Rationale and Evidence for Extended Infusion of Piperacillin–Tazobactam

Evidence from pharmacokinetic–pharmacodynamic and pharmacoeconomic studies point to four-hour infusions of piperacillin–tazobactam as superior to 30-minute infusions. But the clinical evidence amassed to date on this strategy of extended antibacterial infusion provides relatively weak support.

Pharmacy Residency and the Medical Training Model: Is Pharmacy at a Tipping Point?

Not yet, if one considers the entire pharmacy profession, according to a member of the ASHP Board of Directors and the director of the Society’s Accreditation Services. If one narrows the view to hospital or health-system pharmacy, then the answer is maybe.
