes were incidence cases of: 1) self-reported difficulty climbing a flight of stairs or walking 400 metres (mobility limitation), and 2) scoring < 9 in the Short Physical Performance Battery [SPPB] (physical performance limitation). The potential pathways (gait speed, physical activity, balance, depression, and grip strength) were selected based on available theories and examined using mediation analysis adjusting for age, sex, site, cognition, and comorbidities.

Total and direct effects of FOF on both outcomes were significant in all models. After adjustment, the relationship between FOF and mobility limitation was mediated only through gait speed. In women, no mediator linked FOF to SPPB; however, in men depression was a significant mediator.

FOF has a strong direct effect on disability in older adults. Depression and gait speed partially account for incidence of disability.

DEVELOPING A SIMPLE ALGORITHM TO PREDICT FALLS IN PRIMARY CARE OLDER PATIENTS

F. Gomez², Y. Wu³, M. Auais¹, A. Vafaei¹, B. Alvarado¹, 1. *School of Rehabilitation, Queen's University, Kingston, Ontario, Canada*, 2. *University of Caldas, Manizales, Colombia*, 3. *University of Hawaii, Honolulu, Hawaii*

We aimed to establish an algorithm to identify older adults at risk of falling using Classification Regression Trees (with CHAID).

We used longitudinal data (2012–2014) with 1662 participants completed the second assessment. The following risk factors for falls were entered in the CHAID: age, sex, BMI, multimorbidity, cognitive deficit, depression, number of falls in last year, fear of Falling (FOF), chair-rise speed, balance, and gait speed.

The CHAID identified six end nodes with three levels of partitions and four partitioning variables: number of falls, FOF, chair-rise score, and age group. CHAID identified three

subgroups based on number of falls (none, one, ≥ two). Then, the 'no falls' subgroup was split using FOF into high and moderate FOF groups. Those with multiple falls were also split by their chair-rise speed into 'slow or fast' and intermediate speed groups. Then the 'slow or fast' group was further split into two age groups (64–69 and 70–75).

Overall, those with more than two falls last year, slow or fast chair-rise speed, and aged 64–69 years had the greatest odds of falls (OR: 5.25, 95%CI: 3.16–8.88). While those who had no falls last year and low or medium FOF had the lowest odds of falls (0.42, 95%CI: 0.33–0.52).

SESSION 3750 (PAPER)

FALL RISK, PREVENTION, AND EDUCATION

HOW OLDER PATIENTS ON REHABILITATION WARDS RESPOND TO FALLS-PREVENTION EDUCATION

A. Hill¹, J. Francis-Coad⁵, T.P. Haines⁶, N. Waldron³, C. Etherton-Beer², L. Flicker², K. Ingram³, S. McPhail⁴, 1. *School of Physiotherapy and Exercise Science, Curtin University, Perth, Western Australia, Australia*, 2. *University of Western Australia, Perth, Western Australia, Australia*, 3. *WA Department of Health, Perth, Western Australia, Australia*, 4. *Queensland University of Technology, Brisbane, Queensland, Australia*, 5. *The University of Notre Dame Australia, Fremantle, Western Australia, Australia*, 6. *Monash University, Melbourne, Victoria, Australia*

The aim of the study was to determine how providing individualized falls prevention education facilitated behavior change from the perspective of older hospital patients on rehabilitation wards. Patients were also asked to identify possible barriers to engaging in falls prevention strategies. Older patients (n=610) with good levels of cognition (Mini-Mental State Examination score >23/30) received falls prevention education and were then surveyed using a semi-structured questionnaire. They were part of a larger cluster RCT, where the education was delivered on eight hospital rehabilitation wards. Staff received training to support the program. Deductive content analysis was used to map participants' responses against conceptual frameworks of: i) health behavior change; ii) factors influencing patient risk taking behaviours. Participants who responded (n=473) stated that the education raised their awareness, knowledge and confidence to actively engage in falls prevention strategies, such as asking for assistance prior to mobilizing. Participants' thoughts and feelings about their recovery were the main barriers they identified to engaging in safe strategies. These included over-confidence or misjudgement about their ability to achieve mobility tasks and a desire to be independent. The most common task participants identified as potentially leading to risk taking behavior was needing to use the toilet. Individualized falls prevention education assists older hospital rehabilitation patients with good levels of cognition to engage in suitable falls prevention strategies. Staff should communicate and engage with patients to understand their perceptions about their recovery. Staff should also support patients to take an active role in planning their rehabilitation.

A WORLD CAFÉ FORUM EXAMINES OLDER PEOPLES' PREFERENCES FOR SEEKING AND RECEIVING FALLS INFORMATION

A. Hill¹, L. Khong², K.D. Hill¹, C. Bulsara², 1. *School of Physiotherapy and Exercise Science, Curtin University, Perth, Western Australia, Australia*, 2. *The University of Notre Dame Australia, Fremantle, Western Australia, Australia*

Investigating older peoples' preferences for receiving information about falls prevention could enhance communication and increase the uptake of relevant messages. The aim of the study was to examine the views and preferences of community-dwelling older adults about seeking and receiving falls prevention information. A community forum using a modified World Café approach was conducted. Participants explored and discussed five topics in small groups, under the guidance of café table facilitators. Perspectives were captured on paper. The main facilitator then led large group summation and discussion. Thematic analysis identified older peoples' preferences for seeking information about falls prevention and factors that influenced their engagement with the messages. Participants (n=73) who attended the forum provided diverse perspectives around why and how they sought out falls prevention information. Personal experience of falling was the key factor that influenced a decision to seek information. Participants strongly emphasised that respectful, empathetic interpersonal communication about falls between health professionals and the older person was crucial to foster motivation to undertake recommended activities. While participants approached health professionals they also recommended that resources should be readily available through public libraries and seniors' organisations. These were viewed as credible sources of information. Older people suggested a range of practical strategies that could potentially improve design, communication and dissemination of falls prevention information. Health professionals and organisations could use these findings to enhance effective presentation of falls prevention messages, thereby facilitating subsequent uptake of recommended strategies

PATIENT BED MOVES IN ACUTE HOSPITALS—FREQUENCY, RATIONALE, AND DO THEY CONTRIBUTE TO FALLS RISK?

K.D. Hill¹, C. Toye^{1,2}, S. Slatyer^{2,1}, M. Bronson², K. Ingram², S. Kitchen², C. Pienaar¹, C. Bharat², 1. *Curtin University, Perth, Western Australia, Australia*, 2. *Sir Charles Gairdner Hospital, Perth, Western Australia, Australia*

Background: Falls among older people in acute hospitals remain unacceptably high. One factor starting to be recognised as a potential contributor to in-hospital falls may be frequency of bed moves for older in-patients. The aim of this study was to describe frequency and circumstances of bed moves during hospitalisation of older people, and explore associations with falls.

Method: Patients aged 70+ with increased falls risk on admission to one of four participating aged care/medical/rehabilitation wards (based on the Falls Risk Assessment and Management Plan, or admitted because of a fall) were included. Subsequent admissions were excluded. Bed moves for eligible patients were tracked, and reasons for bed moves, and falls that occurred were explored through staff and patient interviews.

Results: 459 patients [mean age 84.9 (sd=7.1), 56% females, mean LOS = 9.8 days (19.7)] were included. Patients had a median of two bed moves (range 1–8) during hospitalisation, and most occurred afternoon to evening, although 12.3% occurred midnight–7.59am. Eight of 29 falls (27.6%) occurred one day after arriving to ED. Several common factors were identified contributing to bed moves, and strategies explored that might be viable alternatives. A case study highlighting multiple bed moves and potential alternatives will be discussed.

Conclusion: Bed moves for older hospitalised patients are common, and may contribute to increased risk of falls, even though paradoxically bed moves may be triggered by a desire to increase surveillance of high falls risk patients. Alternatives to multiple bed moves for high falls risk older patients warrant consideration.

NOVEL ACCURATE APPROACH TOWARD PREDICTING FRAIL OLDER ADULTS' FALLS WITHIN THREE MONTHS

M.R. Tomita¹, A. Olewnik², D. Ghosh², L. Ahrens¹, E. Clark¹, K. Grzebinski¹, C. Haering¹, 1. *Rehabilitation Science, University at Buffalo, Buffalo, New York*, 2. *Mechanical Engineering, University at Buffalo, Buffalo, New York*

The purpose of the study was to find a method towards predicting future falls so that healthcare providers can provide interventions. We compared a new Footbed Sensors (FS) platform, which measures foot pressure 5 force sensors and communicates via Bluetooth, and established measures of fall risks: Age, past falls (in 3, 6, and 9 months), Activity-Specific Balance Confidence (ABC), Berg Balance Scale (BBS), Timed up and Go (TUG) and Instrumental Activities of Daily Living (IADL).

We conducted assessments using 27 frail older adults, and followed up for the next 3 months. Analyses used neural network K-fold for the FS to classify fallers and non-fallers, and logistic regressions for other measures, using single and combined predictors. The sensitivity (predicted fallers/actual fallers) was our main interest, followed by the false positive rate (predicted fallers/actual non-fallers).

Of 27 participants, 6 fell (28.6%). The FS had 83.3% sensitivity, zero false positive, thus 96.3% overall accuracy. The sensitivity for single factors such as age, ABC, TUG, and past falls in 3 and 9 months was 0%, for both IADL and BBS, 16.7%, and for the past fall in 6 months, 50%. For combined, it was 66.7%. The past fall in 12 months had 83.3% sensitivity, but 19.0% false positive, therefore 81.5% overall accuracy.

The FS data classified falls better than existing methods. Potential for real-time fall prediction is an area for future R&D. Additionally, investigating the relationship between the sensor readings and the fallers' risk factors, such as physical balance and strength, is planned.

SELF-REPORTED UNSTEADINESS PREDICTS FEAR-RELATED ACTIVITY RESTRICTION AT TWO YEARS FOLLOW-UP

O. Donoghue¹, A. Setti², N. O'Leary¹, A.M. O'Halloran¹, R. Kenny¹, 1. *Trinity College Dublin, Dublin, Dublin, Ireland*, 2. *University College Cork, Cork, Ireland*

Poor balance may increase the risk of fear of falling (FOF) and falls in older adults. In this analysis, we examine if self-reported unsteadiness during walking is independently associated with FOF, fear-related activity restriction and falls reported at two years follow-up. Data were obtained from the first two waves of The Irish Longitudinal Study on Ageing (TILDA). Community-dwelling adults (mean age 71.3 years; range 65–93 years), with Mini-Mental State Examination score ≥ 18 and who participated in a health assessment at baseline were included ($n=1,621$). Unsteadiness was based on reports of feeling slightly steady, slightly unsteady or very unsteady (versus very steady) during walking ($n=382$, 23.6%). Participants were asked if they were afraid of falling (no FOF, somewhat afraid, very much afraid), if they restricted their activities due to fear (yes/no) and the number of falls in the past year. Ordinal logistic regression and Poisson regression analyses were used to obtain the relative risk of reporting FOF, activity restriction and multiple falls at follow-up after adjusting for socio-demographics, physical and mental health, self-reported sensory function and usual gait speed. We found evidence of an association between unsteadiness and fear-related activity restriction (IRR=1.82 [1.21–1.73], $p=0.004$) and weaker evidence of an association with FOF (IRR=1.30 [0.94–1.80], $p>0.05$) and multiple falls (IRR=1.37 [0.95–1.97], $p>0.05$). Self-reported unsteadiness is an easily obtained measure which may be a useful indicator of an existing or future balance dysfunction. It's inclusion in a clinical assessment presents an opportunity to target individuals for interventions aimed at improving balance and maintaining activity.

SESSION 3755 (PAPER)

TOOLS TO IMPROVE GERIATRIC ASSESSMENT

THE VESPA PRE-OPERATIVE TOOL: A SCALE THAT PREDICTS POST-SURGICAL GENERAL AND GERIATRIC COMPLICATIONS

L. Min^{1,2}, K. Hall^{1,2}, E. Finlayson³, M. Englesbe⁴, W. Palazzolo⁴, H. Hou⁵, A. Miller⁶, K. Diehl⁴, 1. *University of Michigan, Department of Internal Medicine, Division of Geriatric and Palliative Medicine, Ann Arbor, Michigan*, 2. *VA Ann Arbor Healthcare System and the Geriatric Research Education Clinical Center (GRECC), Ann Arbor, Michigan*, 3. *University of California, San Francisco, San Francisco, California*, 4. *University of Michigan, Departments of Surgery, Ann Arbor, Michigan*, 5. *University of Michigan, Urology, Ann Arbor, Michigan*, 6. *Massachusetts Eye and Ear Infirmary / Harvard Combined Otolaryngology, Boston, Massachusetts*

In response to the increasing use of elective surgery among older patients, we implemented the **Vulnerable Elderly Surgical Pathways and outcomes Assessment (VESPA)** into an academic health system general pre-operative clinic (2008–2011) to predict post-operative complications.

We interviewed 770 patients age ≥ 70 years who had upcoming general surgery to assess 5 pre-operative activities of daily living (ADLs) recommended by the American College of Surgeons (bathing/dressing, transferring, shopping, meals), falls, depressive symptoms, and performed a

brief cognitive examination. We also asked a novel question of whether they expected they could manage themselves alone upon discharge. We conducted chart review for geriatric and surgical complications and co-morbidity and collected Work-related Relative Value Units (wRVU, categorized into low/moderate/high tertiles).

Of the 770 interviewed patients, 736 had an operative procedure; of these, 14.3% had one of 5 ADL difficulties and 38.2% foresaw themselves unable to manage self-care alone. A quarter developed either geriatric or surgical complications, 18% had geriatric complications and 15% had surgical complications. **ADL difficulty count (OR 1.2[1.0–1.5]), forseen difficulty with post-operative self-care (OR 1.5[1.0–2.2]), co-morbidity (OR 1.5[1.0–2.3]), male gender (OR 1.6[1.1–2.3]), and wRVUs (moderate vs low OR 1.9[1.1–3.4]; high vs low OR 8.9 [5.4–14.8])** all independently predicted post-operative complications (overall model **Area Under the Curve [AUC]=0.77**), whereas age was not significant (OR 1.0[0.98–1.1]). **Using these results, a whole-point VESPA score used alone to predict complications also demonstrated excellent fit (AUC=0.76).**

In conclusion, pre-operative geriatric assessment of the oldest patients is feasible in general pre-operative clinic and can help identify higher-risk patients.

PREDICTIVE VALUES OF NEW SARCOPENIA INDEX BY FNIH SARCOPENIA PROJECT FOR MORTALITY IN KOREAN ELDERLY

S. Lim^{1,2}, K. Kim^{1,2}, J. Moon^{1,2}, J. Moon^{1,2}, S. Choi^{1,2}, H. Jang^{1,2}, 1. *Internal Medicine, Seoul National University Bundang Hospital, Seongnam-si, Kyunggi-do, Korea (the Republic of)*, 2. *Seoul National University Medical College, Seongnam-si, Korea (the Republic of)*

We evaluated the Foundation for the National Institutes of Health (FNIH) Sarcopenia Project's recommended criteria for sarcopenia's association with mortality among older Korean adults.

We conducted a community-based prospective cohort study which included 560 (285 men and 275 women) older Korean adults aged ≥ 65 years. Muscle mass (appendicular skeletal muscle mass-to-body mass index ratio (ASM/BMI)), handgrip strength, and walking velocity were evaluated in association with all-cause mortality during 6-year follow-up. Both the lowest quintile for each parameter (ethnic-specific cutoff) and FNIH-recommended values were used as cutoffs.

Forty men (14.0%) and 21 women (7.6%) died during 6-year follow-up. The deceased subjects were older and had lower ASM, handgrip strength, and walking velocity. Sarcopenia defined by both low lean mass and weakness had a 4.13 (95% CI, 1.69–10.11) times higher risk of death, and sarcopenia defined by a combination of low lean mass, weakness, and slowness had a 9.56 (3.16–28.90) times higher risk of death after adjusting for covariates in men. However, these significant associations were not observed in women. In terms of cutoffs of each parameter, using the lowest quintile showed better predictive values in mortality than using the FNIH-recommended values. Moreover, new muscle mass index, ASM/BMI, provided better prognostic values than ASM/height² in all associations.

New sarcopenia definition by FNIH was better able to predict 6-year mortality among Korean men. Moreover,

ethnic-specific cutoffs, the lowest quintile for each parameter, predicted the higher risk of mortality than the FNIH-recommended values.

UTILITY OF THE SPPB FOR SHORT-TERM OUTCOME PREDICTION OF MULTIMORBID GERIATRIC REHABILITANTS

S. Grund^{1,6}, M. Denking⁶, U. Braisch^{3,6}, C. Marburger², M. Runge⁴, M. Jamour⁵, 1. *Diakonissenkrankenhaus Mannheim, Mannheim, Germany*, 2. *Klinikum Christopherusbad, Göppingen, Germany*, 3. *Biometrie Universität Ulm, Ulm, Germany*, 4. *Privatpraxis, Esslingen am Neckar, Germany*, 5. *Geriatrische Rehabilitationsklinik Ehingen, Ehingen, Germany*, 6. *Agaplesion Bethesda Klinik Ulm, Ulm, Germany*

Previous studies have shown that frail older inpatients, with a high rate of hospital readmission and in-hospital mortality, benefit from a special postacute treatment in specialized geriatric rehabilitation. The well known short physical performance battery (SPPB) is routinely used for physical performance measurements in these rehabilitation hospitals in Germany. While for community-dwelling persons the SPPB has been shown to allow prediction of disability institutionalization and mortality its predictive validity has not been evaluated yet in a geriatric rehabilitation setting.

Routine data from a quality registry of 12251 geriatric inpatient rehabilitants in Baden Württemberg, Germany (KODAS database, 2012–2014), were retrospectively analyzed using the Mantel-Haenzel chi-square statistic and multiple logistic-regression analysis adjusted to age, sex and number of active comorbidities. The mean age was 82 years and the mean SPPB sum score at admission 2,82. Beside a not normal distribution, the SPPB shows significant differences in the mean Barthel-Indices (Disability Outcome) and for nursing home admissions, acute hospital admissions and mortality over the four major SPPB subgroups. Compared with older community-dwelling persons, geriatric rehabilitation inpatients had a substantially lower SPPB sum score with a pronounced floor effect. Nevertheless it can predict overall markers of disease and mortality.

The present study, shows that the SPPB is associated with multimorbidity at risk of disability, nursing home admissions, severe complications and mortality in a short term follow up.

PREDICTION OF POOR OUTCOMES IN INTERMEDIATE CARE WITH A 10-MINUTE TARGETED GERIATRIC ASSESSMENT

M.R. Aliberti, J.A. Melo, S.Q. Fortes-Filho, D. Apolinario, W. Jacob-Filho, *Division of Geriatrics, Department of Internal Medicine, University of Sao Paulo Medical School, Sao Paulo, Sao Paulo, Brazil*

Comprehensive geriatric assessment is the most consistent predictor of adverse outcomes in older adults, but little is known about its predictive value in acute healthcare settings. We developed a 10-minute Targeted Geriatric Assessment (10-TaGA) with the Delphi Technique for predicting poor outcomes in a prospective cohort involving 537 participants aged 60 and older admitted to a geriatric day hospital. The 10-TaGA includes information on cohabitation status, previous hospitalizations, falls, medications, functionality (Katz

index), cognition (10-point cognitive screener), self-rated health, depression (4-item Geriatric Depression Scale), nutrition and gait speed. These items are classified into three levels: normal, mild impairment and severe impairment. A global risk index is calculated by balancing the scores of the ten items. Based on one-year follow-up, we used hierarchical Cox proportional hazards regressions to associate the 10-TaGA index with unfavorable outcomes (fall, emergency department visit [ED-visit], hospitalization, incident disability and mortality). The 10-TaGA index showed remarkable improvement in all outcomes predictions when included in models containing sex, age and race (block-1), and comorbidities (block-2). The 10-TaGA index high-risk category was substantially associated with fall (hazard ratio [HR] 1.98, 95% confidence interval [CI] 1.15–3.41, $p=0.013$), ED-visit (HR 1.73, 95% CI 1.09–2.76, $p=0.021$), hospitalization (HR 2.52, 95% CI 1.36–4.66, $p=0.003$), disability (HR 3.74, 95% CI 1.88–7.76, $p<0.0001$) and mortality (HR 2.78, 95% CI 1.03–7.51, $p=0.043$). The 10-TaGA was very useful for predicting poor outcomes in intermediate acute care. Older adults categorized as high-risk status by the global index were strongly associated with adverse events.

MULTIMORBIDITY AND LONG-TERM LIMITATIONS WITH ADLS AND IADLS IN OLDER ADULTS

M.Y. Wei, M. Kabeto, K.M. Langa, *Internal Medicine, University of Michigan, Ann Arbor, Michigan*

Background: We aimed to quantify the impact of multimorbidity, using a validated multimorbidity-weighted index (MWI) that weights chronic conditions by the Short Form-36 physical functioning, on future functional decline measured by activities of daily living (ADLs) and instrumental activities of daily living (IADLs).

Methods: The Health and Retirement Study (HRS) is a nationally-representative cohort of >38,000 adults aged ≥ 51 years followed 1992–2012. In 2000, participants were interviewed about physician-diagnosed chronic conditions, from which their MWI was computed. Biennially, participants reported the number of ADLs (range 0–5) and IADLs (range 0–6) they had difficulty performing. We used multiple linear regression to measure the association between baseline MWI quintile and ADL and IADL limitations over 10-year follow-up, adjusted for age, sex, race, and education.

Results: The final sample included 18,432 participants after excluding those missing ≥ 1 health condition variables ($N=180$). At baseline, participants had a weighted mean MWI of 4.2 ± 4.1 and 0.49 ± 1.2 ADL and 0.32 ± 0.95 IADL limitations. At 10-year follow-up, participants with the highest quintile MWI had 1.10 ADL limitations (95%CI: 0.95–1.25, $p<0.001$) and 0.59 IADL limitations (95%CI: 0.48–0.70, $p<0.001$), while the lowest quintile had 0.15 (95%CI: 0.11–0.20) ADL limitations and no significant IADL limitations. There was a dose-response association between multimorbidity and future ADL and IADL limitations.

Conclusion: Multimorbidity using MWI weighted to physical functioning was associated with long-term ADL and IADL limitations, with a doubling in those with the greatest MWI. MWI is a valid multimorbidity measure to target older adults at higher risk for functional decline and disability.

SESSION 3760 (SYMPOSIUM)

IMPROVING PRESCRIBING PRACTICES TO PROMOTE ANTIBIOTIC STEWARDSHIP IN LONG-TERM CARE

Chair: P.D. Sloane, *University of North Carolina, Chapel Hill, North Carolina*

Discussant: M.E. Dellefield, *VA San Diego Healthcare System*

Multi-drug resistant infections are a major public health challenge worldwide, leading to increased mortality from resistant infections and fears that “superbugs” will become common in healthcare settings. Consequently, antibiotic stewardship is being encouraged internationally, so that antibiotics are used “only when needed” and prescriptions written for “the right drug, dose, and duration.”

Antibiotic overuse and multi-drug resistant bacteria are especially common in residential long-term care settings for frail older persons; for example, research has indicated that U.S. nursing home residents are on antibiotics nearly 10% of the time. However, successful implementation of antibiotic stewardship is not straightforward, as decision-making involves a complex interplay of clinical factors, including input from nursing staff, medical providers, residents, and families.

Drawing on a series of nursing home studies in the United States and the Netherlands, this session will discuss the theoretical framework, present some of the key issues driving overprescribing, identify potential interventions, and discuss the results of a dissemination trial. Paper one will present theoretical models of decision-making, drawing from several studies by the investigators. Paper two will discuss how laboratory and radiologic results in these settings are often equivocal, and how this uncertainty fosters overprescribing. Paper three will present results of an international Delphi study aimed at developing an algorithm to guide interpretation of clinical findings in suspected urinary infection. Paper four will discuss methods of implementing antibiotic stewardship and present results of dissemination research in 28 U.S. nursing homes. The discussant will provide an organizational change perspective to integrate the presentations.

DECISION-MAKING AROUND DIAGNOSIS AND TREATMENT OF SUSPECTED INFECTIONS IN LONG-TERM CARE

C.E. Kistler, P.D. Sloane, S. Zimmerman, *University of North Carolina, Chapel Hill, North Carolina*

The decision-making pathway for the diagnosis and treatment of suspected infections in long-term care begins with the initial illness presentation and proceeds through nursing assessment, communication with the medical provider, diagnostic testing, antibiotic selection, and monitoring. At each step, decision-making is fraught with challenges, such as non-evidence based beliefs, time pressure, fear of patient deterioration, and patient or family requests for treatment. We will discuss how these affect the diagnosis and management of the three most common infection types in community-based nursing homes, using data from medical record audits of 260 treated urinary infections, 226 treated respiratory infections, and 161 treated skin/soft tissue infections

from 31 community-based nursing homes in the United States. An overall theoretical model will be presented for understanding these pathways and processes, and for identifying strategies to combat challenges to prevent inappropriate treatment decisions.

THE ROLE OF EQUIVOCAL TEST RESULTS IN ANTIBIOTIC OVERUSE IN LONG-TERM CARE

P.D. Sloane, M. McClester, D. Reed, K. Ward, *University of North Carolina, Chapel Hill, North Carolina*

In U.S. nursing homes (NHs) the majority of residents have cognitive impairment, and doctors are typically on site only a few hours per week. Consequently, diagnosis of respiratory and urinary infections relies less on clinical factors and more on chest x-ray and urine culture results communicated to medical providers by telephone. This session will present data from 480 NH cases of suspected urinary or respiratory infection. Results demonstrated that 87% of urine cultures and 33% of chest x-rays were equivocal – neither negative nor diagnostic respectively of urinary infection or pneumonia – and that medical providers tended to treat equivocal results as though they were diagnostic of infection. This diagnostic sequence of events leads to overtreatment of asymptomatic bacteriuria and viral respiratory infections and, consequently, to overuse of antibiotics. Clinical and psychosocial factors associated with these processes will be discussed, along with recommendations for interventions to reduce inappropriate antibiotic overprescribing.

CAN THE DEFINITIONAL CRITERIA FOR URINARY TRACT INFECTION (UTI) BE IMPROVED? A DELPHI STUDY

L. van Buul, C. Hertogh, *VU University Medical Center, Amsterdam, Netherlands*

Previous research has identified disagreement regarding whether and to what extent certain signs and symptoms in long-term care (LTC) residents indicate the presence of a urinary tract infection (UTI), suggesting that better diagnostic criteria are needed. To address this issue, a Delphi study was organized in which an international panel of 16 experts in infectious diseases in LTCs sought to reach consensus on how to incorporate signs and symptoms into decision-making. After the first round of expert panel responses, consensus was reached on a variety of signs and symptoms deemed not likely to be caused by UTI; examples include diarrhea, new/worsening fatigue; and change in urine color. Final study results will be presented, including a practical and internationally-supported algorithm for the evaluation of signs and symptoms often ascribed to UTIs in current LTC practice. Implementation of this algorithm has the potential to reduce antibiotic overtreatment in LTCs.

ANTIBIOTIC STEWARDSHIP IN LONG-TERM CARE: RESULTS FROM AN IMPLEMENTATION STUDY

S. Zimmerman, D. Reed, J. Preisser, P.D. Sloane, *University of North Carolina, Chapel Hill, North Carolina*

Due to growing concern that unnecessary overuse of antibiotics in nursing homes (NHs) fosters the emergence and dissemination of antibiotic-resistant bacteria, U.S. NHs are being encouraged to establish antibiotic stewardship programs. Unfortunately, successful implementation of such

programs is not straightforward, because decision-making involves a complex interplay of factors. Having demonstrated in a clinical trial that antibiotic prescribing can be reduced by over 25% through comprehensive antibiotic stewardship efforts, our research team implemented a dissemination research study in 28 typical community-based NHs to determine change in prescribing and the factors most critical to success in antibiotic stewardship. After one year of implementation, antibiotic prescribing decreased from 12.39 to 10.95 prescriptions/resident day, with most decrease evident for presumed urinary and respiratory tract infections. The session will also discuss the role of nursing home administration, medical staff leadership, staff and provider attitudes, and intervention activities in achieving and maintaining changes in antibiotic prescribing.

SESSION 3765 (PAPER)

UNIQUE PERSPECTIVES IN UNDERSTANDING END-OF-LIFE CARE EXPERIENCES

48-HOUR HOSPICE HOME IMMERSION PROJECT: INNOVATIVE MEDICAL EDUCATION RESEARCH

M.R. Gugliucci, *Department of Geriatric Medicine, University of New England, Biddeford, Maine*

BACKGROUND: The University of New England College of Osteopathic Medicine *Hospice Immersion* project was piloted in Maine, USA, 2014. It was designed and implemented as an experiential medical education learning model whereby medical students were “admitted” into the local Hospice Home to live there for 48 hours. Until this project, palliative and end of life care education at US Medical Schools were accomplished through traditional medical education methods.

METHODS: The project utilizes qualitative ethnographic and autobiographic research designs, whereby a unique environment or “culture” (Hospice Home) is observed and life experiences of the medical student before, during, and immediately after the immersion are reported by him/her.

RESULTS: Students report new found skills in patient care such as the 1) importance of physical touch; 2) significance of communication at the end of life for the patient, family, and staff; 3) the value of authenticity and sincerity that comes from being comfortable with oneself, which allows silence to communicate caring; 4) connection with and awareness of the person (rather than their terminal illness) and their family; and 5) the importance of speaking with patients and their families about end of life plans in advance.

CONCLUSION: This project humanizes dying and death, solidified student realization that dying is a part of life and what an honor it is to be a part of the care process that alleviates pain, increases comfort, values communication, and human connections. Medical education in death and dying is advanced; essential in preparing our future physicians.

HEALTH CARE UTILIZATION OUTCOMES FOR PATIENTS ENROLLED IN A LATE-LIFE CARE INTERVENTION

K. Fernstrom¹, H. Britt¹, N. Shippee², P. Mobley¹, 1. *Allina Health, Minneapolis, Minnesota*, 2. *University of Minnesota, Minneapolis, Minnesota*

Health systems in the U.S. are faced with increased utilization for patients in their last years of life. Care for patients with serious illness is complex and requires a greater number of clinicians and care settings. This can contribute to duplicative and unwanted medical procedures. As a large portion of the population approaches retirement, health systems must redouble efforts to better serve patients as they near the end of life. LifeCourse is a patient-centered intervention which leverages a layperson care guide to build upon an expanded set of palliative care domains. Care guides meet with patients, their family members and clinicians to help patients articulate goals, take part in decision making, and connect with resources. LifeCourse is a non-randomized prospective study of 450 intervention and 448 usual care patients followed between October 2012 and June 2016. Patients and controls were selected based on diagnosis, disease progression, and comorbidity mix. Using zero-inflated negative binomial regression models we tested whether participation in LifeCourse resulted in decreased utilization on three outcomes, ED visits, inpatient days, and ICU stays. On average, patients in the intervention group experienced 25% fewer inpatient days (IRR = 0.75; 95% CI: 0.62–0.91) and 57% fewer ICU stays (IRR = 0.43; 95% CI: 0.24–0.77). We did not detect a difference in the number of ED visits (IRR = 0.85; 95% CI: 0.72–1.01). Our findings suggest that when a whole-person approach to care is used and patients’ preferences are known there is a beneficial impact on health care utilization in late-life.

PALLIATIVE CARE AFTER HOSPITALIZATION: PATIENT EXPERIENCES AND CARE OUTCOMES IN NURSING HOMES

J. Carpenter^{1,3}, P. Berry², M. Ersek^{3,4}, 1. *University of Utah, Berlin, Maryland*, 2. *Oregon Health and Science University, Portland, Oregon*, 3. *Corporal Michael J. Crescenz VAMC - Philadelphia, Philadelphia, Pennsylvania*, 4. *University of Pennsylvania, Philadelphia, Pennsylvania*

Palliative care consultation (PCC) during hospitalization is increasingly common for older adults with life-limiting illness discharged to nursing homes. Little is known about the consistency between PCC recommendations and post-discharge care. The purpose of this analysis was to describe the care trajectories and experiences of older adults admitted to a nursing home following a hospitalization during which they received a PCC. We recruited a sample of 12 adults over 60 years for this qualitative descriptive study. Care trajectories were mapped using information from medical record audits at five time points from hospital discharge to 100 days following nursing home admission. Interviews (n=15) with participants and surrogates were combined with each participant’s medical record data and care trajectory. Content analysis was employed on the combined dataset. All PCC referrals in this sample (mean age=80 years) were for goals of care conversations during which the PCC team discussed poor prognosis and recommended palliative approaches. All were admitted to a nursing home under the Medicare Skilled Nursing Facility Benefit. Re-hospitalization was common (n = 7); half of the sample lived an average of 19 days. Our analysis revealed three trajectory types: *Focus on Rehabilitative Care*, *Patient-Family Caregiver Incongruence*, and *Comfort Care*. Our findings suggest that there is poor

congruence between PCC recommendations and post-discharge care. Heavy emphasis on recovering functional status through rehabilitation and skilled nursing care despite poor prognosis was identified. Future research should focus on predicting outcomes of rehabilitation and ways to incorporate this information in goals of care discussions.

PERSPECTIVES ON THE IDENTIFICATION OF THE PALLIATIVE PHASE AND ADVANCED CARE PLANNING IN DEMENTIA

C. Smits¹, M. Keurhorst², M. van der Cingel¹, M. Uitdehaag², 1. *Windesheim University of Applied Sciences, Zwolle, Netherlands*, 2. *Saxion University of Applied Sciences, Deventer, Netherlands*

This study aimed to gain insight in the views, experiences and preferences of people with dementia, their family carers, dementia case managers, district nurses and general practitioners regarding early identification of palliative care needs and advanced care planning.

We interviewed 9 people with dementia, 9 family carers and 4 general practitioners individually and organized 2 focus group interviews with district nurses and case managers. Interview and focus group topics involved the process, experiences and preferences regarding the start of the palliative phase and advanced care planning, communication and support.

Analyses of interview transcripts involved thematic content data analyses.

Preliminary analyses show that professionals vary with respect to the start of the palliative phase, some stating that this starts with the diagnosis, others claiming that it starts later in the dementia trajectory. Some people with dementia and family carers do not wish to discuss the future, whereas others make detailed plans, specifically regarding practical medical issues. Professionals emphasize that communication must fit clients' unique experiences, preferences, concerns and fears. All respondents find discussion of palliative matters difficult. Professionals stress that any communication tool should be brief, practical, leaving room for offering person centered care.

We conclude that identification of the palliative phase in dementia and advanced care planning is a sensitive issue for all involved. It requires careful communication that allows for shared decision making. A communication tool for professionals should facilitate professional room and person centred care.

SESSION 3770 (PAPER)

DEMENTIA/ALZHEIMER'S DISPARITIES, PREVALENCE, AND RISKS

POTENTIALLY INAPPROPRIATE MEDICATION AND MORTALITY IN OLDER PEOPLE ATTENDING MEMORY CLINICS

A.J. Cross¹, J. George¹, M. Woodward², D. Ames^{3,4}, H. Brodaty^{5,6}, R. Wolfe⁷, M. Connors^{5,6}, R. Elliott^{1,8}, 1. *Centre for Medicine Use and Safety, Faculty of Pharmacy and Pharmaceutical Sciences, Monash University, Parkville, Victoria, Australia*, 2. *Medical and Cognitive Research Unit,*

Austin Health, Heidelberg, Victoria, Australia, 3. *National Ageing Research Institute, Parkville, Victoria, Australia*, 4. *University of Melbourne Academic Unit for Psychiatry of Old Age, St George's Hospital, Kew, Victoria, Australia*, 5. *Dementia Collaborative Research Centre, School of Psychiatry, UNSW Australia, Sydney, New South Wales, Australia*, 6. *Center for Healthy Brain Aging, School of Psychiatry, UNSW Australia, Sydney, New South Wales, Australia*, 7. *Department of Epidemiology and Preventative Medicine, Faculty of Medicine, Nursing and Health Sciences, Monash University, Melbourne, Victoria, Australia*, 8. *Pharmacy Department, Austin Health, Heidelberg, Victoria, Australia*

Potentially inappropriate medication use may increase the risk of adverse drug events, hospitalization, morbidity and mortality in older people.

The aims of our study were to explore the use of medications that are potentially inappropriate for older people with cognitive impairment (PIMcog), quantify anticholinergic cognitive burden (ACB), and examine whether PIMcog use and ACB were associated with mortality.

We performed cross-sectional and longitudinal analyses of data from the Prospective Research In MEemory clinics (PRIME) study. This study involved 964 community dwelling participants, diagnosed with mild cognitive impairment or dementia, who attended nine Australian memory clinics and were followed up for three years.

PIMcog was defined as any medication considered potentially inappropriate for an older person with cognitive impairment according to the Beers criteria or Screening Tool of Older Peoples Prescriptions (STOPP). Anticholinergic burden was calculated using the ACB scale. 360 participants (37.3%) used a PIMcog at some point during the study, the most common being anticholinergics and sedatives. 624 participants (64.7%) used a medication with potential or definite anticholinergic properties (ACB>0) at some point during the study.

Using time-dependent Cox proportional hazards regression, adjusted for covariates including baseline age, gender, education, cognitive diagnoses, total number of medications, disease burden, cognition, physical function and neuropsychiatric symptoms, PIMcog use (adjusted hazard ratio [HR]: 1.42, 95% confidence interval [CI]: 1.12–1.80) and ACB score (adjusted HR: 1.18, 95% CI: 1.06–1.32) were significantly associated with all-cause mortality over a three year follow-up period.

Efforts are needed to improve prescribing for older people with cognitive impairment.

PATTERNS AND DISPARITIES IN FORMAL DEMENTIA DIAGNOSIS AND AWARENESS OF DIAGNOSIS

H. Amjad¹, A. Ahuja^{1,2}, J.L. Wolff^{3,2}, C.G. Lyketsos¹, Q. Samus¹, D.L. Roth^{1,2}, 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland*, 2. *Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland*, 3. *Johns Hopkins University Bloomberg School of Public Health, Baltimore, Maryland*

Despite increasing prevalence, about half of older adults with dementia are undiagnosed. Both formal diagnosis and patient/family awareness of the diagnosis may have

implications for medical care, decision-making, and future planning. We linked data from the National Health and Aging Trends Study (NHATS), a nationally representative sample of Medicare beneficiaries in the United States, to Medicare claims to examine formal diagnosis (claims-based diagnosis), awareness of dementia (self-reported physician diagnosis), and sociodemographic differences between dementia status groups. Among 7,609 community-dwelling older adults in NHATS, 13.6% (n=1,038) met validated NHATS criteria for probable dementia. We analyzed 633 individuals with probable dementia who had 3 years of continuous fee-for-service coverage in four groups. 116 participants (18.3%) did not report a physician diagnosis but had a claims diagnosis of dementia (unaware but diagnosed); 240 (37.9%) reported a physician diagnosis and had a claims diagnosis (aware and diagnosed); 229 (36.2%) neither reported a diagnosis nor had a claims diagnosis (unaware and undiagnosed); and 48 (7.6%) reported a diagnosis but lacked claims diagnosis (aware but undiagnosed). Females and older participants were more likely to be formally diagnosed, irrespective of awareness of diagnosis. Proportions of non-whites and less than high school educated were greatest in the unaware and undiagnosed group. Median income was greatest in those who were aware and diagnosed ($p < 0.05$ for all between group differences except education, for which $p=0.08$). Understanding both formal diagnosis and awareness of the diagnosis may be important to reduce disparities and improve care in dementia.

A COMPARISON OF THE PREVALENCE OF DEMENTIA IN THE UNITED STATES IN 2000 AND 2012

K.M. Langa^{1,2}, E. Larson³, E.M. Crimmins⁴, J. Faul⁵, D. Levine^{1,2}, M. Kabeto¹, D. Weir⁵, 1. *Internal Medicine, University of Michigan, Ann Arbor, Michigan*, 2. *VA Ann Arbor Center for Clinical Management Research, Ann Arbor, Michigan*, 3. *Group Health Research Institute, Seattle, Washington*, 4. *University of Southern California, Los Angeles, California*, 5. *University of Michigan, Ann Arbor, Michigan*

The aging of the US population is expected to lead to a large increase in the number of adults with dementia, but some recent studies in the US and other high-income countries suggest that the age-specific risk of dementia may have declined over the last 25 years. Clarifying current and future population trends in dementia prevalence and risk has important societal implications.

We used data from the Health and Retirement Study (HRS), a nationally representative population-based longitudinal survey of US adults to compare the prevalence of dementia in the US in 2000 and 2012. Our sample included individuals aged 65 or older from the 2000 (N = 10,675) and 2012 (N = 10,627) waves of the HRS. Dementia was identified in each year using HRS cognitive measures and validated diagnostic classifications.

Dementia prevalence decreased from 11.7% in 2000 to 9.0% ($P < .001$). More years of education was associated with a lower risk for dementia, and average years of education increased significantly (from 11.7 to 12.7 years; $P < .001$) between 2000 and 2012. The decline in dementia prevalence occurred even though there was a significant age- and

sex-adjusted increase between years in the cardiovascular risk profile among older US adults.

The prevalence of dementia in the US declined significantly between 2000 and 2012. An increase in educational attainment among older adults was associated with some of the decline in dementia prevalence, but the full set of social, behavioral, and medical factors contributing to the decline is still uncertain.

ADDRESSING THE INCREASED PREVALENCE OF DEMENTIA IN AUSTRALIAN TORRES STRAIT ISLANDER COMMUNITIES

E. Strivens^{1,2}, S. Russell^{1,2}, 1. *James Cook University, Cairns, Queensland, Australia*, 2. *Cairns and Hinterland Hospital and Health Service, Cairns, Queensland, Australia*

Indigenous Australians have higher rates of chronic disease and poorer health outcomes than the general population. Recently, a fivefold risk of dementia, one of the highest rates worldwide, has been identified in Aboriginal Australians aged 45 years and over (12.4% compared to 2.4%). It is not known if Torres Strait Islanders, who comprise 10% of all Indigenous Australians, share this increased risk of dementia, although high rates of vascular disease, which may increase this risk, are found in these communities. The aim of this study was to assess the prevalence of dementia in the Torres Strait.

A total of 111 Torres Strait residents (34 male) aged 41 to 91 years ($M=64.1$, $SD=11.4$) underwent a diagnostic assessment by a Geriatrician.

The prevalence of dementia was 11.7%, which was significantly higher than in the general population. All but one were diagnosed with Alzheimer's disease (AD), vascular dementia (VaD) or mixed AD/VaD. Cognitive impairment was present in 31% of the sample and 91% of those with cognitive impairment and 76% of those with normal cognition had at least one vascular risk factor.

Results highlight the need for screening for cognitive impairment and dementia in Australian Indigenous communities aged 45 and over to ensure early diagnosis and intervention for those affected by dementia. The need for a culturally appropriate model of care is also crucial to effectively address this problem and there is a role for all health professionals to actively promote healthy lifestyles across the lifespan to reduce dementia risk.

SESSION 3775 (SYMPOSIUM)

NEW APPROACHES TO SPATIAL MECHANISMS OF EXCLUSION IN OLDER AGE

Chair: A. Wanka, *Universität Wien, Austria*

Discussant: N.C. Keating, *Global Social Initiative on Ageing, Seoul, Korea (the Republic of)*

"Ageing in place" is a popular term in current ageing policy, referring to the possibility to remain in one's community across the life-course. Particularly in older age, the immediate living environment gains importance. Such environments can be age-friendly and enabling, but they can also contribute to social exclusion of older adults. In most European countries, various measures - ranging from barrier-free pavements to decentralised home care services - have been implemented to

make urban and rural environments more age-friendly. Yet, spatial mechanisms of exclusion persist to affect particularly those ageing in place. It is thus a crucial task for (critical) environmental Gerontology to analyse concepts like ageing in place and age-friendly cities, dismantling the underlying notions that might contribute to reproducing social inequalities instead of reducing them.

The symposium addresses the following questions:

How are older adults being excluded through spatial mechanisms? Which dimensions of older people's lives does this exclusion affect?

How do older adults themselves perceive these mechanisms? Which strategies of resistance do they deploy?

How can we prevent spatial exclusion and promote inclusive places? How can research and policy react to spatial mechanisms of exclusion when aiming to create inclusive places?

Four papers address these questions from different perspectives and different European countries, comprising older adults' experiences of place in Manchester, UK; the connections between life-course transitions and neighbourhood development in Ireland; older adults' place appropriation in Vienna, Austria; and multilevel-analysis of social inequalities in decentralized home care in the Netherlands.

SOCIAL EXCLUSION AND LIFE-COURSE RELATIONSHIPS WITH PLACE IN DIVERSE URBAN NEIGHBOURHOODS

K. Walsh, *Irish Centre for Social Gerontology, National University of Ireland Galway, Galway, Ireland*

There is a burgeoning literature on the impact of urban contexts on exclusion and participation in later life. Despite this, how urbanised spatial aspects of exclusion evolve over the life course for older people is poorly understood. This paper draws on a voice-led qualitative design, to explore the role of life-course relationships with place in shaping the exclusionary experiences of older adults in diverse urban neighbourhoods. Involving 70 older people in six neighbourhoods across Dublin, Limerick and Galway cities, data was collected through: participatory focus groups; life-course interviews; go-along interviews, and older adult researcher projects. Implicating the intertwined trajectories of older adults and the urban settings that they reside within, findings illustrate that the emergence and influence of exclusionary mechanisms is a function of the life and residential pathways of individuals, and the development path of the neighbourhood itself. Discussion focuses on key life-course transitions and neighbourhood developmental processes.

AGEING TAKES PLACE—A PRAXEOLOGICAL APPROACH TO SPATIAL EXCLUSION IN VIENNA, AUSTRIA

A. Wanka, *Universität Wien, Vienna, Austria*

Environmental Gerontology has shown the importance neighbourhoods for the wellbeing and quality of life of older adults in various dimensions. But it is usually when these environments fail to meet the diverse needs and wishes of older adults that the chain of research and policy responses sets in.

In this paper, however, I propose that adults do not only 'age in place', but that ageing *takes* place. Deploying a praxeological approach I focus on the practices of place

appropriation, spatial disengagement and spatial exclusion. This approach turns the older residents into actors, not mere victims of their residential environment.

Drawing upon a mixed-methods research involving two case studies in Vienna, results show that i) the doing of age differs between privileged and deprived environments and that ii) particularly those older adults living in deprived areas are actively trying to 'take their quarter back'.

SOCIAL INEQUALITIES IN THE DECENTRALIZATION OF HOME CARE IN THE NETHERLANDS

F. Thomese¹, B. Da Roit², *1. Department of Sociology, Free University Amsterdam, Amsterdam, Netherlands, 2. Ca' Foscari University of Venice, Venice, Italy*

Decentralization of home care is often presented as a means of increasing efficiency and quality. Little is known about the redistributive effects of the decentralization within local contexts, and about inequalities *within* municipalities after decentralization. Based on social and cultural capital theories, we hypothesize an increase in socio-economic inequality after decentralization, the more so if care is scarce. We test these hypotheses using data on the decentralization of housekeeping care in the Netherlands in 2007. The Longitudinal Aging Survey Amsterdam (lasa-vu) is enriched with municipal data on the availability of home care. In multilevel analyses we compare the use of formal care in 5,689 cases before and after 2007, given their need, income and education, informal care, and formal personal care. Findings show that low status respondents have a higher probability of receiving household care following the decentralization.

A COMPARISON OF PROGRAMMES AND SERVICES ON MENTAL FITNESS FOR SENIORS IN AUSTRIA AND SPAIN

J. Delgado-Pea¹, M. Garcia-Martín¹, C. Romo-Parra¹, G. Lang³, *1. Universidad de Málaga, Málaga, Spain, 3. Austrian Health Promotion Foundation, Wien, Austria*

Developing age-friendly programmes and services focused in Seniors' Mental Fitness are relevant actions oriented to elder well-being. This paper explores the purposes and methodologies of such implemented programmes and services in Austria and Spain nowadays.

The research investigates them in relation to the several aims, namely: 1. What kind of programmes exist which promote active ageing in the light of maintaining and improving mental fitness? 2. What goals are pursued by means of such actions? 3. What methodologies are normally used in them? 4. In which way can they be improved in the light of the previous aims?

Using a qualitative case-study design, a representative sample of these actions are analysed by Atlas.ti software from an inductive approach. A constructivist grounded theory approach was used to analyse the data. The information was collected by templates designed ad hoc. Additionally, structured in-depth interviews were held with outstanding providers from some of these actions in order to complement the general information obtained in the former step. These interviews explore aspects of the positive and negative features, as well as improvement proposals for such actions.

The results obtained can be applied in the framework of the progress of such programmes and services implementation.

SESSION 3780 (SYMPOSIUM)**EXTENDING QUALITY LIFE YEARS**

Chair: E.M. Verdin, *University of California, San Francisco, San Francisco, California*

This session will focus on cutting edge research that aims to extend quality life years. The presentations will approach this topic ranging from identifying important molecular mechanisms to identifying population health strategies. Topics included in this session will focus on molecular mechanisms of lifespan expansion, modifiable risk factors to prevent cognitive decline, reasons for under treatment of hearing loss, the use of the arts to promote health, and global oral health disparities in older adults.

MODIFIABLE RISK FACTORS TO PREVENT COGNITIVE DECLINE

K. Yaffe, *University of California, San Francisco, San Francisco, California*

A compelling and robust body of research suggests that modifiable risk factor reduction could substantially impact rates of cognitive decline and neurodegeneration. The evidence is strongest for lifestyle risk factors including both physical and cognitive activity as well as for cardiovascular risk factors while promising data is also emerging for depression and sleep disorders. Prior studies have demonstrated that risk factor exposure in mid or later life affects rates of cognitive decline; however, a small but growing body of data indicates that risk factor exposure earlier in the lifecourse may also contribute to an increased risk of poor cognitive performance. Cumulatively, the data supports modifiable risk factor reduction at the population-based level, with increasing support for multi-domain interventions. These findings have critical public health implications for healthcare providers, researchers, and policy makers in the development of strategies to prevent cognitive decline.

HEARING HEALTH CARE: A PUBLIC HEALTH IMPERATIVE

M.I. Wallhagen, *University of California, San Francisco, San Francisco, California*

Hearing loss (HL) is a common problem; approximately 538 million people older >5 have disabling hearing impairment globally. In the US, approximately 48 million individuals over the age of 12 experience HL which becomes increasingly common with age; approximately 68% of persons 70–79 and >80% of those >80 are affected. Although considered non-life threatening, HL is far from benign and is associated with depression, isolation, falls, and possibly cognitive impairment. Given this, the National Academies of Science released a report in 2016 emphasizing that HL is a significant public health issue needing far greater attention and remains undertreated with only about 20–30% of persons who could benefit from amplification using it, although rates increase with age and HL severity. There are multiple reasons for the low use of services. This brief presentation reviews the work I and colleagues are doing at UCSF addressing several of these factors.

THE IMPACT OF ARTS ENGAGEMENT FOR OLDER ADULTS: WHAT'S THE EVIDENCE?

J.K. Johnson, *University of California, San Francisco, San Francisco, California*

An increasing number of studies suggest that engagement in the arts may have beneficial effects on the health and well-being of older adults. Given that the number of Americans age 65 and over is projected to double from 46 million in 2014 to 98 million in 2060, there is an urgent need to develop ways for older adults to remain active and engaged in meaningful ways. Engagement in the arts in ways that are novel, cognitively, physically, and socially engaging, and culturally relevant are increasingly being explored as a way to optimize aging. Current literature will be summarized, along with an update on a large, cluster-randomized trial of a community choir program designed for racial/ethnically diverse older adults in San Francisco (Community of Voices study).

REDUCING THE GLOBAL BURDEN OF ORAL DISEASES IN OLDER ADULTS

S. Hyde, *University of California, San Francisco, San Francisco, California*

Oral health is a fundamental component of health and physical and mental well-being, and is influenced by the individual's changing experience, perceptions, expectations and ability to adapt to circumstances. As such, prevention of oral disease and maintenance of oral health contributes to the systemic health, well-being, and quality of life of older adults. Dental caries, periodontal disease, and tooth loss in older adults are global health concerns because they are highly prevalent worldwide, socioeconomic inequalities contribute to these diseases, many of the risk factors are modifiable, and these diseases result in compromised oral health-related quality of life. Oral care must be tailored to the needs and level of dependency of older adults, and health outcomes can improve with evidence-based approaches and interprofessional collaboration.

MOLECULAR MECHANISM OF LIFESPAN EXTENSION BY CALORIC RESTRICTION

H. Li, *University of California, San Francisco, San Francisco, California*

Caloric Restriction (CR) can extend lifespan and/or confer health benefits in a wide range of species, including primates; however, the molecular mechanisms are not well understood. We investigate the mechanism by which CR extends lifespan using the single cell organism budding yeast as a model. We found that CR, implemented by glucose reduction, extends yeast replicative lifespan and induces a global change of transcriptional and translational programs. In particular, CR represses methionine biosynthetic enzymes and transporters, and adding extra methionine cancels the lifespan extension by CR without affecting the lifespan in the normal media. CR also induces a transient increase of proteasome expression by up-regulating the translation of a master regulator of proteasome genes Rpn4, and that Rpn4 deletion abolish the lifespan extension by CR. These findings suggest that CR's longevity effect is mediated by methionine restriction, and that proteasome is a key downstream effector.

SESSION 3785 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: AGE DIFFERENCES IN DECISION MAKING: THE ROLES OF COGNITION, EMOTION, AND CONTEXT

Chair: J. Strough, *West Virginia University, Morgantown, West Virginia*

Co-Chair: C.E. Loeckenhoff, *Cornell University, Ithaca, New York*

Discussant: T.M. Hess, *North Carolina State University, Raleigh, North Carolina*

This symposium highlights strengths and vulnerabilities of the aging decision-maker. Using national samples from Sweden and the U.K., and community samples from the U.S, the presentations show that patterns of age differences in decision-making depend on task type and context. Emotional and experiential skills that improve with age can facilitate good decision making despite age-related cognitive declines. Using a Swedish population-based sample, Del Missier and Mäntylä found that age-related declines in cognitively-demanding decision-making tasks were explained by age decrements in working and episodic memory, even after accounting for deficits in sensory functioning and processing speed. Other aspects of decision-making performance were spared or improved with age. Using a national sample from the U.K., Eberhardt, Bruine de Bruin, and Strough found age-related improvements in performance on four financial decision-making tasks. These improvements were explained by older adults' increased experience and better emotion regulation. Shook, Strough, Delaney, Ford, and Barker examined whether older and younger adults' judged a patient's medical treatment decision differently depending on its success or failure. In their community-dwelling U.S. sample, older adults were less biased by treatment outcomes than younger adults because they evaluated failed treatments more positively. Loeckenhoff, Riffin, and Ratner examined age differences in decisions about joint replacement in a community sample of U.S. patients. Willingness to have surgery was negatively associated with age, and treatment expectations, time horizons, and attitudes toward risk may be contributing factors. Hess integrates these findings with existing research on aging and decision making and offers directions for future research.

AGING AND THE COGNITIVE UNDERPINNINGS OF DECISION-MAKING COMPETENCE

F. DelMissier^{1,2}, T. Mäntylä², 1. *University of Trieste, Trieste, Italy*, 2. *Stockholm University, Stockholm, Sweden*

In this talk, we will present a series of individual-differences studies mainly carried out within the Swedish Betula project on aging, memory and dementia and its recent extensions to decision making. These large-samples population-based studies investigated the relationships between aging, cognition, and a variety of aspects of decision-making competence. Their outcomes showed that different aspects of decision-making competence depend on diverse aspects of memory and cognitive functioning, highlighting specific functional roles of memory processes in decision making.

Additionally, the age-related decline in more cognitively-intensive decision-making tasks seems mainly due to age declines in working memory and episodic memory, beyond declines in sensory functioning and processing speed. On the positive side, other aspects of decision-making performance are spared or even improve with age, possibly due to knowledge, experience, and better emotion regulation.

AGING AND FINANCIAL DECISION MAKING: OLDER AND WISER?

W. Eberhardt⁴, W. Bruine de Bruin^{1,2}, J. Strough³, 1. *Centre for Decision Research, Leeds University Business School, Leeds, United Kingdom*, 2. *Carnegie Mellon University, Pittsburgh, Pennsylvania*, 3. *West Virginia University, Morgantown, West Virginia*, 4. *Maastricht University, Maastricht, Netherlands*

People of all ages face important financial decisions. The aging literature suggests that older adults experience developmental changes in numeracy, experience, emotion regulation, and motivation that may potentially affect the quality of their decisions. In a national life-span sample ($n=926$) recruited from across the United Kingdom, we therefore examined the role of these four factors in financial decision making. Participants completed established measures of the four factors as well as measures of financial decision making, including money management, credit card repayment, sunk cost bias, and financial decision outcomes. We found that performance on each of our financial decision tasks improved with age. Moreover, these age-related improvements were explained by older adults' increased experience and better emotion regulation. These patterns held in structural equation models that took into account all decision tasks, the four factors, and socio-demographic variables. Our findings have implications for theories on aging and interventions targeting financial decisions.

WEIGHING SUCCESS AND FAILURE: OLDER ADULTS SHOW LESS OUTCOME BIAS THAN YOUNGER ADULTS

N. Shook, J. Strough, R. Delaney, C. Ford, D. Barker, *Psychology, West Virginia University, Morgantown, West Virginia*

'Outcome bias' occurs when the soundness of a decision is judged based on the valence of the decision outcome (e.g., success versus failure), even though such information was not available prior to the decision. To date, age differences in outcome bias have not been investigated, but related research suggests age differences in weighting of valenced information. To investigate age differences in outcome bias, community-dwelling younger ($n = 118$; $M_{\text{age}} = 28$ years) and older ($n = 121$; $M_{\text{age}} = 68$ years) adults were presented with four vignettes that described a patient with a medical condition, treatment option statistics, and the outcome (success or failure) of the patient's treatment decision. Participants judged the patient's treatment decision. Older adults were less biased by decision outcomes than younger adults. Specifically, older adults rated decisions resulting in failure more positively than younger adults. Implications for improving health-related decisions are discussed.

EXPLORING PSYCHOLOGICAL EXPLANATIONS OF AGE DIFFERENCES IN DECISIONS ABOUT JOINT REPLACEMENT

C.E. Loeckenhoff¹, C. Riffin², S. Ratner³, 1. *Human Development, Cornell University, Ithaca, New York*, 2. *Yale University, New Haven, Connecticut*, 3. *The University of Texas Southwestern Medical Center, Dallas, Texas*

Total joint arthroplasty (TJA) is an efficacious treatment for advanced osteoarthritis, but patient acceptance is below medical recommendations, especially among older adults. The present study explored potential explanations of age effects. Participants (n = 100, aged 40–93) had chronic knee or hip pain and were considering but had not previously undergone TJA. Phone interviews assessed demographics, current pain and function, willingness to undergo TJA, and a range of explanatory variables including expected improvements after TJA, future time perspective, aging stereotypes, health locus of control, and accepted risk of death to achieve pain relief. As expected, age was associated with lower willingness to undergo TJA. Among the explanatory variables, limited time horizons, lower expected pain relief, and lower accepted risk of death were associated with both advanced age and lower willingness to undergo TJA. However, this could not fully account for the observed age differences in TJA decisions.

SESSION 3790 (SYMPOSIUM)

POSTTRANSLATIONAL MODULATION OF MACROMOLECULES DURING AGING

Chair: A. Bertolotti, *Cambridge, United Kingdom*

A. Cuervo, *Albert Einstein College of Medicine, Bronx, New York*

All intracellular proteins are subjected to exquisite quality control to assure maintenance of a healthy and functional proteome. Chaperones and proteolytic systems are integral components of the proteostasis networks, which monitor and assist proteins through the multiple steps they undergo through their cellular life (folding, trafficking, assembly, disassembly, refolding and degradation). Loss of protein homeostasis has been identified as one of the hallmarks of aging organisms and underlies the basis of severe age-related disorders such as neurodegenerative diseases. The recent better understanding of the proteostasis networks and their integration across cells, tissues and organs, has revealed them as novel possible targets for anti-aging interventions. In this session, we will review recent findings on age-related changes in the molecular components that participate in cellular homeostasis (chaperones (Frydman), the ubiquitin/proteasome system (Gonos) and autophagy (Cuervo)), the consequences of these changes (Santambrogio) and provide examples of current attempts to modulate the proteostasis networks in aging and age-related disorders (Bertolotti).

AGING-LINKED PROTEOSTASIS DECLINE: IMPLICATIONS FOR NEURODEGENERATIVE DISEASE

J. Frydman, *Stanford University, San Francisco, California*

Chaperones help proteins fold or send them to degradation, but they also regulate conformational protein cycles,

protein-protein interactions, transcriptional programs, and buffer the many mutations present in the proteomes of individuals and cells in both normal and diseased states. The emerging understanding of protein homeostasis as an extraordinarily complex, multifaceted and nuanced actor in cellular regulation, calls for a better consideration of the machinery responsible for it, how it works under normal conditions, how it is regulated and how its impairment leads to disease. This can only occur through the integration of mechanistic, cell biological and genetic data with physiological studies of disease states. It is well-established that an impairment of protein homeostasis during aging underlies the onset of a whole set of neurodegenerative misfolding diseases. In this talk, I will discuss the tremendous therapeutic promise of protein homeostasis regulation in disease and aging.

THE AGING PROTEASOME AND ITS ACTIVATION AS A NOVEL ANTI-AGING STRATEGY

S. Gonos, *Institute of Biology, Medicinal Chemistry and Biotechnology, Athens, Greece*

We have studied proteasome function in replicative senescence and cell survival and have observed reduced levels of proteasome content and activities in senescent cells due to the down-regulation of the catalytic subunits of the 20S complex. Sable over-expression of catalytic subunits or POMP resulted in enhanced proteasome assembly and activities and increased cell survival following treatments with various oxidants. Importantly, the developed “proteasome activated” human fibroblasts cell lines exhibit a delay of senescence by approximately 15%. Moreover, additional findings indicate that the recorded proteasome activation by many inducers is Nrf2-dependent. In this talk, I would share evidence from our current studies that support that proteasome activation is an evolutionary conserved mechanism, as it can delay aging in various in vivo systems.

TARGETING SELECTIVE AUTOPHAGY AGAINST PROTEOTOXICITY IN AGING AND AGE-RELATED DISEASES

A. Cuervo, *Developmental and Molecular Biology, Albert Einstein College of Medicine, Bronx, New York*

Autophagy is an important component of the proteostasis networks that assure maintenance of a healthy proteome in all our cells. Autophagy malfunction is a common feature in aging organism and in many severe age-related diseases such as neurodegenerative conditions. The several autophagic systems that co-exist in most cells are affected in a different manner by age. We have identified the molecular defect in a form of selective autophagy responsible for its diminished activity in aging. Genetic approaches to mimic this defect in young organism have revealed organ-specific changes in proteostasis and different degrees of proteotoxicity, that depend on the ability of each tissue to compensate for the autophagic failure. In this talk I will discuss our current efforts to prevent the decline or to restore normal selective autophagic activity using genetic and chemical interventions and the impact that these manipulations have in physiological aging and in neurodegenerative conditions.

ROLE OF CARBONYL MODIFICATIONS ON AGING-ASSOCIATED LOSS OF PROTEOSTASIS

L. Santambrogio, *Albert Einstein College of Medicine, Bronx, New York*

Protein aggregation is a common biological phenomenon, observed in different physiological and pathological conditions. Decreased protein solubility and a tendency to aggregate is also observed during physiological aging but the causes are currently unknown. Our group has performed a biophysical separation of aging-related high molecular weight aggregates, isolated from the bone marrow and splenic cells of aging mice and followed by biochemical and mass spectrometric analysis. We found that compared to younger mice, old mice have higher protein post-translational carbonylation. We have identified the causative role of these modifications in inducing protein misfolding and aggregation by inducing carbonyl stress in young mice, which recapitulated the increased protein aggregation observed in old mice. In this talk I will share our views on how oxidative stress-related post-translational modifications accumulate in the aging proteome and are responsible for increased protein aggregation and altered cell proteostasis.

STRATEGIES TO SURVIVE THE LOSS OF CELLULAR RESILIENCE TO PROTEIN MISFOLDING IN AGING

A. Bertolotti, *MRC Laboratory of Molecular Biology, Cambridge, United Kingdom*

A broad range of age-related human diseases, including common and devastating neurodegenerative diseases, are caused by the deposition of misfolded proteins that occurs when cells become unable to withstand the pressure of misfolded proteins. Often, proteins, which are normally soluble, eventually misfold and aggregate late in life. The fact that protein aggregates build up later in life suggests that the cellular defense systems against misfolded proteins gradually fail with age. In the past 20–30 years, many components of protein quality control systems have been identified. The challenge that remains is to use this knowledge to identify strategies to correct the broad range of diseases that arise when protein quality control is overwhelmed. In this talk I will discuss our efforts to identify unbiased approaches that can be used to rescue cells from protein quality control catastrophes, such as targeting mechanisms by which cells maintain proteasome homeostasis.

SESSION 3795 (SYMPOSIUM)

VIEWS ON AGING IN THE DYNAMICS OF HEALTH BEHAVIOR AND ADJUSTMENT

Chair: M. Wiest, *Freie Universität Berlin, Germany*

Co-Chair: V. Klusmann, *Universität Konstanz, Konstanz, Germany*

Discussant: H. Wahl, *Heidelberg University, Heidelberg, Germany*

Views on aging (VoA), i.e., individual and societal perceptions and evaluations of aging, are linked to health-related outcomes, particularly in later life. Specifically, positive VoA have been shown to be associated with being more physically active, being happier, being healthier, and living longer. However, the complex interplay of VoA and health are not

yet understood. This symposium brings together four papers that highlight the role of VoA for health behavior and adjustment using differentiated methodological approaches to reveal for whom, how and under what circumstances VoA relate to which health-related outcomes and, consequentially, how VoA can be addressed in interventions. Using ecological momentary assessment, Gabriel et al. show that daily physical activities are related to intra-individual variations of VoA and that physically active participants perceive less age-associated social losses. Finding a longitudinal influence of VoA on the healthiness of eating behavior, Klusmann et al. demonstrate that positive VoA are especially important for older and less educated individuals. Analyzing large survey data captured pre- and post-retirement, Wiest et al. show that positive VoA are associated with less retirement-related change in life satisfaction. Combining survey and experimental data, Robertson and Weiss reveal the effectivity of counter stereotypes for more positive VoA. Integrating the findings that provide strongly needed evidence to fill in existing research gaps, the discussion by Hans-Werner Wahl will direct to comprehensive model building to guide effective intervention development as well as highlight challenges and opportunities for future research linking VoA to health and quality of life in later life.

SUBJECTIVE AGE AND PHYSICAL ACTIVITY: A DAILY-DIARY STUDY WITH COMMERCIALY AVAILABLE WEARABLES

M. Gabriel, L. Schmidt, C. Jansen, M. Sieverding, H. Wahl, *Heidelberg University, Heidelberg, Germany*

Emerging intervention studies suggest that positive self-perceptions of aging (SPA) promote physical activity (PA) in older adults. Short-term intra-individual variation in both PA and SPA calls for an investigation of the day-to-day dynamics. 40 individuals (60–74 years) wore a Fitbit™ device to assess PA and reported subjective ages for a 2-week diary period. Domain-specific SPA were assessed at the outset of this pilot-like study. Multilevel model analyses revealed that individuals felt younger on physically more active days ($\beta = -0.12$; $p < .05$). Domain-specific associations were found at the between-person level, with physically active participants tending to perceive their own aging more in terms of physical decline ($\beta = .34$; $p < .10$) and less in terms of social loss ($\beta = .42$; $p < .05$). Findings suggest that, despite making individuals more aware of age-related physical limitations, PA exertion is paralleled by a positive perception of one's own age.

HOW AND FOR WHOM DO POSITIVE VIEWS ON AGING PROMOTE HEALTHY EATING BEHAVIOR?

V. Klusmann¹, J.K. Wolff², G. Sproesser¹, B. Renner¹, 1. *Psychology, Universität Konstanz, Konstanz, Germany*, 2. *German Centre of Gerontology, Berlin, Germany*

With increasing age, people develop more negative views on aging (VoA) which has been shown to result in lower levels of exercise and functional health. We investigated whether VoA were associated with eating behavior in different age groups and tested underlying mechanisms.

One-year longitudinal data of the Konstanz Life Study with three assessments of 1321 participants, aged

18–93 years, undergoing 2-hour health check-ups were analyzed via a two-step mediation analysis with multi-group modeling.

More positive VoA (t1) predicted more healthy eating at t3 ($b=0.68$, $SE=0.24$, $p=.01$). Self-efficacy and intention to eat healthily (t2) serially mediated this effect, indirect effect $b=0.04$, $p=.02$, 95%CI[0.02, 0.08]. VoA had stronger effects in older (65+yrs) and less educated adults, indicating that fostering more positive VoA via interventions might be especially important for more vulnerable groups. Tackling VoA already in younger ages might help to establish health-promoting social-cognitive dynamics that might stabilize over the life span.

ARE SELF-PERCEPTIONS OF AGING LINKED TO RETIREMENT ADJUSTMENT?

M. Wiest¹, I. Schoellgen², M. Wetzel³, 1. *Freie Universität Berlin, Berlin, Germany*, 2. *Federal Institute for Occupational Safety and Health, Berlin, Germany*, 3. *University of Cologne, Cologne, Germany*

Although prior studies show the importance of self-perceptions of aging (SPA) on development in later life, SPA have not been studied with regard to retirement adjustment yet. However, successful adjustment might be predicted by maintaining a view on aging as a process of personal growth. The present study examines if and how SPA are linked to retirement adjustment. Pre- and post-retirement data of the German Aging Survey was used focusing on adults who retired between the age of 58–65 ($N = 472$). A latent differences score model was employed to analyze retirement-related changes in SPA and life satisfaction (LS). Preliminary analyses showed that individuals with more positive SPA prior to retirement reported higher levels of LS ($\beta = .50$, $p = .001$) and retirement-related changes in SPA and LS are positively linked ($\beta = .50$, $p = .001$). Potential mechanisms linking SPA to retirement adjustment will be discussed.

CAN COUNTER STEREOTYPES CHANGE PERCEPTIONS OF OLDER ADULTS' SOCIAL STATUS?

D. Robertson, D. Weiss, *Columbia University, New York, New York*

Negative age-related stereotypes often entail the perception that older adults have low social status, a perception that is detrimental to health and well-being. Research suggests that people infer general assumptions about group characteristics from exemplars. Thus, presenting a stereotype-inconsistent exemplar (i.e. older person in high-status position) should change people's perception of older adults. In Study 1 (60 countries, $N = 86,026$, 18–99 years) we show that in countries with an older political leader, people perceive older adults as having higher social status ($B = -0.05$, $p < .001$). In Study 2 ($N = 131$; 19–74 years) we demonstrate the causal link such that participants who are exposed to older exemplars holding a prestigious occupational position rate older adults as having a higher social status $F(1.84, 237.33) = 3.57$, $p = .03$. Furthermore, this is mediated by agency-related personality attributions. We discuss implications for interventions to change negative views of aging.

SESSION 3800 (SYMPOSIUM)

AGEING BODY AND SOCIETY: CRITICAL PERSPECTIVES, FUTURE CHALLENGES

Chair: W. Martin, *Brunel University London*

Co-Chair: J. Twigg, *University of Kent*

Discussant: L.C. Hurd Clarke, *University of British Columbia, Vancouver, British Columbia, Canada*

Over the last two decades significant theoretical, methodological and empirical developments have explored the social, biological and cultural dimensions of our bodies as we grow older. An earlier concern within social gerontology that a focus on the bodies of older people represented a return to biological determinism and an overly medical approach has been replaced by a realisation how a focus on ageing bodies offers a novel lens to examine a range of existing sociological and theoretical concerns. These include the nature of the body, self and ageing; social identities and social inequalities; lived experiences and everyday life; health and illness; and ageing across the lifecourse from midlife to deep old age. The analysis of ageing bodies has also operated as a focal point for interdisciplinary work that draws together research across the arts, humanities and social sciences.

It is over twenty years since the absent body in gerontology was highlighted. It is therefore timely to bring together academics and researchers to review the wealth of work in this area and to explore and develop key debates, enhance current and emergent theoretical perspectives, disseminate empirical research and outline future directions for research in 'Ageing, Body and Society'. The papers presented within this symposium contribute to a special issue *Ageing Body and Society: Critical Perspectives, Future Challenges* to be published in the *Journal of Aging Studies* edited by Dr Wendy Martin and Professor Julia Twigg who are also Co-Convenors of an international study group *Ageing, Body and Society* which is within the British Sociological Association (BSA).

UNACKNOWLEDGED DISTINCTIONS: CORPOREALITY AND EMBODIMENT IN LATER LIFE

P. Higgs, C.J. Gilleard, *University College London, London, United Kingdom*

The social science focus on the body has had a growing influence in ageing studies. 'Corporeality' and 'embodiment' are terms used in exploring the relationship between the body and society. In this paper, we argue for making a clear distinction between these two terms. Corporeality, we suggest, is best used to refer to the role of the body as a structure whose identity and meaning is mediated by culture and society, while embodiment might best be used to refer to the use of the body by social actors in realising distinctions, identities and lifestyles. This distinction helps sharpen the difference between studies that address self and others' reactions to physical changes in bodily function which can be attributable to ageing, age associated illness or impairment and studies that explore the 'performances' of ageing including the various realisations of identity and lifestyle in later life.

TRACKED AND FIT: FITBITS, BRAIN GAMES, AND THE QUANTIFICATION OF THE AGING BODY

S. Katz^{1,2}, B. Marshall^{1,2}, 1. *Sociology, Trent University, Toronto, Ontario, Canada*, 2. *Centre for Aging and Society, Peterborough, Ontario, Canada*

This paper explores the technical turn to new ways of quantifying and standardizing measurements of age as these intersect with discourses of anti-aging and speculative futures of 'smart' quantified aging bodies. Often couched in a metaphorical language of 'smart', 'fit', 'boosting' and 'optimizing', the aging body is emerging as a node for data collection, monitoring, and surveillance. The research is located in the current literature that links aging, bodies and technologies, with specific extended examples of wearable devices such as fitness trackers and digital exercises and games designed for memory performance. Original research data are drawn from an analysis of design, marketing and promotional materials as well as qualitative user interviews. Based on such data, conclusions suggest that new technologies around aging and quantifiable fitness create an ambiguous image of the aging body and mind as both improvable but also inevitably in decline.

VISUAL AND MATERIAL DIMENSIONS OF HEALTH, RISK, AND THE AGEING BODY IN EVERYDAY LIFE

W. Martin¹, K. Pilcher², 1. *Brunel University London, Uxbridge, United Kingdom*, 2. *Aston University, Birmingham, United Kingdom*

Health practices are performed and understood within the context of the daily lives of people as they grow older. In this paper we highlight the visual and material dimensions of health, risk and the ageing body in everyday life and the ways a focus on everyday objects and technologies evoke narratives of health and well-being. The paper draws on data from the research study *Photographing Everyday Life: Ageing, Lived Experiences, Time and Space*, funded by the ESRC, UK. This includes: (1) the role of objects and technologies associated with food practices and how participants draw on wider discourses of health and risk; (2) the embodied performance and visual representations of being 'active' signified by everyday objects e.g. shoes, clothes and sports equipment; and (3) the incorporation of objects and technologies into routine health practices of daily life - taking medication/supplements, and self-surveillance techniques around body weight and chronic conditions.

DOES GENDER GET OLD?

T.M. Calasanti, N. King, *Virginia Tech, Blacksburg, Virginia*

That men and women become more alike with age is often noted but rarely examined. We explore one aspect of this assertion, using interview data among people (N=19) aged 41–61 to ask whether masculinity and femininity become less relevant with age. Our examination of discussions of masculinity and femininity—their own and that of their peers—reveals, first, that manhood and womanhood are rooted in naturalized bodies. Second, these gender ideals are based on youthful standards. Third, respondents see masculinity and femininity shifting, for good and for ill with age as bodies change. We conclude that, while popular ideals

of gender are based on youthful bodies, older persons still see themselves as men and women. De-gendering does not occur.

SESSION 3805 (SYMPOSIUM)

ACCELERATING THE PACE OF CHANGE IN THE U.S.: ACHIEVING A HIGH PERFORMING LONG TERM CARE SYSTEM

Chair: S.C. Reinhard, *AARP*

Co-Chair: M. Abrams, *The Commonwealth Fund, New York, New York*

Discussant: M. Juring, *The Scan Foundation, Long Beach, California*

The aging of the population is not just insular to the United States. It has global implications as people, in some parts of the world, are living longer and healthier lives. In 12 years, the leading edge baby boomers will enter their 80s, the age group most likely to need long-term services and supports (LTSS) in the United States. However, the United States has no national long-term care policy or system. The current system for financing and delivering LTSS is largely uncoordinated, fragmented, hard to understand and difficult to navigate. Although many countries face similar challenges when it comes to financing and delivering LTSS, their approach to resolving these challenges are often very different.

To accelerate systematic change, two philanthropic organizations and the largest membership organization for older people in the world (AARP) developed a unique multi-dimensional approach to measure LTSS performance from the perspective of consumers and their families. This partnership also developed promising practices and tool-kits, which will provide practical insight into novel public policies and/or practices that helped states to accelerate the pace of change in the United States. The inclusion of the promising practices will address critical areas of improvement; facilitate information sharing among states, and spark international discussions and approaches to confront the needs of a global aging society.

ACCELERATING THE PACE OF CHANGE IN THE U.S.: ACHIEVING A HIGH PERFORMING LONG TERM CARE SYSTEM

S.C. Reinhard, J.C. Accius, *Public Policy Institute, AARP, Laurel, Maryland*

In a decade, the leading edge baby boomers will enter their 80s, the age group most likely to need long-term services and supports (LTSS). However, the United States has no national long-term care policy or system. To accelerate systematic change, two philanthropic organizations and the largest membership organization for older people in the world (AARP) developed a unique multi-dimensional approach to measure LTSS performance from the perspective of consumers and their families. State systems in the United States are scored across five dimensions: (1) affordability and access, (2) choice of setting and provider, (3) quality of life and quality of care, (4) support for family caregivers, and (5) effective transitions across settings of care. This paper articulates six years of progress & trends in state LTSS reform, while identifying areas of ongoing, needed improvement.

PICKING UP THE PACE OF CHANGE TO SPARK GLOBAL SOLUTIONS

J.C. Accius¹, S.C. Reinhard¹, M. Juring³, M. Abrams², 1. *Public Policy Institute, AARP, Laurel, Maryland*, 2. *The Commonwealth Fund, New York, New York*, 3. *The SCAN Foundation, Long Beach, California*

The delivery and financing of long-term services and supports (LTSS) vary across the globe. The current system in the United States is fragmented and difficult for individuals and families to navigate and access. The wide disparities across states and gaps in support can affect millions of people who encounter a fragmented, expensive LTSS system, often with little choice of setting or care. However, states are transforming their LTSS systems to meet the growing needs of an aging population. Based on the 2017 LTSS State Scorecard, this paper focus on four promising practices to accelerate the pace of change: 1) Aging and Disability Resource Centers; 2) LTSS balancing initiatives; 3) Preventing Long Nursing Home Stays; and 4) Family Caregivers. The inclusion of the promising practices will address critical areas of improvement, facilitate information sharing, and spark international discussions and approaches to confront the needs of a global aging society.

SESSION 3810 (SYMPOSIUM)

SOCIAL NETWORKS AND HEALTH AMONG DIVERSE OLDER ADULTS

Chair: K.M. Abbott, *Miami University*

Discussant: H. Green, *RAND Corporation, Santa Monica, California*

Human socialization patterns naturally change over the lifespan and the ability to maintain relationships with others is a crucial marker of wellness later in life. However, our knowledge of how characteristics such as race, gender, and health status affect relationship formation, maintenance, and dissolution among older adults is not clear. In this symposium, we explore the social networks and health of diverse older adults through five innovative studies. First, using longitudinal data from a community-based sample of 416 adults aged 60 and older, we present a study examining the differential implications of social network types for older men and women. Second, the mediating role of neighborhood gender composition between social networks and health is presented for $n=65$ Black and $n=192$ White men age 55 and older. Third, four waves of data from the Longitudinal Aging Study Amsterdam are used to predict if network composition (kin vs. non kin) impacts the receipt of informal care. Maintenance of social integration is a rapidly growing concern for older adults, as well as their caregivers. Therefore, our fourth study includes 76 spouse and adult child informal caregivers of individuals with dementia are explored for group differences on burden, depression, stress, and grief. Lastly, a study of how $n=55$ assisted living residents perceive their quality of social support are presented using social network mapping and semi-structured interviews. This sample included participants who were 47% Black with 65% having moderate to severe cognitive impairment. Dr. Hank Green will integrate findings, highlighting implications for policy and practice.

SOCIAL NETWORK TYPOLOGIES AND HEALTH IN LATE LIFE: THE MODERATING ROLE OF GENDER

K.L. Fiori¹, H.R. Fuller², 1. *Psychology, Adelphi University, Garden City, New York*, 2. *North Dakota State University, Fargo, North Dakota*

Social network typologies have been used in recent years to assess how the multidimensional confluence of older adults' social ties are linked to health and well-being. Using longitudinal data from a community-based sample of 416 adults aged 60 and older, the purpose of the present study was to examine the differential implications of social network types for older men and women. A cluster analysis using structural, functional, and qualitative network variables revealed four network types: diverse, high community involvement, low community involvement, and restricted. Overall, individuals in the restricted network types reported the highest levels of depressive symptoms and lowest self-rated health over time (controlling for age, marital status, ADLs, and baseline levels). However, interactions with gender revealed that men in restricted networks reported particularly low levels of well-being. In contrast, women in diverse networks rated their health much higher than men in these networks. Implications for targeting interventions are considered.

RACE, GENDER, AND SOCIAL NETWORKS: THE ROLE OF NEIGHBORHOOD CONTEXT AND IMPLICATIONS FOR HEALTH

N.J. Webster¹, K.J. Ajrouch², L. Tighe¹, T.C. Antonucci¹, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *Eastern Michigan University, Ypsilanti, Michigan*

This study investigates the mediating role of neighborhood gender composition on links between men's social networks, race, and health. Data from the metro-Detroit based Social Relations Study (2005), include a sample of Black ($N=65$) and White ($N=192$) men age 55 and older. Black men reported a lower proportion of friends in their networks than White men. This association was mediated by neighborhood gender composition, as: 1) living in neighborhoods with a higher proportion of women was associated with lower network proportion of friends; 2) Black men were more likely than White men to live in higher proportion women neighborhoods; and 3) the race-network proportion friends link became non-significant when controlling for neighborhood gender composition. A lower proportion of friends in network was then associated with higher body mass index, often an early indicator of health problems. Findings highlight the role of socio-environmental context in shaping Black men's later life vulnerabilities.

SOCIAL NETWORK TYPE AND INFORMAL CARE USE: A COMPARISON OF THREE BIRTH COHORTS.

B. Suanet, M.I. Broese Van Groenou, T. Van Tilburg, *Sociology, VU University Amsterdam, Amsterdam, Netherlands*

Studies have extensively examined care received in kin relationships, but have often disregarded non-kin ties. Recent societal changes are likely to have increased the salience of non-kin relationships. Those in friend-focused networks might thus be equally or more likely to receive any informal care compared to those in family-focused networks in the later birth cohorts. Data from the Longitudinal Aging

Study Amsterdam (LASA) are used (75–84 years, 1908–1917, N=550 and 1918–1927, N=270, four observations 1992–2002 and 2002–2012, respectively) to study this premise. Multi-group path analysis shows that in the early birth cohort, being in a friend-focused network has a negative cross-sectional effect on receiving informal care and a positive three-year lagged effect. In the late cohort, older adults in family- and friend-focused are equally likely to receive informal care. Further studies could study whether the mechanisms that underpin informal care provision in kin and non-kin relationships are changing.

DIFFERENCES IN BURDEN SEVERITY IN ADULT-CHILD AND SPOUSAL CAREGIVERS OF PERSONS WITH DEMENTIA

G. Epstein-Lubow^{1,2}, B. Gaudiano^{1,2}, G. Tremont^{1,3}, M. Broughton^{1,2}, S. Salloway^{1,2}, I. Miller^{1,2}, 1. *Brown University, Providence, Rhode Island*, 2. *Butler Hospital, Providence, Rhode Island*, 3. *Rhode Island Hospital, Providence, Rhode Island*

Objective: There is increasing attention to the nature and sources of burden experienced by family caregivers of persons with dementia. This study aimed to test whether adult-child family caregivers of persons with dementia suffer greater perceived burden than spousal caregivers.

Methods: Family caregivers were recruited during care-recipient clinical treatment; the settings of care included an outpatient memory care program and an inpatient geriatric psychiatry service. Demographic information and screening measures for burden, depression, stress, and grief were collected. Statistical analyses were conducted to determine group differences.

Results: Seventy-six participants were recruited (42 adult-child, 34 spousal caregivers). Results showed that adult-child caregivers reported greater burden as compared with spousal caregivers. There were no group differences regarding depressive symptoms, perceived stress or grief. After controlling for demographic differences and location of care, being an adult-child caregiver remained a significant predictor of greater burden severity.

Conclusions: Being an adult-child family caregiver may place an individual at increased risk for experiencing high burden.

NATURE AND MEANING OF SOCIAL TIES AMONG ASSISTED LIVING RESIDENTS AT THE END OF LIFE

M.M. Perkins^{1,2}, S.N. Halpin¹, M. Salvador Comino¹, M.M. Ball¹, C.L. Kemp³, P.J. Doyle⁴, A.E. Vandenberg¹, T.E. Quest¹, 1. *Emory University School of Medicine, Atlanta, Georgia*, 2. *Birmingham/Atlanta VA Geriatric Research, Education, and Clinical Center (GRECC), Atlanta, Georgia*, 3. *Gerontology Institute, Georgia State University, Atlanta, Georgia*, 4. *The SHELTER Group, Baltimore, Maryland*

Social network size and quality of perceived social support are associated with overall well-being in late life. Our research on end-of-life in assisted living (AL) shows that size of residents' social support networks tends to decrease as cognitive impairment increases. Using Year 1 data from a 5-Year NIA-funded study (1R01AG047408-01A1) focusing on 55 residents with cognitive impairment from four

diverse AL communities, we investigate the nature and meaning of these shrinking networks. Residents' mean age is 87 (range=71–103); 47% are African American and 62% are female. The Montreal Cognitive Assessment shows that more than half (65%) have moderate-to-severe cognitive impairment. Thematic analysis shows that some residents draw strength through reminiscence and spiritual ties they maintain with deceased family and friends. As "comrades in illness," others report feelings of isolation related to a lack of meaningful interaction with co-residents. Findings have implications for strengthening social support at end-of-life in AL.

SESSION 3815 (SYMPOSIUM)

SIBLING RELATIONSHIPS IN THE MIDDLE AND LATER YEARS: VARIATIONS BY RACE, CULTURE, AND NATIONALITY

Chair: M. Gilligan, *Iowa State University, Ames, Iowa*
Co-Chair: V.H. Bedford, *University of Indianapolis*

Discussant: A. Lowenstein, *Max Stern Yezreel Valley College*

In this symposium, we consider the roles of siblings in the lives of adults in the middle and later years, using data collected from several nations and from Black and white families within the U.S. All four studies use within-family approaches to explore the ways in which ties within the sibship and with other family members affect adult children's relational and psychological well-being. In the first paper, Bedford and Avioli use data from the U.S. to examine how relationships with other siblings affects twins' dyadic closeness in adulthood. In the second, Rosendahl uses data from Sweden to examine how siblings' relationships with one another are shaped by whether twins are perceived as "units" by other family members. Next, Horge-Freeman uses data from Salvador, Bahia, and Brazil to investigate the role of racial features (skin color, hair, nose shape) in parents' differential treatment of their children, and the long-term consequences of such differentiation on emotional, behavioral and material well-being. Finally, Gilligan, Sutor, Rurka, and Holst use data collected in the U.S. from Black and white families to explore the consequences of sibling death on the sibling relations and psychological well-being of surviving adult children, with particular focus on variations by race and timing of the loss. Taken together, these studies show that the family dynamics that shape both sibling relationship quality and the consequences of sibling relations on well-being are far more similar than different across races, cultures and nationalities.

INFLUENCES ON THE QUALITY AND DYNAMICS OF TWIN RELATIONSHIPS: FOCUSING ON NONTWIN SIBLING INFLUENCES

V.H. Bedford¹, P.S. Avioli², 1. *University of Indianapolis, Indianapolis, Indiana*, 2. *Kean University, Union, New Jersey*

Relationships weigh in powerfully, both positively and negatively, on the well being of adults. We explore a potential contributor to better and worse relationships in the case of twins, potentially the longest relationship of all. Specifically, we ask how other relationships impact on the dynamics and quality of the twinship, with a focus on nontwin sibling

influences. Exploring effects of family and friends in a broader study, we elicited narrative descriptions, thereby generating multiple case studies of twins, aged 33 to 76. Using thematic qualitative analyses, results indicated that (1) the relationship most influential varied widely across twinships, (2) dominant effects of the nontwin sibling on dynamics were potential triangulating and boundary intrusion, both of which the twin respondent recognized and actively fought to avoid (usually successfully), and (3) on twinship quality were primarily the enhancement of closeness and bonding, often resulting from negative nontwin experiences. Implications are discussed.

TWINSHIP FROM A FAMILY PERSPECTIVE— EXPERIENCES OF ADULT TWINS, THEIR NON-TWIN SIBLINGS AND PARENTS

S. PietiRosendahl, *Malardalen, Eskilstuna, Sweden*

Twins do not exist apart from a family and, for a more comprehensive understanding, twinship needs to be seen in its family context. The objective of this study was to explore twinship from the perspectives of adult twins, their non-twin siblings and parents. **Methods:** Qualitative methodology based on semi-structured interviews of middle-aged twins, their non-twin siblings and parents within their families. The data were analyzed using qualitative content analysis. **Findings:** Twinship was described by the twins as an emotionally close relationship with the co-twin but also feeling unnoticed as individuals when treated as a ‘unit’ by family members. Likewise, the older non-twin siblings could feel unnoticed, due to the parental attention given to the twins and, to compensate, take on a ‘caregiving role’ for the twins. Depending on the parents’ insights on twinship, they could facilitate or limit the development of the sibling relationships within the family.

THE CONSEQUENCES OF DIFFERENTIAL TREATMENT BASED ON RACIAL FEATURES FROM CHILDHOOD TO ADULTHOOD

E. Hordge-Freeman, *University of South Florida, Tampa, Florida*

This presentation examines how differential treatment based on racial features (skin color, hair texture and nose shape) in one’s family may have enduring consequences. Relying on research conducted through 116 semi-structured interviews and ethnography in fifteen phenotypically diverse Afro-Brazilian families conducted in Salvador, Bahia, Brazil, I explore the ways that racial socialization (discursive strategies, concrete practices and affective exchanges) often stigmatizes people who possess black racial features and leads to differential treatment among people in the same family. Capturing the lifelong consequences of differential treatment based on racial appearance, interviews with adults (siblings and parents) illustrate how differential treatment translates into differences in one’s access “affective capital.” These differences in affective capital give rise to unique emotional, behavioral, and material consequences that continue to have an impact throughout people’s lives. I end by discussing the relevance of this international study for families and adults in the United States.

CONSEQUENCES OF SIBLING DEATH ON PSYCHOLOGICAL AND RELATIONAL WELL-BEING IN ADULTHOOD

M. Gilligan¹, J. Suito², M. Rurka², M. Holst¹, 1. *Human Development and Family Studies, Iowa State University, Ames, Iowa*, 2. *Purdue University, West Lafayette, Indiana*

In the present paper, we explore the consequences of sibling death on surviving adult children’s psychological well-being and the quality of their relationships with their remaining siblings. Data were collected from ~800 adult siblings nested with ~400 families as part of the second wave of the Within-Family Differences Study. Nearly a quarter of the adult children in the WFDS panel experienced the loss of a sibling at some point in their lives. Using the combination of quantitative and qualitative data collected from surviving siblings, we examine how sibling loss affects relational and psychological well-being, as well as how these outcomes differ by timing of the death and race. Preliminary findings reveal that sibling death predicts depressive symptoms regardless of the timing, whereas the effects on sibling relations occur only for more recent losses. Further, the consequences of sibling loss on both outcomes are greater in Black than white families.

SESSION 3820 (SYMPOSIUM)

NEW DIRECTIONS IN SPIRITUALITY, RELIGION, AND AGEING

Chair: M.L. Johnson, *University of Bristol, Bristol, United Kingdom*

Co-Chair: V.L. Bengtson, *University of Southern California, Los Angeles, California*

There has been a resurgence of research in spiritual dimensions of aging in recent years. In part this has been driven by increasingly robust findings linking health and religiosity, and in part the impetus has come from an awareness of benefits to elders of spiritual practices ranging from contemplative prayer to yoga. In this symposium an international group of scholars present findings from their own research related to these topics. First, Merrill Silverstein and Vern Bengtson use data from the 45-year Longitudinal Study of Generations to examine the relationship between health and religious orientations, finding interesting patterns of self-reported change in spirituality and religion in later life. Malcolm Johnson explores data about the changing relationships between old age and spirituality, their implications for ‘biographical pain’ in the context of life review in old age and for end of life care in late old age. Neal Krause presents data on the biological correlates of three different types of religiously-oriented forms of helping behavior: giving spiritual support to others; drawn from the Landmark Spirituality and Health Survey. Then Biggs will critically analyze the role of spirituality and belief as a road-map for a long life. He will seek to locate the roles attributed to religiosity in later life and compare it to alternative versions of meaning and purpose currently associated with adult ageing.

SPIRITUALITY AND LIFE REVIEW AT THE END OF LIFE IN OLD AGE

M.L. Johnson, *School for Policy Studies, University of Bristol, Bristol, United Kingdom*

The Third and Fourth ages of life bring an increasing preoccupation with our inner selves, our capacity to live with our own pasts and the increasing losses of the present. These spiritual matters are central to the wellbeing of the newly expanded numbers of the very old and in turn of the health of the societies in which they live. Learning to live with ourselves and our past and future as we approach the end of life, is not simply a matter of private reflection. Nor is spirituality confined to those in faith communities. This presentation will explore the dimensions of our spiritual selves as explored through life review to enhance later life. It will consider the unseen 'iceberg' of 'biographical pain'. The earlier findings will be incorporated into findings from current research on end of life care in care homes, commissioned by Public Health England.

HELPING OTHER PEOPLE AND HEALTH

N.M. Krause, *University of Michigan, Ann Arbor, Michigan*

The purpose of this presentation is see if other people bolsters the health of the support provider. Evidence in favor of this proposition comes from three papers that assess three different types of religious helping behavior: giving spiritual support (spiritual support is assistance that is given in order to enhance the religious beliefs and behaviors of the recipient), praying for others, and performing volunteer work. Health is measured with three biological outcomes: cholesterol, C-reactive protein, and resting pulse rates. The data for all three papers comes from the Landmark Spirituality and Health Survey. The findings suggest that providing each type of religiously-oriented support is associated with more favorable health (i.e., lower levels of cholesterol, lower levels of C-reactive protein, and lower resting pulse rates). A theoretical rationale for why helping others conveys health benefits will be provided.

SPIRIT AND BELIEF AS A ROADMAP FOR A LONG LIFE?

S. Biggs, *Melbourne University, Melbourne, Victoria, Australia*

Life in a time of flux concerning the purpose and legitimizing identities associated with longevity, has led to a series of proposals for filling these extra years. While a policy consensus has emerged that extra years of work might be the answer, this leaves open questions about the role of intergenerational relations, vulnerability and engaging with finitude. An alternative discourse based on belief proffers answers to these questions which may require closer engagement by critical forms of gerontology. The degree to which these competing narratives offer a roadmap for a long life will be discussed.

SPIRITUAL DEVELOPMENT IN LATER LIFE: PERSPECTIVES FROM A 45-YEAR LONGITUDINAL STUDY

V.L. Bengtson^{1,2}, M. Silverstein³, 1. *Roybal Institute on Aging, University of Southern California, Santa Barbara, California*, 2. *University of Southern California, Los*

Angeles, California, 3. *Syracuse University, Syracuse, New York*

How does spiritual engagement or religious involvement change with age? An accumulating body of evidence says there is spiritual development in later life, supporting psycho-developmental theories of James, Jung, and Erickson. This study examines such change with data from both survey and in-depth interview responses from the Longitudinal Study of Generations, a study that began in 1970–1 with 2044 family members from 364 three-generation families. Data for this analysis come from the Wave-9 surveys in 2016, along with intensive interviews with 70 individuals 65–95 from a variety of religious and non-religious backgrounds. Results indicate complex trajectories of both change and continuity as individuals reflect on their religious and spiritual biographies following retirement. In the qualitative data we find three patterns of spiritual and religious change reported by respondents: (1) increase over the past 10 years (the most common pattern); (2) stability—maintaining the same level of spiritual and religious involvement as in mid-life; (3) decrease—declining or dropping out of religious engagement. We discuss these findings in terms of both life-course personality theories and social integration/support theories.

SESSION 3825 (SYMPOSIUM)

SUCCESSFUL AGING IN VERY OLD AGE: THE ROLE OF ACTIVITIES

Chair: D.S. Jopp, *University of Lausanne, Lausanne, SCHWEIZ, Switzerland*

Discussant: I. Skoog, *University of Gothenburg*
D. Spini, *Universite de Lausanne*

Since the beginning of the investigation of successful aging activity engagement has been discussed as a key factor. While empirical evidence suggests positive effects of activity engagement in younger old age, less is known about the role of activities in very old age. This symposium tries to close this gap by presenting findings on the importance of activities for successful aging from four international samples with very old individuals. Studies consider different types of activities (e.g., current vs prior leisure activities) as well as different successful aging outcomes including cognitive functioning, functional ability, and well-being. Specifically, Falk and Skoog investigated functional (dis)ability in two cohorts of Swedish 85-year old individuals and the impact of leisure activities. While disability in basic activities of daily living decreased, disability in instrumental activities increased over cohorts; reduced social involvement in the latter cohort may be associated with less IADL capacity. Jopp et al. examined the effect of prior activities on cognitive functioning in two cohorts of the Heidelberg Centenarian Study. Cognitive functioning was higher in the more recent centenarian cohort; prior activities were linked with higher cognitive functioning. Lampraki and Jopp investigated current leisure activities in the Fordham Centenarian Study. Religious and social-public activities were associated with lower depression; social-private activities and technology use were associated with better cognition. Araujo et al. examined leisure activities in the Oporto Centenarian Study. Findings indicated associations between religious activities and well-being. In sum, findings confirm the importance of activity engagement for successful aging in very old age.

FUNCTIONAL DISABILITY AND ABILITY IN SWEDISH 85-YEAR-OLDS — A COMPARISON OF THREE COHORTS BORN 20 YEARS APART

H. Falk^{1,2}, I. Skoog^{1,2}, 1. *Institute of Neuroscience and Physiology, Sahlgrenska Academy at the University of Gothenburg, Gothenburg, Sweden*, 2. *Centre for Ageing and Health (AgeCap) at the University of Gothenburg, Gothenburg, Sweden*

Functional disability is an important issue in very old age. There is some evidence that more recently born individuals have a higher capacity regarding instrumental and basic activities of daily living (IADL, ADL) and that activity involvement may have preventive effects. This study investigated ADL and IADL and leisure activities in two population-based samples of 85-year-olds. Using identical methods, 494 85-year olds were assessed in 1986–87, and 571 85-year olds were assessed 2008–09. Findings indicate that ADL disability decreased across cohorts ($P < 0.001$), but IADL disability increased ($P < 0.05$). Involvement in seniors associations and other associations decreased for women ($P < 0.05$), while reading books regularly was reported more often ($P < 0.001$). In sum, results indicate that although later born cohorts are better equipped to maintain independence in terms of ADL, increased IADL disability and decreased social participation require action to adapt structures and services to the needs of ageing populations.

THE ROLE OF ACTIVITIES FOR COGNITIVE FUNCTIONING: FINDINGS FROM THE HEIDELBERG CENTENARIAN STUDIES

D.S. Jopp¹, K. Boerner², C. Rott³, 1. *Institute of Psychology, University of Lausanne, Lausanne, SCHWEIZ, Switzerland*, 2. *University of Massachusetts, Boston, Massachusetts, 3. Heidelberg University, Heidelberg, Germany*

Cognitive functioning is essential for maintaining independence in very old age. With more individuals reaching very old age, factors that could prevent age-associated loss in cognition are increasingly important. The present study compared levels of cognitive functioning in two cohorts of centenarians and investigated the role of prior activities in the total sample as well as by cohorts, comparing the population-based First ($n = 91$, born 1900/1, Mage = 100.22 years) and Second ($n = 95$, born 1910/1, Mage = 100.48 years) Heidelberg Centenarian Studies. Cognitive functioning (measured by a shortened Mini-Mental State Examination) was higher in the more recent centenarian cohort. Regression findings indicated that living in a care facility was negatively associated with cognition whereas activities and health were positively associated. However, cohort-differential patterns were found for health and activities. Findings indicate better functioning in more recent centenarian cohorts and suggest greater importance of lifestyle in today's centenarians.

ACTIVITIES ENABLE SUCCESSFUL AGING IN VERY OLD AGE: FINDINGS FROM THE FORDHAM CENTENARIAN STUDY

C. Lampraki^{1,2}, D.S. Jopp^{1,2}, 1. *University of Lausanne, Lausanne, Switzerland*, 2. *Swiss National Centre of Competence in Research LIVES, Lausanne, Switzerland*

Engaging in leisure activities in older adulthood is assumed to be a critical factor for successful aging. This paper

investigated activity patterns in the Fordham Centenarian Study ($N = 119$; Mage = 99.25, 95–107 years). Activity categories were identified based on Jopp and Hertzog (2010): social-private, social-public, religious, and experiential activities, crafts, games, sports, and mentally stimulating activities/technology use. Social-private activities were reported most often (68%), followed by mentally stimulating activities (60%). The total number of activities was strongly positively correlated with cognitive functioning, and negatively correlated with depression. Regression analyses revealed that more health-related restrictions and less engagement in religious and social-public activities were associated with higher depression, while higher engagement in social-private activities and technology use were linked with higher cognitive functioning. In sum, despite their advanced age, centenarians stay engaged in various activities, with higher engagement being associated with better well-being and cognitive functioning.

RELIGIOUS SOCIAL ENGAGEMENT AND VALUATION OF LIFE IN PORTUGUESE CENTENARIANS

L. Arajo^{1,2}, L. Teixeira², O. Ribeiro^{2,3,4}, C. Paul², 1. *ESEV, CI&DETS.IPV, Viseu, Portugal*, 2. *CINTESIS, UNIFAI, ICBAS, Porto, Portugal*, 3. *University of Aveiro, Aveiro, Portugal*, 4. *ISSSP, Porto, Portugal*

In very advanced age, successful aging becomes more and more difficult, for instance because age-related losses challenge the possibility to remaining socially engaged. This study analyzes the activity engagement patterns of Portuguese centenarians and its relation with well-being. A sample of 89 centenarians (Mage= 101.1 years, SD=1.4, range: 100–105) from the PT100 Oporto Centenarian Study was considered. Results demonstrated that the majority of the centenarians performed religious activities (94.4%), with 80 individuals (89.9%) praying and 34 (38.2%) going to the church. Regression analyses indicated that religious social engagement was related to Valuation of Life, even when the contribution of health (i.e., diagnosis and ADL) was considered. In sum, findings point to the salience of spirituality in well-being in centenarians and to further explore the contribution of transcendence for capturing social successful aging phenomena in centenarians.

SESSION 3830 (PAPER)

REHABILITATION AND QUALITY OF LIFE

EFFECTS OF A HOME-BASED REHABILITATION PROGRAM ON HEALTH-RELATED QUALITY OF LIFE

J. Edgren^{2,1}, A. Salpakoski³, M. Kallinen^{4,7}, M. Arkela⁵, K. Kokko^{2,1}, R. Nikander^{1,6}, T. Rantanen^{2,1}, S. Sipilä^{2,1}, 1. *Department of Health Sciences, University of Jyväskylä, Jyväskylä, Finland*, 2. *Gerontology Research Center, University of Jyväskylä, Jyväskylä, Finland*, 3. *Research and Development, Mikkeli University of Applied Sciences, Mikkeli, Finland*, 4. *Department of Medical Rehabilitation, Oulu University Hospital, Oulu, Finland*, 5. *Department of Physical and Rehabilitation Medicine, Central Finland Central Hospital, Jyväskylä, Finland*, 6. *GeroCenter Foundation for Aging Research and Development*,

Jyväskylä, Finland, 7. Center for Life Course Epidemiology Research, University of Oulu, Oulu, Finland

Health-Related Quality of life (HRQoL) decreases after a hip fracture (HF) and may remain low for a long time. Knowledge is needed on effective rehabilitation strategies after HF. Purpose of this study was to investigate the effects of individualized home-based rehabilitation on HRQoL among community-dwelling older people after HF.

Population-based clinical sample of over 60-year-old men and women operated for HF (n=81, mean age 80 years, 78 % women) were randomly assigned into control (standard care) and intervention groups on average 70 (SD 28) days after discharged to home. The year-long intervention included an evaluation and modification of environmental hazards, guidance for safe walking, non-pharmacological pain management, progressive home exercise program, physical activity counseling and standard care. HRQoL was assessed by RAND-36 questionnaire at baseline and 3, 6, 12, 18 and 24 months thereafter. GEE models were constructed.

No significant differences were observed between the study groups in health, cognitive or physical characteristics or HRQoL at baseline. The intervention had significant effect over standard care in energy-fatigue dimension of HRQoL (group*time interaction $p=0.026$). Baseline score for energy-fatigue dimension was 53.0 (SD=22.5) for the intervention (IG) and 56.8 (23.4) for control group (CG). Respectively, scores at 12 months were 64.3 (21.3) and 61.4 (26.5). Additionally, emotional well-being dimension improved significantly during the 24-month follow-up ($p=0.047$).

Individualized home-based rehabilitation improved energy-fatigue dimension of HRQoL among community-dwelling older people after HF. Additionally, emotional well-being dimension improved during the follow-up. Further research is needed to define the optimal intervention to improve post fracture HRQoL.

IS HIP FRACTURE REHABILITATION FOR NURSING HOME RESIDENTS COST-EFFECTIVE? RESULTS FROM AN RCT

B. Kaambwa¹, J. Ratcliffe¹, M. Killington¹, E. Liu¹, I. Cameron², S. Kurrle², O. Davies¹, M. Crotty¹, 1. *Flinders Health Economics Group, Flinders University, Adelaide, South Australia, Australia*, 2. *University of Sydney, Sydney, New South Wales, Australia*

Organised multidisciplinary rehabilitation after hip fracture is costly but likely to improve outcomes for nursing home patients who frequently suffer with dementia. Cost-effectiveness evidence of such rehabilitation is however lacking. Using data from nursing home residents who were walking (independently, with aids or with assistance) prior to fracture, we examined the relative cost-effectiveness of post-operative outreach rehabilitation compared to usual nursing home care. An economic evaluation was conducted alongside a randomised controlled trial with 240 patients: intervention (post-operative rehabilitation) (n = 121) or usual care (n = 119) with 4 weeks and 12 month follow-up (at this stage, only 4-week results are reported in the paper). The primary and secondary outcomes were incremental costs per unit improvement in mobility (measured using the Nursing Home Life-Space Diameter - NHLSD) and incremental costs per quality adjusted year (QALY) based on the DemQoL-Proxy,

respectively. Mean Australian total healthcare costs were higher in the intervention compared to usual care by \$1,750/patient. Mean NHLSD scores and QALYs were also higher in the intervention (by 2.71 and 0.0023/patient, respectively) resulting in incremental cost-effectiveness ratios of \$645/unit improvement in the NHLSD and \$760,870/QALY gain. At a willingness-to-pay (WTP) threshold of \$3,000 per unit improvement in the NHLSD, there was an 80% chance that the intervention was the cost-effective option. Compared to usual care, post-operative rehabilitation leads to increased mobility at a low WTP threshold and is also associated with higher QALYs. Further research should consider the cost-effectiveness of an extended post-operative rehabilitation intervention in this population.

OUTPATIENT PHYSICAL THERAPY IN ICELAND: ARE WE FACING THE POPULATION AGING?

S.A. Arnadottir, *Department of Physical Therapy, Faculty of Medicine, University of Iceland, Reykjavik, Iceland*

The purpose of this research was to explore if outpatient physical therapy (OPT) is facing the expanding population of older adults (65 years and older). The research was based on total population data from a national registry with information on all OPT clients reimbursed by Icelandic Health Insurances from 1999 to 2015 (N=172071); and general population data from the Statistics Iceland registry. Fisher's exact or Chi-square tests were used to evaluate statistical significance. Results show that in 1999, older adults accounted for 18.9% of all OPT clients in Iceland while in 2015 they had increased to 24.6% (OR =1.40, 95%CI=1.34-1.45). This increase cannot be fully explained by aging of the Icelandic population, as the proportion of older adults increased from 11.6% to 13.9% from 1999 to 2015. In 1999, 62.4%, 32.4%, and 5.2% of older adults receiving OPT were 65-74, 75-84, and 85+ years, respectively, and 35.5% were men (population proportions in 1999 for same age-groups were: 56.3%, 33.2%, and 10.5%; and 45% were men). In 2015, 53.7%, 34.4%, and 11.9% of older adults receiving OPT were 65-74, 75-84, and 85+ years, respectively, and 37.8% were men (population proportions in 2015 for same age-groups were: 56.8%, 30.1%, and 13.1%; and 47.4% were men). Comparing older adults receiving OPT in 1999 to 2015 reveals, increasing proportion of clients being in older age-groups ($p<.001$) and rising proportion of men ($p=.007$). This case of Iceland presents a growth in older adults seeking OPT service and increased need for geriatric expertise in the field.

WALKING ADAPTABILITY TREADMILL TRAINING IN OLDER ADULTS WITH A FALL-RELATED HIP FRACTURE

M. Roerdink¹, M. van Ooijen^{1,3}, M. Trekop², T.W. Janssen^{1,3}, P.J. Beek¹, 1. *Human Movement Sciences, Vrije Universiteit Amsterdam, Amsterdam, Netherlands*, 2. *PW Janssen, Zorggroep Solis, Deventer, Netherlands*, 3. *Amsterdam Rehabilitation Research Center | Reade, Amsterdam, Netherlands*

The ability to adjust walking to environmental context is often reduced in older adults and falls are common in this population. Adaptability treadmill training (ATT) was developed to practice step adjustments relative to context

projected on the belt (e.g., obstacles and targets), while concurrently exploiting the great amounts of walking practice associated with conventional treadmill training (CTT). In an open RCT with 70 older adults rehabilitating from a fall-related hip fracture, we compared the feasibility, amount of walking practice and efficacy for improving walking ability and reducing fear of falling and fall incidence of six weeks inpatient ATT (n=24), CTT (n=23) and usual physical therapy (UPT, n=23). ATT, CTT and UPT were all well-received by our heterogeneous, frail and multi-morbid sample of older adults (83.3±6.7years). ATT and CTT groups performed significantly more steps per training session (803 and 847, respectively) than participants receiving UPT (343). All groups showed similar improvements in walking ability, fear of falling and general health. Fall incidence was lower in CTT and ATT than in UPT (albeit non-significant). CTT showed stronger improvements in Functional Ambulation Category while ATT showed lower dual-task interference on walking speed. Subgroup analyses revealed several intervention effects favoring ATT and CTT, indicating superiority over UPT for those with low tolerated walking distance (pre-fracture) and low executive function. Future well-powered studies should identify characteristics of individuals who are likely to respond well to CTT and ATT. Such studies are advised to provide sufficient training contrast among interventions and to clinically assess walking adaptability.

HIP FRACTURE REHABILITATION FOR PEOPLE LIVING IN NURSING HOMES: RESULTS OF A RCT

M. Crotty^{1,2}, M. Killington^{1,2}, E. Liu^{1,2}, I. Cameron³, S. Kurrle³, B. Kaambwa¹, J. Ratcliffe¹, M. Chehade⁴, 1. *Flinders University, Adelaide, South Australia, Australia*, 2. *Repatriation General Hospital, Adelaide, South Australia, Australia*, 3. *Sydney University, Sydney, New South Wales, Australia*, 4. *Adelaide University, Adelaide, South Australia, Australia*

Background: It is unclear whether people living in nursing homes benefit from post acute rehabilitation and few trials are done with this group who often suffer dementia. In a group of nursing home residents who were managing to walk (independently, with aids or with assistance) prior to fracture, our aim was to determine whether post-operative rehabilitation (which included a comprehensive geriatric assessment and interdisciplinary rehabilitation program) delivered in nursing homes would improve mobility compared to receiving usual nursing home care.

Methods/Design: Post operatively people admitted from nursing homes with hip fractures were randomly allocated to receive a 4 week geriatric rehabilitation program (minimum 3 visits per week) or usual care. The primary outcome was mobility. Outcomes were measured at 4 and 12 months.

Results: 240 patients were randomly allocated to treatment (n=121) and control (n=119) groups. All measurements were balanced by the randomization at baseline. The average age was 88.6 years (SD 5.6, Range 70–101) with 10% (24) of participants aged over 95 years. At 4 weeks those in the treatment group walked better than those in the control group (mean difference 1.9, 95% CI: 0.6–3.3, p=0.0055). At 12 months outcomes did not differ between treatment and control groups.

Discussion: Even in frail older people post operative comprehensive geriatric assessment and a 4 week program of multidisciplinary rehabilitation can be tolerated and will produce benefits.

QUANTITATIVE RESEARCH METHODS: SAMPLING AND DATA INTERPRETATION

OPTIMIZING DETECTION OF WITHIN-PERSON EFFECTS ON AGING-RELATED OUTCOMES: BENEFITS OF MULTILEVEL SEM

J. Rush¹, P. Rast², S.M. Hofer¹, 1. *University of Victoria, Victoria, British Columbia, Canada*, 2. *University of California, Davis, Davis, California*

Intensive repeated measurement research designs (e.g., daily diary) are frequently used to investigate within-person variation in aging-related outcomes over relatively brief intervals of time (e.g., days, weeks). These designs allow variance to be partitioned into within-person (WP) and between-person (BP) sources of variability, enabling differential effects to be observed at the WP and BP level of analysis. With the increased use of these designs, attention to the optimization of measurement and design features for capturing and predicting systematic WP variation is required. The majority of research on aging utilizing intensive measurement designs rely on composite scale scores, which assumes that the constructs are measured without error. As variance is partitioned into WP and BP variance, measurement error (i.e., unsystematic WP deviations) is confounded with systematic WP variance. Failing to account for such error inflates the amount of WP variance and has the potential to bias WP estimates. An alternative approach makes use of multilevel structural equation modeling (SEM), which permits the specification of latent variables at both WP and BP levels. These models disattenuate measurement error from systematic variance and should produce less biased WP estimates and larger effects. Multilevel composite scores and SEM models were compared through a series of Monte Carlo simulations. Data were generated to examine the models under varying conditions (i.e., scale reliability, occasions, and cluster size). Differences in power, precision, and bias were examined with results revealing that bias was greater in the composite score model than the SEM model, particularly when reliability was low. Implications for the trade-offs between these two approaches will be discussed in terms of aging and health outcomes.

RECRUITMENT OF MIDLIFE AND OLDER ADULTS FOR MENTAL HEALTH AND PHYSIOLOGICAL MEASURES

M.R. Crowther^{1,2}, C.D. Ford^{2,3}, L.D. Vinson⁴, C. Huang⁵, E. Wayde⁶, S. Guin⁷, 1. *Department of Psychology, The University of Alabama, Tuscaloosa, Alabama*, 2. *Alabama Research Institute on Aging, The University of Alabama, Tuscaloosa, Alabama*, 3. *Capstone College of Nursing, The University of Alabama, Tuscaloosa, Alabama*, 4. *U.S. Department of Veterans Affairs, Alexandria, Virginia*, 5. *Center for Palliative and Supportive Care,*

Department of Medicine, University of Alabama at Birmingham, Birmingham, Alabama, 6. VHA National Center for Organization Development, Cincinnati, Ohio, 7. Department of Community and Rural Medicine, The University of Alabama, Tuscaloosa, Alabama

Community and academic partners in rural West Alabama collaborated to increase healthcare access among rural mid-life and older adults. This interdisciplinary healthcare team utilized a mobile unit to provide health screenings and behavioral assessments. The establishment of trust and respect early in the partnership provided a foundation for community engagement and played an intricate part in effectively mobilizing the unit. Providing services via the mobile unit served as an effective way to address issues related to access to care and availability of healthcare providers. It also presented an opportunity for the detection and prevention of mental and medical illness that can be easily assessed by screening measures. Furthermore, when the medical issues were linked to health outcomes, such as metabolic syndrome (MSX) and cognitive impairment, the mobile unit helped promote both physical and mental well-being among rural mid-life and older adults. Descriptive analyses and analysis of variances (ANOVA) were performed to assess the effect of gender, race, and community on the number of MSX risk factors. Results of a three-way ANOVA revealed a significant interaction between gender, age and community on the number of risk factors; post hoc analyses indicated rural communities with lower social economic status (SES) and predominantly African American residents were at greater risk for developing MSX compared to communities with higher SES. The mobile unit provided a great way to engage mid-life and older adults while offering preventive health screenings in rural communities.

CONTEXTUALIZATION OF SURVEY DATA: WHAT DO WE GAIN AND DOES IT MATTER?
