ABSTRACTS

The Gerontological Society of America
67th Annual Scientific Meeting
November 5–9, 2014
Washington, DC

Abstracts are arranged numerically by session and in the order of presentation within each session.

SESSION 5 (SYMPOSIUM)

GERONTOLOGY EDUCATION COMPETENCIES AND ACCREDITATION: ACCOMPLISHMENTS, CONSIDERATIONS AND PROGRESS

Chair: J.C. Frank, *University of California, Los Angeles, Los Angeles, California, University of Southern California, Los Angeles, California*
Co-Chair: H. Sterns, *University of Akron, Akron, Ohio*

This symposium will focus on efforts led by the Association of Gerontology in Higher Education (AGHE) in revitalizing the national consensus based competencies for gerontology education and the steps to date in the developmental process of gerontology education programmatic accreditation. Competency development was anchored in the seminal work of Wendt, Peterson and Douglass (1993) and the more recent competency standards of related fields. The AGHE competency process included input from both internal and external stakeholders to reach consensus. The competencies span the foundations, core processes and applications to settings where gerontologists work, including research and education. The goal of accreditation is to ensure that education provided by institutions of higher education meets acceptable levels of quality. Accreditation also offers some buffer to many of the challenges facing higher education today. During the symposia, individual papers will provide an overview of the competency development process; the final set of AGHE national consensus based competencies for gerontology education; a summary of the feedback received during the comment period on accreditation by Society and AGHE members; the challenges of higher education and the potential benefits of accreditation for the field of gerontology; and next steps. Ample time will be reserved for audience questions and discussion.

AGHE NATIONAL CONSENSUS-BASED GERONTOLOGY EDUCATION COMPETENCIES

J.C. Frank[1,2], J. Damron-Rodriguez[1], *1. University of California, Los Angeles, Los Angeles, California, 2. University of Southern California, Los Angeles, California*

AGHE built consensus for the new gerontology education competencies by using a tiered "circle of influence" method, beginning with AGHE leadership and extending to AGHE members for further internal review and vetting; followed by external input from key stakeholders including colleagues, employers, affinity organizations and older adults. With each of the widening circles of critique and comment, feedback was systematically reviewed, grouped, vetted and much was incorporated into the revision of the competency document. In addition, a number of town hall discussions, presentations, and small group discussions were held over an 18 month period. The competencies were anchored on the seminal work of Wendt, Peterson and Douglass (1993) and are applicable to all levels of higher education. The AGHE Competency Workgroup defined gerontologists in this way: "Gerontologists improve the quality of life and promote the well-being of persons as they age within their families, community and society through research, education and application of interdisciplinary knowledge of the aging process and aging populations". During this symposium, we will review the process, and steps taken to assure inclusiveness and transparency during the developmental phases of this work; and premier the final set of gerontology education competencies. Examples of utilizing the competencies for curricula development, mapping and competency-based outcome evaluation will be provided.

SECURING THE FUTURE OF GERONTOLOGY IN HIGHER EDUCATION: A PROVOST'S PERSPECTIVE ON THE NEED TO PROFESSIONALIZE GERONTOLOGY

R. Wacker, *Provost, University of Northern California, Greeley, Colorado*

The articles in the special edition of Gerontology & Geriatrics Education (2012), Accreditation in Gerontology: Opportunities and Challenges, captured the many sides of the ~40-year-old debate regarding the wisdom of establishing accreditation for gerontology programs. Is it time to move forward? This paper will present an administrative perspective about why the changing context of higher education, including the reduction of public support, the commensurate increase of private/tuition funding, and the heightened accountability for programmatic outcomes; necessitates accreditation for gerontology programs to secure the future of gerontology as a profession.

PROGRESS AND PROCESS: ACCREDITATION FOR GERONTOLOGY

H.L. Sterns, *1. Institute for Life-Span Dev. & Gerontology, The University of Akron, Akron, Ohio, 2. Northeastern Ohio Medical University, Rootstown, Ohio*

This presentation will review the activities of the AGHE Task Force on Accreditation which is an interdisciplinary group of gerontologists under the guidance of the AGHE Executive Committee and GSA Council. A summary of the feedback received during the comment period on accreditation by GSA and AGHE members will be presented. The development of competencies is seen as an essential step in development of dimensions for academic program evaluation and was carried out by the Sub Committee on Competencies. The Sub Committee on Organization is exploring approaches to the development of an accreditation process. Major issues in the development of accreditation will be presented as well as plans to seek input on developing consensus on an accreditation process from gerontology education programs.

SESSION 10 (SYMPOSIUM)

CONSUMPTION PRACTICES IN LATER LIFE: IDENTITY, ACTIVITIES AND DIVERSITY

Chair: M. Hyde, *Stress Research Institute, Stockholm, Sweden*

Despite the growth of the mature market and the evidence that current generations of older people are heavily engaged in consumer culture, consumption practices in later life remain under-researched. Yet consumption is increasingly central to later life and social gerontologists ought to understand how this impacts on the identities and activities of older people as well on wider social environments. If, as some have claimed, the cultures of the third age are constructed through consumption, it should be possible to explore these cultures and their associated consumerist lifestyles through the study of later life consumption practices. To explore this Gilleard and Higgs outline four areas where consumerism sustains, or develops, such cultures: cosmetics and clothing, entertainment and leisure, travel and tourism and information and communication technologies. In their paper on how the accumulation of possessions impacts on residential relocation amongst older Americans Ekerdt and Baker explore the potentially oppressive nature of consumption. Evans and Hyde take a historic perspective and examine time trends in shopping activities for older and younger Americans using data from ten years of the American Time Use Survey. Finally Allen, Hillcoat-Nalletemby and Phillips look at business attitudes to older consumers. This symposium will advance our understanding of consumption practices in later life by bringing together new empirical data with the theoretical debates in third age studies. This is an important yet underdeveloped area of research that is of interest not only to gerontologists but also to other disciplines such as market research, tourism and leisure studies.

CONSUMERISM AND THE THIRD AGE

C. Gilleard, P. Higgs, *UCL, London, United Kingdom*

If lifestyle consumerism is one key element determining the cultures of the third age, we argue, it is displayed most evidently in the consumption of non-essential goods and services such as black goods, eating out and entertainment, fashion, holidays, self-care products and travel. In this paper we present evidence of changing patterns in non-essential household consumption over the last half century, amongst the over-fifties, demonstrating how a 'silver' market has expanded over this time from a very small base post-war and is now occupying a commanding position within most developed economies. Despite the growth of consumer-led later lifestyles, however, youth rather than age provides the dominant image selling most non-essential goods and services, at the same time extending an anti-ageing message to ever younger segments of the adult population. Such contradictions remain central, we suggest, to the cultures of the third age.

POSSESSIONS HAVE AGENCY IN LATER LIFE

D. Ekerdt, L. Baker, *Univ of Kansas, Lawrence, Kansas*

The arrangement of the material world can act upon people quite aside from their having created that world in the first place. Belongings, accumulated over a lifetime for various reasons, become an infrastructure within the household. They can congeal into an undifferentiated mass of "stuff" that in turn shapes behavior. The 2010 wave of the Health and Retirement Study asked older Americans whether their possessions are an obstacle to residential relocation. Altogether, 77% of persons aged 60+ said they were very or somewhat reluctant to move given the effort it would take to deal with their things. Reluctance to move was stronger the more commodious, peopled, affluent, and long-established the household, and among those with more functional limitations. The positive meanings of possessions and home are an emphasis in gerontology, but anxiety about these matters also deserves research. Impingement by the material environment is one of the predicaments of consumption.

SHOPPING PATTERNS FOR OLDER AMERICANS FROM 2003-2012: EVIDENCE FROM THE AMERICAN TIME USE SURVEY

E. Evans[1], M. Hyde[2], *1. Psychology, University of Liverpool, Liverpool, United Kingdom, 2. Stress Research Institute, Stockholm University, Stockholm, Sweden*

Shopping is a key everyday activity for people of all ages. Yet, despite evidence that older people are increasingly engaged in consumer culture, consumer studies are still overwhelmingly focused on younger age groups. Consequently almost nothing is known about the shopping patterns of older people, whether these have changed over time or vary for different groups of older people. To redress this, data from 10 years of the American Time Use Survey (2003-2012) were used to explore time trends in the time spent shopping between and within age groups. The results show that, apart from the oldest and youngest groups, age differences in time spent shopping have largely disappeared. However, amongst those aged 60 and over differences by gender, income, marital status and age persist. Understanding the shopping practices of older people may help businesses to become more age-aware and ensure that older people have a positive shopping experience.

BUSINESS ATTITUDES TO OLDER CONSUMERS: MARKET FAILURE OR FAILURE TO MARKET?

M.C. Allen, S. Hillcoat-Nalletamby, J.E. Phillips, *Centre for Innovative Ageing, Swansea University, Swansea, United Kingdom*

The increasing number and proportion of older people within society, many of whom are relatively wealthy compared to younger generations, signals potential opportunities for businesses. The older consumer market segment has been described as the 'silver market', 'golden economy' and 'longevity dividend'. The promise of this new group of older consumers is substantiated by the size of the market and its anticipated growth over time. However, counter to economic reasoning, companies often do not have specific programmes to attract and keep older consumers and struggle to effectively target them, thus potentially losing revenue. This paper will discuss business attitudes towards older consumers given apparent market failure to capitalise on the burgeoning market to date, alongside the changing role of new cohorts of older consumers entering mass consumer culture.

SESSION 15 (SYMPOSIUM)

LIFE ADVERSITY AND THE COURSE OF DEVELOPMENT: A FOCUS ON RESILIENCE PROCESSES

Chair: F.J. Infurna, *Psychology, Arizona State University, Tempe, Arizona*

Discussant: A.J. Zautra, *Psychology, Arizona State University, Tempe, Arizona*

Life adversity can come from many different sources to impact development in adulthood and old age, ranging from early childhood trauma to premature declines in health, caregiving duties, and loss of close social relationships. The goal of this symposium is to bring together a collection of papers that target factors that promote resilience and adaptive coping, despite experiencing life adversity that could adversely affect health and well-being. Jobin and colleagues examine the age-differential role of optimism in old age and found that dispositional optimism protected against increases in depressive symptoms for the young-old, but not old-old, suggesting that optimism is adaptive depending on one's point in the lifespan. Carr examines the role of four different types of emotion-focused coping for facilitating better psychological and social well-being to spousal loss and found that no one strategy is uniformly protective for all outcomes. Infurna and colleagues use daily diary data from participants in midlife and old age and find that early childhood trauma is associated with stronger declines in well-being when confronted with daily stressors and that mastery is a resilience factor promoting more positive outcomes. Ferraro and Morton's results from a national sample of adults indicate that personal control and perceived life trajectories are resilience factors that reduce the likelihood of psychological distress in old age due to major childhood maltreatment. The discussion by Alex Zautra will integrate the four papers, highlight the importance of and various sources of resilience in adulthood and old age, and consider future routes of inquiry.

IS DISPOSITIONAL OPTIMISM ALWAYS ADAPTIVE? A LOOK AT PERCEIVED STRESS AND CHANGES IN DEPRESSIVE SYMPTOMS ACROSS OLDER ADULTHOOD

J. Jobin[1], C. Wrosch[1], M. Scheier[2], *1. Psychology Department, Concordia University, Montreal, Quebec, Canada, 2. Carnegie Mellon University, Pittsburgh, Pennsylvania*

Dispositional optimism is often associated with favourable outcomes but contextual conditions for adaptive self-regulation (e.g., opportunities and resources) may change across older adulthood (Carver, Scheier & Segerstrom, 2010; Heckhausen, Wrosch & Schulz, 2010). We expected that dispositional optimism would serve adaptive functions among young-old adults, but may lose its adaptive value among older-old adults. This 6-year longitudinal study examined associations between age, optimism, perceived stress, and depressive symptomatology across four waves using an age-heterogeneous sample of 172 community-dwelling older adults (64 – 90 years old). Results indicated that dispositional optimism protected against increases in depressive symptoms over time in young-old adults, but not among older-old adults. Within-person associations further demonstrated that optimism protected young-old (but not old-old) individuals from experiencing depressive symptoms if the perceived higher-than-normal stress. These results imply that optimism benefits young-old adults, but may lose its adaptive function in older-old adulthood. Implications for successful aging will be discussed.

PSYCHOSOCIAL RESILIENCE IN THE FACE OF LATE-LIFE SPOUSAL LOSS: WHICH COPING TACTICS ARE MOST PROTECTIVE?

D. Carr, *Institute for Health, Health Care Policy, and Aging Research, Rutgers University, New Brunswick, New Jersey*

Problem-focused coping (PFC) is considered a more effective strategy than emotion-focused coping (EFC) when managing major life stressors. Yet when the stressful event is irreversible and cannot be altered, such as spousal loss, EFC is considered particularly effective. Scholars have not identified the specific EFC tactics that are most protective for older bereaved spouses, nor have specific EFC tactics been linked with distinctive aspects of psychosocial resilience. Using data from the Changing Lives of Older Couples (CLOC) study, a longitudinal survey of recently bereaved older adults, I prospectively explore the effects of four aspects of EFC (religious coping, denial, positive reappraisal, and distraction) on two aspects of psychological (depressive symptoms, psychological well-being) and social (informal and formal social integration) well-being. Analyses are adjusted for baseline mental health and demographics. Results show that no one strategy is uniformly protective for all outcomes. Implications for theory and practice are highlighted.

CHILDHOOD TRAUMA IS ASSOCIATED WITH GREATER EMOTIONAL REACTIVITY TO DAILY NEGATIVE AND POSITIVE EVENTS: THE ROLE OF MASTERY

F.J. Infurna, C. Rivers, J. Reich, A.J. Zautra, *Psychology, Arizona State University, Tempe, Arizona*

Childhood trauma increases one's likelihood of premature health declines in midlife and old age. Relatively little is known, however, regarding pathways underlying this relationship. Using data from a 30-day daily diary of participants in Midlife (n=191, Mage =54, SD=7.50, 46% women), we examined whether childhood trauma is associated with emotional reactivity to daily negative and positive events as a pathway linking childhood trauma to health and the moderating role of mastery. Childhood trauma was associated with stronger decreases in well-being with negative events and stronger increases in well-being with positive events. For those reporting childhood trauma, higher levels of personal mastery were associated with stronger decreases in well-being with negative events and stronger increases in well-being with positive events. We discuss emotional reactivity as one pathway linking childhood trauma to health, and psychosocial resources to consider when building resilience-promoting interventions for mitigating the detrimental health effects of childhood trauma.

ANTECEDENTS OF LIFE COURSE RESILIENCE AFTER MAJOR CHILDHOOD MALTREATMENT

K.F. Ferraro, P.M. Morton, *Center on Aging and the Life Course, Purdue University, West Lafayette, Indiana*

Considerable research reveals that some types of childhood misfortune are a long-term threat to optimal aging. Nevertheless, some persons face extensive misfortune and thrive. This presentation explicates and tests plausible explanations for optimal aging in the face of major maltreatment during childhood. Using data from a national sample of adults who suffered repeated acts of physical and/or emotional abuse as children, results reveal that personal control was associated with a lower likelihood of psychological distress in adulthood. Whether for victims of physical or emotional abuse, personal control reduced the likelihood of neuroticism, negative affect, and psychotropic drug use in later life. The analysis highlights the role of psychosocial resources to successfully adapt to major forms of child abuse.

SESSION 20 (SYMPOSIUM)

RESEARCH BASED POLICY INITIATIVES TO REDUCE HOSPITAL & NURSING HOME TRANSITION, A STATE PERSPECTIVE

Chair: S. Spoelstra, *College of Nursing, Michigan State University, East Lansing, Michigan*
Discussant: S. Szanton, *John Hopkins University, Baltimore, Maryland*

Transitions among settings can influence quality-of-life, cost, and mortality, and are often precipitated by sentinel events like abuse or falls; however, some are due to the lack of services or use of evidence-based-care. Many state policies are not research based, and often do not focus on minimizing or preventing transitions. Researchers and policymakers need to form relationships to guide research to improve these policies. This symposium will highlight research efforts to improve policies for elderly across the State of Michigan. Each participant will bring a unique perspective to the issue, reporting on factors that influence transitions, as well as identifying strategies for translating evidence-based interventions to minimize transitions. Dr. Given will describe transitions and support services across the state; and integrated care policies in first presentation. Next, Dr. Pickering will present on injury related care transitions by nursing home residents and examine the usefulness of transitions as a quality indicator. Ms. DeKoekkoek will then explore the impact of a Nursing Facility Transition Initiative moving patients from the nursing home into the community; what factors differs among settings; transitions experienced; and policies needed to broaden this program. Next, Dr. Spoelstra will report on a translational research project implementing evidence-based pain, medication management, strength and balance, depression and environmental interventions; and policy changes needed for statewide implementation. Finally, the discussant, Dr. Szanton, an aging researcher, with experience working with CMS, will emphasize how these presentations underscore the need for research based policy initiatives and the need for working relationships with policymakers.

HOSPITAL ADMISSIONS FROM NURSING HOMES AND RETURNS: PATTERNS AND COSTS OF CARE

C.W. Given[1], K. Oberst[2], H. An[2], *1. College of Human Medicine, Michigan State University, East Lansing, Michigan, 2. Michigan State University The Institute For Health Policy, East Lansing, Michigan*

Among dually eligible custodial care nursing home patients, how do diagnoses, functional conditions and transition supports explain admissions and 15 and 30 day re-admissions to Michigan hospitals? Using Medicare and Medicaid claims to identify cardio-pulmonary exacerbations and uncontrolled infections as sentinel conditions (which account for 28% of admissions to US hospitals), this presentation will examine how diagnoses, length of hospital stay are related to discharge to; alternative location (home assisted living) skilled nursing home unit and days in that unit, followed by return to custodial care. Patient function and cognition, physician visits, together with nursing home characteristics will be included to further explain these transitions and the range of annualized costs per patient.

INJURY RELATED CARE TRANSITIONS AS AN INDICATOR OF QUALITY IN NURSING HOMES

C.E. Ziminski Pickering, *College of Nursing, Michigan State University, East Lansing, Michigan*

Nursing home (NH) residents account for 2.2 million emergency department (ED) visits annually with 18% of these visits injury related, leading some to suggest ED care transitions should be used as a quality indicator of NH performance. Fractures and falls are two quality indicators currently used, however they are not fully representative of the scope of injuries which occur in NHs. This project describes injury related ED care transitions by NH residents and examines its usefulness as a quality indicator. Through use of Medicare, Medicaid and MDS data, analysis will examine longitudinal outcomes of NH residents with an ED injury visit. The hypothesis guiding analysis is that NH residents who experience an injury related ED visit are more likely to experience poor outcomes than those who did not. Findings will be presented.

HEALTH CARE USE AFTER NURSING HOME DISCHARGE

T. DeKoekkoek[1], C.W. Given[2], H. An[2], M. Schueller[1], S. Spoelstra[1], *1. Michigan State University College of Nursing, East Lansing, Michigan, 2. Michigan State University Department of Family Medicine, Institute for Health Policy, East Lansing, Michigan*

The State of Michigan serves nearly 20,000 disabled and elderly low-income in a home and community based waiver, providing services to assist living in the community. A Nursing Facility Transition Initiative (NFTI) assists nursing home residents, who prefer to return home, to receive transition support and waiver services. Nursing home placement is costly and associated with a constellation of negative outcomes for older adults, and most older adults prefer to live in the community. We describe the sample and report on 10-years of data comparing NFTI and regular waiver clients performance in walking, transferring, toileting, and their short-term memory loss. The purpose is to determine if those factors influence number, type, or hours of waiver services, reimbursement of NFTI, and 12-month outcomes of: return to nursing home, ER, or hospitalization so that we can recommend policy modifications for NFTI and waiver to the State. Findings will be presented.

TRANSLATING EVIDENCE-BASED CARE IN A STATE WAIVER PROGRAM TO REDUCE TRANSITIONS

S. Spoelstra, *College of Nursing, Michigan State University, East Lansing, Michigan*

Disability reflects a gap between an individual's abilities and the environment in which they function, and is the primary modifiable factor in preventing institutionalization. We report on a pilot study testing dissemination and implementation of a proven intervention, intervening directly on pain, medication management, strength and balance, depression and the home environment, in the State of Michigan waiver program to reduce re-institutionalization. We are enrolling 20 clients who were hospitalized or nursing home within the past 14-days, and providing the intervention plus usual waiver services. We will compare those 20 to a match (age, race, gender) cohort from 2012 who were in the hospital or nursing home and received usual waiver service. Our key outcome of interest is re-institutionalization (hospital or nursing home). Our hypothesis is that low-income disabled older adults who receive the intervention plus usual care will manifest fewer readmissions. Enrollment is ongoing. Findings will be presented.

SESSION 25 (SYMPOSIUM)

MENTAL HEALTH DISPARITIES IN RACIALLY AND ETHNICALLY DIVERSE POPULATIONS

Chair: G. Kim, *The University of Alabama, Tuscaloosa, Alabama*
Discussant: J. Jackson, *University of Michigan, Ann Arbor, Michigan*

As our nation becomes more racially and ethnically diverse, understanding mental health needs of racially/ethnically diverse elderly groups becomes more important. Given that the National Institute on Aging (NIA) has been putting strong efforts to reduce disparities in physical and mental health outcomes and health care between racial/ethnic minorities and nonminorities, this symposium assembles a panel of experts to address racial/ethnic disparities in mental health and mental health care across the life course. The main objectives of this symposium are to (1) address current issues of racial/ethnic disparities in mental health and mental health care among older adults, (2) understand some determinants of mental health and mental health care disparities across the life course, and (3) discuss ways to reduce existing mental health disparities among racial/ethnic minorities. Experts in the field will address various topics on mental health disparities including, but not limited to, longitudinal trends of racial/ethnic disparities in mental health among older adults and geographic disparities in mental health care disparities. Speakers will discuss not only quantitative approaches to disparities but also qualitative approaches to disparities. Racial/ethnic minority groups that will be discussed in the symposium include African Americans/Blacks, Latinos/Hispanics, Asians, and/or other groups. In order to address NIA's strong support for using existing secondary data sets, some speakers will also present findings from several major secondary data sets that are publicly available such as Medical Expenditure Panel Survey and Collaborative Psychiatric Epidemiology Surveys.

HEARTS AND MINDS, STRESS AND SUGAR: DISPARITIES AND DIFFERENCES IN MENTAL AND PHYSICAL HEALTH

B. Mezuk, *1. Family Medicine & Population Health, Virginia Commonwealth University School of Medicine, Richmond, Virginia, 2. Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

In this talk I will provide a conceptual overview and review empirical evidence regarding the mechanisms linking mental health and physical health, and how these processes contribute to the development and persistence of disparities in mid- and late-life. Drawing on findings from the Health and Retirement Study, the Epidemiologic Catchment Area Study, the National Health and Nutrition Examination Study, and other surveys, I will describe the latest epidemiologic research regarding the relationships between stress, stress-related psychiatric disorders (i.e., depression and anxiety), and cardiometabolic conditions (i.e., type 2 diabetes and cardiovascular disease). Situating these findings in a life course framework that acknowledges the dynamic interplay between individuals and their environment, I aim to provide insight into the etiologic processes that contribute to mental health disparities in later life and suggestions for interventions to mitigate these inequalities.

MEASURING TRENDS IN MENTAL HEALTHCARE DISPARITIES AMONG RACIAL/ETHNIC MINORITY ELDERLY

D.E. Jimenez, *Dartmouth Medical School, Lebanon, New Hampshire*

Background: Disparities in mental health service use by racial/ethnic minority elderly are well-documented. Attention is now turning to the question of whether racial/ethnic disparities in mental healthcare are increasing or diminishing. The net effect of changes in healthcare organization and immigration, along with any explicit policies designed to reduce disparities, is not clear. Methods: Four, two-year longitudinal datasets from Panels 9-14 (2004-2011) of the Medical Expenditure Panel Surveys were combined to estimate trends in racial/ethnic disparities in mental healthcare among older adults (aged 65+) with probable mental health need. Results: African-American-White, Hispanic-White, and Asian-White disparities in any use of mental healthcare remained constant from 2004-2011. Conclusions: The mental healthcare system continues to provide less care to racial/ethnic minority elderly than to older Whites, suggesting the need for policy initiatives to improve services for these racial/ethnic minority groups.

RACIAL/ETHNIC DISPARITIES IN MENTAL HEALTH CARE: DOES GEOGRAPHY MATTER?

G. Kim, *Center for Mental Health and Aging / Department of Psychology, University of Alabama, Tuscaloosa, Alabama*

The purpose of this symposium presentation is to summarize the speaker's research on racial/ethnic disparities in mental health care among older adults, especially focusing on the role of geography. The speaker will present recent findings on geographic disparities from publicly available secondary data sets such as the Collaborative Psychiatric Epidemiology Surveys (CPES), Medical Expenditure Panel Survey (MEPS), and Behavioral Risk Factor Surveillance System (BRFSS). Outcome variables that will be discussed are mental health care service utilization, satisfaction with and perceived benefits from mental health care received, and initiation of mental health care. The speaker will present evidence of significant geographic variation of racial/ethnic disparities in various mental health care outcomes. These findings suggest that in order to reduce racial/ethnic disparities at the national level, improving mental health care and delivery in certain geographic areas (e.g., states or counties) may be essential. Clinical and mental health policy implications will be discussed.

MENTAL HEALTH BENEFITS OF RELIGIOSITY ARE TRANSMITTED INTERGENERATIONALLY

C.M. Abdou, L.L. Brown, *Gerontology, University of Southern California, Los Angeles, California*

Both minority status and SES are associated with poorer childhood outcomes. However, cultural capital is thought to buffer against stress—particularly status-based stressors. Nevertheless, research to date has documented group differences in outcomes without examining cultural processes underlying these differences. This is particularly true of research attempting to understand African American–European American health disparities. In the proposed manuscript, we examine whether the cultural resource of parental religiosity reduces disparities in childhood outcomes. In focusing on religiosity, we build upon prior research demonstrating positive effects of religiosity on mental health and educational outcomes in older lower-income African American and Latino samples. Specifically, we examined the effects of parental religiosity on socioemotional functioning (e.g., sociability, shyness, aggression) in African American, European American, and Latino children at age three, predicting that higher religiosity would be associated with better functioning, especially when parents associate religious beliefs with family care.

SESSION 30 (SYMPOSIUM)

CONTEMPORARY APPROACHES TO STUDY COGNITIVE DEVELOPMENT IN THE SECOND HALF OF LIFE

Chair: G. Hülür, *Humboldt University, Berlin, Germany*
Co-Chair: D. Gerstorf, *Humboldt University, Berlin, Germany*
Discussant: C. Hertzog, *Georgia Institute of Technology, Atlanta, Georgia*

The study of cognitive aging has come a long way in helping us better understand the nature and correlates of how central cognitive abilities change in the second half of life. This symposium is devoted to showcasing contemporary endeavors that are geared towards shedding additional light onto key questions the field has been tackling for a long time. In doing so, the symposium compiles empirical papers that move towards within-person considerations of changes in ability structure and fluctuations in performance, a comprehensive assessment of the confounding effects of practice and study dropout, and innovative ways to compensate for cognitive losses. Hülür et al. use data from the Seattle Longitudinal Study to examine cognitive dedifferentiation across the adult lifespan and address this issue from a within-person perspective. MacDonald and Stawski employ data from select measurement bursts to compare different operational definitions of within-person variability and their relations to the psychosocial and health domains. Anstey et al. employ sophisticated models to data from the Australian Longitudinal Study of Ageing to demonstrate how methodological artefacts may have confounded previous findings on late-life memory aging. De Frias will present findings on memory compensation in middle-aged and older adults and highlight the role of mental health, adaptive emotion regulation strategies, and trait mindfulness. The discussion by Christopher Hertzog integrates the four papers, highlights the potentials and limits of these contemporary approaches to better understand cognitive development in the second half of life, and considers future routes of inquiry.

COGNITIVE DEDIFFERENTIATION WITH INCREASING AGE AND PROXIMITY OF DEATH: WITHIN-PERSON EVIDENCE FROM THE SEATTLE LONGITUDINAL STUDY

G. Hülür[1], N. Ram[2], S.L. Willis[3], K. Schaie[3], D. Gerstorf[1,2], *1. Humboldt University, Berlin, Germany, 2. Pennsylvania State University, State College, Pennsylvania, 3. University of Washington, Seattle, Washington*

A central aim of lifespan psychology is to understand ontogenetic changes in the structure of individuals' actions, thoughts, and behaviors. The dedifferentiation hypothesis suggests that the structure of cognitive abilities becomes less differentiated in old age. Although this implies age-related change in the within-person coupling of cognitive abilities, empirical tests have typically approached the issue from a between-person perspective. In the present study, we pursue a within-person test using up to eight repeated measures of fluid, visualization, and crystallized abilities, obtained from 415 participants of the Seattle Longitudinal Study over 49 years. Results revealed that with advancing age and proximity to death, within-person coupling increased (a) among the crystallized abilities, (b) between visualization and fluid abilities, and (c) between visualization and crystallized abilities. In addition, within-person couplings between fluid and crystallized abilities increased with age. We discuss the importance of within-person analyses for understanding changes in the structure of behavior.

A MEASUREMENT BURST APPROACH FOR OPERATIONALIZING AND UNDERSTANDING VARIABILITY MARKERS OF COGNITIVE AGING

S.W. MacDonald[1,2], R.S. Stawski[3], *1. Psychology, University of Victoria, Victoria, British Columbia, Canada, 2. Centre on Aging, Victoria, British Columbia, Canada, 3. Oregon State University, Corvallis, Oregon*

Increasing intraindividual variability (IIV) across reaction time (RT) trials of cognitive tasks share systematic links to aging processes (cognitive and physiological deficits), neurodegenerative pathology (Alzheimer's disease), and brain injury. However, few studies have systematically compared competing operationalizations of variability, decomposed RT variability into labile or stable components, or identified corresponding moderators. We employ data from select measurement burst studies to compare common variability definitions (coefficient of variation, raw and residualized within-person standard deviation), and examine psychosocial and health predictors of RT variability. Preliminary findings demonstrate RT variability both within- and between-persons (ICC range = .34 - .79), and important differences between definitions of variability. Further, psychosocial and health moderators are uniquely associated with slower RT mean and greater RT variability, reflecting potential modifiable risk factors impacting cognitive and brain health. Discussion will focus on the implications of competing variability operationalizations and corresponding moderators for improving our understanding of cognitive aging.

GENDER AND DISTANCE TO DEATH EFFECTS ON LATE-LIFE MEMORY DECLINE: INDIVIDUAL DIFFERENCES OR METHODOLOGICAL ARTEFACTS?

K.J. Anstey[1], K.A. Sargent-Cox[1], M.A. Luszcz[2], *1. Centre for Research on Ageing, Health and Wellbeing, Australian National University, Canberra, Australian Capital Territory, Australia, 2. Flinders University, Adelaide, South Australia, Australia*

Missing data occur in all longitudinal ageing studies, is rarely random, and often occurs in participants with poorer physical health, higher levels of depression, and cognitive decline. Using data collected over four waves of the Australian Longitudinal Study of Ageing (n = 2087 at baseline, mean age = 78), we evaluated trajectories of memory decline using two approaches. First, a typical multilevel model, was used to analyse the data. Second, a multi-level pattern-mixture model that allows the estimation of trajectories of memory decline after adjusting for practice effects, and persistence in the study was used. In the typical model, females had faster memory decline and distance to death influenced observed trajectories. The Pattern-Persistence Model fully explained the effects of gender and distance to death, on memory ageing. These findings suggest that methodological factors may account for some of the individual differences observed in very late-life cognitive ageing.

MEMORY COMPENSATION IN OLDER ADULTS: THE DIFFERENTIAL ROLE OF MENTAL HEALTH, EMOTION REGULATION, AND MINDFULNESS

C. de Frias, *University of Texas at Dallas, Richardson, Texas*

Efforts to identify individual differences in compensatory behaviors are paramount to promoting cognitive resilience in late adulthood. Prior research has examined structural properties and individual growth trajectories of memory compensation. The current study examined associations between everyday memory compensation and three person-level resource domains (i.e., health, emotion regulation, and trait mindfulness) in middle-aged and older adults. In this study, 89 community-dwelling middle-aged and older adults completed the multi-dimensional Memory Compensation Questionnaire, along with measures of health, emotion regulation strategies, and trait mindfulness. Hierarchical regressions showed that poorer mental health was related to more frequent use of select compensatory strategies (e.g., reliance on others for memory assistance, effort investment). Cognitive reappraisers reported using more complex (internal) compensatory strategies. Conversely, having a more mindful predisposition was associated with less frequent use of compensatory strategies. The results suggest that health-related quality of life, adaptive strategies to regulate emotions, and trait mindfulness are additional contexts that determine the degree of engagement in everyday memory compensation.

SESSION 35 (SYMPOSIUM)

THE LEGACY OF LILLIAN TROLL; A TRAILBLAZER FOR FAMILY GERONTOLOGY

Chair: V.H. Bedford, *School of Psychological and Brain Sciences, Indiana University, Bloomington, Indiana*
Co-Chair: K. Fingerman, *University of Texas, Austin, Texas*
Discussant: A. Lowenstein, *Center of Research & Study of Aging, Haifa, Israel*

Lillian Troll died October 24, 2013 at age 98. Her daughter wrote of her death, "she looked at me and smiled. I send that smile to all of you, bearing the warmth and sweetness of her life." This symposium honors the memory of this warm scholar whose astute observations and bold conceptualizations ignited decades of progress in the study of families and aging. The papers presented honor Troll by building on her insights and her interdisciplinary approach. Their authors are fueled by her "mentorship" in the broadest sense of the word. Gatz uses Troll's interest in adults' views of the life course via their understanding of age norms and age bias, by comparing the cohorts of Troll's 1979 survey with a similar sample four decades later. Fingerman et al. builds on Troll's emphasis on the importance of everyday interactions among adult family members. They use a diary technique to examine daily interactions between middle-aged adults and their grown children. Antonucci draws on Troll's creativity, which evolved into a mutual research focus. Antonucci reports findings regarding attachment as a life span concept, how friends and family negotiate their conflicts across the life course, and the role of residential propinquity in these relationships. Suitor et al. piggy-back on Troll's seminal research that demonstrated intergenerational conflict is not pervasive. They apply this method to beliefs about adult children's contact and support of their older parents. Ariela Lowenstein will synthesize these papers with the Troll legacy.

AGE BIAS: FROM SURVEY TO AUTOETHNOGRAPHY

M. Gatz, *Univ of Southern Calif, Los Angeles, California*

Lillian Troll was interested in how people view the lifecourse, how they divide the lifecourse to create age groups, what behaviors are seen as appropriate at different ages, and individual differences in the extent to which one adheres to expectations about what behaviors are age-appropriate or inappropriate. Age is unusual among social categories insofar as—particularly in developed countries with low rates of early life mortality—nearly everyone can expect to become a member of Old Age. Old age thus contrasts with other social categories such as race, ethnicity, gender, or membership in voluntary social groups. This presentation will compare results from Troll's survey of age norms and age bias in 186 adults collected nearly four decades ago to current responses from a sample of similar size and characteristics. Additionally, the talk will review how, as Troll herself aged, she reflected on the experience.

THE LEGACY OF THE UN-MUNDANE: POSITIVE AND NEGATIVE ASPECTS OF DAILY LIFE IN ADULT FAMILIES

K. Fingerman, Y. Cheng, K. Kim, *University of Texas, Austin, Texas*

Lillian Troll described adult family relationships as they occur in real life, including positive and negative daily experiences. Few studies have examined daily life in these ties, however. Middle-aged adults (N = 237) from the Family Exchanges Study completed diary surveys for 7 days regarding activities with grown children. As Troll described, nearly all (96%) middle-aged parents interacted with a grown child that week. Parents reported engaging in the following pleasant activities with grown children at least once: laughing (88%), shared meals (62%), shopping (22%), and watching a movie or sports (51%). Moreover, 34% of middle-aged adults reported being irritated with grown children, 41% worried about a grown child, and 37% reported a child got on their nerves during that week. Grown children affected middle-aged adults' daily experiences. Positive interactions translated into more positive mood and negative interactions were associated with worse better daily mood and more physical symptoms.

LILLIAN'S LEGACY: WHAT WE'VE LEARNED FROM WHAT SHE TAUGHT US

T.C. Antonucci, *University of Michigan, Ann Arbor, Michigan*

Lillian cared about family and friends, good and bad. Living a long life, as Lillian fortunately did, meant she studied many aspects of life. She believed science should start with critical observations and that nothing is too ordinary to study. I will focus on three areas where Lillian provided foundational contributions. In 1976 Lillian wrote of attachment as a life span concept. I will present recent findings on life span attachment. She also spoke of the importance of family and friends and the demilitarized zones they create. I will present recent perspectives on the influence of positive and negative relationship quality with family and friends. And, finally Lillian spoke of the importance of residential propinquity. Recent advances suggest the need to consider both geographic and technological propinquity. These areas benefitted from Lillian's keen observations of life as well as her creative and careful studies of how these phenomena evolve.

USING WITHIN-FAMILY DATA TO ADDRESS 1960S CONCERNS REGARDING THE GENERATION GAP BETWEEN PARENTS AND ADULT CHILDREN

J. Suitor[1], M. Gilligan[2], M. Rurka[4], K. Pillemer[3], *1. Purdue University, West Lafayette, Indiana, 2. Iowa State, Ames, Iowa, 3. Cornell University, Ithaca, New York, 4. Elon University, Elon, North Carolina*

Research on intergenerational relations spanning the 1960s and 1970s was concerned with patterns of contact and support to older parents. This line of work was fueled by concern regarding the social changes occurring across that period, including the civil rights, antiwar, and women's movements, which might lead to conflict with, and abandonment of, older parents. Although research in the 1980s suggested that parents and children typically stayed in regular contact and that children provided care to older parents, questions regarding the availability of adequate care resurfaced as the Baby Boomers' parents entered their later years. Using data from the Within-Family Differences Study, we propose that the substantial degree of variation found in Baby Boomer families suggests that in the 1960s, as well as today, most parents had reliable and supportive relationships with some, although not necessarily all of their adult children.

SESSION 40 (SYMPOSIUM)

WHY AREN'T ALL OLD PEOPLE LONELY?

Chair: C. Victor, *Brunel University, Uxbridge, United Kingdom*

In a speech about older people to the National Children and Adults Services (NCAS) conference on October 18th 2013 the British Health Secretary Jeremy Hunt highlighted the "problem of loneliness that in our busy lives we have utterly failed to confront as a society" and stated variously that "it is a source of "national shame" that as many as 800,000 people in England are "chronically lonely". His suggestion to solve the problem of loneliness in later life is to emulate the 'respect' and explicit inter-generational solidarity he states is articulated within Asian countries and "that every lonely person has someone who could visit them and offer companionship''. Research has consistently demonstrated that loneliness is perceived by 35% of those aged 65+ as a 'normal part of ageing' and 50% expect to get lonelier as they age. There is an extensive body of literature describing loneliness, identifying key risk factors and articulating the negative consequences. Approximately 10% of those aged 65+ report that they are often/always lonely. However this means that two thirds of this age group are not lonely. Despite this body of work, we are still unable to develop effective interventions. By focussing upon those who experience loneliness are we focussing on the wrong group? Would we be better off researching those who do not become lonely? This symposium will focus upon the majority of older people who do not become lonely in order to generate new perspectives on the issue of loneliness in later life

ARE MOST OLDER PEOPLE REALLY NOT LONELY?

C. Victor, *Brunel University, Uxbridge, United Kingdom*

Research into loneliness in later life is dominated by 'prevalence' estimate cross sectional studies; fewer instigations adopt a longitudinal perspective. Studies with 2 data collection points classify older people into four groups: the never lonely; the always lonely; those with worsening loneliness and those with decreasing loneliness. Studies with additional follow up points include a 'fluctuating' category. Using the English Longitudinal Study of Ageing we examine loneliness trajectories for 5000+ people aged 50+. Analysis of changes in loneliness over the 6 years from wave 2 (2004) and wave 5 (2010) using the UCLA loneliness scale demonstrates that 66% are not lonely at any point. Using a self rating loneliness question from wave 1 (2002) to wave 5 (2001) demonstrates that 71% of participants do not rate themselves as lonely at any follow up point. The majority of older people are not lonely and do not become lonely as they age.

WHY ARE NOT ALL OLDER WIDOWED PEOPLE LONELY?

K.M. Bennett, *Psychology, University of Liverpool, Liverpool, United Kingdom*

Loneliness may result from a lack of social contact; from the discrepancy between desired and actual social contact; or arising from the loss of the attachment figure. There is evidence that widows may experience these types of loneliness. One might expect that all older widowed people would be lonely since they have lost their attachment figure and may have reduced social contact. However, using data from a corpus of 236 qualitative interviews with widowed people, I find that 58% are lonely. Many of them discuss how they managed it. The remaining 42% do not report loneliness. I examine the factors that contribute to a) absence of loneliness, b) the reduction or removal of loneliness. The factors fit with an ecological, systems level model, adapted from resilience research. Widowers utilise resources at the individual, community and societal levels. Focusing on these resources offers opportunities to ameliorate the effects of loneliness.

LONELINESS AMONG THE SOCIALLY ISOLATED: FINDINGS FROM THE ENGLISH LONGITUDINAL STUDY OF AGEING

A. Shankar, A. Steptoe, *Department of Epidemiology and Public Health, University College London, London, United Kingdom*

Reduced social contact with others is associated with increased loneliness. There is, however, considerable variation in this and there is limited research examining what factors are associated with feelings of loneliness among those who are objectively isolated. The present analysis used data from wave 5 of the English Longitudinal Study of Ageing to examine the associations between loneliness and age, gender, limiting long-standing illness, wealth, geographical location, personality factors, religious beliefs and perceptions of control in 218 highly isolated individuals. Regression analyses were carried out to examine these associations. Just over 45% of the participants reported never feeling lonely. In univariate analyses, female gender, neuroticism, less perceived control, and greater deprivation were positively associated with loneliness. In multivariate analyses, only neuroticism and perceived control were associated with being lonely. There are differences in reported loneliness even among the most isolated and this may be related to stable personality characteristics.

REFLECTIONS FROM AN ETHNOGRAPHY OF OLDER AMERICANS LIVING ALONE: THE INFLUENCE OF RESOURCES AND AGE SEGREGATION ON LONELINESS

E. Portacolone, *University of California in San Francisco, San Francisco, California, Afghanistan*

This paper suggests two hypotheses that may explain why some older adults living alone do not experience loneliness. The first is that living alone in older age can become so challenging to make the possibility of feeling lonely a luxury. Some older adults live alone have so few resources and so many mounting challenges that they cannot afford to feel lonely. The second is that some older solo dwellers do not experience loneliness because they relocated in age-segregated settings. These suggestions stem from the author's two-year ethnographic investigation of 47 San Franciscans over 75 living alone. The author will compare the take on loneliness of four profiles of older adults living alone distinguished by their amount of resources available and degree of age segregation. The presentation will spur discussions on: (1) the challenging condition of living alone in advanced age in conventional housing; (2) the ambiguous trend towards age segregation.

STRATEGIES TO PREVENT LONELINESS

J. Gierveld, T. Fokkema, *Social Demography,NIDI, The Hague, Netherlands*

About 20 percent of men and women are mildly lonely; another 8 to 10 percent are intensely lonely (Victor et al., 2005). With increasing age, adults are confronted with chronically illness, death of partner and other peers and consequently with higher risks of loneliness. We argue the necessity of loneliness prevention strategies for handling future life events that might trigger the onset of loneliness. Out of the three loneliness coping strategies differentiated (Peplau & Perlman, 1982) we opt for 'improving one's social convoy' by investing time and energy in the quantity and especially in the quality of relationships. We use a process model of coping with loneliness that we tailor to the requirements of adults who are currently not or only mildly lonely. In using this model, we address several phases of the prevention process. Specific attention will be devoted to the main pitfalls associated with each of the phases.

SESSION 45 (SYMPOSIUM)

PANEL ON NEW DIRECTIONS IN SOCIAL DEMOGRAPHY, SOCIAL EPIDEMIOLOGY, AND THE SOCIOLOGY OF AGING

Chair: L. Waite, *University of Chicago, Chicago, Illinois, NORC at the University of Chicago, Chicago, Illinois, Center on Demography and Economics of Aging, Chicago, Illinois*

Discussant: F. Goldscheider, *University of Maryland, College Park, Illinois*

At the request of the National Institute of Aging, the National Research Council's Committee of Population established the Panel on New Directions in Social Demography, Social Epidemiology, and the Sociology of Aging. This panel prepared a report detailing recent contributions and identified new directions of research in the sub-fields. This report resulted from paper presentations and panel discussions. The panel developed a three dimensional conceptual model that include differing levels of analysis, differing development stages, and examples of outcomes of interest along social, institutional, and biographical dimensions. The panel also proposed five recommendations which include: 1) researchers should develop conceptual models for social processes in aging; 2) these models should be used to develop key measures for data collection; 3) models should be promoted in the areas of biomeasures, family relationships, and new technology; 4) the NIA should supplement surveys with people related to the sample group and ensure representation for groups of interest; and 5) transdiscliplinary research should be promoted and encouraged. The symposium will address issues raised by the NRC report. These include how biosocial processes play a role in healthy and unhealthy patterns of aging (Tara Gruenewald) and the strengths and shortcomings of biomeasures (Maxine Weinstein). The other two presentations focus on social and economic contexts. Howard Litwin offers insight at an international level, assessing measures of social networks using both NSHAP and SHARE. Finally, Jacqui Angel and Richard Settersten examine how changes in the social and economic contexts alter the experiences and meanings of aging.

NEW SOCIAL AND ECONOMIC REALITIES OF AGING: OPPORTUNITIES AND CRISES

R.A. Settersten[1], J. Angel[2], *1. Human Development & Family Sciences, Oregon State University, Corvallis, Oregon, 2. University of Texas at Austin, Austin, Texas*

Profound changes in social and economic contexts in the United States and throughout the world have dramatically altered the experiences and meanings of aging. On the social side, we illustrate how the life course has been reconfigured via the shifting boundaries and markers of life periods; the erosion of traditional pathways through education, work, and retirement; and the circumstances and choices of younger cohorts, which differ significantly from past cohorts. We also describe the growing diversity of family and social relationships; their new strengths, vulnerabilities, and ambiguities; and their effects on social support, health, and intergenerational financial exchanges. On the economic side, we illustrate the growing contingencies of retirement for some individuals and groups, and concerns related to public economies and the viability of aging policies and programs. We emphasize the significance of particular policies and programs as levers for both responding to new realities and preparing for the future.

CAPTURING THE INTERPERSONAL MILIEU IN THE SOCIOLOGY OF AGING: CHALLENGES AND OPPORTUNITIES

H. Litwin, *IGDC, Hebrew University, Jerusalem, Israel*

The Final Report on New Directions in the Sociology of Aging assigns social networks a key moderating role in the associations between micro and macro factors, on the one hand, and health and well being outcomes relevant to late life, on the other. The measurement of social networks is an ever changing landscape. This paper explores the costs and benefits of focusing on whole or ego-centered networks, using indirect rather than direct network measures, employing aggregate constructs like "network type" as opposed to individual indicators, and depicting network states versus tracing network change. Networks supply informal transfers (time and money) and facilitate service utilization, but they may also transfer negative properties and/or restrain service use. The implications of the respective methodological choices for the interpretation of study findings and for policy recommendations are illustrated based on findings from major longitudinal databases on aging, particularly SHARE and NSHAP.

BIOSOCIAL INVESTIGATIONS IN THE STUDY OF HEALTHY AGING: WHAT HAVE WE LEARNED? WHAT LIES AHEAD?

T.L. Gruenewald, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

Social scientists have long been interested in identifying biosocial processes that play a role in healthy or unhealthy patterns of aging. Methodological advances continue to facilitate the incorporation of biological measurements into population-based, longitudinal studies of health and aging, as well as smaller-scale experimental and observational investigations. Utilizing efforts to understand the biological embedding of social status as an example, this presentation will highlight some of the theoretical achievements and promises, as well as some of the limitations and challenges, of biosocial investigations. Particular attention will be given to the potential of biosocial investigations for refining life course models of healthy aging as well as the utility of biological measures as surrogate endpoints and early warning signs for intervention. However, some of the methodological limitations and theoretical challenges these studies have raised will also be reviewed in an effort to avoid the pitfalls, and promote the promises, of biosocial research.

BIOMARKERS: IS THE GLASS HALF FULL OR HALF EMPTY?

D. Glei[1], N. Goldman[2], M. Weinstein[1], *1. Georgetown University, Washington, District of Columbia, 2. Princeton University, Princeton, New Jersey*

Over the past 15 or so years, biomarkers have increasingly been incorporated into social surveys. Collecting those biomarkers is a costly investment with complex logistics that can impose significant respondent burdens; are they paying appropriate dividends? Here we raise three points. First, as discussed by Friedman and Kern (2014), we note the need for caution in using biomarkers as endpoints (outcomes): they do not necessarily predict future health and survival. Second, we question how compelling is the evidence showing that biomarkers mediate the relationship between social status and health. And third, we look at the prognostic value of biomarkers for mortality. We see needs for greater replication – can findings be duplicated across datasets?; for comparative studies – do the findings hold up over time and geography?; and for improvements to our strategies for data reduction – our summary scores across biological systems are far from optimal.

SESSION 50 (SYMPOSIUM)

AMBIENT INDEPENDENCE MEASURES FOR GUIDING CARE TRANSITIONS

Chair: K. Wild, *Neurology, OHSU, Portland, Oregon*
Co-Chair: J. Kaye, *Neurology, OHSU, Portland, Oregon*
Discussant: S.J. Czaja, *University of Miami, Miami, Florida*

After age 65, about 70% of Americans will need some long-term care services (adult day services, home care, assisted living, nursing home) to maintain independence. Our research goal has been to develop systems that improve our ability to unobtrusively monitor important health changes due to chronic disease and aging, allowing timely intervention to prevent avoidable loss of independence. We have demonstrated that continuous collection of important health information in the home can enable early identification of clinically significant changes. By collecting additional behavioral and physiological sensor-based data to monitor independence outcomes, the current project evaluates how such technologies may contribute to care transition interventions. These Ambient Independence Measures (patterns of mobility, sleep, medication adherence), collected using unobtrusive sensors distributed throughout an individual's natural living environment, can provide a unique window into the daily functional performance of seniors. In so doing, they allow caregivers, both informal and professional, to base care decisions on objective, systematically assessed real-time activity data at a level that is not attained by current conventional practices. The symposium will present an overview of the AIMS project and its intended goal to test the hypothesis that objective everyday sensed measures may prevent or delay transitions to higher care need. We will then present data from informal and professional caregivers regarding metrics they use in decision making about care transitions. We will discuss specific continuous activity monitoring data as they inform transition decisions. Finally, continuously collected measures of social engagement will be presented as an example of an important predictor of changing care needs.

THE AMBIENT INDEPENDENCE MEASURES FOR GUIDING CARE TRANSITIONS STUDY (AIMS): INTEGRATING TECHNOLOGY AND CLINICAL ASSESSMENT TO BETTER INFORM DECISION MAKING

J. Kaye, D. Austin, J. Petersen, P. Jacobs, N.C. Mattek, N. Larimer, H.H. Dodge, K. Wild, *Oregon Health & Science University, Portland, Oregon*

This presentation orients the audience to the overall project design and novel infrastructure of the Ambient Independence Measures for Guiding Care Transitions study (AIMS). AIMS first tests the ability to capture key functional outcomes (mobility, sleep, socialization, cognition, behavior, medication-taking and wellness) needed to guide care transitions. This is achieved by installing an array of unobtrusive sensors and devices in volunteer's homes: motion-activity sensors, electronic medication-tracker, physiologic sensor 'station', computers and phones. Participants provide weekly Internet-based self-report of life events and health status. Using the longitudinal home-based data, predictive care transition algorithms are iteratively created. In parallel a variety of stakeholders and care teams are assessed to determine the gaps in their information needs to guide optimal decision making and how providing AIMS data may improve their capacity. Subsequently, a RCT of AIMS measures compared to usual care determines if automated continuous measures of function result in optimal care transitions.

CARE PROVIDERS AND CARE TRANSITIONS: FACTORS THAT INFORM DECISIONS ABOUT LEVEL OF CARE

K. Wild, M. Bowman, M. Gregor, A. Seelye, J. Kaye, *Neurology, OHSU, Portland, Oregon*

Decisions about care needs and transitions in levels of care for older adults in long term care facilities depend on coordination between professional staff and family members. Optimally, these decisions are based on evaluations of relevant health and behavioral changes. We held focus groups with professional and informal caregivers to identify the metrics used to inform their decisions regarding changes in care needs. Initial survey-based responses indicated that falls, changes in memory/confusion, and medication adherence were important factors guiding decisions. Themes that emerged from focus group discussions included the reliance on a combination of objective evidence and "gut feelings," differences between family and professional carers' perceptions, and the general fear of transition among residents and their families. Data from in-home monitoring were also seen by professionals as important in documenting the post-transition "positives" such as increased socialization and activity in a safer setting, and overall improvement in quality of life

DESIGN OF AN AMBIENT IN-HOME MONITORING PLATFORM FOR USE IN ASSESSING TRANSITIONS TO HIGHER LEVELS OF CARE

P.G. Jacobs, D. Austin, J. Yeargers, T. Riley, J. Petersen, N. Larimer, J. Kaye, *Biomedical Engineering, OHSU, Portland, Oregon*

In this presentation, we describe the technical aspects of the ORCATECH ambient in-home sensor platform and how we are using this platform to collect behavioral metrics from seniors living independently within their homes. We will describe how infrared (IR) sensors are used to assess mobility including room transitions and walking speeds. IR sensors are also used to assess sleep patterns by placing them above a bed; and they are used in conjunction with door sensors to estimate time spent outside of the home. Computer and phone usage is tracked using both custom and commercial software as we assess how socialization metrics change and can be predictive of a need for higher levels of care. Lastly, we provide an overview of the in-home wireless network and a description of how data is moved from the homes to a remote server where data can be processed.

PREDICTING TRANSITIONS TO HIGHER LEVELS OF CARE AMONG ELDERLY: A BEHAVIORAL APPROACH

D. Austin[1], R.M. Cross[3], P. Jacobs[2], N.C. Mattek[1], J. Petersen[2], K. Wild[1], J. Kaye[1], *1. Neurology, Oregon Health & Science University, Portland, Oregon, 2. Oregon Health & Science University, Portland, Oregon, 3. Oregon State University, Corvallis, Oregon*

Using data collected wirelessly from passive infrared sensors and everyday devices (pill box, phones, computers) strategically installed in the home, we measure and fuse behavioral data collected across multiple key functional areas (activity and mobility, sleep, medication adherence, physiologic trends, and socialization) with traditional standardized clinical assessments and weekly Internet-based self-report data from 150 elders living independently. The data is used to build predictive models such as mixed effects logistic regression models to determine the individual and group factors associated with increased probability of transitioning to higher levels of care. Our working hypothesis is that slower walking speed, less activity, poor sleep and medication adherence, fluctuating weight, and decreased socialization will be important predictors of the need for higher levels of care in the elderly population. These then would be the focus of more informed real-time proactive care planning.

AMBIENT ASSESSMENT OF SOCIAL ENGAGEMENT

J. Petersen, D. Austin, J. Yeargers, T. Riley, K. Wild, J. Kaye, *Oregon Health & Science University, Portland, Oregon*

Social activity is an important part of healthy aging that has been shown to reduce risk of placement in long term care facilities—an undesirable and expensive outcome for many older adults. Given the importance of social activity and the inherent difficulties with measuring social activity levels via surveys, we at ORCATECH are developing a system to unobtrusively monitor social activity. This system detects changes in social engagement that may signal changes in health, cognition, or risk of transition to higher care needs. Currently, we monitor computer usage including applications and websites visited, phone usage, time out-of-home, and total activity levels while home. We will present longitudinal data from each of these social domains, demonstrating the types of data we are collecting and its health implications. Monitoring social engagement may delay or prevent loss of independence as people age.

SESSION 55 (PAPER)

MARRIAGE AND INTIMATE RELATIONSHIPS

THE ROLES OF CONCEALMENT AND PERCEIVED SUPPORT ON MARITAL QUALITY IN COUPLES WITH CHRONIC WIDESPREAD PAIN

K.S. Lyons, K.D. Jones, S. Hiatt, L.M. Miller, *Oregon Health & Science Univ, Portland, Oregon*

Chronic widespread pain (CWP) is a common, debilitating and costly rheumatic pain syndrome that affects primarily women across the lifespan. Research suggests that CWP reduces the ability of the couple to engage in shared activities and the invisibility of illnesses can compromise the supportive context of the couple. Drawing upon the Developmental-Contextual Model of Couples Coping with Chronic Illness (Berg & Upchurch, 2007), the current study examined 191 CWP couples (aged 26 to 81) to determine risk factors for poor couple adjustment. Multilevel modeling was used to control for the interdependent nature of the data and examine both actor and partner effects. Level 1 results indicated that patient and partner relationship quality was moderately correlated (r = .51). Controlling for patient age, length of relationship, and patient physical health, an initial model found higher patient depressive symptoms to significantly predict poorer relationship quality for both members of the couple. However, when measures of concealment and perceived support from partner were included, both concepts were significantly associated with how the couple rated the quality of their relationship with both actor and partner effects. Final models accounted for 50% of the variance in patient relationship quality and 52% of the partner's relationship quality. Discussion will focus on the important roles of dyadic coping and perceived support within couples in the context of CWP.

CONSTRUCTING A SENSE OF COMMITMENT IN "LIVING APART TOGETHER" RELATIONSHIPS IN MID- TO LATER LIFE: LAT PARTNERS RESPONDING TO GENERALIZED OTHERS

K.M. Kobayashi, L. Funk, *University of Victoria, Victoria, British Columbia, Canada*

LAT (Living Apart Together) relationships involve two people in a long-term romantic relationship who choose to live in separate households. Because they tend to lack structural commitments, LAT relationships can be viewed as a manifestation of more voluntary forms of partnership based primarily on emotional bonds, in the context of institutionalized individualism. Despite increasing social acceptance of (and considerable media interest in) non-traditional partnerships, in many ways these relationships are still seen as deviant (and as lacking commitment) by outsiders. In our paper we draw on interpretive analyses of qualitative interviews with 28 mid- to later life LAT couples (56 participants) to explore how these couples construct a sense of commitment in their relationship under these conditions (e.g., responding to both generalized and specific others in rationalizing their relationships). Though participants emphasized specific examples of friends that envy their relationship, they also described more negative reactions from others who expect cohabitation as part of the natural progression of relationships. In response, participants described their commitments as strong, and as rooted, for the most part, in sexual fidelity, mutual exchanges of support, affection, long-term orientation, willingness to work through difficulties, and a history of shared time together. Structural ties, though normally avoided, were also evident among some participants. Ambivalence among some participants with respect to commitment can be explained with reference to their strong desire to maintain independent within their relationship.

CHILDHOOD ANTECEDENTS OF ADULT ROMANTIC ATTACHMENT IN LATE MID-LIFE MEN

C.E. Franz, *Psychiatry, University of California San Diego, La Jolla, California*

Attachment theory has become a key approach for understanding the ontology of close relationships across the life course. For both adults and children, relational/attachment bonds appear to serve multiple purposes ranging from emotional regulation to protection of the species. We examined developmental antecedents associated with romantic attachment in late midlife (age 61) in 994 male twins from the Vietnam Era Twin Study of Aging. Adult attachment was assessed with the Experiences in Close Relationships Inventory (Brennan et al. 1998). Indicators of multiple childhood stressors were assessed in previous data collections. Using mixed effects models, low family warmth (Moos, 1981) and more childhood traumas (Pennebaker, 1988) predicted higher levels of anxious attachment at age 61. Low family warmth and non-white ethnicity predicted higher levels of avoidant attachment. Neither childhood socioeconomic disadvantage nor having parents with a history of legal, drug, alcohol or mental health problems predicted later attachment. When recent stressors were included in the models, however, only the effect of parental warmth remained significant—in part due to significant associations between childhood and current stress. Primarily environmental, not genetic factors, accounted for associations between childhood experiences and adult attachment. Concurrently, men with less secure adult attachment reported fewer confidants, lower happiness with best friend, fewer years in a current intimate relationship, lower satisfaction with the most intimate relationship, greater likelihood of divorce, and higher stress. Thus early experiences had some effect on later life feelings of safety and security in intimate relationships but ongoing experiences remain important.

NEW INTIMATE RELATIONSHIPS AS A RESOURCE FOR INDEPENDENT LIVING IN LATER LIFE

T. Bildtgård[1], P. Öberg[2], *1. Social work, Stockholm university, Stockholm, Sweden, 2. University of Gävle, Gävle, Sweden*

Despite increased research interest in transitions into new intimate relationships in later life, little focus has been on how transitions affect older people's social networks. We investigate the impact of entering into new intimate relationships in later life on interdependent lives. Results are based on both qualitative interviews with 28 Swedes (63–91 years) either dating or living in new relationships initiated 60+ (marriage, cohabitation, LAT), and a quantitative survey to 60–90 year old Swedes (n=1225; response rate 42%). A central theoretical frame is Elder's (1994) principle of interdependent lives. A new relationship usually meant integration into the new partner's social and filial networks (some problems will be discussed) and a restructuring of the relationship chain so that time and energy is redirected to the new partner. A new partner was described as a resource for living independent lives by the older informants, and as a way of "unburdening" the children. Finally, the qualitative interviews hinted at a hierarchy of dependencies. This was confirmed by the survey. A majority of respondents would primarily turn to their partners for social, emotional and practical support, with children as a distant second and "others" third. An exception was personal hygiene, where partners remained the first choice, but where the social services were preferred to children. This hierarchy was the same in new relationships. The results, partly contradicting previous research findings, are discussed in light of Western individualism generally and Swedish welfare-state and state supported individualism in particular.

MORE THAN MONEY: UNDERSTANDING MARITAL INFLUENCES ON RETIREMENT SAVINGS RATES

S.H. Payne, J. Yorgason, *School of Family Life, Brigham Young University, Provo, Utah*

Much has been done to understand predictors of financial preparation for retirement. What is often missed, however, is the value that marriage may have in helping individuals prepare and it can provide a rich contextualization for evaluating retirement issues as most individuals retire as part of a couple (Atchley, 2001). Knoll, Tamborini, and Whitman (2012) found married young adults placed greater value on saving for retirement than their young adult counterparts that are single or cohabiting. Therefore, understanding aspects of the relational context that may influence saving for retirement, such as marital quality and materialism, would add to the current literature. Using data from 584 individuals identifying themselves as married, the purpose of this study, using structural equation modeling, was to examine how personal and relational characteristics were linked to financial attitudes, knowledge, and capabilities and financial well-being using the family financial socialization framework (Gudmunson & Danes, 2011). Supporting the first two hypotheses, marital quality, materialism, age, and household income were found to directly predict financial prudence as a measure of financial attitudes, knowledge, and capabilities and to indirectly predict retirement savings rate as a measure of financial well-being. Financial prudence supported the first hypotheses as well by directly predicting retirement savings rate. Education also supported the first hypothesis, in that it directly predicted an individual's measure of financial prudence. In support of the third hypothesis, education was associated with retirement savings rate. Results suggest the importance of considering both financial and non-financial predictors of saving for retirement.

SESSION 60 (PAPER)

NEW DIRECTIONS ON DEMENTIA DIAGNOSIS AND TREATMENT

DEPRESSION AND COGNITIVE IMPAIRMENT AMONG OLDER RESIDENTIAL CARE RESIDENTS: 2010 NATIONAL SURVEY OF RESIDENTIAL CARE FACILITIES (NSRCF)

M. Sengupta, V. Rome, E. Park-Lee, C. Caffrey, *CDC/NCHS, Hyattsville, Maryland*

Cognitive impairment and depression are common conditions affecting older adults. According to the Department of Health and Human Services' 2010 National Survey of Residential Care Facilities (NSRCF), nearly half of all older residents (aged 65 and older) in assisted living and similar residential care communities (RCCs) had dementia (49%), about a quarter had depression (26%), and 15% had both. Recent research has indicated that depression and dementia may not only co-occur, but that depression may be a risk factor for dementia. While there is growing evidence about the co-occurrence of dementia and depression in the general older adult population, little is known regarding the co-occurrence of these conditions among older residential care residents. Using data from the NSRCF, the first nationally representative survey of RCCs with four or more beds, this study aims to: (a) assess if residents with depression (n=1928) are more likely to be cognitively impaired than other residents (n=4900); and (b) identify facets of cognitive impairment (short-term and long-term memory, confusion, and decision-making) associated with depression. Bivariate analyses (accounting for complex survey design using STATA software) show that more residents with dementia and other cognitive impairments had depression (30%) than other residents (25%). Compared to residents without depression, residents with depression tend to have short-term (55% versus 46%) and long-term (34% versus 28%) memory problems and confusion (57% versus 48%). Multivariate results will be presented on the association between depression and dementia and other cognitive impairments, after controlling for resident and provider characteristics.

THE SOCIAL ENVIRONMENT, APOE E4, AND DEMENTIA: THE SOCIAL ENVIRONMENT AS A MODERATING FACTOR AMONG INDIVIDUALS GENETICALLY PREDISPOSED TO DEVELOP DEMENTIA

J.L. Poey, *University of Massachusetts Boston, Boston, Massachusetts*

The APOE e4 allele is a well known genetic risk factor for Alzheimer's disease and has been associated with hippocampal damage. Variability has been found in this relationship, with twin studies showing monozygotic twins who both have the APOE e4 allele to be discordant for developing Alzheimer's disease. This would indicate environmental influences on the manifestation of disease symptoms. A poor social environment has also been associated with an increased risk of Alzheimer's disease and hippocampal damage. However, there has been limited exploration into the potential moderating influence of the social environment on the relationship of the APOE e4 allele to cognitive functioning. Previous studies have used regional and non-U.S. samples in order to investigate these relationships. This study examined the relationship of the social environment and the APOE e4 allele to cognitive diagnosis using the first U.S. nationally representative sample of older adults focusing on dementia, the Aging, Demographics, and Memory Study (ADAMS) data. It also explored the potential moderating influence of the social environment on the relationship of the APOE e4 allele to cognitive diagnosis. Results indicate that the APOE e4 allele is associated with a greater risk of cognitive difficulty while being more socially engaged and more socially connected are associated with a lower risk of cognitive difficulty in this population. Aspects of the social environment were also found to moderate the relationship of the APOE e4 allele to cognitive diagnosis.

A PROACTIVE OUTREACH TO IDENTIFY, ASSESS, AND TREAT COGNITIVE DISORDERS IN RURAL DWELLING VETERANS: A DEMONSTRATION PROJECT

T.C. Andersen, *Neurology, Gerontology & Social Work,, Salt Lake City, Utah*

In a collaborative demonstration project the University of Utah and the VHA Office of Rural Health partnered with St. Johns Institute for Cognitive Health to provide free memory and cognitive health evaluations for U.S. Veterans. The project is called "Providing Rural Veterans Access to Proactive Memory Care". Traumatic brain injury, post-traumatic stress disorder, and progressive dementing diseases, cause memory disorders to be highly prevalent among veterans. The goal of this program is to identify United States Veterans suffering from memory loss and provide care and/or referral assistance. Services offered include: Cognitive impairment or memory loss assessments, neuropsychological testing as needed, Proactive social work and health educational services, including support and resources, and care coordination with patient's primary care provider. This project highlights the Proactive Dementia Care (PDC) model, developed at the University of Utah Department of Neurology. This intervention was developed and clinical tested over the last 8 years and provides individualized health education and social work services supporting families in the development of a unified plan of progressive support. From August, 2011 through December, 2013, 352 Veterans were enrolled with cognitive evaluations occurred at four screening sites: Jackson and Afton, Wyoming, and Idaho Falls and Pocatello Idaho. The age range of the enrolled Veterans ranged from 24 to 100. Of the 352 enrolled Veterans, 336 were men. Details of the results from pre and post evaluations of the PDC intervention and the lessons learned from this project will be discussed in detail.

PREVENTING HOSPITALIZATIONS IN COMMUNITY-DWELLING OLDER ADULTS LIVING WITH DEMENTIA: REVIEW OF STUDIES 1990-2013

E.A. Phelan[3], K. Debnam[1], L. Anderson[2], S. Owens[4], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. Centers for Disease Control and Prevention, Atlanta, Georgia, 3. University of Washington, Seattle, Washington, 4. Directors of Health Promotion and Education, District of Columbia, District of Columbia*

Increasing attention is being paid to optimizing care for persons living with dementias, including Alzheimer's disease. One of Healthy People 2020 key dementia-related objectives is "to reduce the proportion of preventable hospitalizations in persons with Alzheimer's disease and other dementias." We conducted a scoping review to determine whether there was any measurable effect on acute-care hospitalizations among community-dwelling older adults with dementia. Studies were identified through professional on-line searches (PubMed, CINAHL, Cochrane, Embase, PsycINFO, Wholis, Proquest, EBSCO, and WOS) and feedback from content experts. Of the 423 initial citations, 94 met at least one inclusion criterion, and ten met all inclusion criteria (i.e., had a comparison group, published between 1990-2013, and in English). The majority of eligible studies included health services use (i.e., hospitalizations) as a secondary outcome. Participants in these studies were diagnosed with dementia with severity ratings ranging from mild to severe. Participants were recruited from a range of healthcare and community agencies. Most interventions involved face-to face assessment of the persons living with dementia, their caregivers, and development and implementation of a care plan. No statistically significant reduction in hospitalizations was found across these studies, although one study observed a reduction in hospital days. These findings suggest further research is needed and given the focus on hospitalizations as a secondary outcome, the development of more directive interventions targeted at reducing and preventing acute healthcare utilization by persons with dementia would be important to help meet the goals of Healthy People 2020.

PARKINSON'S DISEASE AND LEWY BODY DEMENTIA AND DRIVING: A REVIEW OF THE LITERATURE

K.M. Turk, E. Dugan, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

Parkinson's disease is a progressive neurodegenerative disease that affects motor function and cognition. Parkinson's disease patients are likely to experience dementia attributable to the manifestation of Lewy bodies in the neurons of the cerebral neocortex. There is significant research about Parkinson's disease and driving, however, very little is known about Lewy Body dementia and driving ability, though the two diseases are closely linked. The purpose of this study was to review the literature about Parkinson's disease and driving and Lewy Body dementia and driving. Based on the Downs and Black (1998) checklist for the assessment of the methodological quality of studies of health care interventions, six indicators were used to score each article on quality. Articles from 1993-2013 that were published in English, used human data, and made a connection between Lewy body dementia and driving or Parkinson's disease and driving were scored and used in the final review. The following databases were searched: EBSCOhost, PubMed, Google Scholar, Proquest, Web of Knowledge, and Publishing Connect. One article about Lewy Body dementia and driving met the inclusion criteria, whereas twenty-one articles met the inclusion criteria for Parkinson's disease and driving. Results indicated cognitive testing is a major predictor of safe driving for those with Parkinson's disease, drivers with Parkinson's disease tend to drive significantly less, limit driving more, and have less confidence behind the wheel than healthy age matched controls. This review also identified a major gap in research about Lewy Body dementia and driving highlighting the need for further research.

SESSION 65 (SYMPOSIUM)

INTERACTIVE WORKSHOP

Chair: J.A. Steiger, *Office of Medical Student Education, George Washington School of Medicine, Washington, District of Columbia*

This part of the symposium will be led by the CAST faculty to engage the attendees in interactive dialogue about what they experienced during the live theatre performance. Participants will explore the challenges and complex issues demonstrated by the experiences of Gwendolyn, her family and the healthcare professionals. An opportunity will be provided to share practical strategies applicable to the care of many individuals with dementia and their families. In addition, attention will be given to evidence based practices, resources and approaches to interprofessional care that can enhance the quality of life for entire families. Participants will be able to deepen their understanding by asking questions of the characters (actors will continue to play their role throughout the workshop).

"TRANSITIONS" THEATRE

C.P. Samenow, *Psychiatry and Behavioral Sciences, George Washington University School of Medicine, Washington, District of Columbia*

This session includes the performance of a play written specifically for educating healthcare professionals in a person-centered approach to caring for individuals living with dementia and their families. Through dynamic scenes with professional actors and music, a family is portrayed that includes an older woman, Gwendolyn, with advancing dementia who lives with her son and his wife, and their teenage daughter. The Taylor family is at a critical juncture and needs to make decisions about the care for Gwendolyn. The play raises issues that include the dilemma and dynamics among healthcare professionals and families, such as identifying possible resources, caregiver burnout, team support and interaction, and system challenges. “Transitions” will be presented by the theater director and a team of 5 actors who will draw the audience into the intimate conversations/experiences of the family members in various scenarios throughout this particular day.

“TRANSITIONS”: AN INTERACTIVE PLAY ABOUT AN INDIVIDUAL WITH DEMENTIA, HER FAMILY AND HEALTH CARE PROFESSIONALS

B. Lunsford, *1. School of Nursing, The George Washington University, Washington, District of Columbia, 2. Center for Aging, Health and Humanities, Washington, District of Columbia*

This symposium will discuss the importance of engaging healthcare professionals in more experiential opportunities for learning and problem-solving complex healthcare issues. Interactive theatre (that can be performed in any classroom, meeting room or auditorium) draws the learner in to research and reflection in a way not possible in traditional lecture/discussion by portraying the first hand experiences of individuals and healthcare professionals. In the first part of this symposium, a play will be presented, “Transitions” that was developed by the Center for Application and Scholarship of Theatre (CAST) and George Washington Center for Aging, Health and Humanities (CAHH). The CAST theatre writer, producer, and director developed this production in collaboration with healthcare professionals, individuals with dementia and their families to provide a dynamic educational experience for healthcare professionals in person-centered care of an older woman with advancing dementia and her family. The second part of this symposium will be an interactive dialogue with attendees. The dialogue will focus on the audience perceptions of what they experienced, as well as the opportunity to explore practical strategies for person-centered care and the optimal utilization of healthcare resources to assist the individual with dementia and her family. The symposium concludes with the educational outcomes achieved from the use of “Transitions” in the Washington D.C. Area Education Center Consortium. Outcomes include participants’ evaluation of the value of using interactive theatre, change in practice in care of older adults with dementia and their family, and change in practice to a more person-centered approach to care.

SESSION 70 (SYMPOSIUM)

RACIAL/SOCIOECONOMIC DIFFERENCES IN DISABILITY POST-STROKE: LESSONS FOR GERONTOLOGY

Chair: B.D. Capistrant, *University of Minnesota, Minneapolis, Minnesota*

Discussant: C. Mendes de Leon, *University of Michigan, Ann Arbor, Michigan*

Racial and socioeconomic differences in disability and physical function persist throughout older age. Stroke affects 8% of adults 65+ and contributes to losses of independence and physical function. Notable racial and socioeconomic patterns emerge for stroke risk and outcomes; for instance, Blacks and persons at lower socioeconomic position have increased risk of incident stroke and lower physical function post-stroke than whites and higher socioeconomic status, respectively. Although mechanisms underlying health disparities in physical function in older age are of interest to gerontologists/geriatricians and neurologists alike, disciplinary silos often separate empirical evidence of these disparities. This symposium will present evidence of racial and socioeconomic differences in post-stroke disability and explore how these mechanisms of post-stroke disparities extend the understanding of health disparities in older-age disability beyond stroke. One presentation builds on evidence of progressive losses of physical function before the stroke and finds post-stroke physical function differences by race and socioeconomic position (SEP) are evident prior to stroke. Another presentation explores explanations of racial differences in post-stroke outcomes, including pre-stroke function and post-stroke care. A third presentation considers both racial and socioeconomic differences in post-stroke outcomes from two large, prospective cardiovascular and stroke cohorts and finds insurance status is salient for timing of functional decline. Lastly, a discussant will draw out common themes from these papers and connect them with the broader literature on racial and socioeconomic disparities in disability in older age. Using stroke as a case study, this symposium will generate insights into disability health disparities in old age.

THE ROLE OF POST-STROKE CAPACITY AND RACIAL DIFFERENCES IN POST-STROKE DISABILITY

L. Skolarus, V.A. Freedman, J. Burke, *Universty of Michigan, Ann Arbor, Michigan*

Despite marked racial differences in stroke incidence, little is known about whether post-stroke disability differs by race and if so, why. We used the National Health and Aging Trends Study (NHATS) to explore post-stroke differences in disability by race. In the NHATS subsample of stroke survivors (N=806), we found that Blacks have a higher prevalence of limitations in self-care, mobility and household activities than Whites. Lower physical capacity for Blacks, measured with a validated, self-reported 12-point scale—rather than socioeconomic differences—was the most important factor accounting for this association. We discuss possible reasons for racial differences in capacity including: 1) pre-stroke capacity; 2) care during the acute stroke period; 3) post-acute rehabilitation care or; 4) factors in the late post-stroke period and argue that further understanding of the causes of racial differences in capacity after stroke is needed to reduce activity limitations after stroke and decrease racial disparities.

DIFFERENCES IN DISABILITY BY RACE AND SOCIOECONOMIC POSITION MATTER PRE-STROKE, NOT JUST POST-STROKE

B.D. Capistrant[1], M. Glymour[2], *1. Division of Epidemiology & Community Health, University of Minnesota, Minneapolis, Minnesota, 2. University of California - San Francisco, San Francisco, California*

Recent evidence suggests individuals who later experienced stroke had faster increases in disability even before stroke onset than similar aged individuals who did not subsequently experience stroke. Although stroke outcomes often vary by race and socioeconomic position (SEP), few studies have examined heterogeneity in pre-stroke disability by these factors. We followed 17,000 older adults from the Health and Retirement Study cohort for up to 12 years to address this gap in the literature. Specifically, we modeled change in I/ADL dependence before, at the time of, and after the stroke stratified by race and measures of SEP at study baseline. Although blacks and persons at lower SEP in general have worse disability post-stroke than whites or higher SEP, respectively, our results suggest that this difference in post-stroke functioning primarily reflects pre-stroke racial and socioeconomic disparities. Although conceptualized to induce acute increases in disability, stroke itself does not exacerbate existing disability disparities.

SOCIOECONOMIC STATUS AND DISABILITY TRAJECTORIES BEFORE AND AFTER VASCULAR EVENTS IN THE ELDERLY

M.S. Dhamoon[1], Y.P. Moon[2], W. Longstreth[3], M. Elkind[2], *1. Icahn School of Medicine at Mount Sinai, New York, New York, 2. Columbia University, New York, New York, 3. University of Washington, Seattle, Washington*

There are socioeconomic disparities in immediate post-stroke disability, and emerging evidence from large prospective cardiovascular cohorts also shows disparities in long-term disability trajectories. In the Northern Manhattan Study (NOMAS) cohort of stroke patients followed annually for 5 years and with censoring of recurrent stroke, we found an annual decline in function in those with Medicaid/no insurance compared to those with Medicare/private insurance. In another analysis in the NOMAS prospective cohort of initially stroke-free participants, we examined 210 participants who experienced an ischemic stroke during follow-up. Among those with Medicaid/no insurance, there was a faster long-term decline in function after stroke compared to before stroke. In the Cardiovascular Health Study, we have confirmed a steeper decline in function after stroke compared to before, as well as racial and socioeconomic disparities in long-term trajectories of disability. These findings suggest a disproportionate burden of disability in lower socioeconomic positions over the long-term.

SESSION 75 (SYMPOSIUM)

CYTOMEGALOVIRUS AND THE AGING OF THE IMMUNE SYSTEM: A MULTIDISCIPLINARY PERSPECTIVE

Chair: B. Zaniello, *University of Washington, SEATTLE, Washington*
Co-Chair: J. Nikolich-Zugich, *University of Arizona, Tucson, Arizona*
Discussant: G. Pawelec, *University of Tübingen, Tübingen, Germany*

Cytomegalovirus (CMV) is a common beta-herpesvirus that is known to cause fatal disease in immunosuppressed hosts and may be associated with greater morbidity and mortality in elderly populations. This morbidity and mortality may be related to intermittent but persistent CMV reactivation and/or reinfection with different CMV strains, with a subsequent impact on health, particularly on the immune system (potentially contributing to “immunosenescence”). This translational symposium will feature new data from recent population studies, human trials and animal model research in this emerging area of study. Talks will approach CMV from a multi-disciplinary perspective, bridging epidemiology, immunology, and gerontology, with clinical practice; topics will include identifying and characterizing the virus’s presence in the aging body, vaccine efficacy in the setting of CMV infection, and the CMV survival (dis)advantage. Potential changes to clinical care will be also be discussed (e.g., vaccine boosters and the prophylactic use of antivirals) as well as other areas of timely interest.

CYTOMEGALOVIRUS REACTIVATION AND SHEDDING IN THE ELDERLY: FREQUENCY, CAUSES, AND CLINICAL IMPLICATIONS

B. Zaniello, *University of Washington, SEATTLE, Washington*

While there are increasing data supporting a role for cytomegalovirus (CMV) in the aging of immune system (and therefore increased mortality and morbidity in older adults) little is known about how CMV infection manifests itself in the immunocompetent host. CMV reactivation (in the blood) and shedding (in saliva and urine) has been well described in the HIV positive and transplant populations but not in the elderly, despite evidence linking both reactivation and shedding in that population to poorer outcomes. I will present data on CMV reactivation and shedding in the geriatric population as well as discuss the clinical utility of laboratory tests used to characterize those events, both common (PCR, CMV IgM) and experimental (e.g., quantitative antibody titers). Data on anti-viral agents and their potential benefit to the healthy elderly population will also be covered.

EXPLORING THE ROLE OF CMV IN STRESS-RELATED ALTERATIONS OF THE AGING IMMUNE SYSTEM

A.E. Aiello[1], A.M. Simanek[2], C. Hanna[4], J. Dowd[3], *1. Epidemiology, University of North Carolina-Gillings School of Global Public Health, Chapel Hill, North Carolina, 2. University of Wisconsin, Milwaukee, Wisconsin, 3. Hunter/CUNY, New York, New York, 4. University of Michigan, Ann Arbor, Michigan*

Research findings have demonstrated significant socioeconomic pattering of CMV antibody levels in aging populations. Some have hypothesized that stress-induced immune alterations may mediate the relations between socioeconomic status and CMV antibody levels. I will present data showing that life stressors influence CMV antibody levels. In addition, I will present results demonstrating that CMV may mediate the association between income and T-cell markers of aging. Last, I will present data examining the impact of CMV in combination with other pathogens on telomere length/activity. Together, these data will provide insights on the pathways by which socioeconomic status and stress may influence CMV and ultimately age related cellular changes.

DIRECT AND INDIRECT EFFECTS OF THE CYTOMEGALOVIRUS (CMV) INFECTION UPON IMMUNE SYSTEM HOMEOSTASIS AND FUNCTION

J. Nikolich-Zugich[1], A.M. Wertheimer[1], B. Park[2], M.S. Bennett[1], D. Nikolich-Zugich[1], V. Pulko[1], J. Uhrlaub[1], M. Smithey[1], *1. Center on Aging and Department of Immunobiology, University of Arizona College of Mecicine, Tucson, Arizona, 2. Oregon Health & Sciences University, Portland, Oregon*

Cytomegalovirus infection has been shown to have fascinating and incompletely understood effects upon health, longevity and immune function in the course of human aging. We will present data from controlled, deliberate lifelong infection of laboratory rodents with CMV and from a large cohort of CMV-infected and CMV-negative human subjects aged 21-100, exploring the impact of CMV on immune repertoire, homeostasis and function against infection. We discuss the results from the standpoint of viral immune evasion, CMV biology and the long-term tango between the immune system and this latent persistent virus in the course of aging, including gaps in the current knowledge and the need for future studies.

THE IMPACT OF CMV INFECTION ON IMMUNITY AND SURVIVAL IN OLDER HUMANS

G. Pawelec, *Second Department of Internal Medicine, University of Tuebingen, Tuebingen, Germany*

There is great inter-individual variability in the increased disease susceptibility and decreased response to vaccination in elderly people; therefore, it would be useful to establish sets of immune biomarkers that reflect immune competence of the individual in this context to allow better selection of prophylaxis and treatment options and to facilitate understanding of the mechanistic basis of immunosenescence. Ideally, this would mean performing longitudinal studies assessing innate and adaptive immune parameters in the context of genetic background, nutrition, socioeconomic factors etc., and correlating these with morbidity and mortality at follow-up. Here I will discuss our data from six such longitudinal studies, including the new Berlin BASE II study from which we are beginning to assemble a more complete picture of clinically-relevant immune signatures. We see an over-riding impact of CMV infection in all these studies. Interventions to prevent or reverse immunosenescence may therefore need to include targeting infectious agents such as CMV.

SESSION 80 (SYMPOSIUM)

AN EDUCATION IN HOPE: FINAL RESULTS, THE IMPACT OF ART CART: SAVING THE LEGACY, AN INTERGENERATIONAL, INTERDISCIPLINARY PROJECT ON OLDER ADULT PROFESSIONAL ARTISTS

Chair: J. Jeffri, *National Center for Creative Aging, Washington, District of Columbia, American University, Washington, District of Columbia, Columbia University, New York City, New York*
Co-Chair: J. Bear-Lehman, *New York University, New York City, New York*
Discussant: P.A. Miller, *Columbia University, New York City, New York*

ART CART; SAVING THE LEGACY is a nine-month interdisciplinary, inter-generational service-learning program that connects aging professional artists with interdisciplinary teams of university students to prepare/preserve their creative work. During the program, professional artists also exemplify social engagement, high self-esteem and self-motivated productivity while also needing environmental modifications to their studios, and sometimes health interventions to maintain and increase productivity, prevent falls, manage fatigue and reduce clutter in order to continue being creative and producing art. The purpose of this symposium is to present the final results of a study of the effectiveness of ART CART on the psychosocial well-being and safe functioning of older adult professional artists (62 years of age and older) in the NYC and Washington DC metro area. Existing data support productivity and social engagement as means to reducing morbidities and mortality, while increasing psychosocial and physical well-being (Clark, Azen, Zemke, Jackson, Carlson, Mandel, et al., 1997; Jackson, Carlson, Mandel, Zemke, Clark, 1998; Waite, 2011; Cohen, 2000, 2006; Miller, 2003a, 2003b, 2004, 2008; Miller & Toner, 1991). It is important to analyze the highly-functioning intervention and control groups of professional artists, since the research will be replicated in 2015 in four locations with a control group from the general population. Existing data can help tell us if professional artists are a model for society, how artists cope and adjust to age-related changes or morbidities in order to continue engagement in the activities and roles most meaningful to them, and their contribution to existing models of "successful" aging.

THE IMPACT OF ART CART: SAVING THE LEGACY COMPARED TO THE GENERAL POPULATION

J. Jeffri[1,2,3], P.A. Miller[3], J. Bear-Lehman[4], S. Kang[5], *1. National Center for Creative Aging, Washington, District of Columbia, 2. American University, Washington, District of Columbia, 3. Columbia University, New York City, New York, 4. New York University, New York, New York, 5. Binghamton University, Department of Social Work, Binghamton, New York*

In this second iteration of ART CART, a nine-month interdisciplinary, inter-generational service-learning program that connects artists with interdisciplinary teams of university students to prepare/preserve their creative work, the program included 19 artists and 38 students from several universities in New York City and Washington DC. In preparation for a 2014-2015 national rollout of ART CART, an experimental research study was conducted to measure the impact of ART CART on the following outcome variables for two groups of artists (those participating in ART CART and a matched control group): morale/depression, social isolation, productivity/activity levels, and safe functioning. This presentation will provide an overview of: 1) the ART CART program; 2) the qualitative and quantitative results of the 2012-13 research study and for the program, including the study purpose and rationale, the sample, and the design and methods and 3) implications for future research with a control group from the general population.

THE IMPACT OF ART CART: SAVING THE LEGACY – ASPECTS OF EMPOWERMENT OF AN OLDER ARTIST POPULATION - PATRICIA A. MILLER, ED.D, OTR/L, FAOTA, COLUMBIA UNIVERSITY/PROGRAMS IN OCCUPATIONAL THERAPY;JANE BEAR-LEHMAN, PH.D., OTR/L, FAOTA, NEW YORK UNIVERSITY STEINHARDT/ NYU COLLEGE OF DENTISTRY

P.A. Miller[1], J. Bear-Lehman[2], *1. Columbia University, New York, New York, 2. OT, New York University, New York, New York*

n the 2012-13 ART CART: SAVING THE LEGACY, the artists', their working partners' and the fellows' testimonies speak to how strongly ART CART has surpassed their expectations and reasons for participating in the program; how it has made a permanent and lasting impression. The artists attest to the importance of documentation of their art and are very appreciative to the ART CART program in its success in teaching them "something so hard". Documentation was not only a practical skill; it was presented as an opportunity for life review. The richness of life review required that long-forgotten works be reviewed, and in this process, many artists discovered themes for their work and enjoyed a new/re-awakening of their earlier works. At the same time, the life review provided the fellows with real-life experience and they learned that "aging is just a natural process through which one can appreciate the beauty of living".

ART CART'S IMPACT: TRANSFORMATIVE LEARNING IN AN INTERGENERATIONAL, INTERDISCIPLINARY ENVIRONMENT

P.H. Lawton, *Art Education, Corcoran College of Art + Design, Washington, DC, District of Columbia*

The ART CART project presented opportunities for transformative learning to occur across multiple generations. The artists, partners, fellows, and faculty represented three generations of participants spanning a variety of disciplines. Transformative learning, one of many adult education theories, results from critical self-reflection that can lead to a change in belief, attitude or perspective (Mezirow, 1991; Cranton, 1994). Transformative learning may also occur as the result of an empowering event such as intergenerational programs (like ART CART) in which participants engage in social interaction through sharing narratives, interpreting/discussing works of art, and hands-on activities that may lead to both personal and communal transformation. This "empowering event" may come about in any number of ways depending upon the individual, his stage of development in the life cycle, and his environment. Sharing knowledge, life experiences, and collaborating in hands-on activities provide the impetus for an empowering event to occur.

SESSION 85 (SYMPOSIUM)

RELEASING THEIR STORIES: USING THE NARRATIVES OF INCARCERATED AND INCARCERATED ADULTS TO EXPOSE SOCIAL INJUSTICES

Chair: T.M. Maschi, *Graduate School of Social Service, Fordham University, New York, New Jersey*

The aging in prison crisis is monumental in scope which has economic, clinical, and moral implications. Major organizations, such as the American Psychological Association and the Robert Wood Johnson Foundation, have called attention to the lack of understanding of the social determinants of health culturally responsive workforce to address diversity in aging. To address this gap in education and professional training, the Narratives of Justice Project as an ancillary project to the Moving Stories Project, was created to expose students and professionals to the narratives of incarcerated and formerly incarcerated older adults. Using a pre and post test design and a sample of 63 master's level students, preliminary quantitative (e.g., paired t-tests) and qualitative findings suggest that students demonstrate a positive change in knowledge, attitudes, and skills about working with older adults with criminal justice histories and increased awareness about empathy for social injustices. These findings have important implications for the use of narratives and stories into sensitivity training to increase professional competencies for marginalized older adults and to provide strategies to identify and respond to social injustices in the field, such as those invoked by the aging in prison crisis.

PRISONERS OF AGE PHOTOGRAPHY PROJECT: ADDRESSING SOCIAL INJUSTICES USING PORTRAITS OF ELDERLY INMATES

T.M. Maschi[1], A. Katz[2], *1. Graduate School of Social Service, Fordham University, New York, New Jersey, 2. University of Southern California, Davis, California*

More than two million North Americans are now behind bars, an estimated 35 percent of them edging far past middle age. A series of photographs and interviews with elderly inmates and corrections personnel conducted in prisons both in the United States and Canada from 1996 to 2004 serve to capture the complexity of a subject that is seldom contemplated – aging offenders in the correctional system. This presentation is of the Prisoners of Age Project, which shows the photographs gathered by across the world representing the images and stories of older adults in prison. The images will encourage participants to explore the socio-economic causes of crime and delinquency, while encouraging them to consider the human dimension of doing time while growing old in prison; the objective being to open the eyes of the participants, to play a role in stimulating social and institutional change by addressing these issues of social justice and human dignity through images and interviews.

ART: A HEALING THERAPY FOR OLDER ADULTS AGING IN PRISON

A. Hongo, A. Katz, *USC, Los Angeles, California*

Art: A Healing Therapy for Older Adults Aging in Prison Prisons are not built for the aging, a vulnerable population often forgotten in the mix. An environment deeply rooted in violence, tension and fear is not conducive to disclosure or trust. Art workshops provide a unique opportunity to freely express feelings in a safe and non-judgmental arena. One does not need to be a professional artist or creative mogul to participate in art therapy. This presentation provides an overviiew of an art therapy program used with a group of older women in prison. Preliminary quantitative and qualitative evaluation results suggest that art therepy has a therapeutic affect on the health and well-being of older adult women. There findings have important implication for the use of the arts in prison with older people. Art can provide a safe and purposeful means of expression, thereby providing a therapeutic means of releasing feelings, stress and emotion. Art generated by older adults in prison has implications to educate students and professionals about lived experiences and the use of art for healing. Older prisoners are particularly vulnerable and art therapy may provide an effective means of bypassing unconscious and conscious defenses, promote disclosure and diminishing symptoms without verbal interpretation.

WHAT OLDER ADULTS IN PRISON AND THE ARTS CAN TEACH ABOUT SOCIAL INJUSTICES

A.D. Katz[1], T.M. Maschi[2], A. Hongo[1], *1. Social Work, University of Southern California, Los Angeles, California, 2. Fordham University, New York, New York*

This symposium will demonstrate how to use the arts and facilitated dialogues in the classroom, professional trainings, and workshops to increase knowledge, values and skills to address social injustice, such as the aging prisoner crisis, using the arts. It draws from a multimedia book project that partnered researchers, educators, artists, students, practitioners and incarcerated older adults in creative works. The presenters will demonstrate how to use the arts and first hand experiences of older adults in prison to assess participants' learning outcomes. The first presentation will demonstrate on the use oral history narratives of incarcerated and formerly incarcerated older adults of their experiences before, during, and after prison with learners, the second presentation will draw from an international photography project of diverse groups of aging people in prison, the third presentation will demonstrate how to use art generated from older adults in prison to educate students and professionals about their lived experiences and the use of the arts for healing. The symposium will include an experiential component and an overview of the evaluation plan and a survey instrument developed to measure attitudes, knowledge and skills towards aging and older adults, criminal and social justice issues, and the use of the arts, multi-media, and advocacy in education and training. A training facilitation guide will be provided to participants to implement the project in their respective institutional or community settings. This symposium emphasizes the importance of teaching empathy to help facilitate practice and policy reform efforts based on the current research.

SESSION 90 (SYMPOSIUM)

JAPAN'S LEGISLATIVE EXPERIENCE, CURRENT STATUS AND FUTURE CHALLENGES IN PREVENTING ELDER ABUSE

Chair: N. Tsukada, *Nihon University Graduate School of Business, Tokyo, Japan*
Co-Chair: L. Nerenberg, *California Elder Justice Coalition, California, California*
Discussant: M. Twomey, *Center of Excellence on Elder Abuse and Neglect, University of California, Irvine, Irvine, California*

Japan enacted the "Law for Preventing the Abuse of Older People and Providing Assistance to Caregivers" in November 9th, 2005, which became effective in, 2006. Japan also started the "Law for Prevention the Abuse of People with Disabilities" in 2013, and this put Japan into a very unique position where it has four independent domestic violence laws. The Law for Preventing the Abuse of Older People and Providing Assistance to Caregiver covers five different types of abusive and neglectful acts and responsibilities of personnel of long-term care institutions and in-home care service providers. This symposium first introduces roles and responsibilities of the national and local governments and private citizens of the country for preventing the abuse of older people, protecting the victims of abuse and assisting caregivers in reducing the burden of caregiving for the overall purpose of achieving elder abuse prevention and elder rights protection. Second, most recently conducted research outcomes regarding current status of victims and abusers of elder abuse in metropolitan municipalities are presented. The research data were collected in collaboration of Asahi Newspaper Company via internet from February to March, 2013, and the respondents were professionals at the department in charge of elder abuse. Structured questionnaires were sent to 229 metropolitan municipalities. A total of 177 completed surveys were returned (response rate of 77.3%), and its obtained 934 cases were analyzed. Finally, future challenges are discussed by introducing an elder abuse prevention system in Matsudo-city.

JAPAN'S LEGISLATION FOR PREVENTING ELDER ABUSE

N. Ikeda[1], N. Tsukada[2], *1. Osaka Advocacy Law Office, Osaka, Japan, 2. Nihon Univbrsity, Tokyo, Japan*

The Law for Preventing the Abuse of Older People and Providing Assistance to Caregivers came into effect in 2006. As shown in the name of the legislation, it is considered protection of older people and assistance of caregivers are inseparable for preventing elder abuse. The Law indicated two elder abuse settings, one in home and the other in institutions. Regarding the latter case, institutions are audited by Long-Term Care Insurance Act and can be at targets of business revocation. For both elder abuse in home and institutions, anyone who discovered an older people who is believed to have been abused by him/her caregiver or someone working for any of the nursing care institutions or nursing care service providers must report the incidence to the municipal government if the older person's life or health is in great danger. This paper discusses Japanese's elder abuse prevention system and key institutions as well.

REALITIES AND ISSUES OF ADMINISTRATIVE SERVICES FOR ELDER ABUSE PREVENTION AND EARLY DETECTION IN URBAN MUNICIPALITIES IN JAPAN

K. Usui[1], Y. Hayami[1], C. Tsumura[1], S. Masuda[1], N. Yamamoto-Mitani[2], M. Kaneda[1], S. Maruo[1], *1. Konan Women's University, Hyogo, Japan, 2. Tokyo University, Tokyo, Japan*

A questionnaire survey was conducted via electronic data with the aims to reveal an overview of elder abuse in urban municipalities and the actual conditions of administrative services. The survey targets were the divisions in charge of elder abuse in a total 229 municipalities . Responses were obtained from 225 municipalities (98.3% recovery rate). The number of cases subsequently determined to constitute abuse comprised 32.8% and 34.0% of the cases in the national survey, respectively.“Establishment of a 24-hour consultation system”as an early detection and caregiver support initiative has been implemented in 56 municipalities (24.9%), and “Incident verification within 48 hours of consultation” has been in 106 municipalities (47.1%). Within the 69 municipalities 10 wards and 10 capitals (29.0%) noted “Incident verification within 48 hours of consultation” was specified in official manuals. Greater efforts for early detection of elder abuse and caregiver support are urgently needed.

ELDER ABUSE IN JAPANESE METROPOLITAN CITIES: A STUDY OF ABUSER TRAITS

N. Tsukada[1], C. Tsumura[2], K. Usui[2], S. Masuda[2], A. Katsumata[3],
1. Nihon University Graduate School of Business, Tokyo, Japan, 2. Konan Women’ University, Kobe-City, Japan, 3. Rehabilitation Institution, Tokyo, Japan

Eight years has been passed since the enactment of the “Law for Preventing the Abuse of Older People and Providing Assistance to Caregivers” in Japan. This paper examined traits of individual abusers of older adults. Data were collected in collaboration with Asahi Newspaper Company via internet from February to March, 2013. Respondents were professionals working for the department in charge of elder abuse in metropolitan municipalities. Structured questionnaires were sent to 229 metropolitan municipalities, and a total of 177 completed surveys were returned (response rate of 77.3%). N=934 reported elder abuse-cases were analyzed. Preliminary analyses revealed that 76.8% of victims were females and “physical abuse”(69.1%) was the highest reported abuse type. Most frequently reported abusers were sons (44.5%), 43.8% of them had identified mental disorders. About 48% of the sons rely on victims’ pensions. Recommendations include facilitating sons’ financial independence from older parents.

ELDERLY PROTECTIVE SERVICES OF MATSUDO CITY AND FUTURE CHALLENGES

T. Wada, *Home Healthcare Services, Irahara Primary Care Hospital, Matsudo City, Chiba, Japan*

Matsudo City, population of approximately 470,000, is in Chiba prefecture, neighboring to the Metropolitan Tokyo. The Elderly Protective Services of the city have 4 conspicuous features; 1.Accepting reports of victims of any age regardless of the stipulation of the law. 2.Giving assessment on the urgency of cases immediately, and case workers are obliged to take direct contact with victims within 24hours, if necessary. 3.Carrying out case management in the affiliation with various sections of the municipal government office. 4.Focusing not only on the rescue of victims, but on the support of perpetrators and family members who are often suffering from serious care-giving burdens. On the other hand, there are many challenges we are facing. They include overwhelming under-reportings due to complicated reporting systems, vague definition of elder abuse of the law often preventing effective case management, and difficulty in coping with financial exploitation based on Japanese culture.

SESSION 95 (PAPER)

HEALTH AND COMMUNITY-BASED CARE AND FINANCING

ESTIMATING COMMUNITY FIRST CHOICE ENROLLMENT

I. Stockwell, A.M. Tripp, *The Hilltop Institute, Baltimore, Maryland*

Beginning October 1, 2011, the Centers for Medicare and Medicaid Services (CMS) offered state Medicaid agencies a new option for rebalancing their long-term supports and services spending from institutional care to home and community-based services (HCBS), called Community First Choice (CFC). In order to assess the affect of Maryland participating in CFC, The Hilltop Institute estimated how many individuals would participate in the new program and how many hours of personal or attendant care they would use. The expected number of CFC participants included individuals who meet one of the following criteria: 1) currently use personal care under a 1915(c) Medicaid waiver, 2) meet nursing facility level of care from the state plan personal care program, 3) are known to be Medicaid-eligible, likely meet nursing facility level of care, and are on the waiting list for a waiver, or 4) are expected to be severely disabled and included in the Medicaid Expansion population. Hilltop also examined plans of care, claims files, and assessment data in order to estimate service utilization for these individuals. Data analysis showed that a significant number of individuals on waiting lists for Medicaid waivers use personal care services through the state plan and that, on average, recipients used 96 percent of the personal or attendant care hours allocated on their plan of care (although this varied by acuity level). The findings of this study were used to assess the financial impact of participating in CFC and to allocate personal care funds across acuity groups.

KEEPING OLDER ADULTS IN THE COMMUNITY: PREDICTING RETENTION OF MENTAL HEALTH AND OTHER HCBS CLIENTS

M. Rose, L.S. Noelker, *Katz Policy Institute, Benjamin Rose Institute on Aging, Cleveland, Ohio*

Many states are seeking to rebalance Medicaid expenditures by broadening the availability of home- and community-based services (HCBS) as an alternative to more expensive institutionalization. However, continued community living for older adults with severe mental illness and/or dual eligibility for Medicaid and Medicare poses special challenges due to the intensity of services needed and the difficulties they present for service providers. Data from a private, non-profit agency that provided in-home services for 1,057 clients in the Cleveland, Ohio, area in FY2011 were used to identify predictors of the clients’ length of stay in HCBS programs. The agency provided intensive case management to most clients, particularly those with mental health disorders. Among these clients were 413 individuals receiving in-home mental health services, including 173 dual eligibles, and 644 other HCBS clients, including 194 dual eligibles. Regression analysis was used to identify significant predictors of length of stay; findings showed that clients in the agency’s mental health or adult day program had longer lengths of stay, while clients with dementia experienced significantly shorter stays. Other predictors of longer lengths of stay were dual eligibility, older age, female gender, disability or never having been employed, and a diagnosis of schizophrenia. These data suggest that many older adults, including those with severe mental illness, can be maintained successfully in the community with appropriate services, funded by Medicare and Medicaid when available, and intensive case management by mental health social workers and counselors.

TOTAL MEDICARE EXPENDITURES UNDERTAKEN BY HOSPICE BENEFICIARIES DURING HOSPICE ELECTION

T.J. Christian[1], M.R. Plotzke[1], J.M. Teno[2], K.E. Lucas[3], H. Loeffler[3],
1. Abt Associates, Cambridge, Massachusetts, 2. Center for Gerontology and Health Care Research, Brown University, Providence, Rhode Island, 3. Centers for Medicare & Medicaid Services, Baltimore, Maryland

We combined 100% Medicare hospice, Part A, Part B, and Part D claims to calculate total Medicare utilization expenditures during hospice elections in calendar year 2012. Our analysis found that the Medicare hospice benefit paid for 91,322,751 service days in 2012 with total payments equal to $15,046,808,584 ($15.0 billion). Additionally, we found that Medicare paid $710,087,321 ($710.1 million) for non-hospice services beneficiaries utilized during hospice enrollment in the following categories: inpatient care services ($202,981,798; or 28.6% of total), skilled nursing facility services ($40,333,844; 5.7%), home health care ($32,140,138; 4.5%), durable medical equipment ($49,529,040; 7.0%), and other Part B services ($385,102,500; 54.2%). Rates per day of Medicare payments for non-hospice Parts A and B services were greatest among states in the South ($10.67 per service day in the South vs. $7.42 Northeast; $6.70 Midwest; $4.04 West). Hospice beneficiaries themselves paid an additional $135,454,501 million ($135.5 million) in coinsurance for these non-hospice Parts A and B services. We also identified $417,901,263 ($417.9 million) in Part D utilization paid by all payers. In total, Medicare services utilized by hospice beneficiaries totaled $15.0 billion (for hospice services) along with an additional $1.3 billion (for non-hospice services) for a grand total of $16.3 billion in 2012. Medicare hospice benefit expenditures have quintupled since 2000, and this analysis demonstrates beneficiaries concurrently utilize a substantial amount of non-hospice services during hospice election. We recommend ongoing regulatory oversight to ensure that covered hospice services are not inappropriately billed to non-hospice parts of Medicare.

UNDERSTANDING AND ACHIEVING PERSON-CENTERED QUALITY OF LIFE OF ELDERS RECEIVING HOME AND COMMUNITY BASED SERVICES

S. Karon[1,2], M. Schlaak[2], *1. RTI International, Madison, Wisconsin, 2. University of Wisconsin - Madison, Madison, Wisconsin*

Home and community based services (HCBS) provide supports that enable people with disabilities and chronic health conditions to remain in their homes, when desired. While the ultimate purpose of these services should be to support people in having the best quality of life possible, few systems exist to determine how well that is being achieved. The PEONIES system, developed to place person-centered quality of life at the center of care planning and quality assurance, was used to assess the quality of life of people receiving Medicaid managed long-term services and supports in Wisconsin. This system provides information about 12 distinct domains of quality of life including the specific outcomes desired by each individual, the types and sources of support needed to support each outcome, and how successfully each is being supported. In Wisconsin in SFY2012, 90% of the desired quality of life outcomes were being fully supported, but the level of support varied by domain. The most frequent sources of support were family and the independent actions of individual receiving assistance. In this presentation, we will share more detail on the types of outcomes that are most important to elders, the types and sources of supports needed and successful support of desired outcomes. Implications for policy and practice will be emphasized, including ways in which formal care systems can work most effectively with the informal providers of support to assure that elders have the quality of life they desire.

THE MEDICARE PART D LOW-INCOME SUBSIDY AND NONADHERENCE DUE TO COST: A RACIAL AND GENDER COMPARISON

L. Bakk[1], A.T. Woodward[2], *1. University at Buffalo School of Social Work, Buffalo, New York, 2. Michigan State University School of Social Work, East Lansing, Michigan*

Racial and gender disparities in cost-related medication nonadherence (CRN) exist despite the implementation of Medicare Part D. The Low-Income Subsidy (LIS) was established under Part D to provide assistance with out-of-pocket prescription drug costs for qualified low-income beneficiaries. While the LIS increases access to medications by reducing drug cost burden, studies have not investigated the LIS's impact on racial and gender differences in CRN. Using cumulative advantage/disadvantage theory as a framework, this cross-sectional study examined whether LIS status directly and indirectly affects the relationship between race, gender, and CRN. Data from the 2007 wave of the Prescription Drug Study, a subsample of the Health and Retirement Study, were used. The analytic sample consisted of 1,279 respondents age 65 and older who were enrolled in Medicare Part D and taking at least one prescribed medication. The outcome variable of interest was CRN, which included not filling, stopping, or skipping doses of a prescription because of cost. The analysis was conducted using logistic regression models. Results indicated that racial disparities in CRN existed under Medicare Part D. However, the inclusion of the LIS variable mediated differences between older Blacks and Whites. Applying for the LIS had a direct affect on CRN, and poorer health and lower income increased the likelihood of nonadherence after accounting for LIS status. Findings suggest that racial differences in CRN are largely driven by applying for the LIS, and provide support for the efficacy of the LIS as a means of reducing disparities among certain vulnerable subpopulations.

SESSION 100 (SYMPOSIUM)

LATE BREAKING NEWS FEATURING ESPO & JUNIOR INVESTIGATOR SHORT TALKS

Chair: R. Buffenstein, *UTHSCSA, San Antonio, Texas*

Late Breaking News featuring ESPO & Junior Investigator Short Talks This session will include paradigm changing new hot topics in aging research. In addition papers will be selected from submitted abstracts featuring mainly emerging scholars and junior investigators. These papers will be chosen by a program committee that evaluates the quality of the work and its relevance to the GSA. People chosen to present from the submitted abstracts will all receive a travel award.

ALZHEIMER-INDUCED CHANGES IN BIOMARKERS IN THE HUMAN LATERAL GENICULATE NUCLEUS

E. Couser, S. Bernstein, *University of Maryland, Baltimore, Baltimore, Maryland*

While Alzheimer's disease (AD) patients are known to experience histological retinal changes, the thalamic intermediaries connecting eye and cortex have been understudied. We wanted to examine whether AD biomarkers are expressed in the normal human lateral geniculate nucleus (LGN) and whether AD alters the presence of these markers. We also wanted to determine whether these markers are expressed in pre-clinical AD. Following IRB approval, we obtained human tissue samples from the Maryland Brain and Tissue Bank. These included normal, pre-clinical, and severe AD. We immunohistochemically evaluated human LGN for the expression of both AD markers (phosphorylated Tau, amyloid precursor protein (APP) and amyloid-β (Aβ)) and inflammation using standard immunohistochemistry (IHC) procedures. Cellular inflammation was compared using IBA1. Slides were analyzed using confocal fluorescent microscope and Fluoview Software. While normal tissue showed minimal expression of AD biomarkers, there was a progressive increase in Tau, APP, Aβ, and inflammation in the lateral geniculate nucleus through the different stages of AD severity. Interestingly, the inflammatory response and deposits of AD biomarkers were shown in significant amounts in the pre-clinical samples of the LGN. The LGN-thalamic structure shows AD-induced alterations as the disease progresses and very early in the disease process. This may result in a decreased ability to process visual information, and visual problems. The presence of inflammation and AD-related biomarkers in pre-clinical AD patients suggests that for at least some older adults, changes in visual processing ability and speed may be due to AD onset, and not normal age-related visual decline.

AGE-RELATED ALTERATIONS IN THE RENIN-ANGIOTENSIN SYSTEM AND SYSTEMIC CHRONIC INFLAMMATION MEDIATE MITOCHONDRIAL DYSFUNCTION IN AGING

T.N. Burks, R. Marx, L. Powell, J.D. Walston, P.M. Abadir, *Geriatric Medicine, Johns Hopkins University School of Medicine, Baltimore, Maryland*

Aging is associated with alterations in the renin-angiotensin system (RAS) and chronic activation of low grade inflammation. Both of these changes have been linked to cardiovascular disease and increased mortality. It is established that increased angiotensin II type I receptor (AT1) signaling leads to the production of reactive oxygen species (ROS) through activation of NADPH oxidase (Nox). Cardiac tissue expresses Nox2 and Nox4 which increase ROS and antioxidants, respectively. The molecular connection between age-related alterations in RAS and inflammation in cardiac muscle has not been fully characterized. We investigated this connection using the interleukin-10 knockout (IL10 KO) mouse that has been used to model chronic inflammation. We demonstrate that there is an increase in AT1 expression in young IL10 KO as compared to young wild-type and old IL10 KO mice. Furthermore, there is a decrease in the expression of Nox4 in young IL10 KO driving the decrease in levels of catalase and activity of peroxidase. The increase in ROS leads to oxidative damage to cardiac DNA, proteins, and mitochondria in young IL10 KO mice. Moreover, the high energy demand of cardiac tissue causes the mitochondria to overcompensate in young IL10 KO, leading to an increase in damaged mitochondria with reduced mitophagy. We conclude that an increase in AT1 signaling and activation of chronic inflammation cause dysfunctional mitochondria and a premature aging phenotype in the cardiac muscle. Thus, our data demonstrates that it may be imperative for prognostic test to be developed and administrated at earlier ages.

DIFFERENTIAL NUTRIENT EXTRACTION WITH ACARBOSE TREATMENT

R.A. Brewer, N.D. Miyasaki, D.L. Smith, *University of Alabama at Birmingham, Birmingham, Alabama*

Acarbose (ACA) is a competitive α-glucosidase and α-amylase inhibitor approved for use in type 2 diabetes. Recent laboratory experiments have demonstrated administration of ACA (0.1% by weight) leads to increased lifespan in mice, with a sex-biased benefit towards males. The mechanism for this lifespan effect is unclear; however, as ACA acts in the gut, reduced carbohydrate absorption may play a role. To assess the effects of ACA on nutrient uptake, male and female C57BL/6J mice were provided ad libitum diet containing ACA at concentrations of 0.05%, 0.10%, 0.15%, or a no-dose control. Male mice receiving all doses of ACA weighed significantly less following six months of treatment than control fed mice (-5 to -11%, $p<0.05$), with no differences in female mice body weights ($p>0.05$). Macronutrient analysis performed on pooled in-treatment group feces from males indicated increasing ACA dosage led to decreasing carbohydrate extraction and increased fat and protein extraction from the diet (i.e. ingestion minus excretion). While total caloric intake was increased with ACA treatment (27-64%, $p<0.05$), calories extracted from the diet were similar among all groups. Fecal levels of individual fatty acids (per gram feces), including arachidonic acid and omega-3 fatty acids, were decreased with ACA treatment. ACA treated mice have significantly larger caecums than control fed mice (>200%, $p<0.001$) and altered fecal fatty acid profiles, suggesting increased carbohydrate fermentation. These studies demonstrate ACA alters nutrient uptake, which may contribute to increases in lifespan.

INCREASED SENESCENT CELL BURDEN HINDERS STEM CELL TRANSPLANTATION SUCCESS IN SKIN

A. Palmer[1,2], T. Tchkonia[1], J.L. Kirkland[1], *1. Robert and Arlene Kogod Center on Aging, Mayo Clinic, Rochester, Minnesota, 2. Mayo Medical Scientist Training Program, Rochester, Minnesota*

Adipose-derived stem cell (ADSC) transplantation is a developing strategy to treat non-healing diabetic ulcers and other chronic superficial wounds. Factors such as increased age, obesity, and diabetes are associated with delayed wound healing as well as lower efficacy of stem cell transplantation. In addition, these conditions are associated with an increased burden of senescent cells throughout the body. Senescent cells are growth-arrested cells that remain metabolically active and have been shown to promote a pro-inflammatory environment through the secretion of various cytokines, growth factors, and matrix remodeling factors, collectively known as the senescence-associated secretory phenotype. We aim to determine the role of increasing senescent cell burden in transplant failure. Our hypothesis is that removal of senescent cells from the recipient mouse prior to transplantation will improve transplant outcomes. To address this hypothesis, we use murine ADSCs transplanted onto dorsal skin wounds in mice, allowing us to track stem cell engraftment and incorporation into regenerating tissue, as well as wound closure. In these studies, we use a novel mouse model in which senescent cells can be selectively cleared by administration of a drug that encourages apoptosis of cells highly expressing p16, a characteristic of senescent cells. The insights we gain into the role of senescent cells in stem cell transplantation may be hugely beneficial to the development of new therapeutic strategies to increase the efficacy of ADSC transplantation for wound healing and other applications.

SESSION 105 (SYMPOSIUM)

EVERYDAY QUALITY OF LIFE IN BLACKS AND WHITES WITH OSTEOARTHRITIS: A MULTI-SITE, MULTI-METHOD STUDY

Chair: P.A. Parmelee, *Center for Mental Health & Aging, The University of Alabama, Tuscaloosa, Alabama*

Discussant: F. Keefe, *Duke University, Durham, North Carolina*

This symposium presents preliminary findings from EQUAL, a multi-site study of racial/ethnic differences in osteoarthritis (OA) of the knee. There is considerable divergence in the experience and effects of OA among African Americans (AAs) and non-Hispanic Whites (NHWs), attributable to a range of biological, psychological and social processes. However, previous work on racial/ethnic differences has focused largely on prevalence and treatment, with little attention to the emotional impact of OA-related pain and disability. EQUAL examines racial/ethnic differences in short-term and longitudinal relationships among pain, disability, everyday activities and mood states, and emotional well-being among AAs and NHWs. Functional assessments, self-reports, and real-time measures of activities, symptoms and affect are combined to construct a comprehensive view of how OA affects physical and emotional functioning. A key focus is on how traditional, global indices of physical and emotional quality of life are reflected in (and shaped by) transitory, within-day variations in symptoms, affect and activities. This session begins with an overview of conceptual framework, design and methods, and preliminary findings on racial/ethnic differences (Parmelee). Greenlee addresses sample recruitment, focusing on the challenges of recruiting minority participants in diverse settings and circumstances. Smith describes use of experience sampling methodology to capture momentary symptoms and associated variations in activities and affect. The final paper (DeCaro) describes use of actigraphy to capture physical activity levels, with emphasis on the special challenges of electronic monitoring in an older, frail population. Discussion (Keefe) addresses conceptual challenges and innovations of this research. (All presentations supported by R01-AG041655)

EVERYDAY QUALITY OF LIFE IN OSTEOARTHRITIS: AN OVERVIEW OF THE EQUAL PROJECT

P.A. Parmelee[1], J.L. Greenlee[1], J.C. Williams[1], K. Zakoscielna[1], D.M. Smith[2], *1. Center for Mental Health & Aging, The University of Alabama, Tuscaloosa, Alabama, 2. Stony Brook University, Stony Brook, New York*

EQUAL is a multi-site longitudinal study of the experience and effects of physician-diagnosed osteoarthritis (OA) of the knee among African American and non-Hispanic White older adults. The study combines traditional self-report and performance measures with a one-week protocol of real-time monitoring of symptoms, activities, and affect using both actigraphy and experience sampling methodology. This presentation reviews the study's biopsychosocial conceptual model and the gaps in the literature that it addresses, paritcularly addressing the dynamics of racial/ethnic differences in the emotional impact of OA-related pain and disability. Special emphasis is given methodological decision points, particularly the logic of combining a two-wave, two-burst experience sampling methodology (ESM) design with traditional measures. Preliminary findings address how basic racial/ethnic differences in OA pain, disability and emotional impact differ as a function of measurement approach, contrasting traditional and ESM assessments. The challenges of multi-site, multi-method research are discussed.

EQUAL SAMPLE RECRUITMENT, ATTRITION AND COMPLIANCE DIFFER BY RACE AND SITE

J.L. Greenlee[1], C.M. Hytner[2], *1. Center for Mental Health & Aging, The University of Alabama, Tuscaloosa, Alabama, 2. Stony Brook University, Stony Brook, New York*

Recruiting large, diverse community samples is often difficult. This paper discusses EQUAL's efforts to recruit and retain a 50% AA, 50% NHW sample in Alabama and New York. Barriers to recruitment, including respondent interests and screening exclusions, are discussed. At this writing, about 11% of contacts from diverse recruiting resources are expressing interest in the study. 104 subjects have completed baseline: 33% are AA, with site differences reflecting both community demographics and recruiting resources. Attrition and compliance appear to differ as a function of race/ethnicity and site. Refusals among persons initially interested in the study are greater among AAs (21%) than NHWs (10%). However, compliance with the 7-day experience sampling protocol is better among AAs (80% completing more than 80% of calls, vs. 57% of NHWs). Thus, once enrolled, AAs are more likely to complete the study. Findings are discussed in terms of implications for research on racial/ethnic differences.

EXPERIENCE SAMPLING OF PAIN AND MOOD QUALITY IN AFRICAN AMERICAN AND NON-HISPANIC WHITE ADULTS WITH OSTEOARTHRITIS OF THE KNEE

D.M. Smith[2], C.M. Hytner[2], P.A. Parmelee[1], *1. Center for Mental Health & Aging, The University of Alabama, Tuscaloosa, Alabama, 2. Stony Brook University School of Medicine, Stony Brook, New York*

Ecological momentary assessment refers to a class of methods in which subjective assessments are elicited in real time, as respondents go about their daily lives; thus, these methods can reduce systematic biases related to memory and context. The ecological method we employ in the EQUAL study, an experience sampling method (ESM), also provides a rich and dynamic portrait of symptoms and emotions as they move throughout the day. By briefly surveying participants four times per day over a one week period, we are able to gather fine-grained information on activities, pain, and mood quality. We can also align this data with objective measures of physical activity and sleep quality over the week. Analyses of these data focus on how daily fluctuations in the experience of pain relate to overall functional ability and emotional well-being, with the goal of illuminating racial/ethnic differences in quality of life in people with OA.

WAIST AND WRIST ACTIGRAPHY AS A MEASURE OF PHYSICAL ACTIVITY PATTERNS AMONG OLDER ADULTS WITH OSTEOARTHRITIS IN THE EQUAL PROJECT

J.A. DeCaro, L. Van Buren, *Center for Mental Health & Aging, The University of Alabama, Tuscaloosa, Alabama*

Given improvements in the quality of data produced by accelerometers, assessment of physical activity in everyday life has become has become viable among "free living" adults. Yet for older adults, patterns of movement and sedentary behavior can challenge standard assumptions about thresholds for activity vs. inactivity. We report on 64 EQUAL participants who wore ActiGraph GT3X triaxial accelerometers across 7 days on the waist during waking hours to capture major body movement, and on the dominant wrist across 24 hrs., to capture limb movement and sleep patterns. On the waist, both standard and Low Frequency Extension (LFE) filters were applied; LFE has greater sensitivity to capture slow movements but may introduce greater error. We discuss participant burden and compliance, and illustrate use of these data streams in conjunction with experience sampling to detect distinct forms of physical or sedentary activity.

SESSION 110 (SYMPOSIUM)

UNDERSTANDING BEHAVIORAL SYMPTOMS IN PERSONS WITH DEMENTIA: CHARACTERISTICS, ASSOCIATIONS, AND MEASUREMENT

Chair: B.R. Hansen, *The Johns Hopkins University, Baltimore, Maryland*
Co-Chair: K.A. Marx, *The Johns Hopkins University, Baltimore, Maryland*
Discussant: K. Van Haitsma, *Polisher Research Institute, North Wales, Pennsylvania*

The number of persons with dementia is expected to quadruple worldwide between 2010 and 2050, making it a public health crisis. Behavioral symptoms are a hallmark of dementia, almost universal, and one of the most challenging aspects to treat. Behavioral symptoms are associated with hospitalizations, inappropriate medication use, and poor quality of life in persons with dementia as well as caregiver burden and depression. The impact of the projected worldwide growth in dementia incidence combined with the high prevalence of behavioral symptoms, and their negative consequences, indicate the need for more careful study of their occurrences. This symposium focuses on the most common and disturbing behavioral symptoms and examines their prevalence, characteristics and measurement challenges drawing upon different studies in progress. Choi et al. examines rejection of care, agitation and aggressive behaviors as distinct but overlapping occurrences in 272 persons with dementia from the NIH supported Project ACT trial. Hansen et al. examines aggressive behaviors in 630 persons with dementia in the NIH supported REACH II trial. Marx et al. examines the role of activity in addressing these behaviors in hospitalized patients using an Alzheimer's association supported feasibility study. Trahan et al. presents methodological strengths and challenges of direct observations as a methodology to record and analyze behavioral occurrences. Taken as a whole these papers suggest that behavioral symptoms are complex and co-occur yet are amenable to modification and measurement. Understanding common behavioral symptoms can help enhance novel measurement and intervention strategies to enhance the quality of life of families.

PREVALENCE OF AGGRESSIVE BEHAVIORS IN PERSONS WITH DEMENTIA BY CAREGIVER REPORT IN A DIVERSE, COMMUNITY-DWELLING SAMPLE

B.R. Hansen, N. Hodgson, L.N. Gitlin, *The Johns Hopkins University, Baltimore, Maryland*

Aggressive behaviors in dementia are highly stressful for persons with dementia and their caregivers. The NIH-supported Resources for Enhancing Alzheimers Caregiver Health II (REACH II) initiative was the first study to recruit a large sample of geographically and race/ethnically diverse caregivers and persons with dementia, providing a unique opportunity to examine caregiver-reported aggressive behaviors among 630 persons with dementia (207 Hispanic/Latino, 207 Black/African-American, and 216 White/Caucasian). In an ongoing secondary analysis of aggressive behaviors in the REACH II baseline data, 39.4% (n=248) persons with dementia demonstrated at least one aggressive behavior in the preceding week, with 11.1% (n=70) having two or more behaviors. Most commonly reported was verbal aggression (34.4%, n=217), followed by hurting others (8.6%, n=54), destroying property (7.1%, n=45), and hurting self (3.3%, n=21). Differences between race/ethnic groups were found for only one sub-type of aggression, destroying property, but not for the other sub-types.

REJECTION OF CARE, AGITATION, AGGRESSION – DISTINCT BUT OVERLAPPING BEHAVIORS

S. Choi, K. Kim, L.N. Gitlin, *School of Nursing, The Johns Hopkins University, Baltimore, Maryland*

We examined 3 commonly reported dementia-related behaviors: rejection of care (ROC), agitation and aggression in 272 patients living at home with family caregivers. Patients were primarily female (52.7%), white (69.9%) and older (M=82.1 years, SD=8.4) with mean MMSE=13.0 (range=0.0-29.0). 147 caregivers (54.0%) indicated ROC behaviors occurred an average of 9.6 (SD=20.1) times per/week. Agitation alone was present in 34.3%, ROC alone in 4.5%, and both in 49.4% of patients (p<.01). ROC increased with cognitive decline; agitation was present in patients with mild cognitive impairment, with highest prevalence in those with moderate impairment. ROC was also strongly associated with verbal aggression, x2 =12.74 (1, N=272), p<.01, and physical aggression, x2=9.60 (1, N=272), p<.01. Findings suggest that ROC, agitation, and aggression are distinct yet overlapping behaviors. Understanding overlapping and distinguishing features of these behaviors would be important for devising effective management strategies.

TESTING THE FEASIBILITY OF THE TAILORED ACTIVITY PROGRAM (TAP) TO MANAGE BEHAVIORS IN PERSONS WITH DEMENTIA ON A CHRONIC CARE UNIT

K.A. Marx[1], L.N. Gitlin[1], K. VanHaitsma[2], D. Alonzi[3], T. Gentile[2], *1. Center for Innovative Care in Aging, Johns Hopkins University, Baltimore, Maryland, 2. Polisher Research Institute, North Wales, Pennsylvania, 3. Johns Hopkins Bayview, Baltimore, Maryland*

Neuropsychiatric behaviors are one of the primary reasons that person with dementia are hospitalized, yet staff working on these units typically receive little training in how to manage difficult behaviors. This study tested the feasibility of adapting the TAP program to a hospital setting. 20 participants (average age 77.5 years, 60% female, 85% Caucasian) were enrolled at the time of admission to hospital unit specializing in geriatric mental health. An average of 5.6 (SD=2.8, Range: 2-10) neuropsychiatric behaviors per participant were reported at admission, with the most frequently reported being agitation (94.1%), dysphoria (70.6%), irritability (70.6%), apathy (58.8%) and anxiety (52.9%). A one month follow-up, post discharge, revealed a significant decline in anxiety (p=.022) and agitation (p=.038). Using a more conservative α=0.1, apathy (p=.087) and appetite/eating disorders (.072) were significantly lower at follow-up. Nonpharmacologic interventions, such as TAP, can be modified and applied in a hospital setting.

DIRECT OBSERVATION OF NEUROPSYCHIATRIC SYMPTOMS OF DEMENTIA VIA VIDEO RECORDING: OPPORTUNITIES AND BARRIERS IN MEASUREMENT

M.A. Trahan[1], K. Van Haitsma[3], B.R. Hansen[2], K.A. Marx[2], D. Patel[2], I.H. Stanley[2], C. Duntzee[3], L.N. Gitlin[2], *1. Trahan Behavioral Services, Washington, District of Columbia, 2. Johns Hopkins University, Baltimore, Maryland, 3. Polisher Research Institute, North Wales, Pennsylvania*

Measuring neuropsychiatric symptoms (NPS) with direct observations has important advantages compared to indirect rating scales, including being more reliable and accurate. We review advantages and challenges of direct observation using video recordings. Data were from a feasibility study evaluating effects of activity on NPS in a geriatric-psychiatry hospital unit. Direct observation data were recorded using Observer XT 10.5. Twenty participants engaged in activity sessions during 63 video observations (M=3.7, range=1-7) for 936 video minutes (M=55.1, range 7-96 minutes). Three participants were not recorded because either s/he refused, was discharged early, or had time conflicts with the videographer. Of the 63 videos, 35% had poor sound quality (activity music too loud to hear participants' verbals) and 44% had visibility problems related to camera angles (sunlight created silhouettes). Protocol recommendations for future users of video recording include avoiding silhouettes, increasing sound capabilities, and cuing session start time when taping, among others.

SESSION 115 (SYMPOSIUM)

INTERGENERATIONAL RELATIONS AND WELL-BEING

Chair: J. Suitor, *Purdue University, West Lafayette, Indiana*
Co-Chair: M. Gilligan, *Iowa State, Ames, Iowa*

In recent years, the study of later-life families has focused increasing attention on the ways in which relations between the generations affect parents' and adult children's well-being. This symposium brings together five papers that pose a diverse set of research questions to shed new light on this issue. In the first paper, Birditt, Hartnett, Fingerman, Zarit, and Antonucci use data from adult children to compare the effects of relationships with parents and offspring on well-being. In the second paper, Reczek and Umberson explore theoretically and empirically how the intersection of gender and sexual identity plays a role in caregiving to older parents. In the third paper, Dykstra connects the constructs of "linked lives" and "lives in context" to address the ways in which institutional arrangements support individual autonomy in families in North America and Europe. Both of the next two papers investigate the role of parental favoritism in well-being. In the fourth paper, Suitor, Gilligan, Peng, and Pillemer use data collected from adult children to compare the relative consequences of being the most favored or most disfavored on depressive symptoms. In the fifth paper, Pillemer, Suitor and Gilligan examine whether the impact of children's problems on older mothers' well-being is moderated by whether the problems are experienced by favored offspring. Finally, the panelists and audience members will discuss how the collective findings increase understanding of the processes by which relations between the generations affect both parents' and adult children's well-being.

INTERGENERATIONAL RELATIONSHIP QUALITY AND WELL-BEING: AN EXTENSION OF THE INTERGENERATIONAL STAKE

K. Birditt[1], C.S. Hartnett[2], K. Fingerman[4], S.H. Zarit[3], T.C. Antonucci[1], *1. Institute for Social Research, University of Michigan, Ann Arbor, Michigan, 2. University of South Carolina, Columbia, South Carolina, 3. Pennsylvania State University, State College, Pennsylvania, 4. University of Texas at Austin, Austin, Texas*

Positive and negative relationship qualities with adult children and parents may have distinct influences on psychological well-being. We present two studies in which participants reported relationship quality with children, parents, and their own well-being. Study 1 participants were aged 40 to 60 and reported on both of their parents, and up to three adult children. Study 2 participants were aged 26 to 93 and reported on both of their parents and the child (aged 13 +) they relied on most. Results show that relationships with children were more consistently associated with well-being than ties with parents and negative qualities were more highly associated with well-being than positive qualities. Findings are consistent with the intergenerational stake hypothesis which suggests that parents are more invested in their children than the reverse and with the negativity effect indicating that negative aspects of relationships have a greater effect on well-being than do the positive aspects.

ADULT CHILDREN'S PROVISION OF CARE TO LATER-LIFE PARENTS: HOW GENDER AND SEXUALITY MATTER

C. Reczek[1], D. Umberson[2], *1. Ohio State University, Columbus, Ohio, 2. University of Texas at Austin, Austin, Texas*

Adult children are a central source of caregiving for later-life parents, especially when parents experience age-related health problems. Importantly, past research demonstrates that who provides care, and how this care is provided, is highly gendered and influenced by marital status. Women are more likely than men to provide care to an aging parent—to their own parent or, if married, their spouse's parent. Past research on gender, marital status, and intergenerational care provision has focused entirely on heterosexual couples caring for aging parents. This raises questions about how gendered dynamics of caregiving might differ for partners in same-sex couples. This paper is a first step toward theorizing and empirically exploring the dynamics of caregiving for aging parents across the gendered relational contexts of gay, lesbian, and heterosexual married couples. We analyze gender and caregiving through the analysis of 90 in-depth interviews with gay, lesbian, and straight married adult children.

INTERGENERATIONAL FAMILY RELATIONS: AUTONOMY AND INTERDEPENDENCE

P.A. Dykstra, *Sociology, Erasmus University Rotterdam, Rotterdam, Netherlands*

This presentation connects two theoretical strands: the notions of "linked lives" and "lives in context". The concept of interdependence, which emphasizes the dynamic interplay between being embedded in a meso context of interconnected family ties and living in a macro context of policy arrangements will be elaborated. Using harmonized data on laws, entitlements, and social services in North America and Europe, I will reveal how and to what degree institutional arrangements support individual autonomy in families (between genders and between generations) and/or shape interdependence. Laws explicating that A's rights or duties are based on family member B's age or status duration are examples of legal interdependence. The absence of publicly provided alternatives to family care and financial support is a form of interdependence by default. The United States serves as a case in point: it is an individualistic society that nevertheless creates high levels of generational interdependence, restricting the autonomy of individual family members. An example from research on grandparenting will serve to illustrate the ways in which national institutional contexts shape generational interdependence and by extension, inequality.

PSYCHOLOGICAL CONSEQUENCES OF MOTHERS' FAVORITISM AND DISFAVORITISM TOWARD ADULT CHILDREN

J. Suitor[1], M. Gilligan[2], S. Peng[1], K. Pillemer[3], *1. Purdue University, West Lafayette, Indiana, 2. Iowa State, Ames, Iowa, 3. Cornell University, Ithaca, New York*

Recent research has documented that most older mothers differentiate among their adult children, particularly regarding emotional closeness and preferences for caregiving and confiding. Such differentiation has been found to have negative consequences on adult children's relational and psychological well-being. In the present paper, we use data collected from approximately 800 adult children from the Within-Family Differences Study to compare the effects of being favored and disfavored on psychological well-being. In particular, we compare the effects of perceptions of mothers' differentiation regarding emotional closeness, pride, conflict, and disappointment. Preliminary analyses indicate that perceptions of being the children with whom mothers have the greatest conflict or in whom mothers are most disappointed have substantially greater negative effects on well-being than do perceptions of being positively favored. Findings are discussed in the context of theories of the relative effects of positive and negative relationship domains.

ADULT CHILDREN'S PROBLEMS AND MOTHERS' WELL-BEING: DOES PARENTAL FAVORITISM MATTER

K. Pillemer[1], J.J. Suitor[2], M. Gilligan[3], C. Riffin[1], *1. Cornell University, Ithaca, NY, 2. Purdue University, West Lafayette, Indiana, 3. Iowa State University, Ames, Iowa*

Research has demonstrated the detrimental effects of adult children's problems on parents' well-being, finding that that stressful events, illness, and off-time transitions in adult children's lives are important predictors of parental depression and other negative mental health outcomes. This presentation seeks to expand knowledge about this issue by exploring whether parental favoritism affects the impact of children's problems on parents' well-being. We test two competing hypotheses. First, it is possible that favoritism will not affect this relationship, due to life-long patterns of attachment to and investment in all children. Second, alternatively we hypothesized that parental distress would be increased when problems occur to a child who is favored by the parent. Using data from a large-scale survey of mothers and their adult children, support was found for the first hypothesis; the effects of children's problems did not differ depending on whether the adult child was favored by the parent.

SESSION 120 (SYMPOSIUM)

MULTI-STUDY ANALYSIS OF HEALTH BEHAVIORS AS MEDIATORS OF THE PERSONALITY-MORTALITY ASSOCIATION

Chair: D. Mroczek, *Psychology, Northwestern University, Evanston, Illinois*

Certain personality traits, especially conscientiousness and neuroticism, predict mortality. Recent investigations utilizing single studies have tested the role of mechanisms, particularly health behaviors, connecting traits to mortality. In the first multi-study analysis of these mechanisms, we used 16 of the IALSA studies that contain personality, health behavior, and mortality information to test whether the specific health behaviors of smoking, heavy drinking and waist circumference (as a proxy for poor eating and lack of exercise) mediate the effect of personality traits on mortality. We employed survival analysis within a structural equation modeling framework to perform a mediation model. Separate and integrated results from this 16-study coordinated analysis point to smoking as the strongest mediator of the conscientiousness-mortality and neuroticism-mortality relationships. Discussion will focus on the benefits and drawbacks of Integrated Data Analysis (IDA) and coordinated analysis in testing substantively important research questions.

MULTI-STUDY COMPARISON OF THE INDEPENDENT AND INTERACTIVE COGNITIVE IMPACTS OF HYPERTENSION AND DIABETES MELLITUS

A. Kelly[1], M. Calamia[2], G. Muniz Terrera[3], L. Hoffman[4], A.M. Piccinin[1], S.M. Hofer[1,5], *1. Psychology, University of Victoria, Victoria, British Columbia, Canada, 2. University of Iowa, Iowa City, Iowa, 3. MRC Unit for Lifelong Health and Ageing, London, United Kingdom, 4. The University of Nebraska–Lincoln, Lincoln, Nebraska, 5. Oregon Health & Science University, Portland, Oregon*

Hypertension (HTN) and diabetes mellitus (DM) are two of the most prevalent health conditions in the older adult population and both place diagnosed individuals at increased risk for earlier or more dramatic decline in several cognitive domains. Though HTN and DM often co-occur, their impacts on long-term cognitive functioning are typically considered independently. To the best of our knowledge, Hassing et al. (2004) is the only study to have compared impacts of HTN alone, DM alone and comorbid HTN and DM on cognitive level and rate of change in older adults. Here, we extend that approach to three independent longitudinal studies, using multilevel modeling to examine changes in cognitive scores across study occasions for participants diagnosed with comorbid HTN and DM relative to HTN-only and DM-only groups. Considering both conditions together is a critical next step to further our understanding of the roles that they may play in age-related cognitive decline.

IDENTIFYING DISTINCT PATTERNS OF CHANGE IN COGNITION: ASSOCIATIONS WITH GENDER, EDUCATION AND PHYSICAL ACTIVITY USING GROWTH MIXTURE MODELS

M. Lindwall[2,1], G. Muniz[3], A. Robitaille[4], *1. Department of Psychology, University of Gothenburg, Gothenburg, Sweden, 2. Department of Food and Nutrition, and Sport Science, University of Gothenburg, Gothenburg, Sweden, 3. MRC Unit for Lifelong Health and Ageing, London, United Kingdom, 4. Department of Psychology, University of Victoria, Victoria, British Columbia, Canada*

The aim of the present study was to identify distinct patterns of trajectories in cognitive change across 7 years using growth mixture models (GMM) and to examine if gender, education and physical activity (PA) could predict class membership in terms of cognitive trajectories across time, when controlling for age. Participants were 9,449 older adults (Mage =62.88, SD =8.54), included in the Survey of Health, Ageing and Retirement in Europe (SHARE) database, who completed measures of cognition (fluency) at three occasions across seven years. Mplus was used to analyze the GGM. Results provided strongest evidence for a four-class model. Education and PA, but not gender, predicted class membership.

EDUCATIONAL INEQUALITIES IN HEALTH BEHAVIORS AT MIDLIFE: IS THERE A ROLE FOR EARLY-LIFE COGNITION?

S. Clouston[1], M. Richards[4,5], D. Cadar[4,5], S.M. Hofer[2,3], *1. Preventive Medicine, Stony Brook University, Stony Brook, New York, 2. University of Victoria, Victoria, British Columbia, Canada, 3. Oregon Health and Sciences University, Portland, Oregon, 4. University College London, London, United Kingdom, 5. MRC Unit for Lifelong Health and Aging, London, United Kingdom*

Education is a fundamental cause of social inequalities in health, and has a strong impact on health behaviors. Recent studies have highlighted early-life cognition as commonly predicting both education and later life health. A mechanism through which educational attainment and childhood cognition plausibly impacts health is through differences in uptake, adherence, and modification of behaviors. Using a counterfactual framework, we examine the role of early-life cognition and education on smoking, drinking, and physical activity at midlife integrating results from the Wisconsin Longitudinal Study, the National Survey of Health and Development, and the National Childhood Development Study. Adolescent cognition was associated with education, but not with health behaviors after adjusting for education. Education was robustly associated with the likelihood of smoking and physical inactivity but not drinking. Our results suggest that education is fundamental to the distribution of poor health behaviors.

IMPLICATIONS OF INCREASES IN INTELLIGENCE ACROSS BIRTH COHORTS FOR LONGITUDINAL RESEARCH ON AGING: ADJUSTING FOR THE "FLYNN EFFECT" IN ESTIMATES OF AGE-RELATED DIFFERENCES AND CHANGES

S.M. Hofer[1,2], S. Clouston[3], *1. Psychology, University of Victoria, Victoria, British Columbia, Canada, 2. Oregon Health & Science University, Portland, Oregon, 3. Stony Brook University, Stony Brook, New York*

Flynn (1984, 1987) provided evidence for a steady increase in intelligence scores (3 IQ points or one-fifth of a standard deviation per decade) across birth cohorts in the U.S. and many European countries. While there is no clear consensus as to the primary cause of these increases, potential causes include schooling, test sophistication, nutrition, stimulating environments, fertility patterns, and infectious diseases. We evaluate the hypothesis that increases in cognitive tests scores across birth cohorts are largely explanatory of between-person age differences (Lee, et al., 2008). Understanding the role of birth cohort in explaining age differences in cognitive functioning is essential for replication and comparative research on aging. We discuss methodological issues related to cohort-based adjustment of test scores and utilize longitudinal studies comprised of multiple cohorts with varying historical contexts and degrees of age/cohort heterogeneity.

INTEGRATIVE ANALYSIS OF LONGITUDINAL STUDIES OF AGING (IALSA): REPRODUCIBLE RESEARCH ON LIFESPAN CHANGES IN COGNITION, PERSONALITY, AND HEALTH USING A COORDINATED ANALYSIS APPROACH

S.M. Hofer[1,2], A.M. Piccinin[1], D.J. Deeg[3], *1. Psychology, University of Victoria, Victoria, British Columbia, Canada, 2. Oregon Health & Science University, Portland, Oregon, 3. Free University Amsterdam, Amsterdam, Netherlands*

Research findings and conclusions often differ across independent longitudinal studies addressing the same topic. Differences in measurements, sample composition (e.g., age, cohort, country/culture), and statistical models (e.g., change/time function, covariate set, centering, treatment of incomplete data) can affect the reproducibility of results. The central aim of the Integrative Analysis of Longitudinal Studies of Aging (IALSA) research network (NIH/NIA R01AG026453, P01AG043362) is to optimize opportunities for conceptual replication and cross-validation of results across heterogeneous sources of longitudinal data by evaluating comparable conceptual and statistical models at the construct-level. This symposium presents new results from five analysis projects that make use of this coordinated analysis approach. Mroczek and colleagues present multi-study results on the link between personality and mortality, with an evaluation of the role of health behaviors as mediators of this association. Kelly and colleagues present results of a multiple-study replication of the impact of hypertension and diabetes mellitus on cognitive impairment and decline, with particular attention to the interaction of these two health conditions. Lindwall and colleagues present evidence for distinct patterns of change using growth mixture models and evaluate the association of educational attainment and physical activity with these patterns. Clouston et al. evaluate the role of cognitive ability early in life in understanding how educational attainment and health behaviors influence health outcomes later in life. Hofer and colleagues evaluate the impact of cohort-related secular increases in intelligence over this last century (i.e., Flynn Effect) on cross-sectional age differences and longitudinal age-changes in several studies differing in birth cohort, age distribution, and country. In each of these presentations, we discuss methodological issues and approaches for reproducible research across international longitudinal studies of aging.

SESSION 125 (SYMPOSIUM)

NARRATIVES OF HEALING: MAKING CONNECTIONS THROUGH STORIES

Chair: P.A. Saunders, *Neurology, GUMC, Washington, DC, District of Columbia*
Co-Chair: K. De Medeiros, *Miami University, Oxford, Ohio*

Recent research in narrative medicine and narrative gerontology has focused on the ways in which narrative can be used interpretively and therapeutically. People live life through a narrative lens. When a person witnesses a car accident, quickly the mind turns toward who and how to tell that story. The way human beings view life experience is reflected in how they tell about them and how these stories influence the way they are remembered and retold. The study of narrative ranges across many fields including sociolinguistics in which the specific linguistic features of stories are examined; to sociology which focuses on the topics and contexts of how and where stories are told; to the field of social work where narratives are used in interventions (narrative therapy), educating social work students, reflections on the field, and in empirical research. This symposium brings together multiple perspectives on narratives as data and as frameworks for research and practice. These papers illustrate how reflective writing can help create better health care providers (Saunders), how dementia cargivers tell stories of loved ones in moments of lucidity (Schrauf), the narratives of older women about their difficult adult children (Smith), the use of narrative in the diagnosis of dementia (Karlawish), and the therapeutic function of listening (de Medeiros). After attending this session, participants will be able to articulate some fundamental concepts used in the narrative analysis, and apply these concepts to how narratives can be interpreted and/or used therapeutically.

A STUDY OF NARRATIVE MEDICINE AS METHOD FOR TRAINING BETTER HEALERS

P.A. Saunders, *Neurology, GUMC, Washington, DC, District of Columbia*

Narrative Medicine provides insight into the human condition. In particular, self-reflective writing nurtures skills of observation and empathy — essential in care of the aging. This paper examines 30 student essays illustrating self-reflection. These essays were collected in a Narrative Medicine course over three years. The Institutional Review Board has reviewed this study. Methods of analysis include content analysis. Results show that students write about personal and professional issues using a standard essay format. The essays include positive and negative experiences as well global explanatory statements to indicate different stances towards the future. Teaching narrative medicine reveals that students can learn and share with fellow students in a supportive environment. Writing during a semester provides an opportunity to create a practice in self-reflection. These findings have implications for how training health professionals with narrative competence is a model for humane and effective care of older adults.

“’WHAT’S A TYPICAL DAY?’ USING NARRATIVE TO DIAGNOSE AND TREAT OLDER ADULTS WITH COGNITIVE IMPAIRMENT.”

J. Karlawish, *University of Pennsylvania, Philadelphia, Pennsylvania*

The diagnosis and treatment of older adults with cognitive complaints must be grounded in measurement — of cognition, function, mood — and the ascendency of the electronic medical record (EMR) has propelled this metric approach into clinical practice. Clinicians zip through a check boxes that record a patient’s and family member’s answers to questions from valuable scales such as the activities of daily living. The EMR has also enabled a “templated note,” meaning much of the text is pre-specified. The clinician simply modifies it to fit the particular patient. The result is a thorough accounting of information that, while legible, is often unreadable and uninformative. What’s missing is a synthesis. The presenter will describe a method of asking each “what is a typical day?” and then using this ecologically valid and nonthreatening question to create a narrative that assesses the quality of informants, patient function, cognition, and quality of life.

DOING LUCIDITY: THE MOMENTARY RETURN OF CONVERSATIONAL AND COGNITIVE COMPETENCE IN DEMENTIA

R. Schrauf, *Pennsylvania State University, State College, Pennsylvania*

Caregiver anecdote, Alzheimers’ websites, and popular books on the disease speak of fleeting moments when a person suffering from deep forgetfulness and often pervasive disorientation will suddenly exhibit complete coherence and clear connection with the present moment. Interestingly, caregivers’ accounts of these moments of clarity are about a return to conversational competence—or meaningful talk. Further, when caregivers and family members tell these stories, they often ‘perform’ that talk in reported speech. In this presentation, I examine family members stories of this phenomenon, paying particular attention to the discursive and narrative devices that they use, not simply to relate, but to “do lucidity” in talk. Based on this evidence, I argue that the function of telling such narratives is to reach for healing—as a matter of re-enacting meaning in relationships and identities wounded by gradual and progressive loss.

GRIEF IN THE CONTEST OF A STRUCTURED AUTOBIOGRAPHICAL WRITING GROUP: A CASE STUDY

K. de Medeiros, *Sociology and Gerontology, Miami University, Oxford, Ohio*

Although the use of writing in therapeutic settings is not new, the focus of many writing programs for older adults is on the stories themselves, not the potential benefits that writing may have for the participant. The purpose of the current paper is to present a case study, drawn from a larger randomized control study on the effectiveness of writing to improve autobiographical memory in older adults. During the course of the 8-week workshop, one participant’s terminally ill husband died. Rather than dropping out of the group, she focused her writing on the loss she was experiencing. Writing then became a way for her to both share her feelings and to gain support from the other group members. Content analysis of the transcripts and pieces written during the group was used. Results point to the collaborative way that writing and sharing one’s stories with others can support healing in later life.

“I NEVER REALLY HAD ANYONE TO ASK ME ‘HOW DID I FEEL ABOUT BEING A MOTHER’”: NARRATIVE INTERVIEWS WITH LOW INCOME OLDER WOMEN ABOUT THEIR DIFFICULT ADULT CHILDREN

J.R. Smith, *Graduate School of Social Service, Fordham University, New York, New York*

This study of poor women’s subjective experiences of mothering across the life-course uses narrative analysis (Reissman, 2008) to examine intergenerational ambivalence (Pillemer & Luscher, 2004). Fifteen women, that self-identified as having “difficult” adult children, were seen 3x to tell their story of early and current parenting dilemmas. An unexpected finding was the interviewee’s appraisal of participation in the study as “therapeutic”. The presentation addresses the value of active listening and life review (Haight, 2003), here focused on mothering. The non-judgmental interviewer, and a semi-structured series of questions that inquired about the ups and downs of parenting served a latent therapeutic function, while being a research study. The study provides new information about the lived experience of older low-income and minority women as mothers.

SESSION 130 (SYMPOSIUM)

COMMUNITIES THAT ‘CARE’: AN ENVIRONMENTAL GERONTOLOGY PERSPECTIVE

Chair: M. Kaup, *ATID, Kansas State University, Manhattan, Kansas*
Co-Chair: J. Norstrand, *Boston College, Chestnut Hill, Massachusetts*
Discussant: K. Diaz Moore, *University of Kansas, Lawrence, Kansas*

This symposium presents research on emerging as well as active models of care and community. Presentations will demonstrate how environmental variables within these communities were studied through both qualitative and quantitative research strategies and highlight how these attributes play a significant role in meeting the needs of diverse aging populations. The first presentation will share the results of a two year study that assesses a grassroots membership-based initiative designed to help older adults to age in place through coordinated care as well as social engagement and peer support. The second presentation focuses on communities designed around co-housing models. Results from this study will be discussed as they relate to the co-housing model that fosters an environment of mutual support, and the author will compare these tendencies for support against other settings where older adults live. A final presentation will examine characteristics of community associated with well-being among older adults geographically disconnected from family. Results will address those community characteristics and the important role they play in addressing the unique needs of vulnerable subgroups. At the conclusion of this symposium, participants will be able to identify how different community models may provide valuable care provisions for older adults, and, how future advancements in planning and design may need to consider the social aspects of support in relationship to the physical environment when considering the overall wellbeing of those aging in place.

CARE AND COMMUNITY: HOW MUCH MUTUAL PEER SUPPORT OCCURS IN ELDER COHOUSING COMMUNITIES?

A.P. Glass, *University of Georgia, Athens, Georgia*

For a variety of reasons, not all elders have family to provide care for them. Investigating what older adults can do to help each other is critical but often overlooked. Mutual support was explored as part of a larger mixed-methods study of three senior cohousing communities (N=54; age range = 58-91). Variations and commonalities existed across the sites. Overall, a large majority (80%) agreed that more mutual support occurs in cohousing than in other settings, and that the residents in their communities depend on each other for support (83%) and look out for each other (94%). At two sites, some respondents had no expectation of providing hands-on care, but others (88% of the total) were willing to provide it to at least some of their neighbors. A mutual support model and case studies of how care was actually provided will also be shared, as well as implications for the future.

CHARACTERISTICS OF COMMUNITY ASSOCIATED WITH OLDER ADULTS’ WELL-BEING

N.J. Webster[1], T.C. Antonucci[1], K.J. Ajrouch[2], *1. University of Michigan, Ann Arbor, Michigan, 2. Eastern Michigan University, Ypsilanti, Michigan*

Research has documented fewer older adults live in close geographic proximity to adult children, suggesting communities will play a greater role in meeting the needs of our aging population. We examine characteristics of community associated with well-being among older adults geographically disconnected from family. Data were collected in 2010-2011 from a nationally representative sample of adults aged 70+ from the monthly Surveys of Consumers (N=294). Greater satisfaction with public transportation and climate were associated with less worry about independence. Also, the effects of community characteristics were moderated by age and marital status. Among the oldest-old, greater satisfaction with neighborhood safety was associated with better life satisfaction, whereas among the young-old there was no association; and among those not married, greater convenience of stores was associated with less loneliness, whereas among those married there was no association. Results document the community’s important role and highlight unique needs of vulnerable subgroups.

THE “VILLAGE” MODEL: CREATING CARING COMMUNITIES?

A.E. Scharlach, C. Graham, *Social Welfare, University of California, Berkeley, California*

The “Village” model has achieved national prominence as a grassroots, consumer-driven, membership-based initiative for helping older adults to age in place, through a combination of care coordination, volunteer-based service provision, referral to preferred providers, and social engagement. Of particular interest is an emphasis on peer support and community involvement. This session presents findings from a two-year study of California Villages, which examined the impact of Village membership on social functioning. Participants included 420 Village members, 282 of whom completed retrospective assessments of Village membership and 138 of whom completed assessments before and after their first 12 months of Village membership. Findings indicated increased sense of community but limited gains in social functioning and varying levels of mutual support, with gains most likely among members with the highest levels of program participation. These findings suggest the need to clarify further the Village model and its ability to promote mutually-supportive social networks.

SESSION 135 (SYMPOSIUM)

LIFE AFTER 85: WHAT DOES IT HOLD AND COULD IT BE IMPROVED?

Chair: C. Jagger, *Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom*
Co-Chair: L. Robinson, *Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom*

Despite numbers of the very old growing faster than any other section of our populations, they are often thought to be hard to recruit to and retain in studies. There is therefore a paucity of information on their health and functioning, particularly cognitive function, and especially as they age further. This symposium focuses on trajectories of cognitive function and disability in the Newcastle 85+ Study (n=852) from age 85 to age 90+, and how these are affected by level of education and the potentially modifiable risk factors of diet and body composition. The first presentation investigates patterns of age-related change in memory and attention, unique measures in this age group, in individuals with normal or impaired global cognitive functioning at baseline. Whether health and demographic factors affect rate of decline was also tested. The second presentation describes dietary patterns in this cohort and shows that one, high in fruit and vegetable intake and low in saturated fats, was associated with lower cognitive decline. The third presentation compares the trajectories of disability between men and women and finds a unique group of men who maintained very low levels of disability over five years. Previous studies exploring the predictive ability of body composition on mortality and disability have been limited due to small size, and a single measure of body composition (BMI); the final presentation addresses these issues by reporting new data on the impact of waist circumference (as well as BMI) on mortality and disability-free life expectancy.

LONGITUDINAL CHANGES IN COGNITIVE FUNCTION IN NORMAL AND IMPAIRED GROUPS

B.C. Stephan[1], G. Muniz Terrera[2], K. Davies[3], J. Collerton[3], C. Jagger[3], *1. Institute of Health and Society, Newcastle University, Newcastle upon Tyne, United Kingdom, 2. University College London, London, United Kingdom, 3. Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom*

Ageing is associated with changes in cognition in some, but not all domains. In young-old samples impaired baseline cognitive function has also been associated with differential rates of decline. Whether similar patterns occur in the very-old is not known. Using the Mini Mental State Examination (MMSE) individuals were classified into not-impaired (MMSE≥26; N=599), mildly-impaired (MMSE 25-22; N=135) and severely-impaired (MMSE≤21; N=105) groups. We compared rates of change over 5-years in the Cognitive Drug Research (CDR) memory, reaction time (RT) and attention tasks and examined potential risk factors (health and lifestyle) associated with them. Memory, RT and attention did not change significantly over time in any group. In the not-impaired group education was associated with better attention (B=0.44, SE=0.15; p<0.005). There were sex differences in attention in the not-impaired (B=2.27, SE=0.68; p<0.005) and mildly-impaired (B=5.38, SE=2.23, p<0.05) groups. Smoking and diabetes also influenced cognitive performance.

FOOD FOR THOUGHT: DIETARY PATTERNS AND THEIR EFFECTS ON COGNITIVE DECLINE IN THE NEWCASTLE 85+ STUDY

A. Granic[1], K. Davies[1], A. Adamson[2], J.C. Mathers[1,2], T. Kirkwood[1], M. Siervo[2], C. Jagger[1], *1. Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom, 2. Human Nutrition Research Centre, Newcastle University, Newcastle upon Tyne, United Kingdom*

Diet as a modifiable lifestyle factor and its role in cognitive aging in very old adults is under-researched. We investigated dietary patterns (DP) in 735 participants in the Newcastle 85+ Study in relation to global and attention-specific cognitive functioning over 3 years. Using two-step clustering and 32 food groups established through 24-hr multipass recall, we derived four distinct DP. Compared with DP1 (‘High Potato & Meat Diet’), participants in DP3 (‘Low Saturated Fat, High Fruit & Vegetable Diet’) had a 59% (p=0.009) and 51% (p=0.05) reduced risk of cognitive impairment (scoring ≤25 MMSE points), and cognitive decline (≥3 MMSE-point loss), respectively at 3-year follow-up after adjustment for confounders. Mixed models revealed a protective effect of DP3 on focused attention (β [SE]=-0.018 [0.008], p=0.03) after adjustment for sociodemographic and other lifestyle factors. Diets high in fruits and vegetables but low in saturated fats may delay cognitive decline in the very old.

TRAJECTORIES OF DISABILITY IN THE VERY OLD: THE EFFECT OF EARLY, MID AND LATE LIFE SOCIOECONOMIC STATUS

A. Kingston[1], L. Robinson[2], T. Kirkwood[1], J. Collerton[1], K. Davies[1], C. Jagger[1], *1. Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom, 2. Institute of Heath and Society, Newcastle University, Newcastle upon Tyne, United Kingdom*

Little is known on whether socioeconomic factors earlier in the life course still impact on disability progression in very late life. We used mortality adjusted group-based trajectory modelling and assessed the impact of early, mid and late-life socioeconomic status (education, occupational class and deprivation). We found four distinct gender specific trajectories. A consistently non-disabled group was found only in men, containing 9.0% of male participants. A profoundly disabled group was evident in women only (12.7%). Men in the consistently non-disabled group were more likely to live in affluent areas (OR: 2.34, 95%CI: 1.35-4.10), to have high education (OR: 1.72 (1.12-2.63)) or be from a professional occupation (OR: 4.34 (1.12-16.7)). A similar pattern was found for women. After adjusting for disease burden, education was still prognostic of trajectory group association. Even at age 85 and over, education remains an important determinant of health maintenance.

ANTHROPOMETRIC MEASURES OF ADIPOSITY AS PREDICTORS OF DISABILITY-FREE LIFE EXPECTANCY AND ALL-CAUSE MORTALITY IN THE VERY OLD

M. Siervo, A. Kingston, T. Kirkwood, J. Mathers, J. Collerton, K. Davies, C. Jagger, *Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, Tyne and Wear, United Kingdom*

Excess adiposity is associated with lower mortality in older subjects – a phenomenon termed as the “Obesity Paradox” but it is uncertain whether whole-body (measured by Body Mass Index (BMI)) and segmental adiposity (assessed by Waist and Hip Circumferences (WC, HC)) are associated with reduced disability risk. We used multistate modelling to test the association of adiposity indexes with transitional shifts in health status (to and from disability and to death) over a 5-year follow-up period. High BMI and WC were both associated with less disability (BMI, HR: 0.36 (0.14-0.91); WC, HR: 0.53 (0.35-0.81)). A smaller HC was linked to an increased mortality risk (HR: 1.40 (1.03-1.89)) whereas a large HC was associated with a greater risk of disability (HR: 1.42 (1.03-1.95)). Excess adiposity was associated with beneficial health effects in the very old though the putative role of small HC as a risk factor for terminal decline warrants further investigations.

SESSION 140 (SYMPOSIUM)

THE EFFECTIVENESS OF PASTORAL CARE SMALL GROUP WORK WITH PEOPLE WHO HAVE DEMENTIA

Chair: E.B. MacKinlay, *Centre for Ageing & Pastoral Studies, Charles Sturt University, Canberra, Australian Capital Territory, Australia*

Butler et al 2004 reported that the only psychiatric or social factor associated with poor survival in dementia was depression. This paper reports the findings of a small group pastoral care program from a larger mixed methods study, to trial different modalities for lowering depression, through 18 weeks of weekly facilitated sessions to reduce levels of depression among residents with dementia. 25 began and 22 completed the study. Sessions addressed themes of gratitude and blessings, images of God, peace and forgiveness, hope and expectation, joy and happiness, and strength and faith. It measured depression (GDS short form), Morale Scale (PGC) and dementia (ACE-R) measured program through pre, mid and end tests with three month follow-up and initial spiritual assessment. Analysis, comparing testing sessions 1 with 3 (GDS) found significant in lowering depression (p<.05). The paper addresses findings and identifies ways of working effectively with these people.

SPIRIT ALIVE: AN INNOVATIVE APPROACH TO PASTORAL CARE FOR INDIVIDUALS WITH DEMENTIA

K.O. Carney, S. Brooks Cope, E. Buss, *Phoebe Ministries, Allentown, Pennsylvania*

Spirit Alive represents an innovative approach to providing spiritual support for individuals with mid to late stage dementia. The model incorporates best practices in dementia care into an interactive small group faith service that is intended to provide the participants with a renewed sense of connection to God and one another. Based upon an individualized assessment of interest, personal history and cognitive level, participants are actively involved in a variety of sensory, cognitive, artistic and social activities that are employed to convey great spiritual truths through familiar stories from various religious traditions. In this presentation, the Spirit Alive model and the various best practices that inform it will be discussed. Preliminary findings based on four Spirit Alive groups that have been operating for the last year will be shared, including data related to participant engagement, clinical benefits of group participation and observed spiritual benefits will be discussed.

SPIRITUAL CARE AND FAMILY CAREGIVING: A PERSON CENTERED APPROACH TO LIVING WITH DEMENTIA

B.T. Mast, *Psychological & Brain Sciences, University of Louisville, Louisville, Kentucky*

Person centered approaches to dementia seek to tailor care efforts to a deeper understanding of the person and their unique identity. For older adults connected with communities of faith, this understanding is partially rooted in their story of faith, their beliefs, values and faith practices. This study investigated the ways in which family caregivers draw upon these aspects of the person in providing care and the ways in which church communities might partner in this care process. Interviews with family caregivers revealed common themes that converge with empirical research on memory functioning and living optimally with dementia, including (1) drawing upon reminiscence and spared autobiographical memory, (2) utilizing procedural memory and faith practices, and (3) addressing a desire to remain connected and valued by their faith community. These findings are discussed within a person-centered framework along with guidelines for faith communities seeking to care for individuals and caregiving families.

THE PLACE OF SPIRITUALITY IN A DEMENTIA-FRIENDLY COMMUNITY

S.H. McFadden, *1. Psychology, University of Wisconsin Oshkosh, Oshkosh, Wisconsin, 2. Fox Valley Memory Project, Appleton, Wisconsin*

The international effort to encourage creation of dementia-friendly communities has given little attention to meeting spiritual needs of persons with the diagnosis and their care partners. This paper presents a case study of how the Fox Valley Memory Project—a multi-dimensional effort to create a dementia-friendly community in northeast Wisconsin—addresses spiritual issues through research on the spirituality and religiousness of memory café participants, outreach to clergy groups and congregations, training programs for congregational volunteers in long-term care, and a monthly spiritual support group initiated by memory café participants. This community case study includes research findings as well as descriptions of programmatic efforts to ensure that the spiritual needs and resilience of individuals, along with various forms of support from congregations, are included in the vision of a dementia-friendly community.

FORGETFUL BUT NOT FORGOTTEN: SPIRITUAL CARE FOR PEOPLE WITH DEMENTIA

B.T. Mast[1], M. Downs[2], *1. Psychological & Brain Sciences, University of Louisville, Louisville, Kentucky, 2. Bradford Dementia Group, Bradford, United Kingdom*

Although a majority of older people describe themselves as either religious, spiritual or both, this aspect of gerontological research has received relatively little attention compared to other social and psychological aspects of aging. This is perhaps even more noticeable in relation to the spiritual care and faith practices of older adults with dementia. The four presentations in this symposium highlight research addressing spiritual care for people with dementia across a variety of contexts and settings, including specialty memory care units, dementia-friendly communities, pastoral small groups, and family caregiving. These presentations share a common focus on resilience, community support, and addressing spiritual needs using person centered approaches that are tailored to people with dementia and grounded in best practice concepts.

SESSION 145 (SYMPOSIUM)

STIMULATING ACTIVE ENGAGEMENT IN PHYSICAL AND FUNCTIONAL ACTIVITY IN INSTITUTIONALIZED OLDER ADULTS: CONNECTING INTERNATIONAL EVIDENCE

Chair: S. Metzelthin, *CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*
Co-Chair: G. Zijlstra, *CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*
Discussant: C.A. Estabrooks, *University of Alberta, Edmonton Alberta, Alberta, Canada*

Institutionalized older adults are insufficiently active in daily life despite their underlying physical capability to be more engaged. Hospitalized older adults spend approximately 83% of their time in bed and nursing homes residents spend on average less than 1 minute a day engaged in moderate physical activity. Acute and long-term care staff is often focused on completion of care tasks and of prevention of injuries from falls and behavioral and psychological symptoms of dementia. This task based and safety approach to care delivery inadvertently results in fewer opportunities for older adults to be actively involved in physical and functional activities. Deconditioning and functional decline are common consequences of this inactivity and residents, families, and even healthcare professionals accept this as a consequence of aging and institutionalization. However, there is a substantial opportunity to prevent deconditioning and functional decline by stimulating active engagement in activities of daily life. These activities need to match the physical capabilities and preferences of older adults as well as the care situation, setting and culture. This symposium consists of five presentations from the Netherlands and the US. The focus of this symposium is on various approaches to stimulate and support institutionalized older adults to engage in physical or functional activities. Furthermore, barriers in encouraging active participation in these activities will be addressed. Our Canadian discussant Carole Estabrooks will reflect critically on the individual presentations and will facilitate a discussion on-site.

FUNCTION FOCUSED CARE IN NURSING HOME SETTINGS IN THE UNITED STATES: OVERCOMING CHALLENGES AND MAKING IT HAPPEN

E. Galik[1], B. Resnick[1], I.A. Pretzer-Aboff[2], *1. School of Nursing, University of Maryland, Baltimore, Maryland, 2. University of Delaware, Newark, Delaware*

Function focused care (FFC) is a philosophy of care in which care is provided with (i.e., doing hand over hand bathing, walking individuals or helping them to self-propel a wheelchair) rather than for (e.g., bathing or dressing individuals, pushing them in wheelchairs) older adults. Challenges to implementing FFC across nursing homes in the United States include symptoms such as resident fear, pain, cognitive impairment and anxiety, lack of understanding in the benefits of FFC, minimal administrative support for FFC, and policies and environments that create barriers to physical activity. This session will summarize themes (facilitators, barriers and benefits of FFC) from qualitative studies with nursing staff. The Social Ecological model and Diffusion of Innovation theory provide the theoretical framework for strategies to overcome challenges and sustain FFC, particularly among residents with dementia. We will also address use of facility based champions to integrate FFC in real world settings.

A FAMILY-CENTERED INTERVENTION TO PROMOTE FUNCTIONAL RECOVERY IN HOSPITALIZED OLDER ADULTS

M. Boltz[1], B. Resnick[2], T. Chippendale[1], J. Galvin[1], *1. New York University, New York, New York, 2. University of Maryland, Baltimore, Maryland*

Hospital-acquired deconditioning is common in older adults and is associated with increased risk for readmissions, unabated delirium, and post-acute functional decline. We examined the feasibility and utility of the Fam-FFC (Family-centered Function-focused Care) intervention that actively engages family caregivers (FCG) and medical patients in a plan for functional recovery. As compared to the control group, the number of 30-day hospital readmissions was lower (X2 = 2.3, p = .01); the return to baseline function was higher (X2 = 9.7, p = .002); delirium severity (F = 20.8, p <.001) and duration (X2 = 4.5, p = .04), and ADL performance (F = 3.3, p =.03.) improved. FCG demonstrated significant increases in preparation (F = 4.4, p =.012) and less anxiety (F = 9.4, p <.0001) from admission to two months post-discharge. Fam-FFC is feasible and has the potential to improve outcomes for hospitalized older adults and FCG

STIMULATING PHYSICAL ACTIVITY AMONG NURSING HOME RESIDENTS: USE OF AN EXERCISE GARDEN

M.H. Bleijlevens[1,2], S. Braun[3,1], M. Kleynen[3,4], *1. Health Services Research, Maastricht University/CAPHRI, Maastricht, Netherlands, 2. Centre of Expertise Geriatric Rehabilitation and Chronic Somatic Care, Sevagram Zorgcentra, Heerlen, Netherlands, 3. Research Centre Autonomy and Participation of People with a Chronic Illness, Faculty of Health, Zuyd University of Applied Sciences, Heerlen, Netherlands, 4. Adelante, Centre of Expertise in Rehabilitation, Hoensbroek, Netherlands*

Exercise gardens are considered best practice for encouraging nursing home residents to become more physically active. An exercise garden is an outdoor facility comprising a supportive, elder friendly physical environment. The equipment present is selected to ensure high levels of accessibility, ease of use and enjoyment. However, information to which extent such a garden is used in practice is lacking. In an exploratory study, behavioral mapping was used to assess the actual use of an exercise garden among 99 psychogeriatric nursing home residents. Results show that 63% of the residents visited the garden at least once a week. In 40% of the cases, residents visited the garden without supervision. If a supervisor was present, this mainly were physical or recreational therapists. Family and nursing staff were very little involved. In conclusion, the garden is used. However, the existing potential to engage residents in physical activity can be better utilized.

MIBBO: A METHOD TO IDENTIFY MEANINGFUL PHYSICAL ACTIVITIES FOR NURSING HOME RESIDENTS

M. Kleynen[1,2], S. Braun[4,3,1], E. van Rossum[1,3], A. Beurskens[1,5], *1. Research Centre Autonomy and Participation of people with a chronic illness, Zuyd University of Applied Sciences, Heerlen, Netherlands, 2. Adelante Rehabilitation Centre, Hoensbroek, Netherlands, 3. Maastricht University / school CAPHRI / Department of Health Services Research, Maastricht, Netherlands, 4. Research Centre Technology in Care, Zuyd University of Applied Sciences, Heerlen, Netherlands, 5. Maastricht University / school CAPHRI / Department of Family Practice, Maastricht, Netherlands*

Inactivity is highly prevalent among nursing home residents. Hence, it is very important to offer meaningful physical activities, matching with the preferences of residents. Therefore, a method to investigate meaningful activities has been developed ('MIBBO'). The approach includes a photo interview: residents sort photos of activities with a physical component (e.g. gardening, preparing a meal) into 'yes, I like to do' versus 'no, I'm not interested'. Residents then choose their top 5 of activities and how or when they would like to perform them. Based on the results a plan is made to embed the preferred activities in daily life. In several pilot studies including 138 residents: 1) the MIBBO was assessed as feasible; 2) test-retest revealed 81% agreement of chosen activities; 3) it was shown that the implementation of the tailored activity plan is possible but complex and needs support of the entire multidisciplinary team.

BARRIERS TO DELIVERING EVIDENCE BASED CARE RELATED TO FUNCTIONAL STATUS OF NURSING HOME RESIDENTS

N. Kuk[1], G. Zijlstra[1], G. Bours[1,2], J.P. Hamers[1], G.I. Kempen[1], *1. Department of Health Services Research, CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands, 2. Zuyd University of Applied Sciences, Heerlen, Netherlands*

It is important to encourage nursing home residents to perform (instrumental) activities of daily living ((I)ADL) independently as much as possible. We developed and initially tested a questionnaire for 1) nurses' use of evidence based care (EBC) related to functional status of residents, and 2) perceived barriers to this care. Based on 14 interviews, 3 focus group interviews with residents and staff members of nursing homes, a literature study and expert consultation a questionnaire was developed. Main topics were: degree of support during (I)ADL, and related barriers. The questionnaire was completed by 37 nurses. Results indicate that IADL was less encouraged by nurses compared to ADL. The 3 most frequently mentioned barriers were residents' fear to walk (86.5%), attention seeking through care (73.0%), and residents' unwillingness to perform activities (64.9%). This indicates that according to nurses the main barriers to EBC related to functional status are on resident level.

SESSION 150 (SYMPOSIUM)

SUCCESSFUL AGING: LESSONS FROM LONGITUDINAL STUDIES

Chair: R. Pruchno, *Institute for Successful Aging, Rowan University School of Osteopathic Medicine, Stratford, New Jersey*
Discussant: L. Poon, *University of Georgia, Athens, Georgia*

Over the past several decades, the quest to understand successful aging has yielded an exponential growth in the number of publications defining the construct and empirical studies examining its predictors. Although it is generally agreed that aging is a process that evolves over time, understanding the fluidity of successful aging has been hindered by an almost exclusive reliance on cross-sectional designs. Fraught with concerns about causal attributions and survivor effects the discussion sections of these studies have stressed the need for longitudinal designs. Although a number of recent longitudinal studies have examined health, well-being, and life satisfaction, few longitudinal studies of successful aging exist. Using data collected from longitudinal studies that have sought to understand successful aging, presenters will examine whether the meaning of successful aging changes over time, what variables predict successful aging at different points in the life course, and strategies for promoting successful aging. The data sets informing the symposium include the Honolulu Heart Program/Honolulu Asia Aging Study, the Georgia Centenarian Study, ORANJ BOWL, and The Manitoba Follow-Up Study.

EFFECTS OF EARLY INFLUENCES AND MIDLIFE CHARACTERISTICS ON SUCCESSFUL AGING: LONGITUDINAL FINDINGS

R. Pruchno[1], M. Wilson-Genderson[2], *1. Institute for Successful Aging, Rowan University School of Osteopathic Medicine, Stratford, New Jersey, 2. Virginia Commonwealth University, Richmond, Virginia*

Previous research revealed that successful aging includes both objective and subjective dimensions. This longitudinal analysis examines how early life influences and midlife characteristics predict stability and change in successful aging over a four-year period. Data from 3,379 people living in New Jersey who completed baseline telephone interviews between 2006 and 2008 and follow-up mail surveys in 2011 were analyzed. Latent profile analysis identified people who aged successfully according to both objective and subjective criteria, neither criteria, and one, but not the other criteria. Multinomial logistic regressions analyses focused on the 2,614 people who were successful according to both objective and subjective criteria at baseline. Findings reveal that characteristics identifiable early in life (gender, race, education, never marrying, incarceration) as well as midlife status (currently married, working), health behaviors (smoking, drinking, BMI, exercise), and social support distinguished people who continued to age successfully four years later from those who did not.

THE DYNAMIC PROCESS OF SUCCESSFUL AGING OF OLD MEN: THE MANITOBA FOLLOW-UP STUDY

R.B. Tate, A.U. Swift, *Manitoba Follow-up Study, University of Manitoba, Winnipeg, Manitoba, Canada*

A cohort of 3,983 young male aircrew recruits from the Royal Canadian Air Force has been followed with routine medical examinations and regular contact since 1948. Over the past two decades, fueled by a growing interest to understand the roles of physical, mental and social functioning on attaining and sustaining a healthy and successful passage through later life, the research focus was expanded from cardiovascular epidemiology to explore the concept of successful aging. Since 1996, an extensive questionnaire has been administered 14 times. This new longitudinal component includes >10,000 lay definitions of successful aging. Thematic analysis supports our understanding of successful aging as a dynamic process through which definition and attainment may change with aging and circumstance. On July 1, 2013, 429 original cohort members were alive at a mean age of 92 years. We continue to contact these men three times a year with surveys and medical updates.

SUCCESSFUL AGING AMONG SEXAGENARIANS, OCTOGENARIANS, AND CENTENARIANS – DOES SUCCESS CONTINUE OVER TIME?

P. Martin[1], J. Cho[2], M. Johnson[3], L. Poon[3], *1. Iowa State University, Ames, Iowa, 2. Texas A&M, College Station, Texas, 3. Univesity of Georgia, Ames, Georgia*

Survivorship into late life can be considered a success, but whether the quality of life meets expectations of success, and whether success changes over time is less clear. This presentation highlights several markers of success and their stability and change over time. Two hundred and one older adults (sexagenarians, octogenarians, and centenarians) were evaluated on four “classic” dimensions (i.e., disease, cognition, functional capacity, and social engagement) and three “alternative” measures (i.e., perceived health, happiness, and perceived economic status) of successful aging. Autoregressive models were computed to evaluate the stabilities and cross-lagged effects of successful aging markers. Stabilities ranged from .32 for social engagement to .81 for functional capacity. Functional capacity at time 1 was a consistent predictor of other successful aging markers, and perceived economic status at time 1 significantly predicted mood at time 2. The results suggest a differential view of successful aging markers embedded in a longitudinal framework.

GENETIC AND LIFESTYLE PREDICTORS OF SUCCESSFUL AGING TO EXCEPTIONAL OLD AGE: THE HAWAII LIFESPAN STUDY

B. Willcox[1], R. Chen[1], K. Masaki[1], Q. He[1], J.S. Grove[1], D.C. Willcox[1,2], L. Poon[3], T. Donlon[1], *1. Kuakini Medical Center/ University of Hawaii, Honolulu, Hawaii, 2. Okinawa International University, Ginowan, Japan, 3. University of Georgia, Athens, Georgia*

Objective: Identify genetic and modifiable factors that predict successful aging to nonagenarian and centenarian ages. Methods: A total of 5820 Japanese-American middle aged men (mean age, 54 [range, 45-68] years) free of morbidity and functional impairments, were followed in a prospective cohort study, for up to 49 years. Using logistic regression, we assessed risk factors predicting three outcomes at ages 90, 95, and 100 years: death, unhealthy aging, (survival with chronic disease and/or disability), successful aging (survival free of chronic disease and disability). Results: Predictors of successful aging included biological (genotype, BMI, blood pressure, blood sugar) health habits (smoking, alcohol, physical activity), and socio-demographic factors (education, marriage). Cumulative multivariable risk factor modeling demonstrated that probability of successful aging varied multi- fold between those with and without protective genotypes and/or modifiable risk factors. Conclusion: While genetics are important, the probability for successful aging until very old age also appears highly modifiable. Supported by NIA grants 2R01AG027060 and 1R01AG038707.

SESSION 155 (PAPER)

PSYCHOSOCIAL, BEHAVIORAL, AND COGNITIVE INTERVENTIONS

EXAMINING THE EFFECTS OF A PERSON-CENTERED SITUATION-SPECIFIC MUSIC INTERVENTION

E.S. Ihara[1], C. Clark[2], C.J. Tompkins[1], H.C. Matto[1], *1. George Mason University, Fairfax, Virginia, 2. Insight Memory Care Center, Fairfax, Virginia*

Creative therapy interventions that are kinesthetic-sensory based, such as music and movement techniques, have been shown to be effective for older adult populations, particularly when personalized, participatory, and socially interactive (Sakamoto, Ando & Tsutou, 2013). Such interventions may actually rewire the striatal-accumbens-cortical pathways in the brain, leading to a reduction in anxiety and depression (Lambert, 2010). Music has been used successfully in various settings (medical, institutional, and adult day care) to decrease agitation, anxiety, medication use, stress and distress, and increase pain control, wellness, and overall sense of control (Chlan et al., 2013; Hartling et al., 2013; Jenninga & Vance, 2002; Stuckey & Nobel, 2010). This presentation will discuss the effects of a person-centered, situation-specific music intervention on behavioral functioning among older adults attending Insight Memory Care Center’s adult day program. Of the 70 total participants in the program, 25 are currently involved in the Music and Memory Program intervention. Preliminary review of the facility’s client tracking data that used 30 minute time-interval behavioral rating forms showed clinically significant improvement in several behavioral domains from pre-post iPod use, including decreases in anxiety, agitation and confusion, and increases in motivation to engage in activities. The results of this intervention during a high-stress time (4-6 pm) in the facility when many participants experience behavioral difficulties with the transition back to their primary residence will be presented. Study findings of the music intervention on micro-level transitional stressors may have important translational implications for further study of this intervention’s effects on macro-level transitioning events.

PILOT TESTING THE USE OF A TECHNOLOGY TOOL IN MEMORY CARE

A. Lazar, H.J. Thompson, G. Demiris, *University of Washington, Seattle, Washington*

Compared to older adults without dementia, people with dementia are much more likely to reside in institutional settings rather than the community. Just as their community-dwelling counterparts, persons living in memory care units (MCU) and assisted living facilities are in need of stimulating activities. Information and communication technology has the potential to facilitate activities for people with dementia. We present an evaluation of a commercially available technology tool designed for older adults with dementia. We conducted a six-month mixed-methods study in two settings within a single facility: a MCU and a memory fitness group for people demonstrating early signs of dementia. We involved four groups: residents of a MCU, family members of residents, staff that interacted with residents, and participants of the memory fitness group. We gathered qualitative data through repeated interviews with staff, family members and memory fitness participants and handwritten notes from weekly sessions with residents of the MCU. Quantitative data included standardized instruments to assess cognition, mood, and quality of life along with an instrument to evaluate resource use. Through this study, we gained a comprehensive view of perceptions towards this technology tool as well as the impact it had on staff and residents. In this study, we present case studies discussing the impact of the technology tool on participants assessed through the use of the standardized instruments along with key insights gained from interviews. This work will inform future use and evaluation studies.

DESIGN AND IMPLEMENTATION OF THE INTERGENERATIONAL ART THROUGH THE AGES ACTIVITY INTERVENTION

T.L. Gruenewald, E.W. Hagood, D. Wang, M.R. Grossman, J. Nowaskie, D. Stanton, N. Marcione, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

Art Through the Ages (ATTA; Art-Through-the-Ages.org) is an intergenerational activity program designed to provide older adult volunteers with creative/intellectual, cognitive, and social activity hypothesized to promote cognitive and physical health in later life, as well as fulfill older adults' desires to make generative contributions that promote the well-being of others. ATTA engages older adults to provide elementary-school age children with standards-based visual arts instruction and guide children in hands-on artistic creation. ATTA fosters intergenerational connections through interactions between older adult volunteers and young children and the sharing of the work and lives of master artists of both the past and present. This presentation will provide an overview of the ATTA program and highlight program elements designed to promote health and well-being in ATTA participants. The findings from a pilot implementation and feasibility study of the ATTA intervention with a cohort of 22 older adults (ages 63-90, M=72) in one public elementary school over the 2013-2014 school year will also be shared. This will include an overview of pre- to post-participation changes in psychological and social well-being, behavior and activity engagement, and performance-based cognitive and physical functioning. We will also review findings from novel experience sampling assessments of daily cognitive-emotional states, activity, and cognitive function, assessed with wireless computer devices in the field at multiple weeklong phases across the volunteer year. Best practices for ATTA program recruitment and implementation will be shared, as well as pre- to post-participation data which supports ATTA as a health and well-being promotion tool.

EARLY STAGE MEMORY LOSS PROGRAMS: RESULTS OF A RANDOMIZED CLINICAL TRIAL COMPARING SINGLE SESSION TO MULTI-SESSION SUPPORT GROUPS

R.G. Logsdon, K.C. Pike, S.M. McCurry, L. Teri, *University of Washington, Seattle, Washington*

Individuals diagnosed with early stage dementia and their family care partners need education and psychosocial services appropriate for their unique situation. Support groups for dementia caregivers have been a mainstay of non-medical services for family caregivers, and many agencies are extending the support group model to also provide services to diagnosed individuals. This presentation describes results of a randomized controlled trial comparing a single-session, half-day educational seminar to an 8-session weekly support group program. Both conditions were conducted by the local Alzheimer's Association chapter; outcomes assessments and data analysis were done by research investigators who were blinded to treatment condition. Primary outcomes were quality of life (QOL-AD) and depression (Geriatric Depression Scale-GDS). One hundred forty-three persons with early stage dementia and 105 care partners were randomized in blocks to the half-day seminar (n=79) or 8-session groups (n=64). At baseline, mean age of participants was 76 years, and mean MMSE score was 22. Fifty-six percent of participants attended with a spouse, 13% with an adult children, 6% with another relative or friend, and 27% attended without a care partner. On the intent-to-treat pre-post analysis, participants in both conditions reported non-significant improvement on QOL and decreased depression on the GDS. There were no differences in outcomes between conditions, and no differences for those who attended with or without a care partner. No changes in care partner outcomes were found for either condition. Additional research is needed to identify and evaluate other alternatives for providing support services to early stage dyads.

IMPROVEMENT OF COGNITIVE FUNCTIONS OF AD PATIENTS BY A NEW COGNITIVE INTERVENTION METHOD

R. Kawashima[1], S. Sereda[2], D.L. Hiller[2], S. Ito[3], H. Otake[3], H. Murata[1], *1. IDAC, Tohoku University, Sendai, Japan, 2. Eliza Jennings Senior Care Network, Cleveland, Ohio, 3. Kumon Learning Therapy Center, Tokyo, Japan*

The purpose of this study was to examine the beneficial effects on cognitive function by a cognitive intervention program designed for dementia care called Learning Therapy in Japan and SAIDO Learning in the United States (hereinafter "SAIDO Learning," as appropriate). SAIDO Learning is a working memory training program that uses systematized basic problems in arithmetic and language, as well as writing. Twenty-three nursing home residents with dementia were assigned as an intervention group, and another twenty-four people with dementia at another nursing home were assigned as a control group. Both nursing homes were operated by the same organization, and residents of both nursing homes received essentially the same nursing care. Thirteen and six subjects of the intervention and control groups, respectively, were clinically diagnosed as Alzheimer's Disease (AD). After the six-month intervention, the AD subjects of the intervention group showed statistically significant improvement in cognitive function, as measured by the MMSE compared with the control subjects. In addition, post hoc analysis revealed that the FAB scores of the intervention group tended to improve after six month intervention. We also observed the restoration of mental status and mood severity only in the intervention group. Our results indicate cognitive intervention through SAIDO Learning is effective and useful for dementia care.

SESSION 160 (PAPER)

MINORITY AGING II

RESIDENTIAL SEGREGATION AND HYPERTENSION PREVALENCE IN BLACK AND WHITE OLDER ADULTS

T. Usher[1], C. Rohde[1,2], D. Gaskin[1,2], R. Thorpe[1,2], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. Hopkins Center for Health Disparities Solutions, Baltimore, Maryland*

Few studies have examined segregation's role on race differences in hypertension among community-dwelling older adults. It is possible racial differences in hypertension result from differences in exposure to adverse conditions. We examined associations among non-Hispanic blacks and whites aged 50 and over in the National Health and Nutrition Examination Survey 1999-2004. Hypertension was defined as systolic blood pressure (BP) ≥ 140 mm Hg, diastolic BP ≥ 90 mm Hg, or self-reported antihypertensive medication use. Our segregation measure reflects combinations of individual race (black/white), neighborhood racial composition (black/white/other/integrated), and individual and neighborhood poverty level (poor/nonpoor). Using logistic regression and adjusting for health-related factors, African-Americans living in: black (OR = 2.54, 95% CI 1.61-4.00), white (OR = 2.56, 95% CI 1.24-5.31), and integrated neighborhoods (OR = 3.23, 95% CI 1.72-6.03) had greater odds of hypertension than whites living in white neighborhoods. Additionally, poor whites in poor neighborhoods (OR = 1.74, 95% CI 1.09-2.76), nonpoor African-Americans in nonpoor (OR = 3.03, 95% CI 1.79-5.12) and poor neighborhoods (OR = 4.08, 95% CI 2.16-7.70), and poor African-Americans in nonpoor (OR = 4.35, 95% CI 2.17-8.73) and poor neighborhoods (OR = 2.75, 95% CI 1.74-4.36) had greater odds of hypertension than nonpoor whites living in nonpoor neighborhoods. In this national sample, individual and neighborhood poverty impacts whites while African-Americans have greater odds of hypertension regardless of neighborhood. Public health interventions targeting hypertension should consider neighborhoods, as their environmental aspects can impact the odds of developing hypertension. Effective neighborhood interventions may differ for African-Americans and Whites.

A MIXED-METHODS STUDY ON SOCIAL CAPITAL AND HEALTH IN ELDERLY ASIAN AND AFRICAN-AMERICAN INDIVIDUALS

K. Kwong[1], Y. Du[1], Q. Xu[2], *1. Tulane University Center for Aging, New Orleans, Louisiana, 2. Tulane University School of Social Work, New Orleans, Louisiana*

Background: Persisting health disparities among minority/immigrant older adult populations demand attention. This study documents the health status of elderly Asian- and African-Americans (65+); identifies and compares health-related risk factors; and explores potential benefits that networking and community participation behaviors might bring to minority elders' overall health. Method: This study adopted a mixed-methods design. Quantitative data was from the California Health Interview Survey 2009 for elderly Asians (n=1075) and African-Americans (n=566), and descriptive and regression analyses were conducted to document health status, and identify and compare risk factors. Based on the results of quantitative data analyses, semi-structured interviews (n=17) were conducted. Along with health status and risk factors, interviews recorded experiences being an older minority/immigrant and perceptions of social connections and community involvement. Qualitative data were analyzed using constant comparison. Results: Quantitative results suggest that U.S.-born Asians enjoy better health than African-Americans, followed by immigrant Asians. While delayed use of healthcare is more prominent among African-Americans, the effect of delayed healthcare on health status is strongest in immigrant Asians. Qualitative data reveal: 1) Asian and African-American seniors maintain engaging relationships with others and these social connections assist them in maintaining and/or improving their overall health; and 2) the possession and utilization of social capital are influenced by acculturation and gender. Implications: Findings suggest that older Asian immigrants may have experienced double disadvantages. As social capital has a role on the health of older minority/immigrant adults, we call for different policy and practice responses to address health concerns of Asian- and African-Americans.

THE ONGOING SIGNIFICANCE OF ETHNICITY: JAPANESE AMERICAN OLDER ADULTS FROM HAWAII IN SOUTHERN CALIFORNIA

A. Choi, *Department of Interdisciplinary Studies, California State University Dominguez Hills, Carson, California*

This paper examines the experiences of a cohort of Japanese Americans who migrated to Los Angeles from Hawaii in the aftermath of WW II. In particular, this study examines how Japanese Americans from Hawaii crafted a unique Japanese American Hawaiian identity that not only spoke to their experiences as transpacific migrants, but also to the volatile racial landscape of postwar Los Angeles. In-depth interviews were conducted with twenty Japanese American Hawaiian older adults who receive services at a congregate meal site that served the Japanese American community in Gardena, CA—-a suburb of Los Angeles. Data were transcribed and independently coded to identify key patterns and themes. It was discovered that as these individuals aged into retirement, many of these older adults identified as Japanese American Hawaiian—-an identity that is very different from Japanese Americans from the mainland. This identity is rooted in a complicated historical matrix that includes not sharing the experience of being incarcerated in internment camps during World War II like Japanese Americans from the mainland, their experiences as Asian Americans in postwar Los Angeles, and their deep ties to Hawaii. Recognizing this difference is crucial in understanding the health behavior and social networks of Japanese American Hawaiian older adults which allows for the provision of culturally appropriate services which leads to a better quality of life for these older adults. Importantly, this study reveals that understanding the saliency of ethnic identity for minority adults is essential for the delivery of culturally competent services.

NEIGHBORHOOD SOCIAL CAPITAL, PLACE ATTACHMENT AND MINORITY ELDERLY HEALTH: RESULTS FROM THE CALIFORNIA HEALTH INTERVIEW SURVEY 2011-2012

Y. Du[1], Q. Xu[2], *1. Center for Aging, Tulane University, New Orleans, Louisiana, 2. School of Social Work, Tulane University, New Olreans, Louisiana*

Background: Health disparities exist among elderly populations. Social ties and trust embedded within the neighborhood, and place attachment can contribute to health outcomes. This study examines and compares the relationships of neighborhood social capital, place attachment and elderly health across different race/ethnic and immigrant groups. Methods: Adopting data from the California Health Interview Survey 2011-2012, seven groups of elderly aged 65+ (N=13,875) were included in the study: foreign-born and U.S.-born White, Asians and Latinos, and U.S.-born blacks. Bivariate analyzes were used to test differences of place attachment, perceived neighborhood trust, and neighborhood engagement across seven groups. Linear regression models were tested to examine the role of minority/immigrant status, perceived neighborhood trust, neighborhood engagement, and place attachment on self-reported general health after controlling demographics. Results: The study found that, except U.S.-born Asian, all minority/immigrant groups reported significant lower level of neighborhood trust than White; U.S-born older adults had significant higher level of neighborhood engagement than their foreign-born counterparts; and U.S.-born Asian reported significant higher place attachment than all other groups.

Regression results indicated that black, foreign-born Asian and Latino (regardless foreign-born or not) older adults reported poorer health than their U.S.-born White counterparts; place attachment (β=0.0001), perceived neighborhood trust (β=0.1168), and neighborhood engagement (β=0.1311) all contributed to elderly health. Implications: Minority and immigration status might exert double disadvantages to elderly health. Policy and practice may also focus on neighborhood programs that promote social ties and community engagement, which would help counteract negative effects associated with minority/immigrant status on elderly health.

HEALTH AND TRAJECTORIES OF LIVING ARRANGEMENTS IN OLD AGE: RACIAL/ETHNIC DIFFERENCES

B. Kim, J. Liang, *The University of Michigan, Ann Arbor, Michigan*

This study analyzed the effects of various physical and mental health problems on the trajectories of living arrangements among older Americans, and evaluated if these associations differed across racial and ethnic groups. The data came from seven waves of the Health and Retirement Study (1998-2010). The sample was restricted to community-dwelling older adults over 60 years with at least one living child at the baseline, and was examined over for a 12-year period (N=10,914; Obs.= 68,156). Living arrangements were categorized into four types: co-, proximate, distant, and other residence. Three health conditions including functional limitations, chronic conditions, and depressive symptoms were examined. Multilevel models of longitudinal data were used for the analyses. Older Americans were more likely to move near to one of their children over time, but they did not usually move into the same household with their children. Caucasian elders were more likely to live in proximate residence than other racial and ethnic groups, and various health problems decreased the probability of them living in distant residence. Hispanic elders were more likely to live with their children, and their living arrangements were relatively stable and not significantly influenced by health status. While physical health problems increased the probabilities of co- or proximate residence among African American elders, depressive symptoms increased the probability of distant residence. The longitudinal study reflects the changes in opportunities, constraints, needs, and preferences over individuals' life courses, which influence living arrangements in old age. The results identified which elderly groups lacked informal support.

SESSION 165 (SYMPOSIUM)

GENOMIC BIOMARKERS OF AGING

Chair: J.M. Murabito, *Medicine, Section of General Internal Medicine, Boston University School of Medicine, Framingham, Massachusetts*
Co-Chair: D. Melzer, *University of Exeter,, Exeter, United Kingdom*
Discussant: L. Ferrucci, *National Institute on Aging, Bethesda, Maryland*

In this symposium we will highlight the use of powerful new genomic technologies in well –characterized population-based cohort studies. A genome-wide investigation of differences in gene expression and epigenetic changes (such as DNA methylation) with age has the potential to provide key insights into biologic mechanisms of aging and age-related disease. The first report of differences in gene expression with chronologic age from the InCHIANTI Study identified genes involved in inflammation or immune function and further developed a model based on the top transcripts that was able to identify young vs. older individuals (Harries 2011). DNA methylation based biomarkers of aging have been developed that correlate with chronologic age across a wide variety of tissues (Horvath 2013). DNA methylation based biomarkers may reflect accelerated aging and ultimately prove useful in predicting longevity. Dr. Andrew Johnson will present a large human discovery and replication study of transcriptome-wide alteration in gene expression with age (n~20,000). This work identified > 1000 genes, many novel. Dr. David Melzer will discuss gene expression transcripts that account for the association between interleukin 6 and age in humans using a mediation analysis. Dr. Brian Chen will present a DNA methylation age predictor in relation to human survival. Age-associated differences in gene expression do not necessarily translate to a role for the gene in determining longevity. Therefore, investigation of the impact of genes with the most significant difference in expression with age in humans on lifespan in C. elegans is underway. Dr. George Sutphin will present these results.

AGE AND BLOOD GENE EXPRESSION STUDIES IN ~20,000 HUMANS REVEAL NEW AGING GENES

M.J. Peters[2], R. Joehanes[1,4], L. Pilling[5], J.M. Murabito[3,4], D. Levy[1,4], L. Ferrucci[6], A.D. Johnson[1,4], *1. National Heart, Lung and Blood Institute, Bethesda, Maryland, 2. Department of Internal Medicine, Erasmus Medical Centre Rotterdam, Rotterdam, Netherlands, 3. General Internal Medicine Section, Boston University, Boston, Massachusetts, 4. The Framingham Heart Study, Framingham, Massachusetts, 5. Epidemiology and Public Health, University of Exeter Medical School, Exeter, United Kingdom, 6. Clinical Research Branch, National Institute on Aging, Baltimore, Maryland*

Specific molecular determinants of aging are poorly understood, few human longevity genes have been discovered, and no effective human anti-aging therapies are known. We report a high-powered meta-analysis of blood transcriptome-wide association studies (TWAS) in 7,257 European ancestry individuals with replication in 8,009 additional individuals within the CHARGE Consortium. We identified and replicated 1,267 genes that are robustly differentially expressed with age. Diverse aging mechanisms are reflected among enriched genes including immunosenescence, DNA repair and replication, and transcriptional and translational dysregulation. Additional experiments support tissue and ancestry generalization (n=4,250 samples) of many replicated genes, potential mediation by methylation (n=3,007), and associations with telomere length (n=2,285) and human longevity genes (from GWAS in 9,793 individuals). Our results suggest novel and known genes and pathways and provide a basis for further basic and translational research into aging and age-associated disease.

INFLAMMATION IN AGING: RESULTS FROM TRANSCRIPTOME-WIDE ANALYSIS IN TWO HUMAN COHORTS

D. Melzer[1], R. Joehanes[2,4], L. Pilling[1], D. Levy[2], P. Munson[2,4], L. Ferrucci[3], *1. Epidemiology and Public Health, University of Exeter, Exeter, United Kingdom, 2. National Heart Lung and Blood Institute's and Boston University's Framingham Heart Study, Framingham, Massachusetts, 3. Clinical Research Branch, National Institute on Aging, Baltimore, Maryland, 4. Mathematical and Statistical Computing Laboratory, Center for Information Technology, Bethesda, Maryland*

Chronically elevated circulating inflammatory markers are common in older persons. We aimed to identify peripheral gene transcripts expression levels that statistically account for the association between serum Interleukin 6 concentrations and age. Blood derived RNA was from the Framingham Heart Study (FHS, n=2422, ages 40-92 yrs), and InCHIANTI study (n=694, ages 30-104 yrs). In FHS, 102 genes (0.6% of 17,324 expressed, >4000 associated with older mean age or IL6 separately) mediated the age-IL6 association, with 29 genes mediating ≥5%. Of these 29, 25 were testable in InCHIANTI; 7 (28%) replicated. The largest effect gene mediated 19% (CI 8.9 to 34.1%) and replicated by PCR in InCHIANTI (n=194, 35.6% mediated, p=0.01). IL6 expression was not a mediator in either cohort. These results suggest that pro-inflammatory cytokines in age-related inflammation may derive largely outside blood. Further work is needed to distinguish pro-inflammatory age-related mediators from age correlated expression changes in blood.

DNA METHYLATION AGE PREDICTS ALL-CAUSE MORTALITY IN THE FRAMINGHAM HEART STUDY

B.H. Chen[1,2], S. Horvath[3], J.M. Murabito[5,2], D.P. Kiel[6,7,2], K. Lunetta[4,2], D. Levy[1,2], *1. National Heart, Lung, and Blood Institute, Framingham, Massachusetts, 2. Framingham Heart Study, Framingham, Massachusetts, 3. UCLA, Los Angeles, California, 4. Boston University, Boston, Massachusetts, 5. Boston University School of Medicine, Boston, Massachusetts, 6. Hebrew SeniorLife, Boston, Massachusetts, 7. Harvard Medical School, Cambridge, Massachusetts*

A growing body of research describing age-related changes in DNA methylation (DNAm) has motivated the use of DNAm to identify a "molecular clock." Horvath (2013) developed an age predictor using penalized regression from DNAm in multiple human tissues from donors across a wide age range. We examined whether Horvath's predictor also predicts risk for age-related phenotypes, such as mortality. We measured DNAm using the Illumina Infinium HumanMethylation450K BeadChip in whole blood samples from 2,153 Framingham Heart Study participants (mean age=65.8 years, range=40.7-92.8; 60.3% women). We hypothesized that the difference in years between predicted age and actual age (i.e., delta age) captures age acceleration and consequent risk of mortality. We found that each 5-year increment in the delta age was associated with a 15% increased mortality risk (HR=1.15, p=0.047). This finding suggests that DNAm-based delta age may contribute in part to the biological basis of aging.

A MULTI-ORGANISM APPROACH TO IDENTIFY NOVEL AGING FACTORS

G.L. Sutphin[1], S. Bean[1], M.J. Peters[2], J. van Meurs[2], J.M. Murabito[3,4], A.D. Johnson[3,5], R. Korstanje[1], *1. The Jackson Laboratory, Bar Harbor, Maine, 2. Rotterdam Study, Erasmus University Medical Center, Rotterdam, Netherlands, 3. Framingham Heart Study, Framingham, Massachusetts, 4. Boston University, Boston, Massachusetts, 5. National Heart, Lung and Blood Institute, NIH, Bethesda, Maryland*

We have developed at multi-organism approach to identify novel aging factors by using worms and mice to narrow sets of candidate aging genes identified in genome-wide human studies. We recently completed two C. elegans longevity screens, one examining genes identified in both human and mouse longevity GWA studies and the other examining genes found to have differential expression with age in humans by the CHARGE Consortium. We are now conducting follow up studies in both worms and mice on genes for which reduced expression increases longevity in C. elegans. Here we present results from both screens and our ongoing mechanistic analysis of selected gene, which includes characterization of the impact of each gene on worm healthspan, identification of interactions between each gene and known worm aging pathways, and aging studies using knockout mice for two genes, the Rab family GTPase, Rab27a, and the Golgi reassembly stacking protein, Gorasp2.

SESSION 170 (SYMPOSIUM)

THE INTERRELATED TRAJECTORIES OF FUNCTION AND MORTALITY

Chair: M. Odden, *Oregon State University, Corvallis, Oregon*
Co-Chair: E.S. Strotmeyer, *University of Pittsburgh, Pittsburgh, Pennsylvania*
Discussant: H. Whitson, *Duke University, Durham, North Carolina*

Functional status and mortality are both critical metrics of the aging process. Yet, the complex relationships between demographics characteristics and chronic conditions with the interrelated trajectories of function and mortality are not fully understood. We explore multifaceted contributors to function and mortality, from the basic epidemiology to the impact on healthcare utilization and costs, in the Cardiovascular Health Study (CHS). CHS is a community-based cohort of 5,888 black and white adults aged >65 years (58% women; 16% black; mean age 72.8 ± 5.6) enrolled in 1989-99 with 10 years of annual examinations, and continuing surveillance for events and functional status. First, we describe incident disability and mortality rates across age, race, and sex to understand the interrelated nature of these demographic trends. Second, we examine a novel multisystem physiologic impairment score and gait speed decline, which is associated with higher mortality risk. Third, we show that functional limitation modifies the association of blood pressure to cardiovascular outcomes and death. Fourth, we explore how changes in multiple aspects of functional status may differentially influence inpatient and outpatient healthcare utilization and costs. Overall, these topics illustrate the importance of trajectories in physical and cognitive function above and beyond their association with mortality. We demonstrate that trajectories to functional decline and mortality are influenced by disease characteristics at earlier time points in older age. The discussant will integrate the topics and indicate future directions to further characterize the interrelated trends in function and mortality, with the goal of improving population health.

AGE, RACE AND GENDER FACTORS IN INCIDENT DISABILITY

M.E. Jacob[1], M. Odden[2], R. Boudreau[1], A. Arnold[3], A.B. Newman[1], *1. Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. Oregon State University, Corvallis, Oregon, 3. University of Washington, Seattle, Washington*

We assessed disability incidence rates; understanding these by age, sex and race is important for targeting prevention. Disability was defined in 4 ways: 1) self-report of inability in any of 6 ADLs, 2) difficulty in any ADL, 3) difficulty in any of 6 IADLs, and 4) mobility limitation (difficulty walking half a mile or climbing 10 steps). Incident disability and mortality rates were calculated for age, gender and race groups over 6 years. The incidence of ADL inability, ADL difficulty, IADL difficulty and mobility limitation were 1.0(0.8-1.1), 8.5(8.1-8.9), 12(11.4-12.5) and 11.2(10.6-11.7) per 100 person-years. Women, older age-groups (per 5 years) and Blacks had higher rates in all four domains. Despite 33.8% higher incident ADL difficulty (9.5 versus 7.1 per100 person-years) and 24.1% higher ADL inability, women had 44% lower mortality rate compared with men. Our results indicate that higher disability rates in women occur in concert with lower mortality rates.

MULTISYSTEM PHYSIOLOGIC IMPAIRMENTS AND CHANGES IN GAIT SPEED IN OLDER ADULTS

A.L. Rosso[1], J. Sanders[1], C. Rosano[1], R. Boudreau[1], S.B. Kritchevsky[2], C. Hirsch[3], M. Carlson[4], A.B. Newman[1], *1. Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. Wake Forest, Winston-Salem, North Carolina, 3. UC Davis, Davis, California, 4. Johns Hopkins, Baltimore, Maryland*

Impairments across multiple physiologic systems may increase risk of slowed gait in older individuals. Cardiovascular Health Study data assessed associations of baseline physiologic index (PI; measuring vasculature, brain, kidneys, lungs, and glucose metabolism; range 0-10 with 0-2 points/system and lower score indicating higher function) with annual gait speed (m/s) over six years. Mixed effects models calculated mean gait speed differences (md; 95% confidence intervals) by PI quartile. Higher PI was associated with slower gait speed at baseline (p<0.001). Those with PI of 5-6 or 7-10 had significantly slower gait speed and faster gait speed decline after adjustment for age, demographics, and health characteristics compared to those with 0-2 (e.g. 7-10: md=-0.062 m/s; 95% CI:-0.089,-0.036). PI explained a larger proportion of the age-gait speed association than chronic disease count (23% vs 8% attenuation). Impairments accumulated over multiple physiologic systems may make older adults more vulnerable to slow gait speed.

DISABILITY MODIFIES THE ASSOCIATION OF DIASTOLIC BLOOD PRESSURE WITH CARDIOVASCULAR EVENTS

C. Peralta[1], R. Katz[2], A.B. Newman[3], B. Psaty[2], M. Odden[4], *1. University of California, San Francisco, San Francisco, California, 2. University of Washington, Seattle, Washington, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, 4. Oregon State University, Corvallis, Oregon*

Mixed findings exist regarding the role diastolic blood pressure (DBP) in cardiovascular (CV) risk in elders. We hypothesized that poor health status, assessed by limitations in activities of daily living (ADL), could identify elders at greater risk for harms associated with low DBP. Adjudicated incident CV events (N=778) and deaths (N=1,289) were collected over 9 years. Among persons with ADL limitation (N=415), higher DBP was associated with a reduction in CV events; hazard ratio = 0.49 (95% confidence interval: 0.25-0.94) and 0.65 (0.44-0.96) for DBP >80 and 80-66, respectively, vs. ≤ 65 mmHg, after adjustment for demographic, physiologic variables, and medication use. There was no association between DBP and CV events in persons without ADL limitation (N=1,946). Those with ADL limitation had the lowest risk of mortality at DBP 80-66 mmHg. Low DBP among those with ADL limitation is associated with higher CV risk and death.

TRAJECTORIES IN PHYSICAL AND MENTAL FUNCTION ARE ASSOCIATED WITH HEALTHCARE UTILIZATION AND COST

N.B. Allen[1], L. Curtis[3], A. Fitzpatrick[2], A. Arnold[2], E.S. Strotmeyer[4], S. Heckbert[2], *1. Department of Preventive Medicine, Northwestern University, Chicago, Illinois, 2. University of Washington, Seattle, Washington, 3. Duke University Medical Center, Durham, North Carolina, 4. University of Pittsburgh, Pittsburgh, Pennsylvania*

Multidimensional patterns in aging and their association with healthcare costs remains unknown. We examined changes (CHS visit 5-11; N=3032) in physical and mental function measures (self-reported health, activities of daily living (ADL), hand grip strength, time to walk 15 feet, cognition (3MSE), depression (CES-D)) and their association with healthcare utilization and Medicare costs. There were no subgroups with distinct trajectories of change over follow-up for these measures, except for the 3MSE score for which a sub-group had rapid declines vs. remaining cohort. 3MSE score changes were moderately correlated with changes in ADLs and hand grip strength. The faster of two trajectories of 3MSE score decline (n=247) was associated with more inpatient (1.78 visits; 95%CI 1.32-2.41) and outpatient (19.7; 95%CI 1.02-378) visits and higher healthcare costs ($18,805; 95%CI $10,492-$27,119) vs. the remaining cohort. In conclusion, rapid cognitive decline in older age is independently associated with increased healthcare utilization and higher costs.

SESSION 175 (SYMPOSIUM)

HIGHLIGHTING THE NEW GENERATION OF GERIATRIC NURSING RESEARCH SCHOLARS

Chair: T. Cortes, *New York University, College of Nursing, New York, New York*
Discussant: M.J. Hammer, *New York University, College of Nursing, New York, New York*

Since 1996, the Hartford Institute for Geriatric Nursing, NYU College of Nursing, has set a national agenda for improving the quality of care of older adults by promoting the significant role that nurses play in the care of older adults. The Hartford Institute has sought to initiate, sustain and expand activities in the four areas of Education, Practice, Research, and Policy. In Research, the Hartford Institute's primary objective is to foster innovative clinical geriatric nursing research and to recognize the contribution of geriatric nurse researchers. The annual, week-long Hartford Institute Geriatric Nursing Research Scholars Program is an intensive mentoring workshop for early-career geriatric nurse researchers. In this symposium, the Hartford Institute highlights the work of these emerging scholars in geriatric nursing research, which describes how health-promotion interventions can positively impact outcomes and how increased knowledge of patient and provider perspectives can impact care. Presenters will: demonstrate how activities that promote positive emotions can reduce the risk of cognitive-decline over time; describe how health-promotion interventions aimed at nutrition and physical activity can significantly improve participants' blood pressure, heart rate, gait speed, physical activity self-efficacy, and successful aging; discuss the perspectives of older adults who experience new-onset urinary incontinence; and discuss primary care NPs' internal barriers, competencies, and educational needs in older adult depression care.

POSITIVE EMOTIONS AND COGNITION AMONG COMMUNITY DWELLING OLDER ADULTS

K. Strout, *University of New England, Westbrook College of Health Professions, Department of Nursing, Portland, Maine*

Broaden and Build theory of positive emotions suggest that when people cultivate positive emotion, they demonstrate psychological growth over time, facilitating their ability to build personal physiologic resources that function as a reserve to manage physical health threats. The theory posits that positive emotions may undo the effect of negative emotions. This research examines the relationship between mood and activities that promote positive emotions and their effects on cognitive decline among aging adults. This population-based longitudinal predictive correlational study examined 873 community dwelling adults age >60 for three years. Adults demonstrating negative emotions (persistent anger with self or others $p<0.001$; unrealistic fears $p<0.001$; repetitive anxious complaints/concerns $p<0.001$; and withdrawal from activities of interest $p<0.001$) had significantly more risk of cognitive decline over time compared to adults who demonstrated positive emotions. Adults with negative emotions who participated in more activities that promote positive emotions reduced their risk for cognitive-decline over time.

EAT BETTER, MOVE MORE FOR HEALTH PROMOTION AND SUCCESSFUL AGING

M. Troutman-Jordan, T. O, *University of North Carolina at Charlotte, School of Nursing, Chalotte, North Carolina*

Background: Growing numbers of older adults and increasing life expectancies reinforce the need for health promotion interventions in this population. One such intervention may be Eat Better, Move More, a physical activity and nutrition program. EBMM may improve cardiovascular health, physical activity participation, and nutrition habits, ultimately promoting successful aging. Methods: Community-dwelling individuals (N= 66) over age 60 were recruited using posters and community agency contacts. After randomization to intervention or control groups, participants completed the Nutrition and Health Questionnaire, Physical Activity. Questionnaire, and Successful Aging Inventory. Twelve weekly EBMM sessions comprised of mini-talks on nutrition and physical activity, and walking groups were provided. After the 12 weeks, follow-up data were collected and delayed intervention control participants were offered EBMM sessions. Results: EBBM significantly improved treatment participants' blood pressure, heart rate, gait speed, physical activity self-efficacy, and successful aging.

REGAINING CONTROL: HOW OLDER ADULTS WITH NEW-ONSET URINARY INCONTINENCE ADDRESS THEIR MAIN CONCERN

A. Dowling-Castronovo, *Wagner College, The Evelyn L. Spiro School of Nursing, Staten Island, New York*

Rational: No literature was identified that addressed the perspectives of older adults who experience new-onset UI. Methodology: After Institutional Review Board approval, Grounded Theory methodology was followed (Glaser, 1978; 1992; 1998; 2002; Glaser & Strauss, 1967). Data collected from 170 hours of 61 field visits between December 2009 to May 2012, interviews with 14 participants, and their medical records were analyzed. Theoretical Findings: Triggered by biological damage, the substantive theory of Regaining Control describes and explains a complex, iterative and overlapping three-phase process of how participants worked to resolve, or attempted to resolve, a much broader concern of loss of control than loss of bladder control. The three phases - Transferring Control, Exercising “Wobbly” Control, and Adjusting to Degree of Control Regained – were influenced by: biological recuperation, understandings of hospitals, and provisional controllers. Conclusion: Regaining Control contributes to the literature about UI, control, and patient-centered care.

NURSE PRACTITIONER BARRIERS, COMPETENCIES AND EDUCATIONAL NEEDS IN OLDER ADULT DEPRESSION CARE

L.M. Novosel, *University of Pittsburgh, School of Nursing, Pittsburgh, Pennsylvania*

Background: Depression in older adults is a chronic, disabling and costly disorder. Nurse practitioners (NPs) are projected to be at the forefront of primary care delivery yet little is known of their readiness and abilities to provide depression care to our rapidly growing, vulnerable aging society. Methodology: Primary care NPs (N =311) completed a self-report survey. Results: The majority were experienced FNPs who “frequently to always” functioned as sole provider of depression care for their older adult patients. NPs realized a responsibility to recognize, diagnose and manage depression yet only 50% felt confident in diagnosing and 40% with management. Few reported skills in depression prevention. Confidence correlated across various methods of educational preparation ($p < .001$). NPs across specialties, including those trained as gerontological NPs, reported limited classroom and clinical training experience in older adult depression. Implications: The findings have significant implications for NP educational programs and clinical practice.

SESSION 180 (SYMPOSIUM)

POLICY SERIES: ELDER JUSTICE: STILL ON THE CONGRESSIONAL TO DO LIST

Chair: R. Blancato, *Matz, Blancato & Associates, Washington, District of Columbia*

The Elder Justice Act was passed in 2010 and is due for reauthorization this year. The President’s Fiscal Year 2015 budget proposal called combating the rising scourge of adult abuse, neglect, and exploitation in America one of the Administration for Community Living’s top priorities. The budget requested $25 million for a new Elder Justice initiative to initiate the development of a national Adult Protective Services data system, including grants to states to test and develop infrastructure, and provide funding for key research, which is essential to the development of evidence-based interventions to prevent, identify and report, and respond to elder abuse. This session will explore elder justice legislation and funding, as well as the work of the federal Elder Justice Coordinating Council.

SESSION 185 (SYMPOSIUM)

ABUSE, NEGLECT, AND EXPLOITATION OF ELDERLY PEOPLE INTEREST GROUP-SPONSORED SYMPOSIUM: POLYVICTIMIZATION IN LATER LIFE

Chair: P.B. Teaster, *Virginia Tech, Blacksburg, Virginia*
Discussant: G. Anetzberger, *Cleveland State University, Cleveland, Ohio*

Polyvictimization in later life, a phenomenon of elder abuse, can easily be conceived of as “wicked.” Polyvictimization occurs when a person aged 60 or older is harmed through multiple co-occurring or sequential types of elder abuse by one or more perpetrators, or when an older adult experiences one form of abuse perpetrated by multiple others with whom the older adult has a personal, professional, or care recipient relationship in which there is a societal expectation of trust. Polyvictimization of older adults can be regarded as a wicked problem because (1) the solution depends on how the problem is framed and vice-versa (i.e., the problem definition depends on the solution), (2) stakeholders have radically different world views and different frames for understanding the problem, (3) constraints that the problem are subject to and resources needed to solve it change over time, and (4) the problem is never solved definitively. This symposium explores the polyvictimization of older adults as a wicked problem, including an examination of its proposed definition and framework. Also explored are characteristics of and impacts on victims and characteristics of perpetrators. Understanding how to identify, interpret and intervene in cases of polyvictimization requires new ways of thinking about the problem, particularly in a person-centered way. The symposium concludes with a summary discussion of polyvictimization on later life: how the conceptualization of this wicked problem will influence its development in research, practice, and policy.

ESTABLISHING DEFINITIONS AND A THEORETICAL FRAMEWORK FOR POLYVICTIMIZATION IN LATER LIFE

P.B. Teaster, *Virginia Tech, Blacksburg, Virginia*

This presentation provides an introduction to what is currently is known about polyvictimization in later life. It involves an exploration of various dimensions of polyvictimization, including its settings and its context. Major findings drawing from the child abuse and IPV literature are summarized, with examples from scholarly and practice literature used to illustrate the effects of polyvictimization. Also presented is the concept of polyvictimization as a phenomenon of elder abuse. The presentation will include with an explanation and definition of polyvictimization in later life as well as the utility of the Socio-Ecological Model for conceptualizing intervention efforts and prevention of the problem.

HOW OLDER ADULTS ARE AFFECTED BY POLYVICTIMIZATION

H. Ramsey-Klawsnik, *Klawsnik and Klawsnik and Associate, Canton, Michigan*

This presentation focuses on the micro and meso levels of the Socio-Ecological Model to discuss polyvictimization of older adults and its effects on older victims. Not only will characteristics of the victims be presented (micro level) but also included is information concerning the complex relationships between victims and their poly perpetrators (meso level). Considered along with the relationship of the victim and poly perpetrator is the setting of the abuse (e.g., community or facility), as well as cascading abuse. The presentation concludes with an examination of the impact of polyvictimization on the older adult victims.

DILEMMA OF SERIAL KILLERS AND ELDERLY VICTIMS

M. Patel, *Criminology and Forensic Science, Dr. Hari Singh Gour University Sagar, Sagar, Madhya Pradesh, India*

The study was carried out to know the noteworthy cases concerning the serial killers of elderly that occurred across the globe. Main objective of the study to know the different circumstances behind killing of elderly and became victims of killers. The INTERNET (E-Media) was the main source of data and the method of content analysis was used. Total 42 cases of elderly serial killings have been found reported between the years 1960-2010. Result shows that highest number (38.09%) of cases was found in United States of America. The study also reveals that the victims were physically frail; mostly living alone and except some cases killing was committed inside the door. Most of the female killers were sexually abused in their childhood. Serial killing was largely based on psychological gratification. The main motive behind the killing was revenge, profit, terror, sexual gain.

INSIGHTS INTO PERPETRATORS OF ELDER POLYVICTIMIZATION

K.A. Roberto, *Virginia Tech, Blacksburg, Virginia*

Drawing on the research and practice literature, this presentation uses the Socio-Ecological Model as a framework to guide the discussion of perpetrators of polyvictimization in late life. Personal characteristics of perpetrators (microsystem), including age, gender, personality attributes, substance abuse and other mental health issues, and motives for abusive behaviors, will be described. Next, the relationship dynamics between perpetrators and their elderly victims (mesosystem) within the context of both the family (spouses/partners, kin) and community (non-family members, facility staff, facility residents) will be discussed. The presentation concludes by addressing the potential consequences for perpetrators of elder polyvictimization, which are influenced by not only their relationships with their victims, but also by the local community response to elder abuse (exosystem), and the broad values, norms, and policies of the greater society (macrosystem).

SESSION 190 (SYMPOSIUM)

LESSENING THE GAP IN ELDER SERVICES: TRAINING AND RETAINING OLDER WORKERS

Chair: P. Cummins, *Sociology & Gerontology, Miami University, Oxford, Ohio, Scripps Gerontology Center, Oxford, Ohio*

Discussant: S.S. Butler, *University of Maine, Orono, Maine*

Occupations that support the long-term care system, especially those related to home and community based care, are projected to experience substantial growth over the coming decade. Over that period, the number of workers aged 55 and over employed in direct care occupations is projected to grow by 70%. These trends reinforce the need to identify strategies to retain older workers employed in direct care occupations and facilitate education and training that will lead to employment. Training must consider the needs and learning styles of older workers while responding to employers' requirements. Presentations address different aspects of older worker involvement in elder services and related training, experience, and accommodations. Straker will present results from a qualitative research project that identified strategies utilized by home health agencies to retain long-term employees and job modifications necessary to accommodate changing physical abilities. Cummins, Kunkel, and Boehle will describe a qualitative research project that identified specific ways in which Senior Community Services Employment Program (SCSEP) participants can support the long-term care ombudsman program in transitioning individuals from long-term care facilities to home and community based settings. Harootyan will discuss pilot projects and sponsored research focusing on the demand/supply of workers in rapidly growing occupations – direct caregiver and community interpreter. Presenters will identify specific direct care occupations suitable for older workers along with required training, experience, and accommodations that will lead to positive outcomes for both employers and employees. Butler will discuss the relevance and importance of training and retaining older workers in elder service occupations.

LEVERAGING RESOURCES BETWEEN THE SENIOR COMMUNITY SERVICE EMPLOYMENT PROGRAM AND THE LONG-TERM CARE OMBUDSMAN PROGRAM

P. Cummins[1,2], S. Kunkel[2,1], S.G. Boehle[1], *1. Sociology & Gerontology, Miami University, Oxford, Ohio, 2. Scripps Gerontology Center, Oxford, Ohio*

Several years ago, Ohio implemented the HOME Choice Program, which facilitates the movement of individuals from long-term care facilities to home and community based settings. Transitions Coordinators (TCs) are responsible for identifying candidates for the program, finding appropriate housing, setting up the household, assisting in the actual move, and making contacts following the move. The Long-term care ombudsman program (LTCOP) is one of several organizations in Ohio that acts as a TC. This research sought to determine the role Senior Community Service Employment Program (SCSEP) participants might play in supporting the LTCOP in the HOME Choice Program and was accomplished through interviews with LTCOP staff and SCSEP program operators. Findings suggest that with appropriate training, SCSEP program participants can play a role in supporting TCs and at the same time, gain valuable customer service experience. Specific components of recommended training will be discussed.

LONG-TERM WORKERS IN LONG-TERM CARE: ORGANIZATIONAL PERSPECTIVES ON WORKER HIRING AND RETENTION

J. Straker, *Scripps Gerontology Center, Oxford, Ohio*

A recent study of high-performing home care agencies and nursing homes in Ohio found that a central focus of these organizations was on retaining staff for the long term and also making appropriate new hires. Qualitative interviews with 135 staff members at 11 nursing homes and 10 home care agencies regarding management practices related to their direct care workforce. Interviews were transcribed and coded using the constant comparative method in Atlas.ti. Seven overarching themes emerged as important across all organizations. Two themes: appreciate and support your staff, and choose good staff and develop them, are particularly relevant for hiring and retention of older workers in aging services jobs. This presentation will include managerial perspectives on staff retention for the long-term, desirable employee characteristics, and job modifications to accommodate changing physical abilities of older employees. Practical tips for keeping staff engaged and attached to these organizations will also be provided.

TRAINING OLDER ADULTS FOR JOBS IN DIRECT CARE AND COMMUNITY INTERPRETING: IT…WORKS

B. Harootyan, *Research, Senior Service America, Inc., Silver Spring, Maryland*

Senior Service America, Inc. (SSAI) conducted pilot projects and sponsored external research focusing on demand/supply of older workers in rapidly growing occupations – direct caregiver (DC) and community interpreter (CI). Paraprofessional DC and CI jobs will increase 45-48% during 2012-2022. SSAI's projects focused on low-income older workers (LIOWs). Results: Between 13% and 32% of surveyed LIOWs (n=251) would work in one of five different DC occupations (basis: willingness to do all listed tasks per job). Research on providers indicated strong likelihood – even desirability – of hiring older workers, especially those with appropriate training/experience. Another project showed that low-income Hispanic elders can readily be recruited for CI training, which involved both classroom and experiential learning over a 13-week period. Results: A high training success rate was followed by a 50% employment rate immediately after 'certification.' Follow-up interviews will ascertain additional employment success since the project's completion. Training models and community linkages are also discussed.

SESSION 195 (SYMPOSIUM)

DEPRESSION AMONG CHINESE OLDER ADULTS: INTERGENERATIONAL PERSPECTIVE BASED ON NATIONAL STUDIES

Chair: V. Lou, *The University of Hong Kong, Hong Kong, Hong Kong, Hong Kong*

Discussant: I. Chi, *The University of Hong Kong, Hong Kong, Hong Kong, Hong Kong*

Depression is the second most common mental illness among older adults worldwide. In Chinese culture, mental disorders still has a strong stigma that is regarded as a "family issue". This symposium will examine risk and protecting factors for depression among Chinese older adults from an intergenerational perspective based on two most recent national studies, namely China Health and Retirement Longitudinal Study (CHARLS) and the 2012 China General Social Survey Aging Pilot Study. Focusing on living arrangement of older adults in China, Liu and colleagues found that non-traditional living (e.g., not living with children's family) was associated with a higher risk of depression. The second paper by Chen and colleagues found that a strong relationship between the parents and non-coresident children provided added emotional benefits, and had a moderating effect in the presence of a strained relationship between parents and the coresident child. The third paper by Wu and colleagues found that in rural China, older people who received financial, instrumental and emotional intergenerational supports from their children were less likely to have depression. The fourth paper by Lou and colleagues found that emotional support from children were associated with lower risk of depression among elderly women but not men. However, financial support from children was associated with lower risk of depression among elderly men and women. Dr. Chi, our discussant, will discuss the implications of these results on a family-focused policy direction in mental health care regarding help-seeking, treatment, and rehabilitation.

CO-RESIDENCE WITH CHILDREN AND DEPRESSION IN CHINESE OLDER ADULTS

J. Liu[1], L. Li[1], Z. Zhang[2], *1. University of Michigan, Ann Arbor, Michigan, 2. Michigan State University, East Lansing, Michigan*

Living with children was used to be considered as the best option for older adults in the societies embedded in the filial culture. Recent studies have indicated that the benefits of co-residing with children may vary by the characteristics of co-resident children, health status of elders and rural/urban residence in China. This study used the data from 2011 CHARLS to examine the associations among gender and marital status of co-resident children, health status and depression in urban and rural adults age 60 and older. The regression results show that living with unmarried child(ren) was related to higher level of depression in both rural and urban elders, and living with married son(s) was particularly associated with higher level of depression in rural elders. The associations of characteristics of co-resident children and elderly depression were significantly lessened by ADL and/or IADL difficulties in rural and urban older adults.

LOOKING WITHIN AND BEYOND CO-RESIDENCY: PARENT-CHILD RELATIONS AND THE PSYCHOLOGICAL WELL-BEING OF CHINESE OLDER ADULTS

F. Chen, L. Bao, *University of Maryland, College Park, Maryland*

The relationship between intergenerational coresidence and psychological well-being of older adults has been extensively examined. In this paper, we move beyond the parent-coresident child dyad and argue that a proper understanding of the emotional health implications of intergenerational ties entails a close examination of the dynamics within the household, and the larger family network. Method: Data from the 2012 China General Social Survey Aging Pilot Study provides us with a unique opportunity to explore parents' relationship with multiple children. Findings: We find that living with an adult child is generally beneficial to an older adult's psychological well-being (CESD, happiness, and life satisfaction), but the magnitude of the effects depends on the strength of the parent-child relationship. In addition, strong relationships between the parents and non-coresident children provides added emotional benefits, and has a moderating effect in the presence of a strained relationship between parents and the coresident child.

THE ROLES OF FAMILY SUPPORT IN DEPRESSIVE SYMPTOMS: EVIDENCE FROM CHINA

Y. Zhang, B. Wu, F. Sloan, *Economics, Duke University, Durham, North Carolina*

Depression is a major issue in China. Family support has been shown to be related to depressive symptoms. However, the underlying mechanisms through which family support affects depressive symptoms are unclear. Using data from the China Health and Retirement Longitudinal Study (CHARLS), we conducted cross-sectional analysis on a large sample (N=15,289) to investigate the role of intergenerational transfers. Measures of such transfers were: living with child; frequent visits from child; frequent visits to parents, and money transfers to child. The study hypotheses were that (1) such transfers reduce depressive symptoms, (2) living with parents confers no benefit, and (3) taking care of parents worsens depressive symptoms of the child. The hypotheses were confirmed for rural but not urban residents, probably because rural but not urban areas retain a traditional family structure. Our results indicate that intergenerational time and money transfers and reduced burden of parental caregiving improve mental health.

COUPLES WITH ONLY ONE SPOUSE HAVING DEPRESSIVE SYMPTOMS: PREVALENCE AND THE ROLE OF INTERGENERATIONAL SUPPORT AMONG CHINESE OLDER ADULTS

V. Lou[1,2], Y. Chen[2], M. Lau[2], T.Y. Lum[1,2], *1. Department of Social Work & Social Administration, The University of Hong Kong, Hong Kong, Hong Kong, Hong Kong, 2. Sau Po Centre on Aging, The University of Hong Kong, Hong Kong, Hong Kong*

Objective: There are limited studies on the prevalence and correlated factors of depressive symptoms occurring only in one spouse of a married couple. We utilized a national representative sample in China to examine prevalence of depressive symptoms and its associated risks among Chinese older couples. Method: A subsample with 1,418 dyads of spouses was selected from China Health and Retirement Longitudinal Study (CHARLES) 2011. Multi-nominal logistic regressions were performed to test risk factors. Findings: The prevalence of depressive symptoms occurring only in wives (around 32%) was over 2 times than that occurring only in husbands (around 12%). Financial support was significantly associated with depressive symptoms occurring in married couples with either husband or wife showed depressive symptoms; emotional support was significantly associated with those with wife showed depressive symptoms. Conclusion: The findings lent support to the sociological proposition that social roles lead to the gender difference in depressive symptoms.

SESSION 200 (SYMPOSIUM)

CARE AND THE FOURTH AGE

Chair: C. Gilleard, *UCL, London, United Kingdom*

The aging of our aging societies raises many issues, not least the feared crisis in care – with too many frail older people needing help and too few people available to adequately meet that need. The aim of the symposium is to explore how the concept of care - as a practice and as a narrative – both shapes and is shaped by our understanding of 'deep', 'real' or 'extreme' old age. While the rhetoric of successful aging offers the prospect of an agentic third age for many in later life, the fourth age acts as its shadow, threatening to put an end to a later life of opportunity, to be replaced by a life 'in care'. The speakers in the proposed symposium will address (i) care and the moral identity of the fourth age (Paul Higgs, UCL, London); (ii) financing long term care and the fourth age (Debbie Price, Institute of Gerontology, KCL); (iii) frailty gender and the fourth age (Susan Pickard, University of Liverpool/ Virginia Polytechnic Institute) and (iv) the fourth age and the care ethic in long term care (Dale Dannefer + co-author, Case Western Reserve University).

CARE AND THE MORAL IDENTITY OF THE FOURTH AGE

P. Higgs, *Faculty of BrainSciences, University College London, London, United Kingdom*

This paper will outline how the 'moral imperative of care' constitutes one of the key axes of the social imaginary of the fourth age. An important part of discussions about the nature of the 4th age is that it is of necessity associated with relations of dependency whether these are physical in nature, or related to cognitive difficulties. Consequently the practices of care come to dominate the discourses of the fourth age through the attribution of a moral imperative which we describe as its moral identity. However this need for care possesses considerable ambiguity because of differences in power and the nature of abjection. Proposed solutions to this dilemma in terms of an ethic of care have been proposed but have limitations. We will discuss how the altruistic emotion of pity needs to be understood alongside ideas of compassion.

FINANCING LONG TERM CARE AND THE SOCIAL IMAGINARY OF THE FOURTH AGE

D. Price[1], D. Bisdee[1], T. Daly[1], L. Livsey[1], P. Higgs[2], *1. Institute of Gerontology, King's College London, London, United Kingdom, 2. University College London, London, United Kingdom*

The emergence of a culture of a 'third age' that rejects narratives of decay and dependency means that the 'fourth age' has become a powerful social imaginary of abjection and loss of hope (Gilleard and Higgs 2011). In this paper we draw on interview data with 45 older couples to show that that this new cultural space has constructed significant barriers to older couples' financial planning for long term care. While people easily contemplate active ageing, successful ageing and death, they are unable to construct any positive meaning for a period between, seeing expenditure as wasted and death as preferable. Cultural narratives of the third and fourth age have made it difficult for people to contemplate planning for long-term care, irrespective of how much it might be in their or the nation's interest.

GENDER, CLASS AND IDENTITY IN THE FOURTH AGE: EMBODIED REPRESENTATIONS OF 'FRAIL' OLDER WOMEN

S. Pickard, *1. School of Sociology, Social Policy and Criminology, University of Liverpool, Liverpool, United Kingdom, 2. Virginia Tech, Blacksburg, Virginia*

'Respectable' gendered embodiment has historically been associated with the middle classes. As Skeggs and others have shown, in the 18th and 19th centuries 'femininity' was constructed as a middle class attribute in direct contradistinction to working class female embodiment. In such representations, 'frailty' was a distinction, associated with passive, refined dependence. Tropes of personhood in late modernity have, of course, changed radically as have processes of social stratification with an emphasis on cultural attributes converging on practices of the self. I will aim to demonstrate in this session that (i) the category of 'frailty' in old age, overwhelmingly concentrated among poor working class women, now serves as a symbolic marker pathologising working class female embodiment in terms of a failure of care of the self and (ii) that this failure is constitutive of the fourth age. I will demonstrate this with reference to clinical discourses and emerging technologies of frailty.

"DOUBLE DISABILITY IN THE FOURTH AGE: HUMAN NEEDS, CULTURE CHANGE AND SOCIAL REALITY."

R. Shura[2], D. Dannefer[1], R.A. Siders[1], *1. Department of Sociology, Case Western Reserve University, Cleveland, Ohio, 2. Hiram College, Hiram, Ohio*

Self-determination theory contends that three fundamental psychological needs are integral to human experience: competence, autonomy and relatedness. These needs are unaltered by age (just as are physical needs like respiration). Nevertheless, disengagement and related ideologies often assume that such needs are less salient in the Fourth Age, and age-unfriendly institutional arrangements and ageist cultural narratives pervasively reflect such assumptions, creating an added set of disabilities for Fourth Age citizens – a "double disability". As an example, helplessness, boredom and loneliness – the "three plagues" of nursing home life identified by culture change advocates – correspond precisely to the three universal needs. In response, culture change efforts have spawned a range of innovative habitats and community design (including "Edenized" and ecologically diverse communities; aging in place; "GreenHouse"/"SmallHouse" designs). Yet few such efforts systematically address the three plagues/needs. We demonstrate the relevance of participatory methodologies as well as theoretical grounding in addressing Fourth-Age quality-of-life.

SESSION 205 (PAPER)

PROMOTING HEALTHY BEHAVIORS AND OUTCOMES

THE LONG-TERM EFFECTS OF THE TIMING OF A CHILD'S MENTAL ILLNESS ON THE WELL-BEING OF AGING PARENTS

E. Namkung[1], J. Greenberg[1,2], J. Song[2], M.R. Mailick[2,1], *1. University of Wisconsin-Madison, Madison, Wisconsin, 2. Waisman Center, Madison, Wisconsin*

Although considerable research has examined the toll of caring for an adult child with serious mental illness on aging parents' health and well-being, few studies have examined whether these effects depend on the age of onset of the child's mental illness. This study extends the prior research by investigating the long-term effects of the timing of the child's mental illness in the parent's life course on their health and well-being in old age. Using the most recent wave of the Wisconsin Longitudinal Study (2011), 330 parents of adult children with serious mental illness were analyzed (213 bipolar, 61 schizophrenia, 56 depression). Propensity Score Matching was used to construct a matched comparison group of parents who do not have children with disabilities (N=971). Overall, Results from multiple regression analysis indicate that parents of adult children with mental illness reported poorer physical health, higher levels of anxiety, and poorer cognition than the parents in the comparison group. In addition, parents whose child had a late-onset mental illness were more vulnerable on multiple dimensions of physical and mental health than parents whose children were diagnosed at earlier life stage. Findings suggest that the long-term effects of a child's mental illness on aging parents' health and well-being partly depends on the timing of the child's mental illness in the parent's life course. Parents whose child had a late-onset mental illness may be particularly vulnerable and in need of additional supports to help them cope with the challenges of caregiving.

PROSPECTS AND CHALLENGES FOR HEALTHY AGING PROGRAMS IN MULTICULTURAL, SUBSIDIZED, SENIOR HOUSING

M. Chang[1], S. Diwan[1], D. Canham[1], T. Adelman[1], K. Mauldin[1], S. Ross[1], T. Semerjian[1], S. Bajpai[2], *1. San Jose State University, San Jose, California, 2. MidPen Resident Services Corp, Mountain View, California*

Increasing numbers of seniors in subsidized housing are aging in place and experience greater risk for chronic illness and disability due to advancing age and lower incomes, necessitating implementation of multifaceted programs for maintaining wellness. The opportunities and challenges of implementing multidisciplinary wellness programs at a subsidized senior housing facility (n=163) are presented. Assessments and healthy aging educational interventions were conducted with residents in their preferred language: Chinese, English, Farsi, Korean, and Russian. Needs assessment results led to developing the following interventions: blood pressure monitoring (Nursing), recreational activities (Recreation Therapy), home safety and strategies for better sleep workshops (Occupational Therapy), Matter of Balance classes (Kinesiology), and nutrition education (Nutrition). The SF-36v2® Health Survey was administered to residents to evaluate its utility as a standardized assessment tool for the facility (Social Work). Sixteen graduate/undergraduate students, supervised by faculty, delivered the programs in addition to 15-20 interpreters/translators; 118 senior residents (72%) participated in one or more programs. Impact and lessons learned: 1) Opportunities for providing diverse activities to maintain resident wellness; 2) Students learned culturally-sensitive practice skills when interacting with older adults in subsidized housing; became aware of different interventions provided by various professions. Challenges included: scheduling of events to address resident needs/preferences and student availability; finding translators/ interpreters and having enough time to have materials translated; multiple IRB applications; project coordination; advertising programs; encouraging and reminding residents to attend programs. Strategies for next steps in the evolution of this partnership based on a collaborative examination of data will be presented.

THE DISSEMINATION AND IMPLEMENTATION OF THE CHRONIC DISEASE SELF-MANAGEMENT PROGRAM AMONG RURAL-RESIDING ADULTS

S.D. Towne[1], M.L. Smith[2,1], S. Ahn[3,1], M.G. Ory[1], *1. Health Promotion and Community Health Sciences, Texas A&M Health Science Center, College Station, Texas, 2. University of Georgia, Athens, Georgia, 3. University of Memphis, Memphis, Tennessee*

Introduction: Rural residents traditionally face gaps in accessing health care services due to limited availability of providers and associated resources. Using data from the Chronic Disease Self-Management Program (CDSMP), an evidenced-based program (EBP) shown to improve older adults' health and well-being, this study aimed to identify CDSMP delivery to rural communities and compare characteristics between rural and urban CDSMP participants. Methods: We analyzed the first 100,000 CDSMP participants enrolled in the nationwide 2010-2012 AoA Evidence-Based Disease Prevention Initiative. We used logistic regression and independent group t-test. Results: Approximately 24% of CDSMP participants lived in rural areas. Overall, 43% of participants were minorities, which was higher in urban (48%) versus rural (26%) areas. Average age was 64 and 66 years for rural and urban areas, respectively. The average number of chronic conditions was similar across rural and urban areas (2.6 for rural, 2.4 for urban). Successful completion of CDSMP (attending 4+ of 6 sessions) was similar across rural/urban areas (78% for rural; 77% for urban). Black participants (OR=1.25) and those living in rural areas (OR=1.08) had higher likelihoods of successfully completing CDSMP in adjusted analysis. Participants residing in a primary care health professional shortage areas (OR=0.93) and males (OR=0.93) had lower likelihoods of successfully completing CDSMP in adjusted analyses. Discussion: Rural participants may be more vulnerable than urban participants in terms of age and chronic illness. Understanding rural reach of CDSMP allows for a benchmark for assessing improvements in future work seeking to bridge gaps in linking rural residents to EBP.

DISCHARGE OUTCOMES OF POST-ACUTE HOME HEALTH PATIENTS

A. Wysocki, V. Mor, *Center for Gerontology and Healthcare Research, Brown University, Providence, Rhode Island*

The use of home health services among post-acute care patients has increased dramatically. Despite the magnitude of home health utilization, there is little current research on the outcomes of patients using formal home health services. In this analysis, we examined discharge location and rehospitalization among home health patients. Our sample included Medicare fee-for-service patients discharged from an acute hospital to home health with corresponding Outcome and Assessment Information Set (OASIS) admission and discharge assessments in 2011. We used logistic regression models to analyze patient characteristics associated with being discharged home and being rehospitalized. We found that individuals who were living alone, had a pressure ulcer at admission, and who had heart failure, chronic obstructive pulmonary disease, or cancer were significantly less likely to be discharged home and significantly more likely to be rehospitalized. Individuals who did not have caregivers to provide activities of daily living or instrumental activities of daily living assistance were less likely to be discharged home. These results suggest that individuals who do not have access to informal caregivers and who have certain high risk conditions at admission are less likely to have a successful home health episode ending in discharge home without a rehospitalization.

DO HOSPITALISTS REDUCE PNEUMONIA READMISSION RATES: A LONGITUDINAL ANALYSIS OF U.S. ACUTE CARE HOSPITALS

J. Epane[1], R. Weech-Maldonado[2], L. Hearld[2], *1. Health Care Administration and Policy, University of Nevada Las Vegas, Las Vegas, Nevada, 2. University of Alabama at Birmingham, Birmingham, Alabama*

Hospitalists constitute a relatively new and fast growing group of hospital-based physicians. Hospitalists may provide better coordination and continuity of care, which may result in lower readmissions. Prior studies examining the relationship between the use of hospitalists and hospital readmissions have been limited to specific hospitals or geographic scope. Our longitudinal (2008-2010) study explores the relationship between hospitals' use of hospitalists and pneumonia readmission using a national sample of U.S. acute care hospitals (N= 3,294). Data from the AHA Annual Survey, the Area Health Resource File (AHRF), and CMS' Hospital Compare files was used for this study. A panel design with facility and year fixed effects regression was conducted for this analysis, controlling for organizational and market factors. Our results indicate that an increase in the use of hospitalists, staffing intensity (high proportion of FTE hospitalists), and contracted hospitalists were associated with lower pneumonia readmissions. Our study validates prior studies that showed that hospitalists are able to reduce pneumonia readmissions. Additionally, our study shows that an adequate staffing level of hospitalists is critical to achieve the desired outcome. Finally, given the costs associated with employing hospitalists, our study suggests that the use of contracted hospitalists may be a cost-effective staffing strategy to reduce pneumonia readmissions. With the implementation of value-based purchasing, providers are seeking strategies to reduce costs while achieving higher quality of care. The use of hospitalists may be a potential staffing strategy to achieve these goals.

SESSION 210 (POSTER)

DEMENTIA AND DELIRIUM

CLINICAL DEMENTIA RATING SCALE PREDICTION OF DEMENTIA DIAGNOSIS: SUBJECT VERSUS INFORMANT REPORTS

M. Kitner-Triolo, Y. An, R.J. O'Brien, S. Resnick, *National Institute on Aging, Baltimore, Maryland*

The Clinical Dementia Rating Scale (CDR) is the preeminent measure of everyday functioning used for dementia diagnosis. Standard administration uses combined CDR total scores (subject and informant) to estimate everyday functioning, but it is not always possible to obtain both the subject and informant CDRs. We investigated whether the subject and informant reports are equally effective in predicting dementia diagnosis and which scores provided the earliest prediction. Cox Proportional Hazard models tested CDR total scores (combined, subject, informant) as predictors of dementia risk in Baltimore Longitudinal Study of Aging participants. Sample 1 tested prediction of dementia from 1-6 years before diagnosis (combined n=419, dementia cases=91; subject n=387, dementia cases=82; informant n=342, dementia cases=60). Sample 2 tested prediction of dementia 3-6 years before diagnosis (combined n=399, dementia cases=91; subject n=369, dementia cases=64; informant n=336, dementia cases=54). Adjusting for sex, education and ApoE genotype, combined, subject and informant CDR total scores were each significant predictors of dementia up to one year before diagnosis (CDR-combined HR=3.40, 95% CI=1.45–7.93; CDR-subject HR=2.46, 95% CI=1.01–5.99; CDR-informant HR=4.33, 95% CI=1.52–12.35). Informant (HR=4.08, 95% CI=1.35-12.34) but not subject (HR=1.64, 95% CI=0.59-4.59) CDR predicted dementia risk 3-6 years before diagnosis. Subject and informant CDRs are each significant predictors of dementia when administered close in time to dementia diagnosis. Earlier in the dementia prodrome, the informant CDR is the stronger predictor of dementia. Our results highlight the importance of informant information in early stages of cognitive impairment.

THE USE AND UTILITY OF SPECIFIC NONPHARMACOLOGICAL INTERVENTIONS FOR BEHAVIORAL SYMPTOMS IN DEMENTIA

J. Cohen-Mansfield[1,2], M.S. Marx[2], M. Dakheel-Ali[2], K. Thein[2], *1. Sackler Faculty of Medicine, Department of Health Promotion, Herczeg Institute on Aging, and Minerva Center for the Interdisciplinary Study of End of Life, Tel Aviv University, Tel Aviv, Israel, 2. Innovative Aging Research, 807 Horton Dr., Silver Spring, Maryland*

This study compares different non-pharmacological interventions for persons with behavioral symptoms and dementia on frequency of use and perceived efficacy in terms of change in behavior and interest. Participants were 89 nursing home residents from 6 Maryland nursing homes with a mean age of 85.9 years. Research assistants presented interventions tailored to the participants` needs and preferences in a pre-intervention trial phase and in an intervention phase. The impact of each intervention on behavioral symptoms and on the person's interest was rated immediately after the intervention by a research assistant. The most utilized interventions in both trial and treatment phases were the social intervention of one-on-one interaction, simulated social interventions such as a lifelike doll and respite video, the theme intervention of magazine, and the sensory stimulation intervention of music. In contrast, the least utilized interventions in both phases were sewing, fabric book, and flower arrangement. Interventions with the highest impact on behavioral symptoms included one-on one social interaction, hand massage, music, video, care, and folding towels. Other high impact interventions included walking, going outside, flower arranging, food or drink, sewing, group activity, book presentation ball toss, coloring or painting, walking, and family video. The results provide initial directions for choosing specific interventions for persons with dementia and also demonstrate a methodology for increasing knowledge through ongoing monitoring of practice. This study was supported by National Institutes of Health grant AG010172 and by the Minerva-Stiftung Foundation Grant number 31583295000.

CHANGE IN QUALITY OF LIFE OF PEOPLE WITH DEMENTIA WHO ARE RECENTLY ADMITTED TO LONG-TERM CARE FACILITIES

H. Beerens, S.M. Zwakhalen, H. Verbeek, D. Ruwaard, J.P. Hamers, *Health Services Research, Maastricht University, Maastricht, Limburg, Netherlands*

Aims: To evaluate the course of quality of life (QoL) of people with dementia (PwD) who are recently admitted to long-term care facilities, and to assess which factors are associated with their QoL. Background: The period after admission to a long-term care facility involves many challenges for PwD. It is currently unknown what happens with QoL following admission and how QoL could be influenced. Design: Observational, longitudinal survey. Methods: Data on 343 PwD who have been recently admitted to long-term care facilities across eight European countries were collected. QoL was assessed by PwD and their caregivers using the QoL-AD. Independent variables included cognitive status, comorbidities, independence in activities of daily living, depressive symptoms, and neuropsychiatric symptoms. Results: Mean QoL did not change after admission. However, on an individual level, three groups were identified, namely people whose quality of life: 1) decreased (self-report: 25%, proxy report: 26%), 2) stayed the same (44% and 49%), and increased (31% and 26%). Better cognitive abilities were associated with a decrease in self-reported quality of life. A decline in caregiver-reported quality of life was associated with greater dependency and more depressive symptoms at baseline. Furthermore, an increased dependency and an increase of depressive symptoms between baseline and follow-up were associated with a decreased caregiver-reported QoL. Conclusion: QoL of PwD does not necessarily decrease after admission to long-term care facilities. Instead, some PwD experienced an increased QoL. In order to improve wD's QoL, cognitive functioning, functional rehabilitation and treatment of depressive symptoms should receive special attention.

INFLUENCES ON DEMENTIA KNOWLEDGE, ATTITUDES, AND CONCERNS: A SURVEY OF WISCONSIN RESIDENTS

S.H. McFadden[1,2], H. Flick[1], A. Koll[1], K. Hubbartt[1], K. Pilling[1], *1. University of Wisconsin Oshkosh, Oshkosh, Wisconsin, 2. Fox Valley Memory Project, Appleton, Wisconsin*

A key component in Wisconsin Department of Health Services' plan for creating "dementia-capable Wisconsin" is raising community awareness and understanding of dementia. This study examined the effects of age, gender, education, and knowing someone with dementia on Wisconsin residents' knowledge about dementia, comfort with people who have dementia, and concerns about receiving a dementia diagnosis. We surveyed 336 Wisconsin residents, ages 18-96 (mean age = 50.4, SD = 21.03). Age was negatively correlated with fear of dementia (r = -.167, p<.01) and of losing personal memories (r = -.323, p<.01). On a 14-item true/false test, the average score was 10.9 correct. Standard multiple regression showed that dementia exposure and level of education significantly predicted dementia knowledge, R2 = .120, R2 adj = .114, F(2,293) = 19.91, p<.001. Education was significantly correlated with comfort with persons with dementia, r = .114, p = .04. People with more knowledge were more concerned about developing dementia (r = .193, p = .000), as were people who know someone with dementia (r = .157, p = .004). Independent t-tests showed women were significantly more knowledgeable than men, more concerned they might be diagnosed with dementia, more likely to say they know someone with dementia, more concerned about having to care for someone with dementia, and more likely to have made lifestyle changes to attempt to prevent dementia. One quarter of the sample had made changes; the most commonly cited were better diet, more exercise, and mental stimulation.

EDUCATING CAREGIVERS TO IMPROVE SLEEP IN PERSONS WITH DEMENTIA: A FIVE WEEK COMMUNITY-BASED PROGRAM

S. Tewary[1], N. Cook[1], S.M. McCurry[2], R. Ownby[1], L.E. Maurice[1], *1. NovaSoutheastern University, Fll, Florida, 2. University of Washington, Seattle, Washington*

Introduction: Sleep problems among persons with dementia (PWD) can be dangerous for patients and stressful for caregivers. Non-pharmacological strategies including the research-based intervention "Nighttime Insomnia Treatment and Education in Alzheimer's Disease (NITE-AD)" has shown promise for improving sleep among PWD and reducing caregiver stress and burden. Applying community-based participatory research principals, we modified NITE-AD for delivery in group settings. In Phase 1, we validated program materials through two facilitated feedback sessions. In Phase 2, we implemented the group curriculum with caregivers of PWD. Methods: Phase 1: Feedback sessions with older adults (n=24) were 1½ hours and centered on validation of recruitment strategies, evaluation tools, and curriculum appropriateness and applicability. Phase 2: we recruited caregivers of PWD to a five-week group program which reviewed the impact of light, exercise and sleep hygiene on reducing sleep disturbances among PWD. The curriculum incorporated ongoing reinforcement and goal setting. Results: Phase 1: Participant (n=24) feedback resulted in program revisions including recruitment flyer wording, inclusion and exclusion criteria, reduction of monitoring tools and program script edits. Phase 2: Seven caregiver-PWD dyads completed the program. Results suggest improvement in caregiver depression and PWD sleep problems. Caregivers reported that the program provided them support and valuable strategies that they will continue to apply. Conclusion: Engagement of older adults in program design is critical for program development. Educating caregivers in a group setting about non-pharmacological strategies for managing sleep with PWD may reduce caregiver burden and improve sleep among PWD. The need for further study is demonstrated.

CREATING EFFECTIVE ONLINE SELF-MANAGEMENT FOR OLDER TYPE 2 DIABETICS WITH MEMORY IMPAIRMENT

C.J. Camp[1], M.J. Skrajner[2], K. Fox[1], V. Antenucci[1], *1. Center for Applied Research in Dementia, Solon, Ohio, 2. Hearthstone Alzheimer Care, Woburn, Massachusetts*

Older adults with Type 2 diabetes (Diabetes Mellitus – DM) who also have memory impairment (MCI or early stage dementia) are both challenged and at risk when attempting to live independently. The ability to effectively monitor blood glucose levels, exercise regimens, diet and exercise regimens often is severely constrained by the combination of DM and the presence of mild cognitive impairment (MCI) or early stage dementia. We describe an exploratory study funded by NIDDK in which Certified Diabetic Educators (CDEs) were linked with 40 older adult with DM and memory impairment using iPads and the internet. CDEs present personalized education sessions to participants, and 18 of the participants also receive a cognitive intervention (spaced retrieval) designed to train the effective use of strategies to enhance medication compliance and reach other goals. Blood glucose and cholesterol measures were assessed at baseline and at 2-, 4-, and 6-months post intervention. HbA1c levels initially declined from baseline after treatment but returned to baseline levels after 6 months, indicating a need to provide continuing follow-up and support after initial treatment for both groups. For LDL cholesterol, a significant interaction effect was found for the Group x Time interaction. LDL levels increase from baseline after treatment for the control group, but showed decline after baseline in the SR group. No main effects were significant. Again, results show the need for follow-up and support after initial treatment, as well as the need to see if the effects produced by SR can be replicated and sustained with follow-up.

UNDER-RECOGNITION AND MISCLASSIFICATION OF DELIRIUM BY EMERGENCY PHYSICIANS

P. Serrano[2], J. Saczynski[1,2,3], J. Ela[2], J. Sun[6], J. Gurwitz[1,2], G.S. Zimmer[6], S.K. Inouye[3,4,5], C. Darling[6], *1. Department of Medicine, University of Massachusetts Medical School, Worcester, Massachusetts, 2. Meyers Primary Care Institute, University of Massachusetts Medical School, Worcester, Massachusetts, 3. Aging brain Center, Institute for Aging Research, Hebrew SeniorLife, Boston, Massachusetts, 4. Department of Medicine, Beth Israel Deaconess Medical Center, Boston, Massachusetts, 5. Harvard Medical School, Boston, Massachusetts, 6. Department of Emergency Medicine, University of Massachusetts Medical School, Worcester, Massachusetts*

Background: Delirium is common in geriatric patients in the Emergency Department (ED). Accurately diagnosing delirium is important for medical decision making. Misclassification of symptoms associated with delirium may lead to inappropriate treatment and increased mortality. Misclassification includes incorrectly diagnosing delirium (false positive) as well as under-recognition of delirium (false negative). Objectives: To study ED physician recognition of delirium by comparing documentation of delirium or keywords associated with delirium (e.g., confusion, acute mental status change) in the ED record with a gold-standard, interviewer-based, delirium assessment. Methods: This ongoing, observational study is enrolling patients ≥70 years old who present to a tertiary-care ED. Delirium is assessed by trained interviewers using the Confusion Assessment Method (CAM). Charts are abstracted for the term delirium or delirium keywords. Results: The 47 patients enrolled to date have a mean age of 82 and 44% are men. Thirteen (28%) patients screened positive for delirium by the CAM. 'Delirium' was documented in only one chart of CAM positive cases (sensitivity=8%; specificity= 97%). Agreement between chart documentation and the CAM was higher when delirium keywords were included (sensitivity= 69%; specificity = 97%). While only 10% of charts with a keyword were CAM negative, 31% of CAM positive cases had no mention of delirium or keywords. Conclusions: Our preliminary results demonstrate that delirium is infrequently documented in the charts of delirious patients and that at times ED physicians misclassify symptoms associated with delirium. Under-recognition and misclassification of delirium may impact medical decision making, patient safety, and clinical outcomes.

THE IMPACT OF CAREGIVERS' SINGING ON EXPRESSIONS OF EMOTION AND COMMUNICATION DURING MORNING CARE SITUATIONS IN PERSONS WITH DEMENTIA

L. Marmstål Hammar, *School of Health, Care and Social Welfare, Mälardalen University, Västerås, Sweden*

The number of persons with dementia (PWD) is increasing rapidly worldwide. Emotions and communication difficulties are common and non-pharmacological interventions should be considered. The inclusion criteria were diagnosed with severe dementia, living at nursing homes and a Mini–Mental State Examination (MMSE) score > 12. Music Therapeutic Caregiving (MTC), when a caregiver sings for or together with the PWD was conducted during morning care. Baseline and intervention sessions were videotaped during eight weeks. The PWDs' expressions of resistant behavior were significantly reduced under the intervention situation. A significant (P=.000) reduction was observed for the unsociable nonverbal variable Does not respond to question. MTC significantly (P=.01) increased the mean score for the sociable nonverbal variable – Calm –Relaxed. For sociable verbal communication, significant differences were observed for the variables Use coherent communication (P=.012), Use relevant communication (P=.009), Responds to questions (P=.000), Humming (P=.004) and Singing (P=.000).

WORK ACTIVITIES AND PERCEIVED COMPETENCIES RELATED TO DEMENTIA AMONG HOME CARE PROVIDERS

D.G. Morgan[1], J. Kosteniuk[1], M.E. O'Connell[2], V. Dal Bello-Haas[3], N.J. Stewart[4], P. Kessler[5], *1. Canadian Centre for Health & Safety in Agriculture, University of Saskatchewan, Saskatoon, Saskatchewan, Canada, 2. Psychology, University of Saskatchewan, Saskatoon, Saskatchewan, Canada, 3. McMaster University, Hamilton, Ontario, Canada, 4. Nursing, University of Saskatchewan, Saskatoon, Saskatchewan, Canada, 5. Sun Country Health Region, Weyburn, Saskatchewan, Canada*

Home care bridges significant service gaps for individuals with dementia in rural communities. This study, aimed at identifying dementia learning needs of home care staff, included 70 Continuing Care Aides (CCAs) and Nurse/Case Managers (CMs), who completed a mail questionnaire. Given a list of 20 work activities related to individuals with dementia, respondents indicated the frequency of performing these activities (1=never, 5=very often); perceived competence (1=novice, 5=expert); and educational interest (yes/no). Analyses included descriptive statistics and chi-square tests. The survey response rate was 67%. The average age of respondents was 45 years; 97% were women. The CCAs' three most frequent work activities were assisting patients with personal care, assisting with daily living activities, and assessing fall risk. The Nurses/CMs' three most frequent activities were assessing fall risk, recognizing changes in cognitive function, and discussing safety issues with patients/families. CCAs were significantly more likely than Nurses/CMs to perceive their competence as "not applicable/novice/beginner" with regard to evaluating cognitive status (89% CCAs vs. 40% Nurses/CMs) and functional ability (77% vs. 44%); discussing anticipated changes (77% vs. 46%), legal issues (97% vs. 51%), communication (63% vs. 31%) and behavioural management strategies (71% vs. 43%) with families; and managing drug treatment (74% vs. 37%), pain (83% vs. 34%), and co-morbidities (80% vs. 43%). The three most desired education topics were similar for CCAs and Nurse/Case Managers: recognizing dementia subtypes (66%/77%), detecting early symptoms (57%/57%), and discussing anticipated disease progression with patients/families (40%/54%). Results have implications for developing targeted educational programming for home care providers.

AGITATION IN DEMENTIA IS ASSOCIATED WITH WORSE CAREGIVER HEALTH OVER TIME: THE CACHE COUNTY STUDY

S. Behrens[1], G.B. Rattinger[2], S. Schwartz[1], C. Lyketsos[3], J. Tschanz[1], *1. Utah State University, Logan, Utah, 2. Fairleigh Dickinson University, Hackensack, New Jersey, 3. John Hopkins Uninniversity, Baltimore, Maryland*

Background Providing care to persons with dementia has been associated with increased stress, burden and depression. In a population-based sample of dementia caregiver and care-recipient dyads, we examined the association between severity of dementia symptoms and caregiver health over time. Methods Three hundred-six persons with dementia (71% Alzheimer's type, 56% female) and their caregivers were visited semiannually for a maximum of 9.5 years. Severity of cognitive, functional and neuropsychiatric symptoms (NPS) was assessed using the Mini-Mental State Exam, Clinical Dementia Rating, and 12-domain Neuropsychiatric Inventory (NPI), respectively. NPS symptom subtype was examined by NPS cluster scores: affective, psychotic, agitation/aggression and apathy. Caregiver health was measured by number of non-psychotropic medications and number of health conditions. Results At baseline, mean (SD) number of caregiver medications and health conditions were 2.5 (2.4) and 1.6 (1.4), respectively. In multivariable linear mixed effects models controlling for patient and caregiver age and other factors, number of caregiver medications increased over time (β=.19, se=.04), whereas number of health conditions remained relatively stable. Agitation was associated with a higher number of health conditions (β =.03, se=.01) and medications (β =.08, se=.03) in the caregiver, although overtime, higher agitation scores were associated with decreasing number of caregiver medications (β =-.03, se=.01). Cognitive or functional impairment in the person with dementia was not associated with caregiver health outcomes. Conclusions Agitation in persons with dementia is associated with worse health outcomes among their caregivers. Treatment strategies for this behavior are needed to benefit both care-recipients and their caregivers.

IMPACT OF A COGNITIVE DECLINE ON OLDER ADULTS' SOCIAL PARTICIPATION IN KOREA

J. Ha, E. Chung, E. Jeong, *Seoul National University, Seoul, Republic of Korea*

Using longitudinal data from the Korean Longitudinal Study of Aging (KLoSA), this study examined: (1) the effects of a cognitive decline on older adults' social participation, including religious activities, leisure and sports activities, and social activities; and (2) the extent to which these effects differ by gender. Analyses are based on data from the 2006 (Time 1; T1) and 2010 (Time 2; T2) waves of KLoSA. The level of cognitive functioning was assessed with the Korean version of the Mini-Mental Status Exam (MMSE-K). A participant with an MMSE score of 24 or above was considered as having a normal cognitive functioning (Group 1), a score of 18-23 as having a mild cognitive impairment (Group 2), and a score of 17 or less as having serious cognitive problems (Group 3). We included in the analytic sample only those who showed normal cognitive functioning at T1, and examined how transitioning from Group 1 at T1 to either Group 2 or 3 at T2 influenced older adults' social participation at T2, controlling for social participation at T1. Results showed that both groups showed lower levels of social participation, compared to those who maintained normal cognitive functioning. Gender difference was significant only among those who experienced a severe decline in cognitive functioning (from Group 1 to Group 3). Women were more negatively affected by a cognitive decline than men. The findings underscore the need for social services that could help older adults maintain their social integration in spite of their cognitive impairments.

DEMENTIA AND MORTALITY IN OLDER ADULTS: A TWIN STUDY

J.Y. Jang[1], N.L. Pedersen[2,1], M. Gatz[1,2], *1. University of Southern California, Los Angeles, California, 2. Karolinska Institutet, Stockholm, Sweden*

Previous studies have found increased mortality in older adults with dementia. However, this is yet to be investigated in a genetically informative sample. Using a population-based sample of twins in the Study of Dementia in Swedish Twins (HARMONY), the present study examined the association between dementia and mortality in the entire sample as well as within twin pairs discordant for dementia status. Cox proportional hazards regression analysis revealed that individuals with dementia had more than doubled risk of death, compared with individuals with normal cognition (HR = 2.62, 95% CI [2.34-2.93]). As hypothesized, comparisons within dementia discordant pairs also showed significantly greater risk of death for those with dementia, indicating that genetic and early environmental influences did not account for the increased risk of death in dementia. Indeed, median survival time since the demented twin's age of onset was 9.8 years for twins with dementia and 15.1 years for their cognitively normal co-twins. The present study is the first to look at survival of dementia patients using the co-twin design. Information about an estimated impact of dementia on patient's lifespan may be useful to families, clinicians, and policy makers in making decisions for dementia care.

A TYPOLOGY OF SUBJECTIVE KNOWLEDGE AND CERTAINTY ABOUT ALZHEIMER'S DISEASE – RESULTS OF AN ONLINE-SURVEY

M. Schindler, R. Rupprecht, F. Lang, *Institute of Psychogerontology, University of Erlangen-Nuremberg, Nuremberg, Germany*

Retrospective surveys of patients with Alzheimer's Disease (AD) show that the delayed diagnosis of AD is often caused by the caregiver's lack of knowledge and difficulties to differentiate between normal aging and a progressive pathological process. Knowledge about AD has been focused by several studies but "certainty of knowledge" was widely ignored. Purpose of this study is to analyze knowledge/certainty about early symptoms of AD in a population of healthy individuals. N=375 persons (78.1% female; age: M=50.14; SD=15.31) participated in our online survey. Beside other items 9 common symptoms of AD and 7 non-AD symptoms were presented. To assess their subjective knowledge, the participants were asked, if the presented symptoms are distinctive for AD. Additionally we asked how certain they were in their response. As dependent variables the number of correct answers ("knowledge-score": M=11.34; SD 2.52) as well as the number of certain and correct answers ("certainty-score": M= 9.13.; SD= 3.92) were calculated. A median-split in both variables resulted in four prototypes of knowledge and certainty: "Mastered Knowledge" (n=95), "Uncertain Knowledge" (n=79), "Hazardous Knowledge" (n=82), "Residual Knowledge" (n=119). First results show an influence of the source of knowledge. Participants in the "mastered knowledge" type are more likely to have occupational contact with AD patients (Chisquare= 21.793; p<.001) while participants who gained their knowledge primarily from family and friends more often belong to the "residual knowledge" type (Chisquare= 21.908; p<.001). Further investigation is necessary to analyze if these types of knowledge have an influence on the delayed diagnosis of AD.

REASONS WHITE AND AFRICAN AMERICAN ALZHEIMER'S DISEASE CAREGIVERS DECIDE TO PROVIDE CARE AT HOME OR IN A NURSING HOME

M.C. Miller, C.N. Porter, *Epidemiology and Biostatistics, University of South Carolina, Columbia, South Carolina*

A qualitative study was conducted to determine reasons White (W) and African American (AA) caregivers of individuals with Alzheimer's disease (AD), eligible for nursing home placement, decide to care for their loved one at home or in a nursing home. Cases (W=227, AA=153) were identified as caregivers of a nursing home residents and controls (W=132, AA=177) were identified as caregivers of individuals staying in the community. Participants' comments were independently reviewed and analyzed. A thematic analysis was performed using QSR NVIVO7. For the W and AA case caregivers, the two most frequently reported themes were: health problems (W=145, AA=69) and behavior problems (W=70, AA=49) of the individual with AD, with W and AA cases identifying different health and behavior problems as being the most troublesome. The third most frequently reported theme for W cases was the patients worsening condition (n=38), whereas AA cases reported feelings of being overwhelmed (n=28). W and AA control caregivers most frequently reported the following theme: caregiver preference to care for their loved on at home (W=42, AA=57). The second and third most frequently reported themes for W controls were: patient's preference to be cared for at home (n=22) and belief of better care at home (n=20), whereas AA controls reported belief of better care at home (n=31) and not ready for nursing home placement (n=29). These results highlight differences in the decision making process for W and AA caregivers suggesting the importance of tailoring services and ongoing support for these specific groups.

PROACTIVE DEMENTIA CARE: A THREE YEAR PILOT STUDY EXAMINING EARLY PSYCHOSOCIAL INTERVENTIONS WITH INDIVIDUALS WITH DEMENTIA AND THEIR CAREGIVERS

T.C. Andersen, *University of Utah, Salt Lake City, Utah*

Background: Psychosocial interventions addressing caregiver burden in moderate-to-severe neurocognitive disorders have been extensively studied and use an array of validated outcome measures. Technological advances in imaging and biomarker technology allow for earlier diagnosis, and psychosocial interventions and related outcomes measures have not kept pace. Current knowledge gaps include research on psychosocial interventions for: 1) Early stages of the disease; and 2) The caregiver-care recipient dyads. This paper reports findings from a pilot study addressing these gaps. Methods: This study examined the effects of Proactive Dementia Care (PDC), an intervention for individuals with early-stage neurocognitive disorders, conducted over a 3-year period at the Cognitive Disorders Clinic at the University of Utah. Eighty dyads (an individual diagnosed with a progressive dementia and a designated caregiver) were enrolled. Study subjects were randomized into either the PDC (treatment) arm or the Standard Dementia Specialist Care (SDSC) treatment-as-usual arm. The PDC intervention allows clinicians to partner with care dyads at the time of diagnosis to develop a comprehensive set of planning steps and to support families in proactively completing these steps. Results: Data was gathered at 4 time-points for this study, baseline (n=80), 4 (n=58), 12 (n=54), and 18 (n=54) months. Analyses were run to determine the differences between the intervention and the treatment as usual group. This poster will provide a detailed report on the findings from the project. Details regarding additional pilot data will be presented as well.

SPIRALING EFFECTS OF MILD COGNITIVE IMPAIRMENT ON SPOUSAL INTERACTIONS

L.M. Butner[1,2], T. Savla[1,2], K.A. Roberto[2], R. Blieszner[1,2], *1. Human Development, Virginia Tech, Blacksburg, Virginia, 2. Center for Gerontology, Virginia Tech, Blacksburg, Virginia*

Stress spillover in spousal relationships is a significant risk factor for poor caregiver outcomes and may affect the quality of care provision. We used the stress process model framework situated within a daily diary paradigm to examine the spillover of daily primary stressors (memory and behavioral problems and symptoms) associated with mild cognitive impairment (MCI) on spousal interactions and the spiraling effects of these for both partners. Seven daily telephone interviews were conducted with 30 spousal care partners of persons with MCI. Spouses reported primary stressors related to the memory and behavior problems exhibited by their partner, secondary stressors such as work-related problems, and occurrences of pleasant and unpleasant marital interactions. Lagged multilevel models revealed that symptoms of mild cognitive impairment were associated with unpleasant interactions with the spouse on the same day (b=.20, p<.01) and predicted unpleasant spousal interactions on the next day (b=.11, p<.01). Consecutively, unpleasant spousal interactions predicted the next day's MCI symptoms and behavior problems (b=.31, p<0.05). Greater escalation of behavioral problems was associated with steeper declines in marital interactions regardless of care partner's overall marital satisfaction. Social support facilitated, and role strain impeded spousal interactions. Results underscore the importance of examining the reciprocal effects of memory-related symptoms and marital interactions for both care partners and care-recipients. Avenues for research and interventions to address communication strategies, strengthen support networks, and reduce role strain in spouses caring for a person with chronic illnesses such as memory loss are discussed.

PRESYMPTOMATIC ALZHEIMER'S DISEASE: FACTORS ASSOCIATED WITH PROSPECTIVE INTEREST IN BIOMARKER TESTING

A. Baer, *Massachusetts School of Professional Psychology, Newton, Massachusetts*

Biomarker tests to detect presymptomatic Alzheimer's disease (AD) will likely soon be available. This study aims to examine whether consumers will be interested in testing, and which sociodemographic characteristics, personality types, coping styles, and other individual factors may impact individuals' likelihood to pursue such testing. In an online survey, participants (N = 662) completed personality and coping inventories and answered questions about AD experiences and perceptions. Additional data was gathered about testing pros and cons, reactions to hypothetically positive test results, prospective interest versus test uptake, acceptable test accuracy, and the importance of pre- and post-test counseling. Quantitative analysis revealed significant prospective interest (66 percent) in presymptomatic AD testing with over 90 percent of respondents believing that pre- and post-test counseling is important. Leading reasons for testing included a family history of AD and desire to plan accordingly. Leading reasons against testing included a lack of treatment options and emotional concerns. The most salient impacts of a hypothetical positive test result included proactive coping, information seeking, preparation, health behavior change, and increased emotional distress. Significant differences for prospective test interest were found for gender ($p = .013$), religion ($p = .015$), perceptions ($p < .001$) and worry ($p = .005$) about developing AD, lifetime AD risk estimates ($p < .001$), knowing someone with AD ($p = .017$), health insurance ($p < .001$), and test uptake ($p < .001$). Additionally, several testing pros, cons, and hypothetical impacts yielded significant differences based on prospective test interest. Results will help tailor guidelines for pre- and post-test counseling protocols and should be considered in the complicated ethical implications that accompany presymptomatic AD testing.

ARE HUMOR STYLES OF PEOPLE WITH DEMENTIA LINKED TO GREATER PURPOSE IN LIFE?

W. Mak[2,1], S. Sorensen[1], *1. University of Rochester, Rochester, New York, 2. Lehman College, Bronx, New York*

In light of the losses people with dementia experience, the ability to reframe situations may enhance their sense of purpose in life. People with dementia often report using humor as a method of reframing difficult situations. Qualitative studies often note the importance of humor in dementia, but its specific benefits are less clear. The goal of this study was to use quantitative methods to determine the relationship between humor styles (adaptive vs. maladaptive) and purpose in life. Questionnaires were administered to people with mild-to-moderate dementia to measure humor styles and purpose in life. The quality of their social relationships was also assessed as a covariate. Adaptive humor styles were associated with greater purpose in life ($\beta=.42$, $p<.01$; $R2 = .19$, $p = .002$) whereas maladaptive humor styles were not. The quality of social relationships accounted for a significant proportion of variance in purpose in life ($\beta=.29$, $p<.05$; $R2 = .07$, $p = .02$), independent of the variance accounted for by humor styles. People with dementia who engage in adaptive humor and have positive social relationships may be more likely to experience a stronger sense of purpose in life. Results are discussed in the context of implications for interventions for people with dementia as well as community-level activity programming.

EXAMINING THE RELATIONSHIP BETWEEN LEADERSHIP AND SUSTAINABILITY OF A DEMENTIA TRAINING PROGRAM IN LONG-TERM CARE

T. Danylyshen-Laycock, D.G. Morgan, *University of Saskatchewan, Saskatoon, Saskatchewan, Canada*

Within health care there is an assumption that once staff receives training they will automatically implement those skills in their daily practice. Unfortunately, simple dissemination of knowledge is not effective in creating and sustaining behavioural change. To study the role of leadership in sustainability of educational programs in long-term care (LTC) homes we conducted two complementary studies. Study One (retrospective) was conducted in five rural LTC homes in which a dementia specific training program (Gentle Persuasive Approaches [GPA] Program) had previously been implemented. Four focus groups with nursing aides and 14 interviews with managers, Registered Nurses, and GPA Program Coaches were completed. Study Two (prospective) followed the implementation of the GPA program over a 14 month period in two rural LTC homes. Interviews were conducted with 18 staff from all departments within the two homes. A total of eighty-five hours of direct observation and 25 hours of shadowing the staff were conducted. Resident charts, incident reports, and communication logs were reviewed. Behaviours required by leadership to implement and sustain an educational program included modelling the skills that are taught in the program, coaching staff, problem-solving with staff, and ensuring that they are following the resident's care plan. Leadership activities that hinder sustainability of the program include displaying a negative attitude towards the program and resident directed care, not addressing performance issues with staff when they are not utilizing the GPA skills to manage a responsive behaviour, and not helping staff when they are struggling with a resident's behaviour.

ETHICAL TENSIONS IN ETHNOGRAPHIC RESEARCH: NAVIGATING A RELATIONAL APPROACH TO CONDUCTING RESEARCH WITH INDIVIDUALS WITH DEMENTIA IN LONG-TERM CARE

G. Puurveen[1], H. Cooke[2], *1. University of British Columbia, Vancouver, British Columbia, Canada, 2. University of Victoria, Victoria, British Columbia, Canada*

Conducting ethically sound qualitative research within dementia care environments poses unique ethical and methodological challenges. In part, this is due to the growing number of residents with cognitive impairment and the challenge researchers face to include their perspective. Yet, it is also due to the complexities inherent in communal living environments and the organizational structures that govern the activities of such environments. This paper explores the ethical challenges encountered in two separate ethnographic studies examining the experiences of persons with dementia residing in long-term care settings. Drawing on a theoretical grounding in personhood and relational ethics we will unpack "BIG E" ethical principles such as respect for persons, beneficence and justice as well as "small e" every day situational ethical and moral concerns. Using case examples drawn from our fieldwork, we will describe the process of consent (both initial and ongoing) and assent. We will discuss the tensions that arose from balancing the responsibility to 'do no harm' with the protection of privacy/confidentiality, particularly as it relates to bearing witness to malignant social positioning of people with dementia. Finally, we will reflect upon the issues of representation, relationship and reflexivity and highlight ways researchers might negotiate these situational concerns within the socio-political environment of long-term care settings.

CHASING THE WANDERER: AN ILLUSTRATION OF SUCCESSFUL MANAGEMENT OF WANDERING IN THE NURSING HOME

K.A. Fisher, H. Okhravi, *Glennan Center for Geriatrics and Gerontology, Eastern Virginia Medical School, Norfolk, Virginia*

Case study: 84 year old Caucasian male with advanced Alzheimer's dementia and history of wandering is admitted to a long term care facility. His medications included Seroquel 350 mg per day, Depakote 500 mg twice per day, to decrease wandering behavior. His speech was unintelligible, and did not follow commands, and constantly walked around his unit. The antipsychotic, followed by Depakote, were discontinued in spite of resistance from nursing staff. He became more alert and interactive, having sporadic moments of intelligible speech, and continued to walk in the dementia secured unit; a significant improvement from his initial presentation. The resident's quality of life improved significantly. Discussion: Wandering is one of several perplexing neuropsychiatric behaviors of dementia that challenges care providers in LTC facilities, especially when staff and resources are limited. The principal goals of treatment should be safety, and optimal quality of life. There have been various treatment modalities utilized for wandering to include pharmacologic and non-pharmacologic methods. Our modern culture of medicine may influence providers to consider non-pharmacological approaches less acceptable. Despite countless warnings, antipsychotics continue to be misused in treating these behaviors. There is no concrete evidence that demonstrates the efficacy of antipsychotics on wandering. Providers must be courageous enough to discontinue these drugs and alternatively shift toward more effective, quality of life enhancing, non-pharmacological methods of wandering management.

IMPLEMENTATION OF AN INTERDISCIPLINARY DELIRIUM RESOURCE TEAM: PREVENTION, ASSESSMENT, AND MANAGEMENT OUTCOMES

B. Heath, D.M. Kresevic, E.F. Smilovich, P. Chen, A. Jennings, *Geriatric Research, Education, and Clinical Center, Louis Stokes Veterans Administration Medical Center, Cleveland, Ohio*

Implementation of an interdisciplinary delirium resource team including geriatricians, nurses, educators and psychiatrists provide education on identification and assessment of delirium. The team successfully piloted use of nursing shift assessment notes targeting symptoms of delirium in patients on a general medical ward correlating these with CAM assessments and expert evaluations. Care checklist pocket cards that outlined clinical practice guidelines were developed and piloted for nurses and physicians to aid in prevention, assessment and management of delirium. Education included webinars, formal lectures and informal rounds/discussions with nurses. Pre and post education evaluations were implemented for nurses and physicians. The mean pretest score for nurses was 75% and posttest 90%. A total of 107 veteran and their families were followed over this year long project. Outcomes for these veterans were compared with a baseline sample of 22 delirious veterans. The baseline sample length of stay was 9.2 days, mortality was 32%, and discharge to nursing home was 59%. Discharge to home was 12%. In our 107 study sample acute length of stay was slightly increased at 11 days, including 4 outliers who had LOS over 30 days. With these outliers removed from the analysis since we had no similar outliers in our baseline the LOS of slightly decreased to 9.0 days. We found, a lower mortality rate of 24.5% and lower nursing home placement rate 51%. Readmission rates were 10%, below other sample reports. Urgent care and emergency room visits following discharge were 15% also below commonly reported statistics in studies of delirium.

ADDRESSING ATTRITION: A HINDERING ASPECT OF DEMENTIA CAREGIVING TRIALS

P.B. Arthur[1,2], L.N. Gitlin[3], W.C. Mann[2,1], *1. University of Florida, Department of Occupational Therapy, Gainesville, Florida, 2. North Florida South Georgia Department of Veterans Affaris, Center of Innovation on Disability and Rehabilitation Research, Gainesville, Florida, 3. Johns Hopkins University, Center for Innovative Care in Aging, Baltimore, Maryland*

Attrition is elevated in dementia caregiving trials due to complexity of the disease and care situations, poor caregiver and patient health and other factors including mortality and nursing home placements. As attrition impacts trial validity, power, time-to-study completion and costs, it is a significant consideration. The few studies on attrition suggest caregiver age, cognition, education, gender, and relationship are implicated. Methods: In this single-blind parallel randomized controlled trial, participants are randomized into high-intensity interventions at home or by telephone. Techniques to lessen attrition include use of attention-control to encourage continued contact, arranging sessions at convenient times and delivery within homes (intervention), or by phone (attention-control). Results: With 55 of 165 dyads recruited, trial attrition is currently 25% (n=14). Reasons for attrition include: death (n=5), nursing home/hospice admission (n=4), time constraints (n=3), out-of-state move (n=1), and change in caregiver (n=1). Caregivers are predominantly female (95%), with an average age of 71(σ 13) and low education. Most (75%) are spouses, report health status as 2.4(σ 1.12) (1= Fair, 2=Good, 3= Very Good), and Veteran health as 1.76 (σ 1.1). Discussion: Most (64%) reasons for attrition are beyond investigator control (death, placement). When recruiting dyads at moderate stage dementia, power calculations should account for high attrition rates as part of the trial design.

DEMENTIA AND MENTAL HEALTH CONCERNS IN VHA SPECIALTY GERIATRICS: OBSERVATIONS AND CLINICAL IMPLICATIONS

C.L. Vair[1,2], J. Gass[2,1], P.R. King[1], M. Wade[1], L.O. Wray[1,2], *1. Department of Veterans Affairs, Buffalo, New York, 2. State University of New York, Buffalo, New York*

Mirroring global demographic trends, the veteran population is aging, placing a substantial demand on the Veterans Health Administration (VHA) to address the increasing care needs of these individuals. Within VHA, primary care is the hub for care coordination, though there are numerous challenges in assessing complex patients and planning for care in this environment, particularly for conditions such as dementia. VHA Geriatric Evaluation and Management (GEM) clinics provide specialty care designed to address complex age-related concerns, which commonly include dementia, functional limitations, and chronic medical and mental health (MH) conditions. Utilizing data extracted from electronic medical records (EMR), the present study describes demographic characteristics, dementia and MH diagnoses, and outpatient healthcare utilization in a sample of 476 patients (84% Caucasian; 95% male; age: M = 81.4, SD = 5.8) evaluated and treated in VHA GEM clinics across Upstate New York. In addition to cognitive impairment, over 66% of the sample had at least one other MH diagnosis coded during the study period. A substantial proportion were also prescribed dementia medications and other psychotropics. Despite nearly half of the sample having an initial MH consultation (49%), low rates of follow-up were observed. Further, the subset of veterans with a comorbid MH diagnosis evidenced 53% more total healthcare encounters than those without a diagnosis. In light of these findings, MH providers such as psychologists and psychiatrists have the opportunity to play important roles as interdisciplinary collaborators in caring for aging veterans and their families in both specialty geriatrics and primary care.

SESSION 215 (POSTER)

MINORITY HEALTH I

HIGH EDUCATIONAL ATTAINMENT MAY DIFFERENTIALLY BENEFIT AFRICAN AMERICAN MEN AND ADDRESS DISPARITIES

J.N. Laditka, S.B. Laditka, *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*

On average, African Americans have more disability and shorter lives than Whites. Yet these race/ethnic categorizations may mask within-group differences in educational attainment, which is importantly associated with disability and mortality. Little recent research has examined associations of educational attainment with active life expectancy (ALE), a measure of life expectancy and the proportions of life with and without disability, for African Americans. We examined ALE for African Americans and Whites using data from the Panel Study of Income Dynamics, 1992-2009 (ages 55+; n=2,348; 12 survey waves; 29,574 person-years), measuring disability by difficulty in activities of daily living. Multinomial logistic regression and Markov models estimated monthly probabilities of disability and death for six education levels, adjusting for gender, race, and age. Microsimulation created large populations to identify outcomes. Bootstrapping provided confidence intervals. A random effect accounted for repeated measures. Compared to those with <8 years of education, African American men with at least a college education lived 42.8% more years from age 55 (95% confidence interval 40.3-44.9) and 35.1% fewer years with disability (95% confidence interval 33.7-37.6). Results for African American women: 4.4% (not statistically significant) and 30.2% (23.8-36.5). For White women: 34.3% (25.3-49.0) and 45.9% (40.1-50.9). For White men: 34.0% (32.0-36.5) and 41% (39.3-43.5). Among men with low education, African Americans lived considerably shorter lives from age 55 than Whites: to age 73.2 (72.5-74.0) compared with 78.3 (77.9-78.7). Thus, the greater benefit from high education for African American men suggests that education may help to address health disparities.

LESSONS LEARNED ABOUT RECRUITMENT OF OLDER AFRICAN AMERICANS FOR COMMUNITY PARTNERED RESEARCH

K.L. Jackson, *Nursing, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Literature suggests that African Americans are underrepresented in scientific research, yet they are disproportionately affected by financial exploitation (FE). FE is underreported due to shame and fear. Cultural humility is crucial when collaborating with African American communities, particularly when the research focus is FE among older African Americans. Lessons learned from developing the institutional review board application, to the use of the researcher as an instrument, and establishing of networks for recruitment are keys to success. Methods/Participants: Community Based Research principles were used to establish a partnership between a faith based community collaborative and academic researchers. A community need for information to protect older African Americans against FE resulted in a partnership to raise the level of awareness, screen for risks, and assess prevalence in a community with high health disparities and vulnerable older African Americans. Results: Lessons learned: 1) clear delineation of specific activities lead to a successful institutional review board application with an exempt status, 2) shared ethnicity does not guarantee acceptance in the community, 3) demonstrating respect for uniqueness of the culture demonstrates caring, 4) demonstrating a genuine caring attitude builds rapport, 5) follow up and seeking permission builds trust, 6) investing time in the community leads to network building, multiple recruitment and data collection opportunities, and 7) sharing progress and seeking feedback maintains a relationship. Conclusion: Examination of FE within the African American context is needed to eliminate this social problem. Community partnering and cultural humility can lead to successful exploration and information sharing.

FINANCIAL STRAIN AND SELF-RATED MENTAL HEALTH AMONG OLDER BLACK AMERICANS

G. Marshall[1], S.L. Szanton[2], R. Thorpe[3], *1. School of Applied Social Sciences, Case Western Reserve University, Cleveland, Ohio, 2. Johns Hopkins University School of Nursing, Baltimore, Maryland, 3. John Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Objective: Little is known about the association between financial strain and self-rated mental health particularly among older Black Americans. The purpose of this study was to examine the association between financial strain and self-rated mental health among older Black Americans. Methods: Using data from the National Survey of American Life, we examined the association between financial strain and self-rated mental health in African Americans (N=1135) and Caribbean Blacks (N=377) 50 years and older. Financial strain consisted of two questions regarding: difficulty paying bills and worried about income. A binary variable was created (0= no financial strain, 1=financial strain) and then summed. Higher scores reflect greater financial strain. The mean score for financial strain for older African Americans was .62 (SD=.48) and for Caribbean Blacks was .66 (SD=.47). After adjusting for age, race, gender, education and income, African Americans who reported high levels of financial strain had a higher odds of poor self-rated mental health (odds ratio (OR))=0.37, 95% confidence interval(CI)=0.21-0 .64 than African Americans who reported lower levels of financial strain. Among Caribbean Blacks who reported high financial strain had a lower odds of self-rated mental health (OR)= 0.24, 95%CI =0.11-0 .53 than Caribbean Blacks who reported lower levels of financial strain. Conclusion: These findings suggest that financial strain may be an important predictor of poor self-rated mental health outcomes for older African Americans and Caribbean Blacks. Future research should examine specific forms of financial strain that may contribute to poor mental health in late-life.

THE VULNERABILITY OF OLDER ETHNIC IMMIGRANTS WITH LIMITED ENGLISH PROFICIENCY

Y. Jang[1], H. Yoon[1], N. Park[2], D.A. Chiriboga[2], *1. UT Austin, Austin, Texas, 2. University of South Florida, Tampa, Florida*

Purpose: The number of U.S. residents who have Limited English Proficiency (LEP) has increased substantially, and the health burden of these LEP populations has emerged as a public health concern. The present study explored the health profiles of Korean American older adults, focusing on LEP as a vulnerability factor. The target population is one of the major LEP groups; Korean is the 4th most common language spoken by LEP individuals in the U.S. Methods: Using pooled data from 1,301 Korean Americans (aged ≥ 60) surveyed in Florida, Texas, and New York during 2008–2013, comparative analyses and multivariate model estimations were conducted. Results: More than 70% of the sample of older Korean Americans exhibited LEP. The LEP group presented more adverse health profiles, having a higher proportion of uninsured, more numbers of medical conditions, poorer ratings of health, and more symptoms of depression. In multivariate models, the likelihood of having health insurance was shown to decrease by 49% in the LEP group. Those with LEP were 2.94 times more likely to report poor or fair health and 1.90 times more likely to have probable depression. The variability by geographic location and contextual factors (e.g., family support and social cohesion) was also discussed. Implications: Findings identified LEP not only as a source of health disparity but also an intervening agent to be targeted in health planning and interventions for older ethnic minority populations.

MAKING CONNECTIONS: UNDERSTANDING LONG TERM CARE AND SUPPORT NEEDS OF COMMUNITY-DWELLING ASIAN OLDER ADULTS

D. Kong[1], J.K. Davitt[2], *1. School of Social Policy and Practice, University of Pennsylvania, PHILADELPHIA, Pennsylvania, 2. School of Social Work, University of Maryland, Baltimore, Maryland*

Linguistic and cultural barriers among older Asian immigrants result in health disparities and the diverse challenges these older adults experience at the different stages of aging. This poster will present the results of a qualitative study of the perceived needs of Korean and Chinese American older adults to enhance their ability to remain in their preferred community residences. 60 interviews were conducted with Korean and Chinese individuals, including older adult personal care service recipients, their family caregivers, and older individuals not receiving personal care services. Interview data were analyzed via NVivo software using content analysis. The main themes identified through the interviews included: challenges in accessing adequate care, barriers to aging in place, challenges for informal caregivers, and service gaps. Language barriers were identified as the biggest challenge faced by older Asian adults, particularly in communicating with health and long term service providers. Other representative themes include: lack of linguistically appropriate health education programs, barriers in seeking/utilizing informal support, transportation and shopping challenges, challenges in accessing ethnic food in mainstream service agencies, and lack of adequate culturally responsive community sites for older adult engagement. Implications of these findings for supporting racially and linguistically diverse populations to age in place in community will be discussed.

COMMUNICATION WITH OLDER RURAL AFRICAN AMERICANS ABOUT CANCER SCREENING: HEALTHCARE PROVIDERS PERSPECTIVE

J.S. Oliver, R.S. Allen, L. Mieskowski, M.K. Eichorst, L. Tang, *Nursing, University of Alabama, Tuscaloosa, Alabama*

Older rural African Americans represent an underserved population. African Americans have the highest incidence and mortality rates related to colorectal cancer in the U.S. compared with other races. Improving health communication between patient and provider may be important in decreasing these disparities. Few studies have identified barriers and/or facilitators to health care providers discussing cancer screening with older rural African American patients. The Agency for Healthcare Research and Quality (AHRQ) 2008 core measures identify provider-patient communication as a very important issue. This study is unique in that it includes health care providers that are practicing in rural communities located the Alabama Black Belt. The area of the state designated as the “black belt” consists of primarily agricultural counties that have the richest soil and the poorest people and is known for its insufficient health care and health disparities. Qualitative interviews were completed with 8 healthcare providers. These health care providers included both physicians and nurse practitioners. We explored both facilitators and barriers of communication among health care providers and older rural African Americans, specifically related to their cancer screening communication. The health care providers rich and informative data resulted in four major themes identified in regards to communication 1) Nodding does not equal understanding 2) Fear is a factor 3) Access and transportation 4) Clergy and family. Cultural knowledge and sensitivity can help decrease communication barriers and increase facilitation of successful communication among older rural African Americans and health care providers.

PUBLICLY AVAILABLE NATIONAL DATA FOR AGING AND HEALTH DISPARITIES RESEARCH: IMPLICATIONS TO GERONTOLOGISTS

G. Kim[1], A.N. Bryant[1], K. Ford[1], C. Huang[1], R. Weech-Maldonado[2], P.A. Parmelee[1], *1. Center for Mental Health and Aging / Department of Psychology, University of Alabama, Tuscaloosa, Alabama, 2. University of Alabama at Birmingham, BIrmingham, Alabama*

Purpose of the Study: Objectives of the present study were (1) to document publicly available national data sets for aging and health disparities research and (2) to provide a useful tool to gerontologists for cost-effective research endeavor. Design and Methods: Publicly available national data sets for both general population surveys (n = 5) and aging-specific surveys (n = 4) were examined as follows: Behavioral Risk Factor Surveillance System (BRFSS); Collaborative Psychiatric Epidemiology Surveys (CPES); Established Populations for Epidemiologic Studies of the Elderly (EPESE); Hispanic Established Populations for Epidemiologic Studies of the Elderly (H-EPESE); Health and Retirement Study (HRS); Midlife in the United States (MIDUS); National Health and Nutrition Examination Survey (NHANES); National Health Interview Survey (NHIS); and Medical Expenditure Panel Survey-Household Component (MEPS-HC). Collected information from these national data sets includes measures of age, race/ethnicity, language, immigration status, health status and healthcare use. Results: Each survey has strengths for aging and health disparities research. However, there is no single data set that has comprehensive information on diversity background or specific measures for aging and health disparities research. Additionally, there is little consensus on how to measure similar health constructs across the existing data sets. Implications: The findings highlight areas for improvement in future data collection for aging and health disparities research. Furthermore, the study will discuss tools that can facilitate future research of gerontology researchers interested in health disparities research or cultural diversity issues.

PAIN INTERFERENCE WITH EVERYDAY ACTIVITIES AMONG OLDER BLACK AND WHITE CANCER PATIENTS: IT’S MORE THAN JUST PAIN SEVERITY

M.L. O’Connor[1], T. Baker[2], J. Krok[3], *1. North Dakota State University, Fargo, North Dakota, 2. University of South Florida, Tampa, Florida, 3. The Ohio State University, Columbus, Ohio*

Given that adults are living longer with more debilitating chronic illnesses, there is a need to understand the impact pain has on the daily activities of this patient population. The current study aimed to determine the influence select indicators have on pain interference with everyday activities among adults (N=150) 55+ years of age receiving outpatient treatment from a Comprehensive Cancer Center in the southeastern United States. Participants completed self-report questionnaires assessing pain interference, health variables (co-morbidities, pain severity, and number of pain locations), and psychosocial variables (self-efficacy for managing symptoms, positive and negative affect, and communication with physicians). A principal component analysis showed that the pain interference items loaded on two distinct composites, physical interference (e.g., walking, normal work) and psychosocial interference (e.g., mood, enjoyment of life). These composites served as outcomes in two multiple regression models; predictors were demographic, health, and psychosocial variables. The final model for physical interference was significant ($R2=0.30$, $p<0.001$), but pain severity was the only significant predictor ($\beta=0.36$, $p<0.01$). In the model for psychosocial interference ($R2=0.51$, $p<0.001$), the following predictors were significant: pain severity ($\beta=0.42$, $p<0.01$), education ($\beta=0.16$, $p<0.05$), self-efficacy for pain ($\beta=-0.17$, $p<0.05$), negative affect ($\beta=0.17$, $p<0.05$), and communication ($\beta=-0.16$, $p<0.05$). Race (being Black) was also marginally significant in this model ($\beta=0.12$, $p<0.10$). These findings emphasize that the experience of pain is multifaceted, and acknowledging such outcomes may provide a means for more individualized treatment to patients diagnosed with chronic and painful medical conditions.

EDUCATION DESEGREGATION AND COGNITIVE DECLINE IN AFRICAN AMERICAN OLDER ADULTS

A. Aiken-Morgan[1], A. Gamaldo[2], R.C. Sims[3], J.C. Allaire[4], K.E. Whitfield[1], *1. Duke University, Durham, North Carolina, 2. University of South Florida, Tampa, Florida, 3. University of Delaware, Newark, Delaware, 4. North Carolina State University, Raleigh, North Carolina*

Previous research has shown that education desegregation influences late life cognitive performance in African American elders. Overall, desegregation has been associated with better performance for certain measures of fluid and crystallized abilities. The present study examined the influence of desegregation on cognitive decline across a three-year span in a sample of 426 community-dwelling African American elders (mean age = 68.6; SD = 9.1). Participants were recruited for the Baltimore Study of Black Aging – Patterns of Cognitive Aging (BSBA- PCA) study and were administered measures across six cognitive domains: global cognition, working memory, memory, language, reasoning, and perceptual speed. Composite T-scores were calculated for each domain. Six repeated-measures analyses of covariance (RM-ANCOVAs) were conducted; the between-subjects factor was desegregated versus segregated schooling, and the within-subjects factor was time (time 1 and time 2). These analyses controlled for age, years of education, and sex. Results showed significant between-group effects, indicating that across two time periods, the desegregation group scored significantly better on reasoning, language, and speed (p < .05). In addition, there was a significant within-group effect for global cognition, indicating that for the entire sample, there was significant decline over time. However, there were no significant schooling group-by-time interactions for any of the cognitive scores, suggesting that both groups declined at the same rate across time. These findings show that while there is a level difference in cognitive performance associated with desegregated schooling, desegregation appears to have less influence on the rate of decline for this African American sample.

PREDICTORS OF PROSTATE CANCER SCREENING IN OLDER AFRICAN AMERICAN MEN

E. Shon, A.L. Townsend, *Case Western Reserve University, Cleveland, Ohio*

Older African American men are more likely to be diagnosed with advanced prostate cancer and continue to have a higher mortality rate caused by prostate cancer than other ethnicities. Cancer screening is recommended as an important part of preventive care. This study used the Health Belief Model (Rosenstock et al., 1974) to examine whether older African American men's demographic/health characteristics, perceived barriers (perceived medical discrimination and other discrimination, perceived financial strain), and sense of control were associated with having prostate cancer screening or not. Data were drawn from the 2010 Health and Retirement Study, and 164 older African American men (M age = 56.58) were included. Hierarchical logistic regression was applied to investigate whether sense of control significantly improved predicted log odds of having prostate cancer screening, after controlling for demographic/health characteristics and perceived barriers. Even though a majority (70%) of the sample had had prostate cancer screening, still 30% had not. Higher sense of control (OR = 1.06), having health insurance (public or private, OR = 3.39), and more comorbidities (OR = 1.72) were significant predictors of having prostate cancer screening. Age, education, previous cancer, and perceived barriers did not significantly predict the log odds of having prostate cancer screening. Findings highlight the importance of sense of control as a potential target for psychosocial and behavioral interventions with older African American men to encourage them to participate in preventive care. Findings also reaffirmed the barrier posed by lack of health insurance.

FAMILY MEMBERS OF OLDER AFRICAN AMERICAN WOMEN WITH BREAST CANCER: WITNESS TO A LIFE-ALTERING EVENT

E.L. Csikai, S.S. Martin, C. Broussard, *School of Social Work, The University of Alabama, Tuscaloosa, Alabama*

Diagnosis of a life-threatening illness, such as cancer, for close family members can be stressful as they may need to help the individual through cancer treatment decisions and the treatment process. Family members may struggle with their potential new roles as "caregivers" and managing concern about and support for the individual diagnosed. However, just as the individual diagnosed must incorporate the cancer experience into their lives, so must the family members. It may be difficult to understand how their feelings may change through the process especially with how experience with cancer has affected their own daily lives and futures. There may be considerable concern about their well-being as well as that of the rest of their families. African American family caregivers may face particular challenges as the combination of age and ethnicity puts older African American women at high risk for poor cancer outcomes. The primary aims of this study were to understand the "cancer experience" of family members of older African American women diagnosed with breast cancer as they provided needed support throughout treatment and beyond. A qualitative phenomenological approach was utilized in this study. In-depth interviews were conducted with 15 family members of older African American women (45 and older) who had been diagnosed with and received treatment for breast cancer. Relationships were: 3 husbands, 4 daughters, 1 daughter-in-law, 3 sisters, 2 nieces, 1 friend and 1 mother-in-law. Interviews were semi-structured, audio-taped, transcribed, and data organized with Atlasti software. Meaning units and themes were extracted from the transcripts illuminating the participants' lived experiences. Respondents described experiences related to the individuals' cancer experiences from initial diagnosis and decisions throughout the duration of treatment. Participants discussed reactions having been witness to this experience in their family. Themes that emerged included: Initial reactions; reactions throughout the experience; family history; caregiving support needed/provided; and concerns/fears for the individual, self, own family. The experiences of these family members revealed the importance of attending to the needs and feelings of family members and provide support that can increase the likelihood of incorporation of cancer diagnoses into their lives in the healthiest manner possible.

DIABETES, DEPRESSION, RACE/ETHNICITY AND AGING

A.S. Phillips, C.A. Guarnaccia, M.E. Douglas, V.T. Martinez, K.G. Edwards, *University of North Texas, Denton, Texas*

Objective: To determine how age/race/ethnicity influences depression in diabetic versus non-diabetic adults using the 2011-2012 National Health and Nutritional Examination Survey (NHANES). Older compared to younger diabetic NHANES participants were predicted to report lower depressive affect. Both older and younger diabetics were predicted to report greater depression than non-diabetic participants. Race/ethnicity was predicted to have a significant influence on depression for diabetics. Method: NHANES, a population-probability study, surveys a nationally representative sample using interviews, and biometric data (physical exams and lab work). The present study analyzed data from 273 participants who both self-reported a diabetes diagnosis and also met American Diabetes Association biometric criteria of having an HbA1c (glycated hemoglobin level) above 6.5% and 2,933 participants who, in comparison, had no self-reported diabetes diagnosis and had an HbA1c level below 6.0%. Results: A 2-way ANOVA revealed a significant main effect for both age F(1, 3,202)=18.96, p<.001 with participants age 65+ reporting less depression than participants ages 20 to 50, and diabetic status F(1, 3,205)=37.97, p < .001 with diabetic participants reporting greater depression than non-diabetics. A 3-way ANOVA revealed a significant main effect for race/ethnicity F(1, 3,205)=5.90, p = .02, on depression, as well as a similar age group and diabetic status main effects. Interestingly, besides diabetics having elevated depression compared to non-diabetics, some racial/ethnic depression differences were present. Conclusion: Older adult diabetic individuals appear to be better protected from depression than their younger diabetic counterparts, as well as potential differences among racial/ethnic groups who have diabetes.

DEPRESSION AND CONFIDENCE IN DISEASE MANAGEMENT IN COMMUNITY-DWELLING OLDER ADULTS DIAGNOSED WITH HEART DISEASES: RACIAL/ETHNIC DIFFERENCES

C.S. Huang, M. Johnson, G. Kim, M.R. Crowther, *Psychology, University of Alabama, Tuscaloosa, Alabama*

Objectives: Confidence in managing heart diseases is crucial to enhance overall health in older adults diagnosed with heart diseases yet it can be impacted by depression, a common comorbid mental health condition found among heart disease patients. This study aims to examine the relations between depression and confidence in disease management in community-dwelling older adults with heart diseases. Methods: Data were drawn from the 2011 California Health Interview Survey (CHIS). 3,705 adults aged 55 and older with a heart disease diagnosis were included in the analysis. Chi-square tests for independence were conducted to examine the association between depression and confidence in control or managing heart disease in four racial/ethnic groups, including Hispanics (n=409), non-Hispanic whites (n=2,891), African Americans (n=153), and Asians (n=252). Results: Asians reported the highest rate of lacking confidence in managing heart disease (53.2%), followed by Hispanics (45.8%), African Americans (44.1%), and whites (36.0%). Chi-square tests revealed significant association between depression and confidence in the overall sample, $\chi 2$ (1, n=3,370) = 6.56, p < .001, phi =-.13. Follow-up analysis revealed significant racial/ethnic differences, with whites demonstrating the strongest association, followed by African Americans and Hispanics. No significant association was found in Asians. Conclusions: Findings demonstrated strong associations between depression and confidence in disease management. Specifically, significant differences were found among four racial/ethnic groups. More research is needed to clarify the mechanism of such differences. Culturally sensitive psychoeducational interventions targeting older adults with heart diseases are suggested to address depression and enhance confidence in heart disease management.

SLEEP DISORDERED BREATHING (MEASURED BY A SELF-APPLIED MONITOR) AND GLOBAL COGNITION IN OLDER WOMEN

L. Vaughan[1], J. Ulanski[2], H.E. Dailey[1], S. Rapp[1], K.L. Stone[3], S. Redline[2], S.A. Shumaker[1], *1. Wake Forest School of Medicine, Winston-Salem, North Carolina, 2. Harvard Medical School, Boston, Massachusetts, 3. Research Institute, California Pacific Medical Center, San Francisco, California*

Objectives: To determine if selected sleep parameters measured by the ApneaLinkTM device are associated with global cognition in older women. Methods: An ancillary study to determine the feasibility of self-administering the ApneaLinkTM in Women's Health Initiative Memory Study (WHIMS) extension participants (Mean [SD] age=85.8[3.9]) was conducted in N=40 older women with normal cognitive function who used it for one night. Sleep parameters included measures of apnea, hypopnea, and hypoxia. Selected sleep parameters were chosen to predict the most recent annual measure of global cognition, controlling for age, education, and Body Mass Index (BMI). Results: Sleep parameters measuring central apnea: (1) the count of all central apneas in the recording (central apnea count [CAC]), and 2) central apneas per hour/sleep time (central apnea index [CAI]) were independently associated with global cognition (CAC; p=.01; CAI; p=.07). Women with >10 CAC in the recording or >5 CAI had marginally lower global cognition (CAC; F(1, 39)=4.40, p=.04, CAI; F(1, 39)=3.82, p=.06). A hierarchical linear regression with age entered first (p=.02) followed by education (n.s.), BMI (p=.02), and CAC (p=.01) demonstrated that CAC predicted significant additional variance in global cognition (R2 change=.12; p=.01) and the full model explained 37% of the variance, F(1, 36)=6.68, p=.01. Discussion: Preliminary data shows that central apneas, likely a marker of underlying cardiovascular disease (CVD) or autonomic system dysfunction, are associated with decreased global cognitive function in this cohort of older women. Further research in a larger sample will explore the relationships between sleep apnea, CVD and global cognition.

SESSION 220 (POSTER)

FAMILY CAREGIVING: DEMENTIA AND CHRONIC PHYSICAL ILLNESS

DAILY FLUCTUATIONS IN NEGATIVE AFFECT FOR FAMILY CAREGIVERS OF INDIVIDUALS WITH DEMENTIA: EFFECT OF DAILY EXPERIENCES AND ADULT DAY SERVICES

Y. Liu[1], N. Ram[1], K. Kim[2], D. Almeida[1], S.H. Zarit[1], *1. Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania, 2. Human Development and Family Sciences, The University of Texas at Austin, Austin, Texas*

The study examined intrinsic fluctuations in daily negative affect and its differential associations with daily stressors, adult day services (ADS) use, and other caregiving characteristics. Intrinsic fluctuations, which are considered a measure of emotional lability, represent the unexplained within-person daily variability in affect after taking into account other sources of variance. Family caregivers (N = 173) of individuals with dementia (IWD) completed an 8-day diary. Each day they completed measures of stressors, and two measures of affect, depressive symptoms and anger. On some of the days, the IWD attended an ADS program, which lowered stressor exposure on caregivers. We fit multilevel models (MLM) with common within-person variance to show average associations between daily stressors and mean level of daily affect. We then fit MLM with heterogeneous within-person variance to test for differential associations between daily stressors, ADS use and intrinsic fluctuations in daily affect. Lower intrinsic fluctuations in both daily affect measures were associated with more ADS use and fewer daily stressors. Additionally, less intrinsic fluctuations in daily anger were associated with better sleep quality, longer duration of caregiving, and greater IWD's ADL dependency. Less intrinsic fluctuations in daily depressive symptoms were associated with younger age, longer duration of caregiving, and greater IWD's ADL dependency. As shown in this study, intrinsic fluctuations have meaningful associations with daily experiences and an intervention that modifies those experiences. Along with levels of affect, intrinsic fluctuation in affect (i.e., emotional lability) represents an important dimension of emotional well-being.

BABY BOOMER CAREGIVER AND DEMENTIA CAREGIVING: FINDINGS FROM THE NATIONAL STUDY OF CAREGIVING

H. Moon[1,2], P. Dilworth-Anderson[1], *1. University of North Carolina-Chapel Hill, Chapel Hill, North Carolina, 2. University of Louisville, Louisville, Kentucky*

Background: Previous studies have well documented the characteristics of baby boomers and other dissimilarities compared with the previous generation but less is known about the experiences of boomer caregivers(CGs) of loved ones with dementia. Aim: The purpose of this study was to compare the characteristics of boomer CGs of people with dementia with those of boomer CGs of people without dementia and to ascertain factors associated with depression and self-perceived physical health status in boomer CGs. Design and setting: We selected boomer CGs from the first wave of National Study of Caregiving (NSOC) with 650 primary boomer CGs (n= 138 of CGs for people with dementia and n=512 CGs for people without dementia). Methods: The Stress Process Model (SPM) was used to examine the effects of resources (the use of paid help and informal support) and stressors (primary: level of CG care activities and interrupted sleep; secondary: strain of caregiving on work, other care, and social activities) on CGs' depression and self-perceived physical health. T-tests and chi-square tests were used to compare SPM domain differences and ordinary least-square multiple regression analysis was used to investigate predictors of CGs' outcomes. Results: High blood pressure and arthritis were the most prevalent chronic diseases in both groups. Significant differences between boomer CGs of people with dementia and CG of PWOD were found for reporting help with daily activities, higher levels of caregiving and social-activity conflict, more interrupted sleep and prevalence of depression. Two groups did not differ significantly with respect to self-perceived health status due to caregiving but were significantly different with respect to use of informal support resources and experiencing conflict. Conclusion: The current results yield important information about the considerable differences between boomer CGs of people with dementia and without dementia within the caregiving experiences. The findings highlight the need to provide tailored interventions to boomer CGs to help them cope with caregiving stress in order to improve their physical and mental health.

BURDEN AMONG MALE ALZHEIMER'S CAREGIVERS: EFFECTS OF DISTINCT COPING STRATEGIES

S. Wilks, J.R. Geiger, L.L. Lovelace, *School of Social Work, Louisiana State University, Baton Rouge, Louisiana*

Purpose Approximately 40% of all informal caregivers in the United States are male relatives and friends. Previous research specifies gender as a factor in the severity of caregiving burden. Focusing on the understudied, increasing population of male Alzheimer's disease (AD) caregivers, the purpose of this study was twofold: to identify their likelihood of utilization among three distinct coping strategies (task, emotion, and avoidance focused); and to examine the effects of these distinct coping strategies on their caregiving burden. Method Data were collected from 138 male AD caregivers in southern United States. A concerted effort was conducted to ensure geographically proportional representation of African American caregivers in the sample. A self-report survey instrument contained demographics, a standardized measure of coping strategies, and two standardized measures of caregiving burden. Stepwise regression revealed the effects of each coping strategy on caregiving burden, controlling for demographics. Results Caucasian caregivers represented 61% of the sample, with African Americans at 36%. The sample reported high levels of burden. Task focused coping was the most frequently employed coping strategy. Yet, the regression models indicated no significant effect of task focused coping on the burden measures. In contrast, emotion focused and avoidance focused coping each showed significant, proportional (same direction) effects on both burden measures. Implications Results suggest that use of emotion and avoidance focused coping among male AD caregivers may be maladaptive, i.e., contributing to higher burden. As such, male AD caregivers may benefit from more task focused coping, such as planning and active problem solving.

DEMENTIA CAREGIVING: AN EXPLORATORY STUDY OF INFORMAL CAREGIVERS IN KATHMANDU VALLEY, NEPAL

A. Gautam, G. Khanal, *National Open College, Kathmandu, Nepal*

Dementia is a rapidly growing problem in all parts of the developing world. Among the 35.6 million people with dementia worldwide, 58% live in low and middle income countries (WHO, 2013). There are no formal arrangements for diagnosis, treatment, care and support for dementia/Alzheimer's caregivers in Nepal. The objective of this study was to explore the perceptions and experiences of informal caregivers of dementia patients in Kathmandu valley, Nepal. A phenomenological study approach was incorporated. Individuals working in the field of dementia were contacted to recruit dementia caregivers. Then, a purposive snowball sampling method was used to recruit the study participants. An interview guide was developed and participants were interviewed. Seven in-depth interviews were conducted in Nepali by the researcher. Field notes were taken immediately after the interviews. Interviews were transcribed and later translated in English. The ethical consideration was approved by the Nepal Health Research Council. Data was analyzed following the steps outlined by Moustakas. Following themes emerged from the study analysis: lack of dementia knowledge; prevalence of dementia stigma; negative, positive, and ambivalent caregiving experiences; and inadequate support from family, relatives, and government. Several problems expressed by the caregivers are analyzed. The health and policy implications of informal caregivers of dementia patients are discussed in the context of an Asian developing country. The study results will offer an insight into the perceptions and experiences of dementia caregivers in Nepal which are important considerations when developing policy to meet the needs of both the dementia caregivers and their patients.

LONG-TERM IMPACT OF STROKE ON FAMILY CAREGIVER PSYCHOSOCIAL OUTCOMES

O.J. Clay[1], W.E. Haley[2], M. Hovater[3], D.L. Roth[4], *1. University of Alabama at Birmingham - Department of Psychology, Birmingham, Alabama, 2. University of South Florida - School of Aging Studies, Tampa, Florida, 3. University of Alabama at Birmingham - Department of Biostatistics, Birmingham, Alabama, 4. Johns Hopkins University - Center on Aging and Health, Baltimore, Maryland*

Background: The long-term effects of stroke on informal caregiver psychosocial well-being have rarely been studied via longitudinal population-based studies and with an appropriate comparison group. Three-year changes in psychosocial outcomes were examined among family caregivers of an epidemiologically-derived sample of stroke survivors from the REasons for Geographic and Racial Differences in Stroke (REGARDS) study, and demographically matched noncaregivers. Methods: Family caregivers of REGARDS participants who reported a stroke event were enrolled in the Caring for Adults Recovering from the Effects of Stroke (CARES) study and completed telephone interviews assessing demographics, depressive symptoms, and life satisfaction at approximately 9, 18, 27, and 36 months after the stroke. A family member of a stroke-free REGARDS participant was also enrolled as a noncaregiving control for each stroke caregiver and completed similar interviews. Results: Data were analyzed for 110 African American and 125 Caucasian caregivers and the same numbers of matched controls. Multilevel models revealed that caregivers showed poorer well-being at 9 months post-stroke than controls on the Life Satisfaction Index (LSI-Z) and the Center for Epidemiological Studies-Depression Scale (CES-D). Significant differences were sustained for 15 months for life satisfaction and 22 months for depressive symptoms. Effects were similar across caregiver race and gender. Conclusions: Stroke caregiving produces marked distress but indicators of psychosocial well-being become comparable to those of noncaregivers by two years after stroke. Interventions for stroke caregivers should recognize both the strains faced by caregivers and their capacity for resilience over time with stroke recovery and psychological adaptation to stress.

RISK APPRAISAL MEASURE AND CHANGE IN POSITIVE ASPECTS OF CAREGIVING: FINDINGS FROM THE REACH II PROJECT

J. Cho[1,2], J. Thorud[1], M.G. Ory[2], A.B. Stevens[1], *1. Scott & White Healthcare, Temple, Texas, 2. TAMHSC School of Rural Public Health, College Station, Texas*

Recent research has addressed both negative and positive caregiver experiences even though the stressful nature of caring for family members with dementia has been documented for decades. The purpose of this study was to examine variations in modifiable and amenable risk areas for family members caring for individuals with dementia by comparing two groups of participants on their experiences related to positive aspects of caregiving (PAC). With a sample of 498 participants who completed a multicomponent psychosocial and behavioral training intervention from the multi-site REACH II project, this study compared two groups of participants on their PAC; participants showing no or negative change and participants showing positive change in the PAC after the intervention. Modifiable and amenable risk factors included seven indicators of the Risk Appraisal Measure at baseline (self-care and healthy behaviors, patient problem behaviors, burden, depression, social support, safety-patient impairment, and safety-caregiving behaviors). Analysis of variance (i.e., ANOVA) was conducted to compare the indicators between two groups. Results showed significant differences in burden and safety-caregiving behaviors. Those who showed positive change in the PAC reported lower levels of both burden and safety-caregiving behaviors than their counterparts with no or negative change in the PAC. No significant differences emerged in self-care and healthy behaviors, patient problem behaviors, depression, social support, and safety-patient impairment between the two groups. Identifying the unique relationships between caregiving risk factors and key intervention outcome measures may contribute to the design and potential efficacy of future caregiving interventions.

PREDICTORS OF CARE BURDEN EXPERIENCED BY CAREGIVERS OF DEMENTIA ELDERLY

H. Kim, Y. Lee, *Inha University, Incheon, Republic of Korea*

Background. Korean culture that dementia elderly should be cared at home by his/her spouse or adult children, is still remaining. In that cultural context, care burden perceived by primary caregiver become worse. The aim of this study was to explore the predictors of care burden of caregivers as the basic knowledge to develop strategy reducing care burden of the primary caregiver. Methods. Ninety five caregivers of dementia elderly were recruited for this study. Participants were a family member or significant other who took care of the elderly in most of time. Revised version of Caregiver Burden Inventory, Medical Outcomes Study Social Support Survey, Center for Epidemiologic Studies Depression scale, Neuropsychiatry Inventory questionnaire were administered. Results. Twenty four (25.5%) caregivers were male. Mean age of the subjects was 56.43(±12.80) years ranging from 25 to 88 years. Fifty five (69.2%) caregivers received more than high school education. Eight one (86.2%) participants married. The relationships between dementia elderly and the caregiver were spouse 25.5%, daughter/son 42.5%, daughter in law 24.5%, and others such as grandson/granddaughter, relatives, sister/brother, etc. 7.6%. Mean care time was 11.2(±7.5) hours per day. Overall care burden score was 29.60(±7.81). Subjective health score was 3.16(±0.94) and ADL score of dementia elderly was 9.42(±2.91). The change of family relationship score was 15.85(±4.37) and social support score was 60.53(±21.31) and depression score was 22.72 (±12.70). In addition, seriousness of behavior of dementia elderly was 14.09(±8.90) and the score of suffering from the neuropsychiatric behavior was 17.07(±12.82). In multiple regression analysis, the significant factors influencing care burden of subjects were depression, ADL function, gender of dementia elderly, and change of family relationship score. These four variables explained about 49 percent of variance of care burden. Conclusion. To reduce caregivers' burden, these significant variables need to be intervened in personal, social and health policy aspects.

INCONGRUENCE IN PERCEPTIONS OF LUNG CANCER PATIENTS' PAIN AND PHYSICAL FUNCTION: THE ROLES OF CONCEALMENT, COMMUNICATION, AND COGNITIVE IMPAIRMENT

L.M. Miller, K.S. Lyons, J. Bennett, *School of Nursing, Oregon Health & Science University, Portland, Oregon*

Most older adults have at least one chronic condition, with almost half living with at least two. In many cases these conditions, or their associated treatment, rely on symptom recognition and effective symptom management to optimize the patient's quality of life. As health care providers often rely on family members (FMs) for information, even when patients (PTs) are alert, incongruent symptom perceptions between patient and family member can create serious problems and clinical challenges. Lung cancer is the leading cause of cancer death in the United States, progresses rapidly, and has a high symptom burden. The median age at diagnosis is 70. The primary goal of the study was to examine PT-FM incongruence in perceptions of PT physical function and pain, and describe variables that predict incongruence. Using multilevel modeling, baseline Level 1 data on 114 family care dyads (mean PT age 69.27±12.07) revealed that FMs, on average, rated PT functional impairment and pain significantly higher than PTs. Controlling for relationship type, depression, FM role overload, stage of disease, and FM physical function, level 2 models revealed that PT concealment was associated with incongruence for both physical function and pain; the PT's cognitive impairment was associated with incongruence for physical function; and the FM's communication problems were associated with incongruence for pain. Together, these variables accounted for 46% and 42% of incongruence in physical function and pain, respectively. Discussion will focus on the roles of open communication within care dyads in a life-threatening context.

THE RELATIONSHIP BETWEEN POSITIVE AND NEGATIVE AFFECT AMONG FAMILY CAREGIVERS OF RELATIVES WITH DEMENTIA

S. Robertson[1], S.H. Zarit[2], M. Hardy[2], *1. Northcentral University, Scottsdale, Arizona, 2. Pennsylvania State University, University Park, PA, Pennsylvania*

Positive (PA) and negative affect (NA) have been conceptualized as bipolar or independent constructs. This study expounded these paradigms using two models of affect as frameworks to investigate the relationship between PA and NA in a sample of 554 dementia caregivers. Measures of demographics, caregiver stress and affect were collected at 3, 6 and 12 months. The dynamic model of affect (DMA) is a state-level model suggesting that occasion-specific stress influences the relationship between PA and NA. The DMA asserts that under stress PA and NA collapse into a single bipolar dimension as information-processing is simplified. Fredrickson's broaden-and-build theory of positive emotions is a trait-level model asserting that PA broadens cognition, assisting people to build personal resources. Using the DMA to represent state-level relationships between the affects, the hypothesis that PA and NA become inversely correlated as caregivers report higher levels of stress was examined. The broaden-and-build theory was used as a framework to investigate the moderating role of trait-level PA on the relationship between occasion-specific stress and NA. Multi-level modeling analyses indicated support for the DMA. Role overload was the most salient source of caregiver stress in its relationship to NA. It was the only source of stress that altered the relationship between PA and NA. Higher levels of role overload had a higher inverse relationship between the PA and NA; as stress levels increased NA increased, driving PA down. While this state-level relationship was significant, trait-level PA did not influence the relationship between stress and NA.

INTIMACY AS A MEDIATOR OF THE RELATIONSHIP BETWEEN CAREGIVER BURDEN AND MARITAL SATISFACTION

M. Szumska, *University of Kansas, Lawrence, Kansas*

Introduction: Due to increased life expectancy and prevalence of chronic health conditions, a growing number of older individuals face challenges of providing care to their spouses. Spousal caregiving can be a stressful experience associated with negative outcomes such as depression or decline in marital satisfaction. However, understanding of the mechanisms through which caregiver burden has negative effects on marital satisfaction remains limited. Methods: The study's hypotheses were tested based on the mediation model using secondary data from the National Social Life, Health, and Aging Project (NSHAP). The NSHAP collected data from a nationally representative sample of 3,005 individuals 57-85 years of age. This study tested intimacy as a potential mediator of the caregiver burden-marital satisfaction link. The study also investigated three possible moderators of the relationship between caregiver burden and marital satisfaction: type of chronic health condition, age, and gender. Results: The negative relationship between caregiver burden and marital satisfaction was partially mediated by intimacy Different types of chronic health conditions differentially impacted the relationship of caregiver burden to marital satisfaction such that the caregivers of individuals with dementia experienced more decline in marital satisfaction than caregivers of individuals with other types of chronic health conditions. Conclusion: Identifying factors that influence marital satisfaction among spousal caregivers can help improve understanding of the caregiver experience. The findings could lead to development of interventions aimed at improving marital satisfaction, which in turn could improve the quality of provided care

DEPRESSIVE SYMPTOMS IN CHINESE AMERICAN ELDERS: THE ROLE OF ACCULTURATION, HEALTH, AND FAMILY SUPPORT

F. Sun[1], X. Gao[1], G. Jiang[2,1], D.W. Coon[1], *1. ASU, Phoenix, Arizona, 2. Jiangxi University of Finance and Economics, NanChang, China*

Purposes: This study aims to identify the influence of acculturation, health, and family support on depressive symptoms in a sample of Chinese American older adults living in the Phoenix Metropolitan area. Methods: Data of this study came from a survey of 385 Chinese American adults aged 55 or above (Mage =72.4; SD =8.7) that live in the Metropolitan Phoenix area. Focus group discussions were used to ensure cultural appropriateness of survey questions. Depressive symptoms were assessed by the 12-item Center for Epidemiological Studies Depression (Cronbach's alpha =. 79). The survey was conducted in 2013 through face-to-face interviews. Results: Three-step hierarchical regression analyses indicate that lower levels of self-rated health, more difficulties of performing instrumental activities of daily living, higher levels of family conflict and lower levels of family intimacy were risk factors of depressive symptoms among Chinese American elders. Acculturation levels of elders were not significantly associated with depressive symptoms after controlling for the effect of health and family support factors. Discussion: Participant perceived health status and family support are primary factors that influence depression among Chinese American elders. The effect of acculturation related stress on the emotional well-being of Chinese elders could be minimal when the elders are of better health and have a supportive family environment. Aging service providers should be aware of the close relationship among physical health, family support and depressive symptoms, and provide interventions that would promote health and family harmony that are essential to the emotional well-being of Chinese American elders.

RELATIONSHIPS AMONG CAREGIVING STAFF AND RESIDENTS: FAMILY, FRIENDS, FUSSING & FIGHTING

H. Ewen, S.J. Hahn, *Sociology and Gerontology, Miami University, Oxford, Ohio*

Continuing care retirement communities afford residents flexibility in structure of activities, housing environments, and provision of health care for the duration of their lives. As such, residents and staff interactions are intertwined throughout all aspects of life within the community. This study is unique in that detailed information on administrator knowledge and perceptions of the social environment were obtained and analyzed qualitatively. This presentation focuses on administrator descriptions of relationships among residents and staff. Our results show that staff-resident relationships are characterized as intimate, engaging, and "like family", particularly within facilities where staff turnover is low. Resident relationships were described as variable: familial, friends, social cliques, and unique personalities. One facility administrator specifically identified three individual social groupings who were unwilling to engage with members of the other groups. Thus, residents aren't necessarily accepting of the whole community as intimate or familial even though staff-resident relationships were characterized as such. Administrators are aware of, and can categorize, the social groups and cliques as follows: temporality, gender, shared interests, and health status. These findings are consistent with prior research within congregate senior housing on social stigmas associated with residents who have shared histories or disparate health ability. Furthermore, the findings support extant research from quantitative studies on staff and resident perceptions of the social relationships within and amongst others who work and live in senior housing.

CONTROL BELIEFS MEDIATE THE RELATIONSHIP BETWEEN QUALITY OF RELATIONSHIP TO PARENT AND SATISFACTION WITH ONE'S OWN AGING

S. Jung, D.S. Jopp, *Psychology, Fordham University, Bronx, New York*

Individuals' perception of their own aging has been found to be an important predictor of physiological and psychological outcomes including subjective well-being, health, and mortality. At the same time, little research addresses the question of what influences individuals' perception of their aging. There is some evidence for psychosocial predictors of self-perception of aging, including personal control beliefs, which seem to mediate the association between social and health resource loss and subjective age. Another recent study found that the quality of relationship to the parents influences individuals' aging satisfaction. The current study examined whether control beliefs determine how a poor (i.e., conflicting) relationship to one's parents influences the self-perception of aging. A total sample of 167 individuals aged 18 to 73 years (M=31.6, SD=14.8) filled out surveys assessing their satisfaction with aging (Philadelphia Geriatric Center Morale Scale; Lawton, 1975), the quality of relationship to parent (Quality of Relationships Inventory including the three subscales: Support, Conflict, and Depth; Pierce, 1994), and control beliefs (Jopp, 2006). Results showed that personal control beliefs partially mediated the effect of the conflicting relationship to parent on aging satisfaction. In other words, experiencing a conflicting relationship to one's parents was negatively related to perceived control, which in turn was positively related to aging satisfaction. At the same time, poor relationship quality was directly negatively linked to aging satisfaction. In sum, the findings demonstrate the important role that psychosocial resources (e.g., control beliefs, quality of close relationship) play in how individuals perceive and evaluate their own aging process.

EXAMINING THE PAINCQ-33 AS A MEASURE OF PAIN MANAGEMENT PERCEPTION AMONG RESIDENTS WITH CHRONIC PAIN

T.D. O'Connor, Y. Scherer, M. Meeker, T. Austin-Ketch, *Nursing, SUNY @ Buffalo, Buffalo, New York*

Problem: Current instruments do not address resident perceptions in pain management (PM) care; therefore, evaluation of a new instrument is warranted. Purpose: To determine the usefulness of the PainCQ-33 as a measure of PM perception. Aims: (1) determine face validity of the PainCQ-33; (2) determine reliability of the PainCQ-33 as a measure of sustainability in PM perception; (3) determine if PainCQ-33 scores correlate with a resident's length of stay (LOS); and (4) explore resident opinions about the PainCQ-33. Previous Findings: Resident barriers to PM exist including knowledge deficits, attitudes, beliefs, mood, behaviors, and expectations for PM. Research Design: A mixed method: (1) a test-retest with approximately 60 residents from a group of nursing homes in Western New York; and (2) focus group discussions with 12 residents. Procedures: Participants completed the PainCQ-33 at baseline, and again 14 days later. Additional instruments to measure covariates included: (1) the Faces Pain Scale – Revised for pain ratings; (2) the five-item Geriatric Depression Scale for depression; and (3) a Clinical Data Form (CDF) for tracking pain medication use, LOS, age, and gender. 12 residents who completed the PainCQ-33 survey shared their opinions about the instrument in two focus group discussions. A moderator followed an interview guide consisting of questions derived from comments about the PainCQ-33. Data Analysis: Comparison of PM perception with LOS, covariates, and confounders were examined using ANCOVA. Focus group transcripts were analyzed using descriptive content analysis. Potential Significance: The PainCQ-33 can assist clinicians in managing barriers to effective PM in nursing homes.

THE IMPACT OF THE LISTEN INTERVENTION ON LONELINESS AND BIOMARKERS OF CHRONIC ILLNESS

L.A. Theeke, M.J. Smith, J. Mallow, T.L. Barr, E. Barnes,
E. Theeke, *Health Restoration, WVU School of Nursing, Morgantown, West Virginia*

This paper presents the results of the first randomized trial of LISTEN (Loneliness Intervention using Story Theory to Enhance Nursing-sensitve Outcomes) a new cognitive behavioral intervention designed to diminish loneliness. The intervention was developed by blending the key concepts of story theory with principles from cognitive behavioral therapy and current state of the science knowledge about loneliness. A sample of 27 (65% female, mean age 75 years) lonely, chronically ill, community dwelling older adults were randomized to LISTEN or attention control groups. Those with dementia or active grief were excluded. LISTEN group participants attended 5 weekly sessions that include focused discussion, thinking activities, writing and homework. Control groups attended 5 weekly health education sessions. Variables collected included loneliness (UCLA Loneliness Scale), depression (GDS), functional ability (Katz ADL), cognition (MMSE), Social Support (MOS Social Support Scale), and Quality of Life (the CASP-12 Quality of Life scale). Diagnoses, medications, and chronic illness control indicators including; fasting glucose, Hgb A1C, B/P, pulse, waist-hip ratio, and BMI were included. The sample was moderately lonely and reported significant functional limitations, pain-related impairments and low energy. Overall quality of life rankings remained high. Loneliness positively correlated with depression, and inversely correlated with quality of life, social support, and social functioning. Participants of the LISTEN groups reported significantly lower loneliness scores (revised UCLA Loneliness Scale) and lower systolic blood pressure for up to 12 weeks post-intervention. Participants rated the LISTEN intervention as feasible and highly acceptable, commenting that they would recommend it as a treatment for loneliness.

UTILIZATION OF INTERNET-BASED RESOURCES FOR DISEASE SELF-CARE AMONG WOMEN WITH CHRONIC CONDITIONS

J. Pettus[1], M.L. Smith[1], S. Ahn[3], C.A. Mendez-Luck[4], S.D. Towne[2], M.G. Ory[2], *1. College of Public Health, The University of Georgia, Athens, Georgia, 2. Texas A&M Health Science Center, College Station, Texas, 3. The University of Memphis, Memphis, Tennessee, 4. Oregon State University, Corvallis, Oregon*

Purpose: This study analyzed data collected from middle-aged and older adult women with one or more chronic conditions who completed the National Council on Aging Chronic Care Survey. Part One analyzed data from 418 women to describe sociodemographics, disease types, and healthcare utilization associated with internet use. Part Two analyzed data from the 251 internet-using women to identify the online self-care resources are they used and for what purposes. Methods: Participant characteristics were compared by age group, number of chronic conditions, and disease types (i.e., cardiovascular disease, diabetes, arthritis, lung disease, depression, and cancer) using chi-square tests, independent sample t-tests, and one-way ANOVA. Results: Approximately 31% of participants were age 65+, 30% reported having three or more chronic condition types, and 65% reported using the internet. A significantly larger proportion of non-internet users reported needing help learning what to do to manage their health conditions and how to care for their health conditions. Among only internet-using women, 18.7% participated in online discussions/chatrooms/listserv and 45.2% read about the experiences of others with chronic diseases. A significantly larger proportion of internet-using women with diabetes and depression reported needing help learning how to manage their health conditions. Larger proportions of internet-using women with depression reported relying on the internet for help/support and interest in reading about others' experiences online. Conclusions: Understanding internet use among women with chronic conditions can inform targeted efforts to increase internet availability, educate potential users about the benefits of online resources, and tailor internet-based materials to meet self-care needs.

CONCORDANCE AND CORRELATES OF SYMPTOM REPORTING FOR CAREGIVERS AND CHRONICALLY-ILL OLDER ADULTS

M.K. Eichorst[1,2], R.S. Allen[1,2], E. Kvale[3,4], *1. Psychology, University of Alabama, Tuscaloosa, Alabama, 2. Center for Mental Health and Aging, Tuscaloosa, Alabama, 3. University of Alabama at Birmingham School of Medicine, Birmingham, Alabama, 4. VA Medical Center, Birmingham, Alabama*

In the U.S. more than 40 million people are caring informally for an aging person. Oftentimes this caregiver acts as a healthcare advocate in formal and informal settings, thus having a vested interest in accurately understanding symptoms experienced by their care recipient. While proxy reports are moderately accurate for some physical symptoms, proxy reports are known to be less accurate for emotional/psychological symptoms. Dyadic level data from the LIFE Project was analyzed to examine the concordance of both physical and psychological symptom reports from older adults and their respective caregivers. In addition, care recipient and caregiver correlates of concordance were examined. Overall, care recipients reported significantly more distress over their physical symptoms than their caregivers predicted ($p<.05$). All four emotional symptoms (sad, worry, irritable, nervous) were low in concordance scores ($<= 60\%$). Correlates of lower symptom-level concordance included higher care recipient scores on negative PANAS items ($p<.05$) and more care recipient symptoms/distress at baseline ($p<.05$). Caregiver stress was also a meaningful predictor of weaker concordance ($p<.05$). Implications for the current project include the synergistic impact of care recipient-caregiver functioning on symptom concordance, and quality of care outcomes for both dyadic members. Results are discussed in terms of the Monin and Schulz (2009) model of caregiving, including care recipient suffering behaviors and caregiver stress response.

SESSION 225 (POSTER)

CAREGIVING

ROSALYNN CARTER INSTITUTE FOR CAREGIVING'S TRAINING CENTER FOR EXCELLENCE - ENSURING QUALITY SUPPORTS FOR CAREGIVERS NATIONWIDE

L.J. Bauer, G. Alston, L. Easom, A.L. Ramos, *Rosalynn Carter Institute, Americus, Georgia*

The Rosalynn Carter Institute for Caregiving (RCI) has conducted more than six years of work related to the integration and implementation of evidence-based programs to help family caregivers in communities across the United States. As a result, the RCI has emerged as a leader and purveyor in providing intensive technical assistance for the implementation of evidence-based caregiver interventions at the community level. In this role of purveyor, the RCI has led the transformative change required in agencies to implement and sustain evidence-based interventions with fidelity and measurable outcomes. As a purveyor of evidence-based caregiver programs, RCI continues to refine its training and technical assistance offerings to assist community agencies that have varying degrees of expertise in adopting evidence-based caregiver programs with fidelity. We have launched the RCI National Training Center of Excellence and offer training and certification as well as intensive technical assistance, in three evidence-based programs: RCI REACH (Resources Enhancing Alzheimer's Caregiver Health); BRI Care Consultation (telephonic support for Alzheimer's) and Operation Family Caregiver (program for service member and veteran families).

CAREGIVING TRAJECTORIES AMONG ADULT CHILD CAREGIVERS: A TYPOLOGY

S. Wang, M.E. Szinovacz, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

This study examined types of changes in caregiver involvement and reasons associated with specific types of change. 20 adult child caregiver sibling dyads and 9 individual caregivers completed semi-structured interviews about their involvement in parental care over time and reasons for changes in care. Qualitative data analyses relied on coding with Atlas.ti software. The data yield three types of changes (both for increases and decreases in care): gradual change (slow gradual increase or decrease in care); spikes (sudden increases or decreases over a short time period, with a return to the previous level after such change); stepwise change (abrupt increases or decreases in care that then remains at that level). Gradual changes are typically associated with changes in the care recipient's health, whereas spikes and stepwise changes are associated with a wider variety of reasons, including changes in the caregiver's or his/her sibling's employment, changes in living arrangements with the parent, changes in the health of the parent's spouse, or temporary health changes in the care recipient such as acute conditions requiring hospitalization. Findings confirm that caregiver involvement varies over time. Changes in care involvement differ in regard to intensity and abruptness. Consequently, longitudinal data are essential to fully understand caregiving and health care providers need to assert whether and how care situations changed over time.

THE EFFECTS OF STOPPING SPOUSAL CAREGIVING ON CAREGIVER DEPRESSION

S. Feld[1], R. Dunkle[1], H. Shen[2], P. Meehan[1], *1. School of Social Work, University of Michigan, Ann Arbor, Michigan, 2. University of Missouri-St. Louis, St. Louis, Missouri*

While studies have examined the effects of spousal caregiving on their mental health, limited work explores factors that affect spousal caregiver depression once caregiving has ended, especially among representative samples of older couples. Spouses may cease caregiving due to their partner's death and institutionalization, or when the partner continues to live in the community with the former caregiver. Using data from the HRS (2000-2010), we included couples in which both members were 50+ and examined the association between the reasons why spousal caregiving (for ADL and/or IADL limitations) ended over a two-year period and caregiver's follow-up depressive symptoms (n = 1,230). We used Pearlin's Stress Process Model to identify and control aspects of the baseline caregiving situation that might affect follow-up depression. Baseline factors included caregiver's depressive symptoms, caregiver's and spouse's health and the type and amount of care the spouse provided. OLS regression results indicated that spousal caregivers whose partner was in a nursing home at follow-up had significantly more depressive symptoms than those whose partner had died or was still co-residing in the community but not receiving spousal care. The level of depressive symptoms for spouse's whose partner died or still resided in the community did not differ. Baseline functional limitations of the caregiver and care recipient, the caregiver's baseline depression, and being a caregiving wife also positively influenced caregiver's depressive symptoms at follow-up. Findings suggest the importance of targeting services to meet the need of spouses after their partner leaves home to reside in a nursing facility.

GIVE THE PEOPLE WHAT THEY WANT: TEN YEARS OF CONDUCTING A CAREGIVER EDUCATION CONFERENCE

S. Fulks, *Gerontology, Barton College, Wilson, North Carolina*

In the fall of 2003 Barton College launched an undergraduate major in Gerontology. Designed as an applied degree, the program is modeled along recommendations from AGHE. Our networking partners - Alzheimer's NC (formerly the Alzheimer's Association of Eastern North Carolina) and the Upper Coastal Plain Area Agency on Aging, became partners in creating a Caregiver Education Conference. Launched in the Spring of 2004 and held annually since, this conference became the model for Alzheimer's NC in offering a series of regional conferences in place of the traditional single state conference. During the past ten years our conference has featured a mix of national, regional and local authorities on virtually all facets of the caregiving experience, as well as students presenting their current research. Our conference draws an average of 214 participants per year, and hosts an average of 24 outside programs and services - enabling networking between the caregivers and the resources available. This presentation features the evaluation of each of the ten conferences by the participants, and demonstrates how the conference has evolved and adapted to the needs of the participants. Each conference features two primary presenters and a series of 'breakout' sessions designed to address more specific interests of the caregivers. Evaluations include style, content and relevance of each topic and the presenter. This content analysis represents a unique opportunity to hear from the participants – offering their assessment and a reality check of what the professionals think caregivers need to know.

EFFECTS OF THE MORE PERSONALITY RESOURCES ON CAREGIVERS' HEALTH

S. Kim, B.G. Knight, *Gerontology, University of Southern California, Los Angeles, California*

It is widely acknowledged that caregiver personal resources play a central role in understanding caregivers' heath. Some researchers suggest that personality resources (e.g. sense of mastery) may help individuals respond to the challenges of caregiving in a growth-conducive way that confers positive health outcomes (Ardelt, 2005; Glück, 2011). The objective of the current study was to examine the role of some personality traits on caregivers' mental and physical health. Participants included 219 caregivers of aging parents (mean age: 52.05) from the second wave of the Midlife in the United States (MIDUS) study. The MORE personality resources consisted of sense of Mastery, Openness to Experience, Reflective Attitude, and Emotional Regulation. Caregivers' health outcomes included depression, life-satisfaction, self-rated health, and allostatic load. Using the multiple mediation model (Preacher and Hayes, 2008), we found that Mastery and Openness to Experience had positive direct effects on life-satisfaction and negative direct effects on depression. Furthermore, Mastery showed a positive direct effect on self-rated health. The MORE personality resources did not mediate the relationship between demographic characteristics (e.g. age, gender, caregiving hours and co-residence) and caregivers' health. Findings support the importance of direct effect of the MORE personality resources on caregivers' mental health, especially Mastery and Openness to Experience. Our results suggest that some personality resources may help people to deal with life challenges, such as caregiving, in a positive way.

HELP-SEEKING CAREGIVERS OF FAMILY MEMBERS IN ASSISTED LIVING AND COMMUNITY HOMES

E.J. Plys, S. Qualls, *University of Colorado Colorado Springs, Colorado Springs, Colorado*

The purpose of the current study was to examine how the setting in which a care recipient (CR) lives and kinship (spouse vs. adult child) influence caregivers' (CG) perception of burden, rate of problem behaviors, and attributions of problem behaviors. Family members seeking caregiver counseling services (n = 379) at an outpatient mental health clinic whose CR lived in assisted living (AL; n = 56), the CR's home (n = 174), and the CG's home (n = 149) completed intake questionnaires that assessed demographic information, the CG's experience, CG's presenting problem, CR behavior problems, and CG subjective attributions of problem behaviors. A series of one-way ANOVAs found that caregivers did not differ across settings on demographic variables (i.e., income, gender, kinship, age), caregiver burden, problem behaviors, or presenting problem. However, attributions for problem behaviors varied by setting, with AL caregivers more likely to attribute behavior problems to mental health issues in the CR, F(2, 347) = 3.31, p = .03, ηp2 = .02, despite similar levels of mental health problem behaviors observed across groups. In addition, after controlling for kinship, attributing problem behaviors to CR mental health issues significantly predicted greater burden, b = 2.45, p = .02, in AL. Only in AL did spouses experience more burden compared to adult children, F(1, 54) = 5.62, p = .02, ηp2 = .09. Results suggest that the caregiver experience and perceptions of challenges may differ across settings, as placement of a family member in AL represents a new role for caregivers.

THE UTILITY OF THE FAMILY EMPOWERMENT SCALE WITH GRANDPARENT CAREGIVERS

B. Hayslip[1], G.C. Smith[2], J. Montoro Rodriguez[3], F. Streider[4], *1. Psychology, University of North Texas, Denton, Texas, 2. kent state University, Kent, Ohio, 3. University of California-San Bernadino, San Bernadino, California, 4. University of Maryland-Baltimore County, Baltimore, Maryland*

The Family Empowerment Scale (FES, Koren, DeChillo, & Friesen, 1992) was developed specifically to assess empowerment in families with emotional disorders, wherein among custodial grandfamilies, difficulties in grandchildren's social, emotional, and behavioral functioning are not uncommon, either in reaction to the dissolution of the family of origin or in response to the newly formed family unit. Utilizing the 3 subscales of the FES which represent differential levels of empowerment (family, service system, community) as indexed by one's attitudes, knowledge, and behavior, we explored the construct and discriminant validity of the FES with grandparent caregivers. Three-hundred thirty-nine (M age = 58.4, n Caucasian = 152, n African American = 149, n Hispanic = 38) custodial grandmothers completed the FES and self-report measures of personal distress (e.g., CES-D), rated grandchild distress (SDQ) and parenting style (PPI). Substantiating its construct validity, FES subscales correlated ($p < .05$) with less self-reported anxiety and depression, more positive personal affect, more positive parenting practices, and less grandchild distress. They were independent of grandmother health. FES Family and FES Community scores were reliably higher ($p < .05$) among African American caregivers, versus Caucasians and Hispanics, whose scores did not differ from one another. These findings suggest the FES to be valuable in understanding empowerment among grandmother caregivers in the face of the many personal and parental challenges they face in raising a grandchild. They also reinforce the family as a resource among African American grandmothers in dealing with the demands of caregiving. [Funded by R01NR012256]

BEHIND THE TIMES: SHOULD SCHOLARS UPDATE HOW FAMILY CAREGIVERS ARE CLASSIFIED?

K. Struckmeyer[1], T. Williams[2], D. Osburn[2], *1. Oklahoma State University, Stillwater, Oklahoma, 2. Arkansas Tech University, Russellville, Arkansas*

Adult caregiving literature identifies caregivers above the age of 18; however, scholars under represent caregivers of all ages, nor acknowledge age differences and possible differences in caregivers' psychosocial development. Chronological age partnered with developmental stages can produce a multitude of strains. Scholars are unsure how physical and mental strains associated with completing developmental tasks affect informal caregivers. Completing numerous daily caregiving tasks, such as ADLs, can be physically and emotionally draining, which may expose the caregivers to an increased risk of experiencing negative psychological emotions. The aim of the current study was to observe adult caregivers in a southern university (n=239), using Erikson's developmental stages and Arnett's "Emerging Adulthood" concept as a model for these age groups: 18-19, 20-24, 25-29, and 30-34 years old. We examined the amount of completed caring activities and the caregivers' psychological affect to determine if new caregiving subgroups should be formed. Eighteen to nineteen year olds differed significantly from all three groups on completed caring activity and negative psychological affect. This was also true for 20-24 year olds on the same variables. Twenty-five to twenty-nine year olds and 30-34 year olds differed significantly from 18-19 and 20-24 year olds on completed caring activity and negative psychological affect; however 25-29 and 30-34 year olds did not differ significantly from each other on these variables. These findings support that caregivers differ in amount of caregiving activity and psychological affect across age groups. Adult caregiving subgroups should be created to account for variations across the developmental stages.

PARENTAL SURVIVAL AND CARE NEEDS AMONG DIFFERENT BABY BOOM COHORTS

M.E. Szinovacz[1], A. Davey[2], *1. Gerontology, Univ Mass Boston, Boston, Massachusetts, 2. Temple University, Philadelphia, Pennsylvania*

There has been considerable concern about the future availability of family care for the baby boom cohorts. However, as care needs typically arise in late old age and care provision is associated with diverse negative health outcomes, a more immediate issue is the care burden faced by the baby boomer cohorts as their parents reach their old age. To address this issue, we compare parental care needs and care provision among four cohorts of baby boomers, namely, those aged 51-56 in 1992, 1998, 2004, and 2010 using pooled data from the nationally representative Health and Retirement Study (N=14,948). Our data indicate that overall 19.5% of respondents have both parents living and 63.2% have at least one living parent. Using logistic regressions that control for gender, age, race, education, marital/partnered status, and foreign born status, we find that parental survival increased substantially for the younger cohorts, especially survival of both parents. In addition, parental frailty (needs help with ADLs or cannot be left alone) is higher among younger cohorts. However, care provision is not significantly higher among younger cohorts, especially when differential survival of parents is taken into account. It is not clear whether frail parent in younger cohorts are more able to rely on spouses or other sources of help or whether they self-manage their frailty. Without doubt, these data raise concerns about the rising morbidity among the elderly and potential associated care provision from sources other than their children.

CONVERGENCE OF SELF-REPORT AND CLINICAL RATINGS OF DEPRESSION AND ANXIETY MEASURES BY CUSTODIAL GRANDMOTHERS

J. Montoro-Rodriguez[1], G.C. Smith[2], B. Hayslip[3], F.H. Strieder[4], *1. California State University San Bernardino, San Bernardino, California, 2. Kent State University, Kent, Ohio, 3. University of North Texas, Denton, Texas, 4. University of Maryland Baltimore, Baltimore, Maryland*

Accurate, time and cost-efficient measurement of depressive and anxiety symptom severity and other caregiver outcomes is of great importance in assessing and monitoring treatment for older adults. Using data from the project COPE – an RCT study to test the impact of intervention programs on the wellbeing of custodial grandmothers and their grandchildren, we examine the level of similarity and equivalence between clinical and self-report measures of depression and anxiety among 152 Caucasian, 149 African Americans and 38 Hispanic custodial grandmothers (N= 339; Mean age = 58.4). Our goals are to look at convergence between self-report measures of depression (CES-D) and anxiety (OASIS) with clinical ratings of depression (MADRS) and anxiety (HAMAS), and note any differences by race in self-report and clinical measures in terms of both continuous scores and clinical cutoffs. Strong to moderate significant zero-order correlations were found between self-report and clinical depression (0.75 and 0.52 for continuous and cutoff measures) and anxiety (0.66 and 0.47 for continuous and cutoff measures). The strength of these correlations was also similar across Caucasian, African American and Hispanics grandmothers.

Analyses of variance indicated significant differences among Caucasian and African American grandmothers for measures of depression and no significant differences for ratings of anxiety among the three groups using both self-report and clinical ratings. Findings indicate that self-report and clinical measures of depression and anxiety among custodial grandmothers are equally valid to detect racial/ethnic differences. These findings support the use of either self-report or clinical ratings measures among custodial grandmothers. [Funded by R01NR012256]

LESSONS LEARNED: RECOMMENDATIONS FOR IN-HOME CAREGIVER SUPPORT INTERVENTIONS

C.M. Daniel[1], I. Freytes[2], T. Osmani[2], B.L. Hicken[3,1,4], M. Luptak[4], M. Grant[2], R. Rupper[1,3,4], *1. VA Salt Lake City HCS, Salt Lake City, Utah, 2. North Florida/South Georgia Veterans Health System, Gainesville, Florida, 3. Veterans Rural Health Resource Center – Western Region, Office of Rural Health, Salt Lake City, Utah, 4. University of Utah, Salt Lake City, Utah*

Accessing interventions designed to meet the needs of dementia caregivers can be difficult given the demand of their caregiving duties. To address this problem, we developed Supporting Caregivers of Rural Veterans Electronically (SCORE), a psychoeducational caregiver intervention delivered via in-home telehealth devices. The purpose of this presentation is to identify: 1) the usefulness of the program; 2) barriers to participation; and 3) recommendations. Participants were assigned a Care Manager, who provided telephone support, assisted with delivery of the educational content, and followed the caregiver over the course of the study. Participants were randomly assigned into one of two groups: 1) telephone support, "attention control group," or, 2) intervention. Caregivers (n = 118) completed semi-structured interviews at the end of the study. Qualitative data were analyzed using the constant comparative method to identify themes. Most participants were female spouses (mean age: 68.75 years old (11.92 years)). Several themes emerged. First, caregivers found the educational information about dementia and its progression most useful. Second, access to a knowledgeable contact person was invaluable. Finally, caregivers preferred receiving information to coincide with the immediate need. Barriers to participating in the program included: limited time to access the content; the demands of caregiving; and the caregivers' own health problems. These results suggest that a technology-based, in-home caregiver support program is a feasible method to provide support to dementia caregivers. Given the time limitations caregivers have, we recommend flexibly tailoring educational material and a Care Manager to support the caregivers' immediate needs.

COMPLEX ASSOCIATIONS AMONG CAREGIVING, IL-6, DHEAS AND METABOLIC DYSREGULATION IN OLDER ADULTS

L. Fredman[1], S.O. Stuver[1], J. Lyons[1], K.L. Bacon[1], T. Heeren[2], *1. Epidemiology Department, Boston University School of Public Health, Boston, Massachusetts, 2. Boston University School of Public Health Biostatistics Department, Boston, Massachusetts*

Psychoneuroendocrinology theories predict that the chronic stress leads to immune system and hypothalamic-pituitary-adrenal (HPA) axis dysregulation, resulting in metabolic syndrome. We hypothesized that caregivers would be more stressed than non-caregivers, resulting in stronger associations between biomarkers of the immune system (IL-6) and HPA axis (DHEAS) with metabolic dysregulation based on ATP-III criteria. The sample included 185 community-dwelling adults aged 60-97 (mean = 74, sd = 7.9) from the Boston MA area, 70% were female, 21% had metabolic syndrome. Participants included caregivers to persons with Alzheimer's Disease or Parkinson's Disease (38%) and non-caregivers (62%). Caregivers were mostly spouses of the care recipient (83%), helped with an average of 5.5 IADLs and 2.9 ADLs, and had been providing care for an average of 6.8 years (sd =8.7). Women caregivers reported higher Perceived Stress Scores than other gender/caregiver groups (mean = 20.2 versus 13.5-16.4, $p<0.01$), but were least likely to have metabolic syndrome (14%) or metabolic dysregulation (mean 1.27 +/- 0.2 components). Men caregivers had the most metabolic dysregulation: 33% had metabolic syndrome; mean 2.29 +/- 0.3 components. In age-adjusted analyses, higher quintiles of IL-6 were associated with greater metabolic dysregulation in caregivers (beta coefficient +/- standard error = 0.49 +/- 0.17 and 0.31+/- 0.09 for men and women, respectively, $p<0.01$), women non-caregivers (0.18, +/- 0.09, $p<0.05$) but not men non-caregivers (0.09 +/- 0.18). DHEAS was not associated with metabolic dysregulation in any group. In conclusion, stress-related physiological associations differed by gender/caregiver group; the hypothesis was supported by results with IL-6 but not DHEAS.

INTERGENERATIONAL CAREGIVING AND BOOMERS: PROVIDING CARE TODAY, NEEDING CARE TOMORROW

F.E. Wilby, M. Luptak, J.A. Spears, *College of Social Work, University of Utah, Salt Lake City, Utah*

More than 85% of adults aged 40–50 years have a living parent (Swartz, 2009) and baby boomers in their 60s are living an additional 19.9 years on average (Arias, 2011). Thus, there is a tremendous impact on family caregiving across generations. Moreover, many boomers share caregiving responsibilities for parents, children, and grandchildren, while anticipating their own future caregiving needs (Fingerman, et al., 2012). We examined family caregiving issues and future self-care needs of 77 participants aged 55-70 who self-identified as caregivers in a study of retirement needs of baby boomers living in a metropolitan area. Sixty-one percent were female. Participants reported providing care for parents (58%), spouses/partners (27%), children/grandchildren (23%), siblings (5%), and/or friends (4%). Caregiving responsibilities included transportation (62%), shopping (60%), housework (58%), meal preparation (58%), friendship (53%), financial assistance (48%), yard work (40%), and bathing (29%). Thirty-six percent indicated they spent between 1-10 hours/week providing care, 12% spent 11-20 hours/week, and 6% responded that care responsibilities never ended. Forty-nine percent reported wanting to live close to family/friends. When asked to anticipate their own future care needs, 33% responded that family members would provide care, 44% were unsure about family support, and 21% had no family caregiver options. Baby boomers are facing intergenerational caregiving responsibilities unlike any time in history. As the balance shifts from boomers providing care to needing care in the coming decades, findings from this study can contribute to the development of micro-, mezzo, and macro-level interventions.

GERMAN SURVEY ON VOLUNTEERING: FAMILIAL CARE AND SELECTION OF VOLUNTEERING DOMAINS IN THE COMMUNITY

J. Simonson, D. Mueller, J.P. Ziegelmann, *German Centre of Gerontology, Berlin, Germany*

Purpose. Having a person in need of care in the family can restrict participation such as volunteering outside the family. Having high pro-social values might motivate those individuals to volunteer despite high care-related time demands. Social contact to other families in similar circumstances might lead to a higher likelihood to volunteer in the domains of care or health ("network hypothesis"). However familial caregivers might also be likely to search for volunteering opportunities in domains that offer experiences that are in contrast to their obligations at home ("volunteering as compensation hypothesis"). Methods. Among 20,005 participants of the German Survey on Volunteering 2009 we have identified 1,284 individuals aged 14-91 years (M=51 years; SD=17.4 years) having a care recipient in the family for whom they are (mainly or partially) responsible. Findings. Compared to the average German population family caregivers reported a higher rate of overall volunteering (39% vs. 36%), as well as a higher rate in the domain of health (5% vs. 2%). With respect to the domain of sports there were no differences (10% in both groups). Logistic regression revealed that (among other variables) prosocial values and not having enough time for activities other than caregiving predicited volunteering outside the family. Interpretation. Prosocial values seem to be more important than time budget for volunteering outside the family. The higher than average rate of volunteering gives further evidence for a link between private and public helping behaviors. In addition, the higher than average rate in the health domain supports the network hypothesis.

PSYCHOLOGISTS IN HOME BASED HOSPICE CARE: A SURVEY AND RECOMMENDATIONS FOR PRACTICE

M.M. Brant, *HBPC, Kansas City VA Medical Center, Kansas City, Missouri*

In a random sample survey of home-based hospice organizations in Missouri the presence and roles of psychologist staff members were assessed. Hospice teams were identified by the state board in this rural and urban sampling. Of the forty-five home-based hospice organizations surveyed, only one had a psychologist on the team and this was in an administrative capacity. Potential barriers to hiring psychologists include expense, interpretation of regulations by state boards for psychosocial services, and lack of understanding of benefits of psychological interventions at the end of life, and lack of interested or trained psychologists. Psychological conditions were identified in this survey for patients and included: depression, anxiety, grief/loss, trauma, and suicidal thoughts/attempts. Palliative and hospice care teams within hospital and the Veteran's Administration system are more likely to have psychologists on staff providing at least part-time services in this specialty area. Barriers can be overcome with internship or other training opportunities within a hospice model and education of state boards and hospice administrators in the efficacy of psychologist staffing.

CHARACTERISTICS OF LATE-LIFE DEPRESSION IN NURSING HOME PATIENTS RELATED TO TIME OF ONSET AND RECURRENCE

R. Smith, S. Meeks, *Psychological and Brain Sciences, University of Louisville, Louisville, Kentucky*

In searching for more effective treatments for depression in late life, researchers have distinguished subtypes based on age of onset or recurrence of episodes. Prior research has found that early onset patients were older, whereas later onset patients or those with recurrent episodes had lower cognitive and physical functioning. Research is conflicting on severity of depression. We analyzed baseline data from a clinical trial in nursing homes. We hypothesized that the recurrent depressed participants would be more impaired in cognition and daily function, have less activity, higher depressive symptoms, and generate greater staff burden and problem behaviors. Participants were 51 residents with major depression diagnosed using a structured interview. Participants were divided by early or late onset and by single episode vs recurrent. Late-onset participants were significantly older and had higher self-reported negative affect, but did not differ in other respects from the early-onset participants. Participants with recurrent episodes spent more time in dependent ADL activity and were less educated. We did not find differences related to cognition, depression severity, or medical burden. In long term care, patient differences based on time of onset and recurrence appear to be minimal; differences from other studies may be due to the higher level of overall medical comorbidity in this sample, as well as a higher mean age, both differences associated with a long-term care population. Since major depression is a known risk factor for long-term care admission, future research should emphasize differences in risk for admission based on depression history.

OLDER ADULTS' PERSPECTIVES ON SELF-CARE OF MULTIPLE CHRONIC CONDITIONS: STATE OF THE SCIENCE

E. Irani, *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*

The prevalence of Multiple Chronic Conditions (MCC) is continuing to rise, reaching more than 60% of persons 65 years or older. Having MCC complicates the diagnosis, management, and natural course of each separate condition. Self-care is crucial in the management of chronic diseases. However, little is known about self-care practices of older adults with MCC and their perspectives on living with MCC. A systematic search was carried in PubMed, CINAHL and EMBASE databases focusing on older adults and combining "self-care" or "self-management" with "multiple chronic conditions", "multiple comorbid conditions", "multiple chronic diseases", "multimorbidity", or "comorbidity". Following a thorough review of the titles and abstracts, 20 articles focusing on older adults' perspectives and challenges of managing and coping with MCC were included. Most studies were qualitative and presented at least two of the following major themes: (1) individuals with MCC prioritize one condition over the others based on their prior experiences and the seriousness, predictability, or controllability of their conditions; (2) individuals with MCC receive health-related recommendations from multiple sources and navigate a fragmented health care system; (3) individuals with MCC face challenges with self-care practices, such as lifestyle changes, polypharmacy, and symptom recognition. Individuals with MCC also identified miscellaneous barriers and facilitators to self-care practices, such as self-efficacy, social support, and access to resources. Through optimal collaboration with patients, health care professionals can start designing interventions and developing guidelines to address the complexity of MCC and bolster self-care practices of older adults with MCC.

EVIDENCE OF DIFFERENTIAL MORTALITY BETWEEN ELDER SELF-NEGLECT TYPES

J. Burnett[1,2,5], A.R. Aschenbrenner[3], P.M. Diamond[3,2], J. Booker[4,2,1], C. Dyer[1,2,4], *1. Internal Medicine, UT Health, Houston, Houston, Texas, 2. Texas Elder Abuse and Mistreatment Institute (TEAM), Houston, Texas, 3. UTHealth, Houston School of Public Health, Houston, Texas, 4. Texas Department of Family and Protective Services, Houston, Texas, 5. Harris Health System, Houston, Texas*

Background: Elder self-neglect independently predicts mortality; beyond other medical, social, physical and mental factors. This study provides new evidence regarding 4-year differential all-cause mortality associated with types of elder self-neglect. Methods: A secondary data analysis of N=5,511 cases of elder self-self-neglect (i.e. age >64) substantiated by Texas Adult Protective Services (APS), between the dates of January 1, 2004 and December 31, 2008 and data from the Texas Vital Statistics was conducted. Datasets were matched using probabilistic and deterministic algorithms. Adjusted 4-year survival analyses were conducted to assess for differential all-cause mortality across medical neglect, physical neglect, mental health neglect and poly-neglect. Results: Differential mortality was assessed by comparing medical neglect (HR = 1.80, 95% CI: [1.25, 2.56], p = 0.00162) and physical neglect (HR = 1.38, 95% CI: [0.97, 1.98], p = 0.0717) to mental health neglect (4-year survival rate: 66.2%, 95% CI: [0.607, 0.723]), adjusting for age. Comparing medical neglect (HR = 1.29, 95% CI: [1.15, 1.45]) to physical neglect also showed a significant difference in mortality. Poly elder self-neglect (HR = 1.27, 95% CI: [1.12, 1.42], p < 0.001) had a greater risk of mortality when compared to a single type of elder self-neglect (4-year survival rate: 66.5%, 95% CI: [64.7%, 68.3%]). Conclusion: This study provides evidence for differential mortality between the types of elder self-neglect. In addition, neglecting multiple domains imposes a greater risk when compared to a single domain. These data have important implications for the case management and triage of APS substantiated elder self-neglect cases.

COGNITIVE BEHAVIOR THERAPY GROUPS FOR OLDER ADULTS: AN EFFECTIVE TREATMENT OPTION TO ENHANCE QUALITY OF LIFE

R.L. Abney, *Geriatrics Center Social Work, University of Michigan Health System, Ann Arbor, Michigan*

Outpatient CBT groups for older adults dealing with mood disorders and difficulties adjusting to changes due to aging and increased health stressors, have been offered at the University of Michigan Geriatrics Center clinics for the last 20 years. They are proven to be an effective and cost efficient model of care. Groups are offered twice every year to 8-12 participants for 10 sessions, and are co-facilitated by 2 clinical social workers. Each session includes educational materials, practice and implementation of skills to group members' situations, and peer support. The poster will give an overview for practitioners to implement CBT groups in various settings, and will include outline and content of group sessions, tools used, and description of the course book with examples specific to the aging cohort. After completion of the 10-week series, participants are offered monthly support group sessions to strengthen their new developed skills, deepen peer support, and prevent and/or address relapse of mood changes. Analysis from data collection from 2008 to the present, include pre and post test scores from group members' Geriatric Depression Scale and Burns Anxiety scale to document changes and improvements of mood over the course of the group therapy sessions. Research documents the value and effectiveness of CBT to the older adult population as a brief evidence based intervention model. By combining these techniques with group peer support, we are able to empower our older adult patients population to improve their quality of life in a meaningful way.

AN EXPLORATORY FACTOR ANALYSIS OF THE PERSON-CENTERED CARE ATTITUDE TEST

C. Harrop-Stein[1], J. Cotter[1], K. Ehlman[2], M. Jones[2], E. Welleford[1], M. Fortner[3], *1. Gerontology, Virginia Commonwealth University, York, Pennsylvania, 2. University of Southern Indiana, Evansville, Indiana, 3. Virginia Mennonite Retirement Community, Harrisonburg, Virginia*

Few validated person-centered care (PCC) surveys exist that measure the extent to which PCC is practiced in care settings; none measure staff members' attitudes toward PCC. This poster presents the results of an exploration of the construct validity of the Person-Centered Care Attitude Test (Per-CCat). The Per-CCat version 5 consists of 42 Likert-type questions divided into four sections that align with PCC principles: care, communication, culture and community, and climate. Eighty-six employees of Virginia Mennonite Retirement Community completed the survey; due to missing data 70 were analyzed. Principle Components Analysis was utilized for the exploratory analysis. Bartlett's Test of Sphericity (X2 = 2006.56, p = .000) and Keiser-Myers-Olkins measure of sampling adequacy (.746) indicated that the data were factorable. The rotated components matrix suggested that there were five components. Using factor loadings > .30, Per-CCat items were sorted into factors and examined for logical groupings. Eight questions were removed because they loaded on more than one factor or did not align with the other questions in the group. The 5 factor, 34 item solution suggested that the Per-CCat does measure attitude toward the following PCC principles: Residents' personhood; staff attitudes toward work; care that honors personhood; work climate; and culture. Further validation studies of the Per-CCat are necessary. Given the trend in long-term care toward person-centered care, a validated survey measuring attitudes toward PCC will be useful for hiring and educating nursing home personnel.

SESSION 230 (POSTER)

COGNITIVE FUNCTION

EMOTION DIFFERENTIALLY IMPACTS PATTERN SEPARATION FOR YOUNGER BUT NOT OLDER ADULTS

A.R. Ponzio, M. Mather, *Gerontology, University of Southern California, Los Angeles, California*

Think about arriving at a vaguely familiar street corner. How does your brain distinguish this street corner from those seen previously and encode it as a unique memory? The CA3 and dentate gyrus subfields of the hippocampus play key roles in pattern separation, the process that permits a new representation that shares features with old representations to be encoded as a unique representation. These hippocampal subfields have many noradrenergic receptors, making them quite responsive to emotional arousal. Both pattern separation processes and noradrenergic systems decline in aging. We examined whether emotion influences pattern separation more for younger than for older adults. Participants completed a continuous recognition memory task. Object and scene images were presented one at a time, with some images repeated. Other images, which were similar to previously seen images, but not exactly the same, were presented as "lure" items. While viewing each image, participants indicated if the item was new, had been previously seen, or was similar to an image they had seen before. Trials were blocked, with blocks containing either emotional or neutral filler items. Younger adults showed better pattern separation (lower false alarms) to similar images in emotional blocks, than neutral blocks. Older adults, alternatively, made marginally more false alarms in emotional blocks, than neutral blocks. Pattern separation was enhanced by emotion in younger adults, but not in older adults. This suggests that an important function of arousal—making new events more distinct from previous events in memory—no longer is as effective in later life.

COMPARING AGE-RELATED COGNITIVE PERFORMANCE IN PARKINSON'S DISEASE TO AGE-RELATED COGNITIVE PERFORMANCE IN AGE- AND EDUCATION-MATCHED CONTROLS

J.W. Elias[1], J.E. Treland[2], *1. Office of Research, UC Davis School of Medicine, Sacramento, California, 2. Private Practice, Gold River, Delaware*

Characterizing age-cognition relationships in patients with Parkinson's disease (PD) receives less attention than efforts devoted to characterizing cognitive differences between PD and normal aging, or establishing cognitive correlates of disease progression. In this study we find age at PD diagnosis (AAD) to be a leading predictor of cognitive function, particularly when compared to age- and education-matched normal controls (NC). By example, in NC (N 29, ages 54-80, M=67 years), long-delay free recall (LDF) on the California Verbal Learning Test (CVLT-C; Children's version is used to ensure adequate PD performance) shows no significant relationship with age (r=-.22) or apathy (r=-.11; Marin's 14-item scale; AP). There is, however, a significant relationship (r=-.52) between LDF and depression (15-item GDS). By contrast, in PD patients (N 30, ages 51-90, M=70 years), age is strongly correlated with LDF (r=-.71) and AAD (r=.96). AAD is similarly related to LDF (r=-.71). As well, GDS and AP correlate with LDF performance in PD (-.52 and -.37, respectively). Of note, AP and GDS have a non-significant linear correlation with each other (r=-.16; trending toward non-linear r). Interestingly, and counter to expectations, duration of disease (DUR) correlates positively with LDF (r=.39) i.e., longer duration relates to better LDF. When entered into a multiple regression model, AAD eclipses other predictors of LDF (e.g., AP, GDS, DUR). Although not completely understood in mechanism, AAD/age emerges as a significant predictor of memory performance for PD patients, and is a major qualitative variable discriminating between performance in age-related NC and PD patients.

DIFFERENCES IN FUNCTION, COGNITION, AND HEALTH VARIABLES BASED ON FRAILTY SEVERITY

K.B. Dassel, L.S. Edelman, N. Sanders, *University of Utah, Salt Lake City, Utah*

Frailty is a complex condition related to disability, aging, and a variety of medical conditions. The current study examined group (N=50) differences between prefrail and frail older adults referred to the University-affiliated Faint & Fall Clinic in relation to cognitive, functional, and health variables. This study sample was on average 75.6 (S.D. = 10.5) years old, 99% White, and 54% female. Participants were categorized as pre-frail (n=29) if they met 1-2 criteria on the frailty index or frail (n=21) if they met 3+ criteria. In regards to daily function there was an even split between impaired and unimpaired IADL functions, whereas there were significantly fewer participants impaired in basic ADLs (only 24% were impaired). Fifty-eight percent of the sample screened positive for depression based on results from the PHQ-2 and/or current treatment with antidepressant medications. Thirty-four percent of patients exhibited impaired cognitive functioning based on the Mini-Cog. Results of a Chi-square analysis exploring group differences (prefrail vs. frail) in the presence of + depression screen, cognitive status, and IADL/ADL functioning revealed that patients who were prefrail were significantly more likely to have a positive depression screen ($x2 = 7.7$; $p < .01$), have IADL impairments ($x2 = 4.0$; $p < .05$), and be obese ($x2 = 4.8$; $p = .03$) compared to those persons who were frail. No significant differences were found between frailty groups on cognitive status or ADL functions. This study suggests that intervention techniques should be targeted towards the prefrail older adult population in order to with to help slow or prevent additional health decline.

PERSON PERCEPTION IN FRAIL, OLDER ADULTS: CONTENT ANALYSIS OF THEIR DESCRIPTIONS OF FAMILIAR OTHERS

S.L. Williams, A. Washburn, *National University, La Jolla, California*

Person perception includes the ability to form and use cohesive internal representations of those we interact with over time. As part of a larger study of social cognition in aging and dementia, 40 nursing home residents, nearly half with GDS scores indicating mild to moderate cognitive decline, completed a test that assessed their ability to describe psychological attributes of familiar others. Participants were instructed to think of two people whom they had known well and to describe each one so that the interviewer would have a clear idea of what he or she was like; they were also asked to describe themselves. Verbatim transcripts of the descriptions of familiar others were scored for two types of statements: “Differentiating,” where the person was described in terms of fairly specific personal characteristics, such as interests or abilities; and “Dispositional,” which described traits having implications for the person’s behavior in multiple situations or which referred to his or her thoughts and feelings. Average number of statements coded as “Differentiating” or “Dispositional” across descriptions was significantly higher for residents with no or minimal cognitive impairment than for those with mild to moderate impairment. Additional analyses examined the general approach that participants took in describing a familiar other, e.g., historical, anecdotal; the specific types of characteristics participants chose, or remembered, to relate; and, finally, how they described themselves. Measures like this are informative about frail, older adults’ lived social experience, as well as their ability to understand and respond to others.

THE TRAJECTORY OF COGNITIVE AGING AND ASSOCIATED FACTORS IN COMMUNITY-DWELLING ELDERLY IN BEIJING

H. Li[1,3], C. Lv[2], T. Zhang[1], Z. Zhang[1], *1. State Key Laboratory of Cognitive Neuroscience and Learning Beijing Normal University, Beijing, China, 2. Academy of Military Medical Sciences, Beijing, China, 3. China Academy of Traditional Chinese Medicine, Beijing, China*

The phenomenon of age-related decrements has been well documented for various cognitive abilities in later life. Unfortunately, there is still only limited evidence in Mainland Chinese old population. In this study, we used a battery of neuropsychological scales to estimate the patterns of age-related declines and the potential associated factors of cognitive function in community-dwelling residents of Beijing. 1248 elderly subjects finished 9 neuropsychological tests assessing general mental status, episodic memory, visual-spatial ability, language, processing speed, and executive function. Their personal information questionnaire including demographic information, medical history, eating habits, lifestyle regularity and leisure activities were also collected. The apolipoprotein E gene was genotyped using TaqMan genotyping assays. One-way analysis of variance showed significant differences in the neuropsychological scores across the age groups. The piece-wise linear fitting results suggested that the performance on Auditory Verbal Learning Test remained stable until 58 years old, and kept declining thereafter. Regarding processing speed and executive function, the linear declines began at early 50s. The Scores on visual-spatial and language tests came down after 66 years old. The rapid decline stage of Mini-Mental Status Examination was from aged 63 to 70 years. Multivariate linear regression indicated that the education, gender, leisure activities, diabetes, and eating habits were associated with cognitive abilities. Our results could enlighten determining the critical periods or optimal times for intervention. The identification of these potential associated factors for cognition in late adulthood, especially those that can be altered, had both scientific significance and clinical relevance.

YOU ARE OVERTHINKING IT: THE NEGATIVE IMPACT OF COGNITIVE REAPPRAISAL ON THE RELATIONSHIP BETWEEN LONELINESS AND PHYSICAL HEALTH

M.C. Chan, H. Fung, *Chinese University of Hong Kong, Hong Kong, Hong Kong*

The detrimental effect of loneliness on health is well documented in the literature. For example, loneliness is found to be a risk factor for health conditions including increased vascular resistance and elevated systolic blood pressure. On the other hand, recent research has found the salutary effect of an emotion regulation (ER) strategy known as cognitive reappraisal on health. Appleton, Buka, Loucks, Gilman, & Kubzansky (2013) contrasted cognitive reappraisal and another ER strategy known as suppression, and found that reappraisal contributed to reduced risk in levels of inflammation, while suppression increased the risk of inflammation. Despite the benefits of reappraisal, a person-by-situation approach suggests that the adaptiveness of different ER strategies depends on the situation in which they are used. In our study with participants across the lifespan (Age 17 to 83), we explored the relationship among loneliness, habitual reappraisal, and the degree of physical or somatic complaints endorsed by the participants. We found that usage of cognitive reappraisal is positively correlated with level of loneliness and negatively correlated with the degree of physical symptoms endorsed by the participants. Furthermore, usage of cognitive reappraisal statistically mediated the positive correlation between loneliness and degree of physical symptoms reported by the participants. Finally, there are no age differences between young, middle, and old age group for the mediation model. The result of this study suggested that cognitive reappraisal is not inherently and always adaptive. Specifically, the present finding supports the critical role of flexibility in deployment of different regulatory strategies depending on context.

DIABETES AND COGNITIVE PERFORMANCE IN A NATIONALLY REPRESENTATIVE SAMPLE: THE NATIONAL HEALTH AND AGING TRENDS STUDY

A. Wennberg[1], R. Gottesman[2,3], C.N. Kaufmann[1], M. Albert[2], L. Chen-Edinboro[1], G. Rebok[1,2,4], J. Kasper[1], A.P. Spira[1,2], *1. Mental Health, Johns Hopkins University Bloomberg School of Public Health, Baltimore, Maryland, 2. Johns Hopkins School of Medicine, Baltimore, Maryland, 3. Welch Center for Prevention, Epidemiology, and Clinical Research, Baltimore, Maryland, 4. Johns Hopkins Center on Aging and Health, Baltimore, Maryland*

Type II diabetes mellitus (DM) and cognitive impairment are common in older adults, and their prevalence is increasing. Thus, it is important to examine the extent to which they are related. We investigated the association of DM diagnosis with cognitive performance and dementia diagnosis using data from 7,606 participants in the National Health and Aging Trends Study (NHATS), a nationally representative cohort of Medicare beneficiaries aged ≥65 years. Participants or proxy respondents reported DM and dementia diagnosis; participants completed a word list memory test and the Clock Drawing Test (CDT), and they rated their own memory. Analyses adjusted for demographic characteristics, body mass index, depression and anxiety symptoms, and medical conditions showed that DM was associated with poorer immediate recall (B=-0.31, 95% CI -0.41, -0.20), delayed recall (B=-0.30, 95% CI -0.43, -0.18), and poorer self-rated memory (B=-0.10, 95% CI 0.04, 0.16), but not with the CDT (B=-0.07, 95% CI -0.15, 0.005). After excluding participants with history of stroke, we found that DM diagnosis was more strongly associated with poorer immediate (B =-0.33, 95% CI -0.44, -0.21) and delayed recall (B =-0.30, 95% CI -0.44, -0.16), CDT performance (B =-0.10, 95% CI -0.17, -0.02), and poorer self-rated memory (B=0.10, 95% CI 0.04, 0.16). There were no associations between DM and dementia diagnosis. These findings, in a recent nationally representative sample of Medicare enrollees, provide further support for DM as a risk factor for poor cognitive performance. Future studies should investigate the possibility of using DM treatment to prevent cognitive decline.

COGNITIVE STATUS AND INITIATION OF PROVIDER-RECOMMENDED LIFESTYLE CHANGES FOLLOWING ACUTE CORONARY SYNDROME

A. Hajduk, M. Waring, C. Kiefe, J.M. Gore, S.D. Person, J. Saczynski, *University of Massachusetts Medical School, Worcester, Massachusetts*

Background: Lifestyle changes are often recommended to patients with acute coronary syndrome (ACS) to reduce their risk of recurrent events. We examined whether patient reports of providers' recommendations for lifestyle changes and patient initiation of recommended lifestyle changes vary by cognitive status. Methods: Cognitive status was assessed during hospitalization in 881 ACS patients (mean age=62, 70% male) from the TRACE-CORE study without dementia or delirium using the Telephone Interview for Cognitive Status (range=0-41, ≤28 signals impairment). During a one-month follow-up interview, patients reported whether they had received recommendations from a health care provider to change their diet, exercise more, quit smoking, reduce stress, or attend cardiac rehabilitation. Patients reporting a recommendation were asked whether they had initiated the change. Multivariable Poisson regression with robust error variance estimated the association between cognitive status and recommendation for and initiation of each lifestyle change. Results: Ninety patients (10%) were cognitively impaired during hospitalization. One month post-discharge, cognitively impaired patients were 29% less likely (RR= 0.71, 95%CI=0.55-0.92) to report recommendation by a provider to attend cardiac rehab and 42% less likely (RR=0.58, 95%CI=0.35-0.95) to report attendance than unimpaired patients. Cognitive status was not associated with reports of provider recommendation for, or patients' initiation of, other lifestyle changes. Conclusions: With the exception of cardiac rehab, patients with and without cognitive impairment were similarly likely to report recommendation and initiation of lifestyle changes. Future research should examine whether cognitively impaired ACS patients can accurately self-report on receipt of recommendation and initiation of lifestyle changes.

DAILY FLUCTUATIONS IN EVERYDAY COGNITION: IS IT MEANINGFUL?

M.E. Chotiner[1], A. Gamaldo[1], W. Grenhart[2], J.C. Allaire[2], *1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. North Caroline State University, Raleigh, North Carolina*

Everyday cognition measures thought processes and reasoning in the context of real-world cognitive competency. Previous research has shown that basic abilities underlie the performance on everyday cognition measures. These prior studies have used a between-subjects approach, which does not account for daily changes in cognition. It is important to take these differences into consideration because basic cognitive abilities fluctuate on a daily basis. The present study explores the utility of capturing daily fluctuations on tasks using real-world stimuli. The study aimed (1) to examine the extent of within-person and between-person variability in everyday cognition (2) investigate the within-person coupling relationship between the DECA, an adapted measure of the Everyday Cognition Battery (ECB), and basic cognitive abilities. A sample of 206 independent-living, adults (M age = 72.79; Range = 60 – 91 years old) were administered a computerized cognitive battery. The cognitive battery included the DECA and psychometric measures of basic cognitive abilities (perceptual speed, reasoning, and memory). Using multi-level model (MLM), significant within-person variability was observed across the DECA (46%), with 54% between-person variability. At each occasion, better performance on the DECA was significantly associated with better performance in simple reaction time (SRT; $p < .01$) and memory (AVLT; $p < .01$) even after accounting for linear time, age, education, and other cognitive measures. In summation, within-person performance fluctuations were observed for everyday cognition tasks. Further research should explore whether fluctuations on everyday measures may be a useful screening of early cognitive decline above and beyond the traditional cognitive measures.

BEHAVIORAL COMPETENCE AND EMOTIONAL WELL-BEING IN MCI: IN BETWEEN COGNITIVE HEALTH AND DEMENTIA?

M. Wettstein[1], U. Seidl[2], H. Wahl[1], N. Shoval[3], J. Heinik[4], *1. Heidelberg University, Heidelberg, Germany, 2. Klinikum Stuttgart, Stuttgart, Germany, 3. Hebrew University Jerusalem, Jerusalem, Israel, 4. Margoletz Psychogeriatric Center, Ichilov Hospital and Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel*

Previous research has rarely investigated which factors, beyond cognitive abilities, are able to discriminate between older adults with mild cognitive impairment (MCI) and demented older adults as well as cognitively unimpaired individuals. In this study, we examined if older individuals with MCI differed from healthy controls (HC) and persons with dementia (AD) in objective and perceived behavioral competence and emotional well-being. Our sample consisted of 257 older adults from Israel and Germany aged 59 to 91 years (M = 72.9; SD = 6.4). Objective behavioral competence (assessed based on Global Positioning System (GPS) based tracking data and a structured questionnaire) of MCI individuals was fairly similar to the HC group. However, regarding perceived behavioral competence and emotional well-being, MCI individuals were more similar to the AD group and below the HC group's mean levels. Moreover, some unique characteristics of the MCI group were found, such as a mean negative affect which was significantly above both other groups and a mean cognitive activity engagement which was in between AD and HC. Moreover, based on a longitudinal analysis with a subsample across approximately 18 months, a mean increase in negative affect was observed in the MCI group only. Findings thus suggest that a differentiated view of MCI individuals is in place: In objective behavioral competence, they are more similar to cognitively healthy individuals, in perceived behavioral competence and emotional well-being, they are closer to demented older adults. Moreover, they reveal some unique characteristics in which they are different from both other groups.

DAILY DEMANDS INTERFERE WITH COGNITION: SOME DAYS ARE BETTER THAN OTHERS

E. Hahn, S. Agrigoroaei, M. Lachman, *Brandeis University, Department of Psych, Waltham, Massachusetts*

Previous research, mainly conducted in lab-based settings and using between-person analyses, has shown that cognitive interference may negatively affect cognition (Clapp & Gazzaley, 2010). We investigated the role of internal sources of interference (i.e., intrusive thinking and multitasking) in everyday life in relation to daily cognition, and the moderating role of age. Participants (n=122; age range:22-94 years) completed a background questionnaire and a daily diary for one week. Cognitive performance was measured at baseline using the Brief Test of Adult Cognition (BTACT) and over seven consecutive days using immediate word recall, category fluency tasks, and self-reported memory problems. Reports of intrusive thinking and multi-tasking were also assessed over the seven days. Multi-level modeling (MLM) examined within-person relationships between interference and daily cognition and age differences. Covariates included gender, education, work status, busyness, and cognitive functioning measured with BTACT. Older age was associated with less intrusive thinking and worse objective daily cognition; age was not related to multi-tasking or daily memory problems. In MLM, participants scored worse on category fluency on days with more intrusive thoughts. Multi-tasking was not related to category fluency. On days with more intrusive thinking and multi-tasking, participants reported more everyday memory problems. Interference was not related to recall and there were no interactions with age. Across the adult lifespan, internal sources of interference associated with the demands of daily life contribute to intraindividual fluctuations in cognitive functioning, particularly executive functioning and everyday memory problems. The results have implications for interventions aimed to improve daily cognition.

COGNITIVE CHARACTERISTICS OF COMMUNITY-DWELLING OLDER PEOPLE WITH MILD COGNITIVE IMPAIRMENT AS ASSESSED BY THE JAPANESE VERSION OF THE MONTREAL COGNITIVE ASSESSMENT

H. Suzuki[1], Y. Fujiwara[1], H. Kawai[1], M. Yasunaga[1], H. Hirano[1], H. Yoshida[1], K. Ihara[2], S.P. Obuchi[1], *1. Research Teams for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan, 2. Department of Public Health, Toho University School of Medicine, Tokyo, Japan*

Background: The Montreal Cognitive Assessment (MoCA) is sensitive to mild cognitive impairment (MCI) in clinical settings and covers several domains, including attention, orientation, language, memory, visuospatial, and executive function. The aim of the study was to examine cognitive characteristics of community elderly with MCI, using a Japanese version of the MoCA (MoCA-J). We used the data from both community setting and clinical setting and compared the scores with the subtests of the MoCA-J. Method: In the community setting, 913 community-dwelling Japanese elderly participated in health examinations. The MoCA-J, MMSE, and other survey of actual life situation were conducted. From the results of the assessment, 913 persons were divided into three groups, Cognitive Impairment (participants who scored <24 in MMSE, n=53, mean age=76.9), Operational MCI (O-MCI, participants who scored <26 in MoCA-J with complaints about memory problems, 315, 74.3), and Normal Control (NC, 416, 72.5). In the clinical setting, MCI patients were recruited from the outpatient memory clinic (Clinical MCI; C-MCI, 30, 77.5). Results: In the community setting, scores on attention, language, memory, and executive function were significantly different among three groups (p<.01 each). There were no significance between NC and O-MCI on orientation score. In comparisons of O-MCI and C-MCI, there were significant difference on memory score (1.5 vs 0.7, p<.01). Conclusion: While older persons with O-MCI as defined by MoCA-J are impaired on several cognitive domains other than orientation, memory have not decline like a MCI patient.

COGNITIVE COMPENSATION IN THE CONTEXT OF AN UNPREDICTABLE PLATFORM PERTURBATION

H. Bruce[1,2], G. Asare[1], I. Makris[3], D.I. Aponte[5], N. St. Onge[3,4,5], K. Li[1,2,5], *1. Dept. of Psychology, Concordia University, Montreal, Quebec, Canada, 2. Centre for Research in Human Development, Montreal, Quebec, Canada, 3. Dept. of Exercise Science, Concordia University, Montreal, Quebec, Canada, 4. Constance-Lethbridge Rehabilitation Center, Center for Interdisciplinary Research in Rehabilitation of Greater Montreal, Montreal, Quebec, Canada, 5. PERFORM Centre, Concordia University, Montreal, Quebec, Canada*

Epidemiological research indicates a link between hearing loss and mobility. A potential explanation is that cognitive compensation occurs in both speech perception and postural tasks in older adults. Therefore, simultaneous listening and balancing might be more challenging for older adults with hearing loss. We investigated this hypothesis using a dual-task paradigm. Samples of healthy young (n = 28) and older adults (n = 8) completed cognitive (modified n-back) and balance (balancing on a moving platform) tasks singly and concurrently. Each condition was given under noisy and quiet conditions, where background noise (babble) was used to simulate auditory aging. Participants made significantly more cognitive errors in noisy compared to quiet conditions, and older adults made more errors when compared to younger adults. Importantly, an interaction between auditory challenge and age indicated that older adults exhibited greater competition for cognitive capacity than young adults, suggesting a different resource allocation strategy. Center of mass data indicated an effect of background noise whereby the amplitude of the peak displacement was decreased. Together, the results suggest that sensory challenge has a negative effect on auditory-cognitive performance and changes the postural response to a mild perturbation. These results support the contention that hearing loss and mobility challenge are linked by their common reliance on compensatory cognitive capacity.

CENTENARIAN OFFSPRING SHOW BETTER COGNITIVE FUNCTION ACROSS LONGITUDINAL FOLLOW-UP

S.L. Andersen[1], L.S. Nussbaum[2,1], P. Sebastiani[2], T.M. Neary[1], L. Feldman[1], J.D. Gass[1], T.T. Perls[1], *1. Medicine/Geriatrics, Boston University School of Medicine, Boston, Massachusetts, 2. Boston University School of Public Health, Boston, Massachusetts*

Centenarian offspring, who have been shown to have reduced morbidity compared to age-matched cohorts, can serve as windows into earlier life advantages of familial exceptional longevity. In this study we examined whether centenarian offspring have better cognitive function than a referent cohort and whether they are able to maintain that cognitive advantage with aging. Methods: New England Centenarian Study (NECS) offspring and referent controls were administered the Telephone Interview for Cognitive Status (TICS), a 51 point measure of global cognitive function, biennially via telephone. Mixed effects models for repeated measures were used to determine average cognitive trajectories for centenarian offspring and referent cohorts by sex and education level. Results: 762 participants (age range 49-97 years) completed at least one administration of the TICS with an average of 2.8 administrations occurring over 3.9 years of follow-up. In both males and females, centenarian offspring with a college degree performed better than referent controls with a college degree followed by centenarian offspring without college degrees and controls without college degrees. Females in each group outperformed males in corresponding groups ($p<0.0001$) which is consistent with other studies that use the TICS. Over follow-up, centenarian offspring maintained higher TICS scores compared to their referent groups. Conclusion: Centenarian offspring from the NECS have better cognitive function across longitudinal follow-up compared to a referent cohort. The cognitive benefits of familial exceptional longevity are evident even at relatively young ages.

MULTI-TASK TRAINING IS THE EFFECTIVE TOOL TO IMPROVE COGNITIVE PERFORMANCE IN OLDER ADULTS

N. Trushkova[1], G. Zelano[2,1], *1. Rehabilitation Research Center "Armonia," Latina, Italy, Aprilia,(latina), Italy, 2. Catholic University, Rome, Italy*

BACKGROUND: many studies confirm the positive effect of dual-task training on cognitive ability in older adults. The aim of our work is to verify that multi-task training is the most effective way to improve cognitive function in people with mild cognitive decline than-dual task. METHODS: we established special gymnastics based on a combination of motor learning tasks (using small tools) and cognitive tasks, forming exercises which require cognitive effort. We created two groups different from each training: Dual-Task Training Group (DTTG) and Multi-Task Training Group (MTTG) each of 32 participants aged ≥ 67 years who scored between 24 and 26 the Mini-Mental State Examination (MMSE). It was proposed to them to perform an hour of activity twice a week for 14 weeks. RESULTS: all participants in both training groups showed improvement in all tests. The average values obtained before and after surgery in the following tests in each group: (DTTG)- Digit Span Forward: 2,9-3,3: Digit Span Backward: 0,6-0,8: Rey Auditory Verbal Learning Test(first attempt): 3,9-5,2: TMT-A: 89,8-78,5: ((MTTG)- Digit Span Forward: 2,8-3,7: Digit Span Backward: 0,5-0,9: Rey Auditory Verbal Learning Test(first attempt): 3,8-5,6: TMT-A: 84,6-71,5. Multi-Task Training Group participants showed significant improvement on MMSE (mean=2.21, $p<0.001$) compared to Dual-Task Training Group (mean=0.93, $p=0.08$) CONCLUSION: multi-task training has proven more effective tool that dual-task training to improve cognitive performance in older adults with mild cognitive decline.

SESSION 235 (POSTER)

AGING AND ENVIRONMENT

VOICES FROM FERNALD: COMPENSATING NUCLEAR WEAPONS WORKERS AND THEIR SURVIVORS

P. Cianciolo, *Sociology & Social Work, Northern Michigan University, Marquette, Michigan*

The Energy Employees Occupational Illness Compensation Act (EEOICPA) was passed by Congress in 1999. The intent of the law has been to provide nuclear weapons workers or their survivors' monetary compensation if the worker contracted or died from specific illnesses caused by exposure to radioactive or toxic materials. Fernald, located northwest of Cincinnati, Ohio, was one among many weapons facilities operating throughout the United States between the 1950s and 1990s. This small exploratory case study examined how former Fernald workers or their survivors experienced applying for the EEOICPA program. In-depth interviews were conducted with middle aged and older individuals examining the range of emotions they felt during the application and determination process, and how the experience has influenced their own family histories,

ROLES OF COMMUNICATION PROBLEMS AND COMMUNICATION STRATEGIES ON RESIDENT-RELATED JOB SATISFACTION MEASURES

M.Y. Savundranayagam, *School of Health Studies, Western University, London, Ontario, Canada*

Although there are interventions aimed at improving communication between nursing home staff and residents with dementia, the relationship between the newly learned communication strategies and job satisfaction is unclear. This study investigated the impact of caregivers' appraisals of the effectiveness of their own communication strategies on job satisfaction measures that are focused on the staff-resident relationship. Staff caregivers (N = 101) of residents with dementia completed questionnaires appraising the distress associated with dementia-related communication problems, appraising the usefulness of communication strategies in resolving misunderstandings, and job satisfaction. Three types of communication strategies were included in the analyses: (a) effective repair strategies, which help to resolve communication breakdowns, (b) completing actions by oneself and (c) tuning out or ignoring the resident. Hierarchical linear regression models revealed that effective repair strategies were significantly linked with feeling close to residents. Additionally, staff members who thought completing actions on their own was a useful strategy were more likely to perceive their role as influential in the lives of residents. In contrast, staff members who appraised tuning out the resident as a useful strategy were less likely to perceive their role as influential to residents. Finally, staff members who appraised dementia-related communication problems as distressing were more likely to report that residents placed unreasonable demands on them. Findings provide preliminary support for understanding mechanisms by which the appraisals of communication problems and communication strategies influence job satisfaction and provide insights into the importance of enhancing communication skills of long-term care staff.

NEIGHBORHOOD WALKABILITY ASSESSMENT FOR SENIORS: USING GEOGRAPHIC INFORMATION SYSTEMS

E. Hwang, N. Gao, R. Wei, *Virginia Tech, Blacksburg, Virginia*

The purpose of this study was to examine walkability for seniors in a low-income neigbhorhood. The objective neighborhood walkability in the DC area was assessed via geographic information systems (GIS) using ArcGIS 10.1 data using the North American Datum (NAD) 1983 state plane coordinate system. Ward 8 in the DC area was selected due to its concentration of low-income families in the southern part of the Anacostia River. First the location of public housing area in Ward 8 was geocoded. To measure the objective neighborhood walkability for seniors, we calculated the access from public housing to the following destinations within .25 miles buffer: food (grocery stores; farmers' markets and community gardens); transportation (bus stations; metro stations); basic facilities (post offices; hospitals and public schools) and recreation (green sites; DC parks and shopping centers). Neighborhood walkability for seniors in our study was not in good condition. They did not have access to food sources within .25 miles. There is only one farmer's market and two groceries existed in Ward 8. None of those were in .25miles from the public housing. Bus stops and sidewalk system in Ward 8 are relatively completed and works efficiently. However, there are only two metro stations in Ward 8 area with one service for only 1/3 part of people live in north part of Ward 8. In addition, people live in north and northeast of Ward 8 had no access to post office and hospitals within .25 miles.

THE ROLE OF EFFICACY IN MAINTAINING WELL-BEING OVERTIME: A PERSON-ENVIRONMENT (P-E) PERSPECTIVE

S. Park, J. Smith, R. Dunkle, *university of michigan, Ann Arbor, Michigan*

Objectives: We examine subgroups of older adults living alone with different health and environmental profiles and ask if their subjective well-being over time is mediated by their sense of personal control. Method: Data came from the 2006 and 2010 wave of Health Retirement Study (HRS: N = 1258, age range 65-104). Four health (sensory-cognitive impaired, physically impaired, frail, and healthy) and three environment profiles (physically average- socially unsupportive, physically unsupported-socially supportive, and physically supportive –socially above average) were identified. Path analysis was conducted to examine associations among the subgroups, perceived control and changes in depressive symptomology over time. Results: Whereas well-being was maintained in the healthy group, it decreased in the other three health profile groups. Especially, the frail group showed the greater decrease in subjective well-being. Analyses revealed that P-E fit enhances or diminishes the sense of personal control and this in turn is associated with the maintenance of subjective well-being. Regardless of social-physical environmental context, personal control was high in the healthy profile subgroup and low in the physically impaired group. When the environment fit was better for the other two health subgroups (the sensory-cognitive impaired group and the frail group), their control was enhanced and well-being was maintained. Discussion: The findings about the heterogeneity of both health limitation and social-physical environment profiles in older adults living alone, and the association between various person-environment profile combinations (fit), control and subjective well-being have important policy and intervention implications.

SUSTAINABILITY IN ASSISTED LIVING FACILITIES: STAFF PERCEPTIONS OF IMPLICATIONS FOR WELL-BEING

A.M. Drolet, E.E. MaloneBeach, M.E. Sokolosky, Q. Zuo, *Human Development and Family Studies, Central Michigan University, Mount Pleasant, Michigan*

Sustainability, or “green living”, is a phenomenon spreading to all areas of building and development. Assisted living facilities (ALFs) have also incorporated sustainability practices into their establishments. However, little research has addressed the impact of sustainability on staff or their perceptions of its influence on residents. We surveyed staffs of ALFs to discover their perceptions of sustainability efforts. Assisted living facilities were identified online, contacted and permission sought to avail surveys to the staff. Subsequently, surveys were delivered to the ALFs and picked up within three weeks. The pen and paper survey was distributed to nine facilities located across Michigan, as well as to employees of ALFs who were members of student organizations. Questions on sustainable practices were grouped into four main categories: demographic information; sustainable practices, including thermal comfort, air quality, lighting and view, acoustic quality, cleanliness and maintenance, and overall sustainability; motivation to green; and views on sustainable practices. The survey also asked how staff members (n=94) were impacted on a day-to-day basis. Additionally, staff perceptions of the impact of sustainability initiatives on resident well-being were measured. The results indicate that efforts toward sustainability largely took the form of conservation of resources to manage costs. Respondents were satisfied with these efforts and supported them. They saw little harm to residents as a result of these activities. However, malodorous conditions were a common source of dissatisfaction. Overall, this study details the perceptions and opinions of ALF staff members and the depth of the impacts of sustainability.

REAL WORLD OUTDOOR WALKING PERFORMANCE IN OLDER ADULTS

N.A. Gallagher, P. Clarke, R. Adams, N.B. Alexander, *Univ Michigan, Ann Arbor, Michigan*

Background: The ability to walk safely is critical to older adults’ independence. Yet few have studied the impact of individual and environmental factors on walking performance in a real-world outdoor setting. Methods: Seventeen community-living (CL) and senior housing (SH) older adults (mean±sd age 66±10) walked outdoors on a planned course that included ramps, crosswalks, and uneven surfaces. Nine individuals completed a 350m course outside the SH and the remainder completed a similar 520m course. Outcomes included course performance time, comfortable gait speed (CGS) and self-reported factors: balance (ABC) and ambulation confidence (Ambulatory Self-efficacy), function (EPESE), and environmental barrier influence on community activity and participation (Facilitators/Barriers Survey). Results: Participants reported little functional impairment (3±1). Mean CGS was 1.2±0.4 m/s. Balance confidence was high (84±15), and slightly lower in confidence to safely ambulate (78±24). Environmental barriers were somewhat likely to interfere with community participation (2.3±1.0) and activity (2.8±0.9). CGS was significantly associated with function (r=-.66,p<.01), and balance (r=.67,p<.01) and ambulation (r=.58,p<.05) confidence, while fewer environmental barriers were associated with community participation (r=-.69,p<.01) and activity (r=-.62,p<.05). Course time (CL=5.4±0.5, IL=7.1±1.2 min) was significantly associated in all participants with CGS (r=-.23-87,p<.05) and in CL participants with barriers to community participation (r=-.98,p<.05). Conclusion: Real-world walking performance in older adults relates to both CGS and environmental barriers to community participation. Environmental barriers influence even unimpaired individuals who are confident in balance and walking. Future work should evaluate these relationships in impaired older adults who may find the environment more challenging.

INFLUENCE OF HOUSING QUALITY ON FEELINGS OF WELLBEING AND NEIGHBORHOOD INTEGRATION

A. Smetcoren[1], L. De Donder[1], N. De Witte[1,3], T. Buffel[1,2], S. Dury[1], T. Kardol[1], D. Verté[1], *1. Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Brussel, Belgium, 2. The University of Manchester, Manchester, United Kingdom, 3. University College Ghent, Ghent, Belgium*

Within environmental gerontology, research has emphasised the importance of housing and environment for the independence of older people. The purpose of this study is twofold. First, it investigates the relationship between housing quality and indicators of individual’s wellbeing (feelings of loneliness, feelings of unsafety, psychosocial well-being, and frequency of falling). Second, the research examines the relationship between housing quality and neighborhood integration (neighbourhood involvement, quantity and quality of contacts, and neighbourhood satisfaction). Survey data from the Belgian Ageing Studies for 67,560 people aged 60 and over living self-reliantly in 142 municipalities in Belgium provide the empirical evidence for the analysis. A multiple linear regression model was conducted. Results indicate a significant relationship between poor housing quality and indicators of well-being. The more inappropriate the dwelling, the more unsafe seniors feel and the higher feelings of loneliness, feelings of depression, and frequency of falling are reported. Poor housing quality also correlates significantly with all the variables of neighborhood integration. The strongest relation is detected for neighborhood involvement. The influence of inadequate housing is often narrowed down to health outcomes, however, this study shows a relationship between poor housing and older people’s neighborhood integration. When looking at policy plans, ‘aging in place’ is considered as an ideal residential strategy for growing old. These findings show consequences of ‘staying put’ when living in maladjusted dwellings and stress the need for developing a variety of housing options so older people can stay as long as possible, with higher life-quality, independently in the home environment.

RELATION OF DRIVING ON THE AMOUNT OF WALKING AMONG OLDER URBAN AFRICAN-AMERICANS

A.B. Mitchell[1], A.L. O'Sullivan[2], Y.L. Michael[3], P. Cacchione[2], J. Johnson[2], *1. Nursing, West Chester Univeristy of Pennsylvania, West Chester, Pennsylvania, 2. Univeristy of Pennsylvania, Philadelphia, Pennsylvania, 3. Drexel Univeristy, Philadelphia, Pennsylvania*

The study was a descriptive, cross sectional, non-experimental survey with a sample of 134 African American adults over age 65 living in community in a large northeastern city. The purpose was to describe the relation of having a driver's license and access to a care with the amount of self-reported walking. The theoretical framework was based on the Ecological Theory of Aging (Nahemow & Lawton). The quantitative instruments used were: a ten question demographic survey detailing driving habits, the SF-12 Health Survey, Neighborhood Environment Walkability Scale (NEWS), and the Community Healthy Activities Model Program Seniors (CHAMPS). Close to half of the participants in each age cohort, young-old, middle-old, and oldest-old, were currently driving and had access to a car. Men drove more than women in every age cohort. Spearman correlations were conducted, and driving a car had a negative correlation with the number of disease conditions present ($r = -.21$), although it was not correlated with any specific demographic items such as age, BMI or length of residence in the neighborhood. In regression models examining the amount of transport walking performed, having access to a car ($p = .013$) was associated with 48 less minutes of walking per week. Driving a car was not a significant variable for the amount of leisure walking performed. Implications for clinicians are to be aware of the number of drivers in the oldest age cohort even in urban areas that have access to public transportation.

THE EMBODIMENT OF PLACE: PERCEPTIONS OF WELL-BEING AND PLACE AMONG OLDER AFRICAN AMERICAN ADULTS IN DETROIT

F. Richards, *Anthropology, Michigan State University, East Lansing, Michigan*

Within gerontology, researchers have increasingly paid attention to the social production of space and place and examined how populations assign meaning to their spatial and built environments. The purpose of this ethnographic study was to examine the lived experiences of community dwelling African American female seniors (AAFS) living with diabetes in Detroit, Michigan. Specifically, this study explored how conceptions of aging and well-being were shaped by African American female seniors attitudes and beliefs regarding Detroit and its perceived impact on their lives. Utilizing a qualitative approach, unstructured and semi-structured interviews were conducted with 40 community dwelling AAFS aged 60 years and over. Employing grounded theory methodology for data analysis, the interviews were transcribed and coded for repetition, similarities and differences using NVivo software by three independent raters. Analysis from the study generated the following themes for African American female seniors conceptions of well-being: adequate financial resources, availability of friends and family for social support, housing, quality of food, and overall health. Preliminary analysis suggests that AAFS beliefs about Detroit and well-being varied depending on the availability of material and social resources, socioeconomic status, and perceived physical bodily limitations. African American senior women with perceived debilitating limitations expressed feelings of vulnerability to the economic transformations within Detroit. This study reveals African American female seniors embodiment of their social and environmental contexts and in turn the various factors that impact their conceptions of well-being and aging. Future discussion concentrates on the role of place in well-being for seniors in post-industrial settings.

THE WALKABLE NEIGHBORHOOD PROJECT: STUDENTS ADVOCATING FOR OLDER ADULTS IN THE COMMUNITY

M. Turner, R. Ludke, K. Chebahtah, E. Kiehne, C.A. Gosselink, *Psychology, Missouri State U, Springfield, Missouri*

In Springfield, MO, community leaders were influenced to form the Healthy Living Alliance in order to preserve the beauty of the Ozarks and promote healthy lifestyles among the residents, including the Walkable Neighborhood Project. University students were recruited to be boots on the ground data collectors who, after training would survey sidewalks, land uses, and access to services (e.g., grocery stores, bus routes). In our gerontology course, the instructor invited us to agree to participate, but not all students were enthusiastic. Some decried the intrusion of the project into the lives older adults because photographs of the neighborhood were involved; others expressed the fear that elders living in less-than-ideal private housing could be fined if they didn't make changes mandated by Big Brother. Ultimately, everybody agreed to participate as part of the Aging Policies and Politics class. As the only Gerontology students volunteering in the project (22 out of 400 students), the class voiced a desire to advocate for the older adults. During a debriefing in class after the survey was completed, students shared what they had observed. A key finding was the difference between neighborhoods of privilege vs. those of low socioeconomic status. In this poster, students' varied expectations, aspirations, and experiences will be presented. In the end, though, students agreed that the project was worthwhile because it had the potential to benefit older adults aging in community throughout the City of Springfield.

DOES THE NEIGHBORHOOD ENVIRONMENT MODIFY GENETIC RISK FOR COGNITIVE DECLINE?

P. Clarke[1], J. Weuve[2], L.L. Barnes[2], D.A. Evans[2], C. Mendes de Leon[1], *1. University of Michigan, Ann Arbor, Michigan, 2. Rush University Medical Center, Chicago, Illinois*

Previous research has identified multiple factors associated with cognitive function, including the ApoE4 gene. However, little research has looked beyond individual factors to consider the role of the neighborhood environment. A greater density of physical resources (recreational centers and parks that promote physical activity) and institutional resources (libraries, bookstores, and community centers that facilitate mental stimulation) may buffer cognitive decline in later life. These benefits may be even greater among those at greater cognitive risk (e4 allele). Using data from the Chicago Health and Aging Project (1993-2011), a prospective cohort study of 3781 adults age 65+, we fit a 3-level growth curve model to examine the role of individual and neighborhood factors (objectively observed at the block group level) on cognitive decline. Results indicate that cognition function (composite of East Boston Memory Test, symbol digit test, MMSE) declines more rapidly in later years ($p < .001$). E4 carriers have a faster rate of cognitive decline ($p < .001$), net of controls. Adults living in a neighborhood with community/recreational centers have higher cognitive function at age 65 ($p < .05$) but do not have significantly different rates of cognitive decline from adults living elsewhere. Older adults who go to neighborhood churches, libraries, and local parks have higher cognitive function than those who never go ($p < .001$), and cognitive function declines more slowly for those making more frequent park visits ($p < .05$). No differences were found in effects by e4 status. These results suggest a role of neighborhood environments in buffering cognitive decline among older adults regardless of genetic risk.

FOOD STAMP USE AND PERCEIVED NEIGHBORHOOD SAFETY: ASSOCIATIONS AMONG OLDER ADULTS

T. Ross, E. Grinshteyn, *School of Community Health Sciences, University of Nevada, Reno, Reno, Nevada*

Background: Feeling safe in one's neighborhood is important for older adults as those who feel safe are more likely to walk in their neighborhood, have social interaction, and use area services, which all lead to better physical and mental health. This research hypothesized that food stamp use led to feeling less safe even after controlling for wealth. Methods: The 2008 Health and Retirement Study dataset was analyzed to assess the association between receiving food stamps and feeling safe among older adults after controlling for wealth. Wealth instead of income was controlled for as older adults of varying financial security have little actual income. Older adults' perception of neighborhood safety was measured as excellent, very good, good, fair, or poor. Three models were run (linear, ordered logit, and generalized ordered logit models). Results: The parallel lines assumption was violated so the results of the generalized ordered logit model are presented. After controlling for wealth, which should remove the effect of financial variation, food stamp receipt was still significantly associated with feeling less safe ($p<0.0001$). This association was stronger for those who felt less safe with food stamp recipients more likely to feel less safe even after controlling for wealth ($\beta=1.04$, $p<0.0001$). Conclusions: Food stamp receipt is associated with feeling less safe even after controlling for financial security. This relationship showing that food stamp receipt thus seems to trigger concerns for older adults should be further researched to understand this complex response to food stamp receipt for older people.

DISCURSIVE REPRESENTATIONS OF THE MEANING OF FINITUDE IN 'CANCER SURVIVORSHIP'

S.M. Hannum[1], K.A. Smith[1], K.I. Coa[1], A.C. Klassen[2,1], *1. Health, Behavior and Society, Johns Hopkins Bloomberg School of Public Health, Halethorpe, Maryland, 2. Drexel University, Philadelphia, Pennsylvania*

Background/Significance. Phenomenological investigations surrounding illness and illness behavior are often rooted in a health beliefs model and are thus described according to personal interpretations of disease, and about life and death. In this paper, we evaluate how older cancer patients describe survivorship in everyday language and discuss implications for initiation of care and self-management behaviors, as guided by one's long-term evaluations of health. Methods. This work draws on data from the Eating for Life study, which included informants with cancers of the breast and prostate, as well as Non-Hodgkin's lymphoma (n=53). Informants were recruited to participate in a semi-structured interview pertaining to experiences and conceptualizations of cancer survivorship and dietary behavior, following acute periods of care. Interview transcripts from those aged 65-74 years (n=21) were used for this sub-analysis and were evaluated using techniques of discourse and narrative analyses to focus on survivorship beliefs within the aging context. Findings. Analyses revealed the importance of age and time, as reflected in beliefs about cancer, its experience, and the potential for recurrence. Cancer illness and survivorship were thus often seen as deeply implicated in disruptions to biography, but also to one's ability to engage in future planning. Conclusions. How older persons conceptualize the future seems to bear deeply on decisions made in reaction to cancer therapies, but also uptake of self-care and overall health management. We suggest that notions of time and cancer survivorship be integrated in care models, with an appreciation of how older persons approach decisions relevant to care.

SESSION 240 (POSTER)

END OF LIFE CARE AND INTERVENTIONS

EFFECTS OF EDUCATION PROGRAM TO PROMOTE ADVANCE DIRECTIVES COMPLETION IN LOCAL RESIDENTS

H. Miho[1,2], A. Kono[1], *1. graduate school of nursing, Osaka city university, Osaka, Japan, 2. Bukkyo University, Kyoto, Japan*

Background: I have developed an education program to facilitating advance directive (AD) completion, utilizing the situation of end-of-life care for people with dementia. The aim of the present research was to examine the effects on the AD completion rate of the education program in local residents. Methods: The design was a quasi-experimental study with intervention and control groups. The study population was local welfare officers from two cities in Osaka, Japan, of them, 81 persons were allocated to the intervention group and 60 persons to the control group. The 70-min intervention program was performed twice for the participants in the intervention group. Primary outcomes were AD completion and intention to complete an AD, as indicated by binary "Yes/No" responses, and the secondary outcomes were AD Knowledge, AD Attitude, and Dementia Knowledge. Results: The intervention group exhibited a significant increase in a between-group comparison of the change in the number of people who completed an AD (odds ratio=5.0, 95% confidence interval=1.0–25.0, $p<0.04$). The results showed that the interactions between Group and Time were statistically significant for scores of both the AD Attitude Survey Test ($F=4.1$, $p=0.04$) and the Dementia Knowledge Scale ($F=4.6$, $p=0.04$). Conclusions: The results suggest that the education program facilitating AD completion could promote the completion, favorable AD attitude and dementia knowledge among local residents.

ENRICHMENT OF PERSONHOOD OF PEOPLE WITH ALZHEIMER'S DISEASE IN INTERGENERATIONAL REMINISCENT TALK

T. Hamaguchi, *University of the Sacred Heart, Tokyo, Japan*

Based on ethnographic observation at a geriatric hospital in Japan, this study will demonstrate (1) intergenerational and intra-generational communicative features of senior residents (male and female, 80s-100s); and (2) ways in which those residents with Alzheimer's disease (hereafter AD) find their personhood in the current setting by referring to the social and interpersonal networks they used to have in the past. In the observed weekly activity called "Tea Time Talk," a group of residents with dementia or AD gather for 30 minutes with a clinical psychologist (hereafter CP) who gives a topic of the day that encourages the participants to reminisce their experiences related to the topic. On the surface level, the younger CP manifests control over the activity. However, the older participants' experiential privilege over the CP quickly gives them a collective teacher's role. Moreover, during the reminiscent talk, the older participants often account for who they are/were by situating themselves in comparative or contrastive relations with others surrounding them (e.g. other family members, people of different ages or opposite gender). It is suggested that their use of interpersonal network as a way to show their selfhood serves as empowerment of personhood. Consequently, it should be emphasized that the reduced social network of those with AD in the current life situation does not necessarily elicit the commonly perceived 'loss of self,' if we look qualitatively at their discourse behavior. This study also illustrates under-researched cognitive features in conversation (e.g. humor production) of those with AD.

MONITORING PAIN AND SYMPTOMS ON A MOBILE PHONE APPLICATION: FACTORS CORRELATED WITH REPORTING FREQUENCY

J. Portanova[1], J. Laguna[1], S. Wu[2], S. Enguidanos[1], *1. USC School of Gerontology, Los Angeles, California, 2. USC School of Engineering, Los Angeles, California*

Access to palliative care is largely limited to the last months of life, provided through hospice, leaving seriously ill patients with limited access to pain and symptom management. Mechanisms to provide efficient monitoring of pain and symptoms are needed. This study aimed to determine the frequency of pain reporting on a mobile phone application among seriously ill, older patients. We recruited English-speaking adults, age 55 or older, with at least one chronic condition, and pain ≥ 3 on a scale of 0 to 10 (n=23). Participants received a mobile phone and training on the application. Approximately 62% were male, with an average age of 73.9+/-11.9. Nearly 60% identified as African-American, 9.1% Hispanic, and 18.2% Caucasian. Over the 75 day period, subjects submitted an average of 27.2 reports (range 1-74), and 30.4% met the submission goal of 3 entries per week. Assistance from others, namely children or grandchildren, in sending reports was inversely correlated with number of reports sent (p=.042). There was a trend toward more reports among those hospitalized in the previous six months (p=.051). No significant correlations were found between number of reports and pain level, age, training hours, education, previous cell phone use, ethnicity or diagnosis. Our pilot study found that those receiving help in submitting pain reports submitted fewer reports overall. Additionally, the lack of correlation between training hours and frequency of reports suggests increased training may not increase reporting frequency. Findings suggest that some seriously ill patients may be able to monitor and submit pain reports.

MEASURING STAFF'S END-OF-LIFE CARE EFFICACY IN ELDERLY CARE FACILITIES IN JAPAN

S. Kubota[1,2], S. Sato[1], *1. Osaka University, Osaka, Japan, 2. Reseah Fellow of Japanese Society for the Promotion of Science, Tokyo, Japan*

In our super-aged society, demand for end-of-life (EOL) care at elderly care facilities is increasing in Japan. The facilities enable elderly adults to spend their last days not in a medical setting but in a daily-life setting. However, many care workers are reluctant to undertake such work. Given the current situation, there is an urgent need to cultivate active attitude for EOL care among staff, however previous studies have addressed only their negative attitudes. Based on social learning theory, this study focused on self-efficacy - the personal drive to do something actively (Bandura, 1977). The purpose of this study was to develop an EOL care efficacy scale (ECES) and to assess its reliability and validity. After conducting a content analysis of 11 textbooks and a focus group interview, a scale consisting of 27 items was created. The study was conducted via a mail-in survey and 1,358 certified care workers completed the ECES. In order to examine the validity, the degree of generalized self-efficacy and job competence were also assessed. An explanatory factor analysis removed two ineligible items and revealed a two-factor structure consisting of instrumental care efficacy and emotional care efficacy. The internal consistencies of the two subscales were above .90. Correlations between ECES and two aforementioned scales ranged from .23 to .45. In conclusion, the ECES was shown to be reliable and valid. This newly conceptualized scale will enable the examination of antecedent factors theoretically and assessment of the effect of potential interventions to maintain the efficacy.

VARIABILITY IN CONTENT AND ECOLOGICAL VALIDITY OF ONLINE PALLIATIVE CARE INFORMATION SHEETS

E. Kozlov, *Psychology, Washington Univ, St. Louis, Missouri*

GSA 2014 abstract Elissa Kozlov Introduction: Americans rely on the Internet for health information, and people are likely to turn to that resource to learn about palliative care. Several palliative care organizations post information sheets about palliative care on their websites. The purpose of this study was to analyze online palliative care information sheets to evaluate the breadth of their content. We also compared the frequency of content appearance to expert rankings of the importance of domains of palliative care knowledge. Methods: Twenty-six information sheets were identified using web search engines. Two researchers independently coded each sheet for content. Palliative care professionals (n=20) rated the importance of 22 content domains. Results: The mean prevalence rate for the 22 domains was 44.7%(SD = 30.4, range = 7.7 – 96.2). The information sheets ranged widely in their coverage of domains. For example, 96% stated that palliative care addresses symptoms of serious illness, while only 11% stated that palliative care helps patients decide if and when to stop curative treatments. Discrepancies emerged between expert ratings of importance and frequency of the information ($r\tau = .25$, $p > .05$). Conclusions: This study demonstrates that palliative care information sheets available online vary considerably in their content coverage. Furthermore, information palliative care professionals rate as important is not always included. In order for palliative care information sheets to be educative and helpful, they need to be consistent, accurate, and comprehensive, otherwise patients might not receive information that facilitates access to this life improving specialty service.

ADVANCE CARE PLANNING WITH DYING OLDER OFFENDERS: INNOVATIONS IN END OF LIFE CARE

M. Stensland, E.L. Robinson, S. Sanders, *University of Iowa, Iowa City, Iowa*

While aging in place is occurring in prisons and correctional facilities throughout the United States, not all prisons have adopted end-of-life care programs. Such programs, like hospice and advance care planning, allow for the facilitation of the dying process and honoring of offender end-of-life wishes. Literature on the benefits of advance care planning with many populations is growing, however, no research to date has been conducted on the benefits of engaging offenders in this process. This study evaluated the process of developing an advance care planning program on an ambulatory care unit of a Midwestern medical classification prison. The program implemented, Honoring Your Wishes, was developed based on the Respecting Choices model of advance care planning. Offenders deemed likely to die within one year participated in facilitated advance care planning discussions with trained volunteers. Through the process of implementing this program in a correctional facility, multiple obstacles were identified that may impact future research in this area. These obstacles include: policy and protocols associated with medical care and transport, family involvement with dying offenders, offender rights associated with medical and end-of-life care, prison bureaucracy including state laws that impact the way advance care planning can be delivered in prisons, and the warden's role in honoring end-of-life wishes. As a first study on implementing advance care planning programs with dying offenders, this study sheds light on barriers that must be addressed to better meet the unique needs of offenders as more are aging and dying in place.

DEATH PERCEPTION: EFFECTS OF KNOWLEDGE OF THE END-OF-LIFE CARE AND EXPERIENCE OF DEATH OF FAMILY OR FRIENDS

M. Hong[1], S. Hong[2], M. Kim[3], *1. Indiana University, Indianapolis, Indiana, 2. University of Hawaii at Manoa, Honolulu, Hawaii, 3. Ehwa Womans University, Seoul, Republic of Korea*

Despite considerable evidence for fear of death, little research has focused on how knowledge about the end-of-life care affects death perception. This study examines the main effects and an interaction effect of knowledge about the end-of-life care and the experience of the death of family or friends on death perception. The data was drawn from a national interview survey in South Korea. A total of 1896 respondents aged from 46 to 64 are included in this study. A Death Perception Scale with 10-items was used to assess perception of death. The average age of the respondent was 56.12 (SD=5.152) and 51% of the respondent were male. Using hierarchical regression analysis, the main effects of knowledge about the end-of-life care and the experience of the death of family or friends in the last year and an interaction between these variables are examined. Demographic factors (i.e., age, education, gender, and religion), life satisfaction, and perceived health are also included in the regression model. Main effects and the interaction effect are all significant. Findings indicate that better knowledge of the end-of-life care is associated with more positive perception of death; however, the effect is stronger for those who have not experienced the death of family or friends. In addition, older age and higher life satisfaction are associated with more positive perception of death. This study contributes to a knowledge base that points to the necessity of death education. Replication studies with other ethnic groups would be needed to generalize the findings.

THE SOCIAL CONSTRUCTION OF DEATH: THE EMERGENCE OF LEGAL TERMINOLOGY TO DEFINE END-OF-LIFE CARE

R. Remle[1], H. Tyrrell[2], *1. Sociology, Francis Marion University, Florence, South Carolina, 2. University of Louisville, Louisville, Kentucky*

New terminology about death has developed in response to the growing use of life-sustaining technologies. In end-of-life cases that involve prolonged use of intensive care, the language used to discuss and diagnose death is now socially determined by legal terminology. Medical diagnoses of brain death, permanent vegetative state or persistent vegetative state have contributed to “naming and framing” discussions about end-of-life care as legal decisions. After the introduction of the living will in 1967, “do not resuscitate” orders, advance directives and healthcare proxy designations have become common terminology in relation to end-of-life care. We present a typology of the social construction of death and dying resulting from legal challenges over patients’ rights to deny or withdraw life-sustaining medical technology. We review the medical literature about advance directives and present a historical outline of landmark legal cases in this field to show that legal actions prior to or during care are now necessary to overrule life-sustaining treatments used by default during medical care. Because of the reliance on legal terminology to frame definitions of dying in a growing number of end-of-life care situations, we encourage service providers for older populations to advocate for individuals and their families to prepare advance directives and designate healthcare proxies before end-of-life care is needed. We conclude with a discussion of the social, economic and political implications of the evolving social, and increasingly public, definition of death framed within medical and legal terminology rather than within traditional, cultural frames.

ADJUSTMENT AFTER BEREAVEMENT: WHAT YOU DON’T DO MATTERS MOST

J. Henrie[1], J.H. Patrick[2], *1. Research Institute on Addictions, State Univeristy of New York at Buffalo, Buffalo, New York, 2. West Virginia University, Morgantown, West Virginia*

Despite the relatively common occurrence of bereavement, or experiencing the death of a loved one, there is considerable variability in individuals’ responses to that experience. In the present study, individuals’ responses to bereavement were investigated using the Stress and Coping Model (Lazarus, 1966; Lazarus & Cohen, 1977; Lazarus & Folkman, 1984) as a framework. Data from 436 individuals who were bereaved for 24 or fewer months prior to participation in the study were used to investigate associations between age, gender, emotion reactivity, coping, history of depression, grief, and adjustment (in terms of both positive and negative well-being) using a structural equation model ($\chi2$ (50) = 165.143, $p < .001$, $\chi2/df = 3.30$, CFI = .939, GFI = .944, RMSEA = .075). The model revealed that older participants, women, and those who reported using more avoidant/involuntary coping strategies reported more grief; that those who reported using more avoidant/involuntary coping, those who reported experiencing more grief, and those who reported having a history of depression reported more negative well-being; and that women, those who reported being less emotionally reactive, those who reported using fewer active engagement coping strategies, those who reported using more avoidant/involuntary coping, those who reported experiencing more grief, and those who reported having a history of depression reported lower positive well-being. Results are discussed in terms utility in identifying who may need more assistance after the death of a loved one and differences between the current sample and samples used in other bereavement research.

PERSONAL GROWTH THROUGH SPOUSAL BEREAVEMENT IN LATER LIFE

S. Chang, *Social Welfare, Kyungsung University, Busan, Republic of Korea*

This study purposes to explore the growing process through spousal bereavement in later life, and to develop the theory. A qualitative research was conducted, and the participants were 17 seniors. The analysis according to Strauss and Corbin’s grounded theory(1998), resulted in 143 concepts, 43 subcategories, and 19 categories. Range analysis according to paradigm showed that the causal conditions were “marital relationships,” “independent/dependent tendencies,” and “emotional readiness for the death of a spouse,” and the phenomena were “depression,” “hopelessness,” “daily stress,” “psychological intimidation,” “regret,” and “sense of being freed.” The contextual conditions that affect these phenomena were “desire for intimate personal relationships” and “desire to maintain independence”; the action/interaction strategies to manage the phenomena were “facing reality” and “efforts for construction of the new life”; and the mediating conditions that promote or suppress these action/interaction strategies were “social support” and “spirituality.” The results were “reconstruction of the meaning in life,” “increase in self-esteem,” “reinforcement of social network”, and “embrace and acceptance.” Furthermore, when personal growth after bereavement of a spouse was analyzed focusing on changes over time, the growth process consisted of three steps: “sadness and despair,” “embracing and moving forward,” and “personal growth.” The pattern analyses were performed to typify recurring relations by category, and 5 types were derived. The results of our study show that personal growth after spousal loss is an integrative process in life after crisis, and can be conceptualized as the process of overcoming the despair that immediately follows the death of a spouse, seeking a new life by actively taking control, and discovering a strengthened self.

THE ROTE ADMINISTRATIVE APPROACH TO DEATH IN SENIOR HOUSING: USING THE OTHER DOOR

H. Ewen, J.K. Chahal, *Sociology and Gerontology, Miami University, Oxford, Ohio*

Administrators of senior housing communities are bound by issues of confidentiality and HIPPA laws when releasing sensitive information to others. As such, administrators' approaches to notification of resident deaths may be inhibited. It is also possible that administrators' perceptions of how to approach death differ from those who experience it, such as staff members who provide direct care or peer residents (Gubrium, 1975). Results show that administrators spoke of approaching death in their facility similar to any other procedural task. The removal of the residents' body varied by community and those responsible for coordination ranged from maintenance crews, on-duty staff, and management. Notification practices were also inconsistent across communities: at beginning of shifts, email messages, word of mouth, or with the use of symbols in common areas. Differences exist in internal cultures on providing open or closed forms of respect, such as keeping the room open as the family packed possessions, or locked doors barring entry of resident friends. These practices are standard for some facilities while others are flexible to accommodate the resident/family requests. Additionally, a majority of the sites did not offer additional training and/or support on death and dying for family and staff members. It was often assumed that staff had previously obtained such training through their previous educational and professional experiences. Findings of the study suggest the need for changes in the way that senior housing staff members currently approach the death of a resident and providing support for staff and family members.

INFLUENCES OF SOCIAL INTEGRATION ON ATTITUDES OF ASSISTED SUICIDE

J.L. Mann, K.L. Costales, M. Plikuhn, *Department of Law, Politics, and Society, University of Evansville, Evansville, Indiana*

With four states passing legislation allowing assisted suicide, and several high profile legal cases capturing media attention, the debate over the "right" to die has become an important part of the national conversation on end-of-life concerns. Drawing from the work of Durkheim (1897/1986) on suicide and social integration, this study examines how varying types of social integration, both within the research participants and in the characters in the described scenarios, affect attitudes of assisted suicide. Using 250 adults, we investigated how participants responded to questions on assisted suicide and scenarios involving the choice of assisted suicide for imagined characters. Preliminary findings indicated that, much like the social patterns governing who commits suicide, the support for assisted suicide differs based on participants' level of social integration, or more specifically, by education level, religiosity, gender, region, and age. Further, when the characteristics of fictitious scenarios indicated a greater level of social integration, participants were much less likely to support their choice of assisted suicide. These findings provide interesting insight to the debate on the attitudes regarding the right to die and assisted suicide.

EVALUATION OF HOSPICE CARE BY FAMILY MEMBERS OF HISPANIC AND NON-HISPANIC PATIENTS

A.M. Kirkendall[1], J.M. Holland[1], J. Reid-Keene[1], N. Luna[2], *1. Social Work, University of Nevada Las Vegas, Las Vegas, Nevada, 2. Nathan Adelson Hospice, Las Vegas, Nevada*

The Hispanic older adult population is increasing rapidly, and past research suggests this demographic group under utilizes hospice services, highlighting the need to improve our understanding of their specific needs in end-of-life. The primary purpose of this study was to compare perceptions of hospice experiences as reported by caregivers of Hispanic versus non-Hispanic patients. This study relied upon information from the Family Evaluation of Hospice Care (FEHC) survey provided by 2,980 caregivers, 152 of whom cared for a Hispanic patient and 2,828 who cared for a non-Hispanic patient. Binary logistic regression was employed for binary outcomes, ordinal logistic regression was used for dependent variables measured on an ordinal scale, and multinomial logistic regression was used when the outcome variable was assessed on a nominal scale. In each analysis, patient's ethnicity (i.e., Hispanic vs. non-Hispanic) was entered as an independent variable, along with the control variables. Caregivers of Hispanic patients were more likely than non-Hispanic caregivers to report that hospice was inconsistent with the patient's wishes and felt they received more attention than desired for emotional issues. Caregivers of Hispanic patients were also more likely to express that emotional/spiritual forms of support were insufficient. Similar levels of satisfaction were reported for caregivers of Hispanics and non-Hispanics regarding dignity/respect, information received from hospice staff, coordination of care, and overall satisfaction, suggesting for the most part hospice adequately meets the needs of Hispanic patients and their caregivers. The implications of this study will inform future efforts to develop culturally sensitive models for hospice care.

SENIORITY AND MEDICAL ERRORS: A MULTI-SOURCE APPROACH FOR HEALTHCARE PROFESSIONALS

H. Weng, *Institute of Gerontology, National Cheng Kung University, Tainan City, Taiwan*

Introduction: Many studies indicate that medical errors decrease as the healthcare professional get more experienced. However, due to diversity and complexity of medical errors, current literature have limited evidence on the individual's experience of medical errors among different types of medical errors. This study aims to examine the association between medical errors and seniority for healthcare professionals. Methods: Using multi-source approach, this study collected samples from surgeons (n=250), nurse anesthetists (n=550), surgical nurses (n=669), physical therapists (n=445), and pharmacists (n= 560). The surgeons filled out the semi-structured questionnaires which included diagnosis errors, treatment errors, procedural errors, and communication errors. The nurse anesthetists, surgical nurses, physical therapists only filled out procedural errors and communication errors. In addition, in-depth survey for 110 healthcare professionals were conducted. Results: Our research finding indicate that types of medical errors for surgeons differ from those of paramedical personnel. Surgeons involved in broader types of medical errors, while the other personnel involved more in specific types of errors, i.e., procedural errors. When all personnel get experienced, all types of medical errors decreased, the percentage raged from 50 % to 10 %. However, communication errors only decreased from 35 % to 50 %.

BARTHEL INDEX OF ACTIVITIES OF DAILY LIVING: ITEM RESPONSE THEORY ANALYSIS FOR LONG-TERM CARE ADULTS

W. Liu, E. Galik, B. Resnick, *University of Maryland, Baltimore, Baltimore, Maryland*

Background The Barthel Index (BI) is a frequently-used measure of independence in activities of daily living (ADLs). Item functioning of various versions of the BI were examined using Rasch analysis. IRT models for ordered polytomous responses may provide more insight into item functioning across levels of independence in ADLs. Objectives To compare fit and appropriateness of the 1-parameter logistic model (1PL), partial credit model (PCM) and generalized partial credit model (GPCM) for the 15-item BI. Methods This study is a secondary analysis of baseline BI data from four randomized controlled trials for 788 residents from multiple long-term care facilities. Three different IRT-based models (1PL Rasch model, PCM and GPCM) were used to estimate item parameters. Fit of items and response vectors was assessed. Overall fit was compared across the three models. Results Item difficulties were similar for all three models. Most of the 15 items located at moderate level of functional independence. In all three models, "don brace" was the easiest ADL and "climbing stairs" was the most difficult. Multiple items showed misfit in both 1PL and PCM. PCM and GPCM item parameters and person proficiency estimates were highly correlated. The difference in deviance between the PCM and GPCM was significant. In the GPCM, most items showed good discrimination but several had negative or very low discrimination parameters. Discussion GPCM results suggested that further revision of the BI may be warranted. Because some items showed poor discrimination, caution should be used when measuring ADL independence with the BI item set.

CHARACTERISTICS AND OUTCOMES OF OLDER ADULTS WHO REFUSE POST-ACUTE CARE SERVICES

K.H. Bowles[1], M. Topaz[1], Y. Kang[1], D.E. Holland[2], *1. University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania, 2. Mayo Clinic, Rochester, Minnesota*

BACKGROUND: A significant part of high quality discharge planning is to assure that older adults have adequate post-acute care (PAC). However, the plans offered to patients are not always acceptable to them. The characteristics of those who refuse PAC and how their decisions affect outcomes are not well understood. AIMS: Compare socio-demographic and clinical characteristics, quality of life, and problems and unmet needs in patients who accepted PAC services to those who refused; (2) examine the association between PAC refusal and 30-day readmission. METHODS: Secondary analysis of 495 patients age 55 and older offered PAC. RESULTS: 28% refused PAC services. Refusers were significantly younger (68 years old versus 73, $p<.001$); married (61.8% versus 45.8%, $p<.001$); with private insurance versus Medicare or Medicaid (35.3% versus 18.3%, $p<.001$); had lower risk of mortality/severity of illness ($p<.001$); shorter lengths of hospital stay (4.8 days versus 7.5 days, $p=.001$); better quality of life ($p<.001$), and fewer problems/unmet needs after discharge ($p<.001$). Refusers' 30-day readmission rate was nearly 6% higher than accepters (18.7% versus 13%, $p=.12$). After adjustment for baseline characteristics, a logistic regression showed that refusers had higher odds of readmission ($OR=2.76$, $p=.002$) and patients with better QOL were less likely to be readmitted ($OR=.15$, $p=.015$). CONCLUSIONS: Younger, married, privately insured, and healthier patients tend to refuse PAC services, but have two times higher chances of 30-day readmission. Implications suggest investigating why patients refuse PAC, tailoring PAC interventions to patient preferences, and examining the reasons for readmissions among this relatively healthy cohort.

HOW TO IMPROVE STAFF'S END-OF-LIFE CARE EFFICACY IN ELDERLY CARE FACILITIES IN JAPAN

S. Kubota[1,2], S. Sato[1], *1. Osaka university, Osaka, Japan, 2. Reseach Fellow of Japanese Society for the Promotion of Science, Tokyo, Japan*

In Japan, demand is increasing for end-of-life (EOL) care in a daily-life setting at elderly care facilities. However, many care workers are reluctant to undertake such work. To cultivate a positive attitude toward EOL care among staff, this study focused on EOL care efficacy (ECE) based on social learning theory (Bandura, 1977). The purpose of this study was to examine the hypothesis that EOL care efficacy is explained by 4 theory-based factors: the number of opportunities to observe role models, the number of opportunities to receive linguistic persuasions, the frequency of feeling a sense of achievement, and an emotional response to EOL care. Through a mailed survey, 467 certified care workers completed two subscales of ECE scale: instrumental care efficacy and emotional care efficacy. They were also asked to report a number of care-provided experiences (control variables) and about the above 4 factors (explanatory variables). Confirmatory factor analysis almost supported the hypothesis ($CFI = .969$, $RMSEA = .071$), but the existence of role models did not significantly affect emotional care efficacy. This might be because emotional care is less visualizable than instrumental care and difficult to imitate. Linguistic persuasions were not significantly to instrumental care efficacy, perhaps because linguistic persuasions are easily denied by the clear outcomes of instrumental care. To motivate staff to perform EOL care, this study suggests using social leaning theory. However, relevant factors differ depending on the type of care; thus, the theory should be used for this purpose with careful attention to the type.

EFFECTS OF CAREGIVING ON CAREGIVERS' USE OF THE INTERNET FOR CAREGIVING INFORMATION

H. Li, *University of Illinois, Urbana, Illinois*

Using the data extracted from the Caregiving in the U.S. 2009 survey, this study describes caregivers' use of the Internet for caregiving information and examines effects of caregiving on caregivers' search for six specific types of online caregiving information. This study included 459 informal caregivers of community dwelling older adults. More than three-quarter and one half of caregivers searched for information about care receivers' conditions (77.1%) and treatments and services for care receivers (52.9%), respectively. Logistic regression analyses revealed effects of caregiving on caregivers' online search differed depending upon types of information. Care receivers' cognitive impairments increased the odd of caregivers' search for information about care receivers' conditions ($OR = 2.72$, $p =.001$), services for care receivers ($OR = 1.65$, $p =.03$), support for caregivers themselves ($OR = 2.32$, $p =.03$.), and care facilities ($OR = 2.67$, $p < .0001$). Caregiving strain increased the odds of caregivers' search for information about care receivers' conditions ($OR = 1.11$, $p =.04$), services for care receivers ($OR = 1.09$, $p =.03$), caregiving tasks ($OR = 1.19$, $p =.03$), and care facilities ($OR = 1.19$, $p =.0001$). Caregiving length increased the odds for caregivers' search for information about health care` professionals ($OR = 1.69$, $p <.03$) but reduced the odds for caregivers' search for information about care facilities ($OR =.52$, $p =.008$). Finally, caregiving hours were significantly related to caregivers' search for information about caregiving tasks ($OR = 1.43$, $p =.008$). The research and practice implications of these findings are discussed.

DEVELOPMENT AND PRELIMINARY EVALUATION OF THE CAREGIVER ASSISTIVE TECHNOLOGY OUTCOME MEASURE

W. Mortenson[1], L. Demers[2], M. Fuhrer[3], J. Jutai[4], J. Lenker[5], F. DeRuyter[6], *1. Occupational Science and Occupational Therapy, University of British Columbia, Vancouver, British Columbia, Canada, 2. University of Montreal, Montreal, Quebec, Canada, 3. National Insitututes of Health, Bethesda, Maryland, 4. University of Ottawa, Ottawa, Ontario, Canada, 5. University at Buffalo, Buffalo, New York, 6. Duke University, Charlotte, North Carolina*

Introduction: Assistive technology is often provided to improve users' independence and thereby reduce the burden on their informal caregivers, but no measure is currently available to capture the outcomes that caregivers experience after device provision. Therefore, the Caregiver Assistive Technology Outcome Measure was created to measure the impact of assistive technology interventions on the burden experienced by informal caregivers. Objective: To describe the development of the Caregiver Assistive Technology Outcome Measure and to report the preliminary evaluation of its psychometric properties. Methods: Based on an existing conceptual framework, a preliminary version of the Caregiver Assistive Technology Outcome Measure was created. Cognitive interviews were used to identify items that needed clarification. A revised version of the Caregiver Assistive Technology Outcome Measure and manual were then reviewed by clinicians. The measure was piloted as part of an intervention study evaluating the effect of assistive technology interventions on users' informal caregivers. Results: We developed a three-part measure, which we refined using cognitive interviews and clinician feedback. The first part of the measure identifies a specific problematic activity to be targeted, the second part measures the burden associated with that activity and final section records perceptions of overall burden. For the specific problematic activity and overall burden sections of the tool, the 6-week test-retest intraclass reliability coefficients were 0.88 (95% CI=.64-.96) and 0.86 (95% CI=.60-.95) respectively. The measure correlated as hypothesized with other measures. Conclusion: The Caregiver Assistive Technology Outcome Measure is a promising new measure with strong content validity and positive psychometric properties.

THE INTRAPERSONAL INFLUENCE: A COMPARISON OF SENSE OF COHERENCE AND SELF-ASSESSMENT OF OLDER ADULTS RECENTLY RELOCATED TO A NURSING HOME AND LIVING IN THE COMMUNITY

J. Bibbo, R. Johnson, *University of Missouri, Columbia, Missouri*

Relocation into a nursing home is a complex transition with multiple factors. We explored intrapersonal factors of (N = 307) European (EA) (n = 153) and African American (AA) (n = 154) community-dwelling older adults (n = 196) and those recently relocated into a nursing home (n = 111). The Orientation to Life Questionnaire assessed sense of coherence (SOC), the Self-Efficacy for Functional Abilities (SEFA), and the Iowa Self-Assessment Inventory assessed these factors. Two (ethnicity) by two (residence) factorial ANOVAs compared the groups at baseline; the Bonferroni correction was used. Results indicated that self-efficacy differed significantly between community-dwellers and nursing home-dwellers, F(1, 297) = 103.47, p < .001. AAs reported significantly more alienation than EAs, F(1, 273) = 11.21, p = .001; community-dwellers reported significantly less alienation than nursing home-dwellers, F(1,273) = 6.68, p = .01. EAs reported more social support than AAs, F(1, 292) = 4.87, p = .028; nursing home-dwellers reported less social support than community-dwellers F(1, 292) = 6.39, p = .012. SOC did not differ between groups but positively accounted for variation in better self-rated cognitive functioning and social support, and less anxiety/depression and alienation. Findings suggested that sense of coherence may impact older adults' self-assessment of interpersonal and intrapersonal resources. Self-assessment and self-efficacy may influence when older adults transition into a nursing home. Longitudinal analyses will explore whether these self-perceptions changed over a two month time period following the transition into a nursing home, providing insights about older adults' adjustment following this complex transition.

INDIVIDUAL AND PROVINCE INEQUALITIES IN HEALTH AMONG OLDER PEOPLE IN CHINA: EVIDENCE AND POLICY IMPLICATIONS

M. Evandrou[1,2], J.C. Falkingham[1,2], Z. Feng[1], A. Vlachantoni[1,2],
1. Centre for Research on Ageing, University of Southampton, Southampton, United Kingdom, 2. ESRC Centre for Population Change, University of Southampton, Southampton, United Kingdom

The design of adequate policies promoting good health and longevity for older people in China is a key policy challenge given the significant differences between provinces. This paper uses multi-level modelling to analyse data from the nationally-representative Chinese Health and Retirement Longitudinal Study (CHARLS) in order to investigate the characteristics associated with poor health among older people, including individual characteristics, household characteristics as well as the characteristics of the provinces in which the older person lives (contextual effects). The results show that female individuals, rural residents, those with an education level lower than high school, with no income sources, who are ex-smokers, and those from poor economic status households are more likely to report disability and poor self-rated health. Individuals living in provinces which are more developed and marketised are less likely to report difficulty with ADLs. Differentials in the health outcomes remain substantial between provinces even after controlling for a number of individual and household characteristics. This research raises policy-relevant questions about the effectiveness of health services for older people in China, particularly those in rural areas.

SESSION 245 (POSTER)

MENTAL HEALTH I

THE IMPACT OF LONELINESS ON OLDER ADULTS' PHYSICAL FUNCTIONING: HEALTH AND MOBILITY OUTCOMES

M.K. Eichorst[1,2], G. Lindley[1,2], C.J. Brown[3], R.S. Allen[1,2], *1. Psychology, University of Alabama, Tuscaloosa, Alabama, 2. Center for Mental Health and Aging, Tuscaloosa, Alabama, 3. UAB Comprehensive Center for Healthy Aging, Birmingham, Alabama*

Recent studies have shown that loneliness is strongly related to various negative outcomes. For example, loneliness can act as a catalyst in age-related health decline, including worsening sleep quality and increased blood pressure. Approximately 5 to 15% of older adults have reported frequent feelings of loneliness. Older adults face a greater threat of social isolation with overall health deterioration and shrinking social networks, vis-à-vis decreased mobility. With more frequent interaction with neighbors and community members being associated with lower levels of loneliness, mobility-limited or sick older adults may face unique challenges in cultivating an accessible network of contacts from which to derive feelings of connectedness. Several factors related to older adults' self-reported loneliness were examined. Sample included 457 older adults (mean age=73; 46% African American, 54% Caucasian) from the UAB Study of Aging. Results indicate that greater loneliness was significantly correlated with current self-reported lower health (r=.25, p<.001) as well as lower self-reported health 6 months later (r=.21, p<.001). Greater loneliness was also significantly correlated to lower current mobility, (r=.31, p<.001). A regression model revealed that loneliness (beta= -.07, p=.003) was a significant predictor of mobility 6 months later, even after controlling for age and current mobility score (F(3, 453)=474.16, p<.001). Implications include the impact of psychosocial constructs, especially loneliness, for physical outcomes such as health and mobility.

HAPPINESS AND SOCIAL DETERMINANTS ACROSS AGE COHORTS IN TAIWAN

H. Hsu, *Asia University, Taichung, Taiwan*

Purpose: The purpose of this study was to examine the happiness and its social determinants across different age cohorts in Taiwan. Methods: The data were from the 2011 "Taiwan Social Change Survey", a face-to-face nation-representative survey. The participants were aged 18 year old or more, and the sample size was 2,135 persons. The samples were divided to three age groups: young (age 18 to 39), middle-aged (age 40 o 64), and elderly (aged 65 or more). Happiness was measured by self-rated happiness level scored 1 to 5. Demographics, socioeconomic status, health and lifestyle, social capital, and quality of life were the predictors. The linear regression was used for the analysis. Results: The happiness level was not significantly different across age cohort groups. The common determinants to happiness across age groups were being non-smokers, having less negative affect and better quality of life. The specific determinants of happiness for the young group were being male, receiving less family support, less formal support, more social trust and more control over life; for the middle-aged group were being social drinkers and g more participation in social groups; and for the older group were lower educated, receiving less family support, higher economic status. Physical health, social class, marital and working status, religion, and using internet were insignificant. Conclusion: Living a healthy lifestyle and being independently, and a better quality of life determine happiness. Social connection factors seemed to be more related to the younger and middle-aged generations than the older cohort, while socioeconomic status determined happiness for the elderly.

RESILIENCE IN LATE-LIFE BEREAVEMENT: EXAMINING THE RELATIONSHIP BETWEEN RESILIENCE AND CUMULATIVE LIFETIME LOSS

S. Shah[1,2], J.L. Imel[1], S. Meeks[1], *1. Univ Louisville, Louisville, Kentucky, 2. VA Palo Alto Health Care System, Palo Alto, California*

Though much of the recent focus in bereavement literature has examined the nature and correlates of complicated grief, it is important to recognize that many older adults endure bereavements without major disruptions in emotional and daily functioning, despite the likelihood of having experienced numerous losses over a lifetime. This suggests an adaptive or resilient coping style within the context of late-life bereavement. The aim of this study was to expand our current knowledge of resilience in late-life bereavement. We investigated the relationships between cumulative lifetime loss, resilience-related coping/emotion-regulation strategies (affective complexity, positive emotions and repressive coping), and resilient vs non-resilient bereavement outcomes. Seventy-four recently bereaved, community-dwelling older adults completed study questionnaires assessing a variety of bereavement-related variables, including depression history history of loss, retrospective affect, current experiences of grief, depression, anxiety and well-being, and social and emotional functioning. While cumulative lifetime loss was largely unrelated to bereavement-related outcomes, experience of positive affect one month post-loss was associated with lower post-loss depression ($r = -.30$, $p < .05$), well being ($r = .25$, $p < .05$) and unimpaired social and emotional functioning ($r = -.28$, $p <. 05$ and $r = -.36$, $p <. 01$, respectively). These relationships highlight the role of positive affect in facilitating or maintaining adaptive post-loss functioning that could be emphasized in grief-related interventions. Suggestions for future research include examining the relationships between the cumulative impact of having experienced multiple bereavements, lessons learned/wisdom gained in the context of coping with loss, and bereavement outcome.

UNDERSTANDING SUICIDE ATTEMPTS AMONG COMMUNITY-DWELLING U.S. CHINESE OLDER ADULTS

R. Chen[1], E. Chang[1], M. Zhang[1], C. Li[1], J. Huang[1], M.A. Simon[2], X. Dong[1], *1. Rush Institute for Healthy Aging, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois*

Background: Suicide attempt is a strong risk factor for completed suicide. Greater cultural barriers and health disparity may place Chinese older adults at high risk for suicide attempts. Yet currently very few studies have been conducted on suicide attempts among U.S. Chinese older adults. This study aimed to examine the prevalence and methods of suicide attempts among community-dwelling Chinese older adults. Methods: Guided by the community-based participatory research approach, 3,159 community-dwelling Chinese older adults in the greater Chicago area were interviewed in person from 2011-2013. Suicide attempts were measured by the Geriatric Mental State Examination-Version A (GMS-A). Results: Of the 3,159 participants, 58.9% were female and the mean age was 72.8 (SD = 8.3). The lifetime prevalence of suicide attempts was 791 per 100,000 and the past 12-month prevalence of suicide attempts was 285 per 100,000. Medication overdose was the most common suicide method both in the group of lifetime suicide attempts and 12-month suicide attempts. Lower income was positively correlated with lifetime suicide attempts and 12-month suicide attempts. Living with fewer household members was positively correlated with lifetime suicide attempts but not with 12-month suicide attempts. Conclusion: Suicide attempt is a significant health issue among U.S. Chinese older adults. Future longitudinal studies should explore risk factors and outcomes associated with suicide attempts in U.S. Chinese aging populations. Policy makers and community stakeholders should improve efforts to improve public awareness of suicidal behaviors, reduce suicide-related stigma, promote mental health services, and extend timely and effective suicide interventions in the Chinese community.

UNDERSTANDING HOPELESSNESS AMONG COMMUNITY-DWELLING CHINESE OLDER ADULTS IN THE GREATER CHICAGO AREA

M. Zhang[1], E. Chang[1], K. Lam[1], R. Chen[1], J. Ruan[1], X. Dong[1], M.A. Simon[2], *1. Rush Institute of Healthy Aging, Chciago, Illinois, 2. Northwestern University, chicago, Illinois*

Background: Hopelessness is an important indicator for psychological well-being. We know very little about the feelings of hopelessness in the U.S. Chinese aging population, the largest and oldest Asian population in the U.S.This study aimed to examine the prevalence of hopelessness among community-dwelling U.S. Chinese older adults. Methods: Data were drawn from the PINE study, a population-based study of Chinese older adults aged 60 and above in the greater Chicago area. Beck Hopelessness Scale -7 was used to examine feelings of hopelessness(Cronbach's alpha=0.82). Data were collected through face – to-face interviews.Results: Of the 3,159 community-dwelling Chinese older adults, 58.9 % were women and the mean age was 72.8 (SD = 8.3). An overall of 40.9 % of the participants reported having hopelessness thoughts.As the most commonly reported hopeless thought, 20.0 % of the participants agreed it was very unlikely to get any real satisfaction in the future.Being older ($r=0.13$, $p<0.001$), being unmarried ($r=-0.09$, $p<0.001$), living with fewer people ($r=-0.05$, $p<0.01$), having been in U.S. for more years ($r=0.08$,$p<0.001$), having been in the community for more years ($r=0.05$,$p<0.01$), having lower overall health status($r=-0.27$, $p<0.001$), poor quality of life ($r=-0.20$, $p<0.001$), and worsened health status over the last year ($r=-0.15$, $p<0.001$) were more likely to report having hopelessness feelings. Conclusion:The feelings of hopelessness were prevalent among community-dwelling U.S. Chinese older adults in the greater Chicago area. Further longitudinal studies are needed to examine the risk factors and outcomes of hopelessness among U.S. Chinese older adults.

GRIEF VS. DEPRESSION: A DEFINING LINE IN OLDER ADULTS WITH AGE RELATED MACULAR DEGENERATION

C.M. Samatas, M. Takahashi, *Northeastern Illinois University, Chicago, Illinois*

Much attention has been paid to the presence of depression and its negative impact on individuals with AMD, but little is known about the comorbid effects of grieving. In this study, we assessed the changes in mood, actions, and behaviors that typically occur in one third of older adults affected with macular degeneration (AMD). In particular, we focused on identifying the orientation of these changes as being symptoms of depression and/or grieving. Through an on-line survey, a total of 115 participants (72 women and 43 men) with ages ranging from 55-85 years old responded to the Grief Diagnostic Instrument (GDI) and the Geriatric Depression Scale (GDS). The result showed that 32% of all participants with AMD were depressed while 54% were identified as grieving. Among those who were found to be grieving, 30% showed no sign of depression. Further, it was also found that for 85% of the participants with AMD the grieving process still remained unresolved after two years. In fact, in participants with AMD, not only had the grieving process gone beyond the normal processing period, but the perception of loss and its severity was shown to be considerably greater than in those participants without AMD. These results suggest that there is a measurable difference between grief and depression, which supports researchers who have been investigating the differences between the symptomology, course and prognosis of each condition.

MENTAL HEALTH SERVICE USE BY OLDER ADULTS: EXPLORING THE RELATIONSHIPS BETWEEN FINANCIAL HARDSHIP, SOCIAL SUPPORT, PSYCHOLOGICAL WELL-BEING, AND OPENNESS TO RECEIVING TREATMENT

K. Ford, G. Kim, *Psychology, University of Alabama, Tuscaloosa, Alabama*

Objectives: This study was designed to examine the relationships between significant barriers to older adults' mental health service (MHS) utilization. We hypothesized that levels of financial hardship, social support, and psychological well-being would contribute to openness to using MHS, which would, in turn, affect past-year MHS utilization. Methods: Drawn from the nationally-representative Collaborative Psychiatric Epidemiology Surveys (CPES),the selected sample included 4,888 adults aged 55 and older. Latent constructs of financial hardship, social support, psychological well-being, and openness to using MHS were tested by conducting confirmatory factor analysis. A series of latent regression models was used to test the relationships among those constructs as well as to predict MHS use. Results: Results from the final latent regression model show that although openness to using MHS directly affected MHS use (Ψ=0.057, $p<0.01$), all other variables also had significant direct effects, including social support (Ψ=0.087, $p<0.01$), financial hardship (Ψ=-0.126, $p<0.01$), and psychological well-being (Ψ=-0.592, $p<0.01$). Only social support had a significant effect on openness to MHS (Ψ=0.179, $p<0.01$), and thus could have an indirect effect on actual MHS use through openness to MHS. Conclusions: Higher socioeconomic status and poorer psychological health contribute to higher likelihood of actual past-year MHS use, but not openness to MHS use. Better social support is positively associated with openness to MHS, which, in turn, contributes significantly to MHS use. Thus, policies that make services more affordable for older adults, and public education campaigns targeting both older adults and their major support networks could help increase older adults MHS use.

RELIGIOUS COPING AND MENTAL HEALTH AMONG UNDERSERVED AFRICAN AMERICAN OLDER ADULTS

K. Ramos[1,2,3], J. Cummings[2,3], M.A. Stanley[2,3], *1. University of Houston, Houston, Texas, 2. Baylor College of Medicine, Houston, Texas, 3. Michael E. DeBakey VA Medical Center, Houston, Texas*

Barriers to accessing psychological services among African American elders include high poverty levels, mistrust of the medical community, continued societal marginalization, and the stigma of mental illness (Black, et al 2011; Neighbors et al., 2007). However, African American elders report religious involvement as a coping mechanism to manage mental health (Chatters, et al 2011). For example, they pray, read religious materials, and attend religious services more than older adults in other ethnic groups (Krause & Chatters, 2005). Studies have found positive effects of religiousness in African American elders in relation to lower levels of depression (Black et al., 2011). Recent research has called attention to the value of integrating religion in care for older adults across multiple health and medical settings (George et al., 2013). However, little is known about the role of religion as it relates to anxiety and well-being in underserved African American older adults. This proposal examines the relations of religiousness and religious coping with depression and anxiety in low-income African American elders. Our findings suggest that negative religious coping (e.g., feeling abandoned by God) is associated with anxiety ($\beta = .35$, $p < .01$) and depression ($\beta = .27$, $p < .05$). Moreover, frequent use of private religious practices was linked to low levels of depression ($\beta = .33$, $p < .05$). Further analyses of the relations between religiousness and satisfaction with life will be examined and clinical implications of using religion to engage African American elders in mental health care will be offered.

LIFE SATISFACTION AND PERSONALITY IN THE OLDEST-OLD: THE ROLE OF SOCIAL CONTEXT AND HEALTH IN RELATION TO NEUROTICISM AND EXTRAVERSION

A. Berg, T.H. Andrén, *Department of Psychology, University of Gothenburg, Gothenburg, Sweden*

Recent studies on aging and well-being have suggested the utility of focusing on subgroups of the heterogeneous old-old population (e.g. Gerstorf, Smith, & Baltes, 2006). In the present study we apply a subgroup perspective to the study of the relationship between life satisfaction and the personality dimensions of neuroticism and extraversion in a sample of 453 individuals aged 80+. Our results demonstrate that introverted and emotionally unstable individuals were less satisfied with their lives, but emotionally stable introverts did not differ from emotionally stable extraverts. Further analyses showed that health and social network characteristics were uniquely associated with emotionally unstable and emotionally stable individuals. A greater portion of variance in life satisfaction was accounted for by multiple variables in the emotionally unstable group. Although no causal inferences can be drawn, our findings can direct recommendations for interventions.

RELATIONSHIPS OF ANXIETY WITH ANXIETY SENSITIVITY, EXPERIENTIAL AVOIDANCE, AND MINDFULNESS IN OLDER ADULTS

C.T. Mahoney, D.L. Segal, *University of Colorado at Colorado Springs, Colorado Springs, Colorado*

Anxiety is common among older adults and can be defined as a feeling of worry, apprehension, unease, or tension about an internal or external experience that has an ambiguous connotation. The purpose of this study was to explore potential risk factors for anxiety symptomatology in older adults, namely anxiety sensitivity, experiential avoidance, and absence of mindfulness. Participants were 41 community-dwelling older adults (M age = 69 years) who anonymously completed the Geriatric Anxiety Scale (GAS; Segal et al., 2010) as a measure of trait anxiety symptoms, the Anxiety Sensitivity Index-3 (ASI-3; Taylor et al., 2007) as a measure of anxiety sensitivity, the Acceptance and Action Questionnaire-II (AAQ-II; Bond et al., 2011) as a measure of experiential avoidance, and the Kentucky Inventory of Mindfulness Skills (KIMS; Baer, Smith, & Allen, 2004) as a measure of mindfulness. As expected, trait anxiety (GAS total score) was significantly positively related to anxiety sensitivity ($r = .49$) and experiential avoidance ($r = .80$), and significantly negatively related to mindfulness ($r = -.38$). Anxiety sensitivity was significantly related to experiential avoidance ($r = .58$), and mindfulness ($r = -.33$). Lastly, experiential avoidance was significantly related to mindfulness ($r = -.42$). Finally, multiple regression was used to examine the contributions of all three factors in predicting trait anxiety. The total variance was 64% (R2, adjusted R2 = .61), $F(3, 36) = 21.48$, $p < .001$, with experiential avoidance (standardized $\beta = .74$) as the only significant (positive) predictor. These findings add to the growing literature that anxiety sensitivity, experiential avoidance, and mindfulness are all meaningfully related to trait anxiety among older adults, indicating that they may be risk factors for anxiety-related pathology.

DOES SOCIAL COHESION MODIFY THE RELATION BETWEEN FUNCTIONAL DISABILITY AND MENTAL WELL-BEING?

S. An, Y. Jang, *School of Social Work, University of Texas at Austin, Austin, Texas*

Social cohesion as part of social capital may play an important role in older individuals' health and well-being. The purpose of this study was to identify (1) the direct effects of functional disability and social cohesion on mental well-being and (2) the buffering effects of social cohesion in the relation between functional disability and mental well-being. Data were drawn from 4,733 community-dwelling older adults included in the NHATS (National Health & Aging Trends Study)

Round 2 (M age = 76.36, SD = 7.27). Multivariate models of mental well-being, measured with the PHQ-4 scale, were estimated in order to test the direct and moderating effects of functional disability and social cohesion. In the direct effect model, both functional disability and social cohesion were found to have negative effects on mental well-being. In addition, their interaction was found to be significant ($\beta = -.03$, $p < .05$). To further explore the interaction effect, the sample was divided into three groups based on the mean and standard deviation of social cohesion. The group with the lowest social cohesion showed a stronger correlation between functional disability and mental well-being ($r=.331$, $p<.001$, $n=1422$) than the group with the highest social cohesion ($r=.232$, $p<.001$, $n=1581$), and the difference was significant ($z=2.94$, $p <.01$). Findings indicate that social cohesion attenuates the negative impacts of functional disability and protect mental well-being of older individuals. Intervention efforts to promote health and well-being in later life should address environmental and community contexts.

SOCIAL SUPPORT, SELF-EFFICACY AND PSYCHOLOGICAL DISTRESS IN BLACK AND WHITE OLDER ADULTS

R.T. Morin, E. Midlarsky, *Clinical Psychology, Columbia University, Teachers College, New York, New York*

Social support and self-efficacy are protective against psychological distress in late life, findings that have implications for theory and intervention as the population ages. However, not all minority groups have been adequately studied. In particular, African Americans have received little empirical attention. In the present study, samples of 164 African American and 146 Caucasian community-dwelling older adults referred for mental health services reported their satisfaction with social support, their perceived self-efficacy and symptoms of psychological distress. A path model investigating the separate relationships among these variables, among African American and Caucasian participants, explained a greater amount of the variance than the model for all participants combined—underscoring the importance of separately studying demographic subgroups. For both groups, greater perceived self-efficacy was significantly associated with lower psychological distress. When social support was investigated, however, Caucasians' satisfaction with social support was significantly associated with lower distress, while in the African American sample, there was no relationship between social support and psychological distress. Additionally, the exploratory mediation analysis indicated that the impact of self-efficacy by social support on psychological distress was stronger for the African American sample than for the Caucasian sample. The importance of investigating possible differences in mechanisms of well-being and successful aging among racial subgroups, as well as potential theoretical explanations and clinical implications of these findings, are discussed.

IS IT SAD OR LONELY AT THE TOP? A COMPARISON OF PSYCHOSOCIAL INDICATORS OF DEPRESSIVE AFFECT AND LONELINESS REPORTED BY CENTENARIANS

J. Taylor, A.J. Bishop, *Oklahoma State University, Stillwater, Oklahoma*

The purpose of the current study was to compare psychosocial indicators of depressive affect and loneliness reported by centenarians. Data originated from a pilot study community-dwelling centenarians $N=154$ ($M = 101$; $SD = 1.71$) residing in Oklahoma. Hierarchical regression analyses using pair-wise deletion was employed, while controlling for the influence of confounding variables including subjective age, gender, education, perceived health, and life traumas. Results indicate that centenarians who reported significantly higher degree of educational attainment ($b = -.15$, $p < .05$) low degree of lifetime exposure to major disasters ($b = .18$, $p < .05$) and low degree of neuroticism ($b = .47$, $p < .05$) also maintained lower depressive affect. Variables within this overall model accounted for 39% of the variance in depressive affect. In addition, loneliness among centenarians appeared to be significantly reduced by higher degree of educational attainment ($b = -.19$, $p < .05$), greater degree of social support ($b = .445$, $p < .05$) and lower degree of neuroticism ($b = -.30$, $p < .05$). Overall, variable in the model accounted for 36% of the variance in loneliness. Results from this study have implications relative to how geriatric clinicians and practitioners seek to improve mental health among long-lived adults.

THE DEVELOPMENT OF AN INTERNATIONAL META-TOOL FOR PAIN IN COGNITIVE IMPAIRMENT: THE PAIC-TOOLKIT

W. Achterberg, *1. LUMC, Leiden, Netherlands, 2. EU-COST, Brussels, Belgium*

Background: Pain is common in people with dementia, yet treatment is often ineffective and identification is challenging. A number of pain assessment tools exist, utilizing observation of pain-related behaviours and facial expressions. However, these often lack sufficient evidence of psychometric properties and are not internationally implemented. The EU-COST initiative "Pain in impaired cognition, especially dementia" aims to combine the expertise of clinicians and researchers to address this important issue by building on previous research in the area, identifying existing pain assessment tools for dementia, and developing consensus for items for a universal meta-tool for use in research and clinical settings. This paper reports on the initial phase of this collaboration task. Methods: All existing observational pain behaviour tools were identified and elements categorised using a three-step reduction process. Selection and refinement of items was achieved through scrutiny of the evidence, consensus of expert opinion, frequency of use and alignment with the AGS guidelines. Results: 12 eligible assessment tools were identified, and pain items categorised according to behaviour, facial expression and vocalisation according to the AGS domains 1 – 3. This has been refined to create the PAIC-toolkit for evaluation. Conclusions: This multidisciplinary, cross-cultural initiative has created a draft Meta-tool for capturing pain behaviour to be used across languages and culture, based on the most promising items used in existing tools. The draft PAIC-toolkit will now be taken forward for evaluation according to COSMIN guidelines and the EU-COST protocol in order to refine included items and optimise the tool.

THE PROTECTIVE EFFECTS OF RELIGIOSITY ON DEPRESSION: A 2-YEAR PROSPECTIVE STUDY

C.R. Ronneberg, E.A. Miller, E. Dugan, F.W. Porell, *Gerontology, University of Massachusetts Boston, Boston, Illinois*

Approximately 20% of older adults are diagnosed with depression in the United States. Extant research suggests that religious activity, or religiosity, may serve as a protective factor against depression. This study examines whether religiosity protects against depression and/or aids in recovery. Data are drawn from the 2006 and 2008 waves of the Health and Retirement Study. The sample consists of 1,992 depressed and 5,740 non-depressed older adults (mean age = 68.12 years) at baseline (2006) for an overall sample size of 7,732. Logistic regressions were employed to assess the relationship between organizational (OR), non-organizational (NOR), and intrinsic (IR) measures of religiosity and depression onset (in the baseline non-depressed group) and depression recovery (in the baseline depressed group) at follow-up (2008), controlling for other baseline factors. Religiosity was found to both protect against and help individuals recover from depression. Individuals not depressed at baseline remained non-depressed two years later if they frequently attended religious services (OR factor), while those depressed at baseline were less likely to be depressed at follow-up if they more frequently engaged in private prayer (NOR factor). Findings suggest that organizational as well as non-organizational forms of religiosity affect depression outcomes in different circumstances (i.e., onset and recovery, respectively). Important strategies to prevent and relieve depression among older adults may include improving access and transportation to places of worship amongst those interested in attending services and encouraging discussions around religious activity with mental health professionals.

GENETIC FACTORS AND COGNITIVE AGING: EVIDENCE FOR NEURODEGENERATIVE GENETIC PLASTICITY

S.K. Runge[1], B. Small[1], G. McFall[2], R.A. Dixon[2], *1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. University of Alberta, Edmonton, Alberta, Canada*

Genetic and environmental factors have the potential to modify cognitive aging, as evidenced by our recent observation that the Apolipoprotein (ApoE) e4 allele constrained the benefits of cognitively-stimulating lifestyle activities (CSLA) in typical aging. In an extension of this research, our first objective was to examine the interactive relationship between Clusterin (CLU) genotype (a risk factor for Alzheimer's disease) and two types of CSLA: integrated information processing (CSLA-II) and novel information processing (CSLA-NI). Our second objective was to examine how this relationship was modified by additional individual factors, such as level of education and ApoE genotype. Using three-wave data across six years of follow-up from the Victoria Longitudinal Study (VLS), we used latent growth analyses to estimate the relationship between CLU and CSLA on changes in cognitive performance (n = 277; ages 55-94). We found significant interactions between CLU, education, CSLA, and ApoE genotype for outcomes in processing speed, and episodic and semantic memory. For all CLU genotypes, higher frequency of participation in CSLA-NI and higher levels of education were associated with higher cognitive outcomes ($p < .05$); however, this effect was more pronounced for the at-risk C/C carriers. Interestingly, the negative effect of ApoE e4 on cognitive performance was only seen in non-risk C/T or T/T carriers ($p < .05$). The results provide additional support that certain genotypes may act "plasticity" factors which make individuals more or less responsive to the protective benefits of cognitive stimulation.

CHANGE IN COGNITIVE FUNCTION: FINDINGS FROM 2 WAVES OF THE NEW ZEALAND LONGITUDINAL STUDY OF AGEING

F. Alpass, L. Callow, C. Stephens, B. Stevenson, *Psychology, Massey University, Palmerston North, New Zealand*

Cognitive decline refers to a range of changes that may vary from mild (those associated with normal ageing) to severe where the ability to perform activities of daily life (e.g., paying bills, medical regimes, planning activities, dressing, bathing) is greatly impacted. The progression of cognitive decline highlights the need for assessment over time as studies have shown that subtle changes can be measured even over short periods, especially in the oldest age groups. This paper looks at changes in cognitive function over 2 years for participants in the New Zealand Longitudinal Study of Ageing (NZLSA). In 2010 1,001 participants aged 49-84 years completed Addenbrooke's Cognitive Examination Revised (ACE-R). Participants were re-tested two years later. ACE-R scores in 2010 and 2012 were highly correlated, $r=.71$, $p<.001$. There was a slight drop in mean ACE-R total scores between wave 1 ($m=93.40$, $sd=5.25$) and wave 2 ($m=92.32$, $sd=6.01$). Just over half those who were retested had a decrease in ACE-R score between waves (482, 54.5%), while 34.5% improved. Comparing those who declined to those who stayed the same or improved, decliners were older, had lower educational attainment, were in poorer health, and were more likely to rate their memory as poorer now (2012) than it had been at wave 1. These findings are consistent with age related declines in cognitive functioning. However, the significant proportion who improved scores between the two waves highlights the considerable heterogeneity within older aged cohorts in the occurrence, rate and type of cognitive decline with age.

COMMUNITY CHOIRS TO PROMOTE HEALTH IN DIVERSE OLDER ADULTS: COMMUNITY OF VOICES STUDY DESIGN AND BASELINE CHARACTERISTICS

J.K. Johnson[1,2], J. Santoyo-Olsson[1], R.R. Freyre[1], S. Gregorich[2], A. Stewart[1,2], C.E. Armenta[1], D. Pounds[1], A.M. Napoles[2], *1. Institute for Health and Aging, University of California, San Francisco, San Francisco, California, 2. Center for Aging in Diverse Communities, University of California, San Francisco, San Francisco, California*

OBJECTIVE: Describe the Community of Voices (Comunidad de Voces) intervention, study design, implementation, and participants' baseline characteristics for those enrolled to date in a research study examining the efficacy of a 1-year community choir program to promote health and well-being of ethnically diverse older adults. METHODS: This study uses a cluster-randomized controlled trial in which 12 San Francisco Administration-on-Aging (AoA) senior centers are being randomized in matched pairs to either: begin the choir immediately (intervention group) or wait 6 months to begin (control group). Participants attend weekly 90-minute choir sessions for 12 months that provide culturally-appropriate repertoire with a combination of socio-emotional, cognitive, and physical engagement. We are collecting primary and secondary outcomes that focus on psychosocial, physical function, and cognition using the NIH Toolbox and legacy measures, as well as completing a cost-effectiveness analysis. RESULTS. To date, we have randomized 6 of 12 sites and enrolled 185 participants. The sample is 36% non-Latino White, 28% African American, 25% Latino, and 12% Asian/Pacific Islander; mean age is 71.5 years (range 60-88, SD=7.2); 70% are women. Twenty percent has less than a high school education, and 27% rated their health as fair or poor. Implementation of computer-administered NIH Toolbox assessments and performance measures in low-resource senior centers will be discussed. CONCLUSIONS: Working collaboratively with AoA senior centers and a community music center has facilitated recruitment. If the intervention is found to be efficacious, it could serve as an easily translatable cost-effective model for promoting optimal aging and reducing health disparities.

FUNCTIONAL AND DECISION MAKING CAPACITY AND QUALITY OF LIFE IN BRAZILIAN OCTOGENARIANS AND NONAGENARIANS

A.R. Mirandola, A.G. Bós, *Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, RS, Brazil*

Introduction: The aging population is a challenge of this century, impacting society and imposing needs of structural adjustments. The longevity involves numerous changes in people's lives, mainly in the oldest-old (80+ years) and when associated with functional disability may impair health, precluding an autonomous life and impairing quality of life. Methods: This study was descriptive analytical cross-sectional quantitative research in the oldest-old (80 years or more) of RS. The instruments used were general questionnaire, a survey of interaction between the oldest-old and his/her life, assessment of functional independence, quality of life, and ability to make decisions. Results: The sample consisted of 47 oldest-old, divided in octogenarians (19) and nonagenarians (28). The average of moral psychological phase of octogenarians was classified as conscientious and nonagenarians' average was conformist. Both groups showed greater loss in decisions related to activities at home. Nonagenarians had worse functional capacity and quality of life when compared to octogenarians. The quality of life was associated with functional capacity and ability to decision making. Conclusions: Investigating factors that may contribute to the oldest-old has higher quality of life is essential for the restructuring of services, public health action plan and providing care with dignity, reaching to maintain functional independence as long as possible, preservation or recovery autonomy and always give priority to a better quality of life of seniors in the final stage of their lives. KEYWORDS: Oldest old; Personal autonomy; Quality of life, Physical functioning

COMPLICATED GRIEF TRAJECTORIES AND ASSOCIATED RISKS

D. Hyun, J. Seok, A. Choi, I. Nam, *Hallym University, Chuncheon, Republic of Korea*

Background: Trajectories of grief can vary during times of bereavement, such as when a caregiver loses a loved one. Given apparent similarities between symptoms of grief and depression, research and theory have often confounded the two. In fact, the construct of grief is distinct from depression and may also have distinct trajectories. Methods: To investigate trajectories of grief and depression, this paper uses data from 221 caregivers recruited from the Resources for Enhancing Alzheimer's Caregiver Health (REACH) project who lost a family member with dementia during the course of the study. Results: Group based mixture modeling identified two distinct trajectories of grief: persistently high and persistently low. Three distinct trajectories of depression were identified: persistently high, medium, and low. Those in the high grief trajectory group were more likely to also be in the high depression trajectory group, whereas those in the low grief trajectory group were more likely to also be in the low depression trajectory group. Significant differences in the proportions between grief trajectory membership and depression trajectory membership suggest that their patterns over time are distinct. Conclusions: Findings provide important insights into the long-term trajectory of emotions during bereavement, which will likely enhance understandings of bereavement-related psychological distress and lead to the development of long-term interventions for the bereaved.

ANXIETY SYMPTOMS AMONG COMMUNITY-DWELLING U.S. CHINESE OLDER ADULTS

R. Chen[1], E. Chang[1], M. Zhang[1], I. Lin[1], M.A. Simon[2], J. Huang[1], X. Dong[1], *1. Rush Institute for Healthy Aging, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois*

Background: Anxiety is a major health problem in late life, yet little is known about anxiety symptoms among Chinese older adults. This study aimed to explore the prevalence and correlates of anxiety symptoms among U.S. Chinese older adults. Methods: Data were from a population-based study of community-dwelling U.S. Chinese older adults aged 60 years and above in the greater Chicago area. Anxiety symptoms were measured by the Hospital Anxiety and Depression Scale (HADS-A) (Cronbach's alpha = 0.80) in face-to-face interview format. Results: Of the 3,159 participants, 58.9% were female and the mean age was 72.8 (SD = 8.3). In total, 65.0% of the participants reported having any anxiety symptoms. Women ($r=0.14$, $p<0.001$), being unmarried ($r=0.07$, $p<0.001$), living with fewer people ($r=0.05$, $p<0.01$), having fewer children ($r=0.04$, $p<0.05$), poor health status ($r=0.27$, $p<0.001$), lower levels of quality of life ($r=0.22$, $p<0.001$) and worsening health changes over the past year ($r=0.15$, $p<0.001$) were positively correlated with any anxiety symptoms among U.S. Chinese older adults. Conclusions: This study emphasizes the need for improving knowledge pertaining to anxiety symptoms among minority older adults. In addition to epidemiologic investigations on prevalence and risk factors of anxiety symptoms, concerted efforts should be put into developing and promoting evidence-based psychotherapy treatments. Community organizations should improve awareness on anxiety symptoms and promote mental health care for U.S. Chinese older adults. Special attention should be given to older women, those who are unmarried, living alone, childless, and with impaired health status and inferior quality of life.

SESSION 250 (POSTER)

SEXUALITY AND AGING

SEXUALITY AND CONSENT IN LONG-TERM CARE: A QUALITATIVE INVESTIGATION OF CURRENT POLICIES, PROCEDURES, AND UNMET NEEDS

M. Syme[1,2], E. Caalaman[2], P.A. Lichtenberg[3], J. Moye[4], L. Mona[5], *1. San Diego State University, San Diego, California, 2. University of San Diego, San Diego, California, 3. Wayne State University, Detroit, Michigan, 4. VA Boston Healthcare System, Boston, Massachusetts, 5. VA Long Beach Healthcare System, Long Beach, California*

Older adults are sexual beings who continue to engage in sexual and intimate activities across their lifespan. However, sexual rights are rarely acknowledged in long-term care (LTC) settings, as it is complex and stigmatized. Providers across disciplines in long-term care face several challenges in sexual and intimate expression management. In order to better understand the challenges and unmet needs in long-term care, a qualitative needs assessment was conducted with a convenience sample of nursing directors of long-term care facilities across the United States (N=20). In-depth, semi-structured interviews were conducted assessing sexual expression management and sexual consent assessment. This included: current policies and procedures, current management and assessment practices, perceived challenges and barriers to patient-centered sexual expression management, unmet needs in sexual expression management, and suggestions for future resources, policies, and procedures. Interviews were audio-recorded and transcribed for analysis. Constant comparative analysis (CCA) was utilized on a subset of interviews for initial development of codes and themes. Initial themes identified included: common challenges to sexual expression management (e.g., balancing patient autonomy and protection from harm, family involvement), importance of specific resources for successful management (e.g., presence/lack of sexuality training, available procedures to consult), and negotiating the environment in long-term care (e.g. privacy issues, time scarcity). Remaining transcripts continue to be analyzed via constant comparative analysis method, with multiple researchers for reliability considerations. Themes and connections will be presented to form a framework for understanding current practices and unmet needs relating to sexual expression management and consent assessment in a long-term care.

PHYSICAL FRAILTY AND SEXUALITY: THE ROLES OF POSITIVE AND NEGATIVE AFFECT?

C. Juang, B.G. Knight, *University of Southern California, Los Angeles, California*

Previous studies have suggested that lower sexual satisfaction and desire in older adults are associated with decline in physical health and condition. The aim of this study is to investigate emotional pathways that explain the association between physical frailty and sexuality among married individuals. Past studies have highlighted the importance of emotional well-being on sexuality. Thus, we hypothesized that increased physical frailty is associated with lower sexual well-being through increased negative affect and decreased positive affect. Our sample included 760 married individuals across the lifespan from the Midlife in the United States (MIDUS) survey who completed both questionnaires and biomarker assessments. Sexuality was a latent construct measured via three items on sexual satisfaction, control and effort. Physical frailty was assessed using Basic Activities of Daily Living, Timed Walk, and Chair Stand Task. Positive and negative affect was measured via the Positive and Negative Affect Scale (PANAS). We used structural equation modeling to test the two mediators simultaneously. The model demonstrated good fit, $\chi 2$ (16, N=716) = 35 (p= .003), CFI= .982, TLI= .969, RMSEA= .041, SRMR= .031. Results suggested that the indirect effect of physical frailty via positive affect was significant

(Z= -2.046, p < .05), whereas the indirect effect via negative affect was not. Findings suggested that in the context of physical frailty, lack of positive affect may have a stronger effect on sexual well-being than increased negative affect.

OLDER ADULT SEXUALITY: COMPARING KNOWLEDGE AND ATTITUDES OF HEALTHCARE PROVIDERS AND EDUCATORS

S.A. Jacobson, *Quinnipiac University, North Haven, Connecticut*

Older adult sexuality is increasingly an area of research, particularly the knowledge and attitudes of healthcare providers and educators. There are three available scales for measuring knowledge and attitudes toward older adult sexuality, but the Aging Sexual Knowledge and Attitudes Scale (ASKAS) (White, 1982a; White, 1982b; White & Catania, 1982) is the only one regularly cited by researchers and used as a scale to measure knowledge and attitudes of healthcare providers, educators, and older adults. According to a search on Web of Knowledge, researchers cite the ASKAS in 94 articles, including literature reviews, correlational studies, and experimental designs. Nonetheless, none of the articles compare knowledge and attitudes across a variety of disciplines. Based on a comparison of results from the available articles, medical and psychology doctoral students had the most knowledge of older adult sexuality (Snyder & Zweig, 2010), followed closely by health educators (Glass & Webb, 1995). On the other hand, older adults in a wellness program had the least knowledge of older adult sexuality (Steinke, 1994), followed closely by other community dwelling older adults (Steinke, 1994) and college students (Hillman & Stricker, 1996a). Additionally, health educators had the most permissive attitudes (Glass & Webb, 1995) and gynecologists had the most restrictive attitudes (Langer-Most & Langer, 2010). These results will be compared to self-reported knowledge and attitudes toward older adult sexuality. Due to a number of limitations of the available scales, suggestions will be made for future research and the development of an updated scale.

CHANGING SEXUAL PRACTICES IN INTIMATE RELATIONSHIPS IN LATER LIFE – A LIFE COURSE PERSPECTIVE

T. Bildtgård[1], P. Öberg[2], *1. Social work, Stockholm university, Stockholm, Sweden, 2. University of Gävle, Gävle, Sweden*

In late modernity sex has escaped its reproductive cage and people form pure relationships, based on mutual satisfaction (Giddens). Ironically, although older people are per definition non-reproductive, they have been neglected in studies on sexuality. The aim is to study sexual attitudes and practices among older people in life-course perspective. We present results from 1) a qualitative interview study with 28 63–91 year old Swedes currently dating or in a relationship (married, cohabiting, LAT) initiated 60+ and 2) a quantitative survey including 1225 60–90 year old Swedes (response rate 42%). The interviews revealed a normative change, from condemnation of extra-marital sex in young adulthood to encouragement of sexual relationships but not marriage in later life. Despite restrictive norms, the survey showed a majority (93%) had had their sexual debut before marriage. All informants had experienced the 1960's sexual liberation and today liberal attitudes seem to encompass later life. Most had had rather active sexual lives. Half or the survey respondents had had ≥4 more sexual partners, and one in five ≥10. Today, an active sex-life was regarded as important for a good relationship. Many informants had interpreted sexual decline as "natural" and age-related, but re-discovered sexuality with their new partner. The survey confirmed relationship length as a better predictor of sexual activity than age. Cohort and period effects will be discussed. It has been argued that sexual practices will become more liberal in the future by cohort replacement. Our data indicates that "the future might already be here".

PERCEIVED SUPPORT IS ASSOCIATED WITH GREATER RETIREMENT PLANNING CONFIDENCE AMONG LESBIAN AND GAY ADULTS

S.E. Mock, E. Schryer, *Recreation and Leisure Studies, University of Waterloo, Waterloo, Ontario, Canada*

Retirement planning includes a consideration of financial needs and timing and is critical for quality of life. Population aging adds urgency to this topic and although there is an increasing diversity of family forms including those lead by lesbian and gay adults, little is known about their retirement planning. The social rejection many lesbian and gay adults face is well documented (Meyer, 2003) and since social support is important for future orientation (Prenda & Lachman, 2001) we suggest it may be particularly important for lesbian and gay adults' retirement planning. Drawing on nationally representative Canadian data (GSS Cycle 21), we selected for non-retired adults between 45 and 70 years old (n = 9,446). Multivariate analyses included demographic controls and self-reported sexual orientation (heterosexual as reference group, bisexual, gay or lesbian). Perceived social support was tested as a moderator of sexual orientation. The three retirement planning outcome variables included age expected to retire, certainty of expected retirement age, and expected retirement income adequacy. There were no main effects for sexual orientation with the retirement planning variables. However, perceived support moderated sexual orientation such that the better supported lesbian and gay adults felt, the younger their expected retirement age, the more certain they were about that age, and the more certain they felt about their retirement income adequacy. Thus, perceived support is important for future orientation and planning in general and may be important for lesbian and gay adults' retirement planning in particular.

TAKING AN INTERSECTIONAL APPROACH TO BODY IMAGE COPING: THE INFLUENCE OF AGEISM, SEXISM, AND RACISM

R. Walker, S.M. Powers, T. Bisconti, *University of Akron, Barberton, Ohio*

As women age, they are more likely to experience the effects of both sexism and ageism. Additionally, older women of Color are subject to the combined effects of ageism, sexism, and racism. Whereas qualitative researchers have examined the link between ageism and beauty work in older women (Hurd Clark, 2011), this link has yet to be established quantitatively. Additionally, a quantitative examination of the impact of multiple forms of discrimination on how women cope with their appearance is not known to exist. Body image coping strategies have previously been examined in younger adult samples in regards to psychosocial outcomes (Cash, Santos, & Williams, 2005; Choma, Shove, Busseri, Sadava, & Hosker, 2009); however, middle aged and older adult women have been excluded. Thus, this research study utilized a sample of 583 women, 18-87 years old, to examine intersections of inequality and discrimination as potential predictors of appearance coping behaviors in women across the lifespan. Results indicate that the intersection of experiences with racism, sexism, and internalized ageism significantly predict avoidance and appearance fixing behaviors but not positive rational acceptance behaviors for women of Color. For white women, the intersection of experiences with sexism and internalized ageism significantly predict avoidance, appearance fixing, and positive rational acceptance behaviors. These results have implications for practitioners as appearance fixing and avoidance behaviors predict levels of depression in women of Color. Avoidance and positive rational acceptance behaviors predict levels of depression in white women.

DEPATHOLOGIZING AGING SEXUALITIES: FEMINIST ACTIVISM AT THE NEXUS OF SEXUAL NORMALIZATION AND ANTI-AGING MEDICINE

A.L. Arbogast, *University of Cincinnati, Cincinnati, Ohio*

The twenty-first century has ushered in new ways of conceptualizing, and new technologies for treating, women's sexualities. With the biomedicalization of aging and sexuality, older adults' sexual desire and performance have become targets for rehabilitation through the consumption of lifestyle drugs. The image of the "sexy senior" has not replaced the stereotype of the postsexual senior but serves as its foil; both are needed to make the contrast between successful aging and mortifying senescence intelligible. The pharmaceutical industry has invested substantial capital in pursuing a marketable solution to aging women's sexual problems, but pharmaceutical companies have wielded far more influence than older women in identifying and defining those "problems," raising concerns for feminist health activists. This paper draws connections between sexual medicine and anti-aging medicine and among various sites of resistance, e.g. pedagogy, research, and clinical practice. Although the political terrain has shifted, I argue that twenty-first-century feminist health activists can reclaim the women's health movement of the 1960s and 1970s as a usable past for tackling new challenges that emerge at the intersections of sexuality and aging.

COMPASSIONATE LOVE ACTIONS AND PHYSICAL AND MENTAL HEALTH: HOW AGE MATTERS

A.C. Faul, J.G. D'Ambrosio, *Kent School of Social Work, Univ Louisville, Louisville, Kentucky*

Compassionate love is defined as love that: values the other at a fundamental level; is accompanied by a free choice to love; reflects a true understanding of the needs and feelings of the person to be loved; reflects a response of the heart; and is accompanied by openness and receptivity (Underwood 2002,2009). Antecedents and consequences of compassionate love were previously studied. This study continues exploration of how positive inner thoughts (self-esteem, self-compassion, self-forgiveness and spirituality) combined with prosocial behaviors (forgiveness, empathy, sympathy, altruism, compassion and compassionate love) can improve perceived health and mental health. This study focuses on how age cohorts mediate these relationships. SEM was used to test the pattern of causal structures on an internet sample of 2245 individuals. Inner thoughts and prosocial behaviors explained 37% of the variance in health and mental health. The strongest pathways to health and mental health were a healthy self-esteem, the ability to have compassion for oneself, and compassionate love actions shown toward others. The goodness of fit statistics for the final model (CMIN/DF=2.54,CFI=0.93,RMSEA=0,05) indicated good model fit. The equivalence of the multidimensional models between the different cohorts were tested and found to be measurement and structurally invariant across cohort groups, giving confidence that the differences seen between cohort groups were true differences. Baby boomers and the silent generation had stronger pathways to health and mental health through the demonstration of compassionate love actions than younger cohorts. Implications for health and mental health promotion strategies for older cohorts will be discussed.

SESSION 272 (POSTER)

COGNITION

COGNITIVE PERFORMANCE AND ITS ASSOCIATION WITH PLASMA LEVELS OF VITAMIN D IN CHILEAN OLDER PEOPLE

H. Sanchez, C. Albala, B. Angel, L. Lera, C. Marquez, *Institute of Nutrition and Techonology foods, Santiago, RM, Chile*

Background: The vitamin D (25OH-D) deficiency is a worldwide public health problem. Older people are especially vulnerable because the decreased ability to synthesize 25OH-D. The autonomy in the older people is sustained mainly by good physical and cognitive performance. Recent research has suggested that 25OH-D plays a role in cognitive function. The objective of this study was to evaluate the association of 25OH-D deficiency with cognitive performance in Chilean older people. Methods: Cross-sectional study corresponding to the baseline of a RCT aimed to determine optimal levels of fortification with 25OH-D and B12 of a milk drink provided by the Chilean ministry of health to beneficiaries. 815 participants ≥70y (61.5% women), mean age 77.3(SD: 5.2), living in 3 cities from different latitudes of the country were randomly selected from primary health care centers registries. Weight, height, 25OH-D and Mini Mental State Examination (MMSE) were measured. Cognitive performance deficit was defined as Percentil 25 of MMSE (MMSE<24). 25OH-D deficit was defined as <50 nmol/L. Crude and adjusted regression models were performed to test the association of cognitive performance and 25OH-D deficiency. Results: Mean 25OH-D was 60.3 nmol/L (SD: 38.2) higher ($p<0.05$) in men (67.1 nmol/L;SD:39.6) than in women (55.6 nmol/L;SD:36.1)). The proportion of 25OH-D deficit was 45.3% (CI95%:40.8-49.8). After age, sex and depression adjusted logistic regression a significant association between cognitive performance and 25OH-D deficit, was observed (OR=1.8; 95%CI: 1.12-2.84). Conclusions: The results suggest an independent role of vitamin D in cognitive performance of older people. Project funded by FONDEF D10I1091

ASSOCIATION BETWEEN GAIT AND COGNITION IN COMMUNITY-DWELLING PATIENTS WITH ALZHEIMER'S DISEASE

N.A. Sobol[1], K. Hoffmann[2], S. Hasselbalch[2], A. Vogel[2], N. Beyer[1], *1. Musculoskeletal Rehabilitation Research Unit & Institute of Sports Medicine, Bispebjerg and Frederiksberg Hospitals, University of Copenhagen, Copenhagen, Denmark, 2. Memory Disorders Research group, Depertment of Neurology, Rigshospitalet, University of Copenhagen, Copenhagen, Denmark*

Background Knowledge about the association between gait performances and cognition in community-dwelling patients with Alzheimer's disease (AD) could be relevant for designing rehabilitation programs focusing on maintaining functional independence and quality of life but few large-scale studies have examined the association. The objective of this study was to explore the association between gait, dual-task performance and cognition in community-dwelling patients with AD. Methods 165 patients (71 females, 94 males), age 71.3±7.5 years (mean±SD), MMSE 24,2±3,5 who participated in the ongoing ADEX study were included. ADEX (Preserving Cognition, Quality of Life, Physical Health and Functional Ability in Alzheimer's Disease: the Effect of Physical Exercise) is a single blinded, multi-centre RCT including 192 community-dwelling patients with mild to moderate AD. Baseline tests included 400-meter walk (400MW, fast speed) and 10-meter walk (10MW, usual speed) single performance and dual-task performance where the cognitive task was to count backwards from 50 while walking. Cognitive function was assessed by Mini-Mental State Examination (MMSE) and Symbol Digit Modalities Test (SDMT). Results 400MW gait speed (m/s) was significantly correlated with MMSE and SDMT ($r=0.225$ and $r=0.224$, $p=0.004$). In addition, MMSE and SDMT were significantly correlated with usual gait speed (m/s) ($r=0.275$ and $r=0.371$, $p<0.0001$) and correct numbers counted backwards under dual-task performance ($r=0.280$ and $r=0.325$, $p < 0.0001$). Conclusions These preliminary data show a weak-to-moderate but significant association between gait performance and cognitive function in community-dwelling patients with AD. Whether gait performance and dual task performance can be improved by exercise is investigated in the ADEX study.

EXECUTIVE HOMEOSTATIC NETWORK IN MILD COGNITIVE IMPAIRMENT

F. Lin, D. Cole, K. Cotton, *University of Rochester, Rochester, New York*

Background: Patients with cognitive deficit constantly encounter stressors requiring overloaded mental effort in their daily lives and this may accelerate their cognitive decline. The executive homeostatic network (EHN) proposes stress regulation as a bidirectional interaction between the central executive network (CEN) and peripheral homeostatic system. In this descriptive correlational study, we examined if the EHN can be used to understand stress regulation in patients with mild cognitive impairment (MCI). We tested the associations of two CEN indicators, executive function (EF) and resting-state functional connectivity (rFC) in CEN, with two cardiovascular homeostatic indicators, reactivity and recovery of heart rate variability (HRV). Method: Seven patients' data are presented here (mean age 77). EF, including cognitive control, verbal fluency, and working memory, was measured using a computer battery package (EXAMINER) at baseline. rFC was collected by BOLD fMRI at baseline. HRV included heart rate (HR) and high frequency (HF) HRV of electrocardiogram at baseline, in response, and in recovery from a standard task with high executive load. Results: Greater HR reactivity while lower HF HRV reactivity was related to greater cognitive control, but not other EF domains. The rFC in CEN existed taking anterior cingulate cortex as the seed, and were related to HR and HF HRV reactivity and recovery, and cognitive control. Conclusion: These preliminary findings suggest that EHN may be useful in understanding the neurophysiological basis of stress regulation in MCI. These results may provide a basis for developing effective stress regulation interventions for individuals with high risk for dementia.

GENDER DIFFERENCE OF EFFECTS FOR 'EMPTY-NEST' ON THE COGNITION AND ITS RISK FACTORS IN HEALTHY CHINA POPULATION ABOVE 60 YEARS OLD

L. Han[1], X. Bai[1], K. Yu[1], B. Jin[1], W. Han[1], X. Zhao[1], X. Chen[2], *1. Shengjing Affiliated Hospital of China Medical University, Shenyang, China, 2. General Hospital of Chinese PLA, Beijing, Beijing, China*

Objective The aim of this study was to estimate the differences of cognition and risk factors of cognition decline between empty-nest and non-empty-nest elderly in healthy China population. Methods In cross-sectional study, we examined 475 healthy elderly (aged 60 – 91 years, 235 men) free from cardiocerebral disease and diabetes mellitus. Participants were categorized into non-empty-nest and empty-nest group. The Mini-Mental State Examination (MMSE) was performed as a assessment of cognition. Carotid intema-media thickness (CIMT) was analyzed using M-mode ultrasonography Results MMSE score of empty-nest group was significantly lower than non-empty-nest group (p=0.002) only for males. Stepwise multiple regression equation analysis in males shows that age and fasting blood glucose (FBG) are independently associated with MMSE in both non-empty-nest (B=-0.166 p<0.001 for age and B=-0.78 p=0.013 for FBG) and empty-nest(B=-0.245 p<0.001 for age and B=-1.539 p=0.007 for FBG) group. However, in non-empty-nest females the age (B=-0.147 p<0.001), systolic blood pressure (SBP, B=-0.102 p=0.001), and diastolic blood pressure (DBP, B=0.117 p=0.003) were independently correlated with MMSE. In empty-nest females only the age (B=-0.168 p=0.005) and estimated glomerular filtration rate (eGFR, B=-0.028 p=0.019) were independently correlated with MMSE. Conclusion The cognition of empty-nest males was lower than non-empty males. There are gender differences of risk factors for cognition decline between empty-nest and not-empty-nest healthy China elderly population. Empty-nest females should pay more attention to faster aging-related decline of the cognition.

SHORTHAND TRAINING AND COGNITION – RESULTS OF A 2 YEAR PILOT STUDY

M. Gogol, D. Schmidt, A. Dettmer-Fluegge, *Geriatric Department, Krankenhaus Lindenbrunn, Coppenbruegge, Germany*

Introduction: We examined a group of women started shorthand learning in 2012 on a yearly basis. The training program consist of an one year phase of learning and a second one of motor speed training in writing shorthand. Hypothesis: The magnitude of learning shorthand is correlated to a less reduction of age associated cognitive abilities. Setting: Ambulatory healthy women. Results: Members of the training group are 17 women, mean age 71.8±4.9 years without cognitive, psychiatric or neurologic diseases. They were all right handed. After one year one woman left the training group for personal reasons. All other participants are compliant to the program after two years consisting of two training session per week in year 1 and one session in year 2. They are independent in all ADL and IADL areas. After 2 years participants perform MMSE better (baseline 27.3±1.4, 2 years 28.8±1.4, p=0.0053). Even subtests of the Rey Complex Figure Test (baseline and 2 years: CFT 89.3±12.2 and 93.9±6.6, p=0.418, CFM 74.8±19.1 and 94.1±9.2, p=0.0015, CQM 65.4±18.8 and 90.4±11.6, p=0.0001) were performed better. All other tests showed a non-significant change. Discussion: Comparing to baseline results we found no decline over 24 month in cognition. In subtests we found a trend to perform better and some tests showed a significant improvement. The data confirm research results that training programs are able to stop or to slow age associated decline.

ARE RESULTS OF COGNITIVE TESTING WITH THE MMSE INFLUENCED BY CENTRAL ACTING ANALGESIC DRUGS?

M. Gogol[1], H. Hartmann[1], S. Wustmann[1], A. Dettmer-Fluegge[1], D. Schmidt[1], A. Simm[2], *1. Geriatric Department, Krankenhaus Lindenbrunn, Coppenbruegge, Germany, 2. Martin-Luther-University Halle, Halle/S., Germany*

Introduction: Growing evidence shows an increasing use of opioids in elderly patients and a high rate for adverse drug reactions like falls, fractures, and mortality. Research question: Are results of cognitive testing with the Mini Mental Status Examination (MMSE, Folstein et al 1975) influenced by use of opioid drugs? Setting: Geriatric inpatient service for acute and rehabilitation care. Methods: Secondary combined analysis of two prospective, single center study cohorts (PROPSYC, 2011 and AGE OUT, 2012) with identical procedure for the MMSE. Results: Overall 395 patients were included, 144 male (M) and 251 female (F). Mean age was 80.0±8.4 (M 76.8±9.1, F 81.9±7.4, p=0.0000) years (y). Mean MMSE was 22.9±4.9 (M 23.3±4.7, F 22.6±5.0, p=0.211) points. Analgesics with central activity were given to 117 of 395 patients (29.6 %). Low potent opioids (tramadole hydrochloride, tilidine, tilidine/naloxone) were identified in 60 patients (M 18, F 42, age 80.9±7.7 y), high potent opioids in 57 patients (M 15, F 42, age 78.3±9.5 y). Transdermal patches were found in (M 6, F 15) and oral drugs in 36 (M 9, F 27) patients. The Pearson correlation r for low potent opioids was 0.044 and for high potent 0.174. Subgroup analysis for transdermal and oral application forms and sex showed no differences. Discussion: Our analysis show now influence on cognitive testing with the MMSE in users of low or high potent opioids compared to non-users.

SELF-REPORT OF BIO-PSYCHO-SOCIAL FUNCTION IN ELDERS AS A PREDICTOR OF MILD COGNITIVE IMPAIRMENT

S. Tarrant[1], E.L. Abner[1,2], K.R. Albrektson[3], D.E. Kenlan[3], A.B. Pursell[3], A.S. Welleford[3], G.A. Jicha[1,4], *1. Sanders-Brown Center on Aging, University of Kentucky, Lexington, Kentucky, 2. Department of Epidemiology, University of Kentucky, Lexington, Kentucky, 3. College of Medicine, University of Kentucky, Lexington, Kentucky, 4. Department of Neurology, University of Kentucky, Lexington, Kentucky*

Introduction: Subjective memory complaints often precede the development of mild cognitive impairment (MCI) and assist in risk stratification in the older population. It is unclear if changes in perception of other lifestyle factors may help in the identification of individuals at-risk for MCI and further identify potential targets for disease prevention. Methods: Participants enrolled as cognitively intact in the University of Kentucky Alzheimer's Disease Center cohort, followed for at least 9 years, either remained cognitively intact (n=143) or developed MCI (n=34). RAND 36-Item Short Form Health Survey (SF-36) physical, social, and emotional well-being scale scores were compared between groups at three time points using a multivariate analysis of variance (MANOVA) adjusted for age at assessment, educational attainment, APOE-4 status, and gender. Results: Participants who transitioned to MCI during the course of the study reported significantly worse emotional well-being and social functioning than those that remained cognitively intact 5-6 years prior to clinically evident cognitive decline (p<.05; MANOVA). While emotional well-being normalized by 2-3 years prior to cognitive transition, lower social function scores persisted, and physical function scores dropped between the 5-6 and 2-3 year time points for participants who eventually developed MCI (p<.05; MANOVA). Discussion: These findings demonstrate that changes in self-reported bio-psycho-social function precede the transition from normal cognition to MCI by 2-6 years. Early identification of perceptual changes in lifestyle factors may signal impending cognitive decline and allow a window for interventions designed to slow or prevent the development of dementia and further maximize well-being in later life.

RACIAL/ETHNIC DIFFERENCES IN TRAJECTORIES OF COGNITIVE FUNCTION IN OLDER ADULTS: ROLE OF SMOKING AND PHYSICAL ACTIVITY

E. Vasquez[1], A. Botoseneanu[2,3], J.M. Bennett[2], B. Shaw[1], *1. Epidemiology and Biostatistics, University at Albany (SUNY), Rensselaer, New York, 2. University of Michigan, Ann Arbor, Michigan, 3. Yale University, New Haven, Connecticut*

Background: The mechanisms responsible for racial/ethnic differences in cognitive function and subsequent cognitive decline in older adults are still unclear. Methods: Data from HRS, a nationally representative sample of older adults (3424 participants, ages 51-61 at baseline) interviewed bi-annually between 1992 and 2008. Hierarchical linear models with time-varying and time-constant covariates were used to define the trajectory of a global cognitive function score between 2002 and 2008. Trajectories of PA (non-active, decreasingly-active, increasingly-active, persistent-active) and smoking patterns were assessed between 1992 and 2002. Results: The average cognitive function decreased following a non-linear decelerating trajectory (intercept b=22.5, linear slope b=-0.16, p<.001, quadratic slope b=0.02; p<.001, and cubic slope b=-0.01, p<.05). Higher levels of education were associated with higher cognition intercept (b=0.62, p<.001), but not with differences in rate-of-decline. Blacks followed cognition trajectories with lower intercept (b=-4.42, p<.001) and slightly slower rate-of-decline (b=0.03, p<.05 for quadratic slope) compared with Whites. Hispanics have cognition trajectories with lower intercept (b=3.82, p<.001) and similar rate-of-decline compared with Whites. These differences remained significant after accounting for racial/ethnic differences in education, PA trajectories, smoking, and other covariates. Conclusion: We found education to have a partial mediating effect on racial differences in cognition trajectories intercept (only) and no mediating effect for PA or smoking among older adults.

IMPLICATIONS OF VASCULAR BURDEN ON DEMENTIA

T. Chabrashvili[1], B.E. Sawaya[2], *1. Neurology, Tufts Medical Center and Tufts University School of Medicne, Boston, Massachusetts, 2. Temple University School of Medicine, Philadelphia, Pennsylvania*

White Matter Disease (WMD) is a reflection of multiple microinsults to the brain over a person's lifetime. We aim to study the burden of white matter disease in an elderly urban population diagnosed with dementia. We hypothesize that White Matter Hyperintensity (WMH) volume and region-specific distribution may be associated with an increased risk of developing dementia and may serve as an MRI marker of risk of dementia. METHODS: We retrospectively selected the MR images of patients with a diagnosis of dementia and quantitatively measured the volume and distribution of WMH on MR fluid attenuated inversion recovery images using an import DICOM (Digital Imaging and Communications in Medicine) image tool of Analyze 10.0 software (AnalyzeDirect). The locations specified were Subcortical, Deep White Matter (DWM) and Periventricular parenchyma. We compared them to age matched controls. RESULTS: 877 patients were diagnosed with Alzheimer's dementia from 2000 to 2010 in an urban hospital. There were 398 patients identified with both dementia and stroke; from the remaining 479 patients with dementia only, 105 had MR imaging available for review (age: 69.2+10.4 years). The dementia group had a significantly higher total ((1.38%+1.30% vs. 0.55%+0.66%, p<0.02), deep (0.36%+0.38% vs. 0.14%+0.15%, p<0.01) and periventricular (0.10%+0.09% vs. 0.03%+0.04%, p<0.04) WMD compared to the controls. CONCLUSION: Dementia patients have significantly more WMD burden than age matched controls in total, deep and subcortical white matter disease. Patients with extensive WMH should be identified and aggressively treated to slow the progression of vascular insults that may affect the progression of dementia.

ASSOCIATION BETWEEN PHYSICAL FUNCTION ASSESSED BY QUESTIONNAIRE AND COGNITIVE DECLINE IN LATE LIFE

M. Sugiyama[1], K. Ito[1,2], N. Sakuma[1], C. Ura[1], H. Niikawa[1,3], H. Inagaki[1], S. Awata[1], *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Tokyo Medical and Dental University, Tokyo, Japan, 3. The University of Tokyo, Tokyo, Japan*

Aims: Recent studies indicate that poor physical function is a risk factor for cognitive decline in late life. To examine the association between poor physical function assessed by questionnaire and cognitive decline after controlling for potential confounding factors. Methods: The participants were all residents aged 65 years and older, living in an urban district of Japan (N=7,682). First, a questionnaire survey was conducted for all participants to examine socio-demographic and health-related variables. Physical function was assessed using the Japanese version of Motor Fitness Scale (MFS), which is a self-rating scale of 14-items. Second, 3,000 residents were randomly selected from this population. The trained nurses visited their homes and the face-to-face interview was conducted to examine cognitive function using the Japanese version of the Mini-Mental State Examination (MMSE). Statistical analyses were performed using multivariate logistic regression analyses. Results: In the second study, 1341 agreed to the interview and 787 who completed MMSE were selected to be analyzed. The total score of MMSE was 27.22±3.16 among all participants; when a cut-off criterion of 23/24 was used, the frequency of low cognitive function was 9.27%. Multivariate logistic regression analyses showed that poor physical function significantly associated with cognitive decline after controlling for potential confounding factors (age; sex; education; income; subjective health feeling; frequency of outdoor activity; history of heart disease, cerebrovascular disease, dementia, Parkinson's disease, depression)(OR: 1.89; 95%,CI: 1.03-3.46). Conclusion: Physical function might associate with cognitive decline in late life, independent of socio-demographic and other health-related variables.

IMPACT OF DIABETES AND HBA1C LEVELS ON COGNITIVE DYSFUNCTION IN JAPANESE OLD SUBJECTS - SONIC STUDY

C. Nakama[1], K. Kamide[1,2], Y. Arai[3], T. Ishizaki[4], Y. Masui[4], K. Ikebe[5], Y. Gondo[6], H. Rakugi[1], *1. Department of Geriatric Medicine and Nephrology, Osaka University Graduate School of Medicine, Osaka, Japan, 2. Osaka University Graduate School of Medicine, Division of Health Sciences, Osaka, Japan, 3. Keio University School of Medicine, Department of Internal Medicine, Division of Geriatric Medicine, Tokyo, Japan, 4. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 5. Osaka University Graduate School of Dentistry, Department of Removable Prosthodontics, Osaka, Japan, 6. Osaka University Graduate School of Human Sciences, Department of Clinical Thanatology and Geriatric Behavioral Science, Osaka, Japan*

Introduction: Diabetes is known to be a risk factor for dementia and cognitive dysfunction. Glycated hemoglobin (HbA1c) is a marker of average blood glucose for 1-2 months, and the goal of HbA1c in the elderly is 7.5-8.0% in guidelines. The aim of this study is to clarify the impact of diabetes and the level of HbA1c on cognitive dysfunction in people aged around 70. Methods: Community-dwelling people age around 70 years (men 479, women 521, 70±1) participated in the invitation survey at the community centers. We interviewed medical histories and medications, and performed MOCA-J as a cognitive test, physical examinations and blood tests. We assessed associations between MOCA-J and diagnosis of diabetes or HbA1c. Results: The score of MOCA-J was significantly lower in diabetes group than in non-diabetes group in women ($p=0.002$), but there was no significant difference in men. When we divided 3 groups (participants who had diabetes and HbA1c ≥7%, diabetes but controlled HbA1c <7% and no diabetes), diabetes and HbA1c ≥7% group tended to have lower score of MOCA-J (22.1±2.8) than no diabetes group (23.1±3.1) in men ($p=0.07$). In women, diabetes and HbA1c ≥7% group had significantly lower score of MOCA-J (21.8±4.7) than diabetes and HbA1c <7% group (23.2±3.3, $p=0.05$) and no diabetes group (23.9±3.2, $p<0.001$). Conclusion: Diabetes is a risk factor for cognitive dysfunction in women than men in the elderly. And the control of HbA1c could be more important for the progression of dementia.

LONELINESS AND COGNITIVE FUNCTION IN THE OLDER ADULT: A SYSTEMATIC REVIEW

L. Boss, D. Kang, S. Branson, *Nursing, UTHSC, Houston, Texas*

Introduction The elderly are especially prone to psychosocial factors, such as loneliness, which place them at high risk for decreased cognitive function. Examination of cognitive function is a research priority due to irreversibility, lack of effective treatment, and accompanied social and economic burdens. Recent evidence indicates that loneliness may influence cognitive function, however, the relationship is complex and better understanding is necessary. Objective To summarize current findings on associations between loneliness and cognitive function in older adults ≥ 60 years. Methods A comprehensive, electronic review of literature was performed in PubMed, Medline (Ovid), and Psycinfo. Studies were limited to original quantitative research, written in English, used human subjects with a mean age ≥ 60 years, and published from January 2000 through July 2013. The initial search elicited 2,059 articles, of which 15 were retrieved. After further exclusion, 11 were included in this review. Results Overall findings indicate that loneliness, in general, was negatively associated with cognitive function. Findings of cross-sectional and longitudinal studies consistently indicated significant and negative associations of loneliness and over 10 different cognitive domains, including, verbal fluency, immediate and delayed recall, working memory, semantic memory, and episodic memory, but not global cognitive function. Discussion & Conclusions Overall findings indicate that higher loneliness is associated with lower cognitive function in the elderly. Although preliminary evidence is promising, additional evidence is necessary to determine causality and potential biological mechanisms underlying the relationship between loneliness and cognitive function. Furthermore, findings should be verified in culturally diverse populations in different ages and settings using rigorous research designs.

A BIOBEHAVIORAL EXAMINATION OF STRESS, DEPRESSION, LONELINESS, AND COGNITIVE FUNCTION IN THE ELDERLY

L. Boss[1], D. Kang[1], N. Bergstrom[1], J. Leasure[2], *1. Nursing, UTHSC, Houston, Texas, 2. University of Houston, Houston, Texas*

BACKGROUND: Stress, depression, and loneliness are associated with adverse cognitive health outcomes in a rapidly growing aging population. Increased cortisol/DHEA ratio, estradiol, or testosterone may also be associated with detrimental cognitive health outcomes. OBJECTIVES: To examine stress, depression, loneliness, and cognitive function from a biobehavioral perspective and enhance understanding of how salivary biomarkers are related to cognitive function in an elderly population. METHOD: Using a cross-sectional design, data were collected once from 71 elderly (mean age 86.4). Stress, depression, loneliness, and cognitive function were measured with standardized instruments, and saliva samples were collected for salivary cortisol, DHEA, estradiol, and testosterone. RESULTS: Main findings include that stress and loneliness were significantly and negatively correlated with global cognitive function ($r = -.25$, $r = -.30$, both p = < .05) and executive function ($r = -.26$, $r = -.40$, both $p < .05$). Cortisol also showed a significant negative correlation with executive function ($r = -.30$, $p < .05$). Estradiol was significantly and positively correlated with global cognitive function in men only ($r = .54$, $p < .05$). DISCUSSION: Loneliness, stress, and cortisol seem to be important biobehavioral variables on cognitive function in the elderly. Additional biobehavioral research is needed in this area with more diverse study participants, longitudinal research designs, and other relevant biomarkers for cognitive functions. With increasing longevity, biobehavioral interactions and cognitive function will remain a significant area of research in the elderly and better understanding of such interactions may reduce adverse burdens in the aging population.

POOR RENAL FUNCTION PREDICTIVE OF FRONTAL EXECUTIVE DYSFUNCTION IN AN ELDERLY COMMUNITY-DWELLING SAMPLE

A.R. Zammit[1], M.J. Katz[1], M. Bitzer[2], J. Lai[2], R.B. Lipton[1], *1. Neurology, Albert Einstein College of Medicine, New York, New York, 2. University of Michigan, Michigan, Michigan*

Background: Poor renal function is widely viewed as a risk factor for cognitive impairment in older adults. This association has rarely been explored in representative, community-based samples of older adults. Herein, we examine the cross-sectional association between eGFR and cognitive function. Methods: The Einstein Aging Study (EAS) is a longitudinal, community-based study of adults age 70+ residing in Bronx County, New York. We calculated eGFR using the method of modification of diet in renal disease (MDRD) using 3 predefined eGFR categories in units of mL/min/1.73m2 as low (<45), medium (45-59) and high (≥60). A battery of 13 cognitive tests was subjected to principle components analysis revealing 3 components, a global component, an episodic memory component and a frontal-executive component. We adjusted for age, sex, race, education and hypertension. Results: The 649 eligible participants had a mean age of 79.2 years and 61% were female. 67 (10.3%) participants had low eGFR. Results showed that declining eGFR significantly and independently predicted executive dysfunction ($\beta = .09$, $p < .05$), but not memory impairment or global cognition. Conclusion: The association of low eGFR and executive dysfunction suggests that low eGFR, or factors associated with it, may be risk factors for poor executive function. Executive dysfunction reflects poor ability to maintain attention, to plan and organize, to process information quickly, and to be mentally flexible; skills that are required to carry out ADLs independently, including adhering to medical treatment. Poor executive function may interfere with adherence to recommendations for the management of kidney disease.

C-REACTIVE PROTEIN AND POST-STROKE COGNITIVE DECLINE IN CARRIERS AND NON CARRIERS OF APOLIPOPROTEIN APOE4 GENOTYPE FROM THE TABASCO STUDY

E. Ben Assayag[1], K. Efrat[1,2], M. Anat[1,3], N. Bornstein[1,2], A. Korczyn[2], S. Shenhar-Tsarfaty[1], *1. Tel Aviv Medical Center, Shoham, Israel, 2. Tel Aviv University, Tel Aviv, Israel, 3. Haifa University, Haifa, Israel*

Background: Carriers of APOE4 allele, a major risk factor for all dementias, have lower C-reactive protein (CRP) than non-carriers. Stroke patients are at increased risk for developing cognitive impairment, while high CRP concentrations were associated with risk of stroke and cognitive impairment. We sought to test whether APOE4 modifies CRP effects on rate of post-stroke cognitive impairment. Methods: Inflammatory markers, APOE4 and cognitive status were determined in 275 first-ever mild-moderate ischemic stroke patients free of dementia from the TABASCO study (mean age: 67.6), without evidence of inflammatory condition, within 72h from onset, who were followed for 2 years. Results: CRP was significantly lower among APOE4 carriers (16.8%) at all time points (admission, 6, 24 months post-stroke). Forty nine participants (17.8%) were found to have clinically significant cognitive decline (CD) over the 2 years. Interestingly, the CD group had elevated CRP levels at all time points than the cognitive intact group and no association between APOE4 genotype and risk for CD. Nevertheless, APOE4 carriers displayed strong negative association of CRP levels with total cognitive scores 24 months post-stroke, while non-carriers presented only weak association (Admission: r=-0.474, p=0.017 vs. r=-0.243, p=0.012; 6 months: r=-0.608, p=0.003 vs. r=-0.249, p=0.017). Conclusions: Lower CRP in APOE4 carriers may reflect impaired immune response in old age. Higher CRP was associated with inferior memory scores 24 months post-stroke and this association was stronger in APOE4 carriers. These findings imply that reduction of CRP might be more efficacious in preventing post-stroke cognitive decline and neurodegeneration in APOE4 carriers.

COGNITIVE FUNCTIONING AND ALL-CAUSE MORTALITY: THE VA NORMATIVE AGING STUDY

J.M. Wang[1,2], L. Lee[1,3], A. Spiro[1,4], *1. VA Boston Healthcare System, Boston, Massachusetts, 2. Boston University School of Public Health, Boston, Massachusetts, 3. Boston University Schools of Public Health and Medicine, Boston, Massachusetts, 4. Boston University Schools of Public Health, Medicine, and Dental Medicine, Boston, Massachusetts*

There is emerging evidence that cognitive functioning factors such as intelligence predict mortality better than more established behavioral risk factors. This study examined the impact of cognitive functioning on all-cause mortality over 50+ years. Data are from the VA Normative Aging Study, a longitudinal study of 2280 men that began in 1963. Participants aged 21-81 were screened for the absence of chronic medical conditions at study entry. Cognitive functioning was assessed in half the sample (n=1040) from 1965-67, using the General Aptitude Test Battery (GATB) to assess general verbal intelligence, visuospatial reasoning, and psychomotor speed. Covariates included age at cognitive testing, education, income, smoking status, and BMI. Cox proportional hazards models were used to assess whether all-cause mortality risk over age from 1963-2013 was associated with GATB factors. In univariate models, higher psychomotor speed was associated with lower mortality risk (HR=0.90, 95% CI: 0.83-0.98). In multivariate models adjusted for covariates, psychomotor speed remained significant (HR=0.84, 95% CI: 0.77-0.92), while performance on other GATB factors was not predictive. Only smoking status had a greater effect on mortality than psychomotor speed (HR=1.87, 95%CI: 1.58-2.21), while age at testing (HR = 0.99, 95%CI: 0.98, 0.99) and education (HR=0.89, 95%CI: 0.82-0.96) had weaker effects. Other well-established risk factors for mortality, such as BMI and income, were not predictive of mortality in fully adjusted models. Thus, greater consideration should be given to cognitive functioning factors such as psychomotor speed, which may be more strongly associated with mortality than other behavioral predictors.

METABOLIC SYNDROME AND COGNITIVE DECLINE IN THE VERY OLD; THE NEWCASTLE 85+ STUDY

S. Harrison, B.C. Stephan, M. Siervo, A. Granic, K. Davies, L. Robinson, T. Kirkwood, C. Jagger, *Newcastle University, Newcastle upon tyne, United Kingdom*

The prevalence of metabolic syndrome (MetS) increases with age. Associations between MetS and poor cognitive function have been reported in populations less than 75 years old, with few studies undertaken in the very-old (e.g., persons aged 85+ years). Using data from the Newcastle 85+ Study (N=845), we tested whether there is an association between MetS and cognitive function in the very-old and also whether inflammation, physical activity or diabetes affects this association. One study found MetS to be associated with decelerated cognitive decline in the very-old; however, this study used a modified version of the National Cholesterol Education Program Adult Treatment Panel III MetS criteria. Using the full MetS criteria, defined as ≥3 of 5 risk factors (elevated blood pressure, elevated glucose levels, elevated triglyceride levels, elevated waist circumference and low levels of high-density lipoprotein (HDL) cholesterol), we found that the prevalence of MetS was 27.4% (N=214). MetS was not associated with baseline cognitive performance or change over 5 years in measures of global (Mini Mental State Examination: MMSE) or domain specific (attention and memory) function. However, after stratifying by inflammation status, those with high levels of inflammation and MetS had a decreased risk of cognitive impairment over 5 years (multivariate adjusted incidence rate ratio (IRR)=0.41 (95% CI: 0.20-0.86), p=0.02). Mapping MetS in the very-old population is difficult; indeed, 94.4% (N=781) of individuals had high blood pressure according to the MetS criteria. The results suggest that cut-off values for the MetS components may need to be revised according to age.

RISK FACTORS OF COGNITIVE DECLINE IN JAPANESE COMMUNITY DWELLERS : A 10-YEAR COHORT STUDY

H. Amano[1], H. Yoshida[2], Y. Fujiwara[1], M. Nishi[1], H. Murayama[1], Y. Taniguchi[1], Y. Nofuji[1], S. Shinkai[1], *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Tohoku Bunka Gakuen University, Sendai, Japan*

Background: To explore the risk factors of cognitive decline not due to stroke, we constructed a cohort study utilizing annual health checkups as a part of the Long-term Care Insurance System in Japan. Methods: Elderly inhabitants of Kusatsu town were followed up for cognitive decline through annual checkups from 2003 to 2013. The measurements included Mini-Mental State Examination (MMSE), education, medical histories, depressive symptoms, number of remaining teeth, body mass index, waist circumference, blood pressure, ankle/ brachial index (ABI), pulse wave velocity, blood analyses, and others. Independent effects of the baseline measures on the risk of cognitive decline, defined as 5 points or larger drop in MMSE, were assessed by the Cox regression. Participants with baseline MMSE score <24, observation period <2 years, or history/incidence of stroke were excluded from the analyses. Results: Among 573 individuals (women:56%, mean age:72) followed up for 6.3 years in average, 34 experienced cognitive decline. The risk was found to positively correlate with older age (per 10 years) (HR=3.1; 95%CI=1.5-6.1), white blood cell count >7000/μL (3.2;1.4-7.2), total tooth loss (3.5;1.7–7.3), waist circumference >median (83.0cm for men, 84.5cm for women) (2.2;1.1–4.6) and ABI <0.85 (8.1;1.0-69.0), and negatively with medication for hyperlipidemia (vs. no history) (0.1;0.0-0.7), after controlling for each other and baseline MMSE score. Conclusion: Low grade inflammation, tooth loss, abdominal obesity, and atherosclerosis would be implicated in cognitive decline not due to stroke. The reduced risk in the medicated hyperclipidemia conceivably reflects the beneficial effects of statin.

SESSION 260 (POSTER)

HEALTH PROMOTION & SUCCESSFUL AGING

ACCELERATED AGING INDUCED BY WORK-RELATED STRESS: SUCCESSFUL PREVENTION STRATEGIES AND INTERVENTIONS

W. Chou[1,2], L.R. Phillips[2,1], E. Ume[1,2], S. Evers-Manly[1,2], J. Mentes[2,1], M. Ndukwe[1,2], A.A. Kehinde[1,2], C.M. Basilio[1,2], *1. Charles R. Drew University of Medicine and Science Mervyn M. Dymally School of Nursing, Los Angeles, California, 2. University of California Los Angeles School of Nursing, Los Angeles, California*

In America we watch our Presidents age while in office. In the four to eight years they serve, their hairs grow grey and their faces become increasingly wrinkled. Popular conjecture is that what appears to be accelerated aging in our Presidents is a manifestation of chronic work-related stress. Work-related stress is present in many industries affecting many of those who work. The purpose of this systematic literature review was to examine the current state of the science on the relationship between accelerated aging and chronic work-related stress. Review of literature included the following online databases: Cinahl, PubMed, Google Scholar, for the following keywords: “work-related stress”, “aging”, “ageing”, “occupational stress”, “workplace stress”, “interventions”, and “nursing”. The questions guiding this review were: (1) What is the empirical evidence for the relationship? and (2) What interventions have been empirically tested for reducing work-related stress and preventing the manifestations of accelerated aging? This presentation will focus on empirical tests of strategies that organizations have used to successfully reduce work-related stress in traditionally high-stress occupations and on the implications of these for designing research on the occupational health of older workers.

DETERMINANTS OF OPTIMAL OR FRAGILE AGING IN BRAZILIAN OLDER PEOPLE

Y. Duarte, M. Lebrão, D.P. Nunes, T. Brito, M. Naslavsky, M. Zatz, *Epidemiology, University of Sao Paulo, Sao Paulo, São Paulo, Brazil*

Methods: The sample was composed by elders interviewed in 2006 and 2010 (n=953) with genotyping data available in SABE Study (Health, Well being and Ageing), São Paulo, Brazil. The variable dependent was elders without functional or cognitive impairment in 2006 who maintained this condition in 2010 (optimal aging) and those who developed severe disability (fragile aging). Results: The optimal aging was associated with younger elderly (70-79 years: OR=0.59; ≥ 80 years: OR=0.35); high schooling (OR=4.86); no Diabetes (OR=1.73) and self-care health (OR=1.49;) and the fragile aging, with oldest-old elderly(OR=2.13); low education(p=0.001); diabetes(OR=1.72); chronic lung disease(OR=2.20), stroke(OR=2.32) and less active social contact(p=0.025). Genotyping analysis stratifying by ‘optimal aging’ (n=479) and ‘fragile aging’ (n=474), HWE is kept in the latter group, but lost within the ‘optimal aging’ group. As they were further followed-up and received scores of maintaining or not their classification of optimal aging, HWE was observed in each score group: 0(n=319), 1(n=146) and 2(n=14); being 1 and 2 ascending deviations from the optimal classification. However, a border line signal of departure from HWE was observed in group 1. The source of this HWE loss is from underrepresentation of APOE ε2 homozygous and overrepresentation of APOE ε4 homozygous individuals from this observed population. Conclusion:The best or worst condition of aging is directly related to social inequality and further investigation on association between the departure from HWE and other APOE-related phenotypes is ongoing to clarify the above mentioned observation.

THE USE OF MOTIVATIONAL INTERVIEWING WITH OLDER ADULTS

E.T. Lamoureux, *Nursing, University of Ma. Amherst, Belchertown, Massachusetts*

Motivational Interviewing (MI) is a communication process that encourages individuals to develop internal motivation in order to implement behavioral changes within their lives. MI is now being successfully utilized in support of health promotion activities. There is extensive literature on the efficacy of MI however there is limited literature on the use of MI within older adults > 65 years of age. Older adults are at risk for increased chronic illness and physical decline; both of which are related to modifiable lifestyles. MI intervention encourages subjects to identify and implement healthy lifestyle changes. Motivational interviewing may not only help older adults explore the opportunities in changing behavior but will help to resolve the ambivalence of change. MI may be an effective approach in helping older adults become more physically active in later years. Declining activity rates in older adults along with physiological aging and disease make physical activity important for older adults. Lack of exercise in the older adult population effects functional ability and quality of life. Older adults have lived many years; many of their habits are deeply ingrained into their lifestyles. As health care personnel we understand that advising older adults to change behaviors has not been effective. MI allows the older adult to collaborate with the health care worker; it is a nonjudgmental process of encouraging change that considers where the older adult is in the continuum of change. It allows older adults the autonomy to make changes in their lifestyles through the process of skill building.

FACTORS RELATED TO QUALITY OF LIFE IN MENTAL ASPECTS IN PERSONS JOINING TO VOLUNTEER GROUPS AS THE SOCIAL CAPITAL

C. Watanabe, M. Kabayama, K. Kamide, *Health Promotion Science, Osaka University Graduate School of Medicine, Suita, Japan*

Aims: Social Capital (SC) is supposed to be getting more important to improve function of the community and to advance health promotion in an advanced aged country, Japan. We investigated the factors related to QOL in mental aspects in persons joining to volunteer groups that were a representative activity of SC in a Japanese typical urban town. Methods: This study conducted with anonymous self-administered questionnaires including SF36-ver.2 scale, and objects of this study were persons joining to volunteer groups in Hirakata city, Osaka prefecture, a mid-sized urban city in western Japan with a population about 410,000. The questionnaires were distributed to 1,076 members in 69 volunteer groups. Results: The answered questionnaires were finally collected from 51 groups and 601 members (response rates: 83.6% and 55.8%, respectively). Since the rate of female in all respondents was 80.0% (476 members), we analyzed only for female subjects. The mean age was 63.9±10.6 years. Rate of subjects with current medical histories was 59.6% and 75.2% answered doing active volunteer performances. The independent related factors to QOL in mental aspect including older age, current medical history, active volunteer performances and higher frequencies of interaction with neighbors were clarified from the multiple regression analysis. Conclusions: Older age, current medical history, active volunteer performances, and higher frequencies of interaction with neighbors are factors related to QOL in mental aspect in persons joining to volunteer groups. These results may be useful for developing SC to promote higher mental QOL in the community.

COMBINED ASSOCIATION OF OVERWEIGHT AND POLYPHARMACY WITH MOBILITY LIMITATION IN COMMUNITY-DWELLING OLDER WOMEN

S. Jung, H. Kobayashi, N. Yabushita, M. Nemoto, Y. Osuka, Y. Okubo, R. Figueroa, K. Tanaka, *University of Tsukuba, Tsukuba, Japan*

Objective: To examine the combined association of overweight and number of medications with mobility limitation (ML). Methods: A cross-sectional study included pooled data on 1087 older women, aged 65 to 91 years (mean age 72.9 ± 5.5 years). The participants were categorized by self-reported number of medications (0 medication (M0), 1 medication (M1), 2 medications (M2), 3 medications (M3), 4 medications (M4), 5 or more medications (M5+)) and body mass index (BMI) (overweight (OW): BMI ≥25 kg/m2, normal weight (NW): BMI <25 kg/m2). ML was assessed by self-reported difficulty in walking 400 meters or climbing stairs. Multivariable logistic regression analyses were performed to determine the combined associations of BMI and number of medications with ML, adjusted for age, exercise habit, smoking, alcohol and hand-grip strength. Results: A total of 28.4% participants had ML. The adjusted odds ratios of BMI combined with medications were 2.75 (1.39-5.44) in the NW plus M5+ group, 2.79 (1.38-5.62) in the OW plus M1 group, 3.13 (1.64-5.98) in the OW plus M2 group, 2.81 (1.32-6.00) in the OW plus M3 group, 4.43 (1.84-10.65) in the OW plus M4 group, 4.22 (1.98-9.02) in the OW plus M5+ group when compared to the NW plus M0 group. The odds ratio of OW with medication was significantly greater than that in NW with M5+. Conclusion: Results suggest that OW, when accompanied with multiple medications, yields greater risk of ML in community-dwelling older women. Key words: older adults, mobility limitation, body mass index, polypharmacy, overweight

CPAP ADHERENCE IN OLDER ADULTS WITH SLEEP APNEA AND MILD COGNITIVE IMPAIRMENT: SUCCESS STRATEGIES

A.R. Brown, C.S. Brotherton, K.C. Richards, *George Mason University, Fairfax, Virginia*

Background: Obstructive sleep apnea (OSA) is prevalent in older adults with mild cognitive impairment. Continuous Positive Airway Pressure (CPAP) is the gold standard treatment for OSA, but numerous studies have shown low adherence to CPAP. To our knowledge, no studies have been conducted on CPAP adherence in older adults with mild cognitive impairment. Motivational interviewing has been shown to increase patients' positive expectations for change and shift the balance of patients' focus from CPAP barriers to the benefits of treatment. We propose the following specific aims: 1) Determine CPAP adherence in older adults with mild cognitive impairment who received a motivational interviewing intervention for CPAP adherence and compare it to published norms in older adults, 2) Determine the perceptions of a subsample of the older adults with mild cognitive impairment on motivational interviewing as an intervention to promote CPAP adherence. Method: Mean 6-month CPAP adherence will be objectively collected from the CPAP devices in 47 older adults with mild cognitive impairment who are part of a larger study investigating the effect of CPAP on memory. Also, we will conduct semi-structured qualitative interviews with approximately 10 of the older adults with mild cognitive impairment to determine their perceptions of motivational interviewing as an intervention for CPAP adherence. Qualitative interview data will be analyzed for emerging themes relevant to the participants' perceptions. Results: None yet. Conclusion: None yet. Funding: R01AG034682 National Institute on Aging and George Mason University OSCAR Program

HEALTH PROMOTION FOR PEOPLE WITH INTELLECTUAL DISABILITIES

A. Roll, *School of Nursing, Madison, Wisconsin*

Background: Longevity of people with intellectual disabilities (ID) has increased considerably, with many now reaching old age. Recent research reveals that people with ID, particularly as they age, experience a much higher burden of illness related to chronic, often preventable illnesses. Health promotion (HP) is one way to achieve 'healthy life expectancy' for this population. Whereas HP for the general population is a well-developed concept, the unique challenges of providing HP for people with ID are not well known. Aim: To summarize the current state of knowledge on how the concept of HP for people with ID is used, identify knowledge gaps, and draw implications for future research and practice. Method: Using Rodgers concept analysis, Medline, PsycINFO, CinAHL, and SocINDEX were searched for literature related to HP and ID from 1963 to 2013. 54 articles were included. Results: While the literature on HP generally refers to healthy people, the literature on HP for people with ID assumes poor health as starting point. Health care provider's lack of knowledge was identified as a primary challenge for achieving HP for people with ID. Most intervention studies focused on improving physical activity and reducing weight, while a few addressed advocacy and empowerment approaches. Very little information was found that articulated unique HP adaptations necessary for people with ID. Conclusions: HP approaches for people with ID cannot easily be adapted from general HP approaches. Instead, they have to take into account the specific requirements and challenges of this group.

FEASIBILITY AND ACCEPTABILITY OF THE DEFEATING URINARY INCONTINENCE WITH EXERCISE TRAINING (DUET) PROGRAM

K. Talley[1], J.F. Wyman[1], U.G. Bronas[1], B. Olson-Kellogg[2], T. McCarthy[3], *1. School of Nursing, University of Minnesota, Minneapolis, Minnesota, 2. University of Minnesota - Physical Med/Rehabilitation, Minneapolis, Minnesota, 3. University of Minnesota - Family Medicine/Comm Health, Minneapolis, Minnesota*

Purpose: The purpose of this study was to develop and assess the feasibility and acceptability of a 12-week toileting disability prevention program for frail older women without dementia. Methods: Pilot study enrolling 21 women (mean age 86) from 3 continuing care communities. Individual randomization to treatment or no attention control group occurred at sites two and three. DUET combines individualized incontinence treatments, physical activity, and bathroom modifications to improve toileting skills. Measures of feasibility included recruitment, enrollment, and retention rates. Acceptability was measured with program adherence. Outcome measures included assessments of toileting skills, gait speed, balance, strength, urinary incontinence, quality of life, and a checklist of environmental toileting barriers. Results: Of the 47 women screened, 30 were eligible and 21 enrolled. Two women withdrew. Pre and post intervention data collection visits lasted 1.5 hours. All but one participant agreed to a pelvic exam done by a continence nurse. Treatment group participants completed all four continence nurse home visits and completed more pelvic floor muscle exercises than prescribed. Adherence to the exercise classes (64%) was higher than that for individualized walking (50%). Women were resistant to bathroom modification recommendations. Treatment group participants had improvements in toileting skills (p=0.026) and urinary incontinence (p=.028). Conclusions: Recruiting and retaining this frail population was feasible. Participants accepted the data collection procedures. Adherence to pelvic floor muscle exercises and group exercise classes was higher than that for individualized walking. Additional strategies to improve motivational techniques for walking and acceptance of bathroom modifications are needed.

MORTALITY AND COMORBIDITY AMONG CENTENARIANS IN THE VETERANS ADMINISTRATION HEALTH CARE SYSTEM DURING 1997-2012

L. Quach[1,2], J. Driver[1,3,4], K. Cho[1,3,4], E. Dugan[2], D.R. Gagnon[1,5], *1. VA Boston Healthcare System, Massachusetts Veterans Epidemiology Research and Information Center, Boston, Massachusetts, 2. The University of Massachusetts Boston, Department of Gerontology, Boston, Massachusetts, 3. Division of Aging, Brigham and Women's Hospital, Boston, Massachusetts, 4. Harvard Medical School, Boston, Massachusetts, 5. Boston University, Department of Biostatistics, Boston, Massachusetts*

The fastest growing segment of the aging population is the very old. Little is known about Veterans who live beyond 100 years of age. This study investigated the characteristics, comorbidities, and annual survival of veterans who were centenarians. Data from the Veterans Administration Health Care System included information on demographics, comorbidities, death, and duration of survival in the period from 1997-2012 for 2,432 subjects. Comorbidities include congestive heart failure (CHF), myocardial infarction (MI), peripheral vascular diseases (PVD), cerebrovascular diseases (CVD), cancers, diabetes, dementia, pulmonary, renal, and liver diseases. Survival analyses were conducted to assess the association of comorbidities and mortality using SAS 9.3. Centenarians were: 91% male, and 72% white. For subjects reaching their 100th birthday (n=2052), 718 died during the following year, 294 were lost to further follow-up or censored and 1040 survived beyond their 100th year. Cancer is the most frequent comorbidity in this population (12%), followed by chronic pulmonary diseases (9%), CVD (8%), diabetes (8%), chronic renal disease (8%); CHF (7%), PVD (7%), dementia (4%), MI (3%), and liver diseases (0.1%). White race was associated with increased risk of death (30%) compared to non-white races (RR: 1.3, 95% CI: 1.1-1.5). A diagnosis of dementia or congestive heart failure increased mortality risk by 40% (RR: 1.4; 95% CI: 1.1-1.8) and 22% (RR: 1.2; 95% CI: 1.0-1.5) respectively, adjusting for other covariates. Health care providers should be alerted to the risks associated with dementia and congestive heart failure among centenarian veterans.

TESTING A THEORETICAL MODEL OF ATTRIBUTED DIGNITY

C. Jacelon, L. Chido, *School of Nursing, University of Massachusetts, Amherst, Massachusetts*

As individuals age the maintenance of dignity increases in importance. Although the research on dignity has increased dramatically over the last 10 years, the relationships among the attributes of dignity are not yet well understood. Dignity, an intrinsic quality of being human, is manifested by an attributed, dynamic cognitive component of the self comprised of a sense of self value, self in relation to others, perceived value from others, and behavior that demonstrates respect toward self and others. This definition of dignity has been operationalized as the Jacelon Attributed Dignity Scales (JADS). The JADS, an 18-item Likert-scaled instrument, has been found to be a valid and reliable measure of attributed dignity comprised of four factors, as indicated above. Using the data from 289 older adults aged 65-95 years, path modeling and regression were employed to test the hypothesized theoretical relationships among the factors of attributed dignity. The findings indicate evidence for bi-directional relationships between 'perceived value from others' and 'self in relation to others', 'self in relation to others' and 'behaving with respect', 'behaving with respect' and 'perceived value from others'. Uni-directional paths between 'self value' and 'self in relation to others', and 'self value and behaving with respect' were also supported. The hypothesized bi-directional relationship between 'self value' and 'perceived value from others' was not supported. Understanding the relationships among the factors of attributed dignity provides insight into the development of interventions to support and enhance elder's dignity to promote successful aging.

POSITIVE PSYCHOLOGY AND AGING THROUGH HEDONIC AND EUDAIMONIC PERSPECTIVES: A SCOPING REVIEW

L.J. Araújo[1], O. Ribeiro[1,2,3], C. Paúl[1], *1. UNIFAI/ICBAS-UP, Porto, Portugal, 2. ISSSP, Porto, Portugal, 3. ESSUA, Aveiro, Portugal*

The phenomenon of ageing population has been primarily presented in terms of individual and social challenges and rarely is referred as an opportunity with benefits to older people and to the community. The study of aging from the lens of Positive Psychology allows this emphasis, looking beyond the decline normally associated with advancing of age and aiming to promote fulfilled and happy years in later life. In order to analyze the investment and statement of Positive Psychology research in the study of aging, a scoping review of the scientific literature published in the last 10 years was conducted. Our goal is to gather evidence on the key conceptual and empirical advancements that illustrate the commitment of Positive Psychology with aging issues. The literature search was conducted across the databases SCOPUS, Web of Science and INFOPsy, looking for papers having "Positive Psychology" and "Aging" (or similar words to aging) on their title, abstract or key-words. Simultaneously, aging related terms were searched in well-known journals of Positive Psychology. This strategy yielded 48 articles, 33 original scientific papers and 15 reviews for analysis. Main themes and study designs are presented and endpoints are discussed according to the hedonic and eudaimonic perspectives of the studies. In spite of the highest number of studies about happiness and life satisfaction (hedonic well-being), it is clear a growing interest on eudaimonic components of well-being in the last years, highlighting the human potential in advancing age and the importance of growth, self-actualization and meaning to a positive aging.

SUCCESSFUL AGING IN CENTENARIANS: THE RELEVANCE OF SOCIAL ENGAGEMENT FOR PSYCHOLOGICAL WELL-BEING

L.J. Araújo[1], O. Ribeiro[1,2,3], L. Teixeira[1], N. Duarte[1], D. Brandão[1], M. Azevedo[1], C. Paúl[1], *1. UNIFAI/ICBAS-UP, Porto, Portugal, 2. ISSSP, Porto, Portugal, 3. ESSUA, Aveiro, Portugal*

Rowe and Kahn's (1997) version of successful aging defines avoidance of disease and disability, maintenance of high physical and cognitive function, and sustained engagement in social and productive activities as essential components of aging successfully. The applicability of this model in very advanced age has been questioned and the relative importance of these aspects to well-being is not properly established. In order to analyze the effect of Rowe and Kahn' criteria on both subjective (hedonic) and psychological (eudaimonic) well-being, 140 individuals with 100 and more years old from the Oporto Centenarian Study (PT100) were interviewed. The mean age of the sample was 101.18 (SD 1.59); 89.3% women, 76.4% widowed and 57.9% living in the community. The Positive Valuation of Life Scale (Lawton et al., 2001), the Satisfaction with Life Scale (Diener et al., 1985) and a questionnaire of health and social information were used for data collection. Descriptive and inferential analyses were conducted. Mean scores of well-being were 27.81 (SD=5.21) for VOL and 6.51 (SD=1.97) for SWLS. Of the successful aging criteria only social engagement, i.e. participation in social activities, had a significant association with psychological well-being ($p<0.01$). These results stress out the influence of activity and social engagement participation in the adaptation to the challenges of very old age. The characteristics, sort and distribution of activities practiced at this age should be further investigated in order to promote and/or adjust available social engagement opportunities.

PREDICTIVE INFLUENCING FACTORS FOR DRUG MISUSE AND ABUSE BEHAVIORS OF THE ELDERLY IN THE COMMUNITY

J. Kim, H. Kang, *College of Nursing, Chonnam National University, Gwangju, Republic of Korea*

Objectives: This study was to identify the factors, and their direct and/or indirect paths, influencing drug misuse and abuse behaviors among the elderly having a multidimensional vulnerability to drug use. The conceptual framework of this study was based on the key concepts in Pender's health promotion model (Pender, 1996). Methods: Based on cross-sectional research, a covariance structure analysis was performed to predict the paths among the factors influencing on drug misuse and abuse behaviors of the elderly. 357 elderly people were participated in this study. Data were analyzed using SAS 9.1 and LISREL 8.53 to test the model. Results: The fitness indices for the modified model were $\chi2$=2.371(p= .796), GFI=0.997, SRMR=.018, AGFI=0.989, NFI=0.988, NNFI=1.042, CFI=1.000, and IFI=1.013. Drug misuse and abuse behaviors directly was influenced on the attitudes toward drug use, and influenced on both directly and indirectly influenced on depression and uncertainty in the model. However, knowledge about drug use and social support only directly was influenced on depression and uncertainty, was not influenced on drug misuse and abuse behaviors in the model. Conclusion: Our findings suggest that to prevent drug misuse and abuse behaviors among the elderly, health professionals must assess depression, uncertainty, and attitudes toward drug use thoroughly. This structural model can promote comprehensive understanding of drug misuse and abuse behaviors in elderly of community by providing a theoretical framework for the prediction path.

PREDICTORS OF HIV RISK BEHAVIORS AMONG OLDER ADULTS: A MULTILEVEL ANALYSIS

L. McCord, *University of North Carolina Charlotte, Charlotte, North Carolina*

With the increase in older adults living with HIV, being diagnosed or infected later in life, it is paramount that HIV risk behaviors are examined in this population. Understanding both environmental and individual factors and their unique influences on HIV risk behaviors among older adults is very important. A study was undertaken to develop an understanding of the environmental and individual population factors that predict HIV risk behaviors among older adults using population-based data from the Behavioral Risk Factor Surveillance System and eight state level data sources, guided by Andersen's Behavioral Model of Health Utilization (2007). The research design for the study was a multilevel repeated cross-sectional design with a three level-nested structure. The software package MLwiN was used to conduct the multilevel analysis using the Deviance Information Criterion (DIC) analytical method to assess the fit of models with Markov chain Monte Carlo (MCMC) estimation. Using a nationally representative sample of 23,950 individuals from 2008 to 2011, nested in 51 states, the trend study allowed for an understanding of the state and individual-level factors that predict participating in HIV risk behaviors. In each step, the model fit improved the DIC statistic. Overall, the results indicated that there were differences between states and their levels of HIV risk behaviors. While HIV risk behaviors decreased from 2008 to 2011, there was significant variation between and within states in the probability of individual HIV risk behaviors. Implications for the significant environmental and individual predictors will be presented.

MAKING CONNECTIONS: FROM CONDOM USE TO SEXUALITY RE-EDUCATION FOR 40+ AGED SINGLE HETEROSEXUAL WOMEN

P.P. Brown, *Winston-Salem State University, Winston-Salem, North Carolina*

Previous research indicates that consistent male condom usage is positively associated with women's higher education and personal income particularly for single, heterosexual women. The current study upends this previously held knowledge, specifically for older, single, heterosexual women. Results indicate that higher personal income and higher education is negatively related to consistent condom use and is statistically significant (p < .05). No prior research was located, which supported these findings. This is a disquieting revelation for researchers who have believed and shown that higher education/income positively correlates with higher and more consistent condom use particularly within sexual health and reproductive health. The current study's findings challenge one of the major assumptions within sexual health research, whereby women will be able to insist on condom usage when they hold more financial power and resources, such as higher education and health benefits, and are not relying on men for their fiscal support. Additionally, this finding supports Connell's cathexis of the "sexual structure of power," whereby women support men's authority even when it is directly affecting their personal reproductive health. The finding also offers some support of Connell's "structure of cathexis," whereby sexual relationships are organized around each individual's emotional attachment to the other partner. "Structure of Cathexis" is based within Connell's "Theory of Gender and Power" and "Emerson's Social Exchange Theory," with financial independence serving as a means for women to insist on condom use and protection from STIs. Additionally, this finding strengthens the need for sexuality re-education of middle-aged and older women.

TELEPHONIC INTERVENTION TO IMPROVE STAR RATINGS

J. Li, K. Den Hartog, C. Taylor, D. Lunderborg, *Healthcare Analytics, Optum, Golden Valley, Minnesota*

Medicare STAR ratings are important components in comparing the quality of Medicare Advantage plans. Compliance with clinical measures is an important metric in STAR ratings. In late 2012, A telephone-based intervention was carried out with members of UnitedHealthcare's Medicare Advantage health plans to help members close gaps in necessary health care and thereby improve the quality of their lives. Members with gaps in STAR quality and performance measures related to missing screenings (C01-C05) were targeted for outreach. Members were called by nurses or health coaches, provided education about how best to receive care, and when appropriate assisted in scheduling appointments with their primary care provider. The impact of the telephonic program was measured by comparing closure rates of engaged individuals to a control group. Closure of the gap was determined by evidence found in healthcare claims that a particular action was taken to close the gap. The control group was drawn from a sample of those who did not participate in the program. Multivariate regression was used to adjust case-mix differences between groups. 91,629 members were identified who were non-compliant with at least one of measures. Of those, 15,879 participated in the program. Participants had increased gap closure rates compared to those who did not participate. The likelihood of closing a gap for participants was 74% higher for C01, 30% higher for C02, and 33% higher for C05. A driver of these gap closures was likely members scheduling visits with their primary care physician, with help from the telephonic program.

THE IMPORTANCE OF CULTURAL ACTIVITY FOR HEALTH AMONG ELDERLY KOREAN IMMIGRANTS

J. Kim[1], A. Han[2], J. Heo[3], *1. Central Michigan University, Mount Pleasant, Michigan, 2. Central Michigan University, Mount Pleasant, Michigan, 3. Texas A&M University, College Station, Texas*

Immigrants may exhibit a sense of cultural preservation when they adapt to and navigate new cultural elements because they are ingrained in their own cultural values and beliefs. Elderly Korean immigrants struggle with accepting and embracing new cultural perspectives, which negatively influence their health and well-being. In spite of adaptation challenges, elderly immigrants may develop their own strategies to deal with adaptation challenges and strive to improve health and well-being. One effective strategy for elderly immigrants to improve health would be to participate in personally meaningful activities. Previous authors suggest that participation in meaningful activities leads to substantial physical, psychological, cognitive, and social benefits among elderly adults. The purpose of this study is intended to capture the value of culture-related activities for the health of elderly Korean immigrants. Using the constructivist grounded theory, this study was designed to capture the value of culturally meaningful activities for health of elderly Korean immigrants. Three themes were identified as benefits of culturally meaningful activity involvement: (a) creating a psychological comfort zone, (b) improving emotional well-being, and (c) experiencing positive intergroup contact. The findings suggest that by engaging in various culturally meaningful activities, elderly Korean immigrants gain a sense of social, cultural, and psychological significance in life. This study also provided evidence that elderly Korean immigrants maintain and develop their cultural identity through culturally meaningful activities.

SESSION 265 (POSTER)

EXERCISE

HIGH CARDIORESPIRATORY FITNESS REDUCES AGE- AND HYPERTENSION-RELATED ARTERIAL STIFFENING IN MEN

K. Tanisawa, T. Ito, R. Kawakami, Y. Gando, Z. Cao, S. Sakamoto, M. Higuchi, *Waseda University, Tokorozawa, Japan*

Hypertension is a common health problem worldwide; its prevalence is above 60% in Japanese older people. Hypertension accelerates age-related increase in arterial stiffness, which is a predictor of cardiovascular diseases. In contrast, previous studies consisting of mainly normotensive subjects demonstrated that high cardiorespiratory fitness (CRF) is associated with reduced arterial stiffness. However it has remained unknown whether high CRF also attenuates age-related acceleration of arterial stiffness in hypertensive individuals. To address this issue, we measured cardio-ankle vascular index (CAVI), a novel indicator of arterial stiffness in 77 middle-aged (aged 30–64 years) and 80 elderly Japanese men (aged 65–79 years) including 96 (61%) hypertensive individuals. CRF was assessed by measuring peak oxygen uptake (VO2peak), and subjects were divided into low- and high-CRF groups. In multiple linear regression analysis, although age was a major determinant of CAVI ($\beta = 0.395$, $p < 0.001$), VO2peak was also associated with CAVI ($\beta = -0.202$, $p = 0.011$) independent of age and other covariates. Two-way ANCOVA revealed that in the low-CRF group, hypertensive individuals had higher CAVI than normotensive individuals (hypertension: 8.50 ± 0.12; normotension: 8.02 ± 0.18, $p < 0.05$), whereas there was no difference in CAVI in the high-CRF group regardless of the presence of hypertension (hypertension: 7.91 ± 0.13; normotension: 8.04 ± 0.14). However, there was no difference in blood pressure between the different CRF groups. These results suggest that high CRF is robustly associated with reduced arterial stiffness in hypertensive middle-aged and elderly Japanese men without altering blood pressure.

RECREATIONAL EXERCISE AND PHYSICAL FUNCTION IN ACTIVE MEN AND WOMEN AGED 50 YEARS AND OVER

S. Barbat-Artigas, S. Dupontgand, C. Pion, M. Aubertin-Leheudre, *University of Quebec At Montreal, Montreal, Quebec, Canada*

Background: Laboratory-based exercise programs have been shown to be effective in enhancing physical function in older adults. However, outside of this ideal context, it is recognized that elderly individuals are very sensitive to factors that may hamper their involvement in exercise. The present study aimed to investigate the relationship between recreational exercise and physical function in men and women 50 years and over. Methods: Data from 164 men and 361 women (50- 89 yrs) involved in the YMCA 50+ Study have been used. Recreational exercises have been identified using structured interview. Participants were asked to specify the weekly exercise time (WET; min/wk) and for how long each activity have been practiced (Average exercise duration: AED; months). Activities were categorized in 3 main categories; Resistance, Aerobic and Body & Mind exercises. A composite score of physical function (PFs) was created based on the timed up-and-go, alternate step, sit-to-stand, and balance tests. Results: After controlling for age, body mass index and comorbidities, total WET explained an additional 1.0% of the variance in PFs ($p = 0.010$). Further stepwise regression analysis including WET and AED of the 3 categories of exercise revealed that Aerobic WET was the only predictor of PFs and explained an additional 0.8% of the variance in PFs ($p = 0.024$). Conclusion: Only Aerobic WET was associated with PFs. Although significant, this relationship was relatively weak, suggesting that recreational exercise have little influence on physical function. Such differences may originate from differences in exercise intensity between laboratory-based and recreational environment.

ELDERLY ROWING-TRAINED MEN HAVE COMPARABLE RISK OF TYPE 2 DIABETES TO NON-DIABETIC COUNTERPARTS

M. Higuchi, T. Ito, K. Tanisawa, X. Sun, Z. Cao, M. Asaka, S. Sakamoto, *Waseda University, Tokorozawa, Japan*

Rowing exercise using boats on water or ergometers at sports gyms has been widely performed by elderly people worldwide. Our previous studies have demonstrated that elderly rowing-trained men have higher cardiorespiratory fitness (CRF), and lower risk for coronary heart diseases than untrained men. In this study, we evaluated metabolic profile associated with type 2 diabetes (T2D) in elderly rowing-trained ($n = 49$) compared with the age-matched non-diabetic men ($n = 91$) (aged 60-79 years). CRF was assessed by measuring peak oxygen uptake. We used MRI to assess total abdominal fat (AF), visceral fat (VF) and subcutaneous fat (SF) areas. We obtained HOMA-IR as a parameter of insulin resistance, and HOMA-β as an insulin secretion. Although rowing-trained had significantly higher CRF than age-matched controls (33.6 ± 4.4 vs. 28.1 ± 5.1 ml/kg/min, $p<0.001$), no differences were observed in BMI (23.9 ± 2.2 vs. 23.3 ± 2.7 kg/m2), and AF (512 ± 87 vs. 479 ± 83 cm2) between the two groups. Rowing-trained men had similar levels of HOMA-IR (1.40 ± 0.85 vs. 1.40 ± 0.73) and HOMA-β (64.1 ± 47.1 vs. 60.6 ± 30.0) to those of age-matched controls. In multiple linear regression analysis for all subjects, no association was observed between CRF and HOMA-IR and HOMA-β. On the other hand, VF and SF areas were independently associated with HOMA-IR and HOMA-β, respectively. This study suggests that elderly rowing-trained men have comparable risk of T2D to non-diabetic counterparts because of similar AF, both VF and SF, despite of their high CRF.

BALANCE AND STRENGTH TRAINING IN OLDER ADULTS: IMPACT OF A SIX-WEEK INTERVENTION ON BALANCE RELATED MEASURES

R. Lucena, C. Thompson, *University of West Florida, Pensacola, Florida*

The purpose of this study included examining relationships between the change in balance confidence, functional mobility, and various measures of balance in older adults after six weeks of balance training only and a combination of balance and strength-training programs. A convenience sample of 34 older adults (>65 years old) was grouped based on their current participation in Balance and Mobility and Strength Training programs held at the University of West Florida: group one [balance training only classes ($n = 15$)], and group two [balance and strength training classes ($n = 19$)]. Each participant was measured on two different occasions: before and after six weeks of training. The following balance-related measures were assessed: The Fullerton Advanced Balance Scale (FAB), the Balance Efficacy Scale (BES), and the 8-foot-up-and-go test. The data were analyzed using the paired samples t-test procedure. There were significant differences between pre and post intervention in both groups for BES scores. The Balance training only (group one) scored significantly higher on the FAB ($p < .001$) and the 8-foot-up-and-go ($p < .01$) than the balance and strength training combination (group two). Both groups demonstrated improved balance confidence after the 6 weeks program. The Balance intervention was more effective in improving functional mobility and balance skills in the studied population. Implication of the study findings for older adults who participate in these types of exercises interventions include optimize their balance performance levels and remain more independent, leading to a better quality of life with reduced risk for falls.

PROGRESSION IN LEVEL OF A NOVEL FALLS-PREVENTION EXERCISE AND PHYSICAL FITNESS

T. Jindo[1], N. Kitano[1,2], M. Saghazadeh[1], T. Tsuji[3,1,2], A. Sato[1], T. Abe[1], K. Tsunoda[4], T. Okura[1], *1. Faculty of Health and Sport Sciences, University of Tsukuba, Ibaraki, Japan, 2. Research Fellow of the Japan Society for the Promotion of Sciences, Tokyo, Japan, 3. Gerontology Research Center, University of Jyväskylä, Jyväskylä, Finland, 4. Meiji Yasuda Life Foundation of Health and Welfare Physical Fitness Research Institute, Tokyo, Japan*

The Square-Stepping Exercise (SSE) is a novel falls-prevention program that includes varied steps in multiple directions, and step patterns that are made progressively more complicated. The purpose of this study was to examine the association between progressing in the step patterns and physical fitness (PF) changes during a SSE program. Participants in this study were 52 community-dwelling older adults (mean age: 70.4 ± 3.9 years, male = 7, female = 45) in Kasama City, Japan. They participated in a SSE program once a week for 3 months. To evaluate PF changes by the exercise program, we measured 7 physical performance tests before and after the intervention: grip strength, one leg stand, sit and reach, 5-time sit-to-stand, timed-up-and-go, 5-m habitual walk and choice-stepping reaction time. Subjects were divided into advanced and basic groups with the median of progression in SSE's step patterns. We used a two-way analysis of variance to examine the interaction between two groups. A significant group-by-time interaction was found only on one leg stand ($P < 0.05$), with the advanced group improving their performance more than basic group. Both groups significantly improved in the following tests: sit and reach, 5-time sit-to-stand, timed-up-and-go, choice-stepping reaction time ($P < 0.05$). Our findings suggest that although participants practicing basic step patterns improved their PF, participants who progressed to more complicated step patterns were more likely to improve their PF. Thus, regardless of progression, attending SSE program might be important in improving older adults' PF.

AEROBIC EXERCISE AND MEMORY TRAINING: EFFECTS DIFFERENTIAL ON MEMORY DEFICITS OF ELDERLY INDIVIDUALS

V. Silva[1], G. Vieira[3], P.U. Cabral[2], L. Marques[4], A. Silva[4], L. Ribeiro[4], C. Correa[5], *1. State University of Rio de Janeiro - UERJ, Rio de Janeiro, Rio de Janeiro, Brazil, 2. State University of Piaui - UESPI, Teresina, Rio de Janeiro, Brazil, 3. Federal University of Juiz de Fora, Juiz de Fora, Minas Gerais, Brazil, 4. University of Trás-os- Montes e Alto Douro, Vila Real, Trás-os- Montes e Alto Douro, Portugal, 5. Federal University of Rio de Janeiro - UFRJ, Rio de Janeiro, Rio de Janeiro, Brazil*

Introduction: Advancing age may have specific negative effects upon a variety of cognitive functions. On the other hand, there are a range of extrinsic factors that may interact to modulate the impact of aging on cognition. Memory training, as it can be seen in this same literature, is one of the main strategy for minimizing such declines. Objective: In this context, we aimed at studying the possible differential effects of two modalities of training upon episodic memory in aged individuals. Method: Sample was composed by 30 healthy older adults of both genders, selected on the basis of having memory deficits, aged 60-70 years and all living in Cataguases - MG. They were randomly divided into three groups. Group 1 performed aerobic exercise training (ATG) while the group 2 practiced an specific memory training by use of a categorization technique (MCG). The third one was a non-training group control (NTG). Results: When compared to their control, both, ATG and MCG groups showed significant improvement in the figure recognition test performance ($p< 0.05$), but in the figures recall test part, the MCG had significantly better performance ($p< 0.05$) than the other groups. Conclusion: Based upon the results we admitted episodic memory training strategy as capable of promoting significant improvement in mnemonic memory functions of the older individuals suffering from memory deficits. In a close, but no significant proportion, aerobic exercises training may also be a good alternative for improving this ability in older individuals.

UNDERSTANDING THE WII EXERGAMES USE AMONG ASSISTED LIVING RESIDENTS

Y. Chao[1], Y. Scherer[1], K.T. Lucke[2], C. Montgomery[1], Y.B. Wu[1], *1. SUNY-BUFFALO, Amherst, New York, 2. Elmira College, Elmira, New York*

Objectives: The purpose of this study was to investigate the physical and psychosocial effects of the Wii exergames incorporating self-efficacy theory on assisted living residents, and the facilitators and barriers that influence residents to exercise. Methods: The study was a mixed method pre/post-test design with a controlled trial. Thirty-two participants (aged 68 to 98 years) were recruited from two facilities. Sixteen participants received an intervention combining self-efficacy theory and Wii exergames twice a week for 4 weeks. The other participants received a health education program. Physical function, fear of falling, depression, and quality of life were evaluated. T-tests were used for data analysis. Results: After the 4 week intervention, the Wii exergame group showed significant improvements in balance ($p < .01$), mobility ($p < .01$), and depression ($p < .05$). The education group showed no significant improvement in any of the outcomes. In addition, the Wii exergames group had significant better mental-health related quality of life than the education group at post-test ($p < .05$). Five themes emerged that facilitated participants' desire to exercise: (1) health and mobility; (2) increased alertness; (3) elevated mindset; (4) social interaction; and (5) structured program. Barriers to engage in exercise included (1) age- or health-related impairments to exercise; and (2) unpleasant experiences related to exercise. Conclusion and Implications: The intervention combining self-efficacy theory with the exergames resulted in physical and psychosocial benefits for older adults. Further research is needed to develop senior-friendly exergames and disseminate the exergaming programs to the clinical practice.

TREATMENT EFFECTS OF WII® BALANCE BOARD IN FALLS PREVENTION FOR COMMUNITY-DWELLING OLDER ADULTS

P. Chang, *School of Occupational Therapy, Texas Woman's University, Houston, Texas*

Introduction: Falls are one of the major public health concerns among older adults. Objective: The purpose of the proposed study was to examine the treatment effects of Wii® Balance Board exercise programs in preventing falls for community-dwelling older adults. Methods: One group pre and post-test design was used for this study. The outcome measures of the study are functional independence, standing balance, walking endurance, and health-related quality of life. Participants are older adults who are 65 years of age and older, reside in the community, have the Mini Mental State Score ≥ 24, and are able to communicate verbally. After baseline assessment, the intervention group will receive treatment once a week for 60 minutes each session over 6 weeks. Each session, participants will spend 40 minutes in exercises and 20 minutes on educational topics including home safety and modification, using adaptive devices, medication management, proper nutrition, and vision check. The paired-t test was used for statistical analysis. Results: Twelve women and men with an average age of 75 years of age participated in a 6-week exercise and education program. Scores indicated significant improvement in functional physical status (activities of daily living), balance, distance walked in 6 minutes, and quality of life in the physical health domain after the intervention. Conclusion: Computer-based (Wii® Balance Board) intervention provided satisfactory treatment effects in preventing falls among older adults. Contribution to OT Practice: This study provides new understanding as how occupational therapists can use computer-based intervention for community dwelling older adults in preventing falls.

EFFECTS OF A SIX-WEEK PROGRESSIVE RESISTANCE TRAINING INTERVENTION ON GAIT SPEED IN COMMUNITY-DWELLING SENIOR ADULTS

K.A. Caillouet, M.D. Hampton, C.A. Caillouet, E. Greska, *University of West Florida, GULF BREEZE, Florida*

INTRODUCTION: Gait speed is a well-known marker of physiological health and is affected by many variables, including motor control and muscular strength. Previous research has related gait speed directly to performance of activities of daily living and quality of life; with higher gait speeds demonstrating greater functional ability and ambulation in older adults. PURPOSE: To examine the effects of a six-week, progressive strength-training intervention on temporal and spatial parameters of gait in senior adults. METHODS: Ten community-dwelling older adults (4 male, 6 female; age=66¬±6.25 years) participated in a six-week progressive strength-training intervention. Pre- and post-assessments were performed during a 4-meter walk using a Vicon three-dimensional motion capture system, collecting at 250Hz. The 16-marker Plug-in Gait model was utilized for lower extremities to quantify angles for hip, knee, and ankle joints, with marker data filtered at 6Hz. The strength-training intervention included six weeks of bi-weekly, 1-hour training sessions targeting all muscle groups. STATISTICAL ANALYSIS: Repeated measures ANOVAs (group x training status) were performed for gait speed, stride length, step time, and joint range of motion. RESULTS: Significant differences were found for stride length ($p<.05$), step time ($p<.05$), left hip extension ($p<.05$), left knee extension ($p<.05$), and right knee extension ($p<.05$). Gait speed increased but was not significant ($p=.06$). CONCLUSION: Influencing factors to improved gait speed included increased stride length and decreased step time, which may indicate enhanced stability and ambulation. Training length, sample size, and/or inter-subject training variations may have influenced the lack of significance in gait speed.

"NOT JUST ANOTHER WALKING PROGRAM" - EVERYDAY ACTIVITY SUPPORTS YOU (EASY) MODEL – PROCESS EVALUATION

M.C. Ashe[1,2], M. McAllister[1,2], M. Dawes[1], G. Wong[2], P. Gardiner[3], J. Sims-Gould[1,2], H.A. McKay[1,2], *1. Family Practice, University of British Columbia, Vancouver, British Columbia, Canada, 2. Centre for Hip Health and Mobility, Vancouver, British Columbia, Canada, 3. University of Queensland, Brisbane, Queensland, Australia*

We assessed feasibility of a lifestyle intervention designed to encourage women at retirement age to gradually increase physical activity. The Everyday Activity Supports You (EASY) feasibility RCT aimed to incorporate more daily tasks and utilitarian walking. We recruited healthy, inactive, community dwelling women aged 55-70 years who could climb a flight of stairs and walk 400 meters (N=25). The six-month EASY program consisted of: group-based education; individualized physical activity prescription; and activity monitoring (Fitbit). Control participants (N=12) received education sessions, with different content. We adopted a knowledge to action framework and conducted a process evaluation to monitor and adapt features of program delivery based on participants' experience. Specifically, we administered feedback questionnaires and recorded participant attendance at each session, requested feedback on program satisfaction and conducted exit interviews. For intervention group participants, attendance ranged from n=6 (46%) to n=13 (100%); median (interquartile range, IQR) was 10 (3.8) participants/session. Control participants had lower attendance at education sessions [median (IQR) 6.5 (1.8) participants]. For both groups, program challenges included low attendance over the summer due to holidays and communication. Intervention successes included regular participant feedback that informed program development, and individualized sessions that instilled self-motivation, accountability and confidence. Participant feedback related to increasing physical activity included: start slow, break up activity into bite-size amounts, and monitor progress. The process evaluation was an invaluable step towards informing a lifestyle intervention that could be scaled-up and disseminated across community settings to encourage women at retirement age to sit less and move more.

FEASIBILITY OF 3-STEP WORKOUT FOR LIFE PROGRAM TO DECREASE ADL DISABILITY IN VULNERABLE ELDERLY

C. Liu, D. Clark, L. Jones, A. Gutierrez, *Indiana University at Indianapolis, Indinapolis, Indiana*

Alleviating or delaying late-life disability is a common goal of gerontologists. Although numerous exercise programs have shown improvement in physical fitness or physical functioning in older adults, the far transfer of exercise benefits to disability outcomes is often limited; in part, because these programs rarely directly intervene the ability to perform activities of daily living (ADL) at home. Our research team has developed the 3-Step Workout for Life program which includes ADL practice as part of the exercise intervention. The purpose of this study is test the feasibility of 3-Step Workout for Life program. Ten older adults (Mean age = 74.5 years) who showed decline in muscle strength, lived a sedentary lifestyle, and had one or more ADL difficulties were recruited. Participants received three training components—muscle strength training, functional training, and ADL training—over 10 weeks and 3 times a week. Adverse events, attendance rates, and subjective and objective change of ADL performance were evaluated. Most adverse events were related to muscle strain or joint pain. The average attendance rate was 78%. The advanced lower extremity function component of the Late Life Function and Disability Instrument was significantly improved after completing the program (Wilcoxon Signed Rank Test, $p = .008$). The average change of motor scale on the Assessment of Motor and Process Skills (a performance-based ADL measure) was more than 2 standard errors, suggesting a clinically meaningful change. The study supports the feasibility of the 3-Step Workout for Life program in vulnerable older adults.

EFFECTS OF WATER-BASED EXERCISE ON DEMENTIA RELATED FACTORS AND CHOLESTEROL IN KOREAN OLDER WOMEN

S. Shin[1], Y. Cho[2], K. Shin[2], *1. Inje University, Busan, Republic of Korea, 2. Pukyong National University, Busan, Republic of Korea*

Purpose: The aim of this pilot study was to investigate the effects of water-based exercise on the levels of dementia related factors (i.e., homocysteine and dehydroepiandrosterone sulfates [DHEAs]) and cholesterol in community-dwelling Korean older women. Methods: Twenty community-dwelling older women aged 65-75 years participated in this study. Ten subjects in the experimental group (EG) participated in one-hour, three days/week water-based exercise program for 12 weeks. Ten subjects were in the control group (CG). The levels of homocysteine, DHEAs, and cholesterol in all subjects were assessed before and after the program. Results: Mean (±SD) age of 20 subjects was 70.7 (±3.2).

The levels of homocysteine were significantly decreased after the water-based exercise program (p<.05) in the EG compared to the CG. The levels of DHEAs were significantly increased after the program (p<.05). In addition, there were significant differences in the levels of blood lipids. Total cholesterol level was significantly decreased after the program (p<.05) in the EG compared to the CG. High-density lipoprotein cholesterol level was significantly increased (p<.05) after the program. However, there was no significant difference in low-density lipoprotein level after the program in both groups. Conclusion: The findings of this study suggest that regular water-based exercise program may be effective in preventing dementia in older adults by improving cardiovascular risks and homocysteine and DHEAs levels.

CAN SEATED EXERCISE CONTRIBUTE TO PHYSICAL ACTIVITY REQUIREMENTS IN COMMUNITY- DWELLING OLDER ADULTS?

S. Ernesto[1], K. Krebs[1], K. Mahaffie[1], G. Formica[2,1], K.K. Mangione[1], *1. Physical Therapy, Arcadia University, Glenside, Pennsylvania, 2. Artman Lutheran Homes, Ambler, Pennsylvania*

Background: Older adults are recommended to participate in moderate physical activity for 30 minutes at least 5 days per week. Those who show signs of frailty (slow gait speed, multiple co-morbid conditions) may have difficulty reaching this goal. The purpose was to determine whether a seated exercise program, performed in group videos and exercise classes, would be intense enough to meet recommended activity levels. Methods: Community-dwelling-older adults (n=31; 71. 5yrs) were recruited from a wellness center. Participants performed a 25 minute whole body seated exercise program. Intensity of the program was measured with downloadable heart rate (HR) monitors and with the 0-10 Rating of Perceived Exertion (RPE) scale. Results: Mean HR for the session was 84 bpm which was within the 50%-70% of maximal HR as recommended by the CDC. However, mean RPE for the group was 2.4. Those with slow gait speed (< 1.0 m/sec) had a mean RPE of 3.1 and the values were significantly higher than the values reported by those with faster gait speed. Persons with higher number of comorbid conditions (> 3) had average RPE values of 2.8. Conclusions: Seated exercise programs are not intense enough to meet the CDC's recommendation for moderate intensity exercise in a general sample of older adults; however, for those with slow walking speed, seated exercise programs are appropriate for daily physical activity. Clinical Relevance: This study identifies a commonly used assessment tool, gait speed, to help classify older adults who may benefit from a seated exercise program.

EFFECTS OF HIGH-SPEED LOW-RESISTANCE BICYCLING INTERVENTION IN PARKINSON'S DISEASE

M. Uygur, M. Bellumori, C.A. Knight, *University of Delaware, Newark, Delaware*

Bradykinesia (i.e. reductions in the speed and amplitude of a movement) is one of the symptoms of Parkinson's disease (PD) that substantially decreases mobility and increases rates of disability and health care costs. Recent studies of high-speed forced and assisted cycling have shown "speedwork" as a valuable training method addressing bradykinesia. However, there is a need for more accessible and feasible training modality as compared to existing training modalities. Purpose: To determine the effects of a six week high-speed, low-resistance (HS-LR) stationary recumbent cycling on the physical and cognitive functions in people with PD. Methods: Pre-exercise tests assessed PD severity (Unified Parkinson's Disease Rating Scale; UPDRS), dynamic (four square step test; 4SST) and static balance (functional reach test; FRT), mobility (6 m walk; 6mW, timed-up-and-go, TUG), dexterity (nine hole peg test; 9HPT), and cognition (simple and choice reaction time; SRT and CRT). These testes were again assessed following a supervised, 6-week (12 sessions), HS-LR training. Each training session included 20, 15-second bouts of fast pedaling that are nested within 30 minutes at a preferred pedaling cadence at the lowest resistance setting of the bike. Results: Fourteen participants (mean(SD) age 62.6 (8.8) years; disease duration 40.1 (28.9) months) participated in the study. UPDRS, 4SST, FRT, 6mW, TUG, 9HPT, SRT significantly (p<0.05) improved after the completion of HS-LR training. Discussion: HS-LR training is an effective training modality that could improve physical and cognitive function in people with PD. Improvements seen in dexterity and cognitive related functions suggest central neural adaptations.

EFFECT OF FUNCTIONAL TRAINING OF UPPER LIMB IN DUAL TASK CONDITION IN PATIENTS WITH PARKINSON DISEASE

S.M. Pompeu[1], J.E. Pompeu[1], V. Pereira[2], C. Tomo[2], *1. São Paulo University, São Paulo, Brazil, 2. Centro UNiversitário São Camilo, São Paulo, Brazil*

The aim of this study was to verify the effects of a dual task training on functions of upper limb and to compare these effects with a training performed at single task condition. It was performed a randomized clinical trial, composed by 14 patients with Parkinson disease, mean age of 69 (4.0) years, on stages 1 and 2 of Hoehn and Yahr scale. Patients were randomized between experimental group (EG) and control group. (CG). CG trained four functional tasks of upper limb in single task condition and the EG trained the same functions while performed verbal fluency tasks. The functional tasks were: (1) wearing a jacket; (2) combing hair; (3) taking a cup to the mouth and (4) answering a phone. Patients performed 5 sessions of training with one hour each one. Each task was trained during 15 minutes. Performance of patients on tasks was assessed in single and dual task condition (associated with a verbal fluency task) before and after training. Beside this, performance of patients on Box and Block Test (B&B) was assessed before and after training. Patients showed improvement on performance of the trained tasks, in single and dual task condition and in B&B after training without differences between groups. This study showed that both kind of training could promote improvement on upper limb function of patients with Parkinson disease.

NEUROMUSCULAR IMPROVEMENTS FOLLOWING A SPEED-BASED CYCLING INTERVENTION (CNS)

M. Bellumori, C.A. Knight, *University of Delaware, Newark, Delaware*

Although slow movement is obvious among older adults, little research supports the safe practice of speed-based exercise in this population. The purpose was to determine the neuromuscular effects of a 6-week speed-based exercise program in older adults. Stationary recumbent cycling was selected to minimize fall risk. Minimal resistance reduced musculoskeltal loads and cardiovascular demand. Two weekly 30-min exercise sessions consisted of interval training in which subjects pedaled at preferred cadence and with 10, 20-s fast cadence intervals. Participants (n=14, 73(7.6) years) completed pre- and post-exercise tests, and a 4 week retention test. No significant changes were observed in a subset of participants (n=7) who served as time-controls. After training, there were improvements in rates of force development (RFD), time to peak force (TTPF), and surface electromyography rate of rise (sEMG-RER) during rapid isometric knee extension. Improvements were maintained 4 weeks after the intervention (p<.05). A central mechanism was implicated because the lower extremity exercise elicited improvements in the untrained upper extremities (isometric elbow extension RFD, TTPF, and sEMG-RER, p<.05). These results support a speedwork strategy which complements current exercise recommendations for older adults and potentially people with movement limitations while supporting the literature related to neural adaptations to high-speed training in older adults.

HIGH VELOCITY QUADRICEPS EXERCISES COMPARED TO SLOW VELOCITY QUADRICEPS EXERCISES FOLLOWING TOTAL KNEE ARTHROPLASTY

D. Doerfler[5,1], R. Andrews[2], B. Gurney[2], C. Mermier[3], M. Rauh[4], *1. University of New Mexico Hospital, Albuquerque, New Mexico, 2. University of New Mexico Health Science Center, Albuquerque, New Mexico, 3. University of New Mexico Exercise Science Department, Albuquerque, New Mexico, 4. San Diego State University, San Diego, California, 5. Rocky Mountain University of Health Professions, Provo, Utah*

Despite improvement in pain and perceived function in patients following total knee arthroplasty (TKA), objective outcome measures of muscular impairment and ambulatory function demonstrate significant deficits. Evidence suggests that quadriceps power may play a greater role in ambulatory function than measures of strength following TKA. The purpose of this study was to compare the effect of high velocity (HV) to slow velocity (SV) quadriceps exercises on functional outcomes and quadriceps power following total knee arthroplasty (TKA). This study was a randomized controlled clinical trial conducted in a university hospital outpatient physical therapy clinic in patients following TKA. Methods: Twenty-one patients between the ages of 50 and 85 years old and four to six weeks out from a unilateral TKA were randomly assigned to a HV group or SV group. Subjects performed an evidence-based standard progressive exercise program in addition to either HV quadriceps exercises or SV quadriceps exercises. Subjects attended 2 sessions per week for 8 weeks. Before and after the 8-week exercise intervention, subjects completed a functional questionnaire, health survey, functional testing, and underwent quadriceps strength and power testing. Both groups demonstrated improvement in ambulatory outcome measures, strength, speed and power. The HV group demonstrated significantly greater improvement in distance walked and perceived physical function, compared to the SV group. Limitations: Limited subject numbers may be responsible for a Type II error. Conclusion: HV quadriceps exercises are an effective rehabilitation strategy in conjunction with a standardized progressive resistance exercise program beginning 4 to 6 weeks after total knee arthroplasty.

BRAIN VOLUME AND CARDIORESPIRATORY FITNESS ACROSS 40 YEARS IN THE BALTIMORE LONGITUDINAL STUDY OF AGING

Q. Tian, S. Resnick, S. Studenski, *National Institute on Aging, Baltimore, Maryland*

Objectives: To examine whether history of cardiorespiratory fitness (CRF) predicts future brain characteristics and whether brain characteristics predict future CRF. Methods: Brain MRI was collected at 1.5 Tesla annually from 1994 to 2003 in 149 participants (mean age = 69 yrs at first MRI). Mean brain volume and atrophy were computed using all available time points. CRF was measured as peak VO2 using treadmill test. Of 149 with brain MRI, 135 had at least one CRF measure between 1975 and 2000 and 73 had at least one CRF measure between 2004 and 2013. Associations of CRF over time with brain volume and atrophy were examined using mixed effects models, adjusted for age at first CRF, age at middle MRI, sex, and intracranial volume. Results: Participants in the top tertiles of occipital gray matter volume had higher peak VO2 than those in the bottom tertile up to 13 years prior (p=.050), and such difference was maintained over time (p>.05). Participants with less atrophy (p=.029) and in the top tertiles of middle frontal gray matter volume (p=.049) had higher peak VO2 up to 8 years later and such difference was maintained over time (p>.05), independent of covariates. Discussion: Older individuals in their seventies with greater occipital gray matter had higher fitness 13 years prior and maintained higher fitness over time compared to those with lower volumes. Less brain atrophy and greater middle frontal gray matter predicts future higher fitness. Additional studies are needed to investigate parallel changes in fitness and brain volume.

NFKB INHIBITION IMPROVES GLUCOSE METABOLISM, BUT ACCELERATES SARCOPENIA AND IMPAIRS EXERCISE TOLERANCE, IN AGED MICE

N. Zhang[1], Y. Zhang[1], H. Van Remmen[1], K.E. Fischer[1], S.N. Austad[1], S.E. Shoelson[2], S. Hussey[3], N. Musi[1], *1. The University of Texas Health Science Center at San Antonio, Barshop Institute for Longevity and Aging Studies, San Antonio, Texas, 2. Harvard Medical School, Joslin Diabetes Center, Boston, Massachusetts, 3. University of South Florida, Tampa, Florida*

Aging is characterized by impairments in glucose metabolism and muscle mass/strength. NFκB is a ubiquitous transcription factor that plays a central role in regulating inflammatory processes. Because aging is a state of low-grade inflammation, it has been hypothesized that increased signaling via NFκB could play an important role on glucose metabolism abnormalities and sarcopenia of aging, through activation of the proteasome. To test this hypothesis, we studied the effect of NFκB inhibition on aging-induced glucose intolerance, insulin resistance, and sarcopenia, in young (3-5 m), mature (12-15 m) and old (33-35 m) transgenic mice with muscle-specific inactivation of NFκB (MISR). In wild type (WT) mice, glucose tolerance (measured with I.P. GTT) and insulin sensitivity (measured with I.P. ITT and euglycemic clamp) worsened as age progressed, whereas MISR mice were protected from age-related alterations in glucose metabolism. Muscle mass, strength and function also declined with age progression in WT mice. However, MISR mice were not protected from sarcopenia; to the contrary, muscle mass (14%, P<0.05) and strength (22%, P<0.05) were lower in very old MISR versus WT mice. Maximal exercise capacity during treadmill running also was severely reduced in young (60%, P<0.05) and old (51%, P<0.05) MISR mice, compared with WT mice of the same age. Consistent with these findings, muscle proteasome activity (26S) was elevated in MISR mice (by 7-13%, P<0.05), regardless of the age. CONCLUSIONS: Improved glucose metabolism in aged MISR mice indicates that NFκB may play a role in the glucose intolerance and insulin resistance of aging. The paradoxical finding that inhibition of NFκB accelerates age-induced sarcopenia and impairs exercise capacity suggests that inflammatory pathways may have dual roles and could help preserve muscle mass and function as age advances.

SESSION 270 (POSTER)

FRAILTY

FRAILTY AS A PREDICTOR OF OUTCOME IN SURGICAL INTENSIVE CARE PATIENTS: A PILOT STUDY

R.W. Cass, M. Lissauer, L.S. Buchanan, *University of Maryland Medical School, Baltimore, Maryland*

The role that frailty plays in surgical intensive care unit (ICU) patients has not been well studied. Frailty is associated with increased age and co-morbidity and is a predictor of falls, hospitalization, and death. This pilot study examined the feasibility of using a survey instrument to assess the frailty of older adults admitted to the surgical ICU. Patients admitted to the surgical ICU at University of Maryland Medical Center who were sixty years or older at the time of admission were approached to participate in the study. Frailty was assessed by a four-question subset of a 38-item survey instrument administered either to the patient or a surrogate with knowledge of the patient. The survey was a combination of the Rand-36 and two additional questions, a format validated in surveys delivered through the mail. Outcome data were obtained from the medical record. In 37 days a total of 44 patients were screened for inclusion, and 21 consented to participate in the study. Of those 21, all 21 had a completed interview. In 14 cases the patient answered the survey questions personally, in 6 cases the survey was answered by a family member of the patient, and in one case answers from both the patient and a family member were available. In this pilot study, there was no significant difference between frail and non-frail patients. Further study will help determine if frailty has an effect on outcome in this population. Supported in part by NIA Short-Term Training Program on Aging 1T35AG036679.

OLDER PATIENT ADMITTED IN THE EMERGENCY DEPARTMENT: TRANSITIONS OF HAND GRIP STRENGTH

C. Garcia-Peña[1], S. Sanchez-Garcia[1], M.U. Perez-Zepeda[2], T. Juarez-Cedillo[1], L.V. Robles-Jimenez[1], C. Espinel-Bermudez[1], *1. Mexican Institute of Social Security, Mexico City, Mexico, 2. National Institute of Geriatrics, Mexico City, Mexico*

Background: To recognize frailty in clinical practice and begin to address how its recognition may impact clinical care it is very important. The aim was to evaluate the modifications in hand grip strength from admission to discharge in patients admitted in the emergency service. Methods: Data are part of the study "Elderly patients in the emergency services: Effectiveness of an educational intervention to improve health outcomes". Persons 65 years or older who were admitted to the emergency services in two General Hospitals, regardless the clinical reason, previous informed consent, were included to the study. Measurements at admission and at discharge are included. Sociodemographic data, previous use of health services, risk of pressure ulcers, depression, cognitive status, quality of life, functionality, comorbidty, medication, nutrition, grip strength, physical activity, walking speed were measured. Results. A total of 372 participants were admitted during the study period. From these, grip strength was measured at admission and discharge in 223 patients. 53.4% (n=119) were female, mean age was 76 years (SD=7.73). 76 patients (34.3%) were scored with 4 to 6 points in the ISAR and 56 patients (25.2) were scored with 3 point or less in the Minicog, also 148 participants (66.4% were found with depression. Diabetes (46%) and Cardiovascular disease (30.6%) were the most frequent morbidities. Mean grip strength at baseline was 10.5 (SD=9.20) and at discharge 7.0 (SD=10.12). More hours in the emergency service represents a more important decrease in the strength. Conclusions Emergency services are important in the loss of functionality.

FRAILTY IS ASSOCIATED WITH COGNITIVE FUNCTION AMONG COMMUNITY-DWELLING OLDER PEOPLE IN JAPAN: A CROSS-SECTIONAL ANALYSIS

S. Chen[1], T. Chen[1], T. Honda[1], K. Narazaki[1], A. Supartini[1], Y. Haeuchi[1], S. Kumagai[1,2], *1. Graduate School of Human-Environment Studies, Kyushu University, Fukuoka, Fukuoka, Japan, 2. Faculty of Arts and Science, Kyushu University, Fukuoka, Fukuoka, Japan*

Background. There is an increasing interest in understanding the association between frailty and cognitive decline with respect to research focus on the correlation between physical and cognitive measures. Frailty is a reduction in the ability to response to stressors and an increased vulnerability to adverse outcomes. This study was to examine the association of frailty to cognitive function among Japanese older adults. Methods. Data were drawn from the baseline of Sasaguri Genkimon Study, which is an ongoing community-based longitudinal observational study of aging and 1515 community-dwelling elderly adults aged 65 and older without dementia and admission to long-term care were eligible for analysis. The frailty phenotype according to Cardiovascular Health Study criteria was operationalized. Cognitive performance was assessed with the Mini-Mental State Examination (MMSE). Results. The mean age of the sample was 73.21 years (SD = 5.98), with 627 men (41.39%). Overall 8.84 % of participants met frailty criteria and 44.16 % were identified as the prefrail. The frail elderly were 4 times more likely to have MMSE impairment (MMSE score <24) with odds ratio (OR) 4.04, 95% confidence interval (CI) 1.77-9.22 and the pre-frailty showed intermediate increased ORs for MMSE impairment (OR= 2.53, 95% CI 1.30-4.91), after controlling for a number of socio-demographic, health and disease characteristics, compared to those not frail. Conclusions. In this community-based sample, frailty was associated with cognitive function. This association indicates its significance in terms of possibility of gerontological assessment and interventions for the prevention and management of both cognitive decline and frailty.

COMPLEXITY IDENTIFIES A HIGH NUMBER OF MIDDLE-AGED AMERICANS WITH DIFFICULTY TO SELF-MANAGE COPD

C.H. Martinez, M.K. Han, C.R. Richardson, C. Cigolle, *Division of Pulmonary and Critical Care Medicine, University of Michigan Health System, Ann Arbor, Michigan*

Patients' clinical complexity can interfere with self-management of individual diseases. Our objective was to investigate for adults with COPD: (1) how many have clinical complexity likely to interfere with ability to self-manage COPD and (2) the association of complexity with health outcomes. We analyzed participants ≥51 years reporting COPD in wave 2006 of the Health and Retirement Study, a nationally-representative longitudinal health survey. We examined three mutually-exclusive groups: relatively healthy (RH) (≤2 other diseases, normal cognition, AND dependency in ≤1instrumental activity of daily living [IADL] or ≤1 activity of daily living [ADL]); difficultly in self- management (DSM) (≥3 other diseases, mild cognitive impairment, severe vision impairment, OR ≥IADL dependencies); and potential limited benefit of interventions (LB) (dementia OR ≥2 ADL dependencies). Statistical methods included logistic regression. 1,871 participants reported COPD (representing 7.4 million nationally): RH, 51% (4.0 million): DSM, 36% (2.6 million), and LB, 13% (800,000). Analyzed by age, the prevalence of DSM and LB groups was lower among the middle-aged (51-64 years) than among the young-old (65-74 years) and the oldest-old (≥75 years). However, the absolute number of middle-aged adults in the DSM and LB groups was comparable to those in the young-old and the oldest-old groups. In fully-adjusted models, increasing clinical complexity was associated with baseline and two-year follow-up fair/poor health status, hospital/nursing home utilization, and death. Characteristics likely to interfere with self-management are common among adults of any age with COPD. Clinical complexity needs to be assessed and accommodated in disease management plans for these patients.

INFLUENCE OF FAT FREE MASS INDEX ON OVERNIGHT FLUID LOSS AND ORTHOSTATIC BLOOD PRESSURE

M.J. Benton[1], M.C. Schlairet[2], *1. University of Colorado at Colorado Springs, Colorado Springs, Colorado, 2. Valdosta State University, Valdosta, Georgia*

At the cellular level, muscle mass determines strength and provides a reservoir for body fluids to maintain blood volume and pressure when consumption is limited. Fat free mass index (FFMI) cutpoints have been established to evaluate risk of muscle and strength losses with age. The current study evaluated the influence of these cutpoints on hydration and blood pressure (BP). Bioelectric impedance analysis was used to evaluate lean mass and hydration in 20 women (71.8 ± 1.2 years). After an overnight fast, early morning orthostatic BP was measured. FFMI was calculated as lean mass (kg)/height (m)2 and cutpoints were defined as Normal (≥15.4 kg/m2) and Low (<15.4 kg/m2). Average overnight loss in total body water was -0.7 ± 0.2 L and was negatively related to FFMI (r = 0.7, p = 0.001). When orthostatic changes were evaluated, there was a trend for between-group differences in systolic BP (p = 0.08) and significant between-group differences in diastolic BP (p = 0.03). Systolic BP changes from lying to sitting were -5.75 ± 7.5 mmHg (Normal) and -5.0 ± 2.3 mmHg (Low), and from sitting to standing were -2.25 ± 7.5 mmHg (Normal) and -16.58 ± 4.9 mmHg (Low). Diastolic BP changes from lying to sitting were -0.38 ± 2.0 mmHg (Normal) and -6.0 ± 2.3 mmHg (Low), and from sitting to standing were +2.0 ± 2.4 mmHg (Normal) and -3.17 ± 2.4 mmHg (Low). FFMI may predict risk for early morning orthostatic blood pressure changes that increase risk for falls in older women.

DIFFERENTIAL IMPACT OF DIABETES ON FRAILTY INCIDENCE IN OLDER MEXICAN AND EUROPEAN AMERICANS

S.E. Espinoza[1,2], C. Wang[1,2], H.P. Hazuda[2], *1. Geriatrics Research, Education, & Clinical Center (GRECC), San Antonio, Texas, 2. University of Texas Health Science Center at San Antonio, San Antonio, Texas*

Background: Diabetes has been shown to predict frailty incidence. The goal of this study was to determine whether diabetes differentially predicts frailty incidence among older Mexican Americans (MAs) compared to European Americans (EAs). Methods: Subjects were 198 MA and 180 EA community-dwelling older adult (65+) participants of the San Antonio Longitudinal Study of Aging (SALSA) who were non-frail at baseline and completed follow-up 1 (FU-1), an average of 7.0 years later (range: 4.4-9.7). Odd ratios (OR) for incident frailty (Fried criteria) by diabetes status (American Diabetes Association criteria) were determined using multiple logistic regression analyses stratified by ethnic group. Covariates included length of follow-up, age, sex and number of comorbid conditions (hypertension, stroke, myocardial infarction, angina, non-skin cancer, and arthritis). Results: Baseline diabetes prevalence was higher in MAs compared to EAs (31.2% vs. 10.6%, p<.001). At FU-1, 37 (18.7%) MAs and 29 (16.1%) EAs had incident frailty. In unadjusted analyses, diabetes was a significant predictor of frailty in MAs (OR= 2.53, 95% confidence interval [CI]: 1.16-5.55, p=0.02) and remained significant after adjusting for length of follow-up, age, sex, and comorbidity (OR=2.56, 95% CI: 1.12-5.85, p=.026). Among EAs, diabetes was not a significant predictor of frailty in any analyses. Conclusions: Diabetes appears to play a key role in development of frailty among older MAs but not older EAs. These results suggest that, particularly in older MAs, interventions aimed at preventing diabetes may lead to reduced frailty with aging.

THE CURRENT CONDITIONS OF AND RELATIONSHIP OF OUTING BEHAVIOR TO PHYSICAL FUNCTION IN ELDERLY

M. Miyake, M. Kimura, *Kyoto Gakuen University, Kameoka, Kyoto, Japan*

Objective: The purpose of this study was to clarify the current conditions of outing behavior, and to examine relationship between physical function and outing behavior in community dwelling elderly. Methods: Data were from inventory survey of community dwelling elderly aged over 65 years old in Kameoka City in 2011. 13,159 individual responded. 2,055 samples were eliminated because of a condition of need for long-term care or support condition. 11,104 analyzed current conditions of outing behavior as purpose and frequency. Then 4,859 residents of 10 local areas in the city were recruited physical function test. Finally, 1,365 individuals participated in physical fitness test and analyzed relationship between outgoing behaviors and walking ability. Results: Incidence of outing at least once a week by age groups was 95.2% of 65-69, 92.6% 0f 70-74, 87.3% of 75-79, 78.8% of 80-84, and 68.3% of 85 over (p<0.001). By sex, 91.0 % of men and 85.4% women went outside once a week (p<0.001). Comparing physical function of outing group and no-outing group, outing group showed significant higher physical function as leg strength (p<0.001), standing chair (p<0.001), balance (p<0.001), timed up and go (p<0.001) and walking speed (p<0.01) than non-outing group even though all variables adjusted age and sex. Conclusion: Higher age group showed lower rate of going out. More women tend to be stay in home than men. Outing behavior maintain good physical function in elderly. Therefore outing behavior of senior citizen is important to maintain physical function in good condition and to prevent frailty.

A REVIEW OF FRAILTY IN DEVELOPING COUNTRIES

T.N. Nguyen[1,2,3], R.G. Cumming[1], S. Hilmer[1,2], *1. Sydney Medical School, University of Sydney, Sydney, New South Wales, Australia, 2. Kolling Institute of Medical Research, Royal North Shore Hospital, Sydney, New South Wales, Australia, 3. Vietnam National Geriatric Hospital, Hanoi, Viet Nam*

Aim. To review the evidence from developing countries on the prevalence of frailty, definition of frailty and factors associated with frailty. Method. A literature search was conducted via MEDLINE and EMBASE. Keywords included “frail”, “frailty”, “prevalence”, “risk factors”, “outcomes”, “developing country”, “developing world”, and names of developing countries according to the classification of the World Bank. Results. A total of 37 articles were reviewed from Brazil (n=13), China (n=9), Mexico (n=8), Peru (n=2), and one each from Russia, India, Lebanon, Belarus and Ecuador. Fried’s criteria were used to define frailty in the majority of studies. Seven articles from China reported Frailty Index, one from Brazil reported the Edmonton Frail Scale, one from Russia reported Steverink-Slaets and Puts score, and one from China used the Hubbard and FRAIL score. The prevalence of frailty in community-dwelling older people was 8%-31% in Brazil, 14%-33% in Mexico, 5%-48% in China, 14% in Belarus, 8% in Peru, 21% in Russia and 27% in Lebanon. The prevalence of frailty in hospitalized older patients was 46%-49% in Brazil, 32% in India and 92% in Mexico. The prevalence of frailty in geriatric outpatient clinics was 31%-71% in Brazil and 28% in Peru. Frailty was associated with increased mortality and comorbidities, decreased physical and cognitive function, and poor perception of health. Conclusion. The limited studies available suggest that frailty occurs frequently in the developing world and it appears to be associated with adverse outcomes. This has implications for policy and health care provision for these ageing populations.

RESPONSE TO ANTIPLATELET DRUGS IN FRAIL AND NON-FRAIL OLDER INPATIENTS WITH ATRIAL FIBRILLATION

T.N. Nguyen[1,3,4], M. Morel-Kopp[2], C. Ward[2], D. Pepperell[2], R.G. Cumming[1], S. Hilmer[1,3], *1. Sydney Medical School, University of Sydney, Sydney, New South Wales, Australia, 2. Northern Blood Research Centre,Kolling Institute of Medical Research, Royal North Shore Hospital, Sydney, New South Wales, Australia, 3. Departments of Clinical Pharmacology and Aged Care, Kolling Institute of Medical Research, Royal North Shore Hospital, Sydney, New South Wales, Australia, 4. Vietnam National Geriatric Hospital, Hanoi, Viet Nam*

Aims. To study the platelet function of older inpatients with atrial fibrillation (AF) taking antiplatelet drugs and explore differences between frail and non-frail patients. Methods. We recruited 52 inpatients with AF aged ≥65years (mean 86±7) from a teaching hospital in Sydney, Australia. Frailty was determined using the Reported Edmonton Frail Scale. Platelet aggregation studies were performed during hospitalization using Whole Blood Impedance Aggregometry (Multiplate). The platelet agonists arachidonic acid and adenosine diphosphate were used to evaluate the response to aspirin and clopidogrel respectively. Cut-off for response to aspirin is an area under the curve (AUC) < 40 units (U). The target AUC in response to clopidogrel is comprised between 20U-42U. Results. Amongst participants taking aspirin, mean±SD AUC was 15±12U (n=38) overall and did not differ with frailty (18±14U frail, n=23; 11±8U non-frail, n=15; p=0.1); 2 (5%) had AUC>40U (both frail). Amongst participants taking clopidogrel AUC was 32±16U overall (n=19), 33±19U in frail (n=11) and 31±14U in non-frail (n=8), p=0.8; 32% had AUC<20U (36% frail, 25% non-frail, p=0.6) and 21% had AUC>42U (27% frail, 13% non-frail, p=0.4) So far, amongst participants followed up 6 months later, 1/25 (AUC=9) reported a minor bleed on aspirin, 1/13(AUC=39) a mild gastric bleed on clopidogrel, and none have reported strokes. Conclusions. Nearly all participants responded to aspirin and half were outside the therapeutic range for clopidogrel. Platelet response did not differ between frail and non-frail older participants. More follow up data are needed to interpret the implication of these measures made in the acute setting.

PREVALENCE OF LOW MUSCLE STRENGTH AND FUNCTION BASED ON DIFFERENT SARCOPENIA CRITERIA IN NONDISABLED OLDER JAPANESE

S. Seino[1,2], S. Shinkai[1], Y. Fujiwara[1], S.P. Obuchi[1], H. Yoshida[1], H. Amano[1], M. Nishi[1], R. Takahashi[1], *1. Tokyo Metropolitan Institute of Gerontology, Itabashi, Japan, 2. The Japan Society for the Promotion of Science, Chiyoda, Japan*

Background: Although there are several operational definitions for sarcopenia, it is debatable whether their cut-off values can be applied to Japanese adults. This study aimed to identify the prevalence of sarcopenia in older Japanese, as determined by muscle strength and function, using two different sets of criteria. Methods: We used pooled data of 4528 nondisabled adults 65 years or older (average 73.9 years, 2083 men, 2445 women) from six cohort studies. We defined low muscle strength and function in two ways: (1) using the European Working Group on Sarcopenia in Older People (EWGSOP) criteria (hand-grip strength (HGS) < 30 kg in men and < 20 kg in women or usual gait speed (UGS) <= 0.8 m/s); and (2) using the Asian Working Group for Sarcopenia (AWGS) criteria (HGS < 26 kg in men and < 18 kg in women and/or UGS <= 0.8 m/s). We also classified low muscle strength and function as the 20th percentiles of sex-specific distributions of HGS and UGS in our population. Results: Using the EWGSOP and AWGS criteria, 37.4% and 18.2% of men, respectively, and 41.8% and 27.4% of women, respectively, had low muscle strength. Using both criteria, 3.2% of men and 6.3% of women had low muscle function. The 20th percentile cut-off values for low muscle strength and function were 26.0 kg and 1.11 m/s, respectively, in men, and 16.0 kg and 1.04 m/s, respectively, in women. Conclusion: Although the AWGS muscle strength cut-off value may be suitable for older Japanese, the low muscle function cut-off value may need revision.

SESSION 275 (POSTER)

AGING-RELATED POLICY, FINANCIAL ISSUES AND ECONOMIC WELL-BEING

THE ADEQUACY OF INFORMATIONAL MATERIALS PROVIDED TO MEDICAID BENEFICIARIES TRANSITIONING INTO MANAGED LONG-TERM CARE IN FLORIDA: A CONTENT ANALYSIS

L. Peterson[1,2], K. Hyer[1,2], *1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. Policy Exchange Center on Aging, School of Aging Studies, Tampa, Florida*

In August 2013, Florida began mandatory enrollment of 86,000 frail older and disabled adults into a Medicaid Managed Long-Term Care program (MMLTC). The state is transferring its risk for Medicaid long-term care costs and services to seven private managed care organizations (MCOs), which are receiving capitated per-beneficiary payments to administer these services. Under this program, beneficiaries have a new role as consumers expected to choose the private long-term care plan that best meets their needs, based on information provided by Florida's Medicaid unit. This study evaluates these print and website materials using guidelines for presenting health care information in a manner that enhances older adults' ability to make appropriate choices and decisions. Included in the criteria are five content elements (e.g., reading level, information clarity, and cognitive demand) and four web site usability elements (e.g., design and organization of information). Results show that the materials are presented in a way that minimizes cognitive complexity, but do not clearly explain the new managed care system. Further, the materials fail to provide beneficiaries with information needed to comprehend key aspects of their choices. Clearly communicating these and other aspects of moving into managed care is critical for the well-being of these beneficiaries, given that they are moving from a public to a privately administered program, and under this program, MCOs will have the power to determine the services beneficiaries receive. The lessons learned in Florida as it transitions to this new system will be instructive to other states adopting managed long-term care.

INCREASING THE ECONOMIC LEVERAGE OF HOME HEALTH AIDES

R.M. Walker, *1. Miami University, Oxford, Ohio, 2. Scripps Gerontology Center, Oxford, Ohio*

Over the last few decades, a consensus among policy makers, healthcare practitioners and health researchers concerning the benefits of aging at home in a community setting. Home health aides, whose assistance enables older Americans to stay in their homes, are a major component of this transition away from institutionalization. Home health aides provide basic medical services, assist with mobility constraints, and help with residence upkeep. Despite their increasingly important role in the healthcare system, home health aides endure socioeconomic hardships; low wages and challenging working conditions result in a high turnover rate. The CDC's 2007 National Home Health Aide Survey outlines these challenging conditions—but it offers the caveat that those who stick with the profession find in it great satisfaction; also, some training, even if not much, will even further increase this gratification. The BLS's 2014-15 Occupational Outlook Handbook describes a profession that, even while experiencing explosive growth, is poorly compensated by the standards of medical assistance professions. The objective of this poster is to examine possible ways that the socioeconomic status of home health aides can be improved; particularly how instituting a more meticulous training and licensure regime that aims to increase home health aides' economic leverage. Using data from the aforementioned sources, I argue that the market for home health aides is expanding rapidly enough to accommodate substantial wage increases if the home health aides were able to alter the notion that their profession is unskilled by increasing the rigor and level of their training.

A STUDY OF FACTORS AFFECTING SERVICE USERS OF PENSION-LINKED LOAN SYSTEM IN JAPAN: BASED ON ANALYSES OF DIFFERENCES AMONG THREE TYPES OF PENSIONS

N. Tsukada[1], Y. Maya[2], J. Nishimura[3], *1. Nihon University Graduate School of Business, Tokyo, Japan, 2. The Pension-Linked Welfare Service Foundation, Tokyo, Japan, 3. Welfare And Medical Service Agency, Tokyo, Japan*

Japan has had a State-run Social Security program since 1942 and has employed a Pension-Linked Loan System (PLLS) since 1974 permitting pensioners to guarantee a loan using their pensions as collateral. Whether to legally abolish this practice has been being under review. The main purpose of this study was to explore differences among users of PLLS based on pension types he/she borrowed against (Old-age, Survivors' or Disability Pension) and factors relating borrowing requests. Study findings were used to make policy recommendations to fit different types of PLLS users if this practice is discontinued. Data for this study was collected in a nationwide survey of PLLS users by mail in August, 2013. Structured questionnaires were sent to 5,000 randomly selected PLLS users. A total of 1,342 completed surveys were returned (response rate of 26.8%). Out of the 1,342 respondents, 851 (63.4%) were Old-age pensioners, 264(19.7%) were Survivors' and 227(16.9%) were Disability pensioners. Preliminary analyses revealed statistically significant differences among loan users based on pension types borrowed against. Disability Pension loan users were statistically younger (average age 54.9) than Old-age and Survivors' pension loan users (71.6 and 72.8). Moreover, loan purposes were different among the three groups of borrowers. Disability pensioners were more likely to obtain the loan to support living expenses and future economic security, Old-age pensioners for home renovations and debt consolidations, and Survivors' pensioners for their child/grandchildren, hospitalization, or ceremonial purposes. Based on study findings, it is recommended that revised PLLS approaches should be tailored to loan user groups.

IMPACT OF LIFE SPAN FINANCIAL HARDSHIP ON THE HEALTH OF ELDERLY JAPANESE

H. Sugisawa[1], E. Kobayashi[2], H. Akiyama[3], J. Liang[4], *1. J.F. Oberlin University, Machida, Tokyo, Japan, 2. Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan, 3. The University of Tokyo, Bunkyo-ku, Tokyo, Japan, 4. The Univbersity of Michigan, Ann Arbor, Michigan*

Several studies conducted in western societies have shown that financial hardship over the life span has a significant impact on the health of elderly people. Japan has a highly accessible health care system, and as such, could findings in western societies also be valid in Japan? Few studies have examined the effects of financial hardship over the life span on the health of elderly Japanese. Therefore, an interview survey was conducted with a representative sample in Japan (N = 2500, age 60 years and older) with an effective sample of 1,324 participants. Four indicators were used to evaluate participants' health status: self-rated health, number of serious chronic illnesses, daily living activities, and symptoms of depression. Financial hardship over the life span was evaluated by three indicators including the period when respondents felt financial hardship ("less than 18 years old," "between 25-35 years old", and "between 35-50 years old"), cumulative number of the period of hardship, and trajectory of financial hardship prior to age 60. The effects of financial hardship on health were examined by controlling for current financial hardship, annual income, and educational attainment. Results indicated that cumulative periods of hardship had a significant effect on certain health indicators. As participants approached old age, effects of each period with financial hardship on health did not increase. The trajectory of financial hardship had only a weak effect on all health indicators. These results suggest a weak relationship between financial hardship and health of elderly Japanese, possible because of accessible health care.

ACTUAL AND SELF-ASSESSED FINANCIAL AND MATH KNOWLEDGE AND THEIR RELATIONSHIP TO FINANCIAL BEHAVIORS

S. Neufeld, *Wayne State University, Detroit, Michigan*

Problem: Americans generally have low levels of financial literacy; that is, a lack of basic knowledge about inflation, interest rates, mortgages, financial markets, investments, etc. Research has shown that low levels of financial literacy are associated with negative financial behaviors and poor outcomes, but often the links established have not been particularly strong. Recent studies have suggested that self-assessed financial knowledge or competence is more connected to financial behaviors and outcomes than actual financial knowledge. In this research we investigate self-assessed and actual financial and math knowledge together in relation to high-cost borrowing behavior (such as the use of payday loans). We are interested in whether low self-assessment is more or less related to high-cost borrowing than actual knowledge, and whether over-confidence in self-assessment is associated with more negative behaviors. Methods: Data are drawn from the 2009 (N>28,000) and 2012 (N>25,000) National Financial Capability Study. Measures include financial literacy, self-assessed financial and math knowledge, and a variety of financial behaviors and outcomes. Findings: Analyses reveal: (1). Actual financial and math knowledge are more strongly related to the use of high-cost borrowing than self-assessed abilities. (2). Over-confidence in financial competence and in math ability was related to greater use of high-cost borrowing. (3) Older adults (65+) scored higher in financial literacy but were slightly lower in self-assessed knowledge than younger groups. Discussion: Financial literacy among Americans remains low but self-assessments of financial knowledge and math ability are high. Dissonance between self-assessed and actual knowledge is associated with more negative financial behaviors.

DOES ADMINISTRATIVE RISK-TAKING AND PROACTIVE BEHAVIORS LEAD TO BETTER NURSING HOME FINANCIAL PERFORMANCE?

J.A. Davis, *1. Management Department, The University of Alabama, Tuscaloosa, Alabama, 2. The Center for Mental Health and Aging, Tuscaloosa, Alabama*

Understanding the business philosophy underpinning management behaviors should reveal the corporate ideologies or principles that guide internal and external activities. Exploring the entrepreneurial orientation (EO) of the nursing home administrator may further help us to understand managerial philosophy. The purpose of this study is to determine whether two components of EO, risk-taking and proactiveness, leads to improved nursing home financial performance. We hypothesize that proactiveness will be associated with better financial performance, but risk-taking will not improve performance. The data for this study comes from the 2009 Online Survey Certification and Reporting system and the 2010 Medicare Cost Reports. Risk-taking is operationalized using the industry adjusted return on assets and proactiveness is measured using the capital expenditures minus depreciation ratio. Finally, financial performance is measured using facility total margins. There were 12,060 nursing homes included in the sample once cases with missing or erroneous data were removed. The results reveal support for our proactiveness hypothesis in that as nursing homes invested in proactive behaviors, their relative total margins also increased. However, the findings did not support our second hypothesis. Rather, we found that nursing homes engaged in risk-taking also had better financial performance. Both findings are consistent with the broader finding from other industries. Thus, nursing homes that engage in these two entrepreneurial practices will be rewarded with better performance. Given the tumultuous nature of the nursing home industry and the challenges posed by ever decreasing reimbursement, administrators should seek new avenues by which to improve overall financial performance.

SUB-ETHNIC DIFFERENCES IN OUT-OF-POCKET PREMIUMS FOR PRIVATE HEALTH INSURANCE AMONG NEAR-RETIREMENT AGED ASIAN INDIVIDUALS

S. Choi, *College of Social Work, University of Tennessee at Knoxville, Knoxville, Tennessee*

Objective: With the implementation of the Affordable Care Act, it becomes more important to understand private health insurance status and the financial burden among pre-retirement aged individuals who are not yet covered by Medicare. This study examined this topic by comparing six sub-ethnic groups of Asian Americans in the U.S., whose heterogeneity is often overlooked with the aggregated data that represent the whole Asian group. Methods: The 2007-2011 National Health Interview Survey were analyzed for 4,628 Asian Americans (ages 50-64), including 697 Asian Indian, 1,125 Chinese, 1,393 Filipino, 434 Japanese, 524 Korean, and 455 Vietnamese individuals. Non-Hispanic Whites were included as a comparison group (n=19,236). The STATA SVY procedures were used to account for the complex sampling design. Results: Overall, 67.9% of pre-retirement aged Asian Americans had private health insurance, while the rates varied from 55.4% among Koreans to 83.8% among Japanese. Among non-Hispanic Whites, 78.4% had private insurance. Among those with private insurance, 8.6% of Asians and 7.3% of non-Hispanic Whites privately purchased their coverage, not through their employment. However, the rates also varied from 4.0% among Filipinos to 21.5% among Koreans. In terms of the annual out-of-pocket premiums, while Asian Americans ($4,093, in 2011 dollars) and non-Hispanic Whites ($4,058) with private insurance paid similar amounts, there were significant subgroup differences: from $3,253 among Vietnamese to $4,876 among Asian Indians. Conclusion: This study demonstrates the importance of examining within-group heterogeneity among Asian Americans in the U.S. in understanding their access to and the burden of private health insurance coverage.

OLDER ADULTS' FINANCIAL PLANNING BEHAVIOR: DOES PERSONALITY MATTER?

A. Lindemer, E. Dugan, P. Xu, *University of Massachusetts Boston, Boston, Massachusetts*

One consequence of the gains in human life expectancy is that adults may live for decades after retirement. Thus, the need for financial preparedness for this is critical. This study investigated if the expectation to live to age 75 or older was associated with retirement financial preparation. Financial preparation measures included: knowledge of current Social Security benefits, ownership of a life and/or long-term care insurance policy, and having a current draft of a will. This research also examined how personality influenced financial preparedness for late-life. Data from the Health and Retirement Study (2010 wave) were analyzed. Inclusion criteria were: age less than 65 and not retired (N=1,997). The sample consisted primarily of white, college educated women (58%) ages 30 to 64 (mean 56). Logistic regression results showed that most participants expected to live to age 75 or older (85%), but this expectation was not a significant predictor of planning for retirement. Surprisingly, it was negatively associated with the purchase of life insurance (OR=0.53). Similarly, none of the personality traits had a significant influence on late-life planning except for neuroticism, which had a negative effect (OR=0.75) on the purchase of life insurance. Results indicate adults who felt financially prepared, were married, widowed, or who had higher incomes were amongst those who were most financially prepared for late life. These results tell of a need to develop policy interventions aimed at helping those who are most vulnerable to ensure that they are financially prepared enough for life after retirement.

PEAK 2.0: A MEDICAID PAY-FOR-PERFORMANCE INCENTIVE FOR NURSING HOMES ADOPTING PERSON-CENTERED CARE

G. Doll[1], L.J. Cornelison[1], M. Kaup[1], S. Sullivan[2], *1. Center on Aging, Kansas State University, Manhattan, Kansas, 2. Kansas Dept. of Aging and Disability Services, Topeka, Kansas*

In 2012 the Kansas Department on Aging and Disability Services (KDADS), under the direction of Secretary Shawn Sullivan, implemented a pay-for-performance program to reward nursing homes that were implementing person-centered care (PCC). While Kansas had been generally believed to be a forerunner in changing the culture of long-term care, implementation of PCC had been sporadic and frequently superficial. KDADS developed an incentive payment rubric and then used the Kansas Culture Change Instrument (KCCI) to assess levels of performance in the more than 125 enrolling in the program. Site visits were made to confirm survey results and 6 homes were selected to enter at the highest level, mentor, earning $4.00 per diem per Medicaid resident. The rest of the homes were asked to write action plans demonstrating how they expected to improve. In the time since the initiation of the program the Kansas State University Center on Aging has been selected to administer the program, providing services for application, education and evaluation. This session details the process used to implement the program including the barriers and prods that have been encountered along the way. Preliminary research highlighting the characteristics of the homes most likely to enroll in the program will be shared. Also included will be information gathered from the KCCI related to the domains of person-centered care most or least frequently adopted.

A MIXED METHODS EXAMINATION OF NURSING HOME CULTURE CHANGE AND COMPETITION FOR MEDICARE RESIDENTS

M. Lepore[1,2], R. Shield[2], J. Looze[3], D. Tyler[2], V. Mor[2], S.C. Miller[2], *1. Planetree, Atlanta, Georgia, 2. Brown University, Providence, Rhode Island, 3. Suffolk University, Boston, Massachusetts*

Artifacts of nursing home culture change include person-centeredness, staff empowerment, and environmental homelikeness, but these conditions also may be found in traditional nursing homes. Studies show that financially incentivized competition for higher paying residents influences nursing home practices and management decisions. We used mixed methods, including a national survey of nursing home administrators and follow-up interviews with a sub-sample of 64 administrators, to explore the presence person-centeredness, staff empowerment, and environmental homelikeness in the context of nursing home payment policy. Utilizing an explanatory sequential design, survey data were initially examined and the interview participant sample was based on preliminary findings from survey analysis (e.g., given our interest in culture change, interviews were conducted only with administrators of nursing homes where culture change artifacts were evident per survey findings). Survey data were linked to Centers for Medicare and Medicaid Services Online Survey and Certification and Reporting data from annual nursing home inspections to determine how the presence of culture change artifacts in a nursing home relates to the prevalence of Medicare residents. We qualitatively delineate how payment policy influences diffusion of these culture change artifacts, and quantitatively examine how payment policy relates to their prevalence. We find payment policy influences culture change implementation, with competition for Medicare residents promoting spread of select environmental and food service artifacts, and heightening the likelihood of environmental artifacts in nursing homes with more Medicare residents. Implications for culture change, payment policy, and measurement are discussed.

CHANGING THE CULTURE MAY NOT CHANGE WHAT MATTERS: CULTURE CHANGE AND NURSING HOME SATISFACTION

J. Straker, H. Reece, *Miami University, Oxford, Ohio*

The culture change initiative has driven change in nursing home design, organization, and care practices for nearly two decades. Despite the overwhelming acceptance of change on the part of nursing homes, and the presence of national initiatives such as Advancing Excellence, only recently has research begun to assess the extent to which culture change practices impact outcomes such as quality of life, quality of care, or satisfaction. This paper reports on a study that combines information about the extent of culture change practices in Ohio nursing homes with statewide data on resident and family satisfaction. In 2012 900 Ohio nursing homes completed a survey module on culture change as part of the statewide Biennial Survey of Long-Term Care Facilities. Statewide data on resident satisfaction from 2011 (n=888) and family satisfaction from 2012 (n=881) were combined with culture change data to assess the extent to which overall culture change or particular culture change practices are related (or not) to resident and family satisfaction. Overall family and resident satisfaction scores show a small but significant correlation (.357***). Overall satisfaction for both groups shows an even smaller relationship (e.g. .180***) with the extent of overall culture change in facilities. Exploring the different domains of culture change finds culture change to be related only to specific areas of consumer satisfaction. For example, the extent of culture change in community integration is the area most positively related to family satisfaction. Implications for practice and research will be presented.

AGING AND DISABILITY RESOURCE CENTERS: THE CHALLENGES OF BRINGING TOGETHER THE DIFFERENT SERVICE LOGIC MODELS OF THE AGING AND DISABILITIES WORLDS

B. Keefe, *Boston University, Boston, Massachusetts*

Our aging society is well known as people live longer with chronic illness and disabilities. Less well known is that services for older adults and younger people with disabilities – historically separated by different funding streams, service systems, and workforces – have merged. The movement to combine services for older adults and younger persons with disabilities is reflected in the creation of Aging and Disability Resource Centers (ADRCs) designed to serve both populations. Using ADRCs to combine aging and disability services has proven challenging, primarily because these two fields have different histories and philosophies. Independent living centers, who serve people of all ages with disabilities, have a service philosophy of consumer control and peer mentoring. The aging service delivery philosophy is based on a medical model where care plans are developed by professionals to protect older adults. Using institutional logics theory and mixed-methods design, I explored whether a unified service logic model for ADRCs was emerging or if these organizations continue to have disparate logic models and whether staff training in aging agencies increased understanding of consumer control. Based on focus groups with directors from disability organizations (n=14), aging organizations (n=8), and Options Counselors located in either organization (n=27), findings revealed that at both director and direct service levels competing service philosophies continue to operate. Through a statewide training on consumer control delivered to 115 Options Counselors in both settings, I found increased understanding of consumer control and better management of the co-existence of logics from these two different service systems.

MANAGED LONG TERM SERVICES AND SUPPORTS IN INDIAN COUNTRY: EMERGING ISSUES

K. McGrew, *Miami University, Oxford, Ohio*

As states move toward managed care approaches to funding and delivering long term services and supports (LTSS), direct service providers are faced with the challenge of whether and how to contract as providers with managed care entities in their states. For the 562 federally recognized American Indian and Alaska Native tribal governments and communities in the U.S., this challenge has unique implications. How are tribes positioned to engage in managed LTSS (MLTSS) in terms of awareness, interest, readiness, and potential impact? A study by Scripps Gerontology Center for the Administration for Community Living identified issues, challenges, and opportunities using key informant interviews and documents review. Key informants included policy analysts and program officers from federal and state agencies; representatives of tribal organizations; tribal leaders and providers; advocates and scholars. Wide disparities in availability, adequacy, and organization of LTSS across Indian communities underlie the findings. Recent legislative authorities have created new opportunities for LTSS and MLTSS in Indian Country, but issues of capacity and infrastructure represent barriers to readiness for MLTSS. Intergovernmental issues are of particular significance. The contractual relationships between states, managed care organizations and providers are especially problematic for tribes and the terms of contracts are often prohibitive or inappropriate for tribal communities. Finally, many tribal communities have had very negative experiences with managed health care systems and/or associated state politics; inaccessibility, cultural inappropriateness, and threats to choice have created a climate of resistance to MLTSS in some areas. The study identifies strategies for MLTSS readiness in Indian Country.

DO SMALL ECONOMIC INCENTIVES ENCOURAGE SOCIAL PARTICIPATION IN OLD AGE?

D. Watanabe[1], S. Sawaoka[2], T. Nakashima[3], S. Ogami[4], *1. Faculty of Humanities, Seikei University, Musashino-shi, Japan, 2. The Dia Fundation for Reserch on Aging Societies, Shinjuku, Japan, 3. Tokyo Dementia Care Research and Training Center, Suginami, Japan, 4. International Longevity Center Japan, Minatoku, Japan*

Purposes: The purpose of this study was to examine whether small economic incentives can encourage social participation in old age. Backgrounds: Yokohama city in Japan established incentive program for the elderly to join nursing care volunteer from 2010. The program allows elderly residents to accumulate point which can be exchange for money by conducting volunteer activities at a nursing care facility or other location. The program is based on the premise that economic incentives encourage elderly volunteers. However, there is no evidence about the relation. Methods: Data were drawn from a sample of 3,345 elderly individuals from Japan in 2013. I divided respondent into 3 types; “volunteer before the start of the program”, “volunteer after the start of the program”, and people do not participate the program. Multinomial logistic regression separately by sex is used to compare these types and to examine the relationship between participation and independent variables which are SES (household income, education, and class of workers) and participation of various group activities. Results: The result on volunteer before the start is that income is not significant. In contrast, the result on volunteer after the start of the program is that income is significant negatively. Other factors seem similar effect between before and after the start. Implications: The small economic incentives have effect to participate as nursing care volunteer. However the incentives of the program are not a lot of money. The incentives do not function economically but as visible symbol of their activities.

ETHNICITY AND OCCUPATIONAL PENSION MEMBERSHIP IN THE UK

A. Vlachantoni[1,2], Z. Feng[1], M. Evandrou[1,2], J.C. Falkingham[1,2], *1. ESRC Centre for Population Change, University of Southampton, Southampton, United Kingdom, 2. Cente for Research on Ageing, University of Southampton, Southampton, United Kingdom*

Reflecting a relatively low-value Basic State Pension, occupational pensions have historically been a key aspect of pension protection within Britain. Existing research shows that minority ethnic groups are less likely to benefit from such pensions and are more likely to face poverty in later life, as a result of the interaction of their labour market participation and pension membership patterns. However, the lack of adequate data on ethnic minorities has so far prevented the direct comparison of different ethnic groups, as well as their comparison to the White British group. Using data from the UK Household Longitudinal Study, this paper explores patterns of employment and the determinants of membership in an employer’s pension scheme among working-age individuals from minority ethnic groups and the White British population. The analysis provides clear evidence that, after controlling for key demographic, health and socio-economic characteristics, ethnicity remains a strong determinant of one’s pension protection prospects through being in paid work, being an employee and working for an employer who offers a pension scheme. However, once an individual is working for an employer offering a pension scheme, the effect of ethnicity on their odds of being a member of that scheme reduces.

THE BABY BOOM GENERATION: FOUR STATISTICALLY SIGNIFICANT COHORTS IN NEED OF UNDERSTANDING

C. Reeer, *HDFS, University of Missouri, Columbia, Missouri*

Abstract The joint influences of the Great Depression and the call-up of American men to fight in World War II resulted in a low birth rate in American society for a number of years. Upon resumption of what we would call normal family functioning following the WWII, the birth rates between 1946 and 1964 soared to heights not seen before or since. From enlarging school systems to employing and training Baby Boomers (a term which originated in the popular media in the 1970s), American society has taken pains to acclimate itself to accommodate this group of 76 million individuals. The downside of applying the Baby Boom sobriquet unilaterally to people with birthdays in 1946 through 1964 denies the effects of social and historical contexts that affected their upbringing differentially, a particularly dangerous mindset given the mighty social changes that occurred within this extended timeframe. This study examines the period effects of changing family conditions through the Generation's birth years and the years in which they reached adulthood (1964-1982). Applying logistic regression to a cross-cultural sample of females from three waves of the National Survey of Family Growth produced four statistically significant birth cohorts. The existence of subgroups within the Generation has policy implications for the future, particularly regarding elder care and financial well-being, with social entitlement programs playing a more critical role for some parts of the Generation than for others.

SESSION 280 (POSTER)

ELDER SERVICES, TRANSPORTATION ASSISTANCE, AND APPLIED TECHNOLOGY

COMMUNITY-DWELLING OLDER ADULT PERSPECTIVES' ON WHAT MATTERS MOST: FINDINGS FROM AN EXPLORATORY INQUIRY

K. Black[1], D. Dobbs[2], *1. College of Arts and Sciences, University of South Florida at Sarasota-Manatee, Sarasota, Florida, 2. Univeristy of South Florida, Tampa, Florida*

Communities across the nation are currently grappling with unprecedented increases among their older adult populations, and bracing for even greater growth in the decades ahead. The study utilized multiple methods of qualitative inquiry to explore what matters most to older adults aging in a community where approximately one-third of the residents are age 65 or older. Findings suggest five key themes: (1) Preserving and promoting health and well-being; (2) Continuing living arrangement and lifestyle; (3) Maintaining autonomy and independence; (4) Engaging in meaningful social opportunities; and (5) Accommodating community assets. Implications for community-based programs serving older adults are discussed.

ADDRESSING THE SUPPORTIVE TRANSPORTATION CHALLENGES OF COMMUNITY-RESIDING OLDER ADULTS

N.M. Silverstein, K.M. Turk, H. Belanger, E. ONeill, A. Rao, R. Solano, *Gerontology, Univ Mass Boston, Boston, Massachusetts*

The ability to get to where you want to go, when you want to go there is a key factor for aging-in-place in our communities. It is often taken for granted until that ability is compromised. The informal network of family and friends, if it exists, is not likely to be a sustainable transportation alternative for persons with cognitive impairment or for older adults with limitations that may not fit eligibility criteria for senior transportation services, where they exist. The purpose of this study was to investigate the potential of communities to address the specialized supportive mobility needs of community-residing older adults. The goal of the research is to inform strategies for practice and policy. Key informant interviews were conducted in 2012 with 32 subjects who were policy leaders from national transportation and aging organizations in the United States, transportation providers, or transportation and aging researchers. These interviews were further analyzed in 2014 through a secondary review of audiotapes and transcripts by the domains of challenges, strategies, and policies. Sub-themes included levels of assistance provided or needed, the role of paid and volunteer escorts, and special assistance related to persons with cognitive impairment. Several informants called for a national policy on senior mobility. Others presented the concept of person-centered mobility. A major conclusion to emerge from the research is the connection of mobility to health care outcomes.

RISK FACTORS FOR DRIVING UNDER THE INFLUENCE OF ALCOHOL AND/OR ILLICIT DRUGS AMONG OLDER ADULTS

N.G. Choi, D.M. DiNitto, *School of Social Work, The University of Texas at Austin, Austin, Texas*

Despite increasing substance use among older adults, there is a paucity of research on alcohol- and drug-related driving safety issues among older drivers. This study (1) examined risk factors for driving under the influence of alcohol and/or illicit drugs (DUI) among older adults, focusing on their substance use patterns and psychosocial vulnerabilities, and (2) discerned differences between those aged 50-64 and those aged 65+. Data came from the public use files of the 2008 to 2012 National Survey on Drug Use and Health. This study focused on the 29,634 respondents aged 50+. Descriptive statistics were used to present past year substance use and self-reported DUI status by age group (50-64 and 65+). Binary logistic regression analysis was used to identify risk factors for DUI. The results show that 69.56% of the 50-64 age group and 52.19% of the 65+ age group used alcohol and/or illicit drugs in the preceding 12 months, and 14.54% and 6.19% of substance users in the 50-64 age group and the 65+ age group, respectively, self-reported DUI. Higher frequency alcohol use, binge drinking, marijuana use, and major depressive episode significantly increased the odds of DUI in both age groups. In addition, lifetime arrest history was a predictor in the 65+ age group only. The findings underscore the need to pay more attention to the treatment needs of older adult who suffer from substance use problems and comorbid mental health problems. Recommendations to reduce substance use and DUI among older adults are discussed.

BRIDGING THE GAP BETWEEN TRANSPORTATION AND HEALTH CARE: DOOR-THROUGH-DOOR VOLUNTEER ESCORTS

S. Wang[1], L.A. Martin[1,2], K. Burr[2], *1. Gerontology, University of Massachusetts Boston, Boston, Massachusetts, 2. FriendshipWorks, Inc., Boston, Massachusetts*

Unsuitable transportation options, confusing medical campuses and hazardous sidewalks are just some of the barriers older adults face when accessing health care. Moreover, access is only part of the healthy aging puzzle. The presence of family, friends or caregivers at appointments has been shown to benefit older adults' comprehension of and adherence to care plans. This evaluation of the FriendshipWorks Medical Escort program highlights the impact of door-through-door services on health care among older and disabled adults. Findings based on 18 volunteer and 60 recipient surveys suggest the program is serving a disadvantaged elder population who are low-income (62%), living alone (86%) and disabled (48%). Sixty-eight percent of elders said it was unlikely they could have attended their appointments without door-through-door assistance. Before finding this service, an alarming 60 percent of elders reported they were unable to schedule procedures and 48 percent said they had missed appointments because of inadequate transportation options. Emotional stress related to obtaining transportation was reported by over half of participants. Volunteers not only assist with transportation needs, but are communicating with medical staff on behalf of the patient (89%), helping pick up prescriptions (77%) and scheduling follow-ups (72%). For all older adults to age well, the society has to encourage and improve medical volunteer services, and address the growing barriers to obtaining medical care.

ASSESSING AND CONTEXTUALIZING LIVABLE COMMUNITIES AND HOUSING FOR OLDER ADULTS

A.E. Palmer[1], R. Ewing[2], T. Bushman[2], A. Garfinkle-Castro[2], *1. Division of Geriatrics, University of Utah, Salt Lake City, UT, Utah, 2. City and Metropolitan Planning, University of Utah, Salt Lake City, Utah*

Livable communities contribute to successful aging, but what exactly is livable? Using amenity proximity and transportation data, we model five examples of housing for older adults in the state of Utah with a newly developed livability index tool. We demonstrate that contextualizing housing within the neighborhood setting gets us closer to visualizing livability. According to AARP's age-friendly cities agenda, livable communities increase opportunities for community engagement and contribute to successful living. Affordable and accessible housing is a critical component of livability. Understanding the measures of livable communities and affordable, accessible housing contextualizes successful living for researchers, community planners and designers, caregivers, and health care professionals. We demonstrate a holistic approach to assessing community livability using two newly developed tools. One is a brochure that identifies, defines, and organizes older adult housing options cross-referenced with levels of care using examples located in Utah and referencing Utah land-use policies. The other is a newly-commissioned livability index that employs concrete, measurable neighborhood-scale indicators. Using the livability index with the housing brochure provides an approach to comprehensive site-and-setting evaluation of housing options. Applying the Utah-specific housing brochure to the livability index provides local examples for case study and analysis. Planners, designers and other policy makers can find policy foci to amplify the development of livable communities and affordable, accessible housing for older adults. These tools, individually and together, provide meaningful, accessible information for decision-making by caretakers, health professionals, and families.

CLASSIFYING AND DETERMINING THE NUMBER OF AMENITY MOVES USING THE HEALTH AND RETIREMENT STUDY

E.K. Smith, *1. Gerontology, University of Kansas, Lawrence, Kansas, 2. Zillner, Lenexa, Kansas*

Studies have varied on the types of relocation that are classified as an amenity move among older adults, creating a lack of information about this motive for relocation. Amenity moves are primarily those undertaken voluntarily in search of lifestyle features such as weather, activities, or lower-cost of living. The Health and Retirement Study (HRS) offered the ability to classify over 40 reasons for relocation, of which 18 reasons were classified as an amenity move. This amenity move relocation typology was applied to both the 2008 and 2010 HRS samples. Approximately 3.2 percent of the 2008 respondents and 2.8 percent of the 2010 respondents relocated due to an amenity reason. This typology system is novel and permits a nationally representative estimate on the number of amenity migrants. Extrapolating to the population ages 50 to 84, potentially 3.6 million persons make an amenity move in a two-year period, affecting communities at the origins and destinations of the moves. A better understanding of the number of older adults who engage in amenity relocation gives senior housing developers and destination community governments a better idea about the demand for products and services. Alternatively, this approximation also provides community service providers with an understanding of the demand for aging in place.

A SYSTEMATIC REVIEW OF THE EFFECTIVENESS OF TELEHEALTH INTERVENTIONS ON MENTAL HEALTH OUTCOMES AMONG OLDER ADULTS

E. Kim[1], Z.D. Gellis[1], B.L. Kenaley[2], *1. School of Social Policy & Practice, University of Pennslyvania, Philadelphia, Pennsylvania, 2. Boise State University, Boise, Idaho*

Telehealth is an innovative health service that uses electronic mediums such as telephone, video, internet, mobile, tablets, and monitoring devices. This systematic review examined the effectiveness of interventions and quality of studies using telehealth interventions. The search was limited to peer-reviewed journal articles published between January 2001 and July 2013 from six databases. Articles met the following criteria: 1) randomized controlled trial; 2) participants' mean age of 60 years or older; 3) telehealth intervention; 4) depression, anxiety/distress, health-related quality of life; and 5) patient self-efficacy of disease management. Eleven studies were assessed using the Review Handbook of Cochrane Collaboration Review of Randomized Controlled Trials. Standardized effect sizes (Hedges) for mean differences in clinical outcomes were calculated to determine relative effectiveness of telehealth interventions. The reports reviewed showed moderate methodological quality (Mean: 5.5 out of 10) with slightly more than half scoring at least 6 out of 10 on the study methods quality scale. Telemonitoring interventions had the highest mean quality scores while telephonic interventions had the lowest. About 90% of reviewed studies included an intervention protocol while 73% described the random allocation process. However, only one study explained methods for addressing performance bias. Overall, telehealth interventions were more effective in improving depression, anxiety/distress, quality of life and self-efficacy in disease management than control interventions. Specifically, 6 out of 9 studies favored telehealth over controls on depression measures. Findings of this systematic review can assist health professionals in considering telehealth interventions for improving mental health among older adults.

ALZHEIMER'S FAMILY CAREGIVERS' IMPRESSIONS OF A PROTOTYPE DESIGN FOR A COACHING DEVICE TO GUIDE DRESSING

D.F. Mahoney[1], W. Burleson[2], E. Mahoney[3], C. Lozano[2], *1. School of Nursing, MGH Institute of Health Professions, Charlestown, Massachusetts, 2. Arizona State University, Tempe, Arizona, 3. EDDEE Consultants, Charlestown, Massachusetts*

Prior research indicates that dressing is the most common daily concern for family caregivers of persons in late early to mid-stage Alzheimer's disease (AD). The purpose of this study was to obtain AD family caregivers' reactions to the feasibility of using context aware technologies to provide customized prompting to sustain dressing abilities while providing caregivers a respite break. Methodology: Qualitative grounded theory approach was employed with primary family caregivers, who helped to dress and undress relatives with AD on a daily basis at home, to explore their impressions. Caregivers were recruited from MA over a six month period. Three focus groups were conducted using a semi-structured probative discussion format. Conversations were recorded, transcribed, and verified. The PI moderated each session and analyzed data with a second reader following content analysis procedures to ensure rigor. Results: Participants (n=25) on average were 63years old (39-83 yo) and had been helping with dressing for 3 years (1-9 yrs). They desired help to reduce their cueing time while respecting their family members' pride and dignity. The majority (24) viewed the proposed technology as an innovative means to attain this and desirable to try (20). Positive technology related themes were Empowering, Reassuring, Customizing, and Privacy Promoting; Impersonal and The Unknown arose as negatives. The adult children were most enthusiastic expressing discomfort when dressing their parents of the opposite gender. Conclusions: Developing a dressing device for the Alzheimer's caregiver-care recipient dyad is highly desirable to “loosen the leash on the caregiver” and buttress role tensions.

NEVER TOO OLD FOR FACEBOOK: OLDER ADULTS’ DESIRE FOR EDUCATION ABOUT TECHNOLOGY AND IDENTITY THEFT

P. Huffman-Oh, B. Hass, *University of Massachusetts, Boston, Boston, Massachusetts*

Technology is increasingly viewed as a vehicle to support positive aging. The benefits of technology adoption, however, are accompanied by the need for information about using technology and preventing identity theft. Little is known about older adults’ perception of the need for training to use technology safely, efficiently, and comfortably. Our objective was to explore the desire for technology training among members of the Osher Lifelong Learning Institutes at U-Mass Boston using an online and paper-based survey distributed to all members. The completion rate was 45% (n=446). Descriptive, bivariate and multivariate analyses were conducted. The majority used email (94.4%), conducted online research (78.3%), and engaged in social networking (51%). Respondents were most interested in trainings about photo management (63.8%), online research (58.7%), video calls (55.7%), and e-commerce (46.0%). Among respondents, 21.9% indicated they were the victims of identity theft. Logistic regression showed that victimization was positively associated with the number of technologies used (computer, tablet, mobile phone, smart TV) (OR 1.35; CI 1.15-1.58, $p \le .001$) and the number of Internet applications used (email, social networking, e-commerce, and research) (OR 1.23; CI 1.06-1.44, $p \le .01$). Interest in training about cyber-security was positively associated with knowing a victim of ID-theft (OR 1.96; CI 1.03-3.76, $p \le .05$) and negatively associated with the number of Internet applications used (OR 0.77; CI 0.67-0.93, $p \le .01$). These findings underscore the critical need for educations that is geared toward the needs and interests of older adults about cyber-security and other technology topics.

COMMUNITY INVOLVEMENT AND NEIGHBORHOOD COHESION: ARE THEY RELATED TO SELF-PERCEPTIONS OF AGING?

P. Huffman-Oh, *University of Massachusetts, Boston, Boston, Massachusetts*

Increasingly, Positive self-perceptions of aging is recognized as an important contributor to health behaviors that support aging in place. While the influence of individual attributes on perceptions of aging has been established, little is known about factors in the social environment associated with positive self-perceptions of aging. This study aimed to examine whether community involvement (volunteering, participation in voluntary associations, attending religious services with friends, and socializing with neighbors) and perceived neighborhood cohesion are associated with positive SPA. Data is drawn from participants in the nationally representative 2008 Health and Retirement Study ($n = 5645$; mean age = 69.1; age range: 50-104) who responded to questions in the leave-behind questionnaire about self-perception of aging, community integration, and neighborhood cohesion. Descriptive, bivariate and multivariate analyses were conducted. The fully adjusted model controlled for demographic (age, gender, race/ethnicity, education, household income, marital status, self-rated health, ADL limitations, and metropolitan residence) and psycho-social variables (neuroticism and loneliness). Volunteering ($B = 0.15$; CI 0.10-0.21; $p \le .001$), socializing with neighbors ($F(2,55)=3.42$, $p \le .05$), attending voluntary associations ($B = 0.08$; CI 0.02-0.13; $p \le .01$), and positively evaluating neighborhood cohesion ($B = 0.10$; CI 0.08-0.12; $p \le .001$) were associated with positive SPA scores. No statistically significant association was observed for attending religious services with friends. This study demonstrates that community involvement and neighborhood cohesion add unique contributions to the prediction of positive perceptions of aging.

OLDER ADULTS’ DIGITAL INFORMATION PROCESSING: A TEST OF REDUNDANCY PRINCIPLE

R. Zheng[1], M. Luptak[1], R. Hill[3], D.J. Smith[1], R. Rupper[1,2], *1. University of Utah, Salt Lake City, Utah, 2. Salt Lake City VA GRECC, Salt Lake City, Utah, 3. University of North Dakota, Grand Forks, North Dakota*

The redundancy principle of multimedia learning posits that information presented simultaneously through animation, audio and text can cause cognitive overload (Mayer, 2001). However, the common causes hypothesis suggests multiple information sources are needed for older adults to effectively process information. To test the effects of the redundancy principle on older adults’ digital information processing, this study compared the effects of redundancy and non-redundancy on youth and older adults’ information processing in a digital learning environment. The study employed a 2 x 2 factorial randomization design with group (youth vs. older adults) and condition (caption vs. non-caption) as Independent Variables. Dependent Variables included recall and transfer answers. Pre-knowledge was entered as a covariant. Ninety-two subjects were recruited (youth: 44, older adults: 48). Participants learned caregiving content through videos in an online environment. No significant results were found for recall for either group. However, the result of caption and non-caption conditions for transfer was significant for older adults with the caption condition outperforming the non-caption condition. Interestingly, no significant difference was found between caption and non-caption conditions for young people in transfer. Pre-knowledge as a covariant was significant. Findings confirmed our common causes hypothesis that older adults need multiple sources to process information. Additionally, pre-knowledge may influence performance in digital learning environments. Factors identified in this study have significant implications for the design and development of web-based applications for older adults.

OLDER ADULT PERCEPTIONS AND SUPPORT FOR IMPROVING WALKING AND PUBLIC TRANSIT INFRASTRUCTURE IN LOS ANGELES COUNTY

T. Kuo[1,3], N. Barragan[1], L. Gase[1,2], *1. Los Angeles County Dept. of Public Health, Los Angeles, California, 2. UCLA Fielding School of Public Health, Los Angeles, California, 3. David Geffen School of Medicine at UCLA, Los Angeles, California*

Introduction: In recent years, federal and local initiatives have applied “aging in place” concepts to promote healthy aging among U.S. populations. However, to effectively operationalize these concepts, the process requires a deeper understanding of public knowledge and support for built environment strategies that are generally less characterized in the literature. This study presents results from a field survey that addresses this evidence gap. Methods: A telephone survey of registered voters in Los Angeles County was conducted in English and Spanish among a registration-based-RDD sample of eligible adults. Interviews using a CATI system were conducted during September-October, 2013. The ~15 minute interviews included questions on participant knowledge, attitudes and views about active transportation, community planning, and socio-demographics. Results: A total of 1,005 interviews were completed for a survey cooperation rate of 54%. Overall, 18.3% (n=184) were aged 65+; of this group, 51.1% (n=94) were female, 26.1% non-whites (n=48), 28.3% (n=52) overweight/obese, and 52.7% (n=97) reported being in very good/excellent health. More than 70% of older adults (aged>65) reported being supportive of improving or expanding public transit services, sidewalks, and transportation for the elderly. Compared to younger adults (age<65), older adults were much less supportive of bike and walking paths/trails ($p<.001$). Discussion: In Los Angeles County, older adult voters were supportive of age-friendly environments and view them as important features of community planning. While much emphasis in the built environment literature to date has focused on child obesity, increased consideration should be given to adding age-friendly interventions in the planning process.

THE NEED AND PROVISION OF COMMUNITY HEALTH AND SOCIAL SERVICES IN MONTGOMERY COUNTY, VIRGINIA

Y. Liu, *Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

Community resources are significant predictors of independent living among older adults. Based on previous research showing that rural seniors, compared to urban seniors, have limited access to community services, the study explored the needs and provision of community health and social services by examining the spatial distribution of older population and service organizations for older adults in Montgomery County. Zip code-level demographic data was obtained from the county office. Researcher used Geographic information system (GIS) software to identify and explain service utilization patterns by comparing older adults using services and layering with resources available to the older adults. Six 50-minute face-to-face interviews with service providers and onsite visits of health and social service facilities were conducted to explore the service programs. Results from the GIS maps indicated that the number of aging population in this area increased in the last decade, and the available services included adult day services, rehabilitation services, independent living, and long term care. However, certain areas were under-served. The providers also indicated the need of mental health and in-home services for older adults. Findings point to the need of health and social services among rural seniors. The local area agency on aging is a unique organization among health and social service agencies in Montgomery County, and it may serve unmet need in areas that are under-served by healthcare organizations in this region. Active role of local continuum care village coordinating and providing services open to the county residents is also highlighted.

RACE, LIFE-SPACE, AND USE OF COMMUNITY-BASED SERVICES: IMPLICATIONS FOR POLICY AND PROGRAMMING

L.L. Lien[1], L. Bakk[2], *1. Rehabilitation Science, University at Buffalo, Buffalo, New York, 2. University at Buffalo, Buffalo, New York*

In older age, declines in health can result in reduced mobility, thereby impacting one’s “life-space” and need for supportive community-based services to maintain independence. Although empirical data supports associations between functional capacity, sociodemographic variables, and mobility, little is known about the relationship between race, life-space, and subsequent utilization of community-based services. Examining such associations can help identify communities of greatest need for supportive services, policies, and programs aimed at reducing health disparities and maintaining independence among older adult residents. In response, this cross-sectional study used a life-space approach to examine the relationship between race and mobility, health status, sociodemographics, and use of community-based services. Data from the 2012 wave of the Health and Retirement Study were used, consisting of 1,542 U.S. respondents aged 50 and older. Multivariate logistic regressions indicated that older Blacks were significantly less likely to travel outside their neighborhood or town, and significantly more likely to utilize congregate meals and transportation services as compared to older Whites. Controlling for sex, age, number of morbidities, annual household income, ADLs, and IADLs had little impact on these associations. While our findings support an already established association between race and reduced mobility, it further indicates higher utilization and therefore potential need for community-based supportive services among this demographic. Future studies are needed that employ multiple methods to further examine why racial inequities in mobility exist. Similarly, exploration of the impact of increased need for supportive services on communities who house a higher percentage of disadvantaged older adults is warranted.

SOCIAL ENGAGEMENT AMONG RESIDENTS LIVING IN LTC FACILITIES IN TAIWAN: ANALYZING THE SIGNIFICANCE OF ENVIRONMENTAL BARRIERS

S. Chao, P. Lu, *Department of Social Work, National Taiwan University, Taipei, Taiwan*

Background: The connection between environment and older individuals’ well-being has received much attention recently. Social isolation and loneliness are frequently reported by older adults living in LTC facilities. This study explores elderly residents’ experiences of environmental barriers to access social engagement in LTC settings. Methods: Eight focus groups were conducted in LTC institutions with different sizes, ownerships and in different locations in 2013. The 44 participants were selected to reflect diversity in age, sex, and length of admission. Data were analyzed using NVIVO version 8.0. Findings: Environmental features that influenced residents’ social engagement patterns including: 1.Physical barriers: no private space to host visitors, and lack of barrier-free environment in the community. 2.Social barriers: unable to communicate with other residents because of their cognitive status and language issues, and unable to develop a close relationship with staff due to their busy work schedule. 3.Attitudinal barriers: self-stigmatization such as felt ashamed for living in LTC, and viewed institutions as a place for recovery rather than making friends. Conclusions and Implications:Residents in LTC facilities experienced internal and external barriers that impeded them from maintaining existing social engagement and developing new social relationships within and outside the institutions. Interventions should be targeted to combat physical, social and attitudinal barriers in order to promote social engagement among residents living in LTC.

GENDER DIFFERENCES IN THE IMPACT OF NEIGHBORHOOD CONTEXT AND SOCIAL NETWORK CHARACTERISTICS ON THE DRIVING BEHAVIOR OF OLDER ADULTS

K. Barton, *1. Gerontology, University of Massachusetts Boston, Boston, Massachusetts, 2. University of Missouri Kansas City Institute for Human Development, Kansas City, Missouri*

Several socio-demographic and mental and physical health variables have been demonstrated to impact older adults’ driving behavior, however, fewer studies have considered whether social factors influence driving behavior. The purpose of this study was to explore the impact of neighborhood context and social network characteristics (quantity and quality of relationships) on the driving status of older adults by gender. This investigation utilizes data from the Health and Retirement Study (HRS), a longitudinal, nationally representative survey conducted biannually. Three waves of HRS data were used in this analysis—2006, 2008, and 2010. The analytic sample included 5,740 older adults (52.8% female) age 65 or older (M=74.2). Preliminary logistic regression analyses revealed that—after controlling for key variables —for females, positive social support from adult children predicted an increased likelihood of driving cessation (OR=1.51, p=.01), whereas positive social support from other family members resulted in a decreased likelihood of driving cessation (OR=0.71, p=.02). No similar relationship between either number of social contacts or quality of social support and driving behavior was demonstrated for males. Neighborhood context was not a significant predictor of driving cessation for either group. These findings suggest that, for females, social network characteristics may influence decisions about driving. For example, for females, adult children may be a source of emotional and/or transportation support for driving cessation, when a positive relationship exists. Research to explore these findings is underway. Findings from this research can be used to better understand ways to promote continued safe driving or cessation from unsafe driving.

DIFFERENCES BETWEEN TOUCH PANEL AND MOUSE USE BY OLDER ADULTS

A. Steinert, M. Haesner, J. O`Sullivan, E. Steinhagen-Thiessen, *Geriatrics Reseach Group, Charité - Universitätsmedizin Berlin, Berlin, Germany*

Background: The use of touch interfaces is seen as a good opportunity for older adults to interact with computers or other gadgets (Murata, Iwase 2005). However, similar to the use of mouse and keyboard, touch interfaces can also cause usability problems for older adults. To date, differences between PC and tablet usage of an online platform by older adults have not yet been evaluated. Methods: A total of 50 participants took part in a pilot study. The sample consisted of mostly healthy, well-educated seniors from an urban environment. On average, participants were 71 years old (Range: 61 -93 years). After a randomization, the participants were asked to perform six tasks both on tablet and PC. The success rate and the amount of time required to solve the tasks were documented in a standardized manner. Results: The older adults made fewer mistakes and needed less time when using the PC compared to using the tablet. There were significant differences in success rate and time needed within individual tasks. The main advantage of the tablet was seen in the portability of the gadget. The main advantage of the PC was the greater size of the screen in contrast to the tablet. Conclusion: Especially for older adults who use a PC regularly it might be easier to interact with mouse and keyboard. Adequate and senior specific training are of great importance among this target audience.

SERVICE LEARNING PROJECT: BUILDING A RURAL COMMUNITY CENTER FROM SCRATCH

R. Maiden, D. Gagne, *Psychology, Alfred University, Alfred, New York*

Twenty-four students in an Adult Development & Aging class engaged in a service- learning project in collaboration with the Allegany County (New York) Office For the Aging. Students designed and co-led focus groups with community leaders and local elderly residents to address questions regarding (1) declining participation at a established senior center with the county, (2) the actual social and activity needs of senior community residents, and (3) considerations for building a new, centrally located community center. Students visited a successful senior center and helped to create a survey, which was then distributed to convenience sample of 109 older adults. Subsequently, 1,000 surveys were distributed to a randomly selected sample of registered voters in the county aged 50 and over. In total, 318 surveys were returned from community members ranging in age from 50 to 98 (M = 69.8). Overall, the "typical" community resident was female, married or widowed, retired, and living in her own home (but not by herself). Approximately 25% reported income levels less than $15,000 in the previous year. Of the older adults surveyed, an average of 30% indicated that they would be willing to participate in activities at a senior center. They were most interested in attending box-office and cultural events, pre-arranged trips, card games, writing, and gardening. They also expressed a strong interest in assorted health screenings and organized fitness activities, particularly hydro aerobics. They also expressed desires for general function rooms and volunteer opportunities. The importance of these findings for the community is discussed further.

AGE-FRIENDLY NYC: REACHING A TIPPING POINT FOR AN AGE-FRIENDLY NEW YORK CITY

D. Block, C. Smith, *The New York Academy of Medicine, New York, New York*

Age-friendly NYC is a partnership between the Office of the Mayor, the New York City Council, and the New York Academy of Medicine (NYAM). In 2013, Age-friendly NYC was named the Best Existing Age-friendly Initiative in the World by the International Federation on Aging and received APHA's Archstone Foundation Award for Excellence in Program Innovation. Now in its 6th year, the initiative asks public agencies, businesses, cultural, educational and religious institutions, community groups, and individuals to consider how changes to policy and practice can create a better city for older adults. Through strategic planning and partnering, Age-friendly NYC has endured despite major political transition, including a new Mayor for the first time in 12 years and 21 new City Council members. Now, Age-friendly NYC seeks to achieve a tipping point by making it the norm rather than extraordinary practice to consider older people in the course of daily business. Over the next three years, Age-friendly NYC aims to have initiatives in 50% of the city's neighborhoods and demonstrated improvements by 1,000 partners. New efforts have also focused more closely on employment, housing and disaster preparedness. This presentation will focus on how to bring an initiative which begins with demonstration to city-wide scale and how to ensure that there areappropriate metrics to track progress.

GETTING SENIORS ONLINE: WHAT MAKES A DIFFERENCE?

B. Harootyan, *Research, Senior Service America, Inc., Silver Spring, Maryland*

Currently, 40% of seniors remain offline. Most are unmotivated to learn computers, believing that the Internet has little relevance for them, computers are too costly and complex, and/or they can't learn to use computers. Offline seniors tend to be over 70, minorities, low-income, and less educated. Senior Service America, Inc. (SSAI) conducts special projects to overcome this senior digital divide. SSAI's Digital Inclusion Initiative (DII) provided free computer coaching sessions at 350 sites. SCSEP (Title V, OAA) participants were Peer Coaches who assisted >26,000 senior learners using a self-paced tutorial program. Results: High 'graduation' rate. Logit regressions showed significant improvement in graduates' computer confidence/skills, while pair-wise analysis indicated significantly improved psychological well-being. SSAI's new "DII-2" pilots specifically target offline seniors through group 'Taste of the Internet' sessions that demonstrate the relative ease of using computers/Internet. Preliminary results: Tastings are effective, characterized by non-threatening peer group interaction and mentors who provide hands-on assistance to only1-2 seniors at a time. 'Tastings' are followed by individual sessions that provide more specific guidance, demonstrating the Internet's relevance to each senior's interests (most commonly: communicating with family members, especially grandchildren - including videos/photos; accessing news from "home"; playing games; and getting healthcare and other consumer information. Although providing offline seniors with a 'Taste' is not expensive, it is labor- and time-intensive. But after such Tastings, most offline seniors become dedicated learners in basic computer-skills training programs (e.g., libraries), especially those with age-appropriate learning methods. The seniors are also informed about possible Internet discount services.

THE CORRECTIONAL AND COMMUNITY LANDSCAPE FOR OLDER ADULTS IN NEW YORK: A CALL FOR THE AGING COMMUNITY TO EXTEND ELDER JUSTICE BEHIND BARS

T.M. Maschi[1], K. Morgen[2], *1. Graduate School of Social Service, Fordham University, New York, New Jersey, 2. Centenary College, Hackettstown, New York*

The adult prison population is rapidly greying and current programmatic and psychosocial services are ill-equipped to handle these men in women within the prison, re-entry, and aging service systems. Data (2012-2013) from the New York State Correctional system of prisoners ages 50 and older (N=9,188) found a prison population that were mostly ages 50-59 (77.3%) followed by ages 60-64 (n=1151), and 65-95 (n=939). Most of the incarcerated older population committed their first convicted crime between the ages of 15 and 49, and were male (96.4%), black (50.2%) and were convicted of a violent offense (73%). Sentence lengths ranged from 3 months to 50 years with an average of 10 years served. The majority of incarcerated older adults had mental health and/o substance use issues (52.8%), vocational training needs (61%), and (most importantly) with a reported earliest release date within the next two years (59.9%). Thus, older adults poised for reentry unique psychosocial, employment, and mental health/addiction needs of the older adult. A sub-set of these data that reflects 2012 recidivism (n=1,068) further add to the alarming story. Of those who recidivated, most did not have a high school diploma or GED (40.1%), had a prior prison term (48.9%), were on parole at time of recidivism (47.9%), and were primarily from the boroughs of New York City (54.5%). Of note, a good number of the recidivism offenses were substance-related: drug sale (19.9%), drug possession (8.7%), or driving intoxicated (5.1%). In sum, these data underscore the need for major revisions in how we work with older adult in the prison, re-entry, and aging care systems. Recommendations for the aging community to expand services to justice involved elders in prison and the community are addressed.

PERCEPTION ON THE EFFECT OF NOISE IN OLDER ADULTS IN A RURAL AREA OF PUERTO RICO

N. Labault-Cabeza, V.E. Reyes-Ortiz, *University of Puerto Rico-Public Health, San Juan, Puerto Rico*

The ability to deal with the noise decreases in the population of older adults, putting them at greater risk of affecting their health in multiple areas and not just in the hearing. Purpose: Explore the knowledge and attitudes of adults 60 years and older towards noise in two communities in a rural area of Puerto Rico. Determine how older adults perceive that noise impact their health. Methodology: A study with a cross-sectional epidemiological design and mixed methodology. Results: Results from our sample differ significantly with a study conducted in 2007 with Puerto Rico's general population. 78.57% considered noise as the most important environmental problem; and 61.90% considered it as the most important environmental pollutant in their community. Noise generated feelings of nervousness (66.67%); being mad and annoyed (45.24%), tension, anxiety (42.86%); and depression (26.19%). Participants demonstrated lack of knowledge of legislation and existing agencies in charge of noise control; and perceived as poor the governmental management to deal with the noise as a contaminant. Implications: This information will help to lay the groundwork to establish revision of existing public policy and development of prevention strategies and awareness-raising programs for this vulnerable segment.

FUTURE DIRECTIONS FOR DIFFERENT TYPES OF SENIOR CENTERS SERVING A METROPOLITAN AREA

M. Cannon, *Institute on Aging, Portland State University, Portland, Oregon*

Senior centers have traditionally served as community focal points representing two models: the social agency model that primarily serves low-income and socially isolated older adults, and the voluntary organization model that is designed for active older adults who have strong community attachments. This poster presents findings from a multiple-case study of five senior centers located throughout the Portland metropolitan area in Oregon. Each traditional model of senior center is represented by two cases, and the fifth case was selected for its unique status as a nationally accredited center. Like most senior centers, the cases in this study operate under the jurisdiction of local governments or as non-profit agencies, and vary in many aspects such as the range of services and programs offered, staffing, technology, access to resources and cultural diversity. This research aimed to better understand challenges, changing conditions and future directions for different types of senior centers serving a metropolitan area. Data collection at each site included interviews with staff as well as focus groups and surveys of senior center participants. Interviews with key informants enriched the data and provided outside perspectives. Data analysis revealed challenges and changing conditions that were both unique to and similar across the different types of senior centers in the metropolitan area, and potential opportunities for growth and resilience to these issues. Recommendations were developed for communities to capitalize on these opportunities and provide mechanisms of support to facilitate the continuation and growth of senior centers in metropolitan areas.

PARTICIPATION RESTRICTIONS, PERCEIVED NEIGHBORHOOD ENVIRONMENT, AND PSYCHOLOGICAL DISTRESS AMONG OLDER ADULTS: DIFFERENCES AMONG RACIAL AND ETHNIC GROUPS

K. Kim[1], H. Yoon[2], S. Kim[3], *1. University of Maryland, Baltimore, Maryland, 2. University of Texas, Austin, Texas, 3. Columbia, New York, New York*

This study addresses the issues of limited literature regarding the relationship among participation restrictions, perceived neighborhood environment, and psychological distress among racial and ethnic older adults. We used the first wave of National Health and Aging Trends Study, a nationally-representative panel study. The study includes 4,097 White, 1,203 Black, and 306 Hispanic older adults. Using a hierarchical logistic regression, we examined how sociodemographic (age, gender, living arrangement, education, income, length of neighborhood residence), health status (chronic diseases, self-rated health, and self-rated memory conditions), interpersonal relationships (social network and participation restrictions on valued activities), and perceived neighborhood environment (perceived neighborhood conditions and social cohesion) are predictive of psychological distress among each racial and ethnic groups. Fewer participation restrictions on valued activities decreased the odds of having psychological distress among all racial and ethnic groups, controlling for all other variables. Higher levels of social cohesion decreased the odds of having psychological distress among White and Black older adults, whereas there was no relationship among Hispanic older adults. In addition, there was no relationship between perceived neighborhood conditions and psychological distress among all racial and ethnic groups. The finding suggests that policy makers and practitioners should plan and provide mental health services to remove participation restrictions on valued social activities to improve psychological distress regardless of racial and ethnic groups. Considering differences in the relationship between perceived neighborhood environment and psychological distress among racial and ethnic groups, implications for future research and practice will be discussed.

FROM KATRINA TO SANDY: WHAT HAVE WE LEARNED ABOUT NURSING HOME DISASTER MANAGEMENT?

A.S. McIlwain, M. Mileski, A.E. Sokan, *Texas State University, San Marcos, Texas*

Disaster management for vulnerable populations represents a major element of community emergency planning yet remains an area wherein guidance is limited and misdirected. For this study, we considered hurricane disaster planning and management in nursing homes. Specifically, we asked if there have been improvements in disaster management since 2005, i.e., Hurricane Katrina. In the event of an impending hurricane, and barring mandatory universal evacuation of facilities, administrators are faced with two options: voluntary evacuation or sheltering in place. Both pose viable threats to nursing home residents, as evidenced by extant scholarship and the highly publicized deaths of frail, older residents in the wake of Hurricanes Katrina and Sandy. To examine this issue, we conducted a two-phase comparative study. Phase one included a systematic review of research articles on nursing home disaster management, field reports, industry reports, and public policies. Phase two included a content analysis of media reports and other news items. Due to variance in focus, scope, and scientific rigor among these sources, we applied a basic analytical methodology. Using standard emergency management concepts, we developed a set of best practices in hurricane disaster planning and management. We also found that not much has changed and that disconnect exists between identified best practices and long term care management practices. As we move forward, our goal is to establish a dialogue on evidence-based disaster management in long term care administration in order to foster improvement in this management area.

SESSION 285 (SYMPOSIUM)

THE COLLAPSE OF PROTEOSTASIS: THE WHY, WHERE, AND HOW

Chair: L.V. Thompson, *University of Minnesota, Minneapolis, Minnesota*
Discussant: A. Cuervo, *Albert Einstein, Bronx, New York***Discussant:** A. Gitler, *Stanford University, Stanford, California*

An imbalance in protein homeostasis results in the accumulation of misfolded and aggregation-prone proteins that are poorly degraded, often accumulating as post-translationally modified proteins and aggregates in different subcellular compartments. These events are hallmarks of human aging and genetic diseases (e.g., amyotrophic lateral sclerosis, Huntington's disease, Parkinson's disease). Understanding cellular processes that lead to the appearance of modifiable, aggregation-prone proteins may lead to the development of strategies to extend healthspan/lifespan and could also delay the onset of aging-related diseases. Specifically, Dr. LaDora Thompson's presentation will discuss how post-translationally modified proteins play a role in age-related skeletal muscle weakness. Dr. Ana Maria Cuervo's presentation will emphasize the importance of cellular quality controls systems, and in particular autophagy in the maintenance of proteostasis. Dr. Aaron Gitler's presentation will discuss how understanding, at a mechanistic level, the cellular consequences of protein misfolding will help to suggest potential strategies for therapeutic intervention. The presentations will highlight novel model systems and experimental approaches that are being used to identify the critical genes, cellular pathways and tissue function affected by poor preservation of the proteome.

HIGH-THROUGHPUT GENETIC SCREENS TO DEFINE MECHANISMS OF NEURODEGENERATIVE DISEASES

A. Gitler, *Stanford University, Stanford, California*

As our population continues to age, neurodegenerative diseases are becoming more prevalent. These devastating human diseases include Alzheimer's disease, Parkinson's disease and amyotrophic lateral sclerosis (ALS). These diseases share a common feature in protein misfolding and aggregation. We use the baker's yeast, Saccharomyces cerevisiae, as a simple, yet powerful, model system to study the cell biology underpinning protein-misfolding diseases. Our goal is to identify the critical genes and cellular pathways affected by misfolded human disease proteins. We have focused on the ALS disease proteins TDP-43 and FUS/TLS and have used yeast models to define novel disease mechanisms and have extended our findings into animal models and even recently into human patients. We recently discovered mutations in one of the human homologs of a hit from our yeast TDP-43 modifier screen as a genetic risk factor for ALS. This underscores the power of such simple model systems to help reveal novel insight into human disease. These screens are also providing new and completely unexpected potential drug targets – another hit from one the TDP-43 modifier screens is a gene encoding lariat debranching enzyme and we discovered that inhibiting this enzyme potently suppresses TDP-43 toxicity in yeast and in mammalian neurons. Launching from these studies in yeast to test known ALS disease genes, we have also been using yeast as a discovery platform to predict novel ALS disease genes based on functional properties (for example, the presence of a prion-like domain) and to combine this approach with human genetics and next generation sequencing to further define the complex genetic landscape of ALS. We anticipate that our approach will be broadly applicable to other human diseases, many of which are deeply rooted in basic biology.

THE ROLE OF PROTEIN DAMAGE IN AGE-RELATED MUSCLE WEAKNESS

L.V. Thompson, *University of Minnesota, Minneapolis, Minnesota*

Damage to cellular macromolecules has long been implicated in the aging process. The accumulation of damaged macromolecules is postulated to decrease the cell's ability to perform its functions, leading to functional deficits, lower adaptability, and increased pathology/disease, all observed with increasing age. Skeletal muscle is particularly vulnerable to damage, in part, due to the rapid and coordinated changes in energy supply and oxygen flux that occur during contraction. With aging, there is a general decline in muscle function. One possible mechanism for the decline in muscle function is there are defects in the myofibrillar proteins responsible for force generation and contraction speed, and defects in the enzymes responsible for metabolism. This presentation will highlight physiological, biochemical, structural, and chemical analyses of key muscle proteins that likely explain the underlying mechanisms for age-related reductions in muscle function.

SELECTIVE AUTOPHAGY IN THE FIGHT AGAINST PROTEOTOXICITY IN AGING

A. Cuervo, *Albert Einstein College of Medicine, Bronx, New York*

Our interest is on autophagy, a conserved pathway for degradation of intracellular components in lysosomes and an essential component of the cellular response against proteotoxicity. In this talk I discuss some of the consequences of the failure of autophagy with age. We have recently generated animal models in which we can modulate the autophagic activity and have learnt that: 1. Toxicity results from a combination of the inability to eliminate damaged proteins and of a gain of function from those proteins that fail to be degraded; 2. The consequences associated to loss of autophagy are tissue dependent; 3. Autophagic pathways can compensate for each other in vivo and 4. Compensatory abilities decrease with age. I will also comment on our current efforts to chemically modulate autophagic activity to enhance the cellular response to proteotoxicity. This work was supported by grants AG021904, AG031782, AG038072 and a Paul Glenn Grant.

SESSION 290 (SYMPOSIUM)

A NEW HORIZON OF PSYCHOSOCIAL ADAPTATION: FROM SUCCESSFUL AGING TOWARD MATURED AGING

Chair: M. Takayama, *Keio University, Yokohama, Kanagawa, Japan*
Co-Chair: Y. Gondo, *Osaka University, Osaka, Japan*
Discussant: P. Martin, *Iowa State University, Ames, Iowa*

The population of the oldest-old is growing faster than any younger segment of the older population in most countries all over the world (United Nations, 2009). This is also the age when more people require care because of illness and frailty which may constrain the potential for well-being at the end of life. However, interestingly, some studies report that well-being of the oldest old is not necessarily lower comparing to the younger elderly people. These facts lead us to a possibility that there is a different mechanism for the oldest old to maintain personal well-being compared to the younger old. In this symposium, we will focus on subjective well-being among the oldest old and the mechanism of psychological adaptation for the oldest old to maintain well-being. Dr. Gondo will talk about age differences of gerontranscendence and selectivity, optimization, and compensation as psychological adaptation among septuagenarians, octogenarians, and nonagenarians. Secondly, Dr. Masui will talk about the path from gerontranscendence to psychological adaptation. Next, Dr. Takayama will focus on two aspects of well-being: feeling active and feeling calm during the last phase of life. Finally, Dr. Cho will talk about agreement between self- and proxy reports on well-being and psychosocial resources. The discussant, Dr. Peter Martin, will discuss subjective well-being from the viewpoint of age and cultural differences.

SHIFT OF PSYCHOLOGICAL ADAPTION MECHANISM FROM YOUNG-OLD TO OLDEST-OLD

Y. Gondo[1], Y. Masui[2], T. Nakagawa[1], Y. Arai[3], K. Ikebe[1], K. Kamide[1], T. Ishizaki[2], R. Takahashi[2], *1. Human sciences, Osaka University, Suita, Japan, 2. Tokyo meroropolitan institute of gerontology, Tokyo, Japan, 3. Keio University School of Medicine, Tokyo, Japan*

The oldest-old are at increased risk of ill health and disability. Recent studies however, indicated that centenarians and oldest-old maintain moderate to high psychological well-being, regardless of decline of functions in wade-ranged domains.We hypothesized that shift of adaptation mechanism from cognitive loaded intentional based one to unintentional based one according to age as a cause of this phenomenon. To test this hypothesis, WHO-5 mental health questionnaire as dependent variable and two adaptation mechanisms, Selection, Optimization, Compensation (SOC), Gerotranscendence(GT) and cognitive function (MOCA) were collected as independent variable from community dwelling young-old, old-old, and oldest-old. Separate multiple regression analysis for each age group showed that both SOC and GT were consistently associated with WHO-5 in young-old and old-old. However, only GT was associated with WHO-5 in the oldest-old. MOCA showed association only in the old-old. These results partially support the hypothesis that shift of adaptation mechanism along with aging.

THE PATH FROM GERONTRANSCENDENCE TO PSYCHOLOGICAL ADAPTATION FROM THE THIRD AGE TO THE FOURTH AGE

Y. Masui[1], Y. Gondo[2], T. Nakagawa[2], M. Ogawa[4], Y. Arai[3], K. Ikebe[2], K. Kamide[2], R. Takahashi[1], *1. Tokyo Metropolitan Institute of Gerontology, itabashi-ku, Tokyo, Japan, 2. Osaka University, Suita, Osaka, Japan, 3. Keio University, Shinjyuku-ku, Tokyo, Japan, 4. Hokkaido University, Sapporo, Hokkaido, Japan*

The theory of gerotranscendence proposes that in old age an individual's meta-perspective shifts from a materialistic and rational view of the world to a more cosmic and transcendent one. It has been hypothesized that gerotranscendence is important for maintaining or improving psychological adaptation in older age. The present study examined the dimensions of psychological well-being that are associated with gerotranscendence. A questionnaire survey was administered to 2,245 septuagenarians, octogenarians and nonagenarians in Japan to assess gerotranscendence, and positive and negative emotional well-being. The results showed that positive emotional well-being was associated with "gratitude for others" and "affirmation of one's past" as subordinate factors of gerotranscendence, whereas negative emotional well-being was associated with "letting go of self-regard" and "acceptance of everything as it is" as subordinate factors, while controlling for another factors. These results suggest that the influence path from gerontranscendence to psychological adaptation comprises a number of different subordinate paths.

WELL-BEING AMONG THE OLDEST OLD IN JAPAN: FROM THE VIEWPOINT OF FEELING ACTIVE AND FEELING CALM

M. Takayama[1], H. Akiyama[2], *1. Keio University, Yokohama, Kanagawa, Japan, 2. University of Tokyo, Tokyo, Japan*

In this study, we focus on two aspects of well-being: feeling active and feeling calm among the oldest old. For the oldest old who tend to require care because of illness and frailty, feeling calm as well as feeling calm active is important for subjective well being. Firstly, we examined how feeling active and feeling calm change during the last phase of life, using longitudinal data from the representative study of the oldest old in Tokyo, Japan (N=663). Secondly we investigated the similarities and differences between resources of feeling active and feeling calm. Results showed that both aspects of well-being decreased significantly, but very slowly. Physical functional limitations were risks for feeling active, whereas these limitations were not risks for feeling calm, but financial strains and negative relations were risks. Moreover, results revealed that mastery beliefs and providing support contributed to both aspects of well-being among the oldest old.

AGREEMENT BETWEEN PROXY AND SELF-REPORTS ON PSYCHOSOCIAL RESOURCES IN OLDEST-OLD ADULTS

J. Cho[1,2], P. Martin[3], M. MacDonald[5], L. Poon[4], *1. Scott & White Healthcare, Temple, Texas, 2. TAMHSC School of Rural Public Health, College Station, Texas, 3. Iowa State University, Ames, Iowa, 4. University of Georgia, Athens, Georgia, 5. Kansas State University, Manhattan, Kansas*

Obtaining information from oldest-old adults is not always easy or feasible. This study examined whether cognitive functioning explains discrepancies between self- and proxy- reported psychosocial resources among 192 dyads from the Georgia Centenarians Study. After applying the False Discovery Rate to *p*-values, mean comparisons and intra-class correlations between self- and proxy- reports showed agreements in fatigue, extraversion, social resources, and activities of daily living; significant discrepancies were obtained in positive and negative affect, loneliness, well-being, perceived economic status, social provisions, neuroticism, and fatigue. Additional regression analyses showed that the cognitive functioning was a significant predictor for discrepancies between both reports in loneliness, reduced motivation, and fatigue. The findings suggest that although discrepancies between self- and proxy ratings might exist in psychosocial resources, both ratings are significantly related to each other. Furthermore, cognitive functioning in extremely old age does not account for disagreements between self- and informant reports in psychosocial resources.

SESSION 295 (SYMPOSIUM)

NAVIGATING THE COMPLEXITY OF DAILY LIFE: THE INTERPLAY OF EMOTIONAL, HEALTH, INTERPERSONAL, AND COGNITIVE PROCESSES

Chair: S. Mejía, *School of Social and Behavioral Health Sciences, Oregon State University, Corvallis, Oregon*
Co-Chair: H. Chui, *University of Bradford, Bradford, Yorkshire, United Kingdom*
Discussant: N. Ram, *Pennsylvania State University, State College, Pennsylvania*

Action theories of life-span development assume individuals' capacity to simultaneously regulate multiple life domains. Successfully regulating affect, health, and relationships, however, hinges on the ability to integrate complex information from multiple sources, and to transform that knowledge into action. This symposium brings together a collection of papers that exemplify the interplay of health, emotions, and decision-making across the lifespan. The session begins by illustrating how positive and negative affect are intertwined with one's own and spouse's daily physical symptoms. Chui and Diehl explore themes of risk and resiliency by examining age-related change in the coupling of daily reports of physical symptoms and self-esteem with negative affect across 7 days. Ho, Michalowski, Gerstorf, and Hoppmann consider the interpersonal dynamics of health and emotions. Their paper examines the dyadic coupling of affect, physical symptoms, and spousal support of couples across 27 measurements over 9 days. The second half of the symposium considers aspects of decision-making, beginning with interpreting visualizations of data that represent progress towards health and social goals. Mejía, Oscar, Allen, Hooker, and Metoyer examine age-related differences in the cost and benefit of matching and mismatching the complexity data visualizations to the complexity of inquiries. Gonzalez, Smith, and Ryan then connect health, emotions, and decision-making by building on their model of daily activity selection, where the selection of daily activities is framed as a decision problem, to predict physical and mental health outcomes. Nilam Ram integrates the papers by leading a discussion on the interplay of within-person processes and feedback loops.

SELF-ESTEEM BUFFERS THE EFFECT OF PHYSICAL SYMPTOMS ON NEGATIVE AFFECT LESS IN OLDER ADULTS

H. Chui[1], M.K. Diehl[2], *1. Psychology, University of Bradford, Bradford, United Kingdom, 2. Colorado State University, Fort Collins, Colorado*

Models of coping and stress emphasize that both risk and resilience factors influence how individuals deal with stressors. The present study focused on physical symptoms as a risk factor and self-esteem as a resilience factor, using data from a daily diary study over 7 days. The sample consisted of young, middle-aged, and older adults (n = 128; M age = 56.72 years; range = 24-90). Results indicated that more daily physical symptoms were associated with higher negative affect (NA). In addition, higher daily self-esteem was associated with lower NA. However, the protective effect of self-esteem diminished with increasing age. That is, controlling for daily self-esteem, the association between physical symptoms and NA was stronger for older adults. These results suggest that although older age is associated with lower NA in general, the buffering effect of self-esteem on the association between physical symptoms and daily NA is reduced in older adults.

PARTNER SYMPTOMS ARE ONLY LINKED WITH DECREASED DAILY AFFECT WHEN THERE IS HIGH SPOUSAL SUPPORT

A. Ho[1], V. Michalowski[1], D. Gerstorf[2], C.A. Hoppmann[1], *1. University of British Columbia, Vancouver, British Columbia, Canada, 2. Humboldt University, Berlin, Germany*

Spousal support is an important social resource in old age, particularly when one or both partners suffer from health problems. Yet, little is known about how spousal support moderates the way physical symptoms one's partner experiences undermine one's own affect quality. By taking 27 simultaneous daily life assessments from 49 older adult couples (M age = 72 years; M relationship duration = 42 years), this study replicates past research by showing that spousal support is associated with high overall positive affect and low overall negative affect. Importantly, time-varying spousal physical symptoms are associated with concurrent reductions in own affect quality but only in spouses who report high spousal support. Taken together, findings indicate that high spousal support has benefits for overall affect quality in old age, but that spouses who support each other are also more affected by each others' physical symptoms than spouses who report little spousal support.

AGE DIFFERENCES IN THE COST AND BENEFIT OF VISUALIZATIONS THAT (MIS)MATCH THE COMPLEXITY OF INQUIRY

S. Mejía[1], N. Oscar[2], P.M. Allen[1], K. Hooker[1], R. Metoyer[2], *1. School of Social and Behavioral Health Sciences, Oregon State University, Corvallis, Oregon, 2. School of Electrical Engineering and Computer Science, Oregon State University, Corvallis, Oregon*

Decision-making requires efficiently interpreting complex information and data visualizations that match the complexity of inquiry may facilitate this process. This study uses data from the web-based EvaDaVis study (N = 1871, Mean age: 33, Range: 18 - 81) to examine age-related differences in the benefit of adapting visualizations to match the complexity of the inquiry. Using a 4 (Visualization: 2 simple vs. 2 complex) x 2 (tasks: find value vs. relate values) x 2 (Matching complexity: match vs. mismatch) design, we examined participants' accuracy and response time of visualization interpretation under two sequences: a simple inquiry mismatched with a complex visualization (s2c) and a complex inquiry mismatched with a simple visualization (c2s). Consistent with classical studies of cognitive aging, age was associated with accuracy under both sequences, but at the cost of time. Under the c2s sequence older adults were quicker to identify oversimplified visualizations to be insufficient to answer complex inquiries.

ACTIVITY ALLOCATION DECISIONS AND HEALTH: HOW OLDER ADULTS SPEND THEIR DAY

R. Gonzalez, J. Smith, L. Ryan, *University of Michigan, Ann Arbor, Michigan*

We build on our previous research showing that the distribution of activities over a day (e.g., reading, socializing, watching TV) can be viewed as an allocation decision. We find a small number of unique activity allocation distributions over a day for a sample of N=968 older adults. We extend those findings by examining key health variables that those activity allocation distributions predict. We observe that activity allocation decisions are associated with and predict important health variables such as the number of functional limitations, BMI, and frequency of major illnesses. We also examine the stability of the activity allocation decision using a second day of data from the same participants. Understanding the link between how people choose to allocate their time over a set of activities and their physical and mental health will aid the development new interventions.

SESSION 300 (SYMPOSIUM)

SLEEP IN OLDER BLACKS: THE ROLE OF PSYCHOSOCIAL AND HEALTH-RELATED FACTORS

Chair: A. Gamaldo, *University of South Florida, Tampa, Florida*
Co-Chair: R. Thorpe, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*
Discussant: R. Salas, *Johns Hopkins School of Medicine, Baltimore, Maryland*

Poor sleep is a major public health concern that is highly prevalent among older Blacks. Yet limited progress has been achieved in understanding poor sleep in older Blacks. This is unexpected since poor sleep is associated with common health conditions (e.g., hypertension and obesity) and impaired cognitive functioning in this population. Moreover, because the number of older Blacks is projected to increase over the next 30 years, identifying and understanding factors that prevent or impede sleep quantity and/or quality should be a high priority. Furthermore, there is much to be gained by examining the factors that create individual variability within Blacks to better understand how to create effective approaches to reduce sleep health disparities. The goal of this symposium is to highlight psychosocial and health related factors that are associated with sleep issues in older Blacks. Each presentation utilizes data from the Baltimore Study of Black Aging. Thorpe and colleagues examine the relationship between obesity and sleep disturbance. Hill and colleagues determine whether changes in mental health indicators such as depression and stress are associated with sleep quality. Ford and colleagues examine the association between sleep quality and depressive symptoms. Gamaldo and colleagues examine the relationship between sleep quality and cognitive functioning. These presentations taken together provide important information that significantly bolsters our knowledge of unique aspects Black life and factors that are critical for consideration in efforts to reduce sleep issues in this group of older Blacks.

RELATIONSHIP BETWEEN SLEEP DISTURBANCE AND OBESITY IN OLDER BLACKS

R. Thorpe[1], C. Ford[2], A. Gamaldo[3], R. Salas[4], C. Gamaldo[4], K.E. Whitfield[5], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. University of Alabama, Tusculoosa, Alabama, 3. Univeristy of South Florida, Tampa, Florida, 4. Johns Hopkins School of Medicine, Baltimore, Maryland, 5. Duke University, Durham, North Carolina*

Little is known about the relationship between sleep disturbances and obesity among older Blacks. Using data from the Baltimore Study of Black Aging, we examined whether sleep disturbance is positively associated with obesity in 450 Blacks ages 50 and older. Obesity was defined as body mass index of ≥30. Sleep disturbance had the following categories: 0= no disturbances; 1= 1 to 9 disturbances; 2= 10 or more disturbances. Among participants, 8% reported no disturbances, 70% reported 1 to 9 disturbances, and 21% reported ≥10 sleep disturbances. After adjusting for age, sex, education, income, medical conditions, and depressive symptoms, individuals who reported ≥10 sleep disturbances had a greater odds of obesity (OR=2.88, 95% CI 1.21-6.88) compared to those with no sleep disturbances. No differences were observed between those with 1-9 sleep disturbances compared to no sleep disturbances. The findings suggest the frequency of sleep disturbances may influence obesity in older Blacks.

ASSOCIATION BETWEEN SLEEP QUALITY AND DEPRESSIVE SYMPTOMS IN OLDER BLACKS

C.D. Ford[1], R. Thorpe[2], A. Gamaldo[3], K.E. Whitfield[4], *1. College of Nursing, The University of Alabama, Tuscaloosa, Alabama, 2. John Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. University of South Florida, Tampa, Florida, 4. Duke University, Durham, North Carolina*

The purpose of this study was to examine the relationship between depressive symptoms and sleep quality in older Black adults using data from the Baltimore Study of Black Aging (n = 450; age = 71.43 ± 9.21). Persons were considered to have depressive symptoms if they scored 16 or more on the Center for Epidemiological Studies Depression Scale. Using the Pittsburgh Sleep Quality Index (PSQI), we classified good sleep quality as <5 and bad sleep quality as >5. Seventeen percent of the participants reported depressive symptoms. After adjusting for age, sex, education, income, and medical conditions, individuals who reported bad sleep quality had greater odds of depressive symptoms (OR=3.40, 95% CI 1.41-8.20) compared to those who reported good sleep quality.

THE 3-YEAR CHANGE IN DEPRESSION SYMPTOMS AND PERCEIVED STRESS PREDICTS SLEEP QUALITY IN OLDER AFRICAN AMERICANS: THE BALTIMORE STUDY OF BLACK AGING

L.K. Hill[1,3,4], A. Gamaldo[6], A. Aiken-Morgan[4], J.C. Allaire[5], R. Thorpe[7], C.L. Edwards[3,4], K.E. Whitfield[2,4], *1. Center for the Study of Aging and Human Development, Duke University Medical Center, Durham, North Carolina, 2. Department of Psychology & Neuroscience, Duke University, Durham, North Carolina, 3. Department of Psychiatry, Duke University Medical Center, Durham, North Carolina, 4. Center for Biobehavioral Health Disparities Research, Duke Unviersity, Durham, North Carolina, 5. North Carolina State Univerisity, Raliegh, North Carolina, 6. University of South Florida, Tampa, Florida, 7. Bloomberg School of Public Health -Johns Hopkins University, Baltimore, Maryland*

Mood disturbance including depression and stress has been associated with poor overall sleep. Research on sleep in older adults has typically focused on duration and less on mental health. The present study examined the impact of changes in depressive symptoms and perceived stress on sleep quality in a community-based sample of older adult African Americans in the Baltimore Study of Black Aging (BSBA). The present analyses are based on longitudinal data (N =450) over a 33-month period. Data included depression and perceived stress (time 1 and 2) and sleep quality (time 2). In hierarchical linear regression models controlling for age, sex, education and health status, the 3-year change in depression and perceived stress (time 2 – time 1), significantly predicted worse sleep quality. These novel results suggest emotional and mental health is critical for sleep quality in older African Americans.

RELATIONSHIP BETWEEN COGNITIVE DECLINE AND SLEEP QUALITY IN OLDER BLACKS

A. Gamaldo[1], J.C. Allaire[2], R. Thorpe[3], A. Aiken-Morgan[4], R. Salas[3], C. Gamaldo[3], K.E. Whitfield[3], *1. University of South Florida, Tampa, Florida, 2. North Carolina State University, Raleigh, North Carolina, 3. Johns Hopkins University, Baltimore, Maryland, 4. Duke University, Durham, North Carolina*

The purpose of the current study is to examine relationship between cognitive functioning and sleep quality in Black older adults. Analyses included participants from the Baltimore Study of Black Aging (BSBA; n = 450; Mean age = 71.43). Standardized cognitive composites, accounting for education, were estimated for 6 cognitive abilities (i.e., global cognition, reasoning, language, memory, speed, and working memory). Change in each composite was estimated across the 2 data collection waves. The Pittsburgh Sleep Quality Index (PSQI) was used to assess sleep quality and only administered at wave 2. Using cross-sectional data, there was no significant association between sleep quality and cognitive performance at wave2. However, decline in memory over a 3-year interval significantly predicted worse sleep quality at wave2, even after adjusting for the covariates (p<.05). These results suggest that changes in cognition may be indicative of poor sleep quality, which, subsequently, may exacerbate cognitive dysfunction.

SESSION 305 (SYMPOSIUM)

THE USE OF DAILY LIFE METHODS IN AGING RESEARCH: INSIGHTS FROM FOUR STUDIES

Chair: C. Matz-Costa, *Boston College, Chestnut Hill, Massachusetts, Sloan Center on Aging & Work at Boston College, Chestnut Hill, Massachusetts*
Discussant: M. Pitt-Catsouphes, *Boston College, Chestnut Hill, Massachusetts*

Methods for studying daily life, including Ecological Momentary Assessment (EMA), Experience Sampling Methods (ESM), and Daily Diary (DD) approaches, involve intensive repeated measurements in natural settings. These assessments could occur "in-the-moment", at scheduled times over a day/week, or using an end-of-day or next-day-recall approach. Collecting ecologically-sensitive data using these methods can help to advance the depth, accuracy, and usefulness of gerontological knowledge and interventions. Further, the use of daily life methods that take advantage of technology to collect a broad range of social, behavioral, cognitive, and health-related data have the potential to advance gerontological research and practice in unforeseen ways. Thus, it is important to assess which approaches to studying daily life among older adults work well, under what circumstances, and with whom. In this session, we will present four studies that have examined daily life among older adults using varied approaches and settings. The first presentation will address drinking behavior through a next-day-recall diary approach among residents of a continuing care retirement community. The second will report on intensive in-the-moment data collected over the course of 5 days to better understand the experiences of social entrepreneurs in later life. Next, findings on differences in momentary affective reactivity to pleasant experiences, or uplifts, collected using smartphones will be discussed. The final presentation will report on data collected using iPad minis to better understand engagement in socially-productive activity in later life. A discussant will reflect on the contributions of these works toward the advancement of gerontological scholarship.

OLDER ADULTS' MOTIVATIONS FOR DRINKING: FINDINGS FROM A DAILY DIARY STUDY IN A CONTINUING CARE RETIREMENT COMMUNITY

P. Sacco[1], K. Burruss[1], C. Smith[2], A. Kuerbis[4], D. Harrington[1], A.A. Moore[5], B. Resnick[3], *1. Social Work, University of Maryland, Baltimore, Maryland, 2. University of Maryland-Baltimore County, Baltimore County, Maryland, 3. University of Maryland-Nursing, Baltimore, Maryland, 4. Columbia University, New York, New York, 5. UCLA, Los Angeles, California*

This study describes patterns of drinking and explores associations between drinking motives, affective states, and drinking behavior among CCRC residents (n=71; mean age=82; SD=7.2) using a phone-based daily diary approach. Results suggest that CCRC residents drank most frequently at home and were alone almost half of drinking days on average, although the context of drinking varied considerably by participant. Problem alcohol use was rare, but hazardous alcohol use due to specific comorbidities (e.g. depression), medications (i.e. benzodiazepines), and exceeding consumption guidelines was common. Older adults endorsed higher social motives for drinking and lower coping motives. Coping and social motives were associated with greater consumption, and higher between-person positive affect was associated with lower consumption. Recommendations for practitioners working with older adults will be discussed as well as the opportunities and challenges associated with using a phone-based daily-diary approach to assess daily drinking, drinking context, and affect levels among CCRC residents.

A WEEK IN THE LIFE OF SOCIAL ENTREPRENEURS IN THEIR ENCORES

C. Halvorsen[1], M. Pitt-Catsouphes[2], S. Berzin[2], *1. Encore.org, San Francisco, California, 2. Boston College, Chestnut Hill, Massachusetts*

Unprecedented numbers of older adults have or have expressed an interest in moving into work that makes a positive social impact on their communities and the world. A collaboration between researchers at Encore.org and Boston College in 2013 aimed to better understand the everyday experiences of older adults involved in purpose work. Thirty social entrepreneurs across the country age 60 and older were mailed an iPad mini and asked to respond to a series of questions up to 8 times a day for five days; 819 surveys were completed in total. Questions focused on respondents' "in the moment" activity, social context, and affect. This presentation will summarize selected findings on the important activities of these extraordinary social entrepreneurs as well as factors that contributed to the successful use of mobile technology to collect intensive daily data within this sample (e.g., high response rates and compliance rates).

INDIVIDUAL DIFFERENCES IN AFFECTIVE REACTIVITY TO DAILY UPLIFTS

E. Munoz[1], S. Scott[2], J. Mogle[1], M. Sliwinski[1], J. Smyth[1], D. Almeida[1], *1. The Pennsylvania State University, University Park, Pennsylvania, 2. University of South Florida, Tampa, Florida*

Pleasant experiences or uplifts are associated with greater positive affect but it remains unclear if personality moderates these responses. We examined personality differences in momentary positive affect (PA) reactivity to uplifts in a sample of 180 adults aged 25 to 65. Participants reported their uplift experiences and their PA at 5 pseudo-random assessments a day for 14 days. Compliance checks revealed that older adults were just as likely to complete the protocol as middle-aged adults. When participants reported an uplift, they had greater PA (B=8.81, SE=.78, p<.001). Individual differences in attentional control (i.e., adult temperament, Rothbart et al., 2000) moderated the effect of uplifts: greater attentional control was associated with smaller increases in PA when an uplift was reported (B=-2.30, SE=.81, p<.01). We review self-reported feedback from participants and discuss the value of utilizing repeated and intensive measurements for the study of individual differences in daily experiences.

THE EXPERIENCE OF ENGAGEMENT IN THE THIRD AGE: AN EXPLORATION OF SOCIALLY-PRODUCTIVE ACTIVITIES

C. Matz-Costa[1,2], K. Klein[1], C. Laudate[1], *1. Boston College, Chestnut Hill, Massachusetts, 2. Sloan Center on Aging & Work at Boston College, Chestnut Hill, Massachusetts*

Few studies have attempted to understand the everyday lived experience of older adults' involvement in productive activities (e.g., paid work, volunteer work, caregiving, and informal helping), despite the value of such information in designing roles/interventions that can promote health in later life. The 2013 EngAGE Study used iPad minis to randomly signal 60 community-dwelling adults age 65 or older to complete a brief survey up to 5 times a day for a week. Post-study, participants commented on their experience in an open-ended interview. In addition to findings on the feasibility/acceptability/burden of the intensive data collection approach, this presentation will share findings on the extent to which individuals are psychologically engaged in their activities, what task characteristics (e.g., variety, autonomy, significance, feedback, challenge, identity) are associated with these positive states of engagement, and the extent to which states of engagement are related to momentary or daily fluctuations in health and well-being.

SESSION 310 (SYMPOSIUM)

THE 'NEW' AGEING POPULATIONS: NEW CONCEPTS OF ADULT AGEING WITH TRADITIONAL CONDITIONS OF CHILDHOOD

Chair: K. Lowton, *Institute of Gerontology, King's College London, London, United Kingdom*
Co-Chair: K.F. Glaser, *Institute of Gerontology, King's College London, London, United Kingdom*

There is considerable gerontological interest in population ageing and the experience of increasing longevity in contemporary societies. These impacts are studied in terms of their demographic and epidemiological consequences; not only are there changes in the proportion of older people in society, but there has also been much debate about the levels of disability, chronic illness, service use and social care in later life. However, alongside this conventional ageing population, 'new' ageing populations are emerging as a consequence of both novel health interventions as well as the changing social contexts in which these interventions are delivered. These changes have enabled many people who would have previously died at a much earlier age to survive and live to ages unimaginable a few decades ago, with life expectancy now increasing for many of these groups at a faster rate than that experienced by the general population. These adult populations, such as those with cystic fibrosis, childhood liver transplant, or autism have been largely neglected by researchers. The emergence of these 'new' ageing populations creates a whole new set of challenges for individuals, families, and services designed to meet their needs, as well as for gerontological theory. In this symposium we will outline three arenas where the term 'new' ageing populations is appropriate and consider commonalities with more traditional models of gerontology, ageing and later life.

HOW DO OLDER ADULTS WITH CYSTIC FIBROSIS AGE? A CRITICAL COMPARISON WITH FRAIL OLDER PEOPLE

K. Lowton, *Institute of Gerontology, King's College London, London, United Kingdom*

Cystic fibrosis (CF) is the most common autosomal recessive genetic disorder in Caucasian people. When it was first described in 1938, average survival was less than one year. Today, more adults than children live with CF. Median age of death of those with CF is rising faster than that of the general population in the US, and in England and Wales

(UK), with those born at the beginning of this century predicted to live into their fifties. However, there is no 'cure' for this condition, and with older age come significant chronic and complex associated health conditions, such as osteoporosis, CF-related diabetes, urinary incontinence in women, and managing polypharmacy. This presentation will draw out the similarities and differences between older adults with CF and older people with frailty, in the context of experiences of health, receipt of care, health policy and gerontological approaches to 'successful' ageing.

BIOGRAPHICAL DISRUPTION AND AGEING: THE CASE OF ADULT SURVIVORS OF CHILDHOOD LIVER TRANSPLANT

P. Higgs[1], K. Lowton[2], C. Hiley[2], *1. Faculty of BrainSciences, University College London, London, United Kingdom, 2. KCL, London, United Kingdom*

Ageing is often perceived as entwined with the development of chronic and disabling conditions. There is a large literature on how these conditions can be viewed either as a form of 'normal ageing' or as 'disrupted biographical narratives'; with the latter approach being based upon normative expectations of health at different stages of life. However, this is problematic in relation to older people where notions of what is 'normal' are difficult to establish. In this paper we further question the concept of biographical disruption in relation to the first cohort of children who underwent liver transplant in the mid-1980s and who are now in early-middle age. We argue that this group helps us to understand the way that contingency influences biographical narratives in conditions of unexpected life expectancy. We argue that reflecting on this 'new ageing population' throws light on the challenges to expectations of normal ageing in contemporary society.

HEALTH IMPACT ON PARENTS CARING FOR YOUNG PEOPLE WITH ADHD AND AUTISM AS THEY GROW OLDER

K.F. Glaser[1], V. D'Astous[1], H. Hayward[2], J. Findon[2], P. Asherson[2], D. Murphy[2], *1. Institute of Gerontology, King's College London, London, United Kingdom, 2. Institute of Psychiatry, London, United Kingdom*

Attention-deficit hyperactivity disorder (ADHD) and autism are lifelong conditions, with persisting symptoms and impairments in adulthood. A significant service gap exists for people with ADHD and autism as they 'transition' into young adulthood. Currently families, rather than services, meet these young people's needs, resulting in a negative health impact on families. However, the implications for service use by parents themselves are unknown. We present findings from a longitudinal study of 192 families caring for a young person (aged 14 to 24) with ADHD (n=91) and autism (n=101) as they transition through young adulthood. Most parents reported that their health was affected by their child's condition leading 40% to use services. Service use among parents was significantly associated with their child's mental health symptoms rather their own. The implications of the findings for older parents caring for a family member growing older with a neurodevelopmental disorder, together with their service needs and use, are discussed.

PLANNING FOR OLD AGE: MEETING THE NEEDS OF ADULTS WITH AUTISM POST PARENTAL CARE

V. D'Astous, K.F. Glaser, K. Lowton, *King's College London, London, United Kingdom*

In 1943, when Kanner identified infantile autism, little thought was given to autism in old age, yet the disabilities of autism are complex and persist across the lifecourse. Today, older adults with autism are a newly recognised ageing population, set to increase rapidly in the near future. Social and demographic changes have resulted in elderly caregivers providing support and security for their adult children with autism, who are very likely to survive them. The impairments in language, social skills, behavioural difficulties and sensitivities to change unique to people with autism may contribute to heightened considerations in planning and preparing for their post-parental care. This research, using quantitative and qualitative methods, explores the future care planning in families with an adult with autism from two historical cohorts. It investigates from a holistic family perspective the concerns, desires and supportive services necessary to maintain adults' wellbeing beyond the life of their parents.

SESSION 315 (SYMPOSIUM)

AGE-RELATED VISION LOSS: UNDERSTANDING AND ADDRESSING THE CONSEQUENCES

Chair: V. Cimarolli, *Jewish Home Lifecare, New York, New York*
Co-Chair: G. Zijlstra, *Maastricht University, Maastricht, Netherlands*
Discussant: A. Horowitz, *Fordham University, Bronx, New York*

Age-related vision loss (ARVL) caused by age-related macular degeneration (AMD) is a common chronic condition associated with increased functional disability, and physical and mental health problems. While the negative consequences of ARVL have been studied extensively, more research is needed to understand risk factors for and protective factors against these negative consequences. Furthermore, evidence-based interventions focusing on preventing and/or alleviating the negative consequences of AMD are scarce, leaving much room for improvement of well-being in this population. Hence, one aim of this symposium is to present new findings from studies with older adults with AMD that investigated factors that may exacerbate or mitigate the negative impact of ARVL. The second aim is to present new findings from studies that evaluated novel intervention approaches regarding their effects for well-being of older adults with AMD (RCTs). First, Dr. Cimarolli (USA) will present data on factors related to social participation with a focus on environmental factors. Then, Dr. Schilling (Germany) will report on a study investigating how the use of types of control strategies predicts depressed mood and overall happiness. Dr. Casten (USA) will present findings from a trial that tested the efficacy of a collaborative intervention consisting of low vision optometry and in-home occupational therapy to prevent depression. Finally, Dr. Sörensen (USA) will present data from a trial that evaluated the effectiveness of an intervention designed to increase preparing for future care – a protective factor for older adults' well-being. Dr. Horowitz (USA) will facilitate a discussion on-site.

SOCIAL PARTICIPATION IN OLDER ADULTS WITH AGE-RELATED VISION LOSS

V. Cimarolli[1], K. Boerner[1,2], J. Reinhardt[1,2], A. Horowitz[3], H. Wahl[4], O.K. Schilling[4], M. Brennan-Ing[5,6], *1. Jewish Home Lifecare, New York, New York, 2. Icahn School of Medicine at Mt. Sinai, New York, New York, 3. Fordham University, New York, New York, 4. Heidelberg University, Heidelberg, Germany, 5. ACRIA, New York, New York, 6. New York University College of Nursing, New York, New York*

This study investigated predictors of social participation in a sample of older adults with age-related vision loss (N=364). Guided by the International Classification of Functioning, Disability and Health (ICF) Model framework, we assessed personal (e.g., age), environmental (e.g., environmental modifications and attachment), impairment (e.g. objective vision impairment severity), activity limitations (e.g., IADL), and social participation indicators (i.e., social challenges faced, perceived social integration). In regression analyses, younger age, more environmental modifications and functional problems due to vision loss emerged as significant predictors of the number of vision-related social challenges faced. In contrast, more optimal income adequacy, attachment to the environment (neighborhood and apartment/house), and objective vision impairment severity, as well as lower levels of depressive symptomatology were related to better social integration. This study paints a complex picture of variables contributing to social participation in older adults with vision loss and highlights the importance of environmental variables for social participation.

CONTROL STRATEGIES AND WELL-BEING UNDER CHRONIC VISION LOSS: ARE THEY LINKED WITHIN INDIVIDUALS?

O.K. Schilling[1], H. Wahl[1], K. Boerner[2,3], J. Reinhardt[2,3], V. Cimarolli[2], M. Brennan-Ing[5,6], A. Horowitz[4], *1. Department of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany, 2. Jewish Home Lifecare, New York, New York, 3. Icahn School of Medicine at Mt. Sinai, New York, New York, 4. Fordham University, New York, New York, 5. ACRIA, New York, New York, 6. New York University College of Nursing, New York, New York*

This study aimed to analyze how the use of the control strategies proposed by Heckhausen and Schulz (1995) is coupled with depressed mood and overall happiness within individuals with age-related macular degeneration (AMD). We analyzed longitudinal data from N = 364 measured at 5 occasions with 6-month intervals in-between, using vision-specific measures of selective primary (SPC), selective secondary, compensatory primary, and compensatory secondary (CSC) control. Mixed model analyses revealed that particularly SPC and CSC predicted low depressed mood and high happiness within individuals. Further analyses revealed that SPC was linked with better well-being only in periods without pronounced loss of functional abilities. Overall, the findings suggest that CSC strategies, promoting disengagement from no longer attainable goals, are crucial for adaptation to chronic vision loss, whereas SPC efforts to reach goals are highly adaptive only as long as a given level of functional competencies remains stable.

LOW VISION DEPRESSION PREVENTION TRIAL FOR AGE-RELATED MACULAR DEGENERATION (VITAL)

B.W. Rovner, R. Casten, *Thomas Jefferson University, Philadelphia, Pennsylvania*

The Low Vision Depression Prevention Trial tested the efficacy of a collaborative intervention consisting of low vision optometry and in-home occupational therapy to prevent depression in Age-Related Macular Degeneration (N = 188). The study enrolled 188 patents with AMD, best eye acuity < 20/70, and subsyndromal depressive symptoms. After baseline, all participants received low vision optometry services and free low vision devices (pre-randomization), followed by randomization to either Behavioral Activation Low Vision Rehabilitation (BA-LVR) (active treatment) or Supportive Therapy Low Vision Rehabilitation (ST-LVR) (attention control). BA-LVR participants had 6 in-home OT visits that included low vision rehabilitation and depression treatment (behavioral activation). ST-LVR participants had 6 in-home supportive therapy sessions. Assessments at 4 and12 months evaluated depression, functional vision, and quality of life (QoL). Results describe the efficacy of BA-LVR to prevent depressive disorders and improve function and QoL, and elucidate mechanisms linking treatment group assignment to study outcomes.

ENHANCING PREPARATION FOR FUTURE CARE AMONG OLDER ADULTS WITH MACULAR DEGENERATION: TESTING A PREVENTIVE PROBLEM SOLVING INTERVENTION

S. Sörensen[1], K. White[2], G.K. Sterns[3,2], K. Zanibbi[1], *1. Psychiatry, University of Rochester School of Medicine and Dentistry, Rochester, New York, 2. Association for the Blind and Visually Impaired, Rochester, New York, 3. Rochester General Hospital, Rochester, New York*

Preparing for Future Care (PFC) encompasses the processes of thinking, gathering information, making decisions, and concrete planning about potential future needs for assistance and long-term care. Previous studies suggest PFC is a protective factor for older adults' well-being, but people with AMD report lower than average rates of PFC, increasing their risk for subsequent depression. We examined whether PFC can be increased in a sample of 213 AMD patients aged 60-96 (63% women). Participants were randomly assigned to an 8-week in-home Preventive Problem-Solving Intervention (PREPSI), designed to enhance PFC, or to an in-home Life Review intervention (attention control). Both conditions received 4 weeks of vision loss education before the intervention. In Linear Mixed Models two out of five subscales of PFC – concrete planning and decision making – improved significantly post-intervention and continued to improve at 6 month follow-up ($p<.05$). Also, post-intervention increase in PFC was correlated with well-being outcomes at 6 months.

SESSION 320 (SYMPOSIUM)

MAKING MEANINGFUL CONNECTIONS IN INTERNATIONAL RESEARCH: FINDINGS FROM FEAR OF FALLING STUDIES

Chair: G. Zijlstra, *Maastricht University, Department of Health Services Research, CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands*
Co-Chair: G.I. Kempen, *Maastricht University, Department of Health Services Research, CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands*
Discussant: G. Zijlstra, *Maastricht University, Department of Health Services Research, CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands*

Fear of falling is common among fallers and non-fallers in older populations. Previous studies have shown that fear of falling can lead to activity restriction, and has a negative impact on balance, gait, mobility, social activity, mental health and independence. Worldwide research on fear of falling in ageing populations has taken a flight in the recent years. This warrants connecting international research findings in search for sustainable prevention strategies to tackle fear of falling. During this symposium findings from five top-quality research studies, including two longitudinal studies, a systematic review, an RCT and a community model for implementation, will be presented. The presenters are from the US, Germany and the Netherlands and will address: 1) the understanding of the incidence of fear of falling among Italian older persons without a recent fall, 2) an up-to-date overview of risk factors for fear of falling according to international studies, 3) the impact of the level of fear of falling on different aspects of functioning over a period of 14 months in Dutch older people, 4) the effects of an intervention on fear of falling in German hip or pelvic fracture patients, and 5) the development and evaluation of a Community Of Practice (COP) model to promote engagement in evidence-based practice related to fear of falling among nursing home staff in the US. The discussion with the audience after the presentations will focus on connecting current evidence for meaningful steps in research and practice related to reducing fear of falling in older populations.

3-YEAR INCIDENCE OF FEAR OF FALLING IN OLDER PERSONS WITH NO HISTORY OF A FALL

N. Deshpande[1], L. Ferrucci[2], *1. Queen's University, Kingston, Ontario, Canada, 2. NIA/NIH, Baltimore, Maryland*

We determined predictors of 3-year incidence of fear of falling (FoF) in older persons with no history of falls. 242 cognitively intact community-living elderly (age≥65 years) without FoF at baseline and attended the 3-year follow-up were included. FoF was quantified at baseline and the 3-year follow-up using Survey of Activities and Fear of Falling in the Elderly (SAFE) questionnaire. Independent measures at baseline included several demographic, sensorimotor and psychosocial variables. 14% participants reported FoF at the 3-year follow up. Being a woman (OR=2.382, p=0.038), having significant depressive symptoms (OR=3.813, p=0.001) and balance performance in the lowest tertile (OR=2.989, p=0.008) were independent predictors of incident FoF in non-fallers. The likelihood of incidence of FoF increased exponentially when two (OR=10.150, p<0.001) or all three (OR=29.000, p<0.001) of these risk factors were present simultaneously. Timely intervention for depression and poor balance in older persons, particularly in older women, may reduce incidence of FoF.

FACTORS ASSOCIATED WITH FEAR OF FALLING AND ASSOCIATED ACTIVITY RESTRICTION IN COMMUNITY DWELLING OLDER ADULTS – A SYSTEMATIC REVIEW

M.D. Denkinger[1], A. Lukas[1], K. Hauer[2], *1. AGAPLESION Bethesda Clinic, Geriatric Centre of Ulm University, Ulm, Germany, 2. AGAPLESION Bethanien Clinic, Geriatric Centre of Heidelberg University, Heidelberg, Germany*

Current interventions to reduce fear of falling (FOF) have yielded conflicting results. One reason could be that important risk factors have not been identified. To identify and rate established and additional risk factors we conducted a systematic review. Results are summarized with respect to different constructs such as FOF, fall-related self-efficacy/ balance confidence and FOF-related activity restriction. Parameters that were robustly associated across all constructs were female gender, performance-based and questionnaire-based physical function, the use of a walking aid and – less robust – a history of falls and poor self-rated health. Conflicting results have been identified for depression, anxiety, multiple and psychotropic drugs. Newly identified and potentially modifiable factors were: urinary incontinence, living in rural areas and, with mixed evidence, factors such as mastery and pain. To conclude, only few risk factors were robustly associated across all FOF-related constructs. Some newer factors have to be tested again in different cohorts.

CONSEQUENCES OF SEVERITY OF FALL-RELATED CONCERNS FOR QUALITY OF LIFE AMONG COMMUNITY-DWELLING OLDER ADULTS. A PROSPECTIVE STUDY

G.I. Kempen[1], E. van der Meulen[1], T. Ambergen[2], G. Zijlstra[1], *1. CAPHRI - Dept. of Health Services Research, Maastricht University, Maastricht, Netherlands, 2. CAPHRI - Dept. of Methodology and Statistics, Maastricht University, Maastricht, Netherlands*

Most studies addressing the consequences of concerns about falls are cross-sectional and/or focused on one specific outcome. In this prospective study we examined the consequences of severity of fall-related concerns for physical, mental and social functioning in 260 Dutch community-dwelling older adults with at least some concerns about falls. At baseline two groups were created with high or low level of fall-related concerns as assessed with the MFES. Five outcome measures were assessed at baseline and 2, 8 and 14 months. After covariate adjustment significant baseline differences between high and low level of fall-related concerns were found for ADL dysfunctioning and social participation. These differences persisted until 14-months follow-up but no widening or narrowing occurred over time. No differences were found for symptoms of depression, feelings of anxiety and social support interactions. Outcomes may help to target groups who are at risk of developing adverse consequences of concerns about falls.

REDUCING FEAR OF FALLING IN HIP FRACTURE PATIENTS: A RANDOMIZED CONTROLLED TRIAL

K. Pfeiffer[1,2], M. Küpper[1], K. Kampe[1], D. Klein[1], A. Pendergrass[1], C. Becker[1], M. Hautzinger[2], *1. Robert-Bosch-Krankenhaus, Stuttgart, Germany, 2. University of Tuebingen, Tuebingen, Germany*

There is only limited information on interventions that combine psychosocial components and physical training in clinical and transitional care of hip fracture patients. A multifactorial intervention to improve physical activity and falls efficacy was evaluated with 124 community-dwelling elderly after hip or pelvic fracture (Mean age = 82.5 years; 76.6 % female). Components of the intervention were (a) relaxation, (b) meaningful mobility goals, (c) falls-related cognitions and emotions, (d) an individual physical exercise program, (e) integration of training and physical activities in daily life, (f) fall hazards. The intervention was delivered in 8 face-to-face sessions during inpatient rehabilitation plus 4 telephone contacts and one home visit over ten weeks after discharge. There were significant between-group effects (p < .05) in favor of the training group on fall's efficacy and the total number of falls, but no effects on the total daily walking time per day three months after discharge.

FALLS AND FEAR OF FALLING IN THE NURSING HOME: A NEW MODEL FOR IMPROVING CARE

H. Lach, T.K. Malmstrom, M. Berg-Weger, J.E. Morley, *Saint Louis University, St. Louis, Missouri*

Falls and fear of falling are common among nursing home residents and facilities are challenged to provide evidence-based care. We developed a Community of Practice (COP) linking academic partners and staff at 15 nursing homes to address falls and fear of falling. Resource staff from each facility participated in a an assessment and full day workshop with faculty of the Geriatric Education Center. Confidence in assessing and managing fall-related issues were assessed using a 10-item questionnaire at the beginning and end of the workshop. COP participants were interdisciplinary (n=45) and 82% had 5 years experience or more. Confidence in addressing falls increased 9.1 points on the 7-70 point scale (p < .0001). Participants were provided ongoing resources for 1 year including access to a an online discussion board, participated in telephone conferences with faculty and each other and collected outcome data.

SESSION 325 (SYMPOSIUM)

INTERRELATIONSHIPS AMONG PERSONAL RELATIONSHIPS, LONELINESS, AND PHYSICAL HEALTH IN THE NSHAP II

Chair: S.M. Moorman, *Boston College, Chestnut Hill, Massachusetts*
Discussant: M. Hayward, *University of Texas, Austin, Texas*

The papers in this symposium use data from the recently-released, publically-available second wave of the National Social Life, Health, and Aging Project (NSHAP) to investigate the complex associations among personal relationships, loneliness, and physical health in later life. The NSHAP is a nationally-representative sample of over 3,000 Americans born between 1920 and 1947. Together, the four papers illustrate processes by which personal relationships get "under the skin," and in turn, health and well-being affect relationships. Warner and Adams examine the longitudinal associations between physical disability and loneliness, and find that physical limitations heighten loneliness. A high quality marriage, however, is a protective factor. Moorman and Greenfield investigate dyadic influences on loneliness in long-term marriage. They find that one's spouse's perceptions of several dimensions of marital quality, as well as one's own perceptions of marital quality, affect one's experiences of loneliness. Gorman, Fahey, and Reddy explore how subjective reports of well-being, including loneliness, and biological measures of stress, such as C-reactive protein, affect rates of heart failure and mortality among men and women. They identify interactions between subjective measures and biomarkers. Liu and Brenneman study sexuality and cardiovascular health over the course of 5 years, concluding that older adults who engage in active, satisfying sexual relationships enjoy reduced cardiovascular risk compared to persons who are sexually inactive and persons who would prefer more sexual intimacy. Hayward's discussion emphasizes how the papers use recent advances in measurement and statistical methods to describe the articulations among the biological, the psychological, and the social.

PHYSICAL DISABILITY AND INCREASED LONELINESS AMONG MARRIED OLDER ADULTS: THE ROLE OF CHANGING SOCIAL RELATIONS

D.F. Warner, S.A. Adams, *University of Nebraska-Lincoln, Lincoln, Nebraska*

Physical disability occurs within a social context. Using data on married older adults from Waves I and II of the National Social Life Health and Aging Project (NSHAP), we estimate cross-lagged structural equation models to examine how changes in physical disability affect loneliness with particular attention to whether simultaneous changes in social support explains this association. While physical limitations increase loneliness and are associated with the deterioration of non-marital relations, these changes do not explain the increases in loneliness. Generally, loneliness and physical limitations are not associated with changes in marital quality and being in a high-quality marriage buffers the effects of physical disability. A minority (~20%) of disabled older adults, however, experience modest declines in marital quality and increases in non-marital support. Increased non-marital support does not compensate for the low and declining levels of spousal support and these disabled older adults—even though they experience increases in total support—report greater loneliness over time. The findings reinforce the importance of the marital relationship for coping with changes in functional abilities with age.

A DYADIC PERSPECTIVE ON MARITAL QUALITY AND LONELINESS IN MIDDLE AND LATER LIFE

S.M. Moorman[1], E.A. Greenfield[2], *1. Boston College, Chestnut Hill, Massachusetts, 2. Rutgers University, New Brunswick, New Jersey*

Previous research on married couples has indicated that loneliness, an unrealized desire for close relationships, can affect even partnered adults. Guided by systems theory, we examined the extent to which individual, spousal, and couple-level reports of relationship quality are risk factors for loneliness among married adults in middle and later life. Using dyadic data from 776 opposite-sex married couples in the National Survey of Health, Social Life, and Aging Project (2010-2011) and structural equation modeling (i.e., the actor-partner interdependence model), we found that discrepancies in received social support, desire for companionship, and marital happiness were associated with loneliness beyond individuals' reports. For sexual satisfaction and relational strain, only individuals' reports were associated with loneliness. Overall, results suggest the importance for research, theory, and practice to consider loneliness among married adults as a dyadic phenomenon—an individual, subjective state that can result from couple-level processes.

STRESS, HEART FAILURE, AND MORTALITY AMONG OLDER MEN AND WOMEN

B.K. Gorman, L.M. Fahey, P. Reddy, *Sociology, Rice University, Houston TX, Texas*

Using data from two waves of the National Social Life, Health, and Aging Project (NSHAP), we investigate how stress relates to heart failure and mortality among seniors. We consider psychosocial and biological dimensions of stress, and examine whether one way that psychosocial stress gets "under the skin" to shape heart failure and mortality risk is via C-Reactive Protein (CRP). We investigate whether stress is more strongly related to mortality among older adults diagnosed with heart failure, and whether these relationships differ by gender. Findings indicate that gender differences in stress exposure do not drive differences in heart failure and mortality rates between men and women in our sample. We also tested for gender differences in stress vulnerability, and found supporting evidence for both heart failure and mortality. We find limited support for the indirect relationship between stress and heart failure (via CRP) but find that CRP is associated with mortality independent of psychosocial stressors.

SEXUALITY AND CARDIOVASCULAR RISK AMONG OLDER ADULTS

H. Liu, S. Brenneman, *Sociology, Michigan State University, East Lansing, Michigan*

Although stereotypes exists that older people do not have sex as much as their younger peers, recent studies suggest that sex remains very important to older adults' quality of life. However, less is known about the relationship between sexuality and health at later life. This is the first national study to investigate how sex affects cardiovascular risk—an important pathogenic mechanism involved in a host of age-related health conditions—among older adults. We use nationally representative longitudinal data from the first two waves of the National Social Life, Health, and Aging Project (NSHAP) to analyze four cardiovascular risk factors: hypertension, heart rate, C-reactive protein (CRP), and cardiovascular events (stroke, heart attack, and health failure). We consider multiple dimensions of sexuality including sexual behavior, sexual quality, and sexual function in relation to cardiovascular risk. We find some evidence for the relationship between sexuality and cardiovascular risk among older adults.

SESSION 330 (SYMPOSIUM)

THE SIBLING CONNECTION: NEW PURSUITS IN SIBLING RESEARCH ON THE PATH FROM CELLS TO SOCIETY

Chair: V.H. Bedford, *School of Psychological and Brain Sciences, Indiana University, Bloomington, Indiana, University of Indianapolis, Indianapolis, Indiana*

Co-Chair: S.P. Rosendahl, *Mälardalen University, Eskilstuna and Västerås, Sweden*

The study of adult siblings, although late to be acknowledged and still under-researched, has much to contribute to our understanding of the complexity of human social aging. This symposium contributes to the "path from cells to society" by examining influences on the sibling relationship and sibling influences on other phenomena from the micro to the macro level. Striking new findings are reported. Beginning with the cellular level (genes), Rosendahl and Rosendahl's comparison of twins reared either apart or together implicitly provides a clue to the feedback loop between the micro and macro levels by controlling for genetic contributions in the study of environmental impact on the twin relationship. Their results reveal fewer commonalities between the two twin groups than previously reported. Focusing on the familial level, Quite and Dykstra break away from the dyadic parent-child paradigm by targeting within-family sibling network influences on parents' support to their adult children controlling for between-family differences. Con et al. target the societal level through cross-cultural comparisons by using multiple within-family informants. Their results reveal more commonalities than expected. Focusing on African cultures, Bedford and Avioli examine several African societies' conceptions of twins and the interaction between these views and the broader cultural beliefs of the societies that hold them. This knowledge provides some insights into the contradictions in Western society's biases toward and treatment of adult twins.

TWINSHIP EXPERIENCED BY TWINS REARED APART VERSUS TOGETHER

S.P. Rosendahl[1], D.C. Rosendahl[2], *1. Sirpa Rosendahl, Mälardalen University, Eskilstuna-Västerås, Sweden, 2. Dan Rosendahl, Trinity Theological Seminary, Newburg, Indiana*

The aim was to explore and describe how older twins reared apart and reared together experience the twin relationship over a life course. Method: The life stories of 30 Swedish older (70+) identical and fraternal twins were analyzed with qualitative content analysis. Results: The relationship patterns among twins reared apart were related to the time of separation, family upbringing, time together after re-union and over the life course. Twins who spent their first years in the biological family and thereafter separated could continue their relationship over the life course, showing the same kind of relationship patterns as twins reared together. Twins who were separated during their first year after birth and reunited several years later showed a more complex relationship pattern, where some lacked an emotionally close relationship and others gradually developed such a relationship over the years. This finding challenges popular views on twins reared apart being emotionally close.

CONFLICT & COOPERATION AMONG SIBLINGS DURING CAREGIVING: COMPARISONS BETWEEN TURKEY AND THE U.S

G. Con[1], J. Suitor[1], M. Gilligan[2], K. Pillemer[3], *1. Purdue University, West Lafayette, Indiana, 2. Iowa State University, Ames, Iowa, 3. Cornell University, Ithaca, New York*

In this paper, we use within-family data collected from adult siblings in Turkey and the U.S. to explore cross-national differences and similarities in the experiences of adult children whose mothers required caregiving. Using cases in which 14 Turkish and 14 American families were matched on number and gender of siblings, we use qualitative data from at least two siblings in the same families to compare patterns of cooperation and conflict among adult children when mothers needed assistance for a recent health event. Preliminary findings reveal more similarities than differences in the experiences reported by siblings in the two cultures, particularly regarding the role of gender in reports of within-family differences in sibling relations during caregiving.

THE ALLOCATION OF PARENTAL SUPPORT TO ADULT CHILDREN A CROSS-NATIONAL PERSPECTIVE

W. Quite, P.A. Dykstra, *Sociology, Erasmus University Rotterdam, Utrecht, Nederland, Netherlands*

In this paper the support adult children receive from their parents is compared to the support their siblings receive. We address whether and to what extent child characteristics relative to sibling characteristics determine the allocation of parents' support, and if this allocation partly depends on the national context. For example, daughters and children living nearby might be more likely to receive support when there is less public health care available since these children are more likely to provide care when their parents are in need. Hereby, we also shed new light on (competing) explanations of family support. Altruism may prevail more when children's needs are relatively high, for example when unemployment benefits are low. By contrast, reciprocity may be a more predominant predictor of parents' support to adult children when parents' needs are relatively high, for instance when public care arrangements are rudimentary.

NONTWINS' PERCEPTIONS OF TWINS: DRAWING ON CROSS-CULTURAL AND CROSS-DISCIPLINARY RESOURCES

V.H. Bedford[1,2], P.S. Avioli[3], *1. School of Psychological and Brain Sciences, Indiana University, Bloomington, Indiana, 2. University of Indianapolis, Indianapolis, Indiana, 3. Kean University, Union, New Jersey*

Recent research findings indicate that old adults' experience of being twins is not very different from their childhood experience. Namely, twins in old age often feel they are treated as a single entity and their individuality is not respected. However, both child and adult research findings about non twins' treatment of twins would suggest otherwise. For instance, twins' parents and school systems often take an individualistic approach toward twins, ignoring their twinship and separating them early in age. Further, some theories about the social structure of the twinship in Western societies claim that twins outgrow their twinship by the time they reach adulthood. The purpose of this paper is to develop a framework that is able to incorporate such contradictions. We do so by examining the perspective of nontwins. Specifically, we review twinship beliefs in African cultures drawing on various disciplines including anthropology, sociology, fine arts, and psychology.

SESSION 335 (PAPER)

SOCIOECONOMIC STATUS AND AGING

SOCIOECONOMIC STATUS AND DIFFERENCES IN DIURNAL CORTISOL PATTERNS: THE BALTIMORE MEMORY STUDY

L. Samuel[1], T. Glass[1], D.L. Roth[2], R. Thorpe[1], B.S. Schwartz[1], *1. Johns Hopkins University Bloomberg School of Public Health, Baltimore, Maryland, 2. Johns Hopkins University School of Medicine, Baltimore, Maryland*

This study examined socioeconomic differences in diurnal cortisol patterns. We hypothesized that lower socioeconomic status would be associated with lower waking cortisol and slower diurnal cortisol decline, markers of hypothalamic pituitary adrenal (HPA) axis aging. Six salivary cortisol samples, taken within a 24-hour period, were analyzed from 570 participants aged 56-78 years in the Baltimore Memory Study. Household wealth measured household income plus assets, categorized as above or below the median. Financial strain was measured by self-report and categorized as moderate to high strain, low strain, or no strain. Education was categorized as High School or less, some college and college degree or more. Polynomial random effects models were used to model change in log cortisol as a function of socioeconomic status variables and time, adjusting for age, sex, and race/ethnicity and their cross-products with time. After adjusting for the diurnal pattern of cortisol as well as fixed effects of confounders, higher household wealth was not associated with waking cortisol level, but was associated with faster diurnal decline in log cortisol since waking ($\beta = -0.006$, SE=0.003, $p<0.05$). Although no financial strain was associated with faster decline in cortisol in unadjusted models, neither financial strain nor education was associated with cortisol change in fully adjusted models. In this study of community dwelling older adults, lower household wealth was associated with a slower afternoon cortisol decline, suggesting diminished inhibitory HPA axis feedback. This provides limited evidence that HPA axis response may mediate the relationship between SES and health in older adults.

ETHNIC IDENTITY, SOCIOECONOMIC STATUS, AND DIABETES IN AGING LATINOS: EVIDENCE OF ETHNIC IDENTITY AS AN UNDERLYING MECHANISM OF THE LATINO HEALTH ADVANTAGE

J.B. Concha, B. Mezuk, *Department of Family Medicine and Population Health, Virginia Commonwealth University, Richmond, Virginia*

Type 2 diabetes is a chronic disease that continues to disproportionately affect Latinos; however, the determinants of variation in diabetes risk within the Latino population are not well understood. Research indicates that aspects of acculturation, like ethnic identity, are related to mental health in Latinos; however, ethnic identity has not been extensively applied to understanding risk of chronic conditions associated with aging, like diabetes. The objectives of this study are to understand the association between ethnic identity and diabetes, and to evaluate whether socioeconomic status modifies this relationship. Data come from the National Latinos and Asian American Study (N=2522). Ethnic identity was measured using the Ethnic Identity scale ($\alpha = .75$). Logistic regression, accounting for the complex study design, was used to assess the relationship between ethnic identity, education, and their interaction on prevalent diabetes. Results reveal that aging Latinos with higher levels of ethnic identity are less likely to have diabetes (OR = .94, 95% CI: .89 - .99) after accounting for age, gender, income, and education. Education was not significantly related to diabetes (OR = .16, 95% CI: .74 – 1.05); however, the interaction between ethnic identity and education was marginally significant (OR = .054, 95% CI: .99 – 1.15) indicating that the protective effect of ethnic identity on diabetes declines as education increases. In sum, having a strong ethnic identity is associated with a lower likelihood of diabetes among older Latinos. Future research should examine how ethnic identity may inform prevention and management efforts for this group.

WEATHERING OF LOW-INCOME WOMEN IN RURAL NORTH CAROLINA: IMPACT OF SEXUAL ABUSE & DOMESTIC VIOLENCE

L. Ritchie, L. Burton, *Duke University, Durham, North Carolina*

Weathering, or accelerated aging, within economically disadvantaged populations has typically been explored among urban residents, with minimal attention to patterns within rural populations. Given the spatial redistribution of poverty in rural spaces, particularly in U.S. Southern regions, it is imperative to examine the prevalence of weathering in these understudied populations. Additionally, weathering has been associated with individuals having histories of sexual abuse and domestic violence (DV), particularly women. Histories of sexual abuse and DV are notably higher in poor southern settings, rendering low-income women at risk for experiencing weathering. In this paper, we use longitudinal ethnographic data on 42 low-income African American, White, and Latino women who participated in the Family Life Project study of rural family poverty to explore the relationship between their life histories of sexual abuse and DV and their physical and mental health. We conceptually framed the investigation using cumulative dis/advantage and stress proliferation theories and analyzed the ethnographic data using a modified ground theory approach. Results indicated that roughly 50% of the women reported histories of sexual abuse and/or DV. Although the majority of women were under the age of 40, more than 70% of them suffered one or more chronic physical and mental health conditions that are often indicative of accelerated aging. Obesity and depression were the most frequently reported health conditions, with many women also suffering from post-traumatic stress disorders, anxiety, advanced cardiovascular disease, cervical cancer, hypertension, diabetes, among other conditions. The implications of these findings for policies and programs are discussed.

HOW DID THE 1996 WELFARE REFORM AFFECT OLDER IMMIGRANTS OVER TIME?

P.M. Kazi[1], L.A. Bailey[2], *1. Economics, Bucknell University, Lewisburg, Pennsylvania, 2. College of Staten Island, CUNY, New York, New York*

Welfare Reform restricted immigrant access to government provided health insurance. Prior literature has found that immigrants were, in some instances, able to increase employer sponsored coverage by increasing their labor supply to offset the decline in government assistance. Using the Current Population Survey March supplements (1994-2013), we examine whether this is true for elderly citizen and noncitizen immigrants (aged 50-74) based on two reasons. First, older workers might be less likely or able to get jobs, particularly in the Great Recession. Second, there may be a preference for hiring Americans, especially during recessions. We show that Borjas (2003)'s finding, that welfare reform did not lead to a decline in health insurance coverage for immigrants because they increased their labor supply, does not hold for older immigrants. Additionally, using the American Community Survey for larger sample sizes (2008-2011), health insurance coverage declined for all groups at similar rates. Further, there was a large decline in employer-sponsored coverage that was offset by increases in public insurance coverage. Finally, we view health as an investment in human capital and want to explore potential effects of the loss in health care coverage on future labor supply. Our hypothesis is that worse government support for new immigrants will lead relatively sick persons to be less likely to be in the labor force/employed in the future due to worse future health. We use panel data from the Health and Retirement Survey (2004-2010) to describe relative health status of citizen and noncitizen immigrants and to explore correlations of health status to employment and labor force participation. We find that noncitizen immigrants are no different in their propensity to work than natives, but citizen immigrants are more likely than natives to work. As expected, we find that worse mental health is correlated to lower likelihoods of employment and labor force participation for older workers.

DOES PERCEIVED FINANCIAL STRAIN RESHAPE SOCIOECONOMIC HEALTH DISPARITIES IN CHINESE OLDER ADULTS?

R. Fu, *Purdue University, West Lafayette, Indiana*

Objectives: Drawing from the latency and pathways models, this article examines (1) whether childhood socioeconomic status (SES), adulthood SES, and subjective SES affect subjective health among older adults in China; and (2) whether these socioeconomic health disparities persist after accounting for perceived financial strain. Methods: Data derived from two waves (2002 and 2005) of the Chinese Longitudinal Healthy Longevity Survey. Binary logistic regression models were used to assess the impact of SES and financial strain on subjective health for a nationwide sample of older adults aged 62–117 (N = 8,175). Results: Urban respondents with non-manual fathers were less likely to report poor health in old age. Being in poverty increased the chance of reporting poor health in urban older adults; this association did not hold after adjusting for perceived financial strain. Perceived financial strain was associated with an elevated risk of poor subjective health for urban and rural inhabitants, independent of SES. Discussion: Findings from the urban sample lend support to the latency model and suggest that socioeconomic advantage in childhood may benefit people's subjective health even many decades later. Perceived financial strain exacts a toll on Chinese older adults' subjective health, independent of their socioeconomic conditions at different life stages. This study underscores the importance of addressing perceived financial strain while exploring socioeconomic disparities in health.

SESSION 340 (PAPER)

SPIRITUALITY AND RELIGION

RELIGIOSITY AFTER A CANCER DIAGNOSIS AMONG COMMUNITY-DWELLING OLDER ADULTS

L.S. Caplan[1], P. Sawyer[2], C.L. Holt[3], C.J. Brown[2,4], *1. Community Health and Preventive Medicine, Morehouse School of Medicine, Atlanta, Georgia, 2. University of Alabama at Birmingham, Birmingham, Alabama, 3. University of Maryland at College Park, College Park, Maryland, 4. Birmingham-Atlanta VA GRECC, Birmingham, Alabama*

Religiosity is important to the health and quality of life of cancer patients. This analysis examined changes in religiosity among African American and Caucasian cancer survivors to understand the impact of a cancer diagnosis on religiosity. Methods: Community-dwelling older adults were interviewed in-home at baseline and 48 months later (the UAB Study of Aging). Three measures of religiosity were assessed: Organizational (service attendance), Non-organizational (private behaviors), and Intrinsic (agreement with attitudinal statements). Bivariate analyses were conducted by cancer category (cancer at baseline, cancer at four years, no cancer). Multivariable linear regression evaluated the independent association of cancer status and religiosity, controlling for baseline religiosity and other factors. Results: 94 persons had cancer at baseline; 45 had a new cancer diagnosis during the four years. There were declines and increases for religiosity measures among all cancer categories. Among persons with cancer, there was a negative association between more recent diagnosis and attendance at religious services (p=.005). Cancer diagnoses (recent or baseline) were not significant in any model. Although not statistically significant, a larger proportion of recently diagnosed persons increased non-organizational religiosity behaviors and intrinsic religiosity compared to persons without cancer and having cancer at baseline. African Americans with a cancer diagnosis were more likely than Caucasians to show increased non-organizational religiosity. Caucasians were more likely to show increased intrinsic religiosity, perhaps because of a ceiling effect among African Americans. Conclusions: Baseline religiosity was the strongest predictor of religiosity at 48 months, suggesting stability of religiosity in the context of cancer diagnoses.

AGED-RELATED LIFE-CHANGING EVENTS AND BABY BOOMER SPIRITUALITY

E.B. MacKinlay[1], R.A. Burns[2], *1. Centre for Ageing & Pastoral Studies, Charles Sturt University, Canberra, Australian Capital Territory, Australia, 2. Australian National University Centre for Research on Ageing, Health and Wellbeing, Canberra, Australian Capital Territory, Australia*

Baby boomers present unique challenges to aged care services. Like previous generations, baby boomers still face challenges of aging. Spirituality in later life, understood largely as meaning in life is crucial to wellbeing. Little has been studied about this dimension of aging for baby boomers. This mixed methods study of baby boomers (N=143), using questionnaire and focus groups, comprised staff (36%) Uniting Care Homes, children (17%) of adults in care, and Uniting Church congregational members (47%). Most participants reported affiliation with the Uniting Church (57%). Around 35% reported other Christian affiliation, with 7% Buddhism or no religious association. Only 15% of staff reported affiliation with the Uniting Church; most belonged to other Christian denominations. For children of care recipients, most reported Christian affiliation. Importantly, a significant proportion (17%) reported no religious affiliation. We studied associations of physical and mental health- depression and psychological wellbeing, spirituality, aging anxiety and the impact of negative life events. We asked whether spirituality protected participants against impact of life events. Overall there was no difference on spirituality between non-Christian and non-religious with those with Christian affiliation ($p > .05$). Therefore we examined the role of spirituality in moderating impact of life stress and life events on mental health, physical health and wellbeing outcomes. Main findings were: Spirituality promotes mental and physical health and lowers anxiety about and fear of ageing.

PATHWAYS TO RESILIENCE: EXPLORING THE CONNECTIONS BETWEEN SPIRITUALITY AND THE MANAGING OF HARDSHIP IN LATER LIFE

L.K. Manning, *Division of Human Services, Concordia University Chicago, River Forest, Illinois*

Research suggests that spirituality is important to a large percentage of the older adult population and serves as a promoter of healthy aging. Resilience can be described as the capacity to navigate adversity in a manner that protects health, well-being, and life satisfaction (Manning, 2013; Ryff, 2003; Reich, Zautra, & Hall, 2010). Scholars have identified several pathways to resilience, including social support (Helgeson & Lopez, 2010), volunteering and civic engagement (Hughes, 2010), and maintaining positive affect (Moskowitz, 2010). Until recently, however, little effort has been made to determine how spirituality contributes to resilience (Faigin & Pargament, 2010; Pargament & Cummings, 2010). Using qualitative research and a phenomenological approach, I conducted and analyzed interviews with 64 participants ranging in age from 53 to 92. I examined the connections between spirituality and resilience, mining for the interpretative essence of spiritual experiences as they related to resilience. Using in-depth interviews, I explored the interplay between spirituality and resilience and how spirituality shaped participants' experiences with adversity and hardship. Major findings include participants' use of spirituality as a tool to promote and maintain resilience. Spiritual resilience was exhibited within four key domains: relational, rational, resourceful, and reflective. The results are presented as an interpretation of the participants' perceptions of their spirituality, and indicate their reliance on spirituality to overcome hardship. In addition, I discuss the connections between spirituality and resilience and compare the domains of spiritual resilience for spiritual and non-spiritual participants.

RELIGION, AGING, AND THE REVALUATION OF RISK: PROGRAMMATIC OPPORTUNITIES AND ANALYTICAL IMPLICATIONS

P.H. Van Ness, *Internal Medicine/ Geriatrics, Yale University School of Medicine, New Haven, Connecticut*

Religion and spirituality are resources that many older adults draw upon to prevent and cope with illness. By understanding how these resources promote physical and mental well-being in some circumstances, healthcare providers and public health officials can sometimes enlist religion and spirituality as aids in their salutary efforts. The objective of this presentation is to advocate a conception of one religion/ health relationship that is especially instructive for healthcare providers and public health workers. Briefly stated, membership in a religious community, including adoption of its characteristic beliefs and practices, frequently involves an approach to risk in which individuals engage in behaviors (e.g., monogamous marriage) that reduce risks for many poor health outcomes; they also engage in other behaviors (e.g., volunteering) that, while possibly involving some increased risks, promote individually and socially constructive ends. As regards many health outcomes, therefore, religiousness often involves a revaluation of risk. Epidemiologic and philosophical evidence will be offered to support this thesis. The presentation will conclude with programmatic reflections on the opportunities that this revaluation of risk offers to persons attending to the health needs of older adults, and with analytical comments about how epidemiologists should represent and communicate risk in studies about religion and health addressed to healthcare providers and the broader public.

SESSION 345 (PAPER)

SERVICES AND PROGRAM USE

VARIATION IN USE OF THE EVIDENCE-BASED "BRI CARE CONSULTATION" PROGRAM

J.H. Rentsch[1], D.M. Bass[1], B. Primetica[1], C. Holloway[2], L. Easom[2], *1. Benjamin Rose Institute on Aging, Cleveland, Ohio, 2. Rosalynn Carter Institute for Caregiving, Americus, Georgia*

BRI Care Consultation, an evidence-based program for persons with health challenges and their caregivers, is delivered by telephone and computer, following a standardized protocol for intervention fidelity. The protocol allows for some tailoring to match enrollee preferences and needs. For example, variation is permitted in the number of "action steps" to address problems and amount of direct and indirect time spent with each care receiver and caregiver. This investigation describes variation in program use among 326 caregivers of persons with dementia who participated in the Georgia BRI Care Consultation replication funded by AoA. It also identifies characteristics of caregivers and care receivers that explain variation in use. Data abstracted from the Care Consultation Information System showed important variation in time spent with each case, number and successful completion of action steps, and number of required contacts completed. Data from structured pre-post caregiver interviews showed variation in use was associated with caregiver and care receiver need and support. Caregivers reporting more health strain and unmet need at enrollment spent more time with Care Consultants, had more and successfully accomplished more action steps, and had more of the required contacts. Caregivers assisting more cognitively impaired care receivers had more and successfully completed more action steps. Caregivers with better informal supports spent more time with Care Consultants and successfully completed more action steps. Results further understandings about characteristics of families that embraced and benefited from the program, as well as how program resources can most efficiently be used in future implementations.

DEVELOPMENT AND VALIDATION OF A HIGH COST NEED-BASED INDEX FOR WAIVER CLIENT COST PREDICTION

K. Oberst, H. An, C.W. Given, *College of Human Medicine, Michigan State University, East Lansing, Michigan*

Home and Community based waiver programs (1915c's) provide services to keep individuals out of institutions. Reimbursement mechanisms are changing from fee-for-service to capitated arrangements prompting interest in development of risk based indices. Our underlying assumptions were client need for service would determine costs, and waiver service delivery would be uniform among providers. We classified clients into high or low cost groups based on average monthly cost using 2011 paid claims. A logistic regression was performed with five covariates (age category, history of long term care residence, toilet transfer, medication management, and bathing functional capacities) to model cost group. All covariates were significant and the model showed 76% accuracy. The results indicated that younger or dependent clients tended to be in the high cost group. Also, clients with a history of long term care stays tended to be in the high cost group. Using the logistic model, the expected probabilities of being in the high cost group were used as an index of service need. Based on the index of service need, the total cost per month for statewide was predicted. The bias between predicted total cost and observed total cost was less than 1%. The bootstrapping method also showed that there is no significant difference between observed and estimated total cost per month (p=0.05). This information could support implementation and refinement of funding for capitated waiver programs.

INFRASTRUCTURE AND INNOVATION IN THE AGING NETWORK: DOES SIZE MATTER?

S. Kunkel[1,2], H. Reece[2], J. Straker[2], *1. Miami University, Oxford, Ohio, 2. Scripps Gerontology Center, Oxford, Ohio*

As the aging network paves new inroads in the health and long-term care systems in the U.S., organizational infrastructure can be a help or a hindrance in responding to new opportunities. The organizational studies literature suggests that size is positively correlated with innovation, but that this relationship is mediated by other factors such as non-profit status and organizational complexity. Such propositions have not been tested in the diverse and rapidly evolving world of aging services. Using data from a 2010 national survey of all area agencies on aging (AAAs), this paper explores the ways in which organization size and structure correlate with involvement in innovative programs. The 618 AAAs in the aging network vary considerably on size of budget and staff, organizational structure, and in uptake of the opportunities for involvement in innovations such as Medicaid managed care, integrated care, and care transitions. The largest AAAs (top two quintiles based on a budget and staff size index) are more likely than smaller AAAs to be non-profit organizations rather than part of county or regional government. The largest AAAs are also significantly more likely than smaller AAAs to: serve diverse target populations, including veterans and younger people with disabilities; be involved in Medicaid managed care; provide formal care transition programs; have more volunteers; and have more formal partnerships with other organizations. There is no size difference among AAAs in planning and operational functions such as strategic planning, tracking consumer outcomes, and developing strategies for financial sustainability.

SENIOR'S SEGMENTATION OF SENIOR CENTER USING PREFERENCE PROGRAMS IN KOREA

J. Kim, J.I. Wassel, *UNCG, Greensboro, North Carolina*

This study conducted in four South Korean senior centers evaluated viable materials for the development of leisure programs for senior welfare centers for the betterment of older adults' quality of living and active aging. Critical to continued participation by seniors in programs is determining their interest and preference of both existing programs and in new programming, together with their likelihood of participation in the programs. South Korea's pivotal position as an Ultra aging society poses numerous policy challenges including encouraging seniors to remain as healthy, engaged, self-reliant and robust for as long as possible. Currently, Korean seniors face continued stereotypes of aging and ageism perpetuated by others and importantly by themselves. This research examined program interest and preference of older Koreans participating in Senior Centers in South Korea. To conduct this study, image-based poster and 7 virtual image cards were created. A total of 406 people were surveyed at Senior Centers and their valid responses of the subjects were analyzed through SPSS 18.0. A conjoint analysis yielded relative importance of each factor and then a perceptual map was acquired through a multidimensional scaling with the Part-worth estimate. Significant differences in program use were found for those with higher education, by sex, and by length of participation at the center; no significant differences were found by age of participant. Recommendations for senior centers increase participation suggest the need to target segmented groups and specific programs.

ADDRESSING THE PERSONAL HEALTH INFORMATION MANAGEMENT NEEDS OF OLDER ADULTS: THE SOARING PROJECT

A.M. Turner[1,2], K. Osterhage[1], A.L. Hartzler[3], T. Beeson[1], S.M. Thielke[4,5], E.A. Phelan[6,1,7], G. Demiris[8], *1. University of Washington - Department of Health Services, Seattle, Washington, 2. University of Washington - Department of Biomedical Informatics and Medical Education, Seattle, Washington, 3. University of Washington - The Information School, Seattle, Washington, 4. University of Washington - Department of Psychiatry and Behavioral Sciences, Seattle, Washington, 5. Geriatric Research, Education, and Clinical Center, Puget Sound VA Medical Center, Seattle, Washington, 6. University of Washington - Medicine/Gerontology and Geriatric Medicine, Seattle, Washington, 7. Group Health Research Institute, Seattle, Washington, 8. University of Washington - Biobehavioral Nursing and Health Services, Seattle, Washington*

Despite the growing emphasis of personal responsibility for individual health management, older adults may not be equipped to manage their health information effectively. Personal health information management (PHIM) technologies for older adults exist, but studies indicate that few older adults use these technologies. Some of the reported barriers are poor health literacy, poor computer skills, and physical and cognitive disabilities. Designing PHIM systems for older adults that are both useful and effective requires a deeper and more organized understanding of their PHIM needs and practices. This presentation describes our new research project, SOARING (Studying Older Adults and Researching Information Needs and Goals) funded by the Agency for Healthcare Research & Quality. We will provide preliminary results on a mixed method study to investigate the PHIM goals, activities and practices of older adults in a variety of living environments. Using the Balance Model, we will present findings from focus groups and interviews conducted with older adults living in a variety of residential settings in the Seattle metropolitan area. Subsequent phases of the study will examine the roles of key stakeholders (including spouses, children, other relatives, friends, and health care providers) in the management of older adults' health information. The project will ultimately lead to a set of evidence-based design guidelines for the future development of PHIM technologies to support older adults, their families, and other caregivers.

SESSION 350 (PAPER)

TECHNOLOGY AND AGING II

MOTIVATING FACTORS IN ADOPTION OF E-HEALTH AMONG OLDER ADULTS

Y. Yeo, *St. Cloud State University, St. Cloud, Minnesota*

In 2009, the Health Information Technology for Economic and Clinical Health Act was implemented to improve the U.S. health care delivery and patient care through health information technology—computerized systems. Adoption of e-health has become important for both healthcare system and health consumers. However, older adults lag far behind younger adults in adoption of e-health. The effects of motivation have been widely tested in older adults achieving health-related goals, but few examined its effects on older adults' e-health adoption. Guided by cognitive evaluation theory, this study hypothesized the following extrinsic and intrinsic motivators are positively associated with Internet use and e-health adoption: extrinsic motivation exercised through patient-doctor communications regarding e-health and intrinsic motivation towards maintaining good health (i.e., health-awareness behaviors; positive attitudes towards e-health information; positive attitudes towards electronic health records [EHRs]; competence in caring for one's health; competence in finding health information). This study analyzed data on adults aged 65 or older (N=1,962) from the Health Information Trends Survey collected in 2008 by employing multivariate logistic regression. This study found that health-awareness behaviors and positive attitudes towards EHRs had significant relationships with Internet use. However, the health-awareness behaviors were not related with e-health adoption. Rather, participation in patient-doctor communication about e-health information and positive attitudes towards EHRs had positive relationship with e-health adoption. For older adults' e-health adoption, this study highlights the significance of doctors' communication with them regarding e-health and collective efforts of policy and health care professionals to help older adults to hold positive attitudes towards EHRs.

WEB USABILITY STUDY OF 50 OLDER ADULTS AND THE CHARACTERISTICS OF THE COGNITIVE IMPAIRED

M. Haesner, A. Steinert, J. O`Sullivan, E. Steinhagen-Thiessen, *Geriatrics Research Group, Charité, Berlin, Germany*

Background: Current research demonstrates that the use of everyday technology differs between people with and without mild cognitive impairment (Malinowsky et al. 2010), but there is still a lack of knowledge about the usage of specific modern technologies, such as web site usage. Methods: In this pilot study 50 older adults aged over 60 took part (25 with and 25 without cognitive impairment). After a screening, several clinical tests assessing fine motor skills and cognition were conducted. The participants were randomized and asked to perform six tasks both on tablet computer and PC. For each task, task duration and task success (error rate) were documented manually by an observing study assistant using a standardized protocol. Results: The seniors with cognitive impairment made more mistakes and more time when using the web platform. Both groups showed significant improvements between the 1st and 2nd session both in success rate and time needed. Conclusion: The present study shows an effect of declined cognitive capacities on web performance. There is a growing interest in technology-based interventions that may potentially delay or reverse cognitive decline in seniors suffering from mild cognitive impairment. Therefore, understanding more about specific abilities and barriers of persons with MCI, is a highly interesting field in usability research.

THE DIVIDE THAT OLDER PEOPLE MAKE: AGE, DIGITAL TECHNOLOGIES AND MEANING AMONG OLDER INTERNET USERS

M. Kania-Lundholm, S. Torres, *Sociology, Uppsala University, Uppsala, Sweden*

This paper builds on an on-going project that aims to contribute to the scholarly debate on the "digital divide" by bringing to fore the complexities of older people's understandings and usage of digital technologies. Most scholarly debates on age and digital technologies, both within social gerontology and media and communication studies, depart from the idea that the "digital divide" pertains mostly to the lack of access and/or skills to use the internet. From this point of view, older people are described not only as a particularly vulnerable group but also as a homogeneous group prone to exclusion. As such, they are believed to be at risk of ending up on the "disconnected" side of the divide. Although research into older people's Internet usage patterns is rapidly growing, their understandings of digital technologies, particularly in relation to how these are informed by their understandings of aging and old age, remain unexplored. This paper is based on the analysis of focus group interviews with 30 older adults (65+) who are active Internet users. In this presentation we focus on the relationship between patterns of the everyday Internet usage and how this usage relates to the informants' understandings of aging and old age. The analysis suggests that the debate on the digital divide fails to address the divide that older people themselves create as they discursively position themselves against non-users when describing when, how and why they engage with digital technologies.

IMPROVING OLDER ADULTS' EHEALTH LITERACY: WHAT GROUP COMPOSITIONS WORK WITH COLLABORATION LEARNING

I. Watkins[1], B. Xie[2,1], J. Gao[1], D. Piper[2], *1. School of Information, University of Texas at Austin, Austin, Texas, 2. School of Nursing, The University of Texas at Austin, Austin, Texas*

Collaborative learning can improve older adults' eHealth literacy, but the interaction between group composition (e.g., based on culture, computer experience) and learning remains unclear. This paper explores this relationship, using qualitative data from the collaborative learning condition of the NIH-funded, four-week long, Electronic Health Information for Lifelong Learners (eHiLL) intervention study. The data reported here are from: 1) observation, open-ended survey questions, and semi-structured interviews with 224 participants ($M = 69.39$; $SD = 7.13$); and 2) written reports from eight eHiLL intervention facilitators that recorded observations for each session (696 total reports). These data were collected between April 2012 and February 2014 at public libraries and senior-living facilities and centers in Austin, Texas and Hyattsville and New Carrollton, Maryland. We analyzed data using a grounded theory approach that applied a constant comparative method and identified themes. First, cultural differences could inhibit collaboration. For example, a Welsh participant who hesitated to collaborate explained her culture emphasized reticence. Second, gender affected collaboration, with female only groups perceived as more communicative than mixed gender or male only groups. Third, collaboration increased when an experienced participant emerged as group leader and guided inexperienced partners. Finally, participants preferred working in pairs to threesomes, especially if participants' experience level varied. Participants found adjusting the tutorial's pace difficult with three participants with different levels of computer experience. These findings will help us interpret quantitative data from the eHiLL study (reported elsewhere), and have important implications to future research on developing effective eHealth literacy interventions for older adults.

DIGITAL GAMES AS A LIFE COURSE EXTENSION OF PLAY IN OLD AGE

J.A. Brown, *Univ of Kentucky, Lexington, Kentucky*

Although the proportion of aging persons who play digital games has increased in recent years, there is a dearth of research that examines its significance as a source of play in old age. This study investigated how senior digital gaming reflects a life course-related extension of the phenomenon of play in old age. Senior gamers age 40 and above were individually interviewed using grounded theory methodology. A semi-structured interview guide was used to explore how each participant engaged in play (non-digital and digital) during childhood (up to age 19), young adulthood (age 20 to 39), middle adulthood (age 40 to 59) and older adulthood (age 60 and above) as a means to establish individual play histories and identify themes. Forty senior gamers participated (25 females) and ranged from age 44 to age 77. Analysis of the coded interview transcripts indicated that as participants aged, their means of play became less physical and more sedentary. In addition, play preferences established during childhood years (e.g. card games, puzzles, story-based games) reemerged in later years and are reflected in their current choice of digital games. Younger cohort participants (those aged 40 to 59 and all have played digital games since their younger adulthood years) expressed increasing reliance upon digital games as a form of play as they approach old age. These themes create a theoretical framework for understanding how digital games serve as a valuable form of play in old age, with particular insight for the future generations of senior gamers.

SESSION 355 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: SENSORY AND MOTOR PERIPHERAL NERVE DECLINES IN OLDER ADULTS IMPACT FUNCTION AND HEALTH OUTCOMES

Chair: E.S. Strotmeyer, *Epidemiology, University of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania*
Discussant: J. Guralnik, *University of Maryland School of Medicine, Baltimore, Maryland*

Age-related sensory and motor peripheral nerve declines are prevalent and contribute to a higher risk of falls and disability. These declines are associated with mortality in diabetes, but have not been previously related to mortality in the general population. In older adults with sensorimotor decline, the intermediate mediators of and potential secondary prevention of geriatric outcomes have been neglected. The Health, Aging and Body Composition (Health ABC) Study enrolled 3075 well-functioning, ambulatory adults, aged 70-79 years (52% women, 42% black) in Pittsburgh, PA and Memphis, TN, in 1997-98, with 6-month contacts through the present. Annual exams were conducted through 2000-01 (year of nerve measures) and biennially through 2006-07. The Study of Osteoporotic Fractures in Men (MrOS), an ongoing cohort of ambulatory men (N = 5994) aged ≥65 years at six U.S. sites, had a nerve function ancillary exam in Pittsburgh, PA, 2.3±0.3 years after 2000-02 enrollment. These studies measured peroneal motor nerve conduction, sural nerve conduction (MrOS), vibration threshold (Health ABC), and 10-g/1.4-g monofilaments. The relationship of sensorimotor nerve function to mortality (Strotmeyer), obesity (Dam), and 400-m walk performance (Lange-Maia) will be described. Neural activation deficits assessed in the Healthy Ageing Network of Competences (HANC; Caserotti) will be related to muscle function and physical performance in mobility-limited participants (aged >70 years; 55% women). Multifactorial interventions to improve balance and function in diabetic neuropathy will be outlined (Vinik). The discussant (Guralnik) will critically review the existing work, focusing on future directions to prevent age-related nerve decline and its resulting geriatric outcomes.

WORSE SENSORIMOTOR NERVE FUNCTION IS ASSOCIATED WITH HIGHER TOTAL MORTALITY RISK

E.S. Strotmeyer[1], R.M. Boudreau[1], J.A. Cauley[1], P. Caserotti[2], A.I. Vinik[3], S.B. Kritchevsky[4], T.B. Harris[5], A.B. Newman[1], *1. Epidemiology, University of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania, 2. University of Southern Denmark, Odense, Denmark, 3. Eastern Virginia Medical School, Norfolk, Virginia, 4. Wake Forest University, Winston-Salem, North Carolina, 5. National Institute on Aging, Laboratory of Epidemiology and Population Science, Bethesda, Maryland*

Older adults experience substantial sensorimotor nerve declines, which are associated with higher mortality in diabetes, but not considered a risk for mortality in the general population. Sensory and motor nerve function in 2241 Health ABC Study participants (51% women, 37% black; aged 76.6±2.9 years; 22% diabetes) and total mortality (N=1171/2241, 8.2±2.8 years follow-up) were examined. Monofilament detection (1.4-g/10-g), vibration threshold, peroneal motor nerve conduction velocity and amplitude were assessed in 2000-01. Separate Cox regression models found lower amplitude per SD, higher vibration threshold per SD, and lack of 10-g monofilament detection were associated with increased mortality: HR=1.14 (95%CI=1.06-1.24), 1.14 (95%CI=1.06-1.22), and 1.32 (95%CI=1.07-1.62) respectively, adjusting for demographic, body composition, heart rate, lifestyle and comorbidity factors. Sensitivity analyses were consistent stratifying diabetic (≥7% vs. <7% hemoglobin A1C) and non-diabetic (≥100 vs. <100 mg/dl fasting glucose) groups by glycemia. Sensorimotor nerve decline, independent of diabetes/glucose control and comorbidities, was associated with mortality.

PERIPHERAL NERVE FUNCTION AND OBESITY IN OLDER MEN

T.L. Dam[1], N. Parimi[2], E.S. Strotmeyer[3], R. Ward[4], K.A. Faulkner[3], S. Zivkovic[3], J.A. Cauley[3], R. Miller[1], *1. Columbia University, New York, New York, 2. California Pacific Medical Center, San Francisco, California, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, 4. Spaulding Rehabilitation Hospital, Boston University, Boston, Massachusetts*

Prevalence of peripheral neuropathy and obesity increases with age, though the association is unknown. Osteoporotic Fractures in Men Study participants (N=606, age 77+5 years, 19% diabetes) with monofilament (1.4g/10g) and automated leg nerve conduction testing and two measures of body mass index (BMI), weight, and total body fat (TBF) by DXA, obtained 2 years apart, were studied. After adjustment for age, race, diabetes, lean mass, cataracts/glaucoma, comorbidity, medications, exercise, and health status, lower motor nerve amplitude, higher sensory and motor nerve latencies were associated with higher BMI (β=0.12kg, 0.63kg, and 0.82kg per standard-deviation, respectively; p<.05 for all). Men with 10-g monofilament insensitivity had significantly higher BMI (β=0.43); poorer motor nerve amplitude and sensory latency had higher weight and TBF. However, no association existed between peripheral nerve function and longitudinal changes in these parameters. Obesity should be further investigated as a risk factor for poorer sensory and motor nerve function.

SENSORIMOTOR PERIPHERAL NERVE FUNCTIONING AND THE LONGITUDINAL RELATIONSHIP WITH ENDURANCE WALKING IN THE HEALTH, AGING AND BODY COMPOSITION STUDY

B. Lange-Maia[1], A.B. Newman[1], P. Caserotti[2], N.W. Glynn[1], T. Harris[3], S.B. Kritchevsky[4], E.M. Simonsick[5], E.S. Strotmeyer[1], *1. Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. University of Southern Denmark, Odense, Denmark, 3. National Institute on Aging, Bethesda, Maryland, 4. Wake Forest University, Winston-Salem, North Carolina, 5. National Institute on Aging, Baltimore, Maryland*

Sensorimotor peripheral nerve deficits affect gait and may reduce walking endurance in older adults. Health ABC Study participants (n=1174, age=76.1±2.8, 49% women, 31% black) underwent sensorimotor peripheral nerve exams at Year 4. The long distance corridor walk (LDCW) at Years 4, 6, 8, and 10 assessed walking endurance. In separate fully-adjusted linear mixed models, 1 SD poorer motor amplitude, 1 SD poorer vibration threshold, 1.4g monofilament insensitivity, and 10g monofilament insensitivity were each associated with slower LDCW completion time (4.92, 5.44, 12.16, and 15.95 seconds slower, respectively, $p<0.05$ for each). 1SD poorer vibration threshold and 10-g monofilament insensitivity were related to a greater slowing/year (1.68 and 3.79 additional seconds/year, respectively, $p<0.05$). Poorer peripheral nerve function is related to slower endurance walking and greater slowing over time. Interventions to improve sensorimotor peripheral nerve functioning should be evaluated to help older adults to maintain walking endurance.

NEURAL ACTIVATION DEFICIT RELATED TO MUSCLE FUNCTION AND PHYSICAL PERFORMANCE

P. Caserotti[1], E.S. Strotmeyer[2], E. Boyle[1], M. Skjødt[1], L.G. Hvid[1], *1. Department of Sports Science and Clinical Biomechanics, University of Southern Denamrk, Odense, Denmark, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

Neural activation deficit (NAD) may play a key role in the pathway of muscle function and physical performance impairments, though most research focuses on muscle mass or force. Muscle function (Isometric knee extension strength (MVC) and explosive force (RFD), KinCom) and physical function (SPPB: 3m usual gait, balance, timed chair rises) were evaluated in participants from the Healthy Ageing Network of Competences (HANC; 82.5±4.8 years, 55% women, current n=24 with recruitment ongoing). NAD was assessed during MVC using twitch interpolation. High and low neural activation deficits were defined as <90% (HNAD, n=17) and >90% (LNAD, n=7), respectively. Significant differences ($P<0.05$) were observed between HNAD and LNAD for MVC (1.38±0.4 vs 1.79±0.3 Nm*kg-1), RFD (3.29±1.6 vs 5.34±2.4 Nm*s-1*kg-1), chair rises (17.7±6.1 vs 10.7±1.9 s) and total SPPB score (7.88±2.0 vs 10.43±1.5). Neural activation deficits are important contributors to muscle function and physical performance and may have critical thresholds.

INTERVENTIONS FOR OLDER ADULTS WITH PERIPHERAL NEUROPATHY (PN)

A. Vinik[1], E. Vinik[1], S. Colberg[2], S. Morrison[2], *1. Eastern Virginia Medical School, Norfolk, Virginia, 2. Old Dominion University, Norfolk, Virginia*

Over 65 years of age, 1/3rd of adults report falling annually. Sensorimotor function declines are a major contributing factor to increased falls. Neuropathy encompasses a range of changes leading to increased falls risk including; visual deficits, sarcopenia, incoordination, weakness, balance deficits, slowing of gait, cognitive impairment, orthostatic hypotension, tachycardia, bradycardia, pain, cardiovascular syncope, and vestibular deficits. Tests included balance (single-leg and dual stance), monofilament/vibration perception, walking speed, strength, and questionnaire responses (QOLDN, fatigue, fracture risk). Prior to training, patients with PN and diabetes reported more previous falls, a higher falls risk, slower reactions, slower gait, weakness of foot dorsiflexion, loss of position sense and altered balance compared to having diabetes alone. Following cognitive/metabolic/strength/balance interventions, participants exhibited significant improvements in hand reaction times (224 to 210 ms, $p<0.01$), increased walking ability (7% increase in velocity, $p<0.01$), greater lower limb strength (6-8% increase in knee extension/flexion strength $p<0.05$), and improved postural dynamics.

SESSION 360 (SYMPOSIUM)

THE FIVE COUNTRY OLDEST OLD PROJECT (5-COOP): RELATIONSHIPS BETWEEN MORTALITY SELECTION AND HEALTH STATUS OF CENTENARIANS

Chair: J. Robine, *U988 / U710, Institut national de la santé et de la recherche médicale (INSERM), Montpellier cedex 5, France, Ecole Pratique des Hautes Etudes (EPHE), Paris, France*
Co-Chair: Y. Saito, *Nihon University, Tokyo, Japan*
Discussant: T.T. Perls, *Boston University, Boston, Massachusetts*

The number of oldest old is increasing dramatically. However, the health status of nonagenarians and centenarians remains controversial: some studies show that they are healthy while others suggest relatively poor health. Few studies have been able to explore how selective mortality and the rate of increase in the oldest old in the population are associated with cognitive and physical status among very old people. The 5-COOP project aims to study these questions by pooling and comparing representative samples of subjects aged 100 years in Denmark, France, Japan (including Okinawa), Sweden and Switzerland. A theoretical sample size of 1250 (5* 250) subjects has been initially set. In a first phase, each sample is analyzed at the country level. In a second phase comparison among countries will be performed by merging the 5 standardized data sets. 5-COOP will increase our knowledge about the age trajectory of several functional and geriatric conditions (mobility, difficulty in activities of daily living, cognitive disorders) and about the relationships between longevity and health (i.e., risk of dependence as well as medical and social needs). This understanding of mortality selection and health status will help us to plan care resources and make better population forecasts.

MORTALITY LEVEL AND NUMBER OF CENTENARIANS: DEMOGRAPHIC CONTRASTS BETWEEN THE 5 COUNTRIES OF THE 5-COOP PROJECT

J. Robine[1,2], Y. Saito[3], B. Jeune[4], M.G. Parker[5], F.R. Herrmann[6], *1. U988 / U710, Institut national de la santé et de la recherche médicale (INSERM), Montpellier cedex 5, France, 2. Ecole Pratique des Hautes Etudes (EPHE), Paris, France, 3. Nihon University, Tokyo, Japan, 4. Danish Aging Research Center, University of Southern Denmark, Odense, Denmark, 5. Aging Research Center, Karolinska Institute, Stockholm University, Stockholm, Sweden, 6. Department of Rehabilitation and Geriatrics, Geneva University Hospitals and University of Geneva, Geneva, Switzerland*

This paper will describe the current demographic trends in the five participating countries (Denmark, Japan, France, Sweden and Switzerland) using six indicators: life expectancy at age 65 (LE65), modal age at death (M), life expectancy at modal age (LEM), probability of death at age 100 (q100), probability of surviving to age 100 (l100) and centenarian rates (CR70). Three demographic contexts were identified: (1) France and Switzerland where the number of centenarians has roughly doubled every decade since the 1970s, (2) Denmark and Sweden where the increase has been much slower and (3) Japan where the increase has been much faster, being multiplied by 3 or 4 every decade. One of the objectives of 5-COOP is to study these demographic trends in relation to the functional health status of people who reach the age of 100 years in the five countries.

THE SWEDISH CENTENARIAN SURVEY

M.G. Parker, B. Meinow, H. Berndt, L. Sundberg, S. Fors, *Aging Research Center, Stockholm, Sweden*

The Swedish Centenarian Survey (SCS) is the first nationally representative survey of centenarians based a random sample of persons born July 1911 - June 1912. Participants were interviewed directly or by proxy (response rate 86%, n=274). Over half of the sample lived in some form of institution. Among those living at home, the majority needed help with shopping, cleaning or preparing food. One fourth of the sample reported having two or more chronic health conditions. Commonly reported symptoms included joint pain (64%), dizziness (44%) and sleeping problems (20%). A third of the sample could bathe without help, and a majority managed to dress and go to the toilet without help. Preliminary analysis suggests that about half the sample have impaired cognition. Gender differences varied by health indicator although men showed better health in general and were significantly better in activities of daily living.

COMPARING TWO CONSECUTIVE SURVEYS OF DANISH CENTENARIANS USING DIFFERENT METHODOLOGIES

K. Andersen-Ranberg, K. Christensen, B. Jeune, S. Vestergaard, *Institute of Public Health, University of Southern Denmark, Odense, Denmark*

We compared two Danish surveys on the 1910 (DK-1910) and 1911-12 (DK-1911) birth cohorts at age 100. We used the same questionnaire at face-to-face interviews, including proxy interviews. The DK-1910 used trained survey agency interviewers and the DK-1911 trained nurses. Participation rate was lower in DK-1911 compared to DK-1910 (49% vs. 62%), but more interviews were carried out with the participant alone (77% vs. 56%), suggesting a selection bias in DK-1911. In fact, comparing DK-1911 to DK-1910, we found higher proportions of independently performing cohort members in all ADL tasks, and higher mean MMSE score (22.4 vs 21.0; $p<0.05$), but handgrip strength and gait speed were similar. Restricting analyses to those interviewed alone attenuated the cohort differences, but remained significant for toileting and for mean MMSE score. Ex-ante harmonization of survey methodologies is highly important in order to compare functions in centenarians.

5-COOP DATABASE AND FUTURE COMMON ANALYSES

F. Herrmann[1], D. Zekry[1], Y. Saito[2], B. Jeune[3], M.G. Parker[4], J. Robine[5], *1. internal medicine, rehabilitation and geriatrics, Geneva University Hospitals, Thonex, Switzerland, 2. Nihon University Advanced Research Institute for the Sciences and Humanities, Tokyo, Japan, 3. Danish Aging Research Center, University of Southern Denmark, Odense, Denmark, 4. Aging Research Center, Karolinska Institute, Stockholm University, Stockholm, Sweden, 5. INSERM/EPHE, Paris & Montpellier, France*

A theoretical sample size of 1250 subjects has been initially set, allowing the simultaneous analysis of up to 125 variables in multiple regression models, which will be weighted according to the survey sampling scheme. In countries or areas with national list of centenarians a random sample has been drawn taking into account mortality. For the others countries, a cluster sampling scheme was used. The original questionnaire was designed in English including standardized instruments with a unique numbering scheme of variables and then translated in each local languages. Comparison among countries will be performed after merging the 5 standardized data sets with usual statistics (chi square, Kruskal-Wallis non parametric and regular ANOVA and multiple regression). The first elements to be compared are the missing rates, the reason data could not be collected and the prevalence of geriatric conditions, including dementia and cognitive disorders.

SESSION 365 (SYMPOSIUM)

NOVEL MODALITIES OF CARE FOR OLDER ADULTS IN RURAL AREAS: NON FACE-TO-FACE ALTERNATIVES

Chair: W.W. Hung, *Geriatrics, Mount Sinai School of Medicine, New York, New York, James J Peters VA Medical Center, Bronx, New York*

Co-Chair: J.L. Howe, *Geriatrics, Mount Sinai School of Medicine, New York, New York*

Older adults living in rural areas have limited access to geriatric teams for their healthcare needs. Providers with training in geriatric medicine often practice in urban areas rather than rural areas, thus further limiting rural older adults' access to quality geriatric care. As a consequence of this disparity, older adults in rural areas have more functional limitations and have worse reported health. Recent technological advances in information technology and networking have allowed for the development of a number of modalities to bridge these care gaps and for geriatric teams located in urban centers to extend their expertise to the care of older adults in rural areas. In this symposium, we highlight clinical and educational interventions that have been implemented with the goal of improving care to older adults at a distance as an alternative to traditional face to face encounters. Presenters will review established programs, evidence on the acceptability and use by older adults and their rural providers, and perceived barriers to implementation. The potential of broader application of these modalities will also be discussed.

TELEGROUP VISITS FOR DEMENTIA

S.M. Thielke, L.Y. Wang, *Puget Sound VA Medical Center, Seattle, Washington*

We describe our experiences with using telemedicine for group visits for Veterans with dementia and their caregivers. Once a month, 4-6 caregiver-Veteran dyads come together in a conference room with a large television screen, and interface with a geriatric psychiatrist and social worker, who are 60 miles away. A geriatric registered nurse coordinates and provides local support. The physician and social worker inquire about dementia-related concerns with each patient and caregiver. Areas of focus include medication reviews, screening for health changes, and safety assessment. Caregiver stress is addressed. Productive discussion among caregivers happens spontaneously. The system has worked without technical difficulties, and people are able to communicate adequately. Participants have been very satisfied overall. They have highlighted the ease of access to specialists, peer-to-peer support, education, better access to other services, convenience, and decreased travel time. We plan to expand and further evaluate this model.

AN INTERDISCIPLINARY TEAM APPROACH IN GERIATRIC TELE-MEDICINE AT THE WILLIAM S MIDDLETON VETERANS AFFAIR HOSPITAL IN MADISON, WI

S. Barczi, L.L. Welch, T. Howell, *GRECC, William S Middleton VA, Madison, Wisconsin*

The Madison VA's (MVA) GRECC Connect program is an innovative, interdisciplinary team model created to improve access to Geriatrics consultation for rural patients with complex, interacting medical and psychosocial problems. This model is designed to assist rural primary care providers in caring for vulnerable older adults less able to travel to the main VA facility. The team conducts a sophisticated triage process on a weekly basis to provide indirect care through e-consults and tele-huddles, creating comprehensive recommendations to assist the primary care team. Its members also provide some direct care via telemedicine in select cases, as well as proactive co-management of the rural providers' patient panels through strategic risk appraisal assessments. Outcomes tracked include recommendations implemented and decreased travel cost and distance for the patient. Provider and patient satisfaction surveys also support the value of the program.

TELEDEMENTIA CLINIC: CLINICAL VIDEO TELEHEALTH TO DIAGNOSE & SUPPORT RURAL VETERANS WITH DEMENTIA

M.I. Rossi[1,2], B. Brott Powers[1], N. Edmonds[1], C. Dolbee[1], J. Hennon[1,2], M.C. Homer[1], *1. GRECC, VA Pittsburgh Healthcare System, Pittsburgh, Pennsylvania, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

Access to specialty care for dementia is often limited to urban centers. Unfortunately traveling long distances to these urban centers can be difficult for rural patients with dementia and add additional stress to already burdened caregivers. The Teledementia clinic was developed at the Pittsburgh VA in May 2013 to address these issues. An interdisciplinary team of clinicians including geriatrician, geriatric psychiatrist, psychologist, and social worker are able to diagnose dementia, monitor on-going cognitive decline, manage behavioral issues, and provide assistance and support to caregivers during the course of the illness. In its first 7 months, the clinic saw 61 patients in 115 visits. Patients saved a total of 7593 miles of travel and $1581 in fuel costs. Driving time saved was an average of 67 minutes per visit. The clinic was well received by patients and caregivers with high satisfaction levels. Challenges and on-going clinic development will be discussed.

CASE-BASED TELECONFERENCE MODEL FOR GERIATRICS CONSULTATION AND EDUCATION: OUTREACH TO RURAL PRIMARY CARE PROVIDERS

T.V. Caprio[1,2], W.W. Hung[3,4], J.L. Howe[3,4], D. Sun[3], J. Deering[3], G. Kochersberger[2,1], S. Fell[2], *1. Medicine/Geriatrics & Aging, University of Rochester, Rochester, New York, 2. Canandaigua VA Medical Center, Canandaigua, New York, 3. James J Peters VA Medical Center, Bronx, New York, 4. Mount Sinai School of Medicine, New York, New York*

An educational intervention using the case based approach was developed which leverages telehealth technology and shared expertise in outreach to rural primary care providers within the VA healthcare system. The format, adapted from the ECHO (Extension for Community Healthcare Outcomes) program, consists of a clinical case presentation majority by rural providers, didactic teaching session with clinical consultant experts, and live question and answer period conducted with participants The focus of the session is on challenging clinical cases, common problems (e.g. driving concerns), or geriatric syndromes. Discussions were conducted using multisite video conferencing with conference call telephone system as backup. A total of 23 sessions were conducted among an average of 12.6 (SD3.7) rural providers in 4.6 (SD1.3) remote sites per session. Preliminary evaluation results indicate that 79% and 57% of providers reported improved skills and knowledge respectively. These results demonstrate the feasibility and potential impact of this educational modality.

SESSION 370 (SYMPOSIUM)

VA GRECC SYMPOSIUM: TAKING NOVEL APPROACHES TO VETERAN-DRIVEN CARE ON A ROAD TEST: CLINICAL DEMONSTRATION PROJECTS IN THE DEPARTMENT OF VETERANS AFFAIRS

Chair: P.R. Padala, *Central Arkansas Veterans Healthcare System, North Little Rock, Arkansas*
Discussant: D.H. Sullivan, *Central Arkansas Veterans Healthcare System, North Little Rock, Arkansas*

This symposium will highlight the effective use of quality improvement initiatives/clinical demonstration projects (CDPs) to embed innovative patient centered processes of care into routine clinical practice within the Department of Veterans Affairs. The CDPs that will be discussed were developed as a part of the VHA New Models of Care (NMOC) sub-initiative, Patient-Centered Alternatives to Institutional Extended Care. Following a quick overview of quality improvement methodology by the session chair, individual sessions will focus on the development and results of five successful patient-centric health promotion projects. Session 1 will focus on development, refinement, and evaluation of an activity promotion clinic. This clinic provides a comprehensive safety screening assessment followed by and motivational counselling that is focused on helping participating veterans adapt and adhere to an individualized walking prescription; follow-up phone and office visits help to maintain motivation and program adherence. This session will discuss the hurdles to full implementation of this clinic and the multi-step processes utilized by the CDP team to overcome these obstacles. This will include discussion of how the screening tools were developed and refined, the equipment was tested and chosen, and operational efficiency and effectiveness was assessed. Session 2 will describe a pharmacy-based transitional care intervention for high risk older veterans transitioning from hospital home. Discussion will include the process of developing the eligibility criteria for the intervention, and what proportion of older adults admitted to our hospital meet these criteria. Preliminary findings of this intervention on 30-day readmission in older Veterans will be discussed. Session 3 will discuss enhancement of a multi-disciplinary memory clinic to include case management approach. Results of improved process on distal outcomes will be discussed. Session 4 will discuss the role of group visits in fostering discussion of advance care planning. An advantage of group visits, (a group meeting of 6-12 Veterans), is that they have a greater amount of time, usually about 60 - 90 minutes, and allow for Veteran-to-Veteran support for in-depth discussions of this complex topic. This widely successful CDP will highlight evaluating the implementation of advance care planning with groups of Veterans and Veteran satisfaction results. Discussant will put everything in context of current health care needs and highlight the importance of utilizing validated quality improvement methodologies.

ACTIVITY PROMOTION CLINIC FOR OLDER VETERANS: LESSONS LEARNT WHILE IMPLEMENTING THE CLINIC AND HURDLES FACED

K.P. Padala[1,2], P.R. Padala[1,2], S.E. Espinoza[3], D. Kellogg[3], D.H. Sullivan[1,2], *1. GRECC, Central Arkansas Veterans Healthcare System, North Little Rock, Arkansas, 2. University of Arkansas for Medical Sciences, Little Rock, Arkansas, 3. South Texas Veterans Healthcare System, San Antonio, Arkansas*

Background: Inactivity and increased sedentary time are major public health problems particularly in elderly veterans. Sedentary behavior foments deleterious effects on physical and mental health, quality of life, and increased health care costs. Methods: We developed an Activity Promotion (Walking) Clinic at VISN 16 and 17 GRECCs to provide Veterans personalized, proactive, and patient driven health care, emphasizing prevention and population health. Results: A comprehensive screening tool was developed. We established the feasibility of delivering reminders and motivating messages using an automated calling system. Discussion will focus on development, refinement, and evaluation of the clinic including hurdles faced, and the multi-step processes utilized to overcome these obstacles. This will also include discussion of how the screening tools were developed and refined, and the equipment was tested and chosen. Conclusions: Our initial findings suggest that an activity promotion program can feasibly be delivered in an outpatient setting.

A PHARMACY-BASED TRANSITIONAL CARE INTERVENTION FOR HIGH-RISK OLDER VETERANS TRANSITIONING FROM HOSPITAL TO HOME

S.E. Espinoza[1,2], R. Rottman-Sagebiel[1,2], D. MacCarthy[1,2], M. Moris[1,2], E. Gonzalez[1,2], A. Conde[1,2], C. Wang[1,2], *1. Geriatrics Research, Education, & Clinical Center (GRECC), San Antonio, Texas, 2. Medicine, Division of Geriatrics and Gerontology, University of Texas Health Science Center at San Antonio, San Antonio, Texas*

Background: We developed a pharmacy-based intervention to reduce hospital readmissions in high-risk older adults. Methods: Our intervention includes an inpatient face-to-face visit by a clinical pharmacy specialist and telephone contact approximately 3 days post-discharge to perform medication reconciliation. Inclusion criteria were developed based on prior evidence and experience, and included outpatient polypharmacy, inappropriate medication usage, and hospitalization in the prior year. Rates of eligibility among older adults admitted to Medicine inpatient units and 30-day readmission rates were monitored. Results: 302 (43.7%) of 693 patients ≥65 years admitted to Medicine units during 05/28/2013-09/30/2013 were eligible. Lower readmission rate for the intervention group was observed only in those who had not been hospitalized in the prior year (11.9% vs. 18.8%). Conclusion: Our findings suggest early intervention with a pharmacist-based transitional care program can feasibly be delivered and may be a useful model to reduce 30-day hospital readmissions in high-risk older adults.

PREVENTING INSTITUTIONALIZATION THROUGH SUPPORTING CAREGIVERS THROUGH EXPANDED SERVICES (PISCES)

J.B. Blumenthal[1,2], K.L. Mordecai[1], D. Loreck[1,2], *1. Baltimore VAMC, Baltimore, Maryland, 2. /University of Maryland, Baltimore, Maryland*

Preventing Institutionalization and Supporting Caregivers through Expanded Services (PISCES) targets the most common reasons for hospitalization and nursing home placement in Veterans with Dementia — namely gait dysfunction, balance problems and behavioral disturbances. This novel program enhances already-successful memory clinics by including: i) specialized services for gait/balance assessment and treatment of behavioral problems, ii) focused follow-up and community education, and iii) extension of the case management services with a goal of ensuring the provision of ongoing coordinated care to these patients and their families, while simultaneously also improving quality/satisfaction, and containing costs. Not only are the lessons learned through this novel program potentially "exportable," but by iv) training providers and coordinating/optimizing the care of these disabled, demented older patients, we further magnify the impact of this program and ensure the propagation of its values.

UTILIZING GROUP VISITS TO DISCUSS ADVANCE CARE PLANNING

K.K. Garner[1,2], P.M. Dubbert[1,2], D.H. Sullivan[1,2], *1. Geriatric Research, Education and Clinical Center, Central Arkansas Veterans Healthcare System, North Little Rock, Arkansas, 2. University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Background: Veterans, their family members, and VA health care providers often do not fully appreciate and utilize advance care planning (ACP) to achieve Veterans preferences for end-of-life care. As a consequence, the care Veterans receive at the end of their life may be different from what they may want to receive. Purpose: Incorporate a novel, group visit approach to discussing ACP utilizing a clinical demonstration project (CDP) mechanism. Methods: Utilized a quality improvement process, Plan-Do-Study-Act, in an iterative, four-stage problem-solving model to improve this important process. Results: We found and addressed numerous challenges in conducting this CDP with our initial 178 Veterans in 17 group visits, namely: utilizing existing group visit infrastructure; recognizing biases and barriers to discussing ACP; and developing sustainable methods. Conclusions: This CDP nurtures the growing attitude that advance care planning is a process and these discussions can be successfully initiated through group visits.

SESSION 375 (SYMPOSIUM)

AGING, ALCOHOL, AND MEDICATION: PROMOTING SAFETY

Chair: F. Zanjani, *BCH, University of Maryland, College Park, Maryland*
Discussant: C.L. Coogle, *Virginia Commonwealth, Richmond, Virginia*

Older adults are a high-risk group for prescription and alcohol interactions largely due to their aging physiology, altered drug metabolism, at least 50% of older adults reporting alcohol consumption, and because they consume prescription drugs at high rates. The majority of older prescription drug users take at least one alcohol-interactive medication, with some taking alcohol-interactive medications and consuming alcohol. Furthermore, prescription overdoses in older adults are commonly associated with alcohol. In combination, alcohol and prescription medication use can seriously lead to exacerbated health problems, serious interactions and poisonings, substance misuse risk, and increased health costs for older adults. In an effort to reduce hazardous alcohol and medication use outcomes this session will discuss pharmacy-level, community-level, state-level, and national-level research efforts. Pharmacy-level efforts explore how pharmacists perceive the alcohol and medication problem, and how they can be involved in educating the public to prevent related hazardous outcomes. Community-level efforts focus on using a modified evidence-based Screening Brief Intervention and Referral to Treatment (SBIRT) with police officers to identify alcohol and medication misuse in the community. Also the National Health and Nutrition Examination Survey (2005-2010) and the 2009 Medicare Current Beneficiary Survey was analyzed to estimate concurrent use of alcohol and CNS-acting medications with implications on better product labeling directed to consumers. Altogether the research will be tied into how the Virginia Alcohol, Aging and Awareness coalition group practices state-level prevention of alcohol and medication interactions in combination with the state department of alcoholic beverage control and state association of beer distributors.

PREVENTING ALCOHOL AND MEDICATION INTERACTIONS: PHARMACIST INTERVIEWS

F. Zanjani[1], R.V. Smith[2], L. Crook[1], R. Clayton[2], N.E. Schoenberg[2], C. Martin[2], *1. BCH, University of Maryland, College Park, Maryland, 2. University of Kentucky, Lexington, Kentucky*

Prescription overdoses in older adults are commonly associated with alcohol. In combination, alcohol and prescription medication use can seriously undermine and exacerbate health problems, lead to serious alcohol/medication interactions, increase substance misuse risk, and increase health costs. This research aims to reduce alcohol and medication interactions (AMI) among rural older adults. Twenty-one qualitative interviews on prescription drug safety with pharmacists and pharmacy technicians were done into two targeted high-risk rural communities. Results indicate that there is a great need for cultural sensitivity when communicating with local residents about alcohol and medication interactions that address community barriers/stigma and the fatality and seriousness of the issue. Participants also indicated the integral role they play in their community's health. Furthermore, the interviews indicated a need for professional education on preventing alcohol and medication interactions in older adults. These data will be used to create, test, and implement effective intervention(s) to prevent AMI.

SBIRT FOR NON-HEALTHCARE PROFESSIONALS

N. Brossoie, *Center for Gerontology, Virginia Tech, Blacksburg, Virginia*

Community professionals providing non-healthcare services (e.g., social workers, police officers, clergy) possess insights into daily community life and are often in the best position to initiate a conversation or brief intervention with persons they suspect of misusing alcohol and/or medications. This study utilized a modification of the evidence-based Screening Brief Intervention and Referral to Treatment (SBIRT) model designed for healthcare providers. Piloted with police officers, the modified SBIRT model included modules on education and awareness, skill building, introspection, and collaborative community response. Training content was sensitive to the mandates, duties, and ethics of law enforcement and incorporated participant perspectives on alcohol use, ageism, social expectations to intervene, and respect for self-determination. Findings suggested future trainings need to address recognizing opportunities to interact with older adults, initiating conversations about substance misuse with an older adult, and identifying opportunities to collaborate with other community professionals to enhance the community's capacity to respond.

CONCURRENT USE OF ALCOHOL AND MEDICATIONS AMONG OLDER ADULTS

P.W. Slattum, M. Mohanty, O. Hassan, *Department of Pharmacotherapy and Outcomes Science, Virginia Commonwealth University, Richmond, Virginia*

Medications have the potential to interact with alcohol resulting in adverse drug events, including falls. The prevalence of concurrent use of alcohol and central nervous system (CNS)-acting medications was evaluated in participants (n=3220) in the National Health and Nutrition Examination Survey (2005-2010). 8.9% of participants reported potential concurrent use of alcohol and CNS-acting medications. The prevalence of at-risk drinking, based on the CARET, was determined in participants in the 2009 Medicare Current Beneficiary Survey. Of 2,293 participants reporting alcohol use, 12.2% were classified as at risk drinkers resulting from the concurrent use of alcohol and medications. Product labeling directed to consumers was evaluated to assess how risk associated with concurrent use of alcohol and medications specifically in older adults is communicated. Concurrent use of alcohol and interacting medications is common among older adults and there are opportunities to improve communication of risk for the older adult population.

SESSION 380 (SYMPOSIUM)

FONDATION IPSEN LONGEVITY PRIZE: AWARD LECTURE BY LUIGI FERRUCCI "CAUSAL PATHWAYS LEADING TO DECLINE IN OLDER PERSONS"

Chair: Y. Christen, *Fondation Ipsen, Boulogne-Billancourt, France*
Co-Chair: G.M. Martin, *Fondation Ipsen, Boulogne-Billancourt, France*

Charis: Yves Christen and George Martin) Introduction: Yves Christen (President of the Fondation Ipsen) Eileen Crimmins (University of Southern California, Los Angeles): Introduction to the Laureate Luigi Ferrucci (NIH, Baltimore): Causal pathways leading to decline in older persons Eileen Crimmins (University of Southern California, Los Angeles): Reaction and Discussion to Luigi Ferruci's lecture

SESSION 385 (PAPER)

CARDIOVASCULAR DISEASE

CARDIOVASCULAR COMORBIDITIES IN LUNG CANCER PATIENTS: TREATMENT-SPECIFIC EFFECTS ON SURVIVAL

J. Kravchenko, M.F. Berry, K.G. Arbeev, I. Akushevich, *Duke University, Durham, North Carolina*

Background. Lung cancer patients aged 65 years and older frequently have cardiovascular diseases (CVDs), but the impact of comorbid CVDs on patients' survival is not well understood. Methods. Impacts of seven CVDs (at baseline and during follow-up) on survival of lung cancer patients were studied for stage- and treatment-specific groups of patients aged 65+ years old in SEER-Medicare database using multivariate analysis controlled by age, TNM stage, and 85 comorbidities representing various systems. Then, 128 combinations of CVDs were investigated to identify how CVDs potentiate each other's effects on patients' survival. Results. 125,657 patients with stage I (27.2%), II (4.6%), IIIa (12.3%), IIIb (19.6%), and IV (36.2%) lung cancer were studied. Most CVDs significantly increased death risk at stages I-IIIb but did not impact survival of stage IV patients. Heart failure and myocardial infarction had highest impacts on survival (HRs up to 1.88, varying by stage and treatment, $p<0.05$). Hyperlipidemia and, less often, arterial hypertension were associated with better survival (HRs up to 0.80, $p<0.05$). Patients with multiple CVDs had significantly increased mortality risk, potentiating each other's impacts, especially when treated with surgery (up to 10 times higher HRs than for sum of each disease effect, $p<0.05$) or chemotherapy+radiotherapy (up to 4 times, $p<0.05$). Conclusion. CVDs affects lung cancer patient survival. These effects vary with stage and treatment and are potentiated when patients have multiple co-existing CVDs. The presence of CVDs should be carefully considered when selecting treatment. Managing CVD comorbidities could improve survival of stage I-IIIb lung cancer patients.

PHYSICIANS' PERCEPTIONS OF RISK STRATIFICATION MODELS IN OLDER ADULTS WITH ACUTE MYOCARDIAL INFARCTION

S.L. Feder[1], D.J. Schulman-Green[1], M. Geda[2], J.A. Dodson[4], M. Tinetti[3,2], T.M. Gill[2], S. Chaudhry[2], *1. Yale University - School of Nursing, New Haven, Connecticut, 2. Yale University - School of Medicine, New Haven, Connecticut, 3. Yale University - School of Public Health, New Haven, Connecticut, 4. Division of Aging, Department of Medicine, Brigham and Women's Hospital, Boston, Massachusetts*

Background: Risk stratification models facilitate acute myocardial infarction (AMI) care by supporting medical decision-making, with higher risk patients receiving more aggressive monitoring and/or earlier treatment. Existing models were derived and validated using data from younger populations, limiting predictive accuracy and relevance in older adults with AMI. Purpose: To describe physician-perceived strengths and weakness of available AMI risk stratification models and ideal risk model components for use in older adults hospitalized with AMI. Methods: This qualitative study was part of an observational study designed to develop and validate risk stratification models for older adults (≥ 75) with AMI. Semi-structured telephone interviews were conducted with cardiologists and hospitalist physicians. Analysis employed the constant comparative method. Results: Physicians (n = 22) completed interviews ranging from 10-30 minutes (mean = 18 minutes). Participants' mean age was 41, with an average of 16 years of medical experience. Existing risk models were seen as well known and clinically useful in general AMI populations. Physicians perceived models as not accounting for geriatric risk factors (e.g., functional status) or predicting outcomes (e.g., health status decline) important for medical decision-making in older adults with AMI. Ideal model components incorporated multidimensional domains including cardiovascular risk factors, social determinants, and functional measures. Operational preferences included rapid completion, multi-device accessibility, and multi-platform integration. Conclusions: Current risk stratification models were perceived as inadequate for use in older adults with AMI. Participants envisioned an ideal risk model as a readily accessible and rapid tool that includes risk factors and outcomes relevant for this population.

GAIT SPEED PREDICTS HOSPITALIZATION IN FUNCTIONALLY INDEPENDENT OLDER ADULTS WITH HEART FAILURE

A. Lo[1], J.P. Donnelly[1], C.J. Brown[2,3,4], *1. Emergency Medicine, UAB, Birmingham, Alabama, 2. VA GRECC Birmingham/Atlanta, Birmingham, Alabama, 3. UAB Div Gerontology/Geriatrics/ Palliative Care, Dept Medicine, Birmingham, Alabama, 4. Comprehensive Center for Healthy Aging at UAB, Birmingham, Alabama*

Background: Heart failure (HF) with 3 million hospitalizations annually is the leading reason for hospitalization in older adults. Reducing HF hospitalizations is a national priority under the Affordable Care Act. To achieve this goal, it is critical to identify older adults with HF who are most at risk for hospitalization. Methods: The Cardiovascular Health Study is a multi-community cohort study. Data on socio-demographic characteristics and clinical variables were collected at enrollment, including gait speed, activities of daily living (ADL) and number of comorbid conditions. Data on hospitalization were collected through annual examinations or contact during the 10-year follow-up period. The association between gait speed and all-cause hospitalization was analyzed using Cox proportional hazards survival models. Results: There were 274 participants with prevalent HF, of whom 257 (94%) had at least one hospitalization over the follow-up period. Multivariate analysis found that slower gait speed (< 0.8m/s vs. >= 0.8m/s) was independently associated with hospitalization (hazard ratio 1.47, 95% CI 1.11-1.94; p=0.007). Sensitivity analyses were performed to determine if the effect of gait speed was a reflection of poor function or increased comorbidity. The effect of gait speed remained true even among those with independent ADL (HR 1.38, 95% CI 1.03-1.88; p=0.03) or with <3 comorbid conditions (HR 1.78, 95% CI 1.09-2.88; p=0.02). Conclusion: Among functionally independent older adults with HF and few comorbid conditions, gait speed is useful for identifying those at risk for hospitalization.

STROKE SYMPTOMS AS A PREDICTOR OF FUTURE HOSPITALIZATION OR EMERGENCY DEPARTMENT VISIT

V.J. Howard[1], M. Safford[1], S. Allen[1], S.E. Judd[1], J.D. Rhodes[1], E.Z. Soliman[3], J.F. Meschia[4], D.O. Kleindorfer[2], *1. University of Alabama at Birmingham, Birmingham, Alabama, 2. University of Cincinnati, Cincinnati, Ohio, 3. Wake Forest School of Medicine, Winston-Salem, North Carolina, 4. Mayo Clinic Jacksonville, Jacksonville, Florida*

Purpose. Our objective was to determine if stroke symptoms are associated with self-reported hospitalization or emergency department (ED) visit in an aging cohort. Methods. Using the validated Questionnaire for Verifying Stroke-Free Status, stroke symptoms (sudden weakness, numbness, unilateral/ general loss of vision, loss of ability to communicate or understand) were assessed in a national, population-based, cohort of 30,239 blacks and whites, > 45 years, enrolled 2003-2007. Analysis was restricted to those stroke/TIA-free at baseline (N=27,126), mean age 64.4+ 9.3. Self-reported hospitalization/ED visit and reason were collected during follow-up through March 2013. Results. One or more stroke symptoms were reported by 4,758 (17.5%). After adjustment for sociodemographic factors, stroke symptoms were most strongly associated with greater risk of hospitalization/ED for CVD (HR = 1.87; 95% CI: 1.78 – 1.96), stroke (HR = 1.69; 95% CI: 1.55 – 1.85), and any cause (HR = 1.39; 95% CI: 1.34 – 1.44). These associations remained significant and only modestly mediated after adjustment for CVD risk factors. The increased risk for future hospitalization associated with stroke symptoms was as large as, or larger than most major stroke risk factors. Conclusions. Stroke symptoms are a powerful marker for future hospitalization and ED visit for stroke and CVD in general. History of stroke symptoms is simple to establish, and may be as important as knowledge of stroke risk factors. Findings suggest a role for stroke symptom assessment as a novel and simple approach for identifying individuals at high risk for CVD including stroke in whom preventive strategies could be implemented.

HEALTH OUTCOME EFFECTS OF COMMON MEDICATIONS IN ELDERS WITH MULTIPLE CONDITIONS

H. Allore, M. Tinetti, H. Lin, Y. Zhan, G. McAvay, *Internal Medicine, Yale Univ., New Haven, Connecticut*

Almost 75% of persons aged ≥ 65 years have multiple chronic conditions (MCC). Most effectiveness research on MCCs has focused on condition specific outcomes and has not considered condition -medication interactions. Determining medication effects is more complex in individuals with MCC. One approach to addressing these limitations is to define effectiveness through the use of cross-condition, universal health outcomes (UHO). Self-reported health (SRH) is a UHO affected by MCC. The complex condition plus medication combinations that occur in those with MCC require analytical techniques that can handle large numbers of variables over time and the sequences in which conditions arise and medications are given. We modified the longitudinal extension of the average attributable fraction (LE-AAF) for a recurrent outcome, SRH, with time-varying conditions, medications and covariates. The LE-AAF method averages the contributions of a medication in all the possible orders and co-occurrences. LE-AAF determines the fractional amount each medication contributes to SRH in the presence of multiple co-existing medications and conditions. Overlapping effects among co-existing medications are taken into account when determining the overall effect of individual medications. The LE-AAF method quantifies the contribution of the time-varying exposure to medications for SRH. LE-AAF of 9 commonly used medications (renin angiotensin system blockers, statins, thiazides, calcium channel blockers, selective serotonin reuptake inhibitors, metformin, warfarin, clopidogrel) recommended for 9 common chronic conditions is demonstrated with Medicare Current Beneficiary Survey enrollees from 2005-2009 with follow-up data available through 2010.

SESSION 390 (SYMPOSIUM)

POLICY SERIES: BACK ON THE AGENDA: ADVANCED ILLNESS AND END OF LIFE POLICY

Chair: B. Lindberg, *The Gerontological Society of America, Washington, District of Columbia*

A recent edition of GSA's policy journal, Public Policy and Aging Report, explored the complex issues of advanced illness and end of life care. This panel will discuss how to ensure that persons and their families get the care they want, what strategies and models are effective in delivering that care, and what tools are available to help ensure that one's wishes are followed.

SESSION 395 (SYMPOSIUM)

HARTFORD CENTERS OF EXCELLENCE IN GERIATRIC SOCIAL WORK AS CHANGE AGENTS

Chair: B. Berkman, *Boston College School of Social Work, Boston, Massachusetts*

Discussant: N. OBrien-Suric, *The John A. Hartford Foundation, New York, New York*

Traditionally Centers of Excellence in Aging have contributed significantly to the development of evidence-based practice knowledge. However, there is a recognized gap between the valuable research knowledge and its translation and use for actual changes in policy or practice. In 2013, five Hartford Centers of Excellence in Geriatric Social Work were funded to work in partnership with local community-based organizations with the aim of becoming "change agents" to shorten the "translational research gap." In this symposium, each of the Center Directors will present their "change agent" model with the tools and strategies employed in their specific community partnerships. Impact on practices and policies in services for vulnerable older adults and their families will be discussed.

COMMUNITY ENGAGEMENT AND THE HARTFORD SILBERMAN CENTER OF EXCELLENCE IN AGING AND DIVERSITY

C. Morano, *Hartford Silberman Center of Excellence in Aging and Diversity, New York, New York*

This paper will present an overview of the strategies the Hartford Silberman Center of Excellence in Aging and Diversity employed to identify key stakeholders and community partners from the initial conceptual design of the proposal up to and including the Center's start up activities. Findings from focus groups with potential partners indicated issues such as community partners prior experiences of collaborating with academic institutions, restrictions on time away from the office, uncertainty about the impact their input would ultimately have on center activities, responsibility to their agencies and demands of large case loads were some of the factors that tempered their initial enthusiasm. The strategies used to overcome anticipated and unanticipated barriers to their participation will also be discussed. The paper concludes with a discussion of how the community partners are informing the Year I initiatives of the Hartford Silberman Center of Excellence in Aging and Diversity.

HEALTHY GENERATIONS: RESPONDING TO THE CHANGING NATURE OF AGING IN SOCIETY

K.I. Fredriksen-Goldsen, *Healthy Generations Hartford Center of Excellence in Geriatric Social Work, Seattle, Washington*

As the global population ages there is increasing diversity and a growing numbers of multigenerational relationships. Healthy Generations: UW Hartford Center of Excellence in Geriatric Social Work is distinguished by its focus on innovation and responding to this changing nature of aging in our society. By incorporating a multigenerational perspective, the Center goals are: Generate the knowledge base needed to address health disparities to promote health equity in diverse and vulnerable older adult populations; design new ways to respond to the increasing diversity of older adults and their families across communities and cultures; and, develop practice and policy change models for prevention and health promotion among midlife and older adults, families and caregivers. The presentation will describe the Center's current activities, as Change AGEnts, to accelerate sustained practice and policy change to harness collective strengths, resources, and community expertise through interdisciplinary and intra-professional collaborations in practice, policy, education and research.

COMMUNITY PARTNERSHIPS TO ENHANCE SERVICE DELIVERY TO LOW INCOME AND FRAIL OLDER ADULTS

R. Dunkle, *University of Michigan Hartford Center of Excellence in Geriatric Social Work, Ann Arbor, Michigan*

The University of Michigan's COE is partnering with several entities to improve knowledge of changes in practice and service delivery to improve the health of older people in the areas of: 1) serving low income elders in HUD housing; and 2) increasing efficacy in work with frail elders with dementia and delirium. Service Coordinators in HUD housing in southeastern Michigan receive training on aging-related topics; plans are underway to create podcasts. Staff are collaborating with social work and nursing staff at the Ann Arbor VA GRECC on their rural health initiative to develop resources and training for the VA rural health clinics serving veterans with dementia. In addition, dementia/delirium training of social work and nursing staff at the University of Michigan Health System will continue. Development of a certificate program is being explored to identify ways to restructure care to improve service delivery to older adults resulting in better outcomes.

THE BOSTON COLLEGE HARTFORD CENTER OF EXCELLENCE IN GERIATRIC SOCIAL WORK

J. Lubben, *Boston College Hartford Center of Excellence in Geriatric Social Work, Boston, Massachusetts*

The Boston College Hartford Center of Excellence (COE) examines four critical areas of gerontological practice: (1) Social Isolation, (2) Productive Engagement, (3) Working Caregivers and (4) Veteran Directed Services. The Hartford COE scrutinizes existing practice protocols looking to identify and test new and improved models of practice. In order to carry out this ambitious agenda, the Hartford COE is partnering with the Institute on Aging at Boston College on all four of these initiatives taking advantage of the IOA's "BC Talks Aging" online education platform. The Sloan Center for Aging at BC is collaborating with the Hartford COE on the projects examining productive engagement and working caregivers whereas the National Center for Participant Directed Services, also located at BC, will provide leadership for testing and implementing a new veteran directed services practice model. All of the identified aging related institutes and centers at BC are directed by gerontological social workers.

USC HARTFORD CENTER OF EXCELLENCE IN GERIATRIC SOCIAL WORK: RESPONDING TO DEMOGRAPHIC SHIFTS AND THE AGING LANDSCAPE

K.D. Lincoln, *University of Southern California Hartford Center of Excellence in Geriatric Social Work, Los Angeles, California*

The goal of the USC Hartford Center of Excellence in Geriatric Social Work is to help advance evidence-based knowledge, practice and policy related to the health and wellness of historically underrepresented, underserved and under-resourced older adults. Our approach to achieving this goal is to develop activities that directly respond to a number of significant shifts in the State of California and in Los Angeles County, specifically. These shifts include: 1) changing demographics, 2) insufficient funding for older adult services, 3) the need for culturally competent, congruent and relevant services and providers, and 4) workforce issues. The current and planned activities to address these issues are organized under four Cores: 1) Administrative, 2) Professional Development and Training, 3) Field Placement Development, and 4) Technology and Innovation. The current activities of each Core will be discussed as well as our blueprint for addressing the significant shifts that impact underserved older adults.

SESSION 400 (SYMPOSIUM)

MEDICARE ANNUAL WELLNESS VISIT AS SPRINGBOARD TO DETECTION OF COGNITIVE IMPAIRMENT, DIAGNOSIS, AND POST-DIAGNOSIS SUPPORT

Chair: R.H. Fortinsky, *Center on Aging, University of Connecticut Health Center, Farmington, Connecticut*

The 2010 Affordable Care Act established the Medicare Annual Wellness Visit (AWV) as an opportunity for Medicare beneficiaries to receive preventive and assessment services during visits with their primary care providers (PCPs). Detection of cognitive impairment is among required AWV services, yet no specific tools are mandated and no data are available regarding tools used for this purpose. This Symposium explains these and related issues being addressed by a GSA-sponsored Workgroup on Cognitive Impairment Detection and Earlier Diagnosis, charged with summarizing available evidence-based cognitive impairment detection tools for use by PCPs, and recommending how more uniform detection can be adopted nationally via the AWV, leading to earlier and improved diagnosis and links with post-diagnosis support services to benefit people with dementia and their families. Presentations from a multidisciplinary panel of Workgroup members will include: (1) an overview of the Workgroup's charge and progress; (2) clinical guidelines for the AWV and efforts by the Centers for Medicare and Medicaid Services to promote cognitive impairment detection by PCPs during the AWV; (3) the Alzheimer's Association's recently-published recommendations for operationalizing cognitive impairment detection by PCPs during the AWV; (4) consumer and family perspectives on the AWV and cognitive impairment detection by a member of the Advisory Council on Alzheimer's Research, Care, and Services created under the National Alzheimer's Project Act; and (5) connections between earlier cognitive impairment detection, earlier dementia diagnosis, and improved access to post-diagnostic services, particularly increasingly available evidence-based non-pharmacologic interventions and care practices for people with dementia and their families.

SESSION 405 (SYMPOSIUM)

SOURCES OF STRAIN AND STRENGTH IN JAPANESE FAMILY CAREGIVER NARRATIVES

Chair: J. Danely, *Anthropology, Rhode Island College, Providence, Rhode Island*

This paper presents findings of an ethnographic study of family caregivers in Japan. The study's purpose was to examine sources of emotional strain and benefits of caregiving for older family members. Data was gathered through interviews with current and bereaved caregivers, and via participant observations of caregiver support groups, adult day care centers, and community-led groups. Analysis identified themes of dissatisfaction with many aspects of the long-term care system and cultural factors contributing to caregiver strain. Additionally, several aspects of caregiving were positively associated with self-efficacy, spiritual growth, compassion, and creation of meaningful bonds with care recipient, family, and community. Data from bereaved family caregivers confirmed that benefits extend beyond the death of a care recipient and that grief is alleviated by community or religious engagement. The findings will be discussed in relation to the major changes to the Japanese Long-Term Care Insurance Program instituted in April 2014.

CAREGIVING AS A PRODUCTIVE ACTIVITY: DOES IT ENHANCE OR REDUCE THE WELL-BEING OF JAPANESE ELDERLY?

K. Katagiri, *Kobe University, Kobe, Japan*

Productive activity is a way in which elderly individuals can engage in society. This study examined how four kinds of productive activity—work, volunteering, housework, and caregiving—relate to health. Data from the "Active Aging Project" survey conducted by Kobe University in 2012 were analyzed using hierarchical multiple regressions. Independent variables were productive activities and interactions of caregiving with work, housework, and volunteering. Caregiving showed a robust negative relationship with health satisfaction, controlling for going to hospital or not. Caregiving women showed worse health when they did housework than when they did not and little difference in health related to outside work. Non-caregiving women showed better health when they did housework and when they did not work outside the home. Many studies have shown the positive effects of productive activities, but this study showed that the effects vary. The combination of these activities should be examined in detail.

IN WHAT CONTEXTS DO NEW ELDER CARE DEMANDS EMERGE IN INDIA?

B.D. Capistrant[1], S. Ghosh[2], G. Friedemann-Sanchez[1], P. Kowal[3], *1. University of Minnesota, Minneapolis, Minnesota, 2. Tata Institute of Social Science, Mumbai, Maharashtra, India, 3. World Health Organization, Geneva, Switzerland*

Although India is aging rapidly, little is known about the regions and types of households where new care needs for older people are most likely to emerge. This study sought to characterize the geographic and household contexts in which caregiving demands arise in India. We used longitudinal data from 10,203 Study on AGEing and Adult Health (SAGE) households (2002, 2007) to calculate the incidence of households' new caregiving demands. We used logistic regression to estimate odds of new caregiving demands associated with state fixed effects and household-level characteristics (demographic, social, and economic). At the state level, there was significant variation in onset of new caregiving between the six SAGE states ($p<0.001$). At the household level, households with new care demands had a higher percentage of female residents. New care needs in India emerge differentially across states, but uniformly to households with more women, following traditionally gendered norms about caregiving roles.

CAREGIVERS' PERCEPTION OF LONG TERM HEALTHCARE SERVICES AND SERVICES USE IN SINGAPORE

C. Liu[1], K. Eom[1], W. Chong[2], A. Chan[1], *1. Duke-NUS Graduate Medical School Singapore, Singapore, Singapore, 2. Agency for Integrated Care, Singapore, Singapore*

Objectives: This study aimed to investigate the role of caregivers' perception of long-term care services in predicting service utilization in Singapore. Method: A national representative survey using a 12 months longitudinal design among patients referred to the Agency for Integrated Care for LTC referrals over a 6 month period (December 2011 to July 2012). 1112 patients who responded to the first two waves of survey (401 care recipients, 711 proxies and 1069 caregivers) were included in the analyses. Findings: Across the six formal LTC services, the take-up rate of referral at the time of interview ranged from 44% (home therapy) to 88% (nursing home). Perceived affordability is significantly associated with future utilization for all types of LTC services. Perceived quality and social connectedness are significantly associated with home-based and center-based LTC services, respectively. Conclusion: Use of LTC services is strongly influenced by caregiver characteristics and perceptions of LTC services.

THEORIZING FAMILY CAREGIVING IN THE ASIAN CONTEXT

V. Lou[1,2], F.K. Ejaz[1], *1. Department of Social Work & Social Administration, The University of Hong Kong, Hong Kong, Hong Kong, Hong Kong, 2. Sau Po Centre on Aging, The University of Hong Kong, Hong Kong, Hong Kong*

Traditions of providing family care to the ill and old in Asian communities have been challenged during the modernization process. Such challenges relate to issues such as reductions in family size, migration of adult children, and varied family attitudes toward government long-term care policies. This symposium aims to advance theoretical understanding of how family-based aged care can be better achieved in the context of emerging long-term care initiatives by different Asian governments to address their rapidly increasing older population. By analyzing national data in India, Dr. Capistrant and his colleagues examined changes in new family caregiving demands and highlighted regional variations and gendered norms about caregiving roles. Two papers on Japan by Drs. Danely and Katagiri tested the controversies on negative and positive influences of caregiving based on the country's long-term care policies. Dr. Soo Han critically analyzed family caregiver support programs under Korea's national long-term care policy and argued the critical role the government plays in its reform of the long-term care system. Dr. Liu examined the relationship between caregivers' evaluation of long-term care services and service utilization in Singapore. Dr. Ejaz will serve as the discussant and will focus on the need to develop an Asian model of family caregiving that examines government long-term care policies in the context of caregiver outcomes that are both positive and negative.

THE MYTH OF A FAMILY CAREGIVING FOR ELDERS WITH CHRONIC DISEASE AND THEIR AGED SPOUSE IN KOREA,

S.K. Han, *1. NamSeoul University, Chunan, Republic of Korea, 2. Care Rights, New York, New York*

Korean government has institutionalized the National LTC insurance plan since 2008, however, 45% of the elderly was left in poverty. 65.6 percent of all family caregivers are women of age 75 and over. And 62 percent of them reported that they spent 20 or more hours caring for their elderly spouse who has a high risk of chronic disease and dementia, not eligible for LTC services, living at home (Ministry of Health & Welfare, 2011), . This study aims to analysis the National LTC Health Care Law, mainly focusing on family caregiver support program for community based on LTC services. And it brings up the difficulties for aged spouse caregivers and elders with chronic disease through the Annual LTC Survey Reports (National Health Insurance Cooperation, 2013, 2013). This study concludes that the Korean government is the most capable of taking on the role of institutionalizing a safe social care system, creating diverse social care services that were proposed to various local communities and grass rooted organizations cooperate to aid family caregivers.

SESSION 410 (SYMPOSIUM)

AGING IN PLACE: GATHERING AND DEVELOPING EVIDENCE FOR A 21ST CENTURY, TECHNOLOGY-ENABLED SYSTEM

Chair: K.J. Chaney, *Agency for Healthcare Research and Quality, Rockville, Maryland*

The digitalization of health care and communities holds much promise to help older adults manage their health and maintain relationships with their peers, caregivers and clinicians. However, many technological systems and applications have not met their expected potential as an ever growing number of older adults looking to age in place seek out these tools to empower this living arrangement. The following panel provides an overview of the research opportunities the Agency for Healthcare Research and Quality's (AHRQ) health IT portfolio is funding to build an evidence base for designing better technology systems to assist older adults, care givers and clinicians. An overview of currently funded work will be presented in addition to an introduction of AHRQ's Active Aging Research Center (AARC).

AGING IN PLACE: UNDERSTANDING THE ROLE OF TECHNOLOGY AND DESIGNING BETTER SYSTEMS

K.J. Chaney[1], D.H. Gustafson[2], K.J. Chaney[1], *1. Agency for Healthcare Research and Quality, Rockville, Maryland, 2. University of Wisconsin, Madison, Wisconsin*

It is well-documented that the majority of older adults prefer to age in place, typically in long-established residences. Designers, researchers, practitioners, and policymakers are increasingly interested in the role that technology can play in facilitating this living arrangement. This interest stems from the implicit assumption that technology can serve as a conduit for meeting the personal (e.g., physical and emotional); interpersonal (e.g., emotional); and formal (e.g., care management) service needs of older adults to support aging in place. However, despite growing interest in and capabilities of technology, issues related to design, use, interoperability, privacy, and access often keep these technologies from reaching their full potential. To inform our knowledge in this problem space and to spur innovation, better design, and adoption, the Agency for Healthcare Research and Quality's (AHRQ's) Health IT Portfolio is funding research aimed at gathering and developing the evidence for a 21st century, technology-enabled care and communication system. Several of AHRQ's ongoing initiatives and current funding opportunities will be discussed, with a focus on its Active Aging Research Center (AARC). Members from the AARC will provide an overview of their efforts to better understand the needs of older adults, caregivers, and their community and the ways technology can be best designed and implemented with stakeholder support to enable aging in place.

PREVENTING FALLS THROUGH AN ONLINE INTERVENTION PROGRAM: DEVELOPMENT AND PRELIMINARY USAGE PATTERNS

J.E. Mahoney[1], V.L. Gobel[1], V. Lecey[2], L.M. Clemson[3], M. Wise[4], A. Isham[4], *1. University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin, 2. Greater Wisconsin Agency for Aging Resources, Madison, Wisconsin, 3. University of Sydney, Sydney, Australian Capital Territory, Australia, 4. University of Wisconsin-Madison College of Engineering, Madison, Wisconsin*

Falls among older adults are frequent and costly and carry high morbidity and mortality. Falls may be prevented through exercise, medical, and behavioral change interventions, yet little is known about barriers and facilitators to falls prevention by older adults. Understanding these barriers and facilitators may inform the development of online interventions to decrease falls. We interviewed 35 older adults who completed the evidence-based falls prevention program, "Stepping On," to understand their barriers and facilitators to maintaining falls prevention activities. Grounded theory analysis identified that graduates of the program maintained cognitive safety behaviors but abandoned exercise because of loss of group support. In response to these findings, we developed online falls prevention tools, including an online risk assessment, tips, exercise videos and instructions, interaction with others who have fallen, and interaction with a falls prevention coach. Data on preliminary usage patterns of the online falls prevention program will be shared.

NEEDS, ASSETS, AND THE DESIGN OF A COMPUTER-BASED SYSTEM FOR ACTIVE AGING AAND SOCIAL ENGAGEMENT

F. McTavish[1], D.H. Gustafson[1], A. Maus[1], J. Judkins[1], D.H. Gustafson[1], C. Glowacki[2], P. Batemon[4], B.D. Iverson[3], *1. Center for Health Enhancement Studies, University of Wisconsin - Madison, Madison, Wisconsin, 2. Aging and Disability Resource Center of Waukesha County, Waukesha, Wisconsin, 3. Aging and Disability Resource Center of Eagle Country, Richland Center, Wisconsin, 4. Milwaukee County Department of Aging, Miwaukee, Wisconsin*

We will describe how a community organization process (ABCD) set the foundation for a computer-based system to help elders reduce isolation, falls, automobile accidents, and informal caregiver burnout and improve medication management. We will describe the system that resulted and how it is being evaluated. We will also describe how the virtual community increases quality of life and behavioral health and reduces isolation by virtually connecting older adults through bulletin boards, chat rooms, and private messaging. It differs from many social networking sites in how its walled garden respects elders' fears of scams. We will discuss barriers faced designing an interactive blog, how we overcame those. Lessons learned from interactions will be shared as well as the characteristics of those who use and don't use the system. This research will help design better systems for today's seniors, and establish design principals for "ubiquitous" technologies of the future.

WHAT MAKES DRIVING HARD: IDENTIFYING CHALLENGES FACING OLDER DRIVERS

J.D. Lee, R. Premnath, M. Gibson, *Industrial and Systems Engineering, University of Wisconsin, Madison, Wisconsin*

For many older adults the ability to drive determines whether they can live independently, and so understanding the challenges older people face in driving is central to supporting independent living. To identify challenges faced by older drivers we developed a system that records video, GPS, accelerometer, and speed data. Drivers were instructed to simply push a button on the steering wheel whenever they encountered a challenging situation. We deployed this system in the cars of 39 older drivers—18 from an urban environment and 21 from a rural environment, who drove with it for several weeks. Subsequently, we discussed their daily driving patterns and the particular challenges they confronted. These challenges included route planning, blind spot checking, and benefiting from co-drivers. A general concept emerged from the interviews: Driving with friends. This concept reflects the idea that driving is a distributed task supported by passengers.

DIGITAL MEDIA AND HEALTH INFORMATION SEEKING: TRACING CHANGES AMONG INSURED AND UNINSURED OLDER ADULTS

D. Shah, T. Moon, Z. Di, *School of Journalism and Mass Communication, University of Wisconsin-Madison, Madison, Wisconsin*

Digital health has grown dramatically, with increasing use of ICTs to address health problems. Questions remain about whether these systems can address the needs of older adults, who have been slow to adopt the technologies through which these solutions are delivered. We examine the changing patterns of digital media usage among seniors, considering whether their use of ICTs is increasing and whether they are using them more for seeking health care information. We analyze data from the 2011 and 2013 Multimedia Audience Research Systems (MARS) health assessment, a national survey related to healthcare. Applying three-way mixed factorial ANOVA with age, insurance, and survey year predicting health-related usage of ICTs, the result reveal that gaps between the insured and the non-insured respondents is widening, though gaps between older and younger seniors appear to be declining. This presentation explores the implications of these findings for the use of ICTs in healthcare.

SESSION 415 (SYMPOSIUM)

COMMUNITY-BASED PALLIATIVE CARE: ADVANCING COLLABORATIVE MODELS FOR UNDERSERVED OLDER ADULTS

Chair: N.S. Parikh, *Brookdale Center for Healthy Aging of Hunter College, New York, New York*
Discussant: A. Berman, *The John A. Hartford Foundation, New York, New York*

Over the past decade, increasing attention has been paid to palliative care as a tool to address the needs of individuals and caregivers in the management of advanced chronic illnesses. While palliative care has steadily become more accessible among hospital-based programs, significant gaps remain for underserved populations, particularly members of ethnic and racial groups, low-income individuals, and older homebound adults. Innovative community-based models that include developing and testing multidisciplinary approaches are urgently needed to improve the provision of palliative care to underserved populations. To begin to address this disparities gap in palliative care, Weill-Cornell's Division of Geriatrics and Palliative Medicine, Brookdale Center for Healthy Aging at Hunter College, Lenox Hill Neighborhood House, and the NYC Department for the Aging are partnering on a pioneering project designed to 1) develop and test a community-based palliative care intervention using community based participatory research (CBPR), and 2) build capacity to deliver key elements of palliative care to older adults via community-based providers. This symposium will demonstrate the partners' translational approach to inform research and practice. A multidisciplinary panel will: a) provide an overview of palliative care using CBPR methodology; b) discuss findings from a community needs assessment with service providers and community residents in an ethnically diverse community; c) summarize results from a mixed-methods study exploring the needs of elders following hospital discharge; and d) describe the process of developing and implementing an educational palliative care curriculum for case managers. This partnership provides a rigorous methodological approach to addressing gaps in community-based palliative care.

COMMUNITY-BASED APPROACHES TO IMPROVE PALLIATIVE CARE DELIVERY IN MINORITY COMMUNITIES

C. Reid[1], J. Callahan[2], D.S. Gardner[3,2], N.S. Parikh[2], C. Kenien[1], C. Villanueva[2], A. Faustin[2], M. Ruiz[2], *1. Weill Cornell Medical College, New York, New York, 2. Brookdale Center for Healthy Aging of Hunter College, New York, New York, 3. Silberman School of Social Work at Hunter College, New York, New York*

While palliative care (PC) service delivery continues to grow, certain communities are less likely to receive them. Efforts are needed to enhance PC program and practice delivery in minority communities. Community-based participatory research (CBPR) constitutes one approach to address this gap. CBPR represents a collaborative process between researchers and community partners; builds on the strengths, knowledge and resources in a community by employing local knowledge to better understand key problems and potential solutions, and facilitates co-learning throughout all phases of the process. While CBPR has been shown to improve health outcomes among persons with diverse chronic conditions, it has been infrequently employed to increase PC program and practice delivery. In this paper, we review existing efforts to employ CBPR approaches to address this problem and describe our approach that includes forming partnerships with key social service and other agencies/organizations serving older adults in a minority community in New York City.

RESULTS FROM A COMMUNITY NEEDS ASSESSMENT: ADDRESSING PALLIATIVE CARE IN DIVERSE POPULATIONS

N.S. Parikh[1], C. Villanueva[1], C. Kenien[2], A. Faustin[1], M. Ruiz[1], D.S. Gardner[3,1], C. Reid[2], J. Callahan[1], *1. Brookdale Center for Healthy Aging of Hunter College, New York, New York, 2. Weill Cornell Medical College, New York, New York, 3. Silberman School of Social Work at Hunter College, New York, New York*

Managing burdensome symptoms and psychosocial/spiritual concerns related to chronic conditions is challenging for many older adults. Despite the proliferation of palliative care, its reach in underserved communities is limited. This paper describes findings from a mixed methods needs assessment of community residents, social service agencies and faith-based organizations in an urban, ethnically-diverse community. The aim was to gain a better understanding of the extent of chronic illnesses among community-dwelling elders, the scope of community supports that address burdensome symptoms, and perceptions of palliative care among elders and providers. Preliminary findings indicate nearly two-thirds (63.4%) of the organizations interviewed provide palliative care services to their clients, but 86% of older respondents reported they had never heard of palliative care. Implications include the need to develop innovative community partnerships, and use CBPR methods to engage community stakeholders in future research and interventions that seek to ameliorate chronic illness and related symptoms.

LOST TO FOLLOW-UP: EXPLORING PALLIATIVE CARE DISPARITIES AMONG COMMUNITY-DWELLING ELDERS

D.S. Gardner[1,2], C. Villanueva[2], *1. Silberman School of Social Work at Hunter College, New York, New York, 2. Brookdale Center for Healthy Aging of Hunter College, New York, New York*

Based primarily in inpatient settings, palliative care programs often fail to reach community-dwelling elders living with chronic conditions and burdensome symptoms. In particular, low-income, Latino, and African American patients who have had inpatient palliative care consultations are significantly less likely than their peers to continue following the service post-discharge. This paper presents findings from a mixed-methods study examining the perspectives and supportive care needs of underserved elders following discharge from a public hospital in a low-income, ethnically and racially diverse community. A purposive sample of 35 chronically-ill older adults were interviewed prior to discharge and one month later to explore their unmet needs, care preferences, management of pain and other symptoms, perceptions of palliative care, and barriers to accessing services in the community. Findings are presented and implications discussed for reducing disparities and promoting greater access to community-based palliative care for all chronically ill older adults and their families.

DEVELOPING CAPACITY TO DELIVER COMMUNITY-BASED PALLIATIVE CARE VIA CASE MANAGEMENT AGENCIES

J. Callahan[1], R. Chacon[2], C. Reid[3], D.S. Gardner[4,1], A. Faustin[1], C. Villanueva[1], G. Rogers[1], C. Kenien[3], *1. Brookdale Center for Healthy Aging of Hunter College, New York, New York, 2. Lenox Hill Neighborhood House, New York, New York, 3. Weill Cornell Medical College, New York, New York, 4. Silberman School of Social Work at Hunter College, New York, New York*

Most older adults who receive community case management suffer from chronic conditions and symptom burden, making them an ideal population for palliative care interventions. In this paper, we describe a pilot program to test a new multi-component educational curriculum in palliative care for case managers (CMs) providing services to older adults in New York City (NYC). A six-hour curriculum was delivered in two sessions to provide CMs with knowledge and skills to assist clients in managing symptoms and long-term care needs. Bi-monthly meetings were held to reinforce initial information presented and assist CMs in implementing these techniques in the field. Finally, a toolkit was developed as an ongoing resource for participants. Preliminary findings indicated that 68.8% of CMs felt more confident providing psychosocial palliative care to clients and caregivers. The long-range goals of this project are to establish the curriculum's effectiveness and then disseminate it in NYC and beyond.

SESSION 420 (SYMPOSIUM)

PERSON-CENTERED CARE: WORKFORCE RELATED ISSUES

Chair: B.M. Willemse, *Program on aging, Netherlands institute of mental health and addiction, Utrecht, Netherlands, Clinical Psychology, VU university, Amsterdam, Netherlands*
Discussant: M. Downs, *Bradford Dementia Group, Bradford University, Bradford, United Kingdom*

There is a growing focus in nursing home care for people with dementia on deinstitutionalization and residents' psychosocial well-being. This has resulted in a direction towards small-scale, homelike and person-centered dementia care. Person-centered care acknowledges that the person and his or her psychological needs should be the focus of care delivery and not the disease. Since the relationships between healthcare workers and people with dementia are central to person-centered care, healthcare worker's attitudes and work methods are crucial. Therefore, it is important to pay attention to staff competencies and well-being in the further development towards person-centered dementia care. The presenters will: 1) present a theoretical framework hypothesizing potential impact of person-centered care on staff outcomes 2) describe staff competences that have been found to be important to provide person-centered care; 3) discuss the achievements and challenges of person-centered care in daily practice; 4) present the results of an intervention through which the Swedish person-centered care guidelines were implemented; 5) discuss the area of tension for staff between providing autonomy, which is central to person-centered care, and the regulatory context in long-term care.

CONNECTING PERSON-CENTERED CARE WITH JOB SATISFACTION, TURNOVER AND CARE QUALITY IN LONG TERM CARE

D. Porock, S. Rajamohan, *Institute for Person-Centered Care, University at Buffalo SUNY, Buffalo, New York*

The role of the nursing assistant is essential in providing daily assistance to the increasing number of frail older adults in long-term care. The nature of the work is physically and emotionally challenging as they care for residents with complex physical and cognitive impairments. Models for understanding stress have been adapted from psychology and management research to explain the impact of stress on nursing home staff. Building on these models, we will advance hypotheses about the potential for changing staff and workforce outcomes based on creation of a person-centered work environment. Further, we will postulate the impact of building knowledge, motivation, skill and competence in person-centered practices on job satisfaction, turnover and quality of care. A strong theoretical framework is necessary for workforce-related research to produce evidence that can drive change including the need to understand the impact of person-centered practices on the bottom line.

SKILLS AND COMPETENCIES OF NURSING STAFF IN LONG TERM CARE PROVIDING PERSON CENTERED CARE

H. Verbeek, R. Backhaus, E. van Rossum, J.P. Hamers, *CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands*

Objective: Long-term care for people with dementia is increasingly organized in small-scale, homelike care settings to facilitate person-centered care. However, further insight is needed in skills and competencies of nursing staff to provide this. Method: Mixed-method design, using questionnaires (n=309), in-depth interviews (n=11) with nursing staff and a focus group (n=11; nurses, managers and educators). Result: Nursing staff mentioned as most important to do their job skills related to ‘patience’ and ‘empathy’, irrespective of care environment. In small-scale, homelike care environments aspects related to ‘client-centeredness’ were more profound whereas in traditional wards ‘cooperation’ was more often mentioned. The focus group indicated observing, alertness for changes and adequate response essential competencies. Conclusion: Quality and adequate education and training of nursing staff is essential in dementia care in order to provide person-centered care. Both educational modules and training on the job should be employed, taking into account the whole residents’ system.

PERSON-CENTERED CARE IN DAILY PRACTICE: ACHIEVEMENTS AND CHALLENGES

B.M. Willemse[1,2], C. Wessel[1], A. Pot[1,2,3], *1. Program on aging, Netherlands institute of mental health and addiction, Utrecht, Netherlands, 2. VU university, Amsterdam, Netherlands, 3. University of Queensland, Brisbane, Queensland, Australia*

In many countries dementia strategies are developed which seek to adopt person-centred approaches to care and to overcome the skills gap in the dementia workforce. The purpose of this study is to explore, from staff and family perspective, which aspects of person-centered care are already integrated by care staff in practice and which aspects need further attention. This insight will help focus staff training in person-centered care. Data were used from the Dutch LAD-study. 343 staff and 256 family caregivers filled out the instrument ‘Measuring Person-Centered Care in Long Term Care’, recently developed by the State University NY. Results indicate that, both staff and family caregivers, on average feel that staff are able to relate to residents in a positive and respectful way, which is an important achievement with regard to person-centered care. Future challenges consists of involving residents in meaningful activities, better understanding resident’s behavior and supporting family caregivers.

IMPROVING STAFF WELLBEING BY IMPLEMENTING NATIONAL GUIDELINES FOR PERSON-CENTRED CARE OF PEOPLE WITH DEMENTIA: THE STUREBY INTERVENTION STUDY

D. Edvardsson[1,2], P. Sandman[3], L. Borell[3], *1. Nursing, La Trobe University, Melbourne, Victoria, Australia, 2. Umea University, Umea, Sweden, 3. Karolinska Institutet, Stockholm, Sweden*

Background Person-centredness has had substantial uptake in the literature on care of older people and people with dementia. However, further evidence is needed on how to implement person-centredness in aged care practice and associated outcomes on staff wellbeing. Methods A quasi-experimental, one-group pre-test/post-test design with 12-months follow-up was used to explore intervention effects on perceived person-centredness of care and environment, and on staff stress of conscience (N=143). Results Significantly higher ratings of person-centredness of care and nursing home hospitality were provided at follow-up. Staff stress of conscience was significantly reduced at follow-up, indicating that staff felt increasingly able to provide the care and activities they wanted to provide post intervention. Conclusions This interactive action-research intervention based on processes of knowledge translation, generation and dissemination from national guidelines for care of people with dementia, increased person-centredness of care practice, perceived hospitality of the setting, and reduced staff stress of conscience.

“WE’RE IN A LITIGATION WORLD NOW”: HOW LONG-TERM CARE WORKERS MANAGE RISK, SAFETY, AND PERSON-CENTERED CARE

K. Scales, *University of Nottingham, Nottingham, United Kingdom*

Autonomy and choice are central to the philosophy and delivery of person-centered care. In nursing homes, where autonomy may be limited by residents’ cognitive and communicative capacities, direct-care workers play a key role in translating these concepts into practice. The extent to which staff promote autonomy, however, is significantly constrained within the broader regulatory context of long-term care. Drawing from a comparative ethnographic study of person-centered care, this presentation will discuss the “culture of blame” characterizing nursing-home regulatory systems: a culture which prioritizes risk-avoidance and legal compliance above all else. It will be argued that navigating these conflicting imperatives – autonomy versus risk-avoidance – required staff to exercise a significant amount of (largely unrecognized and thus unsupported) discretion. By the end of the presentation, participants will be able to identify this intersection of policies in practice and consider ways to support frontline staff in exercising their discretion toward more person-centered outcomes.

SESSION 425 (SYMPOSIUM)

HOUSING FOR AGING IN PLACE: GLOBAL PERSPECTIVES

Chair: E. Hwang, *Virginia Tech, Blacksburg, Virginia*
Discussant: E. Hwang, *Virginia Tech, Blacksburg, Virginia*

Creating supportive housing and living environments has been an emerging challenge for many countries in supporting aging-in-place. In this session, research conducted in three countries representing diverse cultures, populations, and geographic regions will be presented. The first presentation provides an overview of the scientific literature and national policies on housing options that support family caregiving and aging in place. The second presentation showcases intentional community designs developed in an aging-in-place design workshop held in rural southwest Virginia, USA. The “rural”, “suburban”, and “urban” prototypes incorporate the values, culture, and norms of residents as well as facilitate the ability of persons to age in place. The third presentation reveals the voices of homeless seniors as they experience aging-in-place in inner city disadvantaged neighborhoods in metro-Vancouver, Canada. Findings indicate that pathways into homelessness in old age are complex and multi-dimensional. Experiences of individuals are clearly gendered and culturally situated around notions of home and place. The fourth presentation outlines how unique living space norms that reflect local culture in Jeju Island, Korea, affect the care provided to seniors and their quality of life. Analysis of the layouts of vernacular housing (shared yard but separate kitchens) and implications of living with adult children will be discussed. The fifth presentation highlights the continuing challenges faced by persons with disabilities and accessibility using the 2011 American Housing Survey. Together, the five presentations demonstrate that aging-in-place is a layered concept that is influenced by public policy, community resources, personal responsibilities, place, culture, social norms and values.

DISABILITIES AND HOME ACCESSIBILITY OF SENIORS LIVING ALONE: THE 2011 AMERICAN HOUSING SURVEY

H. Kwon[1], E. Hwang[2], J.O. Beamish[2], *1. Purdue University, West Lafayette, Indiana, 2. Virginia Tech, Blacksburg, Virginia*

The purpose of this study is to examine older adults’ residential satisfaction related to their disabilities, home accessibility features, and home accessibility problems.This study used the 2011 American Housing Survey data. The useable sample was 11,520 single-person households, age 55 years and over. The dependent variable was residential satisfaction, and independent variables included disabilities, demographics, kitchen and bathroom accessibility features, and kitchen and bathroom accessibility problems. T-test, ANOVA, correlation, and SEM were used to analyze the relationships.Participants who were older, female renters with less education and income, who lived in multifamily housing in urban areas had more disabilities and reported more home accessibility problems. Those who had more disabilities and home accessibility problems showed lower residential satisfaction scores. Having accessible housing can improve the residential satisfaction of older adults and vulnerable senior households need cost effective modifications and accessible solutions to improve their quality of life.

AGING-IN-PLACE: FINDINGS FROM A RURAL HOME AND COMMUNITY DESIGN WORKSHOP

N. Brossoie, *Center for Gerontology, Virginia Tech, Blacksburg, Virginia*

The Aging in Place Design Workshop evolved out of a need for public dialogue on the need for new or remodeled housing stock to accommodate the growing number of older adults in rural southwest Virginia. Architects, building contractors, aging service providers, community planners, housing professionals, academics, and community members participated in a half day workshop to discuss the meaning of aging in place and to design new intentional housing options for the regions' rural, suburban, and urban areas. The resulting homes and communities were designed around current community infrastructure and resources and included accessibility features. Space for businesses and services was included to stimulate sense of community. Most importantly, community designs reflected regional values, priorities, and culture by incorporating features that support resident independence and self-determination, facilitate social interactions, and promote use and conservation of the natural environment. Next steps include vetting designs in communities with regional planners and builders.

AGING-IN-PLACE FOR HOMELESS SENIORS: RESULTS FROM MULTI-STAKEHOLDER COMMUNITY DIALOGUE

R. Woolrych[1], N. Gibson[3], A. Sixsmith[1], J. Sixsmith[2], *1. Simon Fraser University, Vancouver, British Columbia, Canada, 2. Northampton University, Northampton, United Kingdom, 3. Homeless Community of Practice, Vancouver, British Columbia, Canada*

Aging populations and housing insecurity in inner city areas has increased the numbers of seniors who are homeless or at risk of becoming homeless. The aging-in-place agenda has not fully considered the needs of homeless seniors, as a group who are deprived of home, displaced from community and find it difficult to access the services they need. To address this gap, a multi-stakeholder, community dialogue approach was undertaken in Metro Vancouver to discuss the challenges of senior homelessness and to propose strategies and solutions to address the issue. Ten community dialogue sessions were held with 109 participants comprising older adults, senior's organizations, service providers and local government. The findings identified that pathways into homelessness in old age are complex, highly gendered and culturally situated around notions of home and place. The dialogues identified recommendations for the development of community supported housing, integrated services, and long-term interventions to address the cyclical nature of senior homelessness and support aging-in-place.

MODERN FUNCTION AND ROLE OF THE VERNACULAR HOUSING OF JEJU, KOREA

S. Koh, S. Lee, *Jeju Development Institute, Sout Korea, Jeju, Republic of Korea*

The vernacular housing of particular region reflects a characteristic life style and culture in residence for the elderly. It is likely to be meaningful to figure out the functions and roles in the traditional dwellings of Jeju Island, Korea, since it is a basic facility and life space that has enabled elderly people to live actively and independently. Furthermore, it has some implication for modern society which emphasizes "Active Aging." The purpose of this study is to examine old ones' life and family dynamics in a vernacular housing focusing on the elderly care system. Ethnographic literature review and in-depth interview were carried out. This is to investigate unique characteristics of Jeju's traditional housing, the role and status of old people among family members, diversity of elderly care and nursing, and other factors to affect the elderly welfare system. This research implies somewhat significance that elder people's independent life-style eligible to the residence space in Jeju island has a function and role of sustaining their autonomy and dignity.

HOUSING OPTIONS THAT SUPPORT FAMILY CAREGIVING TO ENHANCE AGING IN PLACE

J.O. Beamish, *Virginia Tech, Blacksburg, Virginia*

While home services and family caregiving often work together to support aging in place, the design of the housing environment can also play a role in supporting seniors who wish to remain at home. Options include home modifications to existing homes to improve accessibility, universally designed new homes, and accessory units that provide separate living spaces for the older adult or caregiver. Case study analysis identified qualities and factors that could improve the home environment and support older adults and their families including improved convenience, accessibility, privacy, and monitoring. However, barriers exist that could impede the implementation and execution of helpful housing options, including availability, costs, regulations, and timeliness. Community programs and policies could be implemented to alleviate the barriers associated with the housing options that support caregiving.

SESSION 435 (SYMPOSIUM)

REVERSE TRANSLATION: NEW MOLECULAR INSIGHTS FROM LARGE COHORT STUDIES FOR THE DEVELOPMENT OF THERAPEUTIC INTERVENTIONS TO PREVENT AGE-RELATED MOBILITY LOSS

Chair: R. Fielding, *NEPS Laboratory, Tufts University, Boston, Massachusetts*

In recent years, emerging evidence from large observational studies has identified novel mechanistic links between the age-related changes in the components of body composition (muscle, fat, and bone) and distal outcomes related to deficits in muscle performance (strength, power, endurance), mobility declines, reduced physical functioning, role disability, and life expectancy. Evidence and target identification from these studies has led to novel physiological experiments that have uncovered the underlying biological mechanisms responsible for these changes. Finally, armed with this information, clinical trials of therapeutic (behavioral and pharmacological) interventions that target mobility loss continue to provide insights into the prevention and treatment of this syndrome. In this Presidential Symposium, three scientific experts will share insights into the epidemiology of mobility from loss large observational studies (Dr. Harris), provide evidence from physiological studies on the specific biological pathways that affect mobility loss in aging (Dr. Ferrucci), and highlight the role of physical activity/exercise as a potential therapeutic in intervention to counteract mobility loss (Dr. Goodpaster). Finally, the chair (Dr. Fielding) will integrate the presentations and highlight the importance of a translational science approach to mobility loss in the context of gerontological research.

PHYSICAL ACTIVITY, EXERCISE AND HEALTHY AGING: BRIDGING MECHANISMS AND PRACTICE

B. Goodpaster, *Florida Hospital & Sanford Burnham Translational Research Institute for Metabolism and Diabetes, Orlando, Florida*

Age-related loss of strength and slower walking speed predisposes frailty, impaired mobility, falls, hospitalization and ultimately early mortality. Moreover, the most contemporary definitions of sarcopenia include strength and walking speed. However, very little is known about the potential unifying mechanisms responsible for both the loss of strength and slow walking speed with aging. Identifying these mechanisms could lead to more refined targets and ultimately treatments for sarcopenia. Mitochondria likely play a central role in aging muscle. This broad consensus, however, is based on evidence from animal models and small-scale human studies. Exercise preserves mitochondrial function, slows muscle loss and prevents several phenotypes of aging, including insulin resistance. Human studies of skeletal muscle mitochondria in aging, however, have not adequately captured the complexity of mitochondrial energetics. We have shown that mitochondria energetics are associated with slower walking speed among older adults. Further translational studies are needed in order to more fully understand the mechanisms by which impaired mitochondrial energetics influences human aging, and whether these defects can be prevented with exercise or other interventions.

LESSONS FROM THE BALTIMORE LONGITUDINAL STUDY OF AGING

L. Ferrucci, *NIA/NIH, Bethesda, Maryland*

The Baltimore Longitudinal Study on Aging (BLSA) is the oldest longitudinal study of aging, spanning more than 50 years. A considerable part of our current knowledge about aging comes from studies performed in the BLSA. When Nathan Shock designed the BLSA, one of the main goals was to demonstrate that diseases and aging can be dissociated. For this reason, participants are enrolled in the BLSA when they are still very healthy and free of major diseases. Recently, very strict, standard criteria were established to define "healthy" status. Because aging affects many physiological systems, BLSA participants are examined from multiple perspectives, making it impossible to provide a comprehensive picture of the collected variables.

MUSCLE, FAT, AND BONE IN HEALTH ABC: A MOLECULAR EPIDEMIOLOGY TRIANGLE

T.B. Harrris, *National Institute on Aging, National Institutes of Health, Bethesda, Maryland*

It is known that muscle, adipose tissue, and bone are all derived from the same progenitor cell, the mesenchymal stem cell. It might be thought that all would also share a common fate with aging, changing synchronously in the body. However, data suggest that instead both muscle and bone have a somewhat reciprocal relationship with adipose tissue; that is, as bone is lost over time, contributing to osteopenia, the amount of adipose in the bone marrow increases and as muscle is lost over time, contributing to sarcopenia, the amount of adipose in the muscle increases. Because the change in muscle appears to be follow a pattern similar to disuse in various muscles, it is unclear how much of the infiltration into bone and muscle is related to 'aging' and how much is related to 'disuse' and whether factors that accelerate the loss of one tissue are related to factors that accelerate loss of the other. It is also unclear whether these tissues are lost in parallel, a relationship that would support the theory of 'mechano-loading' versus each tissue progressively lost at an individual rate. Data from the Health, Aging, and Body Composition Study (Health ABC) will be used to illustrate the relationship of bone, muscle, and adipose to each other and to molecular markers including interleukins and other acute phase-related proteins. These data will be used to explore the underlying relationships in the four race-gender groups included in Health ABC: white men and women and African-American men and women. Data that support or contradict the data from Health ABC will also be utilized to explore these relationships and longitudinal outcomes of disability and death will be examined.

SESSION 440 (SYMPOSIUM)

GSA.NCCA SYMPOSIUM: GENE D. COHEN RESEARCH AWARD IN CREATIVITY AND AGING

Chair: L.S. Noelker, *Benjamin Rose Institute, Cleveland, Ohio*
Discussant: J. Jeffri, *National Center for Creative Aging, Washington, District of Columbia*

The Gerontological Society of American in partnership with the National Center for Creative Aging, an affiliate of George Washington University, will present the 6th Annual Gene D. Cohen Research Award in Creativity and Aging to Rita Charon, M.D., Ph.D, who is a Professor of Medicine and Executive Director, Program in Narrative Medicine, at Columbia University Medical Center. Dr. Charon will report on her research studying patient-physician communication and the outcomes of narrative training for medical students and health professionals. Her findings show that narrative training helps to increase empathy and reflection in health professionals and students. This presentation will be supported by two others, one that examines the state of the field of research related to the arts and human development with a focus on later life. Important directions for future research studies are discussed. The third presentation focuses on the significant influence that the role of listener has in narrative encounters. It reports on research showing that comments by listeners validated the read stories and enhanced the story tellers' experience. The symposium will showcase these pioneering studies that help to establish a new role for humanities and the arts across the spectrum of aging research, education and practice.

LISTENING: THE FORGOTTEN SIDE OF NARRATIVES IN AGING

K. de Medeiros, *Sociology and Gerontology, Miami University, Oxford, Ohio*

Although narrative gerontology has increasingly gained attention in recent years, with numerous research studies, books, and presentations being offered, there is one important aspect of narrative that is often overlooked: the role of the listener. While many studies focus on the content of narratives in various research settings and recognize the interviewer as playing an influential part in what stories are told, few studies have explored the specific role that active listening plays in the narrative encounter as a way of validating the narrative. In this research, discourse analysis was used to examine listeners' reactions to stories being read in the context of an 8-week structured autobiographical writing workshop. Results revealed that supportive comments from listeners functioned to validate participants' stories. Participants who received such comments described greater perceived emotional growth than those who did not read their work aloud. Overall, findings point to the need to pay greater attention to role of listening in narrative work.

BUILDING THE SCIENCE: CREATIVITY AND AGING IN GERIATRIC EDUCATION

G. Hanna, *National Center for Creative Aging, Washington, District of Columbia*

Linking the research of Gene D. Cohen MD PhD with the research of Rita Charon MD PhD to build a contemporary model for geriatric education will be the focus of this paper. Examining the research of Cohen on the impact of mastery and social engagement in redefining quality improvement in geriatric healthcare delivery systems will be expanded by the exploration of Charon's research findings related to narrative medicine focusing on geriatric education specifically. This paper will address geriatric education through the use of the arts and humanities to increase capacity of healthcare professionals in shifting clinical practicies from ones based on signs and symptoms to ones based on strength and satisfaction in terms of person centered care. This paper will additionally demonstarte the importance of the use of arts and humanities to develop innovative instructional startegies as well as a means to evaluate the effectiveness of training across healthcare settings.

SESSION 445 (SYMPOSIUM)

HOSPITAL READMISSIONS: ORGANIZATIONAL APPROACHES TO REDUCE READMISSIONS

Chair: R. Weech-Maldonado, *Health Services Administration, University of Alabama at Birmingham, Birmingham, Alabama*
Discussant: C. Johnson, *University of Washington, Seattle, Washington*

Hospital readmissions represent a preventable patient-level adverse outcome and are an important measure of overall health system performance. Prior research has linked higher rates of readmissions with poorer outcomes including increased mortality. Readmissions are expensive; the annual cost for the Medicare fee-for-service program is estimated at $17 billion with nearly 20% of the beneficiaries readmitted within 30 days of discharge. Reasons for the high rate of readmissions include poor quality of care, premature hospital discharges, and improper transitions of care. Policymakers have increasingly stressed the importance of reducing hospital readmissions as it represents an opportunity to increase quality while lowering costs. In October 2012, the Centers for Medicare and Medicaid Services began to reduce Medicare payments to hospitals that have above average 30-day readmission rates for three conditions (heart failure, acute myocardial infarction, and pneumonia); this program will subsequently be expanded to other conditions in 2014. In addition, the Patient Protection and Affordable Care Act (ACA) includes further incentives to reduce readmissions through value-based purchasing and accountable care organizations. In this symposium, we explore organizational strategies that have the potential to reduce readmissions. In addition, we explore whether reducing payments to hospitals with higher readmission rates may exacerbate racial/ethnic disparities. The first presentation discusses the use of hospitalists as a strategy to reduce pneumonia rehospitalizations. The second presentation examines whether having a hospital-based skilled nursing facility reduces readmission rates. The third presentation explores whether hospitals with a higher proportion of minorities have higher readmission rates and lower financial performance.

DO HOSPITALS WITH SKILLED NURSING UNITS HAVE LOWER READMISSION RATES?

S. Gupta, R. Weech-Maldonado, *The University of Alabama at Birmingham, Birmingham, Alabama*

Hospital-based skilled nursing facilities (HBSNFs) may allow hospitals to improve their continuum of care, thereby reducing their readmission rates. This study seeks to examine if hospitals with HBSNFs have lower readmission rates. Data include a national sample of hospitals (2008-2010) from the AHA Annual Survey, ARF, and CMS Hospital Compare. The dependent variables are 30-day risk adjusted readmission rates for Acute Myocardial Infarction, Heart Failure, and Pneumonia. The binary lagged independent variable represents the presence or absence of a HBSNF. A panel logistic regression with facility and year fixed effects is used for the analysis, controlling for organizational and market factors. Fixed effects would address selection bias and control for unobserved, time-invariant organizational characteristics. Results of this study could assist policymakers in developing strategies (such as incentivizing HBSNFs) promoting better coordination of care for patients, who are not well enough to be discharged and need to be kept under supervision.

MINORITY-SERVING HOSPITALS: IMPACT ON READMISSIONS AND FINANCIAL PERFORMANCE

R. Weech-Maldonado, L. Hearld, F. Zengul, *Health Services Administration, University of Alabama at Birmingham, Birmingham, Alabama*

Research suggests that hospitals caring for a larger proportion of minority patients have lower quality of care. Furthermore, minority-serving institutions are oftentimes teaching hospitals and resource constrained. As such, policies that financially penalize hospitals for higher readmission rates may exacerbate racial/ethnic disparities in care. This paper assesses the relationship between the proportion of inpatient minorities and financial and quality performance. The study uses longitudinal data (2010-2012) for hospitals in California, Florida, and New York from: HCUP State Inpatient Database; AHA Annual Survey; Medicare Cost Reports; and Area Resource File. The dependent variable consists of hospital readmission rates (acute myocardial infarction, heart failure, and pneumonia) and financial performance (operating margin and total margin). The independent variable consists of percent of total admissions for non-Hispanic Blacks, Hispanics, Asian/Pacific Islanders, and Other (reference: non-Hispanic Whites). Data are analyzed using panel regression with hospital and year fixed effects, controlling for organizational and market factors.

DO HOSPITALISTS REDUCE PNEUMONIA READMISSION RATES?

J. Epane[1], R. Weech-Maldonado[2], L. Hearld[2], *1. Health Care Administration and Policy, University of Nevada Las Vegas, Las Vegas, Nevada, 2. University of Alabama at Birmingham, Birmingham, Alabama*

Hospitalists have grown rapidly in hospitals, with the number of FTE hospitalists increasing from 1,001 in 2007 to 2,362 in 2010. Hospitalists may provide better coordination and continuity of care, which may result in lower readmissions. Using a national sample of hospitals (N= 3,294), our longitudinal (2008-2010) study explores the relationship between use of hospitalists and pneumonia readmissions. Data from the AHA Annual Survey, ARF, and CMS' Hospital Compare were used for this study. A panel design with facility and year fixed effects regression was conducted for this analysis, controlling for organizational and market factors. Our results indicate that an increase in the use of hospitalists, staffing intensity (high proportion of FTE hospitalists), and contracted hospitalists were associated with lower pneumonia readmissions. This supports prior research showing that hospitalists reduce pneumonia readmissions. Furthermore, our findings suggest that an adequate staffing level of hospitalists is critical to achieve the desired outcome.

SESSION 450 (SYMPOSIUM)

IMPLEMENTING A HERMENEUTIC APPROACH - A WAY TO ADDRESS CHALLENGING BEHAVIOR IN NURSING HOMES

Chair: M. Roes, *German Center for Neurodegenerative Disease (DZNE), Witten, Germany*

Challenging behavior in persons with dementia is one of the major issues for staff in nursing homes. thus, nurses are confronted with demanding and complex care situations on a daily basis. Challenging behavior is also associated with staff distress and burden. Challenging behavior may be understood as a response to unmet needs, this requires a comprehensive approach and is a key feature of person-centered care. The principles of a hermeneutic circle supports critical thinking, and provides the opportunity to analyze the complex needs and situations of the individuals with dementia. This 'apporach' is toward the nature of understanding, thus the primary intention is to reveal conditions that facilitate understanding. The principles of a hermeneutic circle are used in 12 Nursing homes: two different 'ways to understand' challenging behavior are implemented, using a stepped-wedge-design. At the end of the project (2015) 24 sessions audio taped. Preliminary results (analysis of 4 sessions) will be presented.

HOW TO IDENTIFY NEEDS OF VULNERABLE PEOPLE - CONTRIBUTIONS OF QUALITATIVE RESEARCH METHODOLOGY

M. Roes[1], K. Abbott[2], *1. German Center for Neurodegenerative Disease (DZNE), Witten, Germany, 2. Polisher Research Institute of the Madlyn and Leonard Abramson Center for Jewish Life, North Wales, Pennsylvania*

This is a symposium from members of the GSA qualitative research interest group Most of the time qualitative research methods are used when 'we don't know nothing' about a problem that occurred in practice or when no instrument exist to measure a phenomena or outcome. This understanding may have been stimulated through a methodological progress of the 'causal model of explanation' as a prototype for research. On the other side, qualitative research provides empiric knowledge based on an understanding of reality which is constructed both individually and socially. There is still a high need for qualitative research projects: (A) to get a better, more detailed understanding of highly sensitive issues (e.g. mistreatment); to learn how people address topics (e.g. articulating needs); to observe (e.g. behavior in specific situations) or to reflect the own perspective (e.g. hermeneutic's), and (B) to include people into our research studies who might not be able to participate otherwise (like people with cognitive impairment or dementia). Qualitative research methods are grounds for reasonable understanding, and reflecting reasoning contexts, on which the researcher's interpretation is based. Problems in connecting 'proper' understanding in an interpretative process are discussed in the light of different interpretation schemes. Three different projects will presented: (a) How qualitative methods (e.g. interviews, observation) helped to understand elder mistreatment, physician behavior, and practice (Amanda E. Sokan, PhD, MHA, LL.B:) (b) using focus-group technique to identify the needs of caregivers' of people with dementia attending a Day Center (Debra Hain, PhD) (c) how hermeneutic circle can be used to address challenging behavior issues in nursing homes (Martina Roes, Prof., PhD, MA, RN)

ELDER MISTREATMENT AND PHYSICIAN BEHAVIOR AND PRACTICE: CONNECTING THE DOTS?

A.E. Sokan, *Texas State University, San Marcos, Texas*

Qualitative research assiduously attends to point of view in representing the empirical. Whatever the topic of research… those involved experience what they do from a particular point of view. There is no neutral standpoint." - Jaber Gubrium, 1992. Quantitative methods have long been accepted as de riguer in research, yet qualitative methods steeped as they are in traditions that include recognition of the importance of obtaining participant(s) perspectives and experiences, provide avenues to obtain rich, nuanced understanding of the phenomenon of study. More so, this is relevant when dealing with highly sensitive issues such as elder mistreatment. Participant interviews for example, afford the opportunity to interact, observe behavioral as well as spoken responses, and the option to adapt questions as necessary to yield a higher degree of detail. This presentation illustrates how the use of qualitative methods helped clarify issues, identify underlying constraints, and unearth critical information pertinent to understanding physician behavior/practice.

DETERMINING NEEDS OF CAREGIVERS' OF PEOPLE WITH DEMENTIA ATTENDING A DAY CENTER

D.J. Hain, G. Engstrom, *College of Nursing, Florida Atlantic University, Boca Raton, Florida*

Despite having day centers with excellent activity programs for people with dementia, unmet caregiver needs may exist. To inform future programs, focus groups were used to identify the needs of caregivers of people with dementia who attended a day center in Southeast Florida. Caregivers (60% female) with mean age 76.5 years (SD 8.9) of persons with dementia (n = 22) participated in a onetime focus group session. The transcribed interviews were analyzed using qualitative content analysis. Three themes emerged: 1) needing help with communication; 2) need for behavior management program; 3) needing to connect with others. Trustworthiness was established through credibility, dependability and transferability. The findings support the need to inquire about caregivers' needs and perceptions of current programs in an effort to tailor interventions that meet caregivers' needs. It is hoped by addressing the needs of caregivers, caregiver burden will be reduced.

SESSION 455 (SYMPOSIUM)

HARTFORD CHANGE AGENTS WORKING IN INTERPROFESSIONAL TEAMS TO IMPROVE THE OUTCOMES OF OLDER ADULTS

Chair: M. O'Connor, *Villanova University, Villanova, Pennsylvania*
Discussant: K.H. Bowles, *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

The majority of practicing health care providers have not been trained to work in integrated teams. The Institute of Medicine has called for "active collaboration" among disciplines and recommends redesigning care processes in order to narrow the quality chasm. It is believed that the collective skills and experience of interprofessional team members improves the quality and effectiveness of care. The timely new initiative of the John A. Hartford Foundation, "Hartford Change AGEnts", is designed to support interprofessional collaborators as they work together to improve care provided to older adults. This symposium reflects the interprofessional and collaborative research of four academic institutions and several Hartford Change AGEnts, as all first authors have been direct recipients of funding from the Hartford foundation. Our first presentation describes results from four interprofessional focus groups conducted to elicit home health clinician and physician knowledge about the factors considered important to determine readiness for discharge from home health services among older adults. Next, innovative social work and nursing interviews reveal conjoint efforts to minimize resident to resident aggression in nursing homes. Third, an interprofessional research team describes their efforts to predict which older adults with heart failure discharged from the hospital to home health are at risk for rapid rehospitalization. Then a method to evaluate interprofessional education programs is explored. Our final presentation suggests that interprofessional teams may result in higher value care for complex older adults. This symposium highlights the value of interprofessional collaboration even across academic institutions to improve the outcomes of older adults.

RESIDENT-TO-RESIDENT AGGRESSION IN NURSING HOMES: SOCIAL WORK INVOLVEMENT AND COLLABORATION WITH NURSING COLLEAGUES

R.P. Bonifas, *Social work, Arizona State Univ, Phoenix, Arizona*

Resident-to-resident aggression (RRA) is the most common form of abuse occurring in nursing homes. A frequent strategy employed to address RRA is to make a referral to the facility social worker, yet studies are non-existent regarding how social workers respond to such referrals or how they collaborate with other professionals in doing so. This presentation reports findings from individual and group interviews with 90 social work and nursing personnel regarding conjoint efforts to minimize RRA. Results reveal that social workers have both independent and collaborative responsibilities in assessment and intervention, and that licensed nurses are their primary behavioral management partners. Solo duties include addressing psychosocial harm in victimized residents, delivering psychosocial interventions, and serving as a communications liaison with family members. Collaborative duties include determining factors that triggered aggressive incidents, planning person-centered intervention strategies, organizing delivery of environmental interventions, and performing reciprocal roles that capitalize on each discipline's professional strengths.

HOME- AND COMMUNITY-BASED SERVICES FOR MEDICAID/MEDICARE DUAL ELIGIBLE INDIVIDUALS

J. Van Cleave[1], S. Brosch[2], E. Wirth[2], M. Lawson[3], B.L. Egleston[4], E. Sullivan-Marx[1], M.D. Naylor[5], *1. New York University College of Nursing, New York, New York, 2. New York University Langone Medical Center, New York, New York, 3. Mount Sinai Medical Center, New York, New York, 4. Fox Chase Cancer Center, Philadelphia, Pennsylvania, 5. University of Pennsylvania, Philadelphia, Pennsylvania*

Federal and state governments are developing initiatives to promote cost effective care models for vulnerable populations such as Medicaid/Medicare dual eligible individuals. We extracted data from two capitated Home- and Community-Based Services Programs' (HCBS) medical records to compare providers' hours and personnel costs in delivering care. The study population consisted of 49 dual eligible individuals newly enrolled in the study Health Related Quality of Life: Elders in Long Term Care Study (Mary D. Naylor, PI). Findings from this small sample suggest that inter-professional teams emphasizing primary care services and senior centers may provide higher value care for dual eligible individuals than coordination of care with in-home services. Findings also suggest the need for policy initiatives that facilitate inter-professional team members' communication, promote team members' professional practice to the full extent of their education, and foster services that meet dual eligible individuals' needs and desires.

INTERPROFESSIONAL COLLABORATIVE PRACTICE TO IMPROVE CARE FOR OLDER ADULTS: EMPLOYING RELATIONAL COORDINATION TO EVALUATE AND STRENGTHEN COORDINATION PROCESSES

A. Rao, R. Trotta, *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

Interprofessional education and practice are frequently cited as means to improve care coordination and quality. Yet, methods to evaluate interprofessional programs are not well-developed. Relational Coordination (RC) is a theory describing the relational dynamics of coordinating work. RC is assessed via a validated survey that evaluates the quality of communication and relationships among disciplines. This paper describes pilot findings of a longitudinal study that employs RC to evaluate and strengthen coordination among interprofessional teams caring for older-adult inpatients. To prime medical inpatient teams to engage effectively in interprofessional collaborative practice (IPCP), team members participated in a training framed by the Core Competencies for IPCP (Interprofessional Education Collaborative, 2010). Prior to and three months following this education, nurse, physician, social work, and pharmacist team members completed RC surveys; they will complete subsequent surveys every six months. We will discuss how RC survey results inform targeted team-based coaching to strengthen coordination processes.

PREDICTING EARLY VERSUS LATER READMISSION AMONG HOME HEALTH CARE PATIENTS WITH HEART FAILURE

O. Jarrín[1], C. Zhu[2], K.H. Bowles[1], M. O'Connor[3], C.M. Murtaugh[4], *1. University of Pennsylvania, Philadelphia, Pennsylvania, 2. Ichan School of Medicine at Mount Sinai, New York, New York, 3. Villanova University, Villanova, Pennsylvania, 4. Center for Home Care Policy & Research, Visiting Nurse Service of New York, New York, New York*

Through incentives, penalties and bundled payment initiatives, the Affordable Care Act has placed a premium on improving care and reducing cost, especially related to avoidable hospitalizations. With more than one-quarter of 30-day all-cause rehospitalizations occurring within 1 week, this study aims to predict which patients with heart failure discharged to home health care are at risk for rapid rehospitalization. We hypothesized that variables useful for predicting rapid rehospitalization exist in the assessment data collected by Registered Nurses during the standardized home health intake assessment, reported in the Outcome and Assessment Information Set (OASIS). Logistic regression and discriminant function analysis were used to test a parsimonious set of variables predicting which high-risk patients with heart failure are re-hospitalized within 7 days versus later. The findings have practical implications for hospitals, home health agencies and electronic medical record software systems trying to rapidly identify patients who most need intensive monitoring and support.

IDENTIFYING CRITICAL FACTORS IN DETERMINING READINESS FOR DISCHARGE FROM SKILLED HOME HEALTH SERVICES

M. O'Connor[1], R.M. Madden-Baer[2], K.H. Bowles[3], *1. Villanova University, Villanova, Pennsylvania, 2. Visiting Nurse Service of New York, New York, New York, 3. School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

Medicare relies upon home health clinicians and physicians to evaluate beneficiary needs and to decide to discharge from skilled home health or recertify patients for an additional 60-day episode of care. However, there are no national, empirically derived decision support tools to assist in making these common but important decisions regarding determining readiness for discharge. We conducted 4 focus groups among home health clinicians (RNs, PTs, OTs, STs, MSWs), supervisors and physicians to elicit interprofessional knowledge about the factors considered important to determine readiness for discharge from skilled home health services among older adults. Among the key emergent themes that resulted from the content analysis included patient safety and caregiver availability. This study is the first step in building a standardized approach to discharge decision-making that will assist direct-care clinicians to determine readiness for discharge from skilled home health services among older adults who are vulnerable for poor outcomes.

SESSION 460 (SYMPOSIUM)

IMPLEMENTING AUTONOMY INTO THE DAILY LIVES OF RESIDENTS WITH DEMENTIA: CHALLENGES IN ASSISTED LIVING

Chair: A. Frankowski, *UMBC, Baltimore, Maryland*
Co-Chair: R. Rubinstein, *UMBC, Baltimore, Maryland*
Discussant: K. Macmillan, *School of Social Work, University of Maryland, Baltimore, Maryland*

Autonomy - independence, control, freedom, agency - important in American culture - becomes increasingly difficult to sustain as one ages. It is even more formidable for residents who live in institutional settings. In this symposium we examine the unique challenges that cognitive impairment presents to implementing autonomy into the everyday experience of residents with dementia who live in assisted living (AL) and dementia care units (DCUs). Examining data from five research sites and integrating the perspectives of residents, families, frontline staff, and managers, we explore (a) the concepts of culture change and person-centered care and how they can best be used to incorporate autonomy within the core social model of AL; (b) the challenges to increase autonomy for all residents when individuals with moderate to severe dementia are housed within the general AL population; (c) the DCU as a positive space to enhance autonomy for both residents and staff; (d) the role families play in crafting autonomy into the everyday lives of their relatives living in DCUs; and (e) how care workers understand, classify, and define residents with dementia and the way this affects how autonomy is fostered or constrained in AL. Ethnographic data (field notes and interviews) for this symposium are drawn from an NIA-funded, 4-year qualitative study, “Autonomy in Assisted Living: A Cultural Analysis” and a 14-month NIA-funded supplement into three DCUs from the parent grant. Five diverse Mid-Atlantic AL sites ranging in size from 16 to 100 residents are represented.

AUTONOMY IN ASSISTED LIVING: OBSERVATIONS OF DEMENTIA AS A COMPLICATING FACTOR

P.J. Doyle, A. Frankowski, R. Perez, G.G. Tucker, *Center for Aging Studies, Sociology/Anthropology Department, University of Maryland Baltimore County, Baltimore, MD*

Fostering autonomy has been a central component of the efforts to improve the quality of life for older adults living in nursing homes (NHs) and assisted living (AL) settings. The construct of autonomy has been introduced within culture change, person-centered care, NH regulations, and the core social model of AL. However, cognitive impairment in these environments presents unique challenges to the realization of this ideal. This paper focuses on how an organizational goal of “maintaining residents’ autonomy” can be difficult in the context of dementia. Ethnographic data collected in five diverse ALs were analyzed for this paper where we integrate the perspectives of residents with dementia, their family members, and frontline staff to examine the challenges faced when seeking an autonomous life with dementia. The findings are used to discuss how AL communities can overcome the challenges of dementia care and ensure autonomy for residents with dementia.

WHOSE AUTONOMY? CHALLENGES OF INTEGRATING PERSONS WITH DEMENTIA IN ASSISTED LIVING POPULATIONS

L. Morgan, A. Frankowski, R. Perez, *Sociology & Anthropology, UMBC, Baltimore, Maryland*

Many assisted living (AL) settings integrate residents with dementia into the general population rather than segregating them in special units, retaining them as long as possible, even as their dementia progresses. This paper addresses challenges raised by the resulting diversity in behavior and capacities of residents, and the impact this has on the autonomy of all residents sharing life in AL. In this paper we analyze two ALs and examine the influence of AL and staff philosophies on managing dementia; how efforts to maximize autonomy for all can result in both successful and unpleasant or dangerous encounters among residents; and how ALs favor “special residents” with dementia relative to others, thereby providing them greater autonomy. Outcomes involving the use of shared and personal spaces, autonomy-enhancing social activities, and dynamics of communal interactions, such as meals and social gatherings suggest dementia-integrated settings face challenges to provide equal autonomy for all.

BEHIND LOCKED DOORS: “FREE” EXPRESSION OF AUTONOMY IN DEMENTIA CARE UNITS

A.D. Peeples[1], C.R. Bennett[1,2], G.G. Tucker[1], A. Frankowski[1], *1. Gerontology, University of Maryland, Baltimore County, Baltimore, Maryland, 2. Doctoral Program in Gerontology, UMBC/UMB, Baltimore, Maryland*

Dementia care units (DCUs) are often viewed as controlled physical environments with restricted movement for a small group of residents within assisted living (AL) settings. Behind the locked doors of the DCUs, however, residents and frontline staff find considerable freedom and independence. Residents are actively involved in time-consuming day-to-day decision-making, and staff members are more able to tailor their care to residents’ needs individually. Drawing on data from participant observation and ethnographic interviewing conducted over twelve months in three DCUs, we focus in this paper on how the locked door providing a safe space (the DCU) becomes the mechanism for enhancing the autonomy of both residents and frontline staff. Further, we examine the ways that autonomy is expressed, the forms it takes, and the effect it has on everyday life and work. We conclude with a discussion of how autonomy impacts the overall climate of the DCU.

FAMILY INVOLVEMENT IN DEMENTIA CARE UNITS: PROMOTING AUTONOMY IN EVERYDAY LIFE

A. Frankowski, C.R. Bennett, M. Brazda, G.G. Tucker, A.D. Peeples, M.C. Nemec, R. Hrybyk, R. Perez, *UMBC, Baltimore, Maryland*

Family involvement is often key to residents’ initial adjustment to life in assisted living and later to their transition into dementia care units (DCUs). In this paper, we first explore the role that families play in the lives of their relatives in the DCU and then examine the relationships that families have with frontline staff and managers. Drawing on ethnographic data from participant observation and interviewing conducted sequentially over fourteen months in three DCUs with residents and staff, we focus on families’ long-standing concern with safety; the process of, and change in, residents’ decision-making; attitudes toward formation of social relationships by residents; privacy; and the degree and expression of independence permitted in the DCU. We conclude with an examination of how residents’ family members, partners, and friends work in concert with staff and management to promote autonomy in the everyday experience of residents in the DCU.

THE INFLUENCE OF STAFF MEMBERS’ CLASSIFICATIONS OF RESIDENTS WITH DEMENTIA ON RESIDENTS’ AUTONOMY

R. Rubinstein[2,1], P.J. Doyle[1], J. Eckert[2,1], M. Brazda[1], *1. Center for Aging Studies, Sociology/Anthropology Department, University of Maryland Baltimore County, Baltimore, MD, 2. Department of Sociology and Anthropology, UMBC, Baltimore, Maryland*

The way care workers understand, classify, and define the nature and characteristics of the residents with whom they work affects the extent to which residents’ autonomy is fostered or, conversely, constrained within an institutional context (e.g., assisted living). Frontline staff and managers in five diverse assisted living (AL) communities were interviewed as part of an ethnographic study of autonomy. Their narratives were analyzed to determine their perspectives and classifications of residents with dementia, and observations were noted on how they interacted with residents under their care. Using these data, this paper explores the ways that AL staff members’ classifications of residents with dementia shape aspects of residents’ autonomy. These findings provide insight into the profound influence that AL staff members’ perspectives of residents has on the residents’ quality of life, social environment, and expression of autonomy.

SESSION 465 (SYMPOSIUM)

CONTEMPORARY “AGES OF ME”: NEW INSIGHTS INTO SOCIAL AND SELF PERCEPTIONS OF AGE

Chair: N. Notthoff, *Institute of Personality and Social Research, University of California, Berkeley, Berkeley, California*
Co-Chair: J.M. Montepare, *Lasell College, Newton, Massachusetts*
Discussant: M.L. Hummert, *University of Kansas, Lawrence, Kansas*

Research on age-related social and self-perceptions has generated a wide range of enlightening findings. For example, it is well known that people hold systematic age stereotypes which may manifest themselves in explicit or implicit ways (Nelson, 2004). These social perceptions have far-reaching consequences (Meisner, 2012). Research on subjective self- perceptions of age has shown that adults often experience discrepancies between their actual and subjective age, typically holding younger identities (Montepare & Lachman, 1989; Rubin & Berntsen, 2006). Like social perceptions, these self-perceptions have broad personal implications (Boehmer 2007; Kotter-Gruehn, Kleinspehn-Ammerlahn, Gerstorf, & Smith, 2009). In addition to broadening our understanding of how age impacts our social and personal worlds, existing findings are a catalyst for new questions. In this symposium we bring together several lines of research which explore such new questions. Notthoff and colleagues expand our understanding of age-related social perceptions by probing the power of brief vocal cues to inform perceivers about speakers' age and other attributes such as their cognitive status. Kotter-Gruehn and Gruehn extend work on basic age group categorization with their in-depth inquiry into the interaction of age and gender in shaping perceivers' impressions of the ideal adult. Brothers and colleagues disentangle previously observed relationships between personal views of future time horizons and well-being by considering the intervening role of self-awareness of aging. Finally, Montepare explores the extent to which formerly documented relationships between subjective age perceptions and body image hold true in the contemporary aging landscape.

I HEAR YOU! EXTRACTING INFORMATION ABOUT AGE AND CHARACTERISTICS OF OTHERS FROM VOICE RECORDINGS

N. Notthoff[1], J.M. Montepare[2], M.L. Hummert[3], M. Lachman[4], *1. Institute of Personality and Social Research, University of California, Berkeley, Berkeley, California, 2. Lasell College, Newton, Massachusetts, 3. University of Kansas, Lawrence, Kansas, 4. Brandeis University, Waltham, Massachusetts*

People can be remarkably accurate in quickly forming impressions of others based on "thin slices" of behavior (Ambady & Rosenthal, 1992). How good are they when snippets of information are available through one channel only? We examined the accuracy of 20 young (18-20 years, M=18.45) and 20 older (62-99 years, M=79.70) listeners' perceptions of 102 speakers (34-84 years, M=60.42) formed based on voice recordings in which speakers repeated five numbers. Speakers were participants from the Boston subsample of the MIDUS-study. Listeners rated each speaker's age, intelligence, stress level, and attractiveness. Listeners tended to underestimate speakers' age (Mean Discrepancy=-16.05, SD=11.27, p<.001). Ratings of speakers' age were related to speakers' subjective age (r=.45, p<.001) and to speakers' cognitive performance. Ratings of speakers' intelligence were predictive of actual intelligence indicators (B=.59, SE=.21, p=.006, controlling for age). Implications for interactions in a world in which virtual communications are becoming increasingly common will be discussed.

CAN AGE STEREOTYPES OVERRIDE GENDER STEREOTYPES? PERCEPTION OF IDEAL ADULTS DEPENDS ON AGE AND GENDER

D. Kotter-Gruehn[1], D. Grühn[2], *1. Department of Psychology and Neuroscience, Duke University, Durham, North Carolina, 2. North Carolina State University, Raleigh, North Carolina*

Aging research has mainly focused on the perception of older adults based on age categorizations. Individuals do, however, belong to more than one social category and stereotypes resulting from categorizing people may reflect more than one domain (e.g., age and gender). We examined whether the attributes that characterize an ideal adult differ as a function of age and gender of the ideal adult and/or age and gender of the participant. 302 younger and 146 older adults were assigned to one of three conditions in which they rated (1) the ideal adult/woman/man; (2) the ideal adult/young woman/young man; and (3) the ideal adult/old woman/old man on stereotypical sex-role items. Results show that young adults rate older targets as least similar to an ideal person whereas older adults rate younger targets as least similar to the ideal adult. This effect was further moderated by the gender of the target.

DOES AWARENESS OF AGING EXPLAIN THE RELATIONSHIP BETWEEN FUTURE TIME PERSPECTIVE AND PSYCHOLOGICAL WELL-BEING?

A.F. Brothers[1], M. Miche[2], H. Wahl[2], M.K. Diehl[1], *1. Human Development and Family Studies, Colorado State University, Fort Collins, Colorado, 2. Department of Psychological Aging Research, University of Heidelberg, Heidelberg, Germany*

Although many older adults report relatively high levels of psychological well-being (PWB), a more limited future time perspective (FTP) is common in later life, and is associated with lower PWB. The perception of one's own aging may explain this seemingly discrepant trend, because the way in which one's own aging is experienced when the future is limited may shape a person's sense of well-being. Therefore, we examined if two broad dimensions (i.e., gains vs. losses) of adults' awareness of age-related change (AARC) mediate the association between FTP and PWB. The sample consisted of 586 community-residing adults 40-102 years old. As expected, AARC gains and losses were significant mediators and findings were consistent with partial mediation for all six PWB dimensions. The findings were stronger for AARC losses than gains, suggesting that the conscious awareness of negative age-related changes accounts for a substantial portion of the association between FTP and PWB.

SAME OLD, SAME OLD: PERSISTENT RELATIONS BETWEEN WOMEN'S BODY IMAGE AND SUBJECTIVE AGE

J.M. Montepare, *Lasell College, Newton, Massachusetts*

Twenty years ago, research documented links between women's negative body image and perceptions of themselves as old (Montepare, 1996). Since then, shifting age demographics have purportedly prompted changes in how aging is viewed and valued. This research explored the extent to which previously observed age-related body perceptions may have also changed. 152 women (51 to 84 years) completed a survey about aspects of their body image (BESAA; Mendelson et al., 2001) and subjective age. Age awareness (the extent to which age is viewed as an important personal attribute) was also explored in light of its suggested intervening role in age-related perceptions. As observed two decades ago, many women held negative body attitudes and older age identities. Moreover, now this was especially true for women with high age awareness. Subjective age predicted attitudes more strongly than did actual age. Determinants and implications of these persistent age perceptions are discussed.

SESSION 470 (SYMPOSIUM)

IMPACT OF PENSION REFORMS: EMPLOYMENT TRENDS, WOMEN'S PERSPECTIVES AND STRATEGIES IN IRELAND

Chair: N. Duvvury, *NUI, Galway, Galway, Ireland*

Demographic ageing and its accompanying increased pension costs have led many western countries to implement pension reforms and other policies to extend working life. Ireland has recently introduced such reforms and has simultaneously experienced a prolonged economic recession, accompanied by austerity policies. This paper draws on national employment datasets to analyse differentiated gendered trends in employment participation and pension coverage for older workers. It uses qualitative interview data from a recent cross-border study of Older Women Workers and Pensions (Duvvury et al, 2012) to explore the current and likely future impacts for women of the introduction of such policies. In particular, it uses a lifecourse analytic approach and explores whether and how women in various sectors use 'extended work' or 'delayed retirement' as a strategy to combat cumulative disadvantage they may experience in income and pension-building. This enhances our understanding of how women construct pensions and retirement.

IS SEVENTY THE NEW SIXTY? GENDER AND THE EXTENSION OF WORKING LIFE

D. Street, *Department of Sociology, University at Buffalo, SUNY, Buffalo, New York*

By the 1990s, the average age of retirement had declined to 57 in the United States and 61 in Canada. Since then, the age of retirement has inched up several years in both countries, and current North American workers anticipate staying in paid work even longer in the future. Such broad trends in the relationship between older ages and labor market participation, however, mask persistent differences between women and men workers in liberal welfare states, where 20th century employment and retirement policies were built on the male breadwinner model of employment. Using national level employment data from the United States and Canada, I show how national trends among older workers are gendered, and critically analyze how recent public policy innovations and employment practices are implicated in the extension of working life for women and men.

REINVENTING RETIREMENT IN THE UK: A GENDERED PERSPECTIVE

W.A. Loretto, *Business School, University of Edinburgh, Edinburgh, United Kingdom*

Across industrialised nations demographic changes have prompted a raft of policies focused on extending working lives to accommodate the economic and social costs of ageing populations. Government interventions, local labour market demands, and individual preferences have led to a ‘loosening’ of retirement, with the traditional model of ‘cliff-edge’ retirement becoming increasingly irrelevant. Instead, more people are engaging in some form of phased retirement, e.g. taking on bridge jobs, becoming self-employed and even ‘un-retiring’ (for an overview, see Loretto and Vickerstaff, 2013). This ‘reinvention’ of retirement (Maestas, 2010) has thus far focused mainly on paid work. Significantly, by ignoring other forms of ‘work’ such as volunteering or unpaid care, the current focus serves to marginalise the position of older women. Drawing on a recent survey of 1500 over-50s in the UK, this paper will explore gendered aspects of retirement reinvention.

EXTENDED WORKING LIFE AS A CHALLENGE AND POSSIBILITY: A GENDER PERSPECTIVE OF THE SWEDISH CASE

C. Krekula, *Dept of Social and Psychological Studies, Karlstad, Sweden*

Sweden has a flexible pension age between 61–67 years, and is one of many countries that are considering an extended working life. Therefore, a national investigation into retirement age was conducted in 2011 to establish an overview of retirement-related age limits and investigate the possibilities of encouraging an extended working life. By using Carole Bacchi’s ‘What’s the Problem?’ approach, I will analyse the results of the investigation, ‘Measures for a prolonged working life’. My analysis will problematize the challenges that an extended working life is expected to present and also illustrate how gender is constructed in the review’s conceptions of problems and possibilities. Finally, I will argue that older workers are constructed narrowly and in a manner whereby important characteristics differ from the way in which younger workers are viewed. This means that older women’s opportunities to continue working at an older age have become more problematic

CROSS-NATIONAL GENDER PERSPECTIVES ON OLDER WORKERS

A. Ni Leime[1], S.A. Vickerstaff[2], *1. Irish Centre for Social Gerontology, NUI, Galway, Galway, Ireland, 2. University of Kent, Canterbury, United Kingdom*

Both International agencies and national governments have reacted to demographic aging by implementing policies designed to extend working life. While the pace of reactions has varied, policies that include raising state pension ages/delaying retirement have been introduced in many countries. Yet these policy initiatives do not take into account the differentiated implications of such policies for men and women. Extended working life/postponed retirement processes are gendered, in that women’s and men’s labor market trajectories and employment sectors typically differ. This symposium will facilitate discussion of differences and similarities in the gendered impacts of such policies across five countries with different policy and socio-economic contexts; the United States (US), Canada, the United Kingdom (UK), Sweden and Ireland. Paper 1 interrogates retirement policy in the US and Canada, using national employment data to explore gendered policy trends and analyse the impacts of new policies. Paper 2 analyses quantitative national survey data and discusses the differentiated impacts by gender of the reinvention of retirement in the UK. Paper 3 critically analyses current and future policy formulation regarding extended working life in Sweden from a gender perspective. Paper 4 critically assesses impacts of policy reforms in Ireland analysing pension trends, using qualitative data to identify older workers’ strategies. Aims: 1. Gain understanding of commonalities and differences of the likely impacts of introducing extended working life policies for men and women across five national policy contexts. 2. Stimulate debate and inform future policy on the gender impacts of extended working life policies.

SESSION 475 (SYMPOSIUM)

HUMAN GENETICS OF AGING AND LONGEVITY

Chair: M.E. Levine, *University of Southern California, Los Angeles, California*

Discussant: T.T. Perls, *Boston University School of Medicine, Boston, Massachusetts*

Significant evidence exists supporting the role genetic factors in aging and longevity. Twin studies estimate that genetic differences account for approximately 25-30% of the variation in human lifespan, and there is evidence to suggest that this proportion may be even higher for persons surviving to extreme ages, or individuals exposed to hazardous environmental conditions. With the recent availability of large genetic data sets, researchers now have the resources needed to further investigate the role genes and gene-environment interactions play in aging. The overall goal of this symposium is to present multiple methods for identifying genetic factors that predict a variety of aging and longevity outcomes. The talks will discuss the insights that have been gained from family and twin studies, and describe longevity-associated phenotypes and genotypes which predict survival duration among exceptionally long-lived individuals. Additionally, aside from traditional phenotypes for longevity, such as centenarians, talks will also discuss how using other phenotypes, such as, 1) long-lived smokers as a model for physiological stress resilience, or 2) biomarker algorithms to estimate aging in middle-aged populations, may facilitate discovery of genetic factors that impact aging and longevity. Finally, although many studies in the literature have focused on the effects of individual genes, talks from this symposium will also provide evidence for the importance of additive (polygenic) or multiplicative (epistatic) gene effects, using prior knowledge of gene-disease associations, biological pathways, and protein-interactions, and then demonstrate how these can be used to create risk scores that successfully predict other aging and longevity related outcomes.

MITOCHONDRIAL DNA COPY NUMBER IN HUMAN PERIPHERAL BLOOD CELLS ASSOCIATE WITH AGE, SURVIVAL AND GENERAL HEALTH AMONG ELDERLY

J. Mengel-From, M. Thinggaard, C. Dalgård, K.O. Kyvik, K. Christensen, L. Christiansen, *Epidemiology, Biostatistics & Biodemography, University of Southern Denmark, Odense C, Denmark*

The role of the mitochondria has drawn much attention. Thus we aim to pursue the mitochondria role on aging, survival and health. In our study including 1,067 Danish twins and singletons (18-93 years of age), mainly including elderly and oldest old, the relative quantity of mitochondrial DNA compared to nuclear DNA, i.e. the mitochondrial DNA copy number (mtDNA CN) was measured in peripheral blood cells. We estimated a significant cross-sectional mtDNA CN decline of 0.54 per year for those older than approximately 50 years of age. However, the longitudinal yearly decline within the same individual was more than twice as steep as that estimated in the cross-sectional analysis. Subjects with low mtDNA CN were poorer in terms of all-cause mortality, cognitive performance, physical strength, and self-rated health. Hence, the mtDNA CN mortality association can contribute to the smaller decline in the population (cross sectional) compared to the individual longitudinal decline.

HIGH-DENSITY LIPOPROTEIN CHOLESTEROL PHENOTYPE AND GENOTYPE PREDICT SURVIVAL IN INDIVIDUALS WITH EXCEPTIONAL LONGEVITY

S. Milman[1], G. Atzmon[1], P. Cohen[2], J. Crandall[1], N. Barzilai[1], *1. Albert Einstein College of Medicine, Bronx, New York, 2. University of Southern California, Los Angeles, California*

Individuals with exceptional longevity exhibit a unique high-density lipoprotein (HDL) cholesterol phenotype, which is associated with a CETP gene polymorphism. We hypothesized that longevity-associated HDL phenotype and CETP genotype can predict survival in exceptionally long-lived individuals (median age 97, IQR 96-100). Females (n=326) with HDL levels above the mean had significantly longer survival compared to females with HDL levels below the mean, $p<0.01$. A similar trend was noted in men (n=106). In addition, participants with higher APOA-1 levels and larger HDL particle size survived longer than those with lower levels and smaller particle size, $p<0.01$ and $p=0.02$, respectively. CETP 405VV genotype was associated with extended survival, $p=0.03$. In stratified multivariable adjusted models, positive association between HDL levels and survival was specific to individuals with elevated insulin-like growth factor-1 levels, $p<0.05$. These results confirm that longevity-associated HDL cholesterol phenotype and genotype are predictive of life expectancy in individuals with exceptional longevity.

POLYGENIC RISK FOR COMMON CHRONIC HEALTH CONDITIONS AND THE PACE OF AGING AT MIDLIFE

D. Belsky, *Center for the Study of Aging and Human Development, Duke University, Durham, North Carolina*

How do genetic risks discovered for age-related disease affect the pace of aging in healthy individuals? I studied a birth cohort of 1,000 individuals followed prospectively through their fourth decade of life. I measured cohort members' individual pace of aging using repeated measures of a biomarker panel tracking cardiovascular, metabolic, renal, hepatic, and pulmonary function. I validated aging measures against objective and subjective measures of physical and cognitive function. I next used DNA data and published genome-wide association study results to construct measures of polygenic risk for common chronic diseases—genetic risk scores. I then tested whether individuals at elevated genetic risk for chronic disease exhibited an accelerated pace of aging by midlife. Finally, I tested the extent to which genetic risks discovered for diseases of a specific organ system have consequences for physiology outside of that organ system. Results suggest novel applications of genetic information in studies of aging.

THE WHOLE IS GREATER THAN THE SUM OF ITS PARTS: USING NETWORK ANALYSIS TO IDENTIFY LONGEVITY GENES

M.E. Levine, *University Southern California, Los Angeles, California*

This study uses long-lived smokers—a biologically-resilient phenotype—to identify gene networks associated with longevity. A genome-wide association study was run on 90 current smokers ages 80+ and 730 current smokers under age 70 from the Health and Retirement Study. Single nucleotide polymorphisms with $P<5x10-03$, were used to create a functional interaction (FI) network and identify the sub-networks comprising it. Finally, polygenetic risk scores (PRS) for the whole network (n=208 genes), as well as for each sub-network were created and evaluated using multiple longevity phenotypes. Overall, the PRS predicted whether smokers were long-lived with 99% accuracy (AUC=0.988). Furthermore, the PRS was significantly associated with survival to age 90 among never-smoking African Americans (OR: 1.08, $p=.02$)—another presumably resilient group. Finally, we found that including statistical interactions between the sub-networks improved the ability of the PRS to predict survival to age 90 among both Caucasian and African American never-smokers.

SESSION 480 (SYMPOSIUM)

THE ROLE OF SUBSTANCE ABUSE IN ELDER ABUSE

Chair: K.J. Conrad, *Chestnut Health Systems, Oak Park, Illinois, Univ. of Illinois at Chicago, Chicago, Illinois*

This paper tests a theory of the influence of abuser substance abuse (SA) and victim SA (with controls for abuser and victim factors) on isolation and five types of elder abuse: financial, physical, sexual, emotional, and neglect. Which has stronger influence: abuser SA, victim SA, or the combination on isolation and abuse? The analyses included regression models and structural equation models. Preliminary analyses on financial exploitation indicated that abuser SA predicted financial exploitation whereby less abuser SA was significant. Victim SA was not significant. Final analyses will include over 1500 substantiated cases. Participants will be able to compare the influence of substance abuse by abusers and victims across types of abuse.

SUBSTANCE USE AND ABUSE IN LATER LIFE: LINKING SOCIAL CONTEXTS, SOCIAL NETWORKS, AND INDIVIDUAL FACTORS

S.L. Canham[1], C. Egan[2], J. Culberson[3], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. VA Connecticut Healthcare System, West Haven, Connecticut, 3. Texas Tech University, Health Science Center, Lubbock, Lubbock, Texas*

Considerable research has acknowledged the growing rates of alcohol, prescription, and illicit drug use in later life and the importance of studying this emerging public health problem. However, diversity of social contexts and networks complicate our understanding of how social factors influence individual patterns of substance use. This symposium will include presentations from a group of interdisciplinary researchers representing multiple perspectives across the Health Sciences, Behavioral and Social Sciences, and Social Research, Policy, and Practice Research sections. A presentation by a clinical psychologist will use a social-ecological framework to present empirical literature published over the past decade to update our knowledge of older adults' abuse of alcohol, prescription, and illicit drugs. A second presentation will review alcohol and tobacco use data collected from a sample of adults in rural Louisiana enrolled in a disease self-management education program and discuss associations between exercise frequency, health ratings, and healthcare utilization and alcohol abuse. A third presentation will review the role of substance abuse in elder abuse, testing a theory of the influence of abusers' and victims' substance abuse on isolation and five types of elder abuse—financial, physical, sexual, emotional, and neglect. Finally, a fourth presentation will review results of an analysis of the Health and Retirement Study, specifically addressing how neighborhood-level factors are associated with drinking quantity and frequency in middle-aged and older adults. To conclude this symposium, a geriatrician with extensive experience in addictions research will summarize these individual papers from a clinical and health services perspective and discuss implications.

NEIGHBORHOOD DISORDER, NEIGHBORHOOD SOCIAL COHESION, AND DRINKING IN MIDDLE-AGED AND OLDER ADULTS: FINDINGS FROM THE HEALTH AND RETIREMENT STUDY

S.L. Canham[1,2], L. Chen-Edinboro[1], C.N. Kaufmann[1], P. Mauro[1], M. Scherer[3], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. IRMACS Centre, Simon Fraser University, Burnaby, British Columbia, Canada, 3. Pacific Institute for Research and Evaluation, Calverton, Maryland*

Social context, including neighborhood factors, have been linked to depression; correlates of depression, such as drinking, may also be associated with social context. We studied adults aged 51+ who completed a leave behind questionnaire for the 2008 wave of the Health and Retirement Study. Participants reported neighborhood physical disorder and neighborhood social cohesion/trust, which were our primary predictors, and current drinking status ("ever drinking"). Overall, 54.6% of participants reported ever drinking. In separate adjusted logistic regression models, the odds of ever drinking increased as scores on both social cohesion/trust (odds ratio (OR)=1.07, 95% confidence interval (CI)=1.00-1.14, p=0.050) and physical disorder (OR=1.12, 95% CI=1.01-1.24, p=0.040) increased. Additionally daily drink quantity increased as scores of social cohesion/trust and physical disorder increased; however, these scores were not associated with drinking frequency. Results suggest that drinking is associated with these neighborhood factors and should be considered in understanding how social contexts influence health.

ALCOHOL AND TOBACCO USE AMONG RURAL-DWELLING OLDER ADULTS WITH CHRONIC DISEASE CONDITIONS

K. Kopera-Frye[1], R.A. Harris[2], D.G. Ryman[1], *1. University of Louisiana at Monroe, Monroe, Louisiana, 2. University of San Francisco, San Francisco, California*

Alcohol and tobacco use among Louisiana adults remains a critical public health problem. Your Life, Your Health! (YLYH) is a chronic disease self-management education program which was implemented in Louisiana. The participants consisted of 512 primarily female and Caucasian older adults, with an average education of over 12 years; most having two or more chronic conditions. Pre- and post-program multiple assessment surveys included questions on frequency of exercise, self-rated health, health distress, energy level, communication with physicians, and number of hospitalizations. Alcohol and tobacco use questions included the NMASSIST and CAGE, both of which screen for alcohol and tobacco abuse. Alcohol abuse, as assessed by the CAGE, significantly predicted only decreased exercise frequency post-program; surprisingly, it did not predict health rating, energy levels, healthcare utilization, or communication with physicians. Daiquiri and liquor drive through stands are prominent, and alcohol abuse in this rural area remains of great concern.

RISK AND PROTECTIVE FACTORS FOR OLDER ADULT SUBSTANCE ABUSE: A COMPREHENSIVE LITERATURE REVIEW

C. Egan, *West Haven VA, West Haven, Connecticut*

Understanding the factors that increase and decrease older adults' potential for substance misuse and abuse can provide a foundation for the development of prevention and treatment interventions. A comprehensive literature review was conducted to investigate the risk and protective (R&P) factors associated with older adults' misuse/abuse of alcohol, prescription and illicit drugs. Multiple databases were searched (CINAHL, PsycINFO, PubMed, Social Work and Sociological Abstracts) for empirical literature published from 2004-2014 based on samples of U.S. adults aged 55 and older. R&P factors were conceptualized within a social-ecological framework comprised of individual, peer, family, and community domains. Factors associated with alcohol misuse/abuse were the most commonly researched. Social support, marital status, substance use history, medical status, and religiosity were identified as factors with the strongest research support. Factors with moderate research support included peer norms, mental health history, and chronic pain. Literature review findings and implications will be discussed.

SESSION 485 (SYMPOSIUM)

INTERNET PROGRAMS FOR DEMENTIA CAREGIVERS: GLOBAL DEVELOPMENTS, BENEFITS AND NEXT STEPS

Chair: A. Pot, *Program on Aging, Netherlands Institute of mental health and Addiction, Utrecht, Netherlands, VU University, Amsterdam, Netherlands*

Discussant: S.J. Czaja, *University of Miami Miller School of Medicine, Miami, Florida*

Family is the cornerstone for people with dementia around the world. Since the number of people with dementia will triple until 2050, the number of family caregivers will follow this demographic trend. The detrimental impact of providing care to a family member with dementia is well documented and include psychological distress and poorer immune function. Therefore, efficient and effective support for family caregivers is needed more than ever. The Internet offers opportunities to provide available, accessible, and affordable support for dementia caregivers. The first presentation of this symposium is meant as an introduction into the field and will provide an overview of ICT interventions for dementia caregivers. Then, the content and outcomes of internet-based programs to decrease distress in dementia caregivers from three continents are discussed: North America, Asia and Europe. The last presentation focuses on the development of a global internet intervention for dementia caregivers by the World Health Organization (WHO). This intervention is especially developed for the support of family caregivers in Lower and Middle Income Countries (LMIC) and tries to take different cultural backgrounds into account. We finish by discussing the next steps to be taken in this field, such as culture sensitive content, the relationship between program content and caregivers' outcomes and how to increase compliance. Dr. Sara Czaja will be our discussant.

A SYSTEMATIC REVIEW OF ONLINE SUPPORTS TAILORED TO CAREGIVERS OF PERSONS WITH DEMENTIA

J.M. McMillan[1], J. Holroyd-Leduc[2,3], *1. Internal Medicine, University of Calgary, Calgary, Alberta, Canada, 2. Alberta Health Services, Calgary, Alberta, Canada, 3. University of Calgary, Calgary, Alberta, Canada*

Background: The purpose of this review was to evaluate the evidence regarding web-based resources as an avenue for providing support to dementia caregivers. Methods: We performed a systematic review using search terms such as "dementia", "caregiver", "support", and “interventions”. We searched Ovid Medline, Pubmed, Embase and CINAHL to October 2013. Studies were included if they were English language, and were systematic reviews, randomized controlled trials or other intervention studies that examined internet or web-based interventions for caregivers of persons with dementia. Results: Of the 190 abstracts identified, 28 were reviewed as full text articles and 13 met all eligibility criteria. These included 2 systematic reviews, 6 randomized controlled trials, 1 meta-analysis and 4 non-randomized intervention studies. Positive outcomes included increased caregiver confidence, self-efficacy, improved perceptions of the positive aspects of caregiving, and significant reductions in stress, strain, anxiety and depression in caregivers. Discussion and Conclusion: The potential for caregivers to access support services from the convenience of their own home, such as internet resources, is attractive.

EXPLORING THE EFFECTIVENESS OF AN INTERNET-BASED PROGRAM FOR REDUCING CAREGIVER DISTRESS USING THE ICARE STRESS MANAGEMENT E-TRAINING PROGRAM

D. Gallagher-Thompson[2,1], M. Tzuang[1,2], L. Thompson[2], *1. Stanford Geriatric Education Center, Stanford, California, 2. Dept. of Psychiatry and Behavioral Sciences, Stanford, California*

Adapted from the psychoeducational program “Coping with Caregiving” (CWC) developed by Gallagher-Thompson and colleagues in the U.S., iCare is a web-based program designed to enhance caregivers’ skills to deal with the demanding tasks of caring for a person with dementia, reduce stress and improve quality of life. The uniqueness of this program is that professional actors were used to portray different relationships and various stressful situations that are common for most caregivers, show the typical responses first, and followed by more effective ways of managing the same situation. This method of presentation enables caregivers to role-model the skills being taught. Results from a randomized trial (N=150) found that iCare participants showed a decrease in level of depressive symptoms and stress, and improvement in quality of life. A “translated” evidence-based web-based program such as this has the potential to reach a larger number of caregivers who otherwise may not have access to it.

EFFECTIVENESS OF ONLINE COUNSELING ON CHINESE FAMILY CAREGIVERS OF PEOPLE WITH DEMENTIA

T. Kwok[1], A.M. Au[2], F. Ho[3], *1. Medicine & Therapeutics, the Chinese University of Hong Kong, Shatin, Hong Kong, 2. The Hong Kong Polytechnic University, Hung Hom, na, Hong Kong, 3. Jockey Club Centre for Positive Ageing, Shatin, Hong Kong*

Purpose: Family caregivers of persons with dementia (PWD) may receive caregiver training because of logistical constraints and privacy concerns. This pilot trial examined the effectiveness of online counseling in improving self efficacy of family caregivers of PWD in managing behavioral and psychological symptoms of dementia (BPSD). Subjects and methods: 36 family caregivers of people with dementia participated in a 9-week online intervention based on the cognitive behavioral therapy model. Four subjects dropped out and 26 had post intervention assessment. Outcomes of the intervention were measured by the Chinese version of the Neuropsychiatric Inventory Questionnaire and two domains of the Revised Scale for Caregiving Self-Efficacy. . Results: After participating in the online counseling program, total score in NPI-Q (12-item) reduced significantly ($p = 0.003$, two-tailed). Similarly, caregiver distress score (12-item) decreased significant ($p = 0.012$, two-tailed). No significant change was found in caregiving self-efficacy. Conclusion: Online cognitive behavioral therapy on family caregivers reduced BPSD of PWD and the related distress in the caregivers. A randomized controlled trial is being planned for.

THE EFFECTIVENESS OF ‘MASTERY OVER DEMENTIA’, A GUIDED INTERNET INTERVENTION TO IMPROVE CAREGIVERS’ MENTAL HEALTH

A. Pot[1,3], M. Blom[2], J. Bosmans[3], P. Cuijpers[3], S.H. Zarit[4], *1. Program on Aging, Netherlands Institute of mental health and Addiction, Utrecht, Netherlands, 2. Dutch Alzheimer Association, Amersfoort, Netherlands, 3. VU University, Amsterdam, Netherlands, 4. Penn State University, State College, Pennsylvania*

The content, effectiveness and costs of the Internet Intervention ‘Mastery over Dementia’ (MoD) will be presented and discussed. MoD has been developed by the Netherlands Institute on Mental health and Addiction, in collaboration with the Dutch Alzheimer Association and Geriant, a care provider. In a Randomized Controlled Trial (RCT), caregivers in the experimental group (N=149) receiving MoD, have been compared to caregivers who received a minimal intervention consisting of e-bulletins (N=96). Results based on intention to treat analysis show beneficial effects on several mental health outcomes, including symptoms of depression and anxiety and mastery.

DEVELOPMENT OF ‘ISUPPORT’: A GLOBAL WHO SELF-HELP INTERNET PROGRAM TO SUPPORT CAREGIVERS

T. Dua[1], D. Gallagher-Thompson[3], M. Varghese[6], M. Wortmann[2], A. Pot[4,5], *1. World Health Organization (WHO), Geneva 27, Switzerland, 2. Alzheimer Disease International (ADI), London, United Kingdom, 3. Stanford Geriatric Education Center, Stanford, California, 4. Netherlands Institute on Mental Health and Addiction (Trimbos), Utrecht, Netherlands, 5. VU University, Amsterdam, Netherlands, 6. Natl Inst of Mental Health & Neuro Sciences(NIMHANS), Bangalore, India*

In 2012 the World Health Organization (WHO) and Alzheimer’s Disease International (ADI), jointly developed the report Dementia: a public health priority. This report is aimed at raising global awareness of dementia as a public health priority, to articulate a public health approach and to advocate for action at (inter)national levels based on the principles of evidence, equity, inclusion and integration. As a second step, the WHO has taken the lead to develop an Internet program aimed at the support of caregivers of people with dementia worldwide, including low and middle income countries (LMIC). Experts from around the world are involved in shaping the program. Naturally, much attention is paid to the cultural differences and how to address them. For this purpose, focus groups are held with professionals and caregivers in the U.S. and India among others. First results will be presented and discussed.

SESSION 490 (SYMPOSIUM)

THE UTAH POPULATION DATABASE: VALUE OF LINKED MEDICAL AND FAMILY RECORDS FOR AGING RESEARCH

Chair: K. Smith, *University of Utah, Salt Lake City, Utah, Huntsman Cancer Institute,, Salt Lake City, Utah*

To expand our understanding of the etiology of aging and health risks, especially for questions linking early conditions to later outcomes, it is important that we organize sources of data and methods that span entire lives and cover many decades. Achieving this goal for entire populations is particularly valuable because of the gerontological insights and research designs that can be leveraged. In this symposium, we present four distinctive analyses that rely on the Utah Population Database (UPDB) a unique and powerful data resource that links, at the individual level, comprehensive population-based medical/Medicare, cancer, genealogical, geospatial, and vital records. Because of its scope (7.7 million individuals organized into multigenerational pedigrees), the UPDB allows for both full population-based analyses as well as studies that are based on recruitment into studies from select subpopulations drawn from UPDB. Two papers examine the full population: Hanson considers how cancer and its treatment affect later-life dementia and

Smith examines low birth weight and preterm birth as risks for cardiovascular disease phenotypes. Two other papers rely on samples of elderly that rely on the UPDB data: Queen considers the effects of familial history of longevity on cognitive functioning and Norton examines early life conditions and dementia risk. After attending this Symposium, participants will be able to discuss the research value of linking a wide range of administrative records AND they will be able to discuss how a number of important later–life outcomes (heart disease, dementia, cognitive functioning) are affected by conditions earlier in life.

PROFILES OF COGNITIVE FUNCTIONING: IS FAMILIAL EXCESSIVE LONGEVITY A PROTECTIVE FACTOR IN OLDER AGE?

T.L. Queen, C.A. Berg, H. Hanson, K.R. Smith, *Department of Psychology, University of Utah, Salt Lake City, Utah*

Protective factors to cognitive functioning in later life include education, cardiovascular health, and an engaged lifestyle. In this study, we examine whether a genetic propensity for longevity (familial excessive longevity, FEL) also acts as a protective factor to cognition in older adulthood. Probands selected for high FEL and age-matched controls along with their offspring and controls completed cognitive tests measuring working memory, verbal meaning, perceptual speed, and cognitive status (Mini-Mental State Exam). Probands performed better on average on the MMSE compared to controls and displayed a greater FEL advantage on this task. After controlling for age and gender, probands also performed better on the perceptual speed task. Offspring displayed a trend for performing better on the speed task. The FEL advantage for offspring may not yet be observed given that this group is younger and experiencing fewer cognitive deficits. We will discuss the potential relationship between FEL, cognition, and health.

UNDERSTANDING THE LINK BETWEEN CANCER AND DEMENTIA: EVIDENCE FROM THE UTAH POPULATION DATABASE

H. Hanson[1,2], K. Smith[1,2], K.P. Horn[2], K. Rasmussen[2], J. Hoffman[1,2], *1. Universtiy of Utah, Salt Lake CIty, Utah, 2. Huntsman Cancer Institute, Salt Lake City, Utah*

The underlying chronic systemic inflammation that increases the risk of developing cancer may also increase the risk of developing dementia and in particular, AD. Using the Utah Population Database (UPDB), a longitudinal population-based resource of linked medical and genealogical records, this study investigates the link between cancer an dementia by: (1) using a sample of 109,344 individuals to test the hypothesis that primary breast, prostate, colon, and melanoma cancer diagnoses are associated with an increased risk of dementia after age 65 when accounting for the competing risks of mortality using Medicare data linked to the UPDB, and (2) leveraging 12,985 sibling sets to control for unobserved factors shared by siblings that might contribute to the risk of cancer and dementia. The results of these analyses will provide fundamental insights into whether or not there is an underlying association between systemic inflammation, cancer, and dementia.

THE ROLE OF EARLY STRESSORS AND LATE-LIFE DEMENTIA: THE CACHE COUNTY MEMORY STUDY LINKED TO THE UPDB

M. Norton[1], K.R. Smith[2], H. Hanson[2], J. Tschanz[1], *1. Utah State University, Logan, Utah, 2. University of Utah, Salt Lake City, Utah*

Epidemiologic studies have traditionally relied on self-reports of participants' medical, social, and psychological histories. Subjective self-reports (especially over a lifetime) have known problems with retrospective recall bias. Large vital statistics and medical databases afford a more objective assessment of disease onset and progression, and assessment of risk/protective factors. For studies examining individuals with memory deficits and dementia diagnoses, it is crucial to secure data obtained from other objective sources. The subjects described in this study are from the Cache County Memory Study and have been linked to the Utah Population Database (UPDB), a rich source of linked population-based information for demographic, genetic, epidemiological, and public health studies. Through the Lifespan Stressors and Alzheimer's Disease Study (N=5092), we found significantly faster cognitive decline in late life among persons experiencing offspring death in young adulthood without subsequent live births, and significantly higher AD risk for parental death without remarriage of widowed parent.

LOW BIRTH WEIGHT AND PRETERM BIRTHS AND THEIR EFFECTS ON CARDIOVASCULAR DISEASE: A RETROSPECTIVE COHORT STUDY OF 20,000

K. Smith[2,1], H. Hanson[2,1], B.D. Horne[3], S. Knight[3], K. Curtin[2,1], *1. Huntsman Cancer Institute, Salt Lake City, Utah, 2. University of Utah, Salt Lake City, Utah, 3. Intermountain Healthcare, Salt Lake City, Utah*

The fetal origins theory describes how, during early life, the environment alters development that may have long term effects on later health and disease risk. This study tests the hypothesis that low/high birth weight (BW) and gestational age (GA) are associated with excess risk of specific phenotypes and biomarkers cardiovascular disease (CVD) after controlling for a key set of early and mid-life conditions. Subjects are drawn from the catheterization laboratory (CATH Lab) registry of the Intermountain Heart Collaborative Study (IHCS) established by Intermountain Healthcare that have been linked to the Utah Population Database (UPDB). What is novel about this study is the sample size (N=20,000) where people have both BW/GA (from birth certificates in UPDB) and CVD phenotypes (from the CATH Lab) This study will provide new information about specific elements of the vascular system that early adversity to cardiovascular disease in ways not examined before.

SESSION 495 (PAPER)

AGING AND THREATS TO SAFETY

ENHANCING DISASTER PREPAREDNESS OF BLACK, COMMUNITY-DWELLING OLDER ADULTS

L.M. Brown, K.A. Frahm, *School of Aging Studies, University of South Florida, Tampa, Florida*

A small but growing literature shows that financially or socially disadvantaged older Black adults are disproportionately affected by disasters. In general, older adults are the least prepared subgroup of the population despite historically having the highest rate of disaster-related deaths. However, little is known about what kinds of information are most beneficial or the most effective medium for delivery of information to enhance disaster preparedness. This exploratory study assessed reading ability, beliefs about disasters, social support, financial resources, health status, disaster literacy, current level of preparedness, and preferences for delivery of information by administering a structured questionnaire and disaster readiness assessment to 36 community-dwelling, Black older adults prior to their participation in one of five focus groups. Focus groups provided qualitative data on preferred delivery of information, as well as perceived barriers to and facilitators of disaster preparedness. A separate focus group (n=8) was also conducted with local religious and community leaders to obtain their perspective on elders' needs and ability to prepare for disasters. Our research revealed that most participants planned to use informal sources, such as family, friends, or neighbors as their primary source of information and not rely on written instructions or official directives to guide their preparedness efforts. Effective interventions that promote disaster preparedness are needed as people who plan ahead for disasters typically fare better during the response and recovery phases. A peer-to-peer approach may be beneficial for older adults who are at increased risk for adverse outcomes during disasters because of inadequate preparation.

EMERGENCY PREPAREDNESS AMONG COMMUNITY-DWELLING OLDER ADULTS WITH LONG-TERM CARE NEEDS: FAMILY PERSPECTIVES

T. Wakui[1,2], E. Agree[3], T. Saito-Kokusho[4], I. Kai[5], *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Population, Family and Reproductive Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. Johns Hopkins University, Baltimore, Maryland, 4. National Center for Geriatrics and Gerontology, Obu, Japan, 5. The University of Tokyo, Tokyo, Japan*

The Great East Japan Earthquake of 2011 highlighted a key challenge faced in aging societies: older people with special needs are especially vulnerable to disasters. Family will be the first to provide both guidance and hands-on help, and they have both the responsibility and the opportunity to improve the preparedness of older family members. The objective of this study was to identify support needs for emergency preparedness of older adults with informal caregivers and to understand potential barriers to implementing disaster plans. The 2011 wave of the Fukui Longitudinal Caregiver Survey collected open-ended answers on disaster planning and concerns from 1101 family caregivers of older Japanese with long-term care needs. We used SPSS Text Analytics for Surveys to extract the key concepts, and we categorized and coded them thematically. Most caregivers (73%) were female and the mean age was 65 years old. The family caregivers reported a lack of information on where to evacuate, how to evacuate, and whom they can rely on in time of emergency. Caregivers of older adults with mobility needs were most concerned about evacuation planning, and expected support by others but they had no plans for such support. Those caring for persons with cognitive impairment worried if they would have extra help for their older adults not only in time of evacuation but also at shelters. Targeted information on older adults with mobility and cognitive impairments would be helpful to promote disaster preparation among community-dwelling older adults and their families.

DEVELOPMENT OF DISASTER STAKEHOLDER OUTCOMES IN A NATURAL DISASTER

R. Ferreira[1], A.C. Faul[2], J.G. D'Ambrosio[2], *1. Tulane University, New Orleans, Louisiana, 2. University of Louisville, Louisville, Kentucky*

Communities worldwide are affected by daily fatal disasters. In March 2012, a rural area agency on aging responded to a tornado affecting 5500 households. The impact of the disaster resulted in an overload of cases handled by lay disaster case-managers. A social work evaluation team, contracted to assist the agency on aging, found roadblocks, including delay in response to email, reluctance to question case-managers and clients and concern that responses would reveal shortcomings in services. Through a series of alliance building meetings, the agency and social workers co-created an evaluation plan. A mixed-methods evaluative post-test design was used to evaluate services per the National Voluntary Organizations Active in Disaster (2011) procedural guide. The design included surveys to clients and focus groups with case-managers. The client survey measured service satisfaction, resilience and post-traumatic stress (PTSD). Results indicated overall client satisfaction with services. A major obstacle for older adults in the rural areas affected was PTSD experienced after the event. Limited mental health services in the rural areas exacerbated PTSD symptoms. Lack of employment opportunities and housing were among other obstacles identified that made adjustment after the tornadoes difficult for the older clients served. Case-manager focus group content analysis revealed stress, large caseloads, and lack of resources. Strength and encouragement were found in client stories of resilience and cohesiveness of communities. The evaluation team learned without alliance it's impossible to provide external objective evaluations of services delivered to older adults. The study identified community, direct case-worker and social service agency strengths

CONTINUES EXPOSURE TO COLLECTIVE TRAUMA IN DIFFERENT TYPES OF COMMUNITIES: PSYCHOLOGICAL EFFECTS

I. Regev, O. Nuttman - Shwartz, *School of Social Work, Sapir College, Sderot, Israel*

Most of the existing studies in the field of national trauma have focused on short-term exposure to a security threat, mainly among children, adolescents, and adults. However, there is a lack of knowledge about the ways elderly people adapt to the ongoing security threat and predictors of psychological distress. Thus, the current study aimed to compare the impact of prolonged exposure to missile attacks among elderly people in different types of communities (urban and rural). Another aim was to examine the impact of personal resources (self-esteem, social support, and cognitive appraisals) on psychological distress. Specifically, we examined the correlations of demographic characteristics, personality traits (self esteem), and cognitive appraisals (threat, challenge, and efficacy) with the dependent variable (psychological distress – PTSD). Questionnaires were collected from 298 elderly people residing in the southern region of Israel, which has been a target of missile attacks over the last decade. The results revealed that the urban residents reported higher psychological distress (PTSD) than did their counterparts residing in rural communities. Economic situation contributed significantly to explaining PTSD among elderly rural residents. In contrast, cognitive variables – especially sense of threat – contributed significantly to explaining PTSD among the elderly urban residents. The findings support Hobfoll's COR theory (1989), which sheds light on the importance of personal and environmental resources.

INTERNATIONAL COMPARISON OF FIREARM POLICY AND FATAL HOUSEHOLD VIOLENCE IN MID AND LATER LIFE

S. Salari, C.L. Sillito, *Family & Consumer Studies, University of Utah, Salt Lake City, Utah*

The U.S. ranks number one in firearms owned per capita (88.8 per 100) compared to 178 other nations (UNODC, 2012). Guns are involved in the majority of American homicides (70%) and suicides (51%) (CDC, 2010). Other industrialized countries have substantially fewer firearm deaths due to restrictions. In the U.S. approximately one third of households contain at least one gun. Widespread availability of firearms will play a role in the aging of the population. Suicide has been problematic for elderly white men (29 deaths per 100,000 population; 47 for those 85+) and rates are alarmingly high among Baby Boomers (17.6 per 100,000), which is predicted to increase with age (CDC 2013). Home protection has been the aim of the gun culture in the U.S. However, firearms are far more likely used by a household member to commit homicide, suicide or combination of both. Women are more at risk of intra-familial homicide, while men are more vulnerable to suicide (Krienert & Walsh, 2010). Our study content analyzed 729 intimate partner homicide suicide events (1600 deaths) in the U.S. 1999-2005. Results corroborate the victimization of women, the perpetration patterns of men, and describe the increased lethality of firearm methods. "Suicide pacts" and CDC "mercy killings" were rare. Firearm policy was compared in the other industrialized countries and gun related homicide and suicide rates for those in mid/later life were noted. Firearm availability was related to the lethal outcomes of family violence. Implications for safe homes and violence prevention are discussed.

SESSION 500 (PAPER)

NEW RESEARCH ON DISABILITY AND MOBILITY

COGNITION IMPACTS MOBILITY: RESULTS FROM TWO PILOT RCTS OF THE HEALTHY BRAIN, HEALTHY BODY STUDY

R. Smith-Ray, *Univ of Illinois at Chicago, Chicago, Illinois*

Impaired mobility is a major risk factor for falls. It is becoming clear that the link between the central nervous system and mobility is multifaceted with cognition playing an important role. To date, six studies have intervened on cognition to improve gait and balance, including two pilots conducted by our study team. The purpose of this presentation is to present findings from our two pilot trials. Ninety-six participants were recruited to the Healthy Brain, Healthy Body studies. Both studies used a RCT design and tested the hypothesis that 10-week cognitive training intervention improves balance and gait in older adults. Participants were randomly assigned to a cognitive training intervention or measurement-only control. The intervention was implemented at independent living communities (STUDY1) and senior centers (STUDY2). Primary outcomes included gait speed, distracted gait speed, and balance as measured by Timed Up and Go (TUG) and Berg Balance Scale (BBS). Measures were collected at baseline and 10-weeks. Participants in STUDY1 (N=51) had an average age of 82.0. Participants in the STUDY2 (N=45) had an average age of 72.5. After 10 weeks, intervention participants in both studies performed significantly better than controls on balance (STUDY1: TUG [F(2,36) = 4.47, p = 0.036]; STUDY2: BBS [F(1,31)=5.68, p=0.038). Participants in STUDY2 also performed better than controls on gait speed post-intervention [F(1,29)=6.57; p=0.016)]. Results from these two studies demonstrate the feasibility of a cognitive training intervention across different settings and provide a consistent picture of the link between cognition and balance among older adults.

ASSOCIATION BETWEEN RACE, MULTIMORBIDITY AND MOBILITY LIMITATION AMONG MEN IN THE UNITED STATES

R. Thorpe[1], V. Johnson-Lawrence[2], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. University of Michigan, Flint, Michigan*

Little is known about the relationship between multimorbidity and mobility limitation and if this relationship varies by race among men. Using data from 1999-2010 waves of the National Health and Nutrition Examination Surveys (NHANES), this study assessed the associations of multimorbidity and self-reported limitations, in the contexts of age and race/ethnicity (non-Hispanic white, non-Hispanic black, Hispanic, other) among men (n=5119) aged 50+ years. Multimorbidity was defined as the count of any of 10 chronic conditions: asthma, arthritis, heart disease, stroke, emphysema, chronic bronchitis, hypertension, cancer, diabetes, or chronic kidney failure. Mobility limitations were based on whether respondents reported having any difficulty walking up 10 steps or walking a quartile mile. Complex survey sampling weights were applied in the analyses to account for the sampling design of the NHANES. Logistic regression models showed that greater multimorbidity (OR=1.54, 95% CI = 1.44-1.65) was associated with more limitations among men independent of age, race/ethnicity and marital status. Non-Hispanic black men were more likely to report limitations (OR = 1.42, 95% CI = 1.13-1.78) than non-Hispanic white men. No significant interaction terms of race and multimorbidity were observed in association with mobility limitations. Future work to identify the additional risk factors associated with limitations independent of multimorbidities are warranted, particularly among African American men given their excess chronic disease risk and high rates of premature

RESOLUTION OF UNMET NEED FOR ASSISTANCE WITH ADL DISABILITIES REDUCES RISK FOR FALLING

L.P. Sands, Z. Haas, *School of Nursing, Purdue Univ, West Lafayette, Indiana*

BACKGROUND: Falling increases risk for morbidity and mortality, especially among older adults with activities of daily living (ADL) disability. Unmet need for help with ADL disabilities increases risk for falling, but little is known about whether resolution of unmet ADL need reduces risk for falling. METHODS: Data from the 2011 and 2012 rounds of the National Health & Aging Trends Study provide information about ADL functioning, unmet need for help with ADL disabilities, and self-reported falls in the month before the interview. The analytic sample included 608 community-living older adults who reported unmet need for assistance for at least one ADL disability in 2011. RESULTS: Half of those who reported unmet ADL need in 2011 did not report unmet ADL need in 2012. In 2011, 29% reported falling. In 2012, 27% reported falling. Compared to those who continued to report unmet ADL need in 2012, those who resolved their unmet ADL needs were half as likely to report falling in 2012 (OR= 0.54; 95% CI= 0.29 – 1.00). Among those who reported falling in 2011, 34% of those with resolved unmet ADL need and 48% of those with continuing unmet ADL need reported falling in 2012 (p=0.05). Among those who did not report falling in 2011, 15% of those with resolved unmet ADL need and 26% of those with continuing unmet ADL need reported falling in 2012 (p = 0.01). CONCLUSIONS: Resolution of unmet ADL need reduces risk for falling. The results highlight the importance of interventions that resolve unmet ADL need.

REDUCING EXCESSIVE FEAR OF FALLING WITH EXPOSURE THERAPY PLUS EXERCISE

J. Wetherell[1,2], C. Merz[3], A. Petkus[4], E.S. Bower[4], *1. VA San Diego Healthcare System, San Diego, California, 2. Dept. of Psychiatry, UCSD, La Jolla, California, 3. Washington University, St. Louis, Missouri, 4. SDSU/UCSD Joint Doctoral Program in Clinical Psychology, San Diego, California*

Approximately 10% of older adults living independently in the community, including more than 5% of those who have never fallen, experience moderate to severe fear of falling (FoF) and avoid multiple activities as a result. Excessive FoF leads to decreased physical activity, disability, loss of independence, depression, anxiety, reduced social engagement, poor quality of life, and falls. We developed an in-home, physical therapist-delivered intervention (“Activity, Balance, Learning, and Exposure,” or ABLE) that integrates exposure therapy with exercise and a home safety evaluation for older adults with excessive and disabling FoF. We randomly assigned 40 adults over age 65 with severe FoF and low to moderate objective fall risk to ABLE (n=19) or in-home fall prevention education (FPE; n=21). Participants included 30 women and 10 men, 33% ethnic minority, with a mean age of 78.3 (SD = 7.4, range 65-91). Attrition rates were 2/19 from ABLE and 0/21 from FPE. Participants receiving ABLE improved more than those receiving FPE on fear of falling, as measured by the Falls Efficacy Scale International, F (4, 38) = 5.45, p = .001, and avoidance, as measured by the Adapted Activity Card Sort, F (2, 38) = 4.08, p = .02. Participants in ABLE experienced 6 falls during the intervention, vs. 5 falls in the FPE group. These data suggest that ABLE may be more efficacious than fall prevention education at reducing fear and avoidance in older adults with excessive fear of falling.

DON'T LOSE YOUR BRAIN AT WORK – WORK TASK MOBILITY IS ASSOCIATED WITH GREATER BRAIN VOLUME IN FRONTAL AND STRIATAL REGIONS

J. Oltmanns[1], B. Godde[1], U.M. Staudinger[2], *1. Jacobs Center on Lifelong Learning, Jacobs University Bremen, Bremen, Germany, 2. Columbia University, New York, New York*

Despite age-related declines in some facets, cognitive functioning retains the potential for enhancement throughout the lifespan. Characteristics of the work context such as job complexity have been positively related to adult cognitive functioning (Schooler, 2007). To date, the (neurophysiological and neuropsychological) mechanisms underlying these associations are not well understood. To control for the influence of education and SES, the present study investigates the effect of repeated work-related task changes (=work task mobility; WTM) at a low to medium level of education. Of 3.500 assembly line workers from a production company in northern Germany who had been full-time employed with that company over the last 16 years, 179 persons returned a screening questionnaire. This allowed us to identify 10 (n=20) pairs of participants who differed in WTM (high/low) but were optimally matched for age, sex, job complexity as well as academic performance, openness to new experience and leisure time activity in young adulthood. In order to investigate long-term effects of WTM on a neurophysiological level, we collected structural MR images and used voxel-based-morphometry (VBM) to assess cerebral volume differences between high and low mobile participants. First results revealed that high as compared to low WTM was significantly related to more volume in prefrontal and striatal regions. Two areas that are typically affected by the age-related cognitive decline but seem to be particularly important when it comes to cognitive functioning. Within the limitations of the matching process, these initial results highlight the importance of cumulative effects of work on brain aging.

SESSION 505 (PAPER)

SUBJECTIVE WELL-BEING IN LATER LIFE

DEVELOPING A CONSUMER DRIVEN DEFINITION OF FINANCIAL WELL-BEING FOR OLDER AMERICANS

H.L. Ortiz[1], A. Drever[2], *1. Office for Older Americans, Consumer Financial Protection Bureau, Washington, District of Columbia, 2. Corporation for Enterprise Development (CFED), Washington, District of Columbia*

What is financial well-being? Past research has often alluded to financial well-being without actually defining it, or has used income, savings or assets to infer it. We conducted semi-structured hour-long interviews with 30 practitioners and 56 consumers from a wide range of backgrounds, ages, and regions of the US in order to develop a definition of financial well-being grounded in consumers' everyday experiences. The results of our qualitative analysis tended to converge naturally toward, a single, broadly applicable definition of financial well-being. In summary: financial well-being is freedom from worry about one's finances. It entails having control over one's finances, having the capacity to absorb a financial shock, being on-track to meet financial goals and being able to make choices that allow one to enjoy life. The research also investigated the drivers of financial well-being within the domains of financial behavior, financial knowledge, and personal characteristics. As part of the research we explored whether financial well-being means the same thing to Americans 62 and older and Americans between the ages of 18 and 61. We found that although the same financial well-being definition was relevant for both groups, financial well-being manifests differently in the two populations. And these differences have important measurement, program and policy implications.

DEFINING WELLNESS THROUGH THE VOICE OF COMMUNITY-DWELLING OLDER ADULTS

A.L. Hartzler[1], K. Osterhage[2], T. Beeson[2], G. Demiris[3], E.A. Phelan[4,2,5], S.M. Thielke[6,7], A.M. Turner[2,8], *1. University of Washington - The Information School, Seattle, Washington, 2. University of Washington - Department of Health Services, Seattle, Washington, 3. University of Washington - Biobehavioral Nursing and Health Services, Seattle, Washington, 4. University of Washington - Medicine/Gerontology and Geriatric Medicine, Seattle, Washington, 5. Group Health Research Institute, Seattle, Washington, 6. University of Washington - Department of Psychiatry and Behavioral Sciences, Seattle, Washington, 7. Geriatric Research, Education, and Clinical Center, Puget Sound VA Medical Center, Seattle, Washington, 8. University of Washington - Department of Biomedical Informatics and Medical Education, Seattle, Washington*

As a core component of community living for aging individuals, wellness programs are designed to meet the diverse needs of older adults. Many programs align support services with traditional models of wellbeing comprised of physiological, cognitive, and social dimensions of health defined by theoretical frameworks. Despite these initiatives, little attention has been paid to how older adults themselves define wellness in the context of community living. To address this gap, we are exploring the concept of wellness by engaging community-dwelling older adults in ongoing focus groups (10 participants across 2 sessions to date). Group discussions about participants' goals and activities for staying healthy support and extend existing frameworks. Rather than framing wellness in terms of health-related deficits (e.g., loss of mobility), participants expressed wellness from a position of personal strength – primarily focusing on the ways they stay physically and mentally healthy. For example, participants engage in regular fitness and activities to stay mentally active (e.g., reading, watching game shows, memorizing poetry). The social context of community living illustrated rich interactions among social, physical, and mental dimensions of well-being, including peer exercise programs and social activities (e.g., book club, bridge group). Wellness barriers also surfaced (e.g., physically challenging fitness programs), which were often mediated through support obtained from family, friends, and staff. Because wellness is an important concept that drives both policy and service delivery for aging individuals, incorporating the voice of older adults is critical to understanding and meeting their diverse needs.

RETIREMENT AND TRAJECTORIES OF LIFE SATISFACTION: THE ROLE OF EDUCATION AND LAST LABOR MARKET STATUS

M. Wetzel, O. Huxhold, *German Centre of Gerontology, Berlin, Germany*

Objectives. The research project examines trajectories of life satisfaction at the transition to retirement. Following a life course perspective, we analyze the impact of education and last labor market status on retirement transition for different temporal episodes. Methods. We used data from the German Socio-Economic Panel to estimate a multi-group, multi-episodes dual change score model. For 3,361 retirees with almost 28,000 observations the trajectories of life satisfaction from six years prior, over shortly after, and up to eight years after retirement were modeled discontinuously. Results. Retirement significantly changes the development of life satisfaction in the short-term as well as in the long-term. Educational class was associated with differential long-term developments of life satisfaction. Prior unemployment was accompanied mostly by a positive short-term effect on retirement. Overall, the model fitted the data very well (CFI = 0.981; RMSEA = 0.021). Discussion. The results indicate that retirement is a major change in living conditions which the higher educated process better in the long-term. Last labor market status differences decrease in the short-term but remain in the long-term. Hence, retirement functions in the long-term as a step of cumulative inequality as well as in the short-term as a leveler of inequality.

THE IMPACT OF ADOLESCENT PERSONALITY AND EXPERIENCES ON LATER LIFE SATISFACTION IN PROJECT TALENT

D.L. Achorn[1], J.M. Parisi[2], D. Battle[1], V. McSorley[1], S.J. Lapham[1], G. Rebok[1,2], *1. American Institutes for Research, Washington, District of Columbia, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Individual and contextual early life factors, including personality, family structure, and social support may contribute to life satisfaction in adulthood. Several studies have shown the contemporaneous relations between socio-demographic characteristics and life satisfaction within younger populations (Sastre & Ferriere, 2000; Suldo & Huebner 2004; Zullig, Valois, Huebner, & Drane, 2005). However, relatively little is known about how these early life factors interact with one another to influence life satisfaction in later adulthood. Within the context of the Project Talent (PT) study, we examined the association between personality and life factors in adolescence and life satisfaction in later life. In 1960, PT was initiated to assess the knowledge, personality, interests, and abilities of approximately 400,000 US high school students. The current analysis includes a sample of the original study population who also participated in a 2011-12 collection (N =1,952; M = 68 years). Preliminary longitudinal analyses suggest that adolescent personality and early life factors measured in 1960 are associated with life satisfaction in 2012 and that these associations differ by sex. Specifically, for women, general academic aptitude, mother's involvement before age 18, and the personality dimension of vigor were positively associated with later adult life satisfaction ($p < 0.01$). For men, not having trouble with the police before age 18 and the personality dimensions of vigor, self-confidence, leadership, and calmness were positively associated with life satisfaction 50 years later ($p < 0.01$).

FACTORS OF SUCCESSFUL AGING AND THE EFFECT ON THE LIFE SATISFACTION OF KOREAN BABY BOOMERS

M. Kim[1], L.S. Park[2], *1. Department of Community Development and Welfare, Daegu University, Gyeongsan, Gyeongbuk, Republic of Korea, 2. School of Social Work, University of Wisconsin, Madison, Wisconsin*

Descriptions: Rowe and Kahn's successful aging consists of three parts: avoiding disease and disability, high cognitive and physical function, and engagement of life. However, this model is based on western countries with relatively good retirement plans and does not consider economic factors. Also, when considering "continuity" as a good adapting method to the old age era, preparation for older life is another important successful aging factor. The inclusion of preparation for old age shifts the perspective on successful aging as a process. Without a successful aging process, the outcome of successful aging is impossible. This study examines how three successful aging factors and the preparation for old age affect the life satisfaction of Korean Baby Boomers (born between 1955 and 1963). Method: This study used individual data from the KReIS (Korean Retirement and Income Studies). The factors of successful aging were derived from the third wave data collected in 2009. The life satisfaction and preparation for old age data were derived from the fourth wave data (2011). The sample size for this study was 517. Hierarchical multiple regressions were used to test factors affecting life satisfaction. Findings: For Korean Baby Boomers, their job, marital status, disability, education, and psychological health were important factors affecting life satisfaction. The preparation for aging period and economic independence, which Rowe and Kahn do not consider as factors of successful aging, were found to be important aspects affecting life satisfaction. This cross-cultural perspective expands the model with strong practice and policy implications for successful aging.

SESSION 510 (PAPER)

MINORITY AGING AND SOCIAL SUPPORT

SEXUAL AND GENDER MINORITIES CARING FOR CHRONICALLY ILL ADULTS

D.L. Albright, K.T. Washington, J.A. McElroy, D. Parker Oliver, A. Lewis, S.E. Meadows, S.G. Elliot, *School of Social Work, University of Missouri, Columbia, Missouri*

A number of marginalized communities receive inadequate attention in the extensive body of existing research on informal caregivers; this is particularly true of the sexual and gender minority (SGM) community. This paper features a review of the evidence regarding the experiences of SGMs involved in the informal care of chronically ill friends or family members and examines the specific research strategies that have been involved in developing knowledge in this area. The review found that the SGM caregiving experience is characterized by experienced and anticipated sexual and gender prejudice within health and social service systems, involvement of families of choice, and the invisibility of the needs of SGM caregivers as a community and as individuals. Existing research in this area, which is largely qualitative, provides rich description of caregiver experiences; however, the evidence base would be strengthened by research including a more diverse range of methods, particularly studies aimed at generating results generalizable to the broader SGM community.

BLACK-WHITE DIFFERENCES IN LONELINESS AMONG ELDERS IN THE US

K.G. Emerson, A.P. Glass, *Institute of Gerontology, University of Georgia, Athens, Georgia*

BACKGROUND: Increasing numbers of researchers are finding that loneliness is a significant risk factor for morbidity and mortality. However, much of the research has focused on the overall older population, with few researchers focusing on potential racial differences in loneliness among elders. OBJECTIVES: To determine Black-White differences in prevalence of loneliness in the United States. RESEARCH DESIGN: Data were drawn from the 2010 Health and Retirement Study Leave Behind Questionnaire. The key outcome variable was based on the three-item loneliness scale, where higher scores indicate higher levels of loneliness (range 3-9). T-tests were used to calculate differences in average levels of loneliness by race. Linear regression models were used to test the association between race and loneliness controlling for covariates. SUBJECTS: A total of 1,156 non-Hispanic Black and 5,513 non-Hispanic White elders completed all three items on the loneliness scale. Ages ranged from 51-101 (mean=67), with a majority (57%) female and married (62%). RESULTS: The mean score for Blacks on the loneliness scale was 4.76, which was significantly higher than for Whites (mean 4.35). Blacks were significantly more likely to have higher scores on loneliness (p-value .013) even when controlling for gender, age, living arrangement, marital status, urban/rural living, and number of health conditions. CONCLUSIONS: Among community-dwelling elders in the US, loneliness was significantly higher among Blacks compared to Whites, even after controlling for a number of other factors. Loneliness is a significant public health topic and results suggest a need for more targeted assessment and interventions across race groups.

SOCIAL SUPPORT TRAJECTORIES AND THE MORTALITY RISK OF OLDER MEXICAN AMERICAN WOMEN AND MEN

T.D. Hill[1], B. Uchino[1], J. Eckhardt[1], J. Angel[2], *1. The University of Utah, Salt Lake City, Utah, 2. The University of Texas, Austin, Texas*

Although numerous studies have shown that social support tends to favor longevity, very little research has been devoted to linking trajectories of social support and mortality risk. Because the bulk of previous work has focused on predominantly non-Hispanic white and black populations, more research is needed to explore processes related to social support and longevity in Hispanic populations. Employing seven waves of data collected from the original cohort of the Hispanic Established Populations for the Epidemiologic Study of the Elderly (H-EPESE), we used growth mixture modeling (GMM) to estimate latent classes of social support trajectories. We then used the Cox proportional hazard regression model to estimate the relative risk of all-cause mortality as a function of the social support trajectories. Our GMM results revealed three social support trajectories in the data (consistently high, consistently moderate, and consistently low). Our Cox regression results showed that older Mexican American men who were assigned to the low social support trajectory exhibited a higher mortality risk than their counterparts who were assigned to the high social support trajectory. The social support trajectories were unrelated to the mortality risk of women. A statistically significant gender*social support interaction term confirmed that social support was more strongly associated with the longevity of men than women. Our results extend previous work by identifying multiple latent social support trajectories and by documenting gender variations in the link between social support and mortality risk in the older Mexican American population.

THE LIVES OF LGBT OLDER ADULTS: UNDERSTANDING CHALLENGES AND RESILIENCE THROUGH THE ADDRESSING MODEL

N. Orel[1], C.A. Fruhauf[2], *1. Gerontology, Bowling Green State University, Bowling Green, Ohio, 2. Colorado State University, Fort Collins, Colorado*

The co-editors of the soon to be released book titled “The Lives of LGBT Older Adults: Understanding Challenges and Resilience” will provide a comprehensive overview of cutting-edge research on LGBT older adults and their families and provide practical implications for policy and practice related to LGBT aging individuals and their families. The presenters will pay particular attention to the research that has focused on the strengths and resiliency of the LGBT older adult population and the innovative ways in which individuals have overcome heterosexism and homophobia throughout their lives. The focus on strengths and resiliency is an important advancement in the field as much of the previous literature on LGBT older adults has neglected to address such topics. The presenters will also pay particular attention to the diversity that exists within the LGBT older adult population by “ADDRESSING” the intersectionality of ten cultural factors and personal attributes. Drawing upon the work of Hays (1996, 2008), the acronym ADDRESSING is proposed as a helpful guide that illustrates the cultural factors and personal attributes that influence aging and the importance of these constructs in physical health, mental health, familial relationship, social relationships, and overall wellness. This model will specifically be used to illustrate how cultural factors and personal attributes contribute to the ability of LGBT older adults to access services and shed light to the difficulty in designing services and programs that would meet the needs LGBT older adults and their families.

MINORITY STRESS AND SEXUAL MINORITY OLDER ADULTS: AGEISM, HETEROSEXISM, AND QUALITY OF LIFE

B.L. Perkins, G.I. Caskie, *Lehigh University, Bethlehem, Pennsylvania*

Meyer’s (2003) Minority Stress Theory posits that people who identify as lesbian, gay, or bisexual (LGB) may experience additional stressors due to having a stigmatized identity. These stressors are related to discrimination and prejudiced attitudes, which are negatively related to mental health, loneliness, and quality of life. However, whether Meyer’s model applies to LGB older adults, including the unique social stressor of ageism, has yet to be assessed. Thus, the current study explored whether experiences of ageism, heterosexism, internalized homonegativity, and outness were related to loneliness, life satisfaction, quality of life, and psychological distress in a sample of 98 LGB-identified adults aged 50 and older. Results indicated a significant relationship at the multivariate level (Wilks’ lambda = .671, $p = .002$), with significant variance explained for life satisfaction ($p = .001$), quality of life ($p < .001$), and psychological distress ($p = .029$). Univariate results indicated that greater perceived ageism and outness were significantly related to poorer quality of life ($p = .010$ and $p = .006$, respectively). Greater ageism was also significantly predictive of poorer life satisfaction ($p <.001$). None of the individual predictors were significantly related to psychological distress or loneliness. The influence of biological sex, gender identity, age, ethnicity, and other demographic variables will be assessed. In general, these findings suggest that Meyer’s model may be a useful framework for understanding the unique experiences of LGB older adults, with support for the inclusion of the social stressor of ageism to the original model.

SESSION 515 (SYMPOSIUM)

AGING, THE CNS AND MOBILITY PRECONFERENCE SERIES: FINDINGS AND FUTURE PLANS

Chair: S. Studenski, *NIA, Baltimore, Maryland*
Co-Chair: W.G. Chen, *NIA, Baltimore, Maryland*
Discussant: M. Wagster, *NIA, Baltimore, Maryland*

Loss of independent mobility with aging is a major cause of late life disability. Much is known about cardiopulmonary and musculoskeletal contributors to loss of mobility but only recently recognized is the significant contribution of the CNS to age-related mobility loss, even in the absence of overt CNS disease. A 3 year NIA-funded GSA preconference series focused on multidisciplinary, translational approaches to this topic. This 5-presentation symposium will describe the conference, its findings and plans for the future, including first; a series overview and summary of current knowledge and techniques; second; a translational exploration of potential contributors to CNS-mediated mobility loss, third: findings from this year’s preconference on potential interventions; fourth; future plans for the series and fifth; perspectives from NIA.

REVIEW THE BEST EVIDENCE TO DATE IN SUPPORT OF CNS CONTRIBUTION TO MOBILITY IMPAIRMENT

C. Rosano, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Evidence from basic, clinical, and epidemiological studies strongly support the role of the Central nervous system (CNS) as an important contributor to mobility limitations in older adults without overt neurologic disease. A review of neuroimaging studies indicates that specific brain networks would be related to control of impaired mobility in older adults and clarifies the biological rationale underlying the association between the CNS and mobility. These results raise interesting possibilities that the variance of mobility impairment in older adults may result from different degrees of brain plasticity that may buffer the disabling potential of other systems’ impairment. This differential for brain compensation could potentially explain not only why the relationship of exposure to risk factors or to neuromuscular impairment with disability is highly variable but also why the response to rehabilitative intervention is quite different from individual to individual.

CAUSAL PATHWAYS TO CNS-MEDIATED MOBILITY LOSS

F. Sorond[1], C. Rosano[4], S. Studenski[4], S. Black[3], L. Lipsitz[2], *1. Brigham and Women’s Hospital/Harvard Medical School, Boston, Massachusetts, 2. Hebrew SeniorLife/Harvard Medical School, Boston, Massachusetts, 3. Sunnybrook Health Sciences Centre, Toronto, Ontario, Canada, 4. University of Pittsburgh, Pittsburgh, Pennsylvania*

The central nervous system (CNS) plays a key role in the control of mobility. Some CNS pathologies that disrupt neural networks responsible for gait and balance have a very strong aging component (e.g. PD and vascular disease) while others are modified by age (e.g. MS). However, a key area of knowledge gap is the lack of mechanistic insight into the causal CNS pathways which lead to age-related mobility decline. There is a need for longitudinal studies testing possible mechanisms and studies which manipulate pathological components and identify compensatory mechanisms. We also need uniform measures and nomenclature to facilitate cross-institutional studies. These efforts will advance our understanding of mobility in the context of brain networks, cognition, neuromuscular activation and even the autonomic nervous system. This knowledge will help identify targeted interventions that will integrate neuroplasticity and endogenous compensatory mechanisms towards ameliorating age-related mobility disability.

EXTEND THE STUDY OF AGING, CNS AND MOBILITY INTO THE FUTURE

C. Rosano[1], F. Sorond[2], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. Brigham and Women's Hospital Department of Neurology, Boston, Massachusetts*

Collectively, these workshops have generated important new knowledge, and suggest priority topics and strategies for future research—especially regarding opportunities for future studies and novel uses of previously funded NIH or other data sets. There was consensus that novel approaches that cut across disciplines and go beyond conventional disease-based models are needed to understand the variability of mobility impairment in community-dwelling older adults and identify effective interventions to ameliorate mobility problems. Another programmatic priority is designing new training approaches that integrate concepts and methodologies from individual disciplines, focus on emerging methodologies, and prepare investigators to assess complex, multisystem associations. The aim of the renewal is to facilitate the translation of research results into interventions that will improve mobility for community-dwelling older adults and to spur interest toward new training models. The proposal encourages collaborations among experts in complementary fields of aging, cognitive neuroscience, neurology, neuroimaging, biomedical engineering, neuropsychology, and epidemiology.

FINDINGS FROM YEAR 3: REVIEW OF INTERVENTIONS TO PREVENT AND DELAY MOBILITY IMPAIRMENT

M. Carlson, *Mental Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

This workshop builds on evidence from the first two workshops regarding modifiable risk factors and causal neural mechanisms underlying mobility difficulties. The third workshop evaluates a range of pharmacologic, sensory, electrical, and behavioral interventions that target modifiable risk factors and apply novel methods to more precisely measure the mechanistic pathways identified in Workshop 2 (e.g., inflammation, neuroplasticity) underlying potential benefit. We will review the strengths and limitations of various intervention designs and opportunities to integrate approaches across cognitive and mobility studies in community-based, clinical populations, and animal models to address gaps in our understanding of the role of the CNS on mobility.

SESSION 520 (SYMPOSIUM)

EXPLORING FUNCTION IN THE OLDER ADULT WITH CHRONIC LOW BACK PAIN: THE DELAWARE SPINE STUDIES

Chair: G. Hicks, *University of Delaware, Newark, Delaware*
Discussant: J.F. Bean, *Spaulding Rehabilitation Hospital, Cambridge, Massachusetts*

Improving physical function is a key goal of geriatric rehabilitation clinicians and researchers. Recent literature demonstrates that low back pain (LBP), the most commonly reported symptom among geriatric patients, is specifically linked to functional decline. The goal of this symposium is to highlight recent work exploring factors that explain the relationship between LBP and physical function among community-dwelling older adults using data from a series of Delaware Spine Studies projects. The first paper will utilize data from a comparative study of older adults with and without chronic LBP to examine differential associations between cardiovascular risk factors and physical function. The second paper will use the same dataset to explore the relationship between self-reported and performance-based function in older adults with chronic LBP, as well as the influence of psychosocial factors on each method of measuring function. The third paper will use longitudinal data from Delaware Spine Studies Project 2 to examine the relationship between changes in trunk range of motion and changes in performance-based function. Lastly, the final paper will use data from a pilot randomized trial of older adults with chronic LBP to assess the impact of trunk muscle training augmented with neuromuscular electrical stimulation on physical function compared to trunk muscle training alone. The overall findings of these papers suggest that there are multiple factors that impact function in older adults with LBP and that there is potential to improve function through the development of empirically-driven interventions.

CONTRIBUTIONS OF CARDIOVASCULAR RISK FACTORS TO PHYSICAL PERFORMANCE IN OLDER ADULTS WITH CHRONIC LOW BACK PAIN

V. Allen, P.C. Coyle, T. Velasco, J. Sions, G. Hicks, *University of Delaware, Newark, Delaware*

Among older adults, reduced physical function is associated with increased cardiovascular (CV) risk. Given that older adults with chronic low back pain (CLBP) have reduced function, they may also have increased CV risk profiles. Therefore, we explored associations between CV risk, LBP and function. In our sample, community-dwelling older adults with CLBP (n=66) had increased CV risk, compared to those without LBP (n=57), including elevated numbers of current/past CV conditions (p=.021), higher BMI (p=.017) and larger waist circumference (p=.004). Among LBP participants, linear regression analyses indicated that BMI and waist circumference, beyond demographic covariates and LBP intensity, explained an additional 30.3 and 15.0% of the variance in SF-36 physical function and gait speed (p<.05), respectively. Among participants without LBP, BMI and waist circumference did not explain any additional variance in either measure of physical function (p>.05). Addressing CV risk factors among CLBP patients may be critical in optimizing physical function.

PSYCHOSOCIAL CONTRIBUTORS TO DIFFERENCES IN PERFORMANCE-BASED VS. SELF-REPORTED FUNCTION AMONG OLDER ADULTS WITH CHRONIC LOW BACK PAIN

G. Hicks, J. Sions, T. Velasco, *University of Delaware, Newark, Delaware*

Functional limitations, which can be measured through performance-based or self-reported methods, are common among older adults with chronic low back pain (CLBP), but differences in these two methods have not been explored in CLBP. Therefore, we explored the differences in psychosocial contributors to the Short Physical Performance Battery (SPPB) and the Physical Function (PF) subscale of the SF-36 among 66 older adults with CLBP. SPPB was correlated with PF (r=.58, p<.001), but only accounted for 34% of the variance. Separate multivariate linear regression models for SPPB and PF explained 44 and 45% of the variance, respectively. Pain catastrophizing, fear avoidance beliefs and kinesiophobia were not significant contributors to either model (p>.05). Depressive symptoms contributed significantly to both models, but explained more variance in PF score than SPPB score (16 vs. 6%). Performance-based and self-reported measures capture different aspects of function, with self-reported function being more closely linked to depressive symptoms.

IMPROVED TRUNK MOBILITY IS LINKED TO BETTER PHYSICAL FUNCTION IN OLDER ADULTS WITH CHRONIC LOW BACK PAIN

P.C. Coyle, V. Allen, T. Velasco, M. Sions, G. Hicks, *Physical Therapy, University of Delaware, Newark, Delaware*

Older adults with chronic low back pain (CLBP) have limitations in physical function compared to those who are pain-free, particularly in chair rise performance. Limited trunk range of motion (ROM) may be a contributing factor to dysfunction in this population. Using data from a cohort of 58 community-dwelling older adults with CLBP enrolled in a randomized clinical trial exploring the effectiveness of two physical therapy interventions, we assessed whether changes in trunk ROM were related to changes physical function. Immediately following the twelve week intervention period, there were significant improvements in trunk flexion (p=.014) for the entire sample. After controlling for age, sex, body mass index and intervention group, increases in trunk flexion explained 7.9% (p=.030) and 8.8% (p=.033) of the variance in chair rise performance at 12 and 24 weeks, respectively. Improving trunk flexion may improve physical function, specifically chair rise performance, in older adults with CLBP.

CHRONIC LOW BACK PAIN INTERVENTION: EXERCISE + NEUROMUSCULAR ELECTRICAL STIMULATION VERSUS EXERCISE

J. Sions, G. Hicks, *University of Delaware, Newark, Delaware*

Interventions addressing skeletal muscle [e.g. lumbar exercises (EX) and paraspinals neuromuscular electrical stimulation (NMES)] may improve pain and function in adults with chronic low back pain (CLBP). We conducted a 6-week, randomized, controlled pilot study to determine if EX+NMES was superior to EX for improving pain, multifidus muscle asymmetry, physical and psychosocial function. Thirty-six, community-dwelling adults, aged 60-85 years were recruited. Pre- and post-intervention data was collected, including pain, multifidus activity via ultrasound imaging, function per Short-Form 36, paraspinals endurance, and physical performance tests. Significant between-group differences were found only for pain favoring EX(p=.040); those who received EX+NMES had a trend toward greater multifidus activity symmetry. Both groups demonstrated significant improvements in self-reported physical function, paraspinals endurance, Timed Up and Go, and repeated chair stands(p<.05); but, only individuals in the EX+NMES had significant improvements in functional reach and gait speed(p<.05). Further research may confirm the results of this pilot study.

SESSION 525 (SYMPOSIUM)

THE FRAILTY CONNECTION: ASSOCIATION WITH CHRONIC DISEASE AND HEALTH OUTCOMES

Chair: R. Roiland, *GRECC, William S. Middelton Memorial Hospital, Madison, Wisconsin*
Co-Chair: J. Alderden, *College of Nursing, University of Utah, Salt Lake City, Utah*
Discussant: R. Roiland, *GRECC, William S. Middelton Memorial Hospital, Madison, Wisconsin*

Frailty in older adults is defined as an enhanced state of vulnerability to disease and poor health outcomes. While frailty conveys a general state of vulnerability, the connection between frailty and specific diseases and health outcomes is variable. The presenters in this symposium will explore these various connections and discuss the implications of frailty within specific populations of older adults. Ms. Denfeld's presentation focuses on the conceptualization and measurement of frailty in older adults with heart failure. Her literature review will focus on how frailty manifests within the context of heart failure and identify important dimensions to include in the measurement of frailty within this population. Dr. Tocchi's presentation focuses on the development and validation of the Frailty Index for Elders (FIFE) instrument. Within this study, frailty is conceptualized as multi-dimensional concept with connections to various bio-psychosocial outcomes in both community-dwelling and assisted living facility dwelling older adults. Dr. Roiland's presentation focuses on a pilot study examining the feasibility and acceptability of assessing frailty in hospitalized older Veterans. In addition, the relationship between frailty and transitional care outcomes (e.g., re-hospitalization) will be explored. And finally, Dr. Zavlasky's presentation focuses on long-term mortality in frail, older women and the role various physiological and behavioral factors play in predicting mortality in this population. Together, these presentations will demonstrate the importance of the concept of frailty and its connection to various aspects health among older adults.

CONCEPTUALIZATION AND MEASUREMENT OF PHYSICAL FRAILTY IN HEART FAILURE

Q.E. Denfeld[1], J. Bennett[1], J.M. Gelow[2], J.O. Mudd[2], C.S. Lee[1,2], *1. School of Nursing, Oregon Health &Science University, Portland, Oregon, 2. Oregon Health & Science University Knight Cardiovascular Institute, Portland, Oregon*

As conditions of biological aging, both physical frailty and heart failure (HF) are highly prevalent among older adults. Among those with HF, physical frailty significantly increases adverse clinical and patient-oriented outcomes. However, there remains uncertainty in how to conceptualize and subsequently measure physical frailty in HF. The purpose of this paper is to clearly delineate the conceptual definition of physical frailty specifically in HF in order to then distinguish how to measure this concept. Through a review of the literature, individual dimensions of physical frailty in HF will be identified, including how physical frailty manifests in HF and the shared underlying pathophysiological mechanisms therein. Physical frailty will also be clearly defined in relation to similar, yet distinctly different, concepts. Finally, we will put forth recommendations for how to measure physical frailty in HF based on this conceptual definition.

CORRELATES OF LONG TERM RISKS OF DEATH AMONG FRAIL ELDERLY: OBSERVATIONS FROM THE WOMEN'S HEALTH INITIATIVE OBSERVATIONAL STUDY

O. Zaslavsky[1], A. Zisberg[1], E. Shadmi[1], N.F. Woods[2], B.B. Cochrane[2], A.Z. LaCroix[3], *1. Department of Nursing, University of Haifa, Haifa, Israel, 2. University of Washington, Seattle, Washington, 3. University of California in San Diego, San Diego, California*

Background: We used Women's Health Initiative Observational Study data to examine factors that are associated with long-term survival among frail participants. Methods: Women ages 65+ screened positively for frailty were analyzed. Components of frailty were self-reported low physical function, exhaustion, low physical activity, and unintended weight loss. Logistic regressions characterized the association of baseline risk factors with long-term survival. Results: Frailty was classified in 13,193 participants; among those 37.1% had death reported by December 2013. Older age, more severe frailty, abnormal hemodynamic measures, selected chronic conditions, smoking status, and ADL deficits were positively associated with elevated risks of mortality, whereas income, overweight or obese categories, and self reported health were inversely associated. Relative to normotensive participants, systolic blood pressure >139 mm Hg or diastolic blood pressure < 65 mmHg were associated with respective 1.19 (95% CI=1.07-1.32) and 1. 17 (95% CI=1.05-1.30) increased risk of mortality. Conclusion: The findings might indicate important targets for intervention.

FRAILTY AND TRANSITIONAL CARE OUTCOMES IN HOSPITALIZED, OLDER VETERANS: A FEASIBILITY STUDY

R. Roiland[1], J. Porter[1,2], B. Polnaszek[3], M.L. Hovanes[1,2], L.L. Jensen[1], A. Kind[1,2], *1. William S. Middleton Memorial Hospital, Geriatric Research Education and Clinical Center, Madison, Wisconsin, 2. University-Madison School of Medicine and Public Health, Division of Geriatrics and Gerontology, Madison, Wisconsin, 3. University-Madison School of Medicine and Public Health, Madison, Wisconsin*

Frailty in hospitalized older adults is predictive of outcomes such as nursing home admission and mortality, but its relationship to transitional care outcomes (e.g., re-hospitalization) is not known. The purpose of this study was to evaluate feasibility and acceptability of assessing frailty in hospitalized older Veterans eligible for transitional care programs within the local Veterans Administration hospital. A total of 12 Veterans were recruited and assessed within 48 hours of hospital admission. Eight were classified as frail and four as pre-frail. On average, assessments were completed in approximately 16 minutes (range: 9 - 40) and all participants reported the assessments were acceptable. Three participants, 2 frail and 1 pre-frail, were re-hospitalized or visited the emergency department within 30 days of hospital discharge. Frailty assessment is feasible and acceptable within the hospital setting, but a larger study is needed to better understand the relationship between frailty and transitional care outcomes.

DEVELOPMENT OF A FRAILTY MEASURE FOR OLDER ADULTS: THE FRAILTY INDEX FOR ELDERS (FIFE)

C. Tocchi[1,3], M.D. Naylor[2], J. Dixon[3], R. McCorkle[3], *1. Nursing, New York University, New York, New York, 2. University of Pennsylvania, Philadelphia, Pennsylvania, 3. Yale University, New Haven, Connecticut*

Background/Purpose Frailty is a significant challenge for healthcare. Therefore, it is important to identify frail individuals. Currently no studies have utilized administrative datasets to measure frailty in older adults. The purpose of this study was to develop a concise multidimensional frailty instrument and test determinants of frailty in two groups of older adults. Methods Instrument development encompassed: delineation of content domains; item generation; content validity; quantitative content validity analysis; and psychometric analysis through the use of secondary analysis of data derived from an on-going longitudinal prospective descriptive study. Results Findings indicated: 1) frailty is a complex concept; 2) FIFE is comprised of 10 items; 3) FIFE was able to predict depression; 4) FIFE was able to differentiate differences in demographic profiles by social support environment. Conclusion FIFE is a valid instrument. FIFE can be used to study the relationships among frailty determinants; provide standardized measurement; and develop and measure interventional studies.

SESSION 530 (SYMPOSIUM)

CONCEPTUALIZING, IMPLEMENTING, AND EVALUATING DEMENTIA-FRIENDLY MODELS OF CARE: AN INTERNATIONAL PERSPECTIVE

Chair: M. Boltz, *New York University, New York, New York*
Co-Chair: K. Wolf-Ostermann, *University of Bremen, Bremen, Germany*
Discussant: K. Maslow, *Institute of Medicine National Academies, Washington, District of Columbia*

Dementia-friendly care environments support the function and well-being of persons with dementia (PwD). Relationships with staff, care practices, organizational policies and procedures, the built environment, and connectivity with family and the larger community all interact to impact the outcomes and experiences of PwD. Given that the PwD typically engages with a continuum of health care and social services, the need for a unifying framework of dementia-friendly care and evidence-based interventions across settings is apparent. Bringing together academic researchers from multiple disciplines in Canada, Germany, the Netherlands, and the United States, this symposium will present cross-setting research advancing dementia-friendly care and services. The presenters will describe: 1) an evidence-based conceptual framework for developing and evaluating dementia-friendly hospital care, developed by the Vancouver Island Health Authority; 2) a family- centered, system level intervention designed to improve post-acute outcomes for PwD and family caregivers in the US; 3) the structures, processes of care, as well as health outcomes of local dementia care networks in Germany; 4) the characteristics and outcomes of person-centered care in nursing homes in the Netherlands; and 5) a monitoring tool used by family caregivers to monitor the health and well-being of community-residing PWD as well as their response to care. Together, these studies illustrate the benefits of addressing the social and ecological factors impacting care delivery to older persons with dementia. Research gaps and implications for policy and practice will be addressed.

DEMENTIA CARE NETWORKS PROVIDING MULTIPROFESSIONAL CARE AND SUPPORT – THE DEMNET-D-STUDY

K. Wolf-Ostermann[1], J. Gräske[1], S. Meyer[1], W. Hoffmann[2], J. Thyrian[2], B. Holle[3], S. Schäfer-Walkmann[4], *1. University of Bremen, Bremen, Germany, 2. German Center for Neurodegenerative Diseases (DZNE), Rostock/ Greifswald, Germany, 3. German Center for Neurodegenerative Diseases (DZNE), Witten, Germany, 4. Baden-Wuerttemberg Cooperative State University, Stuttgart, Germany*

In Germany, local networks of stakeholders (community care services, medical doctors, therapists, hospital facilities, self-help organizations, local authorities, etc.) are engaged in providing multiprofessional care and support for the growing number of PwD in the community. The Demnet-D-study surveys structures and processes of 13 dementia care networks (DCN) all over Germany as well as health related outcomes of PwD being supported by them. The study objective is to raise knowledge about useful structures of DCN and to prove effectiveness in terms of organizing better support for PwD and their relatives; 560 PwD and 452 relatives participated in the study. PwD mostly have a severe dementia but still report a moderate quality of life and sufficient social participation. Satisfaction with care and support by DCN seems to be high. Further results will shed some light on the question how to improve care and social participation of PwD in the community.

AN INTERVENTION TO IMPROVE TRANSITIONAL OUTCOMES IN HOSPITALIZED PERSONS WITH DEMENTIA AND FAMILY CAREGIVERS

M. Boltz[1], T. Chippendale[1], B. Resnick[2], J. Galvin[1], *1. New York University, New York, New York, 2. University of Maryland, Baltimore, Maryland*

As compared to other older patients, hospitalized persons with dementia (PWD) are more likely to experience functional decline, unresolved delirium, and unplanned rehospitalizations within 30 days of discharge. In addition, the stay for the family caregiver (FCG) is often associated with intense anxiety and stress, as well as increased strain during and after the hospital stay. Family-centered function-focused care, (Fam-FFC) addresses the social ecological factors impacting the functional recovery of hospitalized PWD. Components of the intervention include environmental assessment /modifications; dementia-specific staff training and family education; FCG engagement in assessment, treatment planning and evaluation; and post-acute follow-up. Fam-FFC begins early in the hospital stay and continues through the post-acute period. This intervention has the potential to improve FCG preparation for caregiving and affective response, and improve the health outcomes (recidivism, delirium duration and severity, function) of PWD.

FACILITATED FAMILY CAREGIVER ASSESSMENT OF DEMENTIA SYMPTOMS

J. Galvin, *NYU School of Medicine, New York, New York*

Alzheimer's disease (AD) is a complex syndrome of cognitive, functional, and behavioral symptoms that reduce quality of life for patients and family caregivers (FCGs). Increasingly, FCGs are viewed by healthcare providers (HCPs) as part of the care team, but little effort has been made to provide them with necessary tools to perform home assessments and make informed decisions regarding care planning. The Healthy Aging Brain Care Monitor (HABC-M) can be used by FCGs to capture, quantify, and monitor cognitive, functional, and behavioral symptoms. This approach can improve: (1) assessment of AD-related symptoms; (2) symptom triage (home management versus bringing patient to medical attention); (3) development of strength-based plans that reflect patient input, values and preferences; and (4) communication with HCPs at the next visit. Use of the HABC-M for monitoring emergent AD symptoms and the effectiveness of individualized care protocols managing these symptoms may improve outcomes for patients and FCGs.

PERSON-CENTERED CARE IN NURSING HOMES FOR PEOPLE WITH DEMENTIA: PRE-CONDITIONS AND OUTCOMES

A. Pot[1,2], B.M. Willemse[1], D. Smit[1], J. de Lange[1], *1. Netherlands Institute on Mental Health and Addiction, Program on Aging, Utrecht, Netherlands, 2. VU University, Amsterdam, Netherlands*

This presentation will focus on the pre-conditions and outcomes of person-centered care (PCC) in nursing home care for people with dementia, using data from the Living Arrangements for people with Dementia (LAD) – study. This is an ongoing study in The Netherlands, with measurements once every two years. For this presentation, we use data from the second data-collection wave in 2010/2011, including 142 homes for people with dementia, 1129 care staff, 1381 residents and 879 family members. Results show that the amount of small-scale care and the presence of an unambiguous care concept are important pre-conditions for PCC. Beneficial outcomes are found for indicators of quality of care, residents' functioning and quality of life, and caregivers' well-being. Although 80% of the care staff believe they provide PCC based on a self-report questionnaire, there is room for improvement, as will be discussed in further detail.

USING A DEMENTIA FRIENDLY HOSPITAL FRAMEWORK TO IMPROVE CARE

B. Parke[1,2], M. McLennan[2], S. Somers[2], C.E. Butcher[2], M. Malone[2], *1. University of Alberta, Edmonton, Alberta, Canada, 2. Vancouver Island Health Authority, Vancouver, New Brunswick, Canada*

Older people with dementia and their caregivers have special care needs when they encounter the hospital setting. When admitted to hospital their needs are complicated by multiple co-morbid problems that contribute to their vulnerability. As such, they are at risk for adverse outcomes associated with hospitalization, and caregivers are at additional risk for fatigue, and hospital acquired caregiver burden. The dementia-friendly acute care (D-FAC) conceptual framework is part of a larger Island Health dementia strategy that aims to ensure safe quality care across the care continuum. We present the D-FAC framework and illustrate how health care professionals working in a general medical hospital unit can mitigate adverse consequences. This involves predicting and preventing remediable problems through customized strategies that consider and address medical, functional, cognitive, and social issues, guided by the D-FAC.

SESSION 535 (SYMPOSIUM)

THE HEALTH RISKS OF SEDENTARY BEHAVIOR

Chair: A. Koster, *Maastricht University, Maastricht, Netherlands*
Discussant: T. Harris, *National Institute on Aging, Bethesda, Maryland*

While most physical activity guidelines still solely focus on the health effects of moderate-to-vigorous physical activity, there is growing evidence that sedentary behavior is a health risk factor independent of moderate-to-vigorous physical activity. The objective of this symposium is to discuss the consequences of sedentary behavior in old age. Sedentary behavior has been associated with poor metabolic outcomes and increased mortality. Little is still known about the effects of sedentary behavior on physical function and disability in old age. Dr. Visser will show the functional consequences of sedentary behavior in old age in the Longitudinal Aging Study Amsterdam. Dr. Stenholm will present how sedentary behavior and physical inactivity over the lifecourse are associated with mobility limitation in old age in the InCHIANTI study. Next to total sedentary time, other aspects of sedentary behavior seem also important. Van der Berg has used data from the AGES-Reykjavik Study to examine whether movement during sedentary behavior is associated with metabolic health. Finally, it is not known how sedentary behavior increases health care costs beyond physical inactivity. This topic will be addressed by Dr. Peeters who will discuss the health care costs associated with prolonged sitting and inactivity in the Australian Longitudinal Study on Women's Health.

FUNCTIONAL CONSEQUENCES OF SEDENTARY BEHAVIOR IN OLD AGE

M. Visser, *1. Health Sciences, VU University Amsterdam, Amsterdam, Netherlands, 2. VU Medical Center, Amsterdam, Netherlands*

We investigated the potential consequences of sedentary behavior in 1,278 participants aged 60-98 years from the Longitudinal Aging Study Amsterdam. Sedentary behavior (h/d, quartiles) was assessed by a validated questionnaire. Mobility disability (score 0-12) and performance (score 0-8) were assessed at baseline and after 3 years. Vital status was monitored for 4.5 years. Mean sedentary time was 7.7 (SD 3.1) h/d. Mean mobility disability and performance changes were -0.40 (1.6) and -0.3 (1.7) and 10.2% died. After adjustment for confounders (including physical activity and baseline value of outcome), higher sedentary time was associated with greater change in mobility disability (-0.6 versus -0.3, highest versus lowest quartile $p<0.05$) and mobility performance (-0.5 versus -0.3, $p=0.14$). Higher sedentary behavior was also associated with higher mortality risk (OR 1.58 versus 1.0, $p=0.09$ (p for trend $p<0.05$)). The results suggest that sedentary behavior may have negative functional consequences in old age.

LIFE-LONG PHYSICAL INACTIVITY AND MOBILITY LOSS IN OLD AGE

S. Stenholm[1,2], A. Koster[3], H. Valkeinen[2], K. Patel[4], S. Bandinelli[5], J. Guralnik[6], L. Ferrucci[7], *1. University of Turku, Turku, Finland, 2. National Institute for Health and Welfare, Turku, Finland, 3. Maastricht University, Maastricht, Netherlands, 4. University of Washington, Seattle, Washington, 5. Azienda Sanitaria di Firenze, Florence, Italy, 6. University of Maryland, Baltimore, Maryland, 7. Natinal Institute on Aging, Baltimore, Maryland*

This study examines whether physical inactivity over the lifecourse is associated with mobility disability in old age. A total of 641 men and women aged ≥ 65 years were followed for 9 years in the InCHIANTI Study. At baseline, participants retrospectively recalled their leisure time physical activity (LTPA) at 20–40 and 40–60 years of age, and reported LTPA in the year prior to baseline. Mobility status was defined as self-reported inability to walk 400 meters or climb and descend 10 steps without help from another person at the baseline, 3-, 6- and 9-year follow-up. Participants who had been physically inactive (minimal or light LTPA) since age 20–40 reported almost three times more often mobility disability at 9-year follow-up (risk ratio 2.69, 95% CI 1.77–4.10) than those who had never been physically inactive after taking into account age, sex, education and other lifestyle factors at baseline.

MOVEMENT DURING SEDENTARY TIME IS ASSOCIATED WITH METABOLIC OUTCOMES

J. van der Berg[1], H. Bosma[1], P. Caserotti[2], G. Eiriksdottir[3], R.J. Brychta[4], C. Stehouwer[5], T.B. Harris[6], A. Koster[1], *1. Department of Social Medicine/CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands, 2. Institute of Sports Science and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark, 3. Icelandic Heart Association, Kopavogur, Iceland, 4. Diabetes Endocrinology and Obesity Branch, National Institute of Diabetes and Digestive and Kidney Diseases, Bethesda, Maryland, 5. Department of Internal Medicine/Cardiovascular Research Institute Maastricht (CARIM), Maastricht University Medical Centre, Maastricht, Netherlands, 6. Laboratory of Epidemiology and Population Sciences, Intramural Research Program, National Institute on Aging, Bethesda, Maryland*

This study explored whether movement during sedentary time is meaningful, and examined the associations between sedentary movement and metabolic outcomes. 631 participants (aged 73-98 years) of the AGESII-Reykjavik Study wore a triaxial accelerometer (ActiGraph GT3X) for 7 consecutive days. Sedentary movement was defined as activity in the anteroposterior and/or mediolateral axes with an intensity >=100 cpm during sedentary time (<100 cpm in the vertical axis). Metabolic outcomes included BMI, waist circumference (WC), HDL-cholesterol (HDL), triglycerides (TG), fasting glucose and C-reactive protein. Compared with those who had the most sedentary movement minutes, participants with fewer sedentary movement minutes had an up to 3.4 kg/m2 higher BMI, an up to 8.3 cm larger WC, an up to 0.13 mmol/L lower HDL level and an up to 1.10 times higher TG level (all $p<0.05$). These findings suggest that movement during sedentary time could be a relevant aspect of sedentary behavior.

HEALTH CARE COSTS ASSOCIATED WITH PROLONGED SITTING AND INACTIVITY

G. Peeters, G. Mishra, A. Dobson, W.J. Brown, *School of Human Movement Studies, The University of Queensland, Brisbane, Queensland, Australia*

Health-related costs from 2001 to 2010 were compared between categories of sitting time and physical activity in >6000 participants (born 1946–1951) from the Australian Longitudinal Study on Women's Health. National health insurance claims data were used to calculate annual costs (Australian Dollars [AU$]). Differences in costs between categories of sitting time (low [0-4], moderate [5-7], high [≥8 hours/day]) and leisure activities (inactive [<40], low [40–600], moderate [600–1200], high [≥1200 MET.minutes/week]) were estimated using quantile regression with bootstrapped 95% CIs. In 2010, annual median costs were AU$668 (IQR=270-1529) in highly active/low sitting participants and AU$760 (IQR=288-1783) in inactive/high sitting participants. Median costs were AU$94 (CI=57-131) higher in inactive than highly active participants. No associations were found between sitting time and costs. High sitting time did not add to the inactivity-associated increased costs. In conclusion, physical inactivity, but not prolonged sitting, was associated with higher health-related costs in mid-age women.

SESSION 540 (PAPER)

FALLS

CIRCUMSTANCES AND OUTCOMES OF FALLS AMONG HIGH RISK COMMUNITY-DWELLING OLDER ADULTS

J.A. Stevens[1], H. Ehrenreich[2], J.E. Mahoney[1], *1. Centers for Disease Control & Prevention, Atlanta, Georgia, 2. University of Wisconsin Medical School, Madison, Wisconsin*

Background: Falls threaten the health and independence of older adults. We investigated the circumstances and injury outcomes of falls among community-dwelling older adults at high risk of falling. Methods: This was a secondary analysis of falls among 328 participants in the Dane County (Wisconsin) Safety Assessment for Elders (SAFE) Research Study. SAFE was a randomized controlled trial of a multifactorial falls intervention conducted from October 2002–December 2007. Participants were community-dwelling adults aged >=65 who reported at least one fall in the year following enrollment. Information on falls was collected prospectively using monthly calendars and telephone interviews were conducted to determine the circumstances surrounding each event. Injury outcomes were defined as none, mild, moderate, and severe. Results: Data were available for 1,172 falls. A generalized linear mixed model analysis showed that being aged >=85 (OR=2.1, 95% confidence interval [CI]=1.2–3.9), female (OR=2.1, 95% CI=1.3–3.4), falling backward and landing flat (OR=5.6, 95% CI=2.9–10.5), sideways (OR=4.6, 95% CI=2.6–8.0) and forward (OR=3.3, 95% CI=2.0–5.7) were significantly associated with the likelihood of injury. Of 783 falls inside the home, falls in the bathroom were more than twice as likely to cause an injury compared to falls in the living room (OR=2.4, 95% CI=1.2–4.9). Conclusions: In this population, most falls occurred inside the home and the likelihood of injury was strongly associated with the direction of the fall. These findings will help clinicians tailor fall prevention for their patients. They also have practical implications for retirement and assisted living communities.

CAN'T WE JUST ASK? AGREEMENT BETWEEN SURVEY AND REGISTER DATA ON INJURIOUS FALLS

S. Karinkanta[1], P. Kannus[1,2], K. Uusi-Rasi[1], A. Heinonen[3], H. Sievänen[1], *1. The UKK Institute for Health Promotion Research, Tampere, Finland, 2. Medical School, University of Tampere, and Division of Orthopedics and Traumatology, Department of Trauma, Musculoskeletal Surgery and Rehabilitation, Tampere University Hospital, Tampere, Finland, 3. University of Jyväskylä, Department of Health Sciences, Jyväskylä, Finland*

Background: The standard method to assess falls is through monthly fall-diaries. However, in large and long-term studies fall-diaries are challenging, and retrospective surveys are considered instead. One might expect that injurious falls are events that are recalled after a long time. Yet, little is known about the accuracy of survey-based recall of injurious falls. This study assessed whether injurious falls recorded in patients files were accurately reported by older people. Methods: 127 Finnish women aged 75 to 84 completed a survey with questions on whether they had fallen during the previous month (MO), previous year (Y), or had injurious falls 1–5 years ago (5Y). All injuries, treatment received and health care visits were asked. These data were compared with computerized patient files of the healthcare system. Results: 69 injurious falls (IF) were found in the patient files: 3 during MO, 10 during Y and 56 during 5Y. All IFs during MO and 80% during Y were correctly reported in the survey. However, during 5Y only 20 (36%) IFs were reported correctly, 6 (10%) incompletely, and 30 (54%) not at all. 6 of 20 fractures (30%) during 5Y were completely missed via the survey, and 3 (15%) were reported as an IF without fracture. All fractures during MO and Y (n=3) were correctly reported. Conclusions: Since over half the injuries sustained are missed in a survey, a questionnaire is an unreliable method to assess injurious falls, especially over periods longer than one year.

OBJECTIVE ASSESSMENT OF FALL RISK IN PARKINSON'S DISEASE USING A BODY-FIXED SENSOR WORN FOR THREE DAYS

J. Hausdorff[1,4,5], A. Weiss[1], T. Herman[1], N. Giladi[1,2,3], *1. Laboratory for Gait & Neurodynamics, Movement Disorders Unit, Department of Neurology, Tel Aviv Sourasky Medical Center, Tel Aviv, Israel, 2. Department of Neurology, Sackler Faculty of Medicine, Tel-Aviv University, Tel Aviv, Israel, 3. Sagol School of Neuroscience, Tel-Aviv University, Tel Aviv, Israel, 4. Department of Medicine, Harvard Medical School, Boston, Massachusetts, 5. Department of Physical Therapy, Sackler Faculty of Medicine, Tel Aviv, Israel*

Background: Patients with Parkinson's disease (PD) suffer from a high fall risk. Previous evaluation approaches are based on self-report or testing at a given time point and may, therefore, be insufficient to optimally capture fall risk. We tested, for the first time, whether acceleration-derived 3-day metrics are associated with fall risk in PD. Methods: 107 patients (Hoehn&Yahr Stage: 2.6±0.7) wore a small, body-fixed sensor (3D accelerometer) on the lower back for 3-days. Walking quantity (e.g., step count) and quality (e.g., frequency-derived variability measures) were determined. Subjects were classified as fallers or non-fallers based on fall history and followed for one year to evaluate predictors of the transition from non-faller to faller. Results: Acceleration-derived 3-day measures significantly differed between fallers and non-fallers and were significantly correlated with previously validated fall risk measures. Walking quantity was similar in the two groups. In contrast, fallers walked with higher step-to-step variability (e.g., anterior-posterior width: fallers: 0.78±0.17 Hz, non-fallers: 0.71±0.07 Hz, p=0.012). Among the non-fallers, sensor-derived measures predicted the time to first fall during follow-up (p=0.0034), whereas many traditional measures (e.g., gait speed) did not. Anterior-posterior width was significantly (p=0.0039) associated with time to fall during follow-up, even after adjusting for traditional measures. Conclusions: These findings indicate that a body-fixed sensor worn continuously can evaluate fall risk in PD. This sensor-based approach was able to identify transitions from non-faller to faller, whereas many traditional metrics did not. This approach may facilitate earlier fall risk detection and may help reduce the high costs associated with falls.

FNIRS STUDY LINKS FREEZING OF GAIT TO FRONTAL LOBE ACTIVATIONIN PATIENTS WITH PARKINSON'S DISEASE

J. Hausdorff[1,5,6], I. Maidan[1,2], H. Bernad-Elazari[1], E. Gazit[1], N. Giladi[1,3,4], A. Mirelman[1], *1. Tel Aviv Sourasky Medical Center, Tel Aviv, Israel, 2. Rivers Lab, Department of Rehabilitation and Movement Science, Rutgers Biomedical and Health Sciences, Newark, New Jersey, 3. Sagol School of Neuroscience, Tel Aviv University, Tel Aviv, Israel, 4. Department of Neurology, Sackler Faculty of Medicine, Tel-Aviv University, Tel-Aviv, Israel, 5. Department of Medicine, Harvard Medical School, Boston, Massachusetts, 6. Department of Physical Therapy, Sackler Faculty of Medicine, Tel-Aviv University, Tel Aviv, Israel*

Recent studies suggest that deficits in executive function contribute to freezing of gait (FOG), an episodic disturbance that is common among patients with Parkinson's disease (PD). Direct evidence is, however, lacking. We examined the association between FOG and frontal lobe activation, i.e., oxygenated hemoglobin (HbO2), as patients with PD walked while instrumented with functional near-infrared spectroscopy (fNIRS). In 49 turns, HbO2 increased by 0.16±0.04 μM before FOG (p=0.003), then reached a peak and declined during FOG. More specifically, increased activation was observed in FOG that occurred during anticipated turns. In contrast, HbO2 did not significantly change before 44 turns that occurred without FOG, and decreased by 0.32±0.08 μM (p=0.004) during these turns. These findings are the first evidence of a direct connection between FOG episodes and frontal brain activation and support the idea that executive function alterations play a key role in this transient motor disturbance that profoundly impacts mobility.

SESSION 545 (SYMPOSIUM)

IMPACT OF NURSE STAFFING MIX ON QUALITY OF CARE IN NURSING HOMES: AN INTERNATIONAL OVERVIEW

Chair: E. van Rossum, *Zuyd University of Applied Sciences, Heerlen, Netherlands, Maastricht University, Maastricht, Netherlands*
Discussant: E.E. Capezuti, *Hunter College of the City University of New York, New York, New York*

During the last three decades, there has been growing concern about nursing home quality in many industrialized countries. Poor care quality has often been associated with insufficient staffing levels, as staffing is presumed to affect the quality of care (QoC) and life (QoL) of nursing home residents. Research on the relationship between staffing and QoC in nursing homes has received considerable attention, especially in the United States. This symposium aims to provide an international perspective on assessing nurse staffing and QoC in nursing homes, with evidence from different countries. The first presenter will draw on data from a longitudinal randomized clinical study of Swedish nursing homes to examine how staffing levels and staff skill mix are related to QoC and QoL. The second presenter offers insights from a nationally (Swiss) nursing home study on the relationship between staffing, turnover and burden of long-term staff absence and QoC indicators. The third presenter will present findings from a study on staffing levels, staffing mix and QoC in Norwegian nursing homes. The fourth presenter will use a national sample of US data to show staffing trends, and the impact the relative changes in staffing-mix have on QoC. The fifth presenter will sum up the evidence from longitudinal studies assessing nurse staffing and QoC in nursing homes.

STAFFING, SKILL MIX, QUALITY OF CARE AND RESIDENT OUTCOMES IN SWEDISH RESIDENTIAL AGED CARE

D. Edvardsson[1,2], C. Juthberg[2], K. Sjogren[2], L.S. Bjoerk[2], A.C. Backman[2], *1. Nursing, La Trobe University, Melbourne, Victoria, Australia, 2. Umea University, Umea, Sweden*

Background: Staffing levels and staffing skill mix are factors repeatedly assumed to influence quality of care and subsequently resident outcomes, even if conclusive evidence is yet to be accumulated. Methods: Randomised and nationally representative data on direct care staff (N≈ 6000) and residents (N≈ 6000) in the longitudinal Swedish National Inventory of Staffing and Care (Svenis) study is used to analyze relationships between staffing levels and skill mix relating to quality of care and resident health indicators such as behavioral and psychological symptoms, quality of life, thriving, and activity participation. Results: Preliminary analyses indicate relationships between staffing levels, staff skill mix and quality of care, and forthcoming analyses will confirm the significance of these relationships as well as how staffing is related to indicators of resident health and quality of life.

STAFFING, TURNOVER AND LONG-TERM ABSENCES DO NOT RELATE WITH QUALITY OF CARE IN SWISS NURSING HOMES

F. Zúñiga, D. Ausserhofer, S. De Geest, R. Schwendimann, *Institute of Nursing Science, Basel University, Basel, Switzerland*

Background: Studies on the relationship of careworker staffing with quality of care in nursing homes show inconclusive results. Methods: A national, representative, cross-sectional survey study was conducted in 163 Swiss nursing homes. Results: The median full-time equivalent per 100 beds was 49 careworkers, 30% of which were registered nurses, median turnover was 10%, 21% of the units had a heavy burden of long-term absences. High quality of care was found, with e. g. 2% of nursing home residents with pressures ulcers, 2% with fall-related injuries, and 5% with weight loss. Neither staffing nor turnover or long-term absences were related to any of the measured quality indicators. Discussion: Swiss nursing homes seem to be sufficiently staffed for providing acceptable quality of care. Other organizational factors (e.g. nurses' work environment, rationing of care) may explain the variability observed in the quality of care indicators. This hypothesis will be tested in future analyses.

STAFFING AND QUALITY OF CARE IN NORWEGIAN NURSING HOMES

A.K. Havig[1], A. Skogstad[3], T. Romøren[4], L. Kjekshus[2], *1. NOVA, Oslo, Norway, 2. University of Oslo, Oslo, Norway, 3. University of Bergen, Bergen, Norway, 4. Gjøvik University College, Gjøvik, Norway*

Background: Staffing levels and staffing mix have shown to be related to quality of care in nursing homes in US studies. However, few European studies have examined the relationship. Methods: A cross-sectional survey of forty nursing home wards throughout Norway was used to collect the data. Quality of care was assessed by relatives, staff and field observations. Results: Staffing levels and ratio of registered nurses were not significantly related to any of the quality of care indices. The ratio of unlicensed staff, however, showed a significant negative relationship to the quality of care indices. Conclusions: Nursing homes should minimize use of unlicensed staff. The study indicates, however, that the relationship between staffing levels, ratio of registered nurses and quality of care is complex. Increasing staffing levels or the ratio of registered nurses alone is not likely sufficient for increasing quality of care.

CHANGES IN STAFF-MIX AND QUALITY IN NURSING HOMES

N. Castle, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Data used in this investigation came from surveys of nursing home administrators (N = 6,000); Nursing Home Compare; the Online Survey, Certification and Reporting data; and the Area Resource File. Staffing characteristics, quality indicators, facility, and market information from these data sources were all measured in 2010. The regression analyses showed that staffing factors (i.e., staffing levels, agency staff, stability, and professional staff mix) were associated with the six quality measures examined. In this investigation, the influence of changes in professional staff mix (i.e., RNs / CNAs) are investigated further. A more favorable professional staff mix is associated with the better quality. Some accounting professional staff mix is needed when examining staffing factors.

NURSE STAFFING IMPACT ON QUALITY OF CARE IN NURSING HOMES: SYSTEMATIC REVIEW ON LONGITUDINAL STUDIES

R. Backhaus[1], H. Verbeek[1], E. van Rossum[2,1], E.E. Capezuti[3], J.P. Hamers[1], *1. Maastricht University, Maastricht, Netherlands, 2. Zuyd University of Applied Sciences, Heerlen, Netherlands, 3. Hunter College of the City University of New York, New York, New York*

Background: While the effect of nurse staffing mix on quality of care (QoC) in nursing homes has been assessed for years, the supporting evidence is weak. This may partly be due to the heterogeneity in study designs. Therefore, we conducted a review focusing on studies with the highest level of evidence: longitudinal cohort studies. Methods: Searching databases led to the inclusion of 20 longitudinal studies; 2 low-quality studies were excluded from analysis. Results: Higher staffing levels were associated with both better (e.g., less restraints/catheterization) and lower QoC (e.g. more restraints/catheterization). Discussion and conclusion: The evidence for a clear positive relationship between staffing and QoC is inconsistent. Major methodological weaknesses in study designs ask for a careful interpretation of findings. To gain a better insight into the effect of nurse staffing on QoC in nursing homes, further well-designed longitudinal studies are necessary.

SESSION 1825 (SYMPOSIUM)

POLICY SERIES: SELF-EMPLOYMENT AND ENTREPRENEURSHIP: THE AGING WORKFORCE'S "ENCORE"?

Chair: G. O'Neill, *National Academy on an Aging Society, Washington, District of Columbia*

This session will provide: (1) a profile of older self-employed adults and entrepreneurs; (2) proposals for policies to promote self-employment and entrepreneurship in later life; and (3) insights from senior-focused entrepreneurship training and education programs.

SESSION 555 (SYMPOSIUM)

RECRUITMENT STRATEGIES FROM A PACE MODEL

Chair: D.V. Petrovsky, *University of Pennsylvania, Philadelphia, Pennsylvania*

A Program of All-Inclusive Care for the Elderly (PACE) center, operated by the University of Pennsylvania School of Nursing, located in an urban Philadelphia neighborhood cares for dually eligible frail older adults with co-morbidities, including dementia (57%) and chronic mental illness (5.75%). Nearly all members (94%) are African American, a group that is difficult to engage in research. This unique model of care cultivates long term program enrollment of the members which has allowed continued researcher access to this understudied population. Evidence-based practice and research are at the core of the center's mission. Facilitators to research at this day center include the presence of a liaison, administration that fosters research endeavors, a Council of Elders, and facility-provided reliable transportation which promotes members' attendance. Research efforts have revealed some successful recruitment strategies. These include (1) purposeful sampling based on staff recommendation, (2) member-to-member referrals, and (3) targeted marketing with incentives.

RECRUITING FOR HOME- AND COMMUNITY-BASED STUDIES OF DEMENTIA CARE NEEDS AND INTERVENTIONS: BARRIERS AND SOLUTIONS

C. Kerssens[1], R. Kumar[1], A. Adams[1,2], C. Knott[3], *1. R&D, SimpleC, LLC, Atlanta, Georgia, 2. Georgia Institute of Technology, Atlanta, Georgia, 3. Aptima, Inc., Washington, District of Columbia*

The National Plan to Address Alzheimer's Disease (http://aspe.hhs.gov/daltcp/napa/NatlPlan2013.shtml) calls for increased enrollment in clinical trials and other research through community outreach. At the same time, it is well-established that family caregivers for persons with dementia (PWD) are extremely burdened in caring for their loved-one and it is difficult to receive and adapt to a dementia diagnosis. In our experience, both factors significantly hamper research recruitment of community-dwelling PWD and their caregivers. We recently implemented several in-home studies of a person-centered dementia care intervention, and observed widespread sensitivities and reluctance to participate as well as high attrition rates. After tailoring recruitment and retention strategies more carefully to household dynamics, we were better able to complete the 3- to 12-week intervention trials (n=19). In this session, we present observations and data from all phases of research and discuss barriers and solutions to enrollment of this population along with implications for future studies.

LESSONS LEARNED RECRUITING MINORITY PARTICIPANTS IN RESEARCH

G.J. McDougall[2,3], G.M. Simpson[1,3,4], *1. University of Alabama, School of Social Work, Tuscaloosa, Alabama, 2. University of Alabama, Capstone College of Nursing, Tuscaloosa, Alabama, 3. Faculty Associate Center for Mental Health and Aging, Tuscaloosa, Alabama, 4. University of Alabama, HDRTP, RCMAR Scholar, Birmingham, Alabama*

In the US Hispanic, elders are expected to increase 86% and African Americans by over 31% compared to a 15% increase in Anglos. The Institute of Medicine (IOM) report on unequal treatment and several other reviews suggest that racial/ethnic minorities less frequently receive appropriate care. To improve quality of life for minority elders, we need information on minority elders' cognitive function as they age. Twenty years of cognitive aging research have generated successful recruitment and retention of older adults from diverse ethnic and racial backgrounds. In this presentation, we discuss lessons learned in implementing trials in the community, and provide examples that lead to improved study outcomes. Categories include advertising and marketing of clinical trials, media relations, recruitment and retention strategies, intervention tailoring, and adaptation of psychometric instruments for diverse groups. The authors acknowledge the National Institute on Aging 1 R01 AG15384 for support with this research.

RECRUITMENT AND RETENTION STRATEGIES OF ETHNICALLY DIVERSE OLDER ADULTS IN COGNITIVE AGING RESEARCH

G.M. Simpson[1,3], M. Harris[2], C. Kerssens[4], *1. University of Alabama, School of Social Work, Tuscaloosa, Alabama, 2. Harding University, Carr College of Nursing, Searcy, Arkansas, 3. Faculty Associate Center for Mental Health and Aging, Tuscaloosa, Alabama, 4. VP of Research and Clinical Innovation, Georgia, Georgia*

In the United States, empirical data indicate racial and ethnic elders are the fastest growing segment of the older adult population. The National Institutes of Health (NIH) reported racial and ethnic elders, women, and individuals with chronic and disabling conditions, are vulnerable for cognitive impairments and face greater health disparities. Legislation of the National Alzheimer's Project Act (NAPA) mandated federal, state, and local community collaborations for successful recruitment and retention of ethnically diverse older adults in cognitive aging research. One of NAPA's major goals is to solicit partnership with funded researchers about effective recruitment strategies of community-dwelling, racial and ethnic elders in cognitive aging research. In this symposium, four funded researchers provide successful recruitment and retention strategies to increase enrollment of community dwelling older adults and their family members in cognitive clinical trials and longitudinal interventions. Graham and Simpson discuss strategies implemented to recruit and retain Hispanic and African American elders for a longitudinal memory training study. Petrovsky and colleagues discuss successful community-based recruitment strategies to overcome barriers in an urban environment for enrollment of older African American adults with cognitive impairments into a Program of All-Inclusive Care for the Elderly (PACE). Aaron identifies and discusses culturally relevant recruitment strategies to reduce African American caregivers' perception of stigma associated with caring for older adults with dementia. Kerssens and colleagues present successful adaptation to traditional research methods for improving recruitment and retention efforts of community-dwelling persons with dementia and their family caregivers.

LESSONS LEARNED WITH RECRUITING AFRICAN AMERICAN FAMILY CAREGIVERS OF PERSONS WITH DEMENTIA

C.S. Aaron, *Mennonite College of Nursing, Illinois State University, Normal, Illinois, Illinois*

An important implication recruitment barrier to address with older African American dementia caregiver is the role of stigma. The stigma of caring for a person with dementia created recruitment difficulties in a mixed method study of women caring (n=50) for persons with dementia. The presenter describes recruitment strategies to reduce caregivers' perception of stigma associated with caring for older adults with dementia and presents culturally relevant strategies to reduce their perceptions inferred with family caregivers' enrollment into cognitive aging research studies. Religious beliefs of African American participants and potential participants have concerning caring for a person with dementia, made them fearful of sharing their experiences of caregiving with the PI. A mixed methods approach revealed insight into validation of the "spiritual reasons" for reluctance to participate in research studies, caregiver support groups and clinical trials. The Author acknowledges the John A. Hartford Foundation for support with this research.

SESSION 560 (SYMPOSIUM)

RAINBOW RESEARCH SYMPOSIUM: TRANSGENDER PERSPECTIVES ON RISK, RESILIENCE AND SUCCESSFUL AGING

Chair: K. Porter, *UMASS Boston, Quincy, Massachusetts*
Co-Chair: V. Fabbre, *University of Chicago, Chicago, Illinois*
Discussant: R. Moone, *University of Minnesota, Minneapolis, Minnesota*

This symposium will highlight transgender aging experiences as distinct, and not simply a mirror of "LGB" (lesbian, gay, bisexual) aging experiences, within which they are often presented. The symposium will present five scholarly papers grounded in a range of methodological approaches that explore risks and resilience in this population, differences by sexual orientation, and the conceptualization of successful aging and minority stress within national and global samples of transgender older adults. The interpretive analyses presented in the first paper challenge traditional conceptualizations of successful aging through the application of queer theory to the experiences of transgender persons who pursue a gender transition in later life. The second paper will analyze the biographical narratives of older transgender persons for critical themes of transphobia and the need for client-centered health and social services for this population. In addition, two studies present findings from data gathered through the Trans MetLife Survey. The first descriptively explores attributes of those who report successful aging, and more specifically the differences in the area of self-actualization. The second reports on significant characteristic differences (t-test and chi-square) between heterosexual and non-heterosexual transgender older adults (N=346), as well as, the significant association found between aging fears and successful aging. In the fifth paper, a national study of transgender older adults (N=146) will be presented that used structural equation modeling to examine the relationships between minority stressors, chronic disease, and psychological distress, and differences between non-transgender LGB older adults and transgender older adults.

GENDER TRANSITIONS IN LATER LIFE: A QUEER PERSPECTIVE ON SUCCESSFUL AGING

V. Fabbre, *University of Chicago, Chicago, Illinois*

This study explores the experiences of transgender persons who contemplate or pursue a gender transition in later life in order to develop culturally diverse conceptualizations of health and wellness in older age. Using extended case method (ECM), in-depth interviews were conducted with male-to-female identified persons (N=22) who have seriously contemplated or pursued a gender transition past the age of 50.

In addition, 170 hours of participant observation was carried out at three national transgender conferences generating ethnographic field notes on the topics of aging and gender transitions in later life. Interpretive analyses suggest that many transgender older adults experience challenges to their gender identities that risk their emotional and physical well-being. Contemporary queer theory is used to understand these experiences by expanding on traditional notions of success and arguing that greater attention to experiences of "queer failure" may be an integral aspect of growth and development for LGBTQ older adults.

SAMPLE CHARACTERISTIC DIFFERENCES BY SEXUAL ORIENTATION FROM THE TRANS MET LIFE SURVEY

K. Porter, C. Ronneberg, *UMASS Boston, Quincy, Massachusetts*

This study compares differences by sexual orientation in 346 transgender older adults. Quantitative analyses (t-tests and chi-square) revealed numerous statistically significant differences. Heterosexual transgender older adults were more likely to have a masculine gender self-perception and a male driver's license sex ($p=.000$), while the opposite was found for sexual minority (SM) transgender older adults. SMs were more likely to make lower incomes, not have children, and not have a partner/spouse than heterosexuals ($p<.05$). SMs were more likely to be out about their gender identity to everyone ($p=.000$), and be out to friends, healthcare providers, and religious leaders ($p<.01$) than heterosexuals. Logistic regressions found an association between several aging fears and successful aging in this population, although there were no differences by sexual orientation. The findings of this study highlight the importance of studying transgender older adults, not simply including the "T" in the "LGBT" group umbrella.

IT'S NOT ALL SCYLLA AND CHARYBDIS: SUCCESSFUL AGING AND RESILIENCE IN THE TRANSGENDER COMMUNITY

T.M. Witten, *Center for the Study of Biological Complexity, Virginia Commonwealth University, Richmond, Virginia*

Much research has shown that the global trans-identified population suffers significant stigma, violence and abuse at the hands of healthcare workers, caretakers, and many other groups. Further, this abuse is often repeated and frequent and takes place across the whole lifespan; from early life until a trans-person is elderly. Yet, in the face of this extremely negative environment, many trans-persons say that they have aged successfully. In this presentation we will explore the Trans MetLife Survey (TMLS) respondent answers to questions around successful aging, resilience and other factors that allow trans-persons to see their lives as successful. We will examine how this is both the same and different from the traditional heterosexual community and we will close with what trans-persons can teach us about aging well.

THE MENTAL HEALTH OF TRANSGENDER OLDER ADULTS: MECHANISMS OF RISK

C.P. Hoy-Ellis, K.I. Fredriksen-Goldsen, *School of Social Work, University of Washington, Seattle, Washington*

Exceedingly limited research on transgender older adults suggests they experience poorer mental and physical health than their non-transgender lesbian, gay, and bisexual (LGB) peers. The minority stress model suggests that unique stressors, such as concealment of minority identity and internalized stigma contribute to higher rates of psychological distress. Other research indicates that chronic disease also increases the risk for psychological distress. This study uses structural equation modeling to examine the relationships between minority stressors, chronic disease, and psychological distress among 146 transgender adults aged 50 and older. After controlling for age, income, and education, findings indicate that concealment, internalized stigma, and chronic disease are each associated with psychological distress among non-transgender LGB older adults, but only internalized stigma is significant among transgender participants. Implications for applying the minority stress model and conducting research with this distinct population are discussed.

SESSION 565 (SYMPOSIUM)

MAKING CONNECTIONS: PROMOTING SUSTAINABILITY AND DIVERSITY IN VILLAGE AGING IN PLACE INITIATIVES

Chair: J.K. Davitt, *University of Maryland, Baltimore, Maryland*

This symposium will highlight the critical connections between research and practice to promote aging in place. The symposium brings together findings from national and state level research with local practice wisdom of providers of Village services. This session will address two key challenges currently facing operating and developing Villages: 1) sustainability, and 2) engaging members with diverse needs and backgrounds. Highlighting research and practice examples from Village programs across the country, the symposium presents results from a national survey of Villages, a survey of Villages in California, and examples of practical challenges and some promising practices implemented by one Village in Baltimore, MD. The first paper presents findings from a second wave of data collection in a national survey of operating Villages, and will focus on challenges and strategies related to the sustainability of these organizations. Using data from the same national survey, the second paper will focus on challenges and strategies related to recruiting, serving, and retaining diverse members, as well as how programs are defining diversity. The third paper will focus on understanding the intersection of sustainability and diversity among Villages operating in one particular state. Drawing on the experiences of one Village operating in Baltimore, MD, the fourth paper focuses on explicating the strategies used at the micro level to enhance member diversity and program sustainability. Presenters will highlight the connections between research, policy and practice in order to enhance translation of best practices to communities, policy makers, and older adults.

CHALLENGES TO VILLAGE SUSTAINABILITY: FINDINGS FROM A NATIONAL STUDY

A.J. Lehning[1], J. Price Wolf[2], H. Wiseman[1], *1. University of Maryland, Baltimore, Maryland, 2. Prevention Research Center, Oakland, California*

While nearly 100 Villages are currently in operation and at least another 100 are in some stage of development, the long-term sustainability of organizations offering this model for aging in place remains unclear. We analyzed quantitative (online survey) and qualitative (telephone interview) data collected in 2012 and 2013 from leaders in 58 Villages to examine the potential facilitators and barriers to the long-term survival of these organizations. Analysis of change between baseline and follow up suggested that while indicators of sustainability (e.g., total membership) are increasing, perceptions of the likelihood the organization will survive are decreasing. Content analyses of follow up interview data indicated that uncertainty about the feasibility of relying on membership fees for funding, fears about meeting the future service needs of an aging membership, and a lack of succession planning for volunteer and professional leadership explain this drop in confidence in sustainability.

MAKING CONNECTIONS: ENABLING AGING IN PLACE FOR DIVERSE OLDER ADULTS

J.K. Davitt, A.J. Lehning, *University of Maryland, Baltimore, Maryland*

This paper presents data from a national survey of operating Villages in the US. The data are derived from a baseline survey in 2012 ($N=69$) and follow-up conducted one year later ($N=58$). Results indicate that Villages, on average, are serving mostly white women between the ages of 65-84 who are not impoverished or economically insecure. Furthermore, 75% of respondents indicated that recruiting diverse members would be a challenge for them over the next 5 years. Respondents also indicated which groups they were interested in recruiting, including: non-white racial/ethnic members, men, lower income and younger members. The paper summarizes the challenges described by respondents in recruiting the specific groups they identified. A major challenge to increasing the diversity of membership is overcoming misperceptions of what the Village is and the types of people it might serve. We discuss the connection between diverse memberships and long term sustainability and implications for policy/practice.

SUSTAINABILITY AND DIVERSITY WITHIN CALIFORNIA VILLAGES

A.E. Scharlach, C. Graham, *Social Welfare, University of California, Berkeley, California*

Developmental processes experienced by Villages were examined in ten California Villages over a two-year period. Data sources included quarterly reports, bi-monthly conference calls, bi-annual in-person meetings, grant proposals, and business plans. Challenges cited most frequently included: member recruitment and retention, volunteer recruitment, and economic stability. Membership growth varied from 12% to 151% during the study period, with greater growth associated with decentralization and local inter-organizational partnerships. Economic diversity was considered more important than racial or ethnic diversity; 4.6% to 54.5% of Villages' members had incomes below their county EESI, with greater diversity associated with government funding. Economic stability was predicated on stable sources of earned and donated resources, to offset perturbations in membership dues. Primary service provision challenges included recruiting enough transportation volunteers, and meeting the needs of increasingly disabled members. These findings have important implications for the stability and effectiveness of Villages and other member-based aging services organizations.

CONNECTING PERSON-PERSON, PERSON-COMMUNITY, AND COMMUNITY-NATIONAL MOVEMENT: A BALTIMORE VILLAGE

L. Levine, *Supportive Community Network, Comprehensive Housing Assistance, Inc., Baltimore, Maryland*

This presentation will describe the experiences of the Comprehensive Housing Services, Inc. (CHAI) in Baltimore, Maryland in the establishment and development of their first Village, Northwest Neighbors Connecting (NNC). NNC emphasizes diversity in age, race and economic status. This presentation will highlight some of the lessons learned from three different approaches to promoting a diverse membership and long-term sustainability. The first presents local strategies to overcome the challenges of including diverse members, including recruitment tactics and diversity dialogues. The presentation will also focus on the connections between diversity and sustainability by highlighting a new initiative related to local rental housing policy and the initiative's involvement in community change to support aging in place for low-income residents. Finally, we will describe a strategy at the national level to create mentorship relationships among villages trying to build diversity and sustainability into their strategies.

SESSION 570 (SYMPOSIUM)

INNOVATIVE AND DISRUPTIVE APPROACHES TOWARD HEARING HEALTH CARE DELIVERY IN THE COMMUNITY

Chair: F.R. Lin, *Johns Hopkins University, Baltimore, Maryland*
Discussant: L.N. Gitlin, *Johns Hopkins University, Baltimore, Maryland*

Two-thirds of adults 70 years or older have a clinically-significant hearing impairment but less than 20% of these individuals receive any form of treatment. For the vast majority of these adults, hearing health care (HHC) remains unaffordable and inaccessible. Medicare covers diagnostic audiology services but not therapeutic or rehabilitative audiology services. Consequently, HHC is an out-of-pocket expense that is generally priced as a "bundled package" where the average price of $4000 for a pair of hearing aids reflects the device cost as well as the services of the audiologist to deliver supportive care for these devices. This business model focuses HHC on only the sale of hearing aids rather than encouraging HHC professionals to educate/counsel patients and provide lower cost devices which can sometimes be a better option. Accessibility of HHC is also a major issue. Hearing screenings are not readily accessible to older Americans, and assuming patients can even afford care, the current model of HHC requires a patient to make multiple trips for follow-up care which limits access for patients with impaired mobility. Multiple factors including a rapid convergence between what is considered a medical device and a consumer electronic, expectations of the baby boomer generation, and a broader understanding of the importance of hearing to healthy aging are catalyzing a change in the current "business as usual" model of HHC. This symposium will explain the current model of HHC in the U.S. and survey current efforts to provide broader access to HHC for older adults.

HEARING HEALTH CARE IN AMERICA

C. Compton-Conley, *Compton-Conley Consulting, Annapolis, Maryland*

America's hearing health care system can be confusing to both consumers and the professionals who work with them. This presentation will describe the current system as well as the changes occurring to the system due to trends in education, health care, legislative and technology. The goal of the presentation will be to provide the audience with a systematic way of navigating the hearing health maze in order to provide patients with appropriate diagnostic and treatment options that reflect best practices.

INTEGRATING A HEARING LOSS SCREENING AND EDUCATION PROTOCOL INTO PRIMARY CARE

M.I. Wallhagen, W.J. Strawbridge, *Physiological Nursing, University of California, San Francisco, San Francisco, California*

Although hearing loss (HL) is a significant problem for older adults, primary care practitioners rarely screen for it and those screened positive often do not take action. Time constraints in primary care and poor understanding of hearing loss and the need for adaptation to hearing loss contribute to this problem. We developed and tested a simple, concise, and inexpensive protocol consisting of screening for HL (single item question plus finger-rub) followed by a 5-minute educational session (brochure and brochure review by the screener). The educational material included information on alternatives to hearing aids including behavioral changes. Discussed are factors influencing the integration of the protocol and the potential benefits of and barriers to wide spread adaptation of such a protocol to promote access to and use of hearing healthcare services and potentially minimize the negative impact of hearing loss.

THE BALTIMORE HEARS STUDY: A NOVEL COMMUNITY-BASED HEARING HEALTH CARE INTERVENTION

C.L. Nieman[1,2], S. Szanton[3,2], E. Tanner[3,2], R. Thorpe[4,2], F.R. Lin[1,2,3], *1. Johns Hopkins University School of Medicine, Dept Otolaryngology HNS, Baltimore, Maryland, 2. Johns Hopkins Center on Aging & Health, Baltimore, Maryland, 3. Johns Hopkins School of Nursing, Baltimore, Maryland, 4. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

The Baltimore HEARS Study is a phased, pilot study to develop and test the feasibility of a novel, community-based hearing health care intervention. Given the prevalence of age-related hearing impairment and resources required to access hearing care, the HEARS Study targets older adults, particularly low-income, minority communities. Baltimore HEARS is a community-delivered intervention designed for hearing impaired older adults and their communication partners and includes: 1) on-site audiometric screening, 2) provision of an affordable, accessible listening device, 3) orientation and programming session, and 4) aural rehabilitation. Older adults with hearing impairment were recruited in collaboration with a community organization that provides subsidized independent housing. Through a mixed methods approach, focus groups were utilized to tailor the intervention to the community's needs, literacy, and preferences. Preliminary effectiveness was assessed through a randomized, 3-month wait-list control and primary outcomes include communication, disability, social engagement, loneliness, depression and quality of life.

DEVELOPMENT OF A COMMUNITY HEALTH WORKER APPROACH TO EXPAND ACCESS TO HEARING HEALTH CARE

N. Marrone[1], D. Sanchez[1], M. Ingram[2], J. de Zapien[2], F.P. Harris[1], S. Colina[3], R. Piper[4], S. Carvajal[2], *1. Dept. Speech, Language, and Hearing Sciences, University of Arizona, Tucson, Arizona, 2. Mel and Enid Zuckerman College of Public Health, University of Arizona, Tucson, Arizona, 3. Dept. Spanish and Portuguese, University of Arizona, Tucson, Arizona, 4. Mariposa Community Health Center, Nogales, Arizona*

Given the current low prevalence of management of hearing loss, it is essential that researchers collaborate with members of the community and providers to assess the state of care and develop interventions to expand access to care. The community health worker model has been used successfully in U.S.-Mexico border communities to increase access to healthcare and self-management for a range of chronic health conditions. Efforts to combine this evidence-based public health model with community-based audiologic rehabilitation will be described. Results from a community needs assessment in a traditionally underserved patient population (rural, border, low socioeconomic status, Mexican American adults) confirmed the need for expanded access to care for chronic hearing loss among older adults facing health disparities. Our hypothesis is that a community health worker model will be effective and relevant in reducing disparities in hearing healthcare via culturally competent health education, social support, and language mediation. [Supported by NIH/NIDCD.]

SESSION 575 (SYMPOSIUM)

THE FUTURE OF AGING SERVICES: A NEW BEGINNING OR THE BEGINNING OF THE END

Chair: R. Applebaum, *Miami University, Oxford, Ohio*
Discussant: R. Hudson, *Boston University, Boston, Massachusetts*

As it approaches 50 the aging network, born from the Older Americans Act of 1965, is at a critical juncture. With the incredible growth of the older population one might have thought that these would be the boom years for those with vast experience in delivering aging services. Instead the traditional aging network is facing major challenges and in many states long-standing providers are fighting for their very survival. How and why has this happened? And what are the implications of these changes for the delivery of services to older people in the United States. This session will explore the current and future changes facing the system that has developed to serve older people in this nation. Do these potential changes represent natural progress and efficiency as the U.S. strives to serve an ever growing aging population— or does this represent proprietary businesses capitalizing on a growing market with limited commitment to serving frail and vulnerable elders? Will these changes improve the service delivery system, or will it accentuate societal inequality, which has been mitigated to some degree through an array of programs and services that have been steadily developed in the U.S.?

THE FUTURE OF AREA AGENCIES ON AGING: EVOLUTION OR REVOLUTION

S. Kunkel[1,2], M. Kaschak[3], H. Reece[2], J. Straker[2], *1. Miami University, Oxford, Ohio, 2. Scripps Gerontology Center, Oxford, Ohio, 3. n4a, Washington, D.C., District of Columbia*

Area agencies on aging (AAAs) have been a mainstay of support for independent living for older adults, care management, and community-based service systems. These 618 organizations are uniquely positioned to serve as the consumer-centered touch point for a holistic and integrated system of health and long-term services and support. However, competitive and rapidly evolving service models are presenting unprecedented challenges to this long-standing network. Though the network has been continually evolving since its inception in 1973, current circumstances call for more revolutionary changes in the way that AAAs do business. Based on data from a 2010 national survey of area agencies on aging conducted with funding from the Administration for Community Living, this presentation will highlight the new activities and innovations being developed across the network in response to these growing challenges

IS THE NON-PROFIT ROLE IN LONG-TERM CARE DISAPPEARING-DOES IT MATTER?

L. Polivka, *Claude Pepper Center, Florida State University, Tallahassee, Florida*

For the last 30 years, publicly supported long-term care has been divided between largely for-profit nursing homes and largely not-for-profit home and community-based services (HCBS) managed through the Aging Network. This long standing division of roles has begun to change in many states over the last decade as state level policymakers with federal support have moved to implement managed care models of long-term care (MLTC) administered mostly through for-profit managed care organizations (MCOs) such as HMOs. This presentation will be a critique of this change in models of long-term care financing and delivery focusing on an analysis of available costs and outcomes data from Florida and several other states. These data are limited but sufficient to support a preliminary comparative assessment of these models. The assessment will also include cost and outcome data on hospice care which has undergone a far more extensive shift from non-profit to for-profit model of care since 2000.

ARE THE STARS ALIGNED FOR IMPROVED CHRONIC CARE MANAGEMENT IN THE NEW AND EMERGING HEALTH CARE WORLD? CHALLENGES AND OPPORTUNITIES FOR THE AGING SERVICE NETWORK

A.S. Rosenfeld, *Steward Health Care System, Boston, Massachusetts*

Optimism reigns among the HCBS providers that under global rates and other innovative financing models the stars (incentives) are finally aligned; that the role of Homemaker oriented Home Care, congregate and home delivered meals programs; Adult Day Care and other HCBS will at last receive both attention and funding as part of secondary and tertiary prevention of chronic disease management programs. Is this optimism warranted? Will the profit status of the risk bearing agency matter? Is the evidence strong enough to alter the traditional cultural bias that exists in the acute care dominated health care world to fully integrate the aging services network? What is the evidence to date to convince them that any $ spent will result in a $ saved support the optimism? From a Total Medical Expense perspective. What are the unique challenges and opportunities for senior leaders of aging services for planning and marketing their programs?

THE FUTURE LOOKS DIFFERENT FROM HERE

R. Browdie, *Benjamin Rose, Cleveland, Ohio*

The forces at work that are changing the environment for the "Aging Network" are national. The "Aging Network" has actually evolved differently in each state, due largely to the deference to state discretion in developing and managing services for older people in each state. As a result, the future of the "Aging Network" heavily depends on geography. The service system for older adults is increasingly dominated by the developments in the health care arena. Strong incentives now exist in federal policy to integrate the funds that used to be managed through states and Medicare funds into single, or at least highly integrated, streams, usually through managed care companies. Important roles of the "Aging Network" are now being absorbed into these new strategies. Thus, in significant ways, the future of the "Aging Network" is very much in question. The presentation will highlight the most significant policy themes and will address how the "Aging Network's" role will potentially evolve.

SESSION 580 (SYMPOSIUM)

GIVING VOICE TO STUDENTS OF ENVIRONMENTAL GERONTOLOGY: BUILDING ON TOMORROW'S SCHOLARLY RESEARCH

Chair: J. Norstrand, *Social Work, Boston College, Newton, Massachusetts*
Discussant: H. Chaudhury, *Simon Fraser University, Burnaby, British Columbia, Canada*

This symposium represents the work of students of the Environmental Gerontology Interest Group who have conducted research related to environment and aging. It is vitally important to nurture student involvement in this field. The symposium provides a wide range of studies, including international research, looking at the individual in the home as well as the surrounding physical and social environment. Research by Beck looks at ADLs and demographics as predictors of home modifications (grab bars, shower seats, and call systems). Miedzianowski studies patrol officers in terms of the relationship between knowledge of normal and pathologic aging, attitudes toward aging, and influence on the preference of patrol officers to work with older adults, including those with Alzheimer's disease and related dementias. Park explores environmental preparedness for old age in South Korea by examining how the environment moderates the effect of live alone and poverty on preparedness for old age. Finally, research by Smith looks at demographic and socio-economic characteristics of those who engage in amenity relocation in order to better understand how residential satisfaction, psychological well-being, and personality traits influence the voluntary nature of amenity relocation. Discussion following this symposium will provide an overview of some of the student work being conducted in the field of environmental gerontology and will stimulate dialogue regarding future directions and research needed in the field.

AGING IN PLACE: WHO HAS MODIFICATIONS IN PLACE TO SUPPORT INDEPENDENCE?

P. Beck, *1. Gerontology, University of Southern California, Los Angeles, California, 2. Fall Prevention Center of Excellence, Los Angeles, California*

Most older adults prefer to age in place, but disability can make this difficult. Home modifications can make it safer for older adults to age in place, but it is not known if older adults that most need these supports have them in place. This study uses the 2010 wave of the Health and Retirement Study to determine which older adults have grab-bars/shower-seats or call systems that can support aging in place. Of 712 respondents 65 or older, 66.01% (n=470) had grab-bars/shower-seats, and 23.46% (n=167) had call systems. Respondents with one as compared to no disability (OR:1.96), renters as compared to homeowners (OR:4.96), and those over age 80 (OR:2.29) were more likely to have call systems. Disability was not associated with having grab-bars/shower-seats. African-Americans (OR:2.11) and homeowners (OR:3.35) were most likely to have grab-bars/shower-seats. More education and resources may be needed to help older adults safely aging in place.

THE IMPACT OF RESIDENTIAL SATISFACTION, PSYCHOLOGICAL WELL-BEING, AND PERSONALITY ON VOLUNTARY LATE-LIFE RELOCATION

E.K. Smith, *1. Gerontology, University of Kansas, Lawrence, Kansas, 2. Zillner, Lenexa, Kansas*

Past research has shown that there are certain demographic and socio-economic characteristics among older adults who engage in amenity relocation. Amenity relocation is undertaken voluntarily for attractive residential features and not driven by health or finances. Little empirical work has been done to expand into understanding how residential satisfaction, psychological well-being, and personality traits influence the voluntary nature of amenity relocation. The Health and Retirement Study (HRS), a nationally representative panel study, offered the ability to examine psycho-social factors and access to reasons for relocation. Reasons for relocation were identified as an amenity move by using a literature review. A series of path analyses were conducted to determine the relationship between the psycho-social factors of interest and amenity relocation. Higher levels of openness to experience ($p<.05$) and lower levels of neuroticism ($p <.05$) were predictive of amenity relocation. These findings highlight the role that psycho-social factors play in amenity relocation.

READY TO BECOME THE MISERABLE OLD?

S. Park[1], S. Lee[2], *1. university of michigan, Ann Arbor, Michigan, 2. Dong Seoul College, Seoul, Republic of Korea*

With the high elderly poverty rate and social isolation among older adults in Korea, understanding on preparation for old age in middle age is important to help vulnerable subgroups. Little research was conducted to what extent environment help them better prepare for their old age. This study aims to examine the association among living alone, low-income and environment as related to preparation for old age. From the 2013 Lives of Older Adults data (N = 2343, age range 40-64), latent class analyses identified three environment subgroups based on five environmental factors. Multi level models examined how the environment moderates the effect of live alone and low-income on preparedness for old age. When living in supportive environment, low- income adults living alone are more likely to be engaged in various activities to prepare for old age. This study highlights the importance of understanding on environmental effect in the transition into old age.

THE RELATIONSHIP BETWEEN PATROL OFFICERS' KNOWLEDGE AND ATTITUDES OF AGING AND THEIR PREFERENCE TO WORK WITH OLDER ADULTS

S.M. Miedzianowski, *A. T. Still University, Shelby Twp, Michigan*

The study examined feedback from patrol officers regarding the relationships between knowledge and attitudes of normal and pathologic aging and the preference of patrol officers to work with older adults, including those with Alzheimer's disease and related dementias (ADRD). Data were collected from 111 patrol officers in the State of Michigan using a web-based survey. Significant relationships were found between knowledge of aging or Alzheimer's disease and patrol officers' preference to work with older adults including those with ADRD. Patrol officers who had greater knowledge of aging and ADRD were more likely to have a preference to work with older adults. Attitudes of patrol officers were more likely to influence the preference if they had prior personal experiences with those with ADRD. This study demonstrated that knowledge and attitudes influences the preference of patrol officers to work with older adults including those with ADRD.

SESSION 585 (POSTER)

MECHANISMS OF AGING

NUTRIENT STRESS AND MITOCHONDRIAL FUNCTION: AN EMERGING ROLE FOR P49/STRAP

E.D. Williams, *Geriatrics, University of Arkansas for Medical Sciences, North Little Rock, Arkansas*

Objective: Cellular senescence (a state of irreversible cell cycle arrest) continues to be an area of interest within aging biology. While its induction in cancer suggests a role in tumor suppression function, its occurrence in other age-related pathologies, in particularly the aging vasculature, may suggest more deleterious effects. However, the mechanism(s) in which cells undergo premature senescence are not well-established, but seem to encompass various factors such as cell type, duration and type of stress. Homeostatic control, including glucose intolerance, diminishes with age and is associated with vascular dysfunctions and the premature appearance of senescence. To better understand glucose-stress induced cell senescence, we studied one protein involved in various facets of senescence: p49/STRAP (SRFBP1). p49/STRAP is an SRF-binding protein that has been shown to interact with mitochondrial complex I (NADH: ubiquinone oxidoreductase) proteins, and its stress-related elevated expression may alter mitochondrial function. Methods: C2C12 cells were “primed” for 12 hours of glucose stress (Normal =100 mg/DL; Low = 30 mg/DL; High = 400 mg/DL) after which, cells were subjected to alternate glucose levels. Mitochondrial function-glycolysis and cellular respiration-was assessed via extracellular acidification (ECAR) and oxygen consumption rate (OCR), respectively. Results: We observed glycolytic output was not affected by glucose stress “priming”, but rather (OCR) was 20%-35%, respectively, higher in cells exposed to low and high glucose compared to normal glucose . Conclusion: Stress-induced p49/STRAP elevated expression may potentially be linked to altered cellular respiration through its effect on mitochondrial complex I of the electron transport chain.

THE ROLE OF MITOCHONDRIAL ISOCITRATE DEHYDROGENASE 2 IN AGE-RELATED HEARING LOSS IN MICE

K. White[1,3], M. Kim[1], C. Han[1], L.K. Walker[1], P. Linser[2], C. Le Prell[3], S. Someya[1], *1. University of Florida, Department of Aging and Geriatric Research, Gainesville, Florida, 2. University of Florida, Whitney Lab, St. Augustine, Florida, 3. University of Florida, Department of Speech, Language and Hearing Sciences, Gainesville, Florida*

Age-related hearing loss (AHL) is the third most common chronic condition among the elderly. By 2030, 19.3% of the population will be over 65 years of age and the prevalence of AHL is expected to increase as well. There are no treatments or preventative interventions for this irreversible sensory disorder but drugs targeting the NADPH system are a key interest towards treatment. One target is mitochondrial isocitrate dehydrogenase 2 (IDH2). IDH2 plays a crucial role in the TCA cycle through the conversion of isocitrate to alpha ketoglutarate and the reduction of NADP+ to NADPH. IDH2 supplies NADPH for the regeneration of mitochondrial glutathione and thioredoxin for protection against oxidative stress, cell loss and resulting hearing loss. Therefore, we hypothesize that loss of mitochondrial IDH2 will compromise auditory function under normal conditions and/or during aging. To investigate whether IDH2 is key to auditory function, we performed Auditory Brainstem Response (ABR) tests to measure hearing sensitivity in Idh2 wild-type (Idh2+/+), heterozygous (Idh2+/-) and homozygous (Idh2 -/-) mice at 3 months of age. Our results showed no significant changes in ABR thresholds at 8, 16, or 32 kHz between Idh2+/+, Idh2+/-, and Idh2-/- mice at 3 months; however, this is still an early time to show age-related stresses. We are currently investigating the roles of mitochondrial Idh2 in maintaining auditory function in young, middle-aged, and old wild-type and Idh2 knockout mice. Oxidative stress studies and histological analyses are currently ongoing.

THE METABOLIC CHARACTERIZATION OF THE INTERLEUKIN-10$^{\mathrm{TM1CGN}}$ MOUSE

R. Westbrook[1], J.M. Langdon[1], C.N. Roy[1], R. De Cabo[2], J.D. Walston[1], *1. Johns Hopkins University, Baltimore, Maryland, 2. National Institute on Aging, National Institutes of Health, Baltimore, Maryland*

The frail, Interleukin 10^{tm1Cgn} ($\mathrm{IL10^{tm}}$) mice have been utilized as a model of frailty because of their propensity to develop skeletal muscle weakness and chronic activation in NFkB pathways. Previous findings in humans indicate that aging and frailty are associated with impaired insulin sensitivity and glucose homeostasis, decreased metabolic rate and locomotor activity, as well as altered respiratory quotient (RQ) and body composition. However, to date, little is known about the body composition and energy metabolism of this frail mouse model. To determine if old $\mathrm{IL10^{tm}}$ frail mice (n=10 per group) have altered insulin sensitivity, glucose homeostasis, oxygen consumption (VO_2), respiratory quotient (RQ), spontaneous locomotor activity, and body composition compared to age and gender matched C57Bl/6 control strain, we performed insulin tolerance tests, glucose tolerance tests, NMR-based body composition analysis, and indirect calorimetry with infra-red activity monitoring, in 20 month old female mice. Interestingly, $\mathrm{IL10^{tm}}$ mice had markedly decreased VO_2 ($p<0.0001$), while RQ, insulin sensitivity, glucose homeostasis and locomotor activity were not significantly altered. $\mathrm{IL10^{tm}}$ also had increased lean mass ($p= 0.0284$) and decreased fat mass percent ($p= 0.0143$) and fluid mass percent ($p=0.0008$) as measured by NMR based body composition analysis. These findings suggest that frailty observed in this mouse model of chronic inflammation may be driven by altered energy metabolism and body composition.

THE ROLE OF INFLAMMATORY CYTOKINES IN CARDIAC HYPERTROPHY DURING AGING

G. Azhar[1,2], S.R. Foster[1,2], X. Zhang[1,2], A. Schrader[1], K. Nagano[3], J.Y. Wei[1,2], *1. University of Arkansas for Medical Sciences, Little Rock, Arkansas, 2. Central Arkansas Veterans Healthcare System, Little Rock, Arkansas, 3. University of Tokyo, Tokyo, Japan*

Background: Myocardial ischemic injury is mediated in part by the pro-inflammatory cytokines, which may be released by smooth muscle cells, macrophages, T-lymphocytes, neutrophils and cardiac myocytes. Elevated levels of IL-1β and IL18 have been observed in a variety of cardiac injury syndromes. The cysteine protease, interleukin converting enzyme (ice or caspase 1), is central in activating IL-1β and IL18. Methods: Hearts of male, 10 month old, ICE -/- mice were used. Microarray on hearts for differentially expressed genes (Degs) was performed using a t-test with a combination of cut-off p-value ($p< 0.05$) and fold change ($FC > 1.5$). Results: The ICE -/- hearts were significantly hypertrophied vs. Age-matched, wild-type controls ($p<0.05$) with increased expression of collagen. We identified 96 genes that were differentially expressed in vivo. These ICE-modulated genes were grouped into categories based on their function. It was observed that genes associated with cytoskeletal function (n=19) and stress response (n=4) exhibited a marked increase in expression (average, 2.7 and 3.1-fold, respectively). Significantly high expression pertinent for the heart was seen with troponin I (3.9), troponin C2 (6.9), ryanodine receptor (3.8) and adiponetin (4.8). Immune response and complement related genes were generally elevated such as TNFα receptor (1.8.) However, genes associated with transcription and translation (n=12) were slightly depressed (average, -0.3). Conclusion: Long-term anti-inflammatory therapy targeting IL-1β and IL18 could produce a compensatory increase in cytoskeletal and structural cardiac genes with cardiac hypertrophy and fibrosis. The role of ICE-regulated genes in cardiac hypertrophy will need further investigation.

AGING EXACERBATES HYPERTENSION-INDUCED INTRACEREBRAL MICROBLEEDS IN MICE

S. Tarantini[1], P. Toth[1,2], D. Sosnowska[1], Z. Tucsek[1,2], A. Koller[2], W.E. Sonntag[1], A. Csiszar[1,2], Z. Ungvari[1,2], *1. Reynolds Oklahoma Ctr on Aging, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Dept of Pathophysiology & Gerontology, Szentagothai Research Center, Univ. Pecs, Pecs, Hungary*

Aging is associated with high prevalence of cerebral microbleeds (CMBs) in the elderly, which contribute to the age-related decline in higher cortical function. Despite its clinical significance, the pathophysiology of CMBs is poorly understood. To establish a novel model of CMB hypertension was induced in young (3 mo) and aged (24 mo) C57B/6 mice (s.c AngII, p.o. L-NAME). Neurological examination and gait analysis followed by histological analysis of CMBs in serial sections of the brain showed that in the aged mice the same level of hypertension lead to significantly earlier onset and increased incidence of CMBs (incidence: young:27%, aged:90% of the animals; average number of CMBs: young:15±3, aged:28±2). Aging exacerbated hypertension-induced cerebral oxidative stress, NADPH oxidase expression (Nox2 mRNA: 2±0.1 fold increase in aged vs. young) and activation of MMPs (6±0.9 fold increase in aged vs. young). Treatment of aged mice with the dietary polyphenol resveratrol (200 mg/kg for 20 days) significantly attenuated oxidative stress, down-regulated NADPH oxidase, decreased MMP activity and prevented/delayed the development of CMBs. Collectively, aging exacerbates hypertension-induced intracerebral microbleeds in mice likely by increasing oxidative stress and MMP activation. Therapeutic strategies to reduce microvascular oxidative stress and MMP activity should be considered for the prevention of CMBs in the elderly.

BISPHENOL ACCELERATED SENESCENCE IN HUMAN CELL AND ZEBRAFISH VIA MODIFICATION OF SERUM LIPOPROTEINS

H. Jung[1,2,3], S. Kim[1,2,3], K. Cho[1,2,3], *1. School of Biotechnology, Yeungnam University, Gyeongsan, Republic of Korea, 2. Research Institute of Protein Sensor, Gyeongsan, Republic of Korea, 3. BK21 plus Serum Biomedical Research and Education Team, Gyeongsan, Republic of Korea*

Bisphenol is well known environmental hormone as a pollutant. We tested a latent toxicity of bisphenol in regarding extent of senescence and atherosclerosis. In lipoprotein level, bisphenol (final 1-10 μM) modified electromobility of high-density lipoproteins (HDL) and low-density lipoproteins (LDL) via exacerbation of cupric ion mediated oxidation. Phagocytosis of oxidized LDL into human macrophage was more accelerated by the co-treatment of bisphenol, suggesting bisphenol accelerated foam cell generation. Bisphenol treatment (final 10-100 nM) into human dermal fibroblast cell caused severe cellular senescence. Water borne exposure of bisphenol (final 10-100 nM) caused remarkable embryo death with slower developmental speed and higher inflammation. In conclusion, low concentration of bisphenol caused initial step of skin senescence and atherogenesis with embryo toxicity. (Jung HJ and Kim SM are co-first authors.) (The authors are grateful for the BK21 plus program of the National Research Foundation for the support of graduate students)

HIGH IRON LEVEL IS RELATED WITH TISSUE SENESCENCE AND LOSS OF FERTILITY VIA LIPOPROTEIN DEGRADATION

S. Kim[1,2,3], K. Cho[1,2,3], *1. School of Biotechnology,Yeungnam University, Gyeongsan, Republic of Korea, 2. Research Institute of Protein Sensor, Gyeongsan, Republic of Korea, 3. BK21 plus Serum Biomedical Research and Education Team, Gyeongsan, Republic of Korea*

Elevated serum iron level is linked with metabolic disease such as diabetes and atherosclerosis. However, the pathological mechanism on serum lipoprotein level is still unknown.In order to elucidate physiological effect of high dose of iron, FeSO4 was treated (final 60 μM, 120 μM) to human serum lipoprotein and macrophages and human dermal fibroblast (HDF) cells. The FeSO4 treated lipoproteins lost anti-oxidant ability with protein degradation and multimerization. Under presence of fructose, the FeSO4 treated HDF cell showed severe cellular senescence 3.5-fold higher than control. In macrophage, low-density lipoprotein (LDL) phagocytosis was accelerated by FeSO4 treatment up to 1.8 fold higher than acetylated LDL (acLDL) alone control. After 24 weeks supplementation with 0.05% and 0.1% FeSO4 in diet with or without high cholesterol, serum total cholesterol level was elevated 3.7-fold and 2.1-fold under normal diet (ND) and 1.4-fold elevated under high cholesterol diet (HCD). Serum Triglyceride was elevated by 1.4-fold and 1.7-fold under ND and 0.9-fold and 1.1-fold under HCD. Serum GOT level was elevated by 1.5-fold and 2.0-fold under ND and 1.3-fold and 1.6-fold under HCD. High consumption of iron impaired reproduction ability in female zebrafish. Iron-fed zebrafish showed reduction of embryo production via impairment of follicular development. In conclusion, high consumption of iron cause hyperglycemia and fatty liver and sterility with reduction of female fertility via degradation of serum lipoprotein. (The authors are grateful for the BK21 plus program of the National Research Foundation for the support of graduate students)

CADMIUM MEDIATED CELLULAR SENESCENCE AND ATHEROGENESIS VIA MODIFICATION OF HIGH-DENSITY LIPOPROTEIN

J. Kim[1,2,3], K. Cho[1,2,3], *1. School of Biotechnology, Yeungnam University, Gyeongsan, Republic of Korea, 2. Research Institute of Protein Sensor, Gyeongsan, Republic of Korea, 3. BK21 plus Serum Biomedical Research and Education Team, Gyeongsan, Republic of Korea*

Although neurotoxicity of cadmium is well known, however, there has been no report about cadmium toxicity in lipid metabolism and cell aging. This study designed to elucidate toxicity of cadmium in lipoprotein metabolism. Ten-fold higher physiological concentration of cadmium caused multimerization of apoA-I and glycation of HDL to impair beneficial activity of HDL. Treatment of cadmium caused more acceleration of low-density lipoprotein (LDL) uptake into macrophage and premature senescence in human dermal fibroblast (HDF) cell. Microinjection of cadmium into zebrafish embryo attenuated embryo development with higher mortality (up to 23% more embryo death). Four weeks consumption cadmium either containing normal diet (ND) and high cholesterol diet (HCD) resulted (final 24 μM) 40% and 65% increase of Total cholesterol and Triglyceride, respectively with hepatic inflammation. Serum glucose was more elevated 15% compared with HCD alone control. In conclusion, cadmium exposure caused impaired of lipoprotein metabolism and elevation of serum lipid profile to result fatty liver change. (The authors are grateful for the BK21 plus program of the National Research Foundation for the support of graduate students)

THE EFFECT OF AGEING ON ISONIAZID INDUCED HEPATOTOXICITY IN FISCHER 344 RATS

J. Mach[1,2,3], A. Huizer-Pajkos[1,2], L. Phillips[4], C. McKenzie[6], V. Cogger[3,5], D.G. Le Couteur[3,5], B. Jones[1,3], S. Hilmer[1,2,3], *1. Kolling Institute of Medical Research, Royal North Shore Hosp, Sydney, New South Wales, Australia, 2. Dept of Clin Pharmacol and Aged Care, Royal North Shore Hosp, Sydney, New South Wales, Australia, 3. Sydney Medical School, Univ of Sydney, Sydney, New South Wales, Australia, 4. Mass Spec Imaging and Proteomics Laboratory, Kolling institute of Medical Research, Sydney, New South Wales, Australia, 5. Centre for Education and Research on Ageing and Anzac Research Institute, Sydney, New South Wales, Australia, 6. Pathology Dept, Prince Alfred Hosp, Sydney, New South Wales, Australia*

Clinically, the risk of isoniazid induced hepatotoxicity increases in old age. Isoniazid hepatotoxicity includes necrosis, steatosis or hepatitis, and involves the toxic intermediates acetylhydrazine and hydrazine. We determined the effect of an toxic regimen of isoniazid or saline vehicle (4 doses/day: 100, 75, 75, 75mg/kg intraperitoneal every 3 hours over 2 days) on hepatotoxicity, steatosis and serum metabolite levels in young (6 months) and old (24 months) male Fischer 344 rats (isoniazid: young n=7, old n=5; saline: young n=7, old n=8). After 15 hours animals were euthanized, livers were prepared for histology and sera were collected for liver function tests and metabolite measurements. Only minor necrosis was observed with isoniazid, and this was non-significantly more prevalent in young animals ($p<0.08$). In contrast, steatosis was significantly more prevalent in old isoniazid treated animals compared to saline ($p<0.05$) while it was not increased in young animals. Compared to saline controls, serum hepatotoxicity markers in isoniazid treated animals were higher in young animals (ALT saline: 72.6±5.7U/L, isoniazid: 108.6±20.0U/L, $p<0.12$; AST saline: 131.1±13.9U/L, isoniazid: 200.4±18.9U/L, $p<0.05$; SDH saline: 2.7±0.2U/L, isoniazid: 5.0±0.6U/L, $p<0.05$); but were unchanged or lower in old animals (ALT, $p<0.04$; AST, $p=0.40$; SDH, $p<0.08$). Amongst animals treated with isoniazid, toxic intermediates were higher in old than young animals (acetylhydrazine young: 16.5±2.7μM, old: 42.4±7.7μM; hydrazine young: 5.3±0.7μM, old: 8.9±2.7μM, $p<0.05$). These results suggest that after toxic doses of isoniazid, young Fischer rats are more susceptible to acute necrosis, while old animals are more prone to steatosis and have higher levels of toxic intermediates.

MODELING PHYSICAL FRAILTY IN MICE: BETWEEN GROUP AND LONGITUDINAL COMPARISONS ON FRAILTY INDEX AND PERFORMANCE

A. Giovanni[1], C. Asbrand[2], P. Florian[2], A. Kandira[2], T. Leeuw[2], C.B. Marta[1], C. Struebing[2], *1. Sanofi, Bridgewater, New Jersey, 2. Sanofi, Frankfurt, Germany*

Loss of physical function represents a major aspect of a frailty syndrome responsible for deficits in the ability to perform activities of daily living, decreased mobility and independence, and increased morbidity and mortality. Our translational medicine approach is to evaluate the utility of aged mice to capture key features that represent this human condition. The health status of aging mice was assessed to identify those that appear frail, for comparison to physical performance and ex vivo muscle contraction. Three groups of male C57/Bl6 mice were followed longitudinally for 4 months beginning at 3, 19, and 24 months of age. Frailty Indexing (FI) was performed as described (Whitehead, J. Gerontol. 2013), with 30 parameters. At baseline, there was a clear difference in FI between the younger mice and the 2 older groups and between the 2 older groups. Furthermore, there was a longitudinal progression in FI from 19-22 months of age. Age-related score-driving features of the FI include vision and hearing loss, alopecia and whisker loss, tail stiffening and kyphosis. Activity patterns, grip strength and gait were unchanged with age. Interestingly, there was no clear correlation between FI and ex vivo muscle contractile properties, but there were clear differences between the youngest and oldest groups in additional physical performance measures. Current efforts are focused on identifying indices and markers that represent the human condition of Frailty for use in translational research to enable target identification and pre-clinical validation of potential therapeutics for Physical Frailty and sarcopenia.

DYSREGULATION OF PRESSURE-INDUCED CA2+ SIGNALING AND MYOGENIC CONSTRICTION OF CEREBRAL ARTERIES IN AGED HYPERTENSIVE MICE

P. Toth[1], A. Csiszar[1], Z. Tucsek[1], D. Sosnowska[1], A. Koller[2,3], M.L. Schwartzman[4], W.E. Sonntag[1], Z. Ungvari[1], *1. ROCA, Geriatric Department, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Department of Pathophysiology and Gerontology, University of Pecs, Pecs, Hungary, 3. Department of Physiology, New York Medical College, Valhalla, New York, 4. Department of Pharmacology, New York Medical College, Valhalla, New York*

Hypertension in the elderly substantially increases the risk of stroke and vascular cognitive impairment (VCI) in part due to an impaired functional adaptation of aged cerebral arteries to high blood pressure. To elucidate the mechanisms underlying impaired autoregulatory protection in aging, hypertension was induced in young (3 mo) and aged (24 mo) C57/BL6 mice by chronic infusion of angiotensin II and pressure-induced changes in smooth muscle (SMC) [Ca2+]i and myogenic constriction of middle cerebral arteries (MCA) were assessed. In MCAs from young hypertensive mice pressure-induced increases in VSMC [Ca2+]i and myogenic tone were increased and these adaptive responses were inhibited by the cytochrome P450 ω-hydroxylase inhibitor HET0016 and the TRP channel blocker SKF96365. Administration of 20-HETE increased SMC [Ca2+]i and constricted MCAs and these responses were inhibited by SKF96365. MCAs from aged hypertensive mice did not show adaptive increases in pressure-induced calcium signal and myogenic tone and responses to HET0016 and SKF96365 were blunted. Inhibition of BK channels by iberiotoxin enhanced SMC [Ca2+]i and myogenic constriction in MCAs of young normotensive animals, whereas it was without effect in MCAs of young hypertensive mice. Iberiotoxin did not restore myogenic adaptation in MCAs of aged hypertensive mice. Thus, functional maladaptation of aged cerebral arteries to hypertension is due to the dysregulation of pressure-induced, 20-HETE and TRP channel-mediated SMC calcium signaling, whereas overactivation of BK channels is unlikely to play a role in this phenomenon.

AGING IMPAIRS MYOGENIC ADAPTATION TO PULSATILE PRESSURE IN MOUSE CEREBRAL ARTERIES

Z. Springo[1,2], P. Toth[1,2], S. Tarantini[1], Z. Tucsek[1,2], A. Koller[2], W.E. Sonntag[1], A. Csiszar[1,2], Z. Ungvari[1,2], *1. Geriatric Medicine, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Dept. of Pathophysiology & Gerontology, Szentagothai Res. Ctr, Pecs, Hungary*

Stability of myogenic tone of cerebral arteries is essential for adequate control over penetration of pressure (P) waves into the distal portion of the cerebral microcirculation (the resistance to flow is dominated by the fourth power of the internal vessel radius). Because aging promotes cerebromicrovascular injury, we tested the hypothesis that aging alters the myogenic response. P-induced constriction of cannulated middle cerebral arteries (MCA) isolated from young (3 mo) and aged (24 mo) mice was assessed. Both young and aged MCAs developed similar myogenic tone in response to stepwise, steady-state increases in intraluminal P. Young MCAs exhibited significant myogenic adaptation to sinusoidal pulsatile P (amplitude: 40 mmHg, freq:450/min). While in myogenically inactive MCAs each P pulse elicited a ~7% distension in synchrony with the pulsatile P, in young myogenically active MCAs the amplitude of the diameter changes induced by the P pulses in the autoregulated P range was significantly attenuated (~2%). The mean P-myogenic tone curve was similar in young MCAs exposed to constant and pulsatile P. In aged MCAs the cyclic changes in diameter induced by the P pulses were increased (~4%) and development of myogenic tone in response to pulsatile P was impaired. Collectively, aging impairs myogenic adaptation of cerebral arteries to pulsatile P, which likely promotes the development of cerebral microbleeds and BBB disruption by allowing high P to penetrate the distal portion of the cerebral microcirculation.

OBESITY IN AGING EXACERBATES BLOOD BRAIN BARRIER DISRUPTION, NEUROINFLAMMATION AND OXIDATIVE STRESS IN THE MOUSE HIPPOCAMPUS: EFFECTS ON EXPRESSION OF GENES INVOLVED IN BETA-AMYLOID GENERATION GENERATION AND ALZHEIMER'S DISEASE

Z. Tucsek[1], P. Toth[1], D. Sosnowska[1], T. Gautam[1], A. Koller[2,3], W.E. Sonntag[1], Z. Ungvari[1], A. Csiszar[1], *1. ROCA, Geriatric Department, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Department of Pathophysiology and Gerontology and Szentagothai Research Center, University of Pecs, Pecs, Hungary, 3. Department of Physiology, New York Medical College, Valhalla, New York*

There is growing evidence that obesity has deleterious effects on the brain and cognitive function in the elderly. However, the specific mechanisms through which aging and obesity interact to promote cognitive decline remain unclear. To test the hypothesis that aging exacerbates obesity-induced cerebromicrovascular damage and neuroinflammation, we compared young (7 mo) and aged (24 mo) high fat diet-fed obese C57BL/6 mice. Aging exacerbated obesity-induced systemic inflammation and BBB disruption, as indicated by the increased circulating levels of pro-inflammatory cytokines and increased presence of extravasated IgG in the hippocampus, respectively. Obesity-induced BBB damage was associated with microglia activation, up-regulation of activating FcγRs and pro-inflammatory cytokines and increased oxidative stress. Treatment of cultured primary microglia with sera derived from aged obese mice resulted in significantly more pronounced microglia activation and oxidative stress, as compared to treatment with young sera. Serum-induced activation and oxidative stress were also exacerbated in primary microglia derived from aged animals. Hippocampal expression of genes involved in regulation of the cellular APP-dependent signaling pathways, beta-amyloid generation and the pathogenesis of tauopathy were largely unaffected by obesity in aged mice. Collectively, obesity in aging is associated with a heightened state of systemic inflammation, which exacerbates BBB disruption. The resulting neuroinflammation and oxidative stress in the mouse hippocampus likely contribute to the significant cognitive decline observed in aged obese animals.

STEM CELLS: CONCEPTUAL INCONSISTENCIES AND UNRELIABLE DEFINITIONS THREATEN THE VALIDITY OF TRANSLATIONAL RESEARCH AND CLINICAL APPLICATIONS

G.R. Shannon, G. Tao, T. Zhang, Y. Xinyang, W. Yijiao, E. Loynachan, L. Meng, *USC Davis School of Gerontology, Los Angeles, California*

In 2012, a paper written by Dr. Yamanaka conveyed his revolutionary concept that induced pluripotent stem cells (iPSC's) were equivalent to embryonic stem cells (ESC's), however, other reputable researchers argue they are not equivalent and are, in fact, inappropriate for use in clinical studies with humans. We performed an environmental scan of 142 scholarly sources including 40 review articles, 86 research articles, six books, one news article, and nine sections from the FDA website. These were entered into a computer software application and sorted by publication date for analysis of key words and themes. We researched the definitions and applications of specific terms like physiological, pathological, in vitro, in situ, and in vivo as they apply to stem cells, stem cell lines, iPSCs, ESCs, and ESC lines. Much of the literature suggested that, when compared with stem cells and ESCs, ESC lines have a higher probability of forming teratomas, karyotyptic abnormalities, and epigenomic modifications, and iPSCs may have a propensity to develop adverse consequences, including genome variability, epigenetic memory, cancer, and immune rejection. We found inconsistencies in terminologies and logical constructs among current research findings, existing scientific criteria, and FDA guidelines. It is critical that universal definitions be proposed and FDA guidelines be reviewed to accurately differentiate between physiological stem cells and ESCs, and pathological ESC lines and iPSCs. The development of common definitions and ethical standards would reinforce transparency and accountability among scientists, government agencies, commercial entrepreneurs, and consumers.

P49/STRAP REGULATES THE EXPRESSION OF MICRORNA AND MICRORNA CLUSTERS

X. Zhang[1], G. Azhar[1], S.C. Rogers[1], S.R. Foster[1], E. Williams[1], J.Y. Wei[1,2], *1. Geriatrics, University of Arkansas for Med Sciences, Little Rock, Arkansas, 2. GRECC, GRE, CAVHS, Little Rock, Arkansas*

Objective: p49/STRAP is a transcription cofactor that has been implicated in cardiac aging. p49/STRAP interacts with serum response factor (SRF) and participates in the regulation of SRF-target genes, which include muscle-specific genes and microRNA genes. MicroRNAs are short, endogenous, single-stranded RNA molecules that regulate various cellular functions. Certain microRNAs and microRNA clusters are important regulators of aging and senescence. Since p49 protein level increases in the aging heart, we hypothesized that p49 might impact microRNA expression, thereby affecting cardiac aging and senescence. Methods: Recombinant p49 adenovirus was used to treat C2C12 cells. The RNA samples were isolated and analyzed with Exiqon microRNA assays. Results: We observed that 39 microRNAs were differentially expressed with at least 1.2-fold change in p49 treated cells versus control adenovirus treated cells ($p < 0.05$, n=3). 20 microRNAs were up-regulated, while 19 microRNAs were down-regulated. 18 microRNA clusters were affected. Five clusters matched those microRNA clusters that are significantly impacted in the heart during aging in our previous study. These clusters are miR-379-410, miR-23-27b-24-1, miR-466-467-669, miR-29b-1-28a and miR-290-295. The SRF-binding site in the promoter region of these microRNA clusters was examined, and the microRNA target genes were analyzed. Conclusion: p49/STRAP is a transcriptional regulator of microRNA and microRNA cluster genes. Overexpression of p49/STRAP altered the expression of a set of microRNA clusters that are associated with cardiac aging. The increased expression of p49/STRAP that is observed in aged mice may impact microRNAs and microRNA clusters and contribute to functional and morphological changes in aging and senescence.

INVESTIGATING THE NEURONAL CONTRIBUTION TO DECLINING MOTOR PERFORMANCE WITH AGE

R. Mahoney[1], T. Kreko[1], B. Eaton[1,2], *1. Physiology, UTHSCSA, San Antonio, Texas, 2. Barshop Institute for Longevity and Aging Studies, San Antonio, Texas*

The deterioration of motor functions in the elderly increases the risks of falling and significantly reduces the quality of life. Currently, it is unclear how changes in motor neuron function contribute to the declines in motor performance with age. Using a novel motor system in Drosophila that combines motor behavior, electrophysiology, imaging, and genetics, we find that motor function declines continuously during aging in Drosophila. Electrophysiology reveals that neurotransmission at the neuromuscular junction is stable in young animals but then abruptly increases in mid-life. This increased level of function is then stably maintained into old age and defended by an adjusted homeostatic response supporting that this change represents a new functional set point of the aged motor neuron. This is the first example of an age-dependent change in a homeostatic set point within the nervous system. Improvement in muscle function by the drug S107 results in a reduction in neurotransmission supporting that this change is likely compensatory for declining muscle function. This manipulation of motor function by S107 is also able to extend lifespan supporting the declining muscle function is an important morbidity in flies. Interestingly, the increase in neurotransmission observed during aging results in a synapse that is vulnerable to exhaustion suggesting that this change might be maladaptive. This supports the alternative model that the changes in motor neuron function might be pathogenic and not compensatory. Evidence for altered calcium signaling in the aged nerve terminal will be discussed as a pathogenic mechanism for age-dependent synapse dysfunction.

THE ROLES OF GLUTATHIONE REDUCTASE IN AGE-RELATED HEARING LOSS IN MICE

S. Someya[1], C. Han[1], M. Kim[1], K. White[1], L.K. Walker[1], P. Linser[2], *1. Departments of Aging and Geriatric Research, University of Florida, Gainesville, Florida, 2. Whitney Laboratory, University of Florida, Marineland, Florida*

Glutathione acts as the major small molecule antioxidant and is found mostly in the reduced form (GSH) in healthy cells. During aging, oxidized glutathione (GSSG) accumulates, and hence an altered ratio of GSH:GSSG is thought to be a marker of both oxidative stress and aging. Glutathione reductase (GSR) plays a critical role in preventing accumulation of GSSG and maintaining the appropriate redox environment in cells through regeneration of GSH, thereby enhancing the glutathione antioxidant defense system. Our goal is to determine the roles of GSR in maintaining auditory function under normal conditions and/or during aging. To investigate whether Gsr knockdown promotes oxidative stress-induce cell death, we conducted in vitro oxidative stress tests using H2O2, followed by cell viability tests in mouse inner ear cells (HEI-OC1) that are transfected with siRNA targeted to Gsr. To investigate whether Gsr is expressed in the mitochondria, cytosol, or nuclei in mouse cochlea, we performed colocalization analysis in the cochlear sections from wild-type and Gsr knockout (KO) mice using immunofluorescence confocal microscopy. We found that Gsr is present in the nuclei of the hair cells, spiral ganglion neurons, and stria vascularis in the cochlea of mice. Knockdown of Gsr increased susceptibility to oxidative stress-induced cell death in cultured mouse inner ear cells. Currently, we are investigating whether Gsr deficiency promotes AHL. Funding: Supported by NIH/NIDCD grants R03 DC011840 (S.S.) and R01 DC012552 (S.S.)

PGC-1α REGULATION OF NEURONAL ENERGY METABOLISM IN MOUSE HIPPOCAMPUS

R. Anderson, *1. Rozalyn Anderson, University of Wisconsin Madison, Madison, Wisconsin, 2. GRECC VA Hospital, Madison, Wisconsin*

The hippocampus is critical for cognition and memory formation, and is vulnerable to age-related atrophy. The importance of cellular metabolism in maintenance of neuronal function and plasticity raises the possibility that there is a metabolic basis for age-related changes in hippocampal architecture and function. Here we show a significant effect of aging on energy metabolism in the hippocampus. Using high-resolution quantitative imaging we detected significant cell type and region-specific differences in activity of the mitochondrial electron transport system (ETS). The levels and sub-cellular distribution of PGC-1α, a master regulator of ETS gene expression, also exhibited cell-type and region specificity. Aging significantly lowered mitochondrial activity in the dentate gyrus but the effect was not independently significant in the CA3 in the CA1 regions. An effect of aging on PGC-1α levels was not detected, indicating that PGC-1α activity, not protein abundance, is sensitive to age. GSK3β is a nutrient sensitive kinase previously associated with the etiology of AD and a key regulator of PGC-1α turnover and activity. Within the hippocampus GSK3β expression was cell type and region specific and its subcellular distribution appeared to be regulated in part by its phosphorylation/activity status. Furthermore, we show that mitochondrial activity, PGC-1α and GSK3β were all differentially regulated in hippocampus from CR mice. These data demonstrate that differences in hippocampus energy metabolism are associated with protection against cognitive and functional decline. We propose that metabolism may be an effective target for interventions to prevent or delay age-related neurodegeneration and vulnerability to Alzheimer's disease.

THE FREE RADICAL TIMER OF AGING: FROM FREE RADICAL CHEMISTRY TO SYSTEMS THEORY OF RELIABILITY

V.K. Koltover, *Institute of Problems of Chemical Physics, RAS, Chernogolovka, Moscow Region, Russian Federation*

There are two generally known concepts in gerontology. Some men see things as the aging program. Others see that the life spans vary in the inverse proportion to the species-specific metabolic rates and say that aging proceeds stochastically. The systems theory of reliability unites both concepts basing on the simple general principles that (i) all biomolecular constructions are designed in keeping with the genetic programs in order to perform the programmed preset functions; (ii) all of them operate with limited reliability; (iii) the timely replacement or prophylaxis of unreliable functional elements, i.e. metabolic turnover, is the main line of assuring the high systems reliability; (iv) there is a finite number of critical elements which perform the supervisory functions over the preventive maintenance; (v) these "supervisors" also operate with the limited reliability. On this basis, the universal features of aging, such as the exponential growth of mortality rate with time and the correlation of longevity with the species-specific resting metabolism are naturally explained. The stochastic malfunctions of the mitochondrial electron transport nanoreactors that produce oxygen anion-radicals (SR) seem to be of first importance. As the reducing agent, SR is capable to affect the ratio of NADH/NAD+ and, by changing the activity of sirtuins, slow down the renewal of biomolecular nanoreactors. Basing on the reliability-theory approach, one can estimate that the longevity of human brain could reach 250 years should the antioxidant defense against the free-radical failures be perfect. Thus, the free-radical timer serves as the effective stochastic mechanism of realization of the programmed deficiency in reliability of biomolecular constructions. Furthermore, the systems reliability approach provides heuristic methodology for development of the preventive medicine including novel anti-aging and anti-radiation protectors based on the stable magnetic isotopes. [Supported by RFBR, grant 14-04-00593a].

RAGE INFLUENCES THE DEVELOPMENT OF AORTIC VALVE STENOSIS IN MICE ON A HIGH FAT DIET

A. Simm[1], N. Nass[2], Y. Yakobus[3], A. Navarrete Santos[3], F.B. Kraus[3], R. Silber[2], B. Hofmann[2], *1. Martin Luther University Halle-Wittenberg, Halle (Saale), Germany, 2. Otto von Guericke University, Magdeburg, Germany, 3. University Hospital Halle (Saale), Halle (Saale), Germany*

Advanced glycation end product (AGE) accumulations as well as a high fat diet are associated with cardiovascular diseases. Activation of the receptor for AGEs RAGE causes an unfavorable pro-inflammatory state. This study shoud proove that a high fat diet results in development of aortic valve stenosis and the possible role of RAGE. Six week old C57BL/6N and C57BL/6N RAGE knockout mice (n=28) were randomly assigned to 4 groups and fed with normal or high fat diet for 32 weeks. Weight gain was determined weekly. At the beginning and after 2, 4 and 7 months, echocardiographic assessments of the aortic valve were made. At the end, plasma lipid levels and histological changes were determined. The high fat diet resulted in accelerated weight gain. However, only C57BL/6 mice developed increased trans-aortic-valve velocities, leaflet thickness and reduced valve area index ($p<0.0001$). Immunohistochemistry of the aortic valves revealed in C57BL/6N mice on a high fat diet more calcification, AGE accumulation and RAGE expression when compared to normal fed control. RAGE -/- mice showed less morphometric changes, calcification and AGE accumulation. After 7 month of high fat feeding, all mice had significantly increased cholesterol levels compared to normal fed control, however RAGE -/- mice were probably protected due to a better HDL/LDL ratio when compared to wild type animals ($p=0.003$). These data suggest that AGEs and RAGE are involved in the development of obesity, hypercholesterolemia and aortic valve changes due to metabolic stress from high fat intake.

THE ROLE OF NEGATIVE SIGNAL REGULATION IN T CELL FUNCTION WITH AGING

T. Fulop, A. Le Page, G. Dupuis, C. Fortin, H. Garneau, A. Larbi, *Centre de Recherche sur le vieillissement, Sherbrooke, Quebec, Canada*

Background: Immune responses are generally impaired in aged mammals. T cells have been extensively studied in this context due to the initial discovery of their reduced proliferative capacity with aging. The decreased responses involve altered signaling events associated with the early steps of T cell activation. Here, we have tested the hypothesis that the T cell pool in elderly subjects displayed reduced functional capacities due to altered negative feedback mechanisms that participate in the regulation of the early steps of T cell activation. Such conditions tip the immune balance in favor of altered T cell activation and a related decreased response in aging. Results: We present evidence that the tyrosine phosphatase SHP-1, a key regulator of T cell signal transduction machinery is, at least in part, responsible for the impaired T cell activation in aging. We used tyrosine-specific mAbs and Western blot analysis to show that a deregulation of the Csk/PAG loop in activated T cells from elderly individuals favored the inactive form of tyrosine-phosphorylated Lck (Y505). Enzymic assays showed that SHP-1 activity was upregulated in T cells of aged donors, in contrast to young subjects. Pharmacological inhibition of SHP-1 resulted in recovery of TCR/CD28-dependent lymphocyte proliferation and IL-2 production of aged individuals to levels approaching those of young donors. Significant differences in the active (Y394) and inactive (Y505) phosphorylation sites of Lck in response to T cell activation were observed in elderly donors as compared to young subjects, independently of CD45 isoform expression. Conclusions: Our data suggest that the role of SHP-1 in T cell activation extends to its increased effect in negative feedback in aging. Modulation of SHP-1 activity could be a target to restore altered T cell functions in aging. These observations could have far reaching consequences for improvement of immunosenescence and its clinical consequences such as infections, altered response to vaccination.

THE ORIGIN OF BIOLOGICAL AGE: STATISTICAL MECHANICS OF DEFICIT ACCUMULATION

A.B. Mitnitski[1], S. Taneija[1], A. Rutenberg[2], K. Rockwood[1], *1. Dalhousie University, Halifax, Nova Scotia, Canada, 2. Dalhousie University, Department of Medicine, Halifax, Nova Scotia, Canada*

People accumulate health problems (or deficits) at different rates, making chronology alone a poor representation of age. Even so, there is a common thread: with time, the number of deficits increases. Deficit accumulation can quantify aging in a frailty index. Recently, we introduced a stochastic framework in which aging arises from the interplay between environmental stressors and the ability to resist or repair the resultant damage. There, the number of accumulated deficits (N) equals the product of the intensity of environmental stresses and the recovery time. Here, we consider the organism as a complex dynamic network of connected nodes. Each node can be in one of two stable states: “healthy ” or “deficit”. Transitions between the states are governed by: (i) interactions between the nodes which depends on network connectivity, and; (ii) a general stochastic mechanism, favouring decline, commonly represented by the Langevin equation with noise representing the environment). We ran Monte-Carlo simulations with up to 10,000 “individuals”, each represented by hundreds of nodes, starting in the healthy state, and changing by the interplay between the random and network-connectivity terms. Importantly, even with no change in parameters, the evolution of the states corresponded to typical frailty index behaviour (e.g., nonlinear deficit accumulation, changes in the frailty index distribution with age) and the Gompertz mortality law. Individual trajectories of deficit accumulation ranged from slow aging in healthy (biologically younger) people to fast aging (in frail individuals). In short, biological aging arises as a consequence of the dynamics of deficit accumulation.

DEFENESTRATION OF THE LIVER SINUSOIDAL ENDOTHELIAL CELL IMPAIRS INSULIN AND GLUCOSE UPTAKE

V. Cogger[1,2,3], M. Mohamad[1,3,4], L. Wu[5], R. De Cabo[6], D.G. Le Couteur[1,2,3], *1. Centre for Education and Research on Ageing, Concord, New South Wales, Australia, 2. Charles Perkins Centre, Sydney, New South Wales, Australia, 3. ANZAC Research Institute, Sydney, New South Wales, Australia, 4. Faculty of Pharmacy, Universiti Teknologi MARA, Malaysia, Malaysia, 5. Faculty of Medicine, University of New South Wales, Sydney, New South Wales, Australia, 6. Translational Gerontology Branch, National Institute on Aging, National Institutes of Health, Baltimore, Maryland*

The liver is central to insulin signalling and glucose metabolism and changes in liver function have been linked to the pathogenesis of insulin resistance and metabolic syndromes. The liver sinusoidal endothelium is perforated with fenestrations (transcellular pores), which facilitate the transfer of substrates from blood into hepatocytes. We hypothesise loss of endothelial fenestrations (defenestration), such as seen in ageing, will reduce insulin and glucose uptake and subsequent signalling in the liver. Here, we investigate insulin and glucose action in normal and defenestrated livers. Defenestration is induced in F344 rats with a single i.p. injection of P407 24h prior to experimentation (1g/kg) as a model of age related liver endothelial changes. Distribution and action of insulin and glucose in control and P407 treated rats were then assessed using: Multiple indicator dilution methods, assessment of protein signalling pathways, modified glucose tolerance tests and measurement of liver glycogen. Defenestration of the liver endothelium led to a significant reduction in the volumes of distribution in the liver for both insulin and glucose, indicating impeded substrate transfer (glucose: 1.54 ± 0.06 control vs 1.10 ± 0.10 P407; insulin: 1.08 ± 0.08 control vs 0.81 ± 0.05 P407, $p<0.001$). Limited access of insulin to the hepatocellular membrane led to decreased phosphorylation of Insulin Receptor Substrate-1 protein ($p=0.045$). Impaired liver glucose action was demonstrated by reduced liver uptake of glucose and dramatically reduced glycogen storage. These findings indicate that defenestration of the liver endothelium impairs the transfer and action of insulin and glucose in the liver and that defenestration may be important in age related hepatic insulin resistance.

A NOVEL MECHANISM FOR EXTRUSION OF NEUROTOXIC COMPONENTS FROM NEURONS

M. Driscoll, I. Melentijevic, M.L. Toth, *Rutgers University, Piscataway, New Jersey*

A major challenge of our time is to understand the aging brain.C. elegans is a powerful model for analysis of conserved mechanisms that modulate healthy aging. In the aging nematode nervous system, neuronal death and/or detectable loss of processes are not readily apparent, but dendrite restructuring and loss of synaptic integrity occur. We are studying the molecular mechanisms that contribute to two major aspects of morphological change in the aging C. elegans nervous system: 1) accumulation of novel outgrowths from specific neurons; and 2) physical decline in synaptic integrity. Along the way, we have discovered a novel mechanism by which large packets of cytoplasm, which can include aggregated proteins or mitochondria, are extruded from neurons. We speculate that the extrusion is a conserved process related to transmission of aggregates in neurodegenerative disease. Dissection of neuronal aging mechanisms in C. elegans may thus influence the development of brain healthspan-extending therapies.

LIFESPAN AND LATE LIFE PATHOLOGY FOR INDOOR HOUSED RHESUS MONKEYS

J.W. Kemnitz, S. Ghanian, R. Colman, R. Anderson, H. Simmons, *Cell & Regenerative Biology, University of Wisconsin-Madison, Madison, Wisconsin*

From 1980 until 2014 the National Institute on Aging has provided support to the Wisconsin National Primate Research Center for maintenance of a set-aside colony of older rhesus monkeys (Macaca mulatta) for studies of normative aging. During this period 192 monkeys have been assigned to this colony (133 females and 59 males). All were at least 15 years of age at the time of assignment and in ostensibly good health. They were subsequently used for noninvasive research and treated therapeutically for illness or injury. Subjects had regular physical exams during life and underwent complete necropsies after death. Euthanasia was performed when death seemed imminent or the animal was in intractable discomfort. Median survival was 26 years, 90% survival 33 years and maximal lifespan was 40 years; these values were the same for both sexes. Observed age-related conditions and risk factors included presbyopia, insulin resistance, decreased lean tissue and bone mass, and multisystem decline. Terminal pathologies included adenocarcinoma of the colon, heart failure and impaired respiration. Frozen and fixed tissue samples have been saved for further analysis. This colony has been very useful for describing aging and designing experiments on interventions to the aging processes in rhesus monkeys, as well as validating this model in the context of human aging.

FIBROBLASTS FROM LONGER LIVED SPECIES OF PRIMATES, RODENTS, BATS, CARNIVORES AND BIRDS RESIST PROTEIN DAMAGE BETTER THAN FIBROBLASTS FROM SHORTER LIVED SPECIES

A.M. Pickering, M. Lehr, W. Kohler, M.L. Han, R. Miller, *Dept of Pathology, University of Michigan, Ann Arbor, Michigan*

Species differ greatly in their rates of aging. Among mammalian species lifespan ranges from two to over sixty years. Here we test the hypothesis that skin-derived fibroblasts from long-lived species of mammals differ from those of short-lived mammals in their defences against protein damage. In parallel studies of rodents, non-human primates, and species from the Laurasiatheria superorder (bats, carnivores, shrews and ungulates), we find associations between species longevity and resistance of proteins to oxidative stress after exposure to H_2O_2 or paraquat. In addition, baseline levels of protein carbonyl are higher in cells from short-lived rodents and non-human primates. These data suggest that resistance to protein oxidation may be required for evolution of longevity in independent clades of mammals, and that evaluation of the properties of primary skin-derived fibroblast can provide insights into the cell biology behind differences in the pace of animal aging across species.

LAMIN A EXPRESSION IN CIRCULATING OSTEOGENIC PRECURSOR CELLS OF FRAIL OLDER PERSONS: THE NEPEAN OSTEOPOROSIS AND FRAILTY (NOF) STUDY

P. Gunawardene, S. Bermeo, K. Gunaratnam, C. Vidal, B. Treder, D.J. Boersma, O. Demontiero, G. Duque, *Ageing Bone Research Program, Sydney Medical School Nepean, The University of Sydney, Penrith, New South Wales, Australia*

BACKGROUND: Lamin A is a protein of the inner nuclear envelope. Low levels of lamin A are associated with progeria, osteoporosis and sarcopenia. In this study, we hypothesized that lamin A expression is also associated with the typical features of frailty in humans. We aimed to develop a non-invasive method to quantify lamin A expression and to determine the relationship between lamin A expression and frailty in a random sample of community-dwelling older individuals. METHODS: Circulating osteogenic precursors (COP) cells and buccal swabs (epithelial cells) were obtained from 80 subjects (70% female, mean age 74±8; 20 frail, 30 intermediate and 30 robust). Frailty was defined according to Fried's standard criteria. Initially, we compared the reliability of quantifying lamin A expression using RT-PCR, flow cytometry and confocal microscopy in both cell types. Flow cytometry analysis of lamin A expression in COP was the most accurate and reliable test. Logistic regression models estimated the relationship between lamin A expression in COP cells and prevalent frailty. RESULTS: Lower lamin A in COP cells was associated with 6 times greater odds of being frail than being robust (odds ratio (OR) = 6.12, 95% confidence interval (CI) = 2.56-10.56) and 2.5 times greater odds of intermediate frailty than robust (OR = 2.58, 95% CI = 1.85-3.52). The association was attenuated but persisted after adjusting for multiple possible confounders. CONCLUSIONS: Lower levels of lamin A expression in late life are associated with prevalent frailty. Further work is needed to understand lamin A expression as a risk stratifier, biomarker, or therapeutic target in frail older persons.

LONGITUDINAL DECLINE OF QUALITY OF LIFE IS DETERMINED BY LOSS OF MUSCLE MASS AND REDUCED PHYSICAL FUNCTIONING IN OLDER ADULTS

A. Trombetti[2,1], K.F. Reid[1], M. Hars[2], F.R. Herrmann[2], R. Fielding[1], *1. Nutrition, Exercise Physiology and Sarcopenia Laboratory, Jean Mayer USDA Human Nutrition Research Center on Aging at Tufts University, Boston, Massachusetts, 2. Geneva University Hospitals and Faculty of Medicine, Geneva, Switzerland*

The age-related loss of skeletal muscle mass and muscle performance are critical determinants of independent physical functioning in later life. Few longitudinal studies have examined how decrements in these parameters impact quality of life in older adults. Twenty-six healthy older subjects (age: 74.1 ± 3.7; short physical performance battery test (SPPB) score: 11.0 ± 0.9) and twenty-two older mobility-limited subjects (age: 77.2 ± 4.4; SPPB score: 7.9 ± 1.3) underwent evaluations of leg extensor muscle power, mid-thigh computed tomography to estimate total muscle cross-sectional area (CSA), and 400m walk performance at baseline and after 3 years of follow-up. Quality of life was assessed at both timepoints using the physical component score (PCS) of the Short Form 36 questionnaire. At follow-up, muscle power decreased -9.4% ($p < 0.001$), muscle CSA decreased -3% ($p < 0.01$) while time to complete 400 m increased 22 ± 46 seconds ($p < 0.001$). Using linear mixed-effects regression models to adjust for study group (healthy/mobility-limited), gender, duration of follow-up and depressive symptoms, the decline of muscle mass ($\beta = 0.10$, $p < 0.05$) and decreased 400m walk time ($\beta = -0.04$, $p < 0.003$) were independent determinants of PCS at follow-up. In older adults with and without mobility-limitations, reduced muscle mass and declining physical function are independent factors that compromise quality of life over a 3 year follow-up period. Future studies should evaluate how intervention strategies designed to maintain muscle mass or restore physical functioning impact quality of life in older adults.

DEPRESSION AS A PREDICTOR OF FUNCTIONAL DECLINE IN COMMUNITY-DWELLING ELDERLY IN KOREA: NATIONWIDE LONGITUDINAL SURVEY

S. Kim[1], S. Kim[1], K. Son[1], B. Cho[1], S. Park[1], J. Lee[1], S. Cho[2], E. Choi[1], *1. Department of family medicine, Seoul National University Hospital, Seoul, Republic of Korea, 2. School of Public Health and Institute of Health and Environment, Seoul, Republic of Korea*

Background: As elderly population is increasing, prediction and prevention of functional decline in elderly are of great concern. This study aimed to evaluate whether prior depressive symptom could predict functional decline 2 years later in Korean aging people. Methods: We used the KLoSA panel, a national representative sample of aging people in Korea. It was conducted twice (2006 and 2008). Self-administered questionnaire was used in the KLoSA panel to obtain functional status, socioeconomic status and medical conditions. We included elderly aged 65 or more without disability in carrying out activities of daily living (ADL) at baseline. Depressive symptom was defined by CES-D 10 score (Center for Epidemiologic Studies Depression Scale) ≥10 at baseline. We performed multiple logistic regression analysis to evaluate association between the baseline depressive symptom and ADL after 2 years. Results: Total 2809 elderly participants were included in this analysis. Among them, 138 (4.9%) reported functional decline in the follow-up after 2 years. After controlling for possible confounders, functional decline was significantly related with depression defined by CES-D 10 (OR 1.61, 95% CI 1.13 to 2.30). Among the components of ADL, the functional status of both 'transfer' and 'feeding' were significantly decreased in elderly with depression (OR 1.85, 95% CI 1.04 to 3.31 and OR 1.67, 95% CI 1.04 to 2.67 respectively). Conclusion: Depressive symptom predicted functional decline 2 years later in Korean elderly without baseline disabilities. Key Words: depression, functional decline, elderly

PATTERNS AND PREDICTORS OF FALLS TRAJECTORIES IN OLDER ADULTS: THE MOBILIZE BOSTON STUDY

A.E. Tchalla[1,2,4], A.B. Dufour[1,2,3], D. Habtemariam[2,3], I. Iloputaife[2,3], T.G. Travison[1,2,3], B. Manor[1,2,3], L. Lipsitz[1,2,3], *1. Institute for Aging Research, Hebrew SeniorLife, Beth Israel Deaconess Medical Center, Boston, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts, 3. Institute for Aging Research, Hebrew SeniorLife,, Boston, Massachusetts, 4. Limoges University,IFR 145 GEIST; EA 6310 HAVAE (Disability Activity Aging Autonomy Environment), Limoges, France*

Objectives: To identify clinically distinct trajectories of falls progression over 5 years and determine baseline characteristics associated with the trajectories and their clinical outcomes. Design, Setting, And Participants: Prospective cohort study of 765 community-dwelling participants in the MOBILIZE Boston Study, who were aged 70 and older during a baseline assessment in 2004-2005 and followed prospectively for falls over 5 years. Group-Based Trajectory Modeling (GBTM) was used to identify trajectories. Main Outcome Measure: Baseline data were collected by questionnaire and comprehensive clinic examination. During the 5 years follow-up, participants recorded falls on daily calendars. Results: We identified 4 distinct trajectories: No Fall (30.1%), Cluster Falls (46.1%), Increasing Falls (5.8%) and Chronic Recurring Falls (18.0%). Compared with the No Fall group, predictors of Cluster Falls were faster gait speed (adjusted odds ratio 1.69 (95CI, 1.50 - 2.56)) and fall in the past year (3.52 (95CI, 2.16 - 6.34)). Predictors of Increasing Falls were Diabetes Mellitus (4.3 (95CI, 1.4 - 13.3)) and Cognitive Impairment (2.82 (95CI, 1.34 - 5.82)). Chronic Recurring Falls trajectory predictors were multimorbidity (2.24 (95CI, 1.60 - 3.16)) and fall in the past year (3.82 (95CI, 2.34 - 6.23)). Symptoms of depression were predictive of all falls trajectories. Hospitalization and Emergency Department visits (59.5%), Injurious falls (66.9%) and Fractures (20.7%) were most common in Chronic Recurring Falls trajectory group. Conclusion: Falls may occur in clusters over discrete intervals in time, or as chronically increasing or recurring events that have a relatively greater risk of adverse outcomes.

ASSOCIATION OF BRAIN ANATOMY WITH PHYSICAL ACTIVITY AND SEDENTARY BEHAVIOR IN OLDER ICELANDERS

N. Arnardottir[1,2], A. Koster[3], S. Sigurdsson[2], L.J. Launer[6], V. Gudnason[2,5], T. Harris[6], K.Y. Chen[4], T. Sveinsson[1], *1. Research Centre of Movement Science, University of Iceland, Reykjavik, Iceland, 2. Icelandic Heart Association, Kopavogur, Iceland, 3. School for Public Health and Primary Care, Department of Social Medicine, Maastricht University, Maastricht, Netherlands, 4. National Institute of Diabetes and Digestive and Kidney Diseases, Metabolic Research Core, Bethesda, Maryland, 5. University of Iceland, Reykjavik, Iceland, 6. National Institute on Aging, Laboratory of Epidemiology, and Population Sciences, Bethesda, Maryland*

With advancing age, many physical parameters change, including brain atrophies and declining physical activity (PA). The aims of this study are to quantify the prospective changes in MRI-derived brain atrophy measurements in a 5-year period, and to explore how they are associated with PA and sedentary behavior (SB) in an older population. PA and SB were measured in the second phase of the AGESII-Reykjavik study using a hip-worn accelerometer (Actigraph GT3X) for seven consecutive days. All participants had a second MRI as a follow-up to their first MRI 5.2 years prior on average (SD=0.2 years). We examined the relative volume of grey matter (GM) and white matter (WM) and the changes in these relative volumes over the 5-year period. PA is expressed as total counts/day, and SB as minutes <100 cpm (counts/min) each day adjusted for wear time and lifestyle PA (≥760 cpm). The mean age at endpoint was 79.2 years (n=361). GM changed from 46.5% (SD=2.9%) to 45.6% (SD=3.0%) and WM from 26.2% (SD=1.7%) to 24.8% (SD=1.9%) during these 5.2 years. Without adjusting for potential confounding variables, all MRI variables separately predicted PA and SB. After adjustments, GM (β=0.12; p=0.033) and WM (β=0.11; p=0.038) at baseline, the 5-year change in GM (β=0.14; p=0.006) and WM (β=0.11; p=0.037) were independently associated with PA, while only the 5-year change in WM (β=-0.098; p<0.001) was independently associated with SB. The results suggest that brain atrophy negatively affects PA in older adults, whereas only WM atrophy is associated with increased SB.

COMPARISON OF PHYSICAL FUNCTION IN POST-MENOPAUSAL BREAST CANCER SURVIVORS AND CANCER-FREE CONTROLS

D. Mick, K. Winters-Stone, *Oregon Health & Science University, Portland, Oregon*

Introduction: Breast cancer and its treatment are associated with more self-reported physical limitations compared to women without cancer. Older breast cancer survivors (BCS) may be at particularly increased risk for poor health outcomes due to the combined effects of aging and treatment. Functional limitations in BCS have not been evaluated through objective measures of physical function, thus the true prevalence of functional limitations remains unknown. Purpose: To describe differences in objectively measured physical function between post-menopausal breast cancer survivors BCS and similarly aged cancer-free controls. Design: Descriptive, cross-sectional case-control. Setting: Oregon Health & Science University nursing research program. Sample: Post-menopausal women, 50-85 years of age, BCS ≤5 years from completion of chemotherapy treatment (n=59) and post-menopausal, 50-85 years of age women (n=56). Methods: Participants underwent tests of objectively measured physical function: walking speed over 4m (m/sec), handgrip strength (kg), time to rise 5 times from sitting (sec), maximal weight lifted during leg press and bench press (kg).

Differences in physical function between BCS and cancer-free controls were determined by ANCOVA adjusting for significant influencing factors. Findings: BCS had significantly lower leg press strength (-31%), bench press strength (-15%), and handgrip strength (-4%), and were slower to rise from a chair (-17%) independent of age, weight, lean leg mass, comorbidities, physical activity level, and self-reported function. Walking speed was similar between groups. Conclusions: BCS display significantly poorer objective measures of strength compared to cancer-free controls but no significant difference in balance and speed.

SESSION 590 (POSTER)

MINORITY HEALTH II

MOTIVATIONS FOR SOBRIETY AMONG ALASKA NATIVE ELDERS

J.P. Lewis, *School of Social Work, University of Washington, Seattle, Washington*

One of the health issues prohibiting Alaska Native Elders from aging well is alcohol and alcohol use disorders, which are impacting many families and communities. A small segment of the Alaska Native population struggle with alcohol use disorders late into life and this prevents them from enjoying their later years, prohibits them from aging successfully and engaging in cultural generative acts (i.e., teaching sewing, beading, hunting skills, skinning, carving, and so on), as well as serving in leadership roles within their family and community. Data Analysis: This study addresses one of the major barriers to successful aging, which is alcohol use disorders and builds on the groundbreaking People Awakening Project conducted in Alaska to explore reasons for sobriety among Alaska Natives aged 18 and older who are in long term recovery or have never drank alcohol. Using secondary data analysis with 10 in depth interviews from the People Awakening Project, this study explores reasons for sobriety among Elder participants from across the State of Alaska. Findings: Alaska Native Elders abstain from drinking alcohol or quit drinking alcohol because of family members and their desire to care for their family members, be role models, and pass on their wisdom to the younger generations (i.e., engage in cultural generative acts). Secondary data analysis is still ongoing as I work through the interview transcripts, but the data and themes gathered from this study will be used to develop a questionnaire to further explore reasons for explore reasons for sobriety, more specifically the roles family and community play in their decision to abstain from drinking and stay sober. This study is a preliminary study to serve as the foundation for a larger study to develop a culturally tailored supportive approach for Alaska Native elders struggling with alcohol use disorders based on the wisdom, experiences, and motivations of Alaska Native elders in long-term recovery from alcohol.

PERCEIVED QUALITY OF FAMILIAL TIES AND WELL-BEING IN MIDLIFE AND OLDER LATINA/OS

E. Hernandez[1], J. Smith[2], B. Ingersoll-Dayton[3], T.C. Antonucci[2], *1. Social Work and Psychology, University of Michigan, Ann Arbor, Michigan, 2. Institute for Social Research, University of Michigan, Ann Arbor, Michigan, 3. School of Social Work, University of Michigan, Ann Arbor, Michigan*

Social relationships are an important correlate of well-being in later life. Among Latina/os, values for familismo (i.e. prioritization support for nuclear and extended family members) and associated expectations of positive family relationships may elevate the significance of social ties for well-being. Despite these cultural values, social ties often have a positive and a dark side, leading to perceptions of ambivalence. We investigate the prevalence and determinants of ambivalent family relationships reported by midlife and older Latina/os and examine the association between ambivalent ties and well-being. A Latina/o sample (N = 1049; M age =67.3) was drawn from the 2008 and 2010 waves of the Health and Retirement Study. After preliminary descriptive analyses of the occurrence and types of ambivalent relationships, multivariate logistic regressions were run to identify unique predictors of reporting ambivalent relationships. Follow-up analyses explored whether relationships with children, family, or friends were more likely to be perceived as ambivalent. Finally, logistic models examined the associations between ambivalent relationships and well-being. Thirty-one percent of midlife Latina/os perceived ambivalence across all relationships compared to 18% of older Latina/os. Marriage and middle-age were uniquely associated with an increased likelihood of reporting ambivalent relationships. Follow-up analyses showed that the older cohort was especially likely to perceive ambivalence when it comes to relying on others. Finally, the likelihood of depressive symptomatology is higher among those who report ambivalence anywhere in their social network. This study has implications for understanding how age-cohort and culture impact the complexity of family dynamics and individual well-being.

THE TURKISH ADAPTATION AND PSYCHOMETRIC PROPERTIES OF THE GERIATRIC ANXIETY SCALE

D.L. Segal[1], F. Karahan[2], E. Hamarta[2], A. Karahan[2], *1. University of Colorado at Colorado Springs, Colorado Springs, Colorado, 2. Necmettin Erbakan University, Konya, Turkey*

Introduction: The Geriatric Anxiety Scale (GAS; Segal et al., 2010) was designed as 30-item self-report assessment tool for anxiety among older adults. The GAS includes a total score as well as somatic, cognitive, and affective subscales. The aims of this study were to adapt and translate the GAS into a Turkish version and to examine its basic psychometric properties. Method: Our study was carried out via a sample of community-dwelling older adults in Konya, Turkey (N = 100; M age = 71.4 years, SD = 6.5 years; range = 65 to 88 years) who were screened to not have a positive history of mental disorder and to have sufficient cognitive abilities. To assess convergent validity, Turkish versions of the Beck Anxiety Inventory (BAI) and the Geriatric Depression Scale (GDS) were also administered. Results: The mean GAS total score was 13.33 (SD = 11.86). In the reliability analyses, two items of the Turkish version (items 2 and 3) were removed due to low (below .3) item-total correlation coefficients. A measure of internal scale reliability (Cronbach's alpha) was excellent for the total score (.91), and acceptable for the subscales (somatic alpha = .71; cognitive alpha = .85; affective alpha = .84). Regarding validity, the GAS total score was significantly and positively correlated with the BAI total score (r = .87, p <. 05) and the GDS total score (r = .57, p <. 05), with large effect sizes. Discussion: The newly translated Turkish version of the GAS appears to have promising utility in an older adult Turkish sample, with adequate internal scale reliability and convergent validity. Future studies of this measure appear warranted.

SLEEP CORRELATES OF MINORITY OLDER ADULTS IN THE BRIGHTEN HEART PROJECT

L.J. Mack, E.E. Emery, H. Li, R. Golden, S.K. Rothschild, *Preventive Medicine, Rush University Medical Center, Chicago, Illinois*

Sleep disturbance is common in older adults and frequently co-occurs with depression. However, little is known about the sleep habits of older adults with depression in minority populations. Thus, we examined self-reported sleep variables in a sample of African American and Latino older adults recruited from urban primary care clinics as part of the BRIGHTEN Heart Project. Patients aged 60+ who screened positive for depression and cardiometabolic syndrome were eligible to participate. For the 250 participants (201 female, 121 African American), the average baseline PHQ-9 total score was 12.00(SD=3.74) and the individual PHQ-9 items with highest averages were low energy 2.08(SD=0.83), depression/hopelessness 1.96 (SD=0.80), and sleep abnormalities 1.89(SD=0.94). Of the entire sample, 12% reported sleep apnea diagnosis, 27.6% reported “other sleep problems” diagnosis, and 90.8% indicated “trouble falling asleep, staying asleep or sleeping too much” at least several days over the past two weeks. In addition, participants reported sleeping a nightly average of 343.40(SD=120.15) minutes over the past seven days. There was a significant negative correlation between PHQ-9 item 3 (sleep abnormalities) and self-reported sleep duration, r=-.294, n=250, p<.001. These results suggest sleep disorders such as insomnia may be highly prevalent in this population and appropriate screening in primary care settings is necessary to help identify patients who could benefit from sleep disorder treatment. The significant correlation between sleep duration and PHQ-9 item 3 suggests that this item should be further evaluated as a screening tool for sleep disorders to be used by primary care providers with older adults.

PERCEPTIONS OF DEMENTIA AND DEMENTIA SERVICES IN ASIAN COMMUNITIES

D. Kong[1], J.K. Davitt[2], K.B. Hirschman[3], P. Cacchione[3], J. Bourjolly[1], *1. School of Social Policy and Practice, University of Pennsylvania, PHILADELPHIA, Pennsylvania, 2. School of Social Work, University of Maryland, Baltimore, Maryland, 3. School of Nursing, University of Pennsylvania, PHILADELPHIA, Pennsylvania*

This poster will present findings from a qualitative study involving older Asian immigrants and their formal and informal caregivers. It is estimated that the age-specific prevalence of dementia among Asian Americans is comparable to that of the general U.S. population. Examining Asian cultural beliefs that influence the understanding of dementia is fundamental to developing culturally appropriate interventions to reduce health disparities and improve clinical outcomes. Qualitative interviews were conducted with 10 older adult (with cognitive impairment) - family caregiver dyads (5 Chinese and 5 Korean pairs) and 20 older Chinese and Korean adults not diagnosed with cognitive impairment. Three focus group interviews were conducted with 30 personal care staff from one homecare agency. All participants were asked about their perceptions of dementia and facilitators and barriers in accessing/ providing care. All data were analyzed via NVivo software using content analysis. The main themes identified included: stigmatization of dementia, misperceptions of the causes of dementia (e.g. dementia as caused by introverted personality, physical inactivity, social isolation, etc). Data suggested that older immigrants and their family members lack awareness of dementia related services. Service related challenges identified by the staff and research/practice implications will also be presented.

MULTIMORBIDITY AND LIMITATIONS IN THE CONTEXT OF AGE AND RACE/ETHNICITY IN THE 1999-2010 NHANES

V. Johnson-Lawrence[1], R. Thorpe[2], *1. PHHS, Univ of Michigan-Flint, Flint, Michigan, 2. Johns Hopkins University, Baltimore, Maryland*

Multimorbidity prevalence is continuously increasing during all stages of the life course in the United States. Chronic conditions may contribute to longer-term functional limitations for adults earlier in the life course, particularly in vulnerable populations. Using data from 1999-2010 waves of the National Health and Nutrition Examination Surveys (NHANES) this study assessed the associations of multimorbidity and self-reported limitations, in the contexts of age and race/ ethnicity (non-Hispanic white, non-Hispanic black, Hispanic, other) among adults aged 20+ years (n=36890). Multimorbidity included 10 chronic conditions: asthma, arthritis, heart disease, stroke, emphysema, chronic bronchitis, hypertension, cancer, diabetes, or chronic kidney failure. Limitations were based on whether respondents reported having any physical, mental, or emotional problems that kept the respondent from working at a job or business. Complex survey sampling weights were applied in the analyses to account for the sampling design of the NHANES. Logistic regression models showed that greater multimorbidity (odds ratio (OR) = 1.44, 95% confidence interval (CI) = 1.38-1.50) and older age (OR=1.01, 95% CI = 1.00-1.01) were associated with more limitations. Hispanics were less likely to report limitations (OR = 0.80, 95% CI = 0.66-0.97). Stronger positive associations of multimorbidity with limitations were found for younger (30-39 yrs) than older (60-69 yrs and 70+ yrs) adults. Future work to further understand the mechanisms through which physical, mental, and emotional limitations are more effectively managed among older working adults is warranted, and can inform patient care for younger adults managing multimorbidities in order to promote successful aging and well-being.

ASSOCIATIONS BETWEEN MMSE CHANGE AND IADL CHANGE IN OLDER ADULTS OF MEXICAN ORIGIN

G.I. Caskie, *Education and Human Services, Lehigh Univ, Bethlehem, Pennsylvania*

Cognitive skills are essential to the ability to perform everyday tasks of daily living (Marsiske & Willis, 1995), and although cognitive status has been linked to poorer functional outcomes (e.g., Millan-Calenti et al., 2012; Samper-Ternent et al., 2008), a great deal of this work has examined cognitive impairment/decline as a static variable (e.g., above/ below a criterion) rather than how the actual rate of cognitive change may be associated with the rate of change in everyday functioning. Also, less research has been conducted with Latino populations. Thus, the current study examines data collected over 13 years for a representative sample of 2,916 older adults, aged 65-90 years, of Mexican-origin on the Mini-Mental State Examination and a measure of IADL limitations. A multivariate latent growth model examining the links between trajectories for MMSE and IADL limitations demonstrated good fit to the data (CFI=.93, RMSEA=.06). Significant average rates of change were observed for both MMSE (-.79, p<.001) and IADL limitations (.39, p<.001); over 13 years, MMSE declined 10.27 points on average, and IADL limitations increased by 5.07. The rate of change in MMSE was highly correlated with rate of change in IADLs (r=-.93); thus, greater declines over 13 years in cognitive ability were associated with greater increases in IADL limitations. Further, nonlinear trajectories fit both constructs significantly better than linear trajectories; for example, after five years, 41% of MMSE decline, but only 19% of IADL change, had occurred, while at eleven years, 65% of total MMSE change had occurred versus 79% for IADLs.

SPIRITUALITY, SOCIAL SUPPORT, AND LIFE SATISFACTION AMONG AMERICAN INDIAN OLDER ADULTS

S. Roh, Y. Kim, K. Lee, Y. Lee, C.E. Burnette, *Social Work, University of South Dakota, Sioux Falls, South Dakota*

Purpose: Given the effects and scope of mental health disparities for American Indians, this study examined the relationships among spirituality, social support and life satisfaction with a sample of American Indian older adults. Methods: Data were collected from a cross-sectional survey with 233 community-dwelling older American Indians aged 50 or older in two Midwestern states. Hierarchical multivariate regressions were conducted to test three sets of predictive variables on life satisfaction: (1) sociodemographic variables, (2) spirituality, and (3) social support. Results: Older American Indians in the current sample were moderately or highly satisfied with their lives and experienced a fair level of spirituality and social support. In a hierarchical regression model, both spirituality and social support were found to play a significant role in enhancing individuals’ life satisfaction. Women and those with lower self-rated health and not being married were found to have lower life satisfaction. Conclusions: The findings suggest that spiritual beliefs and social support are important in understanding and managing life adversity and may provide a useful framework within which normal/ pathological experiences are interpreted and credible coping resources are identified among American Indian older adults. Health professionals must be sensitive to the complexities of spirituality and social support and consider ways to incorporate culturally competent practices of these variables into health education and interventions to promote the quality of life among this population.

HEALTH BENEFITS OF AN INTEGRATIVE REMINISCENCE INTERVENTION WITH OLDER ADULTS IN HARLEM, NEW YORK

M. Sabir[1], K. Pillemer[2], C.R. Henderson[2], S. Kang[1], *1. Human Development, Binghamton University, Binghamton, New York, 2. Cornell University, Ithaca, New York*

Introduction: This research addresses the important problem of racial health disparities in older adulthood. The Structured Life Review is an established, evidence-based, reminiscence intervention that has demonstrated significant health effects; however, only one study has included older African-Americans. Given that this type of intervention is associated with improved physical and psychological health among older adults, expanding it to minority populations is warranted. Purpose: This article reports physical and psychological health outcomes from the Harlem Life Review and Health in Later Life Study, a randomized controlled reminiscence intervention with African American older adults in Harlem, New York. Design and Methods: Following randomization to treatment and waitlist control conditions, participants completed a pretest; met for eight (8) consecutive weekly two-hour sessions of deeply engaging oral reminiscence work; and completed post-tests immediately following the intervention and six months later. Data Analysis: The model for each dependent variable includes Treatment, Time (i.e. wave, 3 levels), their interaction, plus Sex, Marital Status, Education, and Age; plus Individuals as levels of a random classification factor. Results: Preliminary results show a statistically significant decrease in depression ($p = .027$) and perceived stress ($p = .013$), and a trend toward increased self efficacy ($p = .10$). Implications: This cost effective intervention may reduce persistent health disparities across multiple health indicators between African American and other older adults in the U.S.

DEPRESSIVE DISORDERS AMONG AFRICAN AMERICANS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE

G. Carr[1], E. Fuller-Thomson[2], *1. University of Memphis, Memphis, Tennessee, 2. University of Toronto, Toronto, Ontario, Canada*

Chronic Obstructive Pulmonary Disease (COPD) is the third leading cause of death in the United States. Previous studies indicate a strong association between COPD and depression. Limited research has examined the association between COPD and depression in a population-based sample of African Americans. This study reports on secondary analyses of a large, representative U.S. survey, the 2012 Center for Disease Control's Behavioral Risk Factor Surveillance System (BRFSS). The sample included 40,082 African Americans, of whom 3,087 had COPD. The aim was to examine among African Americans: 1) the prevalence of depressive disorders among those with COPD compared to those without COPD, and 2) demographic correlates of depression among those with COPD. More than one-third (37.9%) of African Americans with COPD reported they had ever been diagnosed by a health professional with a depressive disorder in comparison to 12.5% of those without COPD. Among African Americans with COPD, the odds of depressive disorders were higher among females, those under age 65, the obese, those living in poverty, and those who were divorced, widowed or never married in comparison to those who were married. Those who reported that in the past year they had needed to see a doctor but could not because of cost had 67% higher odds of reporting depressive disorders. These findings underline the importance of health professionals regularly assessing levels of depression in their African American patients with COPD. Results of this research help guide targeting and outreach strategies to the most vulnerable patients.

ANXIETY OF ELDERLY ADULTS IN CHINA: LEVEL AND THE INFLUENCING FACTORS

D. Tang[1], D. Wang[2], *1. Institute of Gerontology, Renmin University of China, Beijing, China, 2. School of Psycholgy, Beijing Normal University, Beijing, China*

Geriatric Anxiety Inventory (GAI)was translated in to Chinese and 1292 elderly adults living in communities were measured by GAI-C to explore the reliability and validity of the scale. The situation and influencing factors of anxiety among Beijing elderly adults were investigated. The result shows that: (1) GAI-C can be applied in measuring the anxity of elderly adults in Chinses communities. The participant finished the scale without difficults. (2) GAI-C remains unidimensional structure as the English version. The reliablity and validity of GAI-C are pretty good. the Cronbach's α of the scale is 0.937, one week retest reliability is 0.607, and the correlation with Beck Anxiety Scale is 0.600. (3) 7.4% of the participants were at the risk for anxiety disorder, the score of female was higher than that of male ($t=-4.977$, $p<0.01$), the young-olds were higher than the oldest-olds, and those who only live with spouse were lower than other groups ($F=3.301$, $p<0.05$). (4) According to logistic regression, age, education, activities of daily living (ADL) and social interaction can predict the risk of anxiety disorder.

THE ROLE OF GENERATIVITY FOR RACIAL AND ETHNIC PARENTING: CASE STUDY OF KOREAN-AMERICAN BABY-BOOMERS

L.S. Park, *School of Social Work, University of Wisconsin-Madison, Madison, Wisconsin*

Description: Erikson's developmental theory of generativity (passing down to the next generation) stemming from a Eurocentric perspective heavily influenced by western culture, neglects to address issues that arise for racial and ethnic parents. This study explored the role of generativity for Korea-American adults in midlife when applied to how parents pass down ethnicity and ethnic identity to the next generation. This focus is especially important for the second-generation parents who were heavily influenced by assimilation ideologies and do not have a strong connection to heritage culture. Method: Using convenience and snowball sampling techniques, 16 second-generation Korean baby-boomers born in the U.S. between 1953 and 1965 were interviewed for this qualitative study. Nine of the 16 participants were married with children and lived in 5 different metropolitan areas across the nation. A combination of interpretive life course and life history approaches served as an integrated framework for organizing the context of the interviews. Findings: Findings show that parents expressed strong convictions to preserving Korean culture for the next generation, especially through language and food. Participants stated that becoming parents triggered a renewed interest or a revival in their own ethnic identity. Despite several challenges to second-generation parenting because of their lack of heritage language skills and limited knowledge of culture, parents relied on external sources such as grandparents and heritage language schools to pass on Korean traditional culture. They also took initiative to increase cultural awareness by taking their children to Korean restaurants and visits to Korea.

ILLNESS PERCEPTIONS AND SELF-CARE BEHAVIORS IN OLDER KOREAN PATIENTS WITH HYPERTENSION

H. Yeom, *Nursing, Dongguk University, Gyeongju, Gyeongbuk, Republic of Korea*

As a set of beliefs about health threats, illnesses perceptions of individuals guide behaviors to cope with illnesses. The purposes of this study were to investigate illness perceptions about hypertension and their impacts on self-care behaviors to manage hypertension in older Korean patients. A cross-sectional descriptive study was conducted. A convenience sample of 108 older hypertensive patients(M=76.2 yrs) completed face-to-face interviews about demographic and health-related information, illness perceptions about hypertension, and self-care behaviors. Data was analyzed using descriptive and multiple regression analyses. Participants lived an average of 7.8 years after hypertension diagnosis. Mean scores(range=1~5) of seven illness perceptions were timeline-acute/chronic(3.03), timeline-cyclic(2.19), consequence(1.93), control – personal(3.10), control – treatment(3.81), coherence(3.18) and emotion(2.40), respectively. After controlling for the covariates, timeline-cyclic(β= -.31, p=.042) and coherence(β =.83, p=.050) were significant factors affecting self-care behaviors. The results indicate that older Korean patients tended to believe their hypertension was more chronic rather than acute, more predictable, and less serious. They also tended to believe that hypertension could be controlled by medical treatment rather than personal behaviors, and that they have a clear picture of their high blood pressure. Regression analysis showed that older patients who believed that hypertension was more predictable or that they had a clear understanding of hypertension were likely to perform active self-care behaviors. This study highlights significant influence of illness perceptions related to predictability and coherence on self-care behaviors in older Korean patients with hypertension. The findings emphasize the importance of understanding illness perceptions and development of psycho-cognitive interventions to enhance active self-care behaviors of older hypertensive patients.

CIVIC ENGAGEMENT AMONG MIDDLE-AGED AND OLDER JAPANESE: FACTORS FACILITATING CIVIC ENGAGEMENT FOR JAPANESE

K. Katagiri, *Kobe University, Kobe, Japan*

As Japan is the fastest aging society in the world, supporting its elderly population poses a serious social challenge. Recently, civic engagement has attracted attention as an effective way to overcome this challenge, both for the elderly and for society. Because engaging in civic engagement helps increase the mental and physical health of the elderly and allows society to utilize elderly's potential as a valuable human resource. However little research done on civic engagement of the Japanese elderly. This study aims to investigate factors related to civic engagement among Japanese using JGSS-2012 data. We use 1256 subsamples for subjects aged 45 to 74 years. The dependent variable considers whether the respondent was engaged in volunteer or political activity in the past year. Independent variables were demographic variables, neighborhood characteristics, financial anxiety, the efficacy toward life, and motivation toward social contribution. The result of the logistic regression showed that motivation toward social contribution was the only significant variable for gender and across generations. Highly motivated people were more likely to undertake civic engagement. Further research is necessary to examine how this orientation may be cultivated and various activities that could be included in promoting civic engagement among the Japanese. In this study, we adopted social participation and political activity to measure of the degree of civic engagement according to Western literature. However, there has been little discussion on the concept of civic engagement for Japanese elderly. Further discussion on the concept and its applicability to Japanese should be explored.

ASSOCIATIONS BETWEEN SOCIAL RELATIONS AND LIFE SATISFACTION AMONG OLDER JAPANESE: COHORT, AGE, AND PERIOD VARIATIONS

E. Kobayashi[1], T. Fukaya[1], I. Sugawara[2], S. Shinkai[1], H. Akiyama[2], J. Liang[3], *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. University of Tokyo, Tokyo, Japan, 3. University of Michigan, Ann Arbor, Michigan*

In Japan World War II and the rapid economic growth after the war promoted radical social changes, especially in family structure and values. Different birth cohorts experienced these changes at different life stages, which could have differential impact on life satisfaction (LS). This study examined how the linkages between social relations and LS vary across four birth cohorts at different period and age. Data came from a nationwide survey of older Japanese (N=6,309) for the period of 1987-2012. The respondents were members of four birth cohorts (C1:1901-12, C2:1913-24, C3:1925-36, C4:1937-49), and they were categorized into six groups by a combination of age at measurement (i.e., 63-74 vs. 75-86) and year of survey (i.e., 1987, 1999, and 2012). Data analysis was undertaken separately for men and women by using structural equation modeling. There were significant cohort variations in the linkages between coresident family and LS. Among men being married was positively associated with LS, but the linkage was stronger among the later cohorts (C3, C4). In contrast, among women, the positive correlation between living with a child and LS was stronger for the earlier cohorts (C1, C2). Moreover, the positive association between contact with non-family members and LS among women was greater in 1999 and 2012 than that in1987. Finally, the effect of being married on LS was greater among the young-old than the old-old. Our results suggest that the linkages between social relations and LS have to be interpreted within the context of individual and social changes over time.

ONE-YEAR CHANGE IN MONTREAL COGNITIVE ASSESSMENT PERFORMANCE AND RELATED PREDICTORS IN COMMUNITY-DWELLING OLDER ADULTS

Y. Fujiwara[1], H. Suzuki[1], H. Kawai[1], H. Hirano[1], H. Yoshida[1], K. Ihara[2], P.H. Chaves[3], S.P. Obuchi[1], *1. Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Toho University School of Medicine, Tokyo, Japan, 3. Benjamin Leon Center for Geriatric Education and Research, Florida International University, Miami, Florida*

Background: The Montreal Cognitive Assessment (MoCA) is used for mild cognitive impairment (MCI) screening in older adults in the clinical setting. Its usefulness in community-based settings - e.g., for insight about extend of at-risk population, and unmet needs relevant for public health planning of programs/services - has not been characterized. We examined the distribution and associated predictors of short-term changes in MoCA-J in community-dwelling older adults. Method: Observational data came from 496 community-dwelling older Japanese (age range: 65-84) living in an urban area in Tokyo. Outcome was short-term change in MoCA-J performance, defined as difference in MoCA-J scores obtained 1 year apart (2011-2012), and classified in 3 categories: deterioration (decline ≤2 points), improvement (increase ≥2 points), and stable (within ± 1 point-range). Results: Mean age was 74±4.8 years old; mean MoCA-J was 23.7±3.6. Only 40% had stable MoCA-J performance; 30% experienced deterioration, and 30% improvement. Only age increment, hospitalization in previous year, and slower timed Up and Go [TUG], and maximum walking speed were predictive of subsequent MoCA-J performance deterioration. For example, the odds of MoCA-J deterioration (vs. improvement) was 1.4 (95% CI: 1.2–1.7) higher per 1 second longer TUG, after adjustment for age, gender, years of education, diseases, self-rated health, baseline MoCA-J, and recent hospitalization. Conclusion: We documented clinically meaningful 1-year changes in MoCA-J performance in community-dwelling older adults. Worse TUG and walking speed performance were independent predictors of short-term MoCA-J deterioration. Research aimed at assessing lower-extremity performance-based tests in MCI-related decision-making is warranted.

DEPRESSIVE SYMPTOMS AND ASSOCIATION BETWEEN RISK FACTORS IN OLDER ADULTS IN COLIMA, MEXICO

L. Alemán-de la Torre, E. ArIas-Merino, N. Mendoza Ruvalcaba, R. Meda Lara, *Salud Pública, Universidad de Guadalajara, Tepatitlán, Jalisco, Mexico*

Objective: Estimate the prevalence of depression and its risk factors in the elderly of the state of Colima, Mexico. Methodology: Cross-sectional, study performing the Health, Wellbeing, Ageing (SABE) survey in Colima, Mexico on 1454 elderly. We used the 15 item Spanish version of Geriatric Depression Scale, reference value >6, for detection. Risk factors that were analyzed were social demographic characteristics, functionality, and co-morbidities. OR and adjusted OR (CI 95%<). Results: Social demographic characteristics: mean age 72.2±8.6 years, 61.5% were women. 19.3% didn't study, 58% studied elementary school, 22.6% studied >junior high school. 74.3% men and 53.6% women were married, 23.2% and 49.1% had difficulty performing basic (ADLs) and instrumental activities of daily living (IADLs), and 11.5% had cognitive deficit (CD). Co-morbidities: 49% hypertension, 28.5% diabetes, 28.5% pulmonary disease (PD), 5% stroke, 8.5% cardiovascular disease, and 16.6% osteoarthritis. Relationship between depression and risk factors: 32% had depression, risk factors associated were being a women OR:1.54 (1.22-1.94), >75 years OR:1.82 (1.45-2.28), no school OR:4.11 (2.83-5.96) elementary school OR:2.5 (1.81-3.45), divorced or widowed OR:1.31 (1.05-1.64), ADLs OR:5.42 (4.18-7.03), IADLs OR:3.22 (2.55-4.07), CD OR:3.18 (2.27-4.46), hypertension OR:1.43 (1.15-1.79), diabetes OR:1.31 (1.03-1.67), PD OR:1.79 (1.20-2.66) Stroke OR:1.93 (1.20-3.10), Cardiovascular disease OR:1.76 (1.21-2.56), osteoarthritis OR:2.08 (1.57-2.76) Conclusion: Our study had similar results compared to other studies performed by SABE in Latin America, this multivariate analysis demonstrated cross-sectional risk factors: women, low study, ADLs, IADLs, CD, and osteoarthritis. Some of these risk factors can be modified with proper primary attention and intervention programs.

SIX-MONTH OUTCOMES OF ¡FUERTE Y EN FORMA! IN LATINOS WITH ARTHRITIS

C. Der Ananian[1], A. Miller[1], A. Shah[2], S.L. Hughes[2], *1. Arizona State University, Phoenix, Arizona, 2. University of Illinois at Chicago, Chicago, Illinois*

Broad dissemination of evidence-based physical activity (EBPA) programs for arthritis is recommended. Currently, there are few EBPA programs available in Spanish for older adult Latinos with arthritis. Purpose: This study examined the effectiveness of a Spanish version of Fit and Strong! (¡Fuerte y en Forma!) on physical function and arthritis-related symptoms among Latinos with osteoarthritis. Methods: ¡Fuerte y en Forma!, an 8-week multiple component exercise and health education program, was implemented in two community-based centers serving Latinos (Chicago (n=18) and Phoenix (n=21). Outcome measures were obtained at baseline, 8-weeks and 6 months. Primary outcomes were physical function (six-minute walk), lower extremity (LE) strength (timed chair stands), and perceived LE pain, physical function (PF) and stiffness (Western Ontario and McMaster Universities Osteoarthritis Index, WOMAC). Secondary outcomes were self-efficacy for arthritis management (ASE) and self-efficacy for exercise (EXSE). Repeated measures analysis of variance was used to examine changes over time. Results: Participants had a mean age of 58.8 [8.1] years and were primarily female (n=34; 87.2%). LE strength, WOMAC PF (F=14.3, $p<0.001$) and WOMAC pain (F=11.26, $p<0.001$) significantly improved from baseline to 8-weeks and improvements remained at 6 months. Six-minute walk speed (F= 4.22, p=0.028) and WOMAC stiffness (F=5.49, p= 0.009) significantly improved from baseline to 6-months. ASE (F=42. 39, $p<0.001$) and EXSE (F= 5.18, p=0.01) improved from baseline to 8 weeks and improvements remained at 6 months. Conclusion:¡Fuerte y en Forma! achieved short and longer term improvements in function and arthritis-related symptoms in Latino older adults justifying its broad dissemination.

AFRICAN AMERICAN WOMEN: THEIR WILL TO LIVE

J. Manning Dantis, *Miami University, Oxford, Ohio*

The purpose of this paper is to present findings from a phenomenological study of 18 African American women over the age of 40. The main question addressed in this study was how this population defines their aging experience. Constant comparative analysis was used to allow themes and patterns to emerge from data. From the findings the construct of Willful Living emerged. Willful living is defined as the conscious act of living each day. Willful living includes four components: faithfulness, personal attributes (personality traits), survivorship (current states of being), and purposefulness (future states of being). Willful living as a perspective of individual's aging is a balance of all parts of the person's life and existence, none are seen as totally exclusive. Aging for participants was not just about health or biological changes, but it was also a reflection of their views of who they were, are and who they want to be. Their views of themselves now and into the future have been shaped by their past life experiences with sexual abuse, alcoholism, prostitution, sexism, racism, and social dislocation, in addition to innate personality traits that helped them cope. As black women they are perpetually managing emotional and physical stress, even with positive resources such as family and friends. The women in this study had to find their inner voice and empower themselves to keep going and growing. The findings from this study currently can only be applied to women who fit within the characteristics of the population studied.

SESSION 595 (POSTER)

VETERANS

A COMPARISON OF THE EFFECTS OF CANCER, CANCER TREATMENTS, AND EMOTIONAL FACTORS ON COGNITION IN YOUNGER AND OLDER VETERANS

N.G. Regier[1], A.D. Naik[2], J. Moye[1,3], *1. VA Boston Healthcare System, Boston, Massachusetts, 2. Baylor College of Medicine, Houston, Texas, 3. Harvard Medical School, Boston, Massachusetts*

The investigation of cognitive changes during and following treatment for cancer represents a fairly new and growing area of study. The relatively small body of research exploring this phenomenon has focused primarily on the impact of chemotherapy on the cognition of female breast cancer survivors less than 65 years of age. Additionally, only a few longitudinal studies with long-term assessment are available. The present study examined the associations among demographic variables, cancer site (ie., colorectal, head and neck, esophageal), cancer stage, cancer treatments (i.e., chemotherapy, radiation), emotional variables (i.e., depression, combat PTSD), and cognition in a sample of 168 Veterans residing in Texas and Massachusetts. Longitudinal data collection took place at six months, 12 months, and 18 months post-diagnosis. Hierarchical linear regression analyses examined predictors of change in cognition over the study duration, and logistic regression analyzed factors associated with cognition at baseline and 18-months. Descriptive analyses were also conducted. Of particular importance is the finding that, in older cancer survivors (65+), combat-related PTSD was significantly predictive of cognitive change from six months post-diagnosis to 18 months; depression was marginally predictive. For cancer survivors less than 65 years of age, chemotherapy treatment was marginally predictive of cognitive change over the same interval. Additional results and descriptive analyses are also provided. Results of this study make valuable contributions to the existing cancer survivor research literature that focuses on younger female survivors of breast cancer. This study also has implications for the long-term effects of combat-related PTSD for older adults' cognitive functioning.

AN ANALYSIS OF REMOTE SUPPORT MODALITIES FOR CAREGIVERS OF VETERANS WITH DEMENTIA

B.L. Hicken[1], C.M. Daniel[4], R. Rupper[4,2], M. Luptak[2], M. Grant[4], R. Hill[3], R. Zheng[2], *1. VA Rural Health Resource Center- Western Region, VA Salt Lake City Health Care System, Salt Lake City, Utah, 2. University of Utah, Salt Lake City, Utah, 3. University of North Dakota, Grand Forks, North Dakota, 4. VA Salt Lake City Health Care System, Salt Lake City, Utah*

Caregiver support can reduce the stress associated with dementia caregiving and can be provided through a variety of modalities that allow for tailored interventions to be delivered remotely. However, individual preferences will determine the relative value and utility of these different modalities, which may affect whether a caregiver withdraws from or is satisfied with a support intervention. Supporting Caregivers of Rural Veterans Electronically (SCORE) is a randomized controlled study of an in-home intervention that utilized different modalities for delivering support and education to caregivers of veterans with dementia. Learning modules portraying the progression of dementia and instruction on caregiving skills were delivered via one of three modalities: 1) Internet, 2) in-home telehealth device, and 3) self-guided educational notebook with telephone support. One-hundred ninety-four caregivers of veterans with dementia participated in the program and were randomly assigned to one of the three intervention groups. Over the course of the intervention, 41 (21.1%) caregivers withdrew from the program. However, attrition varied across the three modality groups: 17.1% of the telephone group and 18.8% of the telehealth group withdrew from the program while 26.5% of the Internet group withdrew. Of caregivers completing the program, feedback about the program was generally positive with 72% of participants offering positive comments about the various instructional media. This presentation will discuss a quantitative analysis of the attrition rates from the SCORE program including caregiver factors that predict withdrawal and the relative impact of the various modes of delivery on attrition and program satisfaction.

CAREGIVING OF AND BY OLDER RURAL VETERANS: AN EXPLORATION OF RURAL CONCERNS AND RESOURCES

E. Everett, J. Yorgason, K. Stott, V. Call, L. Erickson, *School of Family Life, Brigham Young University, Provo, Utah*

Caregivers of Veterans living in rural areas face many unique challenges. Research literature suggests that rural residents have poorer health (Rosenthal & Fox, 2000), limited finances (Dwyer & Miller, 1990), limited access to specialty care (Weeks et al., 2004), and often have to travel long distances to receive health care. Caregivers to rural veterans also may have concerns about health care privacy, competency of care, and burnout (Hicken & Plowhead, 2010; Werth, Hastings, & Riding-Malon, 2010). Using data from caregivers of Veterans in the Montana Health Matters (N=39 caregivers) and the Life and Family Legacies studies (N= 53 caregivers), results indicated rural caregivers of Veterans (compared to urban caregivers of Veterans) reported lower life satisfaction, provided more hours of care per day, had poorer health, and went a longer time since their last health checkup. Rural caregivers also reported barriers to care including experiencing challenges related to distance to physician offices, not having health insurance, difficulty getting prescriptions filled, and challenges with insurance claims. Implications for caregivers in rural areas and professionals who serve these rural caregivers will be provided.

RACIAL/ETHNIC DIFFERENCES IN DEPRESSION CARE FOR VETERANS

A.R. Quinones[1,2], S.M. Thielke[3,4], K. Beaver[3], R. Trivedi[3], E.C. Williams[3], V. Fan[3], *1. Public Health & Preventive Medicine, Oregon Health & Science University, Portland, Oregon, 2. VA Medical Center, Portland, Oregon, 3. VA Medical Center, Seattle, Washington, 4. Psychiatry & Behavioral Sciences, University of Washington, Seattle, Washington*

Background: Various studies have identified racial and ethnic disparities in the receipt of guideline-concordant depression care among VA patients. This study aims to characterize racial/ethnic differences in treatment of chronic depression for middle-aged and older Veterans by examining antidepressant and psychotherapy use among Black, White, Hispanic, Asian, and American Indian/Alaska Native (AI/AN) Veterans. Methods: We estimate logistic regression models from a sample of 62,095 chronically depressed patients (mean age 57.5, SD=12.51) using VA medical record data (External Peer Review Program 2009-2010). We examine three outcome measures: receipt of adequate antidepressant therapy (≥80% medications on hand), receipt of adequate psychotherapy (≥6 sessions in 6 months), and receipt of guideline-concordant treatment (combination of both treatments). Results: Compared to Whites, nearly all minority groups had lower odds of adequate antidepressant use and guideline-concordant care in unadjusted and adjusted models (antidepressant adjusted OR range=0.53-0.82, $p<0.05$; guideline-concordant adjusted OR range=0.59-0.83, $p<0.05$). Although receipt of adequate psychotherapy was more common among minority Veterans in unadjusted analyses, differences between Hispanic, AI/AN and White Veterans were no longer significant after covariate adjustment. Once we further adjusted for distance to VA facility, the difference between Black and White Veterans was no longer significant. Conclusions: In order to improve care for minority patients, we need to better understand how patient preferences and provider/system factors interact to generate differences in depression care. It will be increasingly important to differentiate between health service use patterns that stem from genuine differences in patient preferences and those that signify inequitable quality of depression care.

SLEEP HYGIENE AND SLEEP QUALITY IN OLDER VETERAN CAREGIVING DYADS

P.C. Griffiths[1,2,3], A.J. Harrill[1,4,3], M. Whitney[1,3], K. Hepburn[2], *1. Rehab R&D, Atlanta VAMC, Decatur, Georgia, 2. Emory University, Atlanta, Georgia, 3. Georgia Institute of Technology, Atlanta, Georgia, 4. Georgia State University, Atlanta, Georgia*

This study addresses sleep hygiene and sleep quality in caregiving dyads—a topic that has important implications for the quality of life for older Veterans and their family caregivers (CG). Data are from phase one of a three phase study which examined sleep patterns in a sample of Veterans over the age of 60 who require assistance from a cohabitating caregiver (CG). Caregiving can extend over many years and becomes increasingly more demanding as the health and independence of care recipients decline. Sleep quality can be compromised in caregivers. Poor sleep can contribute to falls, medication errors, daytime drowsiness and institutionalization of the care-receiver. In caregiving dyads, the sleep of one care-partner can adversely affect the sleep of the other thereby exacerbating the problem for both members of the dyad. Actigraphy was used over seven nights to objectively measure sleep in 62 Veteran Caregiving Dyads (124 individuals). Daily journals were used to record sleep hygiene practices and to identify the nature and types of sleep disturbance. Dyadic concordance was assessed for sleep hygiene factors, subjective and objective sleep quality. Socio-demographic, health characteristics and descriptive analyses of the sleep hygiene practices for "good" versus "poor" sleepers and Care-Receivers versus Caregivers are compared and contrasted to elucidate potential intervention targets. Results are discussed in terms of the implications for assessment of sleep hygiene factors (which are amenable to intervention) in addition to standardized measures of sleep quality or sleepiness.

VETERANS' PERCEPTIONS AND PREFERENCES ABOUT PAIN MANAGEMENT AND END-OF-LIFE CARE: PRELIMINARY EVIDENCE

D.J. Van Dussen[1], J.G. Cagle[3], A.J. Plant[1], D.L. Albright[2], *1. Sociology, Anthropology, and Gerontology, Youngstown State University, Youngstown, Ohio, 2. University of Missouri, Columbia, Missouri, 3. University of Maryland, Baltimore, Baltimore, Maryland*

Veterans make up a quarter of the deaths in the US. Little is known, however, about their knowledge and preferences about end-of-life care and pain management. Given this, we were interested in how veteran's military experiences might affect their end of life experiences and attitudes. Our exploratory study not only addressed the differences in the knowledge of hospice among veterans, but also the differences in perceptions regarding pain and pain management, as well as end of life. We obtained a small population-based sample (N=123) using a blended sampling frame of randomly selected validated cell phone and landline numbers, and oversampling for Hispanic and African American individuals. The study sample was comprised of 14 veterans. The outcomes of interest were: a 23-item true/false test about knowledge of hospice; attitudes regarding hospice using the 8-item Gerbino scale; and a thirteen item scale measuring attitudes towards pain management. Using an independent samples t-test, we compared the means of the outcomes of interest. Our results suggested that veterans possess more knowledge and more favorable attitudes regarding hospice care and p and display more favorable attitudes regarding pain medication. In keeping with these findings, our data suggests that veterans also hold more positive views about the end of life. Our findings suggest that there are disparities between veterans' and non-veterans' end of life care preferences and attitudes about death. Future research examining the concept of stoicism at the end of life among veterans and educational interventions are needed.

SESSION 600 (POSTER)

CULTURES OF CAREGIVING

NEIGHBORHOOD COHESION AND CAREGIVER BURDEN AMONG THE MEXICAN-ORIGIN POPULATION

S. Rote[1], J. Angel[2], K. Markides[1], *1. Sealy Center on Aging, University of Texas Medical Branch, Galveston, Texas, 2. The University of Texas at Austin, Austin, TX, Texas*

Neighborhood environments impact health in the extent to which they provide resources and safety to their inhabitants. Previous research indicates that elderly foreign-born Mexican American adults tend to live in homogenous neighborhoods that may provide socio-cultural benefits that protect against health decline (Markides, Angel, & Peek, 2013). For example, Eschbach and colleagues (2004) found that older Mexican Americans living in the southwestern U.S. and in high density immigrant areas tend to have more favorable health profiles and a slower health decline over time than those in low density areas. Few researchers, however, have examined the influence of neighborhood resources and support on caregiver burden in general and among the Mexican-origin population in particular. Using data from Wave 7 of the Hispanic Established Population for the Epidemiological Study of the Elderly (H-EPESE, 2010/2011, n=847), we find that caregivers providing support to elderly family members who report high levels of neighborhood solidarity report less depressive symptoms and social stress that those providing care to elderly living in less cohesive neighborhoods. Supportive neighbors may help one another in a number of capacities that allow for older adults to remain in the community and reduce caregiver burden including assistance with instrumental activities of daily living such as providing transportation to the grocery store, and help with housework or emotional support.

"I'M NOT REALLY A DUTIFUL SON": STRUCTURAL AMBIVALENCE FOR JAPANESE MEN CARING FOR AGING PARENTS

R. Hirayama, *1. Japan Society for the Promotion of Science, Tokyo, Japan, 2. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

In this qualitative study, I explored the experiences of Japanese adult sons who assume primary responsibility for caregiving to their aging parents. Although men are increasingly likely to be called upon to meet parental care needs because of sociodemographic trends in the country, it is still seen as "atypical" for sons to be primary caregivers for their parents. Guided by the framework of sociological ambivalence, I focus on contradictory structural arrangements that these sons face in attempts to juggle paid work and parental caregiving. I conducted semistructured interviews with 28 middle-aged caregiving sons mostly from suburban areas in Japan. Through content analysis on interview transcripts, I found two recurrent themes: "gendered notions of filial duty" and "public elder care systems that are unfriendly to working caregivers." Although sons felt obliged to take care of their parents, they were aware that they cannot fulfill their filial duty only by being involved with parental caregiving because sons are traditionally expected to make their parents proud by succeeding in their work career. At the same time, public systems related to family caregiving to older adults, such as family-care leave and national long-term care insurance, did not sufficiently help sons to manage both work and care responsibilities. Forced to focus on either parent care or work career, sons were frustrated that they can never become "a dutiful son." Given these findings, I discuss how Japan's public policy, traditional familial institutions, and unequal distribution of socioeconomic resources shape sons' experiences of parental caregiving.

UNDERSTANDING CULTURAL COMPONENTS OF THE CAREGIVING EXPERIENCE

S.M. Powers, R. Walker, T. Bisconti, *University of Akron, Seven Hills, Ohio*

Throughout the caregiving literature, few researchers have incorporated both positive aspects of care and cultural values in a comprehensive stress and coping model aimed at understanding the subjective caregiving experience. More recently, Knight and Sayegh (2010) proposed a revised Sociocultural Stress and Coping Model (SSCM) that postulates cultural beliefs and values to have a major impact on social support, coping strategies, burden, and depression. Therefore, the current study has utilized the SSCM to examine the relationships between components of culture (i.e., cultural justifications and feelings of familism) as they relate to burden, positive aspects of care, social support, coping styles, and depression. Proposed relationships have been analyzed through a mediator versus moderator hypothesis structure. Individuals were able to participate in this questionnaire study if they, a) provided care to an older adult 50 years or older, and b) provided care for at least 8 hours per week. Results suggest that a caregiver's level of burden, use of different coping styles, and feelings of positivity towards the caregiving role influence the relationship held between cultural values and depression. Implications suggest that culture may be a significant component of the caregiving experience that has been overlooked and under-measured in previous caregiving studies.

THE ROLE OF LIVING ARRANGEMENT AND SOCIAL SUPPORT IN SELF-RATED HEALTH IN OLDER CARIBBEAN WOMEN

C. Ford, I.S. Harvey, *Human Development and Family Studies, University of CT, Storrs, Connecticut*

Research has shown that older adults with high self-rated health and few limitations are better able to maintain an independent residence.

Additionally, the decision to co-reside may provide insight into individuals' social relationships. As social support is a determinant of health, it is important to investigate the impact that living arrangement and social support may have on self-rated health. Cross-cultural implications are of interest as well, as generalizing relationships does little to advance our knowledge about the diversity of the interactions. The aim of the present study was to understand the relationship between living arrangement, social support, and self-rated health in older women. We hypothesized that living with someone would be positively correlated with self-rated health. In depth, semi-structured interviews were conducted with Caribbean women (N=24, M=68.63, SD=12.40) on the islands of St. Croix, St. John, and St. Thomas. 67% of participants reported living with someone. Number of household members ranged between one and seven (M=2.57, SD=1.93). Findings show a correlation between the number of people in one's household and self-rated health ($r=.55$, $p<.05$). Multiple linear regression was used to determine the effect of age, income group, number of household members, and social interaction evaluations on self-rated health. The model was statistically significant ($F(4,4) = 7.38$, $p<.05$), indicating that results were unlikely to have arisen by chance. Future research should focus on the qualities of living arrangements and social relationships to further knowledge on the impact the variables have on self-rated health.

CONGRUENCE OF EXPERIENCE: QUALITY OF RELATIONSHIP OF CAREGIVERS AND RURAL CARE RECIPIENTS

L. Mieskowski, F. Scogin, *Dept. of Psychology, University of Alabama, Tuscaloosa, Alabama*

Quality of relationship between caregivers and care recipients has received increased attention as a potential gatekeeper for the quality of experience of caregiving. Caregiver burden is well-established, but positive reactions such as feeling efficacious in ones' role or finding satisfaction in the ability to provide care to a loved one have also been documented (Dorfman, Holmes, & Berlin, 1996; Spruyette, Van Audenhove, Lammertyn, & Storms, 2002). Furthermore, research suggests that quality of relationship has potential as a mediator or moderator of caregiver burden (Chapell & Reid, 2002; Goldsworthy & Knowles, 2008; Merz & Huxhold, 2010; Pearlin, Mullan, Semple, & Skaff, 1990; Yates et al., 1999). In a sample of rural-dwelling vulnerable elders without dementia, quality of relationship may play a distinct role for both caregiver and care recipient. Forty-nine dyads were asked to rate their relationship and indicate their overall quality of life. Care recipients and caregivers were found to rate their relationship similarly ($r = .46$, $p < .01$), but varied on the strength of rating agreement depending on the area of relationship they were asked to rate (e.g., pleasure, strain, wishing the relationship was better). Additionally, relationship quality was related to well-being ratings in work, neighborhood, and community for caregivers and ($p < .05$), but unrelated to care recipient quality of life domains. Implications of this study include identifying how quality of life may be differentially affected in rural caregiving dyads.

MULTICULTURAL AGING AND IMMIGRANT CAREGIVER TRAINING

I. Choi[1], J. Berry[2], *1. Penn Asian Senior Services, Philadelphia, Pennsylvania, 2. Dementia Specialist Consulting, Cokato, Minnesota*

"Multicultural Aging and Immigrant Caregiver Training" examines the cross-cultural project between Penn Asian Senior Services (PASSi) and Dementia Specialist Consulting offering Asian immigrant caregiver trainings on Dementia. We will discuss the barriers in delivering care to Asian immigrants and how collaborative trainings can overcome these barriers, enhance health outcomes, and improve elderly immigrants' quality of life. PASSi received funding from Independence Blue Cross Foundation in August 2012 to launch a cross-cultural Alzheimer caregiver training program based on the Lakeview Ranch Model of Specialized Dementia Care™. Facilitated by PASSi's multilingual outreach staff, Judy Berry taught 141 home health aides and family caregivers in 5 Asian languages. The trainings improved caregivers' understanding of Alzheimer's and changed how caregivers fundamentally understood and interacted with patients. This improved overall health outcomes and reduced health care costs. Founded by current Executive Director, Im Ja Choi in 2004, PASSi is a nonprofit home healthcare agency and vocational training center focused on Asian immigrants in southeastern Pennsylvania. PASSi currently serves 400 clients in 10 Asian languages, and its unique work model was featured in NY Times in January 2014. Judy Berry founded Lakeview Ranch Inc. in 1999 where she developed the Lakeview Ranch Model of Specialized Dementia Care.™ This nationally recognized model restores dignity, and quality of life to Dementia/ Alzheimer's patients, eliminates dementia related aggressive behavior, and reduces psychotropic drug use. Choi and Berry were both nationally recognized by receiving Robert Wood Johnson Foundation's Community Health Leader Award in 2011 and 2010.

SOCIAL SUPPORT, EMOTIONAL SUPPORT, AND COGNITIVE FUNCTION AMONG OLDER ADULTS LIVING IN DA NANG, VIETNAM AND SURROUNDING RURAL AREAS

H. Nguyen[1], C. Hoang[2], N. Ngoc[3], S.H. Zarit[4], *1. Department of Family and Community Medicine, Wake Forest School of Medicine, Winston-Salem, North Carolina, 2. Da Nang University of Medical Technology and Pharmacy, Da Nang, Viet Nam, 3. Duy Tan University, Da Nang, Viet Nam, 4. Pennsylvania State University, State College, Pennsylvania*

As life expectancy across countries continues to rise, poor cognitive function and dementia have become a major health and social issue. Social and emotional support has been found to reduce risk of dementia and protect against loss of functional capacity. The link between social and emotional support and cognitive function in non-Western settings is not clear. The goal of this study was to determine the relationship between social and emotional support and cognitive function in a representative sample of 600 participants, aged 55 and older living in Da Nang and in surrounding rural districts. The Mini-Mental State Examination was used as the primary cognitive measure. Total social support was the total number of children, other relatives, and friends with whom the participant could talk to about private matters and various problems. Two emotional support measures were used to assess the support individuals received from their children and spouse. Stratified analysis by area of residence (urban vs. rural) was carried out to examine the associations. A multiple linear regression was fitted for each group. Those living in rural areas had more cognitive impairment than those living in the urban area. Adjusted for important confounders, social support and emotional support were associated with better cognitive performance among adults living in urban areas; these associations were not observed in rural areas. Our findings suggest a relationship between social and emotional support and cognition, but the association depends on the nature of the community of residence (urban or rural).

A SYSTEMATIC REVIEW OF THE LITERATURE OF FAMILY CAREGIVING FOR AMERICAN INDIAN/ ALASKAN NATIVE ELDERS

S. Llanque[1], M. Caserta[1], L.M. Savage[2], C.E. Dingley[1], D. Lund[3], C.R. Landry[4], K.G. Cloyes[1], R. Goins[5], *1. University of Utah, Salt Lake City, Utah, 2. Linfield College, Portland, Oregon, 3. California State University, San Bernardino, San Bernardino, California, 4. Native American Youth and Family Center, Portland, Oregon, 5. Western Carolina University, Cullowhee, North Carolina*

This systematic review examined current literature with regards to caregiving of elders in the American Indian/Alaskan Native (AI/AN) population. Articles and books from CINAHL; Health Source-Consumer Edition; Health Source: Nursing/Academic Edition; MEDLINE; PsycARTICLES; Psychology and Behavioral Sciences Collection; PsycINFO; and Google Scholar were examined. The search terms 'American Indian,' 'Alaskan Native,' 'Native American,' 'Caregiving,' and 'Elder' were used, yielding eleven results that fit the aim of this review: three books and eight peer-reviewed articles. Relevant literature was organized based on design, purpose, and evidence/results. The quality of research articles was evaluated using design-based critical appraisal guidelines. The synthesized review revealed the current state of the science focused on the value of aging and caregiving unique to the AI/AN population, evaluating health and psychosocial variables, perceived barriers and benefits of caregiving, issues of access to care, and specific profiles of AI/AN caregivers within a distinct and meaningful cultural context. Consistent with forecasted increases in the aging AI/AN population, the need for caregivers who are prepared and engaged becomes increasingly important, as families typically take on caregiving responsibilities with little preparation. This review synthesizes the current literature, identifying directions for future research to further illuminate the unique nature of the AI/AN caregiving experience. Additionally, this systematic review can serve as a foundation for developing culturally sensitive caregiver programs in the AI/AN populations. Implementing educational and skill-building programs that support caregivers based on their identified needs within their cultural context may decrease burden and improve quality of life.

MECHANISMS THROUGH WHICH TRADITIONAL CULTURAL VALUES PROTECT THE WELLBEING OF ETHNIC ADULT CHILD CAREGIVERS

K. Hsueh[1], W. Cheng[2], *1. University of Missouri-St. Louis, St. Louis, Missouri, 2. National Cheng Kung University, Tainan, Taiwan*

This study explored the role that reciprocal filial values play in protecting the wellbeing of US Chinese adult-child caregivers. Using a structural equation modeling approach, we tested a latent variable model with survey data obtained from 137 Chinese adult-child caregivers living in seven U.S. cities. We examined how reciprocal filial values directly and indirectly affected their wellbeing through mechanisms underlying the protective effects of role rewards and coping against role strain caused by caregiving challenges. Our final model demonstrated a good fit with the data and suggested that reciprocal filial values had both direct and indirect protective effects on caregivers' wellbeing. This final model, informed by the propositions of role theory, social exchange theory and stress-coping theory, offers a theoretical and empirical basis for health care providers, policymakers, and researchers to address culturally sensitive issues related to family caregiving in working with caregivers who share similar filial values and strain.

LIVE-IN AND LIVE-OUT CAREGIVING OF ADULT CHILDREN AND CHILDREN-IN-LAW OF OLDER ADULTS IN THE US AND IN JAPAN: DIFFERENCES AND SIMILARITIES

T. Wakui[1,2], E. Agree[3], T. Saito-Kokusho[4], T. Ishizaki[1], I. Kai[5], *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Population, Family and Reproductive Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. Johns Hopkins University, Baltimore, Maryland, 4. National Center for Geriatrics and Gerontology, Obu, Japan, 5. The University of Tokyo, Tokyo, Japan*

While women traditionally bear most of the caregiving responsibilities around the world, trends toward delayed marriage, improvements in women's status, and changes in family structure are leading to greater variety in family caregiving arrangements. In Japan, a rapidly aging population has resulted in increased involvement of men as caregivers, and raised issues among women on how to juggle the multiple roles of caregiver, worker, and parent. The US has confronted similar issues, as well as a rise in complex family structures from divorce and remarriage. This study compares the living arrangements of adult children and children-in-law caregivers in the United States and Japan, using data from the U.S. National Study of Caregiving (NSOC) (n=613), and the first wave of the Fukui Longitudinal Caregiver Survey in Japan (n=1684). Results showed 88% of Japanese child caregivers were coresident, but in the United States only 51% were living in the household. Multivariate logistic regression analysis showed that married caregivers were less likely to be coresident in both countries. Self-care disabilities and support from friend or family were dominant factors associated with coresidence in the US, but not in Japan, where older and female caregivers were more likely to live in the household. Our results suggest that traditional attitudes about coresidence still prevail in caregiving arrangements in Japan.

LOS CUIDADORES LATINOS UNIDOS: FINAL RESULTS FROM A COMMUNITY-BASED PILOT PROGRAM FOR LATINO FAMILY CAREGIVERS

S. Mudroch[1], H. Tan[1], C. Guse[1], M. Villa[2], M. Bonet[2], M. DeNomie[1], A. Castro[2], Z. Franco[1], *1. Medical College of Wisconsin, Milwaukee, Wisconsin, 2. United Community Center, Milwaukee, Wisconsin*

With an aging population and greater incidence of Alzheimer's disease within the Latino community there is increasing need to address the well-being of Latinos serving as family caregivers of elders with dementia. Caregivers in the Latino community report greater burden of care with potential contributions from language barriers, socioeconomic strain, cultural adaptation, and familial pressures. Few studies have focused on adapting caregiver interventions for Latino family caregivers. In response to calls for a culturally-competent caregiving model, the United Community Center (UCC) and the Medical College of Wisconsin piloted Los Cuidadores Latinos Unidos. This intervention offered a flexible, six-month multi-component program to forty eligible participants. Program elements included psychoeducational sessions guided by Behavioral Activation and Family Systems Theory Model; family education meetings; quarterly workshops; and use of technology. Specially-trained, bilingual Latino family workers from the UCC provided community-embedded service delivery. Impact on caregiver wellness was assessed using data collected at baseline, midpoint, and the conclusion of the intervention using: Zarit Caregiver Burden Assessment, PHQ-9 Depression Scale, Social Connectedness Scale, Quality of Life Scale, an internally-generated family survey, psychosocial summary, and wellness plan. We will present final results from this program, including demographics and intervention effectiveness. In addition, we will examine cultural adaptations in tailoring behavioral activation to Latino caregivers through interviews conducted with family care workers at the UCC and by consultation with a specialist in culturally-appropriate behavioral health interventions. Project findings are available for replication and may be of interest to health professionals who aid Latinos affected by dementia.

HONOR THY FATHER AND MOTHER: PREDICTING ETHNICALLY DIVERSE EMERGING ADULTS' WILLINGNESS TO PROVIDE CARE

S. Hamill, *CSU San Marcos, San Marcos, California*

In 2009, 61.6 million people provided $450 billion in unpaid care to family members; these caregivers included 1.4 million youths under the age of 18, most of whom were caring for a grandparent. The caregiver role provides a unique opportunity to learn about assisting others and may serve to socialize the young to take on future caregiving roles for their own parents. However, little is known about how early caregiving experiences influence young people's willingness to provide care, or how cultural values might encourage assumption of this role. The present study tested two hypotheses: (1) Ethnic minority youths would be more likely to come from caregiving families than whites; and (2) prior caregiving experience, greater spirituality, and more affection for parents would predict greater willingness to assume future caregiver roles for parents. White, Hispanic, and Asian college students (N =

461) completed a survey on college students' spirituality, quality of family relationships, and caregiving responsibilities. Results indicated that Asian students' families were more likely to have provided care to family members than Hispanic or White students. Multiple regression analyses revealed that greater affection for mothers was the best predictor of willingness to provide care for both Hispanic and White students whereas it was not related to willingness to care for Asian students. Conversely, greater spirituality was a significant predictor for Asian students but was not significant in models for Hispanics or Whites. The need to examine the differential impact of cultural factors on caregiving within ethnic groups is emphasized.

THE EFFECT OF KOREAN BABY BOOMER'S VOLUNTEERING ON GENERATIVITY

M. Kim, *Department of Community Development and Welfare, Daegu University, Gyeongsan, Gyeongbuk, Republic of Korea*

Descriptions According to Erikson's psychosocial theory, generativity is obtained through helping others. As a result, caring for others is reflected as a psychological strength, so volunteering can be used as an example of an expression of generativity. Volunteering is a form of social engagement for Korean baby boomers (born from 1955 to 1963) preparing their social identity after retirement. In this study, the effect of Korean Baby boomer's volunteering on generativity were examined. Method The sample size of this study is 280. The sample was collected using a population ratio of baby boomers in Seoul and the Kyungki Province, where two fifth of the Korean population live. Hierarchical multiple regressions were used for data analysis. For control variables, socio-demographic variables such as age, gender, education, religion, job and health were used. For independent variables, the status of client and the characteristics of volunteering were used. Also, the length and frequency of volunteering experience, volunteering satisfaction and personal achievement through volunteering were used. To compare the degree of each independent variable on generativity, standardized coefficient beta was used. Findings Among the socio-demographic variables, age, religion and health were important factors affecting generativity. In regard to client variables, welfare client was an important factor affecting generativity. When considering volunteering variables, the length of volunteer experience, time spent per week, volunteering satisfaction and personal achievement through volunteering were important factors affecting generativity. This study showed that Korean Baby boomers' volunteering was a good explanation of Erikson's psychosocial theory of generativity.

MATURE GAZE: DISEMPOWERMENT OF YOUTH CULTURE ON FEMALES AGING IDENTITY

J. Manning Dantis, *Miami University, Oxford, Ohio*

The purpose of this theoretical paper is to offer Mature Gaze (Forthcoming Manning-Dantis) perspective as a way of critically looking at the power of new forms of media in the development of social identities for older women. Mature Gaze as a construct critically views the illusion of perfection as a way of gaining or losing power. Mature Gaze looks at self-objectification and the link with individuals' misidentifying with youth. For individuals who covet youthful images and disengage from positive feelings towards aging, this may increase the likelihood of a loss of power by going past the line of looking to obsessing. Once an individual disengages from an aging identity and begin to identifying with youth culture, power is potentially shifted to reinforcing the idea that youth is more beautiful. Once individuals give power to the idea that youth equates to beauty, they are also taking power from themselves. Through new networks found on the internet, an individual who creates a persona that is younger or provides information that is from years past reinforces the disengagement they have with their aging self. Through digital medium, the pursuit of perfection can be obtained by photo shopping away any trace of a flaw. Self-objectification creates a need to change what individuals can, or medically remove what they cannot. The concept of Mature Gaze is drawn from independent research in the field of gerontology.

EMOTION REGULATION STRATEGIES AMONG OLDER JAPANESE ADULTS IN INTERDEPENDENT CULTURE

T. Ikeuchi[1,2], H. Osada[1], *1. Gerontology, J. F. Oberlin University Graduate School, Tokyo, Japan, 2. Center for East Asian Studies, Stanford University, Stanford, California*

A growing body of evidence suggests that older adults control their emotions better compared to younger adults. In interdependent cultures, including Japan, emotion regulation strategies, such as suppressing emotion-expressive behavior, are often used to adjust to others. The present study explored cultural and age-related variation in the use of emotion regulation strategies and its associations with psychological health. The study participants, aged 60 to 79 ($M = 66.3$, $SD = 3.8$), were Japanese adults ($n = 220$, 51.4 % female) living in urban areas of Japan. They completed self-administered questionnaires in September, 2012. We tested associations of independent and interdependent self-construal, emotion regulation, and future time perspective with self-reported happiness, life-satisfaction, and loneliness. Results showed that emotion suppression was positively significantly correlated ($r=.205$, $p=.003$) with age, but no significant associations were found between future time perspective and emotion regulation. There were significant positive correlations between interdependence (i.e., belonging and fitting in) and both emotion suppression ($r=.356$, $p=.000$) and emotion reappraisal ($r=.405$, $p=.000$). Although interdependence was not significantly associated with happiness, life-satisfaction, or loneliness, there was a negative correlation ($r=-.155$, $p=.030$) between emotion suppression and happiness. These findings suggest that older Japanese adults may use emotion regulation strategies in order to adjust to others. The implications for how cultural values and attitudes may influence psychological health of older Japanese adults will be discussed.

DIURNAL PATTERNS OF AFFECT AMONG OLDER ADULTS IN INDIA: THE ROLE OF EDUCATIONAL ATTAINMENT

T. Bhatta[1], A. Bardo[2], N. Lekhak[1], *1. Case Western Reserve University, Cleveland, Ohio, 2. Miami University, Oxford, Ohio*

Previous studies on the social origins of psychological well-being have generally found socioeconomic characteristics to have a positive, but weak, influence on global well-being reports. However, global reports do not adequately reflect people's daily experiences and the role of these micro-level events in shaping affective states. As such, social science research has often ignored potential variation in the reporting of psychological well-being by socially structured daily circumstances. Based on a subsample ($n=2411$) of the first wave of the Study on Global Ageing and Adult Health, the present study employs an adapted version of the Day Reconstruction Method (DRM) to examine the stability of both positive and negative states experienced over the course of a day. Additionally, this study explores potential educational differences in the variation of affective states, as measured by the DRM. Findings from random effects models indicate an average decline in both negative affective states and positive affective states over the day. A significant quadratic effect of time suggests an enhancement of positive affect in later parts of the day. In regard to education, the findings reveal a significant positive influence on the initial-average differences in both negative and positive affect, but in relation to changes in affective states over the day, education was found to positively influence only positive affect. This study provides some of the first diurnal patterns of positive and negative affect among the older population in India, and highlights the role of education in shaping positive perceptions of life in relation to daily circumstances.

ONTOLOGIES OF THE BODY AND LIFE-WORLD IN ACTIVE AGING DISCOURSE: ETHNOGRAPHIC CASE STUDY OF "LOCOMOTIVE SYNDROME" AND "MIBYO" IN THE METROPOLITAN AREA OF TOKYO, JAPAN

E. Ricart, *University of Chicago, Chicago, Illinois*

It is well known that Japan has one of the world's most rapidly aging populations. As the baby boomers age, a primary concern is their simultaneous enrollment in national Long Term Care insurance, flooding the system. To counteract this, care-prevention has taken on increased importance for the country. Like active aging, care-prevention mobilizes a discourse of continued physical, social, and mental activity to maintain independence and health. While care-prevention in Japan and active aging in America are similar at the level of discourse, there remain underlying difference in ontologies of the body and life-world. Through a discussion of care-prevention initiatives – Locomotive Syndrome, colloquially referred to as "Locomo," and "Mibyo," a concept culled from traditional Chinese medicine – I discuss ontologies of the aging body and life-world as they manifest in Japan's efforts to counteract the anticipated consequences of an aging society. I additionally suggest a new analytical-lens through which to approach active aging and other aging paradigms. Critical gerontologists have favored an analytical-frame of power-relations (bio-politics, identity-politics, and ideology), resulting in the polarization of the analytical-field into opposing agents. This precludes from observation continuity and coordination between the parts, and the analysis of how these parts form a larger whole. I propose using the analytical-frame of "ontogenesis" to uncover continuities and coordination between the parts (government officials, aging-studies specialists, organizations administering care-prevention programs, and elderly themselves) in the shaping and building of a larger whole – what it means to be aging and aged in Japan today.

KNOWLEDGE AND PERCEPTIONS OF END-OF-LIFE CARE IN CHINESE AMERICAN ELDERS: THE ROLE OF CULTURAL FACTORS

X. Gao, F. Sun, *Arizona State University, Phoenix, Arizona*

Purposes: The twofold aims of this study are 1) to describe the levels of knowledge of advanced directive (AD), end-of-life communication and decision-making in a sample of Chinese American elders living in the Phoenix Metropolitan area, and to 2) identify cultural factors that influence this group's knowledge of AD. Methods: Three focus groups were conducted to ensure that survey questions are linguistically and culturally appropriate. Survey data were collected through face-to-face interviews on Chinese American adults aged 55 or above (n= 385) living in the Phoenix Metropolitan in 2013. Results: About one out of five participants has heard about AD; one in ten has completed an AD. Logistic regression analysis shows that higher education and previous exposure to ventilator use were related to more knowledge of AD. Higher levels of acculturation and longer residency years in the U.S. were associated with higher levels of AD knowledge. Approximately, 6% of participants have spoken with their doctor about usage of life-sustaining interventions while 23% discussed this topic with their family members. The majority prefers talking about end-of-life care when they perceive an emergent need and considers family members should be involved in decision-making together. Discussion: In general, Chinese American elders lack the knowledge of end-of-life care. Educational programs should target Chinese American elders who are of limited education, less experience of life support measures, lower acculturation levels and shorter years of residency. Aging service providers should be sensitive to Chinese family beliefs that are essential to their end-of-life communications and decision-making.

WIDOWHOOD EXPERIENCES AMONG AGING GHANAIAN (AKAN) WOMEN

R. Korang-Okrah, T.L. Peterson, *Social Work, Western Kentucky University, Bowling Green, Kentucky*

Background: In many African societies, the practice of prescribed culturally-gendered widowhood rites is regarded as a rite-of-passage for widowhoods. While widowhood rites reflect traditions of individual tribal groups, the cultural norms and expectations can pose emotional, economic, and social hardships. Yet, little is known regarding widowhood experiences among African aging women. This paper describes widowhood experiences among aging Ghanaian (Akan) widows. Methodology: This phenomenological study explored the experiences of 14 Ghanaian (Akan) widows. They ranged in age from 50 to 81 years. A snowball sampling procedure involving local women gatekeepers was used. Data was collected through semi-structured interviews. Interviews were audiotaped and transcribed verbatim in the native language and back translated into English. Findings: Seven reoccurring themes emerged: (1) bereavement, (2) widowhood rites, (3) emotional loneliness, (4) violation of property rights, (5) confrontation with in-laws, (6) financial strain, and (7) sources of support. Discussion: Our findings suggest that more global attention is needed to understand the challenges faced by aging widows in African societies.

HEALTH BEHAVIORS AND TYPE 2 DIABETES DIAGNOSIS IN CHINA: A CASE-CONTROL STUDY

X. Pan, *Miami University, Oxford, Ohio*

Type 2 diabetes has become a major health problem in China at the beginning of last century. Western literature suggests that the involvement in unhealthy behaviors including active cigarette smoking, heavy alcohol drinking, high carbohydrate intake and being physical inactive increases the risk of type 2 diabetes. However, similar research is extremely limited among the population in China and it is unclear that evidence based on Western culture applies to a Chinese sample. Objective: to investigate the association between the involvement in unhealthy behaviors and type 2 diabetes diagnosis among middle-aged and older adults (45 and older) in China. Method: A 1:N matched case-control study design with conditional logistic regression is used to analyze the data of the Chinese Health and Nutrition Survey (1997-2009). There are 539 cases matched with 553 controls on gender and age. Results: the overall hypothesized model fit the data adequately ($\chi 2 = 1118.87$, df = 9, $p <. 01$). Given a specific age and gender, active cigarette smoking, high carbohydrate intake and being physically inactive are significantly associated with higher risk of type 2 diabetes diagnosis among the middle-aged and older Chinese after controlling for socioeconomic status (i.e., education and income) and the geographic area of residence. Conclusion: findings indicate that major unhealthy behaviors are significantly associated with higher risk of type 2 diabetes diagnosis among middle-aged and older adults in China. These findings are consistent with many other Western studies, which imply that the Western model might apply to the Chinese population.

SESSION 605 (POSTER)

WORK, RETIREMENT AND ECONOMIC WELL-BEING

ASSOCIATIONS BETWEEN UNEMPLOYMENT AND ACTIVE LIFE EXPECTANCY: FOUR DECADES OF PANEL SURVEY EVIDENCE

J.N. Laditka, S.B. Laditka, *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*

It is well-established that job loss and unemployment affect health. Few researchers have studied their effects using a measure that combines disability and mortality. Unemployment may increase disability and mortality through increased risk exposure and risk taking, reduced physical and emotional health, poorer diet, more stress, less use of health care, and reduced self-efficacy. We used employment data from 36 waves (43 years, 1968-2011) of the Panel Study of Income Dynamics (ages 55+, n=1,980, 78,595 person-years). Seven waves measured disability in activities of daily living (ADLs) (1999-2011). We estimated monthly probabilities associated with unemployment of death and disability in ADLs, with multinomial logistic Markov models adjusted for age, sex, ethnicity, education, diabetes and heart disease, and self-reports of fair or poor health during childhood (birth through age 16). The exposure variable indicated individuals in the top 90th percentile of average annual unemployed days, 9 weeks or more. Bootstrapping provided confidence intervals. A random effect accounted for repeated measures. Microsimulation created large populations to identify outcomes. Among White women those with high unemployment lived 1.96 fewer years from age 65 than others (95% Confidence Interval 1.87-2.04) and had 10.0% more years with disability (CI 8.0-12.1). For African American men, results were 1.41 fewer years (1.25-1.56) and 12.2% (9.17-15.14). For White men: 1.83 (1.80-1.85) and 6.87% (6.74-6.99). For African American women: 1.57 (1.40-1.74) and 8.9% (7.3-10.5). Findings can help policymakers, federal agencies, and insurers prepare for changes in disability and mortality that may result from continuing high long-term unemployment.

ARE SPOUSAL WORK HOURS RELATED TO LIFE SATISFACTION IN OLDER DUAL-EARNER COUPLES?

W.H. Wan[1,2], J. Smith[1,2], T.C. Antonucci[1,2], K.S. Birditt[1,2], *1. University of Michigan, Ann Arbor, Michigan, 2. Institute for Social Research, Ann Arbor, Michigan*

Objective Difficulties managing time pressure from work and family may affect each partner's well-being. Studies have focused on younger dual-earner couples where childcare contributes to time pressure. However, work time is likely also important for midlife and older couples (e.g., going back to school or taking care of children and elder parents) which can affect life satisfaction and well-being. This study examines whether asymmetries in spouses' work time among midlife and older dual-earner couples are related to life satisfaction. Methods Data are from a subsample of the 2006 Health and Retirement Study (N = 263 couples; mean age = 59.4, range = 51-84). Actor-Partner Interdependence Models were estimated to examine the effects of the individual's and the partner's work hours on each partner's life satisfaction. Models controlled for age, gender, education, and health. Results Analysis indicated that individual work hours were not associated with individual life satisfaction after controlling for covariates. However, having a partner who worked more hours was associated with lower individual life satisfaction. Further analysis examines differences in these associations when both partners work full-time and when one partner works less than full-time. Conclusion It is important to examine work characteristics of both spouses in order to develop better understanding of factors that affect older dual-earner couples' well-being. Stresses experienced by older workers can be exacerbated by issues in managing time pressure between spouses. Findings suggest that older dual earners need to adapt to changing work contexts and organizations also need to adapt to aging couples' contexts.

EXPLAINING GEOGRAPHIC VARIATION IN ECONOMIC INSECURITY IN LATER LIFE

J.E. Mutchler, J. Lyu, *Gerontology, UMass Boston, Boston, Massachusetts*

Considerable geographic variation in both Social Security benefits and living expenses occurs in the United States. Nationally the average Social Security benefit is not sufficient to cover living expenses for older adults aged 65 and over, and the gap between typical benefit and cost of living is variable across communities. The purpose of this study was to examine factors that explain geographic variation across counties in rates of economic insecurity, using spatial data analysis. The rate of economic insecurity is conceptualized as the ratio of the typical Social Security benefit to the average cost of living, measured using benefit data from the 2011 Social Security Administration and cost of living estimates from the Elder Economic Security Standard Index™. Results from a spatial error model revealed spatial clusters and spatial correlation in economic insecurity. Aggregate features of the county, including demographic characteristics, housing market features, health care climate, and socioeconomic features, were significantly related to the rate of economic insecurity. Our results demonstrate that the typical Social Security benefit brings elders closer to economic security in some geographic locations than in others. These results suggest geographic variability in the extent to which elders must depend on additional sources of retirement income, such as pensions or wages, if they are to make ends meet.

STUDY ON GLOBAL AGEING AND ADULT HEALTH (SAGE): ASSOCIATIONS BETWEEN INCOME ADEQUACY AND WELL-BEING

T. Gildner[1], M.A. Liebert[1], P. Kowal[2], S. Chatterji[2], J. Snodgrass[1], *1. University of Oregon, Eugene, Oregon, 2. World Health Organization, Geneva, Switzerland*

Recent studies have clarified the inter-relationship between income, health, and well-being. A positive correlation is typically observed between greater perceived income adequacy and subjective health and quality of life (QOL); however, these relationships remain poorly tested in older individuals from lower income countries. To address this issue, data were drawn from the World Health Organization's Study on global AGEing and adult health (SAGE), a study of nationally-representative samples of older adults (>50 years old) in six countries (China, Ghana, India, Mexico, Russian Federation, and South Africa). Self-reported income adequacy (n=18,385), health status (n=20,861), and QOL (n=20,818) were obtained. Linear regressions were used to examine the association between these variables, while controlling for age, sex, education, and marital status. Health ($p < 0.001$) and QOL ($p < 0.001$) improved linearly as income adequacy scores increased. Similarly, QOL improved linearly as health increased ($p < 0.001$). Women in all countries except Ghana and South Africa demonstrated significantly lower health scores compared to men ($p < 0.001$). Older adults in China, South Africa, and Russia reported significantly higher income adequacy ratings than their 18-49 year old counterparts ($p < 0.01$); however, the opposite pattern was observed in Ghana and India ($p < 0.01$). Further, income adequacy ratings continued to increase linearly in individuals aged 60 and older compared to those aged 50-59 in all countries except Ghana and South Africa ($p < 0.05$). Therefore, income adequacy, health, and QOL clearly influence one another, with age and sex differentially impacting these associations by country.

OPPORTUNITIES AND CHALLENGES IN WORK-LIFE EXTENSION: PERSPECTIVES OF MANAGERS IN NEW ZEALAND AND THE UNITED STATES

C. Unson[1], M. Richardson[2], S.F. Mohammed[1], *1. Southern Connecticut State University, New Haven, Connecticut, 2. University of Waikato, Hamilton, New Zealand*

Purpose: This study explored the ways in which managers negotiate the benefits and challenges of employing older workers, and thus influence the opportunities available to them. Method: Twenty interviews with managers of for-profit (8) and non-profit (12) agencies in New Zealand (10) and in the US (10) were conducted, transcribed verbatim and analysed independently for themes by two trained coders. Questions pertained to benefits of employing older workers, barriers to hiring and retaining them, and ways an individual and their organization can overcome these barriers. Results: Managers' perceptions of older workers map onto a high stability-low change matrix. Older workers were perceived as settled, reliable, manageable, able to work well with others, prepared to 'go with the flow', able to draw on considerable life and technical experience in crisis situations. Yet, they were also perceived to have 'closed down', to not be seeking advancement, challenge, or change, and while their considerable experience enabled them to solve problems, it was always with historical knowledge. To overcome barriers to retaining older workers, managers' provided training/information that enabled older workers to function well, assessed their needs and retirement goals, planned strategically for a diverse workforce, and showed appreciation for older workers. They expected older workers to keep an open mind, to continue to learn, and to value themselves. Conclusion: In an environment where managers consider "change is good; resisting change is bad" and plateauing is not an option, such perceptions highlight significant opportunities and challenges for the development of older workers.

LONGITUDINAL RELATIONSHIPS BETWEEN DEPRESSIVE SYMPTOMS AND JOB SATISFACTION IN MID-LIFE

V.C. Elsaesser, H. Wahl, O.K. Schilling, *Department of Psychological Aging Research, University of Heidelberg, Germany, Heidelberg, Germany*

Lifespan psychology emphasizes that development includes stability and change. Regarding depressive symptoms, recent research has found an increase in mid-life. Furthermore, there is evidence that middle aged adults show lowered job satisfaction as compared to younger employees. Concerning directions of influence Siegrist's effort-reward-imbalance model assumes that decreased job satisfaction affects increases in depression, but so far longitudinal studies are scarce. The present study analyzed longitudinal relationships between depression and job satisfaction based on data coming from the Interdisciplinary Longitudinal Study of Adult Development and hypothesized that the risk of lowered job satisfaction on increased depression might be stronger than the inverse direction. As part of this study, 381 participants born 1950-52 (T1:M(age) 43.8 years, SD 0.9) were followed from their early forties up to their mid-fifties with follow-ups 4 and 12 years after T1. Latent Change Score Models revealed that whereas lower job satisfaction at T1 was associated with an increase of depression between T1/T2, job satisfaction at T2 did not influence change of depression in the subsequent years up to T3. Seen inversely, higher depression at T1 was marginally significantly related to a decrease of job satisfaction between T1/T2, whereas depression at T2 did not play a role regarding change in job satisfaction between T2/T3. These results might suggest that in contrast to early mid-life where job-related goals are common and job satisfaction is significantly related to depression, mental health in later life may be much more independent of job satisfaction and instead be shaped by other factors.

LINKING WORK-STRESS TO LEVEL AND CHANGE IN WELL-BEING, PERCEIVED CONTROL, AND HEALTH IN MIDLIFE AND OLD AGE

R.J. Joiner, F.J. Infurna, *Arizona State University, Tempe, Arizona*

Much research has focused on linking work stress to cognitive functioning and onset of disease. Relatively little is known, however, about the relationship between work stress and other facets of healthy aging, such as well-being, psychosocial functioning, and self-perceptions of health. Our study investigates whether work stress is associated with levels of and rates of change in perceived control (constraints and mastery), depressive symptoms, functional limitations, and self-rated health. We used data from 2,768 working, middle aged adults (Mage = 61.03, SD = 8.37; 54%women) who participated in the Health and Retirement Study from 2006 to 2012. Our results show higher levels of work stress was associated with 4-year increase in perceived constraints and 4-year declines in mastery beliefs, while controlling for socio-demographics and depressive symptoms. Multilevel modeling analyses focused on linking work-stress to level and rates of change in depressive symptoms, functional limitations, and self-rated health. Results indicated that more work-stress was associated with higher levels of depressive symptoms and functional limitations and lower self-rated health, but not associated with change over time. Our results suggest work stress is a key factor associated with well-being, psychosocial functioning, and self-perceptions of health in midlife and old age. Our discussion focuses on mechanisms that could underlie the link between work stress and psychosocial functioning, well-being, and health and how stressful work environments influence individuals both during one's time of employment, as well as into old age.

EXAMINATION OF SUPERVISOR AGE IN PERCEIVED ETHICAL BEHAVIOR IN QUID PRO QUO HARASSMENT SCENARIOS

J. Steele, J. Doll, K. Mandiola, K. Vizy, L. Bradshaw, *Psychology, Radford University, Radford, Virginia*

Bureau of Labor Statistics (2008) reported a 101% increase in workers over age 65 between 1977-2007. Men increased workforce participation by 75% and women by 147%. Building a functional and supportive intergenerational community within the workplace can be jeopardized by situations that promote or overlook quid pro quo harassment. Quid pro quo harassment is the most common form of sexual harassment in which job benefits are contingent on sexual favors by an authority figure with decision making power. Very little is known about the role of age and quid pro quo harassment within the workplace. This study implemented an experimental, between subjects study design 2 (Gender: male-female) x 3 (Age: 23-45-65) to investigate the role of age and gender on participant perceptions of the ethical supervisor behavior and likelihood to help an employee in vignettes representing quid pro quo harassment. Only age and gender were manipulated across vignette conditions. Data collection is ongoing. Preliminary analyses on 56 undergraduate college student participants (75% female) indicated age differences in perceived ethical behavior by supervisor (F(2, 53) = 3.54, p = .04). Specifically, participants perceived the ethical behaviors (e.g., behaviors were just, moral, fair, acceptable) of 45-year old supervisors (M=1.40, SD=0.58) as more unethical compared to the 25-year-old (M=1.83, SD=0.52) and 45-year-old conditions (M=1.88, SD=0.71). The study has not yet yielded significant findings for gender and willingness to help. Complete study findings will be presented. Future implications for understanding the role of age in sexual harassment within the workplace will be addressed.

REASONS FOR OLDER WORKERS' ANTICIPATED JOB PERFORMANCE CHANGES

M.E. Paggi, D.S. Jopp, *Fordham University, Bronx, New York*

As our workforce becomes increasingly more reliant on older individuals, it is important to understand the nature of older workers' changes in productivity over time. The current study sought to determine older workers' expectations for their future job performance as well as the reasons they believed their performance would change. A sample of 246 older workers (Mage = 59.7, SD = 6.14; age range = 50-78) completed an online survey regarding their anticipated work performance changes and the reasons for these changes. Older workers who predicted their performance would decrease (n = 48; 19.5%) gave reasons such as being close to retirement (45.8%) and age-related changes in functioning (e.g., decreased physical health; 45.8%). Older workers who predicted their performance would remain the same (n = 84; 34.1%) gave reasons such as being hardworking and skilled at one's job (35.7%), being close to retirement (16.7%), and not anticipating change in job responsibilities (14.3%). Older workers who predicted their performance would increase (n = 114; 46.3%) gave reasons such as learning new skills (24.6%), increasing work experience (21.1%), and having more job responsibilities (19.3%). Thus, it seems many older workers who believed their performance would decline were planning on leaving the workforce, while those who believed they would maintain or increase their performance were talented and sought job growth. These results challenge the common misconception that older workers are less valuable than their younger counterparts in terms of productivity, skills, and desire for career advancement.

GRANDPARENTING, EMPLOYMENT STATUS, AND PERCEIVED NEEDS AMONG OLDER PROTESTANTS

J.D. Wilmoth[1,2], J.R. Smith[1], *1. Mississippi State University, Mississippi State, Mississippi, 2. National Strategic Planning and Analysis Research Center, Mississippi State, Mississippi*

A majority of older Americans identify themselves as Protestant Christians (Pew Forum on Religion & Public Life, 2008). Using data from the Family Needs Survey administered by FamilyLife (N = 8,625), this study examines how identified needs of older Protestants vary depending on grandparenting and employment statuses. The nonrandom sample is from 157 Protestant churches diverse in denominations, location, geography, and size. From 31 topics for which participants indicated whether they needed help, we selected 15 topics relevant for older adults to explore whether grandparenting or employment status predicted this issue as an identified need. We conducted a series of two-way ANOVAs with each need as the dependent variable and grandparenting status and employment status as independent variables. Grandparenting status (yes/no) and employment status (retired/employed full time) were coded as dichotomous variables. To avoid Type 2 error in this exploratory study, we set the significance level at $\alpha = .10$. For three of the needs, there was a significant main effect for employment status (Managing finances, p = .080; Growing in relationship with God, p = .010; Adjusting to changes, p < .001). For two needs, there was a significant main effect for grandparenting status (Managing finances, p = .460; Family communication, p = .059). There was a significant interaction effect for seven analyses (Managing finances, p = .010; Managing time, p = .029; Wholesome entertainment, p = .001; Rekindling romance, p = .059; Strengthening marriage, p = .005; Relating to inlaws, p = .085; Family communication, p = .006).

INCOME AND HEALTH IN OLDER WOMEN WITH CHRONIC ILLNESSES

C. Warner[1], K.B. Adams[2], A. Roberts[3], *1. FPB School of Nursing, Case Western Reserve University, Cleveland, Ohio, 2. Walden University, Minneapolis, Minnesota, 3. Miami University, Oxford, Ohio*

Older women have high rates of chronic illness, lower incomes, and higher health care expenditures than other groups. Recent economic downturns and limitations to health care systems present challenges for older people with health concerns and limited financial resources. Despite social and health policies for older adults, health disparities persist. In this study, we examine the first wave of data from 138 community-dwelling older women living with chronic illnesses and the relationship between measures of income adequacy and health (e.g., chronic illnesses (Charlson, 1987), self-assessed health, physical health (SF-12; Ware, 1996) and depressive symptoms (CES-D; Radloff, 1977). The average monthly income for the sample fell in the \$2001-\$3000 range (M=2.6, SD=1.5). Fifty-six percent of the sample reported that they were unable to make ends meet or just managed to get by with their income. Additionally, the women reported an average of nearly four (M = 3.84, SD = 2.1) chronic conditions, including arthritis (79%), hypertension (72%), lung disease (33%), and diabetes (31%). Ninety-nine percent of the sample had some medical insurance. Independent Sample T-tests indicate statistically significant differences in the health measures between women who rated their incomes as inadequate (n=78) and those with adequate incomes (n=60). Women with inadequate incomes reported more chronic illnesses, worse self-assessed and physical health, and more depressive symptoms. These findings suggest that despite health care coverage, income inadequacy is associated with worse mental and physical health. Implications for addressing the health care needs of economically challenged older women with chronic illness are discussed.

THE INFLUENCE OF AGE-RELATED STEREOTYPES ON OLDER ADULTS' WILLINGNESS TO REPORT SUSPECTED ELDER FINANCIAL ABUSE (EFA)

S.C. Gibson, E. Greene, *Psychology, University of Colorado, Colorado Springs, Colorado Springs, Colorado*

Cases of elder abuse are on the rise with the most common form being financial victimization. The present study used vignette methodology to determine under what circumstances older adults would report EFA and how reporting behavior is influenced by age-related self-perceptions and attitudes about aging. A total of 105 older adults, ranging in age from 53 to 90 years (M = 72.07, SD = 7.89) read a hypothetical vignette depicting possible EFA and were instructed to imagine themselves as the older adult in the vignette. The vignette was held constant across three conditions of alleged offender type: a close family member; a distant family member; and a new friend. Participants rated the likelihood they would report the incident using a 4-point Likert scale (e.g., 1=Definitely Would Not Tell; 4=Definitely Would Tell). Participants completed the 18-item Image of Aging Scale (Levy, Kasl, & Gill, 2004) assessing positive and negative age stereotypes, and the 5-item Attitudes toward Own Aging subscale (Lawton, 1975; 2003) assessing self-perceptions of one's aging process. Participants indicated that they "Probably Would Tell" (M = 3.34; SD = .82). A one-way ANOVA explored the likelihood of reporting as a function of offender type. The mean likelihood ratings were highest for the distant family member and lowest for the new friend but not significantly different. Correlational analyses supported the predicted associations between Image of Aging negative age-stereotypes and reporting likelihood (Pearson's r = -.29, p = .003) and positive age-stereotypes and reporting likelihood (Pearson's r = .20, p = .04).

DEPRESSION AND HOUSEHOLD WEALTH AMONG OLDER HISPANIC AMERICANS

J.S. Chae, E. Dugan, B. Gaines, P. Xu, I. Livingstone, *Departement of Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

Previous studies have examined the association of household wealth and mental health status in older adults. Yet, racial and ethnic factors related to wealth and emotional well-being are often overlooked. The U.S. Hispanic population is growing rapidly, but information on wealth and emotional outcomes are lacking. In this study, we seek to address this gap and the association between household wealth and depression among older Hispanic older adults. Using the Health and Retirement Study (HRS) 2010 data, the analytic sample (N=829) contains older Hispanic adults age 65 or older. The level of depression was measured by CES-D8 scale and divided by two binary groups (0: 0 to 3 and 1: 4 to 8). Household wealth status was measured using total net worth including secondary housing. The mean age was 73.95 years (65 – 99 range). 58% of the sample was female, 53% were married, and the average number of years of education was 8.75. Logistic regression analyses identified demographic and socioeconomic status was associated with depression. Specifically: years of education (OR 0.95) and chronic conditions (OR 1.46), (respectively, p<.05, Pseudo R2=0.12). Results highlight the impact of household wealth on depression symptoms is especially pronounced for respondents having chronic conditions. Having more chronic conditions, less wealth, less education was associated with higher risk of depression. This research demonstrates the importance of social determinants of mental health. Future healthcare providers or community program managers should be alerted to the risks for depression symptoms among Hispanic Americans with chronic conditions.

GETTING IN THE DOOR: A CASE STUDY OF UNEMPLOYMENT CHALLENGES

L. Blackman Thompson, *1. Howard University, Washington, District of Columbia, 2. University of Utah, Salt Lake City, Utah*

The devaluation of older workers and the negative stigmas associated with aging have left many older persons unable to re-enter the job market. According to Encel and Studencki (2004), when older workers lose their jobs, their chances of finding another job are extraordinarily low, and for people who lose their jobs in their 50s, they may never find full-time employment again. The purpose of the pilot project was: 1) to examine how older minorities (55 and over) perceive their access to employment opportunities and 2) to determine what factors these older persons believe impact their access to employment opportunities. The theory of intersectionality formed the framework for the research project; however this qualitative study, through the interview process, also sought to increase understanding about the impact of unemployment on older adults. The findings from this preliminary research along with the review of literature found that older applicants felt that they were treated unfairly and differently than their younger counterparts and that many employers had negative preconceived notions about older workers. The findings suggest that more education and awareness is needed for potential employers so that they can be aware of age discriminatory practices. In summary, there is a need to reexamine the hiring practices of employers due to the number of baby boomers who will potentially try to re-enter the workforce. By helping to shape potential employers' attitudes and perceptions of older workers through a strength-based interview process, we will hopefully create a more equitable selection process.

SESSION 610 (POSTER)

HEALTH CARE AND SELF CARE

ACCESS TO HEALTH CARE: TRAVEL DISTANCE OF OLDER ADULTS USING MTA BUS NETWORK

R. Suzuki[1], E. Small[2], C. Manche[3,1], D. Kruger[4], *1. University of Michigan-Flint, Flint, Michigan, 2. University of Texas at Arlington, Arlington, Texas, 3. Western Michigan University, Karamazoo, Michigan, 4. University of Michigan, Ann Arbor, Michigan*

Transportation barriers to primary health care providers are one of the major health concerns of older adults. However, few studies have investigated the degree to which this population was influenced by the spatial relationships between transportation and access to care. The purpose of this study was to examine the relative contribution of distance and time to access to primary health care providers in Flint, MI. The Speak to Your Health Community Survey 2009 and the Mass Transit Authority (MTA) bus routes were used to estimate distance and time between the residents' nearest bus stops and their health care providers on ArcGIS 10.1. Logistic regression analysis on SAS 9.2 was utilized to examine the relationship of the health care use to race, gender, distance and time. Of the 217 participants, a large percentage were Caucasian (52%) or African American (48%) women (73%) with low education levels (52% ≤ high school or GED), married or committed relationship (39%) and retired (78%). Their mean age was 74.14 (SD=7.02). The results indicated that distance and time were positively associated with seeing a health professional to get any kinds of health care in the past 12 month. Race and gender did not relate to the use of health care. No interaction effects of race, gender, distance, and time existed. Identification of possible neighborhood factors of the travel distance and time on the MTA bus use to access to health care will be important. Transportation barriers to care may encompass demographic and distance parameters.

CONNECTING THE DOTS: CURRENT AND FUTURE HEALTH CARE NEEDS OF BABY BOOMERS

M. Luptak, F.E. Wilby, J.A. Spears, *College of Social Work, University of Utah, Salt Lake City, Utah*

Health care coverage is an issue for baby boomers. In 2006, one-fifth of older workers and their spouses (7 million Americans) were uninsured at some point after turning 50 (The Commonwealth Fund, 2006). More recently, three in ten adults, ages 40 and over, had not considered their physical or mental health care needs as they approached retirement (Center for Public Affairs Research, 2013). We surveyed 395 participants aged 55-70 in a metropolitan area about their health care needs. Fifty-nine percent had employer or private insurance, 20% had Medicare, 4% had VA benefits, and 2% had Medicaid. Fifty-seven percent had mental health coverage and 8% had used mental health services. Seventy percent could afford co-pays, 60% could afford premiums, and 55% could afford deductibles. When anticipating post-retirement needs, 55% worried about overall health care affordability. Specifically, 22% worried about covering hospitalizations, 21% worried about covering medications and dental care, and 18% worried about covering vision care and primary care. To meet long-term care needs, 38% would use savings, 34% would rely on government programs, 26% did not know how they would meet long-term care needs, 22% would use long-term care insurance, 20% would rely on home equity, and 12% would rely on family. Forty-one percent planned to continue working past retirement age to pay for health insurance. Findings highlight the compounded worries that boomers have about health and long-term care costs as they move into retirement and reinforce the need for health care systems and policies that better serve older adults.

CHARACTERISTICS AND EXPENDITURES FOR OLDER ADULTS WITH EARLY HOSPITAL READMISSION FOR A PSYCHIATRIC DISORDER

M.A. Becker, T. Boaz, S. Hafner, R. Andel, *University of South Florida, Tampa, Florida*

Introduction: Early hospital readmission (within 30 days of discharge from an initial hospitalization) is considered an indicator of poor quality inpatient treatment. This study examined risk factors and expenditures for early readmission for inpatient psychiatric treatment among older adult Medicaid-enrolled Floridians. Methods: We used eight years of Florida Medicaid enrollment and claims data for (FY 2003-11) as well as data obtained from the Florida Center for Health Information and Policy Analysis, Inpatient Hospital Database, to identify episodes of hospitalization for all Medicaid-enrolled older adults. There were a total of 23,618 inpatient psychiatric hospital episodes for 13,682 older adults currently enrolled in Florida Medicaid for at least 180 days prior to and following the episode. We estimated the relative risk of early rehospitalization using Cox proportional hazards regression in SAS procedure PHREG. Results: Participants were 73.9 ± 7.4 years old; 61.8% female and 47.9% white. Of the 23,618 index hospitalizations for psychiatric treatment, about one in four resulted in the person being rehospitalized for their psychiatric disorder within 30 days. Male gender and alcohol abuse disorder emerged as the strongest predictors of risk of early readmission. The risk associated with psychotic disorder and bipolar disorder was double the risk for major depression. Being White and having two or more medical conditions also increased risk. Medicaid expenditures for early rehospitalization were substantial at $175,336,986. Conclusion: Attention to gender and alcohol abuse disorder may help in efforts to reduce early rehospitalizations.

PHYSICIAN KNOWLEDGE ABOUT CAREGIVING

T. Abramson, D. Lee, D. Yens, *Center for Gerontology and Geriatrics, NYIT, Old Westbury, New York*

Informal caregivers are central in the care of older adults and will play a far greater role as the population ages. Among health care professionals, specifically within schools of medicine, training programs do not allot a large portion of time to geriatrics. Before designing and implementing training and curriculum material it is necessary to first assess current knowledge. Sixty-six physicians, half male, half female, participated in an online survey assessing existing knowledge about informal caregivers, referrals, resources, training, experience, and current practices with caregivers. Direct care was the major source of knowledge with nearly half receiving their knowledge from continuing education programs. Respondents indicated that they had not had formal training, but would be likely to pass on knowledge about resources once trained. Age was negatively correlated with passing on resources. More information was needed about planning and resources (including information on family and health care coordination, health records, hospice, legal/financial planning, living arrangements, resources, and respite care). Additional information was needed about physical and mental health care of care-recipient (behavioral management of symptoms, dental care and the disease process); about the care recipient's care (elder abuse, hygiene, medication, nutrition/meals, safety); and information about caregiver health (stress/burnout, caregiver health). Finances/resources was the topic practitioners were least clear about. Most were knowledgeable about what caregivers do, but there was an expressed desire for more information. The findings indicate that there is a lack of formal educational training and most of knowledge about informal caregivers comes from direct work with older adults.

DEVELOPMENT OF THE IN-HOME MEDICATION MANAGEMENT PERFORMANCE EVALUATION: A VALIDITY STUDY

M. Murphy, S. Stark, E. Somerville, M. Keglovits, Y. Hu, *Program in Occupational Therapy, Washington University School of Medicine, St Louis, Missouri*

Background: The ability to live independently in the community is dependent on medication adherence. Non-adherence to medication routines can result in serious, preventable health consequences. A performance-based medication management tool is needed to evaluate older adults in the home who may be at-risk for non-adherence and to determine appropriate levels of support for continued community independence. In-home structured assessments are ideal for the older adult population to uncover barriers to medication management that would otherwise go undetected by standard clinical examinations. Purpose: This study aimed to assess initial psychometric properties of a 30-minute performance-based instrument conducted in the homes of older adults: the In-Home Medication Management Performance Evaluation. Methods: Content validity of the instrument was determined through the multi-step Content Validity Index (CVI) process. Content experts and older adults provided qualitative and quantitative judgment of the instrument's ability to measure medication management. The outcomes of the CVI process informed instrument revisions. A standardized protocol for instrument administration was developed. Results: Content experts (n=7) were in agreement that the overall instrument was valid for measuring medication management (CVI = 1.0). A total of 6 items were deleted due to CVI scores of <0.80 indicating low agreement. Minor edits were made to order of questions and language usage. Older adult participants (n=5) reported that the instrument was relevant, acceptable, and easy to understand. Implications: The In-Home Medication Management Performance Evaluation appears to be a relevant and valid method to assess performance barriers to medication adherence in the home of older adults.

FICTIVE KIN AND STAFFING ROLES IN INSTITUTIONAL BEREAVEMENT

H. Ewen[1], J.K. Chahal[1], K.A. Anderson[2], *1. Sociology and Gerontology, Miami University, Oxford, Ohio, 2. University of Montana, Missoula, Montana*

Within long-term care (LTC) settings, intimate and caring relationships develop between residents and staff. At some point, these relationships must come to an end, most commonly when the resident dies. Research focuses on the family ideology and importance of such relationships; however, little research has explored the role of this relationship in grief and bereavement in LTC facilities (Dodson & Zincavage, 2007). This study presents findings from open-ended interviews that were conducted with 10 administrators of LTC facilities. Administrators provided information related to community housing and environment, relationships between residents and staff, resident deaths, procedures for dealing with loss, and grief/bereavement services. Qualitative methods, such as thematic analysis, were used to analyze the interview data. Emergent themes suggest that LTC facilities are given freedom in how to provide support for staff members, family members, and other residents after the death of a loved one. However, results show variations in number of deaths in each facility, notification of a resident's death, inclusion of direct care staff (nurses, STNAs) in caring for the deceased, providing memorial services, and offering grief/bereavement support. When speaking of the loss of a resident and ways to provide grief/bereavement support, only three of the ten administrators discussed the importance of extending such services to the staff. Interviews suggest that although administrators currently have services for family, residents, and/or staff after a resident has died, there are several differences among facilities and ways in which the organizations could vastly improve grief/bereavement services for both residents and staff

ASSOCIATION BETWEEN HEALTH BELIEFS AND UTILIZATION OF ARTHRITIS SELF-MANAGEMENT PROGRAM AMONG BLACKS AND WHITES WITH OSTEOARTHRITIS

C.A. Mingo[1], M.L. O'Connor[2], T. Baker[3], *1. Gerontology Institute, Georgia State University, Atlanta, Georgia, 2. North Dakota State University, Fargo, North Dakota, 3. University of South Florida, Tampa, Florida*

Numerous evidenced-based behavioral programs for arthritis are offered at the state, county, and community level. However, utilization of such programs is astonishingly low; only about 1% of individuals with arthritis participated in the Arthritis Self-Management Program (ASMP). Therefore, identifying reasons for low utilization is imperative. The purpose of this study is to examine the relationship between arthritis beliefs (e.g., perceived susceptibility, perceived severity of the condition) and barriers to participation in the group and home version of the ASMP among individuals with Osteoarthritis (OA). Participants were Black (n=60) and White (n=55) older adults (age 50-94). Survey questions were used to assess beliefs about perceived susceptibility and perceived severity of the condition as well as organizational and sociocultural barriers to participation in arthritis interventions. Results from a hierarchical regression model showed perceived susceptibility was significantly associated with organizational barriers to participation in the traditional ASMP (β=.22,p=.03) as well as sociocultural barriers (β=-.26,p=.02) to participation in the home-based ASMP for the total sample. No significant indicators of arthritis beliefs were found when examined by race group. These findings suggest the need to further augment our understanding of how identified health beliefs may encourage or discourage individuals from participating in evidenced-based behavioral health interventions for arthritis. This study begins to account for the myriad of social, cultural, and behavioral indicators influencing willingness to participate in health promotion programs designed to achieve optimal disease and symptom relief.

FINDING THE BED EMPTY: EXPERIENCES OF CERTIFIED NURSING ASSISTANTS IN THE CONTEXT OF RESIDENT DEATH

A. Barooah[1], I. van Riesenbeck[2], K. Boerner[1,3], *1. Jewish Home Lifecare, New York, New York, 2. University of Osnabruck, Osnabruck, Germany, 3. Icahn School of Medicine at Mount Sinai, New York, New York*

This study explored the experiences of certified nursing assistants (CNAs) around transitions related to resident death. Participants were 140 CNAs who had lost a patient in their care within the last two months. Data collection involved comprehensive semi-structured in-person interviews. Specifically, we assessed how CNAs perceived the nursing home's handling of a) removing the deceased's resident's body, b) filling the bed, and c) notifying the staff of the death. Results indicate that negative evaluations of these three aspects were prevalent among the CNAs. CNAs' feelings about bed filling (i.e., bed being filled too quickly) were primarily negative, whereas evaluations of body removal and staff notification varied more in terms of valence. A follow-up analysis of staff notification pathways for CNAs who were not on site when the resident died showed that those who reported learning out about the death by walking into the room and finding the bed empty or filled with a new resident, were significantly more likely to report a negative experience. Arriving at work and being notified by a nurse triggered more neutral or positive responses, whereas being notified by a fellow CNA triggered more neutral or negative responses. In contrast, CNAs were significantly more likely to report a positive experience when they were notified by telephone before coming to work, either by a fellow CNA or a family member. Findings have important implications for handling of transitions around death in the nursing home, suggesting benefits of a more mindful approach to staff notification after resident death.

EVALUATING DEMENTIA CARE IN ASSISTED LIVING USING AN EVIDENCE-BASED ASSESSMENT GUIDE

P.J. Doyle, *Center for Aging Studies, Sociology/Anthropology Department, University of Maryland Baltimore County, Baltimore, Maryland*

There have been dramatic increases in the proportion of assisted living (AL) residents who are experiencing cognitive decline. People with dementia have become a large segment of the AL population. This pattern is not expected to abate; dementia care will remain a central component of AL in many states. Caring for people with dementia presents unique challenges to the social model of AL and can complicate the personal care responsibilities of the nursing aides. As such, AL organizations need to evaluate and improve current dementia care practices. This poster presents a comprehensive assessment tool, which is based on the social model of AL and person-centered dementia care ideals that can be used to evaluate and improve dementia care within AL. A multi-step procedure was used to develop this assessment guide: 1) systematic literature review of current dementia care assessments relevant in the AL context; 2) compiling and reconciling germane items; 3) pilot testing of the assessment guide in 28 AL communities; 4) evaluation of the effectiveness of each item in the guide. This tool was used to systematically guide an observer of AL dementia care environments and facilitate the comparison of current, observed care practices in the observed AL communities to the best practices established in the scientific literature. This tool contains the following sections: care practices; physical and social environment; organizational leadership; culture; and staff members' perspectives of dementia. This poster will explain the components of the guide, its limitations, and its potential use in practice and research.

QUALITY IMPROVEMENT INTERVENTIONS IN LONG-TERM CARE FACILITIES: A REVIEW OF INTERVENTIONAL STUDIES

M. Suzuki, A. Igarashi, K. Takehara, Y. Takai, N. Yamamoto-Mitani, *Graduate School of Medicine, The University of Tokyo, Bunkyo-ku, Tokyo, Japan*

Purpose: To identify what type of interventions has been used in long-term care facilities to improve the quality of their care, given the rapid population aging in many countries. Methods: A systematic search was performed in PubMed. Interventional studies written in English and published within 10 years prior to July 2013 were included. Data were extracted using a table containing fields for study objectives, design, subjects, setting, sample size, interventions, outcomes, and findings by three independent researchers. Results of data synthesis: The initial PubMed search identified 1695 articles. Eighty-six studies met our inclusion criteria. The intervention contents were categorized into 7 types (education, consultation, systematic practice, reminder, feedback, institutional incentives, and personal incentives). "Education" was most frequently used (n=61), followed by "systematic practice" (n=55) and "consultation" (n=45). In many studies, the quality improvement projects consisted of all the three intervention types or two of them. The combination of the intervention types was dependent on outcome domains. For fall prevention, all the three intervention were used; while for pain management and pressure ulcer reduction, a combination of education and systematic practice was used. Conclusions: For the care outcomes involving complicated factors, such as falls, consultations and discussions with all the related personnel appeared to be important. However, for the outcomes for which a systematic care protocol/guideline was available, such as pressure ulcers, consultations may not be priority. Scrutinizing the best combination of interventions for a specific care outcome may lead the interventions to be more effective and sustainable.

MULTILATERAL PREDICTORS OF THE USE OF PHYSICAL RESTRAINTS AMONG KOREAN OLDER ADULTS WITH DEMENTIA

Y. Lim[1], H. Kim[2], H. Lee[3], *1. Yonsei University Wonju College of Medicine, Wonju, Kangwon-do, Republic of Korea, 2. University of kansas, Kansas City, Kansas, 3. Pusan National University, Pusan, Republic of Korea*

Although the use of physical restraints for older adults with dementia is prevalent in Korean geriatric care settings, few studies have identified the multilateral factors affected to the use of physical restraints considering individual and facilities characteristics. The purpose of the study was to determine multilateral factors to use physical restraints while caring for older adults with dementia in Korean geriatric care facilities. In 2011, the Nationwide Survey on Dementia Care of Korea collected demographic and clinical inpatient data from two types of geriatric care facilities including 58 long-term care hospitals and 185 nursing homes. Binary logistic regression analysis was performed to identify persons to whom physical restraints were used. This study included 2,873 adults aged 60 or more who had 19 or lower scores of mini-mental state examination (MMSE). Individual factors included (1) demographic factors (age and gender); (2) clinical factors (MMSE scores, wandering based on revised Algase Wandering scale, self-reported dizziness, falling based on Morse Fall scale, and frequency of bathroom use); and (3) type of geriatric care facilities. Individual clinical factors and facility type were major predictors to identify the physical restraints use group. Korean older adults with dementia were likely to have physical restraints when they had more cognitive impairment (Odds Ratio [OR] = .907, $p < .01$) and higher risk of fall incidence (OR = 2.292, $p < .01$). Unexpectedly, older adults experiencing lower levels of wandering (OR = .324, $p < .01$) and dizziness (OR= .732, $p < .05$) were likely to receive physical restraints application. Older adults with dementia in the nursing homes were 59% lower than those in the long-term care hospitals in receiving physical restraints (OR = .416, p < .01). Both patients' clinical symptoms and facility characteristics should be considered in developing physical restraints protocols. It is required to develop distinct facility regulations for improving patient safety regarding applying physical restraints care for Korean older adults with dementia.

THE MEDIATING EFFECT OF GERIATRIC CAREGIVING SELF-EFFICACY ON THE RELATIONSHIP BETWEEN ATTITUDE TOWARD DEMENTIA AND JOB SATISFACTION AMONG DIRECT CAREHELPERS IN GERIATRIC CARE FACILITIES

Y. Lim[1], G. Hong[2], *1. Wonju College of Medicine, Yonsei University, Wonju, Gangwon-do, Republic of Korea, 2. Hanyang University, Seoul, Republic of Korea*

Although there are many studies on attitudes toward dementia and job satisfaction of carehelpers, few studies have identified the relationships between caregiving self-efficacy and job satisfaction of carehelpers in the geriatric care facilities. The purpose of the study was to explore the mediating effect of caregiving self-efficacy on the relationship between attitude toward dementia and job satisfaction among direct carehelpers caring for older adults with dementia in geriatric care facilities. This study used secondary data obtained from '2011 Nationwide Survey on Dementia Care of Korea (NaSDECK)'. The total sample in this study was 595 direct carehelpers in the 192 geriatric care facilities. Instruments were Inventory of Geriatric Nursing Self-Efficacy Scale, Dementia Attitude Scale, and Job Satisfaction Scale. The data were analyzed using multiple regressions proposed by Baron and Kenny (1986). First, Attitude toward dementia had a significant direct effect on job satisfaction (β=-.161, p < .01). For the next step, attitude toward dementia was correlated with caregiving self-efficacy (β=.405, p < .01). In the third step, caregiving self-efficacy completely mediated the relationship between attitude toward dementia and job satisfaction (β=-.079, p > .01). Results of a series of multiple regression analyses indicated the indirect effect of the attitude toward dementia on the job satisfaction through caregiving self-efficacy. The findings have implications that these relationships can guide health professionals to develop intervention strategies to strengthen caregiving self-efficacy of direct carehelpers caring older adults with dementia in the geriatric care facilities.

PERCEPTIONS OF NURSING HOME RESIDENTS BY STAFF AND STUDENTS

K. Zakoscielna[1], P.A. Parmelee[1], K. Kinney[2], *1. University of Alabama, Tuscaloosa, Alabama, 2. University of Central Florida, Orlando, Florida*

Depression is extremely prevalent in skilled nursing facilities (SNFs), affecting as many as 44% of residents. Improving recognition and treatment of depression is crucial in improving quality of life, but depression remains underrecognized and undertreated in SNFs. Certified nursing assistants (CNAs), in particular, receive little mental health training; hence, they may fail to recognize depression and/or confuse it with cognitive impairment or other disorders. This study used vignettes to evaluate the ability of 87 CNAs and 153 college undergraduates (all women) to recognize depression in hypothetical SNF residents. Undergraduates were used as the comparison group based on similarity to CNAs in current education (high school) and mental health training (little to none). A 2x2x3 ANOVA found that, controlling demographics, CNAs were more likely than students to identify depression in cognitively impaired and intact residents, regardless of actual depressive symptomatology. Additionally, students differentiated between major and minor depression better than CNAs. CNAs were also more likely to attribute dementia to residents, regardless of evidence of cognitive decline. Thus, CNAs overestimate presence of depression in both cognitively impaired and intact residents but are more likely to miss depression in cognitively impaired residents, focusing instead on cognitive symptoms. CNAs are more likely to attribute depression to dementia in cognitively intact residents as well. These findings document continuing gaps in CNAs' ability to recognize and, hence, accurately report symptoms of depression and dementia among their residents, and the strong need for mental health training for CNAs working in nursing homes.

COPING WITH CLIENT DEATH: HOW PREPARED ARE HOME HEALTH AIDES AND WHAT CHARACTERIZES PREPAREDNESS?

I. van Riesenbeck[1], A. Barooah[2], K. Boerner[2,3], *1. University of Osnabruck, Osnabruck, Germany, 2. Jewish Home Lifecare, New York, New York, 3. Icahn School of Medicine at Mount Sinai, New York, New York*

One of the fastest growing professions and highest in demand is home care. Home health aides (HHAs) increasingly play an important role in long-term care provided to elders in the community. Although they provide the day-to-day care and often develop close ties with their clients, little attention has been paid to HHAs' experiences around clients' end-of-life (EOL) and death. This study explored the experiences of 80 HHAs who had lost a client in their care within the last two months. Data collection involved comprehensive semi-structured in-person interviews. Quantitative and qualitative data were examined to better understand to what extent HHAs were prepared for this client death and to identify the staff, client, and context characteristics associated with preparedness for death. Results indicated that over 40% of HHAs felt completely unprepared for the death of their client, both emotionally and in terms of information they had about the client's condition. Characteristics significantly associated with greater preparedness included experiencing the client as in pain and aware of dying, being informed about the client's EOL care plans and reporting similar prior experiences with client death. Several personal views on EOL care of HHAs were also associated with preparedness. Whereas the preference not to be told bad news was associated with less preparedness, favoring alternative medicine was associated with greater preparedness. Findings suggest that HHAs' preparedness for client death could be enhanced both by addressing their personal views on EOL care and by providing more information about the client's status and EOL care plans.

EMOTION REGULATION AND BURNOUT IN DIRECT CARE NURSING HOME STAFF

E.C. Price, P. Bamonti, B. Edelstein, L.A. Gerolimatos, J.J. Gregg, *Department of Psychology, West Virginia University, Morgantown, West Virginia*

Burnout, consisting of emotional, physical, and cognitive exhaustion, has been identified as a substantial problem for nursing home staff (Toker et al., 2012). Burnout may also be characterized by depersonalization and feelings of ineffectiveness resulting from intense, daily interactions with clients (Maslach, 2003; Morse et al., 2012). There has been little research examining emotion regulation strategies associated with burnout in direct care staff (Pitfield, Shahriyarmalki, & Lingston, 2011). The present study surveyed 42 certified nursing assistants (38 female, M age = 35.02, SD = 12.11) at four skilled nursing facilities in the Appalachian region of the United States. Variables of interest included disability/health, job satisfaction, the Maslach Burnout Inventory (MBI; Mind Garden Inc., 2011), and the Cognitive Emotion Regulation Questionnaire (CERQ; Garnefski & Kraaij, 2007). Emotional exhaustion was moderately correlated with the emotion regulation strategies of resignation (r = .36) and rumination (r = .32). Using a linear multiple regression with all CERQ subscales, positive reappraisal accounted for a significant portion of emotional exhaustion, B = -2.78, SE = 1.18, p = .031. Depersonalization was also moderately correlated with positive reappraisal (r = -.42). In addition, dysfunctional coping (as measured by the Brief COPE; Carber, Scheier, & Weintraub, 1989) was associated with emotional exhaustion, B = 1.24, SE = .26, p < .001, whereas emotion- and problem-focused coping were not. In sum, the strategies of avoiding dysfunctional coping and using positive reappraisal show potential usefulness for reducing burnout in direct care staff.

TRANSITIONING FROM A TRADITIONAL NURSING HOME ENVIRONMENT TO GREEN HOUSE®: WHAT ARE STAKEHOLDER OUTCOMES?

C. Harrop-Stein[1], J. Cotter[1], E. Welleford[1], J. Pryor[1], M. Fortner[2], *1. Gerontology, Virginia Commonwealth University, York, Pennsylvania, 2. Virginia Mennonite Retirement Community, Harrisonburg, Virginia*

This poster presents a qualitative research study examining stakeholders' adjustment to Green House®. Green House® is an example of culture change with a focus on providing person-centered care in a homelike environment. Virginia Mennonite Retirement Community (VMRC) located in Harrisonburg, Virginia is the first retirement community in Virginia to build Green House® homes. Thirty residents and forty staff members transitioned to one of three Green House® homes beginning January, 2013. Pre-move focus groups were held in December, 2012 and consisted of 12 residents, 1 family member, and 5 staff members. The first post-move group consisted of 9 residents, 3 family members, and 16 staff members. The second post-move group consisted of 10 residents, 6 family members, and 12 staff members. Following the focus group, tape recordings were transcribed, entered into Atlas ti, coded, and themes were identified. Using grounded theory and the constant comparative method of analysis, themes emerged. Pre-move focus group themes revealed that residents, family, and staff members were concerned about quality of care in a system using fewer staff members. Post-move focus group themes revealed at the time that staffing levels remained a concern. Residents' quality outcomes included improved appetite, socializing, and ambulation. Family members reported that their loved ones adjusted relatively easily to the Green House®. While staff members struggled with autonomous work teams, most preferred this model to that of a traditional nursing home.

ASSESSING THE EFFICACY OF A SHORT AGING SIMULATION WORKSHOP AMONG NURSES AND NURSE ASSISTANTS

S.N. Halpin, *Department of Veterans Affairs, Decatur, Georgia*

Previous studies have identified an inverse relationship between education and ageism among healthcare employees. However, the amount and type of education needed to quell ageism across various educational levels of nursing has been understudied. This study sought to identify changes in ageism following a forty-five minute aging simulation workshop for new employees at the Department of Veterans Affairs in Georgia. The Kogan's Attitudes toward Old People (KOP) scale was administered immediately before and after the workshop in a sample of 183, mostly female (87%) nurses and nurse assistants (Mean age= 42.5, range= 21-70). A statistically significant increase in positive attitudes was observed among Advanced Practice Nurses (APN) (N=11) and Registered Nurses (RN) (N=109) following the workshop. The Kolmogorov-Smirnov test assured normality; therefore parametric tests were used to assess between group differences. There were no significant differences at pre-test between APN's (M=175.6, SD=19.5), RN's (M=167.4, SD=17.4), and Nurse Assistants (NA's) (M=166.9, SD=18.8). At post-test, Post-hoc comparisons using Tukey's test revealed a tiered increase in positive attitudes with APN's (M=197.4, SD=20.4) having significantly higher scores compared to RN's (M=172.4, SD=16.5) and NA's (M=158.5, SD= 21.1) and RN's having significantly higher scores compared to NA's. Results suggest that level of education is related to the efficacy of a brief aging simulation workshop in increasing positive attitudes towards older people. These findings might call for more intensive training for NA's as compared to APN's and RN's.

PEARLS FOR OLDER ADULTS WITH MAJOR AND MINOR DEPRESSION

K. Van Orden[1], D. King[1], C. Peck[2], A. Campbell[2], L.L. Boyle[1], Y. Conwell[1], *1. Psychiatry, University of Rochester Medical Center, Rochester, New York, 2. Lifespan of Greater Rochester, Rochester, New York*

This study examines the effectiveness of an in-home behavioral treatment for late-life depression. The PEARLS model (the Program to Encourage Active, Rewarding Lives for Seniors) involves Problem Solving Therapy, Behavioral Activation, plus collaborative depression care management by a multidisciplinary team. However, PEARLS has only been validated for treating minor depression in older adults. We examined its effectiveness for 26 older adults with either minor or major depression who received social work care management in the Rochester area. We collected PHQ-9 scores at the baseline PEARLS session and the subsequent treatment sessions, allowing us to examine treatment response, as well as completion rates. Treatment completion was significantly associated with outcome: those who completed at least 4 sessions had significantly greater reductions in PHQ-9 over the course of treatment (average drop for completers = 8.22, sd 7.59) vs. non-completers (1.88, std 3.72). Depression severity at baseline (as measured by the Hamilton Rating Scale for Depression) was not associated with degree of treatment response. Further, neither Minor or Major Depression diagnoses at baseline was associated with degree of treatment response. Our data suggest that PEARLS may be an effective treatment for the range of depressive symptoms in later life, not just those with milder presentations.

CHARACTERISTICS ASSOCIATED WITH SYMPTOM IMPROVEMENT AMONG OLDER ADULTS IN PSYCHOTHERAPY

M.C. Feng, E. Mulligan, J. Moye, *VA Boston Healthcare System, Jamaica Plain, Massachusetts*

Religiosity, education, and age have each been studied as factors associated with mental health symptoms. For example, several studies have found religion to be protective against recurrence of depression (e.g. Gallup et al., 2011). Additionally, individuals with less education were shown to be twice as likely to experience late-life depression as those with at least a high school degree (Ladin, 2008). The present analyses examined patient characteristics associated with treatment response as part of a longitudinal study conducted within a VA Geriatric Mental Health Clinic. We anticipated that demographic factors would be associated with changes in depressive and anxiety symptoms over the course of treatment. Self-report measures of depression (GDS) and anxiety (GAI) were collected at baseline and approximately three months later in a sample of 30 older adults (Mean Age = 76.47). Two linear regressions were conducted with residualized Time 2 GDS and GAI scores as dependent variables and age, religiosity, and education (< 13 years, 13+ years) as predictors. Demographic characteristics accounted for approximately 35% of the variance in changes in depressive and anxiety symptoms. Individuals with higher education were more likely to report reduced depression scores (B =- .46, p = .03). Age (B = .34, p = .09) and religiosity (B = -.36, p = .07) were marginally significant predictors. Age was the only significant predictor for anxiety symptoms, with increasing age associated with decreased likelihood of anxiety symptom improvement (B = .51, p = .02). Results and implications are discussed in relation to previous research.

EVALUATING THE COGNITIVE FUNCTION OF JAPANESE YOUNG-, OLD-, AND OLDEST-OLD USING MOCA-J. : THE RESULTS OF SONIC STUDY

H. Inagaki[1], Y. Gondo[2], Y. Ishioka[1], K. Kamide[3], K. Ikebe[4], Y. Arai[5], T. Ishizaki[1], R. Takahashi[1], *1. Research Team for Promoting Independence of the Elderly, Tokyo metropolitan institute of gerontology, Tokyo, Japan, 2. Graduate school of Human Science, Osaka University, Osaka, Japan, 3. Graduate school of Medicine, Osaka University, Osaka, Japan, 4. Graduate school of Dentistry, Osaka University, Osaka, Japan, 5. Kio University School of Medicine, Tokyo, Japan*

The aim of this study is to examine the characteristic of MoCA-J and rate of MCI when applied to community-dwelling elderly, and the effect of age, sex, education and residential area. The subjects were 1,000 elderly of 70±1-years-old, 973 elderly of 80±1, and 272 elderly of 90±1. Female was 1,186 (52.8%). Residential area were Eastern (Kanto) or Western area (Kansai) in Japan (respectively, 1,132 and 1,113 elderly), and urban or rural (respectively, 1,277 and 968). We evaluated the cognitive function by the MoCA-J, and collected other variables using both an interview and a mail survey. Mean score was 22.1±4.04. Median and mode was 23. Skewness was -0.77 and kurtosis was 1.17. Percentage of subjects below cut-of points (25/26) amounted to 79.1%. We compared the mean score by ANOVA for three age groups. In result, score was lower as age increased. Then, we compared by two-way ANOVA for age and each relevant variables, sex difference was not significant, while the effect of years of education, region (Kanto / Kansai), and city size (urban / rural) was significant. MoCA-J might be overestimated the number of MCI elderly, but it is a superior assessment tool to evaluate cognitive function of community-dwelling elderly than screening tests for dementia used in previous studies, because distribution of score is close to normal distribution. We confirmed the effect of age and education, similar to previous studies of cognitive function. The significance of region and city size was questionable statistically, because the effect size was small.

LONGITUDINAL MEDIATION OF GRIP STRENGTH ON WEIGHT-RELATED CHANGES IN COGNITION : RESULTS FROM ACTIVE

A.M. Kueider, G. Rebok, *Mental Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

The increasing prevalence of obesity in older adults has a profound impact on mobility disability, the most common form of disability in community samples of older adults. The purpose of the current study is to examine the extent to which grip strength, a proxy for mobility disability, mediates BMI-related changes in cognition. We used 10-year longitudinal data from the Advanced Cognitive Training for Independent and Vital Elderly study (ACTIVE; N=2,802), a randomized, controlled-trial of behavioral training interventions for memory, inductive reasoning, and processing speed . Hand grip strength, measured with the Jamar hand dynamometer, is associated with lower body strength and predicts mobility disability. We estimated parallel process latent growth curve models of BMI at baseline and cognitive performance mediated by grip strength. At baseline, participants were on average 74 years of age and 39% were overweight (BMI 25-29.9km/m2), 21% obese (BMI 30-34.9km/m2), and 13% Class I obese (BMI≥35km/m2). Findings suggest that both grip strength at baseline (β=0.02; p=.01) and change in grip strength over time (β=-0.06; p=.05) mediated the association between baseline BMI and memory performance. For reasoning and speed performance, only the grip strength intercept (β=0.01; p=.01; β=-0.01; p=.03, respectively) mediated the association between baseline BMI and cognitive performance. For all cognitive outcomes, higher BMI was associated with steeper declines in grip strength over time (p<.01). Although some evidence suggests a higher BMI is protective against dementia and cognitive decline in older adults, current findings suggest that a higher BMI may increase the risk of mobility disability.

SELF-REPORTED SLEEP IS ASSOCIATED WITH RISK-EVALUATION IN OLDER ADULTS

C.G. Genesio[1], K. Seaman[1], J. Howard[1,2], D. Howard[2], *1. The Catholic University of America, Washington D.C., District of Columbia, 2. Georgetown University, Washington D.C., District of Columbia*

As the population ages, older adults often face the challenge of making fast-paced decisions in the face of cognitive decline (Moye & Marson, 2007). Recent studies have associated risky decision making with both sleep (Killgore, 2007) and age (Rolison, Hanoch, & Wood, 2012). Previous work has also established that sleep has a profound effect on learning and memory (Walker & Stickgold, 2004). In the present study, we examined the relationship between risky decision-making and sleep in both young and older adults using the Balloon Analog Risk Taking Task (BART; Lejuez et al., 2002), and self-reported measures of sleep. In the BART, risky behavior is assessed by the average number of successful balloon pumps a participant makes on each block. We correlated this measure with the self-reported amount of sleep each participant had the night before. Results indicated a positive correlation between sleep and risky behavior for older, but not younger adults. Importantly, this correlation was significant in late but not early blocks, suggesting that it increased with experience on the task. These findings are consistent with studies showing age differences in the effect of learning on risk-taking (Rolison, Hanoch, & Wood, 2012), and imply that the relationship between sleep and risky decision-making in older adults may be explained by sleep's effect on learning.

SOCIAL ISOLATION FOLLOWING ORAL-DIGESTIVE CANCER PREDICTS DEPRESSIVE SYMPTOMS

E. Mulligan[1,2], A.D. Naik[3,4], J. Moye[1,2], *1. VA Boston Healthcare System, Brockton, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts, 3. Michael E Debakey VA Medical Center, Houston, Texas, 4. Baylor College of Medicine, Houson, Texas*

Cancer survivorship is on the rise due to improvements in the detection and treatment of cancer, and a large proportion of survivors are older adults. Numerous physical and psychosocial complications that can arise from cancer and its treatment may affect emotional wellbeing, with as a many as one in four survivors reporting major depression in the first year after treatment. Reduced social support is one factor that may place survivors at risk for depression, but more research is needed to understand the nature of this relationship. The purpose of this analysis was to examine the association between social support and depressive symptoms in a longitudinal study of 120 survivors of oral-digestive cancer (mean age = 65.54, SD = 9.11, range = 41-88). There was no significant difference between depressive symptoms at 12 and 18-months post cancer diagnosis. Cross-sectionally, survivor reports of feeling isolated from others (B = .23, p < .05) and strain in relationships as a result of coping with cancer (B = .37, p < .001) were both associated with depressive symptoms at 12-months post diagnosis. Feelings of isolation at 12-months post diagnosis (B = .22, p < .05) were also associated with depressive symptoms at 18-months post diagnosis in longitudinal regression analysis, even after controlling for depressive symptoms at 12 months. Interestingly, age was not associated with depressive symptoms in these multivariate analyses. Implications for social isolation serving as a risk favor for depression following cancer are discussed.

HYPOCHONDRIASIS PREDICTS DEPRESSION AND PAIN IN INDIVIDUALS WITH OSTEOARTHRITIS

J.C. Williams[1,2], P.A. Parmelee[1,2], *1. Psychology, University of Alabama, Tuscaloosa, Alabama, 2. Center for Mental Health and Aging, Tuscaloosa, Alabama*

Previous research indicates that hypochondriasis is a significant predictor of arthritis pain, even when considering arthritis severity and life stress. The goal of this study was to examine the relationships among hypochondriasis, pain, and depression in community-dwelling older adults diagnosed with osteoarthritis (OA) of the knee. The data used for this study were part of a larger study regarding the experience of osteoarthritis in older adults. A baseline assessment was conducted, with a follow-up (Time 2) interview one year later. One hundred ninety-one participants completed the assessments, which included questions regarding OA pain (modified PGC Pain Scale), a checklist of other health problems, and depression (CESD). Separate regression analyses predicting OA pain and depression at Time 2 were conducted with gender, education, race, number of health conditions, and hypochondriasis as predictors. Baseline OA pain and depression were entered as control variables to examine change over the one-year interval. Both baseline OA pain (β= 0.21, p= .005) and hypochondriasis (β= 0.18, p= .02) served as significant predictors of change in OA pain from baseline to follow-up. Similarly, both baseline depression (β= 0.61, p=.000) and hypochondriasis (β= 0.15, p= .01) were significant predictors of Time 2 depression net of baseline depression. Based on these results, hypochondriasis may be considered a relevant predictor of OA pain and depression after one year. This effect was significant even when the number of health conditions was controlled, which indicates that level of hypochondriasis or health anxiety may have important clinical implications. Supported by R01MH51800.

INTERNAL HEALTH LOCUS OF CONTROL PREDICTS PAIN AND INSOMNIA IN OLDER ADULTS WITH OSTEOARTHRITIS

J.C. Williams[1,2], P.A. Parmelee[1,2], *1. Psychology, University of Alabama, Tuscaloosa, Alabama, 2. Center for Mental Health and Aging, Tuscaloosa, Alabama*

Extensive research has been conducted into the relationship between health locus of control and various outcome measures, including pain and depression. The goal of this study was to examine the relationship between internal locus of control (ILOC), pain, and insomnia in older adults. The data used in this analysis were collected as part of a larger study regarding the experience of osteoarthritis in community-dwelling older adults. A baseline assessment was conducted with a follow-up interview (Wave 2) conducted one year later. ILOC was assessed at baseline, while pain and insomnia were assessed at Wave 2. Two hundred ninety-one participants completed the assessment, which included questions about OA pain and sleep. Pain was divided into two categories: general pain and OA pain. Sleep difficulty was also divided into three categories: initial, middle, and terminal insomnia. Five regression analyses were conducted with gender, education, and number of health conditions in block 1. Internal LOC scores were entered in block 2. Wave 2 general pain, OA pain, initial insomnia, or middle insomnia was entered as outcome variables in separate analyses. ILOC significantly predicted general pain (β= -.017, p= .014), OA pain (β= -.131, p= .003), initial insomnia (β= -.131, p= .017), and middle insomnia (β= -.118, p= .037). ILOC was not a significant predictor of terminal insomnia (β= -.082, p= .168). These results have significant clinical implications in that internal health LOC may be used to identify individuals at greater risk for pain and insomnia. Supported by R01MH51800.

CHRONIC CONDITIONS ARE ASSOCIATED WITH LOWER CIRCULATING LEVELS OF DHEA-S: BUFFERING BY SOCIAL SUPPORT

E. Friedman, C. Marini, C. Milliner, A.M. Nowakowski, E. Wehrspann, M.M. Franks, *Human Development and Family Studies, Purdue University, West Lafayette, Indiana*

Older adults are increasingly burdened by multiple chronic medical conditions (MCC) – more than 60% of US adults over age 65 have two or more conditions. Not only does MCC represent a challenge for disease management, but it may constitute an ongoing stressor for the patient. We examine circulating levels of two hormones linked to chronic stress – cortisol and DHEA-S – in the context of MCC, hypothesizing that greater disease burden will be associated with higher levels of cortisol and lower levels of DHEA-S. Further, we examine the extent to which emotional support from family members moderates the links between MCC and the two hormones. Data are from the second wave of the Survey of Mid-Life in the United States (MIDUS), a nationally representative study of middle-aged and older adults. Information on MCC and social support was from self-administered questionnaires. Cortisol and DHEA-S were measured in saliva and blood, respectively. Results showed that after controlling for demographic characteristics, number of chronic conditions was associated with lower levels of DHEA-S (p < .05) but was unrelated to cortisol (p= .32). Support from family was not directly associated with either hormone. However, support buffered the negative relationship between MCC and DHEA-S, such that DHEA-S was significantly higher in respondents with MCC if they also had high levels of support compared to those lacking such support (p< .05). These results suggest: (1) a link between disease burden and a marker of biological health; and (2) that social support may buffer the adverse associations between MCC and DHEA-S.

SESSION 615 (POSTER)

PHYSICAL ACTIVITY AND FUNCTIONING

SIMULTANEOUS VALIDATION OF FIVE COMMERCIALLY-AVAILABLE ACTIVITY MONITORS IN OLDER ADULTS WITH VARIED AMBULATORY ABILITIES

T. Floegel, A. Florez-Pregonero, E. Hekler, M.P. Buman, *Arizona State University, Phoenix, Arizona*

The accuracy of step detection in commercially-available activity monitors is not known in older adults. We assessed the validity of two hip- (Omron HJ-112, Fitbit One) and three wrist-worn (Jawbone UP, Fitbit Flex, Nike Fuelband) activity monitors in older adults of varying ambulatory abilities. Adults were categorized as non-impaired (Short Physical Performance Battery Score [SPPB] score >8), impaired (SPPB ≤8), cane, or walker user. Seventy-seven adults (65-93 years, 75.3% female) ambulated at a self-selected pace on a 100 meter level course wearing all activity monitors simultaneously. Steps were directly observed via video playback. Intraclass correlation coefficients (ICC) and absolute percent error were used to assess accuracy. Non-impaired adults steps were underestimated by 4.4% for Omron HJ-112 (ICC=0.72), 2.5% for Fitbit One (ICC=0.80), 2.8% for Jawbone UP (ICC=0.55), 26.9% for Fitbit Flex (ICC=0.15), and 20% for Nike Fuelband (ICC=0.28). Impaired adults steps were underestimated by 3.2% for Omron HJ-112 (ICC=0.88), 1.7% for Fitbit One (ICC=0.96), 8.2% for Jawbone UP (ICC=0.50), 16.3% for Fitbit Flex (ICC=0.34), and 41.6% for Nike Fuelband (ICC=0.03). Cane and walker users steps were underestimated by >16% (ICC's<0.02) by all monitors. Both hip-worn (Omron HJ-112, Fitbit One) and the wrist-worn Jawbone UP appeared accurate at measuring steps in non-impaired and impaired ambulatory older adults during a self-paced walking test. No activity monitors were valid in cane and walker users. Future research should examine the accuracy of these activity monitors during other ambulatory and non-ambulatory activities; at estimating distance and energy expenditure; and under continuous, free-living conditions.

INFLUENCE OF LATIN DANCE ON MOBILITY AMONG OLDER LATINOS

S. Aguiñaga[1], R.S. Wilson[2], J. Wilbur[2], S.L. Hughes[1], D.X. Marquez[1], *1. Kinesiology and Nutrition, University of Illinois at Chicago, Chicago, Illinois, 2. Rush Alzeimer's Disease Center, Chicago, Illinois*

Disparities exist between Latinos and non-Latino whites in physical function, putting Latinos at increased risk for mobility disability. Physical activity (PA) can protect against mobility disability, however, older Latinos are not physically active at recommended levels. Dance is a culturally appropriate form of PA for older Latinos that physically challenges individuals. This pilot randomized controlled trial (RCT) tested the impact of the BAILAMOS© dance program on mobility in older Latinos. Participants were randomly assigned to a 4-month, twice-weekly dance program or to a health education control group. Participants (N=56) were low active, older [M(SD) age= 64.9 (5.9)], Spanish-speaking Latinos [81.8% female, 81.8% Mexican, years in US= 31.2 (16.8), years of education = 7.0 (4.3)]. Participants engaged in a 400 meter walk test "at their usual pace" pre- and post-program. A repeated measures ANOVA revealed a main effect for time F (9.25) = p<.05 for the 400 meter walk test. Dance participants completed the walk in 429.9(66.28) seconds at baseline and 391.83 (58.8) seconds at post-testing. Health education participants completed the walk in 419.25 (93.78) seconds at baseline and 409.10 (74.30) seconds at post-testing. Results indicate that both groups improved; however, dance participants improved by 38.07 seconds, whereas health education improved by 10.15 seconds. It is possible that participation in regular dancing can improve physical function. Finding innovative ways to improve and maintain physical function is important in order for older Latinos to maintain independence and prevent disability. Funded by the Alzheimer's Association (NIRGD-11-205469) and NIH/NIA (P30AG022849).

PERSONAL AND ENVIRONMENTAL CORRELATES OF PHYSICAL ACTIVITY IN CHINA'S OLDER ADULTS

D. Wang[1,5], Y. Chen[2], B. Cooper[3], N. Morrow-Howell[4,2], G. Chen[5], *1. Department of Physical Education, Beijing, China, 2. Brown School, Washington University, St. Louis, Missouri, 3. Public Health Data & Training Center, Institute for Public Health, Washington University, St. Louis, Missouri, 4. Harvey A. Friedman Center for Aging, Institute for Public Health, Washington University, St. Louis, Missouri, 5. Institution of Population Research, Peking University, Beijing, China*

Objective: Socio-ecological models emphasize that environmental factors play a role in shaping older adults' moderate to vigorous physical activity (MVPA). However, little research validates this relationship in China. This study aims to explore the associations of individual and environmental factors with MVPA among Chinese older adults. Methods: We used the 2011 China Health and Retirement Longitudinal Survey, a national representative sample of respondents over age 45. MVPA was a binary variable (met guideline or not), using the WHO's recommendations for physical activity. We conducted a multilevel logistic regression using HLM 6.08 to examine if individual factors and environmental/infrastructure factors at the community level affected the MVPA of older adults. Findings: Results showed that at the individual level, single compared to married people and women were less likely to meet MVPA recommendations. Levels of physical mobility and self-rated health were positively associated with MVPA. Health behaviors, such as smoking and drinking, were not associated with MVPA. Interestingly, self-rated standard of living and health before age 15 were negatively associated with MVPA. At the community level, people who lived in plain rather than mountainous areas as well as lived in environments with better infrastructure, such as roads, were more likely to meet activity guidelines. Accessibility to public transportation and shopping were negatively related to MVPA. There was no association between access to sport facility, temperature, and MVPA. Conclusions: Strengthening the infrastructure of communities and introducing MVPA programs in accordance with various local conditions may enhance physical activity levels of older Chinese people.

FACTORS ASSOCIATED WITH PHYSICAL ACTIVITY AMONG AFRICAN AMERICAN WITH HEART DISEASE

S. Thapa, C. Lee, I. Livingstone, D.R. Kafle, A. Nawai, E. Dugan, *Gerontology Department, University of Massachusetts Boston, Boston, Massachusetts*

Physical activity among older adults is very important in the maintenance of independence, prevention of disease and quality of life. Physical activity is recommended for many adults with heart disease. Examples of moderate activity include gardening, cleaning the car, walking at a moderate pace, dancing, and floor or stretching exercises. Racial and cultural factors may be related to physical activity. This study explores factors associated with physical activity among African American with heart disease. This cross sectional study analyzed data from the Health and Retirement Study (2010 wave). Inclusion criteria for the study were: age 65 or older, Black race and heart disease. The sample included (N=377), the mean age was 76 years (65-101 range) and 33 % were male and 37% were married. The average number of years of education was 11.32 (SD 3.26). Bivariate analysis showed a positive association between physical activity and education (0.09), self-rated health (0.22), obesity (0.11) and living near friend(0.10), volunteering (0.12) helping others (0.14) and negative association between age (0.21), income (0.14), never drinking (0.11) and moderate drinking (0.11) p<.05. An association was observed indicating older African American with heart disease who were physically active had more education, better health, were not obese, lived near friends and volunteered. Not being moderately physically active was associated with being older, lower income and drinking variables in older African Americans with heart disease. Interventions to help these less physically active improve are needed and can be tailored to overcome variables identified in this study.

DESCRIBING VERY OLD ADULTS WITH VERY HIGH PHYSICAL ACTIVITY LEVELS: FINDINGS FROM THE HEALTH AND RETIREMENT STUDY

I. Livingstone, C. Lee, S. Thapa, C. Somerville, J.S. Chae, E. Dugan, *Gerontology, University of Massachusetts-Boston, Brighton, Massachusetts*

The very old is one of the fastest growing segments in the older population. Research on this group tends to focus on frailty and decline. However this study examines those who are optimally aging by frequently engaging in vigorous physical activities. In this cross-sectional study using 2010 HRS data, the analytic sample (N=1,052) included adults 85 years or older. The mean age was 88.58 years (85-101 range) and 18.3% reported participating in vigorous activities on a daily or weekly basis. 62% of the sample was female, 85.1% were white, 61.2% were widowed, and the average level of education was 12.2 years. 49% of the sample fell within the normal weight range, had 3 diagnosed chronic conditions, and 62% reported having felt rested after a full night's sleep. Consistent engagement in physical activity was positively correlated with males, being married and volunteering and was negatively correlated reporting self-rated fair/poor health and ADLs/IADLs. Based upon the logistic regression, respondents with fair/poor self-rated health were less likely to perform physical activities compared to those who reported good self-rated health (OR=.51). Also, respondents who have more chronic conditions or ADLs/IADLs were less likely to participate in physical activities (OR=.84, OR=.75, OR=.73, respectively). Those who reported living near a relative were more likely to participate in physical activities compared to otherwise (OR=1.73). This research illustrates the heterogeneity of the very old and highlights factors associated with exceptional physical aging. Characteristics of optimal aging is explained for others to utilize and maximize their aging potential.

DOSE-RESPONSE EFFECTS OF EXERCISE ON EMOTION REGULATION AMONG YOUNGER, MIDDLE-AGED, AND OLDER ADULTS

A. Nehrkorn, V.K. Blake, J.H. Patrick, *Psychology, West Virginia University, Morgantown, West Virginia*

National recommendations (CDC, 2011; NIH, 2012) advise adults to engage in 20 minutes of vigorous exercise three times per week or 30 - 40 minutes of moderate intensity exercise five times per week. Dose-response effects of physical exercise on physical health for adults ages 18 to 64 years and adults aged 65+ have been reported, with more minutes of activity being associated with more physical health benefits. We tested whether this dose-response effect would be evident for emotion regulation among a large and age diverse sample. Five hundred younger (YA, M age = 26.6), middle-aged (MA, M age = 48.8) and older (OA, M age = 64.1) adults completed self-report surveys of health behaviors. Activity was summarized into a categorical variable representing those who did not meet the minimum exercise advice (44.6%), those who met minimum standards (26.9%), and those who exceeded minimum standards (28.5%). We conducted a series of Age (3) by Activity (3) ANOVAs on a variety of emotion regulation outcomes. Main effects for age emerged for Negative Affect (YA > MA & OA), rewarding Interpersonal Relationships (OA > YA), and effective Stress Management (OA > YA & MA). Dose-response effects of physical activity were observed for Positive Affect, Interpersonal Relationships, and Stress Management. No Age by Activity interactions emerged. Results are discussed in terms of the psychological benefits of physical activity across the life span.

WHICH SOCIAL INFLUENCE PROCESSES AFFECT PHYSICAL ACTIVITY INTENTIONS AND BEHAVIOR IN LATER LIFE?

J. Newsom, B.A. Shaw, K.J. August, S. Strath, *Institute on Aging, Portland State University, Portland, Oregon*

Maintaining a physically active lifestyle is critical to the prevention of a variety of serious health conditions prevalent in older adulthood. Growing evidence suggests that social networks (e.g., family, friends, neighbors, co-workers) are among the most important psychosocial factors that affect physical activity. Especially needed, however, is research that moves beyond the examination of general measures of social networks or social support in order to focus more precisely on the specific types of social influence processes most likely to encourage and discourage physical activity during later life. Using structural equation modeling, we investigated the effects of four types of social influence processes (physical-activity related emotional support, positive social control strategies, negative social control strategies, and physical-activity related informational exchange) on behavioral intentions and physical activity (CHAMPS; Stewart et al., 1997) in a sample of older adults (N = 217). Although each social influence process was separately related to the outcomes, only physical activity-related emotional support ($b = .347$, $p < .001$) and negative social control strategies ($b = -.191$, $p < .01$) showed significant independent associations with intentions to engage in physical activity. Results also indicated significant indirect effects for emotional support and negative control on energy expenditure as mediated by intentions ($b=.094$, $p < .05$ and $b=-.052$, $p < .05$, respectively). The findings suggest that targeting some areas of social influence, such as promoting emotional support and reducing negative social control attempts from network members, may be the most effective strategies for encouraging physical activity in older life.

PREVALENCE OF ENGAGEMENT IN MOVEMENT THERAPY FOR HEALTH PROMOTION IN A NATIONAL U.S. SAMPLE

N. Marcione, T.L. Gruenewald, *University of Southern California, Los Angeles, California*

An important objective of public health is the identification of lifestyle activities that enhance wellbeing across the life course. Exercise/movement therapies, such as yoga, tai chi and Pilates, have been growing in popularity as a path to better mental and physical health. The objectives of the present analyses were to examine the prevalence of engagement in exercise/movement therapies to prevent/treat illness or maintain health at two time periods approximately a decade apart, potential age variation in the prevalence of engagement, and the mental and physical health correlates of exercise/movement therapy engagement. Participants were from the wave II (2004-2006) and Refresher (2013-2014) cohorts of the National Study of Midlife in the U.S. (MIDUS). Analyses were restricted to those age 34 to 64 years in each sample (wave II n = 3,691; Refresher n = 1,550) to maximize comparability across cohorts. The prevalence of engagement was 15.2% in 2004-2006 and 25.6% in 2013-2014. Age was not related to likelihood of engagement in exercise/movement therapy in either cohort. Those engaging in exercise/movement therapy had higher levels of self-rated physical health in age-adjusted analyses (both cohorts: engagers M = 3.8 vs. non-engagers M = 3.6, p's < .05) but no significant differences in self-rated mental health. Findings indicate a greater level of engagement in exercise/movement therapy in the more recent MIDUS cohort, irrespective of age, suggesting increasing societal engagement in exercise/movement therapy as a health promotion tool. The more favorable self-rated health among engagers points to the health-promoting potential of this lifestyle activity.

INCREASING PHYSICAL ACTIVITY AMONG OLDER LATINO ADULTS

P. Vasquez[1], S. Aguiñaga[1], R.S. Wilson[2], L.F. Fogg[2], J. Wilbur[2], S.L. Hughes[1], D.X. Marquez[1], *1. University of Illinois at Chicago, Chicago, Illinois, 2. Rush University, Chicago, Illinois*

Physical activity is a form of disease prevention that can improve cognitive and physical health. Currently, the recommendations are 150 minutes per week of physical activity. Recent research shows that on average, Latino men and women participate in recreational physical activity for only 12.7 and 10.2 minutes, respectively, per day. A pilot randomized controlled trial (RCT) tested the impact of the BAILAMOS© dance program on lifestyle physical activity. Participants were randomly assigned to a 4-month, twice-weekly dance program or to a health education control group. Participants (N=57) were low active, older [M (SD) age= 64.9 (5.9)], Spanish-speaking Latinos [81.8% female, 81.8% Mexican, years in US= 31.2 (16.8), years of education = 7.0 (4.3)]. Participants completed the CHAMPS physical activity questionnaire pre- and post-program. There was a main effect for time in minutes of light, moderate, and vigorous leisure physical activity (LMVLPA) per week F(5.2)= (p<.05). The dance group reported 650.6 (472.5) minutes of LMVLPA at baseline and reported 817.8 (529.4) minutes of LMVLPA at post testing. The health education group reported 522.8 (368.6) minutes of LMVLPA at baseline and reported 628.9 (387.5) minutes of LMVLPA at post testing. The dance group increased the amount of time of LMVLPA by 345.2 minutes compared to the health education group which improved by 106.1 minutes. Participation in a dance program that is culturally tailored may increase physical activity in multiple domains. Strategies to increase physical activity may directly impact the health of older Latinos. Funded by the Alzheimer's Association (NIRGD-11-205469) and NIH/NIA (P30AG022849).

LONG-TERM EFFECTS OF A COMBINATION OF SPACED RETRIEVAL WITH MONTESSORI-BASED ACTIVITIES IN REDUCING OVEREATING BEHAVIORS AMONG DEMENTED RESIDENTS WITH HYPERPHAGIA

L. Lin, *Institute of Clinical and Community Health Nursing, National Yang-Ming University, Taipei, Taiwan*

Aims. The aims of this study were to compare the long-term effects of both training programs in reducing overeating behaviors for demented residents with hyperphagia. Methods. One hundred thirty-five demented residents with overeating behavior were chosen from six dementia special care units and randomly assigned into an Experimental I (EI) group, an Experimental II (EII) and the control group. Forty-four subjects in the EI group were received spaced retrieval combined with Montessori-based activities training over 30 sessions, forty-eight subjects in the EII group were received spaced retrieval training only over 30 sessions, while 43 subjects in the control group were received routine activities. Data were collected at pre-test, post-test, and at post intervention periods of 1, 3, and 6 months. Data was analyzed and long-term effects were compared using generalized estimating equation. Results. Research findings revealed both EI and EII training could significantly reduce devouring the food and eating amount of residents with dementia at post-test. Moreover, EI training had long-term effects notably in improving in devouring the food and eating amount. Except for post 1 month EI training, there was no significant difference of BMI in both EI and EII training. Conclusion. Both training programs have effects in improving devouring the food and eating amount. In comparison with spaced retrieval only, spaced retrieval combined with Montessori-based activities training has better and long-term effects. However, it costs more in training time for caregivers. Thus, managers in institutions should decide which training they prefer based on their manpower and budget.

PERSONALITY AND COGNITIVE, PHYSICAL, AND SOCIAL COMPONENTS OF LEISURE ACTIVITIES: FINDINGS FROM SONIC STUDY

M. Ogawa[1], Y. Gondo[3], Y. Masui[2], K. Ikebe[6], K. Kamide[5], T. Ishizaki[2], Y. Arai[4], R. Takahashi[2], *1. Hokkaido University, Hokkaido, Japan, 2. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 3. Osaka University, Osaka, Japan, 4. Keio University School of Medicine, Tokyo, Japan, 5. Osaka University Graduate School of Medicine, Osaka, Japan, 6. Osaka University Graduate School of Dentistry, Osaka, Japan*

Previous research has shown significant associations between personality and cognitive function. We thought leisure activities mediate the relationship between these two variables. We examined whether and how Big Five personality traits are associated with cognitive, physical, and social components of leisure activities in Japanese older adults. We used a subsample of 1,936 older adults from the first wave of Septuagenarians, Octogenarians, and Nonagenarians Investigation With Centenarians (SONIC), a multi-cohort longitudinal survey project. This subsample consisted of two age cohorts, those aged 70 and those aged 80 at the time of survey. Among 76 leisure activities, SONIC participants answered which ones they engaged in on a regular basis. Quantifying cognitive and physical loads as well as social interactions required for each activity, we computed cognitive, physical, and social scores to represent how much participants managed each of the three during their leisure activities as a whole. We regressed each of the three scores separately on Big Five traits while controlling for participants' age, gender, and years of education received. A series of multiple regression analyses indicated a consistent association between Big Five traits and components of leisure activities; that is, three of the five traits, namely, openness, extraversion, and conscientiousness, were positively associated with all three (i.e., cognitive, physical, and social) scores. Another trait, neuroticism, also was associated with cognitive but not with physical or social score. Findings suggest that analyzing each component separately may offer further insight into the association between personality and leisure activities in older adults.

A PROPOSAL FOR AN ECOLOGICAL EVALUATION INSTRUMENT OF THE ACTIVITIES OF DAILY LIVING: RESULTS FROM THE ELDERBASK STUDY

J. Yanguas, M. González, A. Garcia-Soler, A. Rodriguez-Laso, *Matia Instituto Gerontológico, San Sebastián, Spain*

There is a growing need to evaluate the capacity of the older person to carry out the activities of daily living using more ecological and adapted instruments to everyday life. These activities make possible for the individual to be independent but they are also a central axis that structures his/her daily life. Being able to carry out these activities gives a sense of personal identity and allows the older person to continue with his/her vital trajectory. We are currently developing a new ecological instrument that case managers may use to assess, in a standardized way, the capacity of an older person with dementia to carry out activities of daily living including those which s/he would like to do but s/he is not able to do, assessing the meaning of the activity for the older person (e.g. independence, dignity, etc). The expected output of this project will be an ecological instrument to assess the daily activities of people with dementia. As a previous step, we have addressed which activities are relevant for the older people. 71 users (52 female, 16 male, age range: 62-92; average age=70.14) were interviewed by means of an exhaustive protocol. A daily activity relevance scale composed by 18 dichotomous items (yes/no) was administered as a part of the protocol, obtaining frequency. Most part of the activities was rated as relevant by most part of the participants, ranging 80.3-95.5%. Further instrument development will take into account the results in order to select the most relevant items.

PICTURING RESIDENTS WITH DEMENTIA: VIEWS OF ACTIVITY DIRECTORS IN CARE COMMUNITIES

M. Pate, S.B. Laditka, J.N. Laditka, *UNCC, Charlotte, North Carolina*

Long-term care culture change seeks to individualize activities to match residents' abilities and interests, including the 40% with dementia. We studied activity planning for persons with dementia through in-depth semi-structured interviews with activity directors in 12 care communities with and without memory care in North Carolina. As part of our larger project, we asked participants to draw a resident with dementia and to describe their drawings. The drawings and verbatim descriptions were our study data. Three researchers coded the sketches and descriptions. Inter-rater agreement was high (.95). Most drawings depicted women. Most included details such as clothing, a handbag, a tennis racket, eyelashes, jewelry, faces, and hair. Half showed residents smiling. Many depicted action, such as waving, dancing, arms outstretched. About 20% included questions such as "Where are you?" or "Who are you?" In their verbal descriptions, most professionals emphasized, "A person with dementia looks like a person without dementia" or "I see my residents as happy and always on the go…happy because we let them be who they are." A few explained in more detail: "The arms are outstretched because the residents are always reaching for something, maybe something they can remember." "Just like they were before, but maybe a little less put together." "I drew her smiling and happy, because that's how my residents with dementia are most of the time." Most participants drew and described unique needs, abilities, and interests of individual residents. This approach elicits unscripted new information about providers' views of persons with dementia.

THE EFFECT OF ARTHRITIS ON THE TRAJECTORIES OF PHYSICAL FUNCTION DIFFICULTY FOR OLDER ADULTS

H. Hsu[1], W. Chang[2], *1. Asia University, Taichung, Taiwan, 2. National Taiwan University, Taipei, Taiwan*

Purpose: The purpose of this study was to explore the effect of arthritis and covariates on physical function trajectories among older adults. Methods: The representative national data of older Taiwanese adults (TLSA) with five waves from 1993 to 2007 were analyzed (n=2288 persons). The Nagi scale was used as the measure of physical function, and group-based trajectory analysis was used for the analysis. Results: Four trajectory groups of physical function difficulty were identified for all the samples as follows: low (28.5%), moderate (25.2%), increasing (37.3%), and early impaired (9.1%). The incidence of arthritis, age, gender, education, self-rated health status and BMI predicted the trajectory groups, whereas economic satisfaction, social participation, comorbidity, depressive symptoms, and alcohol use affected the functional difficulty within the trajectory groups. Among those who had arthritis, four additional trajectory patterns were identified (arthritis-low, arthritis-moderate, arthritis-increasing, and arthritis-high). Age and comorbidity predicted the trajectory patterns for the arthritis patients, and the level of arthritis on daily activities affected the functional difficulty within each trajectory group. Conclusion: The incidence of arthritis affects the physical function trajectories for older adults. Preventing and delaying the onset of arthritis are suggested.

THE ROLE OF PHYSICAL HEALTH AND PERSONALITY INFLUENCING LONELINESS AMONG CENTENARIANS: FINDINGS FROM THE GEORGIA CENTENARIAN STUDY

R.B. Hensley[1], P. Martin[2], M. MacDonald[3], L. Poon[4], M. Johnson[4], *1. Psychology, The College of Saint Scholastica, Duluth, Minnesota, 2. Iowa State University, Ames, Iowa, 3. Kansas State University, Manhattan, Kansas, 4. University of Georgia, Athens, Georgia*

The purpose of this study was to analyze the role that selected physical health variables (lifetime of number of hospitalizations and lifetime diseases) and personality (Extraversion and Neuroticism) played in participants of the Georgia Centenarian Study. These variables were analyzed to determine whether they predicted loneliness. Blocked regression analyses were utilized in this study. In the first block, we used age, sex, ethnicity, current marital status, and residential status. In our second and third blocks, we provided the aforementioned physical health and personality variables. Results indicated that the lifetime number of hospitalizations was a significant predictor of loneliness, β = .26, p. < = .05. The greater the number of hospitalizations present in centenarians, the higher the level of loneliness. Moreover, Neuroticism was a significant predictor of loneliness, β = .56, p. < = .01. The higher the Neuroticism score, the higher the loneliness score. Finally, there was a statistical trend for sex, β = -.20, p. = .05. In essence, being a male centenarian was a significant predictor of loneliness. These results not only add to our understanding of the link between physical health, personality, and loneliness in late life, but also provide a more complete picture of loneliness as well.

PEAK REACTION FORCE IN A CHAIR RISING PREDICTS INCIDENT MOBILITY LIMITATION: 3-YEARS FOLLOW-UP STUDY

T. Tsuji[1,2,3], T. Miyama[4], T. Shiokawa[4], T. Okura[2], *1. University of Jyväskylä, Jyväskylä, Finland, 2. University of Tsukuba, Tsukuba, Ibaraki, Japan, 3. Japan Society for the Promotion of Science, Chiyoda, Tokyo, Japan, 4. TANITA Corporation, Itabashi, Tokyo, Japan*

The vertical ground reaction force (GRF) parameters in a chair rising are useful for measuring lower-limb muscle function in older adults. In recent years, specialized weight scale for easily evaluating those parameters has been developed. This study aimed to investigate whether low peak GRF in a chair rising predicts incident mobility limitation. We performed analyses on 135 community-dwelling older adults, which included 68 men and 67 women, aged 65-84 years (72.4 ± 5.2 years), without mobility limitation at baseline. Each participant was asked to stand up quickly from a sitting position. The peak GRF per body weight parameter (kgf/kg) was measured. Incident mobility limitation was defined as 3 consecutive self-reports of any difficulty walking one-quarter mile, chair standing or climbing 10 steps. Participants were divided into 3 groups according to tertile of the peak GRF by gender (and then combined) and followed for 3 years. Mobility limitations were developed by 24.4% (n = 33) of participants. Cox's proportional hazards models, adjusting for age, medication use, knee pain and low back pain, showed a hazard ratio of 4.49 [95% confidence interval (CI), 0.98-20.66] for the middle and 6.90 (95% CI, 1.53-31.15) for the lowest compared to the highest tertile, respectively. These results suggest that lower peak GRF in a chair rising is associated with increased risk of mobility loss. Diffusion of weight scales with this measurement system may bring in more convenient evaluation of risk of incident of mobility limitation in a clinical setting of nursing-care prevention.

SUPPORT/CONTROL OF EXERCISE AMONG ADULTS WITH DIABETES: THE ROLE OF NORMS FOR INVOLVEMENT IN HEALTH

K.J. August, A. O'Donnell, *Rutgers University, Camden, New Jersey*

Health-related social support and control are two ways in which social network members may impact health behaviors, such as exercise, that are important for successful diabetes management. How patients with diabetes respond to such attempts, however, is likely to be influenced by norms about social network involvement in health. This study thus sought to examine the behavioral and emotional correlates of support and control directed at exercise behaviors. This study further sought to determine whether the discrepancy between norms for family and friends' involvement in patients' health vs. patients' involvement in family and friends' health moderated these associations. We examined these questions using a racially-diverse sample of middle-aged and older adults (45+) with type 2 diabetes (N=56). Patients were more likely to report that they should be involved in family and friends' health than vice versa (t(48)=5.02, p<.001). Results from multivariate regression analyses revealed that support was related to positive emotional (appreciation) and behavioral (adherence to a prescribed exercise regimen) responses, regardless of norm discrepancy (both ps<.05). Social control, in contrast, was unrelated to behavioral responses, but positive social control tactics (persuasion) were related to positive emotional responses (appreciation), whereas negative social control tactics (pressure) were related to negative emotional responses (hostility, guilt) among patients with a norm discrepancy (all ps<.04). The findings from this study highlight the importance of examining norms for social network involvement in health in efforts to understand the differential impact of support and control in promoting exercise behaviors.

THROUGH THEIR EYES: RAISING EMPATHY THROUGH EXPERIENTIAL SIMULATION EXERCISES

P.A. Greenberg, R.J. Karasik, E.T. Peterson, H. Nordell, M. Trelfa, A.L. Greene, *Gerontology, St. Cloud State University, St. Cloud, Minnesota*

The positive impact of empathy on practitioners and service recipients is well documented (Batt-Rasden, et al., 2013; Gerdes & Segal, 2011). Simulation experiences are often used to develop and enhance empathy (Eymard, et al., 2010; Henry, et al., 2011). Simulating experiences of aging often involve "low tech" approaches (e.g., Vaseline on glasses and stones in one's shoes with the intention of simulating impairments in vision and mobility (Hadad & Hadad, 2013). The current study examines the impact of employing newly emerging experiential tools (e.g., vision goggles, empathy lung) which were designed for the purpose of more closely approximating specific health conditions (e.g., glaucoma, macular degeneration, COPD). A series of in-class experiences was developed and implemented in three areas: (a) simulation of normal and pathological processes of aging; (b) health prevention activities (e.g., screenings and exercise); and (c) assistive and adaptive technology using Universal Design. For example, participants were asked to make use of vision restriction goggles to complete tasks, navigate through their surroundings and interact much as a person with a specific impairment might. Pre/post surveys (N= 162) were gathered from undergraduate and graduate gerontology students regarding the impact of these hands on classroom activities. Additionally, a similar series of activities were completed with 75 staff members (including CNA's, Nurses, Social Workers and Recreational Therapists) at a local residential care facility. In both, student and staff participants reported the simulation activities to be instrumental in enhancing their understanding of the challenges older adults may face.

PROFILES OF LANGUAGE PERFORMANCE IN AGING

D. Cahana-Amitay[1], L. Lee[2], A. Spiro[2,3], *1. Boston University School of Medicine, Neurology, VA Boston Healthcare System, Boston, Massachusetts, 2. Boston University School of Public Health, Epidemiology, VA Boston Healthcare System, Boston, Massachusetts, 3. Boston University School of Medicine, Psychiatry, VA Boston Healthcare System, Boston, Massachusetts*

Language changes in aging show decreases in lexical retrieval and sentence processing abilities. Little is known, however, about whether these changes jointly produce distinct profiles of language decrements. This study was designed to characterize profiles of language performance in aging, evaluated by naming and sentence comprehension tasks. We used data on 294 participants from the Language in the Aging Brain project. Participants completed two picture-naming (Boston Naming Test; Action Naming Test) and two sentence comprehension tasks (sentences containing embedded clauses; sentences with multiple negative markers). Each task was scored for accuracy and latency. We conducted a latent profile analysis to identify distinct patterns of language changes in aging. Classes were then compared on demographics (age: 55-96, mean=72, SD=8; 49% female; education: 9-17, mean=15, SD=2). Five classes provided the best fit. Class 1 (8%) included "careless" language users, with performance below mean accuracy and at mean latency. Class 2 (32%) included "average" language users whose performance approximated the mean on all measures. Class 3 (25%) consisted of "careful" language users, who showed accurate but slow performance. Class 4 (19%) included "resilient" language users, with above mean accuracy and faster than mean latency. Class 5 (16%) consisted of "good" language users, with slightly above mean accuracy and slightly below mean latency. Significant differences were found among the classes in age and education, with class 4, the highest language performers, being younger and more educated. Our findings highlight the value of differentiating profiles of language performance in aging.

FUNCTIONAL LIMITATIONS AND DEPRESSION PREDICT HEALTH; SMOKING AND WORD RECALL PREDICT MORTALITY

D.C. Wagner, J.L. Short, *Psychology, George Mason University, Fairfax, Virginia*

We analyzed data from 17,930 adults (aged 50-104) from the 2006, 2008, and 2010 waves of the Health and Retirement Study and 1,171 adults who died between 2006 and 2010 to compare the relative strength of predictors of self-rated health (SRH) at 3 time points and mortality. Significantly correlated predictors ($p < .001$) of SRH included age, years of education, delayed word recall (DWR), depression, restful sleep, frequency of mild activities, smoking, body mass index (BMI), waist circumference, self-rated present memory, self-rated memory compared to 2 years ago, subtracting serial 7s from 100, minimum hand grip strength, maximum hand grip strength, and functional limitations. We conducted multiple linear regression analyses, eliminated redundant predictors, and selected predictors that accounted for the most outcome variance. Education, DWR, depression, sleep, mild activities, smoking, waist circumference, and functional limitations accounted for 42% of the variance in SRH at time 1, 32% at time 2, and 29% at time 3, after controlling for age. Functional limitations was the strongest predictor at all time points, followed by depression, education, waist circumference, and DWR. A segmented time-dependent Cox regression analysis indicated that the strongest predictor of mortality was smoking, followed by DWR, sleep, age, and depression.

HAVE WE UNDERESTIMATED FALL RATES? USING TAILORED APPROACHES TO ASCERTAIN FALL EVENTS

S. Stark, J.C. Morris, E. Somerville, *Washington University, St. Louis, Missouri*

Although falls are a serious health risk for community dwelling older adults, their ascertainment has been complicated by issues such as recall and reporting biases. We examined a novel method, individualized tailored calendars, to accurately ascertain falls in older adults. A convenience sample of 125 cognitively normal participants enrolled in longitudinal studies of cognitively healthy aging at the Knight Alzheimer's Disease Research Center was followed prospectively for 12 months. Tailored calendar journal pages, customized to include personal dates, holiday preferences, and color choices were used to document falls daily and returned via US mail monthly. Participants received as an incentive a five dollar gift card for each month's calendar pages returned. Participants returned 1,487 of 1,500 calendar journals over the 12 month follow up for 99.1 % compliance rate. There were 154 falls reported. The reported fall rate was higher than expected for the healthy population. Tailored calendar journals and gift card incentives may be an effective method to ascertain falls among community dwelling older adults.

SESSION 620 (POSTER)

SUCCESSFUL AGING I

DECISION-MAKING COMPETENCE, LIFE REGRETS, AND SUBJECTIVE WELL-BEING IN MATURE ADULTS

O.L. Pethtel[1,2], Y. Chen[2], *1. Psychology, Saint Francis University, Ebensburg, Pennsylvania, 2. Bowling Green State University, Bowling Green, Ohio*

Mature adults not only need to be competent in making decisions every day, but then also live with the consequences of those decisions. The present study examined age differences in decision-making competence (DMC) and decision outcomes in adults ages 39 through 76. The present study also examined how decision-making competence, dispositional factors, and life regrets differentially predicted life satisfaction. Results revealed that increasing age was related to lower DMC, but higher real life decision-making outcomes (i.e. better consequences of decisions). Older adults, therefore, have demonstrated that they can make good real-life decisions despite declines in decision-related competence. Upon further investigation, life regrets was related to real-life decision-outcomes, whereas DMC was not. The results suggest that the DMC measure may only reflect the cognitive component of decision-making, but other factors are likely to be involved in real-life decision outcomes. In addition, life regrets uniquely explained variance in life satisfaction on top of decision-making competence and dispositional factors. These findings suggest that affective aspects of decision-making, as reflected by life regrets, are more predictive of actual decision outcomes and well-being than cognitive aspects.

RESILIENCE, SAVORING, AND PSYCHOLOGICAL WELL-BEING IN OLDER ADULTS

J. Smith, L. Hollinger-Smith, *Mather LifeWays, Evanston, Illinois*

The benefits of positive emotions extend far beyond momentary pleasant feelings. Positive emotions enhance resilience and increase resources that people can draw upon when they encounter challenges or stressors. Guided by Fredrickson's broaden and build theory of positive emotions and Zautra's dynamic model of affect, the current study examines the relation between resilience and well-being for people with high and low abilities to regulate positive emotions (i.e., savoring). A sample of 164 (74% female) older adults living in a large metropolitan area participated in this study. Participants were recruited from a continuing care retirement community and senior cafés in the surrounding area. Participants completed a survey measuring resilience, savoring, happiness, depression, and satisfaction with life. In older adults, higher resilience and greater ability to savor positive experiences were both independently associated with greater happiness, lower depression, and more satisfaction with life (i.e., greater psychological well-being). The relation between resilience and participants' level of psychological well-being depended on their level of savoring. For people with high savoring beliefs, there was no relation between resilience and psychological well-being. In contrast, people with low savoring beliefs who had high (vs. low) resilience reported greater happiness, less depression, and more satisfaction with life. Lower savoring beliefs tend to be associated with more negative outcomes; however, high resilience appears to buffer or protect against these poor outcomes. These findings have implications for the development of positive interventions to enhance resilience in older adults.

THE PROPORTIONAL POSITIVES OF PURPOSE: EXAMINING ITS LONGEVITY BENEFITS ACROSS ADULTHOOD

P.L. Hill[1], N.A. Turiano[2], *1. Carleton University, Ottawa, Ontario, Canada, 2. West Virginia University, Morgantown, West Virginia*

Research consistently demonstrates that purposeful individuals experience better emotional, psychological, and physical wellbeing. However, it is as yet unclear whether these benefits hold across demographic and developmental groups. Moreover, research is needed that compares purpose to other positive indicators when predicting major outcomes such as mortality risk. For instance, are the benefits of purpose reducible to simply experiencing more positive emotions or relationships with others? Using data from the MIDUS study of U. S. adults (n = 6163; mean age = 47 years), we examined whether the hazard risks associated with purposelessness differed by age or retirement status. Findings suggested that purposeful adults tend to experience longevity benefits across different age groups, as well as before and after retirement. In other words, the value of purpose appears proportional across adulthood. Furthermore, purpose remained a significant predictor of mortality risk even when controlling for known correlates, such as positive affect, negative affect, and positive relations with others. As such, the link between purpose appears robust across adulthood, and when considering multiple alternative explanations.

FACTORS ASSOCIATED WITH NEGATIVE ATTITUDE TOWARD CHILDREN AMONG THE ELDERLY

Y. Murayama, T. Takahashi, S. Murayama, T. Ninomiya, H. Suzuki, H. Yoshida, S.P. Obuchi, Y. Fujiwara, *Tokyo Metropolitan Instiytte of Gerontology, Kazo, Japan*

Several studies show that some elderly express the negative attitude toward children through intergenerational exchange. However, little is known about the factors associated with the negative attitude The objective of this study was to investigate the factors associated with negative attitude toward children among the elderly. A questionnaire survey was conducted to 3,545 older adults. Finally, total of 2,657 participants were included for data analysis (mean age [SD], 72.5 [5.5] years).We used three items to measure negative attitude toward children, which was selected through interview research for elderly (Cronbach's alpha, 0.65). We examined the relationship between negative attitude toward children and variables, and conducted multiple linear regression analyses using significant factors as perceived health status, past medical history, social role and volunteer experience as the independent variable, and the negative attitude toward children as the dependent variable controlling for sociodemographic variables. The analyses were conducted separately for men and women. The results show that the social role was negatively associated with negative attitude toward children of men and women. On the other hand, volunteer experience was negatively associated with negative attitude toward children of men, and perceived health status and past medical history was negatively associated with attitude toward children of women .These results suggest that social role may be essential factors for elderly to express negative attitude toward children. Furthermore, participation in volunteer activities for elderly men and health promotion activities for elderly women may likely to reduce negative attitude toward children and promote intergenerational exchange.

HOW COULD LAY PERSPECTIVES ON SUCCESSFUL AGING COMPLEMENT SCIENTIFIC THEORY? FINDINGS FROM A US AND A GERMAN LIFE-SPAN SAMPLE

D.S. Jopp[1], D. Wozniak[3], A. Damarin[2], M.M. De Feo[1], S. Jung[1], S. Jeswani[1], *1. Psychology, Fordham University, Bronx, New York, 2. Georgia Perimeter College, Dunwoody, Georgia, USA Minor Outlying Islands, 3. Heidelberg University, Heidelberg, Germany*

Despite the strong interest in the concept, there is still no consensus in how to define successful aging. The present paper investigates lay perspectives of the concept of successful aging in young, middle-aged and older adults from two cultures, the USA and Germany, to potentially guide the development of scientific theories of successful aging. Two samples of young, middle-aged, and older adults from the USA (N = 151) and Germany (N = 155) were asked about definitions and determinants of successful aging. Codes were developed to capture common themes among the answers (clustering or open coding; Miles & Huberman, 1994), resulting in 16 main categories. Themes mentioned included resources (personal, social), behaviors (activities), and psychological aspects (strategies, attitudes/beliefs, well-being, meaning) with striking similarities across countries, age, and gender. Health and social resources were mentioned most frequently, followed by Activities/Interests, Virtues/Attitudes/Beliefs, Well-being and Life-management/Coping. Age differences were limited to Growth/Maturation, Respect/Success, and gender differences were limited to Social Resources and Well-being. Education and cultural background effects were limited to psychological aspects and Education/Knowledge, which were more often mentioned by US participants and individuals with more years of educations. In sum, young, middle-aged and older lay persons from the USA and Germany have quite similar concepts of successful aging and consider substantially more dimensions as important than established scientific theories. Given evidence that these factors (e.g., resources, psychological aspects) promote successful aging, considering these aspects in a more comprehensive model of successful aging may enhance our understanding of aging well.

LIFE SATISFACTION AND VOLUNTEERING AMONG OLDER WHITES AND HISPANICS: FINDINGS FROM THE HRS

B. Kim, B. Gaines, C. Somerville, E. Dugan, *UMass Boston, Boston, Massachusetts*

Volunteering has been studied for decades. However, research on the racial, ethnic and cultural factors related to volunteering is limited. The purpose of this study was to investigate the association between life satisfaction and volunteering among older Whites and Hispanics. Data from the 2010 wave of the Health and Retirement Study, Leave-Behind Questionnaire were analyzed. The sample included 5,895 respondents who aged 50 and over (White N=5,209 and Hispanic N=686). The mean age of the respondents was 66, most were women (58%), 64% were Whites and 14% Hispanics. Ordinary Least Squares regression was used to study factors related to levels of life satisfaction. There was a positive relationship between volunteering and life satisfaction, and racial/ethnic differences were found. Volunteering was significantly associated with life satisfaction among Whites ($p<0.01$, R-squared=0.27) but not among Hispanics (R-squared=0.20). Similarly, social support ($\beta=-0.12$) and living alone ($\beta=-0.19$) were significantly related to life satisfaction among Whites but not Hispanics. Hispanics had higher life satisfaction than Whites in general. In both groups, people who were divorced or widowed had lower life satisfaction compared to married people. Results suggest that there were racial/ethnic differences in life satisfaction among Whites and Hispanic associated with volunteer status. These findings could be used to inform current volunteers and encourage people to be involved in volunteer activities. Future research is needed to study the potential factors that may lead to racial differences among older adult volunteers in terms of mental and physical health.

MANAGING EVERYDAY HAPPINESS: THE RELATIONSHIP BETWEEN SELF-REGULATORY STRATEGIES AND WELL-BEING ACROSS THE LIFESPAN

S. Teshale, M. Lachman, *Psychology, Brandeis University, Waltham, Massachusetts*

A review of the findings on the U-shaped well-being curve in adulthood (Ulloa et al., 2013) suggested that well-being is related to the use of adaptive self-regulatory strategies such as selection, optimization, and compensation (SOC). Indeed, SOC and well-being are positively correlated in midlife (Freund & Baltes, 2002); and past work with older adults (Jopp & Smith, 2006) indicates SOC is beneficial for those with limited personal resources. However, SOC differences have usually been studied in terms of between-person differences; it is unclear how within-person SOC usage in midlife and older age connects to well-being from day to day. In this study we used regression models and multilevel modeling to examine the relationship between SOC usage and happiness over one week, among adults aged 22 to 94 (N=122). We also examined how years of education, a marker of personal resources, affected the relationship between SOC usage and well-being. As predicted, on days in which middle aged and older individuals reported more SOC behaviors than their average, they reported higher happiness. Only middle-aged adults showed a significant relationship between weekly averaged SOC and happiness. Results also showed an interaction between years of education and SOC; those with lower education showed a positive relationship between SOC and happiness. Results suggest SOC may be a useful strategy for individuals with fewer personal resources to increase day-to-day well-being, and illustrate SOC's benefits for different age groups. Future studies should examine the directionality of the relationship between daily SOC usage and well-being.

WHO IS YOUR ROLE MODEL OF SUCCESSFUL AGING?

S. Jung, S. Jeswani, D. Drummond, D.S. Jopp, *Psychology, Fordham University, Bronx, New York*

Although the concept of successful aging has received increasing consideration, little attention has been paid to how people develop ideas about successful aging. To date, no studies have examined whether people identify a specific role model of successful aging. This study examined 151 individuals aged 18 to 96 (58% female) living in New York, and asked them to identify a role model of successful aging and reasons why they were chose. The answers provided by study participants were categorized using theme-based coding (Miles & Huberman, 1994) and a coding manual including six categories was developed: Most participants mentioned role models from their family, including parents (26.5%), grandparents (23.2%), and other relatives (15.2%). Other role models included public figures (14.6%) and non-family acquaintances such as mentors or friends (14.6%). Interestingly, only a small number of participants did not indicate any role model (10.6%). While there was limited evidence for age and gender differences, younger participants (18-30 years) were more likely to mention their grandparents as their role models than the middle-aged (31-60 years) and older participants (61 years or above). Reasons mentioned most often for choosing the models were maintaining good health (45.0%), social resources (27.8%), activities (27.2%), and quality of life (21.9%). Gender and age differences were limited to health being mentioned more often in middle-aged participants compared to other age groups. In sum, findings support prior observations that individuals learn most about aging, and particularly successful aging in their immediate family environment.

FIVE-YEAR TRAJECTORIES OF PSYCHOLOGICAL WELL-BEING AMONG LATE MIDLIFE U.S. ADULTS: SIGNIFICANCE OF GENDER AND EDUCATIONAL CORRELATES

H. Ko, K. Hooker, *School of Social and Behavioral Health Sciences, Oregon State University, Corvallis, Oregon*

Research has shown significant sociodemographic correlates and decreasing trends in eudaimonic well-being between adult groups (Ryff & Singer, 2008). However, results are mostly from cross-sectional studies. We examined how five-year trajectories in Psychological Well-Being (PWB) differed by midlife adults' gender and education. Data were from the Foley Longitudinal Study of Adulthood, in which 163 White and African American adults in the greater Chicago area have been surveyed since 2008 (MeanAge= 56.38, SD= 1.00). The sample was composed of 64% females, and 43.6% had graduate degrees, 23.9% had college degrees, 27.0% some college education, and 5.5% were high school graduates. Multilevel modeling was used to investigate the association between gender and education with psychological well-being dimensions (autonomy, environmental mastery, personal growth, positive relations with others, purpose in life, and self-acceptance). Results showed quadratic trajectories in four dimensions, except for linear trajectory in purpose in life and cubic trajectory in autonomy. Females reported higher well-being than males across all dimensions, except for autonomy. Such gender difference was significantly increased over time for two dimensions, self-acceptance and personal growth. Compared to those with graduate degrees, those with high school degrees had lower, inverted U-shape trajectories in self-acceptance, personal growth, and positive relations with others. Those with college degrees reported consistently lower sense of self-acceptance, personal growth, and autonomy than those with graduate degrees. However, education was not related to trajectories in environmental mastery and purpose in life. The findings underscore that opportunities across trajectories of well-being are not equally distributed by sociodemographic factors.

CENTENARIAN OFFSPRING PRESERVE INDEPENDENCE IN DAILY FUNCTIONING

L.S. Nussbaum[1], S.L. Andersen[2], P. Sebastiani[1], J.D. Gass[2], L. Feldman[2], T.M. Neary[2], T.T. Perls[2], *1. Boston University School of Public Health, Boston, Massachusetts, 2. Medicine/Geriatrics, Boston University School of Medicine, Boston, Massachusetts*

Exceptional longevity has been shown to be associated with compression of functional disability towards the end of life. We sought to determine if the offspring of centenarians, in their 60's and 70's are already showing a preservation of physical function compared to a referent cohort. Methods: We collected health and function data on offspring and referent participants of the New England Centenarian Study at enrollment and annual follow-ups. Physical function was assessed using the instrumental activities of daily living (IADL) items from the Older Americans Resources and Services Multidimensional Functional Assessment Questionnaire. Mixed effects models for repeated measures were used to determine average trajectories for centenarian offspring and referent cohorts by sex. Results: Data were collected for 575 centenarian offspring and 337 referents (mean age 78.8 ± 7.1 years) over an average follow-up period of 8 years. Male offspring showed a mean age of onset of physical function impairment of 73 years compared with 70 years for referents. The female offspring did not differ from female referents in the age of onset of impairment (66 years). Both male and female offspring compared to their referent groups demonstrated slower rates of decline over the follow-up period and a significant divergence in the trajectories with increasing age. Conclusions: Even at relatively young ages, centenarian offspring are exhibiting the functional benefits of familial exceptional longevity by maintaining independent living skills longer and with slower decline compared to referents. They may be an important cohort for discovering the genetic and environmental correlates of successful aging.

DIVERSITY OF INTIMACY FORMS AND THEIR IMPORTANCE FOR WELL-BEING IN LATER LIFE

P. Öberg[1], T. Bildtgård[2], *1. University of Gävle, Gävle, Sweden, 2. Social work, Stockholm university, Stockholm, Sweden*

This paper focuses on different forms of intimacy in later life in late modern Sweden and their consequences for well-being. The results are based both on qualitative interviews with 28 Swedes (63–91 years), living in new relationships initiated after the age of 60 (marriage, cohabitation, LAT) or currently dating; and on a quantitative survey to 60–90 year old Swedes (n=1225; response rate 42%). The results show: A great diversity in relationship careers over the life course; a preference for LAT (70%) and cohabitation (26%) in new unions established 60+; strong support from adult children for parents' new LAT (86%) and cohabitation (76%) relationships, but less support for marriage (50%); that new relationships are as important for life-satisfaction as long-lasting ones; after subjective health, a partner is the second most important explanation for life-satisfaction, more important than having children; LAT was the union form that added most to life-satisfaction for men while marriage was the only form that significantly added to the life-satisfaction of women. Results were the same for newly established relationships and older relationships. Results will be discussed in relation to the shift from marriage to divorce culture (Hackstaff), the transformation of intimacy (Giddens), potentials of the third age (Laslett), and gender socialization, but also in terms of how the results can be interpreted in a context of Swedish welfare-state supported individualism where a partner provides both autonomy in relation to adult children and social integration.

EVALUATING AGING POSITION AT RETIREMENT TO REFORMULATE THE CONCEPT OF SUCCESSFUL AGING

D.J. Martin, L. Gillen, *The Center for the Study of Aging, McDaniel College, Westminster, Maryland*

Broadening our understanding of the science of aging to improve quality of life has been a primary goal of the field of gerontology from its inception. Characteristics of quality of life are closely related to successful aging, a term whose operational definitions are frequently equated with good health. This is often in contrast to individual self-assessments of successful aging, which repeatedly include a variable array of subjective and objective criteria framed by personal perception. In this era of person-centered care, constructing a plan for living that addresses the multifaceted nature of the term success requires an interdisciplinary approach, and conceptual clarity in the evaluative process. This paper evaluates existing literature on what it means to age successfully and uses qualitative interviews with recently retired persons to provide the basis for the development of an operational definition of successful aging which considers the diverse aging positions present at time of retirement. Since aging position is seen as modifiable, this information will be useful to the future development of trajectories related to bio-psycho-social-spiritual interactions that can be used to formulate individualized aging plans. Cultivating these plans will be essential for improving quality of later life as efforts are focused on achieving maximum potential at the individual level, regardless of any limitations.

FAITH, RELIGIOUS DOUBT, AND WISDOM IN LATER LIFE

M.M. Duddy, S.Z. Moroz, E. Hillis, M. McGowan, E.H. Thompson, A. Futterman, *College of the Holy Cross, Worcester, Massachusetts*

Our study examines the impact of age-related cognitive change - the emergence of wisdom - on the relationship between faith and doubt in later life in two ways. First we examined the factorial stability of measures of ends (intrinsic) and quest (doubt) in younger (62-75 yrs) and older (75-101) adults in a random sample of 342 older adults living in the Worcester community. Second we examined in 80 semi-structured interviews of older adults (over 60 yrs of age) living in Worcester (including 11 members of the Holy Cross Jesuit Community) the relationship between faith and doubt. These interviews were recorded and later coded for wisdom, using the rating system developed along the lines of the Berlin Aging Study model of wisdom. Shifts in factorial structure were demonstrated in keeping with the development of wisdom in later life: older adults in both late middle age and older samples demonstrated much higher correlations between faith and doubt than that observed in younger adults. In open-ended interviews, older adults frequently demonstrated evidence of wisdom in the way they understood their faith; many voiced robust questioning in the presence of deep faith and relativistic, nuanced, expressions of their faith as one among many "truths". Among demonstrated relationships between background variables and faith and religious doubt, higher levels of education were associated with more doubt in randomly sampled late middle age and older adults as well as in the open ended interviews.

HEALTH, LIFE STRESS, AND WAYS OF BEING RELIGIOUS IN LATER LIFE

M. McGowan, E. Hillis, M.M. Duddy, S.Z. Moroz, A. Futterman, E.H. Thompson, *Psychology, College of the Holy Cross, Worcester, Massachusetts*

Religious belief and behavior is frequently seen as a buffer for stress in later life. For example, religious involvement following the loss of a spouse in later life has been associated with better bereavement outcomes in several studies. By contrast, few studies have examined the impact of different stressors in later life on religious belief and behavior. Our study examined the relationship between life stress in later life (as measured by Moos and colleagues Health and Daily Living Questionnaire) and measures of religious belief and activity in a random sample of 342 older adults living in the Worcester, MA. community. In particular, we examined the impact of both illness, functional impairment, and a variety of both negative and positive life events on ways of being religious – ends religiousness (intrinsic religiosity or religion as and end in itself), means religiousness (extrinsic religiosity or religion as a means to other social and emotional ends), and quest religiousness (religious doubt and questioning of the purpose and meaning of life). In younger samples, these ways of being religious are largely independent of one another and demonstrate inconsistent relationships with stress. In our study, stressors are differentially associated with religious orientation (e.g., ends and quest religiousness are negatively and positively correlated with stress, respectively), and we found a shift in the correlations between ways of being religious in the face of different stressors (e.g., ends and quest religious become more positively correlated in individuals experiencing functional impairments and loss, but less correlated in individuals suffering serious illness). Based on these findings, it appears that some stressors in later life prompt questioning that potentiates faith, while other stressors prompt questioning that may undermine faith.

INFLUENCES OF GRATITUDE AND SPIRITUAL GROWTH ON WELL BEING ACROSS ADULTHOOD

V.K. Blake, J.H. Patrick, *Psychology, West Virginia University, Morgantown, West Virginia*

Positive psychology focuses on ways to increase emotional well-being (Seligman, 2002), yet few studies have examined the effects of positive psychology measures among age-diverse samples. Using data from 490 adults ages 18 to 85 years, we examined the unique contributions of gratitude and spiritual growth on well being, using a pair of 2-step hierarchical regressions. Younger age, female gender, and lower levels of gratitude explained significant variance in Negative Affect [F (3, 490) = 36.01, p < .001, R-square = .18]. Introducing spiritual growth at step 2 explained an additional 3.2% of variance [F (1, 490) = 20.02, p < .001]. Together, the four independent variables accounted for 21.4% of the variance in Negative Affect. The strongest predictor was gratitude (β = -.26). In a parallel regression predicting Positive Affect, female gender and higher gratitude contributed uniquely to the equation [F (3, 490) = 59.71, p < .001; R-square = .259] at Step 1. Introducing spiritual growth at Step 2 explained an additional 12.2% of variance [F (1, 490) = 96.04, p < .001]. When all four independent variables were included, this model accounted for 38.2% of the variance, with gratitude and spiritual growth uniquely contributing to the variance explained in Positive Affect. In the presence of spiritual growth (β = .45), neither age nor gender uniquely added to the variance explained. Results are discussed in terms of the positive effects of spiritual growth, above and beyond that of other positive psychology predictors.

OLDER ADULT'S SPIRITUALITY AND ADJUSTMENT TO AGING: DEVELOPMENT OF A MULTIPLE CORRESPONDENCE ANALYSIS

S. von Humboldt, I. Leal, *ISPA-Instituto Universitário, Lisbon, Portugal*

Purpose: To analyze the indicators of adjustment to aging (AtA) and to investigate the latent constructs that can work as major determinants in spirituality for a cross-national older community-dwelling population. Methods: Questionnaires were completed, assessing participants' background information. Interviews were performed, addressing one core area: indicators of AtA. Complete data were available for 154 older adults, aged between 75-103 years (M = 86.6, SD = 6.98) from two different nationalities. Data was subjected to content analysis. Representation of the associations and latent constructs were analyzed by a Multiple Correspondence Analysis (MCA). Results: The most prevalent response of the interviewed participants for indicators of AtA was 'spirituality' (43.2%) whereas 'financial stability' was the least referred indicator of AtA (10.3%). 'Spiritual activities' was the most reported response regarding 'spirituality' (20.0%). Spirituality for older adults was explained by a three-factor overall model: 'spiritual and existential meaning', 'limit-related awareness' and 'community embeddedness'. Conclusions: The findings presented in this paper emphasized the need to explore the potential of spirituality to AtA and the need for improving the spiritual dimension of health care for the older population. Key Words: Spirituality; Adjustment to Aging; Multiple Correspondence Analysis; Community-Dwelling Older Adults.

SESSION 625 (POSTER)

MENTAL HEALTH II

DELIBERATE SELF-HARM AMONG YOUNGER AND OLDER ADULTS: AN EXPLORATORY STUDY USING THE SELF-HARM INVENTORY

A.L. Connella, D.L. Segal, F.L. Coolidge, *University of Colorado at Colorado Springs, Colorado Springs, Colorado*

Deliberate self-harm (DSH), a non-fatal way of inflicting pain upon oneself, is part of the spectrum of suicidal behaviors. Despite high rates of elder suicide, limited research exists regarding the basic nature of self-harming behaviors among older adults. To address this gap, community-dwelling younger adult (N = 157; M age = 20.5 years; 69% women) and older adult (N = 124; M age = 73.6 years; 65% women) participants anonymously completed the self-report Self-Harm Inventory (SHI), which measures a diverse range of self-harming behaviors and includes a total score. Internal consistency (Cronbach's alpha) for SHI total scores was good among younger adults (.86) and older adults (.79). Results from a 2 (age group) x 2 (gender) factorial ANOVA showed a significant main effect for age such that younger adults (M = 3.42, SD = 3.86) had higher SHI total scores than older adults (M = 1.58, SD = 2.35), F(1, 251) = 17.89, p < .001), with a medium effect size (partial η2 = .07) indicating that 7% of the variance in SHI total scores was explained by age. Neither the main effect for gender nor the age x gender interaction were significant. Finally, to explore specific self-harming behaviors, a chi-square test was computed for each of the 22 SHI items for both age groups (see Table 1). Younger adults endorsed "Yes" responses significantly more frequently than older adults on 13 of 22 SHI items. Future research should examine specific behaviors of older adults who self-harm more frequently and explore relationships between self-harming behaviors and other risk and resiliency factors for elder suicide.

GREATER HEARING IMPAIRMENT PREDICTS WORSE MENTAL HEALTH AMONG OLDER ADULTS

A.V. Hyams[1,2], F. Scogin[1,2], R. Childers[1], M. Hay-McCutcheon[3], *1. The University of Alabama - Department of Psychology, Tuscaloosa, Alabama, 2. The University of Alabama - Center for Mental Health and Aging, Tuscaloosa, Alabama, 3. The University of Alabama - Department of Communicative Disorders, Tuscaloosa, Alabama*

Objectives: Hearing loss affects 80% of older adults. It can lead to conversational and social difficulties, prompting isolation and depression. However, few researchers have studied hearing loss and mental health; interdisciplinary work between audiology and clinical psychology is needed. After attending this session, participants will understand the connection between hearing loss and mental health and recognize the value of interdisciplinary approaches. *Methods:* Preliminary data were collected on participants 60 years and older (N=35) who do not wear hearing aids and have a range of hearing ability (i.e. normal hearing to moderate loss). They completed the SF-36 mental health index, which has good psychometric properties. Hearing thresholds were tested with pure tone audiometry at 250Hz, 500Hz, 1,000Hz, 2,000Hz, and 4,000Hz. Normal hearing was classified as -10-25 dB, mild hearing loss as 26-40 dB, and moderate as 41-55 dB. A simple regression was conducted, with the pure-tone average (PTA) of each participant's five hearing thresholds as the independent variable and the SF-36 mental health score as the dependent variable. *Results:* The regression of mental health on hearing ability showed hearing was significantly associated with mental health, $B = -0.42$, $SE = 0.20$, $\beta = -0.35$, $p < .05$. The more hearing impairment participants had, the worse their mental health. *Conclusion:* The sobering effects of hearing loss on mental health can potentially be reversed with hearing aids, yet only 20% of eligible older adults get them. Audiologists and clinical psychologists must work together to identify candidates and motivate them to pursue intervention.

FEELING THE SQUEEZE? THE EFFECTS OF COMBINING WORK AND INFORMAL CAREGIVING ON PSYCHOLOGICAL WELL-BEING

T. Hansen, S. Daatland, *Aging research, Norwegian Social Research, Oslo, Norway*

Does employment provide respite or add stress to caregivers? As a result of population aging and increasing female employment rates, growing numbers are facing the competing demands of paid work and caregiving. This study explores the effect of providing regular personal care by employment status on six dimensions of psychological well-being. We concentrate on partner and parent care recipients and differentiate between in-household and out-of-household caregiving. We use cross-sectional data from the Norwegian Life Course, Ageing and Generation (LOGG) study (n=11,047, age 25–64). Results indicate that out-of-household caregiving has no significant relationship with men or women's well-being, irrespective of employment status. In-household caregiving, however, relates to lower psychological well-being, but only among women who do not work full-time. The advantages of full-time employment to caregivers may be due to greater opportunity to achieve the full benefits that this role has to offer. There is little to suggest that combining work and caregiving harms well-being. In fact, a "double burden" seems to be experienced by women who combine extensive caregiving with limited employment.

FACTORS AFFECTING MENTAL HEALTH CARE IN DEPRESSED, HOMEBOUND OLDER ADULTS

J. Eisner[1], R. Zweig[1], J. Sirey[2], *1. Ferkauf Graduate School of Psychology, Yeshiva University, New York, New York, 2. Weill Cornell Medical College, White Plains, New York*

Geriatric depression is a significant public concern as it is expected to be second to heart disease in global disease burden. Although depression is prevalent among older adults, fewer than 3% of older adults with documented need report seeing a mental health professional for treatment. Despite the personal costs of depression, most older adults do not seek mental health care. Accordingly, this study applied the Gelberg-Andersen Behavioral Model for Vulnerable Populations to assess the impact of traditional factors and factors specific to vulnerable populations on mental health treatment utilization among homebound, depressed, older adults. We used archival data from a sample of 179 homebound, depressed, older adults, to assess independent predictors of treatment utilization. Initial analyses indicated that female gender and younger age were predictive of prior psychiatric treatment use, whereas Hispanic ethnicity was predictive of current psychiatric treatment. Follow-up logistic regression analyses determined that both low perceived social support (B = -0.15) and mobility impairments (B = -0.12) predicted prior treatment utilization in older adulthood. Poor ADL functioning (B = -0.74) was found to be the single predictor of current treatment utilization. Our findings suggest that perceived deficits in social support and physical functioning may have the most profound effects on treatment utilization for depressed, homebound older adults. We advise clinicians to screen for mobility limitations, poor ADL functioning, and limited social support, as these variables may best predict who is likely to access mental health treatment among the homebound, depressed, older adult population.

BARRIERS TO MENTAL HEALTH CARE UTILIZATION BY RACIALLY/ETHNICALLY DIVERSE OLDER ADULTS: IMPLICATIONS FOR MENTAL HEALTH POLICY

K. Ford, G. Kim, *Psychology, University of Alabama, Tuscaloosa, Alabama*

Objective: This study aims to identify barriers that racial/ethnic minority older adults face to properly utilizing mental health services (MHS), with a view to current and future mental health policy. Methods: Data were drawn from the Collaborative Psychiatric Epidemiology Surveys (CPES).We selected participants with a need for MHS who indicated that they had not utilized services, delayed seeking services, or used MHS and then terminated those services prematurely, and who answered questions regarding the reasons for their underutilization (barriers). Using a series of chi-squared tests of proportional differences, we compared barriers endorsed by Asians (n=250), Hispanics/Latinos (n=806), Blacks/African Americans (n=1,602), and non-Hispanic Whites (n=1,525) across three age groups (18-29; 30-54; and 55+). Results: Asian older adults were more likely than their younger counterparts to endorse items indicating that they were simply not bothered by their psychological problems ($\chi 2$ [2]=8.694; $p<0.05$). Hispanic/Latino older adults were more likely than younger participants to believe that their problem would get better on its own ($\chi 2$ [2]=8.055; $p<0.05$). Black/African American older adults were less likely than younger Blacks/African Americans to delay treatment because they thought it would not work ($\chi 2$ [2]=7.831; $p<0.05$), and less likely to refuse treatment altogether because they thought they could handle their problems without professional help ($\chi 2$ [2]=7.098; $p<0.05$), or that the problem would get better on its own, anyway ($\chi 2$ [2]=7.216; $p<0.05$). Conclusions: Efforts should be made to increase awareness among racial/ethnic minority older adults of the services available to them and the effectiveness of those services.

DO FUNCTIONAL LIMITATIONS AND CHRONIC HEALTH CONDITIONS INCREASE DEPRESSIONS SCORES IN THE ELDERLY?

R. Kennison, Y. Liu, *Psychology, California State University, Los Angeles, Los Angeles, California*

The role of age related functional limitations and self-reported chronic disease on depression scores was investigated in the Health and Retirement Study's 2008 data. The sample included 5835 respondent's ranging in age from 50-83. Multivariate adaptive regression splines (MARS) modeling was employed to identify multiple linear splines. Predictors included functional limitations (ADL, IADL), chronic diseases (back pain, stroke, arthritis, cancer, high blood pressure, heart disease, lung disease, & diabetes) and demographic measures (age, education, gender, being white, being Hispanic). The MARS modeling process resulted in a model that included the following predictors: ADL, IADL, back pain, stroke, education, being female and being Hispanic. ADL limitations included two splines with a large increase in depression score from zero to one limitation, and a more shallow increase from one to three limitations. IADL limitations included two splines with a linear increase in depression score from zero to two limitations and a decrease in score from two to three limitations. Reporting back pain or stroke resulted in higher depression scores. Two splines were identified for education in which the highest depression scores were associated with zero to 7 years of education; there was a linear decline in depression from seven to 17 years of education. Females and Hispanics were associated with higher depression scores compared to males and non-Hispanics. Results emphasize the importance of functional status and selected chronic health conditions on depression scores and provide a more detailed description of change than traditional regression-based models.

SIX-MONTH OUTCOMES OF MOTIVATIONAL INTERVIEWING ON PRESCRIPTION OPIOID MISUSE AMONG OLDER ADULTS

Y. Chang, *School of Nursing, The State University of New York, University at Buffalo, Buffalo, New York*

Background: Prescription opioid misuse or abuse is a problematic, but preventable, behavior and therefore needs interventions; particularly if such interventions can be delivered in the setting where older adults receive their usual care. Motivational interviewing (MI) is a low-cost brief intervention and has been widely used to promote healthy behaviors. The study aimed to examine the six-month outcomes of a 4-week office-based MI on the risk of prescription opioid misuse, motivation to change, pain intensity, self-efficacy, depression, and anxiety in older adults with chronic non-cancer pain. Methods: This study used a one-group with pre-post design and took place at a primary care office and a pain management clinic. A manualized MI was developed based on current literature focusing on medication adherence. The MI consisted of one face-to-face and three telephone sessions. Outcomes including risk for opioid abuse, alcohol use, self-efficacy, motivation to change, depression, anxiety, and pain intensity were measured at baseline, post-treatment, 1, 3, and 6-month follow-up. Descriptive statistics and repeated measured ANOVA were used for data analysis. Results: Twenty-five participants completed the study. Findings indicated a significant reduction in the risk of opioid misuse at post-test and this change sustained at 6-month follow-up. Other improved outcomes include decreased alcohol consumption, improved self-efficacy and motivation to change, decreased pain intensity, decreased depression, and decreased anxiety. Conclusions: The MI demonstrates promising

6-month effects on reducing older adults' risk for prescription opioid misuse and improving other psychological outcomes. Our findings suggested that MI can be effectively delivered in outpatient settings.

PROGRESSION FROM SUBSTANCE USE TO DEVELOPMENT OF SUBSTANCE USE DISORDERS IN THE OLDER PERSON

C.L. Storr[1], K.M. Green[2], *1. University of Maryland, Baltimore, Baltimore, Maryland, 2. University of Maryland, College Park, College Park, Maryland*

As the proportion of older adults in the population continues to increase in many countries around the globe, forecasts project increasing service needs for substance use problems among the elderly. For example between 2000 and 2020, the number of older adults with substance use problems or in need of treatment for a substance use disorder (SUD) are expected to more than double in Europe and the US. Physicians and other caregivers may be more attuned to the physical health problems of older populations, ignoring the signs and symptoms of misuse and SUD. Very little in known about the continuance and onset of substance abuse and its progression to addiction among older adults. This presentation provides a framework for substance involvement and briefly describes various stages that can occur within a continuum of use. Progression can be influenced by individual-level susceptibility (e.g., physiological changes and genetic vulnerability), properties of the substance (e.g., reinforcing properties), and by social environmental factors (e.g., prescribing practices). Age can influence the detection of addiction as signs of abuse and problems resulting from substance use are often dismissed or mistaken for symptoms of ageing problems. Given the impact that substance use problems in older people are likely to have on social and healthcare services, there is a need for a better understanding of substance use behaviors and trajectories, and influences or risk factors for progression among older adults.

PSYCHOSOCIAL BARRIERS TOWARD MENTAL HEALTH CARE SERVICES IN MIDDLE AND OLD AGE

B. Kim, S. Park, *The University of Michigan, Ann Arbor, Michigan*

Purpose: The underutilization of mental health care services has been particularly high among older age groups. Although psychosocial factors significantly influence individuals' perceptions and attitudes toward mental health care utilization, little knowledge exists about psychosocial barriers. This study investigated to what extent financial and physical resources influenced psychosocial barriers that can discourage the use of mental health care services. Method: Six cross-sectional data from 2006-2011 National Surveys on Drug Use and Health were used. The sample was restricted to middle and older adults over 50 years of age who reported that they recognized their mental health problems but had never received mental health care (N =890). The dependent variables included three different types of psychosocial barriers toward mental health care services: stigma, mistrust, and self-perceived ability to handle their mental illness problems (perceived agency). Financial resources were measured with insurance coverage, and physical resources included the geographic proximity to mental health services, the availability of transportation, and information on mental health care services nearby. Results: Even after controlling for various socioeconomic factors, physical resources were found to be associated with lower levels of stigma and perceived agency ($p<.01$). Financial resources were significantly related with lower levels of mistrust and perceived agency ($p<.01$). Implications: This study found that psychosocial barriers in mental health care service use systematically varied by physical and financial situations. These results highlight the importance of understanding the different contexts of unmet service needs in mental health care services.

CORRELATES OF OBJECTIVE AND SUBJECT MEASURES OF CAREGIVER BURDEN AMONG DEMENTIA CAREGIVERS: INFLUENCE OF UNMET PATIENT AND CAREGIVER DEMENTIA-RELATED CARE NEEDS

T. Brown-Hughes, B.S. Black, M. Albert, L.N. Gitlin, D.M. Johnston, C. Lyketsos, Q. Samus, *Johns Hopkins University, Baltimore, Maryland*

BACKGROUND: This study examines the relationship of unmet dementia-related care needs of community-dwelling persons, and their caregivers, to measures of caregiver burden. METHODS: Cross-sectional baseline data were analyzed from participants in a dementia care coordination trial of community-residing persons with dementia (PWD) (n=254) and their caregivers (CG) (n=246). Participants were recruited from Northwest Baltimore, MD. The Zarit Burden Inventory (ZBI) was used to measure subjective caregiver burden. Objective burden was measured by estimating the total hours per week spent doing things for the PWD and or how many hours CGs missed paid work in the prior month due to caregiving responsibilities. The Johns Hopkins Dementia Care Needs Assessment was used to identify unmet dementia-related care needs. Bivariate and multivariate linear regression analyses examined the relationship of unmet needs, demographic, clinical or functional characteristics with CG burden measures. RESULTS: In adjusted multivariable models, patient neuropsychiatric symptoms (NPS) and caregiver unmet emotional needs explained 22% of the variance in ZBI scores. In adjusted multivariable models, caregiver need for respite, patient functional dependency, and caregiver unmet specialty medical needs explained 26% of the variance in the hours per week spent caregiving. PWD's level of functional dependency was the sole correlate of missed time at work, explaining 11% of the variance. CONCLUSIONS: Addressing potentially modifiable unmet caregiver needs may reduce subjective and objective CG burden.

THE DEVELOPMENT OF SELF-ADMINISTERED DEMENTIA CHECKLIST (SDC) (1); EXAMINATION OF INTERNAL VALIDITY USING CONFIRMATORY FACTOR ANALYSES

C. Ura[1], F. Miyamae[1,2], N. Sakuma[1], H. Niikawa[1,3], K. Ito[1,4], T. Okamura[1,3], S. Awata[1], *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Yokohama National University, Yokohama, Japan, 3. University of Tokyo, Tokyo, Japan, 4. Tokyo Medical and Dental University, Tokyo, Japan*

OBJECTIVES: To facilitate access to early diagnosis of and to provide comprehensive services for dementia, it is crucial to educate the early signs and symptoms of dementia to the public. The aim of this study is to examine the internal validity of the Self-administered Dementia Checklist (SDC) which is in the process of development for an education program for dementia. METHODS: The subjects were all residents aged 65 years and older living in an urban residential district in Tokyo (N=5,199). A questionnaire survey including 20 items concerned with "subjective experience of cognitive decline" and "subjective experience of IADL decline" was conducted by mailing and collecting methods. Using exploratory factor analyses (EFA), a 10-item version (SDC-10) was developed. Using confirmatory factor analyses (CFA) and Cronbach's alpha, internal validity and consistency of the SDC-10 was examined. RESULTS: In data from 4,649 valid respondents (male: n=2,118; female: n=2,531; Mean age±SD yrs.: 73.8±6.5 yrs.; response rate: 89.0%), the SDC-10 was developed and designed to have two-factor structure using EFA. This scale had two subscales: subjective cognitive decline subscale (5 items) and subjective IADL decline subscale (5 items). Internal consistency of each subscale and total scale were sufficient (α=.837-.935). Using CFA, a two-factor structure was confirmed with sufficient indices ($\chi2$=347.686, df=30, GFI=.961, AGFI=.937, RMSEA=.049). CONCLUSION: The SDC-10 had sufficient internal validity and consistency.

CLINICAL UTILITY OF THE SYMPTOMS OF DEMENTIA SCREEN IN A PRIMARY CARE POPULATION

J. Shouse, B.T. Mast, *Dept. of Psychological and Brain Sciences, University of Louisville, Louisville, Kentucky*

As the aging population expands, the need for brief and clinically useful screening methods for dementia and cognitive impairment grows with it. The Symptoms of Dementia Screen (SDS) is an 11 item screening measure given to caregivers to assess the care receiver's dementia status. Although it demonstrated excellent psychometric properties at its development, its use has not been explored in primary care settings nor extended to diagnoses of Mild Cognitive Impairment (MCI). This study sought to establish the reliability and clinical utility of the SDS in an outpatient primary care population. Thirty-six physician-referred older adults completed a neuropsychological battery, with a family member completing the SDS. MCI or dementia diagnosis was derived from current diagnostic criteria for dementia and mild cognitive impairment on neuropsychological testing. Analyses suggested borderline acceptable internal consistency, α=.64. Based on a cutoff score of 5, sensitivity and specificity rates were at 83% and 75% for dementia. For MCI, a cutoff score of 4 offered the greatest sensitivity (93%) but limited specificity (50%). Combined, these results suggest the SDS is a sensitive screening measure of cognitive impairment among an outpatient sample. The sample size of unimpaired patients was low, which might have impacted findings related to specificity. Future studies should examine the potential of utilizing a shorter SDS form as well as further development on specificity of items to differentiate between dementia, mild cognitive impairment, and individuals without suspected pathology.

STRUCTURAL REPRESENTATION OF DEPRESSION, ANXIETY, AND AGITATION IN LONG-TERM CARE RESIDENTS WITH DEMENTIA

L.S. Hess, J.C. Williams, S. Meeks, *University of Louisville, Louisville, Kentucky*

Dementia, depression, and anxiety are the most common psychiatric disorders among long-term care residents. Since dementia is associated with behavioral problems that can be difficult to manage, the growing number of long-term care residents with dementia and mental health disorders presents a challenge for providing quality care. Research has established the co-occurrence of depression and anxiety, as well as anxiety and agitation, in this population. However, a consensus on the conceptualization of the co-occurrence of these constructs has not been reached. Through confirmatory factor analyses, this study tested two models of the relationship of depression, anxiety, and agitation. The first model suggested depression and anxiety were linked according to the tripartite model, and agitation and anxiety were connected by shared behaviors. The alternative model indicated depression, anxiety, and agitation were subsumed under a construct representing general distress. The results of this study were consistent with the alternative model ($\chi 2$ [33, N = 65] = 34.48, p = .40; CMIN/df = 1.05, IFI = .96, TLI = .98, CFI = .98, RMSEA = .03). This study suggests depression, anxiety, and agitation may be best considered expressions of general distress rather than discrete manifestations of psychopathology for individuals with dementia in long-term care. Though not clearly defined as disorders, the experience of depression, anxiety, and agitation warrant clinical attention due to increased risk for impairment, distress, and mortality. Along with regular assessment of depression and agitation in long-term care residents, consistent screening for anxiety should also be completed to provide optimal care.

PSYCHOMETRIC PROPERTIES OF A READINESS TO CHANGE MEASURE IN DEMENTIA

E. Shelton[1], K. Judge[1], S. Yarry[2], *1. Adult Development & Aging, Cleveland State University, Akron, Ohio, 2. VA Palo Alto Health Care System, Palo Alto, California*

A recently developed self-report questionnaire, Stages of Change-Dementia Memory loss (SC-DM) for assessing readiness to change in individuals with dementia (IWDs) and their caregivers (CGs) was tested. The measure was developed based on the The Transtheoretical Model (TTM) of behavior change. This model outlines a five-step categorization of an individual's readiness to alter a behavior. Participants were 73 dyads tested as part of a strength-based intervention study. Findings indicated good reliability for both IWDs as well as CGs. Exploratory factor analysis found that factors were best understood in terms of two stages (ready to change/not ready to change) as opposed to the full five stages. The use and value of the SC-DM is discussed in terms of guiding intervention, as well as suggestions for future research.

EFFECT OF CLIENT HEALTH STATUS ON MENTAL HEALTH TRAINEES' CLINICAL JUDGMENTS AND AGEIST BEHAVIORS

S.L. Patterson, G.I. Caskie, *Counseling Psychology, Lehigh University, Bethlehem, Pennsylvania*

Ageism is a widely cited concern in mental health delivery, and health status, particularly poor health, is a component of aging that can contribute to discrimination against older adults (James & Haley, 1995; Messier, 1998). Recent research on ageism fails to address the potential confound of health status in psychotherapy outcomes. In the present study, a sample of 474 mental health trainees were randomly assigned to read a case vignette of either a healthy or an ill older adult client to examine the effects of client health status on trainees' ageist behavior and clinical judgment. One-way MANOVA results showed significant differences between trainees receiving the healthy older client vignette versus the ill older client vignette (Wilks' lambda=.925, p<.001). Follow-up ANOVAs indicated that the health status of the hypothetical client had a significant effect on trainees' self-reported negative ageist behaviors (p=.004), therapeutic process issues (p<.001), and professional bias (p<.001) such that the group receiving an ill hypothetical client endorsed more ageist behaviors, increased difficulty with clinical process issues, and more clinical bias. Group differences between master's and doctoral level trainees in social work, counseling, clinical, and school psychology are also discussed. Consistent with the findings of James and Haley (1995), who surveyed licensed psychologists, our study found evidence of health bias among mental health trainees. Our results contribute to an increased understanding of the role that health status plays in the presence of ageism in trainees and may aid in future formation of curriculum development and clinical education.

ATTITUDES TOWARDS SEEKING MENTAL HEALTH SERVICES AMONG OLDER ADULTS: PERSONAL AND CONTEXTUAL CORRELATES

E. Kessler[1], S. Agines[1], C. Bowen[2], *1. Heidelberg University, Heidelberg, Germany, 2. International Institute of Applied Systems Analysis, Laxenburg, Austria*

Objectives. Especially older adults underutilize professional mental health services. However, little is known about the factors associated with older adults' attitudes towards seeking mental health services (ATSMHS). We therefore investigated a wide range of contextual (e.g., physical access, residence) and personal (e.g., perceived social support, life satisfaction, openness to experience) predictors of ATSMHS in a sample of older community-dwelling adults in Germany. We predicted that representations of old age as well as perceptions of (younger) psychotherapists would be uniquely important for determining ATSMHS. Method. A diverse sample of N=156 older adults (Mage=71.5 years, SD=6.4, range: 60-92) completed questionnaire measures. We used hierarchical linear regression analyses to identify predictors of ATSMHS. Results. In the final saturated model, female gender, urban residence, personal and vicarious experience with psychotherapy and higher perceived social support were each associated with more positive ATSMHS. In addition, more positive representations of old age and less negative perceptions of (younger) psychotherapists explained unique variance in ATSMHS over and above the other predictors. The overall model was significant and explained 49% of the variance in ATSMHS. Discussion. Our findings can be used to inform interventions to improve older adults' ATSMHS. Interventions that seek to improve older adults' representations of their own aging as well as of psychotherapists may be useful for reducing the treatment gap.

INFLUENCE OF PAIN, ANXIETY AND DEPRESSION ON PARTICIPATION IN ELDERLY WITH ARTHRITIS: FINDINGS FROM THE NATIONAL HEALTH AND AGEING TRENDS STUDY (NHATS)

R. Sinha, *Health and Disability Research Institute, Boston University School of Public Health, Boston, Massachusetts*

Introduction: As per NHATS (National Health and Ageing Trends Study), more than half (51.52%) of the elderly (65+) had arthritis. Pain due to arthritis was higher (68.9%) than other examined conditions. Pain, anxiety and depression may potentially influence participation of elderly in society. We aim to study: (a) prevalence of pain, anxiety, depression and participation, and compare these in arthritic and non-arthritic elderly; (b) influence of pain, anxiety and depression on participation in society. Methods: NHATS, 2011 (N=8245) dataset was analyzed. Cross-tabulations were performed for arthritic and non-arthritic populations for pain: bothered by pain and pain ever limited activity; anxiety: feeling nervous, anxious or on edge, and unable to stop worrying; depression: little interest and pleasure in doing things, and felt down, depressed or hopeless; and participation: restricted in one or more of the activities - socializing, going out, caring for others, volunteering, and group/religious. Next, binary logistic regression with participation as outcome was performed after controlling for age, gender, marital status, education, and number of members and children in household. Results: 61.7% were bothered by pain, 42.4% were limited by pain, 42.7% had little interest or pleasure in doing things, 36.8% felt down, depressed or hopeless, 42.9% felt nervous and anxious, 33.5% could not stop worrying and 44.8% reported participation restrictions. These were significantly higher ($p<0.05$) in arthritic elderly. Activity limitations due to pain, anxiety and depression ($p<0.001$) significantly predicted participation restrictions. Conclusions: Pain, depression and anxiety have significant influence on arthritic elderly, and limit their participation in society.

THE EFFECTS OF AGE, STRUCTURE, AND TASK GOALS ON PROBABILISTIC SEQUENCE LEARNING

C. Stillman[1], K.L. Seaman[2], D. Howard[1,3], J. Howard[2,3,4], *1. Georgetown University, Department of Psychology, Washington, District of Columbia, 2. The Catholic University of America, Department of Psychology, Washington, District of Columbia, 3. Georgetown University, Department of Neurology, Washington, District of Columbia, 4. Georgetown University, Center for Brain Plasticity & Recovery, Washington, District of Columbia*

We learn about complex sequential regularities in our environment through experience. This study explored how sequence structure, age, and task goals (predicting vs. responding) moderate this type of learning. Younger and older adults completed one of two probabilistic sequence learning tasks, The Triplets Learning Task (TLT) or the Triplets Prediction Task (TPT). These are similar in that on each trial, or "triplet", participants view two sequentially presented "cues", followed by a "target". Unbeknownst to them, one cue probabilistically predicts the target's location, resulting in some triplets occurring with high (HP) and others with low probability (LP). Structure can be manipulated by changing which cue (Cue 1 or Cue 2) is predictive. Crucially, the tasks differ in their goals; the TLT requires participants to respond to targets appearing on the screen, whereas the TPT requires participants to predict the target's location. Learning in both tasks is characterized by comparing performance on HP vs. LP triplets. We asked: (1) when during training do age differences in learning appear, and (2) how does the structure of the regularity affect learning? The pattern of learning differed dramatically depending on which task participants completed. Age differences appeared early in training when participants were predicting (TPT), but late when participants were responding (TLT). Furthermore, the effect of structure depended on age and task goal. Structure influenced older adults more when making predictions, and younger adults more when making responses. These results suggest that task goals can influence age differences in learning complex sequential regularities.

INDEPENDENT AND INTERACTIVE ASSOCIATIONS OF TWO GENETIC POLYMORPHISMS WITH FIVE PERSONALITY TRAITS ON DECLARATIVE MEMORY PERFORMANCE IN OLDER ADULTS

S. Sapkota[1], S.A. Wiebe[2,1], B. Small[3], R.A. Dixon[2,1], *1. Centre for Neuroscience, University of Alberta, Edmonton, Alberta, Canada, 2. Department of Psychology, University of Alberta, Edmonton, Alberta, Canada, 3. School of Aging Studies, University of South Florida, St. Petersburg, Florida*

Exploring complex biology-personality-cognition linkages in aging, some recent research has reported promising associations among selected genetic polymorphisms, personality factors, and neurocognitive phenotypes. This study examines the influence and magnitude of risk (independently and interactively) associated with (a) two neurodegenerative-related polymorphisms (i.e., Apolipoprotein E (APOE; rs7412; rs429358) and Clusterin (CLU; rs11136000)) and (b) five personality traits with (c) performance and change on two declarative memory domains (i.e., episodic, semantic) in (d) normal older adults. Structural equation modeling was used to examine independent and interactive effects of APOE, CLU, and personality traits (NEO-PI, especially openness to experience and neuroticism) on memory performance at baseline and up to 14 years of longitudinal change in older adults (N = 282; baseline age range = 53-84 years) from the Victoria Longitudinal Study. Several supportive results were observed. First, we observed two personality-memory associations, with higher openness to experience levels associated with better episodic and better semantic memory. Second, three significant gene x personality interactions were observed whereby differentially worse declarative memory performance occurred in the following patterns: (a) APOE allelic risk (ε4+) carriers with lower openness to experience levels, (b) CLU allelic risk carriers (C+) with higher extraversion levels, and (c) CLU allelic risk carriers (C+) with higher neuroticism levels. The first two results support a gene x personality intensification hypothesis for semantic memory performance in aging. Specifically, selected personality trait levels (i.e., openness to experience, extraversion) moderate and magnify the risk contributed by specific neurodegenerative-related genetic polymorphisms (i.e., APOE and CLU) on declarative memory at baseline.

AWARENESS OF CHANGE IN MEMORY AND EXECUTIVE FUNCTIONING PREDICTS EXECUTIVE FUNCTIONING DECLINE

J.S. Carmasin, B.T. Mast, *Psychological and Brain Sciences, University of Louisville, Louisville, Kentucky*

Recent studies suggest that awareness of cognitive decline is a multidimensional construct and that awareness of executive functioning (EF) is underexplored. The current study examined the association between awareness of memory, awareness of EF, and EF decline. The sample included 625 older adult participants (27.2% cognitively normal, 63.2% MCI, 9.6% mild AD) and their study partners (adults who spend 10+

hours a week with a participant) from the Alzheimer's Disease Neuroimaging Initiative (ADNI). Linear regression analyses were used to determine the effects of baseline memory and EF awareness on Trails B performance (a timed EF task) at a 12-month follow-up visit. Memory and EF awareness were respectively operationalized as the 8 Memory and 15 EF questions on the Everyday Cognition (ECog) scale. Higher scores on the ECog indicate greater perceived decline in everyday tasks compared to 10 years prior. The analyses controlled for age, gender, education, baseline depression, and baseline Trails B score. More impaired baseline ECog memory ratings by participants and study partners predicted poorer Trails B performance at 12-month follow-up (participant self-ratings: model R-sq=.646, β=.058, p=.024; study partner ratings: model R-sq=.654, β=.120, p<.001). More impaired baseline ECog EF ratings also predicted poorer Trails B performance at 12-month follow-up (participant self-ratings: model R-sq=.645, β=.051, p=.050; study partners ratings: model R-sq=.649, β=.086, p=.001). These results suggest that both memory and executive functioning subjective ratings on the ECog, among both older adults and close family/friends, are predictors of EF decline.

SUBJECTIVE MEMORY APPRAISAL IN NONAGENARIANS

B. Lyon[1], K.E. Cherry[1], E. Boudreaux[1], A. Barker[1], S. Jazwinski[2], *1. Louisiana State University, Baton Rouge, Louisiana, 2. Tulane University Health Sciences Center, New Orleans, Louisiana*

Subjective memory appraisal plays an important role in successful aging. In this study, we report the first findings from a pilot intervention designed to improve self-rated memory abilities by increasing memory awareness in everyday life. Participants were young-old (60-89 years) and oldest-old (90 + years) adults enrolled in the Louisiana Healthy Aging Study (LHAS). All completed the Memory Controllability Inventory (MCI; Lachman, Bandura, Weaver, & Elliott, 1995) and a 10-item memory self-efficacy scale from the Memory Functioning Questionnaire (MFQ; Zelinski & Gilewski, 2004) at pretest and posttest. Participants were tested in one of three groups: control group 1 (no further contact until posttest), control group 2 (personal memory diary kept over a 4-week period) or an experimental group (received objective information about memory aging, two sessions of memory exercises, and kept the memory diary). For all participants, MCI scores (perceived memory ability subscale) improved at posttest relative to pretest (p < 0.01). However, MFQ scores (memory self-efficacy) were comparable from pre to posttest. Analyses of the memory diary data indicated that the prevalence of memory successes and failures was not associated with age group. These data indicate that subjective memory appraisal remains strong in late life. This research was supported by the Louisiana Board of Regents through the Millennium Trust Health Excellence Fund [HEF(2001-06)-02] and the National Institute on Aging (P01 AG022064).

DO OLDER ADULTS AVOID USING MEMORY RETRIEVAL IN EVERYDAY SITUATIONS? A DAILY DIARY STUDY OF STRATEGIES AND INFLUENCES

M. Jordano, D.J. Frank, D.R. Touron, *Psychology, The University of North Carolina at Greensboro, Greensboro, North Carolina*

For many everyday tasks, skilled performance depends on the ability to shift from an algorithmic strategy (e.g., following a map while driving) to a retrieval-based strategy (e.g., navigating from memory while driving). In previous studies, older adults demonstrated a reluctance to shift to retrieval-based strategies when completing novel tasks. However, the novel tasks used involved numerous massed trials within a laboratory setting. It is currently unknown whether or not older adults will demonstrate retrieval reluctance for everyday tasks involving longer, less intense learning periods. The current study examined older adults' endorsement of various strategies used to complete everyday tasks. For seven consecutive days, younger and older adults completed a diary survey which asked whether or not they performed thirteen everyday activities (e.g., did you go shopping today?). Each activity could be completed using different strategies that varied in their reliance on memory retrieval. For each task, participants specified which strategies they used, indicated how frequently they perform that task, and rated their confidence in using each possible strategy. Hierarchical linear models were used to examine the influence of age on retrieval use, while controlling for frequency of task engagement, time since initial learning (how long ago they first completed the task), task complexity, and motivation to avoid errors. Initial data indicate that older adults use fewer retrieval-based strategies in everyday tasks and report lower confidence in their ability to use retrieval-based strategies, particularly for less frequently completed tasks.

MUSICAL TRAINING, HYPERTENSION, AND NEUROPSYCHOLOGICAL FUNCTIONING IN OLDER ADULT MUSICIANS

J. Strong, B.T. Mast, *Psychological and Brain Science, University of Louisville, Louisville, Kentucky*

Previous research suggests that musical training has a positive impact on cognitive functioning in late life, and that high activity musicians (10+ years of training) show even greater cognitive benefits. Older musicians may also have better cardiovascular health. This study examined whether high levels of musical training had a positive impact on cognition, both directly and indirectly via lower levels of hypertension. We collected the music training history of community dwelling older adult musicians (n=19) and assessed health conditions and neuropsychological profile using a standard battery. All musicians had extensive experience either in an ensemble or in private lessons, and many had pursued careers in music related fields (e.g., performance or education). Musicians were separated into two groups based on the number of years enrolled in private lessons (i.e. "high activity" had more than 10 years). High activity musicians had lower than expected rates of hypertension (27.3% reported a diagnosis of hypertension), whereas "low activity" musicians had higher than expected rates (62.5% reported a diagnosis, $\chi 2=3.616$, p=0.05). Furthermore, musicians without a diagnosis of hypertension performed significantly better on verbal fluency (Animal Naming, F(1,13)=7.02, p<0,05), delayed verbal memory (California Verbal Learning Test, F(1,13)=4.41, p=0.05), and processing speed (Trails A, F(1,13)=6.75, p<0,05). These findings suggest that some of the beneficial effects of musical training on cognition may be due, in part, to better cardiovascular health.

INFORMATION PROCESSING AND DEPRESSIVE SYMPTOMS IN OLDER JAPANESE ADULTS

F. Togo[1], A. Ohnishi[2], K. Ishimatsu[3], *1. The University of Tokyo, Tokyo, Japan, 2. JNIOSH, Tokyo, Japan, 3. Jikei Institute, Osaka, Japan*

The present study assessed the associations between information processing and depressive symptoms in 11 young (aged 18-27 yr) and 37 elderly male volunteers (aged 60-69 yr). Reaction times (RT) for a simple RT task and a flanker task were collected. For the simple RT task, participants pressed a key as quickly as possible once the stimulus appeared on the screen. For the flanker task, stimuli consisted of a row of 5 items with the third (central) item as either a leftward or rightward pointing arrow. Participants pressed one key when the central target pointed to the left or a different key when it pointed to the right. The two items (flankers) on either side of the central target were either horizontal lines (neutral condition) or arrows pointing in the same (congruent condition) or opposite direction (incongruent condition) as the central target. Participants completed 96 trials of the flanker task. Information processing speed was calculated by subtracting the median simple RT (i.e., reflecting motor response time) from the median RT of each flanker condition. Depressive symptom was assessed by the Center for Epidemiological Studies Depression Scale. Elderly subjects had significantly slower processing speed in all flanker conditions compared to young subjects. There was a significant and positive association between processing speed for incongruent condition and the level of depressive symptom in elderly subjects. These results indicate that impaired information processing in the conflict condition requiring executive control might be caused partly by depressive symptoms in the elderly.

THE MEDIATING ROLE OF OPTIMISM AND PESSIMISM ON THE RELATIONSHIP BETWEEN SPIRITUALITY AND DEPRESSION

I. Nam[1], H. Yoon[1], Y. Kim[1], Y. Lim[1], H. Lee[2], K. Choi[1], *1. Hallym University, Chuncheon, Republic of Korea, 2. Hallym Polytechnic University, Chuncheon, Republic of Korea*

Background: Numerous studies have demonstrated the important protective qualities of spirituality against the negative effects of depression. However, few studies examine spirituality's underlying mechanisms through which effects on depression may be produced. Finding a mediating variable linking the spirituality-depression relationship may help practitioners and researchers to develop appropriate spirituality-based intervention models for depression of cancer patients. Methods: In this study, we considered whether optimism could be a mediating variable linking spirituality and depression. We examined relationships between spirituality, optimism, and depression among a sample of 600 South Korean older adults diagnosed with cancer who participated in a three-year longitudinal study about their quality of life. Results: Results from regression and path analyses confirmed that optimism linked spirituality and depression. Higher spirituality levels were associated with increased optimism levels, and in turn the increased optimism levels by spirituality were associated with decreased depression(CI=-.04/-.02). Higher spirituality levels were associated with decreased pessimism levels, and in turn the decreased pessimism levels by spirituality were associated decreased depression(CI=-.05/-.02). Discussion: Understanding optimism and its inverse association with depression level is critical for the appropriate provision of spirituality-based interventions for cancer patients experiencing a difficult time in their life.

SESSION 630 (POSTER)

METHODOLOGICAL ISSUES IN AGING RESEARCH

QUALITATIVE RESEARCH TRENDS IN GERONTOLOGY: AN 18-YEAR ANALYSIS OF 7 JOURNALS (1995 – 2012)

ÁINE. Humble, *Family Studies and Gerontology, Mount Saint Vincent University, Halifax, Nova Scotia, Canada*

It is suggested that qualitative gerontology research is increasing, but little systematic analysis has been carried out to test this assertion. A 2007 study by Schoenberg, Shenk, and Kart that reviewed three years (2003 – 2005) of content in three journals (The Gerontologist, Journal of Applied Gerontology, and Journal of Gerontology: Social Sciences) found that 10% of all empirical studies were qualitative. They also suggested there were "no discernible trends signaling an increase or decrease in the proportion of qualitative articles published" (p. 5), however an analysis of more than three years and more than three journals is needed to make adequate trend claims. This study identified qualitative findings in the same three journals as Schoenberg et al.'s study as well as four additional journals (Canadian Journal on Aging, Journal of Aging Studies, Journal of Cross-Cultural Gerontology, and Journal of Women and Aging) over an 18-year period (1995 – 2012). The overall percentage of qualitative research was 22.93% during that 18-year period, much higher than Schoenberg et al.'s findings. Looking at 3-year intervals for all seven journals, results showed an increase over time: (a) 1995 – 1997: 15.18%, (b) 1998 – 2000: 19.86%, (c) 2001 – 2003: 21.14%, (d) 2004 – 2006: 21.39%, (e) 2007 – 2009: 25.49%, and (f) 2010 – 2012: 32.22%. However, there were dramatic differences across different journals. For example, Journal of Gerontology: Series B published the least amount (2.51% overall), and Journal of Aging Studies published the most (82.66% overall). Some general comments about features such as method details will be presented.

MODELING CHANGES IN GAMBLING BEHAVIOR USING LATENT TRANSITION ANALYSIS

J. Lee[1], G. Yen[1], S.B. Maitland[2], J. Wiebe[3], D. Hodgins[4], B. Gottlieb[2], A. Davey[1], *1. Public Health, Temple University, Philadelphia, Pennsylvania, 2. University of Guelph, Guelph, Ontario, Canada, 3. Responsible Gambling Council, Toronto, Ontario, Canada, 4. University of Calgary, Calgary, Alberta, Canada*

Gambling behavior lies along a dynamic continuum. Some individuals choose not to gamble while others gamble socially or recreationally. Still other individuals may experience problems with their gambling and these problems may vary in terms of severity and duration. To date, little is known about whether subpopulations of gamblers exist, their prevalence, and factors associated with transitions in gambling behavior over time. Past research suggests at least two types of gamblers: 1) recreational (social) and 2) pathological gamblers, but between two and four gambling types of gamblers have been proposed. We apply latent transition analysis to a sample of 328 gamblers (60% women, 61% partnered, aged 18-82) in Winnipeg, Manitoba, sampled 6 months apart. We identified Recreational, Moderate, and Problematic gamblers within eachThe majority were classified as Recreational (63%) at the time of the prevalence study. Bootstrap likelihood ratio tests were used with factor mixture analysis suggested that a 3-class model best characterized the data. Classes are consistent with occasional gamblers, moderate gamblers, and problematic gamblers. Transitions toward less intensive gambling were more prevalent than transitions toward less intensive gambling. Results suggest that latent transition analysis can be a valuable tool for gambling researchers.

USING TREE-STRUCTURED ANALYSIS TO EXPLORE SOCIO-DEMOGRAPHIC AND CANCER TREATMENT CHARACTERISTICS ASSOCIATED TO QUALITY OF LIFE IN OLDER RURAL BREAST CANCER SURVIVORS

A. Azuero, K. Meneses, P. McNees, *University of Alabama at Birmingham, Birmingham, Alabama*

Background: Breast cancer is the most common invasive cancer in women. It is most prevalent among women 50 or older (90% of all cases). Risk of dying from breast cancer decreased in the past decades due to improvements in detection, treatment, and supportive care. Although providing primary treatment remains the priority for clinicians, maintaining survivors' quality of life (QOL) post-treatment is also a main objective. Methods: Secondary analysis of data from 331 older survivors (ages 55-90) enrolled in the Rural Breast Cancer Survivors Study, a study of psychoeducational support interventions among rural Florida-dwelling women. Tree-structured analyses were used to explore the relationships between health-related QOL (measured by SF-36) and socio-demographic and treatment characteristics. Classification trees are models useful for identifying relevant combinations of predictors that cannot be uncovered by traditional linear models. Tree models are not easily described by equations and are therefore depicted graphically. Results: The mental aspect of health-related QOL was predicted by combinations of social support (measured by MOS-SS), number of prescriptions, and reports of changes in economic lifestyle. These variables with the addition of body mass index emerged also as the predictors of the physical aspect of health-related QOL. Conclusion: Results corroborate previous findings linking social support with quality of life, and provide further insight on the interactions of survivors' characteristics influencing QOL. Strengthening of social support networks should be emphasized in post-treatment care of older rural breast cancer survivors, to help improve or maintain both mental and physical aspects of these survivors' QOL.

PSYCHOMETRIC EVIDENCE FOR THE USE OF PARENTING SCALES WITH CUSTODIAL GRANDMOTHERS

W. Merchant[1], G.C. Smith[1], B. Hayslip[2], F.H. Strieder[3], J. Montoro Rodriguez[4], G.R. Hancock[5], *1. Kent State University, Kent, Ohio, 2. University of North Texas, Denton, Texas, 3. University of Maryland, Baltimore, Maryland, 4. California State University, San Bernardino, California, 5. University of Maryland, College Park, Maryland*

Although parenting is increasingly recognized as the central responsibility of custodial grandmothers (CGM), it is unknown if valid and reliable measures of their parenting behaviors exist. We examined the psychometric properties of five parenting scales designed originally for birth parents with a sample of 343 CGM (M age = 54, SD = 10.17) of target grandchildren ages 4-12 (M age = 7.81, SD = 2.56 ; 51% male) enrolled in a multisite randomized clinical trial. At baseline, CGM were asked to complete five parenting scales commonly used with birth parents to assess Inconsistent Discipline; Harsh Discipline; Effective Discipline; Warmth; and Nurturance. Confirmatory Factor Analyses (Mplus 7.11) revealed that the respective items on these five scales measured the same latent constructs in our CGM sample that they were intended to assess among birth parents (CFI = .94 ; RMSEA = .05). We also computed Cronbach's alpha values to evaluate the internal consistency of each measure (range = .72 to .88). To examine construct validity, we then used SEM analyses (Mplus 7.11) to see if these five parenting scales related to indices of CGM psychological distress and TCG behavioral outcomes as theoretically predicted by the Family Stress Model. As expected, statistically significant pathways were observed between CGM distress, each of the five parenting scales, and TCG behavioral outcomes (CFI = .97; RMSEA = .054). We conclude that the five parenting scales examined here are psychometrically sound and suitable for use with samples of CGM. [Funded by R01NR012256]

THE EFFECT OF SPEED OF PROCESSING TRAINING ON IADLS AND DEPRESSIVE SYMPTOMS: RESULTS FROM THE IHAMS RANDOMIZED CONTROLLED TRIAL

F.D. Wolinsky, M.W. Vander Weg, M. Howren, M.P. Jones, M.M. Dotson, *College of Public Health, University of Iowa, Iowa City, Iowa*

Background: Age-related declines in cognition are common. Recent clinical trials have shown that computerized speed of processing training (SOPT) can improve both targeted and non-targeted cognitive outcomes, but evidence of its effects on health outcomes is limited. Methods: Within two age-bands (50-64, > 65) 681 patients were randomized to four groups that each received ten hours of initial training. There were three SOPT intervention groups (on-site, on-site with four hours of subsequent booster-training, or at-home) and an on-site attention-control group using computerized crossword puzzles. Six-hundred-twenty participants (91%) were re-assessed at one year. The onset of difficulties with one or more additional IADLs, and depressive symptomatology reductions of three or more points (0.66 SD) were evaluated using logistic regression analysis. Results: 97 participants (15.6%) experienced the onset of one or more additional IADLs. The SOPT with booster-training group reduced the odds of additional IADL onset (AOR = 0.39, p = 0.013) compared to the attention-control group, but the on-site SOPT and at-home SOPT groups did not. 102 participants (16.5%) experienced declines of three or more points on the CESD-12. The SOPT with booster-training group increased the odds of experiencing such declines on the CESD-12 (AOR = 2.80, p = 0.003) compared to the attention-group, but the on-site SOPT and at-home SOPT groups did not. Conclusion: Fourteen hours of SOPT training led to meaningful and enduring improvements in the everyday lives of older adults by protecting against IADL progression and reducing depressive symptomatology.

THE MULTIDISCIPLINARY DIAGNOSTIC MEDICAL VISIT AT THE COGNITIVE DISORDERS PROGRAM

R.L. Abney[1], K.E. Cahill[2], *1. University of Michigan Health System, Geriatrics Center, Ann Arbor, Michigan, 2. University of Michigan, Michigan Alzheimer's Disease Center, Ann Arbor, Michigan*

The University of Michigan Geriatrics Center, Cognitive Disorders Program provides neurological evaluation and treatment planning for patients with changes in memory. The full evaluation typically spans 3 clinic appointments, including full neurology intake, neuropsychological or imaging testing and diagnostic test review appointment. Since 2013, the Cognitive Disorders Program (CDP), piloted a multidisciplinary team approach for the diagnostic clinic visit schedule of two neurologists: test results review, diagnosis, and treatment planning are reviewed with patients and family caregivers and addressed by a neurologist, nurse practitioner and social worker during one joint clinic appointment. Research (Bunn et al/2012) shows that patients and families desire ongoing support throughout their experience with dementia. Research also indicates that the patient and family caregiver(s) experience the discussion of diagnosis and condition very differently. A multidisciplinary approach provides both patient and family member ample opportunity for individual attention by various team members, or separate time to discuss individual concerns and questions privately with clinic providers. In order to evaluate the effectiveness and value of a multidisciplinary diagnostic visit, a quality improvement project was initiated during the implementation of the pilot process. The CDP team conducts on average 3-5 weekly multidisciplinary diagnostic visits. An analysis of a telephone survey to patients/ family caregivers was designed to provide data about effectiveness and quality improvement areas for the multidisciplinary approach. This study's aim is to verify the hypothesis that patients/families benefit from direct access to the multidisciplinary team and benefit from available supports in managing care giving concerns.

A MENTAL MODEL APPROACH TO AGING AND STRATEGY SELECTION

D.J. Frank, D.R. Touron, *Psychology, The University of North Carolina at Greensboro, Greensboro, North Carolina*

Older adults often perform worse in laboratory task compared to younger adults. Although primarily attributable to decreases in fluid cognitive abilities, age-related performance declines are sometimes exacerbated by sub-optimal strategic choices. Models of strategy selection assume an accurate mental task representation is necessary to choose appropriate strategies. However, task understanding has not been measured directly in older and younger adults. We take a mental model approach to understanding how older and younger adults understand a task and how this impacts strategic choices. Of particular interest is how task understanding and strategic choices change with task experience. Mental model and metacognitive theories suggests that errors in task understanding are corrected through a process of task and performance monitoring and updating. If monitoring and updating require executive control, older adults may fail update their mental models of the task and persist with sub-optimal strategies as a result. Participants learned about a novel chemistry task requiring them to manage a chemical solution and decide what chemicals to add to maintain a chemical balance in the solution. The task was disguised by arbitrary terminology (e.g., Liquid Chemical D, Property Q) but otherwise directly analogous to managing a swimming pool (e.g., adding chlorine, managing pH). Older and younger adults' mental models of the task were measured after instruction and again after task performance. Participants mental models were compared with task performance to assess the impact of mental model updating on strategic choices.

PSYCHOMETRIC PROPERTIES OF THE CAREGIVER REACTION SCALE

K. O'Malley, S. Qualls, M. Kenny, *University of Colorado Colorado Springs, Colorado Springs, Colorado*

Reliable and valid measures of caregiver burden and stresses are critical components of providing effective care to family caregivers because these measures inform treatment options and interventions. Assessments should be comprehensive, including positive aspects of caregiving as well as multiple dimensions of stress and burden. One such measure is the Caregiver Reaction Scale (CRS; Qualls & Kenny, 2008), a clinical tool adapted from research protocols developed by Pearlin et al. (1990) for use in mental health service settings. The CRS is a multi-dimensional scale designed for clinical practice that assesses caregiver burden in addition to feelings of competence and self-confidence. This study examined the psychometric properties of the CRS using a sample of N = 483 family caregivers seeking services in a community based mental health and aging family service agency. 9 of the 10 subscales of the CRS exhibited very good internal reliability consistency $\alpha \geq .82$. Test-retest reliability, conducted on a smaller sample of caregivers, was $r \geq .7$ and convergent validity evidence is positive. A report format was created using visual analog presentation of results for each of the subscales. Means and standard deviations are reported for the clinical sample, both of which are visible on the analog report format used by clinicians. The CRS offers service providers a tool to assess particular dimensions of caregiver experience that can guide interventions and may be used in evaluation.

MEASUREMENT INVARIANCE TESTING OF A MULTIDIMENSIONAL SCALE OF ATTITUDES TOWARD OLDER ADULTS IN TAIWANESE AND AMERICAN COLLEGE STUDENTS

P.M. Allen, H. Ko, K. Hooker, *School of Social and Behavioral Health Sciences, Oregon State University, Corvallis, Oregon*

Previous research has produced mixed findings about the relative positivity of aging stereotypes in Asia and the United States, and one underexplored explanation is that cross cultural differences are domain specific. We examined the utility of one measurement tool for drawing these comparisons across domains by adapting the Older Person Scale (OPS; developed in Taiwan, Lu & Kao, 2009) for use in English and examining its psychometric properties of partial measurement invariance across two samples of Taiwanese (N=658) and American (N=936) college students. The 35-item OPS assesses four domains: Physical (5 items), Psychological (10 items), Relationship (15 items), and Employment (5 items). However, confirmatory factor analyses did not support the four-factor model as suggested by the original scale model in either sample. Analyses of each domain separately demonstrate invariance for the Physical, Psychological, and Relationship domains constrained for equality of factor loadings across culture groups. In particular, the Physical domain items exhibit the strongest measurement properties for both groups. Items from the Psychological and Relationship domains required substantial revisions to the measurement model to achieve equality of factor loadings across groups. The Employment domain performs poorly for the American sample. Even after excluding poorly performing items, our findings suggest that items from this scale are not tapping the higher order construct of attitudes toward older adults in the hypothesized four domains for Taiwanese or American college students in this study. Results suggest that some items may have different meanings between Taiwanese and American cultural contexts.

A VALIDATION OF THE LIFE SATISFACTION SCALE IN A POPULATION OF ADS PARTICIPANTS

A.M. Ogletree, S.E. Jarrott, *Virginia Tech, Blacksburg, Virginia*

With evidence building that adult day services (ADS) benefit family caregivers of frail elders, attention turns to measuring their effect on participants. Life satisfaction is a subjective indicator of well-being that may be difficult for cognitively impaired adults to express. Virginia Tech's ADS adopted the 32-item Lohmann's Life Satisfaction Scale (LSS;1980) for care planning because items reflect dimensions of well-being relevant to the client population. Published psychometrics on the scale, however, are limited. With several years' worth of LSS assessments with a population exhibiting mild to moderate dementia, the current study explores the psychometric properties of the LSS as a research and practice tool. Virginia Tech's ADS integrated assessment system includes an established measure of depression (Geriatric Depression Scale [GDS]; Greenberg, 2007), reflecting the mental health dimension of quality of life (QOL). We assessed the psychometric properties of the LSS by analyzing data for individuals ($N = 87$) who had completed the GDS and LSS within one week of each other. The LSS demonstrated high internal consistency (α=.91). Most individual items positively correlated with the LSS sum score (p <0.01). Individual item and sum LSS scores negatively correlated with GDS sum scores (r = -.23 to -.81, p <0.01), indicating that individuals with less depressive symptoms are more satisfied with life. With few options for self-reported QOL for persons with dementia, our data suggest that the LSS is a viable tool for care providers and researchers striving to understand and improve participants' experiences in ADS.

OUTCOME RATING SCALE: VALIDITY IN AN OLDER ADULT SAMPLE

K. O'Malley, S. Qualls, M. Kenny, *University of Colorado Colorado Springs, Colorado Springs, Colorado*

Evaluating outcomes and assessing the client's belief about their progress have been shown to improve overall effectiveness of the treatment and improve treatment success in cases with poor prognoses. The Outcome Rating Scale (ORS; Miller, Duncan, Brown, Sparks, & Claud, 2003) was designed to assess treatment outcomes and can be administered quickly and efficiently in a clinical setting but it has not been validated in a sample composed entirely of older adults. The ORS is a 4-item scale that uses a visual analog to assess individual, social, interpersonal, and overall well-being. This preliminary study examined the psychometric properties of the ORS for older adults using a sample of N = 42 help-seeking older adults (age M = 71) who completed the assessment on at least 3 occasions approximately 7 days apart during the course of treatment. Test-retest for 3 of the 4 items and the total score were good $r \geq .71$. Internal consistency reliability for the ORS at all times of assessment was excellent $\alpha \geq .95$. Overall, no notable differences in ORS scores for male and female participants were found. The ORS appears to be a valid and reliable assessment of treatment effectiveness for use in an older adult population.

A SYSTEMATIC REVIEW OF TYPE 2 DIABETES MELLITUS AND HYPERTENSION IN NEUROIMAGING STUDIES OF COGNITIVE AGING: TIME TO ESTABLISH NEW NORMS

N. Anderson[1,3,4], L. Meusel[1], N.K. Kansal[1], E. Tchistiakova[2,4], W. Yuen[1], B. MacIntosh[2,3,4], C. Greenwood[1,3,4], *1. Rotman Research Institute, Baycrest, Toronto, Ontario, Canada, 2. Sunnybrook Research Institute, Toronto, Ontario, Canada, 3. University of Toronto, Toronto, Ontario, Canada, 4. Canadian Partnership for Stroke Recovery, Toronto, Ontario, Canada*

The rising prevalence of type 2 diabetes (T2DM) and hypertension in older adults and the deleterious effect of these conditions on cerebrovascular and brain health warrant attention from cognitive aging neuroimaging research. Specifically, interpretation of individual or group differences in blood oxygenation level dependent (BOLD) MRI or positron emission tomography (PET H2O15) signals as reflective of differences in neural activation underlying a cognitive operation of interest requires assumptions of intact vascular health amongst the study participants. Without adequate screening, inclusion of individuals with T2DM and/or hypertension in "healthy" samples may introduce unwanted variability and bias to brain and/or cognitive measures, and increase potential for error. We conducted a systematic review of the cognitive aging neuroimaging literature to document the extent to which researchers account for these conditions. Of the 232 studies selected for review, few explicitly excluded individuals with T2DM (9%) or hypertension (13%). A large portion had exclusion criteria that made it difficult to determine whether T2DM or hypertension were excluded (44% and 37%), and many did not mention any selection criteria related to T2DM or hypertension (34% and 22%). Of all the surveyed studies, only 29% acknowledged or addressed the potential influence of inter-subject vascular variability on the measured BOLD or PET signals. To reinforce the notion that individuals with T2DM and hypertension should not be overlooked as a potential source of bias, we provide an overview of metabolic and vascular changes associated with T2DM and hypertension, as they relate to cerebrovascular and brain health.

WHAT'S THAT SMELL? EXPLORING THE ASSOCIATIONS BETWEEN APOE E4, WORRY, AND AGE THROUGH OLFACTION

E.S. Bower[1], C. Murphy[1,2], *1. SDSU/UCSD Joint Doctoral Program in Clinical Psychology, San Diego, California, 2. San Diego State University, San Diego, California*

The aim of the current study was to explore the effects of worry and the e4 allele of the Apoliprotein E gene (apoE4) on olfactory learning and memory in healthy young and older adults. The olfactory modality is uniquely suited for studying the interaction of apoE4 and worry on cognition. Carriers of e4 allele (apoE4+) perform worse on tests of olfaction compared to noncarriers (apoE4-), and olfactory deficits are associated with certain anxiety-related psychological disorders that are associated with worry. It was hypothesized that higher worry scores would be associated with the poorest performance on tests of odor memory in older apoE4+ adults. Approximately 32 older (60+ years) and 32 younger (18-26 years) adults completed the California Odor Learning Test to obtain measures of odor recall, recognition, and identification. All participants were genotyped for apoE4 status, and completed the Penn State Worry Questionnaire to measure their tendency to worry. Multiple regression analyses including all the 2-way and 3-way interactions were conducted for each of the memory indices. Results for odor recognition and identification revealed nonsignificant interaction effects. Results for odor recall indicated that higher self-reported worry was associated with higher scores on delayed odor recall in both younger and older apoE4- adults. In apoE4+ younger and older adults, worry was not significantly associated with odor recall. These findings may suggest that apoE4+ older and younger adults are not benefiting from performance effects of anxiety.

VASCULAR LESIONS AS A PREDICTOR OF FUNCTIONAL DECLINE AMONG OLDER ADULTS WITH MAJOR DEPRESSION

C. Hybels[1], C.F. Pieper[1], D.C. Steffens[2], *1. Dept of Psychiatry, Duke University Medical Ctr, Durham, North Carolina, 2. University of Connecticut Health Center, Farmington, Connecticut*

Depression is a leading cause of disability among older adults, but it is not fully known why some patients with depression experience functional decline. Research has shown that cerebral vascular changes, or specifically, increased white matter hyperintensities (WMH) seen on brain imaging, are associated with functional impairment. These vascular changes are also associated with late life depression. Our objective was to examine within a sample of older adults initially diagnosed with major depression whether white matter lesion volume was associated longitudinally with functional decline. The study sample was 244 patients with major depression enrolled in the Neurocognitive Outcomes of Depression in the Elderly study and followed for up to sixteen years. Limitations in basic activities of daily living (ADLs), instrumental activities of daily living (IADLs) and mobility were assessed annually. Using mixed model regression analyses and controlling for age, race, sex, education, hypertension, and cognition at their baseline values, increased volume of WMH was associated with an increase in total limitations (p=0.0030). The association was significant across different domains of function. We observed an increase in IADL limitations (p=0.0281), an increase in ADL limitations (p=0.0011), and an increase in mobility limitations (p<0.0001) over time associated with increased WMH volume. These findings suggest increased vascular lesion volume seen in some older patients with major depression is associated with an increased risk of functional decline. Older depressed patients with vascular risk factors may benefit from treatment of cerebrovascular risk factors as well as their depression. (Supported by NIH R03MH095917)

PATTERNS OF EARLY EXPERIENCES AND TRAJECTORIES OF INFLAMMATORY MARKERS: THE VA NORMATIVE AGING STUDY

L. Lee[1,2], L.D. Kubzansky[4], A.J. Mehta[4], J. Schwartz[4], A. Spiro[1,2,3], *1. Boston University Schools of Public Health & Medicine, Boston, Massachusetts, 2. VA Boston Healthcare System, Boston, Massachusetts, 3. Boston University School of Dental Medicine, Boston, Massachusetts, 4. Harvard University School of Public Health, Boston, Massachusetts*

Inflammation is a key mechanism linking early adversities to later-life morbidity. We previously used a person-centered approach to identify patterns of childhood experiences across multiple domains. This study investigated the association between these patterns and trajectories of inflammatory markers in later life. We used data from the VA Normative Aging Study. In 1996, participants responded to a retrospective measure of childhood experiences, the Childhood Experiences Scale (CES). 635 men who had completed the CES provided up to 5 serum measures of inflammatory markers (CRP, IL-1β, IL-6) between 1999-2010 (1st visit age: M=72.5, SD=6.6). In a latent class analysis of CES data, we identified 3 distinct patterns of childhood experiences: normative/supportive (42%), difficult/harsh discipline (15%), and low social integration (43%). Here, we related these patterns to inflammation. First, for each biomarker, we examined whether a no-change, linear, or quadratic change model best described its age trajectory, and extracted for each man the estimated biomarker intercept and slope from the best-fitting model. ANOVA was then used to examine differences in these outcomes among the 3 childhood experience classes. For CRP, there was no significant change over age. The difficult/harsh discipline class had higher CRP than the other classes. IL-1β declined over age; the decline was steeper for the difficult/harsh discipline class, but not significantly so. Rates of IL6 change over age were highly variable, but classes did not differ systematically on IL6 intercept nor slope. Our findings provide some evidence supporting an association between childhood adversities and pathophysiological processes in later life.

PERCEIVED EVERYDAY DISCRIMINATION AND C-REACTIVE PROTEIN IN MIDDLE-AGED AND OLDER ADULTS

H. Collins, L.A. Wray, *Department of Biobehavioral Health, Pennsylvania State University, University Park, Pennsylvania*

Past studies have documented that discrimination is associated with negative physical (e.g., mortality) and mental health (e.g., depression) outcomes. Cumulative disadvantage theory suggests that facing more than one type of discrimination increases the risk of negative health outcomes. Several studies have shown that C-reactive protein, a marker of systemic inflammation, predicts future cardiovascular events, chronic disease, and mortality. The current study used 2006 psychosocial and biomarker data from the nationally representative Health and Retirement Study on 4,486 middle- and older-aged adults, in order to examine age, sex, and race everyday discrimination and their relationships to elevated C-reactive protein levels (>3.0 mg/L), controlling for known covariates of C-reactive protein. The mean age of the sample was 68.16± 9.84 and over half were female (52.10%), Caucasian (91.85%), and had at least a high school education (85.56%). We hypothesized that experience of everyday discrimination, and particularly more than one type of discrimination (age, sex, race) will be associated with elevated C-reactive protein levels. Preliminary results support the literature and suggest that less than high school education (OR=1.46, p = .0003), being female (OR=1.82, p < .0001) or African American (OR=1.54, p = .0007), or having a BMI over 30 (OR=2.90, p < .0001), as well as perceived everyday discrimination (OR=1.13, p = .026), are associated with elevated C-reactive protein levels. These results suggest that everyday discrimination may contribute to elevated C-reactive protein levels. The results also support the current literature that there may be long-term consequences of facing discrimination on health.

LEVELS OF HOMOCYSTEINE AND TRAJECTORIES OF COGNITIVE FUNCTION IN A LONGITUDINAL POPULATION-BASED STUDY

L. Hassing, A. Berg, V. Thorvaldsson, B. Johansson, *Department of Psychology, University of Gothenburg, Gothenburg, Sweden*

In a recent evidence-based analysis on the association between vitamin B12 and cognitive function it was concluded that based on very low quality evidence, there does appear to be an association between homocysteine levels (a by-product of B vitamins) and the onset of dementia. One of the big challenges in research on cognitive aging is how to assess cognitive function and how to measure change in cognitve function across time. There are only a few longitudinal studies on the association between cognitive function and homocysteine that have measured cognitive function across time with multiple assessments. We examined homocysteine in relation to trajectories of cognitive function measured with a range of cognitive tests, at five time points across 8-years. The cognitive abilities examined included tests of long-term memory, short-term memory, speed, verbal and spatial ability, and the MMSE. At baseline the sample of 422 individuals was without dementia. Data was analysed using multilevel modeling adjusting for demographic- and lifestyle factors, and relevant diseases. The results showed that higher levels of homocysteine were associated with lower performance in all cognitive abilities, however, homocysteine was only associated with steeper decline in long-term memory and the MMSE. Our results indicate that high level of homocysteine is related to lower overall cognitive function in old age. The fact that the homocysteine-related effects were noted in mean level differences in cognitive performance, whereas only two cognitive measures showed differences in slopes, suggests that the negative effect of homocysteine are most pronounced in memory.

OLDER ADULTS' ABILITY TO IMPLICITLY LEARN AND USE NOVEL VISUOSPATIAL CONTEXTS TO ENHANCE VISUAL SEARCH

D.M. Elliott[1], N.D. Gayzur[2], L. Langley[1], A. Saville[1], H. Gu[1], *1. North Dakota State University, Fargo, North Dakota, 2. University of Central Oklahoma, Edmond, Oklahoma*

This study investigated the ability of young (18-35 years) and older adults (60-85 years) to use contextual information in inherently low meaning visual scenes (letter arrays) to increase search efficiency. Context was created by generating repeated configurations (consistent target-distractor spatial covariation) and random configurations (no target-distractor spatial covariation). Both young and older adults implicitly learned the spatial covaration in the repeated configurations and used that knowledge to respond faster to repeated configurations than to random configurations. The results suggest that older adults could successfully use context in the form of spatial predictability to guide attention in low meaning visual scenes.

CHECKING OUT: EFFECTS OF TASK DURATION AND TEXT GENRE ON AGE DIFFERENCES IN ZONING OUT WHILE READING

L. Shulley, M. Shake, *Western Kentucky University, Bowling Green, Kentucky*

Previous research has found that older adults report less mind-wandering during reading than younger adults, but the reasons for this are unclear (Krawietz et al., 2012; McVay et al., 2013). The current study investigated whether task duration and text genre may account for these age differences. 34 younger and 34 older adults read a narrative and an expository text for 30 minutes each. While reading, participants were randomly probed every 2-4 minutes for the content of their thoughts. Participants indicated whether their mind was on- or off-task and whether they were unaware of being off-task ("zoning out"). We analyzed the data in a 2 (Age) x 2 (Genre) x 2 (Epoch: First or Second Half of Task) ANOVA. A significant Genre x Epoch interaction, F(1,66) = 6.29, p<.05, showed that participants reported more zoning out for the expository text than the narrative text early in reading. Later in reading, however, zone-outs were equivalent across genres. Furthermore, the aforementioned interaction was subsumed by a significant 3-way interaction with Age, F(1,66), p < .05. The data show that for older adults, zoning out increased over time only for the narrative text (pairwise t(33)=2.09, p<.05), whereas for younger adults, zoning out increased over time only for the expository text (pairwise t(33) = 2.31, p<.05). Results suggest that task duration and text genre affect older and younger adults differently with regard to the extent of their mind-wandering during reading. Findings are discussed in terms of implications for cognitive aging and language processing.

SESSION 635 (POSTER)

TECHNOLOGY

EFFECTS OF VIRTUAL GROUP EXERCISE AT HOME (V-GEAH) ON REDUCTION IN FALL RISKS IN OLDER ADULTS WITH A HISTORY OF FALLING

M.R. Tomita[1], N. Fisher[1], D.K. Ramsey[1], K.M. Stanton[1], R. Sridhar[1], B.J. Naughton[1,2], *1. University at Buffalo, Buffalo, New York, 2. Catholic Health System, Buffalo, New York*

The purpose of the study was to find the adherence rate to and effects of a virtual group exercise at home (V-GEAH) program utilizing video-conference technology, which offered progressive Otago exercise three times a week for 24 weeks. The study used a randomized controlled trial. Participants were community-based people (60-89 years old) without cognitive deficit, who had fallen in the past year. Health, gait and balance, lower extremity strength, and other risk factors were assessed at baseline, 12 and 24 weeks. A treatment group (n=25) received the V-GEAH program, a control group (n=27) received a Tai-chi DVD. Repeated measures ANOVA and post hoc tests were the main statistics. The two groups were equivalent for all demographic and health characteristics at baseline. For the V-GEAH program, attrition was zero and an adherence rate to 72 exercise sessions was excellent (84%-93%). After interventions, the treatment group improved on strength of quadriceps, hamstring, ankle and hip extension and adduction more than the control group. Only the treatment group improved in balance confidence, stride width, basic activities of daily living, and cognition, and had fewer falls. Doing regular solitary home exercise may not be an easy task. The V-GEAH project, connecting participants and healthcare researchers, provided motivation and accountability to continue exercise, which resulted in a high adherence rate to the program and the reduction of fall risk factors. As social media technology advances, its applications to improve health behaviors will increase. Therefore, this approach should be further tested for home therapy and treatment.

MY STROKE TEAM (MYST): A MOBILE TECHNOLOGY SOLUTION TO ENHANCE INTERPROFESSIONAL STROKE CARE

J. Ploeg[1], M. Markle-Reid[1], N. Matthew-Maich[2], L. Harris[1], D. Bender[2], C. Taberner[2], S. Ibrahim[1], R. Valaitis[1], *1. McMaster University, School of Nursing, Hamilton, Ontario, Canada, 2. Mohawk College, Hamilton, Ontario, Canada*

Purpose: The purpose of this study was to co-create a technology-based solution with community-based interprofessional healthcare providers to support evidence-informed care and community reintegration of stroke survivors. Methods: A qualitative descriptive and user centered design approach was used. Interviews and focus groups were conducted with 28 providers to identify current challenges for community-based stroke care in Ontario, Canada. In addition, ten consultations were completed with 23 key stakeholders involved with Canadian stroke rehabilitation to capture insights into current gaps in community care, and provide feedback related to the technology co-creation. Results: Four challenges were identified: 1) fragmented communication within the homecare team; 2) no consistent means to trend client progress/deterioration; 3) home healthcare providers have limited access to resources at the point of care; and 4) gaps identified above translate to critical safety issues. The solution designed was a mobile application (My Stroke Team, MYST) to support best practice implementation in stroke care through: 1) real-time, secure, communication within the circle of care (including client and family caregiver); 2) evidence-informed safety assessments; 3) alerts to relevant providers regarding changes in client status; and 4) access to resources for stroke survivors and providers. Conclusion: Fundamental to the success of this innovation was engagement of end-users throughout the iterative process. MYST has potential to bridge the communication and safety gap in home healthcare, ultimately improving quality of care for stroke survivors and their families. It also has potential to be scaled up, tailored and extrapolated to other chronic conditions.

INTELLIGENT SENSOR SYSTEM FOR EARLY ILLNESS ALERTS IN SENIOR HOUSING

M.J. Rantz, M. Skubic, C.M. Galambos, A.L. Craver, J. Jun, M.D. Pelts, *Sinclair School of Nursing, University of Missouri, Columbia, Missouri*

Early illness detection promotes the health, independence, and function of older adults, and is a key component of aging in place. Identifying health decline from its onset allows interventions during the first stages of illness, thus keeping older adults healthier for longer and “squaring the life curve”. Technology, in the form of environmentally embedded intelligent sensor systems, offers a cost-effective and minimally-intrusive means of early illness detection. Our team has developed an intelligent sensor system consisting of motion sensors, a hydraulic bed sensor, and a Microsoft Kinect that monitors activity, vital signs, and falls. The system is installed in the residence of an older adult, and requires no upkeep or behavior change from the resident. The system sends email messages to facility nursing staff to alert them of changing health indicators. Through a one-year prospective intervention study, we are measuring the clinical and cost-effectiveness of using sensor data compared to using only traditional health assessments to detect early signs of illness or functional decline in older adults living in 12 assisted living facilities in Missouri. Our team includes expertise from nursing, medicine, social work, electrical and computer engineering, and computer science. In addition to refining the sensor system, we are developing a user-friendly sensor interface while exploring residents’ and clinicians’ perceptions of living with and using the system. Qualitative and quantitative data will be presented from the first six months of the study.

FUN, SOCIALIZATION AND HELPFUL STRATEGIES: SUPPORT IN CHRONIC CONDITIONS THROUGH SELFHELP’S VIRTUAL SENIOR CENTER PROGRAM

B.L. Raik[1], C. Chessen[2], S. Code[2], D. Dring[2], *1. Division of Geriatrics, Department of Medicine, Weill Medical College Cornell University, New York, New York, 2. Selfhelp Community Services, New York, New York*

Background: 3.6 million older adults with multiple medical and functional problems are considered homebound. They are socially isolated, cannot attend self-management programs and have low health literacy. Technology allows participation in the “Virtual Senior Center”(VSC) through touchscreen computers and internet. This was a feasibility study of this novel means of reaching this underserved population. Methods: Selfhelp Community Services offered VSC through its case management program to community dwelling, homebound elders. “Being Well” was a 4 week series of workshops lead by a geriatrician and a volunteer that adapted the Chronic Disease Self Management Program for the homebound. Pre and post phone interviews collected self-reported health and symptoms, and self-confidence in managing their health. Results: 23 of 50 potential participants joined at least 1 workshop, 8 participated in 3 or 4 workshops and 11 gave pre and post interviews. Participants were mostly female, average age 82.7 years and averaged 15.2 years of education. After the workshop, more than half reported increased confidence in managing their illness. Over 70% had plans to prepare a list of questions for their doctor. They enjoyed “Being Well” and would recommend it. Self-reported health status was unchanged. Conclusion: “Being well” workshop was well received by VSC members. We found improvement in self-efficacy, such as better communication strategies with their doctors. Continuation of these workshops with Geriatric fellows leading the sessions has been well received. These results suggest expansion of telehealth with interactive communication could benefit this homebound population.

DAILY ROUTINES OF OLDER ADULTS: A NOVEL METHOD OF MEASUREMENT

M. Yefimova[1], Z. Hajihashemi[2], T. Banerjee[2], D.L. Woods[3], M. Popescu[2], M.J. Rantz[2], M. Skubic[2], J.M. Keller[2], *1. University of California, Los Angeles, Los Angeles, California, 2. University of Missouri, Columbia, Columbia, Missouri, 3. Azusa Pacific University, Azusa, California*

Characterizing health trajectories of older adults, reflected in patterns of day-to-day activities (routines), might help identify older adults who are at the greatest risk for decline and adverse events. Automated in-home monitoring systems may note deviations from daily routines and alert healthcare providers to implement timely interventions. The aim of this study was to develop clinically meaningful measures for daily routine activities using a currently developed passive sensor network. A collaborative, multi-campus project between the Schools of Nursing and Department of Engineering and Computer Science at the University of Missouri and the University of California, Los Angeles School of Nursing, focused on analyzing sensor data collected in a retirement community, TigerPlace. The resident apartments were equipped with a wireless network consisting of motion, bed and depth sensors. A retrospective multiple case study (N=6) design was used to quantify sitting behavior, bathroom visits, and sleep, operationalized as daily routine, over a 2-year period. Sitting activity (time spent sitting, sit-to-stand [STS] time) was extracted using a Kinect depth sensor positioned in the living room. A motion sensor captured activity in the bathroom (time, frequency, duration of each visit), while a hydraulic bed sensor detected restlessness and sleeping time. Data was visually inspected for trends. Within-person variability of routine activities may be useful to predict the health trajectories of older adults. Continuous and unobtrusive monitoring of routine activities by an environmental sensor network may be able to capture progressive functional decline of the older adult over time.

PRINTED TELEPRESENCE ROBOT FOR IN-HOME TELECARE FOR AGING POPULATION

H. Li[1], B. Xu[2], K. Zhu[1], Y. Wang[1], *1. School of Information and Electronics, Beijing Institute of Technology, Beijing, China, 2. Peking University, Beijing, China*

3D printed fully customizable telepresence robots with low cost present a future-now solution to the elder care problem of modern society. The proposed telepresence robot is a teleoperated mobile robotic systems in the home of the elderly, can be either operated by a family member for remote homecare purposes, or by a healthcare professional in case of routine medical check-ups and in case of a medical emergency. The affordable laser-based 3D printing solution from our team offers these robots limitless customizability to adapt to each user's medical and health conditions. With user friendly touch screen interface, two robotic arms, a mobile platform, wifi or 3G/4G LTE as standard configuration, they can also be equipped with sensors to detect vital signs including blood pressure, glucose, heart rate, etc. for routine check-ups, and emergency solutions for medical emergency. With advanced artificial intelligence and man-in-the-loop designs, the telepresence robots could act as reliable companions bridging the user with their family members for alleviating loneliness, and offering the possibility of shifting from hospital-centred model of care in geriatrics to a home-based model, creating a future of using telepresence with mobile robotic systems in home telecare.

THE ABSENT SENTRY IN TELEHEALTH FOR OLDER ADULTS WITH HEART FILAURE

M. Murphy, *1. Fairfield University, Fairfield, Connecticut, 2. University of Utah, Salt Lake, Utah*

Data from Veterans with a diagnosis of heart failure, participating in the initial 90 days of the Care Coordination Home Telehealth program is described. First, the study thoroughly describes each daily telehealth component measurement, alerts generated from measurements exceeding either upper or lower pre-defined limits and the addition of nurse documentation after generated alerts, before reporting the association between telehealth program participation and healthcare utilization. Aim:To examine data collected for demographic, telehealth measures, and healthcare utilization the initial 90 days of program participation to identify lapses in human response to a technologic monitor of physiologic health. Results:A high proportion of older Veterans with HF participating in one telehealth program (n-186) submitted telehealth measures at least three sessions throughout the study period. Compliance was high with measuring weight, heart rate, blood pressure, and self-reported health status at each session. The data collection system and secure web-server were reliable. Duration of telehealth alerts were approximately four days before nurse documentation was found to address the occurrence of the alert episode. There were no significant differences in alert frequencies for weight, heart rate, blood pressure, or self-reported health status prior to emergent hospital readmission for decompensating heart failure. Conclusions:Description of home telehealth measurements within one telehealth program contributes to a better understanding of participant and nurse activities within one telehealth program. Full description of telehealth program data contributes to the identification of program vulnerabilities associated with the occurrence of healthcare utilization, including hospital readmission for the participant older veteran with HF. Baseline rates for compliance increased for self-monitoring and adherence with prescribed regimens, self-monitoring for symptom worsening, and reporting worsening symptoms to a member of the care coordination team when duration of alert episodes were less than four days. Nurse response to telehealth alerts was not well-documented in the electronic medical record. More research is needed to determine if nurse response to telehealth alerts impacts hospital readmission rates for worsening HF.

VALIDITY OF A SMARTPHONE-BASED ACTIVITY MONITORING AND FALL DETECTION APPLICATION FOR OLDER PERSONS

J. Vermeulen[1], S. Willard[2], A. Boessen[1], B. Aguiar[3], L.P. de Witte[1,2], *1. Health Services Research, Maastricht University, Maastricht, Netherlands, 2. Zuyd University of Applied Sciences, Heerlen, Netherlands, 3. Fraunhofer Portugal Aicos, Porto, Portugal*

Background: The GoLivePhone® (GLP) is an easy-to-use smartphone-based application with various functionalities (e.g. activity monitoring, fall detection, medication management support, etc.) that can assist community-dwelling older persons in independent living. The aim of this study was to evaluate the validity of the activity monitoring and fall detection functionality of the GLP. Methods: For the validation study of the activity monitoring functionality 15 participants (6 men, age 18-70) were included. Participants walked on a treadmill for 10 minutes starting at 3 km/h accelerating their walking speed with 1 km/h each minute, while wearing a GLP in their trouser pocket and an Actigraph GT3X and a PAM accelerometer on their hip. Pearson Correlations were calculated for intensity of activity registered per minute (in METs). For the validation study of the fall detection functionality, 8 healthy adults (4 men, age 18-24) were included. Participants simulated in total 400 falls, 200 falls with recovery, and 440 daily activities while wearing the GLP in their trouser pocket. Sensitivity and specificity were calculated. Results: Pearson correlation between the GLP activity monitoring application and the Actigraph GT3X and PAM accelerometer were .77 and .84 respectively ($p < 0.01$). Sensitivity and specificity of the fall detection application were .89 and .89 respectively. Conclusion: Smartphone-based applications, such as the GLP, can support older persons in independent living by providing valid feedback to them regarding their level of physical activity. Furthermore, valid fall alarms can be generated but it is recommended that sensitivity and specificity are increased before implementation in practice.

INFLUENCE OF COMPUTERIZED COGNITIVE TRAINING ON MEASURES OF PHYSICAL FUNCTION

J. Blackwood, *University of Michigan-Flint, Flint, Michigan*

Background: Cognitive training has been shown to improve components of cognition with a transfer effect into improvements in function. The purpose of this study was to examine the effects of a computerized cognitive training (CCT) program focused on the areas of attention, set shifting, and visual spatial ability on measures of physical function and fall risk in two groups of community dwelling older adults: those with an initial gait speed of <1.0m/s and those with a gait speed of >1/0m/s. Methods: Twenty community dwelling older adults (slow gait speed group: N=10; fast gait speed group N=10) participated in six weeks of CCT at 3x/wk with measurements at pre/post intervention. Outcomes measures included gait speed, TUG performance, and repeated sit to stand testing. Results: At pre-test, the groups did not differ in age, education level, or in the performance on the cognition assessments. At post-test, subjects in the slow gait speed group demonstrated a statistically significant improvement in gait speed after CCT (Mdn=.65, z= -3.1, p=.002). No significant differences were found on the FTSTS or TUG in either group after CCT. Discussion: For slower walkers, participating in a six week CCT program resulted in an increase in gait speed, however other measures of fall risk were not significantly different from the faster walkers. Conclusions: Further studies are needed to examine how other frequencies of CCT affects physical function and potentially, fall risk.

SESSION 640 (POSTER)

REHABILITATIVE CARE

REVIEW OF RESEARCH EVIDENCE ON THE EFFECTIVENESS OF WHOLE BODY VIBRATION (WBV) ON THE MUSCLE MASS AND STRENGTH OF ADULTS 55 AND OLDER

R.D. Barredo, H. Foster, M.N. Norina Weatherman, J. Hudson, *Physical Therapy, Tennessee State University, Nashville, Tennessee*

PURPOSE: To evaluate research evidence on the effectiveness of WBV in increasing muscle mass and muscle strength of adults 55 and older. DESIGN: Research review, consisting of an evaluation of the level of evidence and the quality of research. METHODS: A literature search of articles evaluating the effects of WBV on muscle mass and/or muscle strength was conducted using PubMed and an EBSCOhost. The articles should have been English-only articles published between January 2000 and November 2013. Studies comparing WBV to other forms of strength training were included if there was a control group that did not receive any training or received sham WBV. Studies were included if their subjects involved active, healthy adults 55 years and older during. RESULTS: Twelve articles met the inclusion criteria. One assessed muscle mass, three assessed muscle mass and strength, seven assessed strength, and one was a follow-up study measuring muscle mass and strength. The study assessing muscle mass reported no significant changes. All other studies reported significant improvements in muscle mass and/or strength. The follow-up study reported a reduction in muscle mass a year after the study. CONCLUSIONS: Research on the effect of WBV training on muscle mass and/or strength in adults aged 55 years and older were either Level Ib or IIa. Ten were moderate quality and two were weak quality. All reported significant changes in both measures except one. The follow-up study suggested that gains in muscle mass would be lost without an exercise program; improvement in strength may be retained.

ANALYSIS OF EXERCISE PROGRAMS IN ASSISTED LIVING FACILITIES – A CROSS-SECTIONAL STUDY

H. Liu[1,2], J. Luo[2], L. Zeng[2], Y. Li[2], *1. University of North Texas Health Science Center, Fort Worth, Texas, 2. Second Affiliated Hospital of Nanchang University, Nanchang, Jiangxi, China*

Introduction. As the population ages, there is an increasing need for data on nature and type of exercise programs in healthy elderly individuals. The purpose of this study was to describe the characteristics of exercise programs in assisted living facilities. Methods. This study was conducted in 12 assisted living facilities in an urban area. The inclusion criteria for subjects were: 65 years and older, able to walk to the activity room with or without an ambulatory device, and able to follow two-step commands. The data collected included number of participants during at the time, demographics of participants and activity directors as well as exercise characteristics (type/mode, quality, intensity, and frequency). Results: In total 216 subjects, ranging from 9 to 29 subjects depending on facilities, participated the study. Fifty five percent of them used assistive devices including walkers or canes. The activity directors' year of experience is from 2-12 years and their education background vary from liberal arts to science. Seated exercises were provided in all 12 facilities, but 4/12 also had additional standing exercise activities. The exercise programs included range of motion exercise only (6/12) or combined with resistance training (6/12). The exercise parameters were identified as: 3-5 times a week, 30-45 minutes each session, 1-2 sets of 10-20 repetitions for each exercise. Exercise precautions were stressed in 4 facilities by activity directors. However, no facility had emphasized exercise precaution and quality movement of each exercise (defined as "true completion of full range of motion for each exercise movement"). Conclusion: Exercise programs in residential care settings encompass a wide range of exercises. The exercises programs predominantly were low intensity chair exercises including flexibility with or without light resistance training. The selection of exercise programs and parameters are affected by the activity director's year of experience and education background. Training and re-training of activity directors may be needed to ensure quality exercises to be provided.

EFFECT OF A QI-GONG ON BALANCE AND QUALITY OF LIFE AMONG OLDER ADULTS – A PILOT STUDY

H. Liu[1,2,3], J. Luo[3], Q. Qiu[2], L. Zeng[3], Y. Li[3], *1. University of North Texas Health Science Center, Fort Worth, Texas, 2. Gannan Medical College, Ganzhou, Jiangxi, China, 3. Second Affiliated Hospital Of Nanchang University, Nanchang, Jiangxi, China*

Background: Tai Chi (TC) and Qi-Gong (QG) are two most commonly performed exercise programs among older adults in China. In recent years in US, TC has been extensively studied and strongly promoted by medical clinicians and researchers to improve balance, strength, endurance, and general health among elderly people. However, the QG, which emphasize slow movement and more attention to the circulation of Qi (the inner energy) in the body, has not been as widely practiced and studied in US as the TC has. The purpose of this study was to identify if the first 6 forms of the routinely used 24 forms can improve subjects' balance and quality of life. Method: The pilot study was conducted in a retirement community. The most popularly practiced Qi Gong movement "Ba-Duan-Jin" (Eight Silk Movement) was introduced, learned and practiced by the study participants. The Ba-Duan-Jin includes eight different slow movements with each focusing on different accupoints of meridians. The intervention parameters were 30 minutes per session, 3 times per week for total of 12 weeks. Twenty subjects qualified with the following selection criteria: 65 years and older, cognitively intact, and able to ambulate independently with or without an assistive device to walk to the activity room. Outcome measures include: a short questionnaire asking about subjects' subjective feeling of balance, control of daily movement, general health, general breathing, single leg stance (SLS), chair rising test (CRT), Tinetti Balance Test (TBT), modified Falls Efficacy Scale (MFES), and SF-12 for quality of life. Data from the study was analyzed with PASW 17.0. Results: Six subjects dropped out of the study because of personal reasons or hospitalization. Among 14 subjects who completed this study, all of them (100%) felt their balance and control of daily movement improved as somewhat to great deal. Seventy-one of subjects reported general health improvement and 79% reported that they have better ability to adjust their breathing. With the paired t-tests, statistically significant differences were identified between the post-intervention in SLS, TBT, and MFES (all $p < .01$) as well as CRT and SF-12 ($p < 0.05$). Conclusions: The eight movements Qi Gong (Ba-Duan-Jin) can improve balance, lower extremity strength, quality of life, and fear of falling among older adults living in a retirement community. This Qi Gong Program may provide one of many exercise choices for clinicians to consider for older adults living in senior communities.

SELF-MANAGEMENT GROUPS FOR PEOPLE WITH DEMENTIA AND THEIR SPOUSAL CAREGIVERS - A RANDOMIZED, CONTROLLED TRIAL

M. Laakkonen[1,2], E. Hölttä[2,1], R.S. Tilvis[3], T.E. Strandberg[3], H. Kautiainen[2], K. Pitkälä[2], *1. Department of Social Services and Health Care, City of Helsinki, Helsinki, Finland, 2. University of Helsinki, Department of General Practice, Helsinki, Finland, 3. University of Helsinki, Department of General Internal Medicine and Geriatrics, Helsinki, Finland*

Introduction No previous studies have investigated the effectiveness of self-management group rehabilitation for people with dementia and their caregivers on their quality of life (QOL). Method During 2011-12, 136 patients with dementia and their spouses were randomized into two arms: group-based self-management intervention group (n=67 couples) and controls (n=69 couples). The patients and spouses met in separate closed groups (ten participants per group) 4 hours once a week for 8 weeks. Intervention sessions were based on "Circle of Friends-method", facilitating peer support and discussions including topics according to participants' preferences and needs. The aim was to enhance participants' self-efficacy, problem-solving skills and mastery. Participants were assessed at baseline, 3 and 9 months. Results The mean age of participants with dementia was 76.8 years, 38% were females, and 72% were at mild stage of dementia according to the Clinical Dementia Rating (CDR) scale. The participation rate in group sessions was high among patients (93%) and their spouses (93%). Participants felt the group sessions useful and supportive for themselves. Cognitive scores (clock drawing test and verbal fluency) of the patients and QOL (SF-36) of the spousal caregivers improved relative to baseline in the intervention group compared with the controls. This change was significant at 9 months assessment. Conclusion Self-management group rehabilitation improved patients' cognition and caregivers' QOL. This is a new treatment model to support patients at their early stage of dementia and their caregivers.

AGE RELATED SATISFACTION WITH INDIVIDUALIZED CARE, THERAPIST CHARACTERISTICS, OUTCOMES AND ORGANIZATION AT A FREE CLINIC FOR PERSONS RECEIVING PHYSICAL THERAPY

M. Milidonis[1], S. Euype[2], K. O'Loughlin[1], K. Vitak[1], M. Blohm[1], *1. Cleveland State University, Cleveland, Ohio, 2. Cleveland Clinic Foundation, Cleveland, Ohio*

Satisfaction is associated with quality healthcare, improved adherence and improved outcomes. The purpose of this study is to evaluate satisfaction with pro bono physical therapy for older compared to younger adults, all of whom have no health insurance and thus, have barriers to accessing physical therapy care. Methods: This is a prospective observational cohort study. Survey was developed from validated satisfaction research questions related to individualized care, therapist characteristics, outcomes and care organization. Final 30 item survey was administered after the first visit. Medical chart abstraction collected additional data on functional difficulties and comorbidities. SPSS 19 used for univariate and bivariate analysis. Surveys were scanned for data entry. Results: Seventy-two subjects completed surveys with 56% female, 71% black, 36% older than 55 years, 44% depression diagnosis and an average of four comorbidities related to function. Subjects were overall satisfied after the first visit of physical therapy. The strongest associations with satisfaction for both age groups was therapist characteristics and individualized care (r=.49). "The way the condition affected me was taken into account" was the strongest satisfaction related question (r=.5) overall. "The meaning of the illness to me personally was taken into account" was the strongest satisfaction related question(r=.53) for older adults. Conclusions: Data suggest pro bono physical therapy is valued after an initial visit. Satisfaction is related to both therapist characteristics and individualized care. Physical therapists practicing in pro bono settings should emphasize individualized care that considers adult lifespan differences

EFFECTS OF CO-MORBIDITIES ON MEDICARE CLAIMS FOR REHABILITATION SERVICES AFTER STROKE

O.C. Sheehan[1], J. Huang[1], J. Rhodes[2], M. Kilgore[2], D.L. Roth[1], *1. Johns Hopkins University, Baltimore, Maryland, 2. University of Alabama at Birmingham, Birmingham, Alabama*

The majority of older adults who experience strokes have multiple chronic conditions. Multi-morbidity is thought to have many adverse health consequences including disability, higher rates of institutionalization and increased use of health care resources, but little is known about whether the presence of co-morbidities affects usage of physical therapy (PT), occupational therapy (OT), or speech and language therapy (SLT) after a stroke event. Using data from the national Caring for Adults Recovering from the Effects of Stroke (CARES) project, Medicare claims data were examined for 81 CARES participants who had traditional Medicare coverage continuously for at least 6 months before and 6 months after an adjudicated stroke event. Medical records were reviewed to determine the presence of coronary artery disease, peripheral vascular disease, arrhythmias, diabetes, or hypertension at the time of stroke. The sample was 46% female and 30% African American. The association of each co-morbidity with the use of rehabilitative therapy after stroke was examined. A history of coronary artery disease was associated with fewer Medicare claims for PT (p=0.002), OT (p=0.008), and SLT (p=0.008) in the 6-month period after stroke. No significant relationships with rehabilitative care utilization were observed for the other co-morbidities. These data suggest that stroke survivors with coronary artery disease are less likely to receive rehabilitative care post-stroke. It remains unclear if this is due to poor exercise tolerance, frailty, or other barriers to rehabilitative care. Further study is needed to better understand the determinants of receiving rehabilitative care after stroke among Medicare beneficiaries.

BALANCE IMPROVEMENT AFTER MOTOR-COGNITIVE TRAINING IN ELDERLY PEOPLE

J.E. Pompeu, K.G. da Silva, A.M. Lobo, F.S. Mendes, M.P. Piemonte, *Physical Therapy, University of São Paulo, São Paulo, São Paulo, Brazil*

Background. Video game interventions have demonstrated consistent positive effects on physical and cognitive abilities in older adults. This study compared two training groups that achieved similar amounts of mobility and balance exercise where one group received a balance intervention by interactive video games that combined physical activity and cognitive challenge. The aim was to investigate the different effects of these two training programs on balance and cognition function in community-living, healthy, and well-functioning older adults. Methods. A randomized controlled trial was conducted with a total of 34 participants with blinded baseline and follow-up assessments. The participants were sedentary older community-dwelling adults. The 14 individual intervention sessions were composed for usual exercises to improve the mobility and balance exercises in standing, without upper limb support, with reducing the base of support and slow and fast movements of the center of gravity. Both programs were similar apart from the use the Nintendo Wii Fit Plus video game for the balance training. Balance, cognition and functional assessments were administrated at baseline, 1-week and 2-mounth follow-up. Results. There was a statistically significant improvement of the balance and cognitive function restrict to the training group that use the video game. This group obtained statistically significant superior performance after training in comparison to the control training group for all of outcomes. Conclusion. Balance training associated with video games that combine physical activity and cognitive challenge can improve balance and cognitive functions in healthy older adults, remediating the aging decline.

IMPROVEMENT ON GAIT, FUNCTIONAL STATUS AND COGNITION AFTER MOTOR COGNITIVE TRAINING IN PATIENTS WITH PARKINSON DISEASE

J.E. Pompeu, A.M. Lobo, K.G. da Silva, F.S. Mendes, M.P. Piemonte, *Physical Therapy, University of São Paulo, São Paulo, São Paulo, Brazil*

The objective was to compare the efficiency of a motor-cognitive training with an isolated motor training on improvement of gait, functional status and cognitive functions of patients with Parkinson disease. It was selected 20 patients with Parkinson disease, mean age of 65.7 (8.24) years, 12 men and 8 women, stages 1 and 2 of Hohen Yahr scale. Participants were randomized between experimental and control group. Both groups performed 14 sessions of 1 hour, twice a week. The first 30 minutes were composed by global mobility exercises. After this, the experimental group practiced 10 Nintendo Wii Fit Plus games, 5 per session, that required motor and cognitive responses and the control group performed a training based on the motor demands of the games practiced by the experimental group. It were compared: the scores of Unified Parkinson Disease Rating Scale (UPDRS) and Montreal Cognitive Assessment (MOCA); gait performance on single and dual task and functional gait before training (BT), after training (AT) and follow up of 30 (RET1) and 60 days (RET2). There was significant interaction among both kind of training and assessment (BT, AT. RET1 and RET2) related to scores of UPDRS and MOCA (ANOVA; $p < 0.001$); gait performance in dual task and functional gait (ANOVA, $p < 0.0001$), confirmed by post hoc test of Tukey, that showed a higher improvement of the experimental group. The motor-cognitive training was superior to the isolated motor training in order to improve the gait, functional status and cognitive functions in Parkinson disease.

FALL PREVENTION IN COMMUNITY-DWELLING OLDER ADULTS AND THE TRANSTHEORETICAL MODEL: A SYSTEMATIC REVIEW

C.L. Moore, J.S. Parrott, S.L. Kaplan, *Rutgers the State University of New Jersey, Newark, New Jersey*

Background: Stages of Change (SOC) and other Transtheoretical Model (TTM) methods of instruction can promote adherence to health behaviors and may be useful in fall prevention. Purpose: This review examines the use of SOC and related TTM concepts to predict and promote adherence to fall prevention recommendations among community-dwelling older adults. Data Sources: PubMed, Cochrane and Google searches of peer-reviewed sources dated February 2003 – February 2013 were conducted using keywords “fall”, “fall prevention” and “adherence” and supplemented by hand searches. Study Selection: 72 abstracts were screened resulting in seven articles that met the inclusion criteria of CEBM Levels I-III. Data Extraction / Synthesis: A standardized critical appraisal form was used to assign quality ratings and extract information which was entered into literature matrices and narratively summarized. Results: Seven studies provided conceptual support for SOC/TTM use by health care providers to promote community-dwelling older adults’ adherence to balance and strengthening fall prevention recommendations. Only one of these studies scored a positive quality rating. No outcomes studies relating adherence to assistive device or environmental modifications met the inclusion criteria. Conclusions: There are strong conceptual frameworks but limited empirical support for using SOC / TTM to predict and promote adherence to fall prevention recommendations among community-dwelling older adults. Available studies focus on adherence to strengthening and balance exercises. Further research on exercise, assistive device and environmental modification adherence is needed.

ABILITY TO WALK AMONG HOSPITALIZED ELDERLY PATIENTS TREATED AT AN ACUTE CARE HOSPITAL IN JAPAN

Y. Lau, *Graduate School of Health Management, Keio University, Kanagawa, Japan*

Introduction: Many older adults lose their ability to walk during hospitalization; most subsequently fail to recover their ambulatory function. This functional decline results in a decreased quality of life and increased physical, psychological and financial burdens on family caregivers. Although many hospitals attempt to shorten the average duration of hospitalization, this results in difficulties in preventing functional declines in walking. Therefore, there is an urgent need to improve this situation. Objectives: To assess the ability to walk among hospitalized elderly patients and identify factors that deteriorate this function. Methods: A retrospective cohort study of the electric charts of 516 patients over 75 years of age treated at a teaching hospital in an urban area was conducted. On admission, 174 patients had pneumonia, 293 had aspiration pneumonia and 102 had urinary tract infections. Differences in the walking function between the time of admission and discharge were compared. Results: A total of 217 patients were bedridden from admission to discharge. No patients were able to maintain their ability to walk independently during hospitalization. Of these patients, 95 required a wheelchair or walking assistance and 113 improved their walking ability, for example, from “bedridden to walking with assistance,” “requiring a wheelchair to walking with assistance,” or “walking with assistance to walking independently.” The walking level declined in 16 patients, and 128 patients died during hospitalization. Conclusions: Elderly hospitalized patients are at risk of declines in their walking ability. Further investigation is needed to clarify factors that inhibit the ability to walk.

SESSION 645 (POSTER)

FAMILIES AND CARE

EXPLORING RELATIONSHIP BETWEEN FAMILY CAREGIVERS’ BURDEN AND QUALITY OF LIFE IN ELDER CANCER PATIENTS

C. Liou, *Chang Gung Univerisity of Science and Technology, Tao Yuen, Taiwan*

Background / Aim: Family caregivers (FC) of cancer patients often feel strains from caring for patients’ needs in trajectory of the disease. FC’s health status and positivity attitude may affect cancer patients’ quality of life. To date, few were known regarding the dynamic between FC’s burden and patients’ quality of life. This preliminary data analysis was employed (1) to explore factors affecting family caregiver’s burden and (2) to identify how FC’s caregiving burden affects elder cancer patient’s quality of life. Method: Secondary analysis from a large data bank. Data provided from the Psychosocial Data Registry, Case Western Reserve University, CA-103736-02, Barbara Daly, PI. FACT-G (Functional Assessment of Cancer Therapy-General) was used to measure patients’ quality of life; POMS (Profile of Mood States) was used to measure patients’ mood state. Caregivers’ burden was measured by CRA (Caregiver Reaction Assessment) and POMS (Profile of Mood States). Result: Total 89 dyads of elder cancer patients and their family caregivers were included in regression analyses. Family caregivers mainly were patients’ spouses. The results yielded (1) FC’s health problem, other psychosocial factors, and patients’ demographic factors significantly explain FC’s mood disturbance (Adjust R2= 32%, $p<0.001$); (2) FC’s disrupted schedule and gender are two significant factors ($p<0.05$) in the second regression model that explains total of 24% variance of patient’s quality of life. Discussion: Results suggested a possible interaction effects between FC’s burden and elder cancer patients’ quality of life. Further investigation on this phenomenon is needed. (Key Words: FC, Family Caregivers Burden, Quality of Life)

HISPANIC/LATINOS WITH ALZHEIMER’S DISEASE: DISPARITIES AMONG INDIVIDUALS AND THEIR FAMILY CAREGIVERS

E. Arruda, D.M. Ingram, O. Paun, *Nursing, Rush University, Chicago, Illinois*

There are critical disparities among Hispanic/Latinos with Alzheimer’s Disease (AD) and their family caregivers. Hispanic/Latinos have the fastest growing prevalence of AD in the United States, which will include 200,000- 1.3 million individuals by 2050. Additional disparities for Hispanic/Latinos with AD include: a) delayed diagnosis; b) decreased use of pharmacological treatments; and c) decreased utilization of long-term care. Hispanic/Latino family AD caregivers are on average younger; less likely to be married; more likely to have children or grandchildren under the age of 18 years living in their household; and they report higher levels of care burden. These disparities are often attributed to a lack of knowledge about the signs and symptoms of AD, social factors, cultural beliefs, and economic barriers. Participating in traditional caregivers support interventions is more difficult for Hispanic/Latino caregivers of PWD due to a lack of health insurance, cultural beliefs, reduced income, lack of transportation, and need for childcare. Targeted interventions are needed to support Hispanic/Latino individuals with AD and their family caregivers.

INFLUENCE FACTORS ON FAMILY STRESS IN THE FAMILIES OF THE ELDERLY WITH DEMENTIA

G. Kim[2], Y. Lee[1], *1. Nursing, Kangwon National University, Chuncheon, Kangwon-do, Republic of Korea, 2. Seoul Women's College of Nursing, Seoul, Republic of Korea*

Purpose. This study was done to examine family adaptation, social support and problematic behavior in elderly with dementia on family stress of families of elderly with dementia and to identify other factors which influencefamily stress. Methods.The participants were 227 and data were collected by personal interviews using questionnaires (family stress, family adaptation, social support, problematic behavior). The data were analyzed using Pearson correlation coefficients, t-test, ANOVA SPSS/WIN 19.0 version, and stepwise multiple regression was done to identify the factors which affect the family stress in the families of elderly with dementia. Results. The results of this study showed as follows. The mean score of family stress was 82.62 (Total 140.00), and family stress showed a significant positive correlation with problematic behavior in elderly with dementia (r=.241, p<.001), whereas a negative correlation with family adaptation (r=-.376, p<.001) and social support(r=-.156, p=.019). Family adaptation was found to be a significant predictor (13.7%) of the family stress and social support, problematic behavior of elderly with dementia and daughter-in-law was identified as significant predictors of family stress. Conclusion.The results of this study indicate that the daughter-in law who is responsible for care of the elderly influences family stress as well as family adaptation and problematic behavior of elderly with dementia. Additionally, it is important to consider the socio-cultural factors in order to manage the familystress and to develop nursing intervention program. Key Words: Elder, Dementia, Family stress

A NURSE-LED CONSULTATION PROGRAM FOR FAMILIES OF THE ELDERLY

R. Mahrer-Imhof, H. Hediger, M. Bruylands, R. Naef, L. Imhof, *School of Health Professions, Institute of Nursing, Wintherthur, Switzerland*

In old age, frailty, impairment of mobility and chronic health problems can lead to increased need of support. Often family members provide care and assistance to the elderly. Caregivers report a paucity of necessary skills and knowledge, feelings of unpreparedness to provide adequate care and increased conflicts within family. Therefore, professional support to elderly and their family members might be pivotal to alleviate stress in families. With a community-based participatory action research (CBPR) approach a nurse-led family-centered consultation has been developed with family caregivers as well as local health service providers. The program that started 2012 comprises of individual consultation sessions with an Advanced Practice Nurse that allows reflecting on the family and caregiving situation, enhancing practical skills of caregivers, and supporting self-efficacy of the family system. After a slow start the program's attendance increased. Preliminary results show a trend that caregiver burden can be alleviated (60.8, ± 20.3 vs.53.6, ± 22.4, p=.268). Preparedness to care increased (2.0, ±.48 vs. 2.4, ±.57, p=.01). The 65 participants of 49 families were highly satisfied with the consultations. To implement a new service using a CBPR is time consuming but eventually rewarding due to a program well-adapted to the families of the elderly. The nurse-led service has a low threshold and it is assumed that the service will be more frequently used in the near future.

DIABETES SELF-MANAGEMENT: THE ROLE OF FAMILY IN MANAGING DIABETES OF OLDER HISPANICS

C.M. Basilio[1], L.R. Phillips[2], E. Ume[1], S. Evers-Manly[1], J. Mentes[2], W. Chou[1], A.A. Kehinde[1], M. Ndukwe[1], *1. School of Nursing, Charles R. Drew University of Science and Medicine, Los Angeles, California, 2. University of California Los Angeles, Los Angeles, California*

Diabetes self-management can be difficult and complex, and may lead to frustrations and confusion. The cognitive and sensory changes associated with aging can compound the complexities of managing diabetes for older adults. Older Hispanics, with less acculturation, may experience even more challenges in diabetes self-management. However, family support may moderate these challenges. This presentation will provide a systematic review of literature on role of the family in supporting older Hispanics in performance of diabetes self-management, focusing specifically on studies of the role family plays in lifestyle modifications and physical activity. The purpose of this presentation is to examine, the extent of role of family in diabetes self-management of older Hispanics. To perform the review, electronic databases such as Cochrane Reviews, PubMed and Google Scholar were searched using keywords "diabetes", "older Hispanic", "family", "diabetes self-management", "physical activity", "diabetes interventions." Intervention studies pertaining to diabetes self-management among older Hispanics that focused on the family were included. Articles focusing on other non-Hispanic ethnic or racial groups and interventions that were not directed to older individuals were excluded. A summary of the state of the science and most efficacious interventions will be part of the presentation.

FAMILY CARE-GIVING, GENDER AND LIFE-SPACE MOBILITY

T. Rantanen, E. Portegijs, A. Viljanen, M. Rantakokko, *Gerontology Research Center, University of Jyvaskyla, University of Jyvaskyla, Finland*

Aim: Life-space (LS) refers to the spatial area a person moves through in daily life, ranging from one room to home, yard, neighborhood, town and beyond town. LS is restricted if the person reaches independently only the neighborhood level. We examined the association between being a family caregiver and LS mobility among community-dwelling older men and women. Methods: A total of 848 community-dwelling people (62% women) aged 75-90 years participated in Life-Space Mobility in Old Age (LISPE). Family caregiver role was established based on self-report. LS mobility composite score (range 0-120) was calculated based on the frequency, need for assistance and life-space level reached during the preceding four weeks. Results: In total, 29 men and 40 women were family caregivers. Among men being a caregiver was not associated with life-space mobility (71.7 SD 23.2 vs. 71.0 SD 19.9) but among women family caregivers had higher life-space mobility than those who were not caregivers (64.7 SD 17.7 vs. 59.1 SD 19.6). LS was restricted to neighborhood level for 242 people (28%). For the odds of restricted LS a significant gender by caregiver status interaction was observed (p<0.001): of the caregivers 28% of the men and 17% of the women had a restricted LS while the corresponding proportions for those not having a caregiver role were 17% and 37%, respectively. Conclusions: Being a family caregiver may restrict LS while it may also lead to larger LS as the care-giver needs to run the errands for the person cared for.

CARE GAP ANALYSIS: IMPROVING OUTREACH OPPORTUNITIES TO ELDERLY PATIENTS WHO ARE DEPENDENT ON ADULT CHILDREN TO OBTAIN ACCESS TO HEALTHCARE KATHY URBAN, MN, CNS, APRN-BC, GROUP HEALTH COOPERATIVE, RISK ADJUSTED SERVICES, SEATTLE, WASHINGTON

K. Urban, *Group Health Cooperative, Seattle, Washington*

There is strong evidence that elderly patients living on their own are dependent on their adult children to manage their healthcare access particularly related to wellness and chronic disease management. Because of this phenomenon we are able to directly correlate an increased usage of Urgent Care and Emergency Room services, frequently leading to hospitalization, when elders lack this support system. In these circumstances we can bridge the care gap and offer home care to promote optimal wellness and chronic disease management. We are further able to project by age and circumstance those patients at highest risk. We have developed algorithms to identify this at risk patient population, connected clinical teams and developed an electronic risk tracking tool to better manage this patient population. Our results are an improved chronic condition outreach program as evidenced by a greater than 60% sustained improvement in annual review of chronic conditions. We saw a doubling in referrals and utilization of our Medical House Call Program and Primary Care Providers direct referrals have improved x10 fold. The patient and caregiver feedback has been overwhelmingly positive. Our care delivery system has been enhanced, we identified a revenue source and the statistics support our continuing this program while doing additional care gap analysis into coming years.

SPIRITUALITY AMONG WOMEN DEMENTIA CAREGIVERS: CONSTRUCT VALIDATION OF THE SPIRITUAL PERSPECTIVE SCALE

N. Lekhak[1], W. Yolpant[1], J.A. Zauszniewski[1], T. Bhatta[2], *1. FPB School of Nursing, Case Western Reserve University, Cleveland, Ohio, 2. Case Western Reserve University, Cleveland, Ohio*

Spirituality has been shown to positively influence physical and psychological well-being of caregivers. Although the Spiritual Perspective Scale (SPS) developed by Reed (1986) has been used to measure spirituality among caregivers, it was originally developed for terminally ill hospitalized patients, and there is no documented psychometric evaluation of the scale's reliability and validity among women dementia caregivers. This secondary analysis of data obtained from 138 women dementia caregivers evaluated the psychometric properties of the 10-item SPS. Exploratory factor analysis revealed a single factor solution for the SPS with average primary factor loadings greater than 0.7. Except for one item, which focused on forgiveness, inter-item correlations were greater than 0.5. As a reflection of strong inter-item correlations, the reliability of the SPS as measured by Cronbach's alpha was 0.93 showed strong internal consistency. Construct validity was supported by significant relationships in the expected directions between the SPS measure of spirituality and theoretically related constructs, including self-assessed health ($r = 0.31$, $p < 0.01$), resourcefulness ($r = 0.39$, $p < 0.01$), depression ($r = -0.34$, $p < 0.01$), negative emotions ($r = -0.36$, $p < 0.01$) and perceived stress ($r = -0.31$, $p < 0.01$) thus, providing evidence for convergent and divergent validity. The findings demonstrate that the SPS is internally consistent and measures a single construct and is therefore, a potentially valuable instrument for future studies of the role of spirituality in reducing stressors associated with caregiving of older adults with dementia.

SESSION 650 (POSTER)

RACE, ETHNICITY, GENDER & ACCESS

BARRIER TO PROSTATE CANCER SCREENING AND PREVENTION IN AFRICAN AMERICAN MEN

A.A. Kehinde[1,2], L.R. Phillips[2], E. Ume[1], S. Evers-Manly[1], J. Mentes[2], C.M. Basilio[1], M. Ndukwe[1], W. Chou[1], *1. Charles R. Drew University of Medicine and Science, Mervin M. Dymally School of Nursing, Los Angeles, California, 2. University of California Los Angeles School of Nursing, Los Angeles, California*

Older African American (AA) men are affected with prostate cancer at a very high rate. Of all races, they have the highest number of individuals with the disease and the highest mortality rate. New and extremely innovative approaches are needed to reverse this trend. Data shows older AA men are particularly resistant to prostate cancer screening procedures. As a consequence, the disease is often diagnosed quite late in the disease trajectory. The electronic database such as Jane.org, The Cochran Library, and PubMed, were searched using the keywords "screening barrier", "prostate cancer" "African American". Literature suggests a common barrier to screening for prostate cancer may be mistrust of older AAs towards prostate cancer screening and treatments. Other barriers may be low socio-economic status, low health literacy and lack of access to screening in the community. Some of these barriers like access to screening sites are more prevalent in AA population, and others are evident in other racial/ethnic groups. The purpose of this systematic review is to (1) identify the barriers, and to explore culturally-sensitive interventions that have been shown to be efficacious for reducing barriers to prostate cancer screening in older AA men; (2) perform a cross-cultural comparison of successful interventions with consideration of the theoretical roots of the intervention and, based on the analysis, (3) identify those interventions with most promise for application in older AA men such as family involvement, personalized education using newsletters and electronic medias.

LIFE-SPACE MOBILITY AND 5-YEAR MORTALITY IN MEXICAN AMERICANS AGED 75 YEARS AND OLDER

S. Al Snih, A. Kumar, S. Teppala, T. Reistetter, K. Markides, K. Ottenbacher, *Division of Rehabilitation Sciences/Sealy Center on Aging, University of Texas Medical Branch, Galveston, Texas*

Objective: Independent mobility is fundamental to maintaining active aging. Life-space defines movement from within one's home to movement beyond one's town or geographic region. The objective of this study is to examine the association between life-space mobility and 5-year mortality in older Mexican Americans. Methods: 731 Mexican Americans aged 75 years and older from the Hispanic Established Population for the Epidemiologic Study of the Elderly. Measures included: sociodemographic, medical conditions, depressive symptoms, cognitive function, body mass index (BMI), and activities of daily living (ADLs). Life-space assessment (LSA) was assessed by asking the participants: "during the past 4 weeks, have you been to other rooms in your home besides the room where you sleep (level 1); been to an area outside of your home (level 2); been to places in your neighborhood other than your own yard or apartment building (level 3); been to places outside your neighborhood but within your town (level 4); and been to places outside your town (level 5)." Results: Of the 731 participants, 233 were confirmed dead five years later through National Death Index (NDI) and reports from relatives. Mean score of LSA was 40.3 (SD=19.6). Controlling for all covariates, the hazard ratio (HR) of death was 0.95 (95%CI, 0.61-1.47) for those in LSA-level 2; 0.56 (95% CI, 0.34-0.96) for those in LSA-level 3; and 0.45 (95% CI, 0.23-0.89) for those in LSA-level 4-5 when compared with those in LSA-level 1. Conclusions: High level in life-space mobility was associated with decreased risk in mortality over 5-years.

THERAPEUTIC MISPERCEPTION OF DRUG THERAPY AMONG SPANISH-SPEAKING ELDERLY PATIENTS AT A HOSPITAL-BASED GERIATRIC CLINIC: A PILOT PROJECT OF TEACHING MEDICAL INTERNS ON CULTURAL COMPETENCY

H. Cheng, *Medicine, University of Virginia, Charlotteville, Virginia*

Background: Understanding benefit and harm of drug therapy from patients is critically important in informed decision making. It is well reported that the participants from randomized controlled trials often misunderstood the benefit and harm of drug therapy. It is called “therapeutic misconception”. However, it is unknown whether such misperception exists among Spanish-speaking elderly patients in daily practice. Furthermore, whether such misperception is recognized by medical interns is not well studied. Therefore, this study was designed to enhance medical interns’ cultural competency and informed decision making on drug therapy via exploring Spanish-speaking elderly patients’ understanding of benefit and harm of drug therapy in daily practice. Methodology: this pilot study was done at a Medication Review and Reconciliation Clinic (MRC) for Older Minorities at a hospital-based geriatric clinic where each intern conducted a structured interview for older (65 and above) Spanish-speaking patients. Two questions during the interview were asked to each patient as following: 1). Do you (patient) think each medicine that you are currently taking will help you? 2). Do you (patient) think each medicine you are currently taking will cause any adverse side effect or hurt you? Spanish-speaking nursing staff at the clinic or Spanish translator from the hospital provided translation during the interview. Descriptive data was analyzed by SPSS. Results: forty five patients who used Spanish as primary language were interviewed. 56% patients were female. Average age was 75 years old. Average education was 7 years. They had five medical problems and too five medications on average. 76% (34/45) patients answered the first question. 94% (32/34) of them think medicine will help them. 64% (29/45) patients answered the 2nd question. 14% of them (4/29) think medicine will cause harm. In conclusion: a significant number of participants didn’t know how to answer the questions. Therapeutic misperception of drug therapy among Spanish-speaking elderly patients is very common. Patients perceived much more benefit than harm from drug therapy. This preliminary study could help educators to design cultural competency and informed decision making curriculum for medical interns.

CHINESE AMERICAN SENIORS WITH HYPERTENSION: LAY STROKE BELIEFS AND TRADITIONAL CHINESE MEDICINE USE

E. Chang[1], E. Hui[1], S. Ma[2,3], D. Araiza[1,3], I. Lee[1,3], L. Trejo[4], M.R. Moore[1], C.A. Sarkisian[1,3], *1. University of California, Los Angeles, Los Angeles, California, 2. Chinatown Service Center, Los Angeles, California, 3. Los Angeles Community Academic Partnership for Research in Aging (L.A. CAPRA), Los Angeles, California, 4. City of Los Angeles Department of Aging, Los Angeles, California*

Methods: We recruited 34 Chinese American seniors with hypertension aged 55 years and older (mean age = 70); none had a history of stroke. A trained facilitator conducted three focus groups in Mandarin and Cantonese at a local social services organization; audio recordings were translated into English and transcribed. After developing a code book using a grounded theory approach, two authors reviewed the transcripts independently for key themes and reconciled any differences in coding. Results: Participants provided biomedical explanations for stroke and were well-informed about risk factors and symptoms; they reported sudden death rather than grave disability as a consequence. Non-biomedical etiologies included wind and extreme changes (e.g. emotions, activity level, environmental conditions). Participants were interested in using diet to prevent stroke; however, they had divergent attitudes towards combining TCM with biomedicine. While participants favored TCM for general health maintenance, they favored prescription medications for hypertension treatment, citing convenience and rapid action despite side effects. Conclusions: Chinese American seniors are familiar with traditional stroke risk factors but also have explanatory models encompassing cultural beliefs and TCM principles. In addition to treating hypertension with prescription medications, seniors also strongly favor diet-based therapies.

DO WE REALLY KNOW THE SYMPTOMATOLOGY OF DEPRESSION IN OLDER BLACKS?

S. Cobb, J. Mentes, *UCLA, Los Angeles, California*

Depression remains as one of the most prevalent mental disorders among older adults, related to increased morbidity, suicide risk, and disability. Depressive symptoms have been found to be more frequent and health crippling for Black elders compared to age-matched Caucasians, attributed by lower life satisfaction and more exposure to major lifetime discrimination, signifying a health disparity. But little is known about the presentation of depressive symptoms in older Blacks, who may minimize or deny these symptoms with health care providers. Data gathered from in-depth qualitative interviews with 10 older Black adults living in metropolitan Los Angeles illuminates the nature and challenges of this population living with depressive symptoms. Using in-depth interviewing techniques, participants were asked about their own self-reported depressive symptoms, perceived consequences of health from their depressive symptoms, and the impact of sociodemographics, cultural beliefs and environment on depressive symptoms. Through content analysis, themes that emerged regarding depressive symptomatology can be used to inform health care providers, especially if facing challenges in detection of depression in the older Black population. By considering cultural beliefs and multiple social factors Black elders have faced in their lifetime, such as racism, health care providers can better understand the expression of depressive symptoms and its outcomes.

FACTORS THAT INFLUENCE HEALTH CARE ACCESS FOR OLDER HMONG PATIENTS IN THE USA

M. Lor, P. Xiong, T. Khang, E. Jacobs, *Nursing, University of Wisconsin-Madison, Madison, Wisconsin*

Background: Immigrant elders are an increasing percent of the aging population in the U.S. Little has been reported on issues of elderly immigrants, including the Hmong, in gaining access to health care including treatment of illness and prevention. Purpose: The purpose of this study was to identify barriers and facilitators that affect the use of treatment of illness and preventive health care by older Hmong. Methods: Eleven Hmong participants (female n = 6; male n = 5) age ranging from 34 to 70 years were interviewed by a bilingual researcher. Interviews were audio taped, transcribed verbatim, translated to English, and coded using inductive content analysis. Results: Most Hmong participants reported accessing the health care system only when symptomatic (e.g. experiencing pain), not for prevention. They also described the need for tangible proof of illness (e.g. x-rays pictures) before agreeing to treatment and a guarantee of cure before agreeing to surgery. Most Hmong described using home remedies (e.g. herbal medicine) to manage their health problems prior to seeking medical care. Health care decisions including care and treatment were always made in consultation with nuclear family members (e.g. husband/wife, children). Conclusion: Preventive care and treatment for illness in older Hmong require careful attention to Hmong cultural practices. Low access may be the result of cultural beliefs as well as system generated barriers. Increasing prevention and early intervention will require innovative strategies. Greater focus on family knowledge might also increase the use of services for prevention and treatment.

ACCESS TO CARE AND SUPPORT: IMPACT OF SOCIOECONOMIC STATUS AND ETHNICITY

E. Verté, N. De Witte, E. Dierckx, A. Smetcoren, L. De Donder, *Vrije Universiteit Brussel, Ixelles, Belgium*

This study examines to what extent socioeconomic status and ethnicity affect the frailty (im)balance of community-dwelling older people in Brussels and in which degree they have access to care and support. Data are derived from the Belgian Ageing Studies, a quantitative design that uses structured questionnaires to obtain information about different facets of quality of life of older adults (N=600). Analyses identified the relation between socioeconomic status, ethnicity on the one hand and frailty (im)balance and access to care and support on the other hand. The findings reveal several socioeconomic and ethnic influences on different components of frailty: (1) physical domain (e.g. (a) older people with a lower socioeconomic status suffer earlier and more frequently from health problems and functional limitations; (b) older migrants experience more health issues then older natives); (2) psychological and social domain (e.g. in terms of elder abuse there is more neglect amidst natives and more financial abuse among the migrant population); (3) environmental domain (e.g. (a) wealthier neighborhoods in Brussels know a larger supply of care services; (b) there is a huge difference in adaptation of the housing situation of older migrants and natives: older migrants live much more often in a serious maladjusted home.). Our results stress the need for a community-based approach to balance the state of frailty with respect to the different socioeconomic and ethnic groups within the population of older people in Brussels.

GENDER DIFFERENCES IN OLDER ADULTS' FOOT SHAPES USING 3D FOOT SCANNER: IMPLICATION FOR SHOE DESIGN

M. Saghazadeh[1], N. Kitano[1], T. Okura[2], *1. Health and Sport Sciences, Tsukuba, Ibaraki, Japan, 2. Faculty of Health and Sport Sciences, Tsukuba, Ibaraki, Japan*

Knowledge of gender differences in foot shape assists shoe manufactures with designing appropriate shoes for men and women. Although gender differences in foot shapes are relatively known among young men and women, less is known about how the older men and women's feet differ in shape. A recent development in foot shape assessment is the use of 3D foot scanners. To our knowledge this technology has yet to be used to examine gender differences in the shape of older adults' feet. This cross-sectional study included 151 older men (74.5 ± 5.6 years) and 140 older women (73.9 ± 5.1 years) recruited in Kasama City, Japan. Foot variables were measured in sitting and standing positions using a 3D foot scanner. Scores were analyzed as both raw and normalized to truncated foot length using independent samples t-test and analysis of covariance. Men showed significantly higher values for navicular height, height of first and little finger, instep, width of heel and metatarsal head, girth and presented lower values for the degree of hallux valgus, in both sitting and standing positions ($p < 0.001$, Cohen's $d = 0.63$-1.6). However, after normalization, the differences in width of metatarsal head, height of first and little fingers in both sitting and standing positions and also heel width in sitting position were nonsignificant. Overall, the current study shows evidence of difference between some of the foot characteristics and shapes of older men and women. These differences should be considered when manufacturing shoes for older adults.

MAKING THE CONNECTION: WOMEN-SPECIFIC BELIEFS ABOUT STROKE PREVENTION AMONG MINORITY SENIORS

I. Lee[1], D. Araiza[1], B. Barba[1], C. Reyes[1], L. Trejo[2,1], M.R. Moore[3], C.A. Sarkisian[1,3], *1. UCLA Division of Geriatrics/The Los Angeles Community-Academic Partnership for Research in Aging (L.A. CAPRA) Center, Los Angeles, California, 2. City of Los Angeles Department of Aging, Los Angeles, California, 3. UCLA Resource Center for Minority Aging Research (RCMAR)/Center for Health Improvement for Minority Elders (CHIME), Los Angeles, California*

Although older racial/ethnic minority women are at greatest risk for stroke, awareness of risk factors, warning signs and prevention remains low in these groups. In order to inform effective primary prevention strategies, women-specific beliefs about stroke and how to best disseminate stroke knowledge and specific risk reduction strategies such as increasing physical activity need to be examined. The objective of this study was to identify women-specific beliefs about stroke prevention and barriers/facilitators to walking in particular as a stroke prevention method among Korean, Chinese, African American, and Latino women aged 60 years and older. We conducted 12 focus groups (3 with each ethnic group) with a sample of 132 women and men and identified beliefs that were unique or particularly important to women with this data. Focus groups were digitally audio taped, transcribed, and reviewed by 2 coders using ATLAS.ti software. Standard qualitative content-analysis methods were used. Results revealed major themes around safety, chronic medical conditions, and not identifying walking as exercise as barriers for women; motivators included having someone to walk with, fear of entering a nursing home, and losing weight. Results will identify best practices and will be used to develop a culturally-tailored stroke risk factor reduction walking intervention to be deployed in senior centers and similar community-based settings.

GENDER DIFFERENCES IN THE RELATIONSHIP BETWEEN AGE-RELATED KIDNEY FUNCTION DECLINE AND CAROTID INTIMA-MEDIA THICKNESS IN A HEALTHY CHINESE POPULATION

L. Han[1], X. Bai[1], K. Yu[1], B. Jin[1], X. Zhao[1], W. Han[1], X. Chen[2], *1. Shengjing Affiliated Hospital of China Medical University, Shenyang, China, 2. General Hospital of Chinese PLA, Beijing, China*

Background Aging-related decline in kidney function is an independent predictor for cardiovascular events and death. The objectives of this study were to identify gender differences in the association between age-related renal function decline and changes of carotid intima-media thickness (CIMT) in healthy Chinese individuals. Materials and methods In cross-sectional study, 852 healthy adults (aged 30 – 98 years, 392 men) were enrolled and examined. Kidney function was estimated by using two markers: estimated glomerular filtration rate (eGFR), which was evaluated by creatinine-based Modification of Diet in Renal Disease (MDRD) Study equation, and cystatin C (CYSC) level. CIMT was assessed using M-mode ultrasonography. Results In both males and females the age was significantly correlated with eGFR (r=-0.113 for males, p=0.025; r=-0.23 for females, p<0.001), CYSC(r=0.38 for males and r=0.634 for fmales, p<0.001) and CIMT(r=0.429 for males and 0.418 for females, p<0.001). I n unadjusted model eGFR (r=-0.155 for males, p=0.02; r=-0.-0.194 for females, p<0.001) and CYSC (r=0.213 for males and r=-0.372 for females, p<0.001) were significantly correlated with CIMT. Multiple linear regression analysis showed that only in females CYSC was significantly associated with CIMT (B=0.213, p=0.001) after full adjustment. The association between eGFR and CIMT was significantly only in an unadjusted model and was lost after full adjustment. Conclusions Our results confirm that aging is a major factor contributing to changes in both kidney and CIMT in a healthy population. Only in females the age-related decline of kidney function was independently associated with the CIMT thickness.

SOCIOECONOMIC INEQUALITIES IN COMPONENTS OF THE NEUROENDOCRINE SYSTEM AMONG OLDER ADULTS

D. Bann[1], K. Ong[2], D. Kuh[1], H. Lashen[3], B. Keevil[4], F. Wu[4], J.M. Holly[5], Y. Ben-Shlomo[5], *1. MRC Unit for Lifelong Health and Ageing at UCL, London, United Kingdom, 2. Cambridge University, Cambridge, United Kingdom, 3. Sheffield University, Sheffield, United Kingdom, 4. Manchester University, Manchester, United Kingdom, 5. Bristol University, Bristol, United Kingdom*

The neuroendocrine system is influenced by environmental factors operating across life, and its functioning may contribute to socioeconomic inequalities found in functional aging. We examined associations between childhood and adult socioeconomic position (SEP) with insulin-like growth factor-I (IGF-I) and testosterone among 791 men and 799 women from mainland Britain participating in the MRC National Survey of Health and Development. Fasting morning blood samples were obtained at 60–64 years—plasma IGF-I was measured by immunoassay and plasma testosterone by liquid chromatography-tandem mass spectrometry. Associations between prospectively ascertained paternal occupational class (4 years) and household income (60–64 years) with IGF-I and testosterone were examined using the relative index of inequality. Lower childhood and adulthood SEP were associated with lower IGF-I among women but not men—mean percentage difference in IGF-I comparing the lowest with the highest childhood SEP (women: -9.16, 95% CI: -17.86 to -0.46; men: 5.57, -3.05 to 14.19), adult SEP (women: -12.16, -20.63 to -3.68; men: -5.16, -13.67 to 3.35). Childhood SEP was not associated with testosterone (men: -3.65, -14.53 to 7.24; women: 15.13, -3.52 to 33.78), but lower adult SEP was associated with lower testosterone among men (-18.77, -29.43 to -8.10) but not women (-2.58, -20.82 to 15.66). Socioeconomic inequalities were found in circulating IGF-I (among women) and testosterone concentrations (among men) in early old age. Further research will examine the extent to which these inequalities explain socioeconomic differences in functional aging, and investigate whether SEP is associated with the typical mid-life declines in these profiles.

RACE AND ETHNIC DIFFERENCES IN MORTALITY BY PHYSICAL ACTIVITY LEVEL

E. Vasquez[1], K.R. Sahakyan[3], J.A. Batsis[2], C.M. Germain[4], F. Lopez-Jimenez[3], V. Somers[3], B.A. Shaw[1], *1. University at Albany (SUNY), Rensselaer, New York, 2. Dartmouth-Hitchcock Medical Center, Lebanon, New Hampshire, 3. Mayo Clinic College of Medicine, Rochester, New York, 4. Duke University Medical Center, Durham, North Carolina*

Background: There is strong evidence of an association between physical activity (PA) and mortality. However, the dose response relationship is not well characterized, particularly among racial/ethnic groups. Methods: The sample comprised 2732 women and 2541 men drawn from NHANES III (1988-1994) aged ≥60years. Participants self-reported PA and were classified as inactive, active (3-6 METs for ≥5 times/week or >6 METs, ≥3 times/week), or insufficiently active (those meet neither criteria). Racial differences were modeled using proportional hazard regression (HR) adjusting for age, gender, smoking, poverty level, comorbidities. Results: Compared with whites, physically active African Americans (AA) males had reduced risk of all-cause mortality (HR: 0.71, 95% CI 0.52-0.97). In AA and Mexican American (MA) females, inactivity was associated with 28% and 35% decreased risk of all-cause mortality (HR: 0.72 [0.53-0.99] and HR: 0.65 [0.47-0.88] respectively) when compared to whites. Race/ethnicity was not related to increased CVD mortality among physically active males or females. Insufficient activity was associated with an approximately 42% decrease in overall mortality in males and females. Conclusion: The risk of all-cause mortality was decreased only in physically active AA males and those with insufficient PA. Further investigation, including studies with longer follow-up, are needed to address the definition and health consequences of varying degrees of PA.

SESSION 655 (POSTER)

CAREGIVING AND SOCIAL SUPPORTS

KINSHIP CAREGIVERS: PREDICTING THE LIKELIHOOD OF ADOPING THE CHILD/REN IN THEIR CARE

D.J. Monahan[1], V. Greene[2], C.J. Smith[3], K.M. Kietzmann[4], *1. Syracuse University, Syracuse, New York, 2. Syracuse University, Syracuse, New York, 3. Syracuse University, Syracuse, New York, 4. Syracuse University, Syracuse, New York*

Background and Introduction. Kinship caregivers are often crucial as a child care resource for families experiencing stress or temporary parenting due to illness, incarceration, or death of a parent. The purpose of this paper is to examine the demographic and social factors that predict kinship caregivers who are "likely to adopt" the children in their care. Methods. Kinship caregivers who were enrolled in a federally funded KinNET program completed the survey (N=102) and the data were entered anonymously into SPSS for analysis. Their mean age was 57.51 years (SD=10.13), 95% were female (SD=.19) and two-thirds were non-white (SD=.73). Results. Using "likelihood of adopting the child in my care," as the outcome variable in the regression analysis, caregiver's age, monthly income, and total hours employed were significant predictors. Data from the participants in the study were entered anonymously into the computer for analysis using the SPSS. Total pressures score, total family needs score, and total physical problems score were not statistically significant predictors. The adjusted R Square was .439 and significant (.006). Implications: This topic is important for researchers, policy analysts and practitioners who are interested in the welfare of children in kinship care. Understanding the factors that are predictive of adopting children in kinship care will help programs target services more effectively. Helping kinship caregivers and the children in their care is also important in promoting their health and social well-being.

INTERGENERATIONAL FAMILY RESPONSIBILITY AND SOLIDARITY IN TAIWAN: IMPLICATIONS FOR AGING POLICY

J. Lin, C. Huang, *National Taiwan Normal University, Taipei, Taiwan*

In Taiwan, the increasing old-age dependency ratio puts state under rising financial pressure. Simultaneously, families with fewer children are faced with higher financial and caring responsibilities for their old-aged members. Do children and the elderly compete for restricted resources in families (and state)? This study had two goals: first, latent class analysis (LCA) was used to examine a typology of public opinion about how responsibility for care and financial security for elders and children should be divided between the family and society. Second, the multinomial logistic regression (MLR) was performed for analyzed the effects of the experience of intergenerational solidarity within the family on people's attitudes towards intergenerational family responsibility and policy preferences. Data were taken from the 2011 Taiwan Social Change Survey consists of an island-wide sample of 2110 adults aged 18 years old and above. Four types were found for people's attitudes: (a) Family Centered: both child and elderly care were family's responsibility, (b) Shared Responsibility: both family and government had responsibility for child and elderly care, (c) Cooperative: government and family cooperated to take care elderly, and child care was family's responsibility, (d) The Elderly Care by Society: elderly care was government's responsibility. Overall, intergenerational solidarity matters for people's attitudes towards family responsibility and policy preferences. The attitudes are not only subject to egocentric considerations.

THE IMPACT OF WORK-FAMILY CONFLICT ON LIFE SATISFACTION AMONG THE 'SANDWICH GENERATION': THE ROLE OF INTERGENERATIONAL RELATIONS

C. Yu, J. Lin, P. Tai, C. Huang, *National Taiwan Normal University, Taipei, Taiwan*

In Taiwan, substantial reductions in fertility and increases in life expectancy over the last couple of decades have resulted in a rapidly aging society. Sandwich Generation, those people "sandwiched" between the competing demands of caring both for their children and for their parents have gained attention. This study analyzed the implications of work-family conflict and intergenerational relations for life satisfaction among the sandwiched-generation adults. Data were taken from the 2011 Taiwan Social Change Survey. Hierarchical multiple regression models were used to test intergenerational relations variables – living arrangement (co-reside with parents), intergenerational support exchange (financial support, help with household chores) and intergenerational affection – as potential mediators of the proposed negative relationship between work-family conflict and life satisfaction in mid-life. Western studies have found that providing support to elderly parents has negative effect on the wellbeing of adult children. However, the present study found that support exchanges between generations exhibited no effect on life satisfaction for either women or men. In addition, although the extended family model is culturally dominant in Taiwan, this study found no effect on life satisfaction stemming from co-residence with aging parents. This study underscores the importance of the emotional component in intergenerational relations. The emotional bonds with aging parents played an important, mediating role in the negative relationship between work-family conflict and life satisfaction for women. The results are discussed in light of the Confucian concept of filial piety and the theoretical model of intergenerational solidarity.

CONNECTING DIVERSE CARE IDEAS: IMMIGRANT CAREGIVERS AND THE GLOBALIZATION OF ELDERCARE

M.E. O'Leary, *Boston University, Boston, Massachusetts*

Concerns about the availability and quality of eldercare have surfaced as aging populations contend with the lack of appeal of frontline care jobs. In Massachusetts, Caribbean and African immigrants fill this labor market niche. This migration affects both the eldercare climate in the U.S. and the countries from which the caregivers migrated. Social theorists have attempted to define globalization, but few scholars ground these processes in empirical research that identifies individuals as agents of global change. Through evidence from forty in-depth interviews with first generation immigrants working as homecare and nursing home aides, this paper explores the globalization of eldercare by focusing on how paid immigrant caregivers think about and perform care for both their clients in the U.S. and for their aging relatives abroad. Immigrant caregivers evaluate the climate of government abandonment in regard to services in their sending countries in comparison with the U.S. healthcare system and entitlement programs for seniors, a system which they see lacking in communal family values. They change the climate of eldercare in their countries of origin by sending remittances, organizing care, sending medical equipment, sharing tips on hygiene and eldercare, and encouraging aging relatives to join them in the U.S. To their American clients, they emphasize fictive kinship. In essence, these immigrants are connectors of diverse ideas of eldercare across borders that homogenize eldercare "best practices" globally. By virtue of their social location as first generation immigrants working in direct care, these caregivers affect change in both sending and receiving countries.

A STUDY OF FACTORS RELATED TO DIFFERENCES IN TYPES OF ABUSE AMONG OLDER COUPLES IN JAPAN

A. Katsumata[1], N. Tsukada[2], *1. Rehabilitation Institution, Tokyo, Japan, 2. Nihon University, Tokyo, Japan*

The purpose of this study was to examine factors related to differences in types of abuse among Japanese older couples, by using data collected from Japan's first nationwide survey of Certified Social Workers (CSWs) at 4,042 Community Comprehensive Support Centers (CCSCs)in August 2010. A structured questionnaire survey was provided to a randomly selected 1,282 CCSCs. A total of 621 responses from CSWs were obtained (response rate of 48.4%). 379 respondents (61.0%) reported their most recent clients for an abuse case was an older couple. Preliminary analyses revealed statistically significant relationships between types of abuse among older couples and factors, such as gender, victims' age, degrees of care burden, whether or not victims has dementia, whether or not abuser has dementia, and perceived causes of elder abuse. For example, it was found that financial abuse was significantly related to victims being male, abusers' health status, revenge for domestic violence (DV) at younger age, and financial distress among older couples. It was also found that neglect was significantly related to victims being male, with higher degree of care burden and with dementia, revenge for DV at younger age, caregiving fatigue, financial distress, and spousal relationships between victims and abusers. Moreover, psychological abuse was significantly related to continuation of DV from younger age and spousal relationships. Findings indicate that some current abuse cases may be reflective of long-term abusive relationships (e.g. revenge for DV, continuation of DV). CSWs may need to explore additional approaches to addressing their abuse cases that account for this.

LONELINESS IN A SENIOR HOUSING COMMUNITY: A PILOT PROJECT

H. Taylor[1,2], I. Ferguson[1], S. Herbers[2], N. Morrow-Howell[1,2], *1. The Brown School of Social Work, St. Louis, Missouri, 2. The Harvey A. Friedman Center for Aging, Washington University, St. Louis, Missouri*

Aims: The purpose of this study is to determine the extent of loneliness in a low-income senior housing building and to determine associated socio-demographic factors. Methods: Seventy-three older adults living in a senior housing building were invited to participate in the Social Connections Survey. In total, 70% (N=51) of the residents completed the survey which included the Hughes 3 item Loneliness Scale, and items on socio-demographics and residential history. Ethnicity is not included as an independent variable because all but two respondents were African American. Analysis: Correlations, T-Tests, and one-way ANOVAs were conducted to address the study aims. Findings: 59.2% reported that they lack companionship some of the time or often, 40% feel left out some of the time or often, and 36% feel isolated from others some of the time or often. Residents who moved further from their previous residence to live in the building (R=.32, p=.025) and older adults of younger ages reported more loneliness (R=-.295, p=.049). Gender, education, current employment status, and willingness to move to the senior housing community were not significantly associated with the residents' loneliness. Implications: Despite living in a building with other peers, there are notable levels of loneliness, especially lack of companionship, among residents living in the senior housing community. Given the lack of association with many socio-demographic variables in this analysis, more work is needed to identify risk factors. More research on this topic is warranted given the potential for programing to reduce loneliness among older adults living in senior housing.

WHAT MAKES INHERITANCE PROCEDURES FAIR FOR PARENTS AND ADULT CHILDREN? A PROCEDURAL JUSTICE LENS

M. Stum, G. Brisse, M.N. Jackson, *University of Minnesota, St. Paul, Minnesota*

While "being fair" is known to be a common goal in family inheritance decisions, relatively little is known about the multiple meanings of fairness and internal guidelines family members use to evaluate fairness. This study examined if and how multidimensional conceptualizations of procedural fairness criteria are connected to and relevant for inheritance decision procedures. Participants included a convenience sample of six intergenerational family sets (one older parent and two adult children per family or 18 individuals). Data collection involved separate personal interviews including three written inheritance scenarios designed to facilitate discussions about fair processes for financial assets as well as personal possessions. Data analysis included identifying emerging fairness criteria themes from individual level transcribed texts using open coding. Modified analytical induction coding followed comparing seven a prior procedural fairness constructs to the open coded themes. Family members consistently articulated some aspect of all seven previously identified procedural justice criteria for judging the if procedures are fair including: 1) Participation (having a voice as owners/receivers, communication, sense of control), 2) Respect for status and standing in the family (who is in and out as decision makers, receivers (in-laws), 3) Accuracy (of owners wishes, value of possessions), 4) Neutrality (consistency across siblings, a level playing field), 5) Trustworthiness (transparent and honest motives), 6) Correction (fixing mistakes, making it right), and 7) Ethicality (not in line with moral/ethical values; taking or stealing). Findings offer baseline rationale for addressing gaps in inheritance prevention and intervention resources needed by family members and practitioners.

FRIENDSHIP MATTERS: EFFECTS OF AN ONLINE FRIENDSHIP INTERVENTION FOR OLDER ADULTS

T. Bouwman[1], M.J. Aartsen[1], T.G. van Tilburg[1], N. Stevens[2], *1. Social Sciences, VU University Amsterdam, Amsterdam, Netherlands, 2. Radboud University, Nijmegen, Netherlands*

An online friendship program was developed to help older people improve the quality and quantity of their social relationships and to help them cope with loneliness. The program encourages participants to develop their relationship network, and also pays attention to two other loneliness coping strategies: adapting standards and reducing the importance of the problem. Data were collected among 337 adults (180 in an intervention and 157 in a control group) aged 50 or over who enrolled in the online friendship program in 2013. The program consists of weekly lessons with exercises, social diaries and several questionnaires. Part of the questionnaires are the measurement of Friendship Expectations on six subscales; symmetrical reciprocity, agency, similarity, enjoyment, instrumental aid and communion. Results shows that the average loneliness of participants is high. Loneliness of the participants in the intervention group decreased after six weeks in the program, while the loneliness in the control group did not change. Additionally, participants in the intervention group had lower loneliness on the days that they conducted exercises from the program and evaluated this exercise as successful. Daily loneliness was lower for both participants in the control group and those in the intervention group when they had valuable contacts during the day. Results with respect to changes in friendship expectations were less clear. Results show that the online friendship program is successful in helping people in their daily social functioning.

YOUNG ADULT PERSPECTIVE:FILIAL PIETY AND ELDER CARE IN CHINA

J. Tan, K.A. Bailey, *Social Work, Bridgewater State University, Bridgewater, Massachusetts*

China has the largest net aging population in the world along with a rapid growth in aging adults. Historically, the family has been the source of support and care for elders, and filial piety has been a fundamental tenet in Chinese culture. However, increased geographic mobility and reduced family size have made more adult children unavailable for elder care. Very little empirical research has examined the attitudes and perspectives among college students in China towards older adults and elderly care. A mixed method approach was used with both quantitative and qualitative data collection. A convenience sample (N= 380) was collected through anonymous, self-administered survey questionnaires. In addition three one-hour long English focus groups were conducted. Survey data were inputted and analyzed using SPSS. Focus groups were transcribed and analyzed using content analysis methods. Quantitative data reported that the ASD scores are neutral, and indicate there are gender differences in perspectives on future elderly care for their parents. Qualitative data suggested that traditional Chinese obligations to live with one's parents throughout life are not as prominent today. In addition, the nursing home business has developed and this option has seemingly become more popular among Chinese families with aging adults. Findings from this study provide important and meaningful information for gerontological educators, service providers, and policy makers. With the one-child policy in place for a generation, China is facing an ever-growing need for trained professional service providers such as social workers to address the needs of older adults.

PREDICTORS AND MODERATORS OF CANCER CAREGIVER BURDEN

A. Schwartz[1], C.C. Hendrix[2], *1. Duke University, Center for the Study of Aging and Human Development, Durham, North Carolina, 2. Duke University, School of Nursing, Durham, North Carolina*

Being unprepared to provide necessary and complex cancer care may intensify the burden caregivers experience. Limited research has examined the conditions placing cancer caregivers at risk of experiencing greater burden in conjunction with their preparedness to care. This study was a secondary analysis of baseline data of an enhanced self-efficacy training for informal cancer caregivers prior to their loved one's discharge from the hospital. The current analysis focused on demographic characteristics and caregiver preparedness (measured using the Preparedness for Caregiving Scale, Archbold et al., 1990) as predictors of caregiver burden (measured using the 5 subscales of the Caregiver Reaction Assessment, Given et al., 1992). A second aim included identifying the factors moderating the relationships between the predictors and outcomes, such as caregiver employment status. Caregivers of patients age 50 and over were included in the analyses, resulting in a sample size of 101. Some main effect findings included caregiver preparedness being positively related to caregiver self-esteem ($b= .20$, $t=2.22$, $p< .05$), yet negatively related to impact on caregiver schedule ($b= -.23$, $t= -2.04$, $p< .05$). Moderation analyses revealed that the older an employed caregiver was, the greater their reported impact on their schedule ($b= .03$, $t= 2.20$, $p< .05$), and the greater their reported impact on their finances ($b= .05$, $t=2.38$, $p< .05$) compared to younger not working caregivers. Study implications will be discussed including how the findings can be used to inform healthcare providers about cancer caregivers who may be at a greater risk of experiencing caregiving burden.

SOCIAL RELATIONSHIPS OF OLDER ADULTS WITH INTELLECTUAL DISABILITIES FROM A LIFE COURSE PERSPECTIVE

L. van Heumen, *University of Illinois at Chicago, Chicago, Illinois*

Background: Research demonstrates that the quality of social relationships affects the health of aging persons (Antonucci, Ajrouch, & Birditt, 2014). Persons with intellectual disabilities (ID) live increasingly longer lives (Factor, Heller, & Janicki, 2012). These individuals need ongoing support as they age but tend to have fewer friends than their nondisabled, aging counterparts (Bigby, 2002). The current study will 1) explore how the social relationships of older adults with ID develop and change across the lifecourse and 2) advance the limited knowledge base on the experiences of aging of this population. Method: A process of paired recruitment was employed to generate a purposeful sample of 10 adults with ID (age 50 and over) and one key support person as a proxy for each participant. Data collection involved two stages: 1) in-depth qualitative interviews with key supports persons that generated life histories and social network maps (Antonucci, 1986) of the persons with ID and 2) in-depth qualitative interviews directly with the persons with ID. A vertical timeline of key events in the life history of participants (Caldwell, 2010) served as a visual cue in the second stage of data collection. All interviews were transcribed and transcripts were coded for dominant themes through an iterative analytic process. Results and conclusions: The social relationships of older adults with ID were significantly impacted by their residential history. Other factors included educational history, the family's socio-economic status and health or functional status. Implications for future research and policy development and enhanced practice will be addressed.

HEALTH STATUS AND GEOGRAPHIC LOCATION: THE ROLE OF SOCIAL SUPPORT

B. Gaines, F.W. Porell, E.A. Bruce, P. Nadash, *University of Massachusetts Boston, Quincy, Massachusetts*

Previous literature identifies the positive effect social support can have on health. However, social support is not typically addressed as it relates to health differences between urban and rural residents. This study advances the literature by examining the role of social support, as well as by distinguishing suburban residents from urban residents. The purpose of this study was to investigate whether self-reported health differences exist among older adults living in urban, suburban, and rural environments. We also examined the role of social support in the relationship between self-reported health and living environment. The data used in this study was obtained from the 2010 Leave Behind Questionnaire from the Health and Retirement Study (HRS), a nationally representative sample of older adults in the United States. Our sample consisted of 7995 older adults (50+) living within the community. Using a logistic regression, results indicate that prior to controlling for social support, urban and suburban older adults have significantly better health than rural residents. However, after including social support variables in the model, significant differences in self-reported health do not exist among older adults living in urban, suburban, and rural areas. These results highlight the importance of social support as a factor mediating the effects of geographic residence on the health status of older adults.

EFFECT OF INTERGENERATIONAL PROGRAMS BETWEEN PRIMARY SCHOOL CHILDREN AND SENIOR VOLUNTEERS ON THE SELF-EFFICACY OF CHILDREN

M. Yasunaga, Y. Murayama, R. Takeuchi, H. Ohba, K. Nonaka, M. Nishi, Y. Fujiwara, S. Shinkai, *Research Teams for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Itabashi, Tokyo, Japan*

Objectives: This study examined the effects of an intergenerational program between 6th grade primary school students and senior volunteers on self-efficacy of children in Japan. Description of the intergenerational program: 29 senior volunteers (Mean [±SD] age, 70.0±5.5 years) were assigned to 85 students of a primary school in Kawasaki City in June 2012. The senior volunteers instructed the students how to read picture books to other students. On the final day of the program, the students read picture books to the 1st grade students. Methods of the program evaluation: Baseline survey was conducted for the 85 students who took the program. The students were asked to evaluate their self-efficacy using the Likert 4 point agree/disagree scale for 10 items. After the completion of 7 periods (days?) of the program, we conducted a follow-up survey asking the same questions. We used analysis of covariance (repeated-measures design) with 'class' and 'sex' as covariates. Results: First, we divided the total self-efficacy scores into lower and higher groups because we expected an effect of this program on children with lower self-efficacy. Comparison of the total scores of self-efficacy between baseline and follow-up surveys revealed that self-efficacy scores of the higher group did not significantly improve (F(1,41) = 1.16, p=.287), but those of lower group significantly improved (F(1,34) = 6.23, p=.018). Conclusion: The intergenerational program can be effective for improving self-efficacy of primary school students.

DO FOREIGN DOMESTIC WORKERS POSITIVELY IMPACT CAREGIVING OUTCOMES? THE CASE OF SINGAPORE

P.A. Rozario, S. Hong, *School of Social Work, Adelphi University, Garden City, New York*

Foreign domestic workers [FDWs] play an intrinsic role in providing instrumental support to family caregivers in Singapore, who can afford such help. We aim to replicate another study, which found that the presence of FDWs was beneficial to family caregivers' well-being in Singapore. Using cross sectional data from a convenience sample of 500 caregivers, we examine the impact of the presence of and satisfaction with the work of FDW on caregiving outcomes, specifically caregivers' self-rated health, satisfaction with family harmony, and perceived caregiving gains. We regressed these outcome variables separately on whether or not caregivers hired an FDW and, if such help was present, how satisfied caregivers were with their FDW. In our multivariate models, we controlled for caregiving demands along with a set of caregiver and care recipient demographic variables. Twenty six percent (n=132) of family caregiver had employed an FDW and 69% (n=91) reported that the FDW's main responsibility was to help with the caregiving tasks. The presence of an FDW in itself was not significantly related to any caregiving outcomes of interest. However, caregivers who were more satisfied with their FDW reported significantly better health than those who were less satisfied. Satisfaction with an FDW was otherwise not related to other caregiving outcomes. Our findings highlight the importance of perceived instrumental social support from an FDW on caregivers' health. Considering their vital roles in supporting family caregivers, we need to also examine the caregiving experience from the perspective of the FDW.

BUILDING A WORKPLACE ELDERCARE PROGRAM RESPONSIVE TO CHALLENGES OF ADULT CHILDREN CAREGIVERS

B.G. Matchar, L.P. Gwyther, *Center for Aging, Duke, Durham, North Carolina*

Some forward-thinking businesses began programs 30 years ago to support employees caring for aging parents. The Duke Employee Elder Care Consultation Program was piloted in 1999 after an annual employee survey revealed increases in eldercare concerns in relation to childcare. Currently, 42% of the Duke workforce is > 50 years old, with an increasing proportion of employees confronting new challenges in balancing work with eldercare responsibilities. The Duke Elder Care Consultation Program offers employees (and their families) an immediate free confidential consultation with a social worker addressing their questions, setting family-centered priorities, and providing specific information and referrals. The consultation becomes an entry point for overwhelmed adult children to access an ongoing range of caregiver consumer information and support as their needs change. Simple flexible worksite-based appointment scheduling accommodates employee/family members' work or shift schedules and addresses access barriers to expert consultation in a crisis. Frequent elder care concerns prompting employed adult children's consultations are a parent's impaired decision-making, selecting and paying for long-term care services, and family conflict. Consultations help employees both set priorities for next steps and make sense of overwhelming and/or contradictory information about appropriate treatment and service options. Success is measured by use of information offered and connections established with credible ongoing support. Responses to a satisfaction survey indicate both anticipated and unanticipated consultation outcomes. Design, implementation and outcomes for adult children caregivers of an employee elder care consultation program will highlight how the program changes over time

END OF LIFE CARE: MEASUREMENT OF CAREGIVER WELL BEING SCALE IN ALLAHABAD, INDIA

R. Gupta, *School of Social Work, San Francisco State University, San Francisco, CA, California*

The purpose of this study was to examine well being of caregivers providing care to elderly family member at the end stage of life. There are several studies on elderly mental well being at end of life, however there is paucity of research on well being of caregivers. While some kind of palliative care is provided to the elderly in India for a few weeks before being discharged from the medical facilty, the responsibility for care of the elderly is still on caregivers. We examined the relevancy of 46 item Ryff Well being Scale on caregivers. The questionnaire was translated in Hindi and back translated in English to gauge measurement equivalence. This was a purposive convenience sample drawn from 30 caregiver who had an elderly relative seeking medical care from private clinics in Allahabad city. Two graduate students and two Professors from Allahabad University Psychology department assisted in reviewing the items and pilot testing them on ten caregivers. Some items were dropped as responses indicated great social desirability bias. About 22 items showed relevancy for caregivers. The t-test results indicate that there are significant gender differences in the ways the caregivers respond to items related to Autonomy in decision making. The final scale included 16 items in 3 subscales such as: a) Autonomy, b) Environmental mastery, c) Personal Growth were relevant for the study. Item analysis of the scale show that with modifications the Revised Well being Scale has face and construct validity. Reliability for the revised version was .78.

STEPFAMILIES CONSTRUCTED IN OLD AGE: EMOTIONAL EXPERIENCES AND OPERATIONAL CONSEQUENCES

C. Koren[1,2], S. Lipman-Schiby[1,2], *1. University of Haifa, Haifa, Israel, 2. University of Haifa, Haifa, Israel*

Second couple-hood in old age following widowhood or divorce is a phenomenon developing with the increase in life expectancy. Researching the phenomenon has focused mainly on perspectives of the re-partnered. The aim of this presentation is to explore re-partnering from the step-family's perspective. Nineteen step-families (38 multigenerational families) were recruited using criterion sampling, of men who re-partnered at age 65+ and women at 60+, with children and grandchildren from a lifelong marriage that ended in widowhood or divorce. We tape recorded and transcribed verbatim one hundred and seven semi-structured qualitative interviews with older partners, adult children, and grandchildren. Analysis was based on grounded theory and dyadic analysis principles adapted to families. It showed how re-partnering in old age caused changes in family structure, creating complex step-families, which have scarcely been studied. Emotional experiences refer to re-partnering being a replacement for couple-hood but not for parenthood or grand-parenthood. Operational consequences refer to various forms of family members "knowing their place" within the step-family. Findings are discussed regarding life course and family life cycle perspectives.

UNADDRESSED GRIEF IN INDEPENDENT AND ASSISTED LIVING FACILITIES IN EAST CENTRAL METROPOLITAN AREA

A. Conlon, P.A. Aldredge, K. Carey, *Virginia Commonwealth University, Richmond, Virginia*

The death of a spouse/life-partner is one of life's most stressful events leading to physical disease and injury such as hypertension, impaired immune function, increased mortality risk and a greater risk for falls as well as mental health concerns such as depression, anxiety, and sleep difficulties. Presently, over 10 million adults age 65 and older are widowed in the United States with approximately 900,000 thousand becoming widowed each year. Often, institutionalization occurs shortly after the loss of a spouse leaving the widowed older adult to grieve alone without support. The purpose of this study was to understand how independent and assisted living facilities address grief and loss concerns of their residents. This included understanding what services are presently offered, who provides these services, and what mechanisms are used to distribute these services. Data was collected by a social work graduate level research assistant who contacted independent and assisted living facilities located within a metropolitan area of the eastern central portion of the United States. Results suggest a lack of bereavement services within these facilities. In many cases, grief and loss remained undetected and unaddressed. Along with the presentation of results, opportunities for policy change are discussed.

VISUAL ACUITY AND ITS ASSOCIATION WITH SOCIAL ISOLATION IN OLDER ADULTS

C. Coyle, B.A. Steinman, *University of Massachusetts, Boston, Massachusetts*

Both research and intuition suggest that vision impairment in late life is related to social isolation. The purpose of this study was to examine the association of clinically measured visual acuity and social isolation in persons 65 years and older. We used data from the National Health and Nutrition Examination Survey (NHANES IV; 1999-2012), a nationally (U.S.) representative sample. Participants were categorized as having blindness (20/200 or worse), low vision (20/40 to 20/100), or normal vision (better than 20/40). Social isolation was measured as the number of social ties across four domains: marriage, contacts with friends and relatives, religious attendance, and membership in social organizations. Each of these ties was a dichotomous variable indicating the presence or absence of ties and scores were summed (0-4). We used logistic regression of weighted data to assess the relative contribution of visual acuity in predicting social isolation, with statistical control over factors representing dimensions of the International Classification of Functioning (ICF) structure. Independent variables/covariates were added to models sequentially as follows: Model 1—vision acuity and (demographic) variables; Model 2—added diagnosed chronic diseases; Model 3— added physical functioning; Model 4—added activities of daily living; and Model 5—added environment variables. For older adults who are blind or visually impaired effects of poor visual acuity in predicting social isolation were substantially reduced when other health covariates were controlled. Results suggest the importance of considering multiple health factors when addressing or screening social isolation among older adults who have vision impairments.

UNDERSTANDING THE IMPORTANCE OF FINANCIAL LITERACY FOR GRANDPARENTS RAISING GRANDCHILDREN: ADDRESSING UNPLANNED ECONOMIC UNCERTAINTY IN LATER LIFE

L. McDonald[1,2,5], R.M. Mirza[1,5], V. Iafolla[1,3], E. Fuller-Thomson[2], K. Dill[4], *1. Institute for Life Course and Aging, University of Toronto, Toronto, Ontario, Canada, 2. University of Toronto- Factor Inwentash Faculty of Social Work, Toronto, Ontario, Canada, 3. University of Toronto- Centre for Criminology and Sociolegal Studies, Toronto, Ontario, Canada, 4. Queen's University- School of Sociology, Social Policy and Social Work, Belfast, Ireland, 5. National Initiative for the Care of the Elderly (NICE), Toronto, Ontario, Canada*

Since 2000, there has been a dramatic increase in the number of older adults with custody of and responsibility for raising their grandchildren (custodial grandparents) in Canada. Research reveals that custodial grandparenting agreements usually arise from an adult child's substance abuse, divorce or separation, mental/physical health issues, teen pregnancy, child abuse, or death. Custodial grandparents face numerous challenges, particularly the additional financial constraints of raising grandchildren in retirement, compounded by inadequate support from social services. This study explores the experiences and financial literacy needs of custodial grandparents, and the development of new, evidence-based financial literacy tools tailored to their unique financial needs. A mixed-methods research design of interviews (n=25) and focus groups (n=30) captured the experiences of custodial grandparents; subsequent participants across Canada (n=150) completed a questionnaire regarding grandparents' care responsibilities and attendant financial impacts. Our findings indicate that custodial grandparents experienced high levels of financial stress due to the uncertain and unplanned nature of the circumstances that led them to their custodial arrangements, compounded by gendered impacts upon grandmother-caregivers. Custodial grandparents expressed the need for improved financial literacy, particularly with regard to support navigating the legal and social welfare systems. New financial literacy tools were developed to capture the legal implications, government benefits, money management and taxation needs of custodial grandparents. Our findings emphasize the diversity in the socio-demographic profile and varied levels of financial literacy of custodial grandparents, and the urgent need to address systematic policy gaps that fail to reflect the changing needs of custodial grandparents.

NURSING HOME RESPITE CARE (NHRC): A VOICE FOR THE FAMILY CAREGIVERS

C.J. Bing, A. Tan, *Care Integrated Division, Agency for Integrated Care, Singapore, Singapore, Singapore*

Like many developing countries, Singapore's healthcare system is undertaking the challenges of managing an ageing population. Since 2012, the Ministry of Health (MOH) has recognized family caregivers as an integral social fabric to maintaining the care of their care recipients within the comfort of their homes. In implementing the various national initiatives to supporting caregivers, there is also a paradigm shift, such that community services become more inclusive towards caregivers' needs. Family caregivers were previously not subsidized when they utilized nursing homes as a respite option. However, on 15 May 2013, AIC, a subsidiary of MOH, implemented the Nursing Home Respite Care (NHRC), a pilot that runs for 2 years. AIC became the central source of enrolling the caregivers and supporting them with respite care services. This has enabled the more financially disadvantaged family caregivers and vulnerable caregivers to access this service. In this poster, participants will understand how NHRC has become a voice for the family caregivers and the positive impact it has made to the care system in Singapore. Participants will also understand how the respite team was formed to proactively engaged caregivers to accessing this service and the positive case studies on the benefits of this service. AIC will also document the various data and statistics that forms our evaluation study and the journey we have taken to mainstreaming this service into a mainstream programme.

SESSION 660 (POSTER)

INTERNATIONAL, CROSS-CULTURAL, AND RACIAL/ETHNIC ASPECTS OF AGING

LONG-TERM AGED-CARE FACILITIES IN MALAYSIA: UNDERSTANDING THE POTENTIAL OF INJURY RISKS PRESENTED BY THE CHARACTERISTICS OF THE PHYSICAL ENVIRONMENTAL SETTING AND ITS INFLUENCE UPON THE WELL-BEING AND QUALITY OF LIFE AMONG THE OLDER POPULATION

S.-. Venkataraman[1], H. Bartlett[1], J.A. Oxley[2], L.-. Farnworth[2], L.-. Day[2], *1. Monash University, Bandar Sunway, Selangor, Malaysia, 2. Monash University (Australia), Melbourne, Victoria, Australia*

Introduction: The population of Malaysia is ageing, and the need to provide supported accommodation and health care, including occupational therapy, is increasing. There is a growing industry of aged care facilities, including registered and unregistered nursing homes and 'shelter' homes. These facilities provide care for their clients, however, little is known about the levels of care provided, experiences of the elderly, implications for risk of injury (particularly fall-related injuries) and quality of life, and institutional strategies to prevent fall-related injuries. These issues are relevant for occupational therapy practice in Malaysia. Objective: This study aimed to identify potential risk factors within long-term care facilities in Malaysia, understanding what the physical risk factors are, how they contribute to falls, and examining the relationships between activity, participation and social inclusion in everyday life. Methods Data was collected at 28 aged care facilities using the Residential Environment Impact Survey (REIS) (Fisher et al., 2008). The REIS is a non-standardised, semi-structured assessment instrument designed to examine the environmental impact of community residential facilities on residents. The data collection included four key components: semi-structured interviews with staff; semi-structured interviews with residents; observational assessment; and observation of daily activities. Results The paper will outline the findings from this study that have significant implications for care of the elderly in Malaysia. Important information on the level and type of care provided in long-term facilities, as well as information on falls risk and overall health and wellbeing of the elderly living in these aged care facilities and shelter homes will be described. Conclusion The paper will conclude by providing recommendations for occupational therapy practice, including the potential roles of occupational therapists in education, advocacy, environmental adaptation and direct client care, in reducing the prevalence and lack of awareness about falls and their long-term outcomes in Malaysian aged care facilities. Key words: physical environment, social influence, hazards, older residents, early identification, potential injury risk, falls, staff perception.

PSYCHOLOGICAL WELL-BEING AMONG OLDER ADULTS IN CHINA: A COMPARISON OF URBAN AND RURAL DIFFERENCES

H. Chen[1], A. Mui[2], N. Jiang[2], Y. Li[2], Y. Zhang[2], *1. Washington University in St. Louis, St. Louis, Missouri, 2. Columbia University School of Social Work, New York, New York*

The secondary research is based on the WAVE I (2010) of the WHO Study on Global AGEing and Adult Health (SAGE). This study analyzed a nationally representative sample aged 60 and older from China (n = 4,817). Psychological well-being (measured by WHOQOL which included elders' perceptions on physical and psychological health, social relationships, and environment) and residency differences were examined (urban=2,962; rural=1,853). Results showed that urban elders were older than their rural counterparts (mean age: 69.3 vs. 66.8). More women were in the rural setting than in the urban area (64.9% vs. 52.3%), and urban elders were more educated than rural elders (35% vs. 3% elders had high school or above schooling). Bivariate analysis on WHOQOL showed that rural elders perceived better psychological well-being than urban elders. Multiple regression analysis also indicated that living in an urban setting is associated with lower levels of psychological well-being score, other factors being equal. Besides residency differences, elders who reported lower level of psychological well-being tended to report poor self-rated health, less education, and less financial satisfaction. The cross-sectional analyses of the data show that elders' poorer sense of psychological well-being is associated with health and financial factors. Results support social intervention for elders in China that focus on health programs and financial support to enhance their psychological well-being. In addition, more research is warranted to examine life satisfaction including other stressors, family factors, belief systems, and coping skills that may be associated with rural and urban elders' varying levels of psychological well-being.

PSYCHOLOGICAL WELL-BEING AMONG OLDER MEN AND OLDER WOMEN IN CHINA: FINDINGS FROM THE WHO STUDY ON GLOBAL AGEING AND ADULT HEALTH (SAGE)

Y. Zhang[1], A.C. Mui[1], H. Chen[2], N. Jiang[1], Y. Li[1], *1. Columbia University, New York, New York, 2. Washington University, St. Louis, Missouri*

The secondary research is based on the WAVE I (2010) of the WHO Study on Global AGEing and Adult Health (SAGE). This study analyzed a nationally representative sample aged 60 and older from China (n = 4,817). The primary question was to examine gender differences (female=2,750; male=2,065) in psychological well-being (as measured by WHOQOL which included elders' perceptions on physical health, psychological health, social relationships, and environment). Data showed that Chinese women in the sample were older than their male counterparts (mean age: 68.9 vs. 67.6), there were more women than men in urban areas (68.5% vs. 61.5%) older women were more likely than older men to have some college education (9.8% vs. 5.8%), and more women were satisfied with their financial situation than men (57.1% vs. 56.1%). In terms of psychological well-being, older men reported slightly lower levels of WHOQOL scores than older women. In terms of perceived health, elderly men reported poorer health conditions than elderly women (21% vs. 19%) and women reported fewer numbers of chronic illnesses than men (1.26 vs. 1.5). Multiple regression results indicate that, all factors being equal, elders' lower level of psychological well-being score is associated with poorer self-rated health, less education, less financial satisfaction, living in an urban setting, and having more chronic illnesses. Gender differences disappeared after controlling for other factors in the regression model. Data suggest that interventions to enhance psychological well-being should include a focus on health programs, financial support, and targeting elders living in urban settings.

RACIAL/ETHNIC AND GENERATIONAL DIFFERENCES IN CAREGIVING: IMPLICATIONS FOR PRACTICE

C.E. Miyawaki, *University of Washington, Seattle, Washington*

This study examined the sociodemographic characteristics and health status of Asian, Hispanic and non-Hispanic White American family caregivers of older adults across three immigrant generations. Using the 2009 California Health Interview Survey dataset, 8,117 caregivers (591: Asian, 989: Hispanic and 6,537: White) were selected. It used descriptive and univariate analyses, and F and Chi-square tests as well as one-way analysis of variance were performed. Significant differences of sociodemographic characteristic and health were found across racial/ethnic groups and generations. Not surprisingly, Hispanic caregivers were the youngest and White counterparts the oldest. 2nd generation Asian and Hispanic caregivers were the youngest while 2nd generation White caregivers were the oldest. Asian and White caregivers attained higher education than Hispanics; however, only Asian and Hispanic caregivers' educational attainment increased with later generations. The vast majority self-rated their health as good; however, the later the Asian and Hispanic caregivers' generations, the poorer their health status. Percentages of Asian and Hispanic caregivers with chronic health conditions increased the later the caregivers' generation whereas those of White caregivers were similar across generations. The vulnerability distinctive to each racial/ethnic group by generation points to the necessity of researchers and practitioners' understanding the historical background and recency of immigration of each group. Findings suggest that efforts to design linguistically, culturally and generationally appropriate assistance to diverse groups of family caregivers should take account of generational differences across racial/ethnic groups. Interviews with multiple generations of Asian caregivers were explored to further examine their caregiving experiences in this future research trajectory.

RELATIONSHIP BETWEEN SUBJECTIVE SOCIAL EXCLUSION AND POWER AS A COMMUNITY RESIDENT IN MARGINAL COMMUNITIES

Y. Watanabe, *Musashino University, Nishitokyo, Tokyo, Japan*

Purpose: A marginal community is defined as a community in which over 50% of the population are over 65 years old and facing difficulty maintaining adequate function for their daily lives. Community residents need to support each other to maintain their lives. This occurs not only in Japan, but also worldwide, especially in developed countries. This research aims to reveal the relationship between subjective social exclusion and the power as a resident in the marginal community. Method: Research was conducted in 2012 through a questionnaire administered to people over 20 years old. Multivariate logistic regression was used for the analysis. Subjective social exclusion was measured by "Feeling difficulty participating in the community meeting (DP)" and "feeling difficulty accepting own opinion in the community (DA)". The power was measured by The Support Power for the Elderly Scale (SPES), which consists of 2 subscales: sense of power (SP) and sense of sharing community problems (SS). Other variables considered in the models were age and gender. Results: The results indicate that SPES/SS/SP are significant predictors ($P<.05$) for DP/DA (SPES for DP odds ratio (OR)=1.056; 95% confidence intervals (95%CI)=1.000 to 1.114, SS for DP OR=1.150; 95%CI=1.015 to 1.304, SPES for DA OR=1.099; 95%CI=1.032 to 1.170, SS for DA OR=1.248; 95%CI=1.074 to 1.450, SP for DA OR=1.125; 95%CI=1.036 to 1.223). Conclusion: The study suggests that the community residents whose power is low cause subjective social exclusion. Powerless people might be uncomfortable in a marginal community and lose chances to find their power.

THE ASIAN FAMILY, THE STATE AND CARE FOR URBAN OLDER ADULTS: A COMPARISON OF SINGAPORE, CHINA AND INDONESIA

T. Wu, *Tsao Foundation, Singapore, Singapore*

This empirical paper examines elder care received in urban Singapore, China and Indonesia in terms of the care recipient's family network, household income; and public benefits available. Using three comparable cross-sectional country datasets, OLS regressions are carried out to examine the role of the family and the state in care provision. Asian values of filial piety and intergenerational support are expected to form the underlying basis for the family as the main care provider. But there is much variation in how care is provided across the three Asian countries. Findings show that the Singaporean elder receives a substantial amount of informal care when there are both primary and secondary family caregivers. However in Singapore and China, there is a substitution effect between a hired live-in maid and a family member as caregiver. Only in Indonesia, informal care received increases with the size of the family household. Established old-age benefits from the Chinese socialist welfare system and public health insurance in Indonesia reduce the amount of informal care needed by urban elders. After attending this activity, participants will be able to discuss the extent to which Asian filial piety is practiced in caregiving and the underdevelopment of old age policies in Asia.

INDICATORS OF SUCCESSFUL AGING AND LIFE SATISFACTION: THE COHORT EFFECT IN CHINA

Y. Chen[1], N. Morrow-Howell[1,2], *1. Washington University in St. Louis, St. Louis, Missouri, 2. Harvey A. Friedman Center for Aging, St. Louis, Missouri*

Aim: This study explores the association between indicators of successful aging (including mental health, economic security, and social engagement), intergenerational transmission of socioeconomic status (SES), and life satisfaction. The study also examined whether associations are moderated by different age cohorts (middle-aged and older adulthood). Methods: Data are from the first wave (2011) of the China Health and Retirement Longitudinal Study, a nationwide panel study comprised of a representative sample of Chinese residents over age 45. The study analyzed 2,554 middle-aged adults and 1,017 older adults. A multiple regression analysis model was conducted to examine the association between indicators of successful aging, intergenerational transmission of SES, and life satisfaction in two age cohorts. Findings: Results showed that age cohort does moderate the observed relationships. Higher levels of social engagement and economic security were positively associated with life satisfaction in the middle-aged group, while social engagement was insignificant among older adults. Mental health had the strongest relationship to life satisfaction among both age cohorts. In addition, in the middle-aged cohort, SES in adulthood totally mediated the effects of SES in childhood on life satisfaction. For the older cohort, neither childhood nor adulthood SES related to life satisfaction. Implications: These results suggest that the intergenerational transmission of SES differs between cohorts of older Chinese, which may reflect the differing sociohistorical times of their life courses. Improving economic security as well as mental health will improve the life satisfaction of both cohorts of Chinese older adults.

THE RELATIONSHIP BETWEEN HAVING GENERATIONAL IDENTITY AS BOOMERS AND RETIREMENT READINESS IN KOREA

Y. Bae, G. Han, S. Nah, J. Kang, *Seoul National University, Seoul, Republic of Korea*

Korea's Baby Boomers born between 1955 and 1963 take up 15% of current Korea's total population and this large demographic group has started to retire since 2010. Accordingly, academic and societal attention on Boomers' retirement and the quality of life after their retirement has been increasing. However, Baby Boomer concept has been introduced to general public only recently. Therefore, the main purpose of this study is to examine whether Boomers have the generational identity themselves and whether having Boomer identity is associated with the degree of retirement readiness. The first wave of "Korean Baby Boomers Panel Study" collected between May and August 2010 was used for analysis. The data is comprised of total 4,668 Korean Baby Boomers. Retirement readiness was evaluated in three dimensions; general, health and financial readiness. The major findings are as follows. First, only 49% of Korean Boomers were aware that they are Baby Boomers. Second, the proportion of people having Boomer identity was significantly greater among men and higher SES group. Lastly, the group with Boomer identity showed higher levels of general (β=.086, p<.001), health (β=.105, p<.001) and financial readiness (β=.065, p<.001) even after controlling gender, age, marital status, education level and monthly income. The result of this study suggest that having Boomer identity is important for Boomers to recognize and prepare for their life after retirement. More implications of these findings are discussed further.

MEASURING INTERPERSONAL PROCESSES OF CARE IN THE MEDICAL SETTING: AN ETHNIC COMPARISON

L. Bakk[1], T. Cadet[2], *1. University at Buffalo School of Social Work, Buffalo, New York, 2. Simmons College School of Social Work, Boston, Massachusetts*

The Patient Protection and Affordable Health Care Act stresses a patient-centered approach to care that actively engages individuals in the health care process. Research indicates that patients' experiences in the health care setting can support positive health behaviors and outcomes. While empirical evidence suggests that ethnic differences in patient satisfaction exist, it is unclear whether interpersonal practices between physicians, nurses, and older Hispanics differ from older non-Hispanics. This cross-sectional study examined the association between ethnicity and four domains of interpersonal processes of care (IPC). Data from the 2011 wave of the Health Care Study, a subsample of the Health and Retirement Study, were used. The sample consisted of 7,239 respondents age 50 and older identifying as either Hispanic or non-Hispanic. The analysis was conducted using logistic regression models. Respondents indicating their doctors and nurses did not explain medical issues in a comprehensible manner were more likely to be Hispanic than non-Hispanic (p<.001). Older Hispanics reported significantly poorer quality of IPC with physicians and nurses for respect (p<.01), listening (p<.01), and spending adequate time (p<.001) than older non-Hispanics. Controlling for gender, age, number of morbidities, self-reported health, annual household income, and health insurance status had little impact on these findings. Educational attainment, however, appeared to mediate the association between explaining medical issues, demonstrating respect, and ethnicity. Results suggest that differences in IPC exist between older Hispanics and non-Hispanics, and highlight the need to develop interventions to improve interpersonal skills in the health care setting, particularly when serving ethnic minority populations.

RACIAL/ETHNIC DISPARITIES IN NONADHERENCE AND MEDICARE PART D: HEALTH AND RETIREMENT STUDY 2004-2010

L. Bakk, *University at Buffalo School of Social Work, Buffalo, New York*

Cost-related nonadherence (CRN) assumed a central position in the policy justification for Medicare Part D. Prior to Medicare Part D, older Blacks and Hispanics reported greater CRN compared to older non-Hispanic Whites. It remains unclear whether racial and ethnic disparities have changed since the benefit's implementation. Using cumulative advantage/disadvantage theory as a framework, this longitudinal study examined 1) whether racial and ethnic disparities in CRN have changed since Part D, and 2) whether socioeconomic status and health status mediate the relationship between race, ethnicity, and CRN over time. Four waves of data from the Health and Retirement Study (2004 – 2010) were used to evaluate CRN before and after Medicare Part D's implementation. The analytic sample consisted of 5,259 respondents age 65 and older that enrolled in Medicare Part D and were taking at least one prescribed medication. The outcome variable of interest was CRN, or not filling or taking a prescribed medication because of cost. The analysis was conducted using mixed-effects logistic regression models. Results indicated that older Blacks and Hispanics were significantly more likely to report CRN both before and after Medicare Part D compared to older non-Hispanic Whites. While socioeconomic status and health status did not affect racial disparities, annual household income mediated ethnic differences in CRN. Further, the rate of CRN for older Hispanics significantly decreased over time in comparison to non-Hispanic Whites. Results suggest that while older Hispanics had improvement in CRN over time, racial and ethnic disparities continue to persist despite Medicare Part D.

I WANT TO SEE YOU BUT I DON'T WANT TO BE YOU

C. Clark, *Psychology, Queens University of Charlotte, Charlotte, North Carolina*

Many people fear or even dread getting old. Those with more negative views of aging in general also tend to have poor outlooks on their own aging and both groups have higher mortality than those with positive views. There is a need to identify what contributes to aging attitudes in order to improve views. The data reported here are part of a larger study on attitudes towards aging in which 1768 men and women aged 18-95 representing 7 different ethnic groups answered questions regarding attitudes toward and experiences with older people. We previously reported ethnic, gender, and demographic differences in negative attitudes. This paper presents an analysis of ethnic experiential differences (the quantity and quality of interactions with older persons) and how they contribute to attitudes toward self and other aging. Participants reported more contact with older persons in their families compared to older non relatives and almost half (46%) of the sample reported sharing their home with an older person with 71% reporting that sharing as positive. However, when you break these and other experiences down by ethnicity, an interesting pattern emerges. Asian, Latino, and Native Americans are more likely than all other groups to have more overall experience (i.e., visiting or spending time with older family and friends) and more positive experience interacting with older persons. However, they fear growing old more than others (all ps<.01). Results will be discussed in terms of the role of experience in contributing to positive and negative views of aging.

LATINO BABY BOOMERS: BARRIERS TO HEALTH

V.M. Villa[1,2,3], M. Aranda[4], S. Wallace[2,3], *1. CSULA Applied Gerontology Intstitute/ School of Social Work, Los Angeles, California, 2. UCLA School of Public Health, Los Angeles, California, 3. UCLA Center for Health Policy Research, Los Angeles, California, 4. USC School of Social Work, Los Angeles, California*

Latinos will comprise 20% of the next generation of older adults, representing the largest minority population age 65+. Utilizing data from the California Health Interview Survey 2011, barriers to health experienced by Latinos and non-Hispanic whites ages 47 to 65 in 2011 who report having diabetes and/ or heart disease are examined. Logistic regression estimates the odds of experiencing barriers to care among U.S Born Latinos, non-U.S. Born Latinos, and non-Hispanic Whites. The Latino population is disadvantaged relative to non-Hispanic Whites for several health barriers including delays in medical care, lack of verbal and written care plans, difficulty understanding their health provider, and inability to contact their physician with questions about their disease/condition. The Latino disadvantage attenuates when controlling for socioeconomic status and demographics for some but not all health barriers. As access to health care improves for the Latino population under the Affordable Care Act, providers will need to be sensitive to the barriers to health and wellness experienced by the population. Strategies will need to be developed that are culturally competent and empower the population to overcome individual as well as structural barriers. Toward that end, programs and services focusing on prevention, chronic disease self- management, and health education will be paramount.

AFRICAN AMERICAN BAPTIST CLERGY: "SHERPERDING THEIR FLOCK"

K.L. Stansbury[1], G. Marshall[2], *1. School of Social Work and Human Services, Eastern Washington University, Cheney, Washington, 2. Case Western University, Cleveland, Ohio*

Older adults exhibit a range of patterns in usage of mental health services, yet they typically underutilize formal mental health services. Older African Americans in particular report consulting informal sources such as family, friends, and clergy about mental health needs. Previous studies indicate African Americans elders use the church and clergy to cope with mental health challenges. However, little is known about how African American clergy assist elders with mental health challenges Objective: The purpose of this study is to explore African American clergy's pastoral care to elder congregants experiencing mental health challenges. Methods: Using a grounded theory approach, this study employed theoretical purposive sampling to recruit 18 rural and urban clergy members who self-identify as members of the Baptist denomination. Per grounded theory methodology, constant comparative analysis was used for data analysis. Results: Analysis of the interviews identified a major theme holistic pastoral care: "sheparding their flock" and involves a process of pastoral care that consisted of pastoral awareness; pastoral screening; pastoral counseling; internal ministries; and follow-up. A model of pastoral of care is presented to explain the complexity of the helping process from the viewpoint of the participants. Discussion: This study provides evidence that African American clergy were active in assisting their mentally distressed elder congregants. This study contributes to the understanding of African American clergy's mental health activities with elder congregants. and the potential to increase practitioner understanding of how to support African American clergy in their pastoral care efforts for older adults with mental health challenges.

HEALTHY COMMUNITIES FOR OLDER ADULTS: PLANNING FOR SOCIAL SUSTAINABILITY IN PORTLAND, COPENHAGEN, AND NAGOYA

J. Kohon, *Portland State University, Portland, Oregon*

Sustainability has become a dominant narrative in urban planning practice (Davidson, 2010). Planning for environmental sustainability offers co-benefits for older adults in urban communities, such as improved air quality, reduced energy costs, and reduced susceptibility to heat-related illness (Younger, Morrow-Almeida, Vindigni, and Dannenberg, 2008). However, many approaches to sustainability planning practice overemphasize environmental preservation and economic growth, while ignoring the social aspects of sustainability such as social inclusion, multi-generational interaction, and displacement prevention (Campbell, 1996). City and regional planners require examples of how to include the needs and perspectives of older persons in urban planning efforts. This research study takes a cross-cultural, cross-national perspective at understanding how older adults are considered in innovative sustainability-focused, neighborhood-scale planning projects that emphasize the social dimension of sustainability in Portland, Oregon; Copenhagen, Denmark; and Nagoya, Japan. Case studies, including 22 qualitative interviews with community stakeholders, participant observation, and social determinants of health template analysis of planning-related documents, provide a detailed picture of how socio-cultural context impacts planning for the needs of local older adult populations. Findings suggest that communities are developing innovative strategies to better understand and provide for the needs of their aging citizens, while continuing to grapple with many challenges associated with their aging societies.

BUILDING COMMUNITY CAPACITY TO ENHANCE THE WELL-BEING OF OLDER ADULTS IN NICARAGUA: AN OVERVIEW OF EFFORTS FROM ONGOING INTERNATIONAL COLLABORATIONS

A. DeLaTorre[3,1], K. Wilson[3,1], M.B. Neal[1], T. Boggis[2], *1. Institute on Aging, Portland State University, Portland, Oregon, 2. Pacific University, Forest Grove, Oregon, 3. Jessie F. Richardson Foundation, Clackamas, Oregon*

In collaboration with the charitable non-profit Jessie F. Richardson Foundation (JFRF), Pacific University and Portland State University have taken students and faculty to Nicaragua in order to increase the capacity of homes for older adults and their wider communities in improving the health and well-being of older adults. This presentation describes the strategies and outcomes of two service-learning programs:

(1) an interprofessional program for health professional students led by Pacific University, and (2) a community health/community development program with interdisciplinary students led by Portland State University. Strategies that are deemed successful in producing positive outcomes are described including: education about healthy aging and management of age-related health conditions, intergenerational program development, asset mapping, documentation and record-keeping methods, among others. Both universities work closely with JFRF to conduct projects aligned with strategic outcomes developed by Foundation staff and the Nicaraguan Advisory Council on Aging through the year pertaining to community development, training and education, and clinical opportunities carried out by students and faculty. Outcomes from work during the 2013-14 programs will be detailed, including professional and caregiver trainings delivered, and home and community assessments completed. Additionally, an update will be provided on the development of the National Training Plan on Aging in Nicaragua; this Plan is the result of collaboration between JFRF, members of the Nicaraguan Advisory Council on Aging, and international gerontologists and geriatricians.

TRACKING THE LATINO BABY BOOMERS INTO OLD AGE: AN UPDATED SOCIODEMOGRAPHIC AND ECONOMIC PROFILE

Z.D. Gassoumis[1], K. Wilber[1], F. Torres-Gil[2], *1. Davis School of Gerontology, University of Southern California, Los Angeles, California, 2. University of California, Los Angeles, Los Angeles, California*

The population of Latino baby boomers (born 1946-1964) in the United States embodies two crucial demographic shifts: a growing older adult population and increasingly many individuals of Latino or Hispanic origin in the U.S. This poster extends previous work laying out the sociodemographic and economic characteristics of the Latino boomers from the 2000 decennial Census by tracking their characteristics as they have neared and entered retirement. Decennial Census data from 2010 are used to present overall baby boom population numbers, broken up by race/ethnicity. This information is augmented by data from the American Community Survey, to track changes in demographic and socioeconomic characteristics between 2000 and present. Data are broken down by citizenship status, to inform how the variations among the Latino boomers previously identified in the 2000 Census have changed over time, during both the economic recession of 2007 and the attainment of retirement age by members of the boomer cohort. For example, between 2000 and 2008, the year in which the oldest boomers reached the age of early retirement under Social Security and the peak of the economic recession in the U.S., median individual income levels for naturalized Latino boomers dropped by only 3.25% (from $20,000 to $19,350), compared to a 5.0% drop for U.S.-born Latino boomers ($22,000 to $20,898) and a 5.6% drop for non-citizen Latino boomers ($12,300 to $11,610). Implications are presented for the Latino boomer population as it enters retirement, as well as for the U.S. as it ushers in a burgeoning Latino population.

AN INTERGENERATIONAL APPROACH TO UNDERSTANDING PERCEPTIONS OF HEALTHY AGING IN NICARAGUA

C. Bolkan[1], M.B. Neal[2], A. DeLaTorre[2], M.B. Neal[3], *1. Washington State University, Vancouver, Vancouver, Washington, 2. Portland State University, Portland, Oregon, 3. Jessie F. Richardson Foundation, Clackamas, Oregon*

Nicaragua is the second poorest country in the Western Hemisphere and significantly lacking expertise in gerontology and geriatrics. Local universities, in partnership with the Jessie F. Richardson Foundation (JFR) - a non-profit organization in Oregon - have developed programs focused on the health and well-being of older adults in Nicaragua. A number of different terms are used to conceptualize the idea of "aging well" (e.g., successful, optimal, productive aging), but most models reflect the view of academic researchers and not the perspective of older adults, particularly those in understudied populations. There are also limited cross-cultural studies on the unique perceptions of healthy aging. In this project, we aimed to: (a) provide a service-learning opportunity for undergraduate students, (b) promote intergenerational training and communication, (c) hear the voices of both Nicaraguan youth and elders regarding their perceptions and expectations of aging in their own country, and (d) evaluate the usefulness of this type of intergenerational project. Fluent/native speaker students, Nicaraguan youth, and Nicaraguan elders aged 60+ all participated in face-to-face informal interviews/focus groups to discuss their perceptions about aging in Nicaragua. Youth and elder participants were recruited from local, community-based organizations. Overall, we found there was a yearning to improve intergenerational contact in the community. This was a useful activity to promote intergenerational relationships and challenge common age stereotypes. We also discuss implications for implementing intergenerational projects in developing countries.

PERCEPTION OF RESILIENCE AND WELLBEING AMONG ELDERS IN LTC FACILITIES (OLD-AGE HOMES) IN INDIA

S. Balaswamy, *College of Social Work, The Ohio State University, Columbus, Ohio*

There is an emerging interest in the area of resilience and associated factors that shapes the life experiences of the elderly. Several conceptual framework have been offered to understand how elders use their life experiences, personal strengths and social relationships to help cope with adversities like loss, physical and mental illnesses, physical impairments, being marginalized, and cognitive deficits. Although references exists on the potential cultural and social difference among elders in their coping and attribution to resilience, there is not much research in this area. Also cited, but not studied is the contribution of the 'social community' in enhancing resilience along with individual determinations. This study explores the extend to which elders who are marginalized (poor, institutionalized, chronically ill) attribute their 'resilience' or aging well to personal strengthens over social community indicators. A mixed methodology was used to collect data from 154 residents of old-age homes in two major southern cities in India. In addition to structured in-person interviews, in-depth life stories were analyzed from 10 case studies. Findings from the structured interviews suggest that social relationships are important predicator of perception of well-being and level of acceptance on being in an institution than with family which is the norm. Most resident attributed their positive attitude towards aging to a 'sense of belonging' to the larger community of elders with whom they co-exist and the church community. More than three-fourth of the respondents identified 'having a meaningful life' and described activities such as caring for residents, performing tasks, helping the church, praying together. The importance of individual and community level interventions are discussed.

SESSION 665 (POSTER)

GERONTOLOGICAL EDUCATION AND CHALLENGES IN AGING RESEARCH

BRIDGING THE GAP BETWEEN HEALTH ADMINISTRATION AND NURSING: INTERPROFESSIONAL EDUCATION AGING

A. Temple, M. Mast, *Health Sciences, James Madison University, Harrisonburg, Virginia*

As health care professionals are increasingly involved in interprofessional collaborations, it is important that students of allied health programs engage in interprofessional education (IPE). The purpose of this research was to explore the effect of IPE among health administration majors enrolled in a gerontology course and nursing majors enrolled in a family caregiving course during Fall 2013. Students from each discipline were paired together to complete two, 2-hour service learning visits to provide in-home respite and companion care to frail older adults and their family caregivers coordinated through a local non-profit agency, Caregivers Community Network. Prior to the visits, students jointly participated in a "Life of a Caregiver" simulation and discussed their respective professions and anticipated roles. At the end of the semester, students met to debrief on the experience. Pre- and post-surveys were completed by 44 students (59% response rate) to explore their perception and evaluation of IPE. Results from Wilcoxon signed ranks test using pre- and post-values on the Interdisciplinary Education Perception Scale suggest the IPE intervention improved students' perception of their profession and the role of other professions ($Z = -2.25$, $p = 0.02$). Furthermore, the overwhelming majority of students indicated that the shared learning experience helped them achieve IPE learning objectives. These findings suggest that service learning as an IPE activity may be useful in helping students across clinical and non-clinical disciplines be better prepared to work together as collaborative practice teams providing care to aging adults.

THE VETERANS AFFAIRS (VA)—HEALTH AND RETIREMENT STUDY (HRS) DATA LINKAGE PROJECT

K.M. Langa[1,2], F.D. Wolinsky[3], R.B. Wallace[3], Q. Zhang[4], A. Geers[2], M. Kabeto[1,2], L. Kuhn[1,2], E. Tarlov[4], *1. University of Michigan, Ann Arbor, Michigan, 2. VA Ann Arbor Healthcare System, Ann Arbor, Michigan, 3. University of Iowa, Iowa City, Iowa, 4. Hines VA Hospital, Hines, Illinois*

Background: About 50% of US men aged 65+ have served in the military, and are potentially eligible to obtain health care from the Veterans Affairs (VA) health care system. Therefore, research on the health and health care of older US adults will miss a significant segment of the population if VA care is not considered. To better understand which older Veterans are using VA care, and how that care affects their long-term health outcomes, we are developing a unique data source linking longitudinal data from the Health and Retirement Study (HRS) with VA health care data. Methods: The HRS is an NIA-funded ongoing nationally-representative longitudinal cohort study that has been collecting data since 1992 on more than 30,000 US adults aged 51+. About 7,100 HRS respondents have reported prior military service. For Veterans that utilize the VA health care system detailed data are collected on diagnoses, utilization, medications, vital signs, lab values, and long-term care services. These VA data will be linked to longitudinal HRS data on health, work history, economic status, and family characteristics, as well as Medicare claims, and biomarker and genetic data. The linked data will be made available to eligible VA and non-VA researchers. Conclusions: The VA-HRS Data Linkage Project will provide unique data for researchers interested in the long-term outcomes of military service and VA health care for the health and well-being of older Veterans. This presentation will provide details on the sample, variables, timeline, and process for obtaining access to the VA-HRS dataset.

THE THIRD ACT: CONTEMPLATING AGING - A UNIQUE ARTS/UNIVERSITY COLLABORATION

A.P. Glass, *University of Georgia Institute of Gerontology, Athens, Georgia*

My research has led me to develop a model of "aging better together intentionally," in which I have documented advantages of dealing with aging communally, through sharing information, humor, mutual support, and having meaningful discussions about aging. For this to happen, individuals first have to accept that they are aging. My research finds many of those who can embrace that fact would appreciate chances to talk about it. Unfortunately, few opportunities are offered in our age-denying society. A catalyst for the community to engage in a conversation about aging presented itself when the curator of a local association of contemporary art (ATHICA) approached me about a proposed art exhibition focused on aging. Such collaboration between the arts community and the academic community is rare. Collaboration with an academic gerontology program is even more uncommon. This art exhibit and associated events, including a symposium on "Contemplating Aging," provided an innovative way to help engage the community in considering this topic. We were also able to involve our gerontology students in providing ideas and information, and we infused material about public health and aging issues, such as dementia, osteoporosis, and end-of-life care, into the content accompanying the artwork. All events were well attended, with a range of ages, including many young people. Through our collaboration, we made a stronger, more interesting exhibition that is an innovative way to promote conversations to help people have a better experience with aging. The response shows there is an interest in learning more about this topic.

PREPARING STUDENTS IN PERSON CENTERED AND PARTICIPANT DIRECTED COMPETENCIES FOR THE AGING AND DISABILITY NETWORK OCCUPATIONS

N.R. Hooyman[1], K.J. Mahoney[2], M. Sciegaj[3], *1. University of Washington, Seattle, Washington, 2. Boston College, Chestnut Hill, Massachusetts, 3. Pennsylvania State University, University Park, Pennsylvania*

According to a recent national survey of social workers in area agencies on aging (AAA), there is a need for additional training in person-centered and participant-directed (PC/PD) competencies. While AAA directors stressed the importance of training, the survey found that AAAs often lack the resources for staff development and training in PC/PD competencies. The need for such preparation is shaped by a rapidly changing policy and practice context: the expectations of the Administration for Community Living (ACL) for a competency-based approach; the Affordable Care Act's (ACA) inclusion of PC care and the expansion of PD services; and requirements for these competencies by the Centers for Medicare and Medicaid Services. Given these changes, it is imperative that students acquire PC/PD competencies to work effectively with older adults and persons with disabilities in community-based health and LTSS. To address the need for workforce development in PC/PD, this paper will present findings from a national project funded by the New York Community Trust to prepare social work students with PC/PD competencies to work effectively within the Aging and Disability Network as well as community-based long-term services and supports funded by the ACA. The project partners nine schools of social work with nine aging and disability network agencies for the purposes of articulating and infusing PC/PD competencies into social work curriculum. Effective strategies to infuse such competencies into required curriculum will be discussed, and examples of teaching resources (e.g., lectures, case studies, modules) and measures of student competency attainment presented.

PROMOTING FACULTY DEVELOPMENT IN A TIME OF SCARCE RESOURCES

J.L. Howe[2,1], E.F. Ansello[3], Z.S. Tan[4], J.L. Griffith[2,1], R. Price[4], E. Perweiler[5], L. Redford[6], M. Berg-Weger[7], *1. GRECC at James J. Peters VAMC, Bronx, New York, 2. Icahn School of Medicine at Mount Sinai, New York, New York, 3. Virginia Commonwealth University, Richmond, Virginia, 4. University of California, Los Angeles, Los Angeles, California, 5. University of Medicine and Dentistry of New Jersey, Stratford, New Jersey, 6. University of Kansas Medical Center, Kansas City, Kansas, 7. Saint Louis University School of Social Work, St. Louis, Missouri*

In an environment of limited funding for continuing education, travel, and paid time off, creative solutions are needed for professional development for faculty members. With funding from the Bureau of Health Professions, Health Resources and Services Administration, the California Geriatric Education Center (GEC) and Virginia GEC each developed 160 hour interprofessional faculty development leadership programs. The Consortium of New York GECs, Central Plains GEC, Gateway GEC of Missouri and Illinois, and New Jersey GEC also teamed up to create a 160 hour Faculty Development Collaborative Program. Faculty members from a wide range of disciplines participate in online and in-person learning with experts in the health professions and aging. In addition to content in geriatrics and gerontology, the programs include components on mentorship, leadership, research, teaching and teambuilding. One approach is a Virtual Learning Community in which faculty participate in webinars, connect with other faculty members, access learning resources, and work on a mentored capstone project. Another model incorporates weekend retreats, monthly sessions, and geriatrics seminars which provide opportunities for faculty members and mentors to interact in person. The final model is a "train the trainer" program in which faculty members become champions for geriatrics and gerontology within their academic institutions. Challenges to implementing faculty development programs across all sites include: coordinating across institutions, keeping faculty members engaged, ensuring completion of faculty evaluations, dealing with transitions in leadership, and managing bureaucracy within institutions. Participant and program evaluation data is collected across all sites and will be presented.

EFFECTS OF SHARED DECISION-MAKING WITH NURSE AIDES ON NURSE JOB PERFORMANCE AND SATISFACTION IN NURSING HOMES

C. Cready, C.E. Hudson Castillo, *Sociology, University of North Texas, Denton, Texas*

The movement away from a medical model to a person-centered model of care in nursing homes has often involved strategies to empower nurse aides, who provide much of the one-on-one, day-to-day care of residents. The benefits of such strategies for nurse aides, residents, and family members is well documented. However, little is known about the effects of nurse aide empowerment strategies on nurses. Thus, the current study used survey data collected from 178 nurses employed in 11 Texas nursing homes to examine the effects of nurse perceptions of the use of shared decision-making between nurses and nurse aides in the nursing home on nurse reports of job performance and satisfaction. About 25% of nurses surveyed agreed that shared decision-making between nurses and nurse aides was used in the nursing home. Estimates from three regression models revealed that, all else equal, shared decision-making had a significant positive effect on nurse job satisfaction both directly and indirectly through the concurrent increase in the nurse's perception of personal job performance. The positive relationship between nurse job satisfaction/performance and perception of shared decision-making is a vital aspect of shared governance models. Given the resistance of some nurses to implementing shared governance models in nursing homes, incorporating a discussion of the potential benefits of shared decision-making to nurses is crucial in the implementation of new practices.

THE ROAD MAP FOR AGING RESEARCH IN ARAB COUNTRIES: WHERE IS THE EVIDENCE FOR PRIORITY SETTING?

A. Sibai, A. Rizk, C. Costanian, *American University of Beirut, Beirut, Lebanon*

In the wake of health transitions, shifting demographics and rapid increase in number and share of the older persons in Arab countries, the need to align investments in health research and development (R&D) with old-age opportunities and challenges cannot be underestimated. We aim in this paper to describe the landscape of aging research in Arab countries, assess trends in quantity, quality, methods of study, themes, and co-authorship profile, and map them against demographic, economic and development indicators. A literature review from five academic databases for a period of two decades (1993-2013) was conducted. Findings indicate that aging research has increased seven-fold across the two decades, with middle-income countries showing the sharpest rise and highest impact of publishing. Literacy rates more strongly influenced research productivity than population aging indicators or government investment in R&D. Notably, collaboration with international co-authors (19.8%) was more frequent than with regional co-authors (3.9%) and had an enhanced bearing on the impact factor (IF) of the publishing journal (mean IFs 2.517 and 1.492, respectively). The majority of publications was disease-centered, descriptive in nature and relied mostly on cross-sectional study designs. In spite of the increasing regional instability, only a few focused on 'seniors in emergencies,' and there was a total lack of studies on 'aging and economic growth'. While the broad determinants of population aging are better understood, the mechanisms through which health, well-being, and autonomy can be maintained and extended are less so, further underlining the need to improve monitoring and priority setting for health R&D.

INCREASING HEALTHY LIFE EXPECTANCY BY 2 YEARS BY THE YEAR 2020: A CHALLENGE FROM THE EUROPEAN RESEARCH AREA ON AGING

C. Tannenbaum, *Université de Montréal, Montreal, Quebec, Canada*

Healthy life expectancy is defined as the number of years an individual spends in "good" or "very good" health. At age 65, only half of an older adult's remaining years are spend in good health. For the average 65 year old woman this means that 10 out of her remaining 20 years will be spent in ill health or with disability. The European Research Area on Aging is an international consortium that is currently funding 6 projects to narrow the gap between overall and healthy life expectancy in seniors. This paper's presenter is leading one of these projects, the "Continence across Continents to Upend Stigma and Dependency trial" across Canada, the UK and France. The current paper will describe the challenges involved in conducting an international randomized trial testing an intervention to increase active healthy life expectancy in older women. Modifiable components that drive ratings of quality of life in older women will be presented and include physical functioning, lifestyle habits, mental health, and social participation. Immediate, intermediate and final outcomes will be discussed as a function of these components. Ways of measuring an improvement in healthy life expectancy among individual trial participants will be compared. The sample size requirements for such a trial and the economic endpoints desired by government stakeholders cannot be ignored. The imperative to augment clinical research expertise on healthy aging is eclipsed only by the need to deliver research results that are rigorous, credible and that risk influencing government to better invest in healthy aging.

THE GERONTOLOGICAL IMAGINATION: WE HAVE REACHED A CRITICAL MASS

B. Kaskie[1], H. Ewen[2], D.C. Carr[3], *1. University of Iowa, Iowa City, Iowa, 2. Miami Unviersity of Ohio, Oxford, California, 3. Stanford University, Palo Alto, California*

Since 1993, 239 individuals have graduated with a PhD in gerontology. Yet the disciplinary status of gerontology remains a debate. Previous evaluations resolved that the field fell short because the demand for doctorates in gerontology and the integration of gerontological knowledge into occupational roles were not convincing. This presentation uses data collected from the Gerontology Education Longitudinal Study (GELS) to reassess these two factors. The data are based on a survey of the population of all alumni with gerontology PhDs in 2011. Our sample includes 34% (n=75) of the population of gerontology alumni. Results indicate that 99% are employed, with 66% working in academic institutions in various roles including tenured professor, tenure track professor, adjunct, research, and clinical faculty. Nearly 50% of these individuals had completed/were completing a post-doctoral fellowship. The remaining 33% were employed in non-academic positions within government agencies, health system administrations and other organization types. The majority of respondents indicated they were working in multi-disciplinary and interdisciplinary roles, applying their gerontological training. Less than 20% were not working in an organization or a role that focused on gerontology. Our findings suggest that the field of gerontology has reached a critical mass and now meets all key criteria needed to qualify as an academic discipline. This session will conclude with a discussion about the need to enhance the status of doctoral programs in gerontology by creating competencies, establishing accreditation criteria, and allocating institutional resources.

MENTORING IN AGING PROCESS (MAP): MAPPING MEMORIES OF MENTORING THROUGH THE LIFECOURSE LENS

C. Corley, *Human and Organizational Development, Fielding Graduate University, San Gabriel, California*

The aging of the field of aging has created a legacy that GSA and its members are increasingly documenting. A visual map of the social networks created through formal and informal mentoring can demonstrate the magnitude of the contributions of individual mentors and institutions/organizations that foster mentoring. This poster session presents a visual case study of the mentoring lifecourse of gerontological social work leaders (e.g. Rose Dobrof, Nancy Hooyman, Barbara Berkman and others) and their influence via social networks in social work and interdisciplinary contexts. Using social media and outreach to gerontological social work organizations (e.g. AGE Social Work), a map of the Mentoring in Aging Process (MAP) is presented via solicitation of "mentor moments" virtually. Using social media, brief incidents of mentor/mentee engagement are collected and mapped using mind-mapping and related tools. Since mentoring is a cross-generational process over time combining individual biography and history, "mentor moments" of mentors and mentees are illuminated through concepts of the life course perspective (e.g. cumulative advantages; agency). The adaptive resources of career and intellectual advances offered in mentoring relationships are highlighted. An additional component of the presentation is real-time interaction as conference participants contribute additional "mentor moments" viewing the MAP illustration. This process contributes to legacy-building and recruitment/retention of practitioners, educators and researchers in aging.

GERIATRICIANS IN GERMANY

K. Hager, V. Grosse, *Center for Medicine in the Elderly, Hanover, Germany*

Background: The first geriatric clinics in Germany were founded in the 1970s. The first official certificate in geriatrics was inaugurated in 1992. Medicine in the elderly has become an obligatory subject at medical schools since 2003. Objective: The aim of the study was to evaluate the number of German geriatricians and the possibilities for qualification in the different German Bundesländer. Methods: Medical associations in the different Federal Lands (Bundesländer) were contacted and the number of geriatricians in their district was requested. Results: 11 of the 16 medical associations returned their data. There were 1206 doctors with a certificate of geriatrics registered. The mean percentage of geriatricians was 0.46% (0.09-1.56) of all registered doctors. The number of people 75 years or older per geriatrician also varied greatly between the Federal Lands with a proportion of 8000 to over 100.000 people per geriatrician. In recent years the interest seems to have risen slightly, however. In 2010 100, in 2011 107 and in 2012 124 doctors became registered geriatricians in the 11 Federal Lands. Most geriatricians first completed a formation in internal medicine, some also in general medicine and some in neurology. In the last years some medical associations opened the way to different forms of geriatric formation. Conclusion: Despite the more than 40 year of geriatric medicine in Germany the number of geriatricians is still low. Several reasons can be discussed. One reason may be that a certificate has only been available for a little more than 20 years and the teaching at medical schools has only been obligatory for 10 years. For a long time one requirement was an approval as medical specialist for example in internal medicine as well as 24 months of work in a geriatric clinic. Furthermore the economic stimulus for general practitioners is practically nonexistent. Some resistance from other medical specialties may also have played an important role.

CONNECTING THE PRESENT AND FUTURE: A CONTENT ANALYSIS OF INTRODUCTORY GERONTOLOGY COURSE SYLLABI

T.M. Kruger[1], N.M. Silverstein[2], C. Andreoletti[3], J. Carrión-Baralt[4], R. Karasik[5], D.B. Bradley[6], K. Kopera-Frye[7], *1. Applied Health Sciences, Indiana State University, Terre Haute, Indiana, 2. University of Massachusetts Boston, Boston, Massachusetts, 3. Central Connecticut State University, New Britain, Connecticut, 4. Universidad de Puerto Rico, Gobernador Piñero, Puerto Rico, 5. St. Cloud State University, St. Cloud, Minnesota, 6. Western Kentucky University, Bowling Green, Kentucky, 7. University of Louisiana Monroe, Monroe, Louisiana*

At the 2014 Association for Gerontology in Higher Education (AGHE) meeting in Denver, members of the Academic Program Development Committee (APDC) led a workshop on developing an introductory gerontology course syllabus. Twenty-eight participants from a variety of levels and types of gerontology programs discussed components of introductory gerontology courses, including course descriptions, objectives, readings, formative and summative assessments, and pedagogical strategies. Several common themes emerged, which were related to syllabus components and course competencies. Syllabi were collected from the workshop participants and APDC committee members. A content analysis specifically addressed course overviews, rationales, and learning objectives/outcomes. Common and divergent themes were observed across the syllabi and were categorized as either knowledge- or skill-based. Knowledge-based themes included diversity and stereotypes, demographics, current events, policy, the interdisciplinary nature of gerontology, and career awareness/preparedness. Skill-based themes included taking informed positions, identifying and evaluating scholarly literature, and comparing theoretical perspectives across ways of knowing. Suggestions for future directions include further study of more advanced gerontology course syllabi, with an eye to aligning with the competencies emerging from the AGHE Accreditation Task Force. The overarching goal of this project is to produce best practices course syllabi for GSA and AGHE educational members. By educating future gerontologists, and others who will work with older adults, in core competencies, we will positively impact quality of life and well-being of the population as we all age.

UNDERGRADUATE GERONTOLOGY STUDENTS: WHO ARE THEY, WHAT DO THEY WANT, AND WHY SHOULD WE CARE?

K. Humber, *1. Gerontology and Behavioral Sciences, University of Maryland University College, Adelphi, Maryland, 2. UMBC, Baltimore, Maryland*

Information on the characteristics of undergraduate gerontology students is largely absent in the literature. Anecdotal evidence suggests that gerontology students are quite different from the typical college student and importantly, are different from the modal non-traditional learner as well. Understanding who these students are and how they can best be served by their institutions may be useful in terms of recruitment, curricular planning, and professional development. This work reports on a survey that provides a preliminary snapshot of undergraduate gerontology students at a large public university and confirms that these students collectively have a unique demographic profile that distinguishes them from other student populations. Strategies and recommendations for recruitment and for managing student expectations and needs are discussed.

ME & MY WISHES: PROTOTYPING LONG TERM CARE RESIDENT VIDEOS TO COMMUNICATE CARE PREFERENCES

G.L. Towsley, L. Ellington, S.L. Beck, B. Wong, *University of Utah, Salt Lake City, Utah*

As part of a program of research to facilitate communication of care preferences for today and at end of life, we developed, Me & My Wishes© (MMW), a video recorded conversation with long term care residents. Using a participatory action research (PAR) approach we sought input from staff and residents to finalize the MMW interview guide and video recording approach. A non-staff member, trained in social work, conducted the interviews. Two residents created a prototype MMW video and completed a survey, debriefing interview, and viewing of an edited version of their video. We found that residents were willing, able, and not distressed by creating MMW. Each recording lasted about one hour and resulted in an edited MMW video lasting about 20 minutes. Positive responses (e.g. good for family or staff to hear feelings about preferences) about creating and viewing the video outweighed the concerns (room distracting, wait time for recording). Residents did not feel any topics or questions should be omitted and both planned to share their video with adult children or staff. An aide suggested MMW could be used to learn about residents and "to know what residents expect from us"; but expressed concern about time needed to watch a video. Staff members of the PAR team recommended viewing all or parts of MMW in care conference, staff training, and using MMW to assist with educating family members or advocating for resident wishes. This study demonstrated feasibility and potential usefulness of MMW to better align care with resident preferences.

GAIT SPEED AND FUNCTIONALITY OF THE OLDER PATIENTS DISCHARGED FROM THE EMERGENCY DEPARTMENT

L.V. Robles-Jimenez, C. Garcia-Peña, *UIESS Aging, IMSS, Distrito Federal, Mexico*

Background. Loss of functionality at discharge represents a serious issue because of its consequences. Methods: Data were collected through a standardized questionnaire. Face-to-face interviews were made by nurses previously trained, during 7 days per week from March to July, 2013. Functionality was measured by Barthel scale. Gait speed was calculated for each participant using distance in meters and time in seconds. All participants were advised to walk at usual pace and from standing point. Patients were instructed to walk down a hallway trough 50 centimeters for acceleration. Gait speed was measured over a distance of 4 meters. Patients could use assistive devices if needed, and each participant was timed for two walks. Value higher than 7 seconds was considered positive. Data analyses were performed using STATA v10. Results: 66 patients were evaluated. The mean age was 74.4 years and 62.12% were female. 45 cases had hypertension diagnosed by a doctor and 5 cases had also chronic renal failure, depending on dialysis or hemodialysis. 65.15% reported falls in the past two years and 37.21% had more than two falls. 37 cases required more than 7 seconds to walk 4 meters, 36 cases were scored with low dependence, and 1 case had total dependence. Of the 29 cases that required less than 7 seconds, 26 had low dependence and no one had total dependence. Conclusions: Our findings demonstrate that Gait speed and functionality was not related at discharge of the emergency department. Further analysis has to be performed.

HOW TO CONSTRUCT AN ETHNODRAMA: CONNECTING GENERATIONS THROUGH ARTS BASED RESEARCH

J. Eaton, *University of Utah, Salt Lake City, Utah*

Arts based approaches to research are growing in popularity however terminology and methodology differ vastly, reducing the impact of research based performance. The purpose of this study is to improve consistency of qualitative methodology through the description of the process utilized to create an ethnodrama focusing on possible selves. Twelve older adult residents of an assisted living facility were paired with twelve baccalaureate nursing students to collect data on the topic of possible selves. A total of 24 semi structured interviews were collected from interviews conducted between student and older adult dyads. Interviews were digitally recorded, transcribed, and analyzed in an iterative process utilizing first cycle invivo coding and second cycle pattern coding. Themes relating to late life potential were identified, including hopes, fears, barriers, and aids to possibility. Composite characters were created in order to represent these themes. Ten final interviews were recorded with student adult dyads reading the script and providing feedback as member checks. The process of ethnodrama creation involved data collection, analysis in two cycles, annotation, outlining, editing, member checks, and revision. The final draft was work shopped with a theatre company, allowing professional interpretation as a second level of review in order to increase audience understanding. Ethnodrama has the potential of increasing innovation in research but, in order to be utilized and accepted in the research community, methodology must be clarified to improve consistency and rigor.

TAILORING EVALUATION METHODS FOR INTERGENERATIONAL HEALTH PROGRAMS WITH OLDER ADULTS AND CHILDREN

P. Holtgrave[1], J. Teufel[2,1], S. Schroeder[3], S. Lovegreen[1], *1. OASIS Institute, St. Louis, Missouri, 2. Mercyhurst University, Erie, Pennsylvania, 3. St. Louis Regional OASIS, St. Louis, Missouri*

Providers of intergenerational programs often lack cost-effective methods for measuring health and other impacts among older adult and child program participants. To address this need, OASIS has adapted evaluation methods to be used by trained older adult volunteers and university students to reliably measure: 1) levels of older adult and child participant physical activity, 2) monetary return on investment of older adult volunteerism, and 3) goal attainment of older adult volunteers for OASIS' CATCH Healthy Habits program. Evaluation methods were adapted to measure the effectiveness of the OASIS CATCH Healthy Habits intergenerational, volunteer-led physical activity and nutrition program in 19 cities across 15 states. In addition to administering pre- and post-program surveys to child participants (grades 3-5) and older adult volunteers (age 50-plus), adult and child (grades K-5) physical activity intensity was observed during the program using the System for Observing Fitness Instruction Time (SOFIT). Volunteer return on investment was measured using the web-based Strategic Metrics and Results Tracking (SMART) tool and program impact on older adult goal setting was captured by incorporating the Goal Attainment Scaling (GAS) method. Results support that cost-effective evaluation methods can be adapted and used by trained, lay individuals, including older adult volunteers and university students, to reliably measure and effectively report the impact of intergenerational volunteer-based health programs while enhancing the skills of capacity-building older adult volunteers and students.

THE IMPACT OF STUDY DESIGN ON MEASURING CARE-RELATED BURDEN WITH THE CARERQOL INSTRUMENT

J.E. Lutomski, M. Olde Rikkert, R. Melis, O. Behalf of TOPIC-MDS Consortium, *Dept. of Geriatric Medicine, Radboud University Medical Center, Nijmegen, Netherlands*

Pooled datasets are becoming increasingly frequent in healthcare research. Heterogeneity between study designs can result in differential measurement error. The objective of our analysis was to explore the measurement properties of the CarerQol instrument, which measures and evaluates care-related burden among informal caregivers, across two study design features, sampling framework (i.e. general population, primary care, hospital) and survey mode (i.e. questionnaire, interview). Data were extracted from The Older Persons and Informal Caregivers Minimum DataSet (TOPICS-MDS), a pooled dataset with information on 3,610 informal caregivers throughout the Netherlands. Meta-correlations and linear mixed models between the CarerQol's seven dimensions (CarerQol-7D) and a valuation component measuring caregiver's level of happiness (CarerQol-VAS) were performed. Cronbach's α were calculated for the CarerQol-7D. The CarerQol-7D dimensions were correlated to the CarerQol-VAS in the pooled dataset and predefined subgroups. However, the strength of these correlations was notably weaker among caregivers who were interviewed versus those who completed a questionnaire. Moreover, significant interaction terms in the linear mixed model were observed between survey mode and four of the seven dimensions of the CarerQoL-7D, underscoring meaningful differences in the reporting of these dimensions in questionnaire versus interview-administered surveys. Internal consistency was reasonable in the pooled dataset ($\alpha = 0.59$), though lower among caregivers sampled from the general population ($\alpha = 0.53$) versus primary care ($\alpha = 0.62$) or hospital settings ($\alpha = 0.60$). In conclusion, survey mode impacts on CarerQol reporting. Pooling mixed mode data should be interpreted with caution or ideally avoided in the original study design.

RURAL PENSIONS IN HIGH-GROWTH DEVELOPING COUNTRIES: MODELS FOR PROVIDING OLD AGE SECURITY TO THE RURAL POOR

M. Cansoy, J. Williamson, *Sociology, Boston College, Brightton, Massachusetts*

Our paper provides an assessment of alternative policies for providing old-age security in rural areas of high-growth developing countries with the goal of deciding which approaches seem to hold the most promise. Until quite recently it has been taken for granted among international pension policy analysts that it is all but impossible to provide publically supported old age security in rural areas of developing countries, but today these assumptions are being questioned as a number of countries are making impressive strides to provide such coverage for a substantial fraction of their rural populations. Our research focuses on a set of six high-growth developing countries (China, India, Russia, Brazil, South Africa, and Turkey) that are often viewed as regional policy leaders in a number of spheres. Our data is derived in part from interviews with experts and in part from various reports prepared by government agencies as well as reports available from various international financial institutions. We pay particular attention to approaches that emphasize unfunded noncontributory social pensions (based on more redistributive or social democratic approaches) and contrast them with funded contributory approaches (emphasizing more neoliberal approaches). We conclude that both approaches have their benefits and their limitations, but for the rural poor, old-age security programs that emphasize the social pensions seem to be the most effective, particularly when it comes to the very important issue of extending coverage.

DEFINING AN AGE FRIENDLY COMMUNITY: VIEWS OF OLDER RESIDENTS IN A RURAL, RETIREMENT DESTINATION

P. Huffman-Oh, *University of Massachusetts, Boston, Boston, Massachusetts*

Creating age friendly communities is increasingly recognized as an important vehicle to support aging in place. Despite the number of people aging in rural areas, few studies have explored how life-long residents and in-migrants to small towns create age-friendly, liveable communities. This study used photo-voice to explore the perceptions of older residents in one rural coastal retirement destination. The study was publicized through the town's newsletter and at senior center activities. Twenty-eight older residents (N=11 long-term residents, N=17 residents who moved in retirement) participated. A variety of interpretive methods were used—participant observations, in-depth interviews, focus group discussions, and textual analyses. The researcher and participants co-constructed (1) a public photographic exhibition and; (2) a text containing participant narratives expressed through photographs, reminisces, and personal reflections. The study findings suggested that life-long residents and retiree newcomers have different conceptualizations of what makes a community age-friendly. Life-long residents emphasized self-reliance while in-migrants stressed the importance of community supports to help residents remain independent. Themes that arose from the narratives of long-term residents included (1) family; (2) history in place; and (3) social networks. Themes that arose from the narratives of retiree newcomers were (1) civic engagement; (2) volunteerism; and (3) formal supports. Prominent themes in both groups were (1) transportation and (2) housing. This study adds to existing theory by exploring diverse narratives of aging in place that co-exist in a single community and illustrates how different constructions of aging in place can influence policies meant to create an age-friendly community.

EFFECTS OF COMMUNITY AGE-FRIENDLINESS ON HEALTH STATUS OF OLDER ADULTS IN CHINA: A MULTILEVEL PERSPECTIVE

Y. Wang, *School of Social Work, Washington University in St. Louis, Saint Louis, Missouri*

Introduction. Although Age Friendly Communities (AFC) Initiatives have gained worldwide attention, the effects of AFC on well-being of older adults have yet to be empirically documented. This study explores the association between community age-friendly characteristics and health status of older adults in China. Methods. Data came from China Health and Retirement Longitudinal Study (CHARLS) baseline survey, including 17,780 individuals from 453 communities. Two-level hierarchical linear model (HLM) method was used. Community-level independent variables include transportation, housing, access to community facilities and amenities, and access to health care services. Individual-level dependent variables include self-rated health status, and depression score. Demographics factors at the individual level were controlled. Results. Results suggest that after controlling demographic factors (i.e. age, education, marital status) associated with overall well-being of older adults, the community age-friendly characteristics have significant effects on the physical and mental health of older adults. Older persons living in communities that have housing with better basic facilities such as sewer system ($p=.048$) and waste management ($p=.001$) report better health status. Older adults also rate their health status better when medical facilities are conveniently located ($p=.035$). Older residents living in neighborhoods with accessible community services and facilities such as elderly association ($p=.049$) and outside excising facilities ($p=.001$) are less likely to be depressed. Conclusion. Community age-friendliness is significantly associated with the overall well-being of older adults. In the face of population aging, increased efforts to make communities more age-friendly may lead to improved population health.

TRENDS IN THE INFORMAL AND FORMAL HOME CARE USE OF OLDER ADULTS IN THE NETHERLANDS BETWEEN 1992 AND 2012

J.C. Swinkels[1], B. Suanet[1], D.J. Deeg[2], M. Broese van Groenou[1], *1. Sociology, VU University Amsterdam, Amsterdam, Netherlands, 2. VU University medical centre, Amsterdam, Netherlands*

Abstract Purpose of the Study: To investigate trends in the use of informal and formal care of community-dwelling older people over the last two decades in the context of the reform of long term care services and modernization of informal relationships. Design and Methods: Seven observations of the Longitudinal Aging Study Amsterdam covering the time span between 1992 and 2012 were analyzed using multilevel logistic regression analysis. The sample entailed 9,585 observations from 3,574 respondents, aged between 65 and 86 years old and living independently at each time of measurement. Measures included formal and informal care use, health, socio-demographics, partner status, social network, privately paid help and mastery. Results: Formal home care use increased slightly between 1992 and 2012 while the use of informal care decreased to a larger extent. Multivariate analyses showed a negative association between formal and informal care use, which decreased over time. Analyses showed improved cognitive functioning, increased availability of partners and social network size, and increased use of privately paid care among this age-group over time, but these positive trends did not explain the decrease in informal care use. Implications: The results may reflect a societal trend of weakened informal solidarity, perhaps caused by increased individualization. Also, technological and medical developments may have reduced the amount of care needed for comparable levels of health. The decreased substitution effect suggests that complementary or supplementary forms of care use may be more common in the near future.

UNDERSTANDING THE COSTS OF DISABILITY AMONG MEDICARE BENEFICIARIES

P. Roberto[1,2], M. Dai[1,3], S.E. Tom[1], E. Sheldon[1,3], B. Stuart[1],
1. University of Maryland Baltimore, Baltimore, Maryland,
2. Pharmaceutical Research and Manufacturers of America, Washington, District of Columbia, 3. University of Maryland Baltimore County, Baltimore, Maryland

Background Disability is a significant driver of Medicare costs due to greater demand for medical services and increased likelihood of admission to long-term care facilities. We developed nationally-representative estimates of the relationship of Medicare spending to the severity of disability within the Medicare population. Methods Using data from the 2008-2009 Medicare Current Beneficiary Survey (n = 6,145), we defined disability as any limitation to Instrumental Activities of Daily Living (IADL) and according to number of limitations with Activities of Daily Living (ADL; 1-2 = mild; ≥ 3 moderate/severe). Costs were ascertained from Medicare Parts A and B claims. Beneficiaries reported sociodemographic and health characteristics at baseline. Results Average Medicare spending over the 2008-2009 period was $11,471. Among beneficiaries who reported mild disability in 2008, 15.4% progressed to moderate/severe disability in 2009, while 12.3% reported IADL-only limitations and 23.5% reported that they no longer had any disability. Among beneficiaries with an IADL-only limitation in 2008, progressing to mild or moderate/severe disability in 2009 was associated with a 71% and 123% increase in spending, respectively. Full recovery from an IADL-only limitation was associated with a 5.7% spending decrease. Multivariable analyses indicated that increases in disability severity were associated with significant increases in Medicare spending between 2008 and 2009 ($p<.05$), while improvements in functional status were generally associated with non-significant spending decreases. Conclusions As the number of Medicare beneficiaries continues to grow, targeted interventions aimed at preventing increases in disability severity could offer a significant opportunity for Medicare savings.

SOCIAL NETWORK SIZE AND PERFORMANCE IN ADLS AND IADLS AMONG COMMUNITY-DWELLING OLDER ADULTS WITH PROBABLE DEMENTIA: IS THERE A RELATIONSHIP?

M.L. Ellis, C. Sharpe, V. Molinari, *School of Aging Studies, University of South Florida, Tampa, Florida*

Previous research has shown older adults with larger social networks have reduced difficulty in performance of Activities of Daily Living (ADL). However, limited research exists on the relationship between social network size and performance in Instrumental Activities of Daily Living (IADL). The relationship between social network size and IADL performance is of particular interest as difficulty in IADL performance may be an indicator of the presence of dementia. The relationship between social network size and difficulty in ADL and IADL performance was examined in a cross-sectional, national sample of community-dwelling older adults within the National Health and Aging Trend Study (NHATS). Participants included in this study (N=1038) were classified as having probable dementia, indicated by a clinical diagnosis and or cognitive impairment in two or more cognitive domains. Independent variables included socio-demographics and social network size. Outcomes examined for ADL difficulty were dressing, bathing with and without grab bars and meal preparation. Outcomes examined for IADL difficulty were shopping, banking, laundry, and medication organization and compliance. Logistic regression results indicate fewer social network members was associated with increased difficulty in meal preparation, banking, dressing, bathing without grab bars, medication organization and medication compliance. Results indicate a relationship between social network size and performance in ADLs and IADLs among community-dwelling older adults with probable dementia. The potential of social network size to influence functional performance could have widespread policy implications for aging in place. Further research should examine other characteristics of social networks that may mediate ADL and IADL performance. Further research should examine other characteristics of social networks (e.g., frequency and quality of relationship) that may mediate ADL and IADL performance.

FINANCIAL LITERACY AND HOUSEHOLD WEALTH IN LATER LIFE

J.S. Chae[1], F.W. Porell[1], E.A. Miller[1], E.A. Bruce[2], *1. Gerontology Department, University of Massachusetts Boston, Boston, Massachusetts, 2. Pension Action Center, Gerontology Institute, University of Massachusetts Boston, Boston, Massachusetts*

Extant research demonstrates an association between basic financial literacy and retirement-related economic outcomes. To date, however, these studies have only examined numeracy or basic skills and comfort with numbers. Other components of financial literacy—knowledge and use of basic economics and financial concepts—remains little examined. This study uses data from the 2010 Health and Retirement Study (HRS) and its new financial literacy module to examine the relationship between financial literacy and household wealth among older adults in the United States (N=1,596). Ordinary Least Squares regression analyses estimated the association between both the numeracy and non-numeracy components of financial literacy and total household wealth, controlling for other demographic and socioeconomic status variables. Results indicate that only non-numeracy components of financial literacy were associated with household wealth ($p<.05$). In particular, a non-numeracy index incorporating knowledge of stock markets, interest rate changes, and investment risks was positively related to wealth in retirement. Years of education was positively related to household wealth as well. In contrast, African American and divorced respondents reported lower household wealth; so too did respondents with higher levels of pension income. Findings suggest that non-numeracy components of financial literacy may better explain household wealth than the numeracy components of financial literacy, perhaps due to the acquisition of the knowledge and skills necessary to attain higher returns on investments. Future studies should investigate the effects of non-numeracy financial literacy on other economic outcomes to inform the development of policies that help ensure older adults' financial security in retirement.

WHY ARE SOME STATES' DEMENTIA REGULATIONS FOR ASSISTED LIVING MORE STRINGENT THAN OTHERS?

M.C. Nattinger, A.J. Potter, B. Kaskie, *Health Management and Policy, University of Iowa, Iowa City, Iowa*

Background: Assisted living has become an attractive residential alternative to nursing facilities for persons with dementia. However, unlike federally regulated nursing facilities, assisted living facilities are state regulated. Little is known about the structure and function of assisted living regulations and if such policies influence dementia-care quality. Objective: To identify state regulations of dementia-care in assisted living, and develop a taxonomy reflecting distinct qualitative differences among regulation types. Methods: Using LexisNexis, we identified state dementia-specific staffing and physical environment assisted living regulations through 2013. The quality of regulation types was determined by assessing their scope and stringency on a scale from 0-5, with more explicit standards for dementia-specific training, staffing levels, resident safety and comfort generating higher scores. Scale scores were used to create two constructs reflecting staffing and physical environment. Correlational analyses were performed to assess construct independence. Results: The stringency of dementia-specific staffing and physical environment regulations vary significantly across states. For example, 14 states have no dementia-specific staffing standards, while 48 states offered no regulations restricting access to sharp/toxic objects among persons with dementia. The constructs were modestly correlated (0.43 $p<0.01$), suggesting two distinct state policy approaches to shaping dementia care in assisted living. Conclusions: Relative to the resident population size, the amount of state-level dementia-specific assisted living policy activity is modest. The existing policies appear to be multidimensional, focusing on different aspects of dementia-care quality. Further research will continue to document the policy structure shaping assisted living and determine why states take varied approaches to regulation.

DEPRESSION INCREASES THE RISK OF ELDER FINANCIAL EXPLOITATION: MEDIATING EFFECTS OF PHYSICAL HEALTH AND ISOLATION

A. Pearce, C. Davis, P. Liu, S. Estevez-Cores, S. Wood, *Psychology, Scripps College, Claremont, California*

In recent years financial exploitation has become an increasingly relevant issue among the older adult population. It has been established in the literature that factors such as self-reported depression and loneliness can often lead to a subsequent decline in physical health. It has also been established that a decline in physical health can negatively impact decision making and lead to riskier and poorer choices. The current study aims to explore how depression, loneliness, and physical health increase the likelihood of financial exploitation in older adults and specifically if any of the above mentioned factors serve as mediators of financial exploitation. Participants (n=189) filled out surveys that assessed topics including physical health, depression, social support, and financial exploitation in the past year. Structural equation modeling with AMOS was used to test whether physical health and isolation acted as mediating variables in the effect of depression on financial exploitation. Model fit provided by modification indices was good, $\chi2$ (2) = .819, p= .664, $\chi2$ /df = .410, CFI = 1.000, RMSEA < .001. All paths were significant, all $p<.05$. Depression predicted physical health and isolation respectively, and the two mediators also respectively predicted financial exploitation. Physical health and loneliness were found to be mediating variables in the effect of depression on financial exploitation. Prevention and intervention programs should focus on the two mediating variables, and future research should continue exploring mediating and moderating effects of predictors on elder financial exploitation.

SESSION 670 (SYMPOSIUM)

EXERCISE IS REGENERATIVE MEDICINE: EFFECTS ON MITOCHONDRIAL FUNCTION

Chair: M.M. Bamman, *University of Alabama at Birmingham and Birmingham VAMC, Birmingham, Alabama*
Discussant: M. Tarnopolsky, *McMaster University, Hamilton, Ontario, Canada***Discussant:** K.E. Conley, *University of Washington, Seattle, Washington*

Marcas Bamman, University of Alabama, Birmingham, Exercise is regenerative medicine: Restoring myogenic and mitochondrial function in aging and Parkinson's Disease; Mark Tarnopolsky, McMaster University, Systemic benefits of exercise on mitochondrial function in aging; Kevin Conley, University of Washington, Exercise as the cure for what AGES us. Exercise training in its various forms profoundly influences the physiology of every organ system, and accomplishes this by the induction of molecular processes and signaling events that have a marked impact on cellular function. Because of its multi-potency, exercise training has been used successfully to mitigate cellular dysfunction in aging and several chronic diseases. As such, exercise if dosed effectively can be a powerful tool in the burgeoning field of regenerative medicine. In this session, the three speakers will focus on the well-established links between mitochondrial dysfunction, aging, and the progression of age-related disease, and the mechanisms by which exercise training can restore functional capacity, in part by its regenerative effects on mitochondria with a particular focus on skeletal muscle.

EXERCISE AS THE CURE FOR WHAT AGES US

K. Conley, *University of Washington, Seattle, Washington*

Here we present the first direct and non-invasive measurement of NAD/H redox states in elderly (65-80 yrs old) human muscle in vivo before and after exercise training. Magnetic resonance spectroscopic (MRS) measures in the vastus lateralis reveal mitochondrial NADH, which is a natural biomarker indicating mitochondrial function, and NAD+, which is a limiting co-factor in mitochondrial biogenesis. Six months of endurance training reversed the elevated mitochondrial NADH and the reduced NAD+ in elderly muscle to restore the levels found in adults. Parallel improvements were found in mitochondrial function (coupling: P/O) and mitochondrial capacity (ATPmax) in vivo. Thus, NAD/H redox states reflecting mitochondrial function and capacity are sensitive to an intervention and reveal mitochondrial improvements with endurance training in the elderly. After attending this presentation, participants will understand how non-invasive MRS can be used to: 1) capture mitochondrial properties and 2) reveal exercise training responses in human tissues in vivo.

EXERCISE IS REGENERATIVE MEDICINE: RESTORING MYOGENIC AND MITOCHONDRIAL FUNCTION IN AGING AND PARKINSON'S DISEASE

M.M. Bamman, *Birmingham VA Medical Center and University of Alabama at Birmingham, Birmingham, Alabama*

Parkinson's disease (PD) is a debilitating, neurodegenerative disease that manifests as disrupted motor behavior (bradykinesia, tremor, postural instability, rigidity), which dramatically impacts mobility function and life quality. Weakness, low muscle power, and fatigability are common findings in PD. Because risk increases with age (96% diagnosed >age 50), PD progresses concurrent with the obligatory losses of muscle mass and function consequent to aging that likely compound the deleterious effects of the primary disease which include mitochondrial dysfunction. In apparently healthy older adults, we have documented aging-related muscle atrophy, weakness, low muscle power, and fatigability, and have demonstrated robust improvements in muscle mass and function in response to high-intensity resistance exercise training (RT). In this session we will describe more recent results in aging PD patients, showing encouraging benefits of a novel exercise prescription combining high intensity RT with bodyweight interval training to improve both motor and mitochondrial function.

SESSION 675 (SYMPOSIUM)

WELL-BEING IN THE SECOND HALF OF LIFE: FROM DAY-TO-DAY FLUCTUATIONS TO YEAR-BY-YEAR CHANGES

Chair: S.C. Krupka, *Humboldt-University Berlin, Berlin, Germany*
Co-Chair: D. Gerstorf, *Humboldt-University Berlin, Berlin, Germany*
Discussant: F. Lang, *Friedrich-Alexander University, Erlangen-Nuremberg, Germany*

When asking people once a year, empirical reports indicate that general well-being is, on average, stable across adulthood and old age. However, evidence is accumulating to suggest that this positive picture is more complex when looking at particular phases of life or when zooming into people's everyday lives. This symposium brings together a collection of empirical papers to showcase contemporary endeavors towards better understanding the risk and protective factors for well-being at multiple levels of analysis and time scales. Krupka and colleagues use multi-year data from the Health and Retirement Study to investigate how the conditions preceding different causes of death shape end-of-life well-being decline. Lee and colleagues use data from the National Survey of Daily Experiences (NSDE) to examine how age-related changes over 10 years in well-being can be predicted by the diversity of activities people pursue in their daily lives. Urban and colleagues also use data from the NSDE to demonstrate that the nature and correlates of age differences in well-being depend upon whether the time frame used in these reports was daily, weekly, or monthly. Finally, Ryan and Queen make use of data obtained with the Daily Reconstruction Method to examine how reporting that a day's activities were meaningful moderate associations of daily positive and negative affect with general life satisfaction. The discussion by Frieder Lang integrates these papers, highlights their theoretical and methodological contributions, and considers challenges and opportunities for future research revolving around the nature and correlates of well-being in the second half of life.

DOES CAUSE OF DEATH MODERATE LATE-LIFE CHANGE IN WELL-BEING?

S.C. Krupka[1], F.J. Infurna[2], I. Demuth[3], I. Schöllgen[1], N. Ram[4], D. Gerstorf[1,4], *1. Humboldt-University Berlin, Berlin, Germany, 2. Arizona State University, Tempe, Arizona, 3. Charité, Berlin, Germany, 4. Pennsylvania State University, University Park, Pennsylvania*

Well-being often shows major deteriorations with impending death. Yet, little is known about whether and how well-being declines are steeper for certain causes of death than for others. We use longitudinal data from 6,829 by now deceased participants of the Health and Retirement Study (*M* age at death = 78.61) to examine differences in late-life trajectories of depressive affect across six leading causes of death, after covarying for age at death, gender, education, comorbidity, and disability. Results revealed that dying of respiratory conditions was particularly detrimental for people's well-being, with highest overall levels and steepest increases in depressive affect. Participants dying from cancer also experienced stronger late-life increases in depressive affect than those dying from cardiovascular diseases. Our models suggest that diseases, functional limitations, and causes of death impact, but do not entirely determine late-life well-being. We discuss how symptoms, life circumstances, and treatment side effects contribute to our findings.

DIVERSITY OF DAILY ACTIVITIES AND AGE-RELATED CHANGES IN SUBJECTIVE WELL-BEING

S. Lee, R. Koffer, B.N. Sprague, D. Almeida, *Human Development and Family Studies, Penn State University, State College, Pennsylvania*

Using two-waves' data ten years apart from the National Survey of Daily Experiences (N=793), this study examined whether diversity of daily activities predicted age-related changes in four domains of subjective well-being: psychological well-being, depression, and positive and negative mood. Activity diversity was defined as the breadth of daily participation in various activities, including paid work, time with children, volunteering, and physical activities. Results from multilevel models revealed that older adults (age=59–74) who engaged in more diverse activities reported higher psychological well-being and lower depression at both waves than those with less diverse activities; younger people (age=24–34) with more diverse activities decreased in depression and negative affect from wave-1 to wave-2, whereas those with less diverse activities increased in them. Our findings suggest that activity diversity is beneficial for older adults' concurrent eudemonic well-being and leads to positive changes ten years later for younger adults' eudemonic and hedonic well-being.

THE ROLE OF TEMPORAL REPORTS IN AGE DIFFERENCES IN EMOTIONAL WELL-BEING

E.J. Urban[1], S.T. Charles[1], J. Mogle[2], D. Almeida[2], *1. University of California, Irvine, Irvine, California, 2. Pennsylvania State University, University Park, Pennsylvania*

Older adults often appraise stimuli and remember events less negatively compared to younger adults. These appraisals may play a role in age differences in emotional well-being, a phenomenon that may be more pronounced for reports of emotions that span longer periods of time and require a greater demand on memory processes. The current study examined people who completed the Midlife in the United States (MIDUS) and National Study of Daily Experiences (NSDE) and reported recollected negative affect across three temporal windows. Participants ranging from 25 to 74 years-old at the first wave of data collection reported their monthly, weekly, and daily negative affect at each time point. Older age was related to lower levels of negative affect for all measures, but the age difference varied across the three temporal windows. Age differences were smallest when people reported their daily negative affect and greatest when people reported their monthly negative affect.

MEANING MATTERS: IMPLICATIONS FOR AFFECT AND LIFE SATISFACTION

L.H. Ryan[1], T.L. Queen[2], *1. Institute for Social Research, University of Michigan, Ann Arbor, Michigan, 2. University of Utah, Salt Lake City, Utah*

The current study investigates two research questions. First, is the meaning attributed to a day's activities positively associated with life satisfaction? Second, do the associations of positive and negative affect linked to a day's activities with life satisfaction differ based on how meaningful the day's activities were rated? With a sample of older adults (N=968; age range = 50 - 94), this study examines reports on up to 10 activities yesterday, feelings of well-being associated with each activity, and an assessment of the meaningfulness of yesterday's activities. After controlling for age, gender, education, health, and number of activities, results indicate that positive affect in a day is more strongly associated with life satisfaction among individuals who reported high meaning. In addition, differential patterns for the effect of meaning on life satisfaction are identified when looking within specific activities. Interpretation relative to the subjective well-being literature will be considered.

SESSION 680 (SYMPOSIUM)

IMMIGRATION, SOCIAL RELATIONS, AND HEALTH

Chair: I.O. Govia, *The University of the West Indies, Mona, Kingston 7, Jamaica*

In this symposium we examine the social and psychological well-being of native and immigrant aging persons in the USA and Germany. Hernandez, Smith, and Ingersoll-Dayton examine ambivalent relationships among older Latino/as in the US, noting that immigrant status contextualizes how perceived quality of familial support is associated with well-being, especially among Latina/os at older ages. Ajrouch and Webster explore social relations and forgiveness among Arab Americans. Arab American immigrants report higher levels of depressive symptoms than the US born. Similarly, for immigrants, age is negatively correlated with life satisfaction, while for the US born life satisfaction increases as age increases. Govia, Turkelson, and Ryan consider the ways in which immigration and gender are associated with the mental health of Caribbean Blacks in the US. While nativity matters for the depressive symptoms of men, immigration cohort is what predicts distress among foreign-born Caribbean women. Vogel, Simonson and Tesch-Roemer consider differences in volunteering between native and immigrant persons in Germany. Migrants are less likely to volunteer than non-migrants; however these differences are less pronounced among those in later adulthood than among these in middle adulthood. After this symposium, participants will be able to 1) discuss the associations between nativity and social and health outcomes across the lifespan, and particularly at older ages, for Latinos, Arab Americans, and Caribbean Blacks in the US, and for native versus immigrant persons in Germany; and 2) compare and contrast the US and Germany as contexts for the aging of foreign-born persons relative to native born persons.

VOLUNTEERING ACTIVITIES AMONG ELDER IMMIGRANTS IN GERMANY

C. Tesch-Roemer, C. Vogel, J. Simonson, *German Centre of Gerontology, Berlin, Germany*

Conflicting hypotheses exist about volunteering patterns among immigrants and native populations. One hypothesis suggests that volunteering rates (and devoted hours) are lower among immigrants than native populations because of different language skills or disadvantaged socio-economic status. An opposing hypothesis suggests that among immigrants, rates and hours are higher than in native populations because of using volunteering to cope with challenges in the migration and integration processes. Using data on adults 40 years and older (N =13152; migrants n = 1683 migrants) from the 2009 German Survey on Volunteering, we explore these hypotheses. Findings suggest that migrants are less likely to volunteer than non-migrants in Germany. Differences in volunteering activities are less pronounced among those aged 60+ than among those aged 40 to 59. Differences in rates can be partially attributed to duration of stay at the place of residence. Findings are discussed with respect to migration in the German context.

IMMIGRATION AND THE MENTAL HEALTH OF CARIBBEAN BLACK MEN AND WOMEN IN THE USA

I.O. Govia[1,2], A. Turkelson[2], L. Ryan[2], *1. The University of the West Indies, Mona, Kingston 7, Jamaica, 2. Institute for Social Research, Ann Arbor, Michigan*

Over the life course, immigration factors may be associated with mental health differently for immigrant Black men and women in the US. Using data from the National Survey of American Life, we explore interactions between immigration factors and gender on the mental health of adult Caribbean Blacks (N = 1400; foreign born n = 1045). Analyses suggest that US born men are more likely to have depressive symptoms than are foreign-born men, while nativity differences are not significant for women. On the other hand, women who migrated to the US between 1986-1989, 1990-1995, and 1996-2002 are all different from those who migrated in 1915-1979, whereas immigration cohort differences were not significant in the distress levels of Caribbean men. Findings will be discussed with respect to gendered immigration experiences and differential consequences for the mental health of Black immigrant and immigrant-ancestry men and women in the USA.

AMBIVALENT RELATIONSHIPS AND WELL-BEING IN LATER LIFE: COMPARING US-AND FOREIGN-BORN LATINA/OS

E. Hernandez[1], J. Smith[2], T.C. Antonucci[2], B. Ingersoll-Dayton[3], *1. Social Work and Psychology, University of Michigan, Ann Arbor, Michigan, 2. Institute for Social Research, University of Michigan, Ann Arbor, Michigan, 3. School of Social Work, University of Michigan, Ann Arbor, Michigan*

Familismo is a Latina/o cultural value system prioritizing strong familial ties where elders are granted special consideration. However, immigration status impacts whether older Latina/os feel fulfilled when it comes to being understood by and able to rely upon family members. Expectations that are only partially met lead to ambivalent relationships, which can in turn influence well-being. Using data from the Health and Retirement Study, we apply an intergenerational ambivalence framework to examine the characteristics of US-born (N=492) and foreign-born (N=554) Latina/os aged 50 and over reporting ambivalent relationships. After controlling for education, marital status, and health status, regression models revealed that being older, foreign-born, and having a smaller network size were associated with a greater likelihood of reporting ambivalent relationships. Additionally, we explore the relationship between the presence of ambivalent ties and well-being. Immigrant status contextualizes how perceived quality of familial support impacts well-being, especially among older cohorts of Latina/os.

FORGIVENESS, SOCIAL RELATIONS AND WELL-BEING: A LIFE COURSE IMMIGRANT PERSPECTIVE

K.J. Ajrouch[1,2], N.J. Webster[2], *1. Sociology, Eastern Michigan University, Ypsilanti, Michigan, 2. University of Michigan, Ann Arbor, Michigan*

Forgiveness and social relations have documented importance for well-being across the life course, yet we understand little about the role of immigrant status in this process. Using a unique random sample of Arab Americans from metro-Detroit, home to the largest and most visible concentration of Middle-Eastern Americans in the U.S. (N=96), we examine main and moderating effects of immigrant status on forgiveness, social relations, and well-being. Participants range in age from 19-76 and two-thirds are immigrants. Findings show immigrants are older, report more co-ethnics in their networks, disagree that an apology is needed before granting forgiveness, and report more depressive symptoms compared to U.S.-born Arab Americans. Interaction analyses show that as age increases, life satisfaction is higher for the U.S. born, but lower for immigrants. Findings will address ways in which divergent experiences between immigrants and the U.S. born may reflect differences in integration as well as cultural coping strategies.

SESSION 685 (SYMPOSIUM)

HELP-SEEKING AND EARLY DETECTION OF COGNITIVE IMPAIRMENTS IN THE COMMUNITY

Chair: T.Y. Lum, *The University of Hong Kong, Hong Kong, Hong Kong*

Co-Chair: G. Wong, *The University of Hong Kong, Hong Kong, Hong Kong*

Detection of cognitive impairment is the necessary first step to allow effective treatment and support services, which help maintain or improve mental state and quality of life of people with dementia and their caregivers. Under-diagnosis and delays in help-seeking nevertheless remain common, possibly due to fear, lack of awareness, and barriers in accessing diagnostic service. Based on an ongoing casenote review study (n=497) of an easily accessible, territory-wide assessment service for dementia in Hong Kong, this symposium includes three papers that examine help-seeking behaviours and early detection issues in community-dwelling people with suspected dementia. Ng and colleagues reviewed the pattern and extent of delays in seeking help, and the enabling factors of the caregiver/care receiver that have expedited help-seeking. Wong and colleagues discusses the role of comprehensive assessments performed by trained professionals (e.g., social workers, occupational therapists) in facilitating the clinical diagnosis of dementia, including the specificity of assessments and a piloted collaborative model with specialists and general practitioners for more efficient early detection. Ho and colleagues examined in detail subjective complaints and observed symptoms that, as reported by people with suspected dementia and their caregivers, have prompted them to seek professional help. Self-reported cognitive problems were compared with signs observed by caregivers for congruity. These findings will inform targeted strategies to promote earlier help-seeking, development of effective and cost-effective early detection services, and programming key messages for raising public awareness of dementia. Nancy Hodgson will discuss the pathway to care in promoting early intervention for dementia.

SELF-REPORTED AND CAREGIVER-OBSERVED SIGNS OF COGNITIVE IMPAIRMENTS IN HELP-SEEKERS

A. Ho[1], “. Lou[1], C. Ng[1,2], T.Y. Lum[1], G. Wong[1,2], M. Lau[1], D. Kwok[1], *1. The University of Hong Kong, Hong Kong, Hong Kong, 2. Hong Kong Alzheimer’s Disease Association, Hong Kong, Hong Kong*

Incongruity between subjective complaints and informant observation of cognitive impairments poses barriers to help-seeking. Methods: Casenote review of 266 dyads seeking assessment for suspected dementia between 2006 and 2013. Chi-square and Kappa coefficient were calculated between self-reported and caregiver-observed warning signs. Findings: Caregivers on average reported 1.2 (S.D. 1.6) more signs than the person with suspected dementia. The most common complaints made by both parties were: memory loss (72.9%), misplacing things and losing the ability to retrace steps (10.2%), and confusion over time or place (3.4%). Agreement was in general very low in all types of complaints (all k<.02). Disagreement was significant regarding complaints of confusion over time or place ($\chi2=6.5$, p=.02), withdrawal from work or social activities ($\chi2=27.8$, p<.01), and somatic complaints ($\chi2=7.0$, p=.04). Implications: People with suspected dementia and their caregivers tend not to agree on cognitive complaints, which may be due to decreased insight or fear.

ASSESSING COGNITIVE IMPAIRMENTS IN HELP-SEEKERS: FINDINGS FROM AN EARLY DETECTION SERVICE

G. Wong[1,2], C. Ng[1,2], T.Y. Lum[1], *1. The University of Hong Kong, Hong Kong, Hong Kong, 2. Hong Kong Alzheimer’s Disease Association, Hong Kong, Hong Kong*

Identifying people showing early signs of dementia allows for timely intervention. Assessments provided by dementia care professionals may facilitate clinical diagnosis. Methods: Casenote review of an early detection service in Hong Kong provided by trained social workers and occupational therapists between 2006 and 2013, and clinical reports of referred cases for medical checkup. Findings: Among 497 help-seekers, 45.2%, 27.0%, 5.1%, and 0.5% showed questionable, mild, moderate, and severe impairment, respectively, on Clinical Dementia Rating. Mild cognitive impairment or dementia was suspected in 274 cases. Based on hospital reports available from 134 referred cases, majority received a diagnosis of dementia (68%) or MCI (20%); other underlying conditions (e.g., subdural haemorrhage) were detected in 5%. Implications: Cognitive impairments of varying degree are common among help-seekers. Assessment service for help-seekers provided by trained professionals, with coordinated diagnostic and clinical follow-up, is a viable option for early intervention in dementia.

CHARACTERISTICS OF EARLY HELP-SEEKERS FOR SUSPECTED DEMENTIA

C. Ng[1,2], T.Y. Lum[1], G. Wong[1,2], M. Lau[1], D. Kwok[1], *1. The University of Hong Kong, Hong Kong, Hong Kong, 2. Hong Kong Alzheimer’s Disease Association, Hong Kong, Hong Kong*

Delays in seeking professional help are common in people with dementia. Identifying characteristics of early help-seekers would inform public awareness strategies. Methods: Casenote review of people seeking help from a low-barrier, territory-wide professional assessment service available since 2006 in Hong Kong. Findings: A total of 497 casenote records were reviewed (67% female; age 75.5 ± 8.8 years). People waited on average 18.4 months (median, 14 months; range, 1-84 months) since first notice of symptoms before seeking assessment. Among help-seekers who were assessed as having probable dementia, a multiple regression model (R2=.39, F(15,87)=3.77, p<.01) showed that earlier help-seekers had more symptoms observed by caregiver (p=.03), higher MMSE score (p<.01), were older (p<.01), and had better IADL (p=.02); subjective complaints of the person were unrelated (p=.56); severity on different clinical domains predicted delays differentially. Implications: The number of symptoms observed by caregivers predicted earlier help-seeking, which is associated with milder disease.

SESSION 690 (SYMPOSIUM)

HUMANISTIC GERONTOLOGY: THE IMPORTANCE OF A NEGLECTED FIELD

Chair: J. Baars, *University of Humanistic Studies, Haarlem, Netherlands*

One of the main sources of the humanities are a shared interest in the (inter)human condition in its uniquely different manifestations. What does it mean to live a human life? For our concerns we may add: does aging still play a part in this? Or does this stop with the end of ‘normal’ or ‘productive’ adulthood? Can the most pressing questions about human aging be reduced to the main paradigms of contemporary gerontology: how to remain as healthy and functioning as a ‘normal adult’? Even answering these questions affirmatively presupposes a normative evaluation and although there is no scientific proof to establish what the right answer might be this does, for the humanities, not imply the end but the beginning of further questioning. Taking a normative stance does not imply being prescriptive, but an invitation to leave the splendid isolation of modern subjectivism and to join the conversation as a person who is faced with shared concerns: we are always already aging and involved in experiences of its meaning or meaninglessness. Many of these concerns have been voiced in the humanities since millennia, also in relation to human aging. The symposium begins with Tom Cole’s exploration of the history, rationale and prospect of humanistic gerontology as it emerged in the late 20th century to challenge and complement mainstream gerontology. It continues with discussing some themes that are basic to Humanistic Gerontology: practical wisdom and intrinsic virtues (Ricca Edmondson) and time and temporality (Jan Baars).

AGING: HAVING THE TIME OF OUR LIVES

J. Baars, *University of Humanistic Studies, Haarlem, Netherlands*

If we are fortunate, we are having the time of our lives as we are aging. However, there remains a nagging awareness that time is running out, in spite of efforts to prolong it. Even if our lives would become substantially longer, we would still need a reconciliation with its finitude. It may help to follow the traces of persons who searched for a deepening of finite life. For this we need to develop temporal perspectives that articulate human experiences of what it means to live in finite time.

Some intriguing traces tell us about ways to regain the time that seemed to be lost in the past, showing connections that may inspire present identities and hope for the future.

HISTORY AND RATIONALE OF HUMANISTIC GERONTOLOGY

T.R. Cole, *The John P. McGovern, M.D. Center for Humanities and Ethics, University of Texas Health Science Center, Houston, Texas*

Tom Cole Humanistic gerontology arose in the late 20th century to challenge and complement mainstream gerontology, whose discourse in the 1990s was characterized by highly technical, instrumental, avowedly objective, and value-neutral methods but lacked an appropriate language for addressing basic moral and spiritual issues in an aging society. Its history has been summarized in three Handbooks of Humanities and Aging edited by Cole et. al. (1992, 2000, 2010). Humanistic gerontology focused the methods, subject matter and disciplines of the traditional humanities, which are inspired by the perennial question "What does it mean to be human?" on its core question: "What does it mean to grow old? This question, of course, breaks down into multiple culturally and historical specific questions and has no final answer. The overview will conclude with speculation about the prospects for humanistic gerontology and its academic siblings today.

WISE ACTIONS AND INTRISIC VIRTUES: ANCIENT TRADITIONS AND EMPIRICAL DATA

R. Edmondson, *School of Political Science and Sociology, National University of Ireland Galway, Galway, Ireland*

This paper examines empirical evidence on effects in practice of the relationship perennially alleged between wisdom and virtue. Amélie Rorty indicates that virtuous communicative processes operate throughout the life of Aristotle's practically-wise person; Martha Nussbaum translates his 'phronesis' as 'virtuous wisdom'. Contemporary views (Baltes and Staudinger, Sternberg) associate wisdom with ethical discernment and empathy. What exactly do such capacities contribute to wisdom? The work of writers like MacIntyre on the degradation of ethical language in the contemporary world suggests problems in explaining these links; Marcel contends that language about wisdom has suffered a similar fate. Linking this debate to Cole's arguments on ideology, the paper explores what we can still say about how the social virtues contribute to wisdom. Analysing ethnographic traces collected over fifteen years among twelve main respondents, it argues that these social virtues have identifiable practical effects, though only if they are exercised for intrinsic reasons.

SESSION 695 (SYMPOSIUM)

NIMH UPDATE ON PRIORITIES AND OPPORTUNITIES IN MENTAL HEALTH AND AGING RESEARCH

Chair: G. Niederehe, *NIMH, Bethesda, Maryland*
Co-Chair: J. Evans, *NIMH, Bethesda, Maryland*

In this symposium, National Institute of Mental Health (NIMH) staff members will describe current priorities for the Institute, inform the audience of NIMH programs that support research efforts on aging and mental health, and outline particular areas of opportunity for new studies. The initial presentation will describe the current funding context at the Institute, provide an overview of how NIMH funding programs are organized, and discuss general trends and recent developments affecting the grant application process. Particular emphasis will be placed on a recent updating of the NIMH Strategic Plan as a central indicator of current priorities. The subsequent presentations will describe various programs through which the NIMH supports studies of mental health and aging, as well as highlight research questions of particular interest to the Geriatrics and Aging Processes Research Branch, and the Services Research and Clinical Epidemiology Branch. The final portion of the session will be devoted to a question and answer period during which audience members will be encouraged to pose questions to the presenters and identify issues of particular interest for expanded discussion.

THE FUNDING CONTEXT: RECENT DEVELOPMENTS, STRATEGIC PRIORITIES AND NIMH FUNDING PROGRAMS

J. Evans, *National Institute of Mental Health, Bethesda, Maryland*

This introductory presentation will describe the current research funding context at NIH and NIMH for proposing projects related to mental health and aging, both in terms of long-term trends and recent events. The information covered will include the status of the Congressional appropriations process for the coming year, and other special initiatives or situational elements that may bear upon aging-related research (such as recent NIH Funding Opportunity Announcements, noteworthy recent scientific advances, or organizational changes). A recent process of updating the NIMH Strategic Plan will be described, with emphasis on the centrality of this Plan as an articulation of current Institute research priorities. This presentation will also cover how funding programs are organized at NIMH, typical funding mechanisms, forms of support available for aspiring investigators in early stages of a research career, and the basic steps in preparing to apply for an NIH grant.

NEW DIRECTIONS IN THE BEHAVIORAL SCIENCE AND NEUROSCIENCE OF AGING AND MENTAL HEALTH

G. Niederehe, *Geriatrics Research Branch, NIMH, Bethesda, Maryland*

This presentation will discuss the translational research programs of the NIMH Geriatrics and Aging Processes Research Branch, highlighting particular opportunities for advancing the behavioral science and neuroscience of late-life mental disorders. Under its Research Domains Criteria (RDoC) initiative, NIMH promotes research on aspects of mental disorder that cut across traditional diagnoses and are measurable both dimensionally and at multiple levels of analysis (e.g., functional, physiological, neurobiological). Research themes to be emphasized include: the importance of studying how theorized key factors in the aging process interact with the change trajectories shown by those with chronic mental disorders; the desirability of integrating genetic, brain imaging, cognitive and affective neuroscience, and other technologies to advance a mechanistic understanding of disorder pathophysiology; mapping the neural circuits associated with mental disorders in older adults; and identification of biomarkers indicative of either vulnerability to or resilience against developing mental disorder in later life.

NIMH, EXPERIMENTAL MEDICINE, AND CLINICAL TRIALS RESEARCH: NEW DIRECTIONS AND OPPORTUNITIES

J. Evans, *National Institute of Mental Health, Bethesda, Maryland*

This presentation will review the Psychosocial Intervention and Aging, and the Pharmacologic and Somatic Intervention and Aging, research programs within the NIMH Geriatrics and Aging Processes Research Branch. NIMH has recently released several funding opportunity announcements signaling a new direction for the Institute's clinical trials research and focusing on an experimental medicine approach to speeding development of new treatments and accelerating the movement of improved therapies to patients with mental disorders. This presentation will explain this methodological approach, which emphasizes establishing an intervention's engagement of a clear mechanism of action (or "target"), and its application to late-life mental disorders and highlight opportunities for clinical research, including studies that examine various potential avenues for personalizing care for older adults with mental disorders. Aging-related issues, ranging from those pertinent to clinical neuroscience to those involved in community-based effectiveness research, will be discussed as opportunities for innovation and discovery.

OPPORTUNITIES FOR INNOVATIVE MENTAL HEALTH SERVICES RESEARCH FOR AGING POPULATIONS

D.A. Chambers, *Services Research & Clinical Epidemiology Branch, NIMH, Bethesda, Maryland*

This presentation will discuss programs of the NIMH Services Research and Clinical Epidemiology Branch that support research on the organization, delivery and economics of mental health services for older adults. Relevant research areas may range from the clinical epidemiology of the mental disorders shown by older adults in various service settings to strategies for improving older adults' access and adherence to mental health care to systemic interventions designed to improve the quality and outcomes of care. Special emphasis will be placed on investigations of optimal ways to disseminate and implement evidence-based interventions and other research findings into typical geriatric service settings. Other services research priorities include investigations of helpseeking patterns, the active therapeutic ingredients in complex community-based services programs, innovative information technologies and organizational platforms to enhance services delivery effectiveness and reach, and methods of increasing the sustainable uptake of scientifically based mental health services in diverse community settings.

SESSION 700 (SYMPOSIUM)

IMPLICATIONS OF POSITIVE AND NEGATIVE MARITAL QUALITY: FROM BIOLOGICAL SYSTEMS TO DIVORCE

Chair: K. Birditt, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*
Co-Chair: K. Fiori, *Adelphi University, Garden City, New York*
Discussant: J. Yorgason, *Brigham Young University, Provo, Utah*

The purpose of this symposium is to examine the implications of marital quality for multiple levels of individual functioning. In particular, we address how marital quality influences biological indicators, physical well-being, psychological well-being, and marital longevity. Birditt and colleagues examined links between negative marital quality and blood pressure among middle-aged and older couples in the Health and Retirement Study. They found that husbands had greater blood pressure when wives reported greater negative marital quality. In contrast, wives had lower blood pressure when husbands reported greater negative marital quality. Ryan and colleagues also assessed middle-aged and older couples in the Health and Retirement Study, finding that perceptions of marital support were significantly associated with higher self-rated health and fewer functional limitations. Interestingly, the health benefits of spousal relationship quality were greater if the spouse also perceived the relationship as high in quality. Examining the same sample of middle-aged and older couples over time, Fiori and Rauer found that individuals with better quality marital ties reported fewer depressive symptoms, and this association was mediated by loneliness. In particular, individuals with poorer quality marital ties may experience greater loneliness, which in turn leads to greater depressive symptoms. Brown and colleagues examined couples from the newlywed years to middle age, and found that couples who attended church together were less likely to divorce; these associations were even greater among couples with better quality marriages. Overall, these papers highlight the complexity of marital quality within and between couples and show how marital quality influences multiple levels of well-being.

BENEFICIAL NEGATIVITY? NEGATIVE MARITAL QUALITY AND BLOOD PRESSURE AMONG MIDDLE-AGED AND OLDER COUPLES

K. Birditt[1], N. Newton[2], L. Ryan[1], *1. Institute for Social Research, University of Michigan, Ann Arbor, Michigan, 2. Northwestern University, Evanston, Illinois*

Negative marital quality is highly relevant to well-being and health, especially for older couples. Emerging evidence suggests, however, that there may some benefits to relationship negativity under stressful circumstances. The present study examines links among chronic stress, negative spousal relationship quality, and blood pressure among middle-aged and older couples. Participants include married and cohabiting couples (N = 1356 couples) from waves 2006 and 2010 of the Health and Retirement Study, a nationally representative longitudinal study of approximately 22,000 persons born in 1953 or earlier. The link between husbands' reports of chronic stress and husbands' blood pressure appeared to be exacerbated by greater spousal negativity. In contrast, the link between wives' stress and wives' blood pressure appeared to be buffered by greater feelings of negativity among husbands. We also examine whether these associations vary between middle age and older adults. Implications for theory, practice, and future research will be discussed.

SPOUSAL SOCIAL SUPPORT AND STRAIN: IMPACTS ON HEALTH IN OLDER COUPLES

L.H. Ryan, W.H. Wan, J. Smith, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Using a nationally representative sample of couples aged 51+ in the United States (N = 1,923 couples), the current study investigated whether both partners' perceptions of relationship support and strain are associated with an individual's self-rated health and functional limitations. The sample had an average age of 67.17 years (SD=9.0; range=50-97). Actor-Partner Interdependence Models adjusting for couple interdependencies were applied. After accounting for age, education, gender, race, and couple differences in length of marriage, results indicate that individual perceptions of support were significantly associated with higher self-rated health and fewer functional limitations. These individual-level benefits increased if the spouse also perceived positive support and low strain. Finally, the negative association of an individual's perceived support on functional limitations was greater in those with a spouse reporting low levels of perceived strain. Findings are discussed relative to theory on behavioral and psychological pathways between partners' perceptions of support and health.

TWO CAN BE AS BAD AS ONE: MARITAL QUALITY, LONELINESS, AND MENTAL HEALTH IN OLDER ADULTHOOD

K. Fiori[1], A. Rauer[2], *1. Gordon F. Derner Institute of Advanced Psychological Studies, Adelphi University, Garden City, New York, 2. Auburn University, Auburn, Alabama*

The benefits of marriage for older adults' health appear to be largely contingent on the quality of the relationship, with evidence suggesting that the positive and negative aspects of the marriage differentially predict well-being. However, few studies have tested the mechanisms underlying these processes. Based on some limited evidence showing that loneliness may mediate between social network variables and health, we test whether loneliness, which results from a perceived discrepancy between desired and actual social relationships, mediates the association between positive and negative social exchanges with spouse and depressive symptoms. Using a sample of older married adults (N = 2,834) from the Health and Retirement Study, we found evidence for such mediation for current depressive symptoms, controlling for demographic variables and prior depressive symptoms. Our findings imply that loneliness is an important mechanism by which positive and negative social exchanges with spouse affect well-being.

RELIGIOSITY AND MARITAL STABILITY OVER 16 YEARS AMONG BLACK AMERICAN AND WHITE AMERICAN COUPLES

E. Brown[1], T.L. Orbuch[2], Y. Yoo[1], K.S. Birditt[2], *1. Human Development and Family Studies, University of Connecticut, Storrs, Connecticut, 2. University of Michigan-ISR, Ann Arbor, Michigan*

We examined the effects of religious homogamy (attendance of church together) on marital stability over 16 years for Black American couples and White American couples. Our findings indicate that the role religiosity plays in the stability of marriage over time varies by gender, race and marital relationship quality. Black American couples reported greater religious homogamy than did White American couples. Husbands reported greater religious homogamy than did wives. Greater religious homogamy was predictive of a decreased risk of divorce. Interaction effects revealed that the link between religious homogamy and decreased divorce was greater among higher quality marriages (more positive and less negative). Results highlight the importance of examining multiple aspects of religiosity and the marital relationship from both husbands and wives.

SESSION 705 (SYMPOSIUM)

CUMULATIVE DIS/ADVANTAGE ACROSS TIME, PLACE AND SOCIAL LOCATION: COMPARATIVE APPROACHES TO LIFE-COURSE INEQUALITY

Chair: D. Dannefer, *Department of Sociology, Case Western Reserve University, Cleveland, Ohio*
Co-Chair: S. Crystal, *Rutgers University, New Brunswick, New Jersey*

As the general problem of inequality becomes more prominent as a national issue, so does its relevance for social gerontology. The growing scholarly interest in the intersection of age and inequality continues to be seen in the rapidly growing body of research on processes and patterns of cumulative dis/advantage, conceptualized as a cohort-based, life course process. Some of the most provocative and revealing findings of recent research in studies of cumulative dis/advantage (CDA) come from comparative studies that examine how patterns and processes of cumulative dis/advantage may be similar, or may vary across different conditions. Papers in this symposium respond to calls from leading gerontologists working in this area by presenting findings that examine trends and variations in the magnitude of cumulative dis/advantage between and within social contexts: (1) across time – focusing on the last several decades of the U.S. experience; (2) within social location – e.g., exploring gender differences in the U.S. using the National Health Interview Survey and (3) between nations - using HRS (Health and Retirement Study) and ELSA (English Longitudinal Study of Aging) data.

IS EDUCATION DESTINY? UNPACKING THE CUMULATIVE DIS/ADVANTAGES OF EDUCATIONAL ATTAINMENT ON ADULT MORTALITY RISK

J.K. Montez, K. Barnes, *Case Western Reserve University, Cleveland, Ohio*

Educational attainment is a strong predictor of mortality and a “fundamental cause” of mortality inequalities. Higher-educated adults tend to accumulate advantages, such as lucrative employment and salubrious social ties, which lower mortality. Despite these population-level tendencies, there is considerable individual-level heterogeneity in whether post-education advantages are actually accumulated (e.g., many low-educated adults are gainfully employed). Understanding this heterogeneity may provide valuable insights into policies to reduce educational inequalities in mortality. This study examines how dis/advantages accumulated after formal education—economic circumstances, social ties, health behaviors—modify education’s effect on mortality. We use data from the 1997-2006 National Health Interview Survey Linked Mortality File on adults aged 30-84 and estimate discrete-time event history models by gender. Education is not destiny; its effect on mortality is significantly altered by post-education dis/advantages. For example, smoking erased the mortality benefits of a college degree. We conclude with strategies for reducing educational inequalities in mortality.

EDUCATIONAL DIFFERENCES IN HEALTH INEQUALITY IN THE US AND ENGLAND: IS CUMULATIVE DIS/ADVANTAGE COUNTRY-CENTRIC?

J. Kelley-Moore[1], B. Vanhoutte[2], J. Nazroo[2], D. Dannefer[1], J. Lin[1], *1. Sociology, Case Western Reserve University, Cleveland, Ohio, 2. University of Manchester, Manchester, United Kingdom*

It is widely acknowledged that socioeconomic position is a substantial driver of health disparities in later life and this relationship is relatively obdurate between countries. CDA posits that inequality increases with age while stratification frameworks emphasize gradients in health. We blend these two perspectives and test whether there are differences in average health status by education level and differences in patterns of variability by age within educational strata. We then compare the magnitude of health inequality by education between the US and England. Using HRS and ELSA, we calculate intra-cohort differentiation in trajectories of functional limitations and depressive symptoms. In both nations, we find a gradient in mental and physical health by education level. While health inequality increases with age overall, the pattern is most stark at the lowest levels of education in the US and England. We discuss implications of both SES attainment and societal context on health inequality.

HOW UNEQUAL CAN WE GET? THE PAST, PRESENT AND FUTURE OF CUMULATIVE ADVANTAGE

S. Crystal[1], D. Shea[2], A.M. Reyes[2], *1. Institute for Health, Rutgers University, New Brunswick, New Jersey, 2. Penn State University, University Park, Pennsylvania*

As overall inequality reaches historic highs, we re-examine the age distribution of inequality explored by Crystal and Shea 25 years ago and implications for cumulative advantage. Comparisons using 2010 and 1983-84 Survey of Income and Program Participation data show old-age inequality has grown to unprecedented levels. Excluding home equity, the Gini index for the elderly increases parallel to growth among younger ages. Including home equity still shows the elderly to have the highest level of inequality, but growth in inequality appears to be slower among older cohorts. Compared to the 1980s, the prosperous elderly are more likely to be married, less likely to be in poor health, and more likely to be well-educated. The penurious elderly are more likely to be the oldest-old divorced, and/or Hispanic. Relying predominantly on Social Security, the lower 40% would be disproportionately disadvantaged by reduced cost-of-living adjustments.

DISPROPORTIONATE BURDEN OF OUT OF POCKET HEALTH CARE COSTS IN LATE LIFE

A. Akincigil, K.A. Zurlo, E. Kalay, S. Crystal, *Institute for Health, Rutgers University, New Brunswick, New Jersey*

Despite the near-universal health insurance coverage provided by Medicare, uncovered and under-covered medical service use results in large out-of-pocket (OOP) health care costs. Indeed, when OOP medical expenses are included in calculations, the revised poverty rate for seniors increases from 8.7% to 15.9%. We describe economic burden of OOP medical expenditures among community-dwelling elderly Medicare beneficiaries, using data from the Medicare Current Beneficiary Survey (MCBS) from 2007. The most vulnerable spent more than 20% of their income on OOP medical expenses. Certain segments of the population were disproportionately vulnerable to financial insecurity from OOP medical costs, including females, older old (age 75+), and those with lower income and living with chronic conditions, even after controlling for supplemental coverage from secondary sources. These subpopulations have been accumulating economic disadvantages over their life course. Our results provide clearer insight into the contribution of OOP health care costs to late life inequality, despite the addition of the pharmacy benefit to Medicare in 2006.

SESSION 710 (SYMPOSIUM)

HEALTH DISPARITIES RESEARCH AT THE NATIONAL INSTITUTE ON AGING

Chair: R. Thorpe, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*
Co-Chair: C.V. Hill, *National Institute on Aging, Bethesda, Maryland*
Discussant: M. Bernard, *National Institute on Aging, Bethesda, Maryland*

Maintaining functional independence is a major public health concern that increases with age and varies by race and sex; yet, modest progress has been achieved as minority older adults consistently exhibit poorer functional status than white older adults. As the older segment of the population is growing larger and becoming more diverse and with the magnitude of the observed race-related differences, identifying and understanding factors that prevent or impede the functional decline is priority. The National Institute on Aging has taken special efforts to support research endeavors that explore ways to reduce or eliminate health disparities. The goal of this symposium is to highlight the different resources and research opportunities that NIA offers to support aging researchers, centers, and institutions for health disparities-related research or programs. Murthy will discuss the different health disparities research opportunities that are available from the NIA Extramural Division of Aging Biology. Silverberg will identify the different resources focused on health disparities related research within the Division of Neuroscience. Joseph will discuss the different health disparities research opportunities that are available from the Division of Geriatrics and Clinical Geriatrics. Haaga will highlight the different resources and research opportunities that are available to address health disparities within the Division of Behavior and Social Research. These presentations taken together provide important information that significantly bolsters our knowledge of resources and research opportunities that are critical in efforts to reduce/eliminated health disparities in late life.

NIA'S DIVISION OF NEUROSCIENCE AND HEALTH DISPARITIES RESEARCH

N. Silverberg, *National Institute on Aging, Bethesda, Maryland*

Within the NIA, the Division of Neuroscience (DN) fosters and supports extramural and collaborative research and training to further the understanding of neural and behavioral processes associated with the aging brain. An area of special emphasis is brain-behavior relationships. An important component of this Division is the support of basic, clinical, and epidemiological studies of AD and related dementias of aging. Variant processes and brain-behavior relationships lead to disparities in Alzheimers disease and related dementias for specific racial/ethnic groups. This presentation seeks to discuss determinants of variation in brain-behavior relationships among U.S. priority health disparities populations, mapping these to the NIA Health Disparities Framework.

THE NIA DIVISION OF GERIATRICS AND CLINICAL GERONTOLOGY'S APPROACHES FOR ADDRESSING HEALTH DISPARITIES

L. Joseph, *National Institute on Aging, Bethesda, Maryland*

The NIA Division of Geriatrics and Clinical Gerontology (DGCG) supports research on health and disease in the aged and research on aging over the human lifespan, including its relationships to health outcomes. DGCG comprises 3 major research areas, administered by its three Branches—Geriatrics, Clinical Gerontology, and Clinical Trials. Division-wide emphases include research training and career development for investigators across a wide range of specialties to expand their capabilities to address clinical aging issues, and the application of new technologies to expand opportunities for clinical aging research. The purpose of this presentation is to describe DGCG's approaches to enhancing NIA's health disparities research portfolio and aligning with the NIA Health Disparities Research Framework.

THE NIA DIVISION OF BEHAVIOR AND SOCIAL RESEARCH AND HEALTH DISPARITIES RESEARCH

J. Haaga, *National Institute on Aging, Bethesda, Maryland*

The Division of Behavioral and Social Research (DBSR) supports social, behavioral, and economic research and research training on the processes of aging at both the individual and societal level. DBSR fosters cross-disciplinary research, at multiple levels from genetics to cross-national comparative research, and at stages from basic through translational. Health Disparities research represents an important dimension of the funding opportunities developed and supported by DBSR. The purpose of this presentation to describe funding opportunities and future directions at DBSR.

HEALTH DISPARITIES RESEARCH AT NIA'S DIVISION OF AGING BIOLOGY

M. Murthy, *National Institute on Aging, Bethesda, Maryland*

The objective of NIA's Division of Aging Biology (DAB)-funded research is to elucidate the basic cellular and molecular, genetic, and physiological mechanisms underlying the process of aging and age-related changes in animal models and human studies that are relevant to human aging. These studies include investigations of the biological aging or structure and function relationships that relate to age-related diseases. DAB's approach to funding health disparities will include assessing determinants of variation in the mechanisms that underlie aging and age –related changes using cellular and human studies in health disparities populations. The purpose of this presentation is to discuss strategic direction for DAB's focus on health disparities research, highlighting areas of emphasis and linkages to the NIA Health Disparities Research Framework.

SESSION 715 (SYMPOSIUM)

SLEEP HEALTH AND THE APPROPRIATE USE OF OTC SLEEP AIDS IN OLDER ADULTS: RESULTS FROM A GSA SUMMIT

Chair: S.M. Albert, *Behavioral & Community Health Sciences, University of Pittsburgh, Pittsburgh, Pennsylvania*

The prevalence of sleep problems increases with age, resulting in a large number of older adults who struggle with sleep, including chronic insomnia, occasional sleep disturbances, sleep apnea, periodic limb movements, and REM Behavior Disorder . Many older adults and their caregivers turn to over-the-counter (OTC) sleep aids to to treat their disturbed sleep. However, these products should be used only for occasional difficulty with sleep, and their safety and efficacy in older adults is unclear. To engage national stakeholders in a discussion on OTC sleep aid use by older adults and explore strategies for improving safe use of these products, the Gerontological Society of America organized a National Summit on OTC Sleep Aids and Sleep Health in Older Adults. The Summit included presentations from national experts on sleep health and use of OTC sleep aids. Summit participants examined sleep health and aging, use of OTC sleep aides, opportunities to improve safe and effective use, and ways to make sleep health more central in the care of older adults. Key findings from the Summit include the high prevalence of sleep disturbances and recourse to OTC sleep aids, the long half-life of these medications and possible next-day effects, frequent anticholinergic side effects, and the need for concerted efforts by pharmacists and other providers to address sleep health in old age.

SLEEP HEALTH IN OLDER ADULTS

P. Zee[1], M.V. Vitiello[2], S.M. Albert[3], *1. Northwestern University, Chicago, Illinois, 2. University of Washington, Seattle, Washington, 3. University of Pittsburgh, Pittsburgh, Pennsylvania*

Sleep disorders have many deleterious health consequences. In one survey 4.7% of adults reported falling asleep while driving in the past 30 days. The prevalence of disturbed sleep increases with age due to age-related changes in circadian rhythms, apart from the effects of declining health. Approximately 44% of older individuals experience disturbed sleep at least a few nights each week, and rates of disturbed sleep are even higher among individuals with dementia and their caregivers. In healthy older adults, sleep quality remains roughly the same, but poor sleep quality is prevalent among those with co-morbid medical and psychiatric disorders. While aging does change some sleep parameters, it is not primarily responsible for the increased prevalence of insomnia and other sleep disorders in older adults, suggesting that sleep health in old age is an important goal for clinical and public health interventions.

NONPRESCRIPTION SLEEP AID USE BY OLDER ADULTS

T. Roth, *Henry Ford Health System, Detroit, Michigan*

Nonprescription strategies are often used in the treatment of insomnia and occasional sleeplessness. Available OTC sleep aids include the first-generation antihistamines diphenhydramine and doxylamine, which are approved by the Food and Drug Administration (FDA). Diphenhydramine is found in Nytol, Sominex, Tylenol PM, Excedrin PM, Advil PM, Unisom SleepGels, and Zzzquil; and doxylamine in Unisom SleepTabs, Equaline Sleep Aid, and Good Sense Sleep Aid. Although these agents are indicated for treatment of occasional sleeplessness (but are not indicated for chronic insomnia), many people use them on a regular basis. Among older adults with sleep problems, about one in five reported using an OTC sleep aid, either alone or in combination with herbals or prescription sleep aids. Because older adults have slower metabolisms than younger adults, half-lives of these agents tend to be prolonged in older adults, suggesting next-day and anticholinergic adverse events (falls, drowsiness), may be a substantial problem.

OPPORTUNITIES TO IMPROVE SAFE AND EFFECTIVE USE OF OTC SLEEP AIDS

M. Toscani, *Rutgers University, New Brunswick, New Jersey*

Pharmacists are readily accessible health care providers in the community and frequently interact with older adults. Pharmacists can help educate individuals on the selection and proper use of products and tell them when they should seek medical attention. Medication Therapy Management (MTM) services include medication therapy reviews, medication reconciliation services during care transitions, and pharmacotherapy consultations, and could be very useful for safe and effective use of sleep aids. Pharmacists and other health care providers need to work with patients (and care partners) to determine why patients are taking sleep aids (e.g., occasional sleeplessness, etc.) and determine other conditions and other products they may be taking that could potentially cause problems with their regimen. Opportunities for dialogue and educating patients and families, and for reaching consumers at the point of sale, are central for improving appropriate use of OTC sleep aids.

DISCUSSANT: OTC SLEEP AIDES: THE VIEW FROM CHRONOBIOLOGY

D. Bliwise, *Emory University, Atlanta, Georgia*

Donald L. Bliwise, Ph.D., Professor of Neurology, Psychiatry and Behavioral Sciences, and Nursing, and Director, Program in Sleep, Aging and Chronobiology, at the Emory University School of Medicine, and Wesley Woods Center will provide a perspective on OTC sleep aides from the perspective of chronobiology.

DISCUSSANT: OTC SLEEP AIDS: A SLEEP HEATH PERSPECTIVE

S. Ancoli-Israel, *University of California at San Diego, San Diego, California*

Dr. Sonia Ancoli-Israel, Professor Emeritus of Psychiatry and Medicine, Director, Gillin Sleep and Chronomedicine Research Center, Deputy Director, Stein Institute for Research on Aging, and Director of Education, UCSD Sleep Medicine Center will provide a perspective on OTC sleep aids from the perspective of sleep health.

SESSION 720 (SYMPOSIUM)

GETTING GRANDMA ONLINE: PROCESS, OUTCOMES, AND CHALLENGES ASSOCIATED WITH CONDUCTING A 5 YEAR ICT AND QUALITY OF LIFE RANDOMIZED CONTROLLED TRIAL IN ASSISTED AND INDEPENDENT LIVING COMMUNITIES

Chair: S. Cotten, *Michigan State University, East Lansing, Michigan*

In this symposium we detail an NIA funded 5 year randomized controlled trial (2009 – 2014), designed to train older adults in assisted and independent living communities to use computers and the Internet. We begin by discussing how the project idea came to be, the rationale, goals, and theory for the project. The processes for starting a technology-focused project such as this one, as well as unexpected challenges in the early phases are also noted. Next, we detail the design elements, setting, sampling design, and other methodological components involved in conducting this randomized controlled trial. A variety of types of data were collected during the course of the study. We provide both qualitative and quantitative results showing the effects of the intervention on a range of quality of life outcomes. We also note areas where we failed to find results that were originally expected when the proposal was developed. Finally, we discuss the challenges associated with this project, limitations, lessons learned, and various ways to extend this work.

ICTS AND QUALITY OF LIFE: OLDER ADULTS, SOCIAL CONNECTIONS, AND THE INTERNET

W.A. Anderson[1], E. Yost[2], V. Winstead[1], R.W. Berkowsky[1], S. Cotten[3], *1. University of Alabama at Birmingham, Birmingham, Alabama, 2. College of William and Mary, Williamsburg, Virginia, 3. Michigan State University, East Lansing, Michigan*

This session covers the background, rationale, and theory behind the ICTs and Quality of Life study. As people age and move into independent and assisted living, they often experience declines in social connections and quality of life. Recognizing that ICTs can help people maintain or increase social connections and social capital, we designed and conducted a five-year, three-arm, randomized, controlled intervention study to find out whether ICT use could help older adults in independent and assisted living maintain or increase social capital and whether any change in social capital was related to maintenance or improvement in quality of life. We addressed limitations of previous studies by 1) collecting data at five separate time points over the course of fourteen months, allowing us to trace the trajectories of social capital and quality of life over time; and 2) employing a three-arm design, with both attention and true control groups.

DESIGN AND SETTING

V. Winstead[1], E.A. Yost[2], R.W. Berkowsky[1], W.A. Anderson[1], S. Cotten[3], *1. Sociology, University of Alabama at Birmingham, Birmingham, Alabama, 2. College of William and Mary, Williamsburg, Virginia, 3. Michigan State University, East Lansing, Michigan*

The design for this study is a randomized, controlled trial intervention with older adults in 19 assisted and independent living communities (AICs) conducted in a mid-size city in the southeastern US. Participants from each of the communities were randomly assigned into one of three arms: 1) an ICT (Information and Communication Technology) arm that participated in 8 weeks of customized computer/Internet training, 2) an Activities Control arm that participated in 8 weeks of non-computer related activities such as trivia, sing-a-longs/musical events, or games, or 3) a True Control (survey only) arm. Residents were then recruited from each of the AICs. Participants from all three arms were surveyed five times over the course of a year- at baseline, at the conclusion of the ICT or Attention Control intervention, or for the True Control group, approximately 8 weeks after baseline), and at 3-, 6-, and 12-month intervals for follow-up.

KEY RESULTS FROM THE UAB ICTS AND QUALITY OF LIFE STUDY

R.W. Berkowsky[1], S. Cotten[2], V. Winstead[1], E.A. Yost[3], W.A. Anderson[1], *1. Sociology, University of Alabama at Birmingham, Birmingham, Alabama, 2. Michigan State University, East Lansing, Michigan, 3. The College of William and Mary, Williamsburg, Virginia*

The purpose of the UAB ICTs and Quality of Life Study was to explore how ICTs can increase the social capital and enhance the quality of life of older adults in assisted and independent living communities. This presentation will focus on discussing the results garnered thus far based on the quantitative analysis of survey data as well as the qualitative analysis of instructor notes, field notes, focus groups, and miscellaneous notes from study personnel. Discussion will focus on how ICT interventions were found to improve attitudes towards ICTs and decrease perceived limitations to using technologies, contribute to decreased feelings of loneliness, decrease social and spatial barriers associated with assisted and independent living, and help decrease the digital divide for assisted and independent living residents, among others. Discussion of the results will also focus on how general assisted and independent living activities, technology-centered or otherwise, can enhance quality of life.

UAB ICT QOL STUDY: LIMITATIONS, LESSONS LEARNED, AND FUTURE GOALS

E. Yost[1], V. Winstead[2], W.A. Anderson[2], R.W. Berkowsky[2], S. Cotten[3], *1. College of William and Mary, Williamsburg, Virginia, 2. University of Alabama at Birmingham, Birmingham, Alabama, 3. Michigan State, East Lansing, Michigan*

The UAB ICT QoL Study evaluated the impact of technology on quality of life outcomes in older adults in ALFs. After evaluating experiences from a five year randomized control technology study of nineteen assisted and independent living communities (ALFs) in the Deep South, we examine limitations, lessons learned, and future goals of study. The researchers discuss lessons learned, including best practices for recruitment, and retention. Recruitment in ALFs pose challenges dealing with bureaucracy and overcoming social and spatial barriers. Retention has challenges helping participants continue to utilize technology and ensure ALF staff continues to work with team members. Retention post intervention dealt with resident relocation and health declines. We will evaluate the limitations of our study due to the population and historical perspective of technology for this cohort. Lastly, we will also discuss our current plans for extending technology interventions within this population, including ongoing research on tablet computers.

SESSION 725 (SYMPOSIUM)

NEIGHBORHOOD EFFECTS ON WELL-BEING AND BEHAVIOR

Chair: S.M. Moorman, *Boston College, Chestnut Hill, Massachusetts*
Discussant: J.A. Ailshire, *University of Southern California, Los Angeles, California*

The papers in this symposium inquire about older adults' perceptions of their neighborhoods, and how these perceptions shape well-being and behavior. The first three papers research the experiences that influence perceptions of one's neighborhood. Stokes and Moorman study the age composition of neighborhoods, and show that neighborhoods comprised primarily of families (i.e., adults in midlife and their minor children) are associated with a relatively low sense of social integration and poor psychological well-being among older adult residents. Older adults fare better in age-representative neighborhoods, as well as in neighborhoods that contain an overrepresentation of older adults or young adults. Moorman and Stokes indicate that daily age discrimination and opportunities for generativity mediate the effect of age composition on well-being. Iveniuk further documents neighborhood experiences, finding that both objective factors (e.g., crime rate) and subjective factors (e.g., neighborhood cohesion) influence the level of danger older adults perceive in their neighborhoods. The final two papers examine how older adults act on their perceptions of a neighborhood. In longitudinal data, Riley, Hawkley, and Cagney find that neighborhood disorder makes local moves more likely, while neighborhood cohesion reduces the probability of long-distance moves. Latham and Clarke's investigation of participation in valued activities reveals that neighborhood disorder is associated with less frequent enjoyable trips out and less frequent attendance at religious services and other organization meetings, while neighborhood cohesion is associated with more frequent visits to friends and family. Ailshire's discussion focuses on how the information gained from these projects can advance policy and practice.

NEIGHBORHOOD AGE COMPOSITION AND ADULTS' WELL-BEING

J.E. Stokes, S.M. Moorman, *Sociology, Boston College, Chestnut Hill, Massachusetts*

Neighborhood contextual factors such as disadvantage and segregation are known influences on individuals' health and well-being. This study examined the influence of neighborhood age composition on middle-age and older adults' social integration and psychological well-being. Data were merged from the 2010 US Census and the second wave of the National Survey of Midlife Development in the United States (MIDUS II). The sample included 4,017 individuals from 3,714 census tracts. Using random intercept models and 9 categories of neighborhood age composition, we assessed the influence of neighborhood age composition on adults' social integration and psychological well-being over and above individual- and neighborhood-level factors. Results indicate that neighborhoods that overrepresent families are significantly worse for middle-age and older adults' social integration and psychological well-being than age-representative neighborhoods, neighborhoods that overrepresent older adults, and neighborhoods that overrepresent young adults. We discuss the implications of these findings for policy and future research.

MECHANISMS LINKING NEIGHBORHOOD AGE COMPOSITION TO OLDER ADULTS' SUBJECTIVE EXPERIENCE

S.M. Moorman, J.E. Stokes, *Boston College, Chestnut Hill, Massachusetts*

For older adults, the costs or benefits of peripheral ties to younger persons may depend on the nature of the contact between them. This study examined whether opportunities for generativity and instances of daily age discrimination mediate the effects of neighborhood age composition on older adults' social integration and psychological well-being. Data from the 2010 US Census and the 2006 wave of the National Survey of Midlife Development in the US were matched, and structural equation models were used to examine individuals nested within neighborhoods (i.e., census tracts). Findings show that generativity is associated with a stronger sense of social integration and higher psychological well-being, while age discrimination is associated with a weaker sense of social integration and lower psychological well-being. These experiences account for most associations between neighborhood age composition and older adults' social integration and psychological well-being. These results reveal mechanisms by which neighborhood factors have their effects.

PARTNERS AND CRIME: PERCEPTIONS OF NEIGHBORHOOD DANGER IN OLDER COUPLES

J. Iveniuk, *University of Chicago, Chicago, Illinois*

In this paper, I examine older adults' perceptions of their neighborhood environment, specifically differences in perceived danger, which may have implications for overall quality of life at older ages. My analyses use the reports of matched partners in cohabiting and marital dyads, where both partners in the dyad rated same neighborhood environment. These reports come from a nationally representative survey of older adults, linked to geocoded crime data, census data, and interviewer ratings of neighborhood disorder (N=3377). Controlling for crime rate, neighborhood ethnic composition and neighborhood social characteristics (e.g. social cohesion) substantially impacted perceptions of danger. Husbands, but not wives, were also more likely to feel as if their neighborhood was dangerous if they resided in this neighborhood for less than five years. Additionally, the higher the crime rate, the more husbands and wives agreed with one another's assessments of neighborhood danger.

LINKS BETWEEN NEIGHBORHOOD CHARACTERISTICS AND RESIDENTIAL MOBILITY AMONG COMMUNITY-DWELLING OLDER ADULTS

A. Riley[1,2], L. Hawkley[2], K. Cagney[1,2], *1. University of Chicago, Chicago, Illinois, 2. National Opinion Research Center, Chicago, Illinois*

We measured the impact of neighborhood disorder on residential mobility of older adults between Waves 1 and 2 of the National Social Life Health and Aging Project. After controlling for other variables known to influence residential mobility, the relative risk of a local move is 1.3 times higher (95% CI: 1.02, 1.73) for each unit increase in neighborhood disorder, while the relative risk of a distance move is 2.2 times lower (CI: 0.28, 0.74) for each unit increase in neighborhood disorder. Although neighborhood embeddedness is not significantly associated with risk of a local move, it is negatively associated with risk of a distance move (RRR=0.64, CI: 0.44, 0.93). Neighborhood embeddedness slightly attenuated the positive association between neighborhood disorder and local moves. We detected no significant associations between neighborly exchange and residential mobility. These results raise questions about how neighborhood characteristics may promote residential stability and vary opportunities for residential moves.

NEIGHBORHOOD DISORDER, PERCEIVED SOCIAL COHESION, AND PARTICIPATION IN VALUED ACTIVITIES: FINDINGS FROM THE NATIONAL HEALTH & AGING TRENDS STUDY (NHATS)

K. Latham[1], P. Clarke[2], *1. Department of Sociology, Indiana University-Purdue University Indianapolis, Indianapolis, Indiana, 2. University of Michigan, Ann Arbor, Michigan*

Previous research has observed a link between neighborhood characteristics and functional health outcomes among older adults; however, much of this research has focused on disability and mobility, yet social participation is another important aspect of functional health that may be sensitive to neighborhood characteristics. This research, using data from the first wave of the National Health & Aging Trends Study (NHATS), explores whether neighborhood disorder (e.g., graffiti, trash/litter, or vacant homes) or perceived neighborhood social cohesion predicts participation in valued activities such as visiting friends/family or attending religious services among older Americans. Controlling for numerous sociodemographic characteristics, activity importance (value), and health risk factors, greater social cohesion was associated with increased odds of visiting friends/family (OR=1.19, p=0.011); however, more neighborhood disorder was associated with decreased odds of attending religious services (OR=0.76, p=0.023), participating in clubs/organizations (OR=0.57, p=0.001), and going out for enjoyment (OR=0.73, p=0.008).

SESSION 730 (SYMPOSIUM)

NEW PERSPECTIVES ON HOME, BELONGING AND AGING IN THE COMMUNITY

Chair: T. Scharf, *Irish Centre for Social Gerontology, NUI Galway, Galway, Ireland*

Discussant: H. Chaudhury, *Simon Fraser University, Vancouver, British Columbia, Canada*

Despite a burgeoning scientific literature on aging in place, significant ambiguity around notions of home and belonging persists. Abiding questions relate to the subjective and evolving meanings associated with such constructs, their relationship with place-based individual and cultural identity, and their connections to wellbeing outcomes for aging adults. Diversity of individual life-course experiences, residential and relocation trajectories, and processes of community change compound these questions, adding further complexity to feelings of home and belonging in contemporary aging communities. As a result, there is a need for greater coherence of empirical and conceptual perspectives on home, belonging and aging. Drawing on research conducted in diverse socio-spatial settings and focused on different groups of aging adults, this symposium aims to provide empirical and conceptual insight into evolving constructions of a sense of home and belonging in aging communities, highlighting implications for older residents. In the first paper, Buffel uses narrative interviews with Turkish older migrants in an inner-city district in Brussels (Belgium) to examine constructions of home, and implications for identity and belonging, in terms of transnational relocation. In the second paper, Walsh, Rowles and Scharf use a qualitative case-study from rural South West Ireland, to introduce a life-course model of home as a sense of 'at-oneness' with the residential environmental context. In the third paper, Oswald and Kaspar present data from three urban districts of Frankfurt (Germany) concerning community belonging and aging in place, unpacking connections between urban identity and wellbeing for older people aged 80 years and over.

CONSTRUCTIONS OF HOME, PLACE AND BELONGING AMONG OLDER MIGRANTS LIVING IN INNER-CITY NEIGHBOURHOODS

T. Buffel, *1. The University of Manchester, Manchester, United Kingdom, 2. Adult Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium*

This paper combines two strands of literature that hitherto have been kept largely separate: research in environmental gerontology on the one hand and work dealing with transnational migration on the other. In doing so, it aims to contribute to the understanding of the ways in which older migrants experience and negotiate the notion of 'home', both as a location and a set of relationships that contribute to feelings of belonging and identity. Drawing on semi-structured interviews with older Turkish migrants living in Brussels, the paper addresses experiences of home in relation to distant and remote places, as well as to proximate and immediate locales. The discussion focuses on the interconnections between these, suggesting that such an approach may offer a way forward in terms of understanding how older migrants' transnational ties shape their local sense of belonging and vice versa.

CONSTRUCTING HOME OVER THE LIFE COURSE: TOWARD A MODEL OF AT-ONENESS

K. Walsh[1], G.D. Rowles[2], T. Scharf[1], *1. Irish Centre for Social Gerontology, National University of Ireland Galway, Galway, Ireland, 2. Graduate Center for Gerontology, University of Kentucky, Lexington, Kentucky*

This paper contributes to the spatio-temporal understanding of home from a life-course perspective. We explore (1) how older adults construct the experience of being at home; (2) the role of personal history in evolving constructions of home over the life course; and (3) the role of a changing community in shaping and modifying constructions of home as people age. Empirical data derive from in-depth interviews with ten older residents of a dispersed rural community in South West Ireland. Home was manifest in a taken-for-granted and implicit sense of at-oneness with the local environmental context, involving the interwoven dimensions of: place of origin; inherited meaning; relational harmony; rhythm and routine; aesthetic functional landscape; and invested effort. The findings provide the basis for a dynamic life-course model of home as a sense of at-oneness. The relevance of this model to other contexts and to aging in place and age-friendly policies is discussed.

COMMUNITY BELONGING AND AGING IN PLACE – THE ROLE OF URBAN IDENTITY FOR WELL-BEING IN VERY OLD AGE

F. Oswald, R. Kaspar, *Interdisciplinary Ageing Research, Goethe University Frankfurt, Frankfurt, Germany*

The aim of this presentation is to test the impact of person-environment (P-E) exchange processes of "Agency" (e.g., out-of-home activity, housing related control beliefs) and "Belonging" (e.g., urban related identity, social cohesion) on well-being (valuation of life) in addition to health effects. Data are drawn from a survey with 595 community-dwelling elders from three urban districts (Frankfurt, Germany) stratified by age (70-79 vs. 80-89) and household composition (living alone vs. with partner). Findings indicate substantial effects for Agency and Belonging indicators on well being and differentiated effects for both age groups. Multi-Group-SEM shows that particularly in very old age out-of-home activities (beta = .25*), social cohesion (beta = .24*), and urban related identity (beta = .23**) considerably buffer negative impact of health on well-being. The findings underpin the need for an age-differentiated understanding of development in very old age and to particularly address various P-E exchange processes in this regard.

SESSION 735 (SYMPOSIUM)

A 25-YEAR PERSPECTIVE ON WHAT WE KNOW ABOUT GRANDPARENTS RAISING GRANDCHILDREN: WHERE WE HAVE BEEN AND WHERE WE ARE GOING

Chair: C.A. Fruhauf, *Human Development & Family Studies, Colorado State University, Fort Collins, Colorado*
Co-Chair: B. Hayslip, *University of North Texas, Denton, Texas*
Discussant: G.C. Smith, *Kent State University, Kent, Ohio*

For nearly three decades, researchers have been interested in understanding the experiences of grandparents raising grandchildren. The interest in custodial grandparents has resulted in perhaps over hundreds of studies from scholars in the disciplines of human development and family studies, nursing, psychology, and social work. As scholars it is important to reflect on our previous work as we contemplate current endeavors and plan the future of gerontological research and discovery. In this symposium, investigators with extensive experience researching grandparents raising grandchildren will present theoretical, methodological, and practical lessons learned from their disciplines. The first paper, by Hayslip and Maiden, will address contributions made from psychology with particular attention towards remaining challenges for psychologists researching grandparent caregivers. Fruhauf, Dolbin-MacNab, and Yancura's paper will focus on how human development and family studies scholars have advanced the understanding of the family system as it relates to grandparents, parents, and grandchildren while taking into account the impact of culture on grandfamilies. Our third paper, by Whitley and Fuller-Thomson, will address aspects related to multiculturalism, environmental, psycho-social, developmental, and social justice from the standpoint of social work research and practice. The final paper, presented by Musil and colleagues, will focus on the contributions from the field of nursing, including healthy aspects of aging, among grandparent caregiver research. Smith, the discussant, will integrate the key points from these papers while addressing considerations for future research as scholars embark on the next 25 years of research related to grandparents raising grandchildren.

PSYCHOLOGY'S CONTRIBUTIONS TO CUSTODIAL GRANDPARENTING: PAST AND FUTURE

B. Hayslip[1], R. Maiden[2], *1. Psychology, University of North Texas, Denton, Texas, 2. Alfred University, Alfred, New York*

Psychologists have studied grandparents raising their grandchildren for 25 years. Their research has highlighted individual differences among them along such parameters as gender, age, and race/ethnicity as they relate to grandparents' personal and social resources in coping with caregiving. The differential impact of the difficulties their grandchildren experience on them has been emphasized, as has examining grandparent caregivers in terms of not only the challenges they face but also the strengths they bring to bear in this respect. An additional research focus has been the intersection of their needs for social, medical, and health-related services and their adjustment to this new role. Numerous challenges remain however: 1) the implementation of theory that promotes an understanding of their adjustment over time, wherein role identity theory, convoy theory, and life span theory hold much promise to inform longitudinal research, targeting both grandparents and grandchildren over an extended period of time, 2) gaining a better understanding of the interpersonal, community, and societal context in which custodial grandparenting occurs, emphasizing relationships with both custodial and noncustodial grandchildren, spouses, adult children, grandparent peers, as well as service providers, consistent with ecological theory, and 3) greater emphasis on the mental health consequences of interventions that are both preventative and remedial in nature that target interactions among members of the grandfamilial system, recognizing the uniqueness of each grandfamily and the ecological context in which they are embedded. In meeting these goals, a more comprehensive and enduring understanding of grandparents raising grandchildren can be achieved.

PERSPECTIVES FROM HUMAN DEVELOPMENT AND FAMILY STUDIES ON GRANDFAMILIES

C.A. Fruhauf[1], M.L. Dolbin-MacNab[2], L. Yancura[3], *1. Human Development & Family Studies, Colorado State University, Fort Collins, Colorado, 2. Virginia Tech, Blacksburg, Virginia, 3. Universit of Hawaii at Manoa, Honolulu, Hawaii*

For nearly three decades, Human Development and Family Studies (HDFS) scholars have made significant theoretical, empirical, and practical contributions to the understanding of grandfamilies. Theoretically and empirically, using the life course perspective, family systems, and human ecological theories, these scholars have extended the understanding of grandfamilies by exploring the intersections between individual, family, community, and sociocultural contexts. Applying these research findings to direct practice, HDFS scholars have also made substantive contributions to psychotherapy, support groups, respite programs, and community educational efforts benefiting custodial grandparents and their grandchildren. Despite these contributions, there remains a dearth of knowledge related to (a) family relationships, including relations with the middle generation; (b) the effectiveness of formal support services; and (c) the influence of cultural diversity. This presentation proposes a more inclusive and in-depth understanding of custodial grandparents and their grandchildren, using these ideas as guides to advance the research and practice agendas in HDFS.

SOCIAL WORK PERSPECTIVES ON CUSTODIAL GRANDPARENTS: WHAT HAVE WE LEARNED IN THE PAST QUARTER CENTURY?

D. Whitley[1], E. Fuller-Thomson[2], *1. Georgia State University, Atlanta, Georgia, 2. University of Toronto, Ontario, Ontario, Canada*

Social workers use multiple theoretical perspectives to interpret social phenomena, and use that knowledge to inform research and practice. The phenomenon of grandparents raising grandchildren is a case in point. Social workers have contributed extensively to understanding this family group. Their efforts helped to identify individual, family and community-based needs, strengths, and practice interventions based on direct observations, qualitative studies, participant surveys, policy analysis, as well as secondary data analysis. As we move toward 25 years of research and service delivery involving grandparent-headed families, five domains frame the context for illustrating social work's continuous efforts to building new knowledge: multicultural, environmental, psycho-social, human development, and social justice. These domains set the stage for comprehending past efforts, and frame the discussion for defining future interests toward theory-building, research inquiry, and practice interventions. Defining necessary resources to accommodate future knowledge-building efforts is also an essential component to complete the discussion.

A 25-YEAR PERSPECTIVE ON GRANDPARENT RESEARCH: PERSPECTIVES AND CONTRIBUTIONS FROM THE NURSING DISCPLINE

C. Musil[1], J. Zauszniewski[1], S.J. Kelley[2], *1. Case Western Reserve University, Cleveland, Ohio, 2. Georgia State University, Atlanta, Georgia*

Nursing is a discipline with a practice mandate. Nursing's concern with the physical and mental health of individuals, families and communities guides how nurses view the theory-research-practice cycle focused on the well-being of grandparents raising grandchildren. Several theoretical perspectives – most not unique to nursing - have guided nursing research with grandparent caregivers, including Stress and Coping, Family Adaptation and Family Systems, Social Support, and Resourcefulness theories. Future studies may incorporate self-management, biological and genetic models. Research methods primarily have included cross-sectional designs, although longitudinal, mixed methods, qualitative and intervention studies conducted by nurses have made significant contributions to knowledge about grandparent caregivers. Nurses' practice in geriatric, mental health, community or pediatric settings modifies how they apply this knowledge to the care of grandparents raising grandchildren and their families. The interdisciplinary nature of nursing has provided a platform for nurses to make unique and collaborative contributions to grandparent caregiver research.

SESSION 740 (PAPER)

INTERGENERATIONAL RELATIONSHIPS

CHANGING PATTERNS IN LIVING ARRANGEMENTS AND THEIR IMPACTS ON INTERGENERATIONAL TRANSFERS OF OLDER CHINESE

T. Chen, *Renmin University of China, Beijing, China*

Objectives. Sociodemographic transitions are altering the traditional family-based support mechanism prevalent within developing countries. This study investigated the determinants of living arrangements as well as their influence on intergenerational transfers in China to assist with predicting and planning for future needs. Methods. Data derived from a 2006 survey of 19,947 respondents aged 60 and randomly selected from 20 provinces in China. Multinomial logistic regressions were estimated to address determinants of living arrangements. I then adopted logistic and OLS regressions to estimate the effects of multiple living arrangements on the incidence and amount of transfers received. Results. The decision to coreside appeared to be determined more by older parents' instrumental needs, rather than their financial needs. Although living far from their offspring had no significant effect, proximity increased the likelihood of receiving transfers from children for urban elderly. I also failed to find significant effects of living arrangements on the incidence of transfers for rural elderly, possibly because of data limitations. Where upward intergenerational transfers had taken place, rural older people living close to or living far from children were predicted to receive more than those coresiding with them. Discussion. Living close to children, rather than coresiding with them, does not necessarily weaken intergenerational transfers, and is set to become the primary living arrangement for older Chinese people in the foreseeable future.

EXPLORING INTERGENERATIONAL RELATIONSHIPS – USING DIGITAL STORYTELLING AS A FORM OF PUBLIC SOCIOLOGY TO EXAMINE THE MEANING OF KINSHIP, HOME AND COMMUNITY ACROSS THE LIFE COURSE

S. Bodnar-Deren, *Sociology, Virginia Commonwealth University, Richmond, Virginia*

Digital storytelling (DST) has emerged over the past few years as a powerful approach to community engaged learning and a tool to make sociology public. It has been successful in facilitating connections and understanding between people from different sociodemographic, cultural and cohort groups. Expanding upon Loe's (2013) Intergenerational Collaborative Research Project, students from two Virginia Commonwealth University classes: Senior Seminar in Public Sociology and Aging/Life Course Sociology, engaged in an intergenerational DST project, in which students were matched with community-based elders. Eight storytelling pairs (student/senior) created three-minute digital stories focused on the themes of kinship, home or community. Over the course of six weekly sessions dyads worked together to create a single story for their dyad that illustrated how these themes united them, cognoscente of age, period and cohort affects. At the project's end, the pairs presented their work at a school-based research symposium. Students participated in pre-post testing, using the Facts on Aging Quiz (FAQ1) and structured interviews/focus group were held with seniors and students to evaluate the project. Qualitative data analysis revealed that participants were pleased with the project and surprised to find out how central the themes were to their individual stories, especially in terms of the similarities they found. Participants reported increased feelings of connectedness to their communities and each other; and for home-bound participants and students, decreases feelings of isolation. Both older/younger participants reported reductions in ageist perceptions. Students reported increased understanding of Sociology of the Life Course concepts, the process of aging, and community engagement.

CHILDREN'S DIVORCE AND INTERGENERATIONAL RELATIONSHIPS IN RURAL CHINA

Z. Cong[1], M. Silverstein[2], *1. Human Development and Family Studies, Texas Tech Univ, Lubbock, Texas, 2. Syracuse University, Syracuse, New York*

Intergenerational support has been shown to be an important factor affecting elder parents' health and well-being, particularly for Chinese rural elders who have limited access to other sources of support. This study examined the influence of children's change of marital status on their financial and emotional support to parents, as well as their parents' financial help to them. We also examined whether the influences were contingent to children's gender. The sample derived from a five wave longitudinal study (2001-2012) of older adults in rural Anhui Province. Our working sample included 11898 observations from 4 stacked intervals (2001-2003, 2003-2006, 2006-2009, 2009-2012), representing 4927 unique children with 1170 elder parents. The random effects model shows that children's divorce significantly reduced their emotional closeness with parents and their financial support to parents but not necessarily their contact with parents. In addition, sons' divorce increased financial support from their parents. This paper discusses these findings in the context of changing rural Chinese families where patrilineal tradition was combatting with the process of modernization.

FAMILIES AND TRANSMISSION ACROSS GENERATIONS: AN EXAMINATION OF THE MODERATING EFFECT OF GENDER

V.L. Bengtson, R. Cobb, *University of Southern California, Los Angeles, California*

We examine continuity across generations by assessing if the influence of grandparents on the spirituality and religious behaviors of young adult grandchildren varies over time and across gender. Guided by the life course perspective and a theoretical model of intergenerational values transmission, we use a mixed method approach with panel data from a longitudinal study of families to explore whether grandparental influences across gender and SES. It was hypothesized that grandparental influence would be evident in both institutional and subjective dimensions of religion; that there would be significant gender effects, with a strong tilt in influence; and that class effects would be evident, with grandparent influence more evident in lower SES families. To explore these associations, we use data from a long-term study of 3,500 individuals from more than 400 four-generation Southern California families who have been surveyed eight times between 1971 and 2006. Results only partially supported these hypotheses. Grandparent influence was less marked in formal than in subjective aspects of religion, and gender differences were insignificant.

COMMUNICATION DYNAMICS AND CHALLENGES IN GRANDFAMILIES: AN EXPLORATORY INVESTIGATION

J.D. Bertapelle, J.D. Tiernan, *Elliott School of Communication, Wichita State University, Wichita, Kansas*

This study investigates the communication dynamics of grandfamilies. Grandfamilies are also called "skipped generation families." They are loosely defined as grandparents taking on parental responsibilities for their grandchildren, and are a growing population in the United States, with 2.4 million households headed by a grandparent and 7.8 million children sharing households with grandparents, according to the 2009 Census. This growing population has been largely underresearched, with minimal scholarship regarding communication in these families. These families face challenges not seen as often or to the same degree as in traditional family structures. These include, but are not limited to, depression, anxiety, feelings of loss, anger and divided loyalties, all of which can influence communication patterns. Communication dynamics in these families will be assessed through key informant interviews and surveys of grandparents and grandchildren. Specifically, this exploratory investigation will focus on communication practices within grandfamilies, frequency of communication, and attitudes and challenges toward open communication. Further, the study will look at how grandfamilies function as a community of practice, sharing common experiences, goals and knowledge. Grandparents and grandchildren of all ages will be recruited using snowball sampling, stemming from announcements about the study at a mid-size Midwestern university, as well as online sources and social media sites pertaining to grandfamilies. Findings will highlight the diverse issues faced by grandfamilies as they negotiate dynamics within their family structure, sheading light on trials they face, and potentially offering insight into how grandfamilies and the larger grandfamily community may more effectively function as communities of practice.

SESSION 745 (PAPER)

INFORMAL CAREGIVING: METHODOLOGICAL ISSUES

SELECTION BIAS AND PSYCHOSOCIAL MEDIATORS DO NOT FULLY EXPLAIN CAREGIVERS' DECREASED MORTALITY RISK

B.D. Capistrant, *Division of Epidemiology & Community Health, University of Minnesota, Minneapolis, Minnesota*

In contrast to previous literature, a few recent studies have shown informal, family caregiving to be associated with a decreased mortality risk. However, the main hypothesized mechanisms to explain this association (healthy worker selection bias into caregiving roles and psychosocial benefits of altruism) have not been well tested empirically. We assessed the association between spousal caregiving and all-cause mortality using data from 11,476 Health and Retirement Study cohort members between 2000-2010. Spousal caregiving was defined as >=14 care hours/week, self-reported by care recipient at each wave (2000-2008). Mortality was self-reported by next of kin at each biennial HRS survey between 2002 and 2010. We used a stabilized inverse-probability-weighted marginal structural model, specifically a logistic model, to estimate the odds of caregiving on morality. Specifically, we estimated the controlled direct effect of caregiving on mortality after controlling for the altruism indirect mechanism; this estimate was also weighted by the inverse of the probability of being a caregiver given health characteristics to account for healthy worker selection bias. After accounting for both healthy worker selection bias and mediation by altruism, the controlled direct effect of spousal caregiving was a 38% reduced odds of mortality (odds ratio (OR): 0.62, 95% Confidence Interval (CI): 0.47, 0.80). Longer caregiving duration (2 consecutive survey waves) was associated with a statistically significant reduced odds of mortality (OR:0.80, 95% CI: 0.69, 0.91), though smaller in magnitude. Neither health worker selection bias nor altruism mediation can fully account for spousal caregiving being associated with lower odds of mortality.

PROTECTING THE HEALTH OF "SANDWICHED" CAREGIVERS: ASSOCIATIONS BETWEEN CAREGIVING INTENSITY AND FOUR DOMAINS OF CAREGIVER BURDEN AMONG SANDWICH GENERATION CAREGIVERS FROM THE NEW NATIONAL STUDY OF CAREGIVERS

S.A. Cohen, A.E. Phillips, M.J. Brown, Y.A. Sherif, *Department of Family Medicine and Population Health, Virginia Commonwealth University, Richmond, Virginia*

Over 50 million informal caregivers provide care to older adults, saving the US economy hundreds of billions of dollars annually, despite the impacts on caregiver quality-of-life. Increased longevity and intergenerational age have expanded the number of caregivers in the "sandwich generation", those who provide care both to an aging relative and children. How the established associations between caregiver intensity and burden differ among sandwiched caregivers remains largely unknown, however. We used a new, comprehensive database (National Study of Caregiving-NSOC) of 1,014 informal caregivers to assess associations between caregiving intensity and four domains of caregiver burden identified and validated through exploratory factor analyses: social, financial, positive emotional, and negative emotional. Generalized linear models were used to model the associations between caregiver intensity and burden, stratified by presence of children at home to assess effect measure modification by being a sandwiched caregiver. Overall, social burden was significantly associated with an increasing number of ADLs (OR 1.20, p=0.004) and IADLs (OR 1.28, p<0.001), and hours spent caregiving per month (OR 1.02 per 10-hour increase, p=0.001). When stratified by sandwiched caregiver status, similar results were found for non-sandwiched caregivers, but for sandwiched caregivers, only hours per month remained significant (OR 1.08, p=0.010). There were also notable differences by sandwiched caregiver status for the other burden domains. Therefore, programs designed to protect caregiver health should consider these important sociodemographic distinctions, and address the potentially modifiable aspects of caregiving intensity associated with specific types of burden to support this vital component of the US healthcare system.

ONLINE HEALTH EDUCATION FOR MEDICATION MANAGEMENT BY "SANDWICH GENERATION" INFORMAL CAREGIVERS

A.M. Steffen[1], N. George[1], J. Epstein[3,1], M. VanDyke[2], *1. Psychology, University of Missouri-St. Louis, St. Louis, Missouri, 2. St. Louis College of Pharmacy, St. Louis, Missouri, 3. Missouri Institute of Mental Health, St. Louis, Missouri*

This presentation features pilot data from a randomized clinical trial of an online health education intervention for informal caregivers. In this "Sandwich Generation Diner" project that uses a nationwide sample, we aim to (1) increase reported knowledge and use of effective medication management strategies by women caring for an older relative or friend and (2) decrease medication-related caregiving hassles. Women (N=200) who assist an older relative or friend with medication management are randomly assigned to one of two formats of health education materials on the internet: (1) Multimedia vignettes depicting actors encountering and responding to common medication-related challenges, or (2) Traditional written and short video clips of information and suggestions from medical experts. Caregivers have access to these materials over two months and receive weekly email invitations to review the material. Monthly online assessments track reported medication adherence and refill patterns, strategies used for medication management, perceptions of medication hassles, and adverse events for the care recipient. In the Narrative Vignette Condition (n=100), an innovative branching (nonlinear) format provides scripted storyboard scenarios of caregiving situations that involve medication issues. Participants select brief video narratives that correspond with one of the four modules on medication-related caregiving challenges. In the Comparison Didactic Group (n=100), similar medication management information and suggestions are provided in a more traditional format using written text and short video clips of experts providing suggestions ("talking heads"). Pilot data from the first seven months of data collection will be presented, along with a description of key features of the intervention.

DEVELOPMENT OF A FAMILY CAREGIVER DELIRIUM KNOWLEDGE QUESTIONNAIRE

M. Bull, L. Boaz, J.M. Sjostedt, *Nursing, Marquette University, Milwaukee, Wisconsin*

Delirium is a medical emergency in older adults that is often under-recognized by family caregivers and health care providers. Family caregivers, who are familiar with the older adults' usual behaviors, can play a key role in early recognition of delirium symptoms. However these family caregivers might have limited knowledge of delirium. Previous studies focus on health care providers' knowledge of delirium; few studies focus on family caregivers' knowledge of delirium or describe a valid, reliable instrument to measure family caregiver knowledge of delirium. The purpose of this study was to: 1) develop a family caregiver delirium knowledge questionnaire (CDKQ) and 2) establish validity and reliability of the measure. A 19 item CDKQ was developed based on the symptom interpretation model and review of the literature. The items address delirium risk factors, symptoms, and appropriate actions. A panel of experts was used to establish content validity. A cross sectional design was used and the CDKQ was distributed to three samples of family caregivers for older adults (Mailed, Internet, In-person). A total of 164 family caregivers completed the CDKQ. Family caregivers' ages ranged from 21 to 94, and they were predominately female (82.3%) and White (99.4%). The findings provide evidence for construct validity and internal consistency reliability. The CDKQ can be a useful outcome measure for educational interventions on delirium with family caregivers of older adults. Results also provide insights for refining the CDKQ.

HOW DO CAREGIVER FACTORS AFFECT TIME TO CLINICAL MILESTONES IN DEMENTIA?

G.B. Rattinger[1], S. Behrens[2], E.B. Fauth[2], M. Norton[2], C. Lyketsos[3], J. Tschanz[2], *1. School of Pharmacy, Fairleigh Dickinson University, Florham Park, New Jersey, 2. Utah State University, Logan, Utah, 3. Johns Hopkins University, Baltimore, Maryland*

Projected rising dementia prevalence heightens the need to identify factors affecting costs. Higher costs have been associated with severe dementia while caregiver factors have been associated with slower dementia progression. We examined which caregiver factors predicted time to key clinical milestones of severe dementia, institutionalization and mortality in a population-based sample of persons with dementia. We used data from the population-based Cache County Dementia Progression Study. Measures for dementia progression and the care environment were collected semi-annually. Caregiver relationship-closeness was assessed with the Whitlach Scale and problem-focused coping with the Ways of Coping Checklist-Revised. Other factors included co-residence with the dementia participant (or participant living alone), kin-relationship, age and dementia duration. Cox proportional hazard models estimated the association between caregiver factors and hazard of severe dementia, institutionalization and mortality, controlling for covariates. There were 306 DPS subject caregiver-dyads available for analyses: 43% spouses; 49% adult children; 50% co-resided at baseline. Most dementia participants were female (56%) with mean(sd) baseline age of 86.0 (5.73) years. Of spousal-caregivers, 73% were female and 95% co-resided with person with dementia. Non-coresiding dyads at baseline were associated with a hazard of 3.5(p= 0.049) for severe dementia; 2.4(p=0.005) for institutionalization with inclusion of covariates. Participants living alone were associated with higher hazard for both outcomes. Caregiver relationship closeness and problem-focused coping were not associated with hazard of severe dementia or institutionalization, and no caregiver factors predicted hazard of death. Co-residence confers a protective effect from reaching severe dementia and institutionalization; investigation of mechanisms is warranted.

SESSION 750 (PAPER)

WORK AND OCCUPATIONS

WHERE ARE EMPLOYED OLDER PEOPLE WORKING?: AN ANALYSIS OF OCCUPATION TRENDS ACROSS THE AGE SPECTRUM

S. Sterns-Cole, *U.S. Census Bureau, Washington, District of Columbia*

Although occupations of people over the age of 55 have been studied in the past, research on the subject did not break the older population into multiple age groups. This research will characterize the occupations of employed United States residents age 16 and over by age group, exploring how the proportion of people in major occupation groups: differ between older and younger employees; change after the age of 55; and differ for part-time and full-time employees. This analysis will use American Community Survey (ACS) data, examining employed people age 16 and over. We will identify 17 major occupation groups with similar rates of employment across the age spectrum and groups that are more sensitive to age. While occupation patterns are influenced by shifts in the global economy, variations in the rate of employment can also be affected by age requirements for partial and full retirement benefits. A lower percentage of older workers than younger workers in a given occupation, among subjects eligible for retirement benefits, may mean that more people took an early retirement in that field; while a higher percentage of older workers than younger workers may indicate that more people retired later or changed careers. For instance, based on logic and prior research, we may expect that people in more physically demanding fields would retire earlier, and that the percentage of older workers in these fields may fall, as people get progressively older.

UNCERTAIN FUTURES: BOOMERS WORKING IN A TURBULENT IT ENVIRONMENT

P. Moen, E. Kojola, *University of Minnesota, Minneapolis, Minnesota*

Career and retirement paths are in flux, in light of uncertainties brought about by a turbulent global economy and a dismantling of the social contract between employers and employees. Resulting insecurities are a key risk factor for subjective and economic well-being as well as health. Unfortunately, most existing research on older workers and retirement planning investigated earlier cohorts and may well be out of date. How do these macro-level forces play out in proximal work environments to shape micro-level experiences of the large cohort of boomers (b. 1946-64)? This longitudinal study of Boomers and a comparison group of younger (GenX) workers in an information technology division of a Fortune 500 company investigates the impact of job conditions (including the recent announcement of a merger), subjective well-being (including job satisfaction and burnout), health, and family circumstances on both leading-edge and trailing-edge Boomers' expectations about leaving the firm along with their plans for retirement. Drawing on two waves of survey data as well as in-depth interviews, we find identifiable differences both by gender and by cohort in the factors related to expectations of leaving the firm and planning for retirement. Boomer men have lower intentions to leave their current jobs than do Boomer women or GenX men. However, some factors, including job satisfaction and job insecurity, predict exit expectations (in opposite directions) across gender and cohort. This study offers policy as well as theoretical implications, in terms of promoting understanding of factors shaping the ongoing voluntary connectedness of Boomers to the workforce.

ASSESSING GERONTOLOGICAL NEEDS FOR CONTINUING AND GRADUATE EDUCATION IN URBAN AND RURAL AREAS OF OHIO

D.J. Van Dussen, S.M. Leson, E.S. Emerick, J.A. Voytek, *Sociology, Anthropology, and Gerontology, Youngstown State University, Youngstown, Ohio*

The current project surveyed 766 health care professionals from both urban and rural care settings in Ohio and examined differences in professional's needs and interests in continuing gerontological education in Ohio. A series of crosstabs were utilized to investigate the surveys returned from the 729 health care professionals working in Ohio. The maximum time willing to travel one way to attend classes/workshops to earn gerontology certificate for classes held once a week for both urban and rural drivers was 1 hour (4,N=514)=11.65, p=.020. Of the 462 urban respondents and 72 rural respondents whose 'first choice training schedule was most preferred' was distance-learning at 39% and 49% respectively. The rate of urban participants who were 'very interested' or 'somewhat interested' in obtaining a master's degree was 17% and 24% of rural participants responded. Urban participants 'very interested' or 'somewhat interested' in a earning a graduate gerontology certificate was 25% and of rural participants, 28% respectively. Implications of these findings include improving methods that Youngstown State University can apply to increase gerontological education access in both urban and rural areas. Discussion will consider possible strategies that Ohio can do to increase opportunities for further education. This can be a great service to the urban and rural areas of the aging population in the state of Ohio.

OPTIMIZING OLDER WORKERS' LABOR MARKET EXPERIENCES BY UNDERSTANDING EMPLOYER ATTITUDES

P. Taylor[1], C. McLoughlin[2], E.M. Brooke[3], *1. Federation University Australia, Churchill, Victoria, Australia, 2. Monash University, Churchill, Victoria, Australia, 3. Swinburne University of Technology, Melbourne, Victoria, Australia*

Among The Developed Economies, Against A Background Of Population Aging And Concerns About The Sustainability Of Social Welfare Systems, Policymakers Are Enacting Measures To Prolong Working Lives. Walker (2005) Has Argued That 'Future Competitiveness In The Private Sector And Efficiency In The Public Sector Will Rest Increasingly On The Performance And Productivity Of Aging Workforces'. Yet Several Decades Of Research Points To Employers' Stereotypical Attitudes As Presenting Significant Barriers To Older Workers' Labor Force Participation. This Paper Reports On A Survey Of 595 Medium And Large Employers' Attitudes Towards Older Workers That For The First Time Describes The Absolute And Comparative Value Of These Evaluations. This Study Used An Innovative Approach To Assessing Employer Attitudes By Obtaining Evaluations Of Older Workers, Younger Workers And Those Described As Being In Their Prime Working Years Across 12 Work-Related Individual Characteristics. This Approach Afforded The Direct Comparison Of Older Workers To Early Career Workers And Prime Age Workers. Employers' Stereotypical Attitudes Favored Older Workers On Qualities That Were Less Valued. Organization Characteristics And Employer Demographics Were Associated With Substantive Differences In Stereotypical Attitudes. Organizational Practices Were Also Associated With Employer Attitudes. It Is Argued That The Findings Support The Application Of Social Role Theory To The Understanding Of Workplace Age Discrimination.

MULTIPLE CHRONIC CONDITIONS AND WORKING IN LATER LIFE: IS RESILIENCE A POTENTIAL MEDIATOR?

K. Jason[1], D.C. Carr[2], T.R. Washington[3], T. Hilliard[5], C.A. Mingo[4], *1. Sociology, UNC Charlotte, Charlotte, North Carolina, 2. Stanford Center on Longevity, Stanford, California, 3. University of Georgia, Athens, Georgia, 4. Georgia State University, Atlanta, Georgia, 5. UNC Chapel Hill, Chapel Hill, North Carolina*

The risk of late life chronic disease and its impact on work engagement is a growing public health concern. Little research has examined the association between multiple chronic conditions (MCC; i.e., co-occurrence of two or more chronic diseases) and the work behaviors of older adults. This study combines the risk and resilience framework with Bronfenbrenner's ecological model of human development to examine three research questions: (1) What is the relationship between MCC (an individual risk factor) and workforce behavior (i.e., stopping work, working more, working less, or working the same) in older workers?; (2) How do other contextual risk factors (e.g., poverty) and stressful life events (i.e., perceived lifetime discrimination) influence workforce behaviors?; and (3) What role does resilience play in these relationships? We use a pooled sample of working adults age ≥51 with two consecutive waves of data from the Health and Retirement Study (n=3,912). Findings indicate that having MCC at baseline increases the risk of decreasing work participation; onset of MCC decreases risk of maintaining or increasing work hours; and history of perceived lifetime discrimination decreases risk of working fewer hours. As resilience increases, so does the risk of working more hours. Resilience potentially mediates the relationship between MCC at baseline on working fewer hours, and partially mediates the effect of lifetime discrimination. Findings suggest that MCC is a barrier to working in later life. However, resilient individuals are less impacted by MCC.

SESSION 755 (PAPER)

DISCOVERY EXCHANGE: MENTAL HEALTH AND MINORITY POPULATIONS

RACIAL/ETHNIC DIFFERENCES IN WITHIN-DAY LINKAGES OF PAIN, FATIGUE AND MOOD STATES IN OSTEOARTHRITIS

T. Key[2], J.L. Greenlee[1], D.M. Smith[3], P.A. Parmelee[1,2], *1. Center for Mental Health & Aging, The University of Alabama, Tuscaloosa, Alabama, 2. Department of Psychology, The University of Alabama, Tuscaloosa, Alabama, 3. Stony Brook University School of Medicine, Stony Brook, New York*

Previous research on osteoarthritis (OA) documents that pain is correlated with fatigue, and that both variables are linked to depression and anxiety. Limited evidence further suggests that these dynamics may differ across racial/ethnic groups. This research explores possible mechanisms underlying these effects, using experience sampling methodology to examine within-day covariation of pain, fatigue and positive (PA) and negative affect (NA) among older AAs (N=18) and NHWs (N=33) with diagnosed knee OA. Participants were contacted by cellphone four times daily for 7 days, with time of the call randomized within 3-hour blocks, for ratings of current pain, fatigue, and positive and negative affect (PGC PANAS); all ratings were made on 5-point scales. Initial analyses yielded no racial/ethnic differences in within-person means or variability (SDs) in fatigue, pain or affect across the 28 data points. For the sample as a whole, PA was negatively correlated, and NA positively correlated, with fatigue and pain. However, AAs showed much stronger associations of fatigue with both PA (r = -.534) and NA (.797) than did NHWs (PA r = -.135; NA r = 0.375). This was not true for the association of pain with PA (AAs = -.376; NHWs = -.288) or NA (AAs = .614; NHWs = .615). Thus, although AAs and NHWs displayed similar overall levels and variability of fatigue, pain and moods, the associations among those variables difference markedly for the two groups, reflecting a closer linkage of fatigue (but not pain) with short-term mood states. (Supported by R01 AG041655)

SOCIAL NETWORK, FAMILY RELATIONSHIP AND WORRIES AMONG CHINESE OLDER ADULTS—A COMPARISON BETWEEN IMMIGRANT, NON-IMMIGRANT, AND YO-YO FAMILIES

L. Xu[1], J. Liu[2], M. Guo[3], W. Mao[4], I. Chi[4], *1. School of Social Work, UT-Arlington, Arlington, Texas, 2. School of Social Work, University of Michigan, Ann Arbor, Michigan, 3. School of Social Work, University of Iowa, Iowa, Iowa, 4. School of Social Work, University of Southern California, Los Angeles, California*

Background and purpose: Population aging and immigration are reshaping the demographic profile and support needs of older persons. In the recent decades, many Chinese older adults migrated to the US to reunion with their children (immigrant family), or go back and forth between China and abroad (yo-yo family). For older adults, they have different kinds of worries in their later life. This study addressed two questions: (1) whether worries differed for older adults in those immigrant, non-immigrant and yo-yo families; (2) how social network and family relationship influence the worries differently for older adults in these three types of households. Method: A cross-sectional survey was conducted in Los Angeles and Beijing between 2010 and 2012. The immigrant family sample consisted of 236 immigrant Chinese elders, 293 yo-yo elders, and 257 non-immigrant older adults. The dependent variable was worry which was measured by a scale. The independent variable was social network, and family relationships. ANOVA, Chi-square test, and regression were conducted using SPSS 17.0. Results: The results showed that there were significant differences on social network and family relationships as well as worries among older adults in these three types of families. The regression results showed that emotional closeness with children was the most important beneficial factor for worries among these three groups. While for immigrant elders, local friends also played important roles. Conclusion and implications: The findings confirm the importance of family relationships on the psychological well-being of older adults, and have important implications for policy and practice.

RACIAL DIFFERENCES IN SELF-REGULATORY STRESS COPING BEHAVIORS IN OLDER ADULTS: EVIDENCE FROM THE HEALTH AND RETIREMENT STUDY (HRS)

B. Mezuk[1,2], I.O. Govia[2], J. Rafferty[2], K. Kershaw[3], H. Lee[4], J. Jackson[2], *1. Family Medicine & Population Health, Virginia Commonwealth University School of Medicine, Richmond, Virginia, 2. Institute for Social Research, University of Michigan, Ann Arbor, Michigan, 3. Northwestern University, Evanston, Illinois, 4. University of Washington, Seattle, Washington*

Emerging research suggests that coping with stress using self-regulatory health behaviors may contribute to racial/ethnic disparities in mental and physical health. The goal of this study was to characterize stress-coping behaviors and examine variation in these behaviors by race. Data come from the 2008 HRS, and analysis is limited to participants who completed an experimental module on coping behaviors (NWhite=1072, NBlack=204). Participants reported the frequency with which they engage in eight behaviors (smoke tobacco, drink alcohol, use drugs, exercise, eat, pray, social support, counselor) and the perceived effectiveness of these behaviors on relieving stress. Blacks were more likely than Whites use prayer (73.6% vs. 56.7%, p<0.001), social support (32.3% vs. 19.3%, p<0.001), and talking to a counselor (12.9% vs. 4.6%, p<0.001) to cope with stress. Blacks were less likely use eating to cope (6.5% vs. 11.1%, p<0.05), but there were no differences in exercise, smoking, drug use, or alcohol as stress-coping behaviors. The perceived effectiveness of coping behaviors was similar for both Blacks and Whites who employed these strategies. For example, 30.7% of Whites and 26.7% of Blacks said eating reduces their feelings of stress a great deal; 85.6% of Whites and 89.5% of Blacks reported prayer reduces their stress a great deal. In conclusion, although there are differences in the frequency of stress-coping behaviors, among those who use any particular strategy the perceived effect on stress reduction does not vary by race. Additional analyses will examine whether these coping behaviors modify the relationship between race and mental health.

SUICIDAL IDEATION AMONG COMMUNITY-DWELLING U.S. CHINESE OLDER ADULTS

R. Chen[1], E. Chang[1], M. Zhang[1], Y. Zhen[1], J. Ruan[1], M.A. Simon[2], X. Dong[1], *1. Rush Institute for Healthy Aging, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois*

Background: Suicide ideation is one of the most prevalent predictors for completed suicide. Despite its severity, suicidal ideation among U.S. Chinese older adults has received very little research attention. This study examined the prevalence and correlates of suicidal ideation among U.S. Chinese older adults. Methods: Guided by the community-participatory research approach (CBPR), 3,159 community-dwelling Chinese adults aged 60 years and above in the greater Chicago area were interviewed in person. 2-week suicidal ideation was measured by the ninth item of the Patient Health Questionnaire (PHQ-9). 12-month suicidal ideation and lifetime suicidal ideation were measured by the Geriatric Mental State Examination-Version A (GMS-A). Results: Of the 3,159 participants, 58.9% were female and the mean age was 72.8 (SD = 8.3). The 2-week prevalence of suicidal ideation, 12-month prevalence of suicidal ideation and lifetime suicidal ideation was 3.5%, 4.8% and 9.4%, respectively. Age, sex, marital status, education, income, living arrangement, country of origin, years in the U.S., overall health status, quality of life, and health changes over the last year were significantly correlated with suicidal ideation. Discussion: Suicidal ideation was common among U.S. Chinese older adults in the greater Chicago area.

The prevalence of suicidal ideation differed by socio-demographic and health related characteristics. Future longitudinal studies should be conducted to explore the risk and protective factors associated with suicidal ideation at different time periods. Health care providers should promote screening for suicidal ideation among U.S. Chinese older populations. Special attention should be given to women, widowed, low income, and those having poor health conditions.

THE PREVALENCE OF LONELINESS AMONG CHINESE OLDER ADULTS IN THE GREATER CHICAGO AREA

M. Zhang[1], E. Chang[1], R. Chen[1], Y. Li[1], J. Huang[1], M.A. Simon[2], X. Dong[1], *1. Rush Institute of Healthy Aging, Chciago, Illinois, 2. Northwestern University, chicago, Illinois*

Objectives:Loneliness is an important health indicator of psychological and social well-being. However, we have limited understanding of loneliness among Chinese older adults in the U.S. This study aimed to describe the overall prevalence of loneliness, identify the prevalence of specific symptoms, and examine loneliness by socio-demographics in a community-dwelling Chinese population.Methods:Data were drawn from the PINE study, a population-based study of 3,159 U.S. Chinese older adults in the greater Chicago area.Loneliness was assessed using a validated three-question R-UCLA Scale through face-to-face interviews.Results: Of the 3,159 participants, 58.9% were female and the mean age was 72.8 (SD = 8.3).The overall prevalence of any loneliness symptom was 26%. Lack of companionship was the most common symptom of loneliness (20.5 %). Women (28.4%) were more likely to report loneliness symptoms compared to men.Older adults who live alone (40.2 %), aged 80+ (31.5 %), with poor health status (43.8 %), poor quality of life (45.8 %), and negative health changes over the past year (33.1 %) were more likely to experience loneliness.Loneliness symptoms were less likely to be reported by married participants (20.2 %).Conclusions:Loneliness is common among U.S. Chinese older adults in the greater Chicago area. Our findings call for further investigations on several subgroups of Chinese older with higher prevalence of loneliness. Future longitudinal studies are needed to improve the understanding of risk factors and outcomes associated with loneliness among Chinese older adults.

LONELINESS AND MORTALITY: RESULTS FROM THE SINGAPORE SOCIAL ISOLATION, HEALTH, AND LIFESTYLE SURVEY

A. Chan[1,2], P. Raman[1], R. Malhotra[1], *1. Health Services and Systems Research, Duke-National University of Singapore Graduate Medical School, Singapore, Singapore, 2. National University of Singapore, Singapore, Singapore*

Studies on the effects of social support and loneliness on mortality in older people generally agree that healthy social networks and emotional fulfillment are keys to successful ageing. Loneliness has been established as a predictor of mortality and advancement of disability. We used data from the Social Isolation, Health, and Lifestyles Survey commissioned by the Ministry for Community Development, Youth, and Sports in 2009 to develop evidence-based policies targeting the enhancement of social participation in the Singaporean elderly. In this study, we explored three different dimensions of loneliness and their effects on all-cause mortality after a three-year follow-up period. We looked at how perceived loneliness at the individual level, social contact and ties, and living arrangements affected the risk of mortality. Cox proportional hazard analyses showed that after adjusting for socio-demographic and health risk factors, only perceived loneliness remained significantly associated with mortality (HR=1.07). The protective effects of living arrangements and social contact disappeared with the addition of health variables. Our results were comparable to other international studies in which perceived loneliness was significantly associated with the risk of mortality but social networks and living arrangements were not. We discussed policy implications of our results and proposed interventions: perceived usefulness of public multi-generational housing, expansion of Senior Activity Center resources, and better training of general practitioners to understand loneliness in the elderly. In future research, we hope to define and frame loneliness in the local context to better elucidate the meaning of loneliness and its effects in the Singaporean elderly.

SESSION 760 (SYMPOSIUM)

AN ONLINE BOOSTER PROGRAM USED IN AN ONLINE BONE HEALTH TRIAL: LESSONS LEARNED

Chair: E. Nahm, *University of Maryland School of Nursing, Baltimore, Maryland*

The aim of this presentation is to report lessons learned about implementing an online booster intervention used in a large scale online bone health study that examined the long-term effects of two theory-based online bone health programs (N = 866). The two interventions were: (1) Bone Power program, an 8-week intensive online program, and (2) Bone Power Plus program, including the Bone Power Program followed biweekly theory-based eHealth newsletters. The newsletters were delivered via e-mail and consisted of the content that highlighted major health topics in the learning modules, recent research findings on a selected topic, calcium-rich recipes, an interactive goal attainment form (in every other newsletter), and members' success stories. All outcome measures showed significantly greater improvement in both intervention groups at 8 weeks; however, a few measures regressed at 12 months. No significant booster effects were observed. Further research is needed in the area of online booster interventions.

LONG TERM ADHERENCE ACROSS MULTIPLE BEHAVIORS: WHOEVER SAID IT WOULD BE EASY!

B. Resnick[1], M. Hammersla[1], M.G. Ory[2], *1. University of Maryland, Baltimore, Maryland, 2. Texas A & M, College Station, Texas*

Health behaviors consistent with decreasing risk of disease such as cardiovascular disease and osteoporosis include regular physical activity and adhering to dietary recommendations and prescribed medications. Long-term adherence is defined as remaining engaged in these behaviors for greater than 6 months. Much of the research in this area focused on qualitative methods and was informative. When quantitative approaches were used, individuals were often excluded if they "dropped out" of the study related intervention. Thus adherence was considered only among those highly motivated to participate. Rates of long-term adherence across all behaviors generally range from 40 – 70%. Numerous factors have been identified as influencing both short and long term adherence. Most commonly these included acute illness or disease exacerbation associated with the behavior (e.g, pain associated with exercise), caregiving responsibilities, beliefs about the benefits, or simply having no motivation. Some interventions have been noted to positively impact adherence such as identification of individualized goals (both short and long term), a sense of group cohesion, use of structured programs and feedback (either direct or remote) from experts. The purpose of this symposium is to address the use of several interventions that incorporated theoretically based approaches and a variety of techniques to improve long term adherence to diet, exercise and recommended medications. Specifically, we will describe the PRAISEDD and Bone Health interventions and techniques incorporated to increase long-term adherence, their theoretical and empirical support, evidence of efficacy and recommendations for future research.

PEOPLE REDUCING RISK AND IMPROVING STRENGTH THROUGH EXERCISE, DIET, AND DRUG ADHERENCE (PRAISEDD): LONG TERM BEHAVIOR CHANGE ACROSS MULTIPLE BEHAVIORS

B. Resnick, M. Hammersla, K. Michael, *University of Maryland, Baltimore, Maryland*

The PRAISEDD project aimed to disseminate a successful adaptive physical activity exercise program in a community of underserved and vulnerable older adults and to promote long-term integration and adoption of lifestyle behaviors (diet, exercise and medication adherence) focused on prevention and management of cardiovascular disease. The PRAISEDD Program uses the social ecological model and self-efficacy theory and includes three Phases: Phase I-The Education Initiation Phase (1 week/2 sessions); Phase II- The Practice Phase (11 weeks/22 sessions); and Phase III-The Inoculation Phase (9 months). A total of 59 residents attended a Meet and Greet Session to learn about PRAISEDD, 42 were approached and 32 consented. Interventions to optimize adherence included flyers about classes, goal identification, facilitation of group cohesion, focusing on benefits and ongoing support by experts. Adherence rates at 12 months ranged from approximately 50% for exercise to 90% for diet and medication use.

NEXT STEPS IN LONG TERM ADHERENCE: WHAT TO FOCUS ON AND WHAT NOT TO BOTHER WITH

B. Resnick, *University of Maryland, Baltimore, Maryland*

Findings from these studies support and expand on prior work identifying factors that influence long-term adherence to health behaviors. There is evidence to support the value of a social ecological model and self-efficacy theory. Successful approaches include the identification of goals that the individual believes will be beneficial to his or her health; ongoing exposure to experts; a group approach; building confidence; making the activities fun; and providing ongoing cues and reminders. Future work should consider incorporating concepts from the Selection Optimization and Compensation model and focus on how the individual might strive to achieve their goal(s) (e.g., make plans for how to allocate resources, use the environment); how he or she might compensate for an inability to achieve the stated goal by revising goals following challenging life events (e.g, changes in physical status). Future work needs to direct address and focus on coping planning and ways to overcome nonadherence.

TESTING ADAPTIVE PHYSICAL ACTIVITY IN STROKE (TAPAS): WHAT WORKS AND WHAT IS NEEDED FOR LONG TERM ADHERENCE

K. Michael, *University of Maryland, Baltimore, Maryland*

The intervention, Testing Adaptive Physical Activity in Stroke" (TAPAS), was a progressive program of music-accompanied walking, weight-shifting, leg lifts, foot placement routines, partial squats, marching, chair exercises, and obstacle course navigation in a supervised gym. Exercise sessions were held for an hour 3 days/week for six months. Individual homework routines were prescribed. TAPAS produced dramatic improvements in balance, dynamic gait, and 6-minute walks, and small but significant increases in peak VO2 and no change in fatigue, falls efficacy, or daily step activity and individuals became more sedentary overtime. This study revealed a disconnection between the physical improvements in the lab and the behavioral performance at home. Focus groups indicated that important determinants of long term adherence to physical activity included social support and self-efficacy or beliefs about the benefits and risks and that it is essential to bring the exercise programs out of the gym and into the community.

SESSION 765 (SYMPOSIUM)

TRANSLATIONAL SCIENCE IN AGING ACROSS SETTINGS

Chair: K. Rose, *School of Nursing, Univ of VA-, Charlottesville, Virginia*

Co-Chair: K.A. Gretebeck, *University of Michigan, Ann Arbor, Michigan*

Discussant: H.M. Young, *University of California Davis, Davis, California*

Translating scientific findings into practice is paramount to insure best care for older adults across all health care settings. The purpose of this presentation is to provide examples of translational science by nurse scientists undertaken across multiple healthcare environments to improve care for older adults. Specifically, these presentations will discuss: 1) fall prevention strategies implemented in nursing homes; 2) diabetes prevention and management program implemented in a cross cultural community-based setting; 3) function-focused care applications in assisted living environments; and 4) feeding tube placement patterns in older adults with dementia in nursing homes. The challenges and opportunities in translational science work will also be explored. Lastly, Dr. Heather Young, an expert in gerontological nursing, will be the discussant for this symposium

TRANSLATING SCIENCE TO PRACTICE IN NURSING HOMES

R.A. Anderson, *Duke University, Durham, North Carolina*

Efficacy trials have shown that care to reduce fall risk factors delivered by specially-hired external study-staff lowers fall rates, recurrent falls, and injurious falls in nursing home (NH) residents. However, prior attempts to move fall reduction strategies into everyday practice by in-house staff have not been successful. We propose that a particular barrier to implementing evidence-based programs has been that they do not fully address staff interdependencies inherent in care for falls or other geriatric syndromes. We hypothesized that an intervention that helps NH staff establish relationship networks and communication channels to support learning and behavior changes, would improve uptake of a traditional falls reduction program. In this presentation we will describe the rationale for a system level intervention, the translation approach using complexity science, and provide an overview of results of a randomized pilot-study trial in a sample of 4 community and 4 VA NHs.

CULTURALLY-INFORMED COMMUNITY CAPACITY PROGRAMS FOR HEALTHY AGING: CROSS-NATIONAL EXEMPLARS

L. Skemp, *Our Lady of the Lake College, Baton Rouge, Louisiana*

Community Based Participatory Research aims to partner with communities in chronic illness program design and implementation; however, adherence and community uptake remains problematic. The Culturally-Informed Healthy Aging model (CIHA) was used in the development of chronic illness programs for older adults in St. Lucia, West Indies and south India. The CIHA systematically partners with community members to identify health needs and use "cultural capital" and translational science to tailor best practices for culturally-informed assessment, programming and evaluation. Cross nationally diabetes prevention and management programming was undertaken. In 2013 the program expanded in both communities, including to all 36 St. Lucian Health Centres with no amputations for program participants. Variables influencing program development and sustainability include trust, shared purpose, time in the field, community engagement, student participation, and measurable outcomes that make sense to all partners. Comparison of CIHA programming informs the design of community capacity building programs for aging.

TRANSFORM TUBE FEEDING TO INTENSIVE INDIVIDUALIZED COMFORT CARE

R.P. Lopez, *MGH Institute of Health Professions, Boston, Massachusetts*

There is general agreement that feeding tubes do not benefit older adults with advanced dementia, yet the practice continues. The purpose of this presentation is to explore the complexity of making feeding decisions for people with dementia and to put forth a new paradigm of care to help translate feeding guidelines into practice. It will begin with a review and synthesis of a series of qualitative studies conducted in regions of the country with both high and low tube feeding rates. The deep emotional connection with food and feeding and the complexity of organizational and cultural factors will be explored. The findings of these studies suggest that rather than limiting care, patients and families should be provided the option of "intensive individualized comfort care," a model of care that seeks to attain comfort and family centered care. Implications for clinical practice and future research will be addressed.

DISSEMINATION AND IMPLEMENTATION OF FUNCTION FOCUSED CARE INTO ASSISTED LIVING SETTINGS

B. Resnick, *University of Maryland, Baltimore, Maryland*

Residents in assisted living settings engage in limited amounts of physical activity and decline functionally more rapidly than peers in nursing homes. Function Focused Care for Assisted Living (FFC-AL) was developed to prevent decline and improve function and physical activity. Building off previous work we disseminated and implemented FFC-AL into 20 assisted living facilities housing over 1,000 residents. The dissemination process involved teaching champions from each setting our four step approach: (Step I) Environment and Policy/Procedure Assessments; (Step II) Education of Staff; (Step III) Developing Function Focused Goals for Residents; and (Step IV) Mentoring and Motivating. Outcomes were evaluated using the Reach, Efficacy/Effectiveness, Adoption, Implementation, and Maintenance (RE-AIM) model. Over a 12 month period policies and environments were altered to facilitate function and physical activity and there were decreases in falls and hospital transfers. Subsequently, we developed a website and training videos and are disseminating FFC-AL to 100 settings.

SESSION 770 (SYMPOSIUM)

HOSPITALIZATION-ASSOCIATED DISABILITY: NEW EVIDENCE AND FUTURE RESEARCH AGENDA

Chair: B.M. Buurman, *Yale School of Medicine, New Haven, Connecticut, University of Amsterdam, Amsterdam, Netherlands*
Co-Chair: K. Covinsky, *UCSF, San Francisco, California*
Discussant: T.M. Gill, *Yale School of Medicine, New Haven, Connecticut*

New or worsening disability is a common adverse outcome of hospitalization. Depending on the patient population studied, the incidence of hospitalization-associated disability ranges from 10% to 50%. In 2011, a conceptual model for hospitalization-associated disability during acute illness was presented in JAMA, including pre-existent risk factors, severity of the acute illness, hospitalization factors and post-discharge care. This conceptual model still has many open questions, such as what is the optimal time-frame of disability measurement, how should recovery be defined and what factors contribute to succesful recovery from hospitalization-associated disability. In this symposium, these topics will be covered, and new data will be presented. An agenda for future research will be formulated. This symposium is intended for geriatricians, general practitioners, nurses and other investigators in geriatrics and gerontology. Lectures : 1) Lecture 1: hospitalization-associated disability: where do we stand? (Kenneth Covinsky, UCSF) 2) Lecture 2: course of disability before and after ICU admission in older persons (Lauren Ferrante, Yale) 3) Lecture 3: Factors affecting the recovery from hospitalization-associated disability in skilled nursing facilities (SNFs) (Bianca Buurman, Yale) 4) Lecture 4: Statistical Challenges Of Time-Varying Hospitalization On Recurrent Disability (Heather Allore, Yale) 5) Discussion: what are the black boxes in research; setting a future research agenda (Thomas Gill, Kenneth Covinsky)

FACTORS AFFECTING THE RECOVERY FROM HOSPITALIZATION-ASSOCIATED DISABILITY IN SKILLED NURSING FACILITIES

B.M. Buurman[2,1], L. Han[2], E.A. Gahbauer[2], L. Leo-Summers[2], H. Allore[2], T.M. Gill[2], *1. University of Amsterdam, Amsterdam, Netherlands, 2. Yale School of Medicine, New Haven, Connecticut*

In this talk, we will present factors affecting recovery from hospitalization-associated disability in older people who were subsequently admitted to a SNF. We combined monthly disability data from the Precipitating Event Project (PEP), a longitudinal cohort study of 754 community-dwelling older people, with data from the Minimal Data Set (MDS) that is administered at the time of admission into a SNF, and subsequently at fixed time points during the SNF stay. The analytical sample includes 394 participants who were hospitalized and subsequently discharged to an SNF. For all patients, disability data 12-months before and after the hospitalization were analyzed, as well as data on geriatric conditions, intensity of rehabilitation, readmissions and discharge disposition from the SNF. We used mixed model regression analysis to identify factors associated with successful recovery from disability.

STATISTICAL CHALLENGES OF TIME-VARYING HOSPITALIZATION ON RECURRENT DISABILITY

H. Allore, B.M. Buurman, *Yale School of Medicine, New Haven, Connecticut*

The design and analysis of observational studies of disability face several analytic challenges, including the frequency of observations to capture time-varying exposures, such as hospitalization, and recurrent outcomes, such as disability. Given the high risk of mortality or severe disability during or post-hospitalization among older adults, timing of measurement is critical to establish temporal precedents and to capture outcomes given the competing risk of death. Gerontologic biostatistics consists of the study and development of statistical methodology used in the design, analysis, and interpretation of biomedical research regarding the older populations. Examples of administrative data, triggered and fixed interval designs will be contrasted. Ways in which death can affect a longitudinal analysis include informative censoring and selection effects. Longitudinal methods highlighting the relationship between hospitalization and disability include generalize linear, multistate, latent class trajectory, and joint models. Reflections on the effect estimates from each given non-trivial proportions of decedents are discussed.

THE COURSE OF DISABILITY IN THE YEAR IMMEDIATELY BEFORE AND AFTER AN ICU ADMISSION IN OLDER PERSONS

L.E. Ferrante[1], M.A. Pisani[1], T.E. Murphy[2], E.A. Gahbauer[2], L. Leo-Summers[2], T.M. Gill[2], *1. Yale University, New Haven, Connecticut, 2. Yale School of Medicine, New Haven, Connecticut*

We identified distinct sets of functional trajectories in the year before and after an ICU admission and calculated the probability of transitioning from a specific pre-ICU trajectory to a specific post-ICU trajectory. The analytic sample included 291 persons aged 70+ years who had at least one ICU admission (1998–2011). In the year before ICU admission, 3 functional trajectories were identified: minimal disability (30%), mild-to-moderate disability (44%), and severe disability (26%). 70 (24%) participants died in the ICU or within 1-month post-hospital discharge. Post-hospitalization, 3 functional trajectories were identified: minimal disability (20%), mild-to-moderate disability (30%), and severe disability (50%). Of the survivors, 69 (32%) transitioned to a worse functional trajectory in the year after ICU admission.

Conclusion: Nearly a third of older ICU survivors transition to a worse functional trajectory after ICU admission. Additional research is needed to identify modifiable risk factors for worsening functional trajectories after critical illness.

SESSION 775 (SYMPOSIUM)

HEARING IMPAIRMENT, COGNITION, AND BRAIN FUNCTION –INSIGHTS FROM EPIDEMIOLOGIC AND CLINICAL STUDIES

Chair: F.R. Lin, *Johns Hopkins University, Baltimore, Maryland*
Discussant: M. Carlson, *Johns Hopkins University, Baltimore, Maryland*

The potential functional consequences of age-related hearing impairment for older adults are beginning to surface in epidemiologic studies demonstrating independent associations of hearing loss with cognitive functioning and dementia. Multiple mechanisms may mediate these associations including the effects of hearing impairment on cognitive load, brain function/structure, and social isolation. Alternatively, a common pathologic cause could also underlie associations of hearing and cognitive functioning in older adults. These options are not mutually exclusive, and multiple pathways could likely co-exist and contribute to cognitive impairment. Importantly, the hypothesized mechanistic pathways are intriguing because they suggest that hearing rehabilitative treatments could potentially help mitigate cognitive declines in older adults. The public health impact of investigating these associations is substantial given that hearing loss is prevalent in nearly two-thirds of all adults over 70 years and fewer than 20% receive any form of intervention. In this symposium, we will present recent epidemiologic and experimental studies from the United States and United Kingdom that have investigated the association of hearing impairment with patterns of gray matter density, cortical density, memory systems, and cognitive functioning, and we will discuss the practical and research implications of these findings for geriatrics and gerontology.

HEARING LOSS AND THE BRAIN: INSIGHTS FROM NEUROIMAGING

J.E. Peelle, *Department of Otolaryngology, Washington University in St. Louis, Saint Louis, Missouri*

How does long-term auditory deprivation affect the way our brains process speech? At the population level, age-related hearing loss is associated with changes in cognitive ability. One possible mechanism underlying these changes is neural plasticity induced by sensory decline. I will review data from behavioral and fMRI studies that speak to the added cognitive demands associated with acoustic challenge, exploring these issues in the context of a brain-based model of speech comprehension. Evidence from multiple sources is consistent with a shared resource framework of speech comprehension in which domain-general cognitive processes supported by discrete regions of frontal cortex are required for both auditory and linguistic processing. The specific patterns of neural activity depend on the difficulty of the speech being heard, as well as the hearing and cognitive ability of the listeners. These findings have implications not only for everyday speech comprehension, but may potentially affect cognitive function more broadly.

THE NEGATIVE EFFECT OF HEARING LOSS ON VISUOSPATIAL MEMORY FUNCTIONS

J. Ronnberg[1], M. Rudner[1], S. Hygge[2], G. Keidser[3], *1. Linnaeus Centre HEAD, Swedish Institute for Disability Research, Department of Behavioural Sciences and Learning, Linköping University, Linköping, Sweden, 2. Environmental Psychology, Faculty of Engineering and Sustainable Development, University of Gävle, Gävle, Sweden, 3. National Acoustic Laboratories, Sydney, New South Wales, Australia*

The UK Biobank offers cross-sectional epidemiological data collected on 500,000 individuals in the UK between 40 and 69 years of age. Using the UK Biobank data, the aim of this study was to investigate the effects of hearing loss and hearing aid usage on visuospatial memory function in a sample of 138 098 participants. The triple-digit speech-in-noise test was used to divide the participants into three groups: poor, insufficient and normal hearers. We found clear negative effects of hearing loss on both working memory and long-term memory, with the strongest effect for visuospatial long-term memory. These effects are independent of age but mitigated by the use of hearing aids. Age also showed strong main effects for the memory tasks and interacted with hearing loss for the working memory tasks. Broader theoretical implications based on a memory systems approach will be discussed.

HEARING IMPAIRMENT AND COGNITIVE DECLINE: ATHEROSCLEROSIS RISK IN COMMUNITIES NEUROCOGNITIVE STUDY

J.A. Deal[2], A. Sharrett[2], M. Albert[3], A.R. Sharrett[2], T.H. Mosley[4], D.S. Knopman[5], L. Wruck[6], F.R. Lin[1], *1. Epidemiology, JHU/APL, Baltimore, Maryland, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. Johns Hopkins School of Medicine, Baltimore, Maryland, 4. Univerisity of Mississippi Medical Center, Jackson, Mississippi, 5. Mayo Clinic, Rochester, Minnesota, 6. University of North Carolina Gillings School of Global Public Health, Chapel Hill, North Carolina*

Objective: To test the hypothesis that hearing impairment in older age is associated with a faster rate of 20-year longitudinal change in cognitive function measured from midlife into older age. Study population: 253 men and women from Washington County, Maryland (mean age 76.9 +5.4 years). Three cognitive tests were repeatedly administered from 1990-2013. Audiometric testing was performed in 2013. Methods: Trajectories of 20-year change in standardized test scores were modeled using generalized estimating equations. A pure-tone average was calculated in the better-hearing ear using thresholds from 0.5-4 kHz. Results: The multivariable-adjusted difference in 20-year rates of memory decline comparing persons with moderate/severe HI to participants without HI was -0.47 standard deviations (95% CI:-0.87,-0.08). Conclusions: Moderate/severe HI was associated with faster memory decline (on a word list learning task) but not with tests in other domains. These findings add specificity to the limited literature available on the impairments associated with HI.

HEARING IMPAIRMENT AND 7-YEAR COGNITIVE CHANGE IN OLDER ADULTS: THE HEALTH ABC STUDY

J.A. Deal[2], J. Betz[1], K. Yaffe[3], E.M. Simonsick[4], T. Harris[4], E. Helzner[5], S. Satterfield[6], F.R. Lin[1], *1. Epidemiology, JHU/APL, Baltimore, Maryland, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. University of California, San Francisco, San Francisco, California, 4. National Instiute on Aging, Bethesda, Maryland, 5. Suny Downstate Medical Center, New York City, New York, 6. University of Tennessee Health Science Center, Memphis, Tennessee*

We investigated whether hearing impairment (HI) is associated with faster rates of 7-year cognitive decline in 808 men and women with audiometric testing (2000-01) and neurocognitive testing at 4 visits (1999-2006) (mean age 73.6±2.7 years, 47% black). HI was defined by the average of speech frequencies (0.5-4 kHz) in the better-hearing ear (normal: <25 dB, mild: 25-40 dB, moderate/greater: 40+ dB). We estimated trajectories of change in memory, psychomotor speed and perceptual attention with linear mixed models. After adjustment for demographics and vascular risk factors, HI was associated with poorer baseline performance on the Buschke Selective Reminding Test (β = -2.3 words [95% CI: -4.3, -0.29]; moderate/greater HI vs. normal hearing). No differences in rates of decline were observed by HI status, although trends were observed by severity of HI in memory and psychomotor speed. In this biracial cohort of older adults, HI was associated with poorer baseline memory performance.

SESSION 780 (SYMPOSIUM)

RESULTS FROM THE 2013 SENIOR CORPS STUDY AND ANALYSIS OF THE NATIONAL RSVP COMPETITION

Chair: E.J. Tan, *Senior Corps, Corporation for National and Community Service, Washington DC, District of Columbia*
Discussant: J. Haaga, *National Institute on Aging, Bethesda, Maryland*

The Corporation for National and Community Service, the federal agency that administers Senior Corps and AmeriCorps, is seeking to partner with researchers to develop National Service into a platform for public health interventions. Senior Corps is comprised of the Foster Grandparent Program (FGP), RSVP and the Senior Companion Program (SCP), and is one of the nation's largest organizations for volunteers age 55 and over, with over 1100 grants across the US. FGP began as a federal program in 1965, with Foster Grandparents serving children, and SCP beginning in 1974 with Senior Companions primarily serving older adults. All FGP and SCP volunteers were required to be within 200% of the poverty level. Both FGP and SCP national service participants serve from 15 to 40 hours a week, for which they receive a small stipend of $2.65 per hour of service. RSVP is one of the largest volunteer programs with 274,500 volunteers in Fiscal Year 2013 who served in more than 38,000 community organizations nationwide to deliver essential services. We present the initial results of the Senior Corps National Evaluation that occurred in 2013 and the results of an analysis of the 2013 RSVP competition. This was the 1st ever competitive renewal for RSVP grants that were awarded as far back as 1971.After attending this activity, participants will be able to 1) define National Service 2) discuss how grant competitions can make their selection processes more objective and transparent 3) discuss the potential health benefits of national service participation.

RELIABILITY AND VALIDITY OF THE 2013 RSVP GRANT APPLICATION REVIEW PROCESS

R. Ghertner, P. Stengel, V. Garibaldi, M. Coles, E.J. Tan, *Senior Corps, Corporation for National and Community Service, Washington DC, District of Columbia*

We describe a four-step framework that was used to validate the RSVP 2013 grant application review process: assess inter-rater reliability between application reviewers, assess factorial validity of instrument, and assess the measurement reliability of the final scores. Inter-rater reliability was above 0.90, a common threshold for high-stakes measurement. After conducting confirmatory factor analysis, the final model merged two of the original five domains of selection criteria, resulting in four domains. The final model was found to have strict measurement invariance, high convergent validity and measurement reliability between 0.88 and 0.93 for all domains. These results validate the 2013 RSVP measurement model, indicating the grant review process was an objective and defensible method to determine funding decisions. After attending this activity, participants will be able to explain how the RSVP, a federal program, conducts grant selection, and discuss how grant competitions can make their selection process more objective and transparent.

ACCESS TO VOLUNTEER OPPORTUNITIES AND THE POTENTIAL HEALTH BENEFITS OF NATIONAL SERVICE: FGP AND SCP

E.J. Tan[1], A. Georges[2], S. Gabbard[2], D. Pratt[2], S. Wrightsman[1], A. Roberts[1], A. Nerino[1], M. Hyde[1], *1. Senior Corps, Corporation for National and Community Service, Washington DC, District of Columbia, 2. JBS International Inc, Burlingame, California*

After attending this activity, participants will be able to discuss the evidence of better self-reported health among National Service Participants. FGP/SCP respondents were compared to respondents from the Health and Retirement Study (HRS). Foster Grandparents and Senior Companions were 90 percent female, with 55 to 99 years of age, and a mean age of 72. FGP/SCP respondents were 40% African American. FGP/SCP respondents reported a higher rate of difficult walking 1-block as compared to volunteers in the matched HRS comparison group. However, they were less likely to report poor health than volunteers and non-volunteers in the matched HRS comparison group. These findings suggest that national service increases access to volunteer opportunities and may have a positive impact on self-reported health. This is preliminary evidence of a potential health benefits to participation in national service as compared to participation in community volunteering.

PSYCHOSOCIAL OUTCOMES ASSOCIATED WITH NATIONAL SERVICE PARTICIPATION IN SENIOR CORPS

E.J. Tan[1], A. Georges[2], S. Gabbard[2], D.J. Pratt[2], S. Wrightsman[1], A. Roberts[1], A. Nerino[1], M. Hyde[1], *1. Senior Corps, Corporation for National and Community Service, Washington DC, District of Columbia, 2. JBS International Inc, Burlingame, California*

After attending this activity, participants will be able to discuss if there is evidence of better self-reported psychosocial outcomes in National Service Participants. The responses from representative sample of FGP/SCP participants were compared to respondents from the Health and Retirement Study (HRS) and Consumption and Activities Mail Survey (CAMS). The preliminary analysis comparing SCP/FGP national service participants vs. similar "volunteers" who are not national service participants, show that FGP and SCP national service participants may have higher self-efficacy, social ties, life satisfaction and less loneliness, as compared to similar HRS/CAMS respondents who were self-identified as volunteers. This is still preliminary but does indicate a possible line of analysis. Additional preliminary data from a descriptive analysis of RSVP volunteers will also be presented.

SESSION 785 (SYMPOSIUM)

AGE-FRIENDLY BANKING: CONNECTION TO FINANCIAL CAREGIVING AND PREVENTING ELDER FINANCIAL EXPLOITATION

Chair: E.R. Costle, *AARP Public Policy Institute, Washington, District of Columbia*
Co-Chair: S. Lock, *AARP Policy, Stategy and International Affairs, Washington, District of Columbia*
Discussant: D. Whitman, *AARP Policy, Stategy and International Affairs, Washington, District of Columbia*

AARP and other groups have studied the connections between family caregiving and its importance not only to the people who receive such care but to the society as a whole. However, little research has been done on one of the more complicated nonmedical areas of family caregiving—helping an older relative and friend manage his or her finances. This can include paying bills, carrying out banking transactions, choosing among insurance policies and even avoiding foreclosure. Like many other caregiving tasks, such financial caregiving is essential to the life and wellbeing of older people. AARP also focuses on the role of banking institutions in facilitating financial caregiving and at the same time protecting older people from financial exploitation. Obtaining reliable statistics on the prevalence of elder financial exploitation, whether by strangers or friends or family members is difficult. However, such fraud is generally considered to be increasing because of the growing number of older susceptible individuals and new technology used in frauds. This research documents the prevalence of fraud and scams among the older people receiving financial management assistance, and suggests banking services that may enable the financial caregiver to spot problems and intervene at an early stage or even before the money is lost. This symposium highlights AARP's new research on financial caregiving, places it in the context of caregiving research generally, and details the use and potential use of banking services for financial caregiving and the detection and prevention of elder exploitation.

FINANCIAL CAREGIVING: MANAGING MOM'S MONEY

E.R. Costle, J. Gunther, R. Wilson, *Public Policy Institute, AARP, Washington, District of Columbia*

Although many research projects have focused on family caregiving, this paper is the first to focus on financial caregiving. AARP conducted a telephone survey with 2200 financial caregivers including an oversample of African Americans, Hispanic and Asian respondents and followed by 40 in-depth interviews. Among other findings, the participants will hear detail about the caregivers and the recipients of care including age, ethnicity, living arrangements, the specific tasks performed and reasons why the recipients need help. The findings also include the perspective of the caregivers including the ease or difficulty in providing various financial management tasks, the time devoted to the assistance, and difficulties encountered . The surveyed revealed that 10% of financial caregivers were aware of fraud perpetrated against the person they are caring for. Differences in the responses among ethnic groups are noted. Participants will also learn how caregivers handled bank accounts and legal permissions for those they cared for.

IT'S TIME FOR AGE-FRIENDLY BANKING: AN IN-DEPTH LOOK AT HOW BANKS CAN BECOME MORE ACCESSIBLE, PREVENT EXPLOITATION, AND PROVIDE NEEDED SERVICES AND PRODUCTS FOR SENIORS AND CAREGIVERS

J. Gunther, S. Lock, *AARP, Washington DC, District of Columbia*

As the populations ages and grows age-friendly banking is becoming ever more important. There are three main principles of age–friendly banking: preventing financial exploitation of seniors, tailoring products and services to seniors and caregiving, and improving accessibility of banks. New groundbreaking AARP research shows seniors' banking trends, banking needs-products and services, accessibility needs so banks can provide a positive user experience. In addition, this research shows how banks play a central role as the aging population grows as banks will experience a rise in their bank deposits as well as deposit rise in deposit fraud. Banks are in the special role to provide damage control on the cost of fraud both in training employees but also by providing products and services that empower seniors and their caregivers to prevent exploitation. The program will present research on why and how banks may play a role in becoming age-friendly.

SESSION 790 (SYMPOSIUM)

PROVIDING NURSING HOME CARE TO VETERANS: LESSONS FOR POLICY & PRACTICE IN THE VA AND OTHER SETTINGS

Chair: E.A. Miller, *Providence VA Medical Center, Providence, Rhode Island, University of Massachusetts Boston, Boston, Massachusetts, Brown University, Providence, Rhode Island*

Co-Chair: O. Intrator, *Brown University, Providence, Rhode Island*

Veterans may receive nursing home (NH) care in Veterans Health Administration (VHA) operated Community Living Centers, State Veterans Homes, or community NHs paid under VHA contracts or other sources (Medicare, Medicaid, self-pay). Veteran Affairs Medical Centers (VAMCs) are required to pay for NH care for Veterans whose need for care resulted from their service-related disability. VAMCs, at their discretion, may also provide VHA-paid care to other Veterans. Understanding the characteristics and determinants of NH utilization by Veterans is important for long term VHA planning to meet the needs of an older, increasingly frail Veteran population. Moreover, the demand for long-term care within the VHA stemming from the large number of elderly World War II and Korean War Veterans and the aging of Vietnam-era Veterans foreshadows considerable growth in demand for long-term care that the rest of the country will experience. This symposium draws on analyses of the VHA's experience to inform long-term care policy and practice in the VHA and other settings. Stefanie Gidmark (Providence VA) provides an overview of VHA's NH referral process. Edward Miller and Emily Gadbois (Providence VA, UMass Boston) describe lessons from VHA's process for NH referral and contracting for integrated care initiatives promulgated under the Patient Protection and Affordable Care Act. Orna Intrator (Canandaigua VA, University of Rochester) and Susan Miller (Providence VA, Brown University) use data tracking Veterans service use across VA and non-VA sites of care to develop strategies for improving the provision of nursing home and end-of-life care, respectively.

FACTORS THAT GUIDE NURSING HOME REFERRALS WITHIN THE VETERANS HEALTH ADMINISTRATION

S. Gidmark[1], E.A. Miller[2,1], E.A. Gadbois[2,1], M. Guihan[3,4], O. Intrator[5,6], *1. Providence VAMC, Providence, Rhode Island, 2. University of Massachusetts, Boston, Massachusetts, 3. Hines VA Medical Center, Hines, Illinois, 4. Northwestern University, Evanston, Illinois, 5. Canandaigua VA Medical Center, Canandaigua, New York, 6. University of Rochester, Rochester, New York*

This study describes factors that influence nursing home (NH) placement decisions within the Veterans Health Administration (VHA). Thirty-six semi-structured interviews were conducted with key informants at 12 Veterans Affairs Medical Centers (VAMCs). Results indicate that NH bed supply, VA eligibility status and payer source impact facility placement decisions. Other placement factors include NH proximity to the Veteran's family, Veteran's specialty care needs (e.g., wound care, ventilator care), predicted length of stay, and the demographic profile of residents served, including age, race, and proportion of Veterans served. Veterans with dementia and psychiatric problems or a criminal or violent history are hardest to place. Local differences in resources and practices and facility and Veteran characteristics lead to variation in NH referral across VAMCs. Recognizing this variation implies that the VHA must concentrate on promoting the consistent monitoring of care nationally in order to ensure that Veterans receive the best care wherever they are placed.

LESSONS FROM THE VA NURSING HOME PROGRAM FOR DUAL ELIGIBLE INITIATIVES UNDER THE AFFORDABLE CARE ACT

E.A. Miller[1,2,3], S. Gidmark[1], E.A. Gadbois[2], M. Guihan[4], O. Intrator[3,5,6], *1. Providence VA Medical Center, Providence, Rhode Island, 2. University of Massachusetts Boston, Boston, Massachusetts, 3. Brown University, Providence, Rhode Island, 4. Edward Hines Jr. VA Medical Center, Hines, Illinois, 5. Canandaigua VA Medical Center, Canandaigua, New York, 6. University of Rochester, Rochester, New York*

This study examines how Veterans' eligibility for multiple payment sources impacts nursing home (NH) referrals within Veterans Affairs Medical Centers (VAMCs). Data derive from 36 semi-structured interviews with respondents with in-depth knowledge of the NH program at 12 VAMCs. Results indicate that placement decisions within the VA NH program are contingent, in part, on the types of facilities available, including Community Living Centers, Contract Nursing Homes, and State Veterans Homes. Results also indicate that variation in NH referral across VAMCs derives from differences in both regional markets and local policies, most notably with respect to how Veterans eligible for multiple payment sources—VA, Medicare, and Medicaid—are handled. Findings highlight the potential for state and local differences in resource allocation decisions, including under Affordable Care Act initiatives that seek to rationalize how care is provided to frail and disabled elders eligible for multiple payment sources (i.e., Medicare and Medicaid).

OVERSIGHT OF VETERANS HEALTH ADMINISTRATION COMMUNITY LIVING CENTERS: THE CLC DASHBOARD

E.A. Gadbois[5,4], L. Minor[3], O. Intrator[2,1], *1. Public Health Sciences, University of Rochester, Rochester, New York, 2. Canandaigua VAMC, Canandaigua, New York, 3. Veterans Health Administration Center Office, Geriatrics & Extended Care Operations (10NC4), Washington, District of Columbia, 4. University of Massachusetts Boston, Boston, Massachusetts, 5. Providence VAMC, Providence, Rhode Island*

Veterans Health Administration's Central Office of Geriatrics & Extended Care (GEC) oversees operation of 134 Community Living Centers (CLCs) which provide short and long stay services to Veterans. A CLC Dashboard was created to help GEC oversee quality of care and access by monitoring outcomes, utilization and need over time. The dashboard presents 5 consecutive quarters of data for each CLC to allow for quarterly monitoring, adjusted for seasonal variation. Comparisons to average measures of CLC and community NHs in Veterans Integrated Service Network and nationally allows contextualization and benchmarking. Example measures are: percent of Veterans admitted who require a low level of care; average Resource Utilization Groups (RUGS) casemix index; Advancing Excellence Campaign measure of consistent assignment of nurses; 30-day rehospitalization rates; and potentially preventable hospitalization rates. This dashboard helps GEC administrators improve identification of higher and lower performing CLCs within their regional context, thereby targeting improvement of practices and ultimately leading to excellence in care of these frail Veterans.

UNDERSTANDING SITES OF DEATH FOR VETERANS WHO RECEIVE NURSING HOME CARE

S.C. Miller[1,2], S. Cai[3,4], O. Intrator[3,4], *1. Providence VA Medical Center, Providence, Rhode Island, 2. Brown University, Providence, Rhode Island, 3. Canandaigua VA Medical Center, Canandaigua, New York, 4. University or Rochester, Rochester, New York*

Where veterans die has not been systematically studied nor has the validity of the sites of death in the VA Residential History File (RHF), which tracks Veterans across VA and non-VA sites of care. We used California's death statistical master file to validate the sites of death in the RHF for 7,300 Medicare-eligible Veterans dying in California in 2008/09 and with any community living center (CLC) or nursing home (NH) care. Often, the RHF provided greater specificity; for example, the master file frequently identified deaths in hospital-based CLCs/NHs as hospital deaths while the RHF correctly classified these as hospital-based CLC/NH deaths. After reconciliation, there was a 90.6% agreement between the two data sources. These validated RHF data enable the VA to evaluate factors associated with varying sites of death. An example of such an analysis, considering a VA medical center's level of palliative/hospice beds and staffing, will be presented.

LESSONS FROM THE VA NURSING HOME PROGRAM FOR PROVIDER CONTRACTING UNDER THE AFFORDABLE CARE ACT

E.A. Gadbois[1,2], E.A. Miller[1,2,3], S. Gidmark[1], M. Guihan[3,4], O. Intrator[5,6], *1. Providence VAMC, Providence, Rhode Island, 2. University of Massachusetts Boston, Boston, Massachusetts, 3. Brown University, Providence, Rhode Island, 4. Hines VAMC, Hines, Illinois, 5. Canandaigua VAMC, Canandaigua, New York, 6. University of Rochester, Rochester, New York*

This study draws lessons from nursing home (NH) contracting in the Veterans Health Administration (VHA) for integrated care initiatives promulgated under the Affordable Care Act (e.g., Accountable Care Organizations, bundled payments). Thirty-six semi-structured interviews were conducted with key informants from 12 VA Medical Centers (VAMCs). Results indicate that the contracting process largely mirrors national contracting regulations, but significant variation was observed in how practices have evolved across VAMCs due to differences in local needs, resources, and practices. Operationally, this variation is reflected in the number and distribution of NH contracts across catchment areas, the services available in contracted facilities, and the level of facility and resident oversight provided. Challenges with contracting include difficulty recruiting/retaining NHs, especially in rural areas, due to the additional inspection required under VHA contracting/oversight. Overall, findings highlight difficulties associated with implementing one-size-fits-all contracting policies across jurisdictions with markedly diverse service populations, resource needs, and market characteristics.

SESSION 795 (SYMPOSIUM)

CONDITIONS AND CORRELATES OF PERSONALITY MATURITY IN ADULTHOOD AND OLD AGE

Chair: A. Reitz, *Columbia University, New York, New York*
Co-Chair: U.M. Staudinger, *Columbia University, New York, New York*
Discussant: D. Mroczek, *Northwestern University, Chicago, Illinois*

How to promote personality maturity remains a fascinating question that is of key interest in lifespan, personality, and clinical psychology. However, what exactly drives personality maturity is still not well understood. One of the main reasons is that the assessment of personality maturity poses several challenges. The present symposium brings together a collection of empirical studies that examine conditions and correlates of personality maturity in adulthood and old age using cutting-edge methodology. Glück and Dorner use a content analysis to identify two key components that allow transforming personal experiences into maturity. Newton and colleagues use a longitudinal design to address gender differences in the differential association of personality maturity and adjustment with generativity and ego integrity. Kunzmann and Rohr use an autobiographical memory task to examine the emotional quality and complexity of the memories as signs of personality maturity in young and older adults. Staudinger and Reitz use an intervention design to examine the effects of training of life reflection on personality maturity. As an expert in lifespan personality development, Daniel Mroczek will integrate and discuss the different studies to get a deeper understanding of the nature and development of personality maturity. In sum, the main aim of this symposium is to discuss different state-of-the-art methodologies and approaches to increase insights into the conditions and correlates of personality maturity in adulthood and old age.

“I’M CONSTANTLY FORCED TO RELATIVIZE WHAT I THOUGHT LIFE WAS”: WISE WAYS OF THINKING ABOUT LIFE

J. Glueck, L. Dorner-Hoerig, *Alpen-Adria Universität Klagenfurt, Klagenfurt, Austria*

How does wisdom develop? We have argued that resources such as openness and reflectivity enable people to integrate life challenges in a wisdom-fostering way (Glück & Bluck, 2014). To better understand the processes underlying such growth, Dorner (2012) identified two main characteristics of growth in the psychotherapeutic and psychological literature. Process orientation is the acceptance and appreciation of life’s constant changes and challenges. Self-integration is a perceptiveness towards one’s own experiences and emotions that fosters a more comprehensive self-understanding. To test the prediction that these two characteristics contribute to the development of wisdom, narratives of difficult life experiences and conflicts from 47 wisdom nominees and 47 age- and gender-parallel control participants were content-analyzed. Wisdom nominees showed significantly higher levels of both process orientation and self-integration. These findings shed some light on the processes by which individuals with certain resources are able to transform personal experiences into growth.

MIDLIFE PERSONALITY DEVELOPMENT: GENDER DIFFERENCES IN ADJUSTMENT AND GROWTH

N. Newton, *1. Northwestern University, Evanston, Illinois, 2. psychology, Univ Michigan, Ann Arbor, Michigan*

According to Erikson and colleagues (1986), late midlife personality development comprises elements of both generativity and ego integrity (see also Kivnick & Wells, 2014), which relate to subjective well-being and transcending the self (respectively). Analogous to this approach, Staudinger and Kunzmann (2005) articulate a bi-directional model of personality development, in which personality adjustment relates to well-being, and personality growth relates to self-transcendence. These two theoretical approaches provide the basis for this study examining the associations between generativity, ego integrity, personality adjustment, and personality growth (or maturity). Using data from the Foley Longitudinal Study of Adulthood (N = 145; age 59-63), results show that although personality adjustment and maturity relate to generativity and ego integrity, associations differ by gender, whether examining adjustment and growth scales or their constituent components: Big Five personality traits; psychological well-being subscales. Findings highlight the heterogeneous nature of adult personality development, and the utility of nuanced analyses.

SIGNS OF ANGER AND SADNESS IN AUTOBIOGRAPHICAL MEMORIES: AGE MATTERS

U. Kunzmann, M.K. Rohr, *University of Leipzig, Leipzig, Germany*

The modulation of negative affect has been regarded as an important facet of the mature personality in adulthood and old age. Given that negative affect is a multidimensional concept, however, questions regarding age differences in specific negative emotions remain. In this study, we asked young and older adults to think aloud about two situations in which they felt particularly sad or angry. The resulting protocols were then assessed by the frequencies of sadness- and anger-related emotions and the salience of social motivations and control behaviors that are typically associated with either anger (social distancing, tenacious goal pursuit) or sadness (search for social nearness, flexible goal adjustment). Our analyses suggest that the signs of anger decrease with age, whereas the signs of sadness remain stable or increase. We propose that these multidirectional age differences in anger and sadness have important implications for our understanding of personality maturity across the adult life-span.

PLASTICITY OF PERSONALITY MATURITY: THE ROLE OF LIFE REFLECTION AND SOCIAL CONTEXT

U.M. Staudinger, A. Reitz, *Columbia University, New York, New York*

Is it possible to promote people’s insights into their own life and if yes, how? The goals of the present intervention study were to examine whether personality maturity can be facilitated and whether life reflection and/or an interactive minds context were helpful in this regard. We used a sample of 80 natural dyads. The 160 participants, ranging in age from 20 to 80 years, were randomly assigned to one of four training conditions. These conditions differed on two dimensions: (i) the type of social cognitive process (life reflection versus reminiscence) and (ii) dyadic versus monadic settings. Results showed that training in life reflection facilitated personality maturity irrespective of whether it was conducted in a dyadic or monadic setting by half a standard deviation. No age differences were found. The findings highlight the plasticity of personality maturity and the validity of the maturity measure used.

SESSION 800 (SYMPOSIUM)

A NONPHARMACOLOGIC APPROACH TO TREATING PAIN TO REDUCE DISABILITY AMONG OLDER HOME HEALTH PATIENTS

Chair: C.M. Murtaugh, *Center for Home Care Policy & Research, Visiting Nurse Service of New York, New York, New York*
Co-Chair: C. Reid, *Weill Cornell Medical College, New York, New York*
Discussant: K.K. Mangione, *Arcadia University, Glenside, Pennsylvania*

Pain is an underassessed and undertreated risk factor for disability among older persons and is highly prevalent among individuals receiving home care. Cognitive behavioral therapy (CBT) is a well-developed evidence-based strategy for the mitigation of pain and associated disability. Teaching non-pharmacological pain management therapies in the home care setting is critical to providing access to these effective pain management methods since many older patients rarely leave home and cannot participate in community-based CBT programs. This symposium will present results from a cluster randomized controlled trial (RCT) designed to compare the effectiveness of usual care provided to older home health patients admitted with activity-limiting pain to usual care plus instruction by physical therapists (PTs) in a Cognitive-Behavioral Pain Self-Management (CBPSM) program. The first paper describes preliminary work where we translated a CBPSM protocol that was effective in reducing chronic back pain among individuals at senior centers for use in home health care with delivery by PTs. The second paper reports on baseline pain and disability levels, and coping strategies of the approximately 450 patients enrolled in the trial with a particular focus on differences among 3 race-ethnicity groups enrolled in roughly equal numbers: Hispanics, non-Hispanic African Americans, and non-Hispanic others (primarily whites). The third paper reports trial results with primary outcomes of reduction in disability and pain intensity between baseline and 60-day follow-up assessments. The final paper will present quantitative and qualitative data on PT fidelity to the protocol and patients’ experiences using the CBPSM techniques.

ADAPTING A COGNITIVE-BEHAVIORAL PAIN SELF-MANAGEMENT PROGRAM FOR USE IN HOME HEALTH CARE

K. Beissner[1], E.C. Bach[2], C. Reid[3], C.M. Murtaugh[4], M.A. Trachtenberg[4], S.J. Parker[3], *1. Department of Physical Therapy, Ithaca College, Ithaca, New York, 2. Visiting Nurse Service of New York, New York, New York, 3. Weill Cornell Medical College, New York, New York, 4. Center for Home Care Policy and Research, New York, New York*

Seventeen home care PTs were trained in the evidence-based senior center CBPSM program. They suggested changes to make it more feasible for home care and useful for their clients, as well as modifications and resources needed for successful implementation. An interdisciplinary panel made final decisions on program adaptation including content reduction. Another 32 PTs were trained in the revised program and implemented it with their patients. Patient feedback was obtained after each PT session with more than 90% recalling being taught about CBPSM with ratings of helpfulness high across the techniques. PT uptake was assessed 3 months after their initial training with 24.0% of therapists continuing to use the entire protocol with their patients. Most PTs reported a high level of comfort in delivering the program, especially deep breathing (90.0%) and general relaxation (86.2%). Program barriers included concerns about patient adherence and the time required to implement the program.

RACE-ETHNICITY GROUP DIFFERENCES IN PAIN, DISABILITY AND COPING STRATEGIES AT HOME CARE ADMISSION

C.M. Murtaugh[1], Y. Barrón[1], K. Beissner[4], E.C. Bach[1], C.R. Henderson[3], S. Sridharan[1], C. Reid[2], *1. Center for Home Care Policy & Research, Visiting Nurse Service of New York, New York, New York, 2. Weill Cornell Medical College, New york, New York, 3. Cornell University, Ithaca, New York, 4. Ithaca College, Ithaca, New York*

The trial enrolled roughly equal numbers Hispanics, non-Hispanic blacks, and non-Hispanic others ages 55 and older with activity limiting pain. On admission, there were significant differences among the groups in pain intensity and disability. Hispanics and non-Hispanic blacks, relative to the "other" group, reported higher levels of pain at its worst, on average and right now ($p<0.001$ in all cases). They also reported higher levels of disability, compared to the other group, based on a count of ADL and IADL limitations (Hispanics vs. others $p=0.079$; non-Hispanic blacks vs. others $p=0.001$) and the Roland Morris scale ($p<0.01$ in both cases). While coping strategies tended to be similar, Hispanics and non-Hispanic blacks reported that current treatments only relieved about 50% of their pain compared with 60.7% for the other group ($p<0.005$ in both cases). These findings underscore the need to improve pain management among minorities and home health patients in general.

RESULTS OF A RANDOMIZED CONTROLLED TRIAL OF THE EFFECTIVENESS OF A CBPSM PROGRAM IN HOME HEALTH CARE

C. Reid[1], C.R. Henderson[3], K. Beissner[2], E. Bach[4], Y. Barrón[4], S. Sridharan[4], M.A. Trachtenberg[4], C.M. Murtaugh[4], *1. Weill Cornell Medical College, New York, New York, 2. Ithaca College, Ithaca, New York, 3. Cornell University, Ithaca, New York, 4. Visting Nurse Service of New York, New York, New York*

We conducted a cluster RCT to compare the effectiveness of usual care (UC) provided to patients admitted with activity-limiting pain to UC plus instruction by PTs in CBPSM techniques. We hypothesized that patients receiving UC+CBPSM vs. UC alone would have (1) significantly better physical functioning as measured by Gait Speed and Timed Chair Stands tests) and self-reported disability levels, and (2) significantly reduced levels of pain intensity and increased levels of pain relief 60 days after home health admission. The extent to which treatment benefits accrue among patients in each of three race-ethnicity groups as well as among patients with different pain conditions will be presented. The effects of other patient-level (e.g. age, gender), provider-level (e.g., years of therapist experience), and agency-level (e.g., team size) characteristics on treatment outcomes will also be presented. Outcome analyses will begin in April once enrollment is completed.

PHYSICAL THERAPISTS' FIDELITY TO THE PROGRAM AND PATIENTS' EXPERIENCES USING THE CBPSM TECHNIQUES

E.C. Bach[1], M.A. Trachtenberg[1], K. Beissner[3], S. Sridharan[1], Y. Barrón[1], C.R. Henderson[4], C.M. Murtaugh[1], C. Reid[2], *1. Visiting Nurse Service of NY, New York, New York, 2. Weill Cornell Medical College, New York, New York, 3. Ithaca College, Ithaca, New York, 4. Cornell University, Ithaca, New York*

PT fidelity to the program will be assessed by comparing intervention and control group PTs on: (1) rates of use of the "pain" problem in the patient's home health record; and (2) patient follow-up interview responses concerning whether they were taught each technique. Baseline pain problem data for a cohort similar to those enrolled (N=9652) indicate that, among the 51% with some documentation, 42% were taught the reason for pain, 57% breathing exercises and 8% imagery. We also will convene intervention PT focus groups to learn about any program tailoring and implementation barriers. Patients' experiences using the CBPSM techniques will be assessed by evaluating responses to follow-up survey questions concerning their understanding and use of each technique and its effect on their pain. Results of telephone interviews with a sample of patients to learn how experiences differ by pain condition and race-ethnicity status also will be reported.

SESSION 805 (SYMPOSIUM)

POST-ELECTION ANALYSIS: FUNDING AND POLICY IMPLICATIONS FOR AGING RESEARCH AND SERVICES

Chair: B. Lindberg, *The Gerontological Society, Washington, District of Columbia*

This session will provide up-to-the-minute information on and analysis of the 2014 mid-term election results. A national polling expert will present data on the election outcomes, including how age segments voted and what issues were most important to their decisions. An authority on aging policy and entitlement programs will review the implications for Social Security, Medicare, Medicaid, Older Americans Act, and the aging network, and discuss how the election results will affect the congressional leadership, committee chairs, and the agenda for the 114th Congress. Another panelist will suggest how the election results are likely to affect funding for basic research in aging and program evaluation. The symposium will devote at least 30 minutes for questions and comments from the audience.

SESSION 810 (SYMPOSIUM)

HOW TO PUBLISH

Chair: L. Ferrucci, *National Institute on Aging, Baltimore, Maryland*

This session is designed for anyone who would like to learn more about how to get published in peer-reviewed journals in the field of aging. Emerging scholars and professionals will find this symposium especially useful. This session will be divided into two parts: 1. Podium presentations by the editors in chief of two GSA journals will provide advice and guidance on critical components of publishing in peer-reviewed journals; 2. Roundtables organized by editors from each journal will provide an opportunity to meet informally with editors from GSA and AGHE journals and ask specific questions about getting published.

Participants will be encouraged to visit as many roundtables as they wish during this component of the session.

GETTING READY TO PUBLISH

S.B. Kritchevsky, *Wake Forest Baptist Medical Center, Winston-Salem, North Carolina*

The first part of the symposium will discuss manuscript development and journal targeting to optimize the chances for timely acceptance and the wide dissemination of your research results to an audience most likely to appreciate your work. Options for publication have increased tremendously over the previous decade making targeting appropriate journals more difficult. The symposium will discuss the pros and cons of differing kinds of publication types (i.e. open-access on-line only versus traditional print journals) to help authors make better selections.

PUBLISHING FROM TWO PERSPECTIVES

R. Pruchno, *Rowan University School of Osteopathic Medicine, Stratford, New Jersey*

The second part of the symposium will examine publishing from the perspective of authors and that of editors. From the author's perspective, the importance of writing for a specific journal and following the journal's Instructions to Authors will be highlighted. The importance of writing well and avoiding self-plagiarism will be discussed. Authors will gain understanding about how to make decisions about each aspect of an article, including its title, abstract, introduction, method, results, and discussion. Panelists will discuss how editorial decisions are made, strategies authors can use to increase the likelihood of gaining acceptance for their work, and commonly made errors. Authors will learn about the review process and the life course of peer-reviewed manuscripts.

SESSION 815 (SYMPOSIUM)

THE GEROSCIENCE INTEREST GROUP (GSIG) – NIH CROSS-INSTITUTE ROUND TABLE

Chair: F. Sierra, *Division of Aging Biology, National Institute on Aging, Bethesda, Maryland*

A central concept of geroscience is that multiple human diseases arise from a common cause, aging itself. Thus, slowing down the process of aging (as it has been done in animal models) represents a potentially fruitful approach to concurrently address and combat the many chronic conditions affecting the elderly. The GeroScience Interest Group (GSIG) is a collaborative effort across several NIH Institutes to support the development of new tools, models and paradigms that address the basic biological underpinnings of these multiple diseases. By pooling resources and expertise, the GSIG identifies major cross-cutting areas of research and proposes coordinated approaches to identify hurdles and envision solutions to the health problems of our burgeoning elderly population. The round table will consist of 5-6 short presentations by representatives of different NIH institutes, including an introduction by Dr. Felipe Sierra (NIA). Individual speakers from 5-6 major NIH Institutes and Centers will be available as discussants at the round table and representatives from additional NIH units will be identified during the presentations.

SESSION 820 (SYMPOSIUM)

AGING IN THE STEPFAMILY CONTEXT: INTERGENERATIONAL RELATIONSHIPS AND SUPPORT DYNAMICS

Chair: C.W. Sherman, *Life Course Development Program, Institute for Social Research, Ann Arbor, Michigan*
Co-Chair: S. Van der Pas, *VU University Medical Center, Amsterdam, Netherlands*

Aging adults have increasingly complex marital and family histories. Current and future cohorts of older adults face sustained rates of divorce and repartnering across the life course, and the nature and strength of their intergenerational ties with adult children and stepchildren is likely to impact the availability, type and quality of support exchanges. This symposium highlights five papers from the US and Europe that examine the factors influencing stepfamily ties, support, and care provision between older parents/stepparents and adult children/stepchildren. Arranz Becker and colleagues examine contact frequency between biological, adoptive and step parents and their adolescent and adult children using data from a German panel study. Suanet and colleagues examine the respective influences of parental partner status, partner history and family structure on help received from adult children across multiple waves of the Health and Retirement Study. Silverstein uses data from the Longitudinal Study of Generations to examine factors that contribute to the strength of adult children's relationships with older parents and stepparents, while van der Pas and colleagues,using longitudinal data from the Netherlands, report on how widowhood and later repartnership influence relationships with biological and step- children. Finally, Sherman presents convoy data and qualitative findings to describe adult stepchildren's attitudes towards, and experiences of, providing assistance and care to parents and stepparents. Together these papers use diverse datasets and methodologies to illustrate and illuminate the intricate nature of intergenerational ties and support dynamics in stepfamilies. Implications of the findings for addressing the care needs of aging adults and stepfamily members will be discussed.

"WHO SHOULD DO WHAT?": ADULT STEPCHILDREN'S EXPERIENCES OF PROVIDING ASSISTANCE AND CARE FOR OLDER STEPPARENTS

C.W. Sherman, *Life Course Development Program, Institute for Social Research, Ann Arbor, Michigan*

Adult children are called upon to provide assistance and care for aging parents, and are second only to spouses as long-term caregivers. Increasingly, such support occurs in the stepfamily context without clear social or familial expectations regarding adult stepchildren's role and responsibilities. This paper presents findings from a multi-method pilot study of adult stepchildren's (n=30) care-related attitudes and actual care experiences for older parents and stepparents. Low levels of inclusion of stepparent(s) and/or stepfamily members were evident in the adult stepchildren's social relations convoys. Differences by age, gender and duration of stepfamily membership will be presented. Qualitative findings reflect the range of attitudes and experiences of providing care for aging stepparents. Findings illuminate the complex dynamics encountered by many adult stepchildren with respect to support and care for aging parents and step-parents. Implications for future caregiving research and practice within stepfamilies will be discussed.

FAMILY STRUCTURE AND CONTACT BETWEEN PARENTS AND ADULT CHILDREN

O. Arránz Becker[1], N. Lois[2], V. Salzburger[2], B. Nauck[2], *1. University of Mannheim, Mannheim, Germany, 2. Chemnitz University of Technology, Chemnitz, Germany*

The present study examines contact frequency (face-to-face and through media) of biological parents, stepparents and adoptive parents with multiple adolescent and adult children. The analyzed data from the

German Family Panel (pairfam) include reports from up to three parents (total N = 4,957) per family (N = 3,115) on their relations (N = 11,746) with up to four biological and social children. Multilevel analyses show that fathers tend to 'swap families' in that they maintain less contact to their biological children from a previous partnership than to joint children with the current partner; in contrast, mothers generally have less contact with their stepchildren. Several sociobiological and sociological mechanisms underlying this pattern are discussed. The goals of the presentation are (1) to enable participants to gauge the relative impact of biological and social parenthood on parent-child contact and to (2) gain insights into stepfamily life in the German context.

EXPLAINING THE "STEP-GAP" IN THE INTERGENERATIONAL RELATIONSHIPS OF AGING BABY-BOOMER PARENTS: THE VIEW FROM BELOW

M. Silverstein, *Aging Studies Institute, Syracuse University, Syracuse, New York*

Due the divorce revolution of the late 20th century, Baby Boomers are poised to enter their later years in complex families with various configurations of step- and biological relationships. This demographic condition raises questions about the adequacy of children to provide support and care for their older parents. This paper examines whether the following factors explain differences in the strength with which adult children maintain relationships with mature parents and step-parents as measured by contact frequency, emotional closeness, and providing support: amount of time having lived with parents during childhood, whether economic investments were received from parents, and perceptions of familialism of parents. Data derive from 638 adult children (mean age = 30) participating in the 2005 wave of the Longitudinal Study of Generations. These analyses provide a basis for assessing how children in complex families will cope with serving the needs of their aging parents for support and care.

WIDOWED PARENTS' CONTACT WITH THEIR BIOLOGICAL AND STEPCHILDREN

S. Van der Pas[1], B. Suanet[2], T. van Tilburg[2], *1. EMGO Institute for Health and Care Research, VU University Medical Center, Amsterdam, Netherlands, 2. VU University Amsterdam, Amsterdam, Netherlands*

Still little is known about how widowhood influences relationships with biological and stepchildren. Using data from the Longitudinal Aging Study Amsterdam from observations in 1992 and 2002, this study investigates widowed stepparents' contact with their adult stepchildren in comparison to their biological children (123 stepparents, 56-88 years old; 355 step and 255 biological children). The focus is on widowed stepparents (n=56), of whom the stepchildren origin from their previous partnership, and widowed stepparents who have remarried (n=37) or repartnered (n=30), of whom the stepchildren origin from the current partnership. Results show that repartnered respondents have the least frequent contact with stepchildren, followed by remarried and widowed respondents. These differences are also observed for contact with biological children. The results suggest that life-events such as widowhood induce responses by both biological and stepchildren, but that the contact relies on earlier parental investments.

PARTNERSHIP STATUS AND HISTORY, FAMILY STRUCTURE AND INSTRUMENTAL HELP RECEIVED FROM CHILDREN BY U.S. OLDER PARENTS: EVIDENCE FROM THE HEALTH AND RETIREMENT STUDY 1998-2008

B. Suanet[1], J.A. Seltzer[2], S. Van der Pas[3], T.G. van Tilburg[1], *1. Department of Sociology, VU University Amsterdam, Amsterdam, Netherlands, 2. Department of Sociology, University of California, Los Angeles, Los Angeles, California, 3. EMGO Institute, Institute for Health and Care Research, Department of Epidemiology and Biostatistics, VU Medical Center, Amsterdam, Netherlands*

Objectives. The objective of this study was to investigate whether the effect of parental marital status, marital history and family structure on instrumental help given by adult children to older parents has changed across birth cohorts. Methods. Five waves of the Health and Retirement Study covering a time span of 10 years between 1998 and 2008 are employed. We conducted multilevel analyses for older mothers and fathers separately. Results. Data showed relative stability in the number of child helpers, the amount of hours of help and anticipated help of older parents in biological and stepfamilies across birth cohorts. Our results point at the importance of partnership status and history rather than the family structure for explaining the help that older parents receive from their (step)children. Discussion. In contrast to the theory on de-institutionalization of biological families and social selection in remarriages and stepfamilies, we find no changes in help that older parents receive from their children in biological and stepfamilies. A possible explanation for the latter could be that remarriages with children nowadays involve parent-child relationships with a higher relationship quality.

SESSION 825 (SYMPOSIUM)

LIVING LONG, FEELING WELL, AND ACHIEVING MEANING: CLARIFYING THE DIFFERENTIAL IMPACT OF DISTAL, PROXIMAL, AND TRAUMATIC LIFE EVENTS IN OLD-OLD AGE

Chair: A.J. Bishop, *Human Development and Family Science, Oklahoma State University, Stillwater, Oklahoma*
Discussant: D.S. Jopp, *Fordham University, New York, New York*
